This is required for Audit purpose also during the Transaction the Party Merged state can be retrieved using this draft record. Validation is performed on Input. If PartyMergeDTO or any of the merging partyIds is null, Exception is thrown. The method can be called from two perspectives. The Draft already exists but it needs to get updated (a valid mergeId is given). PartyMergeState entity is directly loaded from the Party Merge state table If no such record exists in the DB against given mergeId, a partyMergeState is created which and persisted into the DB. If the record Exists, it gets updated with the new data and values which comes as input to the method. A new Draft needs to be created.(No mergeId given) Victim party status id set to MERGE_INITIATED which gets persisted. Then required Party details record for survivor and victim for merge is collected. With these data Party Merge State entity is created and persisted into DB. @see PartyMergedStateRepository#get @see PartyMergedStateRepository#merge

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	updateWorkflowTrackerSummarizedEntity	This method will update the Workflow Tracker Summarized Entity.	com.ofss.fc.module.party.jar@\com\ofss\fc\app\party\service\partymerge\PartyMergeApplicationService	initiateMerge	This method is used for initiating merge. The Merge process follows sequential steps as below: First validation of Input Parameter (PartyMergeDTO) is done. If PartyDTO (IndividualDTO for

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		@param workflowTrackerSummarizedEntityDTO			Party type Individual, TrustDTO for Trust, OrganizationDTO for Legal Entities) in the PartyMergeDTO is null, then it by default gets set to corresponding value of survivor's. In case mergeId is null, that means SaveAsDraft has not been called before for this particular party merge, so saveAsDraft is called. After all the data are available for the merge to proceed, Validation of Party Merge Business Policy is done. Any error occurred during this validation gets recorded in partyMergeResponse. Now, based on the purpose for which the method has been called, the behavior is as below: Initiate Party Merge (Actual Party Merge) Validation is performed for party data, i.e. comparison is done for data that comes to the method in form of Input and what actually exists in the DB. If any Difference found while doing comparison, the method gets informed about data change and the Merge Process stops at this point. If no difference found, PartyMergeAudit object is created which stores the currently existing data about the survivor Party.(before party merge takes place) Now, Party Merge is performed.The data corresponding to both survivor and victim gets merged and set to survivor. In case error occurs

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					while performing the above merge, the errors gets added to the response . Then, Merge of party accounts and party relationships are done and errors, if any recorded, get added to response Now, Merge takes place in other modules corresponding to the parties and errors, if any, get added to the Response. After all the merging events have been performed, and no error in the response: An Entity PartyMergeHistory gets persisted into the DB, indicating the parties have successfully been merged. Party Merge status in PartyMergeState is updated to COMPLETED. The Entity Status of Victim party is set to CLOSED., indicating victim party no longer exists. The party merge status of Victim party is set to MERGED, indicating the party has been merged to some other party. post merge PartyMergeAudit is formed, which contains survivor party related data after party merge has successfully taken place. This PartyMergeAudit Entity gets persisted into the DB The results of the PartyMerge event gets persisted into the DB. otherwise, the Errors in response get persisted in the Party Merge State Table. Validate Party Merge (Virtual simulation of Party Merge) Merge takes place in other

In the Inquiry DTO the docTypeId field would not contain any value. Steps to be performed are 1) Create an instance of AccountAddressLinkageInquiry Response. 2) Fetch the transaction status using fetchTransactionStatus(). 3) Create Transaction Context by passing SessionContext and INQUIRE (as MaintenanceType) as an arguments. 4) Based on the account type , check the validity of the account and get its status by calling the appropriate Application Service through tha adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDAInquiryApplicationService with the accountId as input. If the account type is TD , call fetchAccountDetails() method exposed by the TermDepositAccountApplicationService with the accountId as input. 5) Call validateAccount() method with accountId and status as the inputs. If the account status is closed or dormant , " Closed/Dormant Account " error message would be displayed. 6) Check for the validity of the party and its account relationship by calling

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					fetchPartyAccountRelationship() method exposed by the PartyAccountRelationshipApplication Service with accountId and partyId as the input. If the party is not valid, "Invalid Party" error message is displayed. If the party does not have any relatinship with the account, "No Relationship with the Account" error message is displayed. 7) Create an instance of the Domain Service (AccountAddressLinkageService). 8) Call the fetchPartytAddressLinkage() method of the AccountAddressLinkageService with accountId and partyId as the input. 9) Receive the AccountAddressLinkage entity in response. 10) Based on this response, call different Application Services to fetch other relevant details through the adapter. a) Call the fetchPartyDetails() of PartyApplicationService with partyId as the input to get party details. b) For all the postal address preference set in the linkage call the fetchPartyAddress() of PartyAddressApplicationService to with partyId and postalAddressType to get party postal address. c) Call the fetchPartyAccountRelationship() of PartyAccountRelationshipApplication Service with accountId and partyId as input to get the relationship. d) For each docTypeId in the linkage, call the fetchDocumentType() of

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					DocumentTypeApplicationService with docTypeId as the input to get the description of the document. 10) Fill the AccountAddressLinkageInquiryResponse with all the relevant details. 11) Convert the AccountAddressLinkageInquiryResponse entity to DTO using the Assembler. 12) Return the AccountAddressLinkageInquiryResponseDTO. @see AccountAddressLinkageService#fetchPartyAddressLinkage @see IAccountDDAAdapter#validateAccountStaus @see IAccountDDAAdapter#callOverridableFinancialPolicy @see IAccountLoanAdapter#validateAccountDuringInquiry @see EnumerationHelper#fromValue @see AssociatedPartyApplicationService#fetchAssociatedPartyDetails @see IAccountDocumentAdapter#fetchDocumentDetails @see IAccountPartyAdapter#fetchPartyAddress @see IAccountPartyAdapter#fetchPartyDetails @see IAccountPartyAdapter#fetchAllPartiesofAccount @see AssociatedPartyRepository#get @param accountAddressLinkageInquiryDTO @param sessionContext @exception The following error codes

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountPartyAdapter	fetchAllPartiesOfAccountForOperatingInstruction		com.ofss.fc.module.account.jar@\com\ofss\fc\app\account\service\operatinginstructions\OperatingInstructionApplicationService	fetchInquiryInstruction	This method is used to provide the non financial operating instruction details. When a inquiry based transaction being performed on an account is to be processed, Operation executive checks whether any operating instructions are being defined for the respective account or not. This method will accept account Id, transaction Id and party Id as input arguments. The instruction description maintained against the Inquiry operating instruction type would be used in displaying in the text fields for inquiry operating instruction. Following are the steps to be followed in this method:- Create an instance of Inquiry Response Create an object of Assembler Invoke its toDomainObject() method and convert the InquiryInstructionRequestDTO to the domain object InquiryInstructionRequest. Create an instance of Domain Service and invoke it's fetch method by passing FinancialInstructionRequest. This

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					would return domain object. This domain object will have the instruction details as a response. Invoke the fromDomainObject() method of Assembler and pass the domain object to it. It would return the DTO in response. Set the DTO as a part of InquiryResponse @see OperatingInstructionService#fetchInquiryInstruction @see IAccountDDAAdapter#fetchGroupIfAccountMemberOfGroup @see IAccountPartyAdapter#fetchAllPartiesOfAccountForOperatingInstruction @see IAccountSMSAdapter#validateUserAccessforRoles @see IAccountDDAAdapter#fetchAccountPreferences @see IAccountLoanAdapter#fetchLoanAccountPreferences @see IAccountPartyAdapter#fetchPartyBasicDetails @see CommonAccountMinorStatusStrategy#fetchPartyMinorStatus @see IAccountPartyAdapter#fetchPartyBankPolicy @see IAccountDDAAdapter#fetchBankCode @see IAccountLoanAdapter#fetchBankCode @see IAccountTDAdapter#fetchBankCode @see IAccountPartyAdapter#fetchAccountRoleNameFromPartyToPartyRelationship @see

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountPartyAdapter	fetchPartyName	This method is used to fetch party name.	com.ofss.fc.module.agent.jar@\com\ofss\fc\app\agent\service\agent\AgentInquiryApplicationService	fetchAgentDetails	This method is used to persist the agent related details which consists mainly of agentId,commission Details(AutoCommision OR DiscretionaryCommisin OR ExistingCommission) ,commission receipient Id , commission receipient Name into the DB. Key is the arrangement Id which can be account Id or submission Id or facility Id and Serial Number. This method checks if the arrangement ID is already existing then it copies the entry in backup table and updates it. otherwise it adds the new entry into the DB. This method is called in amend scenarios when the commission of a agent changes as the limits changes. In this case we copy the current agent details to history table and update the current record with the new commission details. The previous commission Details are copied to the existing commission details of the updated record. Commission present can be of 3 types:- (1) Existing commission - this refers to the commission which the broker is currently holding before he changes it. (2) AutoCommission :- This refers

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					to the commision either manually entered or fetched from external system. (3) Discretionary Commission :- If auto commision is changed then it is entered in the discretionary commission Brief Procedure of working of ADD is like this:- it checks if module calling is not ELCM then it fetches the latest arrangement Id record from DB. if there are no records present for the arrangement ID then it checks if the calling module is ELCM or not, if ELCM then fetches the latest serial number and increases it by 1 and then adds the records to DB. If calling module is not ELCM and no records are found then directly add record to DB. IF records were already found in while fetching latest arrangement from DB then it is first copied to history, then the current record is deleted from the base table and then from the passed DTO a entity object is formed and the key and commission Receipient id and agent party id are set to it and sent to add to DB. Following are the mandatory attributes in the DTO being passed to add a record to DB:- (1) arrangement ID - refers to account Id or submission Id or facility Id (2) Agent ID- refers to Broker / Introducer ID. @see AgentArrangementLinkageService#fetchProductGroupFromProduct @see IAgentArrangementLinkageAdapter#

This method handles the following scenarios.
					 1. If there is no {@code PartyToAccountRelationshipDTO} existing for the account i.e new account
					     => If the input is one or more new {@code PartyToAccountRelationshipDTO} then it will add the {@code PartyToAccountRelationshipDTO}.
					 2. If there are {@code PartyToAccountRelationshipDTO} already exist for an account. Lets consider there are 5 Parties (A, B, C, D & E) linked to the account CASA0001.
					     => CASE 1: If the input has all 5 {@code PartyToAccountRelationshipDTO} then it will update all 5 {@code PartyToAccountRelationshipDTO}.
					     => CASE 2: If the input has all 5 {@code PartyToAccountRelationshipDTO} and 2 of the {@code PartyToAccountRelationshipDTO} has isLinkedToAccount flag as false, in such case 2 {@code PartyToAccountRelationshipDTO}s with isLinkedToAccount flag value as false will be deleted and other 3 {@code PartyToAccountRelationshipDTO}s

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					will be updated. => CASE 3: If the input has only 3 out of 5 {@code PartyToAccountRelationshipDTO}s and out of these 3 one {@code PartyToAccountRelationshipDTO} is not linked to account. In such case, it will assume to {@code PartyToAccountRelationshipDTO}s which are not part of the input is not linked to account and it will remove those {@code PartyToAccountRelationshipDTO}s. In this scenario, only two {@code PartyToAccountRelationshipDTO} will be updated and other 3 will be deleted. @see PartyToAccountRelationshipService#fetchPartyIdsOfAccount @see PartyToAccountRelationshipService#fetchPrimaryAccountHolderRelationship @see IPartyPMUAdapter#fetchProductDetails @see PartyToPartyRelationshipService#fetchRelatedPartiesForParty @see PartyNameService#fetchLegalName @see PartyToAccountRelationshipRepository#get @see PartyToAccountRelationshipService#validatePartyToAccountRelationships @see PartyToAccountRelationshipService#changePartyToAccountRelationship @see

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDALoanAdapter	creditFunds	Method to credit funds in loan account. @param accountId @param amountToCredit @param populateAccountingEventAmountDebit	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\service\account\core\DemandDepositAccountService	creditFundsOnCreditInterestSettlement	This method is used to credit funds on credit interest settlement. This function specially created because we do not want to call {@link #creditFunds} method as it does not take value date < process date. But this case is possible in case of settlement. Consider following situation - Credit Settlement date: 31-Jan-2011, 31-Jan, 1-Feb, 2-Feb-2011 falls on holiday. So this settlement will be processed in the BOD of 3-Feb-2011. In this case Transaction.PostingDate = 3-Feb-2011 Transaction.valueDate=1-Feb-2011 So in this case valuedate < processDate. , {@link #creditFunds} method does not allow this case. This method is created to overcome this condition. As we do not want to consider this transaction as backdated transaction. This method will perform following activity- 1) TransactionDates settlementTransactionDates = new TransactionDates() transactionDates.postingDate = input.accountTransaction.TransactionDates.postingDate transactionDates.valueDate = input.accountTransaction.TransactionDates.ValueDate transactionDates..transactionDate = input.accountTransaction.TransactionDates.transactionDate. 2) TransactionDates

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					creditTransactionDates = new TransactionDates() transactionDates.postingDate = input.accountTransaction.TransactionDates.postingDate transactionDates.valueDate = input.accountTransaction.TransactionDates.postingDate transactionDates..transactionDate =input.accountTransaction.TransactionDates.transactionDate. 3) AccountTransaction.transactionDates = creditTransactionDates.. As creditFunds gives error on backdates we change the date 4) load DemandDepositAccount- 5) Call demandDepositAccount.creditFunds method to credit the funds. 6) AccountTransaction.transactionDates = settlementTransactionDates. 7) prepareDDFinancialStatementItem(AccountTransaction)-- In statement we want value date as settlement date + 1. @see DemandDepositAccountRepository#loadDDAForFinancialTransaction @see IFinancialDemandDepositAccount#credit @see StatementItemService#addDDFinancialStatementItem @see FinancialStatementItemRepository#load @see FinancialStatementItemRepository#updateFinancialStatementItem @see DemandDepositAccountRepository#u

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDALoanAdapter	intiamteOnOffsetBalanceChange	The method will be called to intimate the loan account which has been marked as beneficiary for a CASA offset account on balance change in the offset account. @param accountId	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\service\account\executor\BalanceChangeActionExecutor	executeAction	Refer the class level documentation for this. This method will first call the method {@link IDemandDepositAccount#checkAndMoveBalances} While updating the current book balances it needs to check whether the Future Book Balances for the same date are moved into the current book balances. The offset clear and unclear balance would be sent to interest for compuation If Future Book Balances for the next date also exist at that time, the current book balances will be updated with those Future Book Balances if the effective dates of both the balances are same. After updating the

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					current book balances, balances history will be maintained, thus an instance of the balance w.r.t the effective date. If the account is not OD,the interest computation process is invoked to calculate interest on the current balances. For OD accounts, this process will be done in the proportionate OD shell. Refer {@link IntimateInterestActionExecutor} . This method need not to bother about the interest computation parameters, it will simply call {@link InterestFacade#invokeInterestComputation()}. While computing interest, interest will always be computed on current balances. Refresh the balance statistics by calling account.statistics.refreshForBalances In BalanceChangeActionExecutor, we will set the crossover field of BalanceInformationDTO either to true or false, depending upon the different amounts(TOD,OD,Overline,AUF). This method works as follows : <pre> Load DemandDepositAccount = {@link DemandDepositAccountRepository#load()} Call {@link IDemandDepositAccoun#checkAndMoveBalances()} Balancechangeactionexecutor will use BalanceInformationDTO and will set the different types of Amount. New
