If new parties are getting linked to accounts which are already part of bundle thenthe parties should be added as bundle owners as well. This service will return the bundle details and an array of bundled accounts which are impacted per bundle. The following steps are performed- i) All bundles with bundle owners as parties in the old parties list are fetched ii) If bundle status is Active or Inactive, check that at least one party is present in new parties list whichwas not present as existing Bundle owner iii) Create list of credit accounts under the facility being amended which are part of the above bundles iv) It will also create a list of bundle owners based on the union of new owners of accounts which are linked tobundle as well as existing bundle owners. @see IOriginationApplicantAdapter#fetchPartyDetails@see

A query is used to check the total number of accounts that are already opened for the applicant for a given offer whereby the relationship of the

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					applicant to the account is either SOW, JAF or JAO. Also, accounts that are marked as 'CLOSED' are ignored in the count. Finally, a check for the total count is checked against the max limit set for each offer in PMU and if it exceeds, an error is thrown and the user is not allowed to setup the account. Originally, the validation was performed at product level instead of offer level. Additionally, the validation was performed for DDA, OD, TD, LOANS instead of DD and TD. @see IOriginationApplicantAdapter#fetchNoOfAccountsForParty @see IOriginationPMUAdapter#fetchDDAOfferDetails @see #fetchPartyAdapter @see #fetchPMUAdapter @param sessionContext @param partyId @param productCode @param currencyCode @param accountSerialNumber @param productGroupLinkageType @throws FatalException @exception {@link OriginationErrorConstants#MAX_ACCTS_REACHED_BRN} {@link OriginationErrorConstants#MAX_ACCTS_EXCEEDED}

com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	registerActivityAndGenerateEvent	Used to register an Activity with an associated Event @param activityID @param eventID @param eventProcessingDate @param activityLog @return @throws FatalException	com.ofss.fc.module.agent.jar@\com\ofss\fc\app\agent\service\agent\AgentArrangementLinkageApplicationService	addAgentArrangementLinkage	This method is used to persist the agent related details which consists mainly of agentId,commission Details(AutoCommision OR DiscretionaryCommisin OR ExistingCommission) ,commission receipient Id , commission receipient Name into the DB. Key is the arrangement Id which can be account Id or submission Id or facility Id and Serial Number. This method checks if the arrangement ID is already existing then it copies the entry in backup table and updates it. otherwise it adds the new entry into the DB. This method is called in amend scenarios when the commission of a agent changes as the limits changes. In this case we copy the current agent details to history table and update the current record with the new commission details. The previous commission Details are copied to the existing commission details of the updated record. Commission present can be of 3 types:- (1) Existing commission - this refers to the commission which the broker is currently holding before he changes it. (2) AutoCommission :- This refers

Adapter Path	Adapter Method	Interface Method Javadoc	Consumer Service	Consumer Service Method	Consumer Service Method Javadoc
					to the commision either manually entered or fetched from external system. (3) Discretionary Commission :- If auto commision is changed then it is entered in the discretionary commission Brief Procedure of working of ADD is like this:- it checks if module calling is not ELCM then it fetches the latest arrangement Id record from DB. if there are no records present for the arrangement ID then it checks if the calling module is ELCM or not, if ELCM then fetches the latest serial number and increases it by 1 and then adds the records to DB. If calling module is not ELCM and no records are found then directly add record to DB. IF records were already found in while fetching latest arrangement from DB then it is first copied to history, then the current record is deleted from the base table and then from the passed DTO a entity object is formed and the key and commission Receipient id and agent party id are set to it and sent to add to DB. Following are the mandatory attributes in the DTO being passed to add a record to DB:- (1) arrangement ID - refers to account Id or submission Id or facility Id (2) Agent ID- refers to Broker / Introducer ID. @see AgentArrangementLinkageService#fetchLatestAgentArrangementLinkage @see
