**TOP-00037: Invalid descriptor event code [{0}].**

**Cause:** An application should never encounter this exception. This exception usually occurs at the time of developing TopLink. The exception means that the descriptor event manager does not support the event code passed in the event.

**Action:** Contact Oracle Support Services.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00038: Identity map constructor failed because an invalid identity map was specified.**

**Cause:** The identity map constructor failed because an invalid identity map was specified. The identity map class given in the descriptor cannot be instantiated. The exception is a Java exception that is raised by a Java reflection when TopLink instantiates the identity map class. TopLink wraps only the Java exception.

**Action:** Inspect the internal exception, and refer to the Java documentation.

**Type:** ERROR

**Impact:** Configuration

**TOP-00039: This descriptor does not specify a Java class.**

**Cause:** The descriptor does not define a Java class. The Java class is not specified in the descriptor.

**Action:** Specify the Java class.

**TOP-00041: A non-read-only mapping must be defined for the sequence number field.**

**Cause:** A non-read-only mapping is not defined for the sequence number field. A mapping is required so that TopLink can put and extract values for the primary key.

**Action:** Define a mapping.

**TOP-00043: Missing class for indicator field value [{0}] of type [{1}].**

**Cause:** TopLink is missing the class for indicator field value classFieldValue of type type. There was no class entry found in the inheritance policy for the indicator field value that was read from the database. It is likely that the method addClassIndicator(Class class, Object typeValue) was not called for the field value. The class and typeValue are stored in a hash table, and later the class is extracted from the hash table by passing typeValue as a key. Because Integer(1) is not equivalent to Float(1), this exception occurs when the type of typeValue is incorrectly specified.

**Action:** Verify the descriptor.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00044: Missing class indicator field from database row [{0}].**

**Cause:** The class indicator field is missing from the database row that was read from the database. This is performed in the inheritance model where after reading rows from the database, child domain objects are to be constructed depending upon the type indicator values.

**Action:** Verify the printed row for correct spelling.

**Action:** Define a mapping for the primary key.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00047: The multiple table primary key mapping must be specified when a custom multiple table join is used.**

**Cause:** The multiple table primary key mapping is not specified when a custom multiple table join is used. If multiple tables are specified in the descriptor and the join expression is customized, then the primary keys for all the tables must be specified. If the primary keys are not specified, then the exception occurs.

---

**Action:** Call the method `addMultipleTablePrimaryKeyFieldName(String fieldNameInPrimaryTable, String fieldNameInSecondaryTable)` on the descriptor to set the primary keys.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00048: Multiple writable mappings exist for the field [{0}]. Only one may be defined as writable, all others must be specified read-only.**

**Cause:** Multiple writable mappings for the field `fieldName` are defined in the descriptor. Exactly one must be defined as writable; the others must be specified as read-only. When multiple write mappings are defined for the field, `TopLink` is unable to choose the appropriate mapping for writing the value of the field in the database row. Therefore, the exception is raised during the validation process of descriptors. The most common cause of this problem is when the field has direct-to-field mapping, as well as one-to-one mapping. In this case, the one-to-one mapping must either be read-only or a target foreign key reference.

**Action:** Make one of those mappings read-only.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00049: An attribute transformation method name is not specified for this mapping.**

**Cause:** The attribute transformation method name in the transformation mapping is not specified. This method is invoked internally by `TopLink` to retrieve value to store in the domain object.

**Action:** Define a method and set the method name on the mapping by calling the method `setAttributeTransformation(String methodName)`.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00050: A field name is not set for this mapping.**

**Cause:** No field name is specified in direct-to-field mapping.

**Action:** Set the field by calling `setFieldName(String fieldName)`.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00051: No foreign keys have been specified for this mapping.**

**Cause:** Neither the selection criteria nor the foreign keys were specified on one-to-one mapping. If the selection criterion is not specified, then `TopLink` tries to build one from the foreign keys specified in the mapping.

**Action:** Specify the fields.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00052: No reference key has been specified for this mapping.**

**TOP-00055: The descriptor callback method [{0}] cannot be found. It must take a Session or a DescriptorEvent as its argument.**

**Cause:** TopLink cannot find the descriptor callback method on the domain class. It must take a Session or a DescriptorEvent as its argument. TopLink tries to invoke the method using Java reflection. It is a Java exception and TopLink is wrapping only the main exception.

**Action:** Inspect the internal exception, and refer to the Java documentation.

The instance method methodName does not exist in the reference class className and therefore cannot be used to create a key in a map. A map container policy represents the way to handle an indexed collection of objects. **WWC-40018: General invalidation message processing exception: %1**

**Level:** 1

**Type:** ERROR

**Impact:** Other

**WWC-40019: cannot open Oracle Web Cache connection**

**Cause:** Oracle Portal was not able to send the invalidation message to Oracle Web Cache. This can happen if one or more of the following occurred: 

- There was a problem in connecting to Oracle Web Cache from the host running the Portal database. An intermittent network issue could have caused this error. Or, the Oracle Web Cache host cannot be reached. Verify that the Portal database host can consistently resolve and ping the Oracle Web Cache host. If a firewall exists between the two hosts, ensure that the firewall allows invalidation messages to pass through.
- Oracle Web Cache was not running. It might have been stopped, or restarted at the time when the invalidation messages were sent by Oracle Portal or providers. Or, Oracle Web Cache might have failed.
- Oracle Web Cache invalidation port problems were encountered. This can happen if the Oracle Web Cache invalidation port value used by Oracle Portal is different from the actual Oracle Web Cache invalidation port. Try restarting the Oracle Portal OC4J instance to see if this helps.

**Type:** ERROR

**Impact:** Other

**WWC-43188: You have registered this Web provider with the \"Same Cookie Domain\" check box selected.**

**Cause:** Cookies created by this provider were forwarded to the user's browser and managed by the browser instead of Oracle Portal. After being managed by the browser, the cookies were sent to any other Web server that: 

- Was accessed within the same browser session.
- Fell within the relaxed scope specified when the cookie was created.

**Action:** This can result in cookie collisions and errors or loss of sessions in unrelated Web applications. To minimize the possibility of cookie collisions, ensure that: 

- Any custom cookies created by the Web provider have names that are unique to that Web provider.
- All portal instances accessed using the Federated Portal Adapter are configured with different DAD names.
- PDK-Java release 1 (JServ) Web providers requiring this setting are installed in uniquely named JServ servlet zones.
- PDK-Java release 2 (OC4J) Web providers do not use this setting if they use servlet sessions. This is because the cookie used to identify the session is always called JSESSIONID. This name is specified in the Servlet 2.3 specification. Relaxing the scope of a JSESSIONID cookie will almost certainly cause session-related problems to occur in other, unrelated, Web applications.
