In case of joint applications where one or more applicant(s) are not present, each applicant provides preferences such as statement and address for delivery. The new joint applicant is also added in the party account

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					relationship. If the account is opened with a single applicant, the single party is initially added as a Sole Owner on the account. When a joint applicant provides preferences for such account , the existing primary party relationship is changed to Joint and First and the new joint applicant is added as Joint and Other. For accounts opened with 2 or more applicants, the existing party relationships remain unchanged as Joint And First and Joint And Other. The new joint applicant is added with a relationship of Joint And Other. Finally, all joint applicant party level statement preferences and addresses are updated. @param SessionContext ,sessionContext, , Session Context which must contain the session context information such as user id, branch, branch code, channel etc. @param String accountId, Indicates the identifier for the account for which account holder preferences are being updated. @param AccountHolderPreferenceDTO ,holderPreferenceDTO, , This class contains information about preferences captured for the applicant of the demand deposit account. It has information about the external banking facilities such as internet banking, phone banking and mobile banking, demand deposit

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\taxation\ITaxationCoreAdapter	computeAndReturnTax	This will be used to compute the tax for an arrangement number. This will be called by the interest module. @param taxComputationRequest @return @throws FatalException	com.ofss.fc.module.taxation.jar@\com\ofss\fc\app\taxation\service\core\TaxManagementApplicationService	computeAndReturnTax	This method is called to retrieve the tax computed for an arrangement which in case of CASA is an account number and in case of TD it is combination of account number#deposit number. This method will follow following steps to compute The interest module will trigger a call to the TDS module for Tax computation whenever needed. The Tax deduction can be done at different stages of interest processing like accrual, compounding and capitalization. 1. Load tax Parameters 2. If the LCY is different

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					from the ACY, TDS module converts the interest amount from the ACY to LCY. 3. TDS module checks if Tax waiver is applicable for this account/deposit. 4.If Yes, TDS module checks if any of the following conditions are met, a) If the 'Exempt entire amount' flag is checked. b) If interest amount [in LCY] is less than equal to the threshold amount specified for the waiver or 5. If yes, TDS module intimates Interest module that Tax is not applicable for the account/deposit. 6.If no, TDS module checks if any Tax exemption criterion has been maintained for the ???customer type??? and ???customer class??? of the customer holding this account/deposit. 7.TDS module evaluates the Tax exemption based on the interest amount (in LCY), customer type, customer class and age of the customer to whom this account/deposit belongs. (In case of joint accounts, the TDS module will evaluate all the Tax exemption criteria individually for each joint account/deposit holder and the least of all exemption amounts will be used for Tax processing). 8.If the interest amount (in LCY) is less than the exemption amount then the TDS module intimates the interest module that the account/deposit is Tax exempt. 9.If the interest amount

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					(in LCY) exceeds the exemption limit, the TDS module will make a call to the Pricing module (Fees) for Tax amount computation. TDS module will send the interest amount (in LCY), Account holder details (Like customer type, customer class, age; these details are used as facts for evaluating PPC???s). 10.The Pricing module will do the following on receiving the Tax computation request 1. Evaluate the PPC???s based on the customer facts passed and resolve the Base Price Definition (PD) chart/s. (The PPC???s may be maintained for the product under which the account/deposit is opened or may be defined at the bank level. PPC???s defined at the bank level will be applicable for all the products in the bank). 2. Retrieve the TCY code from the base PD . 3. If the TCY is different from LCY, It converts the interest amount from LCY to TCY. 4. Compute the base tax amount using the tax rate maintained in the Base PD/s. 5. Check by if there is any additional PD/s defined in the Base PD/???s. 6. If Yes, check if any additional tax/es are applicable to this account/deposit by checking if the interest amount exceeds the exemption limit (in TCY) defined in the Additional Pd/???s. 7. If yes, compute the Additional Tax/es using

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					the Tax rate maintained in the Additional PD???s. 8. Calculate the ???Total Tax amount??? a. If Additional Tax/es are applicable the total Tax amount = Base Tax/es + Additional Tax/es. b. If Additional Tax/es are not applicable the total Tax amount = Bases Tax/es. 9. Pricing module checks if any more Base PD???s are applicable to this account/deposit If yes it repaeats steps 2 through 9, else proceeds to step 10. 10. Pricing module will compute the Sum of all ???Total Tax amounts??? as calculated in step 8 during each iteration and returns it to the TDS module along with the ???Tax type??? breakup details (for inquiry purposes). 11.On receiving the TDS amount the TDS module will A. Apply rounding rules defined for Tax B. Log event for accounting entries for TDS in TCY. For a detailed description of the accounting entries refer section 10.1.1.2. (For a detailed explanation on the recovery of this Tax amount refer section ???Tax Recovery???). C. Convert tax amount from TCY to ACY if needed. D. Return the Tax amount in ACY to the Interest module @see ITaxationCoreAdapter#computeAndReturnTax @param SessionContext @param TaxComputationRequestDTO

		flag to indicate whether credit interest is computed or debit interest is computed.			
com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAInterestAdapter	doDailyInterestComputation	This method will be called to invoke interest computation for an account for a process date. Balances will be passed to the service on which the interest will be calculated. DDA also pass the information about the state of the DemandDeposit Account, whether it is liable for credit interest or debit interest. @param accountId Account Id for which the interest computation is invoked. @param balancesMap	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\utils\interest\InterestFacade	invokeInterestComputation	This method calls the interest module to compute the interest, It may be called at the time of account opening or at the time of online balance change or at the time of batch processing. So the same method is called at each time to interact with interest module to compute the interest for the account. This method will also be called for computing back dated interest. This method will be designed in such a manner so that all calls to interest computation will only occur via this method only. CASA module need to send few details to interest on the basis of which Interest module compute the interest for an account. arrangement number : account number for which the interest will be computed. interest class : CASA module can easily predict the state of an account, i.e. whether the account is in Credit state of Debit state. Bank accounts may have a positive, or credit balance, where the bank owes money to the customer; or a negative, or debit balance, where the customer owes the bank money.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		balances for which the interest will be computed. @param requestDate date on which the interest computation is requested. @param effectiveDate effective date for the interest computation. @param isCredit flag to indicate whether credit interest is computed or debit interest is computed.			Credit : This states that a CASA account has positive balance. In such case, bank owes money to the customer. In banking terms, customer din't utilised neither of the OD, TOD, Overline and AUF facility. Debit : This states that a CASA account has negative balance. In such case, customer owes money to the bank. In banking terms, customer has utilised either of the OD, TOD, Overline or AUF facility to draw funds. interest division : Interest can either be calculated on the regular amounts, or can be calculated on the bonus. For calculation of interest in different amount types, different rules are defined. So, the interest module will be intimated about the interest division. For CASA it will be always Regular. For more Details on this see {@link InterestDetails} product class : Interest module need to know about the calling module. For CASA it will be {@link ProductClass#CASA} request date : Dates are very important in Banking. Request date will always be the process Date when the interest module is invoked for interest computation. effective date : When interest is computed on a balance change event, effective date will be same as of request date. But when the interest will be computed for a back dated entry interest

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					will be computed from that date, thus effective date will be that back dated date. Effective date can either be equal to request date or less than the request date, but it cannot be greater than the request date. Map of balances : Interest will be calculated on some balance amounts. There are different balances in CASA module, and each balance may have a different rate of interest. Clear Balance : Cash deposited by the customer into the bank. For more see {@link EffectiveBalances#clearBalance} Unclear Balance : Cash deposited by the customer in form of cheque or other instrument which is awaiting confirmation. For more see {@link EffectiveBalances#unclearBalance} Overdraft Utilisation : Cash overdrawn from the account by using Overdraft facility. For more see {@link EffectiveBalances#utilizedOverdraftLimit}. Overline Utilisation : Cash overdrawn from the account by using Overline facility above overdraft utilisation. For more see {@link EffectiveBalances#overlineAmount}. TOD Utilisation : Cash overdrawn from the account by using Temporary Overdraft facility. For more see {@link EffectiveBalances#todAmount}. AUF Utilisation : Cash overdrawn

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					from the account by using Advance Against Unclear Funds facility. For more see {@link EffectiveBalances#utilizedAUFAmount}. This method works as follows : <pre> requestDate = processDate effectiveDate = effectiveDate First check request date >= effective date. If the above condition satisfies, then determine whether account is in credit state or debit state. If any one of AUF, OD, TOD, Overline amounts is not zero, then the account is in debit state, else it is in credit state. To check this: set isCredit = true; for (Map.Entry<BalanceType, Money> balanceMap: queryMap.entrySet()) { if(balanceMap.getKey() == BalanceType#AUFUtilized || balanceMap.getKey() == BalanceType#OverdraftUtilized || balanceMap.getKey() == BalanceType#TODUtilized || balanceMap.getKey() == BalanceType#Overline) { if(balanceMap.getValue() > 0)<i>0 refers to zero money of the same currency as of account</i> <i>currency to make zeroMoney can be retrieved from any value of balanceMap object</i> { set isCredit = false; break; } } } Since, interest computation need to know the state of

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					account, to compute either credit or debit interest. DDA module can easily predict the state of the account, by analyzing balances. Call Interest adapter to invoke interest computation. com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAInterestAdapter	doBackDatedInterestProcessing	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. @param applicationContext @param backDatedInterestProcessingRequestDTO	com.ofss.fc.app.adapter.impl.jar@\com\ofss\fc\app\adapter\impl\dda\DDAInterestAdapterFactory	getAdapter	

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAInterestAdapter	doBackDatedInterestProcessing	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. @param applicationContext @param backDatedInterestProcessingRequestDTO	com.ofss.fc.module.dda.jar@\com\ofss\fc\domain\dda\service\account\executor\BackdatedTransactionActionExecutor	performBackdatedInterestProcessing	This method performs actual backdated processing for interest computation. It is created so as to facilitateinternal recursive calls to this method. When a backdated transaction takes place on an account, interest has to be recomputed for the account. In case, the transaction value date is beyond the settlement date, then adjustment entries have to be passed forthe settlement date and recomputation has to to be done with the updated balances. In order to facilitate recomputation, the caller module (CASA in this case) , prepares a set of balance recordsalong with the interest rates from the value date of the transaction upto the posting date. This set of records is sent to the interest module to enable it to perform computations. Along with the balancerecords, an instance of the BalancechangeAnalyser is also sent. This class, which implements the interfaceIBalanceChangeAnalyser, consists of a service to settle the adjustment amount and prepare the balance recordswith the updated balances of the account. In effect, the interest service {@link IDDAInterestAdapter#doBackdatedInterestProcessing} recomputes the interestfrom the value date, settles the adjustment amount and recomputes interest again beyond the settlement date. Itis a recursive process and

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					continues till the current processing date. As part of the alternate account maintenance, if an alternate account is maintained for InterestPosting of theinput.account, then the adjustment entry has to be posted to the alternate account. This will result in a backdated transaction of the alternate account, and hence recomputation of interest of thealternate account has to be triggered. It might so happen that the entry results in a beyond cap transaction forthe alternate account. Hence, the whole process of recomputation explained above has to be performed for thealternate account as well. Therefore, this method has been designed in a fashion to support recursive calls for interest recomputation. The method works as follows: - Call the method {@link BackdatedProcessingHelper#populateBalanceRecords} topopulate the balance records as required by the interest service. - Prepare theBackdatedInterestProcessingRequestDTO with the balanceRecords returned by the service above, account id andrequested date. The instance of the class {@link DDABalanceChangeAnalyser}, which is required by the back datedinterest processing request is later set in the adapter impl class. - Call the

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					service{@link IDDAInterestAdapter#doBackdatedInterestProcessing} with the request created in the step above torecalculate and process the backdated interest. Validate the response returned by the interest service.Open a loop for the BackDatedInterestSettlementResponseDTO response. If the(InterestClass = Credit, AlternateAccount#AccountTypeForCreditPosting = DemandDeposit andAlternateAccount#AccountIdForCreditPosting <> null) OR (ElsIf the interestClass = Debit,AlternateAccount#AccountTypeForDebitPosting = DemandDeposit and AlternateAccount#AccountIdForDebitPosting <>null), then Open a loop for the BackDatedInterestSettlementResponseDTO If the value of (BackDatedInterestSettlementResponse#oldPostTaxInterestAmount <>BackDatedInterestSettlementResponse#newPostTaxInterestAmount), it means that an adjustment entry has been passedfor the settlement date. Since the adjustment entry has hit the alternate account, backdated interest computationfor the alternate account also needs to be triggered. Call the service {@link BackdatedTransactionExecutor#perfor

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					mBackdatedInterestProcessing} with theeffectiveDate as the BackDatedInterestSettlementRespons e#dueDate and the accountId as theAccountIdForCreditPosting OR AccountIdForDebitPosting as the case may be. - Exit loop for BackdatedSettlementResponseDTO. The records in the BackdatedSettlementResponse will be inascending order of dueDate. So, the interest needs to be recomputed from the earliest date on which anadjustmenet has been made. And hence, the call to the service is required only once. @see BackdatedProcessingHelper#populate BalanceRecords@see AdapterFactoryConfigurator#getAda pterFactory@see IDDAInterestAdapter#doBackDatedI nterestProcessing@see BalanceHistoryItemRepository#loadH istoryForBackdatedPeriod@see BalanceHistoryItemRepository#saveO rUpdate@see #performBackdatedInterestProcessing @param applicationContext@param effectiveDate@param accountId
com.ofss.fc.app.adapt er.internal.interface.ja r@\com\ofss\fc\app \adapter\dda\IDDA InterestAdapter	doBackDated InterestProce ssing	This service is used for recomputation of interest and posting of adjustment	com.ofss.fc.app.adapter.i mpl.jar@\com\ofss\fc\ app\adapter\impl\dda \DDAInterestAdapter	doBackDatedInte restProcessing	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. For example, DD module performs backdated cash deposit

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
		entries for an account if backdated transaction occurs on an account. @param applicationContext @param backDatedInterestProcessingRequestDTO			transaction. Due to this the base balance for interest computation would change for all subsequent interest computations happened after value date of backdated transaction. Hence interest needs to be recomputed for all subsequent balance changes which happened after value date of backdated transaction. Also if backdated transaction has crossed current Accrual/Compounding/Capitalization/Settlement cycles then all these interest phases needs to be reprocessed and Interest adjustment entries needs to be passed for differential interest amount. This method works as follows: - Convert the input DTO to balance record entity by invoking {@BalanceRecordDTO.convertDTOToEntity() } - Create instance of BalanceChangeAnalyser using the input.applicationContext - Create the factContext with factMap, DDAAccount.AccountId as parameter. Retrieve the account Id from the input backDatedInterestProcessingRequestDTO - Construct BackDatedInterestProcessingRequest with the values fetched or retrieved above - Invoke the service {@link BackDatedInterestProcessingService#

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					doBackDatedInterestProcessing} to preform back dated interest processing. - Validate backDatedInterestProcessingRespons e. If the status code is not success, throw Business Exception. - Get InterestPlanItemProcessingResult from BackDatedInterestProcessingRespons e returned by the above service - Retrieve the InterestPlanItemKey and BackDatedInterestSettlementRespons e from the result and populate InterestPlanItemKeyDTO,List<BackD atedInterestSettlementResponseDTO> map. - Return back Dated Interest Settlement Response Map @param applicationContext @param backDatedInterestProcessingRequest DTO

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAProductAdapter	fetchCASAPreferencesInquiryResponse	@param productId @return	com.ofss.fc.module.dda.jar@\com\ofss\fc\app\dda\service\account\unclaimed\DDAAutoStatusChangeProcessExecutor	executeAction	When the account is identified for unclaimed processing it is logged in unclaimedActivityDetails. So on the unclaimed frequency processing date, such accounts woule be picked up. Again the check would be made to see if the parameters are modified, if yes the action would be relogged again with next due date. If the process type is automatic then the {@link com.ofss.fc.domain.dda.service.account.executor.AgingStatusChangeActionExecutor#executeAction(ApplicationContext, AccountBasedActionKey, DDActionRequest, Date)} would be called to mark the account as unclaimed. If there is an exception in the processing and the account cannot be marked as unclaimed. In that case the unclaimed status would remain the same ie mark as unclaimed. This record would be picked up in the next unclaimed frequency processing date. If the unclaimed process type is manual then the manual start date and end date would be update in the UnclaimedActivityDetails. On the end date manual processing enddate action would be logged as per the expiry date maintained at the bank level unclaimed policy details. If no action is taken then the account would be marked as unclaimed after the expiry date.

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					Please take a note that first the check would be made to see if the account has hold, lien, negative balance, account is linked to the facility and user defined status as credit block , debit block and total block. If yes then the account wont be taken mark as unclaimed for automatic process and also wont be shown under manual task review. Instead the action would be picked up in the next unclaimed frequency processing cycle.Check is also made for dependent and offset accounts.Same is applicable. @see DemandDepositAccountRepository#loadWithLockWait @see AgingStatusChangeActionExecutor#processAgingForDormantStatus @see CommonAccountAutoStatusChangeDetailsRepository#load @see CommonAccountAutoStatusChangeDetailsRepository#update @see DDAAdapterInstanceCreationUtil#fetchDDAProductAdapter @see IDDAProductAdapter#fetchCASAPreferencesInquiryResponse @see AccountStatusManagementService#modifyAccountStatus @see ActivityEventLogger#logActivityForOnline @see CommonAccountAutoStatusChangeDetailsRepository#get @see AgingStatusDatesHandler#logAutoClosureAction @see CommonAccountAutoStatusChangeS

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAProductAdapter	deriveSingleStatementEntryFlag	This method derives the single statement entry flag @param accountId @return	com.ofss.fc.module.dda.jar@\com\ofss\fc\app\dda\service\transaction\MultiFundDepositApplication	depositMultiFund	This function will be used when a customer wishes to deposit cash and cheques simultaneously in a single transaction. Bank can decide whether to display the transaction as a single entry in Account Statement as well as Statement inquiry screen in OBP. Also Bank can decide whether to charge a single fee for multi fund deposit transaction or charge separate fees for each cheque deposit and cash deposit in a Multi fund deposit transaction. Please note cheque deposit transaction is a non-fee event in product space however in consulting space it is a fee event. TODO: Based on offer level parameter, the fee is charged. The parameter may indicate single fee for the entire transaction If Multi Fund transaction is not restricted for the offer, system will enable the accordion ???Multi Fund Deposit Parameters???. This accordion will have following 2 check boxes 1. Charge Single Fee for a Multi Fund Transaction 2. Display Single Transaction in Bank Statement <u>Charge Single Fee for a Multi Fund Transaction</u> If ???Charge Single fee for a Multi Fund Deposit??? checkbox is checked, system will charge single fee for Multi fund transaction. System will fetch

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					fee for the event Multi Fund Deposit transaction. This fee can be negotiated if defined in price definition. If this checkbox is not checked, system will charge fee for each cheque deposit and cash deposit in Multi fund transaction. System will fetch fee associated with events Cash deposit and Cheque Deposit. Please note in this case Fee associated with cheque deposit and cash deposit cannot be negotiated even though it may be defined as a Negotiable fee. <u>Display Single Transaction in Bank Statement </u> If ???Display Single Transaction in Bank Statement??? checkbox is ticked, system will display the transaction as a single entry in Account Statement as well as Statement inquiry screen in OBP. Please note this cumulative single entry will not include fee amount / amounts. Fee entry / entries will be displayed separately in the statement / statement inquiry screen. If this check box is not checked, system will display separate entries for each cheque deposit and cash deposit in statement and statement inquiry screen for Multi fund deposit transaction. The approach taken for the processing is. The payments screen will get the details of transaction to be performed. The details include

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					- Cheque of the banks other than own bank. - Cheque of the own bank. - Cheque where amount is less than threshold (Direct credit to DDA.) - Manager Cheques of same bank - Manager Cheques of different banks Now there are 2 approaches possible to cater given requirements. 1.No change in any service and payments can call in loop as per existing flows.CASA can accept the statement flags for controlling statement behaviour. But after each credit - If there are holds on CASA they will get knocked off in the processing.Which will log the statement entries which will cause the problem in running balance. - CASA will raise the accounting after each processing which needs to be stopped as payment needs amount tag info to add their details. So this approach is not taken for the processing. Now other approach is Payments will identify the different types of cases possible on CASA and fills them in separate arrays. There are 3 arrays possible - ClearingTransactionDTO:=The array of ClearingTransactionDTO {@link ClearingTransactionDTO} indicates the unclear transaction going to happen on CASA

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					account. - CashTransactionDTO:= The array of CashTransactionDTO {@link CashTransactionDTO} indicates the cash transaction going to happen of CASA account. - FundDepositDTO := The array of FundDepositDTO {@link FundDepositDTO} indicates the credit which are going to happen on CASA account Now for each DTO DDA will call respective services for performing credits {@link DemandDepositCashTransactionService#depositCashApplication(CashTransactionDTO, Boolean)} , {@link ChequeClearingApplicationService#updateBalanceOnChequeDepositInternal(ClearingTransactionDTO, Boolean)} , {@link DDATransactionApplicationService#creditAccountApplication(AccountTransactionDetailsDTO, boolean)} Each method while calling credits set {@link FinancialEventType} as RegularWithoutHold.The RegularWithoutHold will not include Earmarks in the processing.For the unclear related transactions it will not perform reapportion on account.So Earmarks will not be apportioned. This Method logic works as follows - It validates the

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					mandatory parameters passed by the caller by using method {@validateMandatoryParameters } - Then the call is given to derive the singleStatement entry flag from the product by using the {@IDDAProductAdapter} - Now the obtained value of flag is passed to respective cash ,credit and unclear credits for further processing along with response object. - Each method is suppose to fill the response with array of respective method response. - The respective method response should contain the original request and amount tags corresponds to that request. - Then if entry for singleStatementEntry flag is true then it calls generating 1 statement entry from the state of account - Then this method process fees for given transaction based on chargeFeeParameter defined at the offer level. - If that parameter is true then fee of MFD full transaction is charged otherwise individual fee is charged - link {@linkplain MultiFundDepositApplication#processFees(MultiFundDepositDTO)} </p> @see com.ofss.fc.domain.dda.entity.account.balances.policy.MultiFundDepositBusinessPolicy#validatePolicy @see MultiFundDepositBusinessPolicyFact
