					override conditions. If these override conditions are authorized by the authorizer based on the SMS setup, the transaction will be successful. The override conditions will be applicable for both debit and credit accounts. The funds transfer method works as follows: - Call the assembler method {@link FundsTransferTransactionAssembler#toInformationObject} to convert the details of the incoming DTO to Information object FundsTransferTransaction. - Validate if the transaction is duplicate by calling the service of the parent class {@link super.validateDuplicateTransaction}. - Call the private method checkFundsTransferBusinessPolicies to validate the business rules for the transaction. - Call the method {@link super.manageTransactionDates} for posting date validations. - Get the transactionReferenceNumber from the sessionContext. - Get the subsequence number using {@link TransactionAuditItemHelper#getNextSequenceNumber(transactionReferenceNumber: String): int}. - Call {@link super.debitFunds(accountTransaction: AccountTransaction):

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					DebitResponse} for debitting the provider account with the transaction amount. - Call the private method creditBenficiaryAccounts to credit the funds in the one or multiple beneficiary accounts as the case may be. - Call the private method {@link this.manageFee} to levy fees on the account . The fees will always be levied on the debit account. - Open a loop for the beneficiary accounts. - Create a new AccountTransaction for the credit account by copying the details of the debit AccountTransaction and updating the accountId and transactionAmounts with the beneficiary details. - Add the new AccountTransaction in the accountTransactionarray. - Log financial accounting event using {@link super#raiseFinancialEvents(accountTransacitonArray: AccountTransaction[], feeDetails: FeeDetails, instrumentId: String)}. Pass the accountTransactionarray created above to the service. TODO:// Amit to confirm whether a debit entry is to be passed for each credit entry on one debit entry should be passed with multiple credit entries. - Call the method {@link this.handleFundsTransferOverride} to check the override conditions. @see

					ice through the TD adapter. Validate deposit number and its status by calling fetchDeposit of DepositApplicationService through the TD adapter. (Done in validateAccountAndfetchProductCode) - Create an object of Assembler - Invoke its toDomainObject() method and convert the AccountNominationRequestDTO to the domain object - Create an instance of Domain Service and invoke it's fetch method by passing NominationStructure. This would return a domain object. - Invoke the fromDomainObject() method of Assembler and pass the domain object to it. It would return the response DTO in response. - Set the DTO as a part of Inquiry Response - For each party in the domain object fetched call fetchPartyDetails of PartyApplicationService through the adapter. Set each response in the Inquiry Response. - The inquiry response will not have any deposit details. - Fill the Transaction Status by calling the method fillTransactionStatus and pass the transactionstatus as an argument to it. - Set the response status as transaction status - Put the above set of operations in try-catch block and specify the possible

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					exceptions in catch blocks. - Close the interaction in finally block. - return the Response of this operation. / @see AccountNominationService#fetchNominations @param sessionContext @param accountNominationRequestDTO @return AccountNominationsResponse @throws FatalException

This method will log an action in CASA for computation of the offset credit interest. The beneficiary balance may get updated on a holiday. The value date and the balance-as-of-that-date will be provided by the beneficiary

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		effectiveDate @param isCrossOver @param transactionType @param transactionAmount			account holder module. Based on the value date of beneficiary balance change , holiday processing of the offset credit interest will also be performed.Action will be triggered on the next working date with a due date/ value date as holiday. Assumption : Offset is linked to the beneficiary account and is active. The Overdraft account viz. beneficiary always uses the unclear funds for availing the offset benefit. Hence the distribution of outstanding balance into buckets is performed as follows. 1. List accounts based on priority 2. Check the first account's (clear + unclear) balance 3. Offset the outstanding amount with the balance as received in step 2. 4. If outstanding amount is greater and has not been offset by Account priority#1, move to account priority#2. 5. Repeat the steps from 2 to 4 untill all the outstanding amount is offset / the sum of offset account balances is not available for offset. @see OffsetAccountRepository#loadAllActiveLinkedAccountDetails @see DemandDepositAccountRepository#load @see BalanceHistoryItemRepository#load @see DemandDepositUtil#populateBalanceHistoryItemWithCurrentBalance @see

This method internally calls the Pricing module's {@link EventPriceApplicationService#getPriceOnEvent()} via adapter to actually calculate the fees and return the same back to the caller. For a particular event, multiple fees may be calculated with the same pricing ticket number. Hence an array of {@link PriceFeatureDTO} is returned back to the caller method. The following is the algorithm for the method: Arrangement Id, Event Id, Arrangemant Module, Task Module Type, Process Date, cyyCode array, FactDTO is passed as input parameter to this method.Get the AccountPricingAdapter by calling {@link getAccountPricingAdapterInstance(): AccountPricingAdapter} / Call {@link IAccountPricingAdapter#getFeeOnEvent()} passing the required inputs and PricingDetails will be returned from Pricing by this call through adapter. @see FeesManagementServiceHelperFactor

					mode details Service charge details. <p> The method follows the following algorithm: Set the statement request key from {@link UUIDGenerator#generateUuid()} Set the statementRequestStatus as pending. Create a new instance of {@link AbstractBusinessPolicy} based on the instance type of statementRequest and validate the same. The statement requests will be placed at the deposit level as it an account level statement request may cause inconsistencies during batch. Hence for the current account, all the deposits are fetched and statement request is placed for each with {@link TDStatementRequest#accountBasedStmtId} as the same. For System initiated request, make sure that the {@link StatementRequest#getCustomerInitiatedRequest()} is initialized with all the components as null so that isReorder flag is not persisted as null. Call the {@link #create(AbstractDomainObject, com.ofss.fc.framework.repository.AbstractRepository)} method with instance of {@link StatementRequestRepository} @param tdStatementRequest @param partyId , Denotes the partyId @param branchId , Denotes the branchId @throws FatalException

The steps are as follows:- Check for Mandatory attributes by passing Operating Instruction DTO as argument to validateBeforeProcess IF type == "GROUP" THEN Call validateAccount() and pass GroupId, Type and AccountType as input arguments. ELSE Call validateAccount() and pass AccountId, Type and AccountType as input arguments. Create an instance of Assembler Pass the OperatingInstructionDTO as an argument to toDomainObject() of Assembler and convert it to domain object. This would return the entity OperatingInstruction. Create an instance of Domain Service Call the reopenOperatingInstructions method

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAPartyAdapter	fetchAllPartiesOfAccount	This method is used to fetch all the parties for the given account id @param accountId @return @throws FatalException	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\service\account\group\AccountGroupBusinessPolicy	validateAccounts	TODO: Add order by partyId in the HQL fetchAllPartiesOfAccount. This method will be used to validate the accounts of the group. The accounts should satisfy the following conditions to be a part of the group. - Should be a valid CASA Account. - Account Status should be valid for Group Account Maintenance. - All the accounts of the group should have the same currency. - The customer account relationship should be valid for Group Account Maintenance. - The account should not belong to more that one

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					group with the same purpose. - There should be a minimum of 2 accounts involved in a group. The relationship between the account and the party should be in the role of a Customer and should be one of the following: - Sole Owner - Joint And First - Joint And Other - All the accounts of the group should be belong to the same party or set of parties as the case maybe. For e.g. <table border=1> <tr> <td>AccountNumber</td> <td>PartiesToTheAccount</ /td> </tr> <tr> <td>111</td> <td>A~B</td> </tr> <tr> <td>222</td> <td>A~B</td> </tr> <tr> <td>333</td> <td>A~C</td> </tr> <tr> <td>444</td> <td>A~B</td> </tr> <tr> <td>555</td> <td>A~C</td> </tr> <tr> <td>666</td> <td>A</td> </tr> </table> In the above case: - Accounts 111, 222 and 444 can belong to the same group. - Accounts 333 and 555 can belong to the same group. - Accounts 111,222, and 555 cannot belong to the same group.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					- Accounts 111 and 666 cannot belong to the same group. The method works as follows: - Declare a local variable previousListOfParties = null. - Declare a local variable previousCurrency = null. - Check the size of the array AccountGroupMember in the business policy DTO. If the size < 2, then add appropriate error message to the list of validation errors. - Open a loop for the accounts of maintained for the group. - Load the account by calling repository method {@link DemandDepositAccountRepository#load} to validate if the account exists or not. If the account does not exist, then add an error message to the list of validation errors. - If the (previousCurrency <> null && DemandDepositAccount.getCurrencyCode() <> previousCurrency), then add error message to the list of validation errors. - Set the value of previousCurrency = DemandDepositAccount.getCurrencyCode() - Check the status of the account by calling the service {@link DemandDepositAccount#validateStatus} to check if the status is valid for Group Account Maintenance. If the status is not valid, add error message to the list of validation errors.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					- Get the parties associated with the account along with their relationships by calling the service {@link IDDAPartyAdapter#fetchAllPartiesOf Account}. - Open a loop for the response returned by the above service. - If the looprecord.partyId = accountGroup.partyId, then - If the looprecord.relatioshipType is not one of the relationships mentioned above, then add appropriate error message to the list of validation errors. - If the looprecord.roleId <> Customer, then add appropriate error message to the list of validation errors. - Concatenate the partyId in a tilde separated list and assign to variable listOfParties. - If none of the parties in the list = accountGroup.partyId, then add appropriate error message to the list of validation errors. - If (previousListOfParties != Null && previousListOfParties <> listOfParties), then add appropriate error message to the list of validation errors. - Set previousListOfParties = listOfParties. - Call the repository method {@link AccountGroupRepository#fetchNumb erOfGroupsForAPurpose} to get the number of groups of the same purpose of which the account is a

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAPartyAdapter	fetchPartyName	This method will fetch legal name of party from flx_pi_names_b. This will call PartyNameApplicationService to get legal name of the party. @param sessionContext @param partyID @return	com.ofss.fc.module.account.jar@\com\ofss\fc\app\account\service\accountaddresslinkage\AccountAddressLinkageApplicationService	fetchAccountAddressLinkage	This method fetches the address linkages for all the parties associated with the account. In the Inquiry DTO the partyId and docTypeId fields would not contain any value. Steps to be performed are 1) Create an instance of AccountAddressLinkageInquiryResponse. 2) Fetch the transaction status using fetchTransactionStatus(). 3) Create Transaction Context by passing SessionContext and INQUIRE (as MaintenanceType) as an arguments. 4) Based on the account type , check the validity of the account and get its status by calling the appropriate Application Service through tha adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDAInquiryApplicationService with the accountId as input. If the account type is TD , call fetchAccountDetails() method exposed by the TermDepositAccountApplicationService with the accountId as input. 5) Call validateAccount() method with accountId and status as the input. If the account status is closed or dormant , " Closed/Dormant Account " error message would be displayed. 6) Create an instance of the Domain Service

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					(AccountAddressLinkageService). 7) Call the fetchAccountAddressLinkage() method of the AccountAddressLinkageService with accountId as the input. 8) Receive the AccountAddressLinkage entity in response. 9) Based on this response, call different Application Services to fetch other relevant details through the adapter. a) For each party in the AccountAddressLinkage, call the fetchPartyDetails() of PartyApplicationService with partyId as the input to get party details. b) For each party in the AccountAddressLinkage, i) For all the postal address preference set in the linkage call the fetchPartyAddress() of PartyAddressApplicationService to with partyId and postalAddressType to get party postal address. c) For each party in the Account Address Linkage, call the fetchPartyAccountRelationship() of PartyAccountRelationshipApplication Service with accountId and partyId as input to get the relationship. d) For each docTypeId in the linkage, call the fetchDocumentType() of DocumentTypeApplicationService with docTypeId as the input to get the description of the document. 10) Fill the AccountAddressLinkageInquiryResp onse with all the relevant details. 11)

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc

The account is opened by calling {@link DemandDepositAccountService#openDemandDepositAccount()}. The following is the algorithm for the method: - Instantiate {@link DDACloningBusinessPolicy} using the parameterized constructor by passing the existing DDA as the parameter. - Validate the existing DDA by calling {@link DDACloningBusinessPolicy#validate()} - In case of any validation errors, throw an exception and stop processing. - Call {@link DemandDepositAccountService#openDemandDepositAccount()} by passing {@link IDemandDepositAccount}. This will open the account. - Since the account is opened independently, the balances for this new account are initialized to zero.

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDLCMAdapter	createBorrowingEntity		com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\service\account\core\DemandDepositAccountService	updateBackdatedFunds	This is a common method used to update funds to a demand deposit account during a backdated transaction. The service is used to update funds both during a credit and a debit transaction. When a backdated transaction occurs, the funds have to be updated from the value date of the transaction upto the current process date. This is required in order to recompute the interest for the account. The demand deposit account contains a EffectiveBalance Pair of the current and future balances. The past balances of the account are available in the BalanceHistoryItem. Hence, when a backdated transaciton takes place, the records of the BalanceHistoryItem will be updated starting from the value date of the transaction. Finally, the current balance of the account will be updated. The method works as follows: - Loads the demand deposit account by calling {@link DemandDepositAccountRepository#load} using accountTransaction.accountId. - Validate the status of the account by calling the service {@link DemandDepositAccount#validateStatus} to verify whether funds can be credited to the account or not. - Retrieve the OD limit start date and AUF start date from demand deposit account

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					(DemandDepositAccount#getBalances# getBalanceLimits#getOverdraftLimit/ #getAufLimit#startDate) - Call the service {@link DemandDepositAccount#resetEffectiveBackDate} with the transaction value date to update the value of the attribute effectiveBackDate at the account level. - transactionAmounts = {@link TransactionAmounts#prepareTransactionAmounts()} - Load the details of the balance history item from the value date of the transaction by calling the service {@link BalanceHistoryItemRepository#loadHistoryForBackdatedPeriod} with the value date as the value date of the transaction. - Open a loop for the list of records returned by the above service. - If the effective date of the Balance history Item record < value date of the transaction, it means there is no row present in BalanceHistoryItem as of the value date. A row needs to be created in the BalanceHistoryItem with the effective date as the value date of the transaction. Prepare a balance history Item record with the effective date as the value date of the transaction, and the rest of the details same as the loop record and use for the below processing. - When creating new balance history item, use the OD

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					start date and AUF start date retrieved above - If the value of the input.transactionType = Credit, call the service {@link BalanceHistoryItem#credit} to update the credit amount in the balance history. ElsIf the value of input.transactionType = Debit, call the service {@link BalanceHistoryItem#debit} to update the debit amount in the balance history. Pass the transaction value date as the effective date of the loop record. - Call the service {@link BalanceHistoryItemRepository#saveOrUpdate} with the details of the transaction response returned by the service above. Reset the value date to the posting date in the attribute TransactionDates. If the value of the input.transactionType = Credit, call the service {@link DemandDepositAccount#credit} ElsIf the value of the input.transactionType = Debit, call the service {@link DemandDepositAccount#debit} - Update the instance of the DemandDepositAccount by calling the update() method of the repository {@link DemandDepositAccountRepository#update} - Construct and log the financial statement item - Invoke StatementItemService.addDDFinancia

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Key for entity AccountFacilityLinkage, contains account Id and Facility Id, using this information we can inquire about a facility linked to a account.i.e its start date , end date , fixed rate duration if applied. fixedRatePeriod:Fixed rate period defines the start date end date for the period through which the account is charged a fixed rate.fixed rate period start date should always be equal to linkage period start date. linkagePeriod:Linkage Period defines the Start Date and End Date for the facility linked to the account @return {@link com.ofss.fc.service.response.TransactionStatus} @throws com.ofss.fc.infra.exception.FatalException Please refer to the documentation above for Transaction Failure section
com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDLCMAdapter	closeFacility	This method would be called during manual account closure and written off services @param accountId @param facilityIDs	com.ofss.fc.app.adapter.impl.jar@\com\ofss\fc\app\adapter\impl\dda\DDLCMAdapter	closeFacility	3.2.1.4 Delinking of the OD Facilities at the time of Account Closure As per the current functionality, system does not allow the user to close any account, if the account is linked to an OD facility. As part of R2.4 enhancement, system should allow the user to ???Delink/Close the OD Facility??? at the time of account closure and proceed ahead with the account closure process. In the Account

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Closure Screen, there will be a flag ???Close OD Facility??? If user wishes to close the OD facility along with Account closure, then ???Close OD Facility??? checkbox should remain, to be checked. CASA module will call LCM module and inform about the closure of OD facility along with Closure of the CASA Account. If the account is the last account attached to OD facility, LCM will close the OD Facility automatically along with the account closure. If the account to be closed is last account linked to OD Facility and is the nominated account for facility closure then LCM will inform facility fee amount to be collected from CASA Account. If the account to be closed is not the last account attached to facility, then LCM will send error message ???Facility cannot be closed as this account is not the last account attached to Facility???. In this case, user needs to uncheck the Close OD Facility flag and proceed with CASA Account Closure. If user does not wish to close the facility while CASA Account Closure then Close OD Facility checkbox should be unchecked, then system will delink the account from Facility as part of account closure. Please note the following: When CASA account which is nominated for facility fees is getting closed, LCM will check if it is

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					the last account attached to facility and facility closure request has come from CASA, then LCM will send the Facility Fee amount to be collected from CASA Account. When CASA account which is nominated for facility fees is getting closed, LCM will check if it is the last account attached to facility and facility closure request has not come from CASA, then LCM will delink the account from facility and remove account as nominated account for facility fees. When CASA account which is nominated for facility fees is getting closed, LCM will check if it is the last account attached to facility and if it is not the last account attached to facility , then LCM will delink the account from facility and remove account as nominated account for facility fees When Facility fees are to be debited from CASA Account, system will add those to the fees to be collected as part of account closure and arrive at the closeout balance. 3.2.1.5 Delinking of the OD Facilities at the time of Account Writeoff As per the current functionality, at the time of account writeoff system does not automatically delink the account from the OD facility or close the OD Facility, even if the account being written off is the last account in the facility. Currently, even after account writeoff, the account remains linked

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					to the facility, as it was before writeoff process. As part of R2.4 enhancement, while account writeoff, system will automatically: Delink the account being written off from the OD Facility and If the account being written off is the last account in the OD Facility, then it will automatically close down the OD Facility along with the account being written off.

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDLCMAdapter	fetchFacilityNominationDetailsForAccount		com.ofss.fc.app.adapter.impl.jar@\com\ofss\fc\app\adapter\impl\dda\DDLCMAdapter	fetchFaciltiyFeeForNominatedAccount	3.2.1.4 Delinking of the OD Facilities at the time of Account Closure As per the current functionality, system does not allow the user to close any account, if the account is linked to an OD facility. As part of R2.4 enhancement, system should allow the user to ???Delink/Close the OD Facility??? at the time of account closure and proceed ahead with the account closure process. In the Account Closure Screen, there will be a flag ???Close OD Facility??? If user wishes to close the OD facility along with Account closure, then ???Close OD

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Facility??? checkbox should remain, to be checked. CASA module will call LCM module and inform about the closure of OD facility along with Closure of the CASA Account. If the account is the last account attached to OD facility, LCM will close the OD Facility automatically along with the account closure. If the account to be closed is last account linked to OD Facility and is the nominated account for facility closure then LCM will inform facility fee amount to be collected from CASA Account. If the account to be closed is not the last account attached to facility, then LCM will send error message ???Facility cannot be closed as this account is not the last account attached to Facility???. In this case, user needs to uncheck the Close OD Facility flag and proceed with CASA Account Closure. If user does not wish to close the facility while CASA Account Closure then Close OD Facility checkbox should be unchecked, then system will delink the account from Facility as part of account closure. Please note the following: When CASA account which is nominated for facility fees is getting closed, LCM will check if it is the last account attached to facility and facility closure request has come from CASA, then LCM will send the Facility Fee amount to be collected

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					from CASA Account. When CASA account which is nominated for facility fees is getting closed, LCM will check if it is the last account attached to facility and facility closure request has not come from CASA, then LCM will delink the account from facility and remove account as nominated account for facility fees. When CASA account which is nominated for facility fees is getting closed, LCM will check if it is the last account attached to facility and if it is not the last account attached to facility , then LCM will delink the account from facility and remove account as nominated account for facility fees When Facility fees are to be debited from CASA Account, system will add those to the fees to be collected as part of account closure and arrive at the closeout balance. 3.2.1.5 Delinking of the OD Facilities at the time of Account Writeoff As per the current functionality, at the time of account writeoff system does not automatically delink the account from the OD facility or close the OD Facility, even if the account being written off is the last account in the facility. Currently, even after account writeoff, the account remains linked to the facility, as it was before writeoff process. As part of R2.4 enhancement, while account writeoff, system will automatically:

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Delink the account being written off from the OD Facility and If the account being written off is the last account in the OD Facility, then it will automatically close down the OD Facility along with the account being written off.

The data is extracted either from the service inputs or a

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
			erviceMetadataService		fixed set of entities that are configured and provided for out-of-the box for participating in the authorization process. The data that comes in as input for the service can be configured as directly available or indirectly available. Directly available input is one which would be a non-data object input and can be used directly in the authorization process. For example, transaction currency or transaction amount is taken as direct input in debit or credit services. An indirect input is a data element or attribute which can be obtained from a data object which come into the service as a direct input and hence needs to be extracted by recursing the object graph at runtime. An example of this would be the transaction branch input which is an attribute in the session context. In case where the data is taken from the domain entity, the key field data required to load an domain entity instance from the datastore is expected to be a direct or indirect input to the service call. @param inputs @return @throws FatalException
