Adjustment can be done for the following interest phases : Accrual, Compounding and Capitalization. This method takes an {@link InterestAdjustmentRequestDTO} as input which contains information about what needs to be adjusted and on which arrangement. There are certain rules that need to be adhered to in order to perform the adjustment. These rules are encapsulated in the {@link InterestAdjustmentBusinessPolicy}. If these rules are not met the adjustment transaction is rejected. After doing so based on the Interest Class it delegates the calls to adjustDebitInterest or adjustCreditInterest. If the adjustment is successful, then {@link TransactionStatus} is returned by this method. This service can also be invoked as part of a backdated interest recomputation. In such a case, only the statistics are updated - No accounting entries are passed. The interestAdjustmentRequestDTO.isBac

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					kdatingProcessing indicates whether it is a backdated interest recomputation. This method works as follows: Call {@link InterestUtilityHelper#formArrangementNumber} to form the arrangement number from the account id and the deposit number. Set arrangementNumber = formArrangementNumber(accountId, depositNumber) Load The InterestPlanItem by invoking the InterestPlanItemService.fetchInterestPlanItemForGivenDate method. The input parameters are set by using the attributes of InterestAdjustmentRequestDTO: <style type="text/css"> table.tableizer-table {border: 1px solid #CCC; font-family: Arial, Helvetica, sans-serif; font-size: 12px;} .tableizer-table td {padding: 4px; margin: 3px; border: 1px solid #ccc;} .tableizer-table th {background-color: #104E8B; color: #FFF; font-weight: bold;} </style> <table class="tableizer-table"> <tr class="tableizer-firstrow"><th>Argument</th><th>Set From</th></tr> <tr><td>arrangementNumber</td><td>arrangement

This schedule configuration has been defined as per user requirement. - If there is no custom schedule configuration defined, then the default configuration is being referred for defining Stages. - If the custom schedule configuration has been defined already, then it's being referred for defining the stages.

Base rate of interest.- Attached Rate charts can be tiered or not tiered.For tiered rate chart instead of giving effective rate doing by processing, It just gives rate chart details.Consumers are expected to analyse specific rate chart to get effective base rate of interest. Margin rate of interest- It can be either positive or negative. More than one rate	com.ofss.fc.app.adapter.impl.jar@\com\ofss\fc\app\adapter\impl\dda\DDAPricingAdapter	fetchInterestRateDetailsForReprising	This method will fetch the interest rate details that will be required for updating rate in Demand deposit account. The rate details are not be returned when magin is included. User Descretionary margin (UDM) is given for a period only. It has start and end date indicating the period when the UDM is effective. If UDM is applicable from a future date after account opening then a future dated rate change action should be logged. It is not require to log rate change action on start date if UDM start date is already passed on account opening date. If UDM is gettting expired on a future date then also a future dated rate change action needs to be logged. Future dated UDM action for expiry date will be logged from next date of UDM expiry date. If the expiry date is not present indicating no expiry of the UDM and hence no action will be logged. UDM can be fixed or variable hence logging action in both the cases. Rate change action is required to be logged at the time of account opening only. When it is a call from account opening service then it will have pricingPlanId as an input. If pricing plan id is not passed and value is null then this is a call from RateChangeActionExecutor.executeAction which does not pass pricing plan id as input. @param sessionContext @param accountId

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAPricingAdapter	fetchInterestRateDetails	This method will fetch the interest rate details that will be required for updating rate in Demand deposit account @param accountId @param partyId @param accountCurrencyCode @return {@link AccountBalanceRateDTO} @throws FatalException	com.ofss.fc.module.dda.jar@\com\ofss\fc\app\dda\service\account\core\DDAInquiryApplicationService	fetchInterestRateDetails	Interest can be thought of as "rent of money". When money is deposited in a bank, interest is typically paid to the depositor as a percentage of the amount deposited. when money is borrowed, interest is typically paid to the lender as a percentage of the amount owed. The percentage of the principal that is paid as a fee over a certain period of time (typically one month or year), is called the interest rate. There are two types of interest in demand deposit module Credit interest: Bank gives interest on money which is deposited by the customer. Credit interest generally given on {@link EffectiveBalances#clearBalance} Debit interest:Bank levies heavy interest on money which is overdrawn using following facilities Overdraft facility: Overdraft facility is product level attribute. Overdraft products are created separately. Overline facility : Please refer {@link AccountFacilities#hasOverline} for

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					more details. Temporary Overdraft: Please refer {@link AccountFacilities#hasTOD} AUF facility : Customer can use funds which are not yet cleared. There is limit present for AUF facility {@link AUFLimit}. Please refer following balances for debit interest. {@link EffectiveBalances#utilizedOverdraftLimit}: {@link EffectiveBalances#overlineAmount} {@link EffectiveBalances#todAmount} {@link EffectiveBalances#utilizedAUFLimit} Interest rates are maintained in pricing module.At the time of account opening pricing module creates pricing plan for demand deposit account .Interest rates can be tiered or non tiered(absolute). Interest rates are maintained for following types . Credit interest. Overdraft interest Overline interest. TOD(temporary overdraft) interest. AUF(Advance taken against uncleared funds) interest. This method is used to inquire interest rates based on {@link InterestRateDetailsDTO}, It provides following types of information about interest rates. Base rate of interest - If the base rate defined for an interest type is non-

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					tiered, method will provide the absolute applicable base rate. If the base rate defined for an interest type is tiered, method will give a applicable rate chart. Consumers of this service are expected to analyse rate chart to get the effective base rate of interest. Cumulative margin rate of interest - If the margins defined for an interest type is non-tiered, method will give absolute margin rate (value in BigDecimal). This rate can be positive or nagative. If the margin defined for an interest type is tiered, method will give applicable rate chart. If more than one rate chart are applicable then all rate charts will be returned. Consumers of this service are expected analyse each rate chart to get effective margin rate of interest. UDM (User defined margin) rate of interest- This rate is given account level price benefit chart screen(ALPBC). This rate is always absolute value irrespective of the tiered or non tiered base/margin rates. If UDM is not given for a rate type in ALPBC screen, method will give <code>0 </code> . Net interest rate : Net rate can be derived using following formula <code>Net rate = base rate + cumulative margin rate + UDM</code> Consider following scenarios If base

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					rate and margin rate are non tiered then net rate can be derived. If base rate or margin rate is tiered ,net rate can not be derived.In such scenarios net rate will be null. Interest rates are fetched from pricing module using adapter layer.This method performs following activities. Validate demand deposit account: call {@code DemandDepositAccountService#validateDemandDepositAccount}. Call {@link IDDAPricingAdapter#fetchInterestRateDetails} for given {@link InterestRateDetailsDTO}. Prepare response using {@link InterestRateDetailsDTO} returned in step 2. @see AdapterFactoryConfigurator#getAdapterFactory @param SessionContext ,sessionContext, , This parameter captures the basic information about the user of the system. Following are the steps involved. Increase Limit Amount: Reprice if account is in fixed Rate period parameter is checked / Variable rate period parameter is checked Decrease Limit Amount: Reprice if account is in fixed Rate period parameter is checked /

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Variable rate period parameter is checked. Offer Swap Increase Limit Amount / Decrease Limit Amount +Offer swap : In this case irrespecitive of reprice parameter being yes or no, system will reprice the account for which offer swap is to be done. Increase / Decrease Limit Term / Link new collateral to facility /De link existing collateral /add or remove borrower - In these case reprice parameter is not applicable. If once account configuration is done & pricing ticket is generated and you made changes like party updated and again coming to account configuration, in that scenario this method checks for critical fact changes and create new recommendation. If pricing ticket exists and no critical fact changed, then this method also does the interest stage date updates. This is done to handle scenario: Say Account configuration is done on Sep 20th and now being reviewed and processed on Sep 25th then stage dates are with respect to Sep 25th. @see AdapterFactoryConfigurator.getAdapterFactory(CommonAdapterFactoryConstants.DDA_PRODUCT_ADAPTER_FACTORY)# getAdapter @see AdapterFactoryConfigurator#getAdapterFactory @see IDDAProductAdapter#fetchDDABankPolicy @param
