					receipient Id , commission receipient Name into the DB. Key is the arrangement Id which can be account Id or submission Id or facility Id and Serial Number. This method checks if the arrangement ID is already existing then it copies the entry in backup table and updates it. otherwise it adds the new entry into the DB. This method is called in amend scenarios when the commission of a agent changes as the limits changes. In this case we copy the current agent details to history table and update the current record with the new commission details. The previous commission Details are copied to the existing commission details of the updated record. Commission present can be of 3 types:- (1) Existing commission - this refers to the commission which the broker is currently holding before he changes it. (2) AutoCommission :- This refers to the commision either manually entered or fetched from external system. (3) Discretionary Commission :- If auto commision is changed then it is entered in the discretionary commission Brief Procedure of working of ADD is like this:- it checks if module calling is not ELCM then it fetches the latest arrangement Id record from DB. if there are no records present for the arrangement ID then it checks if the calling module

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					is ELCM or not, if ELCM then fetches the latest serial number and increases it by 1 and then adds the records to DB. If calling module is not ELCM and no records are found then directly add record to DB. IF records were already found in while fetching latest arrangement from DB then it is first copied to history, then the current record is deleted from the base table and then from the passed DTO a entity object is formed and the key and commission Receipient id and agent party id are set to it and sent to add to DB. Following are the mandatory attributes in the DTO being passed to add a record to DB:- (1) arrangement ID - refers to account Id or submission Id or facility Id (2) Agent ID- refers to Broker / Introducer ID. @see AgentArrangementLinkageService#fetchLatestAgentArrangementLinkage @see AgentArrangementLinkageRepository#fetchLatestSerialNumberFromHistory @see AgentArrangementLinkageService#deleteAgentArrangementLinkage @see AgentOfferRestrictionApplicationService#fetchAgentOfferRestriction @see AgentArrangementLinkageService#addAgentArrangementLinkage @see AgentArrangementLinkageRepository#fetchCurrentCommision @see AgentArrangementLinkageService#fe

Below details provide the information about the parameters, about which, the knowledge is required in order to prepare Accounting Event Details.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		eventCode @return @throws FatalException			Parameter Name:- listOfAmountTagDetailsBySettlement Description:- This parameter represents the list of Accounting Event - Amount tag Details. After performing Settlement with CASA Accounts, Settlement provides Amount tag details. "Loan Draw Down Operation" and "Loan Redraw Operation" are suitable examples to be considered for this. In case of Draw down, Settlement provides Debit Amount Tag details. Credit Amount Tag details will be prepared by Loan Accounting Service. In case of Redraw, Settlement provides Credit Amount Tag details. Debit Amount Tag details will be prepared by Loan Accounting Service. <u>NOTE:-</u> If the Settlement is done with more than one CASA Accounts, the list will have more than one Amount Tag Details. The cases, when there is no involvement of Settlement, this argument need to be passed as "NULL". Loan Arrears Capitalization is a suitable example to be considered for this. <u>NOTE:-</u> Both (Credit Amount Tag & Debit Amount Tag) Amount Tag Details will be prepared by Loan Accounting

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Service. - Parameter Name:- transactionDescription Description:- This parameter represents the description about the transaction for which Accounting Event need to be logged. - Parameter Name:- amountTagToDirectionMap Description:- This parameter represents mapping between Amount Tag and the Direction of flow of amount. For Debit Amount Tag, the DirectionType being mapped is OUT. For Credit Amount Tag, the DirectionType being mapped is IN. This parameter plays an important role while populating the Amount tag details. - Parameter Name:- isCashTransaction Description:- This parameter identifies the instrument reference sent by the module required for clearing/payment reconciliation. Here, it needs to be passed as NULL. - Parameter Name:- nonProductDomainCategory Description:- This parameter indicates the event (for which Accounting Event need to be logged) has occurred due to Non Product Domains (like Payment, Cash Transaction, ATM, Bill Payment etc).

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Above mentioned examples are non-products, or Product has not been defined for above categories. - Parameter Name:- isTransactionFromLoanAccountToExternalAccount Description:- This parameter identifies whether amount transfer is from Loan Account to CASA Accounts or vice versa. If the transaction flow is Loan Account -> CASA Account (e.g. Redraw), this parameter need to be passed as TRUE. If the transaction flow is CASA Account -> Loan Account (e.g. Drawdown), this parameter need to be passed as FALSE. </p> @see LoanAccountService#fetchLoanAccount @see LoanTransactionAttributesService#fetchOriginalTxnRefNumber @see LoanBalanceAggregateRepository.loadAggregate(loanAccountId)#fetchMaxSequenceNumber @see LoanBalanceAggregateRepository#loadAggregate @see ILoanProductAdapter#fetchDomainCategoryForEvent @see #prepareAccountingEventAmountTagDetailsDTO @see CurrencyService#roundAmount @see TransactionAmounts#prepareTransactionAmountsWithInputRate @see LoanInsuranceApplication#fetchInsur

This method internally calls validateLoanScheduleConfigurationDetails method which validates the loan schedule configuration details. Also it calls defineSchedule method which creates the dummy account with given details and generates

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					default schedule based on the given schedule configuration details. The method populateLoanScheduleConfiguration Details also calls generateRepaymentRecords which generates the blown up schedule based on the summary schedule defined in defineSchedule call. Algorithm Get the parent account id for split from the {@link LoanRepaymentScheduleConfiguratio nDTO#getParentAccountIdForSplit()}. If the parent account id is not null then check whether arrear exists for the account. Create a dummy response {@link LoanDummyScheduleResponse} by calling and get the next repayment date from the dummy response. Set {@link AccountScheduleAttributesDTO#setA ccountNominatedForBundlePeriodicF ee(boolean)} from the {@link LoanRepaymentScheduleConfiguratio nDTO}. If {@link LoanRepaymentScheduleConfiguratio nDTO#getScheduleGenerationDate()} is after process date, then call {@link LoanSimulationAdapter#simulateFut ureDateSplit(parentAccountIdForSplit , loanRepaymentScheduleConfiguratio nDTO)} and return the response. If {@link

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					UserModifiedStageParameterDTO} is not null then : Set the {@link LoanRepaymentScheduleConfigurationDTO#getRepaymentDay()} as {@link UserModifiedStageParameterDTO#getFirstPrincipalRepaymentDate()} Get the {@link LoanRepaymentStageDTO} from the {@link LoanDummyScheduleResponse#getRepaymentStageDTOs()}. Call the {@link LoanScheduleSimulationApplicationService#checkNextRepaymentDate(UserModifiedStageParameterDTO, LoanRepaymentStageDTO[])}. Derive the {@link LoanRepaymentStageResponse}by calling {@link LoanScheduleSimulationApplicationService#updateStageOnParameterChange(SessionContext, String, Integer, Date, Integer, UserModifiedStageParameterDTO, LoanRepaymentStageDTO[], SortedMap, List, LoanRepaymentScheduleConfigurationDTO)} Get the array of {@link LoanRepaymentStageDTO} from the {@link LoanDummyScheduleResponse#getRepaymentStageDTOs()} and set the repaymentStageDTO derived from {@link LoanRepaymentStageResponse}.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Get the loanScheduleResponse {@link LoanScheduleResponse} by calling {@link LoanScheduleSimulationApplicationService#updateScheduleOnStageChange(SessionContext, String, Integer, Integer, Date, LoanRepaymentStageDTO[], SortedMap, List, LoanRepaymentScheduleConfigurationDTO)}. Set the loanRepaymentStageDTO from the loanScheduleResponse. If loanRepaymentStageDTO is not null, then Load the {@link PrincipalScheduleTemporalPeriod} with the loanRepaymentStageDTO. Derive the nextRepaymentDate by looping through the array of LoanRepaymentStageDTO. Add bundleId and bundleReferenceId to the {@link LoanTransactionAttributesService}. Derive the {@link LoanBlownupScheduleResponse} dummyBlownUpScheduleResponse by calling {@link LoanScheduleSimulationApplicationService#generateRepaymentRecords(SessionContext, String, Integer, Date, BigDecimal, LoanRepaymentStageDTO[], SortedMap, List, LoanRepaymentScheduleConfigurationDTO, AccountScheduleAttributesDTO)}.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Fill the final response {@link LoanScheduleOutputResponse} by: response.setSessionId(dummySummaryScheduleResponse.getSessionId()); response.setRepaymentStageDTOs(loanRepaymentStageDTO); response.setRepaymentRecordsDTOs(dummyBlownupScheduleResponse.getRepaymentRecordsDTOs()); response.setNextRepaymentDate(nextRepaymentDate); response.setYearBaseType(dummySummaryScheduleResponse.getYearBaseType()); Delete dummySummaryScheduleResponse by calling {@link LoanScheduleSimulationApplicationService#deleteTemporalData(LoanDummyScheduleResponse)}. On financial or non financial transaction event, application stores transaction details in terms of{@link StatementItem}.</br> The list of the financial or non financial events on which details are logged isfixed. Financial transaction generally updates balances of the account for example TD payin,redemption, Interestsettlement etc.Non financial transaction does not update balances but they update non financial attributes of theaccount account address. Transaction inquiry request may come from branch banking or direct banking. In case of branch banking operation executive may want to see transaction performed on particular accountwithin specified period. In case of direct banking ,customer may want to see transactions performed on account.{@link

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					TransactionInquiryDTO} contains start and end date .This method lists all the transactions where{@link TransactionAmount#transactionDate} is greater or equal than {@link TransactionInquiryDTO#startDate} and{@link TransactionAmount#transactionDate} is less than or equal to {@link TransactionInquiryDTO#endDate} . Pleaserefer {@link StatementInquiryFilterInputDTO} for more details . Financial transaction details contains following details. - Transaction Amounts: Amount in different currencies. - Transaction key/Audit Details: Unique information to identify transaction (transactionReferenceNumber+subsequence number).Using this number we can inquire further details about transaction. - Service Charge Details: Pricing reference number or pricing ticket from which details can be asked frompricing module. - Transaction source details- channel and application user. - Transaction dates: Different dates indicating realization of transaction. - Transaction Event Details: Event such as credit fund, In terms of transaction mnemonic. Non financial transaction contain

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					following details - Event date : Date on which event is performed. - Event description : description of the event like "Interest rate is changed from 5% to 4.5%" @see IAccountLoanAdapter#fetchLoanAccount@see StatementInquiryService#searchLoanTransactions@see StatementInquiryService#fetchLoanTransactions@see StatementItemFilterFactory#createRangeFilterInstannce@see StatementItemFilterFactory#createEqualityFilterInstannce@see StatementItemFilterFactory#createInFilterInstannce@see StatementStatistics#updateStatictics@param transactionInquiryDTO MI,{@link TransactionInquiryDTO},transactionInquiryDTO, It contains the following attributes: - accountId: String MI it is the id of the account for which TD transactions are inquired for. - statementPeriodType: {@link StatementPeriodType} MI denotes the period type for which the inquiry is done - statementInquiryFilterInputDTO: {@link StatementInquiryFilterInputDTO}, it contains the following attributes:

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					- statementInquiryFilterTypes: {@link StatementInquiryFilterType}[] it has all the filters that need to be applied.Optional - startAmount: {@link MoneyDTO} MI if amount range filter is chosen. Denotes the start amount range. - endAmount: {@link MoneyDTO} MI if amount range filter is chosen. Denotes the end amount range. - checkNumberStart: String MI if cheque range filter is chosen. Denotes the start range. - checkNumberEnd: String MI if cheque range filter is chosen. Denotes the end range. - transactionDescription: String MI if transaction description filter is chosen. Denotes the description for which the inquiry is to be made - transactionMnemonics: String MI if transaction mnemonics filter is chosen. Denotes the mnemonics for which the inquiry is to be made - lastNumberOfTransactions: int. Denotes last number of transaction to be inquired for in case of last x transactions filter. If this value is set to zero, the default values will be picked up from statement parameters. This is mostly used for mini statement inquiry in ATMs. - lastNumberOfDays: int. This

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					denotes the last number of days for which the transactions are to be fetched. If this is set to zero, then default values will be picked up from statement parameters. - startDate :{@link Date} Denotes the value date range start parameter. It need not be passed if the StatementPeriodType is either current or prior as in this cases the period is got from {@link StatementRequestApplicationService} methods. Also if either of Last_X_Transaction or Last_N_Days filter are used, it can be null. It is a mandatory input for all other cases. - endDate : {@link Date} Denotes the value date range end parameter. It is mandatory for the same cases as the start date. - isAscending : boolean MI denotes if the inquired statement is to be sorted in ascending or descending order. @return {@link LoanTransactionInquiryResponse}. com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountLoanAdapter	fetchCollectionDetails		com.ofss.fc.module.account.jar@\com\ofss\fc\app\account\service\accountaddresslinkage\AccountAddressLinkageApplicationService	modifyAccountAddressLinkage	This method modifies the address linkages for all the parties associated with the account. Steps to be performed are 1) Set the task code of the operation for Interaction 2)Create Transaction Context by passing SessionContext and ADDITION (as MaintenanceType) as an arguments 3) Based on the account type , check the validity of the account and get its status by calling the appropriate Application Service through tha adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDAInquiryApplicationService with accountId as the input. If the account type is TD , call fetchAccountDetails()

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					method exposed by the TermDepositAccountApplicationService with accountId as the input. 4) Call validateAccount() method with accountId and status as the input. Only accounts with status " regular" are allowed to have linkages maintained. If the account status is closed or dormant , " Closed/Dormant Account " error message would be displayed. 5) Check for the validity of the each party and its account relationship by calling fetchPartyAccountRelationship() method exposed by the PartyAccountRelationshipApplicationService. If the party is not valid, "Invalid Party" error message is displayed. If the party does not have any relatinship with the account, "No Relationship with the Account" error message is displayed. 6) i) Call validateCombinedStatementSelection() method with AccountAddressLinkageDTO as the input. If the validation fails, error message would be displayed. ii) Call validateHoldOption() method with AccountAddressLinkageDTO as the input.If the validation fails, error message would be displayed. 7) Create an object of AccountAddressLinkageAssembler. Convert the AccountAddressLinkageDTO to

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					domain object using the AccountAddressLinkageAssembler. 8) Create an instance of Domain Service (AccountAddressLinkage Service). 9) Call the modifyAccountAddressLinkage() method of the AccountAddressLinkageService with the instance of AccountAddressLinkage created in the above step. 10) Fill the Transaction Status by calling the method fillTransactionStatus. 11) Put the above set of operations in try-catch block and specify the possible exceptions in catch blocks. 12) Close the interaction in finally block. 13) Return the transactionStatus object as response of this operation. @see AccountAddressLinkageService#modifyAccountAddressLinkage @see IAccountDDAAdapter#intimateCollection @see IAccountLoanAdapter#fetchCollectionDetails @see IAccountLoanAdapter#updateCollectionOnAddressTypeChange @see AccountActivityEventLogger#logActivityForOnline @see IAccountDDAAdapter#validateAccountStaus @see IAccountDDAAdapter#callOverridableFinancialPolicy @see IAccountLoanAdapter#validateAccountDuringInquiry @see IDDAPartyAdapter#fetchAllPartiesOf

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountLoanAdapter	updateCollectionOnAddressTypeChange	This method would intimate collection on address type change for default comm address @param accountId @param defaultCommAddressType	com.ofss.fc.module.account.jar@\com\ofss\fc\app\account\service\accountaddresslinkage\AccountAddressLinkageApplicationService	modifyAccountAddressLinkage	This method modifies the address linkages for all the parties associated with the account. Steps to be performed are 1) Set the task code of the operation for Interaction 2)Create Transaction Context by passing SessionContext and ADDITION (as MaintenanceType) as an arguments 3) Based on the account type , check the validity of the account and get its status by calling the appropriate Application Service through tha adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDAInquiryApplicationService with accountId as the input. If the account type is TD , call fetchAccountDetails() method exposed by the TermDepositAccountApplicationService with accountId as the input. 4) Call validateAccount() method with accountId and status as the input. Only accounts with status " regular" are allowed to have linkages maintained. If the account status is closed or dormant , " Closed/Dormant Account " error

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					message would be displayed. 5) Check for the validity of the each party and its account relationship by calling fetchPartyAccountRelationship() method exposed by the PartyAccountRelationshipApplication Service. If the party is not valid, "Invalid Party" error message is displayed. If the party does not have any relatinship with the account, "No Relationship with the Account" error message is displayed. 6) i) Call validateCombinedStatementSelection( ) method with AccountAddressLinkageDTO as the input. If the validation fails, error message would be displayed. ii) Call validateHoldOption() method with AccountAddressLinkageDTO as the input.If the validation fails, error message would be displayed. 7) Create an object of AccountAddressLinkageAssembler. Convert the AccountAddressLinkageDTO to domain object using the AccountAddressLinkageAssembler. 8) Create an instance of Domain Service (AccountAddressLinkage Service). 9) Call the modifyAccountAddressLinkage() method of the AccountAddressLinkageService with the instance of AccountAddressLinkage created in

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					the above step. 10) Fill the Transaction Status by calling the method fillTransactionStatus. 11) Put the above set of operations in try-catch block and specify the possible exceptions in catch blocks. 12) Close the interaction in finally block. 13) Return the transactionStatus object as response of this operation. @see AccountAddressLinkageService#modifyAccountAddressLinkage @see IAccountDDAAdapter#intimateCollection @see IAccountLoanAdapter#fetchCollectionDetails @see IAccountLoanAdapter#updateCollectionOnAddressTypeChange @see AccountActivityEventLogger#logActivityForOnline @see IAccountDDAAdapter#validateAccountStaus @see IAccountDDAAdapter#callOverridableFinancialPolicy @see IAccountLoanAdapter#validateAccountDuringInquiry @see IDDAPartyAdapter#fetchAllPartiesOfAccount @see IAccountPartyAdapter#checkIfPartyRelatedToAccount @see AssociatedPartyRepository#get @see IAccountDDAAdapter#updateCollectionForAccount @see IAccountCollectionAdapter#intimateCorrespondancePreferenceUpdate @see IAccountTDAdapter#updateLastActi

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAPCAdapter	closeBillPaymentSchedule	Method to close the bill payment schedule when SI has been closed . If the standing instruction has been closed , then the bill payment	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\entity\account\facility\instruction\StandingInstruction	execute	Execution of Periodic Funds Transfer instructions (Standing Instruction) is handled at batch process, Beginning of Day operations (BOD). The execution of Periodic Funds Transfer instructions happens on the previous working day, or the next working day in case the execution day is a holiday, This is the concrete implementation of the execute method. This method executes the

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		schedule has to be closed @param instructionKeyDTO			Standing Instruction as follows: - The Periodic Transfer Instruction will always be initiated during BOD. - The system checks the accounts which are due for Periodic Transfer based on the Periodic Transfer Start Date and the Recurrence pattern maintained. - The System Validates end date for the instruction. The Conditions when the Periodic Transfer Instruction is to be terminated is maintained in the recurrence pattern. - System checks the status of the provider and beneficiary Accounts. Business rules to be built to allow or reject based on the status of the account - The system validates the holiday processing rules (Refer Holiday Processing) - System identifies the accounts eligible to execute Periodic Transfer Instruction on this processing date - The System Checks If the Funds are available in the Provider accounts - The Execution of the instruction is based on the priority defined for the accounts. - The System Executes the transfers - The system updates the book balance and passes the accounting entries (posting dated will be the current system date) - The System maintains a Transaction Reference number for Audit purpose - The System

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					updates the Next Execution date. (For Accounts, which the Periodic Transfer Instruction ends the next execution date is not updated) Holiday Processing for Standing Instructions - The Holiday Processing can configured for the ???day of execution??? as defined by the business rules of the bank - If the Business rule indicates that the execution is to be processed the previous day, then the accounts for which the funds transfer is due will be processed the day before the bank holiday - If the date for execution is not configured to previous, the system will initiate the instruction order on the next working day. - Transactions falling on a holiday will be executed on next working day, but if the frequency is daily, the transactions will only be executed on working days. - Scenario 1: ???Day Of Execution??? is ???Previous Day??? - The System identifies that the next day is a holiday in the Bank Calendar - The System validates all the account due for sweep out till the next working day. - Scenario 2: ???Day Of Execution ??? is the ???Next Working Date??? - The System checks if the previous day was a

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					holiday in the Bank Calendar - The System validates all the account due for sweep out from the last working date.
