  New Features for 11g Release 1 (11.1.1) ...................................................................................................................... xxv

Part I  Understanding Oracle Fusion Middleware

1  Introduction to Oracle Fusion Middleware
   1.1  What Is Oracle Fusion Middleware? .............................................................................................................. 1-1
   1.2  Oracle Fusion Middleware Components ........................................................................................................ 1-1

2  Understanding Oracle Fusion Middleware Concepts
   2.1  Understanding Key Oracle Fusion Middleware Concepts ................................................................................... 2-1
   2.2  What Is an Oracle WebLogic Server Domain? ................................................................................................ 2-3
   2.2.1  What Is the Administration Server? ................................................................................................................ 2-3
   2.2.2  Understanding Managed Servers and Managed Server Clusters ................................................................. 2-4
   2.2.3  What Is Node Manager? ................................................................................................................................ 2-5
   2.3  What Is an Oracle Instance? .................................................................................................................................. 2-5
   2.4  What Is a Middleware Home? ................................................................................................................................ 2-5
   2.5  What Is a WebLogic Server Home? ...................................................................................................................... 2-5
   2.6  What Is an Oracle Home? ...................................................................................................................................... 2-6

Part II  Basic Administration

3  Getting Started Managing Oracle Fusion Middleware
   3.1  Setting Up Environment Variables ..................................................................................................................... 3-1
   3.2  Overview of Oracle Fusion Middleware Administration Tools ........................................................................ 3-4
   3.3  Getting Started Using Oracle Enterprise Manager Fusion Middleware Control ........................................... 3-5
   3.3.1  Displaying Fusion Middleware Control ......................................................................................................... 3-6
   3.3.2  Using Fusion Middleware Control Help ........................................................................................................ 3-7
4 Starting and Stopping Oracle Fusion Middleware

4.1 Overview of Starting and Stopping Procedures ..................................................... 4-1
4.2 Starting and Stopping WebLogic Servers .............................................................. 4-1
4.2.1 Starting and Stopping Administration Servers Using the Command Line .......... 4-1
4.2.2 Starting and Stopping Managed Servers Using the Command Line ................... 4-2
4.2.3 Starting and Stopping Managed Servers Using Fusion Middleware Control ......... 4-2
4.2.4 Configuring Node Manager to Start Managed Servers ...................................... 4-2
4.3 Starting and Stopping Components ....................................................................... 4-3
4.3.1 Starting and Stopping Components Using the Command Line ........................... 4-3
4.3.2 Starting and Stopping Components Using Fusion Middleware Control ............. 4-4
4.4 Starting and Stopping Fusion Middleware Control ............................................... 4-4
4.5 Starting and Stopping Oracle Management Agent ................................................ 4-4
4.6 Starting and Stopping Applications ...................................................................... 4-4
4.6.1 Starting and Stopping Java EE Applications Using the Command Line ............... 4-5
4.6.2 Starting and Stopping Applications Using Fusion Middleware Control .............. 4-5
4.7 Starting and Stopping Your Oracle Fusion Middleware Environment .................. 4-5
4.7.1 Starting an Oracle Fusion Middleware Environment ......................................... 4-5
4.7.2 Stopping an Oracle Fusion Middleware Environment ....................................... 4-6
4.8 Starting and Stopping: Special Topics ................................................................. 4-7
4.8.1 Starting and Stopping in High Availability Environments ................................. 4-7
4.8.2 Forcing a Shut Down of Oracle Metadata Repository ....................................... 4-7

5 Managing Ports

5.1 About Managing Ports ......................................................................................... 5-1
5.2 Viewing Port Numbers ....................................................................................... 5-1
6 SSL Configuration in Oracle Fusion Middleware

6.1 How SSL Works ................................................................. 6-1
6.1.1 What SSL Provides ......................................................... 6-2
6.1.2 About Private and Public Key Cryptography ......................... 6-2
6.1.3 Keystores and Wallets ..................................................... 6-3
6.1.4 How SSL Sessions Are Conducted ..................................... 6-3
6.2 About SSL in Oracle Fusion Middleware .............................. 6-5
6.2.1 SSL in the Oracle Fusion Middleware Architecture ............... 6-5
6.2.2 Keystores and Oracle Wallets .......................................... 6-7
6.2.3 Authentication Modes .................................................... 6-7
6.2.4 Tools for SSL Configuration ........................................... 6-8
6.3 Configuring SSL for Configuration Tools ............................... 6-8
6.3.1 Oracle Enterprise Manager Fusion Middleware Control ............ 6-8
6.3.2 Oracle WebLogic Server Administration Console ............... 6-8
6.3.3 WLST Command-Line Tool ............................................ 6-9
6.4 Configuring SSL for the Web Tier ........................................ 6-9
6.4.1 Configuring Load Balancers ............................................ 6-9
6.4.2 Enabling SSL for Oracle Web Cache Endpoints ................. 6-9
6.4.2.1 Enable Inbound SSL for Oracle Web Cache Using Fusion Middleware Control 6-9
6.4.2.2 Enable Inbound SSL for Oracle Web Cache Using WLST .................... 6-11
6.4.2.3 Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control ................. 6-11
6.4.2.4 Specify the Wallet for Outbound SSL from Oracle Web Cache Using WLST .............. 6-13
6.4.3 Enabling SSL for Oracle HTTP Server Virtual Hosts ............... 6-13
6.4.3.1 Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control 6-14

7 Managing Keystores, Wallets, and Certificates

7.1 Key and Certificate Storage in Oracle Fusion Middleware .............................................. 7-1
  7.1.1 Types of Keystores................................................................................................. 7-1
  7.1.1.1 JKS Keystore and Truststore ........................................................................ 7-1
  7.1.1.2 Oracle Wallet ................................................................................................. 7-2
  7.1.2 Keystore Management Tools .............................................................................. 7-2
  7.2 Command-Line Interface for Keystores and Wallets ................................................ 7-3
  7.3 JKS Keystore Management ................................................................................... 7-4
  7.3.1 About Keystores and Certificates ..................................................................... 7-4
  7.3.1.1 Sharing Keystores Across Instances ............................................................. 7-4
  7.3.1.2 Keystore Naming Conventions ................................................................. 7-5
  7.3.2 Managing the Keystore Life Cycle ...................................................................... 7-5
  7.3.3 Common Keystore Operations ........................................................................... 7-5
      7.3.3.1 Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control ................................................................. 7-6
      7.3.3.2 Creating a Keystore Using WLST .............................................................. 7-6
      7.3.3.3 Exporting a Keystore Using Fusion Middleware Control ....................... 7-7
      7.3.3.4 Exporting a Keystore Using WLST ......................................................... 7-7
      7.3.3.5 Deleting a Keystore Using Fusion Middleware Control ........................ 7-7
      7.3.3.6 Deleting a Keystore Using WLST ............................................................ 7-8
      7.3.3.7 Importing a Keystore Using Fusion Middleware Control ....................... 7-8
      7.3.3.8 Importing a Keystore Using WLST ......................................................... 7-8
      7.3.3.9 Changing the Keystore Password Using Fusion Middleware Control ...... 7-9
      7.3.3.10 Changing the Keystore Password Using WLST .................................... 7-9
  7.3.4 Managing the Certificate Life Cycle ..................................................................... 7-9
  7.3.5 Common Certificate Operations ....................................................................... 7-9
      7.3.5.1 Generating a New Key for the Keystore Using Fusion Middleware Control ................................................................. 7-10
      7.3.5.2 Generating a New Key for the Keystore Using WLST ............................. 7-11
      7.3.5.3 Generating a Certificate Signing Request Using Fusion Middleware Control ................................................................. 7-11
      7.3.5.4 Generating a Certificate Signing Request Using WLST ....................... 7-12
      7.3.5.5 Importing a Certificate or Trusted Certificate into a Keystore Using Fusion Middleware Control ................................................................. 7-12
      7.3.5.6 Importing a Certificate or Trusted Certificate into a Keystore Using WLST ........................................................................................................ 7-13
Part III  Advanced Administration

11  Managing the Oracle Metadata Repository

11.1 Understanding a Metadata Repository ......................................................... 11-1
11.2 Creating a Database-Based Metadata Repository ........................................... 11-1
11.3 Managing the MDS Repository ................................................................ 11-2
11.3.1 Understanding the MDS Repository ...................................................... 11-3
11.3.1.1 Understanding MDS Operations ...................................................... 11-4
11.3.2 Registering and Deregistering a Database-Based Metadata Repository .... 11-5
11.3.2.1 Registering a Database-Based MDS Repository ................................ 11-5
11.3.2.2 Deregistering a Database-Based MDS Repository ......................... 11-7
11.3.3 Registering and Deregistering a File-Based Metadata Repository .......... 11-8
11.3.3.1 Creating and Registering a File-Based Metadata Repository ............... 11-8
11.3.3.2 Deregistering a File-Based Repository ............................................ 11-9
11.3.4 Viewing Information about an MDS Repository ...................................... 11-9
11.3.5 Listing Repositories and Partitions ........................................................ 11-10
11.3.6 Configuring an Application to Use a Different MDS Repository or Partition .. 11-10
11.3.6.1 Cloning a Partition ........................................................................... 11-10
11.3.6.2 Creating a New Partition and Reassociating the Application to It .......... 11-12
11.3.6.3 Changing the System Data Source .................................................... 11-13
11.3.7 Moving Metadata from a Test System to a Production System ................. 11-13
11.3.8 Moving from a File-Based Repository to a Database-Based Repository ...... 11-15
11.3.9 Deleting a Metadata Partition from a Repository ..................................... 11-16
11.3.9.1 Deleting a Metadata Partition Using the Command Line ..................... 11-16
11.3.9.2 Deleting a Metadata Partition Using Fusion Middleware Control ........ 11-16
11.3.10 Purging Metadata Version History ....................................................... 11-16
11.3.11 Managing Metadata Labels in the MDS Repository ............................... 11-17
11.3.11.1 Creating Metadata Labels ............................................................... 11-17
11.3.11.2 Deleting Metadata Labels ............................................................... 11-18
11.3.11.3 Listing Metadata Labels .................................................................. 11-18
11.3.11.4 Promoting Metadata Labels ............................................................ 11-18
11.4 Managing Metadata Repository Schemas ..................................................... 11-18
11.4.1 Changing Metadata Repository Schema Passwords ............................... 11-18
11.4.2 Changing the Character Set of the Metadata Repository ....................... 11-19

12  Changing Network Configurations

12.1 Changing the Network Configuration ......................................................... 12-1
12.1.1 Changing the Network Configuration of a WebLogic Managed Server ........ 12-1
12.1.2 Changing the Network Configuration of Web Tier Components ............... 12-2
12.2 Changing the IP Address of a Metadata Repository Installation .................... 12-3
12.3 Moving Between On-Network and Off-Network .......................................... 12-5
12.3.1 Moving from Off-Network to On-Network (Static IP Address) ................. 12-5
12.3.2 Moving from Off-Network to On-Network (DHCP) .................................. 12-6
12.3.3 Moving from On-Network to Off-Network (Static IP Address) .................. 12-6
12.4 Changing Between a Static IP Address and DHCP ....................................... 12-6
12.4.1 Changing from a Static IP Address to DHCP ......................................... 12-6
12.4.2 Changing from DHCP to a Static IP Address............................................................ 12-6
12.5 Using IPV6 ................................................................................................................. 12-7
12.5.1 Supported Topologies for IPv4 and IPv6 Network Protocols............................... 12-8
12.5.2 Configuring Oracle HTTP Server for IPv6............................................................ 12-10
12.5.3 Disabling IPv6 Support for Oracle Web Cache...................................................... 12-10
12.5.4 Configuring Oracle Single Sign-On to Use Oracle HTTP Server with IPv6 ..... 12-11
12.5.5 Configuring Oracle Access Manager Support for IPv6....................................... 12-13
12.5.5.1 Simple Authentication with IPv6..................................................................... 12-13
12.5.5.2 Configuring IPv6 with an Authenticating WebGate and Challenge Redirect 12-13
12.5.5.3 Considerations ............................................................................................... 12-14
12.5.5.4 Prerequisites .................................................................................................. 12-14
12.5.5.5 Configuring IPv6 with Simple Authentication.................................................. 12-15
12.5.5.6 Configuring IPv6 with an Authenticating WebGate and Challenge Redirect 12-16
12.5.5.7 Configuring IPv6: Separate Proxy for Authentication and Resource WebGates... 12-18

Part IV Advanced Administration: Backup and Recovery

13 Introducing Backup and Recovery
13.1 Understanding Oracle Fusion Middleware Backup and Recovery.......................... 13-1
13.1.1 Impact of Administration Server Failure ............................................................... 13-2
13.1.2 Managed Server Independence (MSI) Mode....................................................... 13-2
13.1.3 Configuration Changes in Managed Servers....................................................... 13-2
13.2 Oracle Fusion Middleware Directory Structure..................................................... 13-3
13.3 Overview of the Backup Strategies.......................................................................... 13-3
13.3.1 Types of Backups.................................................................................................. 13-4
13.3.2 Recommended Backup Strategy........................................................................... 13-5
13.4 Overview of Recovery Strategies............................................................................ 13-6
13.4.1 Types of Recovery............................................................................................... 13-6
13.4.2 Recommended Recovery Strategies..................................................................... 13-7
13.5 Backup and Recovery Recommendations for Oracle Fusion Middleware Components......................................................................................................................... 13-7
13.5.1 Backup and Recovery Recommendations for Oracle SOA Suite.......................... 13-7
13.5.1.1 Backup and Recovery Recommendations for Oracle BPEL Process Manager. 13-8
13.5.1.2 Backup and Recovery Recommendations for Oracle Business Activity Monitoring................................................................. 13-9
13.5.1.3 Backup and Recovery Recommendations for Oracle B2B .............................. 13-9
13.5.1.4 Backup and Recovery Recommendations for Oracle Business Rules......... 13-10
13.5.1.5 Backup and Recovery Recommendations for Oracle WebLogic Server JMS 13-10
13.5.2 Backup and Recovery Recommendations for Oracle WebCenter....................... 13-12
13.5.2.1 Backup and Recovery Recommendations for Oracle WebCenter .............. 13-12
13.5.2.2 Backup and Recovery Recommendations for Oracle WebCenter Portlets .... 13-13
13.5.2.3 Backup and Recovery Recommendations for Oracle WebCenter Discussions Server .................................................................................................................. 13-13
13.5.2.4 Backup and Recovery Recommendations for Oracle WebCenter Wiki and Blog Server .................................................................................................................. 13-14
13.5.2.5 Backup and Recovery Recommendations for Oracle Content Server .......... 13-14
13.5.3 Backup and Recovery Recommendations for Oracle Identity Management...... 13-14
13.5.3.1 Backup and Recovery Recommendations for Oracle Internet Directory .......... 13-15
13.5.3.2 Backup and Recovery Recommendations for Oracle Virtual Directory .......... 13-15
13.5.3.3 Backup and Recovery Recommendations for Oracle Directory Integration Platform .................................................................................................................... 13-16
13.5.3.4 Backup and Recovery Recommendations for Oracle Directory Services Manager .................................................................................................................... 13-16
13.5.3.5 Backup and Recovery Recommendations for Oracle Identity Federation .... 13-17
13.5.4 Backup and Recovery Recommendations for Oracle JRF Installations .......... 13-17
13.5.4.1 Backup and Recovery Recommendations for Oracle Web Services Manager 13-17
13.5.4.2 Backup and Recovery Recommendations for Oracle Platform Security Services...................................................................................................................... 13-18
13.5.5 Backup and Recovery Recommendations for Web Tier Installations .......... 13-18
13.5.5.1 Backup and Recovery Recommendations for Oracle HTTP Server .......... 13-18
13.5.5.2 Backup and Recovery Recommendations for Oracle Web Cache ............ 13-19
13.5.6 Backup and Recovery Recommendations for Oracle Portal, Oracle Forms Services, and Oracle Reports Installations ........................................................................ 13-19
13.5.6.1 Backup and Recovery Recommendations for Oracle Portal ................... 13-19
13.5.6.2 Backup and Recovery Recommendations for Oracle Forms Services ........ 13-20
13.5.6.3 Backup and Recovery Recommendations for Oracle Reports ............... 13-20
13.5.6.4 Backup and Recovery Recommendations for Oracle Business Intelligence Discoverer .................................................................................................................... 13-22
13.6 Assumptions and Restrictions ............................................................................. 13-22

14 Backing Up Your Environment

14.1 Overview of Backing Up Your Environment ..................................................... 14-1
14.2 Limitations and Restrictions for Backing Up Data ............................................. 14-2
14.3 Performing a Backup ......................................................................................... 14-3
14.3.1 Performing a Full Offline Backup .................................................................. 14-4
14.3.2 Performing an Online Backup of Run-Time Artifacts ................................ 14-5
14.4 Creating a Record of Your Oracle Fusion Middleware Configuration ................. 14-6

15 Recovering Your Environment

15.1 Overview of Recovering Your Environment ..................................................... 15-1
15.2 Recovering After Data Loss, Corruption, Media Failure, or Application Malfunction 15-2
15.2.1 Recovering a Middleware Home .................................................................... 15-2
15.2.2 Recovering an Oracle WebLogic Server Domain ......................................... 15-2
15.2.3 Recovering an Oracle Instance Home ........................................................... 15-3
15.2.3.1 Recovering After Oracle Instance Home Deleted from File System .......... 15-3
15.2.3.2 Recovering After Oracle Instance Home Deregistered ......................... 15-3
15.2.4 Recovering the Administration Server Configuration .................................. 15-4
15.2.5 Recovering a Managed Server ...................................................................... 15-4
15.2.5.1 Recovering a Managed Server When It Cannot Be Started ..................... 15-5
15.2.5.2 Recovering a Managed Server When It Does Not Function Correctly ........ 15-6
15.2.5.3 Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory ......................................................................................................................... 15-7
15.2.6 Recovering Components ............................................................................. 15-7
15.2.6.1 Recovering After a Component’s Files Are Deleted or Corrupted .............. 15-7
15.2.6.2 Recovering a Component That Is Not Functioning Properly After Configuration Change .................................................... 15-8
15.2.6.3 Recovering Components After Cluster Configuration Change ................................................................. 15-8
15.2.7 Recovering a Cluster ........................................................................................................................................ 15-9
15.2.7.1 Recovering a Cluster After Deletion or Cluster-Level Configuration Changes .............................. 15-9
15.2.7.2 Recovering a Cluster After Membership Is Mistakenly Modified ............................................... 15-10
15.2.8 Recovering Applications .................................................................................................................................. 15-10
15.2.8.1 Recovering Application Artifacts ............................................................................................................. 15-11
15.2.8.2 Recovering a Redeployed Application That Is No Longer Functional ........................................ 15-11
15.2.8.3 Recovering an Undeployed Application ............................................................................................... 15-11
15.2.8.4 Recovering a Composite Application ........................................................................................................ 15-12
15.2.9 Recovering a Database ........................................................................................................................................ 15-12
15.3 Recovering After Loss of Host .............................................................................................................................. 15-13
15.3.1 Recovering After Loss of Administration Server Host .............................................................................. 15-13
15.3.1.1 Recovering the Administration Server to the Same Host .................................................................. 15-13
15.3.1.2 Recovering the Administration Server to a Different Host ................................................................. 15-14
15.3.2 Recovering After Loss of Managed Server Host ....................................................................................... 15-15
15.3.2.1 Recovering a Managed Server to the Same Host .................................................................................. 15-15
15.3.2.2 Recovering a Managed Server to a Different Host ................................................................................ 15-17
15.3.2.3 Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory ............................. 15-19
15.3.3 Recovering After Loss of Component ........................................................................................................... 15-19
15.3.3.1 Recovering a Java Component to the Same Host ............................................................................... 15-19
15.3.3.2 Recovering a Java Component to a Different Host ............................................................................... 15-19
15.3.3.3 Recovering a System Component to the Same Host .............................................................................. 15-19
15.3.3.4 Recovering a System Component to a Different Host .............................................................................. 15-20
15.3.3.5 Recovering Oracle SOA Suite After Loss of Host .................................................................................. 15-21
15.3.3.6 Recovering Oracle Business Activity Monitoring to a Different Host ................................................. 15-22
15.3.3.7 Recovering Oracle WebCenter to a Different Host ............................................................................... 15-22
15.3.3.8 Recovering Web Tier Components to a Different Host ......................................................................... 15-22
15.3.3.8.1 Recovering Oracle HTTP Server to a Different Host ............................................................................ 15-22
15.3.3.8.2 Recovering Oracle Web Cache to a Different Host .............................................................................. 15-22

Preface

This guide describes how to manage Oracle Fusion Middleware, including how to start and stop Oracle Fusion Middleware, how to change ports, deploy applications, and how to back up and recover Oracle Fusion Middleware.

Audience

This guide is intended for administrators of Oracle Fusion Middleware.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at http://www.oracle.com/accessibility/.

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

Deaf/Hard of Hearing Access to Oracle Support Services

To reach Oracle Support Services, use a telecommunications relay service (TRS) to call Oracle Support at 1.800.223.1711. An Oracle Support Services engineer will handle technical issues and provide customer support according to the Oracle service request process. Information about TRS is available at http://www.fcc.gov/cgb/consumerfacts/trs.html, and a list of phone numbers is available at http://www.fcc.gov/cgb/dro/trsphonebk.html.

</tbody>
</table>
What's New in This Guide?

This preface introduces the new and changed administrative features of Oracle Fusion Middleware that are described in this guide, and provides pointers to additional information.

New Features for 11g Release 1 (11.1.1)

11g Release 1 (11.1.1) includes many new and changed features, including the following:

- The inclusion of Oracle WebLogic Server in Oracle Fusion Middleware, replacing Oracle Containers for Java EE. Oracle WebLogic Server is an enterprise-ready Java application server that supports the deployment of mission-critical applications in a robust, secure, highly available, and scalable environment. For an overview of Oracle WebLogic Server and the Oracle Fusion Middleware environment, see Section 2.1.

- New commands for many functions. Many components and services now use Oracle WebLogic Server Scripting Tool (WLST) commands. For example, commands to configure log files are WLST commands. See Section 3.5.1 for general information about invoking WLST.

- The Oracle Metadata Service (MDS) Repository, a particular type of repository that contains metadata for certain types of deployed applications. This includes custom Java EE applications developed by your organization and some Oracle Fusion Middleware component applications, such as Oracle B2B. For information about the MDS Repository, see Section 11.3.

- Wallet and Keystore Management: 11g Release 1 (11.1.1) provides new features for managing Oracle wallets and JKS keystores:
  - Password-protected Wallets

  When creating a wallet in prior releases, the administrator was always required to create a password-protected wallet. Once this wallet was created, the administrator could optionally create an auto-login wallet. Components needed the auto-login wallet at run-time. Without an auto-login wallet, the password had to be specified in the component configuration file in an encrypted or obfuscated format.

  In 11g Release 1 (11.1.1) this behavior has changed. Every time you create a password-protected wallet, an auto-login wallet is automatically created as well. This enables management tasks to be performed on the password-protected wallet, while components can use the auto-login wallet at run-time. This eliminates the need to store passwords in configuration files.
To take advantage of this feature when creating a wallet with Fusion Middleware Control, you need to uncheck the auto-login check-box and enter the wallet password. Remember that this creates both the password-protected and auto-login wallets.

A new type of wallet has also been introduced, which is a standalone auto-login wallet. This wallet can be used for both management and run time without requiring a password. To create this wallet when creating a wallet with Fusion Middleware Control, check the auto-login check box. You do not need to provide a password for this type of wallet.

---

**Note:** The standalone auto-login wallet is the default choice for wallet creation.

---

- **Wallet and Keystore Management Tools**

  In prior releases, Oracle Wallet Manager was the graphical interface tool and `orapki` the command-line tool to manage Oracle wallets.

  In 11g Release 1 (11.1.1), Oracle Wallet Manager has been discontinued and replaced by Fusion Middleware Control, which is a web-based interface. WLST is the new command-line tool. You can use both these tools to manage not just Oracle wallets, but also JKS keystore files.

  An additional advantage of these new tools is that they allow you to manage keystores centrally across instances, since they work in the context of a management server.

  You can still use `orapki` to manage both Oracle wallet and JKS keystore, but only local changes (on a per-instance basis) are possible. `orapki` is the only tool that allows management of PKCS#11 wallets and CRLs.

  The following table shows the different tools and their capabilities:

<table>
<thead>
<tr>
<th>Tool</th>

Part I

Understanding Oracle Fusion Middleware

This part provides an overview to Oracle Fusion Middleware and its concepts as they relate to administering Oracle Fusion Middleware.

Part I contains the following chapters:

- Chapter 1, "Introduction to Oracle Fusion Middleware"
- Chapter 2, "Understanding Oracle Fusion Middleware Concepts"
Introduction to Oracle Fusion Middleware

Oracle Fusion Middleware is a comprehensive family of products ranging from application development tools and integration solutions to identity management, collaboration, and business intelligence reporting. This chapter provides an introduction to Oracle Fusion Middleware.

It includes the following topics:

- What Is Oracle Fusion Middleware?
- Oracle Fusion Middleware Components

1.1 What Is Oracle Fusion Middleware?

Oracle Fusion Middleware is a collection of standards-based software products that spans a range of tools and services: from Java EE and developer tools, to integration services, business intelligence, and collaboration. Oracle Fusion Middleware offers complete support for development, deployment, and management.

1.2 Oracle Fusion Middleware Components

Oracle Fusion Middleware provides the following components:

- Oracle WebLogic Server, an enterprise-ready Java application server that supports the deployment of mission-critical applications in a robust, secure, highly available, and scalable environment. Oracle WebLogic Server is an ideal foundation for building applications based on Service Oriented Architecture (SOA).

  See Also: Oracle Fusion Middleware Introduction to Oracle WebLogic Server

- Oracle SOA Suite, a complete set of service infrastructure components for designing, deploying, and managing composite applications. Oracle SOA Suite enables services to be created, managed, and orchestrated into composite applications and business processes. Composites enable you to easily assemble multiple technology components into one SOA composite application.

  See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite

- Oracle WebCenter, an integrated set of components with which you can create social applications, enterprise portals, collaborative communities, and composite applications, built on a standards-based, service-oriented architecture. Oracle
WebCenter combines dynamic user interface technologies with which to develop rich internet applications, the flexibility and power of an integrated, multi-channel portal framework, and a set of horizontal Enterprise 2.0 capabilities delivered as services that provide content, collaboration, presence and social networking capabilities. Based on these components, Oracle WebCenter also provides an out-of-the-box enterprise-ready customizable application, WebCenter Spaces, with a configurable work environment that enables individuals and groups to work and collaborate more effectively.

**See Also:** Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter

- Oracle HTTP Server, which provides a Web listener for Java EE applications and the framework for hosting static and dynamic pages and applications over the Web. Based on the proven technology of the Apache HTTP Server, Oracle HTTP Server includes significant enhancements that facilitate load balancing, administration, and configuration.

  **See Also:** Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server

- Oracle Web Cache, a content-aware server accelerator, or reverse proxy, that improves the performance, scalability, and availability of Web sites that run on Oracle Fusion Middleware.

  **See Also:** Oracle Fusion Middleware Administrator’s Guide for Oracle Web Cache

- Oracle Identity Management, which provides a shared infrastructure for all Oracle applications. It also provides services and interfaces that facilitate third-party enterprise application development. These interfaces are useful for application developers who need to incorporate identity management into their applications.

  **See Also:** Oracle Fusion Middleware Integration Guide for Oracle Identity Management

- Oracle Internet Directory, a general purpose directory service that enables fast retrieval and centralized management of information about dispersed users and network resources. It combines Lightweight Directory Access Protocol (LDAP) Version 3 with the high performance, scalability, robustness, and availability of an Oracle Database.

  **See Also:** Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory

- Oracle Virtual Directory, an LDAP version 3 enabled service that provides virtualized abstraction of one or more enterprise data sources into a single directory view. Oracle Virtual Directory provides the ability to integrate LDAP-aware applications into diverse directory environments while minimizing or eliminating the need to change either the infrastructure or the applications. It supports a diverse set of clients, such as Web applications and portals, and it can connect to directories, databases, and Web Services.

  **See Also:** Oracle Fusion Middleware Administrator’s Guide for Oracle Virtual Directory
Oracle Identity Federation, a self-contained federation solution that provides the infrastructure that enables identities and their relevant entitlements to be propagated across security domains—this applies to domains existing within an organization as well as between organizations.

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle Identity Federation

Oracle Web Services Manager, which provides a way to centrally define and manage policies that govern Web services operations, including access control (authentication and authorization), reliable messaging, Message Transmission Optimization Mechanism (MTOM), WS-Addressing, and Web services management. Policies can be attached to multiple Web services, requiring no modification to the existing Web services.

See Also: Oracle Fusion Middleware Security and Administrator’s Guide for Web Services

Oracle Platform Security Services (OPSS), which provides enterprise product development teams, systems integrators, and independent software vendors (ISVs) with a standards-based, portable, integrated, enterprise-grade security framework for Java Standard Edition (Java SE) and Java Enterprise Edition (Java EE) applications.

OPSS provides an abstraction layer in the form of standards-based application programming interfaces (APIs) that insulate developers from security and identity management implementation details. With OPSS, developers do not need to know the details of cryptographic key management or interfaces with user repositories and other identity management infrastructures. Using OPSS, in-house developed applications, third-party applications, and integrated applications benefit from the same uniform security, identity management, and audit services across the enterprise.

OPSS is available in both JavaEE and JavaSE environments. OPSS is standards-based and designed to be portable to third-party application servers.

See Also: Oracle Fusion Middleware Security Guide

Oracle Portal, a Web-based tool for building and deploying e-business portals. It provides a secure, manageable environment for accessing and interacting with enterprise software services and information resources. A portal page makes data from multiple sources accessible from a single location.

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle Portal

Oracle Business Intelligence, a complete, integrated solution that addresses business intelligence requirements. Oracle Business Intelligence includes Oracle Business Intelligence Reporting and Publishing, Oracle Business Intelligence Discoverer, and Oracle Business Intelligence Publisher.

See Also: Oracle Fusion Middleware Configuration Guide for Oracle Business Intelligence Discoverer
This chapter provides information about Oracle Fusion Middleware concepts that are related to administering Oracle Fusion Middleware.

- **Understanding Key Oracle Fusion Middleware Concepts**
- **What Is an Oracle WebLogic Server Domain?**
- **What Is an Oracle Instance?**
- **What Is a Middleware Home?**
- **What Is a WebLogic Server Home?**
- **What Is an Oracle Home?**

### 2.1 Understanding Key Oracle Fusion Middleware Concepts

Oracle Fusion Middleware provides two types of components:

- A **Java component**, which is an Oracle Fusion Middleware component that is deployed as one or more Java EE applications and a set of resources. Java components are deployed to an Oracle WebLogic Server domain as part of a domain template. Examples of Java components are the Oracle SOA Suite and Oracle WebCenter components.

- A **system component**, which is a manageable process that is not deployed as a Java application. Instead, a system component is managed by the Oracle Process Manager and Notification (OPMN). The system components are:
  - Oracle HTTP Server
  - Oracle Web Cache
  - Oracle Internet Directory
  - Oracle Virtual Directory
  - Oracle Forms Services
  - Oracle Reports
  - Oracle Business Intelligence Discoverer
  - Oracle Business Intelligence

A Java component and a system component are peers.
After you install and configure Oracle Fusion Middleware, your Oracle Fusion Middleware environment contains the following:

- An Oracle WebLogic Server domain, which contains one Administration Server and one or more Managed Servers. The Administration Server contains the Oracle WebLogic Server Administration Console and Oracle Enterprise Manager Fusion Middleware Control. The Managed Servers contain components, such as Oracle WebCenter and Oracle SOA Suite.
  
  See Section 2.2 for information about Oracle WebLogic Server domains.

- If your environment includes system components, one or more Oracle instances. See Section 2.3 for information about Oracle instances.

- A metadata repository, if the components you installed require one. For example, Oracle SOA Suite requires a metadata repository.

Figure 2–1 shows an Oracle Fusion Middleware environment with an Oracle WebLogic Server domain that contains an Administration Server and two Managed Servers, and an Oracle instance. The environment also includes and a metadata repository.

Figure 2–1  Oracle Fusion Middleware Environment

Your environment also includes a Middleware home, which consists of the Oracle WebLogic Server home, and, optionally, one or more Oracle homes. See Section 2.4.
2.2 What Is an Oracle WebLogic Server Domain?

An Oracle WebLogic Server administration domain is a logically related group of Java components. A domain includes a special WebLogic Server instance called the Administration Server, which is the central point from which you configure and manage all resources in the domain. Usually, you configure a domain to include additional WebLogic Server instances called Managed Servers. You deploy Java components, such as Web applications, EJBs, and Web services, and other resources to the Managed Servers and use the Administration Server for configuration and management purposes only.

Managed Servers in a domain can be grouped together into a cluster.

The directory structure of a domain is separate from the directory structure of the WebLogic Server home. It can reside anywhere; it need not be within the Middleware home directory.

A domain is a peer of an Oracle instance. Both contain specific configurations outside of their Oracle homes.

Figure 2–2 shows a domain with an Administration Server, three standalone Managed Servers, and three Managed Servers in a cluster.

Figure 2–2 Oracle WebLogic Server Domain

See Also: Oracle Fusion Middleware Understanding Domain Configuration for Oracle WebLogic Server for more information about domain configuration.

The following topics describe entities in the domain:

- What Is the Administration Server?
- Understanding Managed Servers and Managed Server Clusters
- What Is Node Manager?

2.2.1 What Is the Administration Server?

The Administration Server operates as the central control entity for the configuration of the entire domain. It maintains the domain's configuration documents and
distributes changes in the configuration documents to Managed Servers. The Administration Server serves as a central location from which to monitor all resources in a domain.

Each domain must have one server instance that acts as the Administration Server.

To interact with the Administration Server, you can use the Oracle WebLogic Server Administration Console, Oracle WebLogic Scripting Tool (WLST), or create your own JMX client. In addition, you can use Oracle Enterprise Manager Fusion Middleware Control for some tasks.

Oracle WebLogic Server Administration Console and Fusion Middleware Control run in the Administration Server. Oracle WebLogic Server Administration Console is the Web-based administration console used to manage the resources in an Oracle WebLogic Server domain, including the Administration Server and Managed Servers. Fusion Middleware Control is a Web-based administration console used to manage Oracle Fusion Middleware, including components such as Oracle HTTP Server, Oracle SOA Suite and Oracle WebCenter, Oracle Portal, and Oracle Identity Management.

See Also:

- Section 3.3 for more information about Fusion Middleware Control
- Section 3.4 of this book, as well as the Oracle Fusion Middleware Introduction to Oracle WebLogic Server and the Oracle WebLogic Server Administration Console Online help for more information about Oracle WebLogic Server Administration Console

### 2.2.2 Understanding Managed Servers and Managed Server Clusters

**Managed Servers** host business applications, application components, Web services, and their associated resources. To optimize performance, Managed Servers maintain a read-only copy of the domain's configuration document. When a Managed Server starts up, it connects to the domain's Administration Server to synchronize its configuration document with the document that the Administration Server maintains.

When you create a domain, you create it using a particular domain template. That template supports a particular component or group of components, such as the Oracle SOA Suite. The Managed Servers in the domain are created specifically to host those particular Oracle Fusion Middleware components.

Oracle Fusion Middleware Java components (such as Oracle SOA Suite, Oracle WebCenter, and some Identity Management components), as well as customer-developed applications, are deployed to Managed Servers in the domain.

If you want to add other components, such as Oracle WebCenter, to a domain that was created using a template that supports another component, you can extend the domain by creating additional Managed Servers in the domain, using a domain template for the component which you want to add. See Section 16.2 for more information.

For production environments that require increased application performance, throughput, or high availability, you can configure two or more Managed Servers to operate as a cluster. A **cluster** is a collection of multiple Oracle WebLogic Server server instances running simultaneously and working together to provide increased scalability and reliability. In a cluster, most resources and services are deployed identically to each Managed Server (as opposed to a single Managed Server), enabling failover and load balancing. A single domain can contain multiple Oracle WebLogic Server clusters, as well as multiple Managed Servers that are not configured as clusters. The key difference between clustered and non-clustered Managed Servers is
support for failover and load balancing. These features are available only in a cluster of Managed Servers.

See Also: "Understanding WebLogic Server Clustering" in Oracle Fusion Middleware Using Clusters for Oracle WebLogic Server

2.2.3 What Is Node Manager?

**Node Manager** is a Java utility that runs as a separate process from Oracle WebLogic Server and allows you to perform common operations for a Managed Server, regardless of its location with respect to its Administration Server. While use of Node Manager is optional, it provides valuable benefits if your Oracle WebLogic Server environment hosts applications with high-availability requirements.

If you run Node Manager on a computer that hosts Managed Servers, you can start and stop the Managed Servers remotely using the Administration Console or the command line. Node Manager can also automatically restart a Managed Server after an unexpected failure.

See Also: Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server

2.3 What Is an Oracle Instance?

An **Oracle instance** contains one or more system components, such as Oracle Web Cache, Oracle HTTP Server, or Oracle Internet Directory. The system components in an Oracle instance must reside on the same computer. An Oracle instance directory contains updatable files, such as configuration files, log files, and temporary files.

An Oracle instance is a peer of an Oracle WebLogic Server domain. Both contain specific configurations outside of their Oracle homes.

The directory structure of an Oracle instance is separate from the directory structure of the Oracle home. It can reside anywhere; it need not be within the Middleware home directory.

2.4 What Is a Middleware Home?

A **Middleware home** consists of the Oracle WebLogic Server home, and, optionally, one or more Oracle homes.

A Middleware home can reside on a local file system or on a remote shared disk that is accessible through NFS.

See Section 2.5 for information about Oracle WebLogic Server homes. See Section 2.6 for information about Oracle homes.

2.5 What Is a WebLogic Server Home?

A WebLogic Server home contains installed files necessary to host a WebLogic Server. The WebLogic Server home directory is a peer of Oracle home directories and resides within the directory structure of the Middleware home.
2.6 What Is an Oracle Home?

An Oracle home contains installed files necessary to host a specific product. For example, the SOA Oracle home contains a directory that contains binary and library files for Oracle SOA Suite.

An Oracle home resides within the directory structure of the Middleware home. Each Oracle home can be associated with multiple Oracle instances or Oracle WebLogic Server domains.
Part II
Basic Administration

This part describes basic administration tasks.
It contains the following chapters:

- Chapter 3, "Getting Started Managing Oracle Fusion Middleware"
- Chapter 4, "Starting and Stopping Oracle Fusion Middleware"
- Chapter 5, "Managing Ports"
- Chapter 6, "SSL Configuration in Oracle Fusion Middleware"
- Chapter 7, "Managing Keystores, Wallets, and Certificates"
- Chapter 8, "Deploying Applications"
- Chapter 9, "Monitoring Oracle Fusion Middleware"
- Chapter 10, "Managing Log Files and Diagnostic Data"
When you install Oracle Fusion Middleware, you install the binary files, such as executable files, jar files, and libraries. Then, you use configuration tools to configure the software. This chapter provides information you need to get started managing Oracle Fusion Middleware, including information about the tools you use.

This chapter includes the following topics:

- Setting Up Environment Variables
- Overview of Oracle Fusion Middleware Administration Tools
- Getting Started Using Oracle Enterprise Manager Fusion Middleware Control
- Getting Started Using Oracle WebLogic Server Administration Console
- Getting Started Using Command-Line Tools
- Getting Started Using the Fusion Middleware Control MBean Browsers
- Managing Components
- Changing the Administrative User Password
- Basic Tasks for Configuring and Managing Oracle Fusion Middleware

### 3.1 Setting Up Environment Variables

When you installed Oracle Fusion Middleware, you were logged in to your operating system as a particular user. You should always log in as this user to manage your installation because this user has permission to view and modify the files in your installation’s Oracle home.

To use Oracle Fusion Middleware, you must set environment variables as shown in the following tables:

- Table 3–1, "Environment Variables for Linux and UNIX"
- Table 3–2, "Environment Variables for Windows"

#### Table 3–1  Environment Variables for Linux and UNIX

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY</td>
<td>hostname:display_number:screen_number</td>
</tr>
<tr>
<td></td>
<td>Beginning with Oracle Application Server 10g, very few tools, such as oidadmin, require the DISPLAY variable.</td>
</tr>
</tbody>
</table>
Table 3–2 shows the environment variables for Windows.

Table 3–1 (Cont.) Environment Variables for Linux and UNIX

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Value</th>
</tr>
</thead>
</table>
| LD_LIBRARY_PATH      | On Solaris, make sure the value contains the following directory:  
|                      | $ORACLE_HOME/lib32  
|                      | On Linux and HP-UX, make sure the value contains the following  
|                      | directory:  
|                      | $ORACLE_HOME/lib  
|                      | On IBM AIX, make sure this environment variable is not set.  
| LIBPATH              | If the calling application is a 32-bit application, make sure the value  
|                      | contains the following directory:  
|                      | $ORACLE_HOME/lib32  
|                      | If the calling application is a 64-bit application, make sure the value  
|                      | contains the following directory:  
|                      | $ORACLE_HOME/lib  
|                     | (Solaris only)  
| LD_LIBRARY_PATH_64   | Make sure the value contains the following directory:  
|                      | $ORACLE_HOME/lib  
| SHLIB_PATH           | (HP-UX only)  
|                      | Make sure the value contains the following directory:  
|                      | $ORACLE_HOME/lib32  
| MW_HOME              | Set to the full path of the installation’s Middleware home. Do not  
|                      | use a trailing slash in the definition. The following example shows  
|                      | the full path:  
|                      | /scratch/Oracle/Middleware  
| ORACLE_HOME          | Set to the full path of the installation’s Oracle home. Do not use a  
|                      | trailing slash in the definition. The following example shows the  
|                      | full path:  
|                      | /scratch/Oracle/Middleware/ORACLE_HOME_SOA1  
| ORACLE_INSTANCE      | Optional. Set to the full path of an Oracle instance. Do not use a  
|                      | trailing slash in the definition. Setting this is useful if you have only  
|                      | one Oracle instance in your environment or you will be working  
|                      | with just that one instance. The following example shows the full  
|                      | path of a Web Tier installation:  
|                      | scratch/Oracle/Middleware/WebTier/instances/instance1  
| PATH                 | Make sure the value contains the following directory, which  
|                      | contains basic commands used by all installations:  
|                      | $ORACLE_HOME/bin  
|                      | When you start to work with specific components, you may want  
|                      | to add additional directories to your path, as recommended by the  
|                      | component documentation.  
| JAVA_HOME            | Make sure the value contains the following directory:  
|                      | MW_HOME/jdk  
| CLASSPATH            | Make sure the value contains the following directories:  
|                      | $ORACLE_HOME/lib:MW_HOME/jdk/lib  

Table 3–2 shows the environment variables for Windows.
Best Practices for Multiple Installations on a UNIX Host

If you have multiple installations of Oracle Fusion Middleware on a UNIX host, it is very important to completely set your environment when managing a particular installation.

Some Oracle Fusion Middleware commands use the MW_HOME and ORACLE_HOME environment variables to determine which installation to operate on, and some use the directory location of the command. It is, therefore, not sufficient to simply reset your environment variables or `cd` to a different Oracle home as you move between installations. You must fully change to the new installation as follows:

1. Log in as the user who installed Oracle Fusion Middleware.
   
   On UNIX hosts, you may also use the `su` command to switch to the user, but be sure to use the dash (-) option so your environment is set the same as it would have been had you actually logged in as that user. For example:

   ```bash
   su - user
   ```

2. Set the correct environment variables for the installation, as described in Table 3–1.

3. Execute commands in the Middleware home and Oracle home of the correct installation.

Multiple Installations by the Same User   If you installed multiple installations as the same user, ensure that you are in the correct Middleware home and Oracle home and have the correct environment variables set when working on a particular installation.

---

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MW_HOME</td>
<td>Set to the full path of the installation’s Middleware home. Do not use a trailing slash in the definition. The following example shows the full path: C:\oracle\Middleware</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>Set to the full path of the installation’s Oracle home. Do not use a trailing backslash in the definition. The value is automatically set by Oracle Universal Installer.</td>
</tr>
<tr>
<td>ORACLE_INSTANCE</td>
<td>Optional. Set to the full path of an Oracle instance. Do not use a trailing slash in the definition. Setting this is useful if you have only one Oracle instance in your environment or you will be working with just that one instance. The following example shows the full path of a Web Tier installation: C:\oracle\Middleware\WebTier\instances\instance1</td>
</tr>
<tr>
<td>PATH</td>
<td>Make sure the value contains the following directory, which contains basic commands used by all installations: ORACLE_HOME\bin</td>
</tr>
<tr>
<td>JAVA_HOME</td>
<td>Make sure the value contains the following directory: MW_HOME\jdkn</td>
</tr>
<tr>
<td>CLASSPATH</td>
<td>Make sure the value contains the following directories: ORACLE_HOME\lib:MW_HOME\jdkn\lib</td>
</tr>
<tr>
<td>TEMP</td>
<td>Set to your temp directory, for example, C:\temp.</td>
</tr>
<tr>
<td>TMP</td>
<td>Set to your temp directory, for example, C:\temp.</td>
</tr>
</tbody>
</table>
You may want to set up some scripts to make it easy to change from one installation to another.

### 3.2 Overview of Oracle Fusion Middleware Administration Tools

After you install and configure Oracle Fusion Middleware, you can use the graphical user interfaces or command-line tools to manage your environment.

Oracle offers the following primary tools for managing your Oracle Fusion Middleware installations:

- Oracle Enterprise Manager Fusion Middleware Control. See Section 3.3.
- Oracle WebLogic Server Administration Console. See Section 3.4
- The Oracle Fusion Middleware command-line tools. See Section 3.5.
- The Fusion Middleware Control MBean Browser. See Section 3.6.

Note that you should use these tools, rather than directly editing configuration files, to perform all administrative tasks unless a specific procedure requires you to edit a file. Editing a file may cause the settings to be inconsistent and generate problems.

Both Fusion Middleware Control and Oracle WebLogic Server Administration Console are graphical user interfaces that you can use to monitor and administer your Oracle Fusion Middleware environment. You can perform some tasks with either tool, but, for other tasks, you can only use one of the tools. Table 3–3 lists some common tasks with the recommended tool.

| Table 3–3 Comparing Fusion Middleware Control and WebLogic Server Administration Console |
|-------------------------------------|---------------------------------------------|
| Task                               | Tool to Use                                |
| Manage Oracle WebLogic Server      | Use:                                       |
| Create additional Managed Servers  | WebLogic Server Administration Console     |
| Clone Managed Servers              | WebLogic Server Administration Console     |
| Cluster Managed Servers            | WebLogic Server Administration Console     |
| Start and stop Oracle WebLogic Server | Fusion Middleware Control or WebLogic Server Administration Console |
| Add users and groups               | WebLogic Server Administration Console if using the default embedded LDAP or use the LDAP server's tool when using another LDAP server |
| Manage Data Sources                | Use:                                       |
| Create data sources                | WebLogic Server Administration Console     |
| Create connection pools            | WebLogic Server Administration Console     |
| Manage JMS Resources               | Use:                                       |
| Create JMS queues                  | WebLogic Server Administration Console     |
| Advanced queuing                   | WebLogic Server Administration Console     |
| Manage SOA environment             | Use:                                       |
| Deploy SOA Composite applications  | Fusion Middleware Control                  |
| Monitor SOA Composite applications | Fusion Middleware Control                  |
| Modify Oracle BPEL Process Manager MBean properties | Fusion Middleware Control |
A `farm` is a collection of components managed by Fusion Middleware Control. It can contain Oracle WebLogic Server domains, one Administration Server, one or more Managed Servers, clusters, and the Oracle Fusion Middleware components that are installed, configured, and running in the domain.
Fusion Middleware Control organizes a wide variety of performance data and administrative functions into distinct, Web-based home pages for the farm, domain, servers, components, and applications. The Fusion Middleware Control home pages make it easy to locate the most important monitoring data and the most commonly used administrative functions—all from your Web browser.

The following topics are discussed in this section:

- Displaying Fusion Middleware Control
- Using Fusion Middleware Control Help
- Navigating Within Fusion Middleware Control
- Understanding Users and Roles for Fusion Middleware Control
- Viewing and Managing the Farm
- Viewing and Managing Components
- Viewing the Status of Applications

3.3.1 Displaying Fusion Middleware Control

To display Fusion Middleware Control, you enter the Fusion Middleware Control URL, which includes the name of the host and the port number assigned during the installation. The following shows the format of the URL:

http://hostname.domain:port/em

For some installation types, such as the Web Tier, if you saved the installation information by clicking Save on the last installation screen, the URL for Fusion Middleware Control is included in the file that is written to disk (by default to your home directory).

For other installation types, such as Oracle SOA Suite, the information is displayed on the Create Domain screen of the Configuration Wizard when the configuration completes.

The port number is the number of the Administration Server. By default, the port number is 7001.

To display Fusion Middleware Control:

1. Display Fusion Middleware Control by entering the URL in your Web browser. For example:

   http://host1.example.com:7001/em

   The following shows the login page:
2. Enter the Oracle Fusion Middleware administrator user name and password and click **Login**.

   The default user name for the administrator user is `weblogic`. This is the account you can use to log in to Fusion Middleware Control for the first time. The password is the one you supplied during the installation of Oracle Fusion Middleware.

3.3.2 Using Fusion Middleware Control Help

   At any time while using the Fusion Middleware Control Console, you can click **Help** at the top of the page to get more information. In most cases, the Help window displays a help topic about the current page. Click **Contents** in the Help window to browse the list of help topics, or click **Search** to search for a particular word or phrase.

3.3.3 Navigating Within Fusion Middleware Control

   Fusion Middleware Control displays the target navigation pane on the left and the content pane to the right. For example, when you first log in to Fusion Middleware Control, the farm home page is displayed on the right.

   From the target navigation pane, you can expand the tree and select an Oracle WebLogic Server domain, an Oracle WebLogic Server Managed Server, a component, an application, or a Metadata Repository.

   When you select a target, such as a Managed Server or a component, the target's home page is displayed in the content pane and that target's menu is displayed at the top of the page, in the context pane. For example, if you select a Managed Server, the WebLogic Server menu is displayed. You can also view the menu for a target by right-clicking the target in the navigation pane.

   The following figure shows the target navigation pane and the home page of an Managed Server. Because a Managed Server was selected, the dynamic target menu listed in the context pane is the WebLogic Server menu.
In the preceding figure, the following items are called out:

- **Target Navigation Pane** lists all of the targets in the farm in a navigation tree.
- **Content Pane** shows the current page for the target. When you first select a target, that target's home page is displayed.
- **Farm Menu** provides a list of operations that you can perform on the farm. The Farm menu is always available.
- **Dynamic Target Menu** provides a list of operations that you can perform on the currently selected target. The menu that is displayed depends on the target you select. The menu for a specific target contains the same operations as those in the **Right-Click Target Menu**.
- **Right-Click Target Menu** provides a list of operations that you can perform on the currently selected target. The menu is displayed when you right-click the target name in the target navigation pane. In the figure, even though the WebLogic Server is selected and its home page is displayed, the right-click target menu displays the operations for a metadata repository because the user has right-clicked the metadata repository.

The menu for a specific target contains the same operations as those in the **Dynamic Target Menu**.
- **Topology Viewer** displays the topology of the farm.
- **Target Name** is the name of the currently selected target.
- **General Information Icon** provides information about the target. For example, for a domain, it displays the target name, the version, and the domain home.
- **Context Pane** provides the name of the target, the name of the current user, the host name, and the time of the last page refresh, as well as the Refresh icon.
- **Expand All/Collapse All** lets you expand or collapse the navigation tree.
- **Refresh** indicates when the page is being refreshed. Click it to refresh a page with new data. (Refreshing the browser window refreshes the page but does not retrieve new data.)
- **Return to login** takes you to the login page when you click the Oracle Enterprise Manager logo.

In addition, from Fusion Middleware Control, from the home pages of targets such as the Administration Server or Managed Servers, you can access the WebLogic Server Administration Console.

Table 3–4 describes some common ways you can navigate within Fusion Middleware Control.

### Table 3–4 Navigating Within Fusion Middleware Control

<table>
<thead>
<tr>
<th>To:</th>
<th>Take This Action:</th>
</tr>
</thead>
<tbody>
<tr>
<td>View all of the targets in the farm</td>
<td>Click the <strong>Expand All</strong> icon at the top of the target navigation pane.</td>
</tr>
<tr>
<td>Navigate to the farm</td>
<td>Select the farm from the target navigation pane. The farm’s home page is displayed in the content pane.</td>
</tr>
<tr>
<td>Operate on the farm</td>
<td>Select the <strong>Farm menu</strong>, which is always available at the top left of Fusion Middleware Control.</td>
</tr>
<tr>
<td>Operate on a target</td>
<td>Right-click the target in the target navigation pane. The <strong>target menu</strong> is displayed. Alternatively, you can select the target and use the <strong>dynamic target menu</strong> in the context pane.</td>
</tr>
<tr>
<td>Return to the target’s home page</td>
<td>Click the <strong>target name</strong> at the top left-hand corner of the context pane.</td>
</tr>
<tr>
<td>Refresh a page with new data</td>
<td>Click the <strong>Refresh</strong> icon in the top right of the context pane.</td>
</tr>
<tr>
<td>Return to a previous page</td>
<td>Click the breadcrumbs, which appear below the context pane. The breadcrumbs appear when you drill down in a target. For example, choose Logs from the WebLogic Server menu, then View Log Messages. Select a log file and click View Log File. The breadcrumbs will show:</td>
</tr>
<tr>
<td>View the host on which the target is running</td>
<td>Select the target in the target navigation pane and view the host name in the target’s context pane. You can also view the host name by clicking the General Information icon.</td>
</tr>
<tr>
<td>Return to the login page</td>
<td>Click the <strong>Oracle Enterprise Manager logo</strong> at the top left of the page.</td>
</tr>
<tr>
<td>View the topology</td>
<td>Click <strong>Topology</strong>.</td>
</tr>
</tbody>
</table>
3.3.4 Understanding Users and Roles for Fusion Middleware Control

To access Fusion Middleware Control and perform tasks, you must have the appropriate role. Fusion Middleware Control uses the Oracle WebLogic Server security realm and the roles defined in that realm. If a user is not granted one of these roles, the user cannot access Fusion Middleware Control.

Each role defines the type of access a user has. For example, a user with the role Admin has full privileges. A user with the role Operator has privileges to perform essential day-to-day operations. A user with the role Monitor has privileges only to view the configuration.

**See Also:** "Users, Groups, and Security Roles" in the Oracle Fusion Middleware Securing Resources Using Roles and Policies for Oracle WebLogic Server

3.3.5 Viewing and Managing the Farm

When you log in to Fusion Middleware Control, the first page you see is the Farm home page. You can also view this page at any time by selecting the farm in the target navigation pane.

The following figure shows the Farm home page:
The Farm menu is displayed at the top of the page. From the Farm menu, you can take the following actions:

- Create clusters.
- View log messages.
- Specify monitoring credentials

The Farm menu is always displayed, even if you have selected other entities.

You can view the farm topology by selecting **Topology**. The Topology Viewer provides you with a high-level view of the topology, including Managed Servers, deployed applications, and the routing configuration. See Section 9.3.

### 3.3.6 Viewing and Managing Components

From the target navigation pane, you can drill down to view and manage the components in your farm.

For example, to view and manage Oracle SOA Suite, take the following steps:

1. In the target navigation pane, expand the farm, then **SOA**.
2. Select the SOA instance.

The home page for the SOA instance is displayed, as shown in the following figure:
3. From the SOA Infrastructure menu, you can perform many administrative tasks, such as starting, stopping, and monitoring Oracle SOA Suite and deploying SOA composite applications.

As another example, to view and manage Oracle HTTP Server, take the following steps:

1. In the target navigation pane, expand the farm, then Web Tier.
2. Select the Oracle HTTP Server instance, for example, ohs1.

The home page for the Oracle HTTP Server ohs1 is displayed, as shown in the following figure:
3. From the HTTP Server menu, you can perform many administrative tasks, such as starting, stopping, and monitoring Oracle HTTP Server.

   See Also: Section 9.1.5 for more information about monitoring components

3.3.7 Viewing the Status of Applications

   From the target navigation pane, you can drill down to view and manage the applications in your farm.

   To view Java EE applications:

   1. From the target navigation pane, expand the farm and then **Application Deployments**.

   2. Select the application that you want to view.

      The application's home page is displayed. In this page, you can view a summary of the application's status, entry points to the application, Web Services and modules associated with the application, and the response and load.

   To view SOA Composite Applications:

   1. From the target navigation pane, expand the farm, then **SOA**, and then **soa-infra**.

   2. Select the application that you want to view.

      The application's home page is displayed. It shows information about the application, such as the recent instances of the application, the faults and rejected messages and the policies.
3.4 Getting Started Using Oracle WebLogic Server Administration Console

Oracle WebLogic Server Administration Console is a Web browser-based, graphical user interface that you use to manage an Oracle WebLogic Server domain. It is accessible from any supported Web browser with network access to the Administration Server.

Use the Administration Console to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters
- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy Java EE applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

3.4.1 Displaying the Oracle WebLogic Server Administration Console

To display the Administration Console:

1. Enter the following URL in a browser:

   http://hostname:port_number

   The port number is the number of the Administration Server. By default, the port number is 7001.

   The login page is displayed.

2. Log in using the user name and password supplied during installation or another administrative user that you created.

   Oracle WebLogic Server Administration Console is displayed:
Alternatively, you can access the Administration Console from Fusion Middleware Control, from the home pages of targets such as the Administration Server or Managed Servers.

3.4.2 Locking the WebLogic Server Configuration

Before you make configuration changes, lock the domain configuration, so you can make changes to the configuration while preventing other accounts from making changes during your edit session. To lock the domain configuration:

1. Locate the Change Center in the upper left of the Administration Console screen.
2. Click Lock & Edit to lock the configuration edit hierarchy for the domain.

As you make configuration changes using the Administration Console, you click Save (or in some cases Finish) on the appropriate pages. This does not cause the changes to take effect immediately. The changes take effect when you click Activate Changes in the Change Center. At that point, the configuration changes are distributed to each of the servers in the domain. If the changes are acceptable to each of the servers, then they take effect. If any server cannot accept a change, then all of the changes are rolled back from all of the servers in the domain. The changes are left in a pending state; you can then either edit the pending changes to resolve the problem or revert the pending changes.

3.5 Getting Started Using Command-Line Tools

Oracle Fusion Middleware provides the following primary command-line tools to manage most Oracle Fusion Middleware components:

- WebLogic Scripting Tool (WLST). See Section 3.5.1.
Oracle Process Manager and Notification Server (OPMN). See Section 3.5.2.

3.5.1 Getting Started Using the Oracle WebLogic Scripting Tool (WLST)

The Oracle WebLogic Scripting Tool (WLST) is a command-line scripting environment that you can use to create, manage, and monitor Oracle WebLogic Server domains. It is based on the Java scripting interpreter, Jython. In addition to supporting standard Jython features such as local variables, conditional variables, and flow control statements, WLST provides a set of scripting functions (commands) that are specific to WebLogic Server. You can extend the WebLogic scripting language to suit your needs by following the Jython language syntax.

You can use any of the following techniques to invoke WLST commands:

- Interactively, on the command line
- In script mode, supplied in a file
- Embedded in Java code

For example, to invoke WLST interactively, and connect to the WebLogic Server, use the following commands:

```java
java weblogic.WLST
connect('username', 'password', 'localhost:7001')
```

To display information about WLST commands and variables, enter the help command. For example, to display a list of categories for online commands, enter the following:

```
wls:/base_domain/serverConfig> help('online')
help('activate')            Activate the changes.
help('addListener')         Add a JMX listener to the specified MBean.
help('adminHome')           Administration MBeanHome.
help('cancelEdit')          Cancel an edit session.
help('cd')                  Navigate the hierarchy of beans.
help('cmo')                 Current Management Object.
```

To monitor the status, you use the WLST state command, using the following format:

```
state(name, type)
```

For example, to get the status of the Managed Server soa_server1, use the following command:

```
wls:/SOA_domain/serverConfig> state('soa_server1', 'Server')
Current state of 'soa_server1' : RUNNING
```

See Also: Oracle Fusion Middleware WebLogic Scripting Tool Command Reference

3.5.1.1 Using Custom WLST Commands

Many components, such as Oracle SOA Suite, Oracle Platform Security Services (OPSS), Oracle Fusion Middleware Audit Framework, and MDS, and services such as SSL and logging, supply custom WLST commands.
To use those custom commands, you must invoke the WLST script from the Oracle home in which the component has been installed. Do not use the WLST script in the WebLogic Server home.

The script is located at:

(UNIX)  $ORACLE_HOME_for_component/common/bin/wlst.sh
(Windows)  $ORACLE_HOME_for_component\common\bin\wlst.cmd

For example, to run the custom WLST commands for Oracle SOA Suite on a Linux system, use the following commands:

cd  $ORACLE_HOME_for_SOA/common/bin
./wlst.sh

### 3.5.1.2 Using WLST Commands for System Components

In addition to the commands provided by WLST for Oracle WebLogic Server, WLST provides a subset of commands to manage system components. These commands are:

- `startproc(componentName [, componentType] [, componentSet])`: Starts the specified component
- `stopproc(componentName [, componentType] [, componentSet])`: Stops the specified component
- `status(componentName [, componentType] [, componentSet])`: Obtains the status of the specified component
- `proclist()`: Obtain the list of components

To use these custom commands, you must invoke the WLST script from the Oracle home in which the component has been installed. Do not use the WLST script in the WebLogic Server home. The script is located at:

(UNIX)  $ORACLE_HOME_for_component/common/bin/wlst.sh
(Windows)  $ORACLE_HOME_for_component\common\bin\wlst.cmd

### 3.5.2 Getting Started Using Oracle Process Manager and Notification Server

Oracle Process Manager and Notification Server (OPMN) manages and monitors the following Oracle Fusion Middleware components, referred to as system components:

- Oracle HTTP Server
- Oracle Web Cache
- Oracle Internet Directory
- Oracle Virtual Directory
- Oracle Forms Services
- Oracle Reports
- Oracle Business Intelligence Discoverer
- Oracle Business Intelligence

OPMN provides the `opmnctl` command. The executable file is located in the following directory, which you should add to your PATH environment variable:

(UNIX)  $ORACLE_INSTANCE/bin
(Windows)  $ORACLE_INSTANCE\bin
To view the status of all system components in an Oracle instance, use the following command:

```opmnctl status
Processes in Instance: webtier_inst
```

<table>
<thead>
<tr>
<th>ias-component</th>
<th>process-type</th>
<th>pid</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>webcache1</td>
<td>WebCache-admin</td>
<td>19556</td>
<td>Alive</td>
</tr>
<tr>
<td>webcache1</td>
<td>WebCache</td>
<td>19555</td>
<td>Alive</td>
</tr>
<tr>
<td>ohs1</td>
<td>OHS</td>
<td>7249</td>
<td>Alive</td>
</tr>
</tbody>
</table>

To view the status of a particular component or component type, use the following command:

```opmnctl status componentName [componentType] [componentSet]
```

For example, to view the status of an Oracle Virtual Directory instance named ovd1, use the following command:

```opmnctl status ias-component=ovd1
```

You can use OPMN to start and stop system components, monitor system components, and perform many other tasks related to process management. For example, you can use the following commands to start and stop OPMN and all OPMN-managed processes, such as Oracle HTTP Server and Oracle Web Cache:

```opmnctl startall
opmnctl stopall
```

To start a component, use the following command:

```opmnctl startproc componentName [componentType] [componentSet]
```

For example, to start an Oracle HTTP Server instance named ohs1, use the following command:

```opmnctl startproc ias-component=ohs1
```

- Chapter 4 for information about starting and stopping your Oracle Fusion Middleware environment
- Chapter 9 for more information about monitoring your Oracle Fusion Middleware environment
- Oracle Fusion Middleware Oracle Process Manager and Notification Server Administrator’s Guide

### 3.6 Getting Started Using the Fusion Middleware Control MBean Browsers

A managed bean (MBean) is a Java object that represents a JMX manageable resource in a distributed environment, such as an application, a service, a component or a device.

MBeans are defined in the Java EE Management Specification (JSR-77), which is part of Java Management Extensions, or JMX, a set of specifications that allow standard interfaces to be created for managing applications in a Java EE environment. For information about JSR-77, see:
You can create MBeans for deployment with an application into Oracle WebLogic Server, enabling the application or its components to be managed and monitored through Fusion Middleware Control.

See Also: "Understanding WebLogic Server MBeans" in the Oracle Fusion Middleware Developing Custom Management Utilities With JMX for Oracle WebLogic Server

Fusion Middleware Control provides a set of MBean browsers that allow you to browse the MBeans for an Oracle WebLogic Server or for a selected application. You can also perform specific monitoring and configuration tasks from the MBean browser.

The following topics describe how to view the MBeans:

- Using the System MBean Browser
- Using the MBeans for a Selected Application

### 3.6.1 Using the System MBean Browser

To view the System MBean Browser specific to a particular Oracle WebLogic Server Managed Server and to configure and use the MBeans:

1. From the target navigation pane, expand the farm, then WebLogic Domain, and then the domain.
2. Select the Managed Server.
3. From the WebLogic Server menu, choose System MBean Browser. The System MBean Browser page is displayed.
4. Expand a node in the MBean navigation tree and drill down to the MBean you want to access. Select an MBean instance.
5. To view the MBean's attributes, select the Attributes tab. Some attributes allow you to change their values. To do so, enter the value in the Value column.
6. To view the available operations, select the Operations tab. To perform an operation, click the operation. The Operations page appears. Enter any applicable values and click Invoke.

See Also: The Fusion Middleware Control online help

### 3.6.2 Using the MBeans for a Selected Application

You can view, configure, and use the MBeans for a specific application by taking the steps described in Section 3.6.1, and drilling down to the application. As an alternative, you can navigate to an application's MBeans using the following steps:

1. From the target navigation pane, expand the farm, then Application Deployments.
2. Select the application.
3. From the Application Deployments menu, choose System MBean Browser. The System MBean Browser page is displayed, along with the MBean information for the application.
4. To view the MBean’s attributes, select the Attributes tab. Some attributes allow you to change their values. To do so, enter the value in the Value column.

5. To view the available operations, select the Operations tab. To perform an operation, click the operation. The Operations page appears. Enter any applicable values and click Invoke.

3.7 Managing Components

Oracle Fusion Middleware components include Oracle WebLogic Server, Java components that are part of Oracle SOA Suite and WebCenter, such as Oracle BPEL Process Manager or Oracle Business Activity Monitoring, and system components such as Oracle Web Cache.

To manage the Oracle WebLogic Server and Java components, you can use WLST, Oracle WebLogic Server Administration Console, or Fusion Middleware Control.

To manage system components, you can use OPMN, WLST, or Fusion Middleware Control.

See:

- Oracle Fusion Middleware Installation Planning Guide and the individual installation guides for information about installing and configuring components
- Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server for installing and configuring Oracle WebLogic Server
- The administration guide for each component or suite for more information about managing these components.

3.8 Changing the Administrative User Password

During the Oracle Fusion Middleware installation, you must specify a password for the administration account. Then, you can use this account to log in to Fusion Middleware Control and the Oracle WebLogic Server Administration Console for the first time. You can create additional administrative accounts using the WLST command line or the Oracle WebLogic Server Administration Console.

See Also: The following chapters in the Oracle Fusion Middleware Security Guide:

- "Understanding Users and Roles"
- "Configuring and Managing Users and Roles"

You can change the password of the administrative user using the Oracle WebLogic Server Administration Console or the WLST command line.

3.8.1 Changing the Administrative User Password Using the Command Line

To change the administrative user password or other user passwords using the command line, you invoke the UserPasswordEditorMBean.changeUserPassword method, which is extended by the security realm’s AuthenticationProvider MBean.

For more information, see the changeUserPassword method in the Oracle Fusion Middleware Oracle WebLogic Server MBean Reference.
3.8.2 Changing the Administrative User Password Using the Administration Console

To change the password of an administrative user using the Oracle WebLogic Server Administration Console:

1. Navigate to the Oracle WebLogic Server Administration Console. (For example, from the home page of the domain in Fusion Middleware Control, select To configure and managed this WebLogic Domain, use the Oracle WebLogic Server Administration Console.)

2. From the target navigation pane, select Security Realms. The Summary of Security Realms page is displayed.

3. Select a realm, such as myrealm. The Settings for the realm page is displayed.

4. Select the Users and Groups tab, then the Users tab. Select the user. The Settings for user page is displayed.

5. Select the Passwords tab.

6. Enter the new password, then enter it again to confirm it.

7. Click Save.

3.9 Basic Tasks for Configuring and Managing Oracle Fusion Middleware

The following provides a summary of the steps you need to take to configure and manage a basic Oracle Fusion Middleware environment after you have installed the software:

2. Configure components, such as Oracle SOA Suite, Oracle HTTP Server, or Oracle Web Cache. See Oracle Fusion Middleware Installation Planning Guide.

5. Configure load balancing. You can configure load balancing between different components or applications. See the Oracle Fusion Middleware High Availability Guide.

7. Monitor your environment and manage log files. See Chapter 9 and Chapter 10.

This guide also describes other tasks that you may need to perform, depending on your Oracle Fusion Middleware environment.
This chapter describes procedures for starting and stopping Oracle Fusion Middleware.

It contains the following topics:

- Overview of Starting and Stopping Procedures
- Starting and Stopping WebLogic Servers
- Starting and Stopping Components
- Starting and Stopping Fusion Middleware Control
- Starting and Stopping Oracle Management Agent
- Starting and Stopping Applications
- Starting and Stopping Your Oracle Fusion Middleware Environment
- Starting and Stopping: Special Topics

4.1 Overview of Starting and Stopping Procedures

Oracle Fusion Middleware is a flexible product that you can start and stop in different ways, depending on your requirements. In most situations, you can use Fusion Middleware Control, Oracle WebLogic Server Administration Console, or the WLST or OPMN commands to start or stop Oracle Fusion Middleware components.

These tools are completely compatible and, in most cases, can be used interchangeably. For example, you can start a J2EE component using WLST and stop it using Fusion Middleware Control.

4.2 Starting and Stopping WebLogic Servers

You can start Oracle WebLogic Administration Servers using the WLST command line. You can start and stop Managed Servers using the WLST command line, the WebLogic Server Administration Console, or Fusion Middleware Control. The following sections describe how to start and stop WebLogic Servers using the WLST command line, Fusion Middleware Control, or both.

4.2.1 Starting and Stopping Administration Servers Using the Command Line

You can start and stop Oracle WebLogic Server Administration Servers using the WLST command line. When you do so, you also stop the processes running in the
Starting and Stopping WebLogic Servers

Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start a WebLogic Administration Server, use the following command:

```
MW_HOME/user_projects/domains/domain_name/bin/startWebLogic.sh
-Dweblogic.management.username=weblogic
-Dweblogic.management.password=password
-Dweblogic.system.StoreBootIdentity=true
```

To stop a WebLogic Administration Server, use the following command:

```
MW_HOME/user_projects/domains/domain_name/bin/stopWeblogic.sh
```

4.2.2 Starting and Stopping Managed Servers Using the Command Line

You can use WLST to start and stop a WebLogic Managed Server.

To start a WebLogic Managed Server, use the following command:

(UNIX)  ```
MW_HOME/user_projects/domains/domain_name/bin/startManagedWebLogic.sh
managed_server_name admin_url username password
```

(Windows)  ```
MW_HOME\user_projects\domains\domain_name\bin\startManagedWebLogic.cmd
username password admin_url
```

To stop a WebLogic Managed Server, use the following command:

(UNIX)  ```
MW_HOME/user_projects/domains/domain_name/bin/stopManagedWebLogic.sh
username password admin_url
```

(Windows)  ```
MW_HOME\user_projects\domains\domain_name\bin\stopManagedWebLogic.cmd
username password admin_url
```

4.2.3 Starting and Stopping Managed Servers Using Fusion Middleware Control

Fusion Middleware Control, as well as the Oracle WebLogic Server Administration Console, use Node Manager to start Managed Servers. If you are starting a Managed Server that does not contain Oracle Fusion Middleware products other than Oracle WebLogic Server, you can start the servers using the procedure in this section.

However, if the Managed Server contains other Oracle Fusion Middleware products, such as Oracle SOA Suite, Oracle WebCenter, or Oracle JRF, you must first configure Node Manager, as described in Section 4.2.4.

To start or stop a WebLogic Managed Server using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.
2. Select the Managed Server.
3. From the WebLogic Server menu, choose Control, then Start Up or Shut Down.

Alternatively, you can right-click on the server, then choose Control, then Start Up or Shut Down.

4.2.4 Configuring Node Manager to Start Managed Servers

If a Managed Server contains other Oracle Fusion Middleware products, such as Oracle SOA Suite, Oracle WebCenter, or Oracle JRF, the Managed Servers environment must be configured to set the correct classpath and parameters. This environment information is provided through the start scripts, such as startWebLogic and setDomainEnv, that are located in the domain directory.
If the Managed Servers are started by Node Manager, (as is the case when the servers are started by the Oracle WebLogic Server Administration Console or Fusion Middleware Control) Node Manager must be instructed to use these start scripts so that the server environments are correctly configured. Specifically, Node Manager must be started with the property `StartScriptEnabled=true`.

There are several ways to ensure that Node Manager starts with this property enabled. As a convenience, Oracle Fusion Middleware provides the following script, which adds the property `StartScriptEnabled=true` to the `nodemanager.properties` file:

**(UNIX)** `ORACLE_HOME/common/bin/setNMProps.sh`.
**(Windows)** `ORACLE_HOME\common\bin\setNMProps.cmd`

For example, on Linux, execute the `setNMProps` script and start Node Manager:

```
ORACLE_HOME/common/bin/setNMProps.sh
MW_HOME/wl_server_n/server/bin/startNodeManager.sh
```

When you start Node Manager, it reads the `nodemanager.properties` file with the `StartScriptEnabled=true` property, and uses the start scripts when it subsequently starts Managed Servers. Note that you need to run the `setNMProps` script only once.

### 4.3 Starting and Stopping Components

You can start and stop components using the command line, the WebLogic Server Administration Console, or Fusion Middleware Control, depending upon the component. The following sections describe how to start and stop components using the command line and Fusion Middleware Control.

#### 4.3.1 Starting and Stopping Components Using the Command Line

If a component is a Java component, you use WLST commands to start and stop the component. If a component is a system component, you use `opmnctl` commands to start and stop the components.

- To start and stop Java components, use the WLST `startApplication` and `stopApplication` commands:
  ```
  startApplication(appName, [options])
  stopApplication(appName, [options])
  ```
  For example, to start Oracle Directory Integration Platform, use the following command:
  ```
  startApplication("DIP")
  ```

- To start and stop system components, use the `opmnctl` command-line tool. It is located in the following directory:
  ```
  (UNIX) ORACLE_HOME/opmn/bin
  (Windows) ORACLE_HOME\opmn\bin
  ```
  To start or stop OPMN and all system processes, such as Oracle HTTP Server:
  ```
  opmnctl startall
  opmnctl stopall
  ```
To start, stop, or restart a component using opmnctl:

- `opmnctl startproc ias-component=component_name`
- `opmnctl stopproc ias-component=component_name`
- `opmnctl restartproc ias-component=component_name`

For example, to start Oracle HTTP Server, ohs1:

- `opmnctl startproc ias-component=ohs1`

To start, stop, or restart the subprocess of a component:

- `opmnctl stopproc process-type=process`
- `opmnctl startproc process-type=process`
- `opmnctl restartproc process-type=process`

### 4.3.2 Starting and Stopping Components Using Fusion Middleware Control

To start, stop, and restart components:

1. From the navigation pane, expand the farm, then navigate to the component.
2. Select the component, such as **SoaInfra**.
3. From the dynamic target menu, choose **Control**, then **Start Up** or **Shut Down**.

**Note:** If OPMN is not started, you cannot start system components such as Oracle HTTP Server or Oracle Internet Directory using Fusion Middleware Control. To start OPMN, use the following command:

- `opmnctl start`

### 4.4 Starting and Stopping Fusion Middleware Control

If Fusion Middleware Control is configured for a domain, it is automatically started when you start an Oracle WebLogic Server Administration Server, as described in Section 4.2.1.

If Fusion Middleware Control is configured for a domain, it is automatically stopped when you stop an Oracle WebLogic Server Administration Server, as described in Section 4.2.1.

### 4.5 Starting and Stopping Oracle Management Agent

Oracle Management Agent is designed specifically for monitoring particular Oracle Fusion Middleware components.

To start Oracle Management Agent, use the following command:

- `opmnctl startproc ias-component=EMAGENT`

To stop Oracle Management Agent, use the following command:

- `opmnctl stopproc ias-component=EMAGENT`

### 4.6 Starting and Stopping Applications

You can start and stop applications using WLST command line, the WebLogic Server Administration Console, or Fusion Middleware Control. The following sections
Starting and Stopping Your Oracle Fusion Middleware Environment

describe how to start and stop applications using the command line and Fusion Middleware Control.

4.6.1 Starting and Stopping Java EE Applications Using the Command Line

To start or stop applications with the WLST command line, use the following commands:

```
startApplication(appName, [options])
stopApplication(appName, [options])
```

The application must be fully configured and available in the domain. The startApplication command returns a WLSTProgress object that you can access to check the status of the command. In the event of an error, the command returns a WLSTException. For more information about the WLSTProgress object, see "WLSTProgress Object" in the Oracle Fusion Middleware Oracle WebLogic Scripting Tool.

4.6.2 Starting and Stopping Applications Using Fusion Middleware Control

To start or stop a Java EE application using Fusion Middleware Control:

1. From the navigation pane, expand Application Deployments.
2. Select the application.
3. From the Application Deployment menu, choose Control, then Start Up or Shut Down.

To start or stop a SOA Composite application using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then SOA, and then soa-infra.
2. Select the application.
3. On the SOA Composite page, click Start Up or Shut Down.

4.7 Starting and Stopping Your Oracle Fusion Middleware Environment

This section provides procedures for starting and stopping an Oracle Fusion Middleware environment. An environment can consist of Oracle WebLogic Server domain, an Administration Server, multiple Managed Servers, Java components, system components, including Identity Management components, and a metadata repository. The components may be dependent on each other and it is important to start and stop them in the proper order.

You can follow these procedures when you need to completely shut down your Oracle Fusion Middleware environment. For example, when preparing to perform a complete backup of your environment, or apply a patch.

4.7.1 Starting an Oracle Fusion Middleware Environment

To start an Oracle Fusion Middleware environment:

1. Start any database-based metadata repository:
   a. Set the ORACLE_HOME environment variable to the Oracle home for the database.
   b. Set the ORACLE_SID environment variable to the SID for the database (default is orcl).
   c. Start the Net Listener:
Starting and Stopping Your Oracle Fusion Middleware Environment

4-6
Oracle Fusion Middleware Administrator’s Guide

ORACLE_HOME/bin/lsnrctl start

d. Start the database instance:
   ORACLE_HOME/bin/sqlplus /nolog
   SQL> connect SYS as SYSDBA
   SQL> startup
   SQL> quit

2. Start Oracle Identity Management system components:
   a. Set the ORACLE_HOME environment variable to the Oracle home for the Identity Management components.
   b. Start OPMN and all system components:
      opmnctl startall

3. Start the Oracle WebLogic Server Administration Server as described in Section 4.2.1.

4. Start the Oracle WebLogic Server Managed Servers as described in Section 4.2.2. Any applications deployed to the server are also started.

5. Start OPMN and all system components.
   a. Set the ORACLE_HOME and ORACLE_INSTANCE environment variables to the Oracle home and Oracle instance for the system components.
   b. Start OPMN and all system components in that Oracle instance:
      opmnctl startall

6. If your environment includes components that are targets monitored by Oracle Management Agent, start Oracle Management Agent, as described in Section 4.5.

4.7.2 Stopping an Oracle Fusion Middleware Environment

To stop an Oracle Fusion Middleware environment:

1. Stop system components, such as Oracle HTTP Server. You can stop them in any order.
   a. Set the ORACLE_HOME and ORACLE_INSTANCE environment variables to the Oracle home and Oracle instance for the system components.
   b. Stop OPMN and all system components in that Oracle instance:
      opmnctl stopall

2. If your environment includes components that are targets monitored by Oracle Management Agent, stop Oracle Management Agent, as described in Section 4.5.

3. Stop the Oracle WebLogic Server Managed Servers as described in Section 4.2. Any applications deployed to the server are also stopped.

4. Stop Oracle Identity Management components:
   a. Set the ORACLE_HOME environment variable to the Oracle home for the Identity Management components.
   b. Stop OPMN and all system components:
      opmnctl stopall
5. Stop the Administration Server as described in Section 4.2.1.

6. Stop any database-based metadata repository:
   a. Set the ORACLE_HOME environment variable to the Oracle home for the database.
   b. Set the ORACLE_SID environment variable to the SID for the database (default is orcl).
   c. Stop the database instance:
      ```
      ORACLE_HOME/bin/sqlplus /nolog
      SQL> connect SYS as SYSDBA
      SQL> shutdown
      SQL> quit
      ```
   d. Stop the Net Listener:
      ```
      ORACLE_HOME/bin/lsnrctl stop
      ```

4.8 Starting and Stopping: Special Topics

This section contains the following special topics about starting and stopping Oracle Fusion Middleware:

- Starting and Stopping in High Availability Environments
- Forcing a Shut Down of Oracle Metadata Repository

4.8.1 Starting and Stopping in High Availability Environments

There are special considerations and procedures for starting and stopping High Availability environments, such as:

- Oracle Fusion Middleware Cold Failover Cluster
- Oracle Application Server Disaster Recovery

See: Oracle Fusion Middleware High Availability Guide for information about starting and stopping in high-availability environments

4.8.2 Forcing a Shut Down of Oracle Metadata Repository

If you find that the Oracle Metadata Repository instance is taking a long time to shut down, you can use the following commands to force an immediate shutdown:

```
ORACLE_HOME/bin/sqlplus /nolog
SQL> connect SYS as SYSDBA
SQL> SHUTDOWN IMMEDIATE;
```

Immediate database shutdown proceeds with the following conditions:

- No new connections are allowed, nor are new transactions allowed to be started, after the statement is issued.
- Any uncommitted transactions are rolled back. (If long uncommitted transactions exist, this method of shutdown might not complete quickly, despite its name.)
- Oracle does not wait for users currently connected to the database to disconnect. Oracle implicitly rolls back active transactions and disconnects all connected users.

The next startup of the database will not require any instance recovery procedures.
See Also: *Oracle Database Administrator’s Guide* in the Oracle Database 11g documentation library
Managing Ports

This chapter describes how to view and change Oracle Fusion Middleware port numbers.

It contains the following topics:

- About Managing Ports
- Viewing Port Numbers
- Changing the Port Numbers Used by Oracle Fusion Middleware

5.1 About Managing Ports

Many Oracle Fusion Middleware components and services use ports. Most port numbers are assigned during installation. As an administrator, it is important to know the port numbers used by these services, and to ensure that the same port number is not used by two services on your host.

For some ports, you can specify a port number assignment during installation.

See Also: Appendix C for a complete list of allotted port ranges. Refer to the installation guide for directions on overriding port assignments during installation.

5.2 Viewing Port Numbers

You can view the port numbers currently in use with the command line or Fusion Middleware Control, as described in the following topics:

- Viewing Port Numbers Using the Command Line
- Viewing Port Numbers Using Fusion Middleware Control

5.2.1 Viewing Port Numbers Using the Command Line

To view the current port numbers for system components, use the following command:

(UNIX) ORACLE_INSTANCE/bin/opmnctl status -l
(Windows) ORACLE_INSTANCE\bin\opmnctl status -l

To view the port numbers for Oracle WebLogic Server, you can use the WLST command, with an attribute. For example, to get the Administration Port, use the following command:

wls:/SOA_domain/serverConfig> get('AdministrationPort')
5.2.2 Viewing Ports Numbers Using Fusion Middleware Control

You can view the port numbers of the domain, the Administration Server, Managed Servers, or components, such as the SOA Infrastructure and Oracle Web Cache, using Fusion Middleware Control.

For example, to view the ports of a domain:

1. From the navigation pane, expand the farm and then **WebLogic Domain**.
2. Select the domain.
3. From the WebLogic Domain menu, choose **Port Usage**.

The Port Usage page is displayed, as shown in the following figure:

<table>
<thead>
<tr>
<th>Port in Use</th>
<th>IP Address</th>
<th>Component</th>
<th>Channel</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>5000</td>
<td>192.168.1.150</td>
<td>WAS_Services</td>
<td>Default</td>
<td>tcp</td>
</tr>
<tr>
<td>7001</td>
<td>192.168.1.150</td>
<td>WebLogic Domain</td>
<td>Default</td>
<td>tcp</td>
</tr>
<tr>
<td>8000</td>
<td>192.168.1.150</td>
<td>Administration Server</td>
<td>Default</td>
<td>tcp</td>
</tr>
</tbody>
</table>

Optionally, you can filter the ports shown by selecting a Managed Server from **Show**.

The Port Usage detail table shows the ports that are in use, the IP Address, the component, the channel, and the protocol.

You can also view similar pages for the Administration Server, Managed Servers, and components, such as the SOA Infrastructure and Oracle Web Cache, by navigating to the target and choosing **Port Usage** from the target’s menu.

5.3 Changing the Port Numbers Used by Oracle Fusion Middleware

You can change the port numbers for some Oracle Fusion Middleware components, using Fusion Middleware Control, Oracle WebLogic Server Administration Console, or the command line.
This section provides the following topics:

- Changing the Oracle WebLogic Server Listen Ports
- Changing the Oracle HTTP Server Listen Ports
- Changing Oracle Web Cache Ports
- Changing OPMN Ports (ONS Local, Request, and Remote)
- Changing Oracle Portal Ports
- Changing the Metadata Repository Net Listener Port

For information about changing Oracle Internet Directory ports, see “Configuring Server Properties” or “Setting System Configuration Attributes by Using ldapmodify” in the Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory.

### 5.3.1 Changing the Oracle WebLogic Server Listen Ports

You can change the HTTP listen port and the HTTPS (SSL) listen port for a WebLogic Administration Server or a Managed Server using the Oracle WebLogic Server Administration Console:

1. Navigate to the server.
   The server setting page is displayed.

2. On the General tab, change the number of the Listen Port or SSL Listen Port.

3. If the server is running, restart the server.

   **See Also:** Oracle Fusion Middleware Configuring Server Environments for Oracle WebLogic Server for more information about changing Oracle WebLogic Server ports

### 5.3.2 Changing the Oracle HTTP Server Listen Ports

To change the Oracle HTTP Server Listen ports (non-SSL or SSL), there are often dependencies that must also be set. For example, if you are using Oracle Web Cache to improve the performance of your Oracle Fusion Middleware environment, you must modify the Oracle Web Cache origin server settings whenever you modify the Oracle HTTP Server Listen ports.

The following topics describe how to modify the Oracle HTTP Server HTTP or HTTPS Listen port:

- Enabling Oracle HTTP Server to Run as Root for Ports Set to Less Than 1024 (UNIX Only)
- Changing the Oracle HTTP Server Non-SSL Listen Ports
- Changing the Oracle HTTP Server SSL Listen Port
5.3.2.1 Enabling Oracle HTTP Server to Run as Root for Ports Set to Less Than 1024 (UNIX Only)

On a UNIX system, if you are changing the Listen port to a number less than 1024, perform these steps before you change the Oracle HTTP Server Listen port.

By default, Oracle HTTP Server runs as a non-root user (the user that installed Oracle Fusion Middleware). On UNIX systems, if you change the Oracle HTTP Server Listen port number to a value less than 1024, you must enable Oracle HTTP Server to run as root, as follows:

1. Log in as root.
2. Run the following commands in the Oracle home:
   
   ```
   cd ORACLE_HOME/ohs/bin
   chown root .apachectl
   chmod 6750 .apachectl
   ```

5.3.2.2 Changing the Oracle HTTP Server Non-SSL Listen Ports

To change the Oracle HTTP Server non-SSL (HTTP) Listen port, follow the procedures in the following tasks. Note that, on a UNIX system, if you are changing the Listen port to a number less than 1024, you must first perform the steps in Section 5.3.2.1.

- Task 1, "Modify the Oracle HTTP Server Listen Port"
- Task 2, "Update Oracle Web Cache"
- Task 3, "Restart the System Components"

Task 1  Modify the Oracle HTTP Server Listen Port

To change the Oracle HTTP Server Listen port:

1. From the navigation pane, expand the farm, then Web Tier, then select the Oracle HTTP Server instance.
2. From the Oracle HTTP Server menu, choose Administration, then Ports Configuration.
3. Select the Listen port that uses the HTTP protocol, then click Edit.
4. Change the port number, then click OK.
5. Restart Oracle HTTP Server. (From the Oracle HTTP Server menu, choose Control, then Restart.)

Task 2  Update Oracle Web Cache

If you are using Oracle Web Cache as a reverse proxy, you must update Oracle Web Cache:

1. From the Fusion Middleware Control navigation pane, expand the farm, then Web Tier. Select the Oracle Web Cache instance.
2. From the Web Cache menu, choose Administration, then Origin Servers.
3. Select the origin server for which you have changed the port, and click Edit.
   
   The Edit Origin Server page is displayed.
4. In the Port field, change the port number.
5. Click OK.
6. Restart Oracle Web Cache. (From the Web Cache menu, choose Control, then Restart.)

Task 3 Restart the System Components
Restart OPMN and all system components in that Oracle instance:

```bash
opmnctl stopall
opmnctl startall
```

5.3.2.3 Changing the Oracle HTTP Server SSL Listen Port
To change the Oracle HTTP Server SSL (HTTPS) Listen port, follow the procedures in the following tasks. Note that, on a UNIX system, if you are changing the Listen port to a number less than 1024, you must perform the steps in Section 5.3.2.1.

- Task 1, "Modify the Oracle HTTP Server SSL Listen Port"
- Task 2, "Update Oracle Web Cache"
- Task 3, "Re-register mod_osso"
- Task 4, "Restart System Components"

Task 1 Modify the Oracle HTTP Server SSL Listen Port
To change the Oracle HTTP Server SSL Listen port:

1. From the navigation pane, expand the farm, then Web Tier, then select the Oracle HTTP Server instance.
2. From the Oracle HTTP Server menu, choose Administration, then Ports Configuration.
3. Select the Listen port that uses the HTTPS protocol, then click Edit.
4. Change the port number, then click OK.
5. Restart Oracle HTTP Server. (From the Oracle HTTP Server menu, choose Control, then Restart.)

Task 2 Update Oracle Web Cache
If you are using Oracle Web Cache as a reverse proxy, you must update Oracle Web Cache:

1. From the Fusion Middleware Control navigation pane, expand the farm, then Web Tier. Select the Oracle Web Cache instance.
2. From the Web Cache menu, choose Administration, then Origin Servers.
3. Select the origin server for which you have changed the port, and click Edit. The Edit Origin Server page is displayed.
4. In the Port field, change the port number.
5. Click OK.
6. Restart Oracle Web Cache. (From the Web Cache menu, choose Control, then Restart.)

Task 3 Re-register mod_osso
If you have enabled Oracle Single Sign-On authentication (that is, you registered mod_osso), follow these steps to re-register mod_osso:
1. On the Identity Management host, set the environment variables ORACLE_HOME and ORACLE_SID.

2. On the Identity Management host, run the ssoreg script, using the -remote_midtier option. The script is located at:

   (UNIX) ORACLE_HOME/sso/bin/ssoreg.sh
   (Windows) ORACLE_HOME\sso\bin\ssoreg.bat

   For example, on LINUX:
   
   $ORACLE_HOME/sso/bin/ssoreg.sh -oracle_home_path $ORACLE_HOME
   -config_mod_osso TRUE
   -site_name example.com:7778
   -remote_midtier
   -config_file $ORACLE_HOME/Apache/Apache/conf/osso/myosso.conf
   -mod_osso_url http://example.com:7778

   The resulting configuration file (myosso.conf in the example) is an obfuscated osso configuration file.

3. Copy the obfuscated osso configuration file to the 11g Release 1 (11.1.1) middle-tier instance.

4. On the middle-tier host, run the following script to complete the registration:

   (UNIX) ORACLE_HOME/Apache/Apache/bin/osso1013 config_file
   (Windows) perl ORACLE_HOME\Apache\Apache\bin\osso1013 config_file

**Task 4 Restart System Components**

Restart OPMN and the system components in that Oracle instance:

opmnctl stopall
opmnctl startall

### 5.3.3 Changing Oracle Web Cache Ports

You can change the HTTP and HTTPS listen ports, the administration port, the statistics port and the invalidation port for Oracle Web Cache using Fusion Middleware Control.

To change the port number:

1. From the navigation pane, expand the farm, then Web Tier, then select the Oracle Web Cache instance.

2. From the Web Cache menu, choose Administration, then Ports Configuration.

3. Select a port, then click Edit.

4. Change the port number, then click OK.

5. Restart Oracle Web Cache. (From the Web Cache menu, choose Control, then Restart.)

### 5.3.4 Changing OPMN Ports (ONS Local, Request, and Remote)

This section describes how to change any of the following port numbers:

- ONS Local port
- ONS Request port
- ONS Remote port
To change these ports:

1. Stop OPMN, and all OPMN-managed processes:

   (UNIX) `ORACLE_INSTANCE/bin/opmnctl stopall`
   (Windows) `ORACLE_INSTANCE\bin\opmnctl stopall`

2. Open the `opmn.xml` file:

   (UNIX) `ORACLE_INSTANCE/config/OPMN/opmn`
   (Windows) `ORACLE_INSTANCE\config\OPMN\opmn`

3. Under the `<notification-server>` element, modify the `local`, `remote`, or `request` parameter, depending on the port you are changing, in the `<port>` element, and then save the file.

   For example:

   `<port local="6101" remote="6201" request="6004"/>`

4. Start OPMN, and all OPMN-managed processes:

   (UNIX) `ORACLE_INSTANCE/bin/opmnctl startall`
   (Windows) `ORACLE_INSTANCE\bin\opmnctl startall`

**5.3.5 Changing Oracle Portal Ports**

Oracle Portal maintains information about some of the ports used by its underlying components. This section describes how to manage Oracle Portal ports. It includes the following topics:

- Changing the Oracle Portal Midtier Port
- Changing Oracle Portal Invalidation Port
- Changing Oracle Portal Oracle Internet Directory Port
- Changing PPE Loopback Port
- Changing Oracle Portal SQL*Net Listener Port
- Restarting WLS_PORTAL Managed Server

---

**Note:** When you change these ports as described in this section, only the Oracle Portal configuration is updated. To update or change the port numbers of an underlying component, such as Oracle Web Cache or Oracle Internet Directory, see the component-specific documentation for information about managing ports.

The configuration procedures described in this section require you to restart the WLS_PORTAL managed server.

---

**5.3.5.1 Changing the Oracle Portal Midtier Port**

In a default installation, you can access Oracle Portal through the Oracle Web Cache port, such as 8090. This port is referred to as the Oracle Portal Midtier Port. You must update this port if Oracle Web Cache is configured to listen on a different port or Oracle Web Cache is front-ended by a Proxy or Load Balancing Router (LBR).

To change the Oracle Portal Midtier port in Fusion Middleware Control:

1. From the navigation pane, expand the farm, choose **Portal**, and select the Portal instance.
2. From the Portal menu, choose **Settings**, and then **Wire Configuration**.

3. Select the Database Access Descriptor, such as `portal`.

4. Expand the Portal Midtier section.

5. Change the port number, and click **Apply**.

6. Restart the WLS_PORTAL managed server. For more information, see Section 5.3.5.6.

### 5.3.5.2 Changing Oracle Portal Invalidation Port

Oracle Portal caches content in Oracle Web Cache. When content changes, Oracle Portal invalidates such cached content and maintains the Oracle Web Cache invalidation port. If you reconfigure the Web Cache invalidation port, you must update the port information maintained by Oracle Portal.

To change the Oracle Portal Invalidation port in Fusion Middleware Control:

1. From the navigation pane, expand the farm, choose **Portal**, and select the Portal instance.

2. From the Portal menu, choose **Settings**, and then **Wire Configuration**.

3. Select the Database Access Descriptor, such as `portal`.

4. Expand the Web Cache section.

5. Change the Invalidation Port number. If the Invalidation user name and the password are blank, enter the user name and the password.

6. Click **Apply**.

7. Restart the WLS_PORTAL managed server. For more information, see Section 5.3.5.6.

### 5.3.5.3 Changing Oracle Portal Oracle Internet Directory Port

Oracle Portal maintains information about Oracle Internet Directory ports.

To change the Oracle Portal Oracle Internet Directory (OID) port in Fusion Middleware Control:

1. From the navigation pane, expand the farm, choose **Portal**, and select the Portal instance.

2. From the Portal menu, choose **Settings**, and then **Wire Configuration**.

3. Select the Database Access Descriptor, such as `portal`.

4. Expand the OID section.

5. Change the port number.

6. Enter the Oracle Internet Directory user name and the password.

7. Click **Apply**.

---

**Note:** The Port number, Invalidation user name, and Invalidation password entered here must match the corresponding values of the Oracle Web Cache instance used by Oracle Portal. For more information about resetting these values, see the *Oracle Fusion Middleware Administrator's Guide for Oracle Web Cache*.
8. Restart the WLS_PORTAL managed server. For more information, see Section 5.3.5.6.

5.3.5.4 Changing PPE Loopback Port
While servicing Portal pages, Oracle Portal makes loopback calls using the default site port. In some configurations, such as external SSL, you must configure the loopback call to a port other than the default site port.

To change the PPE Loopback port in Fusion Middleware Control:
1. From the navigation pane, expand the farm, choose Portal, and select the Portal instance.
2. From the Portal menu, choose Settings, and then Page Engine.
3. Expand the Advanced Properties section.
4. Change the port number in the Use Port.
5. Specify the protocol in the Use Protocol field.
6. Click Apply.
7. Restart the WLS_PORTAL managed server. For more information, see Section 5.3.5.6.

5.3.5.5 Changing Oracle Portal SQL*Net Listener Port
Oracle Portal maintains information about the repository connection in the host:port:service name format inside a Database Access Descriptor (in a file named portal_dads.conf). If the SQL*Net listener is reconfigured to listen on a different port, you must reconfigure this port value in Oracle Portal.

To change the Oracle Portal SQL*Net Listener port in Fusion Middleware Control:
1. From the navigation pane, expand the farm, choose Portal, and select the Portal instance.
2. From the Portal menu, choose Settings, and then Database Access Descriptor.
3. Select the Database Access Descriptor, such as /pls/portal.
4. Click Edit.
5. Expand the Portal Database Access Details section.
6. Update the Database Connect String field to reflect the new port.
7. Click OK.
8. Restart the WLS_PORTAL managed server. For more information, see Section 5.3.5.6.

5.3.5.6 Restarting WLS_PORTAL Managed Server
To restart WLS_PORTAL managed server in Fusion Middleware Control:
1. Expand the Farm domain, such as Farm_ClassicDomain.
2. Expand WebLogic Domain.
3. Expand the domain, such as Classic Domain.
4. Expand cluster_portal, when applicable.
5. Choose WLS_PORTAL.
6. From the WLS_PORTAL WebLogic Server menu, choose Control, then Shut Down. Ensure that the status of WLS_PORTAL shows Down.

7. From the WLS_PORTAL WebLogic Server menu, choose Control, then Start Up. Ensure that the status of WLS_PORTAL shows Up.

5.3.6 Changing the Metadata Repository Net Listener Port

If your environment includes a metadata repository, and you want to change the listener port number, perform the procedure in this section.

First, determine if it is necessary to change the metadata repository listener port number. If you are concerned about the fact that you have another database on your host using the same port, it is possible that the metadata repository and the other database can use the same port.

Note that multiple Oracle Database 10g and Oracle Database 11g databases can share the same Oracle Net listener port. If you install a metadata repository on a host that contains Oracle Database 10g and Oracle Database 11g databases, they can all use port 1521. There is no need to change the metadata repository port number.

---

**Note:** If you want to run two listeners that use the same key value on one host, refer to Section 5.3.6.1, "Changing the KEY Value for an IPC Listener".

---

A metadata repository may be used in several different ways. Use the following table to determine the steps that are required for changing your type of metadata repository:

<table>
<thead>
<tr>
<th>If the Metadata Repository is used as follows:</th>
<th>Follow these tasks to change its Oracle Net listener port:</th>
</tr>
</thead>
</table>
| Identity Management repository and product metadata repository | Task 1, "Stop Components"
Task 2, "Change the Metadata Repository for Oracle Net Listener Port"
Task 3, "Change the System Data Source"
Task 4, "Update Oracle Internet Directory"
Task 5, "Update Oracle Single Sign-On"
Task 6, "Update Other Components" |
| Identity Management repository only | Task 1, "Stop Components"
Task 2, "Change the Metadata Repository for Oracle Net Listener Port"
Task 4, "Update Oracle Internet Directory"
Task 5, "Update Oracle Single Sign-On" |
| Product metadata repository | Task 1, "Stop Components"
Task 2, "Change the Metadata Repository for Oracle Net Listener Port"
Task 3, "Change the System Data Source"
Task 4, "Update Oracle Internet Directory"
Task 6, "Update Other Components" |

The procedure consists of the following tasks:

- Task 1, "Stop Components"
- Task 2, "Change the Metadata Repository for Oracle Net Listener Port"
Task 1  Stop Components
Stop all components that use the Metadata Repository. See Chapter 4 for instructions.

Task 2  Change the Metadata Repository for Oracle Net Listener Port
On the metadata repository host:

1. Ensure that the ORACLE_HOME and ORACLE_SID environment variables are set.
2. Stop the metadata repository listener:
   
   lsnrctl stop

3. Edit the listener.ora file, which is located at:
   
   (UNIX) ORACLE_HOME/network/admin/listener.ora
   (Windows) ORACLE_HOME\network\admin\listener.ora

   Under the LISTENER entry, update the value for PORT. Save the file.

4. Edit the tnsnames.ora file. The default location is:
   
   (UNIX) ORACLE_HOME/network/admin/tnsnames.ora
   (Windows) ORACLE_HOME\network\admin\tnsnames.ora

   Make the following changes to the file:
   
   a. Update the PORT value in each entry that applies to MDS Repository.
   b. Add an entry like the following:

   
   newnetport =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = tcp) (HOST = hostname) (PORT = port))
   )

   In the example, hostname is the fully qualified host name and port is the new port number.

5. Start the metadata repository listener:
   
   lsnrctl start

6. Using SQL*Plus, log in to the metadata repository as the SYSTEM user with SYSDBA privileges and run the following command:
   
   SQL> ALTER SYSTEM SET local_listener='newnetport' scope=spfile;

7. Using SQL*Plus, restart the metadata repository:
   
   SQL> SHUTDOWN
   SQL> STARTUP

8. Start Oracle Internet Directory:
   
   opmnctl start
   opmnctl startproc ias-component=OID
**Task 3** Change the System Data Source  
Change the system data source to use the new port number for the metadata repository. To do so, you use Oracle WebLogic Server Administration Console:

1. In the Change Center, click **Lock & Edit**.
2. In the Domain Structure section, expand **Services**, then **JDBC**, and select **Data Sources**.  
The Summary of JDBC Data Sources page is displayed.
3. Select the data source you want to change.  
The Settings page is displayed.
4. Select the Connection Pool tab.
5. To change the database port, modify the **URL** field. For example:
   
   `jdbc:oracle:thin:@hostname.domainname.com:1522/orcl`

6. Click **Save**.
7. Restart the servers that use this data source. (Click the Target tab to see the servers that use this data source.)

**Task 4** Update Oracle Internet Directory  
On the Identity Management host, update Oracle Internet Directory with the new Oracle Net listener port number:

1. Update the port number in tnsnames.ora file, which is located in the following directory:
   
   (UNIX) `ORACLE_INSTANCE/config`
   
   (Windows) `ORACLE_INSTANCE\config`

2. Update the registration of the component with the Administration Server, using the `opmnctl updatecomponentregistration` command with the new port number, as shown in the following example:
   
   ```
   opmnctl updatecomponentregistration -Db_info DBHostName:TNSPORT:DBSERVICE_NAME -componentName oid1 -componentType OID
   ```

3. Start OPMN and all processes in the Oracle instance in the Oracle Internet Directory Oracle home:
   
   `opmnctl startall`

**Task 5** Update Oracle Single Sign-On  
If you are using Oracle Single Sign-On, from the Oracle Single Sign-On Oracle home:

1. On UNIX systems, set the `LD_LIBRARY_PATH`, `LD_LIBRARY_PATH_64`, `LIB_PATH`, or `SHLIB_PATH` environment variables to the proper values, as shown in Table 3–1. The actual environment variables and values that you must set depend on the type of your UNIX operating system.

2. Update Oracle Single Sign-On with the new repository port number by executing the following command:

   - On UNIX systems:
     
     ```
     $ORACLE_HOME/jdk/bin/java -jar $ORACLE_HOME/sso/lib/ossoca.jar reassoc -repos $ORACLE_HOME
     ```
- On Windows systems:
  ```java
  %ORACLE_HOME%/jdk/bin/java -jar %ORACLE_HOME%/sso/lib/ossoca.jar reassoc
  -repos %ORACLE_HOME%
  ```

**Task 6  Update Other Components**

In each Oracle instance that uses the metadata repository:

1. Update the following file with the new Oracle Net listener port number:
   - UNIX: `ORACLE_INSTANCE`/config/tnsnames.ora
   - Windows: `ORACLE_INSTANCE`\config\tnsnames.ora

2. Check the following file:
   - UNIX: `ORACLE_HOME`/ohs/conf/dads.conf
   - Windows: `ORACLE_HOME`\ohs\modplsql\conf\dads.conf

   Locate the line that begins with `PlsqlDatabaseConnectString`.
   - If the line ends with `ServiceNameFormat` or `SIDFormat`, update the line with the new MDS Repository port number, save the file, and restart Oracle HTTP Server.
   - If the line ends with `NetServiceNameFormat`, you do not need to do anything.

3. Start the components that use the metadata repository, as described in Section 4.3.

**5.3.6.1 Changing the KEY Value for an IPC Listener**

It is not possible to run two listeners at the same time that are configured to use the same KEY value in their IPC protocol address. By default, the metadata repository listener has its IPC KEY value set to EXTPROC. Hence, if your computer has another IPC listener that uses the EXTPROC key, you should configure the metadata repository listener to use some other key value such as EXTPROC1.

To change the KEY value of an IPC listener:

1. Stop the listener (make sure your ORACLE_HOME environment variable is set first):
   ```
   lsnrctl stop
   ```

2. Edit the `listener.ora` and `tnsnames.ora` files. In each file, find the following line:
   ```
   (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC))
   ```

   Change it to the following:
   ```
   (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC1))
   ```

3. Restart the listener:
   ```
   lsnrctl start
   ```
You can configure Oracle Fusion Middleware to secure communications between Oracle Fusion Middleware components using SSL, which is an industry standard for securing communications. Oracle Fusion Middleware supports SSL version 3, as well as TLS version 1.

**Note:** SSL version 2 has been de-supported in 11g Release 1 (11.1.1) due to security concerns; components or applications that used SSL version 2 in pre-11g Release 1 (11.1.1) will automatically be upgraded to use other SSL versions, that is, SSL version 3 and TLS version 1.

This chapter provides an overview of SSL and how you can use it with Oracle Fusion Middleware components and applications. It contains these topics:

- How SSL Works
- About SSL in Oracle Fusion Middleware
- Configuring SSL for Configuration Tools
- Configuring SSL for the Web Tier
- Configuring SSL for the Middle Tier
- Configuring SSL for the Data Tier
- Advanced SSL Scenarios
- Best Practices for SSL
- WLST Reference for SSL

**Note:** Where SSL connections are configured within Oracle WebLogic Server, this chapter provides references to the relevant Oracle WebLogic Server documentation rather than duplicating the instructions here.

### 6.1 How SSL Works

This section introduces basic SSL concepts. It contains these topics:

- What SSL Provides
- About Private and Public Key Cryptography
How SSL Works

6.1.1 What SSL Provides

SSL secures communication by providing message encryption, integrity, and authentication. The SSL standard allows the involved components (such as browsers and HTTP servers) to negotiate which encryption, authentication, and integrity mechanisms to use.

- **Encryption** provides confidentiality by allowing only the intended recipient to read the message. SSL can use different encryption algorithms to encrypt messages. During the SSL handshake that occurs at the start of each SSL session, the client and the server negotiate which algorithm to use. Examples of encryption algorithms supported by SSL include AES, RC4, and 3DES.

- **Integrity** ensures that a message sent by a client is received intact by the server, untampered. To ensure message integrity, the client hashes the message into a digest using a hash function and sends this message digest to the server. The server also hashes the message into a digest and compares the digests. Because SSL uses hash functions that make it computationally infeasible to produce the same digest from two different messages, the server can tell that if the digests do not match, then someone had tampered with the message. An example of a hash function supported by SSL is SHA1.

- **Authentication** enables the server and client to check that the other party is who it claims to be. When a client initiates an SSL session, the server typically sends its certificate to the client. Certificates are digital identities that are issued by trusted certificate authorities, such as Verisign. Chapter 7, "Managing Keystores, Wallets, and Certificates" describes certificates in more detail.

  The client verifies that the server is authentic and not an imposter by validating the certificate chain in the server certificate. The server certificate is guaranteed by the certificate authority (CA) who signed the server certificate.

  The server can also require the client to have a certificate, if the server needs to authenticate the identity of the client.

6.1.2 About Private and Public Key Cryptography

To provide message integrity, authentication, and encryption, SSL uses both private and public key cryptography.

**Secret Key Cryptography**

Private, or symmetric, key cryptography requires a single, secret key shared by two or more parties to secure communication. This key is used to encrypt and decrypt secure messages sent between the parties. This requires prior and secure distribution of the key to each party. The problem with this method is that it is difficult to securely transmit and store the key.

In SSL, each party calculates the secret key individually using random values known to each side. The parties then send messages encrypted using the secret key.

**Public Key Cryptography**

Public key cryptography solves this problem by employing public and private key pairs and a secure method for key distribution. The freely available public key is used to encrypt messages that can only be decrypted by the holder of the associated private
key. The private key is securely stored, together with other security credentials, in an encrypted container such as an Oracle wallet.

Public key algorithms can guarantee the secrecy of a message, but they do not necessarily guarantee secure communication because they do not verify the identities of the communicating parties. To establish secure communication, it is important to verify that the public key used to encrypt a message does in fact belong to the target recipient. Otherwise, a third party can potentially eavesdrop on the communication and intercept public key requests, substituting its own public key for a legitimate key (the man-in-the-middle attack).

To avoid such an attack, it is necessary to verify the owner of the public key, a process called authentication. Authentication can be accomplished through a certificate authority (CA), which is a third party trusted by both of the communicating parties.

The CA issues public key certificates that contain an entity’s name, public key, and certain other security credentials. Such credentials typically include the CA name, the CA signature, and the certificate effective dates (From Date, To Date).

The CA uses its private key to encrypt a message, while the public key is used to decrypt it, thus verifying that the message was encrypted by the CA. The CA public key is well known, and does not have to be authenticated each time it is accessed. Such CA public keys are stored in wallets.

### 6.1.3 Keystores and Wallets

In Oracle Fusion Middleware, Oracle Virtual Directory uses a JKS keystore to store keys and certificates. Configuring SSL for Oracle Virtual Directory thus requires setting up and using JKS keystores.

Other components use the Oracle wallet as their storage mechanism. An Oracle wallet is a container that stores your credentials, such as certificates, trusted certificates, certificate requests, and private keys. You can store Oracle wallets on the file system or in LDAP directories such as Oracle Internet Directory. Oracle wallets can be auto-login or password-protected wallets.

Components that use Oracle wallet include:

- Oracle HTTP Server
- Oracle Web Cache
- Oracle Internet Directory

Configuring SSL for these components thus requires setting up and using Oracle wallets.

For more information about configuring keystores and wallets, see:

- Section 6.2, "About SSL in Oracle Fusion Middleware" for a fuller description of keystore and wallet usage in Oracle Fusion Middleware
- Chapter 7, "Managing Keystores, Wallets, and Certificates" for a discussion of these terms, and administration details

### 6.1.4 How SSL Sessions Are Conducted

The SSL protocol has two phases: the handshake phase and the data transfer phase. The handshake phase authenticates the server and optionally the client, and establishes the cryptographic keys that will be used to protect the data to be transmitted in the data transfer phase.
When a client requests an SSL connection to a server, the client and server first exchange messages in the handshake phase. (A common scenario is a browser requesting a page using the https:// instead of http:// protocol from a server. The HTTPS protocol indicates the usage of SSL with HTTP.)

Figure 6–1 shows the handshake messages for a typical SSL connection between a Web server and a browser. The following steps are shown in the figure:

1. The client sends a Hello message to the server.
   The message includes a list of algorithms supported by the client and a random number that will be used to generate the keys.
2. The server responds by sending a Hello message to the client. This message includes:
   - The algorithm to use. The server selected this from the list sent by the client.
   - A random number, which will be used to generate the keys.
3. The server sends its certificate to the client.
4. The client authenticates the server using the server's certificate.
5. The client generates a random value ("pre-master secret"), encrypts it using the server's public key, and sends it to the server.
6. The server uses its private key to decrypt the message to retrieve the pre-master secret.
7. The client and server separately calculate the keys that will be used in the SSL session.
   These keys are not sent to each other because the keys are calculated based on the pre-master secret and the random numbers, which are known to each side. The keys include:
   - Encryption key that the client uses to encrypt data before sending it to the server
   - Encryption key that the server uses to encrypt data before sending it to the client
   - Key that the client uses to create a message digest of the data
   - Key that the server uses to create a message digest of the data
   The encryption keys are symmetric, that is, the same key is used to encrypt and decrypt the data.
8. The client and server send a Finished message to each other. These are the first messages that are sent using the keys generated in the previous step (the first "secure" messages).
   The Finished message includes all the previous handshake messages that each side sent. Each side verifies that the previous messages that it received match the messages included in the Finished message. This checks that the handshake messages were not tampered with.
9. The client and server now transfer data using the encryption and hashing keys and algorithms.
6.2 About SSL in Oracle Fusion Middleware

This section introduces SSL in Oracle Fusion Middleware. It contains these topics:

- **SSL in the Oracle Fusion Middleware Architecture**
- **Keystores and Oracle Wallets**
- **Authentication Modes**
- **Tools for SSL Configuration**

6.2.1 SSL in the Oracle Fusion Middleware Architecture
In the Oracle Fusion Middleware architecture shown in Figure 6–2, the numbered circles represent the endpoints that can be SSL-enabled. For configuration details about each endpoint, see:

1. Section 6.4.2.1, "Enable Inbound SSL for Oracle Web Cache Using Fusion Middleware Control" and Section 6.4.2.2, "Enable Inbound SSL for Oracle Web Cache Using WLST"
2. Section 6.4.2.3, "Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control" and Section 6.4.2.4, "Specify the Wallet for Outbound SSL from Oracle Web Cache Using WLST"
3. Section 6.4.3.1, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control" and Section 6.4.3.2, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using WLST"
4. Section 6.4.3.3, "Enable SSL for Outbound Requests from Oracle HTTP Server"
5. Section 6.5.1.1, "Inbound SSL to Oracle WebLogic Server"
6. Outbound connections to the LDAP server can originate from Oracle Platform Security Services or from Oracle WebLogic Server:
   a. Section 6.5.1.2.1, "Outbound SSL from Oracle Platform Security Services to LDAP"
   b. Section 6.5.1.2.2, "Outbound SSL from LDAP Authenticator to LDAP"
7. Section 6.6.1.1, "Enable Inbound SSL on an Oracle Internet Directory Listener Using Fusion Middleware Control" and Section 6.6.1.2, "Enabling Inbound SSL on an Oracle Internet Directory Listener Using WLST"
8. Section 6.6.2.3, "SSL-Enable a Data Source"
9. Section 6.6.3.1, "SSL-Enable Oracle Database"
10. Section 6.5.6, "Client-Side SSL for Applications"
11. Section 6.5.2, "Configuring SSL for Oracle SOA Suite"
12. Section 6.5.3, "Configuring SSL for Oracle WebCenter"
13. Section 6.3.3, "WLST Command-Line Tool"
14. Section 6.6.1.3, "Enabling Outbound SSL from Oracle Internet Directory to Oracle Database"
15. Section 6.6.3.1, "SSL-Enable Oracle Database"

In addition, you can configure SSL for identity management components. For details, see:

- Section 6.5.4.1, "Configuring SSL for Oracle Directory Integration Platform"
- Section 6.5.4.2, "Configuring SSL for Oracle Identity Federation"
- Section 6.5.4.3, "Configuring SSL for Oracle Directory Services Manager"

**Keystores and Wallets**

Keystores and wallets are central to SSL configuration and are used to store certificates and keys.

For details, see Section 6.2.2, "Keystores and Oracle Wallets."
6.2.2 Keystores and Oracle Wallets

Oracle Fusion Middleware supports two types of keystores for keys and certificates:

- JKS-based keystore and truststore
- Oracle wallet

In 11g Release 1 (11.1.1), all Java components and applications use the JKS keystore. Thus all Java components and applications running on Oracle WebLogic Server use the JKS-based KeyStore and TrustStore.

The following system components continue to use the Oracle wallet:

- Oracle HTTP Server
- Oracle Web Cache
- Oracle Internet Directory

You can use Fusion Middleware Control or the command-line WLST and orapki interfaces, to manage wallets and their certificates for these system components. You can use either the Fusion Middleware Control or WLST to SSL-enable the listeners for these components.

Oracle Virtual Directory uses a JKS-based keystore. You can use Fusion Middleware Control or WLST to manage JKS keystores and their certificates for Oracle Virtual Directory. You can use either the Fusion Middleware Control or WLST to SSL-enable the listeners for Oracle Virtual Directory.

JDK's keytool utility manages the keystore used by Oracle WebLogic Server listeners for Java EE applications. This is the only keystore tool to manage these keystores; no GUI tool is available for this purpose.

For more information about these types of stores, and when to use which type of store, see Section 6.1.3, "Keystores and Wallets".

See Also: Section 7.1, "Key and Certificate Storage in Oracle Fusion Middleware" for keystore management

6.2.3 Authentication Modes

The following authentication modes are supported:

- In no-authentication mode, neither server nor client are required to authenticate.
  Other names for this mode include Anonymous SSL/No Authentication/Diffie-Hellman.
- In server authentication mode, a server authenticates itself to a client.
  This mode is also referred to as One-way SSL/Server Authentication.
- In mutual authentication mode, a client authenticates itself to a server and that server authenticates itself to the client.
  This mode is also known as Two-way SSL/Client Authentication.
- In optional client authentication mode, the server authenticates itself to the client, but the client may or may not authenticate itself to the server. Even if the client does not authenticate itself, the SSL session still goes through.
6.2.4 Tools for SSL Configuration

Oracle Fusion Middleware uses two kinds of configuration tools, common and advanced.

**Common Tools**
- Fusion Middleware Control
- WLST command-line interface
- Oracle WebLogic Server Administration Console
- `keytool` command-line tool

These tools allow you to configure SSL and manage Oracle Wallet/JKS keystore for any listener or component in Oracle Fusion Middleware.

**Advanced Tools**
- Oracle Wallet Manager GUI interface
- `orapki` command-line interface

These tools allow you to configure advanced features like managing file-based CRLs, PKCS11-based wallets, and so on.

**See Also:** Section 7.1, "Key and Certificate Storage in Oracle Fusion Middleware" for keystore management

6.3 Configuring SSL for Configuration Tools

Several tools are available for Oracle Fusion Middleware configuration. This section describes how to configure SSL for these tools to enable them to connect to an SSL-enabled Oracle WebLogic Server.

For a list of all the configuration tools, see Section 6.2.4, "Tools for SSL Configuration."

This section contains these topics:
- Oracle Enterprise Manager Fusion Middleware Control
- Oracle WebLogic Server Administration Console
- WLST Command-Line Tool

6.3.1 Oracle Enterprise Manager Fusion Middleware Control

Take these steps:
- Ensure that the SSL port is enabled on the Oracle WebLogic Server instance on which Fusion Middleware Control is deployed, and that the browser (from which you will launch Fusion Middleware Control) trusts the server certificate.
- Now launch Fusion Middleware Control using SSL-based URL.

6.3.2 Oracle WebLogic Server Administration Console

Ensure that the SSL port is enabled on the Oracle WebLogic Server instance. Now launch the administration console by providing the SSL port in the URL. You may get a warning that the certificate is not trusted; accept this certificate and continue.
6.3.3 WLST Command-Line Tool

For details about configuring SSL for WLST, take these steps:

1. Launch the WLST shell.
2. Execute the WLST command:
   
   ```python
   help('connect')
   ```

   Follow the instructions described in the help text to set up the WLST shell in SSL mode.

6.4 Configuring SSL for the Web Tier

This section contains these topics:

- Configuring Load Balancers
- Enabling SSL for Oracle Web Cache Endpoints
- Enabling SSL for Oracle HTTP Server Virtual Hosts

6.4.1 Configuring Load Balancers

Use the instructions specific to your load-balancing device to configure load balancers in your Oracle Fusion Middleware environment.

6.4.2 Enabling SSL for Oracle Web Cache Endpoints

This section explains how to enable SSL for Oracle Web Cache listening endpoints using Fusion Middleware Control and WLST.

6.4.2.1 Enable Inbound SSL for Oracle Web Cache Using Fusion Middleware Control

You can SSL-enable inbound traffic to Oracle Web Cache listening endpoints using these steps:

---

**Note:** This information applies only to inbound communication; for information about SSL-enabling outbound traffic from Oracle Web Cache to Oracle HTTP Server, see Section 6.4.2.3, "Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control".

---

1. Select the Oracle Web Cache instance in the navigation pane on the left.
2. Create a wallet, if necessary, by navigating to Oracle Web Cache, then Security, then Wallets.

   For details about wallet creation and maintenance, see Chapter 7, "Managing Keystores, Wallets, and Certificates".

3. Navigate to Oracle Web Cache, then Security, then SSL Configuration.

   The SSL Configuration page contains two sets of information:
Configuring SSL for the Web Tier

The top table shows the inbound settings for a list of listening endpoints. A check in the **SSL Enabled** column indicates that the endpoint is configured for SSL.

The bottom portion of the page shows outbound SSL configuration. For more information about outbound SSL, see Section 6.4.2.3, "Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control."

4. Select an endpoint, and click **Edit**.

The Edit Port page appears. This page contains two sections—a top portion with general details like port and IP address, and a bottom section that configures SSL parameters.

5. To disable SSL, uncheck **Enable SSL**; restart the component instance by navigating to Oracle Web Cache, then **Control**, then **Restart**.

6. To enable SSL for this endpoint, check **Enable SSL**. Next, enter SSL configuration parameters:
   - Select an Oracle wallet from the drop-down list.
   - Ensure that the wallet contains the server certificate and its corresponding CA certificate.
   - Select the type of SSL authentication.
   - Select the protocol version (the available options are determined by your choice of authentication).

7. Click **OK**.
8. Restart the Oracle Web Cache instance by navigating to Oracle Web Cache, then Control, then Restart.

See Also: Section 7.4.1.3, "Sharing Wallets Across Instances"

6.4.2.2 Enable Inbound SSL for Oracle Web Cache Using WLST
You can enable SSL for inbound traffic to Oracle Web Cache using the WLST command-line tool.

SSL-Enable Oracle Web Cache Inbound in server-auth Mode Using WLST
Take these steps:

1. Determine the listening endpoints for this Oracle Web Cache instance by running the following command:
   
   listListeners('inst1','wc1')
   
   This command will list all the listening endpoints for this instance; select the one that needs to be configured for SSL. For example, select CACHE.index1.LISTEN.index1.

2. Configure the listening endpoint with SSL properties:
   
   configureSSL('inst1','wc1','webcache','CACHE.index1.LISTEN.index1')

Note:
- configureSSL uses defaults for all SSL attributes; see Table 6–5 for details.
- You may also specify a properties file as a parameter to configureSSL; see Table 6–4 for details.

6.4.2.3 Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control
Outbound Oracle Web Cache refers to traffic from Oracle Web Cache to Oracle HTTP Server.

There are two aspects to set up SSL for outbound traffic from Oracle Web Cache: selecting a wallet for outbound SSL and configuring SSL.

Wallet Selection
Take these steps:

1. Navigate to Oracle Web Cache, then Security, then SSL Configuration.
2. At the bottom of the page, click **Change Wallet** to display the available wallets for this listener.

3. Select the desired wallet for outbound SSL and click **OK**.

**SSL Configuration**

Take these steps:

1. Navigate to the Oracle Web Cache instance, then **Administration**, then **Origin Servers**.

   This page displays the Oracle HTTP Servers with which this Oracle Web Cache instance can communicate. For example, if Oracle Web Cache can talk to two different Oracle HTTP Servers you would see two rows in the table.

In this example, the Oracle Web Cache instance is currently configured for non-SSL communication to the origin server over this host and port.

2. To enable SSL for outbound traffic to this origin server, select the row and click **Edit**.

3. The Edit Origin Server page appears:
4. Use the Protocol drop-down box to change the protocol to https.

5. Click OK. Oracle Web Cache is now configured to communicate to the origin server over SSL.

---

**Note:** When editing the origin server settings on this page, ensure that Oracle HTTP Server is listening at this port in SSL mode.

---

6.4.2.4 Specify the Wallet for Outbound SSL from Oracle Web Cache Using WLST

To change the wallet in use for outbound SSL connections from Oracle Web Cache, use a command like the following:

```bash
configureSSL('inst1', 'wc1', 'webcache', 'CACHE.index0.CLIENTSSL', 'property-file.prop')
```

where:

- `inst1` is the name of the application server instance
- `wc1` is the name of the Oracle Web Cache instance
- `webcache` is the component type
- `CACHE.index0.CLIENTSSL` is the listener name for client SSL
- `property-file.prop` contains:
  ```
  KeyStore=wallet-path
  ```

6.4.3 Enabling SSL for Oracle HTTP Server Virtual Hosts

This section shows how to manage SSL configuration for Oracle HTTP Server virtual hosts.

For inbound traffic:

- **Section 6.4.3.1**, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control"

- **Section 6.4.3.2**, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using WLST"

For outbound traffic:

- **Section 6.4.3.3**, "Enable SSL for Outbound Requests from Oracle HTTP Server"
6.4.3.1 Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control

You can SSL-enable inbound traffic to Oracle HTTP Server virtual hosts using these steps:

1. Select the Oracle HTTP Server instance in the navigation pane on the left.

2. Create a wallet, if necessary, by navigating to Oracle HTTP Server, then Security, then Wallets.

   For details about wallet creation and maintenance, see Chapter 7, "Managing Keystores, Wallets, and Certificates".

3. Navigate to Oracle HTTP Server, then Administration, then Virtual Hosts.

   This page shows what hosts are currently configured, and whether they are configured for http or https.

<table>
<thead>
<tr>
<th>Name</th>
<th>Server Name</th>
<th>Type</th>
<th>Ports</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>*:8880</td>
<td>IP BASED</td>
<td>8880</td>
<td>HTTPS</td>
<td></td>
</tr>
<tr>
<td>*:4443</td>
<td>IP BASED</td>
<td>4443</td>
<td>HTTPS</td>
<td></td>
</tr>
</tbody>
</table>

4. Select the virtual host you wish to update, and click Configure, then SSL Configuration.

   The SSL Configuration page appears.

5. You can convert an https port to http by simply unchecking Enable SSL.

   To configure SSL for a virtual host that is currently using http:
   - Check the Enable SSL box.
   - Select a wallet from the drop-down list.
Configuring SSL for the Web Tier

6.4.3.2 Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using WLST

Take these steps:

1. Determine the virtual hosts for this Oracle HTTP Server instance by running the following command:

   ```
   listListeners('inst1','ohs1')
   ```

   This command lists all the virtual hosts for this instance; select the one that needs to be configured for SSL. For example, you can select vhost1.

2. Configure the virtual host with SSL properties:

   ```
   configureSSL('inst1',
               'ohs1',
               'ohs',
               'vhost1')
   ```

   From the Server SSL properties, select the SSL authentication type, cipher suites to use, and the SSL protocol version.

   **Note:** The default values are appropriate in most situations.

   **Note:** The choice of authentication type determines the available cipher suites, and the selected cipher suites determine the available protocol versions. For more information about ciphers and protocol versions, see Section 6.9.28, "Properties Files for SSL".

6. Click OK to apply the changes.

7. Restart the Oracle HTTP Server instance by navigating to Oracle HTTP Server, then Control, then Restart.

8. Open a browser session and connect to the port number that was SSL-enabled.
6.4.3.3 Enable SSL for Outbound Requests from Oracle HTTP Server

You enable SSL for outbound requests from Oracle HTTP Server by configuring mod_wl_ohs.

The steps are as follows:

1. Generate a custom keystore for Oracle WebLogic Server (see Section 6.5.1, "Configuring SSL for Oracle WebLogic Server") containing a certificate.

2. Import the certificate used by Oracle WebLogic Server from Step 1 into the Oracle HTTP Server wallet as a trusted certificate. You can use any available utility such as WLST or Fusion Middleware Control for this task.

3. Edit the Oracle HTTP Server configuration file \INSTANCE_HOME\config\OHS\ohs1\ssl.conf and add the following line to the SSL configuration under mod_weblogic:

   \WlSSLWallet \"$(ORACLE_INSTANCE)/config/OHS/ohs1/keystores/default\"

   where default is the name of the Oracle HTTP Server wallet in Step 2.

Here is an example of how the configuration should look:

   \<IfModule mod_weblogic.c>
   WebLogicHost myweblogic.server.com
   WebLogicPort 7002
   MatchExpression *.jsp
   SecureProxy On
   WlSSLWallet \"$(ORACLE_INSTANCE)/config/OHS/ohs1/keystores/default\"
   \</IfModule>

Save the file and exit. Restart Oracle HTTP Server to activate the changes.

4. Ensure that your Oracle WebLogic Server instance is configured to use the custom keystore generated in Step 1, and that the alias points to the alias value used in generating the certificate. Restart the Oracle WebLogic Server instance.

   mod_wl_ohs also supports two-way SSL communication. To configure two-way SSL:

1. Perform Steps 1 through 4 of the preceding procedure for one-way SSL.

2. Generate a trust store, trust.jks, for Oracle WebLogic Server.

   The keystore created for one-way SSL (Step 1 of the preceding procedure) could also be used to store trusted certificates, but it is recommended that you create a separate truststore for this procedure.

3. Export the user certificate from the Oracle HTTP Server wallet, and import it into the truststore created in Step 2.

   You can use any available utility such as WLST or Fusion Middleware Control for export, and the keytool utility for import.

4. From the Oracle WebLogic Server Administration Console, select the Keystores tab for the server being configured.

Note:

- configureSSL uses defaults for all SSL attributes; see Table 6–5 for details.
- We could also specify a properties file as a parameter to configureSSL; see Table 6–4 for details.
5. Set the custom trust store with the `trust.jks` file location of the trust store that was created in Step 2 (use the full name).

6. Set the keystore type as JKS, and set the passphrase used to create the keystore.

7. Under the SSL tab, ensure that Trusted Certificate Authorities is set as from Custom Trust Keystore.

### 6.5 Configuring SSL for the Middle Tier

Using SSL in the middle tier includes:
- SSL-enabling the application server
- SSL-enabling components and applications running on the application server

This section addresses mid-tier SSL configuration and contains these topics:
- Configuring SSL for Oracle WebLogic Server
- Configuring SSL for Oracle SOA Suite
- Configuring SSL for Oracle WebCenter
- Configuring SSL for Oracle Identity and Access Management
- SSL-Enable Oracle Reports, Forms, Discoverer, and Portal
- Client-Side SSL for Applications

### 6.5.1 Configuring SSL for Oracle WebLogic Server

This section describes configuration for the application server.

#### 6.5.1.1 Inbound SSL to Oracle WebLogic Server

For information and details about implementing SSL to secure Oracle WebLogic Server, see *Oracle Fusion Middleware Securing Oracle WebLogic Server*.

#### 6.5.1.2 Outbound SSL from Oracle WebLogic Server

This section describes how to SSL-enable outbound connections from Oracle WebLogic Server.

##### 6.5.1.2.1 Outbound SSL from Oracle Platform Security Services to LDAP

This section explains how to configure SSL for policy stores and credential stores connections to an LDAP directory. Anonymous and one-way SSL is supported.

**Anonymous SSL**

Start the LDAP Server in anonymous authentication mode.

For Oracle Internet Directory, see [Section 6.6.1.1, "Enable Inbound SSL on an Oracle Internet Directory Listener Using Fusion Middleware Control"](#).

If using another directory, consult your LDAP server documentation for information on this task.

**One-Way SSL**

Prerequisite: LDAP Server in SSL Server Authentication Mode.

For details on this procedure, see the *Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory*. 
6.5.1.2.2 Outbound SSL from LDAP Authenticator to LDAP

When you configure an LDAP authenticator in Oracle WebLogic Server, you can specify that connections to the LDAP store should use SSL.

Take these steps to configure the authenticator:

1. Log in to the Oracle WebLogic Server Administration Console.

2. In the left pane, select Security Realms and click the name of the realm you are configuring.

3. Select Providers, then Authentication and click New.

4. In the Name field, enter a name for the authentication provider.

5. From the Type drop-down list, select the type of the Authentication provider and click OK.
   For example, if using Oracle Internet Directory, choose OracleInternetDirectoryAuthenticator.

6. Select Providers, then Authentication and click the name of the new authentication provider to complete its configuration.

7. On the Configuration page for the authentication provider, set the desired values on the Common and Provider-Specific tabs.

   a. Common Tab
      Set the Control Flag to SUFFICIENT for all authenticators, including the DefaultAuthenticator

   b. Provider-Specific Tab
      host: host-name
      port: port-number
      principal: cn=orcladmin
      credential/confirm: password
      user base dn: cn=Users,dc=us,dc=oracle,dc=com
      group base dn: cn=Groups,dc=us,dc=oracle,dc=com

8. Save your changes and restart the server.

6.5.1.2.3 Outbound SSL to Database

Configuring SSL between Oracle WebLogic Server and the database requires two sets of steps:

- Configuring SSL Listener for the Database
- Configuring SSL for the Data Source on Oracle WebLogic Server

Configure an SSL Listener on Oracle Database

To configure the database with an SSL listener, you must specify the server’s distinguished name (DN) and TCPS as the protocol in the client network configuration files to enable server DN matching and TCP/IP with SSL connections. Server DN matching prevents the database server from faking its identity to the client during connections by matching the server’s global database name against the DN from the server certificate.
You must manually edit the client network configuration files, tnsnames.ora and listener.ora, to specify the server's DN and the TCP/IP with SSL protocol.

For details, see Section 6.6.3.1, “SSL-Enable Oracle Database.”

See Also: Configuring Secure Sockets Layer Authentication in the Oracle Database Advanced Security Administrator’s Guide for more information about configuring SSL for the database listener

SSL-Enable the Data Source On Oracle WebLogic Server

See Section 6.6.3.2, "SSL-Enable a Data Source.”

6.5.2 Configuring SSL for Oracle SOA Suite

SSL configuration for Oracle SOA Suite varies with the type of connection being secured.

SSL in Oracle WebLogic Server

SSL features in Oracle WebLogic Server include:

- How to set up SSL at the core server
- How to enable SSL for a web service

For these and related topics, see Oracle Fusion Middleware Securing Oracle WebLogic Server.

SSL for SOA Composites

The following tasks are also needed to secure Oracle SOA Suite applications:

- SSL-protecting SOA composites
- Accessing SSL-protected web services from within SOA composites

For these and related topics, see the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite.

6.5.3 Configuring SSL for Oracle WebCenter

For information and details about how to implement SSL connections for Oracle WebCenter, see the following topics in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter:

- Securing the WebCenter Spaces Connection to Oracle Content Server with SSL
- Securing the Browser Connection to WebCenter Spaces with SSL

6.5.4 Configuring SSL for Oracle Identity and Access Management

You can configure SSL for Oracle Identity and Access Management components residing on the middle tier:

- Configuring SSL for Oracle Directory Integration Platform
- Configuring SSL for Oracle Identity Federation
- Configuring SSL for Oracle Directory Services Manager
6.5.4.1 Configuring SSL for Oracle Directory Integration Platform

You can configure Oracle Directory Integration Platform to use SSL for communications with connected directories. The Oracle Fusion Middleware Integration Guide for Oracle Identity Management provides details about the following SSL tasks for Oracle Directory Integration Platform:

- Configuring Oracle Directory Integration Platform for SSL Mode 2 Server-Only Authentication
- Managing the SSL Certificates of Oracle Internet Directory and Connected Directories
- Bootstrapping in SSL Mode
- Configuring the Third-Party Directory Connector for Synchronization in SSL Mode
- Configuring and Testing Oracle Internet Directory with SSL Server-Side Authentication
- Testing SSL Communication Between Oracle Internet Directory and Microsoft Active Directory

6.5.4.2 Configuring SSL for Oracle Identity Federation

---

**Note:** Use Sun Microsystems' keytool utility to manage keystores and certificates required for SSL configuration in Oracle Identity Federation.

---

6.5.4.3 Configuring SSL for Oracle Directory Services Manager

You can configure Oracle Directory Services Manager to use SSL for communications with connected directories. The Oracle Fusion Middleware Administrator’s Guide for Oracle Virtual Directory provides details about the following SSL tasks for Oracle Directory Services Manager:

- Logging into the Directory Server from Oracle Directory Services Manager Using SSL
- Managing Oracle Directory Services Manager’s Key Store
- Storing Oracle Directory Services Manager’s Certificate in Oracle Virtual Directory

6.5.5 SSL-Enable Oracle Reports, Forms, Discoverer, and Portal

This section contains these topics:

- SSL for Oracle Reports
- SSL for Oracle Forms
- SSL for Oracle Discoverer
- SSL for Oracle Portal

6.5.5.1 SSL for Oracle Reports

To SSL-enable Oracle Reports, you need to enable SSL on the components front-ending Oracle WebLogic Server.
For example, if you have an Oracle HTTP Server and an Oracle Web Cache front-ending the Oracle WebLogic Server that hosts Oracle Reports, you need to configure the following:

- Inbound SSL for Oracle Web Cache
  See Section 6.4.2.1, "Enable Inbound SSL for Oracle Web Cache Using Fusion Middleware Control."

- Inbound SSL for Oracle HTTP Server
  See Section 6.4.3.1, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control."

- Inbound SSL for Oracle WebLogic Server
  See Section 6.5.1.1, "Inbound SSL to Oracle WebLogic Server."

- SSL between Oracle Web Cache and Oracle HTTP Server
  See Section 6.4.2.3, "Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control."

- SSL between Oracle HTTP Server and Oracle WebLogic Server
  See Section 6.4.3.3, "Enable SSL for Outbound Requests from Oracle HTTP Server."

**Note:** These steps are necessary only if you wish to set up end-to-end SSL. In most cases, it is sufficient to enable SSL only on the first component getting the request, since the other components are usually within the intranet.

For example, if the request is sent to Oracle Web Cache, you may only need to follow the first step. If the request is sent to Oracle HTTP Server, you may only need to follow the second step. Select the steps as dictated by your topology.

Additionally, Oracle Reports in Fusion Middleware Control accesses the reports servlet for data. If that communication needs to take place over SSL, you must complete the manual procedure described in Oracle Fusion Middleware Publishing Reports to the Web with Oracle Reports Services.

### 6.5.5.2 SSL for Oracle Forms

To SSL-enable Oracle Forms, you need to enable SSL on the components front-ending Oracle WebLogic Server.

For example, if you have an Oracle HTTP Server and an Oracle Web Cache front-ending the Oracle WebLogic Server that hosts Oracle Forms, you need to configure the following:

- Inbound SSL for Oracle Web Cache
  See Section 6.4.2.1, "Enable Inbound SSL for Oracle Web Cache Using Fusion Middleware Control."

- Inbound SSL for Oracle HTTP Server
  See Section 6.4.3.1, "Enable SSL for Inbound Requests to Oracle HTTP Server Virtual Hosts Using Fusion Middleware Control."

- Inbound SSL for Oracle WebLogic Server
See Section 6.5.1.1, "Inbound SSL to Oracle WebLogic Server."

■ SSL between Oracle Web Cache and Oracle HTTP Server
See Section 6.4.2.3, "Enable Outbound SSL for Oracle Web Cache Using Fusion Middleware Control."

■ SSL between Oracle HTTP Server and Oracle WebLogic Server
See Section 6.4.3.3, "Enable SSL for Outbound Requests from Oracle HTTP Server."

---

**Note:** These steps are necessary only if you wish to set up end-to-end SSL. In most cases, it is sufficient to enable SSL only on the first component getting the request, since the other components are usually within the intranet.

For example, if the request is sent to Oracle Web Cache, you may only need to follow the first step. If the request is sent to Oracle HTTP Server, you may only need to follow the second step. Select the steps as dictated by your topology.

---

### 6.5.5.3 SSL for Oracle Discoverer

Running Oracle Discoverer over **https** requires installing a security certificate on the Discoverer Plus client machine, importing certificate details into the Java Plug-in certificate store, and related tasks.

The *Oracle Fusion Middleware Configuration Guide for Oracle Business Intelligence Discoverer* provides details about configuring SSL for Oracle Discoverer in these sections:

■ About Running Discoverer over HTTPS
■ About Discoverer and the Oracle Fusion Middleware Security Model

### 6.5.5.4 SSL for Oracle Portal

Oracle Portal uses a number of different components (such as the Parallel Page Engine, Oracle HTTP Server, and Oracle Web Cache) each of which may act as a client or server in HTTP communication. As a result, each component involving Oracle Portal in the middle tier is individually configured for https.

For details, see the *Oracle Fusion Middleware Administrator’s Guide for Oracle Portal.*

### 6.5.6 Client-Side SSL for Applications

For information on how to write SSL-enabled applications, see "Using SSL Authentication in Java Clients" in *Oracle Fusion Middleware Programming Security for Oracle WebLogic Server.*

For best practices, refer to Section 6.8.2, "Best Practices for Application Developers."

### 6.6 Configuring SSL for the Data Tier

This section contains these topics:

■ Enabling SSL on Oracle Internet Directory Listeners
■ Enabling SSL on Oracle Virtual Directory Listeners
■ Configuring SSL for the Database
6.6.1 Enabling SSL on Oracle Internet Directory Listeners

Out of the box, Oracle Internet Directory nodes are SSL-enabled in no-auth mode.

This section explains how to SSL-enable Oracle Internet Directory listeners using Fusion Middleware Control and the WLST command-line tool.

6.6.1.1 Enable Inbound SSL on an Oracle Internet Directory Listener Using Fusion Middleware Control

In this example, the following steps enable SSL in no-auth mode for an instance of Oracle Internet Directory using Fusion Middleware Control:

1. Select the Oracle Internet Directory instance in the navigation pane on the left.

2. Navigate to Oracle Internet Directory, then Administration, then Server Properties.

3. Click Change SSL Settings.

4. On the SSL Settings dialog:

   - Select Enable SSL.
   - Set SSL Authentication to No Authentication.
   - Set Cipher Suite to All.
   - Set SSL protocol version to v3.
   - Click OK.

5. Restart the Oracle Internet Directory instance by navigating to Oracle Internet Directory, then Control, then Restart.

6. To verify that the instance is correctly SSL-enabled, execute an `ldapbind` command of the form:

```
ldapbind
```
ldapbind -D cn=orcladmin
- U 1
- h host
- p SSL_port

Notes: - U 1 represents the no-auth mode.

SSL Enabling in Other Authentication Modes
The steps for SSL-enabling in other authentication modes are the same, except that in
the SSL Settings dialog, you would set the appropriate authentication type.

Note: Other authentication types need an Oracle wallet.

6.6.1.2 Enabling Inbound SSL on an Oracle Internet Directory Listener Using WLST
Configure the listener with SSL properties in no-auth mode as follows:

configureSSL('inst1',
'oid1',
'oid',
'sslport1')

Note: The Oracle Internet Directory port name is always "sslport1".

SSL Enabling in Other Authentication Modes
You can do this by running the configureSSL command with a properties file as a parameter
and specifying an appropriate authentication type parameter value. For details, see the Oracle Fusion Middleware Administrator's Guide for Oracle Internet Directory.

6.6.1.3 Enabling Outbound SSL from Oracle Internet Directory to Oracle Database
Two sets of procedures are needed to configure SSL connections from Oracle Internet
Directory to Oracle Database:

- Configure SSL for the Database
- Configure Outbound Oracle Internet Directory

Configure SSL for the Database
The steps to configure Oracle Database for SSL are described in Section 6.6.3.1,
"SSL-Enable Oracle Database."
Configure Outbound Oracle Internet Directory
Take these steps to configure SSL for outbound traffic from Oracle Internet Directory to Oracle Database:

1. Stop the Oracle Internet Directory server instances whose outbound traffic to the database is to be configured with SSL using this `opmnctl` syntax:
   ```
   $ORACLE_INSTANCE/bin/opmnctl stopproc ias-component=componentName
   ```
   For example:
   ```
   $ORACLE_INSTANCE/bin/opmnctl stopproc ias-component=oid1
   ```

2. Configure Security Socket Layer authentication on the database to which the Oracle Internet Directory server instance is connecting.
   For details, see *Oracle Database Advanced Security Administrator’s Guide*.

3. Restart the database/listener as required.

4. Start Oracle Internet Directory server instances using this `opmnctl` syntax:
   ```
   $ORACLE_INSTANCE/bin/opmnctl startproc ias-component=componentName
   ```
   For example:
   ```
   $ORACLE_INSTANCE/bin/opmnctl startproc ias-component=oid1
   ```

   **Note:** Only the no-authentication mode is supported.

### 6.6.2 Enabling SSL on Oracle Virtual Directory Listeners

This section explains how to enable SSL for an instance of Oracle Virtual Directory.

The *Oracle Fusion Middleware Administrator’s Guide for Oracle Virtual Directory* provides additional information on these topics:

- Configuring SSL for Listeners Using Fusion Middleware Control
- Configuring SSL for Listeners Using WLST
- Configuring a Mutual Authentication SSL Connection Between Oracle Virtual Directory and Oracle Internet Directory

#### 6.6.2.1 Enable SSL for Oracle Virtual Directory Using Fusion Middleware Control

The steps to enable SSL are as follows (the example illustrates the `server-auth` mode):

1. Select the Oracle Virtual Directory instance in the navigation pane on the left.

2. Select a keystore to use for the operation by navigating to **Oracle Virtual Directory**, then **Security**, then **Keystores**
   
   Choose from the list of keystores that appears. If you need to generate a new keystore, see Section 7.3.3.1, “Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control” for details.

3. To SSL-enable the listener, navigate to **Oracle Virtual Directory**, then **Administration**, then **Listeners**.

4. Select the LDAP SSL Endpoint listener, and click **Edit**.
5. Click Change SSL Settings.

6. On the SSL Settings dialog:

- Select Enable SSL.
- For Server Keystore Name, select the keystore you created in step 3, for example, OVDtestJks.
- For Server Keystore Password, type the keystore password you specified in step 3.
- For Server Truststore Name, select the keystore you created in step 3, for example, OVDtestJks.
- For Server Truststore Password, type the keystore password you specified in step 3.
- Expand Advanced SSL Settings.
- For SSL authentication, select Server Authentication. This is the default setting.
- For Cipher Suite, select the applicable cipher suite, in this example All.
- Click OK.

7. Stop and start the Oracle Virtual Directory instance by navigating to Oracle Virtual Directory, then Control, then Stop and Start.

8. To verify that the instance is correctly SSL-enabled, execute an `ldapbind` command of the form:

```
ldapbind -D cn=orcladmin
   -U 2
   -h host
   -p SSL_port
   -W "file://DIRECTORY_SSL_WALLET"
```

**Note:**
- `-U 2` represents the server-auth mode.
- `DIRECTORY_SSL_WALLET` is the path to a wallet file, not including the wallet file name.
- This wallet must contain the trusted certificate of the CA that issued the server certificate.

### SSL Enabling in Other Authentication Modes

The steps for SSL-enabling in other authentication modes are similar, except that in the SSL Settings dialog, you would set the appropriate authentication type.

**Note:** If configuring SSL for an LDAP listener, SSL communication is verified using `ldapbind`. If it is an http listener, it is verified using a browser.

#### 6.6.2.2 Enabling SSL on an Oracle Virtual Directory Listener Using WLST

Take these steps to configure the listener in server-auth mode:

1. Determine the listeners for this Oracle Virtual Directory instance by running the following command:

```
listListeners('inst1','ovd1')
```

This command lists all the listeners for this instance; select the one that needs to be configured for SSL. For this example, select LDAP SSL Endpoint.

2. Obtain the name of the SSL MBean for the Oracle Virtual Directory listener:

```
getSSLMBeanName('inst1',
   'ovd1',
   'ovd',
   'LDAP SSL Endpoint')
```

This command will return the SSL MBean name.

3. Set the passwords for the keystore and truststore in the MBean with the following commands:

```
cd ('SSL_MBean_Name')
set('KeyStorePassword',java.lang.String('password').toCharArray())
set('TrustStorePassword',java.lang.String('password').toCharArray())
```

4. Configure the listener with SSL properties:
Enabling SSL in Other Authentication Modes
You can do this by running the `configureSSL` command with a properties file as parameter and specifying appropriate authentication type parameter value. For details, see “Creating and Managing Oracle Virtual Directory Listeners” in the Oracle Fusion Middleware Administrator’s Guide for Oracle Virtual Directory.

6.6.3 Configuring SSL for the Database
This section contains these topics:

- SSL-Enable Oracle Database
- SSL-Enable a Data Source

6.6.3.1 SSL-Enable Oracle Database
Take these steps to SSL-enable Oracle database:

1. Create a root CA and a certificate for the DB. Here is an example:

   ```bash
   mkdir root
   mkdir server

   # Create root wallet, add self-signed certificate and export
   orapki wallet create -wallet ./root -pwd password
   orapki wallet add -wallet ./root -dn CN=root_test,C=US -keysize 2048 -self_signed -validity 3650 -pwd password
   orapki wallet display -wallet ./root -pwd password
   orapki wallet export -wallet ./root -dn CN=root_test,C=US -cert ./root/b64certificate.txt -pwd password

   # Create server wallet, add self-signed certificate and export
   orapki wallet create -wallet ./server -pwd password
   orapki wallet add -wallet ./server -dn CN=server_test,C=US -pwd password
   orapki wallet display -wallet ./server -pwd password
   orapki wallet export -wallet ./server -dn CN=server_test,C=US -request ./server/creq.txt -pwd password

   # Import trusted certificates
   orapki cert create -wallet ./root -request ./server/creq.txt -cert ./server/cert.txt -validity 3650 -pwd password
   orapki cert display -cert ./server/cert.txt -complete
   orapki wallet add -wallet ./server -trusted_cert -cert
   ```

   **Note:** Steps 2 and 3 are required only for server-auth and mutual-auth modes.
2. Update listener.ora, sqlnet.ora, and tnsnames.ora for the database.
   a. This example shows the default listener.ora:

   ```
   SID_LIST_LISTENER =
   (SID_LIST = (SID_DESC = (SID_NAME = PLSExtProc) (ORACLE_HOME = /path_to_O_H) (PROGRAM = extproc)))
   LISTENER = (DESCRIPTION_LIST = (DESCRIPTION =
   (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC1))
   (ADDRESS = (PROTOCOL = TCP)(HOST = mynode.mycorp.com)(PORT = 1521))
   (ADDRESS = (PROTOCOl = TCPS)(HOST = mynode.mycorp.com)(PORT = 2490))
   ))
   WALLET_LOCATION = (SOURCE = (METHOD = FILE) (DIRECTORY = /wallet_location))
   SSL_CLIENT_AUTHENTICATION = FALSE)
   ```

   And here is an updated listener.ora file, illustrating a scenario with no client authentication:

   ```
   SID_LIST_LISTENER =
   (SID_LIST =
   (SID_DESC =
   (GLOBAL_DBNAME = dbname)
   (ORACLE_HOME = /path_to_O_H)
   (SID_NAME = sid))
   )
   )
   SSL_CLIENT_AUTHENTICATION = FALSE
   ```

   WALLET_LOCATION =
   (SOURCE =
   (METHOD = FILE)
   (METHOD_DATA =
   (DIRECTORY = /wallet_path)
   )
   )

   LISTENER =
   (DESCRIPTION_LIST =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC1521))
   )
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCP)(HOST = mynode.mycorp.com)(PORT = 1521))
   )
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCPS)(HOST = mycorp.com)(PORT = 2490))
   )
   )

   Note that the SSL port has been added.

   b. Likewise, a modified sqlnet.ora file may look like this:
c. A modified tnsnames.ora file may look like this:

```
OID =
  (DESCRIPTION =
    (ADDRESS = (PROTOCOL = TCP)(HOST = mynode.mycorp.com)(PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = mynode.mycorp.com)
    )
  )

SSL =
  (DESCRIPTION =
    (ADDRESS_LIST =
      (ADDRESS = (PROTOCOL = TCPS)(HOST = mynode.mycorp.com)(PORT = 2490))
    )
    (CONNECT_DATA =
      (SERVICE_NAME = mynode.mycorp.com)
    )
    (SECURITY=(SSL_SERVER_CERT_DN=\"CN=server_test,C=US\")
  )
```

3. Test the connection to the database using the new connect string. For example:

```
$ tnsping ssl
$ sqlplus username/password@ssl
```

See Also: The chapter "Configuring Secure Sockets Layer Authentication" in the Oracle Database Advanced Security Administrator’s Guide.

6.6.3.2 SSL-Enable a Data Source

Take these steps to configure your data sources on Oracle WebLogic Server to use SSL.

1. Create a truststore and add the root certificate (which is created when SSL-enabling the database) as a trusted certificate to the truststore.

2. In the Oracle WebLogic Server Administration Console, navigate to the Connection pool tab of the data source that you are using.

   Note: The data source can be an existing source such as an Oracle WebCenter data source, or a new data source. See Creating a JDBC Data Source in Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server for details.

The properties you need to specify in the JDBC Properties text box depend on the type of authentication you wish to configure.

- If you will require client authentication (two way authentication):
  
  ```
  javax.net.ssl.keyStore=..(password of the keystore)
  javax.net.ssl.keyStoreType=JKS
  javax.net.ssl.keyStorePassword=...(password of the keystore)
  javax.net.ssl.trustStore=...(the truststore location on the disk)
  ```
If you will require no client authentication:

```
javax.net.ssl.trustStore=...(the truststore location on the disk)
javax.net.ssl.trustStoreType=JKS
javax.net.ssl.trustStorePassword=...(password of the truststore)
```

3. In the URL text box, enter the jdbc connect string. Ensure that the protocol is TCPS and that SSL_SERVER_CERT_DN contains the full DN of the database certificate. Use the following syntax:

```
jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCPS)(HOST=host-name)(PORT=port-number)))(CONNECT_DATA=(SERVICE_NAME=service))(SECURITY=(SSL_SERVER_CERT_DN="CN=server_test,C=US")))
```

4. Test and verify the connection. Your data source is now configured to use SSL.

### 6.7 Advanced SSL Scenarios

This section explains how to handle additional SSL configuration scenarios beyond the basic topologies described earlier:

- **Hardware Security Modules and Accelerators**
- **CRL Integration with SSL**

#### 6.7.1 Hardware Security Modules and Accelerators

A Hardware Security Module (HSM) is a physical plug-in card or an external security device that can be attached to a computer to provide secure storage and use of sensitive content.

---

**Note:** This discussion applies only to Oracle HTTP Server, Oracle Web Cache, and Oracle Internet Directory, which are the system components supporting HSM.

---

Oracle Fusion Middleware supports PKCS#11-compliant HSM devices that provide a secure storage for private keys.

Take these steps to implement SSL for a component using a PKCS#11 wallet:

1. Install the HSM libraries on the machine where the component is running. This is a one-time task and is device-dependent.

2. Next, create a wallet using Oracle Wallet Manager (OWM) or the `orapki` command-line tool. Note the following:
   a. Choose PKCS11 as the wallet type.
   b. Specify the device-specific PKCS#11 library used to communicate with the device. This library is part of the HSM software.

On Linux, the library is located at:

- For LunaSA (Safenet): `/usr/lunasa/lib/libCryptoki2.so`
- For nCipher: `/opt/nfast/toolkits/pkcs11/libcknfast.so`
On Windows, the library is located at:

For LunaSA (Safenet): C:\Program Files\LunaSA\cryptoki.dll

3. Now follow the standard procedure for obtaining third-party certificates, that is, creating a certificate request, getting the request approved by a Certificate Authority (CA), and installing the certificate signed by that CA.

The wallet you set up is used like any other wallet.

4. Verify the wallet with the orapki utility. Use the following command syntax:

   orapki wallet p11_verify [-wallet [wallet]] [-pwd password]

   **See Also:** Appendix H, "Oracle Wallet Manager and orapki" for details about orapki

5. Configure SSL on your component listener using the `configureSSL` WLST command, providing a properties file as input. Your properties file should specify the full path of the PKCS#11 wallet directory on the machine where the component is running. *(Note: Do not save the PKCS#11 wallet in the instance home directory. Only wallets created and managed through Fusion Middleware Control or WLST should reside in the instance home.)*

   A sample properties file could look like this:

   ```
   SSLEnabled=true
   AuthenticationType=Server
   PKCS11Wallet=/tmp/lunasa/wallet
   ```

   **Note:** You must use the WLST command `configureSSL` to configure the PKCS11 wallet. You cannot do this task using Fusion Middleware Control or any other tool.

---

### 6.7.2 CRL Integration with SSL

**Note:**

- This discussion applies only to Oracle HTTP Server and Oracle Web Cache.
- CRL validation is managed through WLST; you cannot perform this task through Fusion Middleware Control.

Components that use SSL can optionally turn on certificate validation using a certificate revocation list (CRL). This allows them to validate the peer certificate in the SSL handshake and ensure that it is not on the list of revoked certificates issued by the Certificate Authority (CA).

This section describes how to configure a component to use CRL-based validation, and how to create and set up CRLs on the file system.

#### 6.7.2.1 Configuring CRL Validation for a Component

Configure SSL on your component listener using the `configureSSL` WLST command, providing a properties file as input.

The properties file must be set up as follows:
1. The CertValidation attribute must be set to url.
2. The CertValidationPath attribute must be of the form "file://file_path" or "dir://directory_path".
   - Use the first format if you are using a single CRL file for certificate validation. This CRL file should contain a concatenation of all CRLs.
   - Use the second format if you are specifying a directory path that contains multiple CRL files in hashed form.
     See Section 6.7.2.2, "Manage CRLs on the File System" on how to create CRLs in hashed form.

In this example, the properties file specifies a single CRL file:

```plaintext
SSLEnabled=true
AuthenticationType=Server
CertValidation=crl
KeyStore=ohs1
CertValidationPath=file:///tmp/file.crl
```

In this example, the properties file specifies a directory path to multiple CRL files:

```plaintext
SSLEnabled=true
AuthenticationType=Server
KeyStore=ohs1
CertValidation=crl
CertValidationPath=dir:///tmp
```

### 6.7.2.2 Manage CRLs on the File System

You use the `orapki` command-line tool to manage CRLs on the file system. For details on this topic, see Section H.2.5, "Managing Certificate Revocation Lists (CRLs) with orapki Utility."

**CRL Renaming to Hashed Form**

If specifying a file system directory, the CRL must be renamed. This enables CRLs to be loaded in an efficient manner at runtime. This operation creates a symbolic link to the actual CRL file. On Windows, the CRL is copied to a file with a new name.

To rename a CRL:

```plaintext
orapki crl hash
[-crl [url|filename]] [-wallet wallet] [-symlink directory]
[-copy directory] [-summary] [-pwd password]
```

For example:

```plaintext
orapki crl hash -crl nzcrl.txt -symlink wldir -pwd password
```

If the CRL file name is specified at runtime, multiple CRLs can be concatenated in that file. The CRL created in this example is in Base64 format, and you can use a text editor to concatenate the CRLs.
CRL Creation

Note: CRL creation and Certificate Revocation are for test purposes and only used in conjunction with self-signed certificates. For production use, obtain production certificates from well-known CAs and obtain the CRLs from those authorities.

To create a CRL:

```bash
orapki crl create
[-crl [url|filename]] [-wallet [cawallet]] [-nextupdate [days]] [-pwd password]
```

For example:

```bash
orapki crl create
-crl nzcrl.txt -wallet rootwlt -nextupdate 3650 -pwd password
```

Certificate Revocation

Revoking a certificate adds the certificate’s serial number to the CRL.

To revoke a certificate:

```bash
orapki crl revoke
[-crl [url|filename]] [-wallet [cawallet]] [-cert [revokecert]] [-pwd password]
```

For example:

```bash
orapki crl revoke
-crl nzcrl.txt -wallet rootwlt -cert cert.txt -pwd password
```

6.7.2.3 Test a Component Configured for CRL Validation

To test that a component is correctly configured for CRL validation, take these steps:

1. Set up a wallet with a certificate to be used in your component.
2. Generate a CRL with this certificate in the revoked certificates list. Follow the steps outlined in Section 6.7.2.2, "Manage CRLs on the File System."
3. Configure your component to use this CRL. Follow the steps outlined in Section 6.7.2.1, "Configuring CRL Validation for a Component."
4. The SSL handshake should fail when this revoked certificate is used.

6.8 Best Practices for SSL

This section outlines some best practices for Oracle Fusion Middleware component administrators and application developers. It contains these topics:

- Best Practices for Administrators
- Best Practices for Application Developers

6.8.1 Best Practices for Administrators

Best practices for system administrators include the following:

- Use self-signed wallets only in test environment. You should obtain a CA signed certificate in the wallet before moving to production environment. For details, see Chapter 7, "Managing Keystores, Wallets, and Certificates."
It is recommended that components (at least in the web tier) use certificates that have the system hostname or virtual host or site name as the DN. This allows browsers to connect in SSL mode without giving unsettling warning messages.

A minimum key size of 1024 bits is recommended for certificates used for SSL. Higher key size provides more security but at the cost of reduced performance. Pick an appropriate key size value depending on your security and performance requirements.

Lack of trust is one of the most common reasons for SSL handshake failures. Ensure that the client trusts the server (by importing the server CA certificate into the client keystore) before starting SSL handshake. If client authentication is also required, then the reverse should also be true.

### 6.8.2 Best Practices for Application Developers

The following practices are recommended:

- Use Java Key Store (JKS) to store certificates for your Java EE applications.
- Externalize SSL configuration parameters like keystore path, truststore path, and authentication type in a configuration file, rather than embedding these values in the application code. This allows you the flexibility to change SSL configuration without having to change the application itself.

### 6.9 WLST Reference for SSL

Starting with 11g Release 1 (11.1.1), WLST commands have been added to manage Oracle wallets and JKS keystores and to configure SSL for Oracle Fusion Middleware components.

Use the commands listed in Table 6–1, Table 6–2, and Table 6–3 for this task.

**See Also:** Section 7.2, "Command-Line Interface for Keystores and Wallets" for important instructions on how to launch the WLST shell to run SSL-related commands. Do not launch the WLST interface from any other location.

**Note:** All WLST commands for SSL configuration must be run in online mode.

You can obtain help for each command by issuing:

```
help('command_name')
```

6.9.1 addCertificateRequest

Online command that generates a certificate signing request in an Oracle wallet.

**6.9.1.1 Description**

This command generates a certificate signing request in Base64 encoded PKCS#10 format in an Oracle wallet for a component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). To get a certificate signed by a certificate authority (CA), send the certificate signing request to your CA.

**6.9.1.2 Syntax**

```
addCertificateRequest('instName', 'compName', 'compType', 'walletName', 'password', 'DN', 'keySize')
```

**6.9.1.3 Example**

The following command generates a certificate signing request with DN `cn=www.acme.com` and key size 1024 in `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`:

```
wls:/mydomain/serverConfig> addCertificateRequest('inst1', 'oid1', 'oid','wallet1', 'password', 'cn=www.acme.com', '1024',)
```

---

**Note:** WLST allows you to import certificates only in PEM format.

---

6.9.2 addSelfSignedCertificate

Online command that adds a self-signed certificate.

**6.9.2.1 Description**

This command creates a key pair and wraps it in a self-signed certificate in an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). Only keys based on the RSA algorithm are generated.

**6.9.2.2 Syntax**

```
addSelfSignedCertificate('instName', 'compName', 'compType', 'walletName', 'password', 'DN', 'keySize')
```
6.9.2.3 Example
The following command adds a self-signed certificate with DN `cn=www.acme.com`, key size 1024 to `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`:

```
<wls:/mydomain/serverConfig> addSelfSignedCertificate('inst1', 'oid1',
'oid','wallet1', 'password', 'cn=www.acme.com', '1024')
```

6.9.3 changeKeyStorePassword
Online command that changes the keystore password.

6.9.3.1 Description
This command changes the password of a Java Keystore (JKS) file for an Oracle Virtual Directory instance.

6.9.3.2 Syntax
```
changeKeyStorePassword('instName', 'compName', 'compType', 'keystoreName',
'currPassword', 'newPassword')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs', 'oid', and 'webcache'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the filename of the keystore.</td>
</tr>
<tr>
<td>currPassword</td>
<td>Specifies the current keystore password.</td>
</tr>
<tr>
<td>newPassword</td>
<td>Specifies the new keystore password.</td>
</tr>
</tbody>
</table>

6.9.3.3 Example
The following command changes the password of file `keys.jks` for Oracle Virtual Directory instance `ovd1` in application server instance `inst1`:

```
<wls:/mydomain/serverConfig> changeKeyStorePassword('inst1', 'ovd1',
'ovd','keys.jks', 'currPassword', 'newpassword')
```

6.9.4 changeWalletPassword
Online command that changes the password of an Oracle wallet.
6.9.4.1 Description
This command changes the password of an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). This command is only applicable to password-protected wallets.

6.9.4.2 Syntax
\[
\text{changeWalletPassword('instName', 'compName', 'compType', 'walletName', 'currPassword', 'newPassword')}\]

### Table: Argument Definition

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'oid', 'ohs', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the filename of the wallet.</td>
</tr>
<tr>
<td>currPassword</td>
<td>Specifies the current wallet password.</td>
</tr>
<tr>
<td>newPassword</td>
<td>Specifies the new wallet password.</td>
</tr>
</tbody>
</table>

6.9.4.3 Example
The following command changes the password for wallet1 from currpassword to newpassword for Oracle HTTP Server instance ohs1 in application server instance inst1:

\[
wls:/mydomain/serverConfig> \text{changeWalletPassword('inst1', 'ohs1', 'ohs', 'wallet1', 'currpassword', 'newpassword')}\]

6.9.5 configureSSL
Online command that sets SSL attributes.

6.9.5.1 Description
This command sets the SSL attributes for a component listener. The attributes are specified in a properties file format (name=value). If a properties file is not provided, or it does not contain any SSL attributes, default attribute values are used.

For details about the format of properties files, see Section 6.9.28, "Properties Files for SSL."

6.9.5.2 Syntax
\[
\text{configureSSL('instName', 'compName', 'compType', 'listener', 'filePath')}\]

### Table: Argument Definition

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'oid', 'ohs', and 'webcache'.</td>
</tr>
<tr>
<td>listener</td>
<td>Specifies the name of the component listener to be configured for SSL.</td>
</tr>
<tr>
<td>filePath</td>
<td>Specifies the absolute path of the properties file containing the SSL attributes to set.</td>
</tr>
</tbody>
</table>
6.9.5.3 Examples
The following command configures SSL attributes specified in the properties file
/tmp/ssl.properties for Oracle Virtual Directory instance ovd1 in application
server instance inst1, for listener listener1:

`wls:/mydomain/serverConfig> configureSSL('inst1', 'ovd1', 'ovd', 'listener1', '/tmp/ssl.properties')`

The following command configures SSL attributes without specifying a properties file.
Since no file is provided, the default SSL attribute values are used:

`wls:/mydomain/serverConfig> configureSSL('inst1', 'ovd1', 'ovd', 'listener2')`

6.9.6 createKeyStore

Online command that creates a JKS keystore.

6.9.6.1 Description
This command creates a Java keystore (JKS) for the specified Oracle Virtual Directory
instance. For keystore file location and other information, see Section 7.3.6.1, "Location
of Keystores."

6.9.6.2 Syntax
`createKeyStore('instName', 'compName', 'compType', 'keystoreName', 'password')`

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the filename of the keystore file to be created.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the keystore password.</td>
</tr>
</tbody>
</table>

6.9.6.3 Example
The following command creates JKS file `keys.jks` with password `password` for
Oracle Virtual Directory instance `ovd1` in application server instance `inst1`:

`wls:/mydomain/serverConfig> createKeyStore('inst1', 'ovd1', 'ovd','keys.jks', 'password')`

6.9.7 createWallet

Online command that creates an Oracle wallet.

6.9.7.1 Description
This command creates an Oracle wallet for the specified component instance (Oracle
HTTP Server, Oracle WebCache or Oracle Internet Directory). Wallets can be of
password-protected or auto-login type. For wallet details, see Chapter 7, "Managing
Keystores, Wallets, and Certificates."

6.9.7.2 Syntax
`createWallet('instName', 'compName', 'compType', 'walletName', 'password')`
6.9.7.3 Examples

The following command creates a wallet named \textit{wallet1} with password \textit{password}, for Oracle HTTP Server instance \textit{ohs1} in application server instance \textit{inst1}:

\texttt{wls:/mydomain/serverConfig> createWallet('inst1', 'ohs1', 'ohs','wallet1', 'password')}

The following command creates an auto-login wallet named \textit{wallet2} for Oracle WebCache instance \textit{wc1}, in application server instance \textit{inst1}:

\texttt{wls:/mydomain/serverConfig> createWallet('inst1', 'wc1', 'webcache','wallet2', '')}

6.9.8 deleteKeyStore

Online command that deletes a keystore.

6.9.8.1 Description

This command deletes a keystore for a specified Oracle Virtual Directory instance.

6.9.8.2 Syntax

deleteKeyStore('instName', 'compName', 'compType', 'keystoreName')

6.9.8.3 Example

The following command deletes JKS file \textit{keys.jks} for Oracle Virtual Directory instance \textit{ovd1} in application server instance \textit{inst1}:

\texttt{wls:/mydomain/serverConfig> deleteKeyStore('inst1', 'ovd1', 'ovd','keys.jks')}

6.9.9 deleteWallet

Online command that deletes an Oracle wallet.

6.9.9.1 Description

This command deletes an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory).
### 6.9.2 Syntax

```java
deleteWallet('instName', 'compName', 'compType', 'walletName')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'oid', 'ohs', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet file to be deleted.</td>
</tr>
</tbody>
</table>

### 6.9.3 Example

The following command deletes a wallet named `wallet1` for Oracle HTTP Server instance `ohs1` in application server instance `inst1`:

```bash
wls:/mydomain/serverConfig> deleteWallet('inst1', 'ohs1', 'ohs', 'wallet1')
```

### 6.9.10 exportKeyStore

Online command that exports the keystore to a file.

#### 6.9.10.1 Description

This command exports a keystore, configured for the specified Oracle Virtual Directory instance, to a file under the given directory. The exported filename is the same as the keystore name.

#### 6.9.10.2 Syntax

```java
exportKeyStore('instName', 'compName', 'compType', 'keystoreName', 'password', 'path')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>path</td>
<td>Specifies the absolute path of the directory under which the keystore is exported.</td>
</tr>
</tbody>
</table>

#### 6.9.10.3 Example

The following command exports the keystore `keys.jks` for Oracle Virtual Directory instance `ovd1` to file `keys.jks` under `/tmp`:

```bash
wls:/mydomain/serverConfig> exportKeyStore('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', '/tmp')
```

### 6.9.11 exportKeyStoreObject

Online command that exports an object from a keystore to a file.
6.9.11.1 Description
This command exports a certificate signing request, certificate/certificate chain, or trusted certificate present in a Java keystore (JKS) to a file for the specified Oracle Virtual Directory instance. The certificate signing request is generated before exporting the object. The alias specifies the object to be exported.

6.9.11.2 Syntax
exportKeyStoreObject('instName', 'compName', 'compType', 'keystoreName', 'password', 'type', 'path', 'alias')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of the keystore object to be exported. Valid values are 'CertificateRequest', 'Certificate', 'TrustedCertificate' and 'TrustedChain'.</td>
</tr>
<tr>
<td>path</td>
<td>Specifies the absolute path of the directory under which the object is exported as a file named base64.txt.</td>
</tr>
<tr>
<td>alias</td>
<td>Specifies the alias of the keystore object to be exported.</td>
</tr>
</tbody>
</table>

6.9.11.3 Examples
The following command generates and exports a certificate signing request from the key-pair indicated by alias mykey in keys.jks, for Oracle Virtual Directory instance ovd1 in application server instance inst1. The certificate signing request is exported under the directory /tmp:

wls:/mydomain/serverConfig> exportKeyStoreObject('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'CertificateRequest', '/tmp','mykey')

The following command exports a certificate or certificate chain indicated by alias mykey in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1. The certificate or certificate chain is exported under the directory /tmp:

wls:/mydomain/serverConfig> exportKeyStoreObject('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'Certificate', '/tmp','mykey')

The following command exports a trusted certificate indicated by alias mykey in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1. The trusted certificate is exported under the directory /tmp:

wls:/mydomain/serverConfig> exportKeyStoreObject('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'TrustedCertificate', '/tmp','mykey')

6.9.12 exportWallet
Online command that exports an Oracle wallet.
6.9.12.1 Description
This command exports an Oracle wallet, configured for a specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory), to files under the given directory. If the exported file is an auto-login only wallet, the file name is cwallet.sso. If it is password-protected wallet, two files are created—ewallet.p12 and cwallet.sso.

6.9.12.2 Syntax
exportWallet('instName', 'compName', 'compType', 'walletName', 'password', 'path')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'oid', 'ohs', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the wallet.</td>
</tr>
<tr>
<td>path</td>
<td>Specifies the absolute path of the directory under which the object is exported.</td>
</tr>
</tbody>
</table>

6.9.12.3 Examples
The following command exports auto-login wallet wallet1 for Oracle Internet Directory instance oid1 to file cwallet.sso under /tmp:

wls:/mydomain/serverConfig> exportWallet('inst1', 'oid1', 'oid', 'wallet1', '', '/tmp')

The following command exports password-protected wallet wallet2 for Oracle Internet Directory instance oid1 to two files, ewallet.p12 and cwallet.sso, under /tmp:

wls:/mydomain/serverConfig> exportWallet('inst1', 'oid1', 'oid', 'wallet2', 'password', '/tmp')

6.9.13 exportWalletObject
Online command that exports a certificate or other wallet object to a file.

6.9.13.1 Description
This command exports a certificate signing request, certificate, certificate chain or trusted certificate present in an Oracle wallet to a file for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). DN indicates the object to be exported.

6.9.13.2 Syntax
exportWalletObject('instName', 'compName', 'compType', 'walletName', 'password', 'type', 'path', 'DN')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
</tbody>
</table>
### 6.9.13.3 Examples

The following command exports a certificate signing request with DN `cn=www.acme.com` in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1. The certificate signing request is exported under the directory `/tmp`:

```
wlst:/mydomain/serverConfig> exportWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'CertificateRequest', '/tmp', 'cn=www.acme.com')
```

The following command exports a certificate with DN `cn=www.acme.com` in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1. The certificate or certificate chain is exported under the directory `/tmp`:

```
wlst:/mydomain/serverConfig> exportWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'Certificate', '/tmp', 'cn=www.acme.com')
```

The following command exports a trusted certificate with DN `cn=www.acme.com` in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1. The trusted certificate is exported under the directory `/tmp`:

```
wlst:/mydomain/serverConfig> exportWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedCertificate', '/tmp', 'cn=www.acme.com')
```

The following command exports a certificate chain with DN `cn=www.acme.com` in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1. The certificate or certificate chain is exported under the directory `/tmp`:

```
wlst:/mydomain/serverConfig> exportWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedChain', '/tmp', 'cn=www.acme.com')
```

### 6.9.14 generateKey

Online command that generates a key pair in a Java keystore.

#### 6.9.14.1 Description

This command generates a key pair in a Java keystore (JKS) for Oracle Virtual Directory. It also wraps the key pair in a self-signed certificate. Only keys based on the RSA algorithm are generated.

#### 6.9.14.2 Syntax

```
generateKey('instName', 'compName', 'compType', 'keystoreName', 'password', 'DN',
```
6.9.14.3 Examples

The following command generates a key pair with DN cn=www.acme.com, key size 1024, algorithm RSA and alias mykey in keys.jks, for Oracle Virtual Directory instance ovd1 in application server instance inst1:

```
wlst:/mydomain/serverConfig> generateKey('inst1', 'ovd1', 'ovd','keys.jks',
'password', 'cn=www.acme.com', '1024', 'mykey', 'RSA')
```

The following command is the same as above, except it does not explicitly specify the key algorithm:

```
wlst:/mydomain/serverConfig> generateKey('inst1', 'ovd1', 'ovd','keys.jks',
'password', 'cn=www.acme.com', '1024', 'mykey')
```

6.9.15 getKeyStoreObject

Online command that shows details about a keystore object.

6.9.15.1 Description

This command displays a specific certificate or trusted certificate present in a Java keystore (JKS) for Oracle Virtual Directory. The keystore object is indicated by its index number, as given by the listKeyStoreObjects command. It shows the certificate details including DN, key size, algorithm, and other information.

6.9.15.2 Syntax

```
getKeyStoreObject('instName', 'compName', 'compType', 'keystoreName', 'password',
'type', 'index')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>DN</td>
<td>Specifies the Distinguished Name of the key pair entry.</td>
</tr>
<tr>
<td>keySize</td>
<td>Specifies the key size in bits.</td>
</tr>
<tr>
<td>alias</td>
<td>Specifies the alias of the key pair entry in the keystore.</td>
</tr>
<tr>
<td>algorithm</td>
<td>Specifies the key algorithm. Valid value is 'RSA'.</td>
</tr>
</tbody>
</table>
6.9.15.3 Examples
The following command shows a trusted certificate with index 1 present in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1:

```
wlst:/mydomain/serverConfig> getKeyStoreObject('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'TrustedCertificate', '1')
```

The following command shows a certificate with index 1 present in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1:

```
wlst:/mydomain/serverConfig> getKeyStoreObject('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'Certificate', '1')
```

6.9.16 getSSL
Online command that lists the configured SSL attributes.

6.9.16.1 Description
This command lists the configured SSL attributes for the specified component listener. For Oracle Internet Directory, the listener name is always sslport1.

6.9.16.2 Syntax
```
getSSL('instName', 'compName', 'compType', 'listener')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ovd', 'oid', 'ohs', and 'webcache'.</td>
</tr>
<tr>
<td>listener</td>
<td>Specifies the name of the component listener.</td>
</tr>
</tbody>
</table>

6.9.16.3 Example
The following command shows the SSL attributes configured for Oracle Internet Directory instance oid1, in application server instance inst1, for listener sslport1:

```
wls:/mydomain/serverConfig> getSSL('inst1', 'oid1', 'oid', 'sslport1')
```

6.9.17 getWalletObject
Online command that displays information about a certificate or other object in an Oracle wallet.
6.9.17.1 Description
This command displays a specific certificate signing request, certificate or trusted certificate present in an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). The wallet object is indicated by its index number, as given by the listWalletObjects command. For certificates or trusted certificates, it shows the certificate details including DN, key size, algorithm and other data. For certificate signing requests, it shows the subject DN, key size and algorithm.

6.9.17.2 Syntax
getWalletObject('instName', 'compName', 'compType', 'walletName', 'password', 'type', 'index')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs', 'oid', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the wallet.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of wallet object to be exported. Valid values are 'CertificateRequest', 'Certificate', and 'TrustedCertificate'.</td>
</tr>
<tr>
<td>index</td>
<td>Specifies the index number of the wallet object as returned by the listWalletObjects command.</td>
</tr>
</tbody>
</table>

6.9.17.3 Examples
The following command shows certificate signing request details for the object with index 0 present in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> getWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'CertificateRequest', '0')
```

The following command shows certificate details for the object with index 0 present in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> getWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'Certificate', '0')
```

The following command shows trusted certificate details for the object with index 0, present in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> getWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedCertificate', '0')
```

6.9.18 importKeyStore
Online command that imports a keystore from a file.
6.9.18.1 Description
This command imports a Java keystore (JKS) from a file to the specified Oracle Virtual
Directory instance for manageability. The component instance name must be unique.

6.9.18.2 Syntax
importKeyStore('instName', 'compName', 'compType', 'keystoreName',
'password', 'filePath')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore being imported. This name must be unique for this component instance.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>filePath</td>
<td>Specifies the absolute path of the keystore file to be imported.</td>
</tr>
</tbody>
</table>

6.9.18.3 Example
The following command imports the keystore /tmp/keys.jks as file.jks into Oracle Virtual Directory instance ovd1. Subsequently, the keystore is managed through the name file.jks:

wls:/mydomain/serverConfig> importKeyStore('inst1', 'ovd1', 'ovd', 'file.jks',
'password', '/tmp/keys.jks')

6.9.19 importKeyStoreObject
Online command that imports an object from a file to a keystore.

6.9.19.1 Description
This command imports a certificate, certificate chain, or trusted certificate into a Java keystore (JKS) for Oracle Virtual Directory, assigning it the specified alias which must be unique in the keystore. If a certificate or certificate chain is being imported, the alias must match that of the corresponding key-pair.

6.9.19.2 Syntax
importKeyStoreObject('instName', 'compName', 'compType', 'keystoreName',
'password', 'type', 'filePath', 'alias')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of the keystore object to be imported. Valid values are 'Certificate' and 'TrustedCertificate'.</td>
</tr>
<tr>
<td>filePath</td>
<td>Specifies the absolute path of the file containing the keystore object.</td>
</tr>
</tbody>
</table>
6.9.19.3 Examples

The following command imports a certificate or certificate chain from file `cert.txt` into `keys.jks`, using alias `mykey` for Oracle Virtual Directory instance `ovd1`, in application server instance `inst1`. The file `keys.jks` must already have an alias `mykey` for a key-pair whose public key matches that in the certificate being imported:

```java
wls:/mydomain/serverConfig> importKeyStoreObject('inst1', 'ovd1', 'ovd','keys.jks', 'password', 'Certificate','/tmp/cert.txt', 'mykey')
```

The following command imports a trusted certificate from file `trust.txt` into `keys.jks` using alias `mykey1`, for Oracle Virtual Directory instance `ovd1` in application server instance `inst1`:

```java
wls:/mydomain/serverConfig> importKeyStoreObject('inst1', 'ovd1', 'ovd','keys.jks', 'password', 'TrustedCertificate','/tmp/trust.txt', 'mykey1')
```

6.9.20 importWallet

Online command that imports an Oracle wallet from a file.

6.9.20.1 Description

This command imports an Oracle wallet from a file to the specified component instance (Oracle HTTP Server, Oracle WebCache, or Oracle Internet Directory) for manageability. If the wallet being imported is an auto-login wallet, the file path must point to `cwallet.sso`; if the wallet is password-protected, it must point to `ewallet.p12`. The wallet name must be unique for the component instance.

6.9.20.2 Syntax

```
importWallet('instName', 'compName', 'compType', 'walletName', 'password', 'filePath')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs', 'oid', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet being imported. The name must be unique for the component instance.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the wallet.</td>
</tr>
<tr>
<td>filePath</td>
<td>Specifies the absolute path of the wallet file being imported.</td>
</tr>
</tbody>
</table>

6.9.20.3 Examples

The following command imports the auto-login wallet file `/tmp/cwallet.sso` as `wallet1` into Oracle Internet Directory instance `oid1`. Subsequently, the wallet is managed with the name `wallet1`. No password is passed since it is an auto-login wallet:

```java
wls:/mydomain/serverConfig> importWallet('inst1', 'oid1', 'oid', 'wallet1', '', '/tmp/cwallet.sso')
```
The following command imports password-protected wallet /tmp/ewallet.p12 as wallet2 into Oracle Internet Directory instance oid1. Subsequently, the wallet is managed with the name wallet2. The wallet password is passed as a parameter:

wls:/mydomain/serverConfig> importWallet('inst1', 'oid1', 'oid', 'wallet2', 'password', '/tmp/ewallet.p12')

6.9.21 importWalletObject

Online command that imports a certificate or other object into an Oracle wallet.

6.9.21.1 Description

This command imports a certificate, trusted certificate or certificate chain into an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache component or Oracle Internet Directory). When importing a certificate, use the same wallet file from which the certificate signing request was generated.

6.9.21.2 Syntax

importWalletObject('instName', 'compName', 'compType', 'walletName', 'password', 'type', 'filePath')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs', 'oid', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the wallet.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of wallet object to be imported. Valid values are 'Certificate', 'TrustedCertificate' and 'TrustedChain'.</td>
</tr>
<tr>
<td>filePath</td>
<td>Specifies the absolute path of the file containing the wallet object.</td>
</tr>
</tbody>
</table>

6.9.21.3 Examples

The following command imports a certificate chain in PKCS#7 format from file chain.txt into wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

wls:/mydomain/serverConfig> importWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedChain', '/tmp/chain.txt')

The following command imports a certificate from file cert.txt into wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

wls:/mydomain/serverConfig> importWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'Certificate', '/tmp/cert.txt')

The following command imports a trusted certificate from file trust.txt into wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

wls:/mydomain/serverConfig> importWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedCertificate', '/tmp/trust.txt')
6.9.22 listKeyStoreObjects

Online command that lists the contents of a keystore.

6.9.22.1 Description
This command lists all the certificates or trusted certificates present in a Java keystore (JKS) for Oracle Virtual Directory.

6.9.22.2 Syntax
listKeyStoreObjects('instName', 'compName', 'compType', 'keystoreName', 'password', 'type')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of keystore object to be listed. Valid values are 'Certificate' and 'TrustedCertificate'.</td>
</tr>
</tbody>
</table>

6.9.22.3 Examples
The following command lists all trusted certificates present in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1:

wls:/mydomain/serverConfig> listKeyStoreObjects('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'TrustedCertificate')

The following command lists all certificates present in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1:

wls:/mydomain/serverConfig> listKeyStoreObjects('inst1', 'ovd1', 'ovd', 'keys.jks', 'password', 'Certificate')

6.9.23 listKeyStores

Online command that lists all the keystores for a component.

6.9.23.1 Description
This command lists all the Java keystores (JKS) configured for the specified Oracle Virtual Directory instance.

6.9.23.2 Syntax
listKeyStores('instName', 'compName', 'compType')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
</tbody>
</table>
6.9.23.3 Example
The following command lists all keystores for Oracle Virtual Directory instance ovd1 in application server instance inst1:

```
wls:/mydomain/serverConfig> listKeyStores('inst1', 'ovd1', 'ovd')
```

6.9.24 listWalletObjects
Online command that lists all objects in an Oracle wallet.

6.9.24.1 Description
This command lists all certificate signing requests, certificates, or trusted certificates present in an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory).

6.9.24.2 Syntax
```
listWalletObjects('instName', 'compName', 'compType', 'walletName', 'password', 'type')
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs', 'oid', and 'webcache'.</td>
</tr>
<tr>
<td>walletName</td>
<td>Specifies the name of the wallet file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the wallet.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of wallet object to be listed. Valid values are 'CertificateRequest', 'Certificate', and 'TrustedCertificate'.</td>
</tr>
</tbody>
</table>

6.9.24.3 Examples
The following command lists all certificate signing requests in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> listWalletObjects('inst1', 'oid1', 'oid', 'wallet1', 'password', 'CertificateRequest')
```

The following command lists all certificates in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> listWalletObjects('inst1', 'oid1', 'oid', 'wallet1', 'password', 'Certificate')
```

The following command lists all trusted certificates in wallet1, for Oracle Internet Directory instance oid1, in application server instance inst1:

```
wls:/mydomain/serverConfig> listWalletObjects('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedCertificate')
```

6.9.25 listWallets
Online command that lists all wallets configured for a component instance.
6.9.25.1 Description
This command displays all the wallets configured for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory), and identifies the auto-login wallets.

6.9.25.2 Syntax
listWallets('instName', 'compName', 'compType')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid values are 'ohs','oid', and 'webcache'.</td>
</tr>
</tbody>
</table>

6.9.25.3 Example
The following command lists all wallets for Oracle Internet Directory instance oid1 in application server instance inst1:

wls:/mydomain/serverConfig> > listWallets('inst1', 'oid1', 'oid')

6.9.26 removeKeyStoreObject
Online command that removes an object from a keystore.

6.9.26.1 Description
This command removes a certificate request, certificate, trusted certificate, or all trusted certificates from a Java keystore (JKS) for Oracle Virtual Directory. Use an alias to remove a specific object; no alias is needed if all trusted certificates are being removed.

6.9.26.2 Syntax
removeKeyStoreObject('instName', 'compName', 'compType', 'keystoreName', 'password', 'type', 'alias')

<table>
<thead>
<tr>
<th>Argument</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>instName</td>
<td>Specifies the name of the application server instance.</td>
</tr>
<tr>
<td>compName</td>
<td>Specifies the name of the component instance.</td>
</tr>
<tr>
<td>compType</td>
<td>Specifies the type of component. Valid value is 'ovd'.</td>
</tr>
<tr>
<td>keystoreName</td>
<td>Specifies the name of the keystore file.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password of the keystore.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of the keystore object to be removed. Valid values are 'Certificate', 'TrustedCertificate' or 'TrustedAll'.</td>
</tr>
<tr>
<td>alias</td>
<td>Specifies the alias of the keystore object to be removed.</td>
</tr>
</tbody>
</table>

6.9.26.3 Examples
The following command removes a certificate or certificate chain denoted by alias mykey in keys.jks, for Oracle Virtual Directory instance ovd1, in application server instance inst1:

wls:/mydomain/serverConfig> x removeKeyStoreObject('inst1', 'oid1', 'oid', 'keys.jks', 'ovd', 'Certificate', 'mykey')
WLST Reference for SSL

SSL Configuration in Oracle Fusion Middleware

6.9.27 removeWalletObject

Online command that removes a certificate or other object from an Oracle wallet.

6.9.27.1 Description

This command removes a certificate signing request, certificate, trusted certificate or all trusted certificates from an Oracle wallet for the specified component instance (Oracle HTTP Server, Oracle WebCache or Oracle Internet Directory). DN is used to indicate the object to be removed.

6.9.27.2 Syntax

```
removeWalletObject('instName', 'compName', 'compType', 'walletName', 'password', 'type', 'DN')
```

6.9.27.3 Examples

The following command removes all trusted certificates from `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`. It is not necessary to provide a DN, so you pass null (denoted by `None`) for the DN parameter:

```
wls:/mydomain/serverConfig> removeWalletObject('inst1', 'oid1', 'oid', 'wallet1', 'password', 'TrustedAll',None)
```
The following command removes a certificate signing request indicated by DN `cn=www.acme.com` from `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`:

```
wls:/mydomain/serverConfig> removeWalletObject('inst1', 'oid1', 'oid','wallet1', 'password', 'CertificateRequest','cn=www.acme.com')
```

The following command removes a certificate indicated by DN `cn=www.acme.com` from `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`:

```
wls:/mydomain/serverConfig> removeWalletObject('inst1', 'oid1', 'oid','wallet1', 'password', 'Certificate','cn=www.acme.com')
```

The following command removes a trusted certificate indicated by DN `cn=www.acme.com` from `wallet1`, for Oracle Internet Directory instance `oid1`, in application server instance `inst1`:

```
wls:/mydomain/serverConfig> removeWalletObject('inst1', 'oid1', 'oid','wallet1', 'password', 'TrustedCertificate','cn=www.acme.com')
```

### 6.9.28 Properties Files for SSL

SSL configuration employs certain properties files for use with the WLST `configureSSL` command. The files contain parameters to specify the desired SSL configuration, such as authentication type, cipher values, and SSL version.

You can use descriptive names if you need to manage multiple properties files for different components. For example, you could have properties files named `ohs-ssl-properties.prop` or `ovd-ssl-properties.prop`.

#### 6.9.28.1 Structure of Properties Files

All the SSL properties files have a consistent structure.

*Table 6–4* provides details about the key-value structure and usage of these files.

<table>
<thead>
<tr>
<th>Key</th>
<th>Mandatory?</th>
<th>Allowed Values for Oracle HTTP Server, Oracle Internet Directory, and Oracle Web Cache</th>
<th>Allowed Values for Oracle Virtual Directory</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSLEnabled</td>
<td>No</td>
<td>true false</td>
<td>true false</td>
<td>Either value</td>
</tr>
<tr>
<td>Ciphers</td>
<td>No</td>
<td>SSL_RSA_WITH_RC4_128_MD5 SSL_RSA_WITH_RC4_128_SHA SSL_RSA_WITH_3DES_EDE_CBC_SHA SSL_RSA_WITH_DES_CBC_SHA SSL_DH_anon_WITH_RC4_128_MD5 SSL_DH_anon_WITH_3DES_EDE_CBC_SHA SSL_DH_anon_WITH_DES_CBC_SHA TLS_RSA_WITH_AES_128_CBC_SHA TLS_RSA_WITH_AES_256_CBC_SHA</td>
<td>One of more of the ciphers allowed by the JSSE provider. For the complete list of ciphers allowed by JDK 1.5, see Appendix A of the following guide -<a href="http://java.sun.com/j2se/1.5.0/docs/guide/security/jsse/JSSERefGuide.html">http://java.sun.com/j2se/1.5.0/docs/guide/security/jsse/JSSERefGuide.html</a></td>
<td>One or more comma separated values</td>
</tr>
<tr>
<td>SSLVersions</td>
<td>No</td>
<td>nzos_Version_3_0 nzos_Version_3_0_With_2_0_Hello nzos_Version_1_0</td>
<td>TLSv1 SSLv2Hello (cannot be specified alone, must specify at least one other version) SSLv3</td>
<td>One or more comma separated values</td>
</tr>
</tbody>
</table>
Table 6–5 shows the default values:

<table>
<thead>
<tr>
<th>Key</th>
<th>Mandatory?</th>
<th>Default Value for Oracle HTTP Server</th>
<th>Default Value for Oracle Web Cache</th>
<th>Default Value for Oracle Internet Directory</th>
<th>Default Value for Oracle Virtual Directory</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSLEnabled</td>
<td></td>
<td>true</td>
<td>true</td>
<td>true</td>
<td>true</td>
<td>Either value</td>
</tr>
<tr>
<td>Ciphers</td>
<td></td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>Path of the CRL file, or directory containing CRL files</td>
</tr>
<tr>
<td>SSLVersions</td>
<td></td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>Any one value</td>
</tr>
<tr>
<td>KeyStore</td>
<td></td>
<td>Valid wallet name</td>
<td>Valid keystore name</td>
<td>Valid truststore name</td>
<td>Any one value</td>
<td></td>
</tr>
<tr>
<td>TrustStore</td>
<td></td>
<td>N/A</td>
<td>None</td>
<td>None</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>AuthenticationType</td>
<td></td>
<td>None</td>
<td>Server</td>
<td>Server</td>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Optional</td>
<td>Optional</td>
<td>Mutual</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

- At least one DH_anon cipher must be used in SSL no-auth mode. For all other modes, at least one RSA cipher must be used.
- The value of the KeyStore parameter must be specified when configuring SSL in server-auth, mutual-auth, or optional client auth.
- If only AES ciphers have been specified, the SSLVersions parameter must contain TLSv1 or nzos_Version_1_0.
- If you are doing CRL-based validation, the value of the CertValidation parameter should be crl and the value of the CertValidationPath parameter should point to the CRL file/directory.
6.9.28.2 Examples of Properties Files

Some examples demonstrating the use of the properties files follow.

**Example 1: Basic Properties File**

```
SSLEnabled=true
AuthenticationType=None
CertValidation=none
```

This properties file specifies no authentication mode, and default values will be used during SSL configuration for ciphers and SSL version. Keystore and truststore properties are not specified since the authentication type is None. For other authentication types, keystore must be specified.

**Example 2: Basic Properties File**

```
SSLEnabled=
AuthenticationType=None
CertValidation=none
```

This properties file is exactly the same as above, except that \texttt{SSLEnabled} is explicitly specified without any value. This is the same as not specifying the key at all. In both cases, the default value will be used.

Therefore, all the following three settings have the same meaning:

```
SSLEnabled=true
```

Here the value \texttt{true} is explicitly specified.

```
SSLEnabled=
```

Since no value is mentioned here, the default value of \texttt{SSLEnabled} (\texttt{true}) is used.

- The key \texttt{SSLEnabled} is not present in the properties file.
  - Since the key is not present, its default value (\texttt{true}) is used.

**Example 3: Properties File with Version for OHS**

```
SSLEnabled=true
AuthenticationType=Mutual
SSLVersion=nzos_Version_3_0
CertValidation=crl
CertValidationPath=file:///tmp/file.crl
KeyStore=ohs1
```

This properties file has:

- Default values for ciphers
- Keystore
- SSL version v3
- CRL validation turned on
- Mutual Authentication mode

**Example 4: Properties File with Ciphers for Oracle Virtual Directory**

```
AuthenticationType=Server
Ciphers=SSL_RSA_WITH_RC4_128_MD5
```

Oracle Fusion Middleware Administrator's Guide
SSLVersion=SSLv3,SSLv2Hello
KeyStore=ovidentity.jks
TrustStore=ovdtrust.jks
SSLEnabled=true

This properties file contains:
■ Specific cipher value
■ SSL Version
■ Server authentication mode
Managing Keystores, Wallets, and Certificates

This chapter explains how to use Oracle Fusion Middleware security features to administer keystores, wallets, and certificates. It contains these sections:

- Key and Certificate Storage in Oracle Fusion Middleware
- Command-Line Interface for Keystores and Wallets
- JKS Keystore Management
- Wallet Management

7.1 Key and Certificate Storage in Oracle Fusion Middleware

Private keys, digital certificates, and trusted CA certificates are stored in keystores. This section describes the keystores available in Oracle Fusion Middleware and contains these topics:

- Types of Keystores
- Keystore Management Tools

7.1.1 Types of Keystores

Oracle Fusion Middleware provides two types of keystores for keys and certificates:

- JKS Keystore and Truststore
- Oracle Wallet

7.1.1.1 JKS Keystore and Truststore

A JKS keystore is the default JDK implementation of Java keystores provided by Sun Microsystems. In 11g Release 1 (11.1.1), all Java components and Java EE applications use the JKS-based keystore and truststore.

You use a JKS-based keystore for the following:

- Oracle Virtual Directory
- Applications deployed on Oracle WebLogic Server, including:
  - Oracle SOA Suite
  - Oracle WebCenter
In Oracle Fusion Middleware, you can use GUI or command-line tools to create, import, export, and delete a Java keystore and the certificates contained in the keystore. See Section 7.1.2, "Keystore Management Tools" for details.

While creating a keystore, you can pre-populate it with a keypair wrapped in a self-signed certificate; such a keystore is typically used in development and testing phases.

The other choice is to generate a certificate signing request for a keypair, so that you can request a signed certificate back from a Certificate Authority (CA). Once the CA sends the certificate back, it is imported into the keystore; the keystore now contains a trusted certificate, since it comes from a trusted third-party. Such a keystore is typically used in production environments.

Keystores are always password-protected.

### 7.1.1.2 Oracle Wallet

An Oracle wallet is a container that stores your credentials, such as certificates, trusted certificates, certificate requests, and private keys. You can store Oracle wallets on the file system or in LDAP directories such as Oracle Internet Directory. Oracle wallets can be auto-login or password-protected wallets.

You use an Oracle Wallet for the following components:

- Oracle HTTP Server
- Oracle Web Cache
- Oracle Internet Directory

In Oracle Fusion Middleware, you can use GUI or command-line tools to create, import, export and delete a wallet and the certificates contained in the wallet. See Section 7.1.2, "Keystore Management Tools" for details.

When creating a wallet, you can pre-populate it with a self-signed certificate; such a wallet is called a test wallet and is typically used in development and testing phases.

The other choice is to create a certificate request, so that you can request a signed certificate back from a Certificate Authority (CA). Once the CA sends the certificate back, it is imported into the wallet; such a wallet is called a third-party wallet.

Either the test wallet or the third-party wallet may be password-protected, or may be configured to not require a password, in which case it is called an auto-login wallet.

### 7.1.2 Keystore Management Tools

Oracle Fusion Middleware provides these options for keystore operations:

- WLST, a command-line interface for JKS keystores and wallets
- orapki, a command-line tool for wallets
- Fusion Middleware Control, a graphical user interface
- Oracle Wallet Manager, a stand-alone GUI tool for wallets, recommended for managing PKCS#11 wallets

This table shows the type of keystore used by each component, and the tool(s) available to manage the keystore:
### About Importing DER-encoded Certificates

Note the following when importing DER-encoded certificates:

- To import DER-encoded certificates or trusted certificates into an Oracle wallet, use:
  - Oracle Wallet Manager or
  - `orapki` command-line tool
- To import DER-encoded certificates or trusted certificates into a JKS keystore, use the `keytool` utility.

### Additional Information

Details about the tools are provided in these sections:

- Command-Line Interface for Keystores and Wallets
- JKS Keystore Management
- Wallet Management
- Appendix H, "Oracle Wallet Manager and orapki"

### 7.2 Command-Line Interface for Keystores and Wallets

Oracle Fusion Middleware provides a set of `wlst` scripts to create and manage JKS keystores and Oracle wallets, and to manipulate their stored objects.

#### How to Launch the WLST Command-Line Interface

Navigate to `$ORACLE_HOME/common/bin` and execute the script `wlst.sh` (Linux platforms) or `wlst.cmd` (Windows platforms).
This brings up the WLST shell. Connect to a running Oracle WebLogic Server instance by specifying the user name, password, and connect URL. After connecting, you are now ready to run SSL-related WLST commands as explained in the subsequent sections.

7.3 JKS Keystore Management

This section describes the typical life cycle of keystores and certificates, and how to use Oracle Fusion Middleware tools to create and maintain keystores and certificates. It includes these topics:

- About Keystores and Certificates
- Managing the Keystore Life Cycle
- Common Keystore Operations
- Managing the Certificate Life Cycle
- Common Certificate Operations
- Keystore and Certificate Maintenance

7.3.1 About Keystores and Certificates

Keys and certificates are used to digitally sign and verify data and achieve authentication, integrity, and privacy in network communications.

A Java keystore (JKS) is a protected database that holds keys and certificates for the organization. Oracle Fusion Middleware utilizes JKS keystores for Oracle Virtual Directory and for applications deployed in Oracle WebLogic Server.

Access to a keystore requires a password which is defined at the time the keystore is created, by the person who creates the keystore, and which can only be changed by providing the current password.

In addition, each private key in a keystore can be secured by its own password.

This section contains these topics:

- Sharing Keystores Across Instances
- Keystore Naming Conventions

7.3.1.1 Sharing Keystores Across Instances

Oracle recommends that you do not share keystores between component instances or Oracle instances, since each keystore represents a unique identity.

The exception to this is an environment with a cluster of component instances, in which case keystore sharing would be an acceptable practice.

Note that no management tools or interfaces are available to facilitate keystore sharing. However, you can export a keystore from one instance and import it into another instance.
7.3.1.2 Keystore Naming Conventions

Follow these naming conventions for your JKS keystores:

- Do not use a name longer than 256 characters.
- Do not use any of the following characters in a keystore name:
  | ; , ! @ # $ ( ) < > / \ ' ` ~ { } [ ] = + & ^ space tab

Note: Observe this rule even if your operating system supports the character.

- Do not use non-ascii characters in a keystore name.
- Additionally, follow the operating system-specific rules for directory and file names.

7.3.2 Managing the Keystore Life Cycle

Typical life cycle events for a JKS keystore are as follows:

- The keystore is created. Keystores can be created directly, or by importing a keystore file from the file system.
- The list of available keystores are viewed and specific keystores selected for update.
- Keystores are updated or deleted. Update operations require that the keystore password be entered.
- The keystore password can be changed.
- The keystore can be deleted.
- Keystores can be exported and imported.

7.3.3 Common Keystore Operations

This section explains the following keystore operations:

- Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control
- Creating a Keystore Using WLST
- Exporting a Keystore Using Fusion Middleware Control
- Exporting a Keystore Using WLST
- Deleting a Keystore Using Fusion Middleware Control
- Deleting a Keystore Using WLST
- Importing a Keystore Using Fusion Middleware Control
- Importing a Keystore Using WLST
- Changing the Keystore Password Using Fusion Middleware Control
- Changing the Keystore Password Using WLST
7.3.3.1 Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control

Take these steps to create a keystore:

1. Log in to the domain of interest using Fusion Middleware Control.
2. From the navigation pane, locate your component instance.
3. Navigate to `component_name`, then Security, then Keystores. For example, navigate to Oracle Virtual Directory, then Security, then Keystores.

   **Note:** The component type is displayed at the top of the page, adjacent to the Topology icon.

4. The Java Keystore page appears. On this page you can create, update, and delete keystores, and perform other keystore management tasks.
5. Click Create. The Create Keystore dialog appears.
6. Provide keystore details such as name and password.
   You can also request a self-signed certificate in this dialog, and fill in the alias name and DN information.

   ![Create Keystore Dialog](image)

   **Note:** If you want to use this keystore only to store trusted certificates, you can uncheck the Create Self-Signed Certificate checkbox. This will create a keystore with no keypair.

7. Click Submit. The new keystore appears in the list of Java keystores.

7.3.3.2 Creating a Keystore Using WLST

Assuming the instance name is `inst1`, use this command to create a keystore:

```bash
createKeyStore('inst1', 'ovd5', 'ovd', 'newKeyStore', 'password')
```

where `password` is the password for this keystore.
7.3.3.3 Exporting a Keystore Using Fusion Middleware Control

If multiple Oracle Virtual Directory instances want to share the same keystore file, this can be achieved by exporting the keystore from one instance and importing it into the other instances.

Take these steps to export a keystore:

1. Navigate to the Java Keystores page for the component instance, as explained in Section 7.3.3.1, "Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control."

2. Select the desired keystore from the list of stores.

3. Click Export.

4. A dialog box appears in which you must enter the keystore password to continue.

5. Specify a file system location, and click OK.

7.3.3.4 Exporting a Keystore Using WLST

Assuming the instance name is `inst1`, use this command to export a keystore:

```bash
exportKeyStore('inst1', 'ovd5', 'ovd', 'test', 'password', '/tmp')
```

where `password` is the password for this keystore.

This command exports the keystore into a file named `test` under the directory `/tmp`.

7.3.3.5 Deleting a Keystore Using Fusion Middleware Control

Take these steps to delete a keystore:

1. Navigate to the Java Keystores page for the component instance, as explained in Section 7.3.3.1, "Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control."

2. Select the desired keystore from the list of stores.

3. Click Delete.

4. A dialog box appears to request confirmation of the delete request.

See Also: Section 7.3.3.7, "Importing a Keystore Using Fusion Middleware Control"
5. Click Delete.

7.3.3.6 Deleting a Keystore Using WLST
Assuming the application server instance name is inst1, use this command to delete a keystore:

delekeystore('inst1', 'ovd5', 'ovd', 'demo')

where the component type is ovd, the component instance is ovd5, and the keystore is named demo.

7.3.3.7 Importing a Keystore Using Fusion Middleware Control
1. Navigate to the Java Keystores page for the component instance, as explained in Section 7.3.3.1, “Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control.”
2. Click Import.
3. The Import Keystore dialog box appears.
4. Browse the file system to locate the keystore file.
5. Provide a name for the keystore. Enter the keystore password.

6. Click OK.
7. The imported keystore appears in the list of Java keystores.

7.3.3.8 Importing a Keystore Using WLST
Assuming the instance name is inst1, use this command to import a keystore:
importKeyStore('inst1', 'ovd5', 'ovd', 'demojks', 'password', '/tmp/demojks.jks')

where password is the password for this keystore.

### 7.3.3.9 Changing the Keystore Password Using Fusion Middleware Control

Take these steps to change a keystore password:

1. Navigate to the Java Keystores page for the component instance, as explained in Section 7.3.3.1, "Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control."
2. Select a keystore and click Change Password.
3. A dialog box appears on which you must enter the current password and enter a new password. The new password must be entered a second time to confirm.
4. Click OK to change the password. In future, any operations performed on this keystore or its certificates will require the use of the new password.

### 7.3.3.10 Changing the Keystore Password Using WLST

Assuming the instance name is inst1, use this command to change the keystore password:

changeKeyStorePassword('inst1', 'ovd5', 'ovd', 'demojks', 'current_password', 'new_password')

where current_password is the current password for this keystore, and new_password is the new password.

### 7.3.4 Managing the Certificate Life Cycle

Typical life cycle events for a certificate residing in a keystore are as follows:

- A self-signed certificate is automatically created for the keypair.
- A certificate signing request (CSR) is generated, and can then be exported to a file.
- Certificates are imported into the keystore. A certificate can either be pasted into a text box or imported from the file system. You can import both user certificates and trusted certificates (also known as CA certificates) in this way.
- Certificates or trusted certificates are exported from the keystore out to a file.
- Certificates or trusted certificates are deleted from the keystore.

### 7.3.5 Common Certificate Operations

This section describes the following common certificate operations:
7.3.5.1 Generating a New Key for the Keystore Using Fusion Middleware Control

To generate a new key (that is, a new self-signed certificate) for a keystore:

1. Navigate to the Java Keystores page for the component instance, as explained in Section 7.3.3.1, "Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control."

2. Select the keystore from the list of stores.

3. A dialog box appears in which you must enter the keystore password to continue.

4. The Manage Certificates page appears. Here, you can manage both types of keystore entries, that is, certificates and trusted certificates.

5. Click the Generate Keypair button.

6. In the Generate Keypair dialog, enter the details for the new key and click OK.
Example: Generating a Key Pair

When you complete these steps, a new public-private key pair is generated for the keystore, and the public key is wrapped in a self-signed certificate.

While these steps generate a new keypair for an existing keystore, you can also generate a new keypair when creating the keystore itself. For details, see Section 7.3.3.1, "Creating a Keystore Using Oracle Enterprise Manager Fusion Middleware Control."

7.3.5.2 Generating a New Key for the Keystore Using WLST

Assuming the instance name is inst1, use this command to generate a new key for a keystore:

```
generateKey('inst1', 'ovd5', 'ovd', 'newKeystore', 'password', 'subject_dn', 'key_size', 'alias')
```

where password is the password for this keystore, subject_dn is the distinguished name by which the key pair is generated, key_size is the key size in bits, and alias is the key alias.

7.3.5.3 Generating a Certificate Signing Request Using Fusion Middleware Control

Take these steps to create a Certificate Signing Request (CSR):

1. From the navigation pane, locate your component instance.
2. Navigate to component_name, then Security, then Keystores.
3. Select the desired keystore from the list of stores.
4. A dialog box appears in which you must enter the keystore password to continue.
5. The Manage Certificates page appears. Select the self-signed certificate for which you want to generate the CSR and click Generate CSR.
6. A dialog box appears, showing the generated signing request. You can either:
   - Copy the CSR from the dialog box and paste it to a file.
   - Click the Export CSR button to directly save it to a file.

7.3.5.4 Generating a Certificate Signing Request Using WLST

Assuming the instance name is `inst1`, use this command to generate and export a CSR:

```
exportKeyStoreObject('inst1', 'ovd5', 'ovd', 'newKeystore', 'password', 'CertificateRequest', '/tmp', 'alias')
```

where `password` is the password for this keystore, `/tmp` is the path under which the certificate request is generated in BASE64 format in the file `base64.txt`, and `alias` is the alias of the key pair that is used to generate the certificate request.

7.3.5.5 Importing a Certificate or Trusted Certificate into a Keystore Using Fusion Middleware Control

Take these steps to import a certificate, or a trusted certificate, into a keystore:

1. From the navigation pane, locate your component instance.
2. Navigate to `component_name`, then `Security`, then `Keystores`.
3. Select the desired keystore from the list of stores.
4. A dialog box appears in which you must enter the keystore password to continue.
5. The Manage Certificates page appears. Click the `Import` button.
6. A dialog box appears with which you can either:
- Paste the Base-64 encoded contents of a certificate or trusted certificate into the keystore directly.
- Select a certificate or trusted certificate file from the file system.

You need to specify an alias while importing a certificate.

When importing a certificate, the alias should match the alias of the corresponding keypair.

When importing a trusted certificate, the alias should be unique in the keystore.

7. Click OK. The Manage Certificates page appears, showing the newly imported certificate or trusted certificate.

7.3.5.6 Importing a Certificate or Trusted Certificate into a Keystore Using WLST

Assuming the instance name is `inst1`, use this command to import a certificate into a keystore:

```bash
importKeyStoreObject('inst1', 'ovd5', 'ovd', 'newKeystore', 'password', 'Certificate', '/tmp/cert.txt', 'alias')
```

where `password` is the password for this keystore, `/tmp/cert.txt` is the file that contains BASE64 encoded certificate, and `alias` is the alias by which this certificate is imported. Note that this alias must be same as that of the key pair that was used to generate this certificate request.

7.3.5.7 Exporting a Certificate or Trusted Certificate from the Keystore Using Fusion Middleware Control

Take these steps to export a certificate or trusted certificate from the keystore:

1. From the navigation pane, locate your component instance.
2. Navigate to `component_name`, then Security, then Keystores.
3. Select the desired keystore from the list of stores.
4. A dialog box appears in which you must enter the keystore password to continue.
5. The Manage Certificates page appears. Click Export.
6. A dialog box appears which shows the Base64 encoded certificate or trusted certificate. You can either copy the contents from the text box and paste it to a file, or select the Export button to save it directly to a file.

7.3.5.8 Exporting a Certificate or Trusted Certificate from the Keystore Using WLST

Assuming the instance name is inst1, use this command to export a certificate:

```
exportKeyStoreObject('inst1', 'ovd5', 'ovd', 'newKeystore', 'password', 'Certificate', '/tmp', 'alias')
```

where password is the password for this keystore, /tmp is the path under which the certificate is generated in BASE64 format in the file base64.txt, and alias is the alias of the certificate being exported.

7.3.5.9 Deleting a Certificate or Trusted Certificate from the Keystore Using Fusion Middleware Control

Take these steps to delete a certificate, or a trusted certificate, from a keystore:
1. From the navigation pane, locate your component instance.
2. Navigate to component_name, then Security, then Keystores.
3. Select the desired keystore from the list of stores.
4. A dialog box appears in which you must enter the keystore password to continue.
5. The Manage Certificates page appears. Select the certificate or trusted certificate to be deleted, and Click Delete.
6. A dialog box appears asking you to confirm the choice. Select OK to confirm.
7.3.5.10 Deleting a Certificate or Trusted Certificate from the Keystore Using WLST

Assuming the application server instance name is inst1, use this command to delete a certificate:

```
removeKeyStoreObject('inst1', 'ovd5', 'ovd', 'newKeystore', 'password', 'Certificate', 'alias')
```

where password is the password for this keystore and alias is the alias of the certificate being deleted.

7.3.5.11 Converting a Self-Signed Certificate to a Third-Party Certificate Using Fusion Middleware Control

Take these steps to convert a self-signed certificate, residing in a keystore, into a third-party certificate:

1. From the navigation pane, locate your component instance.
2. Navigate to component_name, then Security, then Keystores.
3. Select the keystore that contains the self-signed certificate from the list of stores.
4. A dialog box appears in which you must enter the keystore password; click OK to continue.
5. The Manage Certificates page appears.
6. A new certificate request must be generated for the self-signed certificate that is to be converted. Select the certificate and click Generate CSR. In this example, the request is made for the self-signed certificate with alias demo.
The certificate request is displayed.

7. You can either:
   - Copy and paste the Base64-encoded certificate request to a file.
   - Export it directly to a file with the **Export CSR** button.

8. Submit the certificate request file to a certificate authority (CA).

9. The CA signs the certificate request and generates a certificate. The CA will return you one of the following:
   - A single file containing both the newly generated certificate and its own CA certificate in **pkcs7** format
   - Two files, one containing the newly generated certificate and a second containing its own CA certificate

10. Use **Import** to import these files into your keystore:
   - If you received a single file from the CA, import it as a certificate, using an alias that matches the alias of the self-signed certificate you are replacing (from Step 6)
   - If you received two files:
     - Import the file containing the CA certificate as a trusted certificate (use an alias that is unique in the keystore)
     - Import the certificate file as a certificate (using an alias that matches the alias of the self-signed certificate you are replacing

---

**Note:** The order is important: you must import the trusted certificate first, followed by the certificate.

---

The CA returned a single file, which is imported as a certificate:

11. After import, the certificate issued by the CA replaces the self-signed certificate.

### 7.3.5.12 Converting a Self-Signed Certificate to a Third-Party Certificate Using WLST

Use these steps to convert a self-signed certificate to a third-party certificate:

1. Generate and export a CSR.

```bash
exportKeyStoreObject('inst1', 'ovd5', 'ovd', 'jks1', '<password>', 'CertificateRequest', '/tmp', 'mykey')
```
2. Submit the CSR /tmp/base64.txt to a certificate authority. The CA will return a newly generated certificate and its own certificate, either as one file in PKCS#7 format or as two separate files.

3. If you receive a single file from the CA, run the command:

   ```
   importKeyStoreObject('inst1', 'ovd5', 'ovd', 'jks1', 'password', 'Certificate', '/tmp/cert.txt', 'alias')
   ```

   where password is the password for this keystore, /tmp/cert.txt is the file that the CA returned and contains the BASE64 encoded PKCS#7, and alias is the alias by which this certificate is imported. Note that this alias must match that of the key pair that was used to generate the certificate request.

   If you receive two files from the CA, import the CA certificate first as a trusted certificate, followed by the newly generated certificate:

   ```
   importKeyStoreObject('inst1', 'ovd5', 'ovd', 'jks1', 'password', 'TrustedCertificate', '/tmp/cacert.txt', 'unique_alias')
   ```

   where unique_alias is a unique alias by which the trusted certificate is imported.

   ```
   importKeyStoreObject('inst1', 'ovd5', 'ovd', 'jks1', 'password', 'Certificate', '/tmp/cert.txt', 'alias')
   ```

   where password is the password for this keystore, /tmp/cert.txt is the file that the CA returned and contains BASE64 encoded certificate, /tmp/cacert.txt is the file containing the BASE64 encoded CA certificate, and alias is the alias by which this certificate is imported. Note that this alias must match that of the key pair that was used to generate the certificate request.

### 7.3.6 Keystore and Certificate Maintenance

This section contains the following administration topics:

- Location of Keystores
- Replacing Expiring Certificates
- Effect of Host Name Change on Keystores

#### 7.3.6.1 Location of Keystores

The root directory for Oracle Virtual Directory keystores is located in $ORACLE_INSTANCE/config/OVD/ovd_instance_name/keystores.

This root directory will contain all the JKS files.

A sample structure, assuming there are two keystores named keys.jks and trust.jks respectively, would look like this:

```
ORACLE_INSTANCE/config/OVD/ovd_instance_name/keystores/keys.jks
ORACLE_INSTANCE/config/OVD/ovd_instance_name/keystores/trust.jks
```

#### 7.3.6.2 Replacing Expiring Certificates

An expiring certificate should be replaced before it actually expires to avoid or reduce application downtime.

The steps for replacing an expiring certificate are as follows:

1. Generate a certificate request from the keystore (use the same key-pair for which the current expiring certificate was issued).
2. Provide this certificate request to the third-party Certificate Authority (CA) for certificate issuance. The validity date of the new certificate should be earlier than the expiration date of the current certificate. This overlap is recommended to reduce downtime.

**Note:** Steps 1 and 2 are not required when the third-party CA already maintains the certificate request in a repository. In that case, simply ask the CA to issue a new certificate for that certificate request.

3. Import the newly issued certificate into the keystore using the same alias as that of the key-pair.

4. If the new certificate was issued by a CA other than the one that issued the original certificate, you may also need to import the new CA’s trusted certificate before importing the newly issued certificate.

### 7.3.6.3 Effect of Host Name Change on Keystores

Typically, the certificate DN is based on the host name of the server where the keystore is used.

For example, if a keystore is being created for the Oracle Virtual Directory server on host my.example.com, then the DN of the certificate in this Oracle Virtual Directory keystore will be something like:

"CN=my.example.com,O=organization name"

This synchronization is required because most clients do host name verification during the SSL handshake.

Clients that perform host name verification include web browsers and Oracle HTTP Client, among others. If the host name of the server does not match that of the certificate DN:

- A clear warning is displayed (in the case of browser clients).
- There may be SSL handshake failure (in the case of other clients).

Thus, whenever you have a keystore on a server that is accepting requests from clients, you must ensure that whenever the host name of this server changes, you also update the certificate in the keystore.

This can be done by requesting a new certificate with a new DN (based on the new host name).

#### For a Production Keystore

The steps are:

1. Generate a new request with the new DN (based on a new host name).
2. Send this request to a certificate authority (CA).
3. Get back a new certificate from the CA.
4. Import the new certificate with the same alias as the key-pair for which certificate request was generated.

#### For a Self-signed Keystore

The steps are:
1. Delete the existing keystore.

2. Create a new keystore with a key-pair using the new DN (based on the new host name).

For Both Keystore Types
For both production and self-signed keystores, once the new certificate is available in the keystore, make sure that it is imported into all the component keystores where it needs to be trusted. For example, if the HTTP listener on Oracle Virtual Directory was SSL-enabled and its certificate changed due to a host name change, then you need to import its new certificate into the client keystore or browser repository so that it can trust its new peer.

7.4 Wallet Management
This section contains the following topics:

- About Wallets and Certificates
- Accessing the Wallet Management Page in Fusion Middleware Control
- Managing the Wallet Life Cycle
- Common Wallet Operations
- Managing the Certificate Life Cycle
- Accessing the Certificate Management Page for Wallets in Fusion Middleware Control
- Common Certificate Operations
- Wallet and Certificate Maintenance

7.4.1 About Wallets and Certificates
This section contains the following topics:

- Password-protected and Autologin Wallets
- Self-Signed and Third-Party Wallets
- Sharing Wallets Across Instances
- Wallet Naming Conventions

7.4.1.1 Password-protected and Autologin Wallets
You can create two types of wallets:

- Auto-login wallet
  This is an obfuscated form of a PKCS#12 wallet that provides PKI-based access to services and applications without requiring a password at runtime. You can also add to, modify, or delete the wallet without needing a password. File system permissions provide the necessary security for auto-login wallets.
Password-protected wallet

As the name suggests, this type of wallet is protected by a password. Any addition, modification, or deletion to the wallet content requires a password.

Every time a password-protected wallet is created, an auto-login wallet is automatically generated. However, this auto-login wallet is different from the user-created auto-login wallet described in the previous bullet. While the user-created wallet can even be updated at configuration time without a password, an automatically generated auto-login wallet is a read-only wallet that does not allow direct updates. Modifications to the wallet must occur through the password protected file (by providing a password), at which time the auto-login wallet is regenerated.

The purpose of this system-generated auto-login wallet is to provide PKI-based access to services and applications without requiring a password at runtime, while still requiring a password at configuration time.

7.4.1.2 Self-Signed and Third-Party Wallets

Self-signed wallets contain certificates for which the issuer is the same as the subject. These wallets are typically created for use within an intranet environment where trust is not a high priority. Each self-signed wallet has its own unique issuer; hence, in an environment with multiple components and wallets, the trust management tasks increase n-fold.

When created through Fusion Middleware Control, a self-signed wallet is valid for five years.

Third-party wallets contain certificates that are issued by well known CA’s. The functionality and security remain the same as for self-signed wallets, but the use of third-party certificates provides added trust because the issuers are well known, so they are already trusted by most clients.

**Difference Between Self-Signed and Third-Party Wallets**

From a functional and security perspective, a self-signed certificate is comparable to one issued by a third party. The only difference is that a self-signed certificate is not trusted.

7.4.1.3 Sharing Wallets Across Instances

Oracle recommends that you do not share wallets between component instances or Oracle instances, since each wallet represents a unique identity.

The exception to this is an environment with a cluster of component instances, in which case wallet sharing would be an acceptable practice.
Note that no management tools or interfaces are available to facilitate wallet sharing. However, you can export a wallet from one instance and import it into another instance.

### 7.4.1.4 Wallet Naming Conventions

Follow these naming conventions for your Oracle wallets:

- Do not use a name longer than 256 characters.
- Do not use any of the following characters in a wallet name:
  ```
  | ; , ! @ # $ ( ) < > / \ ` ~ { } [ ] = + & ^ space tab
  ```

  **Note:** Observe this rule even your operating system supports the character.

- Do not use non-ascii characters in a wallet name.
- Additionally, follow the operating system-specific rules for directory and file names

Due to the way data is handled in an LDAP directory such as Oracle Internet Directory, wallet names are not case-sensitive.

Thus, it is recommended that you use case-insensitive wallet names (preferably, using all lower case letters). For example, if you have created a wallet named `UPPER`, do not create another wallet named `upper`; doing so could cause confusion during wallet management operations.

### 7.4.2 Accessing the Wallet Management Page in Fusion Middleware Control

An Oracle wallet is associated with the component where it is utilized. To locate a component instance:

1. Log into Fusion Middleware Control using administrator credentials.
2. Select the domain of interest.
3. From the navigation pane, locate the instance (for example, an OHS instance) that will use the wallet. Click on the instance.
   The component type now appears on the upper left of the page adjacent to the Farm drop-down.
4. Select the component type drop-down (for example, Oracle HTTP Server).
5. Navigate to Security, then Wallets.
6. The Wallets page appears.

On the Wallets page, you can:

- Create a wallet.
- Delete a wallet.
- Import a wallet.
- Export a wallet.

### 7.4.3 Managing the Wallet Life Cycle

Typical life cycle events for an Oracle wallet are as follows:

- The wallet is created. Wallets can be created directly, or by importing a wallet file from the file system.
- The list of available wallets are viewed and specific wallets selected for update.
- Wallets are updated or deleted. Update operations for password-protected wallets require that the wallet password be entered.
- The wallet password can be changed for password-protected wallets.
- The wallet can be deleted.
- Wallets can be exported and imported.

### 7.4.4 Common Wallet Operations

This section describes the steps required to perform a range of wallet management functions, including:

- Creating a Wallet Using Fusion Middleware Control
- Creating a Wallet Using WLST
- Creating a Self-Signed Wallet Using Fusion Middleware Control
- Creating a Self-Signed Wallet Using WLST
- Changing a Self-Signed Wallet to a Third-Party Wallet Using Fusion Middleware Control
- Changing a Self-Signed Wallet to a Third-Party Wallet Using WLST
- Exporting a Wallet Using Fusion Middleware Control
- Exporting a Wallet Using WLST
- Importing a Wallet Using Fusion Middleware Control
- Importing a Wallet Using WLST
- Deleting a Wallet Using Fusion Middleware Control
- Deleting a Wallet Using WLST

#### 7.4.4.1 Creating a Wallet Using Fusion Middleware Control

Take these steps to create a wallet:

1. Navigate to the Wallets page for your component instance. See Section 7.4.2, "Accessing the Wallet Management Page in Fusion Middleware Control."
2. Click Create.
3. The Create Wallet page appears.
4. Enter a wallet name.
5. Check or uncheck the Autologin box, depending on whether your wallet will be an auto-login wallet. The default is an auto-login wallet.
See Section 7.4.1.1, "Password-protected and Autologin Wallets" for details.

6. Click Submit.

7. At this point, you must choose whether to add a certificate request (CR) at this time. If you choose not to do so, you can always add the CR later; see Section 7.4.7.1, "Adding a Certificate Request Using Fusion Middleware Control."

In this example, we choose to add a CR:

8. Click Finish.

9. There are two options for the CR:
   ■ Copy and paste the Base64-encoded certificate request from the text box to a file
   ■ Export it directly to a file with the Export Certificate Request button.

10. A message appears confirming the wallet creation.

7.4.4.2 Creating a Wallet Using WLST

**Note:** The WLST commands described in this chapter use Oracle Internet Directory as the example component. The same commands can be executed for Oracle HTTP Server or Oracle Web Cache by changing the third parameter from "oid" to "ohn" or "webcache" respectively.

Assuming the instance name is inst1, use this command to create a wallet:

```bash
createWallet('inst1', 'oid1', 'oid', 'oid2', 'password')
```

where oid2 is the wallet name and password is the password for this wallet. If an auto-login wallet needs to be created, the password should be specified as "" (that is, no text between the quotes).
7.4.4.3 Creating a Self-Signed Wallet Using Fusion Middleware Control

Take these steps to create a self-signed wallet:

See Also: Section 7.4.1.2, "Self-Signed and Third-Party Wallets"

1. Navigate to the Wallets page for your component instance. See Section 7.4.2, "Accessing the Wallet Management Page in Fusion Middleware Control."

2. Click Create Self-Signed Wallet.

3. On the Self-Signed Wallet page, enter data to create the wallet. This includes:
   - The wallet name
   - Whether this is an auto-login wallet

See Also: Section 7.4.1.1, "Password-protected and Autologin Wallets"

   - The DN information
   - The key size

4. Click Submit.

5. A confirmation message is displayed and the new wallet appears in the list of wallets.

7.4.4.4 Creating a Self-Signed Wallet Using WLST

Assuming the instance name is inst1, use these commands to create a self-signed wallet:

createWallet('inst1', 'oid1', 'oid', 'oid2', 'password')
addSelfSignedCertificate('inst1', 'oid1', 'oid', 'oid2', 'password', 'subject_dn', 'key_size')

where oid2 is the wallet name, subject_dn is the distinguished name of the self-signed certificate, key_size is the key size in bits and password is the password for this wallet. If an auto-login wallet needs to be created, the password should be specified as " (that is, with no text between the quotes).

### 7.4.4.5 Changing a Self-Signed Wallet to a Third-Party Wallet Using Fusion Middleware Control

For steps to convert a self-signed wallet into a third-party wallet, see Section 7.4.8.3, "Changing a Self-Signed Wallet to a Third-Party Wallet."

### 7.4.4.6 Changing a Self-Signed Wallet to a Third-Party Wallet Using WLST

For steps to convert a self-signed wallet into a third-party wallet, see Section 7.4.8.3, "Changing a Self-Signed Wallet to a Third-Party Wallet."

### 7.4.4.7 Exporting a Wallet Using Fusion Middleware Control

Take these steps to export a wallet:

1. Navigate to the Wallets page for your component instance. See Section 7.4.2, "Accessing the Wallet Management Page in Fusion Middleware Control."
2. Select the row corresponding to the wallet of interest.
3. Click Export.
4. The Export Wallet page appears.
5. Enter the filename and the location where the wallet is to be exported.
6. Click OK.

**Note:** Do not click on the wallet name itself; this opens the wallet for certificate management operations.
### 7.4.4.8 Exporting a Wallet Using WLST

Assuming the instance name is `inst1`, use this command to export a wallet:

```bash
exportWallet('inst1', 'oid1', 'oid', 'selfsigned', 'password', '/tmp')
```

where `password` is the password for this wallet (specify '' as password for auto-login wallet).

If it is an auto-login wallet, this command will export the wallet into a file named `cwallet.sso` under the directory `/tmp`. If it is a password-protected wallet, there will be two files created under `/tmp`, namely `ewallet.p12` and `cwallet.sso`.

### 7.4.4.9 Importing a Wallet Using Fusion Middleware Control

Take these steps to import a wallet:

1. Navigate to the Wallets page for your component instance. See Section 7.4.2, "Accessing the Wallet Management Page in Fusion Middleware Control".
2. Click Import.
3. The Import Wallet page appears.
4. If this is an auto-login wallet, check the box and enter the wallet name. No password is required.
5. If this is not an auto-login wallet, uncheck the auto-login box. Specify both the wallet name and password.
6. Click OK. The wallet is imported into the repository.

### 7.4.4.10 Importing a Wallet Using WLST

Assuming the instance name is `inst1`, use this command to import a wallet:

```bash
importWallet('inst1', 'oid1', 'oid', 'oid5', 'password', '/tmp/ewallet.p12')
```

where `password` is the password of the wallet being imported and `/tmp/ewallet.p12` contains the wallet file (if there are two files `ewallet.p12` and `cwallet.sso`, point to `ewallet.p12`). Point to `cwallet.sso` only if it is an auto-login wallet - in this case, the password should be specified as "."

### 7.4.4.11 Deleting a Wallet Using Fusion Middleware Control

Take these steps to delete a wallet:
1. Navigate to the Wallets page for your component instance. See Section 7.4.2, "Accessing the Wallet Management Page in Fusion Middleware Control."

2. Select the row corresponding to the wallet of interest.

3. Click Delete.

4. The wallet is deleted and no longer appears on the list of wallets.

7.4.4.12 Deleting a Wallet Using WLST

Assuming the instance name is inst1, use this command to delete a wallet:

```
deleteWallet('inst1', 'oid1', 'oid', 'selfsigned')
```

7.4.5 Managing the Certificate Life Cycle

The complete certificate life cycle, starting from wallet creation, includes these actions:

1. Create an empty wallet (that is, a wallet that does not contain a certificate request).
2. Add a certificate request to the wallet.
3. Export the certificate request.
4. Use the certificate request to obtain the corresponding certificate.
5. Import trusted certificates.
6. Import the certificate.

These steps are needed to generate a wallet with a third-party trusted certificate. For details about this task, see Section 7.4.7.9, "Converting a Self-Signed Certificate into a Third-Party Certificate Using Fusion Middleware Control."

See Also: Section 7.4.6, "Accessing the Certificate Management Page for Wallets in Fusion Middleware Control"

7.4.6 Accessing the Certificate Management Page for Wallets in Fusion Middleware Control

An Oracle wallet is associated with the component where it is utilized. To locate a component instance:

- Log into Fusion Middleware Control using administrator credentials.
- Select the domain of interest.
Use the navigation pane to locate the instance (for example, an Oracle HTTP Server instance) that will use the wallet.

After locating your component instance, there are two ways you can access a wallet’s certificate management page in Fusion Middleware Control:

- Go to the **Wallets** page, select the line for the wallet of interest and click **Manage**.
- Go to the **Wallets** page, locate the wallet of interest, and click on the wallet name.

On the Certificate Management page, you can:

- Add a certificate request.
- Export a certificate request, a certificate, or a trusted certificate.
- Import a certificate or a trusted certificate.
- Delete a certificate request, a certificate, or a trusted certificate.

### 7.4.7 Common Certificate Operations

This section describes the following common certificate operations:

- Adding a Certificate Request Using Fusion Middleware Control
- Exporting a Certificate, Certificate Request, or a Trusted Certificate Using Fusion Middleware Control
- Importing a Certificate or a Trusted Certificate Using Fusion Middleware Control
- Deleting a Certificate Request, a Certificate, or a Trusted Certificate Using Fusion Middleware Control
- Converting a Self-Signed Certificate into a Third-Party Certificate Using Fusion Middleware Control

#### 7.4.7.1 Adding a Certificate Request Using Fusion Middleware Control

It is possible to add a certificate request at the time you create the wallet, but if it was not done at that time, you can do so using the following steps:

1. Navigate to the Certificate Management page. See Section 7.4.6, "Accessing the Certificate Management Page for Wallets in Fusion Middleware Control."

2. Click **Add Certificate Request**.

3. A dialog box appears where you enter the CRs DN values:
4. Click OK.

5. The new CR is generated and a dialog box appears with the CR in the text box. You can either:
   - Copy and paste the Base64-encoded certificate request to a file.
   - Export it directly to a file with the Export Certificate Request button.

7.4.7.2 Adding a Certificate Request Using WLST

Assuming the instance name is `inst1`, use this command to add a certificate request for a wallet:

```
addCertificateRequest('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'subject_dn', 'key_size')
```

where `password` is the password for this wallet, `subject_dn` is the distinguished name by which the certificate request is generated and `key_size` is the key size in bits.

7.4.7.3 Exporting a Certificate, Certificate Request, or a Trusted Certificate Using Fusion Middleware Control

Take these steps to export a certificate, a certificate request (CR), or a trusted certificate:

1. Navigate to the Certificate Management page. See Section 7.4.6, "Accessing the Certificate Management Page for Wallets in Fusion Middleware Control."

2. Select the certificate, CR, or trusted certificate and click Export.
3. A dialog box appears with the certificate, CR, or trusted certificate in the text box. You can either:
   - Copy and paste the Base64-encoded certificate to a file.
   - Export it directly to a file with the Export Certificate or Export Trusted Certificate button.

7.4.7.4 Exporting a Certificate, Certificate Request, or a Trusted Certificate Using WLST
Assuming the instance name is inst1, use this command to export a certificate request:

```bash
exportWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'CertificateRequest', '/tmp', 'subject_dn')
```

where `password` is the password for this wallet, `/tmp` is the path under which the certificate request is exported in BASE64 format in the file `base64.txt`, and `subject_dn` is the distinguished name of the certificate request that is exported.

To export a certificate or trusted certificate, replace `CertificateRequest` in the above command with `Certificate` or `TrustedCertificate`.

7.4.7.5 Importing a Certificate or a Trusted Certificate Using Fusion Middleware Control
Take these steps to import a certificate or a trusted certificate:

1. Navigate to the Certificate Management page. See Section 7.4.6, "Accessing the Certificate Management Page for Wallets in Fusion Middleware Control."
2. Click Import.
3. In the Import Certificate dialog, you can select either a certificate or a trusted certificate.
4. There are two ways to do the import:
   - Paste the Base64-encoded certificate or trusted certificate in the text box.
   - Use the file selector to browse your file system to locate a file containing the Base64-encoded certificate or trusted certificate.
5. Click OK.

7.4.7.6 Importing a Certificate or a Trusted Certificate Using WLST
Assuming the instance name is inst1, use this command to import a certificate into a wallet:

```bash
importWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'Certificate', '/tmp/cert.txt')
```
where password is the password for this wallet and /tmp/cert.txt is the file that contains BASE64 encoded certificate.

To import a trusted certificate, replace Certificate in the above command with TrustedCertificate.

### 7.4.7.7 Deleting a Certificate Request, a Certificate, or a Trusted Certificate Using Fusion Middleware Control

Take these steps to delete a CR, a certificate, or a trusted certificate:

1. Navigate to the Certificate Management page. See Section 7.4.6, "Accessing the Certificate Management Page for Wallets in Fusion Middleware Control."
2. Select the row containing the certificate request, certificate or trusted certificate.
3. Click Delete.
4. A dialog box appears, requesting confirmation.
5. Click Yes.
6. The object no longer appears in the Manage Certificates list.

### 7.4.7.8 Deleting a Certificate Request, a Certificate, or a Trusted Certificate Using WLST

Assuming the instance name is inst1, use this command to delete a certificate:

```bash
removeWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'Certificate', 'subject_dn')
```

where password is the password for this wallet and subject_dn is the distinguished name of the certificate being deleted.

To delete a certificate request or trusted certificate, replace Certificate in the above command with CertificateRequest or TrustedCertificate.

### 7.4.7.9 Converting a Self-Signed Certificate into a Third-Party Certificate Using Fusion Middleware Control

A self-signed certificate residing in a wallet can be converted into a third-party certificate signed by a certificate authority (CA). Take these steps to perform the task:

---

**Note:** The steps are illustrated for use with Oracle Internet Directory, and similar steps are applicable for generating wallets to use with Oracle HTTP Server and Oracle Web Cache.

---

1. From the navigation pane, locate your component instance.
2. Navigate to component_name, the Security, then Wallets.

3. From the list of wallets, select the wallet that contains the self-signed certificate.

4. The Manage Certificates page appears. It contains the list of certificates in the wallet.

5. A new certificate request must be generated for the self-signed certificate that is to be converted. Select the self-signed certificate and click **Add Certificate Request**. A dialog box appears:

   ![Add Certificate Request Dialog]

6. Enter the certificate request (CR) details and click OK.

   The CR is generated. You can either:
   - Copy and paste the Base64-encoded certificate request to a file.
   - Export it directly to a file with the Export Certificate Request button.

7. Submit the certificate request file to a certificate authority to generate a certificate. This is an offline procedure that you can execute in accordance with your local policy for obtaining certificates.

8. The CA signs the certificate request and generates a certificate. The CA will return you one of the following:
   - A single file containing both the newly generated certificate and its own CA certificate in pkcs7 format
   - Two files, one containing the newly generated certificate and a second containing its own CA certificate

9. Use **Import** to import these files into your wallet:
   - If you received a single file from the CA, import it as a trusted certificate, using an alias that matches the alias of the self-signed certificate you are replacing (from Step 3).
   - If you received two files:
     - Import the file containing the CA certificate as a trusted certificate (use an alias that is unique in the wallet).
     - Import the certificate file as a certificate (using an alias that matches the alias of the self-signed certificate you are replacing).

**Note:** The order is important; you must import the trusted certificate first, followed by the certificate.
The CA returned a single file, which is imported as a trusted certificate:

10. After import, the certificate issued by the CA replaces the self-signed certificate.

7.4.7.10 Converting a Self-Signed Certificate into a Third-Party Certificate Using WLST

Follow these steps to convert a self signed certificate to a third-party certificate using WLST:

1. Add a certificate request, for example:
   
   ```
   addCertificateRequest('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'subject_dn', 'key_size')
   ```

2. Export the certificate request:
   
   ```
   exportWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'CertificateRequest', '/tmp', 'subject_dn')
   ```

3. Submit the certificate request /tmp/base64.txt to a certificate authority. The CA will return a newly generated certificate and its own certificate, either as one file in PKCS#7 format or as two separate files.

4. If you receive a single file from the CA, run the following command
   
   ```
   importWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'TrustedChain', '/tmp/cert.txt')
   ```

   where `password` is the password for this wallet and `/tmp/cert.txt` is the file that the CA returned and contains BASE64 encoded PKCS#7.

   If you receive two files from the CA, import the CA certificate first as a trusted certificate, followed by the newly generated certificate.

   ```
   importWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'TrustedCertificate', '/tmp/cacert.txt')
   ```

   ```
   importWalletObject('inst1', 'oid1', 'oid', 'selfsigned', 'password', 'Certificate', '/tmp/cert.txt')
   ```

   where `password` is the password for this wallet, `/tmp/cert.txt` is the file that the CA returned and contains BASE64 encoded certificate and `/tmp/cacert.txt` is the file containing the BASE64 encoded CA certificate.

7.4.8 Wallet and Certificate Maintenance

This section contains the following administration topics:

- Location of Wallets
7.4.8.1 Location of Wallets
This section describes the location of wallets for different components.

**Root Directory for an Oracle Internet Directory Wallet**
The root directory for wallets is $ORACLE_INSTANCE/OID/admin.
This root directory will contain subdirectories with wallet names; these subdirectories
will contain the actual wallet files.

For example, assuming there are two wallets named oid1 and oid2, respectively, a
sample structure could look like:

$ORACLE_INSTANCE/OID/admin/oid1/cwallet.sso
$ORACLE_INSTANCE/OID/admin/oid1/ewallet.p12
$ORACLE_INSTANCE/OID/admin/oid2/cwallet.sso

**Root Directory for an Oracle HTTP Server Wallet**
The root directory for wallets is $ORACLE_INSTANCE/config/OHS/ohs_instance_name/keystores.
This root directory contains subdirectories with wallet names; these subdirectories
contain the actual wallet files.

For example, assuming there are two wallets named ohs1 and ohs2, respectively, a
sample structure could look like:

$ORACLE_INSTANCE/config/OHS/ohs_instance1/keystores/ohs1/cwallet.sso
$ORACLE_INSTANCE/config/OHS/ohs_instance1/keystores/ohs1/ewallet.p12
$ORACLE_INSTANCE/config/OHS/ohs_instance1/keystores/ohs2/cwallet.sso

**Root Directory for an Oracle Web Cache Wallet**
The root directory for wallets is $ORACLE_INSTANCE/config/WebCache/webcache_instance_name/keystores.
This root directory will contain subdirectories with wallet names; these subdirectories
will contain the actual wallet files.

For example, assuming there are two wallets named wc1 and wc2, respectively, a
sample structure could look like:

$ORACLE_INSTANCE/config/WebCache/webcache_instance1/keystores/wc1/cwallet.sso
$ORACLE_INSTANCE/config/WebCache/webcache_instance1/keystores/wc1/ewallet.p12
$ORACLE_INSTANCE/config/WebCache/webcache_instance1/keystores/wc2/cwallet.sso

7.4.8.2 Effect of Host Name Change on Wallet
Typically, the wallet DN is based on the host name of the server where the wallet is
used.

For example, if a wallet is being created for the Oracle HTTP Server my.example.com,
then the DN of the certificate in this Oracle HTTP Server wallet will be something like
"CN=my.example.com,O=organization name".

This synchronization is required because most clients do host name verification during
the SSL handshake.
Clients that perform host name verification include web browsers and Oracle HTTPClient, among others. If the host name of the server does not match that of the certificate DN, then:

- A clear warning will be displayed (in the case of browser clients).
- There may be SSL handshake failure (in the case of other clients).

Thus, when you have a wallet on a server that is accepting requests from clients, you must ensure that whenever the host name of this server changes, you also update the certificate in the wallet.

You can do this by requesting a new certificate with a new DN (based on the new host name).

**For a Production Wallet**

The steps are:

- Generate a new request with the new DN (based on new host name).
- Send this request to a certificate authority (CA).
- Get back a new certificate from the CA.
- Delete the older certificate and certificate request from the wallet.
- Import the new certificate.

**For a Self-signed Wallet**

The steps are:

- Delete the existing wallet.
- Create a new wallet with a self-signed certificate using the new DN (based on the new host name).

For both production and self-signed wallets, once the new certificate is available in the wallet, you need to make sure that it is imported into all the component wallets where it needs to be trusted. For example, if Oracle WebLogic Server is SSL-enabled and the certificate for Oracle WebLogic Server changed due to a host name change, then you need to import its new certificate into the Oracle HTTP Server wallet so that it can trust its new peer.

### 7.4.8.3 Changing a Self-Signed Wallet to a Third-Party Wallet

You can convert a self-signed wallet into a third-party wallet, one that contains certificates signed by a trusted Certificate Authority (CA).

Assuming a self-signed wallet named MYWallet, containing a certificate with DN as "CN=my.example.com,O=example", take these steps to convert it into a third-party wallet:

1. Remove the user certificate "CN=my.example.com,O=example" from the wallet.
2. Remove the trusted certificate "CN=my.example.com,O=example" from the wallet (this has the same DN as the user certificate, but is a separate entity nonetheless).
3. Export the certificate request "CN=my.example.com,O=example" from the wallet and save it to a file.
4. Give this certificate request file to a third-party certificate authority (CA) such as Verisign.
5. The CA will return one of the following:
   ■ A user certificate file and its own certificate file
   ■ A single file with a certificate chain consisting of a user certificate and its own certificate

6. Import the above file(s) into the wallet.

7.4.8.4 Replacing an Expiring Certificate in a Wallet
An expiring certificate should be replaced before it actually expires to avoid or reduce application downtime.

The steps for replacing an expiring certificate are as follows:

1. Export the certificate request from the wallet (this is the same request for which the current expiring certificate was issued).

2. Provide this certificate request to the third-party Certificate Authority (CA) for certificate issuance. The validity date of the new certificate should be earlier than the expiration date of the current certificate. This overlap is recommended to reduce downtime.

   **Note:** Steps 1 and 2 are not required when the third-party CA already maintains the certificate request in a repository. In that case, simply request the CA to issue a new certificate for that certificate request.

3. Remove the existing certificate (the one that is about to expire) from the wallet.

4. Import the newly issued certificate into the wallet.

   To reduce downtime, remove the previous certificate and import the new certificate in the overlap period when the new certificate has become valid and the older one has not yet expired.

5. If the new certificate was issued by a CA other than the one that issued the original certificate, you may also need to import the new CA's trusted certificate before importing the newly issued certificate.
Deployment is the process of packaging application files as an archive file and transferring them to a target application server. This chapter describes how to deploy applications, such as Java EE or SOA applications, to Oracle Fusion Middleware.

It contains the following topics:

- **Overview of Deploying Applications**
- **Understanding Data Sources**
- **Deploying, Undeploying, and Redeploying Java EE Applications**
- **Deploying, Undeploying, and Redeploying Oracle ADF Applications**
- **Deploying, Undeploying, and Redeploying SOA Composite Applications**
- **Deploying, Undeploying, and Redeploying WebCenter Applications**
- **Changing MDS Configuration Attributes for Deployed Applications**

### 8.1 Overview of Deploying Applications

Oracle WebLogic Server provides a Java EE-compliant infrastructure for deploying, undeploying, and redeploying Java EE-compliant applications and modules.

You can deploy the following into Oracle WebLogic Server:

- A complete Java EE application packaged as an Enterprise Archive (EAR) file.
- Standalone modules packaged as Java Archive files (JARs) containing Web Services, Enterprise JavaBeans (EJBs), application clients (CARs), or resource adapters (RARs).
- An ADF application. Oracle Application Development Framework (Oracle ADF) is an end-to-end application framework that builds on Java Platform, Enterprise Edition (Java EE) standards and open-source technologies to simplify and accelerate implementing service-oriented applications.
- An Oracle SOA Suite composite application. A SOA composite application is a single unit of deployment that greatly simplifies the management and lifecycle of SOA applications.
- An Oracle WebCenter application. WebCenter applications differ from traditional Java EE applications in that they support run-time customization, including the application's pages, the portlets contained within these pages, and document libraries.

A Metadata Archive (MAR) is a compressed archive of selected metadata, such as the application-level deployment profile, for an application. A MAR is used to deploy...
metadata content to the metadata service (MDS) repository. The following application types use a MAR as a container for content that is deployed to the MDS repository: ADF applications, SOA composite applications, and Oracle WebCenter applications.

You can use Fusion Middleware Control, Oracle WebLogic Server Administration Console, Oracle JDeveloper, or the command line to deploy, undeploy, or redeploy an application. Which method you use depends on the type of application, as described in Table 8–1.

If your application uses an MDS Repository, you must register the repository with the Oracle WebLogic Server domain before you deploy your application. Applications such as custom Java EE applications developed by your organization and some Oracle Fusion Middleware component applications, such as Oracle B2B, and Oracle Web Services Manager, use an MDS Repository. For information about the MDS Repository and registering the repository, see Section 11.3.

**Note:** If your application contains an application-level credential store, and you are moving the application from a test to a production environment, you must reassociate the credential store, as described in "Reassociating the Domain Policy Store" in the Oracle Fusion Middleware Security Guide.

### 8.2 Understanding Data Sources

A data source is a Java object that application components use to obtain connections to a relational database. Specific connection information, such as URL or user name and password, are set on a data source object as properties and do not need to be explicitly defined in an application’s code. This abstraction allows applications to be built in a portable manner, because the application is not tied to a specific back-end database. The database can change without affecting the application code.

Applications use the Java Naming and Directory Interface (JNDI) API to access a data source object. The application uses a JNDI name that is bound to the data source object. The JNDI name is logical and can be mapped to any data source object. Like
data source properties, using JNDI provides a level of abstraction, since the underlying data source object can change without any changes required in the application code. The end result is the details of accessing a database are transparent to the application.

**See Also:**  *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server* for more information about data sources

When you configure certain Oracle Fusion Middleware components, such as Oracle SOA Suite or Oracle WebCenter, using the Oracle WebLogic Server Configuration Wizard, you specify the data source connection information. If the components use the MDS Repository, the Configuration Wizard prepends "mds-" to the data source name to indicate that the data source is a system data source used by MDS Repository.

**See Also:**  *Oracle Fusion Middleware Creating Domains Using the Configuration Wizard* for information about specifying data sources with the Configuration Wizard

To create an MDS data source, you should use Fusion Middleware Control or WLST to set the correct attributes for the data source. The MDS data source is displayed in the navigation pane in Fusion Middleware Control and in the domain structure in the Administration Console. If your application uses an MDS Repository, you must register the repository with the Oracle WebLogic Server domain before you deploy your application. For information about the MDS Repository and registering the repository, see Section 11.3.

**Note:**  When you create the data source, you must use the MDS schema created by the Repository Creation Utility (RCU), not other schemas.

Although it is not recommended, you can also use the Oracle WebLogic Server Administration Console to create a MDS data source. If you do, note the following:

- You must prefix the data source name with "mds-" if you intend it to be used with MDS Repository.
- You must target the data source to the Administration Server and to all Managed Servers to which you are deploying applications that need the data source.
- You must turn off global transactions.

If you are using RAC or Oracle Fusion Middleware Cold Failover Cluster, you must configure multi data sources. To do so, you must use the Oracle WebLogic Server Administration Console. Note that if you create a multi data source and you add an existing MDS data source to it, the data source you added is no longer considered a valid MDS repository. The repository is not displayed in Fusion Middleware Control or Oracle WebLogic Server Administration Console. For example, the MDS repository is not listed in the Fusion Middleware Control navigation pane and is not displayed as a choice for a target metadata repository when you deploy an application.

**See Also:**  *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server* for more information about configuring multi data sources
8.3 Deploying, Undeploying, and Redeploying Java EE Applications

You can use Fusion Middleware Control, Oracle WebLogic Server Administration Console, Oracle JDeveloper, or the command line to deploy, undeploy, or redeploy a Java EE application. The following topics describe using Fusion Middleware Control and the command line to accomplish these tasks:

- Deploying Java EE Applications
- Undeploying Java EE Applications
- Redeploying Java EE Applications

See Also: Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for information about deploying using Oracle WebLogic Server Administration Console and for more information about using the WLST command line

8.3.1 Deploying Java EE Applications

You can deploy an application to a WebLogic Managed Server or a cluster. This section describes how to deploy an application to a Managed Server.

8.3.1.1 Deploying Java EE Applications Using Fusion Middleware Control

To deploy a Java EE application to a Managed Server using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.
2. Select the server in which you want to deploy the application.
   The server home page is displayed.
3. From the WebLogic Server menu, choose Application Deployment, then Deploy.
   The Deployment Wizard, Select Archive page is displayed, as shown in the following figure:

   ![Deployment Wizard, Select Archive](Image)

   Select Archive

   Specify the application or the exploded directory. Optionally, you can specify a deployment plan.

   Archive or Exploded Directory
   Java EE archive, Web Modules (.WAR files), EJB Modules (.RAR files) and Resource Adapter Modules (.RAR files) can be deployed. You can also deploy an exploded archive that is present on the server where Enterprise Manager is running.
   - Archive even this archive where this web browser is running.
   - Archive or exploded directory is on the server where Enterprise Manager is running.

   Deployment Plan
   The deployment plan is a file that contains the deployment settings for an application. You can use a previously saved deployment plan for this application later in the deployment process, you can optionally add the deployment plan and save it for future deployment of this application. If you do not have a deployment plan, one will be created automatically during the deployment process when deployment configuration is done.
   - Create a new deployment plan when deployment configuration is done.
   - Deployment plan is on the machine where this web browser is running.

   4. In the Archive or Exploded Directory section, you can select one of the following:
- **Archive is on the machine where this browser is running.** Enter the location of the archive or click **Browse** to find the archive file.

- **Archive or exploded directory is on the server where Enterprise Manager is running.** Enter the location of the archive or click **Browse** to find the archive file.

5. In the Deployment Plan section, you can select one of the following:
   - Create a new deployment plan when deployment configuration is done.
   - Deployment plan is on the machine where this web browser is running. If you select this option, enter the path to the plan.
   - Deployment plan is on the server where Enterprise Manager is running. If you select this option, enter the path to the plan.

6. Click **Next**.
   
The Select Target page is displayed.

7. Select the target to which you want to deploy the application. The Administration Server, Managed Servers, and clusters are listed. You can select a cluster, one or more Managed Server in the cluster, or a Managed Server that is not in a cluster. Although the Administration Server is shown in the list of targets, you should not deploy an application to it. The Administration Server is intended only for administrative applications such as the Oracle WebLogic Server Administration Console.

8. Click **Next**.
   
The Application Attributes page is displayed.

9. In the Application Attributes section, for **Application Name**, enter the application name.

10. In the Context Root of Web Modules section, if the web module does not have the context root configured in the application.xml file, you can specify the context root for your application. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.

11. In the Distribution section, you can select one of the following:
   - Distribute and start application (servicing all requests)
   - Distribute and start application in admin mode (servicing only admin requests)
   - Distribute only

12. Click **Next**.
   
The Deployment Wizard, Deployment Settings page is displayed.

13. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. Depending on the type of application, you can:
   - Configure Web modules: Click **Go to Task** in the Configure Web Modules row. The Configure Web Modules page is displayed. Click **Configure General Properties** to view and edit the general configuration for the Web Module or **Map Resource References** to map the resource references.
     
     For example, you can change the session invalidation interval or the maximum age of session cookies.
Configure application security. Click Go to Task in the Configure Application Security row. Depending on what type of security is used, different pages are displayed.

If the application contains jazn-data.xml or cwallet.sso, the Configure Application Security page displays the following sections:

- If it contains jazn-data.xml, the page displays the Application Policy Migration section.
- If it contains cwallet.sso, the page displays the Application Credential Migration section.
- If it contains both, the page displays both sections.

For information about these settings, see "Deploying JavaEE and ADF Applications with Oracle Enterprise Manager" in the Oracle Fusion Middleware Security Guide.

If the application contains neither of these files, the Configure Application Security page displays the following options:

- DD Only: Use only roles and policies that are defined in the deployment descriptors.
- Custom Roles: Use roles that are defined in the Administration Console; use policies that are defined in the deployment descriptor.
- Custom Roles and Policies: Use only roles and policies that are defined in the Administration Console.
- Advanced: Use a custom model that you have configured on the realm’s configuration page.

Configure EJB modules: Click Go to Task in the Configure EJB modules row. The Configure EJB Modules page is displayed. Click Configure EJB Properties to view and edit the general configuration for the EJ Bs or Map Resource References to map the resource preferences.

For example, you can configure the maximum number of beans in the free pool or the network access point.

You can edit and save the deployment plan, if you choose. If you edit the deployment plan and change descriptor values, those changes are saved to the deployment plan. In addition, the following configurations are saved to the deployment plan:

- Application attributes
- Web module configuration
- EJB configuration

Application attributes related to MDS are stored in the file adf-config.xml. Application security attributes are stored in weblogic-application.xml.

Fusion Middleware Control updates the relevant files and repackages the .ear file.

15. Click Deploy.

Fusion Middleware Control displays processing messages.

16. When the deployment is completed, click Close.
To deploy an application to multiple servers at the same time, navigate to the domain. Then, from the WebLogic Domain menu, select Application Deployment, then Deploy. The deployment wizard displays a page where you can select the servers.

### 8.3.1.2 Deploying Java EE Applications Using the WLST Command Line

You can deploy an application using the WLST command line. To deploy a Java EE application when WLST is connected to the Administration Server, you use the WLST command deploy, using the following format:

`deploy(app_name, path, [targets] [stageMode], [planPath], [options])`

You must invoke the deploy command on the computer that hosts the Administration Server.

For example, to deploy the application `mainWebApp`:

`deploy('myApp', '/scratch/applications/wlserver_10.3/samples/server/examples/build/mainWebApp')`

You can also deploy the application using the weblogic.deployer, as shown in the following example:

```
java weblogic.Deployer -adminurl http://localhost:7001
   -user weblogic -password weblogic -deploy
   -name myApp c:\localfiles\mainWebApp
   -plan c:\localfiles\productionEnvPlan.xml
```

See Also:

- "Deployment Tools" in Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for more information about using WLST to deploy applications
- The Oracle Fusion Middleware WebLogic Scripting Tool Command Reference

### 8.3.2 Undeploying Java EE Applications

You can undeploy an application from a Managed Server or a cluster. This section describes how to undeploy an application from a Managed Server.

#### 8.3.2.1 Undeploying Java EE Applications Using Fusion Middleware Control

To undeploy a Java EE application from a Managed Server using Fusion Middleware Control:

1. From the navigation pane, expand Application Deployments.
2. Select the application to undeploy.
   The application home page is displayed.
3. From the Application Deployment menu, choose Application Deployment, then Undeploy.
   The confirmation page is displayed.
4. Click Undeploy.
   Processing messages are displayed.
5. When the operation completes, click Close.
Alternatively, you can navigate to the domain, Managed Server, or cluster. Then, from the target's menu, choose Application Deployment, then Undeploy. In the Select Application page, select the application you want to undeploy.

### 8.3.2.2 Undeploying Java EE Applications Using the WLST Command Line

You can undeploy an application using the WLST command line. To undeploy a Java EE application when WLST is connected to the Administration Server, you use the WLST command undeploy, using the following format:

```
undeploy(app_name, path, [targets] [options])
```

You must invoke the undeploy command on the computer that hosts the Administration Server.

For example, to undeploy the application businessApp from all target servers and specify that WLST wait 60,000 ms for the process to complete:

```
wls:/mydomain/serverConfig> undeploy('businessApp', timeout=60000)
```

### 8.3.3 Redeploying Java EE Applications

You can redeploy an application that has been undeployed from a WebLogic Managed Server or a cluster. This section describes how to redeploy an application to a Managed Server.

#### 8.3.3.1 Redeploying Java EE Applications Using Fusion Middleware Control

To redeploy a Java EE application to a Managed Server using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then Application Deployments.
2. Select the application.
   
   The application home page is displayed.
3. From the Application Deployment menu, choose Application Deployment, and then Redeploy.
   
   The Select Application page is displayed.
4. Click Next.
5. In the Archive or Exploded Directory section, you can select one of the following:
   
   - **Archive is on the machine where this browser is running.** Then, enter the location of the archive or click Browse to find the archive file.
   
   - **Archive or exploded directory is on the server where Enterprise Manager is running.** Then, enter the location of the archive or click Browse to find the archive file.
6. In the Deployment Plan section, you can select one of the following:
   
   - **Create a new deployment plan when deployment configuration is done.**
   
   - **Deployment plan is on the machine where this web browser is running.** If you select this option, enter the path to the plan.
   
   - **Deployment plan is on the server where Enterprise Manager is running.** If you select this option, enter the path to the plan.
7. Click Next.
The Application Attributes page is displayed.

8. Click Next.

The Deployment Wizard, Deployment Settings page is displayed.

9. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. Depending on the type of application, you can:
   - Configure Web modules
   - Configure application security
   - Configure EJB modules

You can edit and save the deployment plan, if you choose. If you edit the deployment plan and change descriptor values, those changes are saved to the deployment plan. In addition, the following configurations are saved to the deployment plan:
   - Application attributes
   - Web module configuration
   - EJB configuration

Application attributes related to MDS are stored in the file adf-config.xml. Application security attributes are stored in weblogic-application.xml. Fusion Middleware Control updates the relevant files and repackages the .ear file.

11. Click Redeploy.

Processing messages are displayed.

12. When the operation completes, click Close.

8.3.3.2 Redeploying Java EE Applications Using the WLST Command Line

You can redeploy an application using the WLST command line. To redeploy a Java EE application when WLST is connected to the Administration Server, you use the WLST command `redeploy`, using the following format:

`redeploy(app_name, planpath, [options])`

You must invoke the redeploy command on the computer that hosts the Administration Server.

For example, to redeploy the application `businessApp` from all target servers:

`redeploy('businessApp')`

8.4 Deploying, Undeploying, and Redeploying Oracle ADF Applications

The Oracle Application Development Framework (Oracle ADF) is an end-to-end application framework that builds on Java Platform, Enterprise Edition (Java EE) standards and open-source technologies to simplify and accelerate implementing service-oriented applications.

You can use Fusion Middleware Control, Oracle WebLogic Server Administration Console, Oracle JDeveloper, or the command line to deploy, undeploy, or redeploy an Oracle ADF application. The following topics describe using Fusion Middleware Control, the Administration Console, and the command line to accomplish these tasks:
8.4.1 Deploying Oracle ADF Applications

You can deploy an application to a WebLogic Managed Server or a cluster. This section describes how to deploy an application to a Managed Server. This example assumes that you have created an .ear file containing the ADF application.

8.4.1.1 Deploying ADF Applications Using Fusion Middleware Control

To deploy an Oracle ADF application using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.

2. Select the server in which you want to deploy the application.

   The server home page is displayed.

3. From the WebLogic Server menu, choose Application Deployment, then Deploy.

   The Deployment Wizard, Select Archive page is displayed.

4. In the Archive or Exploded Directory section, you can select one of the following:
   - Archive is on the machine where this browser is running. Then, enter the location of the archive or click Browse to find the archive file.
   - Archive or exploded directory is on the server where Enterprise Manager is running. Then, enter the location of the archive or click Browse to find the archive file.

5. In the Deployment Plan section, you can select one of the following:
   - Create a new deployment plan when deployment configuration is done.
   - Deployment plan is on the machine where this web browser is running. If you select this option, enter the path to the plan.
   - Deployment plan is on the server where Enterprise Manager is running. If you select this option, enter the path to the plan.

6. Click Next.

   The Select Target page is displayed.

7. Select the target to which you want to deploy the application.

8. Click Next.

   The Application Attributes page is displayed, as shown in the following figure:
9. In the Application Attributes section, for **Application Name**, enter the application name.

10. In the Context Root of Web Modules section, if the web module does not have the context root configured in the application.xml file, you can specify the context root for your application. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.

11. The Target Metadata Repository section allows you to choose the repository and partition for this application. If the partition name is not specified in the adf-config.xml file, the application name plus the version is used as the default partition name. This ensures that the partition used is unique in the domain so that the metadata for different applications will not be accidentally imported into the same repository partition and overwrite each other. Typically, each application’s metadata is deployed to its own partition.

   - To change the repository, click the icon next to the **Repository Name**. In the Metadata Repositories dialog box, select the repository and click **OK**.
   - To change the partition, enter the partition name in **Partition Name**. Oracle recommends that you create a new partition for each application. If you enter a name of a partition that does not exist, the partition is created.

The adf-config.xml file in the .ear file is updated with the new information.
If the partition or repository specified in the application is not valid in the domain, Fusion Middleware Control displays a message.

12. If the application's adf-config.xml file archive contains MDS configuration for an MDS shared repository, the Shared Metadata Repository section is displayed. It allows you to choose the repository and partition for this application. If the partition or repository specified in the application is not valid in the domain, Fusion Middleware Control displays a message.

If you change the repository or partition, the adf-config.xml file in the .ear file is updated with the new information.

13. In the Distribution section, you can select one of the following:
   - Distribute and start application (servicing all requests)
   - Distribute and start application in admin mode (servicing only admin requests)
   - Distribute only

14. Click Next.

   The Deployment Wizard, Deployment Settings page is displayed.

15. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. Depending on the type of application, you can:
   - Configure Web modules: Click Go to Task in the Configure Web Modules row. The Configure Web Modules page is displayed. Click Configure General Properties to view and edit the general configuration for the Web Module or Map Resource References to map the resource references.
     For example, you can change the session invalidation interval or the maximum age of session cookies.
   - Configure application security. Click Go to Task in the Configure Application Security row. Depending on what type of security is used, different pages are displayed.
     If the application contains jazn-data.xml or cwallet.sso, the Configure Application Security page displays the following sections:
     - If it contains jazn-data.xml, the page displays the Application Policy Migration section.
     - If it contains cwallet.sso, the page displays the Application Credential Migration section.
     - If it contains both, the page displays both sections.
     For information about the settings in this page, see "Deploying JavaEE and ADF Applications with Oracle Enterprise Manager" in the Oracle Fusion Middleware Security Guide.
     If the application contains neither of these files, the Configure Application Security page displays the following options:
     - DD Only: Use only roles and policies that are defined in the deployment descriptors.
     - Custom Roles: Use roles that are defined in the Administration Console; use policies that are defined in the deployment descriptor.
- Custom Roles and Policies: Use only roles and policies that are defined in the Administration Console.
- Advanced: Use a custom model that you have configured on the realm's configuration page.

Configure EJB modules: Click Go to Task in the Configure EJB modules row. The Configure EJB Modules page is displayed. Click Configure EJB Properties to view and edit the general configuration for the EJBs or Map Resource References to map the resource preferences.

For example, you can configure the maximum number of beans in the free pool or the network access point.

Configure ADF Connections. To modify the ADF connections, click Go to Task in the Configure ADF Connections row. The Configure ADF Connections page is displayed, showing the current connection information. To modify a connection type, click the Edit icon for a particular row. For example, you can modify the connection information for an external application. For more information about ADF connections, see Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework.

You can edit and save the deployment plan, if you choose.

17. Click Deploy.
Fusion Middleware Control displays processing messages.

18. When the deployment is completed, click Close.
To deploy an application to multiple servers at the same time, navigate to the domain. Then, from the WebLogic Domain menu, select Application Deployment, then Deploy. The deployment wizard displays a page where you can select the servers.

8.4.1.2 Deploying ADF Applications Using the WLST Command Line or the Administration Console
You can deploy an ADF application using the WLST command line or the Oracle WebLogic Server Administration Console.

Take the following steps:

1. If your application uses an MDS repository, you must configure the application archive (.ear) file before you deploy your application. You must provide the repository information for the deploy target repository and any shared metadata repositories using the WLST getMDSArchiveConfig command. The repository specified must already be registered with the domain before deploying the application. The following example show how to use this command to get the MDSArchiveConfig and call the setAppMetadataRepository method to set the deploy target repository. Otherwise, your application will fail to start.

   wls:/offline> archive = getMDSArchiveConfig(fromLocation='/tmp/App1.ear')
   wls:/offline> archive.setAppMetadataRepository(repository='AppRepos1',
           partition='partition1', type='DB', jndi='mds-jndi1')

   The operation places the changes in the MDS configuration portion of the adf-config.xml file in the archive file.

2. Save the changes to the original .ear file, using the following command:
3. Deploy the application.

To deploy an application when WLST is connected to the Administration Server, you use the WLST command `deploy`, using the following format:

```java
deploy(app_name, path, [targets] [stageMode], [planPath], [options])
```

You must invoke the deploy command on the computer that hosts the Administration Server.

For example, to deploy the application `myApp`:

```java
deploy("myApp","/scratch/applications/myApp", targets='myserver', timeout=120000)
```

**See Also:**

- "Deployment Tools" in Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for more information about using WLST to deploy applications
- The Oracle Fusion Middleware WebLogic Scripting Tool Command Reference

To deploy the application using the Oracle WebLogic Server Administration Console:

a. If you have not already done so, in the Change Center of the Administration Console, click **Lock & Edit**.

b. In the left pane of the Administration Console, select **Deployments**.

c. In the right pane, click **Install**.

**See Also:** The Help in the Oracle WebLogic Server Administration Console.

### 8.4.2 Undeploying Oracle ADF Applications

To undeploy an Oracle ADF application using Fusion Middleware Control:

1. From the navigation pane, expand **Application Deployments**, then the application to undeploy.

The application home page is displayed.

2. From the Application Deployment menu, choose **Application Deployment**, then **Undeploy**.

The confirmation page is displayed.

3. Click **Undeploy**.

Processing messages are displayed.

4. When the operation completes, click **Close**.

Alternatively, you can navigate to the domain, Managed Server, or cluster. Then, from the target’s menu, choose **Application Deployment**, then **Undeploy**. In the Select Application page, select the application you want to undeploy.

Note that when you undeploy an application, documents stored in the MDS partition are not deleted.
8.4.3 Redeploying Oracle ADF Applications

When you redeploy an application, if the application contains a Metadata Archive (MAR), the contents of the MAR is imported to the application's metadata repository only if the MAR is changed. If the MAR is unchanged from previous deployment of the application, it is ignored.

To redeploy an Oracle ADF application using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then **Application Deployments**.
2. Select the application.
   The application home page is displayed.
3. From the Application Deployment menu, choose **Application Deployment**, and then **Redeploy**.
   The Select Application page is displayed.
4. Click Next.
   The Select Archive page is displayed.
5. In the Archive or Exploded Directory section, you can select one of the following:
   - **Archive is on the machine where this browser is running**. Then, enter the location of the archive or click **Browse** to find the archive file.
   - **Archive or exploded directory is on the server where Enterprise Manager is running**. Then, enter the location of the archive or click **Browse** to find the archive file.
6. In the Deployment Plan section, you can select one of the following:
   - **Create a new deployment plan when deployment configuration is done**.
   - **Deployment plan is on the machine where this web browser is running**. If you select this option, enter the path to the plan.
   - **Deployment plan is on the server where Enterprise Manager is running**. If you select this option, enter the path to the plan.
7. Click Next.
   The Application Attributes page is displayed.
8. In the Application Attributes section, for **Application Name**, enter the application name.
9. In the Context Root of Web Modules section, if the web module does not have the context root configured in the application.xml file, you can specify the context root for your application. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.
10. The Target Metadata Repository section is displayed. It allows you to choose the repository and partition for this application:
    - To change the repository, click the icon next to the **Repository Name**. In the Metadata Repositories dialog box, select the repository and click **OK**.
    - To change the partition, enter the partition name in **Partition Name**. Oracle recommends that you create a new partition for each application. If you enter a name of a partition that does not exist, the partition is created.
11. If the application's adf-config.xml file archive contains MDS configuration for an MDS shared repository, the Shared Metadata Repository section is displayed. It allows you to choose the repository and partition for this application.

12. Click Next.
   The Deployment Settings page is displayed.

13. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. You can:
   - Configure Web modules
   - Configure application security

   You can edit and save the deployment plan, if you choose.

15. Click Deploy.
   Fusion Middleware Control displays processing messages.

16. When the deployment is completed, click Close.

17. In the Confirmation page, click Redeploy.

8.5 Deploying, Undeploying, and Redeploying SOA Composite Applications

SOA composite applications consist of the following:

- Service components such as Oracle Mediator for routing, BPEL processes for orchestration, human tasks for workflow approvals, business rules for designing business decisions, and complex event processing (CEP) for queries of event streams
- Binding components (services and references) for connecting SOA composite applications to external services, applications, and technologies

These components are assembled together into a SOA composite application. This application is a single unit of deployment that greatly simplifies the management and lifecycle of SOA applications.

You can use Fusion Middleware Control, Oracle JDeveloper, or the command line to deploy, undeploy, or redeploy a SOA application. The following topics describe using Fusion Middleware Control to accomplish these tasks:

- Deploying SOA Composite Applications
- Undeploying SOA Composite Applications
- Redeploying SOA Composite Applications

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite

8.5.1 Deploying SOA Composite Applications

When you deploy a SOA composite application, the deployment extracts and activates the composite application in the SOA Infrastructure.

You can deploy SOA composite applications from Fusion Middleware Control with the Deploy SOA Composite Composite wizard:
1. From the navigation pane, expand the farm, then SOA, and then select soa-infra. The SOA Infrastructure home page is displayed.

2. From the SOA Infrastructure menu, choose SOA Deployment, then Deploy. The Deployment Wizard, Select Archive page is displayed, as shown in the following figure:

   ![Deployment Wizard, Select Archive](image)

   This wizard lets you create a runtime environment for SOA composite applications. Once this operation is performed, these applications can be administered using Oracle Enterprise Manager. A single composite revision or a bundle containing revisions of multiple SOA composites can be deployed.

   Specify the archive or exploded directory and configuration plan to deploy a single revision of a SOA composite. Or specify a zip file and configuration plan to deploy multiple composite revisions at once.

   **Archive or Exploded Directory**
   You can deploy a Service archive (SAR) or a ZIP file containing one or more Service archives (SARs). You can also deploy an exploded archive directory that is present on the server on which Enterprise Manager is running. Ensure that the revision information for each SOA composite is provided in its application package.

   - **Locate Archive**
     - Archive is on the machine where this web browser is running.
     - Archive or exploded directory is on the server where Enterprise Manager is running.

   **Configuration Plan**
   The configuration plan is a file that contains the deployment settings for a SOA composite revision.

   - **Locate Configuration Plan**
     - No external configuration plan is required.
     - Configuration plan is on the machine where this web browser is running.
     - Configuration plan is on the server where Enterprise Manager is running.

3. In the Archive or Exploded Directory section, specify the archive of the SOA composite application to deploy. The archive contains the project files of the application to be deployed (for example, HelloWorld_rev1.0.jar for a single archive or OrderBooking_rev1.0.zip for multiple archives).

4. In the Configuration Plan section, optionally specify the configuration plan to include with the archive. The configuration plan enables you to define the URL and property values to use in different environments. During the process deployment, the configuration plan is used to search the SOA project for values that must be replaced to adapt the project to the next target environment.

5. Click Next.
   The Select Target page appears.

6. Select the WebLogic Server or cluster to which to deploy the SOA composite application archive. You can deploy to multiple servers and clusters.

7. Click Next.
   The Confirmation page appears.

8. Review your selections.

9. Select whether or not to deploy the SOA composite application as the default revision. The default revision is instantiated when a new request comes in.

10. Click Deploy.
    Processing messages are displayed.

11. When deployment has completed, click Close.
8.5.2 Undeploying SOA Composite Applications

You can undeploy SOA composite applications from Fusion Middleware Control:

1. From the navigation pane, expand the farm, then SOA, and then select soa-infra. The SOA Infrastructure home page is displayed.
2. From the SOA Infrastructure menu, choose SOA Deployment, then Undeploy. The Confirmation page is displayed.
3. Review your selections.
4. If you are satisfied, click Undeploy. Processing messages are displayed.
5. When undeployment has completed, click Close.

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for complete information about deploying SOA Composite applications

8.5.3 Redeploying SOA Composite Applications

You can redeploy SOA composite applications from Fusion Middleware Control with the Redeploy SOA Composite wizard:

1. From the navigation pane, expand the farm, then SOA, and then select soa-infra. The SOA Infrastructure home page is displayed.
2. From the SOA Infrastructure menu, choose SOA Deployment, then Redeploy. The Select Archive page appears.
3. In the Archive or Exploded Directory section, select the location of the SOA composite application revision you want to redeploy.
4. In the Configuration Plan section, optionally specify the configuration plan to include with the archive.
5. Click Next. The Confirmation page appears.
6. Select whether or not to redeploy the SOA composite application as the default revision.
7. Click Redeploy. Processing messages are displayed.
8. When redeployment has completed, click Close.

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for complete information about deploying SOA Composite applications
8.6 Deploying, Undeploying, and Redeploying WebCenter Applications

WebCenter applications differ from traditional Java EE applications in that they support run-time customization, such as the application’s pages, the portlets contained within these pages, and the document libraries. Customizations are stored as follows:

- WebCenter application customizations are stored in Oracle Metadata Services (MDS), which is installed in a database.
- Portlet producer customizations (or preferences) are usually stored in a database preference store.

You can use Fusion Middleware Control, Oracle JDeveloper, or the command line to deploy, undeploy, or redeploy a WebCenter application. The following topics describe using Fusion Middleware Control to accomplish these tasks:

- Deploying WebCenter Applications
- Undeploying WebCenter Applications
- Redeploying WebCenter Applications

See Also: Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter

8.6.1 Deploying WebCenter Applications

To deploy your application to a Managed Server that resides outside JDeveloper, you must first create application deployment plans. In Oracle JDeveloper, first create a project-level deployment profile and then an application-level deployment profile. The project-level deployment profile is packaged as a Web Application Archive (WAR) file. The application-level deployment profile is packaged as a Metadata Archive (MAR). A MAR is a compressed archive of selected metadata. A single MAR can contain metadata content of multiple projects. MAR files are used to deploy metadata content to the MDS repository. For information about creating deployment plans with Oracle JDeveloper, see Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter.

To deploy an Oracle WebCenter application to a Managed Server using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.
2. Select the server in which you want to deploy the application.
   The server home page is displayed.
3. From the WebLogic Server menu, select Application Deployment, then Deploy.
   The Deployment Wizard, Select Archive page is displayed.
4. In the Archive or Exploded Directory section, you can select one of the following:
   - Archive is on the machine where this browser is running. Then, enter the location of the archive or click Browse to find the archive file.
   - Archive or exploded directory is on the server where Enterprise Manager is running. Then, enter the location of the archive or click Browse to find the archive file.
5. In the Deployment Plan section, you can select one of the following:
   - Create a new deployment plan when deployment configuration is done.
Deploying, Undeploying, and Redeploying WebCenter Applications

- Deployment plan is on the machine where this web browser is running. If you select this option, enter the path to the plan.
- Deployment plan is on the server where Enterprise Manager is running. If you select this option, enter the path to the plan.

6. Click Next.
   The Select Target page is displayed.

7. Select the target to which you want to deploy the application.

8. Click Next.
   The Application Attributes page is displayed.

9. In the Application Attributes section, for Application Name, enter the application name.

10. In the Context Root of Web Modules section, specify the context root for your application if you have not specified it in application.xml. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.

11. The Target Metadata Repository section allows you to choose the repository and partition for this application. If the partition or repository specified in the application is not valid in the domain, Fusion Middleware Control displays a message.

   - To change the repository, click the icon next to the Repository Name. In the Metadata Repositories dialog box, select the repository and click OK.
   - To change the partition, enter the partition name in Partition Name. Oracle recommends that you create a new partition for each application. If you enter a name of a partition that does not exist, the partition is created.

     Each application must have a unique partition in the repository.

12. Click Next.
   The Deployment Wizard, Deployment Settings page is displayed.

13. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. Depending on the type of application, you can:

   - Configure Web modules: Click Go to Task in the Configure Web Modules row. The Configure Web Modules page is displayed. Click Configure General Properties to view and edit the general configuration for the Web Module or Map Resource References to map the resource references.

     For example, you can change the session invalidation interval or the maximum age of session cookies.

   - Configure application security. Click Go to Task in the Configure Application Security row. Depending on what type of security is used, different pages are displayed.

     If the application contains jazn-data.xml or cwallet.sso, the Configure Application Security page displays the following sections:

     - If it contains jazn-data.xml, the page displays the Application Policy Migration section.
     - If it contains cwallet.sso, the page displays the Application Credential Migration section.
If it contains both, the page displays both sections.

For information about the settings in this page, see "Deploying JavaEE and ADF Applications with Oracle Enterprise Manager" in the Oracle Fusion Middleware Security Guide.

If the application contains neither of these files, the Configure Application Security page displays the following options:

- **DD Only**: Use only roles and policies that are defined in the deployment descriptors.
- **Custom Roles**: Use roles that are defined in the Administration Console; use policies that are defined in the deployment descriptor.
- **Custom Roles and Policies**: Use only roles and policies that are defined in the Administration Console.
- **Advanced**: Use a custom model that you have configured on the realm's configuration page.

- **Configure EJB modules**: Click Go to Task in the Configure EJB modules row. The Configure EJB Modules page is displayed. Click Configure EJB Properties to view and edit the general configuration for the EJBs or Map Resource References to map the resource references.

  For example, you can configure the maximum number of beans in the free pool or the network access point.

- **Configure ADF Connections**: To modify the ADF connections, click Go to Task in the Configure ADF Connections row. The Configure ADF Connections page is displayed, showing the current connection information. To modify a connection type, click the Edit icon for a particular row.

  For more information about setting these attributes, see the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

14. **Expand Deployment Plan**.
   
   You can edit and save the deployment plan, if you choose.

15. **Click Deploy**.
   
   Fusion Middleware Control displays processing messages.

16. **When the deployment is completed, click Close**.

### 8.6.2 Undeploying WebCenter Applications

To undeploy a WebCenter Application:

1. From the navigation pane, expand Application Deployments, then the application to undeploy.

   The application home page is displayed.

2. From the Application Deployment menu, select Application Deployment, then Undeploy.

   The confirmation page is displayed.

3. **Click Undeploy**.

   Processing messages are displayed.

4. When the operation completes, click Close.
Alternatively, you can navigate to the domain, Managed Server, or cluster. Then, from the target's menu, choose Application Deployment, then Undeploy. In the Select Application page, select the application you want to undeploy.

8.6.3 Redeploying WebCenter Applications

To redeploy a WebCenter Application:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.

2. Select the server in which you want to deploy the application.
   
   The server home page is displayed.

3. From the WebLogic Server menu, select Application Deployment, then Redeploy.
   
   The Select Application page is displayed. You can only redeploy applications that are versioned. If the application is not versioned, you must undeploy, then redeploy.

4. Select the application to redeploy.

5. Click Next.
   
   The Select Archive page is displayed.

6. In the Archive or Exploded Directory section, you can select one of the following:
   
   - Archive is on the machine where this browser is running. Then, enter the location of the archive or click Browse to find the archive file.
   
   - Archive or exploded directory is on the server where Enterprise Manager is running. Then, enter the location of the archive or click Browse to find the archive file.

7. In the Deployment Plan section, you can select one of the following:
   
   - Create a new deployment plan when deployment configuration is done
   
   - Deployment plan is on the machine where this web browser is running. If you select this option, enter the path to the plan.
   
   - Deployment plan is on the server where Enterprise Manager is running. If you select this option, enter the path to the plan.

8. Click Next.
   
   The Application Attributes page is displayed.

9. In the Application Attributes section, for Application Name, enter the application name.

10. In the Context Root of Web Modules section, specify the context root for your application if you have not specified it in application.xml. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.

11. In the Target Metadata Repository section, select the MDS repository and for Partition Name, enter a partition name. If the partition or repository specified in the application is not valid in the domain, Fusion Middleware Control displays a message.

12. Click Next.
   
   The Deployment Settings page is displayed.
13. On this page, you can perform common tasks before deploying your application or you can edit the deployment plan or save it to a disk. You can:

- Configure Web modules
- Configure application security

You can edit and save the deployment plan, if you choose.

15. Click Redeploy.
Fusion Middleware Control displays processing messages.

16. When the deployment is completed, click Close.

8.7 Changing MDS Configuration Attributes for Deployed Applications

If your application uses an MDS repository, you can modify configuration attributes after the application is deployed. To view or modify the attributes, you can use the System MBean Browser or WLST.

Note: Changes to this configuration are persisted in MDS as customizations. Because these are persisted as customizations:

- Any changes made to this configuration are retained across application deployments. For example, if a configuration attribute is changed and if the application is redeployed to the same partition, the previously changed attribute value is still retained.
- In a cluster, if an attribute is changed on one Managed Server, that change is propagated to all Managed Servers in the cluster automatically.

8.7.1 Changing the MDS Configuration Attributes Using Fusion Middleware Control

Take the following steps:

1. Navigate to the application's home page by expanding the farm, then Application Deployments. Then, select an application.
   The application's home page is displayed.

2. From the Application Deployment menu, choose System MBean Browser.
   The System MBean Browser page is displayed.

3. Expand Application Defined MBeans, then oracle.adf.share.config, then Server: name, then Application: name, then ADFConfig, then ADFConfig, and ADFConfig.

4. Select MDSAppConfig.
   The Application Defined MBeans page is displayed, as shown in the following figure:
5. You can view the description and values for the attributes.

Table 8–2 describes the configuration attributes that are specific to MDS. Note that other attributes, such as ConfigMBean appear in browser, but these are generic attributes for all MBeans.

**Table 8–2  MDS Configuration Attributes for Deployed Applications**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AppMetadataRepositoryInfo</td>
<td>Read only. Describes the metadata repository partition where the application is deployed.</td>
</tr>
<tr>
<td>AutoPurgeTimeToLive</td>
<td>Automatically purge versions of metadata documents older than the given time interval, specified in seconds. Any unlabeled versions older than this time interval are automatically purged on any subsequent update from this application. If the value is not set, versions are not automatically purged.</td>
</tr>
<tr>
<td>DeployTargetRepository</td>
<td>The name of the target repository configured for the application.</td>
</tr>
<tr>
<td>ExternalChangeDetection</td>
<td>Specifies that the MDS repository is polled to determine if any applicable metadata changes have been performed external to the application. If changes are detected, notifications are sent. This attribute is applicable only to database-based repositories. The default is true.</td>
</tr>
</tbody>
</table>
6. To view or modify an attribute, select the attribute. The attribute page is displayed.

7. If the attribute is not read-only, you can change the values. For example, for AutoPurgeTimeToLive, you can change the interval, by entering a new value in Value.

8. Click Apply.

9. Navigate up to ADFConfig (the parent of MDSAppConfig) and select it.

10. In the Operations tab, click Save.

11. Click Invoke.

### 8.7.2 Changing the MDS Configuration Using WLST

You can change the MDS configuration using WLST. The following example shows a WLST script that reads and then sets the ReadOnlyMode attribute:

```plaintext
***
Getting ReadOnlyMode Attribute from MBean
***
connect('username', 'password', 'hostname:port')
application = 'application_name'
attribute = 'ReadOnlyMode'
beanName = 'oracle.adf.share.config:ApplicationName=' + application +',name=MDSAppConfig,type=ADFConfig,Application='+ application +',ADFConfig=ADFConfig,*'
beanObjectName = ObjectName(beanName)
beans = mbs.queryMBeans(beanObjectName, None)
bean = beans.iterator().next().getObjectName()
custom()
value = mbs.getAttribute(bean, attribute)
print value

***
Setting ReadOnlyMode Attribute from MBean
```

---

**Table 8–2 (Cont.) MDS Configuration Attributes for Deployed Applications**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExternalChangeDetectionInterval</td>
<td>The maximum time interval, in seconds, to poll the MDS repository to determine if there are external metadata changes. This attribute is only valid if ExternalChangeDetection is enabled. The default is 30 seconds.</td>
</tr>
<tr>
<td>MaximumCacheSize</td>
<td>The maximum metadata cache size limit, in kilobytes. If the value is 0, caching is disabled. If no value is specified, there is no cache limit. In this case, cached data is stored indefinitely.</td>
</tr>
<tr>
<td>ReadOnlyMode</td>
<td>Changes the application to read-only mode, so that no updates can be made to the application's repository partition, including configuration and application metadata.</td>
</tr>
<tr>

Monitoring Oracle Fusion Middleware

This chapter describes how to monitor Oracle Fusion Middleware using Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Server Administration Console, and the command line. It describes the following topics:

- Monitoring the Status of Oracle Fusion Middleware
- Viewing the Performance of Oracle Fusion Middleware
- Viewing the Routing Topology

9.1 Monitoring the Status of Oracle Fusion Middleware

Monitoring the health of your Oracle Fusion Middleware environment and ensuring that it performs optimally is an important task for the administrator.

Oracle Fusion Middleware provides the following methods for monitoring the status of your environment:

- You can monitor the status of Oracle WebLogic Server domains, servers, Java components, and applications using Oracle WebLogic Server Administration Console. From the Administration Console, navigate to the entity's page. See "Overview of the Administration Console" in the Oracle Fusion Middleware Introduction to Oracle WebLogic Server for information on monitoring using the console.

- You can monitor the status of Oracle WebLogic Server domains, servers, Java components, system components, and applications using Fusion Middleware Control. Navigate to the entity’s home page, for example, to the home page for an Oracle HTTP Server instance.

- You can monitor the status of your environment using the command line. To monitor the status of Java components with the command line, use the WLST state command, using the following format:

  state(name, type)

  For example, to get the status of the Managed Server server1, use the following command:

  wls:/mydomain/serverConfig> state('server1', 'Server')
  Current state of "server1": SUSPENDED

  To monitor the status of system components with the command line, use the opmnctl status command, using the following format:

  opmnctl status [scope] [options]
For example, to view the status of all processes monitored by OPMN, use the following command:

opmncnt status

The following topics provide more detail:

- Viewing General Information
- Monitoring an Oracle WebLogic Server Domain
- Monitoring an Oracle WebLogic Administration Server or Managed Server
- Monitoring a Cluster
- Monitoring a Component
- Monitoring Java EE Applications
- Monitoring ADF Applications
- Monitoring SOA Composite Applications
- Monitoring Oracle WebCenter Applications

### 9.1.1 Viewing General Information

You can view the overall status of the Oracle Fusion Middleware environment from the home page of the farm using Fusion Middleware Control. This page lists the availability of all components, an application deployment summary, including SOA composites, if any SOA composite applications are deployed.

To view the status, from the navigation pane, select the farm.

The farm home page is displayed, as shown in the following figure:
9.1.2 Monitoring an Oracle WebLogic Server Domain

You can view the status of a domain, including the servers, clusters, and deployments in the domain in the domain home page of Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain.
2. Select the domain.

The domain home page is displayed, as shown in the following figure:
This page shows the following:

- A general summary of the domain, along with a link to the Oracle WebLogic Server Administration Console
- Information about the servers, both the Administration Server and the Managed Servers in the domain
- Information about the clusters in the domain
- Information about the deployments in the domain

See Also: "Overview of the Administration Console" in the Oracle Fusion Middleware Introduction to Oracle WebLogic Server for information about monitoring an Oracle WebLogic Server domain using the Oracle WebLogic Server Administration Console. The Administration Console provides details about the health and performance of the domain.

9.1.3 Monitoring an Oracle WebLogic Administration Server or Managed Server

You can also view the status of a WebLogic Administration Server or Managed Server in Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.
2. Select the server.
   The server home page is displayed.
The following figure shows the home page for a Managed Server:

![Managed Server Home Page](image)

This page shows the following:

- A general summary of the server, including its state, and information about the servlets, JSPs, and EJBs running in the server
- Response and load
- Information about the applications deployed to the server

See Also: "Overview of the Administration Console" in the Oracle Fusion Middleware Introduction to Oracle WebLogic Server for information about monitoring servers using the Oracle WebLogic Server Administration Console. The Administration Console provides details about the health and performance of the server.

### 9.1.4 Monitoring a Cluster

You can view the status of a cluster, including the servers and deployments in the cluster using Fusion Middleware Control.

To monitor a cluster:

1. From the navigation pane, expand the farm, then **WebLogic Domain**, and then the domain.
2. Select the cluster.

The cluster page is displayed, as shown in the following figure:
This page shows the following:

- A general summary of the cluster, including broadcast channel, if appropriate, the load algorithm and the messaging mode.
- A server section, with a table listing the servers that are part of the cluster.
- A deployments section with information about the applications deployed to the cluster.

**See Also:** "Overview of the Administration Console" in the *Oracle Fusion Middleware Introduction to Oracle WebLogic Server* for information about monitoring a cluster using Oracle WebLogic Server Administration Console. The Administration Console provides details about the health and performance of the cluster.

### 9.1.5 Monitoring a Component

You can view the status of a component, including whether the component is started or not, in the component home page in Fusion Middleware Control.

To monitor a Java component, such as WebCenter Spaces:

1. From the navigation pane, expand the farm, then the type of component, such as WebCenter, then the component, such as WebCenter Spaces.
2. Select the component. For example, select **WebCenter Spaces**.

   The component home page is displayed, as shown in the following figure:
To monitor system components, such as Oracle HTTP Server:

1. From the navigation pane, expand the farm, then **Web Tier**.
2. Select the component, such as ohs1.

   The component home page is displayed.

---

**See Also:** "Overview of the Administration Console" in the *Oracle Fusion Middleware Introduction to Oracle WebLogic Server* for information about using the Oracle WebLogic Server Administration Console to monitor Java components.
9.1.6 Monitoring Java EE Applications

To monitor a Java EE application using Fusion Middleware Control:

1. From the navigation pane, expand Application Deployments, then select the application to monitor.
   The application's home page is displayed.

2. In this page, you can view a summary of the application's status, entry points to the application, Web Services and modules associated with the application, and the response and load.
   The following figure shows a portion of the application's home page:
This page shows the following:

- A summary of the application, including its state, the Managed Server on which it is deployed, and information about active sessions, active requests, and request processing time
- Entry points, including any Web modules and Web services
- A list of modules with the type of module for each
- Response and load, which shows the requests per second and the request processing time
- A list of most requested servlets and JSPs

### 9.1.7 Monitoring ADF Applications

To monitor an ADF application:

1. From the navigation pane, expand **Application Deployments**, then select the application to monitor.
   
   The application's home page is displayed.

2. In this page, you can view a summary of the application's status, entry points to the application, Web Services and modules associated with the application, and the response and load.

### 9.1.8 Monitoring SOA Composite Applications

To monitor a SOA composite application:
1. From the navigation pane, expand SOA, then soa-infra. Select the application to monitor.

The application's home page is displayed.

2. From this page, you can monitor the running instances, faults and rejected messages, and component metrics.

The following figure shows part of a SOA composite home page:

This page, with the Dashboard tab selected, shows the following:

- The recent instances
- Recent faults and rejected messages
- Component metrics

### 9.1.9 Monitoring Oracle WebCenter Applications

To monitor an Oracle WebCenter application:

1. From the navigation pane, expand Application Deployments, then select the application to monitor.

   The application's home page is displayed.

2. In this page, you can view a summary of the application's status, entry points to the application, Web Services and modules associated with the application, and the response and load.

3. To view service metrics, from the Application Deployment menu, choose Web Center, then Service Metrics.

   The following figure shows the Service Metrics page:
If you encounter a problem, such as an application that is running slowly or is hanging, you can view more detailed performance information, including performance metrics for a particular target, to find out more information about the problem.

Oracle Fusion Middleware automatically and continuously measures run-time performance. The performance metrics are automatically enabled; you do not need to set options or perform any extra configuration to collect them.

Note that Fusion Middleware Control provides real-time data. If you are interested in viewing historical data, consider using Oracle Enterprise Manager 10g Grid Control.

For example, to view the performance of an Oracle WebLogic Server Managed Server:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.

2. Select the server to monitor.

   The Managed Server home page is displayed.

3. From the WebLogic Server menu, choose Performance Summary.

See Also: Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter for more information about service metrics

9.2 Viewing the Performance of Oracle Fusion Middleware

If you encounter a problem, such as an application that is running slowly or is hanging, you can view more detailed performance information, including performance metrics for a particular target, to find out more information about the problem.

Oracle Fusion Middleware automatically and continuously measures run-time performance. The performance metrics are automatically enabled; you do not need to set options or perform any extra configuration to collect them.

Note that Fusion Middleware Control provides real-time data. If you are interested in viewing historical data, consider using Oracle Enterprise Manager 10g Grid Control.

For example, to view the performance of an Oracle WebLogic Server Managed Server:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then the domain.

2. Select the server to monitor.

   The Managed Server home page is displayed.

3. From the WebLogic Server menu, choose Performance Summary.
The Performance Summary page is displayed. It shows performance metrics, as well as information about response time and request processing time for applications deployed to the Oracle WebLogic Server.

4. To see additional metrics, click **Show Metric Palette** and expand the metric categories.

The following figure shows the Performance Summary page with the Metric Palette displayed:

![Performance Summary Page](image)

5. Select additional metrics to add them to the Performance Summary.

6. To overlay another target, click **Overlay**, and select the target. The target is added to the charts, so that you can view the performance of more than one target at a time, comparing their performance.

7. To customize the time frame shown by the charts, you can:
   - Click **Slider** to display a slider tool that lets you specify that more or less time is shown in the charts. For example, to show the past 10 minutes, instead of the past 15 minutes, slide the left slider control to the right until it displays the last 10 minutes.
   - Select the calendar and clock icon. Then, enter the **Start Time** and **End Time**.

You can also view the performance of a components, such as Oracle HTTP Server or Oracle SOA Suite. Navigate to the component and select **Monitoring**, then **Performance Summary** from the dynamic target menu.

### 9.3 Viewing the Routing Topology

Fusion Middleware Control provides a Topology Viewer for the farm. The Topology Viewer is a graphical representation of routing relationships across components and elements of the farm. You can easily determine how requests are routed across components. For example, you can see how requests are routed from Oracle Web Cache, to Oracle HTTP Server, to a Managed Server, to a data source.
The Topology Viewer enables you to easily monitor your Oracle Fusion Middleware environment. You can see which entities are up and which are down.

You can also print the topology or save it to a .png file.

To view the topology using Fusion Middleware Control:

1. Click **Topology**.
   - The Topology Viewer is displayed in a separate window.

2. To see information about a particular target, place your mouse over the target. To view additional information, click **More**.
   - The following shows the Topology Viewer window, with information about the Oracle Web Cache component webcache1:

3. From the View menu, you can save or print the image, expand or collapse all of the nodes, or change the orientation of the topology to be left to right or top to bottom.
   - In addition, you can refresh the status and the metrics or update the topology. To refresh the status and metrics, click **Refresh Target Status and Metrics**. To update the topology shown in the viewer, click **Update Topology**. If a target has been
added or deleted, the target list and relationships are updated. This option also updates the status and metrics.

4. From the **Auto Refresh** dropdown, you can enable or disable automatically refreshing the status and metrics. When you enable auto-refresh, the Topology Viewer refreshes the metrics every 60 seconds.

5. With Topology Viewer, you can also:
   - Search for a target within the topology. This makes it easier to find a target if you have many targets. Enter the name in the **Find** box. The target is highlighted and the topology is repositioned so you can see the target if it was not previously visible in the viewing area.
   - View the status of the targets. Choose **Up**, **Down**, or **Unknown** from the Target Status at the top of the page.
   - Navigate to the home page of a target. Right-click the target, and select **Home**.
   - Hide or show the status or metrics. Click **Status** or **Metrics** in the Overlays section.
     If you select Metrics, one key performance metric for the component is displayed. (You cannot change the metric that is displayed.)
   - View the routing relationships between components. For example, you can view the routing from Oracle Web Cache to Oracle HTTP Server to Oracle WebLogic Server.
   - You can perform operations directly on the target by right-clicking. The right-click target menu is displayed. For example, from this menu, you can start or stop an Oracle WebLogic Server or view additional performance metrics.

6. To change what is visible in the topology view, drag the shaded section in the navigator window, which is located in the bottom right.

---

**Notes:**

- If you use Mozilla Firefox, when you click an entity in Topology Viewer to take you back to the main Fusion Middleware Control window, focus is not returned to the main window. For example, if you right-click an entity and select logs from menu, the focus remains on the Topology Viewer window. (If you go back to the main window, the Logs page is correctly displayed.)

  To workaround this problem, make the following change in Firefox:
  
  From the Tools menu, select **Options**, and then **Content**. Click **Advanced**. In the Advanced JavaScript Settings dialog box, select **Raise and lower windows**.

- If you use Internet Explorer, turn off the **Always Open Popups in New Tab** option.
Managing Log Files and Diagnostic Data

Oracle Fusion Middleware components generate log files containing messages that record all types of events, including startup and shutdown information, errors, warning messages, and access information on HTTP requests. This chapter describes how to find information about the cause of an error and its corrective action, to view and manage log files to assist in monitoring system activity and to diagnose problems.

It contains the following topics:

- Overview of Oracle Fusion Middleware Logging
- Understanding ODL Messages and ODL Log Files
- Searching and Viewing Log Files
- Configuring Settings for Log Files
- Correlating Messages Across Log Files and Components

10.1 Overview of Oracle Fusion Middleware Logging

Most Oracle Fusion Middleware components write diagnostic log files in the Oracle Diagnostic Logging (ODL) format. Log file naming and the format of the contents of log files conforms to an Oracle standard and, by default, the diagnostic messages are written in text format.

ODL provides the following benefits:

- The capability to limit the total amount of diagnostic information saved.
- Older segment files are removed and newer segment files are saved in chronological fashion.
- Components can remain active, and do not need to be shutdown, when older diagnostic logging files are deleted.

You can view log files using Fusion Middleware Control or the WLST `displayLogs` command, or you can download log files to your local client and view them using another tool (for example a text editor, or another file viewing utility).

**Note:** Oracle WebLogic Server does not use the ODL format. For information about the Oracle WebLogic Server log format, see Oracle Fusion Middleware Configuring Log Files and Filtering Log Messages for Oracle WebLogic Server.
10.2 Understanding ODL Messages and ODL Log Files

Using ODL, diagnostic messages are written to log files and each message includes information, such as the time, component ID, and user.

The following example shows an ODL format error messages from Oracle SOA Suite:

[2009-04-23T10:54:00.206-07:00] [soa_server1] [NOTIFICATION] [oracle.mds] [tid: [STANDBY].ExecuteThread: '1' for queue: 'weblogic.kernel.Default (self-tuning)'] [userId: <anonymous>] [ecid: 0000I3K7DCnAhKB5JZ4Eyf19wAgN000001,0] [APP: wsm-pm] "Metadata Services: Metadata archive (MAR) not found."

In the message, the fields map to the following attributes, which are described in Table 10–1:

- **2009-04-23T10:54:00.206-07:00**: Timestamp, originating
- **soa_server1**: Organization ID
- **NOTIFICATION**: Message Type
- **oracle.mds**: Component ID
- **tid: [STANDBY].ExecuteThread: '1' for queue: 'weblogic.kernel.Default (self-tuning)’**: Thread ID
- **[userId: <anonymous>]**: User ID
- **ecid: 0000I3K7DCnAhKB5JZ4Eyf19wAgN000001,0**: Execution Context ID
- **APP: wsm-pm**: Supplemental Attribute
- **"Metadata Services: Metadata archive (MAR) not found."**: Message Text

By default, the information is written to the log files in ODL text format. You can change the format to ODL XML format, as described in Section 10.4.4.

Table 10–1 describes the contents of an ODL message. For any given component, the optional attributes may not be present in the generated diagnostic messages.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>TSTZ_ORIGINATING (TIME)</td>
<td>The date and time when the message was generated. This reflects the local</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>time zone.</td>
<td></td>
</tr>
<tr>
<td>Timestamp, normalized</td>
<td>The timestamp normalized for clock drift across hosts. This field is used</td>
<td>No</td>
</tr>
<tr>
<td>(time_norm)</td>
<td>when the diagnostic message is copied to a repository on a different host.</td>
<td></td>
</tr>
<tr>
<td>Organization ID (org_id)</td>
<td>The organization ID for the originating component. The ID is oracle for all</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Oracle components.</td>
<td></td>
</tr>
<tr>
<td>INSTANCE_ID (INST_ID)</td>
<td>The name of the Oracle instance to which the component that originated</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>the message belongs.</td>
<td></td>
</tr>
<tr>
<td>COMPONENT ID (COMP)</td>
<td>The ID of the component that originated the message.</td>
<td>Yes</td>
</tr>
<tr>
<td>MESSAGE_ID (MSG_ID)</td>
<td>The ID that uniquely identifies the message within the component. The ID</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>consists of a prefix that represents the component, followed by a dash,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>then a 5-digit number. For example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>OHS-51009</td>

<td>The type of message. Possible values are: INCIDENT_ERROR, ERROR, WARNING,</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>NOTIFICATION, TRACE, and UNKNOWN. See Table 10–4 for information about the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>message types.</td>
<td></td>
</tr>
</tbody>
</table>
### Understanding ODL Messages and ODL Log Files

**Table 10–2** shows additional attributes that are rarely used.

#### Table 10–2  Infrequently Used ODL Format Message Fields

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>MESSAGE_LEVEL (MSG_LEVEL)</td>
<td>The message level, represented by an integer value that qualifies the message type. Possible values are from 1 (highest severity) through 32 (lowest severity). See Table 10–4 for information about the message levels.</td>
<td>Yes</td>
</tr>
<tr>
<td>HOST_ID (HOST_ID)</td>
<td>The name of the host where the message originated.</td>
<td>No</td>
</tr>
<tr>
<td>HOST_NW_ADDR (HOST_ADDR)</td>
<td>The network address of the host where the message originated.</td>
<td>No</td>
</tr>
<tr>
<td>MODULE_ID (MODULE)</td>
<td>The ID of the module that originated the message. If the component is a single module, the component ID is listed for this attribute.</td>
<td>Yes</td>
</tr>
<tr>
<td>PROCESS_ID (PID)</td>
<td>The process ID for the process or execution unit associated with the message.</td>
<td>No</td>
</tr>
<tr>
<td>THREAD_ID (TID)</td>
<td>The ID of the thread that generated the message.</td>
<td>No</td>
</tr>
<tr>
<td>USER_ID (USER)</td>
<td>The name of the user whose execution context generated the message.</td>
<td>No</td>
</tr>
<tr>
<td>ECID</td>
<td>The Execution Context ID (ECID), which is a global unique identifier of the execution of a particular request in which the originating component participates. You can use the ECID to correlate error messages from different components. See Section 10.5 for information about ECIDs.</td>
<td>Yes</td>
</tr>
<tr>
<td>RID</td>
<td>The relationship ID (RID), which distinguishes the work done in one thread on one process, from work done by any other threads on this and other processes, on behalf of the same request. See Section 10.5 for information about RIDs.</td>
<td>No</td>
</tr>
<tr>
<td>SUPPL_ATTRS</td>
<td>An additional list of name/value pairs which contain component-specific attributes about the event.</td>
<td>No</td>
</tr>
<tr>
<td>MESSAGE TEXT (TEXT)</td>
<td>The text of the error message.</td>
<td>Yes</td>
</tr>
<tr>
<td>Message Arguments (arg)</td>
<td>A list of arguments bound with the message text.</td>
<td>No</td>
</tr>
<tr>
<td>Supplemental Detail</td>
<td>Supplemental information about the event, including more detailed information than the message text.</td>
<td>No</td>
</tr>
</tbody>
</table>

For most Java components, the log file location is:

(UNIX) `MW_HOME/user_projects/domains/domain_name/servers/server_name/logs`

(Windows) `MW_HOME\user_projects\domains\domain_name\servers\server_name\logs`

The default name of a log file is `server-name_diagnostic.log`.

For system components, the default log file location is:
Table 10–3 shows the log file location for components of Oracle Fusion Middleware.

In the table, `DOMAIN_HOME` refers to the following directory, which is the WebLogic Server domain home:

`MW_HOME/user_projects/domains/domain_name`

In the table, `ORACLE_INSTANCE` refers to the following directory, which is the Oracle instance home:

`MW_HOME/instance_name`

<table>

10.3 Searching and Viewing Log Files

You can search, view, and list log files across Oracle Fusion Middleware components. You can search and view log files using Fusion Middleware Control or you can download a log file to your local client and view the log files using another tool. You can also list and search log files using the WLST command-line tool.

This section covers the following topics:

- Searching Log Files
- Viewing Log Files and Their Messages
- Downloading Log Files

Note the following about using the WLST commands:

- To use the custom WLST logging commands, you must invoke the WLST script from an Oracle home in which the Oracle Fusion Middleware component has been installed. See Section 3.5.1.1 for more information.

- The configuration commands, such as setLogLevel, only work in connected mode. That is you must connect to a running WebLogic server before you can invoke the commands.

The configuration commands are supported for Java components that run within a WebLogic Server, but are not supported for Oracle WebLogic Server. The configuration commands are not supported for system components.

- The log viewing commands work whether you are connected or not connected to a WebLogic server. If you are not connected, you must specify the path in the oracleInstance parameter. You specify either the WebLogic domain home, or the Oracle instance.

- Most of the WLST logging commands require that you are running in the domainRuntime tree. For example, to connect and to run in the domainRuntime tree, use the following commands:

  ./wlst.sh
  connect('username', 'password', 'localhost:port_number')
  domainRuntime()
The `listLoggers`, `getLogLevel` and `setLogLevel` commands work in config and runtime mode. In config mode the commands work on loggers that are defined in the configuration file. In runtime mode, the commands work directly with loggers that are defined in the server JVM. By default, the `setLogLevel` command sets the level on the run-time logger and updates the logger definition in the configuration file. By default, the `listLoggers` and `getLogLevel` commands return run-time loggers.

**See Also:** "Logging Custom WLST Commands" in the Oracle Fusion Middleware WebLogic Scripting Tool Command Reference

## 10.3.1 Searching Log Files

You can search for diagnostic messages by time, type of message, and certain log file attributes by using Fusion Middleware Control or WLST commands, as described in the following topics:

- Searching Log Files Using Fusion Middleware Control
- Searching Log Files Using the Command Line

### 10.3.1.1 Searching Log Files Using Fusion Middleware Control

You can search for diagnostic messages using standard and supplemental ODL attributes using the Log Messages page of Fusion Middleware Control. By default, this page shows a summary of the logged issues for the last hour.

You can modify the search criteria to identify messages of relevance. You can view the search results in different modes, allowing ease of navigation through large amounts of data.

The following sections describe how to search log files:

- Searching Log Files: Basic Searches
- Searching Log Files: Advanced Searches

#### 10.3.1.1.1 Searching Log Files: Basic Searches

This section describes how to perform basic searches for log messages.

You can search for all of the messages for all of the entities in a domain, an Oracle WebLogic Server, a component, or an application.

For example, to search for messages for a domain:

1. From the WebLogic Domain menu, choose **Logs**, then **View Log Messages**.

   To search for messages for a component or application, select the component or application. Then choose **Logs**, then **View Log Messages** from that target's menu.

   The Log Messages page displays a Search section and a table that shows a summary of the messages for the last hour, as shown in the following figure:
2. In the Date Range section, you can select either:
   - **Most Recent**: If you select this option, select a time, such as 3 hours. The default is 1 hour.
   - **Time Interval**: If you select this option, select the calendar icon for **Start Date**. Select a date and time. Then, select the calendar icon for **End Date**. Select a date and time.

3. In the Message Types section, select one or more of the message types. The types are described in Table 10–4.

4. You can specify more search criteria, as described in Section 10.3.1.1.2.

5. Click **Search**.

6. To help identify messages of relevance, in the table, for **Show**, select one of the following modes:
   - **Messages**: Shows the matching messages.
     
     To see the details of a particular message, click the message. The details are displayed below the table of messages.
     
     To view related messages, select a message, then click **View Related Messages** and select by **Time** or by **ECID (Execution Context ID)**.
   
   - **Group by Message Type**: Summarizes the matching messages by grouping them based on message type at the target level. This is the default mode.
     
     To see the messages, click the count in one of the message type columns. The Messages by Message Type page is displayed. To see the details of a particular message, click the message. The details are displayed below the table of messages.
- **Group by Message ID**: Summarizes the matching messages by grouping them based on message ID, message type, and module IDs at the target level.

  To see the associated messages, click the count in the **Occurrences** column. The Messages by Message ID page is displayed. To see the details of a particular message, click the message. The details are displayed below the table of messages.

10.3.1.2 **Searching Log Files: Advanced Searches**

This section describes some of the advanced search mechanisms you can use.

You can refine your search criteria using the following controls in the Log Messages page:

- **For Message**, you can select an operator, such as **contains**, and enter a value to be matched.

- **Add Fields**: Click this to specify additional criteria, such as Host, which lets you narrow the search to particular hosts. Then click **Add**.

  For each field you add, select an operator, such as **contains**, and enter a value to be matched.

- **Broaden Target Scope**: Click this to expand the search to logs associated with all members of the parent of the target. For example, if you are searching an application’s logs, you can expand the search to contain the Managed Server to which the application is deployed.

- **Selected Targets**: Expand this to see the targets that are participating in the search. To add targets, click **Add** and provide information in the dialog box. To remove targets, select the target and click **Remove**.

10.3.1.2 **Searching Log Files Using the Command Line**

You can search the log files using the WLST `displayLogs` command. You can narrow your search by specifying criteria, such as time, component ID, message type, or ECID.

To search for error messages generated in the last 5 minutes, for the Oracle HTTP Server ohs1, use the following command:

```
displayLogs(target='opmn:asinst_1/ohs1', last=5)
```

To search for error messages generated in the last 10 minutes for the Managed Server soa_server1, use the following command:

```
displayLogs(oracleInstance='/scratch/oracle1/Oracle/Middleware/user_projects/domains/soa_domain', target='soa_server1', last=10)
```

You can narrow your search by using the `query` parameter and specifying criteria, such as component ID, message type, or ECID. In the `query` clause, you can specify a query expression with any of the attributes listed in Table 10–1. Some of the criteria you can use are:

- **Types of messages**. For example, to search for ERROR and INCIDENT_ERROR messages for the Managed Server soa_server1, use the following command:

  ```
  displayLogs(oracleInstance='/scratch/oracle1/Oracle/Middleware/user_projects/domains/soa_domain', target='soa_server1',
  query='MSG_TYPE eq ERROR or MSG_TYPE eq INCIDENT_ERROR')
  ```
A particular ECID. For example, to search for error messages with a particular ECID (140.87.134:13934:1186078666446:0) for the Managed Server soa_server1, use the following command:

```python
displayLogs(oracleInstance='/scratch/oracle1/Oracle/Middleware/user_projects/domains/soa_domain', target='soa_server1',
query='ecid eq 140.87.134:13934:1186078666446:0')
```

Component type. For example, to search for messages from Oracle HTTP Server instances, use the following query:

```python
displayLogs(query='COMPONENT_ID eq ohs')
```

Range of time. To search for error messages that occurred within a specified range of time, you specify the attribute TSTZ_ORIGINATING with both from and to operators, using the following format:

```python
displayLogs(query='TSTZ_ORIGINATING from start_time and TSTZ_ORIGINATING to end_time')
```

You specify the date using the following ISO 8601 time format:

```
2007-09-30T12:00:00:0000-08:00
```

For example, to display the error message from between 8:00 a.m. and 11 a.m. on April 17, 2009, use the following command:

```python
displayLogs(query='TSTZ_ORIGINATING from 2009-04-17T08:00:00-07:00 and TSTZ_ORIGINATING to 2009-04-17T11:00:00-07:00')
```

To display a count of messages, grouped by specific attributes, use the `groupBy` parameter to the WLST command `displayLogs`. For example, to display the count of WARNING messages by component, use the following command:

```python
displayLogs(groupBy=['COMPONENT_ID'], query='MSG_TYPE eq WARNING')
```

### 10.3.2 Viewing Log Files and Their Messages

You can view the log files for a specific component using Fusion Middleware Control or WLST.

#### 10.3.2.1 Viewing Log Files and Their Messages Using Fusion Middleware Control

You can view the messages for all of the entities in a domain, an Oracle WebLogic Server, a component, or an application.

For example, to view the log files and their messages for a Managed Server:

1. From the navigation pane, expand the farm, then **WebLogic Domain**, and then the domain. Right-click the Managed Server name and choose **Logs**, then **View Log Messages**.

   The Log Messages page displays the log files for the Managed Server and any applications running in that server.

2. Expand **Selected Targets** and in the row for a particular component or application, click the **Target Log Files** icon.

   The View Log Files page is displayed. On this page, you can see a list of log files related to the Managed Server, as shown in the following figure:
3. Select a file and click **View Log File**.

   The View Log Files page is displayed. On this page, you can view the list of messages.

4. To view the details of a message, select the message.

   The details are displayed in the pane below the listing, as shown in the following figure:

   By default, the messages are sorted by time, in ascending order. You can sort the messages by the columns Time, Message Type, or Message ID by clicking the column name.

5. To view messages that are related by time or ECID, click **View Related Messages** and select by **Time** or **by ECID** (Execution Context ID).

   The Related Messages page is displayed.

### 10.3.2.2 Viewing Log Files and Their Messages Using the Command Line

You can list the log files for an Oracle WebLogic Server domain, server, an Oracle instance, or component using the WLST `listLogs` command.
You can use this command while connected or disconnected. While connected, the default target is the Oracle WebLogic Server domain.

To list the log files, first use the domainRuntime command as described in Section 10.3. The following describes how to list and view log files:

- To list all of the log files for the Oracle WebLogic Server soa_server1, use the following command:

```
wlst:/soa_domain/domainRuntime> listLogs(target='server_soa')
```

```
file://dadvmn0623/scratch/oracle1/Oracle/Middleware/user_projects/domains/SOA_domain/servers/soa_server1/logs/soa_server1.log
2009-03-17 16:40:45 4.9M soa_server1.log00001
2009-03-17 18:35:35 4.9M soa_server1.log00002
2009-03-17 20:30:25 4.9M soa_server1.log00003
...
```

- To list the logs for the Oracle HTTP Server ohs1 in the Oracle instance asinst_1, use the following command:

```
listLogs(target='opmn:asinst_1/ohs1')
```

- To list the logs while disconnected, you must specify the oracleInstance parameter, passing it either the Oracle WebLogic Server domain or the Oracle instance home for the system component. For example, to list the log files for the Managed Server soa_server1:

```
listLogs(oracleInstance='/scratch/Oracle/Middleware/user_projects/domains/SOA_domain',
         target='soa_server1')
```

- To view the diagnostic messages in log files, use the WLST `displayLogs` command. This command works when you are either connected or disconnected.

For example, to view the messages generated in the last 10 minutes in the log files for the Oracle WebLogic Server domain, use the following command:

```
displayLogs(last=10)
```

```
[2009-05-05T08:05:29.652-07:00] [soa_server1] [NOTIFICATION] [BEA-000628] [Common] [host: dadvmn0623] [nwaddr: 10.229.149.27] [tid: ACTIVE].ExecuteThread: '10' for queue: 'weblogic.kernel.Default (self-tuning)'] [userId: <WLS Kernel>] [TARGET: /SOA_domain/soa_server1] [LOG_FILE: /scratch/Oracle/Middleware/user_projects/domains/SOA_domain/servers/soa_server1/logs/soa_server1.log] Created '1' resources for pool "SOADataSource", out of which '1' are available and '0' are unavailable. [2009-05-05T08:05:29.673-07:00] [soa_server1] [NOTIFICATION] [BEA-000628] [Common] [host: dadvmn0623] [nwaddr: 10.229.149.27] [tid: oracle.integration.platform.blocks.executor.WorkManagerExecutor$1@17f5105] [userId: <anonymous>] [TARGET: /SOA_domain/soa_server1] [LOG_FILE:
The previous command returns the messages sorted by time, in ascending order.

To display the log files for the Oracle HTTP Server ohs1 in the Oracle instance asinst_1, use the following command:

displayLogs(target='opmn:asinst_1/ohs1')

You can search the messages by specifying particular criteria and sort the output, as described in Section 10.3.1.

See Also: "Logging Custom WLST Commands" in the Oracle Fusion Middleware WebLogic Scripting Tool Command Reference for more information about the listLogs and displayLogs commands

10.3.3 Downloading Log Files

You can download messages using Fusion Middleware Control or the WLST command-line tool.

10.3.3.1 Downloading Log Files Using Fusion Middleware Control

You can download the log messages to a file, either the matching messages from a search or the messages in a particular log file.

To download the matching messages from a search to a file using Fusion Middleware Control:

1. From the navigation pane, select target, such as the domain.

2. From the dynamic target menu, choose Logs, then View Log Messages.

The Log Messages page is displayed.

3. Search for particular types of messages as described in Section 10.3.1.

4. Select a file type by clicking Export Messages to File and select one of the following

   - As Oracle Diagnostic Log Text (.txt)
   - As Oracle Diagnostic Log Text (.xml)
   - As Comma-Separated List (.csv)

   An Opening dialog box is displayed.

5. Select either Open With or Save to Disk. Click OK.

To export specific types of messages or messages with a particular Message ID to a file:

1. From the navigation pane, expand the farm, then WebLogic Domain, and then domain. Select a Managed Server.
2. From the dynamic target menu, choose Logs, then View Log Messages.
   The Log Messages page is displayed.
3. Search for particular types of messages as described in Section 10.3.1.1.
4. For Show, select Group by Message Type or Group by Message ID.
5. To download the messages into a file, if you selected Group by Message Type, select the link in one of the columns that lists the number of messages, such as the Errors column. If you selected Group by Message ID, select one of the links in the Occurrences column.
   The Messages by Message Type page or Message by Message ID is displayed.
6. Select a file type by clicking the arrow near Export All to File.
   You can select one of the following:
   - As Oracle Diagnostic Log Text (.txt)
   - As Oracle Diagnostic Log Text (.xml)
   - As Comma-Separated List (.csv)
   An Opening dialog box is displayed.
7. Either select Open With or Save to Disk. Click OK.

To download the log files for a specific component using Fusion Middleware Control:
1. From the navigation pane, expand the farm. For system components, expand the installation type, such as Web Tier and select the component. For Java components, expand the farm, then the component type, and then select the component.
2. From the dynamic target menu, choose Logs, then View Log Messages.
   The Log Messages page is displayed.
3. In the Log Files column, click a log file.
   The Log Files page is displayed. On this page, you can see a list of log files related to the component or application.
4. Select a log file and click Download.
5. An Opening dialog box is displayed.
6. Select either Open With or Save to Disk. Click OK.

10.3.3.2 Downloading Log Files Using the Command Line
You can download log files using the WLST displayLogs command and redirecting the output to a file. For example:

```bash
displayLogs(type=['ERROR','INCIDENT_ERROR'], export='download_log.txt')
```

The messages are written to the file download_log.txt.

10.4 Configuring Settings for Log Files
You can change the log settings of Managed Servers and Java components using Fusion Middleware Control or WLST.
For Java components, you can configure the following options for log files:

- The name and location of log files. See Section 10.4.1.
- The size of log files: You can specify that a new file is created either when the log file reaches a certain size or when a particular time is reached. This is called log file rotation. See Section 10.4.2.
- The level of information written to log files. See Section 10.4.3.
- The format of the log files. See Section 10.4.4.
- The Locale encoding. See Section 10.4.5.

### 10.4.1 Changing Log File Locations

You can change the name and location of log files by using Fusion Middleware Control or the WLST command-line tool.

#### 10.4.1.1 Changing Log File Locations Using Fusion Middleware Control

To change the location of a component's log file using Fusion Middleware Control, navigate to the component's home page and choose **Logs**, then **Log Configuration** from the dynamic target menu.

For example, to change the name and location of a component log file using Fusion Middleware Control:

1. From the navigation pane, select the component.
2. From the dynamic target menu, choose **Logs**, then **Log Configuration**.
   
   The Log Configuration page is displayed.
3. Select the Log Files tab.
4. In the table, select the logger and click **Edit Configuration**.

   The Edit Log File dialog box is displayed, as shown in the following figure:

   ![Edit Log File Dialog Box](image)

   **Note:** Note that you cannot configure options for log files of system components, which are listed in Section 3.5.2. For information about how to configure options for log files for system components, see the Administrator's Guide for the component.
5. For Log Path, enter a new path.
6. Click OK.
7. In the confirmation window, click Close.

10.4.1.2 Changing Log File Locations Using WLST
To change the log file location using WLST, use the `configureLogHandler` command. For example, to change the path of the logger named odl-handler, use the following command:

```bash
configureLogHandler(name='odl-handler', path='/scratch/Oracle/logs')
```

10.4.2 Configuring Log File Rotation
An ODL log is a set of log files that includes the current ODL log file and zero or more ODL Archives (segment files) that contain older messages. As the log file grows, new information is added to the end of the log file, `diagnostic.log`. When the log file reaches the rotation point, it is renamed and a new log file, `diagnostic.log` is created. You specify the rotation point, by specifying the maximum ODL segment size, or, for the log files of some components, the rotation time and rotation frequency.

Segment files are created when the ODL log file `diagnostic.log` reaches the rotation point. That is, the `diagnostic.log` is renamed to `diagnostic.logn.log`, where `n` is an integer, and a new `diagnostic.log` file is created when the component generates new diagnostic messages.

To limit the size of the ODL log, you can specify:

- The maximum size of the logging directory. Whenever the sum of the sizes of all of the files in the directory reaches the maximum, the oldest archive is deleted to keep the total size under the specified limit.
  
  By default, the log files are rotated when they reach 10 MB. The maximum size of all log files for a particular component is 100 MB.

- The maximum size of the log file. You specify that a new log file be created when a specific time or frequency is reached.

---

**Note:** After you change the log file rotation, you must restart the Managed Server for the changes to take effect.

---

10.4.2.1 Specifying Size-Based or Time-Based Rotation Using Fusion Middleware Control
To configure log file rotation using Fusion Middleware Control for a component:

1. From the navigation pane, select the component.
2. From the dynamic target menu, choose Logs, then Log Configuration.
   
   The Log Configuration page is displayed.
3. Select the Log Files tab.
4. In the table, select the logger and click Edit Configuration.
   
   The Edit Log File dialog box is displayed.
5. In the Rotation Policy section, you can select one of the following:
   
   - **Size Based:** If you select this, enter the following:
- For **Maximum Log File Size**, enter the size in MB, for example, 15.
- For **Maximum Size of All Log Files**, enter the size in MB, for example, 150.

**Time Based:** If you select this, enter the following:
- For **Start Time**, enter the date when you want the rotation to start. For example, enter 10-APR-2009.
- For **Frequency**, you can select **Minutes** and enter the number of minutes, or you can select **Hourly**, **Daily**, or **Weekly**.
- For **Retention Period**, you can specify how long the log files are kept. You can select **Minutes** and enter the number of minutes, or you can specify **Day**, **Week**, **Month**, or **Year**.

Specifying a shorter period means that you use less disk space, but are not able to retrieve older information.

6. Click **OK**.

7. In the confirmation window, click **Close**.

### 10.4.2.2 Specifying Size-Based or Time-Based Rotation Using the Command Line

To specify log file rotation using WLST, use the `configureLogHandler` command. You can specify size-based rotation or time-based rotation.

For example, to specify that the log files rotate daily and that they are retained for a week, use the following command:

```bash
configureLogHandler(name='odl-handler', rotationFrequency='daily', retentionPeriod='week')
```

To specify that the size of a log file does not exceed 5MB and rotates when it reaches that size, use the following command:

```bash
configureLogHandler(name='odl-handler', maxFileSize='5M')
```

### 10.4.3 Setting the Level of Information Written to Log Files

You can configure the amount and type of information written to log files by specifying the message type and level. For each message type, possible values for message level are from 1 (highest severity) through 32 (lowest severity). Some components support only some of the levels for each message type. Generally, you need to specify only the type; you do not need to specify the level.

When you specify the type, Oracle Fusion Middleware returns all messages of that type, as well as the messages that have a higher severity. For example, if you set the message type to **WARNING**, Oracle Fusion Middleware also returns messages of type **INCIDENT_ERROR** and **ERROR**.

Table 10–4 shows the message types and the most common levels for each type.

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCIDENT_ERROR</td>
<td>1</td>
<td>A serious problem that may be caused by a bug in the product and that should be reported to Oracle Support. Examples are errors from which you cannot recover or serious problems.</td>
</tr>
</tbody>
</table>
The default is NOTIFICATION, level 1.

The INCIDENT_ERROR, ERROR, WARNING, and NOTIFICATION with level 1 have no performance impact. For other types and levels, note the following:

- **NOTIFICATION**, with level 16: Minimal performance impact.
- **TRACE**, with level 1: Small performance impact. You can enable this level occasionally on a production environment to debug problems.
- **TRACE**, with level 16: High performance impact. This level should not be enabled on a production environment, except on special situations to debug problems.
- **TRACE**, with level 32: Very high performance impact. This level should not be enabled in a production environment. It is intended to be used to debug the product on a test or development environment.

Table 10–5 shows the log level mappings among ODL format, Oracle WebLogic Server, and Java.

### Table 10–5 Mapping of Log Levels Among ODL, Oracle WebLogic Server, and Java

<table>
<thead>
<tr>
<th>ODL</th>
<th>WebLogic Server</th>
<th>Java</th>

</tbody>
</table>
Configuring Settings for Log Files

10.4.3.1 Configuring Message Levels Using Fusion Middleware Control
You can set the message level for a particular log file or for loggers.

To set the message level for a component log file:

1. From the navigation pane, select the component.
2. From the dynamic target menu, choose Logs, then Log Configuration.
   The Log Configuration page is displayed.
3. Select the Log Files tab.
4. In the table, select the log file and click Edit Configuration.
   The Edit Log File dialog box is displayed, as shown in the following figure:

   ![Edit Log File Dialog Box]

5. For Log Level, select the logging level. For example, select WARNING:1 (WARNING).
6. Click OK.
7. In the confirmation window, click Close.

To set the message level for one or more loggers for a component:
1. From the navigation pane, select the component.

---

<table>

</table>

Table 10–5 (Cont.) Mapping of Log Levels Among ODL, Oracle WebLogic Server, and ODL WebLogic Server Java
2. From the dynamic target menu, choose Logs, then Log Configuration.
   The Log Configuration page is displayed.
3. Select the Log Levels tab.
4. For View, select Runtime Loggers or Loggers with Persistent Log Level State.
   Run-time loggers are loggers that are currently active. Persistent loggers are loggers that are saved in a configuration file and log levels of these loggers are persistent across component restarts. A run-time logger can also be a persistent logger, but not all run-time loggers are persistent loggers.
5. In the table, to specify the same level for all loggers, select the logging level for Root Logger for run-time loggers or oracle for persistent loggers. Then, for the child loggers, specify Inherit from Parent. For most situations, that is sufficient.
   However, if you need to specify the level for a particular logger, expand Root Logger or oracle, then, for the logger that you want to modify, select the logging level. For example, for the logger oracle.wsm.management.logging, select WARNING:1 (WARNING).
6. Click Apply.

10.4.3.2 Configuring Message Levels Using WLST
To set the message level with WLST, you use the setLoglevel command. To get the current message level, you use the getLogLevel command. You must be connected to WebLogic Server before you use the configuration commands.

You can view the log level for a logger for an Oracle WebLogic Server. For example, to view the log level of the Oracle WebLogic Server soa_server1, use the following command:

```
getLogLevel(logger='oracle', target='soa_server1')
```

You can set the log level for a particular logger. The following example sets the message type to WARNING for the logger oracle.soa:

```
setLogLevel(target='soa_server1', logger='oracle.soa', level='WARNING')
```

To get a list of loggers for the Oracle WebLogic Server soa_server1, use the listLoggers command:

```
listLoggers(target='soa_server1')
```

```
<table>
<thead>
<tr>
<th>Logger</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.soa</td>
<td>WARNING:1</td>
</tr>
<tr>
<td>oracle.soa.adapter</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle.soa.b2b.aptransport</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle.soa.b2b.engine</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle.soa.b2b.repository</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle.soa.b2b.transport</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td>oracle.soa.b2b.ui</td>
<td>&lt;Inherited&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
You can also filter logger names using the pattern parameter and a regular expression. For example, to return all loggers that begin with oracle in the Oracle WebLogic Server soa_server1, use the following command:

```java
listLoggers(target='soa_server1', pattern='oracle.*)
```

```
oracle                                   | NOTIFICATION:1
oracle.adapter                           | <Inherited>
oracle.adapter.jms.logger                | <Inherited>

```

### 10.4.4 Specifying the Log File Format

By default, information is written to log files in ODL text format. You can change the format to ODL XML format.

#### 10.4.4.1 Specifying the Log File Format Using Fusion Middleware Control

To change the format using Fusion Middleware Control:

1. From the navigation pane, select the component.
2. From the dynamic target menu, choose Logs, then Log Configuration. The Log Configuration page is displayed.
3. Select the Log Files tab.
4. In the table, select the log file and click Edit Configuration. The Edit Log File dialog box is displayed.
5. For Log File Format, select Oracle Diagnostics Logging - XML.
6. Click OK.
7. In the confirmation window, click Close.

#### 10.4.4.2 Specifying the Log File Format Using WLST

To specify the log file format using WLST, you use the `configureLogHandler` command. You use the `format` parameter and specify either ODL-Text or ODL-XML. ODL-Text is the default.

For example, to specify ODL XML format, use the following command:

```java
configureLogHandler(name='odl-handler', format='ODL-XML')
```

### 10.4.5 Specifying the Log File Locale

The language and data formats used in the log files are determined by the default locale of the server Java Virtual Machine (JVM). You can change them using the Language and Regional Options applet in Control Panel on Windows or the LANG and LC_ALL environment variables on a UNIX platform.

The character encoding of log files is determined by the server JVM's default character encoding or an optional configuration setting. You should choose an encoding that supports all languages used by the users, or the log file may be corrupted. By default, log is in the server JVM's default character encoding. If you change the encoding, delete or rename old log files to prevent them from being damaged by the new logs appended in a different encoding.

For support of any language, it is recommended to use Unicode UTF-8 encoding. On a UNIX operating system, setting the LANG and LC_ALL environment variables to a locale with the UTF-8 character set enables UTF-8 logging (for example, `en_
US.UTF-8 for the US locale in UTF-8 encoding. On Windows, you can enable UTF-8 logging as described in the following topics.

### 10.4.5.1 Specifying the Log File Encoding Using WLST

To specify the log file encoding using WLST, use the `configureLogHandler` command. You can use the encoding parameter to specify the character set encoding. JVM default encoding is the default.

For example, to specify UTF-8, use the following command:

```java
configureLogHandler(name="odl-handler", encoding="UTF-8")
```

### 10.4.5.2 Specifying the Log File Encoding in logging.xml

To specify the log file encoding in the `logging.xml` file, use an optional encoding property. You can specify the encoding property to specify the character set encoding. JVM default encoding is the default.

For example, to specify UTF-8, add the following encoding property in the `log_handler` element:

```xml
<property name='encoding' value='UTF-8'/>
```

---

**10.5 Correlating Messages Across Log Files and Components**

Oracle Fusion Middleware components provide message correlation information for diagnostic messages. Message correlation information helps those viewing diagnostic messages to determine relationships between messages across components. Each diagnostic message contains an Execution Context ID (ECID) and a Relationship ID (RID):

- An ECID is a globally unique identifier associated with the execution of a particular request. An ECID is generated when the request is first processed.
- A RID distinguishes the work done in one thread on one process, from work done by any other threads on this and other processes on behalf of the same request.

The ECID and RID help you to use log file entries to correlate messages from one application or across Oracle Fusion Middleware components. By searching for related messages using the message correlation information, multiple messages can be examined and the component that first generates a problem can be identified (this technique is called first-fault component isolation). Message correlation data can help establish a clear path for a diagnostic message across components, within which errors and related behavior can be understood.

You can use the ECID and RID to track requests as they move through Oracle Fusion Middleware.

The following shows an example of an ECID:

```
152.68.202.244:43750:1172674368694:1
```

The RID is one or more numbers separated by a colon (:). The first RID created for a request is 0. Each time work is passed from a thread that has an ECID associated with it to another thread or process, a new RID is generated that encodes the relationship to its creator. That is, a new generation is created. Each shift in generation is represented by a colon and another number. For example, the seventh child of the third child of the creator of the request is:

```
0:3:7
```
You can view all the messages with the same ECID using the WLST `displayLogs` command. For example:

```bash
displayLogs(ecid='0000H19TwKUCs1T6uBi8UH18lKWX000002')
```

You can search for messages with a particular ECID on the Log Messages page in Fusion Middleware Control:

1. From the WebLogic Domain menu, choose **Logs**, then **View Log Messages**.
   
   To search for messages for a component or application, select the component or application and then choose **Logs**, then **View Log Messages** from that target’s menu.

2. Specify search criteria, as described in Section 10.3.1.1.2.

3. Click **Search**.

4. Select a message, then click **View Related Messages** and select by **ECID** (Execution Context ID).

   The messages with the same ECID are displayed, as shown in the following figure:

```
soainfra@10-22:~$ wsadmin.eval('
    displayLogs(ecid='0000H19TwKUCs1T6uBi8UH18lKWX000002')
')
```

5. Trace the ECID to the earliest message. (You may need to increase the date or time range to view the first message with the ECID.)
Part III
Advanced Administration

This part describes advanced administration tasks that involve reconfiguring Oracle Fusion Middleware.

It contains the following chapters:

- Chapter 11, "Managing the Oracle Metadata Repository"
- Chapter 12, "Changing Network Configurations"
This chapter provides information on managing the Oracle Metadata Repository.
It contains the following topics:

- Understanding a Metadata Repository
- Creating a Database-Based Metadata Repository
- Managing the MDS Repository
- Managing Metadata Repository Schemas

11.1 Understanding a Metadata Repository

A metadata repository contains metadata for Oracle Fusion Middleware components, such as Oracle BPEL Process Manager, Oracle B2B, and Oracle WebCenter. It can also contain metadata about the configuration of Oracle Fusion Middleware and metadata for your applications.

Oracle Fusion Middleware supports multiple repository types. A repository type represents a specific schema or set of schemas that belong to a specific Oracle Fusion Middleware component (for example, Oracle BPEL Process Manager or Oracle Internet Directory.)

A particular type of repository, the Oracle Metadata Services (MDS) repository, contains metadata for certain types of deployed applications. This includes custom Java EE applications developed by your organization and some Oracle Fusion Middleware component applications, such as Oracle B2B. For information related specifically to the MDS Repository type, see Section 11.3.

You can create a database-based repository or, for MDS, a file-based repository. For production environments, you use a database-based repository. Most components, such as Oracle BPEL Process Manager, require that a schema be installed in a database, necessitating the use of a database-based repository.

11.2 Creating a Database-Based Metadata Repository

You use the Oracle Fusion Middleware Metadata Repository Creation Utility (RCU) to create the metadata repository in an existing database.

You can use RCU to create multiple repositories in a single database. You can use it to create the MDS repository or a repository for metadata for particular components, such as Oracle WebCenter. RCU creates the necessary schemas for the components. See Appendix D for a list of the schemas and their tablespaces and datafiles.

With RCU, you can also drop component schemas.
Managing the MDS Repository

**Note:** Oracle recommends that all metadata repositories reside on a database at the same site as the components to minimize network latency issues.

For information about managing a database-based MDS Repository, see Managing the MDS Repository.

**See Also:**
- *Oracle Fusion Middleware Repository Creation Utility User’s Guide* for information about how to use RCU to create a database-based metadata repository
- For information about which versions of Oracle databases are supported, and other prerequisites for the database, see:
  

### 11.3 Managing the MDS Repository

Oracle Metadata Services (MDS) repository contains metadata for certain types of deployed applications. Those deployed applications can be custom Java EE applications developed by your organization and some Oracle Fusion Middleware component applications, such as Oracle B2B, and Oracle Web Services Manager. A Metadata Archive (MAR), a compressed archive of selected metadata, is used to deploy metadata content to the MDS Repository, which contains the metadata for the application.

You should deploy your applications to MDS in the following situations, so that the metadata can be managed after deployment:

- The application contains seeded metadata packaged in a MAR.
- You want to enable user personalizations at run time.
- You have a custom Oracle WebCenter application.
- You have a SOA composite application (SCA).

The following topics provide information about the MDS repository:

- Understanding the MDS Repository
- Registering and Deregistering a Database-Based Metadata Repository
- Registering and Deregistering a File-Based Metadata Repository
- Viewing Information about an MDS Repository
- Listing Repositories and Partitions
- Configuring an Application to Use a Different MDS Repository or Partition
- Moving Metadata from a Test System to a Production System
- Moving from a File-Based Repository to a Database-Based Repository
- Deleting a Metadata Partition from a Repository
- Purging Metadata Version History
- Managing Metadata Labels in the MDS Repository
11.3.1 Understanding the MDS Repository

The MDS framework allows you to create customizable applications. A customized application contains a base application (the base documents) and one or more layers containing customizations. MDS stores the customizations in a metadata repository and retrieves them at run time to merge the customizations with the base metadata to reveal the customized application. Since the customizations are saved separately from the base, the customizations are upgrade safe; a new patch to base can be applied without breaking customizations. When a customized application is launched, the customization content is applied over the base application.

A customizable application can have multiple customization layers. Examples of customization layers are industry and site. Each layer can have multiple customization layer values, but typically only one such layer value from each layer is applied at run time. For example, the industry layer for a customizable application can contain values for health care and financial industries; but in the deployed customized application, only one of the values from this layer is used at a time. For more information about base documents and customization layers, see "Customizing Applications with MDS" in the Oracle Fusion Middleware Fusion Developer’s Guide for Oracle Application Development Framework.

An MDS Repository can be file-based or database-based. For production environments, you use a database-based repository. You can have more than one MDS Repository for a domain.

A database-based MDS Repository provides the following features that are not supported by a file-based MDS Repository:

- Efficient query capability: A database-based MDS repository is optimized for set-based queries. As a result, it provides better performance on such searches with the database repository.

  The MDS Repository query API provides constructs to define the query operation and to specify conditions on metadata objects. These conditions are essentially a set of criteria that restrict the search results to certain set of attribute types and values, component types, text content, and metadata paths. The API allows multiple conditions to be combined together to achieve dynamic recursive composition using OR and AND constructs.

- Atomic transaction semantics: A database-based MDS repository uses the database transaction semantics, which provides rollbacks of failed transactions, such as failed imports or deployments.

- Versioning: The MDS Repository maintains versions of the documents in a database-based repository. Versioning allows changes to metadata objects to be stored as separate versions rather than simply overwriting the existing data in the metadata repository. It provides version history, as well as the ability to label versions so that you can access the set of metadata as it was at a given point in time.

- The capability in a running environment to isolate metadata changes and test them for a subset of users before committing them for all users.

- Support for external change detection based on polling. This allows one application to detect changes another application makes to shared metadata. For example, if you have an application deployed to Managed Servers A and B in a...
cluster, and you modify the customizations for the application deployed in Managed Server A, the data is written to the database-based repository. The application deployed in Managed Server B uses the updated customizations. This supports high availability (in particular, active/active scenarios.)

- Clustered updates: Updates from multiple hosts to the metadata are allowed. For a file-based MDS Repository, updates can be made from only one host at a time.

The MDS Repository supports Oracle databases, as well as non-Oracle databases. For more information about the supported databases, see:

In an MDS Repository, each application, including Oracle Fusion Middleware components, is deployed to its own partition. A partition is an independent logical repository within one physical MDS Repository, whether it is database-based or file-based.

For information about deploying applications and associating them with an MDS Repository, see Chapter 8.

11.3.1.1 Understanding MDS Operations

You can use Fusion Middleware Control or WLST commands to perform most operations on the MDS Repository. However, for some operations, you must use System MBeans. The following sections describe using Fusion Middleware Control and WLST commands to perform the operations, unless only System MBeans are supported. In that case, the sections describe how to use System MBeans to perform the operation.

You can view information about the repositories, including the partitions and the applications deployed to each partition. You can also perform operations on the partitions, such as purging, deleting, importing metadata, or exporting metadata.

Note the following when you use the MDS operations described in the following sections:

- The export operation exports a versioned stripe of metadata documents from an MDS Repository partition to a file system directory. The directory must be accessible from the host where the application is running. Because versioning of metadata is supported only for database-based repositories, only the tip version (the latest version) is exported from a file-based repository.

- The import operation imports metadata documents from a file system directory to a MDS Repository partition. The directory must be accessible from the host where the application is running. If the target repository is a database-based repository, the metadata documents are imported as new tip versions.

---

**Note:**

- To use the custom WLST MDS commands, you must invoke the WLST script from an Oracle home in which the Oracle Fusion Middleware component has been installed. See Section 3.5.1.1 for more information.

- For more information about the WLST commands used in these sections, see “Metadata Services (MDS) Custom WLST Commands” in the Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.
Table 11–1 lists the roles needed for each operation. The roles apply whether the operations are performed through the WLST commands, Fusion Middleware Control, or MBeans.

Table 11–1  MDS Operations and Required Roles

<table>
<thead>
<tr>
<th>Operation</th>
<th>WebLogic Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear cache</td>
<td>Operator role for application</td>

</tbody>
</table>

For information about how these roles map to logical roles, see “Mapping of Logical Roles to WebLogic Roles” in the Oracle Fusion Middleware Security Guide.

11.3.2 Registering and Deregistering a Database-Based Metadata Repository

The following sections describe how to register and deregister a database-based MDS repository:

- Registering a Database-Based MDS Repository
- Deregistering a Database-Based MDS Repository

11.3.2.1 Registering a Database-Based MDS Repository

You create a database-based MDS repository using RCU, as described in Section 11.2. Before you can deploy an application to an MDS repository, you must register the repository with the Oracle WebLogic Server domain.

To register a database-based MDS repository using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain.
2. Select the domain.
3. From the WebLogic Domain menu, choose Metadata Repositories.

The Metadata Repositories page is displayed, as shown in the following figure:
4. In the Database-Based Repositories section, click **Register**.
   The Register Database-Based Metadata Repository page is displayed.

5. In the Database Connection section, enter the following information:
   - For **Database**, select the type of database.
   - For **Host Name**, enter the name of the host.
   - For **Port**, enter the port number for the database, for example: 1521.
   - For **Service Name**, enter the service name for the database. The default service name for a database is the global database name, comprising the database name, such as orcl, and the domain name. In this case, the service name would be `orcl.domain_name.com`.
   - For **User Name**, enter a user name for the database which is assigned the SYSDBA role, for example: SYS.
   - For **Password**, enter the password for the user.
   - For **Role**, select a database role, for example, SYSDBA.

6. Click **Query**.
   A table is displayed that lists the schemas and their metadata repositories in the database, as shown in the following figure:
7. Select a repository, then enter the following information:
   - For **Repository Name**, enter a name.
   - For **Schema Password**, enter the password you specified when you created the schema.

8. Click **OK**.

   The repository is registered with the Oracle WebLogic Server domain. In addition, a system data source is created with the name mds-repository_name. Global transaction support is disabled for the data source.

To register a database-based MDS Repository using the command line, you use the WLST `registerMetadataDBRepository` command. For example, to register the MDS Repository mds-repos1, use the following command:

```
wlst:/weblogic/serverConfig> registerMetadataDBRepository(name='mds-repos1',
               dbVendor='ORACLE', host='hostname', port='1521',
               dbName='ora11', user='username', password='password',
               targetServers='server1')
```

11.3.2.2 Deregistering a Database-Based MDS Repository

Deregistration does not result in loss of data stored in the repository. However, any applications using this repository would not function after the repository is deregistered. You must ensure that no application is using the repository before you deregister it.

To deregister an MDS repository using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then **WebLogic Domain**.
2. Select the domain.
3. From the WebLogic Domain menu, choose **Metadata Repositories**.

   The Metadata Repositories page is displayed.

Alternatively, you can navigate to the Register Metadata Repositories page by choosing **Administration**, then **Register/Deregister** from the Metadata Repository menu when you are viewing a metadata repository home page.
4. Select the repository from the table.
5. Click Deregister.
6. Click Yes in the Confirmation dialog box.

To deregister a database-based MDS Repository using the command line, you use the WLST deregisterMetadataDBRepository command. For example, to deregister the MDS Repository mds-repos1, use the following command:

```
wlst:/weblogic/serverConfig> deregisterMetadataDBRepository(name='mds-repos1')
```

### 11.3.3 Registering and Deregistering a File-Based Metadata Repository

The following topics describe how to register and deregister a file-based metadata repository:

- Creating and Registering a File-Based Metadata Repository
- Deregistering a File-Based Repository

#### 11.3.3.1 Creating and Registering a File-Based Metadata Repository

You can create a file-based MDS repository and register it with an Oracle WebLogic Server domain using Fusion Middleware Control.

To register a file-based repository using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain.
2. Select the domain.
3. From the WebLogic Domain menu, choose Metadata Repositories.
   
   The Metadata Repositories page is displayed.
4. In the File-Based Repository section, click Register.
   
   The Register Metadata Repository page is displayed.
5. Enter the following information:
   
   - For Name, enter a name. For example, enter repos1. The prefix mds- is added to the name and a repository with the name mds-repos1 will be registered. If you enter a name that begins with mds-, a repository with the given name will be registered.
   
   - For Directory, specify the directory. The Administration Server and Managed Servers that run the applications that use this repository must have write access to the directory. The directory is created if it does not exist.
   
   Note the following:
   
   - If the path specified exists on the file system, the metadata file repository is registered; all the subdirectories under this path are automatically loaded as partitions of this file-based repository.
   
   - If the path specified does not exist, a directory with this name is created on the file system during the registration. Because there are no partitions created yet, there are no subdirectories to load.
   
   - If the specified path is invalid and cannot be created for some reason, such as permission denied or the path exists as a file not a directory, an error is displayed and the registration fails.

6. Click OK.
The repository is created and registered. It is now displayed on the Metadata Repositories page.

You can now create and delete partitions. Those changes will be reflected in the directory on the file system.

You can also create a file-based repository using system MBeans. For information about using the System MBean Browser, see Section 3.6.

11.3.3.2 Deregistering a File-Based Repository

You can deregister a file-based MDS repository using Fusion Middleware Control.

To deregister a file-based repository using Fusion Middleware Control:

1. From the navigation pane, expand the farm, then WebLogic Domain.
2. Select the domain.
3. From the WebLogic Domain menu, choose Metadata Repositories.
   The Metadata Repositories page is displayed.
4. In the File-Based Repository section, select the repository and click Deregister.
5. Click OK in the Confirmation dialog box.
   If the file-based repository is valid, it is removed from the repository list. Otherwise, an error is displayed.

You can also deregister a file-based repository using system MBeans. For information about using the System MBean Browser, see Section 3.6.

11.3.4 Viewing Information about an MDS Repository

To view information about an MDS Repository with Fusion Middleware Control:

1. From the navigation pane, expand the farm and then expand Metadata Repositories.
2. Select the repository.

The following figure shows the home page for an MDS Repository:

3. To see general information about the repository, such as the type of repository and location, click the Info icon in the context pane, as described in Section 3.3.3.
11.3.5 Listing Repositories and Partitions

You can use the System MBean operations listPartitions, listRepositories, and listRepositoryDetails to get a list of partitions in the repository, a list of repositories and details of the repository registered with the domain:

1. In Fusion Middleware Control, from the navigation pane, navigate to the WebLogic domain and select it. From the WebLogic Domain menu, choose System MBean Browser.

   The System MBean Browser page is displayed.

2. In the page’s navigation pane, expand Application Defined MBeans, then expand oracle.mds.lcm. Expand the domain, then MDSDomainRuntime, and then select MDSDomainRuntime.

3. In the Application Defined MBeans pane, select the Operations tab.

4. Click one of the operations to view the information.

11.3.6 Configuring an Application to Use a Different MDS Repository or Partition

When you deploy an application, you can associate it with an MDS Repository. You can subsequently change the MDS Repository or partition to which an application is associated, using WLST or Fusion Middleware Control. For example, a different repository contains different metadata that needs to be used for a particular application.

To associate an application with a new MDS Repository or partition, you can either:

- Redeploy the application, specifying the new repository or partition. To create a partition, you can either:
  - Clone the partition to a different repository. Cloning the partition is valid only with a database-based repository with databases of the same type and version. When you clone the partition, you preserve the metadata version history, including any customizations and labels.
    Section 11.3.6.1 describes how to clone a partition and how to redeploy the application, specifying the partition that you have cloned.
  - Export the metadata from the current partition and import the metadata into the new partition, then redeploy the application, specifying a new partition.
    Section 11.3.6.2 describes how to redeploy the application, specifying a new repository or partition.
- Change the system data source. When you change the system data source, you can change the database or the schema in which it is stored.
  Section 11.3.6.3 describes how to change the system data source.

11.3.6.1 Cloning a Partition

You can clone a partition to the same repository or a different repository using the system MBean cloneMetadataPartition. Both the original repository and the target repository must be a database-based repository.

To clone the partition, and then redeploy the application to a new repository or to the same repository:

1. Clone the partition, using the cloneMetadataPartition system MBean. The following example clones partition1 from the old repository to the new repository:
a. In Fusion Middleware Control, from the navigation pane, navigate to the Managed Server from which the application is deployed. From the WebLogic Server menu, choose **System MBean Browser**.

The System MBean Browser page is displayed.

b. In the System MBean Browser’s navigation pane, expand **Application Defined MBeans**, then expand **oracle.mds.lcm**. Expand the domain, and then **MDSDomainRuntime**. Select **MDSDomainRuntime**.

c. In the Application Defined MBeans pane, select the Operations tab.

The following figure shows the System MBeans Browser with the Application Defined MBeans pane:

![Application Defined MBeans](image)

- Select **cloneMetadataPartition**.

  The Operation: cloneMetadataPartition page is displayed.

e. In the Parameters table, enter the following values:

  - For **fromRepository**, enter the name of the metadata repository that contains the metadata partition from which the metadata documents are to be cloned.
  
  - For **fromPartition**, enter the name of the partition from which the metadata documents are to be cloned.

  - For **toRepository**, enter the name of the metadata repository to which the metadata documents from the source repository partition are to be cloned.

  - For **toPartition**, enter the name of metadata repository partition to be used for the target partition. The name must be unique within the repository.
you do not supply a value for this parameter, the name of the source partition is used for the target partition.

If the toRepository name is the same as the original repository, you must enter a partition name and the name must be unique within the repository.

f. Click **Invoke**.

g. Verify that the partition has been created by selecting the repository in the navigation pane. The partition is listed in the Partitions table on the Metadata Repository home page.

2. Redeploy the application, as described in Section 8.4.3, Section 8.5.3 or Section 8.6.3 depending on the type of application. When you do so, you specify the new partition and repository in the Application Attributes page:

   a. To change the repository, click the icon next to the **Repository Name**. In the Metadata Repositories dialog box, select the repository and click **OK**.

   b. To change the partition, enter the partition name in **Partition Name**.

11.3.6.2 Creating a New Partition and Reassociating the Application to It

You can create a new partition in the new repository by redeploying the application and specifying the new partition. Then, you transfer the metadata to the new partition using WLST.

You can use this procedure to transfer metadata between two different types of repositories (file-based to database-based, or from an Oracle Database to another database).

To create a new partition and reassociate the application to it:

1. Export the metadata from the source partition to a directory on the file system using the WLST **exportMetadata** command:

   ```
   wls:/weblogic/serverConfig> exportMetadata(application='sampleApp',
   server='server1', toLocation='/tmp/myrepos/mypartition', docs='/**')
   ```

2. Redeploy the application, as described in Section 8.4.3, Section 8.5.3 or Section 8.6.3 depending on the type of application. When you do so, you specify the new partition and repository in the Application Attributes page:

   a. To change the repository, click the icon next to the **Repository Name**. In the Metadata Repositories dialog box, select the repository and click **OK**.

   b. To change the partition, enter the partition name in **Partition Name**.

3. Import the metadata from the file system to the new partition using the WLST **importMetadata** command:

   ```
   wls:/weblogic/serverConfig> importMetadata(application='sampleApp',
   server='server1', fromLocation='/tmp/myrepos/mypartiton', docs='/**')
   ```

4. Optionally, deregister the original repository, as described in Section 11.3.3.2 or Section 11.3.2.2.

   Alternatively, you can create new partition using the WLST command **createMetadataPartition**. The partition name must be unique within the repository. If the partition parameter is missing, the name of the source partition is used for the target partition. The following example creates the partition partition1:

   ```
   wls:/weblogic/serverConfig> createMetadataPartition(repository='mds-repos1',
   ```
11.3.6.3 Changing the System Data Source
You can change the system data source to reassociate an application to a new repository. You can change the database or the schema that contains the data source. To do so, you use Oracle WebLogic Server Administration Console:

1. In the Change Center, click Lock & Edit.
2. In the Domain Structure section, expand Services, then JDBC, and select Data Sources.
   The Summary of JDBC Data Sources page is displayed.
3. Select the data source you want to change.
   The Settings page is displayed.
4. Select the Connection Pool tab.
5. To change the database, modify the URL field. For example:
   \[jdbc:oracle:thin:@{hostname.domainname.com}:1522/orcl\]
6. To change the schema, modify the Properties field, changing the user property. For example, to specify a schema named OFM-MDS, use the following:
   \[user=OFM-MDS\]
7. For Password, enter the password for the schema, then confirm the password.
8. Click Save.
9. Restart the servers that use this data source. (Click the Target tab to see the servers that use this data source.)

To use WLST to transfer metadata:

1. Export the metadata from the original partition using the exportMetadata command:
   \[wls:/weblogic/serverConfig> exportMetadata\(application='sampleApp', server='server1', toLocation='/tmp/myrepos/mypartition', docs='/**')\]
   This command exports a versioned stripe of the metadata documents from the metadata partition to a file system directory.
2. If the partition that will import the metadata is on a different system, copy the exported metadata to that system.
3. Import the metadata to the other partition using the WLST importMetadata command:
   \[wls:/weblogic/serverConfig> importMetadata\(application='sampleApp', server='server1', fromLocation='/tmp/myrepos/mypartiton', docs='/**')\]
   The value of the fromLocation parameter must be on the same system that is running WLST. It cannot be on a network drive.

The next request to the application uses the new partition.

11.3.7 Moving Metadata from a Test System to a Production System
You can transfer the metadata in MDS from one partition to another. As an example, you want to move an application from a test system to a production system. You have
Managing the MDS Repository

a test application that is deployed in a domain in the test system and a production application deployed in a domain in the production system. You want to transfer the customizations from the test system to the production system. To do that, you transfer the metadata from the partition in the test system to a partition in the production system.

To transfer the metadata from one partition to another, you export the metadata from the partition and then import it into the other partition. You can use Fusion Middleware Control or WLST to transfer the metadata.

To use Fusion Middleware Control to transfer metadata:

1. From the navigation pane, expand the farm, expand Application Deployments, then select the application.
2. From the Application Deployment menu, choose MDS Configuration. The MDS Configuration page is displayed.
3. Click Export. The Export dialog box is displayed, as shown in the following figure:

   ![Export dialog box](image)

4. In the Export dialog box, enter a directory location to which the metadata can be exported.
   
   If you check Exclude base documents, this operation exports only the customizations, not the base documents. See Section 11.3.1 for information about base documents and customizations.
   
   The target path must be accessible from the system where the application is running. The path must be a directory that currently exists. The metadata is written to a subdirectory of the directory that you specified, with the name of the partition that was exported as the name of the subdirectory.
   
   Click OK.
5. In the Confirmation dialog box, click Close.
6. From the navigation pane for the production system, expand the farm, expand Application Deployments, then select the application.
7. Click Import.
   
   The Import dialog box is displayed, as shown in the following figure:
8. In the Import dialog box, enter the directory specification that contains the exported metadata. Include the subdirectory with the partition name in the specification. The path must be accessible from the system where the application is running. The path can be a directory or an archive.

9. Click OK.

11.3.8 Moving from a File-Based Repository to a Database-Based Repository

You can move from a file-based repository to a database-based repository. (You cannot move from a database-based repository to a file-based repository.)

To minimize downtime, take the following steps to move an application's metadata from a file-based repository to a database-based repository:

1. Use RCU to create schemas in the new repository, as described in Section 11.2.

2. Create a new partition using the WLST command `createMetadataPartition` with same name as source partition:

   ```bash
   wls:/weblogic/serverConfig> createMetadataPartition(repository='mds-repos1', partition='partition1')
   ```

3. Export the metadata from the source partition to a directory on the file system:

   ```bash
   wls:/weblogic/serverConfig> exportMetadata(application='sampleApp', server='server1', toLocation='/tmp/myrepos/partition1', docs='/**')
   ```

4. Import the metadata from the file system to the new partition:

   ```bash
   wls:/weblogic/serverConfig> importMetadata(application='sampleApp', server='server1', fromLocation='/tmp/myrepos/partition1', docs='/**')
   ```

5. Redeploy the application, as described in Section 8.4.3, Section 8.5.3 or Section 8.6.3 depending on the type of application. When you do so, you specify the new partition and repository in the Application Attributes page:

   a. To change the repository, click the icon next to the Repository Name. In the Metadata Repositories dialog box, select the repository and click OK.

   b. To change the partition, enter the partition name in Partition Name.

6. Deregister the file-based repository, as described in Section 11.3.3.2.
11.3.9 Deleting a Metadata Partition from a Repository

You can delete metadata partitions if there are no applications either deployed to the partition or referring to the partition. You may want to delete a metadata partition from the repository in the following circumstances:

- When you undeploy an application. Oracle Fusion Middleware leaves the metadata partition because you may still want the metadata, such as user customizations, in the partition. If you do not need the metadata, you can delete the partition.
- When you have transferred metadata from one partition to another and configured the application to use the new partition.
- When you have cloned a partition and configured the application to use the new partition.

Note that deleting a partition deletes all the data contained in the partition.

11.3.9.1 Deleting a Metadata Partition Using the Command Line

To delete a metadata partition from a repository, you can use the WLST command `deleteMetadataPartition`. For example, to delete the metadata partition from the file-based repository repository1, use the following command:

```
wls:/weblogic/serverConfig> deleteMetadataPartition(repository='mds-repos1',
                                        partition='partition1')
```

11.3.9.2 Deleting a Metadata Partition Using Fusion Middleware Control

To delete a metadata partition from a repository partition using Fusion Middleware Control:

1. From the navigation pane, expand the farm and then expand Metadata Repositories.
2. Select the repository.
   The repository home page is displayed.
3. In the Repository Partitions section, select the partition and click Delete.
4. In the confirmation dialog box, click OK.

11.3.10 Purging Metadata Version History

For database-based MDS repositories, you can purge the metadata version history from a partition. (File-based MDS repositories do not maintain version history.) This operation purges version history of unlabeled documents from the application’s repository partition. The tip version (the latest version) is not purged, even if it is unlabeled.

To purge labeled documents, you must first delete the label, as described in Section 11.3.11.2.

Consider purging metadata version history on a regular basis as part of MDS Repository maintenance, when you suspect that the database is running out of space or performance is becoming slower. This operation may be performance intensive, so plan to do it in a maintenance window or when the system is not busy.

For specific recommendations for particular types of applications, see the documentation for a particular component.
To use WLST to purge metadata version history, use the `purgeMetadata` command. You specify the documents to be purged by using the `olderThan` parameter, specifying the number of seconds. The following example purges all documents older than 100 seconds:

```
wlst:/weblogic/serverConfig> purgeMetadata(application='sampleApp',
                                           server='server1', olderThan=100)
```

To use Fusion Middleware Control to purge the metadata version history:

1. From the navigation pane, expand the farm, expand **Application Deployments**, then select the application.

2. From the Application Deployment menu, choose **MDS Configuration**. The MDS Configuration page is displayed.

3. Click **Purge**. The Purge dialog box is displayed.

4. In the **Purge all unlabeled past versions that are older than** field, enter a number and select the unit of time. For example, enter 3 and select **months**.

5. Click **OK**. A progress box is displayed. When the operation completes, a completion box is displayed.

6. Click **Close**.

### 11.3.11 Managing Metadata Labels in the MDS Repository

A **metadata label** is a means of selecting a particular version of each object from a metadata repository partition. Conceptually, it is a collection of document versions, one version per document, representing a *horizontal stripe* through the various document versions. This stripe comprises the document versions which were the tip versions (latest versions) at the time the label was created.

Document versions belonging to a label are not deleted by automatic purging, unless the label is explicitly deleted. In this way, creating a label guarantees that a view of the metadata as it was at the time to label was created will remain available until the label is deleted.

You can use a label to view the metadata as it was at the point in time when the label was created. You can use the commands to support logical backup and recovery of an application's metadata contained in the partition.

Labels are supported only in database-based repositories.

The following topics describe how to manage labels:

- **Creating Metadata Labels**
- **Deleting Metadata Labels**
- **Listing Metadata Labels**
- **Promoting Metadata Labels**

#### 11.3.11.1 Creating Metadata Labels

To create a label for a particular version of objects in a partition in an MDS Repository, you use the WLST command `createMetadataLabel`. For example, to create a label named `prod1` for the application `my_mds_app`, use the following command:
Managing Metadata Repository Schemas

11.3.11.2 Deleting Metadata Labels
To delete a metadata label, you use the WLST command `deleteMetadataLabel`. For example, to delete a label named `prod1` for the application `my_mds_app`, use the following command:

```
wls:/weblogic/serverConfig> deleteMetadataLabel(application='my_mds_app',
       server='server1', name='prod1')
```

If the application has more than one version, you must use the `applicationVersion` parameter to specify the version.

To find the labels associated with an application, use the `listMetadataLabels` command, as described in Section 11.3.11.3.

11.3.11.3 Listing Metadata Labels
You can list the metadata labels for a particular application. To do so, use the WLST command `listMetadataLabel`. For example, to list the labels for the application `my_mds_app`, use the following command:

```
wls:/weblogic/serverConfig> listMetadataLabels(application='my_mds_app',
       server='server1')
```

If the application has more than one version, you must use the `applicationVersion` parameter to specify the version.

11.3.11.4 Promoting Metadata Labels
You can promote documents associated with a metadata label so that they are now the last version. That is, you can promote them to the tip. Promote a label if you want to roll back to an earlier version of all of the documents captured by the label.

To promote a label to the tip, use the WLST command `promoteMetadataLabel`. For example, to promote the label `prod1`, use the following command:

```
wls:/weblogic/serverConfig> promoteMetadataLabel(application='my_mds_app',
       server='server1', name='prod1')
```

If the application has more than one version, you must use the `applicationVersion` parameter to specify the version.

11.4 Managing Metadata Repository Schemas
The following topics describe how to manage the metadata repository schemas:

- Changing Metadata Repository Schema Passwords
- Changing the Character Set of the Metadata Repository

11.4.1 Changing Metadata Repository Schema Passwords
The schema passwords are stored in the database.

For example, to change the password of the schema `OFM_MDS`:
1. Connect to the database using SQL*Plus. Connect as a user with SYSDBA privileges.

2. Issue the following command:

   SQL> ALTER USER schema IDENTIFIED BY new_password;

   For example, to change the OFM_MDS password to abc123:

   SQL> ALTER USER OFM_MDS IDENTIFIED BY abc123;

3. If you change the MDS Repository schema password, you must change the password for the corresponding MDS repository data source, using Oracle WebLogic Server Administration Console:

   a. From Domain Structure, expand Services, then JDBC, and select Data Sources.
   b. Click the data source that is related to the MDS repository.
   c. Click the Configuration tab, then the Connection Pool tab.
   d. For Password, enter the new password.
   e. Click Save.
   f. Restart the Managed Servers that consume the data source.

11.4.2 Changing the Character Set of the Metadata Repository

For information about changing the character set of metadata repository that is stored in an Oracle Database, see Oracle Database Globalization Support Guide:

http://www.oracle.com/technology/documentation/support/database.html

Oracle recommends using Unicode for all new system deployments. Deploying your systems in Unicode offers many advantages in usability, compatibility, and extensibility. Oracle Database enables you to deploy high-performing systems faster and more easily while utilizing the advantages of Unicode. Even if you do not need to support multilingual data today, nor have any requirement for Unicode, it is still likely to be the best choice for a new system in the long run and will ultimately save you time and money as well as give you competitive advantages in the long term.
This chapter provides procedures for changing the network configuration, such as the host name, domain name, or IP address, of an Oracle Fusion Middleware host.

This chapter includes the following topics:
- Changing the Network Configuration
- Changing the IP Address of a Metadata Repository Installation
- Moving Between On-Network and Off-Network
- Changing Between a Static IP Address and DHCP
- Using IPV6

### 12.1 Changing the Network Configuration

This section describes how to change the host name, domain name, IP address, or any combination of these, of a host that contains the following installation types:
- Oracle WebLogic Server. When you change the host name, domain name, or IP address of Oracle WebLogic Server, you also automatically change the information for Java components, such as Oracle SOA Suite and Oracle WebCenter components that are deployed to Oracle WebLogic Server.
- Oracle Fusion Middleware Web Tier components, Oracle Web Cache and Oracle HTTP Server. You can change the host name or the IP address.

The following topics describe how to change the host name, domain name, or IP address:
- Changing the Network Configuration of a WebLogic Managed Server
- Changing the Network Configuration of Web Tier Components

#### 12.1.1 Changing the Network Configuration of a WebLogic Managed Server

To change the host name, domain name, or IP address of a WebLogic Managed Server:

1. Display the Administration Console, as described in Section 3.4.1.
2. In the Change Center, click **Lock & Edit**.
3. Create a machine, which is a logical representation of the computer that hosts one or more WebLogic Servers, and point it to the new host. (From the Home page, select **Machines**. Then, click **New**.) Follow the directions in the Administration Console help.
You must disable Host Name Verification on Administration Servers that access Node Manager, as described in the Help.

4. Change the Managed Server configuration to point to the new machine:
   a. From the left pane of the Console, expand Environment and then Servers. Then, select the name of the server.
   b. Select the Configuration tab, then the General tab. In the Machine field, select the machine to which you want to assign the server.
   c. Change Listen Address to the new host.
      Click Save.

5. Start the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following command:

   DOMAIN_NAME/bin/startManagedWeblogic.sh managed_server_name
   admin_url username password

   The Managed Server connects to the Administration Server and updates its configuration changes.

12.1.2 Changing the Network Configuration of Web Tier Components

If you change the host name, domain name or IP address of a host that contains multiple Oracle instances, you must change the network configuration of each Oracle instance that resides on that host. You do not need to make changes to any system component that resides on another host.

You can change the network configuration of Oracle HTTP Server and Oracle Web Cache by using the following command:

   (UNIX) ORACLE_HOME/chgip/scripts/chgiphost.sh
   (Windows) ORACLE_HOME\chgip\scripts\chgiphost.bat

The format of the command is:

   chgiphost.sh | chgiphost.bat
   [-noconfig] [-version] [-help]
   [-oldhost old_host_name -newhost new_host_name]
   [-oldip old_IP_address -newip new_IP_address]
   -instanceHome Instance_path

The parameters have the following meanings:

- noconfig: The default for changing the network parameters.
- version: Displays the version of the chgiphost tool.
- help: Displays help for the command.
- oldhost: The fully qualified name of the old host. Use this parameter, with newhost, to change the host name or domain name, or both.
- newhost: The fully qualified name of the new host. Use this parameter, with oldhost, to change the host name or domain name, or both.
- oldip: The old IP address.
- newip: The new IP address.
- instanceHome: The full path of the Oracle instance.
For example, to change the host name, domain name, and IP address of a host that contains either Oracle HTTP Server or Oracle Web Cache, or both, take the following steps:

**Task 1 Prepare Your Host**
Prepare your host for the change:
1. Perform a backup of your environment before you start this procedure. See Chapter 14.
2. Shutdown all Oracle Fusion Middleware processes. See Chapter 4.

**Task 2 Change the Hostname, Domain Name, or IP Address**
Update your operating system with the new hostname, domain name, IP address, or any combination of these. Consult your operating system documentation for information on how to perform the following steps.
1. Make the updates to your operating system to properly change the host name, domain name, or IP address.
2. Restart the host, if necessary for your operating system.
3. Verify that you can ping the host from another host in your network. Be sure to ping using the new hostname to make sure everything is resolving properly.

**Task 3 Run the chgiphost Command**
Follow these steps for each Oracle instance that contains Oracle HTTP Server or Oracle Web Cache on your host. Be sure to complete the steps entirely for one Oracle instance before you move on to the next.
1. Log in to the host as the user that installed Oracle Fusion Middleware.
2. Run the chgiphost command.

   The following example changes the host name from host_a to host_b and the domain name from dom_1 to dom_2 for an Oracle instance named inst_a. It also changes the IP address:

```
chgiphost.sh -noconfig
   -oldhost host_a.dom_1 -newhost host_b.dom_2
   -oldip old_IP_address -newip new_IP_address
   -instanceHome /scratch/Oracle/Middleware/inst_a
```

**Task 4 Restart Processes**
Restart all Oracle Fusion Middleware processes. See Chapter 4.

**12.2 Changing the IP Address of a Metadata Repository Installation**

This section describes how to change the IP address of a host that contains a metadata repository:

The following sections describe the procedure:
- Task 1, "Stop All Oracle Fusion Middleware Components"
- Task 2, "Shut Down the Database"
- Task 3, "Change the IP Address"
- Task 4, "Start the Database"
Task 1  Stop All Oracle Fusion Middleware Components
Stop all components that use the Metadata Repository, even if they are on other hosts. Stop the Administration Server, the Managed Servers, and all components, as described in Chapter 4.

Task 2  Shut Down the Database
Prepare your host for the change by stopping the database:

1. Set the ORACLE_HOME and ORACLE_SID environment variables.
2. Shut down the listener and database:
   1. `lsnrctl stop`
   2. `sqlplus /nolog`
   3. `SQL> connect SYS as SYSDBA`
   4. `SQL> shutdown`
   5. `SQL> quit`
3. Verify that all Oracle Fusion Middleware processes have stopped.
4. To make sure Oracle Fusion Middleware processes do not start automatically after a restart of the host, disable any automated startup scripts you may have set up, such as `/etc/init.d` scripts.

Task 3  Change the IP Address
Update your operating system with the new IP address, restart the host, and verify that the host is functioning properly on your network. Consult your operating system documentation for information on how to perform the following steps:

1. Make the updates to your operating system to properly change the IP address.
2. Restart the host, if required by your operating system.
3. Verify that you can ping the host from another host in your network. Be sure to ping using the new IP address to make sure everything is resolving properly.

Task 4  Start the Database
Start the database:

1. Log in to the host as the user that installed the database.
2. Set the ORACLE_HOME and ORACLE_SID environment variables.
3. On UNIX systems, set the LD_LIBRARY_PATH, LD_LIBRARY_PATH_64, LIB_PATH, or SHLIB_PATH environment variables to the proper values, as shown in Table 3–1. The actual environment variables and values that you must set depend on the type of your UNIX operating system.
4. Start the database and listener:
   1. `sqlplus /nolog`
   2. `SQL> connect SYS as SYSDBA`
   3. `SQL> startup`
   4. `SQL> quit`
   5. `lsnrctl start`
Task 5  Change the System Data Source
If you use the IP address in the data source definition, change the system data source to use the new IP address for the metadata repository. To do so, you use Oracle WebLogic Server Administration Console:

1. In the Change Center, click Lock & Edit.
2. In the Domain Structure section, expand Services, then JDBC, and select Data Sources.
   
   The Summary of JDBC Data Sources page is displayed.
   
3. Select the data source you want to change.
   
   The Settings page is displayed.
   
4. Select the Connection Pool tab.
5. To change the IP address, modify the URL field. For example:

   `jdbc:oracle:thin:@hostname.domainname.com:1522/orcl`

6. Click Save.
7. Restart the servers that use this data source. (Click the Target tab to see the servers that use this data source.)

Task 6  Restart Your Environment
Start the components that use the Metadata Repository:

1. Start all components that use the Metadata Repository, even if they are on other hosts. Start the Administration Server, the Managed Servers, and all components, as described in Chapter 4.
2. If you disabled any processes for automatically starting Oracle Fusion Middleware at the beginning of this procedure, enable them.

12.3  Moving Between On-Network and Off-Network
This section describes how to move an Oracle Fusion Middleware host on and off the network. The following assumptions and restrictions apply:

- The host must contain an instance that does not use an Infrastructure, or both the middle-tier instance and Infrastructure must be on the same host.
- DHCP must be used in loopback mode. Refer to Oracle Fusion Middleware Installation Planning Guide for more information.
- Only IP address change is supported; the host name must remain unchanged.
- Hosts in DHCP mode should not use the default host name (`localhost.localdomain`). The hosts should be configured to use a standard host name and the loopback IP should resolve to that host name.
- A loopback adapter is required for all off-network installations (DHCP or static IP). Refer to Oracle Fusion Middleware Installation Planning Guide for more information.

12.3.1  Moving from Off-Network to On-Network (Static IP Address)
This procedure assumes you have installed Oracle Fusion Middleware on a host that is off the network, using a standard host name (not `localhost`), and would like to
move on the network and use a static IP address. The IP address may be the default loopback IP, or any standard IP address.

To move on to the network, you can simply connect the host to the network. No updates to Oracle Fusion Middleware are required.

12.3.2 Moving from Off-Network to On-Network (DHCP)

This procedure assumes you have installed on a host that is off the network, using a standard host name (not localhost), and would like to move on the network and use DHCP. The IP address of the host can be any static IP address or loopback IP address, and should be configured to the host name.

To move on to the network:

1. Connect the host to the network using DHCP.
2. Configure the host name to the loopback IP address only.

12.3.3 Moving from On-Network to Off-Network (Static IP Address)

Follow this procedure if your host is on the network, using a static IP address, and you would like to move it off the network:

1. Configure the /etc/hosts file so the IP address and host name can be resolved locally.
2. Take the host off the network.
3. There is no need to perform any steps to change the host name or IP address.

12.4 Changing Between a Static IP Address and DHCP

This section describes how to change between a static IP address and DHCP. The following assumptions and restrictions apply:

- The host must contain all Oracle Fusion Middleware components, including Identity Management components, and any metadata repository associated with those components. That is, the entire Oracle Fusion Middleware environment must be on the host.
- DHCP must be used in loopback mode. Refer to Oracle Fusion Middleware Installation Planning Guide for more information.
- Only IP address change is supported; the host name must remain unchanged.
- Hosts in DHCP mode should not use the default host name (localhost.localdomain). The hosts should be configured to use a standard host name and the loopback IP should resolve to that host name.

12.4.1 Changing from a Static IP Address to DHCP

To change a host from a static IP address to DHCP:

1. Configure the host to have a host name associated with the loopback IP address before you convert the host to DHCP.
2. Convert the host to DHCP. There is no need to update Oracle Fusion Middleware.

12.4.2 Changing from DHCP to a Static IP Address

To change a host from DHCP to a static IP address:
1. Configure the host to use a static IP address.

2. There is no need to update Oracle Fusion Middleware.

12.5 Using IPv6

Oracle Fusion Middleware supports Internet Protocol Version 4 (IPv4) and Internet Protocol Version 6 (IPv6.) Among other features, IPv6 supports a larger address space (128 bits) than IPv4 (32 bits), providing an exponential increase in the number of computers that can be addressable on the Web.

An IPv6 address is expressed as 8 groups of 4 hexadecimal digits. For example:

```
2001:0db8:85a3:08d3:1319:8a2e:0370:7334
```

Table 12–1 describes support for IPv6 by Oracle Fusion Middleware components. In the table:

- The column **IPv6 Only** shows whether or not a component supports using IPv6 only for all communication.
- The column **Dual Stack** shows whether or not a component supports using both IPv6 and IPv4 for communication. For example, some components do not support using IPv6 only, because some of the communication is with the Oracle Database, which supports IPv4, not IPv6. Those components might support dual stack, allowing for IPv6 communication with other components.

<table>
<thead>
<tr>
<th>Component</th>
<th>IPv6 Only</th>
<th>Dual Stack</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle WebLogic Server</td>
<td>Yes</td>
<td>Yes</td>
<td>Most Oracle WebLogic Server plug-ins do not support IPv6. IPv6 is enabled with Oracle HTTP Server with the mod_wl_ohs plug-in.</td>
</tr>
<tr>
<td>Oracle HTTP Server</td>
<td>Yes</td>

<td>Yes</td>
<td>Requires a dual stack, because Oracle Database requires IPv4 addresses.</td>
</tr>
</tbody>
</table>
The following topics provide more information about Oracle Fusion Middleware support for IPv6:

- Supported Topologies for IPv4 and IPv6 Network Protocols
- Configuring Oracle HTTP Server for IPv6
- Disabling IPv6 Support for Oracle Web Cache
- Configuring Oracle Single Sign-On to Use Oracle HTTP Server with IPv6
- Configuring Oracle Access Manager Support for IPv6

### 12.5.1 Supported Topologies for IPv4 and IPv6 Network Protocols

The following topologies for IPv4 and IPv6 are supported (dual-stack means that the host is configured with both IPv4 and IPv6):

- **Topology A:**
  - Oracle Database on IPv4 protocol host

---

<table>

---
Using IPV6

- Oracle WebLogic Server on dual-stack host
- Clients on IPv4 protocol host
- Clients on IPv6 protocol host

- **Topology B:**
  - Oracle Database on IPv4 protocol host
  - One or more of the following components on dual-stack hosts: Oracle WebLogic Server, Oracle SOA Suite, Oracle WebCenter, Oracle Business Activity Monitoring, Fusion Middleware Control
  - Oracle HTTP Server with mod_wl_ohs on IPv6 protocol host

- **Topology C:**
  - Database, such as MySQL, that supports IPv6 on IPv6 protocol host
  - Oracle WebLogic Server on IPv6 protocol host
  - Clients on IPv6 protocol host

- **Topology D:**
  - Oracle Database on IPv4 protocol host
  - One or more of the following components on dual-stack hosts: Identity Management, Oracle SOA Suite, Oracle WebCenter, Oracle Business Activity Monitoring, Fusion Middleware Control
  - Clients on IPv4 protocol host
  - Clients on IPv6 protocol host

- **Topology E:**
  - Oracle Database on IPv4 protocol host
  - One or more of the following components on IPv4 protocol host: Oracle Portal, Oracle Forms Services, Oracle Reports, Oracle Business Intelligence Discoverer, and Oracle Single Sign-On Release 10.1.3.4
  - Oracle HTTP Server with mod_proxy on dual-stack host
  - Clients on IPv6 protocol host

- **Topology F:**
  - Oracle Access Manager Release 10.1.4.3 and applications, such as SOA composite applications on IPv4 protocol host
  - Oracle HTTP Server with mod_proxy on dual-stack host
  - Clients on IPv6 protocol host

- **Topology G:**
  - Oracle Database on IPv4 protocol host
  - One or more of the following components on IPv4 protocol host: Oracle SOA Suite, Oracle WebCenter, Oracle Business Activity Monitoring, Fusion Middleware Control on IPv4 protocol host
  - Oracle HTTP Server with mod_wl_ohs on dual-stack host
  - Clients on IPv6 protocol host
12.5.2 Configuring Oracle HTTP Server for IPv6

To configure Oracle HTTP Server to communicate using IPv6, you modify configuration files in the following directory:

```
ORACLE_INSTANCE/config/OHS/ohs_name
```

For example, to configure Oracle HTTP Server to communicate with Oracle WebLogic Server on hosts that are running IPv6, you configure mod_wl_ohs. You edit the configuration files in the following directory:

```
ORACLE_INSTANCE/config/OHS/ohs_name
```

In the files, specify either the resolvable host name or the IPv6 address in one of the following parameters:

- `WebLogicHost hostname` | `[IPaddress]`
- `WebCluster [IPaddress_1]:portnum1, [IPaddress_2]:portnum2, [IPaddress_3]:portnum3, ...`

You must enclose the IPv6 address in brackets.

Any errors are logged in the Oracle HTTP Server logs. To generate more information, set the mod_weblogic directives `Debug All` and `WLLogFile path`. Doing so will log module-specific messages.

Note the following limitations:

- Dynamic clusters are supported only on IPv4 nodes, or in a mixed cluster where each node is configured with a resolvable host name (instead of an IP address or a blank) in the Listen Address.

  To change the Listen Address, use the Oracle WebLogic Server Administration Console and edit the Listen Address in the Server: Configuration: General page, as described in the Oracle WebLogic Server Administration Console help.

- If the cluster contains IPv6 nodes and the host names are not resolvable, the cluster must be static, not dynamic. To set the cluster to static, change the `DynamicServerList` to Off. If you add or delete any cluster members, you must manually update the configuration file and restart Oracle HTTP Server.

  To change the `DynamicServerList` to Off, edit the Oracle HTTP Server configuration files.

12.5.3 Disabling IPv6 Support for Oracle Web Cache

By default, IPv6 support is enabled for Oracle Web Cache. You can disable it in the `webcache.xml` file, which is located in the following directory:

- (UNIX) `ORACLE_INSTANCE/config/WebCache/webcache_name`
- (Windows) `ORACLE_INSTANCE\config\WebCache\webcache_name`

In the file, change the value of the `IPV6` element to "No". For example:

```
<IPV6 enabled="No"/>
```
12.5.4 Configuring Oracle Single Sign-On to Use Oracle HTTP Server with IPv6

Oracle Single Sign-On Server supports IPv4. However, you can configure Oracle Single Sign-On Server to work with clients that support IPv6 by setting up a proxy server and a reverse proxy.

The steps in this section assume that you have installed Oracle Single Sign-On Server Release 10.1.4.3 and a proxy server such as Oracle HTTP Server that acts as a front end to the Oracle Single Sign-On Server.

Take the following steps to configure Oracle Single Sign-On to work with clients that support IPv6:

1. Enable the proxy server:
   a. Run the ssoCfg script on the single sign-on middle tier. This script changes the host name stored in the single sign-on server to the proxy host name. Use the following command syntax, entering values for the protocol, host name, and port of the proxy server:
      
      (UNIX) $ORACLE_HOME/sso/bin/ssocfg.sh http proxy_server_name proxy_port
      (Windows) %ORACLE_HOME%\sso\bin\ssocfg.bat http proxy_server_name proxy_port

   b. Update the targets.xml file on the single sign-on middle tier. The file is located in:

      (UNIX) ORACLE_HOME/sysman/emd
      (Windows) ORACLE_HOME\sysman\emd

      Open the file and find the target type oracle_sso_server. Within this target type, locate and edit the three attributes that you passed to ssocfg:
      - HTTPMachine—the HTTP server host name
      - HTTPPort—the SSL port number of the Oracle HTTP server
      - HTTPProtocol—the server protocol

   c. Add the lines that follow to the httpd.conf file on the single sign-on middle tier. The file is at ORACLE_HOME/Apache/Apache/conf. These lines change the directive ServerName from the name of the actual server to the name of the proxy:

      KeepAlive off
      ServerName proxy_host_name
      Port proxy_port

      Note that if you are using SSL, the port must be an SSL port such as 4443.

   d. (SSL only) If you have configured SSL communication between just the browser and the proxy server, configure mod_certheaders on the middle tier. This module enables the Oracle HTTP Server to treat HTTP proxy requests that it receives as SSL requests. Add the lines that follow to httpd.conf. You can place them at the end of the file. Where they appear is unimportant.

      Enter this line to load the module:

      (UNIX) LoadModule certheaders_module libexec/mod_certheaders.so
      (Windows) LoadModule certheaders_module modules/ApacheModuleCertHeaders.dll

      If you are using Oracle Web Cache as a proxy, enter this line:

      AddCertHeader HTTPS
If you are using a proxy other than Oracle Web Cache, enter this line:

```
SimulateHttps on
```

e. Reregister mod_osso on the single sign-on middle tier. This step configures mod_osso to use the proxy host name instead of the actual host name. For example, on Linux:

```
$ORACLE_HOME/sso/bin/ssoreg.sh
   -oracle_home_path ORACLE_HOME
   -site_name example.mydomain.com
   -config_mod_osso TRUE
   -mod_osso_url http://example.mydomain.com
```

f. Update the Distributed Configuration Management schema:

```
ORACLE_HOME/dcm/bin/dcmctl updateconfig
```

g. Restart the single sign-on middle tier:

```
ORACLE_HOME/opmn/bin/opmnctl restartproc process-type=HTTP_Server
ORACLE_HOME/opmn/bin/opmnctl restartproc process-type=OC4J_SECURITY
```

h. Log in to the single sign-on server, using the single sign-on login URL:

```
http://proxy_host_name:proxy_port/sso/
```

This URL takes you to the single sign-on home page. If you are able to log in, you have configured the proxy correctly.

2. If you have not already done so, install Oracle HTTP Server 11g Release 1 (11.1.1) to use as a reverse proxy for IPv6.

3. Change the Oracle HTTP Server 11g Release 1 (11.1.1) configuration to enable reverse proxy:

a. Stop Oracle HTTP Server:

```
opmnctl stopproc ias-component=component_name
```

b. Edit the following file:

(UNIX) `ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf`
(Windows) `ORACLE_INSTANCE\config\OHS\ohs_name\httpd.conf`

Append the following to the httpd.conf file:

```
#---Added for Mod Proxy
ProxyRequests Off

<Proxy *>
Order deny,allow
Allow from all
</Proxy>

ProxyPass /sso http://OHS_host:OHS_port/sso
ProxyPass / http://OHS_host:OHS_port/
ProxyPassReverse / http://OHS_host:OHS_port/
ProxyPreserveHost On
```

In the example, `OHS_host` and `OHS_port` are the host name and port of the front-end server for Oracle Single Sign-On, discussed in Step 1.
c. Restart the Oracle HTTP Server. For example, to restart ohs1:

```plaintext
opmnctl startproc ias-component=ohs1
```

### 12.5.5 Configuring Oracle Access Manager Support for IPv6

You can configure Oracle Access Manager to work with clients that support IPv6 by setting up a reverse proxy server. Several scenarios are provided here. Be sure to choose the right configuration for your environment.

#### 12.5.5.1 Simple Authentication with IPv6

Figure 12–1 illustrates simple authentication with Oracle Access Manager configured to use the IPv6/IPv4 proxy.

**Note:** In a WebGate profile, an IPv6 address cannot be specified. In a WebGate profile, the virtual host name must be specified as a host name, for example, `myapphost.foo.com`, not as an IP address.

**Figure 12–1 Simple Authentication with the IPv6/IPv4 Proxy**

As illustrated in Figure 12–1, the IPv6 network communicates with the IPv6/IPv4 proxy, which in turn communicates with the Oracle HTTP Server and WebGate using IPv4. WebGate, Oracle Access Manager servers, and Oracle WebLogic Server with the Authentication provider all communicate with each other using IPv4.

#### 12.5.5.2 Configuring IPv6 with an Authenticating WebGate and Challenge Redirect

Figure 12–2 illustrates configuration with a single IPv6 to IPv4 proxy (even though `myssohost` and `myapphost` could use separate proxies).
Figure 12–2 IPv6 with an Authenticating WebGate and Challenge Redirect

As illustrated in Figure 12–2, the IPv6 network communicates with the IPv6/IPv4 proxy, which in turn communicates with the Oracle HTTP Server using IPv4. WebGate, Oracle Access Manager server, and Oracle WebLogic Server with the Identity Asserter all communicate with each other using IPv4.

You should be able to access the application from a browser on the IPv4 network directly to the IPv4 server host name and have login with redirect to IPv6 myssohost.foo.com.

12.5.5.3 Considerations

The following considerations apply to each intended usage scenario:

- IP validation does not work by default. To enable IP validation, you must add the IP address of the Proxy server as the WebGate’s IPValidationException parameter value in the Access System Console.
- IP address-based authorization does not work because all requests come through one IP (proxy IP) that would not serve its purpose.

12.5.5.4 Prerequisites

Regardless of the manner in which you plan to use Oracle Access Manager with IPv6 Clients, the following tasks should be completed before you start:

- Install an Oracle HTTP Server instance to act as a reverse proxy to the Web server (required for WebGate).
- Install and complete the initial set up of Oracle Access Manager (Identity Server, WebPass, Policy Manager, Access Server, WebGate) as described in Oracle Access Manager Access Administration Guide.
12.5.5.5 Configuring IPv6 with Simple Authentication

Configuring your environment for simple authentication with Oracle Access Manager using the IPv6/IPv4 proxy is described in the procedure in this section. See Figure 12–1 for a depiction of this scenario.

The configuration in this procedure is an example only. In the example, **OHS_host** and **OHS_port** are the host name and port of the actual Oracle HTTP Server with WebGate. You must use values for your environment.

---

**Note:** For this configuration you must use the Web server on which the WebGate is deployed as the Preferred HTTP host in the WebGate profile. You cannot use the IPv6 proxy name.
---

To configure IPv6 with simple authentication:

1. Configure Oracle HTTP Server 11g Release 1 (11.1.1) or any other server to enable reverse proxy:
   a. Stop Oracle HTTP Server with the following command:
      ```bash
      opmnctl stopproc ias-component=component_name
      ```
   b. Edit the following file:
      ```bash
      (UNIX) ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf
      (Windows) ORACLE_INSTANCE\config\OHS\ohs_name\httpd.conf
      ```
   c. Append the following to the httpd.conf file:
      ```bash
      #---Added for Mod Proxy
      <IfModule mod_proxy.c>
      ProxyRequests Off
      ProxyPreserveHost On
      ProxyPass /http://OHS_host:OHS_port/
      ProxyPassReverse /http://OHS_host:OHS_port/
      </IfModule>
      ```
   d. Restart Oracle HTTP Server using the following command:
      ```bash
      opmnctl startproc ias-component=component_name
      ```

2. Log in to the Access System Console. For example:
   ```bash
   http://hostname:port/access/oblix
   ```
   In the example, **hostname** refers to computer that hosts the WebPass Web server; **port** refers to the HTTP port number of the WebPass Web server instance; **/access/oblix** connects to the Access System Console.
   The Access System main page appears.

See Also:
- *Oracle Fusion Middleware Installation Guide for Web Tier*
- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
3. Click **Access System Configuration**, and then click **AccessGate Configuration**. The Search for AccessGates page appears. The Search list contains a selection of attributes that can be searched. Remaining fields allow you to specify search criteria that are appropriate for the selected attribute.

4. Select the search attribute and condition from the lists (or click **All** to find all AccessGates), and then click **Go**.

5. Click an AccessGate's name to view its details.

6. Click **Modify**.

7. For **Preferred HTTP Host**, specify the Web server name on which WebGate is deployed as it appears in all HTTP requests. The host name within the HTTP request is translated into the value entered into this field regardless of the way it was defined in a user's HTTP request.

8. To enable IP validation, add the IP address of the proxy server as the value of the **IPValidationException** parameter.

9. Click **Save**.

**12.5.5.6 Configuring IPv6 with an Authenticating WebGate and Challenge Redirect**

Use the procedure in this section to configure your environment to use Oracle Access Manager with the IPv6/IPv4 proxy and an authenticating WebGate and challenge redirect. Figure 12–2 shows a depiction of this scenario.

The following procedure presumes a common proxy for both form-based authentication and the resource WebGate. For example, suppose you have the following configuration:

- Resource WebGate is installed on http://myapphostv4.foo.com/
- Resource is on http://myapphostv4.foo.com/testing.html
- Authenticating WebGate is on http://myssohostv4.foo.com/
- Login form is http://myssohostv4.foo.com/oamsso/login.html
- Reverse Proxy URL is http://myapphost.foo.com/

**Note:** For this configuration, the Preferred HTTP host must be the name of the Oracle HTTP Server Web server that is configured for this WebGate. For instance, a WebGate deployed on myapphost4.foo.com must use myapphost4.foo.com as the Preferred HTTP host. You cannot use the IPv6 proxy name.

In the following procedure, you configure the Oracle HTTP Server, configure WebGate profiles to use the corresponding Oracle HTTP Server as the Preferred HTTP host, and configure the form-based authentication scheme with a challenge redirect value of the reverse proxy server URL (http://myapphost.foo.com/ in this example).

Be sure to use values for your own environment.

To configure IPv6 with an authenticating WebGate and challenge redirect:

1. Configure Oracle HTTP Server 11g Release 1 (11.1.1) or any other server, as follows:
   a. Stop Oracle HTTP Server with the following command:
b. Edit the following file:

UNIX: ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf
Windows: ORACLE_INSTANCE\config\OHS\ohs_name\httpd.conf

c. Append the following information for your environment to the httpd.conf file. For example:

```html
<IfModule mod_proxy.c>
ProxyRequests On
ProxyPreserveHost On
#Redirect login form requests and redirection requests to Authentication WebGate
ProxyPass /obrareq.cgi http://myssohostv4.foo.com/obrareq.cgi
ProxyPassReverse /obrareq.cgi http://myssohostv4.foo.com/obrareq.cgi
ProxyPass /access/sso http://myssohostv4.foo.com/access/sso
ProxyPassReverse /access/sso http://myssohostv4.foo.com/access/sso

# Redirect resource requests to Resource WG
ProxyPass /http://myapphostv4.foo.com /
ProxyPassReverse /http://myapphostv4.foo.com /
</IfModule>
```

d. Restart Oracle HTTP Server using the following command:

opmnctl startproc ias-component=component_name

2. In the Access System Console, set the Preferred HTTP host for each WebGate as follows:

a. Log in to the Access System Console. For example:

http://hostname:port/access/oblix

In the example, hostname refers to computer that hosts the WebPass Web server; port refers to the HTTP port number of the WebPass Web server instance; /access/oblix connects to the Access System Console. The Access System main page appears.

b. Click Access System Configuration, and then click AccessGate Configuration.

The Search for AccessGates page appears. The Search list contains a selection of attributes that can be searched. Remaining fields allow you to specify search criteria that are appropriate for the selected attribute.

c. Select the search attribute and condition from the lists (or click All to find all AccessGates), and then click Go.

d. Click an AccessGate's name to view its details.

e. Click Modify.
Using IPV6

f. For **Preferred HTTP Host** specify the name of the Oracle HTTP Server Web server that is configured for this WebGate. For instance, a WebGate deployed on `myapphostv4.foo.com` must use `myapphostv4.foo.com` as the Preferred HTTP host.

g. To enable IP validation, add the IP address of the Proxy server as the value of the `IPValidationException` parameter.

h. Click **Save**.

i. Repeat for each WebGate and specify name of the Oracle HTTP Server Web server that is configured for this WebGate.

### 3. From the Access System Console, modify the Form authentication scheme to include a challenge redirect to the Proxy server, as follows:

a. Click **Access System Configuration**, and then click **Authentication Management**.

b. Click the name of the scheme to modify, and then click **Modify**.

c. Configure the challenge redirect value to the Proxy server URL. In this example, the Proxy server URL is `http://myapphostv4.foo.com/`

d. Click **Save**.

### 12.5.5.7 Configuring IPv6: Separate Proxy for Authentication and Resource WebGates

In this configuration you have multiple proxies: for example a separate proxy for the authentication WebGate and another proxy for the resource WebGate. You can access the application from a browser on the IPv4 network directly to an IPv4 server host name with a login redirect to an IPv6 host. For example:

- Resource WebGate is on `http://myapphostv4.foo.com/
- Authenticating WebGate is on `http://myssohostv4.foo.com`
- Proxy used for `myapphostv4.foo.com` should be `myapphostv4.foo.com`
- Proxy used for `myssohostv4 foo.com` should be `myssohostv4.com`

**Note:** You cannot use the IPv6 proxy name as the Preferred HTTP host in a WebGate profile.

In the example, `OHS_host` and `OHS_port` are the host name and port of the actual Oracle HTTP Server that is configured for WebGate. Be sure to use values for your own environment.

To configure IPv6 with a separate proxy for authentication and resource WebGates:

1. Configure Oracle HTTP Server 11g Release 1 (11.1.1) or any other server for multiple proxies, as follows:
   
   a. Stop Oracle HTTP Server with the following command:

   ```bash
   opmnctl stopproc ias-component=component_name
   ```

   b. Edit the following file:

   ```
   UNIX: ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf
   Windows: ORACLE_INSTANCE\config\OHS\ohs_name\httpd.conf
   ```
c. Append the following information for your environment to the httpd.conf file. For example:

```<IfModule mod_proxy.c>
ProxyRequests Off
ProxyPreserveHost On

ProxyPass /http://OHS_host:OHS_port
ProxyPassReverse /http://OHS_host:OHS_port
</IfModule>
```

d. Restart Oracle HTTP Server using the following command:

```
opmnctl startproc ias-component=component_name
```

2. In the Access System Console, set the Preferred HTTP host for each WebGate as follows:

a. Log in to the Access System Console. For example:

```
http://hostname:port/access/oblix
```

In the example, `hostname` refers to computer that hosts the WebPass Web server; `port` refers to the HTTP port number of the WebPass Web server instance; `/access/oblix` connects to the Access System Console.

The Access System main page appears.

b. Click `Access System Configuration`, and then click `AccessGate Configuration`.

The Search for AccessGates page appears. The Search list contains a selection of attributes that can be searched. Remaining fields allow you to specify search criteria that are appropriate for the selected attribute.

c. Select the search attribute and condition from the lists (or click `All` to find all AccessGates), and then click `Go`.

d. Click an AccessGate's name to view its details.

e. Click `Modify`.

f. For `Preferred HTTP Host` specify the name of the Oracle HTTP Server Web server that is configured for this WebGate. For instance, a WebGate deployed on `myapphostv4.foo.com` must use `myapphostv4.foo.com` as the Preferred HTTP host.

g. To enable IP validation, add the IP address of the Proxy server as the value of the `IPValidationException` parameter.

h. Click `Save`.

i. Repeat for each WebGate and specify name of the Oracle HTTP Server Web server that is configured for this WebGate.

3. From the Access System Console, modify the Form authentication scheme to include a challenge redirect to the Proxy server, as follows:

a. Click `Access System Configuration`, and then click `Authentication Management`.

b. Click the name of the scheme to modify, and then click Modify.
c. Configure the challenge redirect value to the Proxy server URL that acts as a reverse proxy for the authentication WebGate. In this example, the Proxy server URL is http://myssohost.foo.com/

d. Click Save.
Part IV
Advanced Administration: Backup and Recovery

Backup and recovery refers to the various strategies and procedures involved in guarding against hardware failures and data loss, and reconstructing data should loss occur. This part describes how to back up and recover Oracle Fusion Middleware. It contains the following chapters:

- Chapter 13, "Introducing Backup and Recovery"
- Chapter 14, "Backing Up Your Environment"
- Chapter 15, "Recovering Your Environment"
This chapter provides an introduction to backing up and recovering Oracle Fusion Middleware.

This chapter includes the following topics:

- Understanding Oracle Fusion Middleware Backup and Recovery
- Oracle Fusion Middleware Directory Structure
- Overview of the Backup Strategies
- Overview of Recovery Strategies
- Backup and Recovery Recommendations for Oracle Fusion Middleware Components
- Assumptions and Restrictions

13.1 Understanding Oracle Fusion Middleware Backup and Recovery

An Oracle Fusion Middleware environment can consist of different components and configurations. A typical Oracle Fusion Middleware environment contains an Oracle WebLogic Server domain with Java components, such as Oracle SOA Suite, and an Oracle WebLogic Server domain with Identity Management components. It can also include one or more Oracle instances.

The installations of an Oracle Fusion Middleware environment are interdependent in that they contain configuration information, applications, and data that are kept in synchronization. For example, when you perform a configuration change, you might update configuration files in the installation. When you deploy an application, you might deploy it to all Managed Servers in a domain or cluster.

It is, therefore, important to consider your entire Oracle Fusion Middleware environment when performing backup and recovery. You should back up your entire Oracle Fusion Middleware environment at once, then periodically. If a loss occurs, you can restore your environment to a consistent state.

The following topics describe concepts that are important to understanding backup and recovery:

- Impact of Administration Server Failure
- Managed Server Independence (MSI) Mode
- Configuration Changes in Managed Servers
See Also:

- Section 2.2 for conceptual information about an Oracle WebLogic Server domain
- Section 2.2.1 for conceptual information about the Administration Server
- Section 2.2.2 for conceptual information about Managed Servers and clusters
- Section 2.2.3 for conceptual information about Node Manager

13.1.1 Impact of Administration Server Failure

The failure of an Administration Server does not affect the operation of Managed Servers in the domain but it does prevent you from changing the domain's configuration. If an Administration Server fails because of a hardware or software failure on its host computer, other server instances on the same computer may be similarly affected.

If an Administration Server for a domain becomes unavailable while the server instances it manages—clustered or otherwise—are running, those Managed Servers continue to run. Periodically, these Managed Servers attempt to reconnect to the Administration Server. For clustered Managed Server instances, the load balancing and failover capabilities supported by the domain configuration continue to remain available.

When you first start a Managed Server, it must be able to connect to the Administration Server to retrieve a copy of the configuration. Then, you can start a Managed Server even if the Administration Server is not running. In this case, the Managed Server uses a local copy of the domain's configuration files for its starting configuration and then periodically attempts to connect with the Administration Server. When it does connect, it synchronizes its configuration state with that of the Administration Server.

13.1.2 Managed Server Independence (MSI) Mode

Managed Servers maintain a local copy of the domain configuration. When a Managed Server starts, it contacts its Administration Server to retrieve any changes to the domain configuration that were made since the Managed Server was last shut down. If a Managed Server cannot connect to the Administration Server during startup, it can use its locally cached configuration information—this is the configuration that was current at the time of the Managed Server's most recent shutdown. A Managed Server that starts without contacting its Administration Server to check for configuration updates is running in Managed Server Independence (MSI) mode. By default, MSI mode is enabled. However a Managed Server cannot be started even in MSI mode for the first time if the Administration Server is down due to non-availability of the cached configuration.

13.1.3 Configuration Changes in Managed Servers

Configuration changes are updated in a Managed Server during the following events:

- On each Managed Server restart, the latest configuration is pulled from the Administration Server. This happens even when the Node Manager is down on the node where the Managed Server is running. If the Administration Server is unavailable during the Managed Server restart and if the MSI (Managed Server Independence) mode is enabled in the Managed Server, it starts by reading its
local copy of the configuration and synchronizes with the Administration Server when it is available. By default MSI mode is enabled.

- Upon activating every administrative change like configuration changes, deploy or redeploy of applications, and topology changes, the Administration Server pushes the latest configuration to the Managed Server. If the Managed Server is not running, the Administration Server pushes the latest version of the configuration to the Managed Server when it does start.

### 13.2 Oracle Fusion Middleware Directory Structure

The following shows a simplified view of the Oracle Fusion Middleware directory structure:

```
MN_HOME
  |- Instance_home
    |- conf
      |- component_type
        |- component_name
    |- diag
      |- logs
        |- component_type
          |- component_name
    |- slc
    |- inc
    |- logs
    |- modules
  |- Oracle_home
    |- bin
    |- common
    |- tools
  |- user_projects
    |- applications
    |- domains
      |- domain_name
      |- servers
        |- server_name
  |- utils
  |- inter_server
```

### 13.3 Overview of the Backup Strategies

To back up your Oracle Fusion Middleware environment, you can use:

- File copy utilities such as copy, xcopy, or jar.

  For example, for online backups on Windows, use copy; for offline backups on Windows, use copy, xcopy, or jar. Do not use Winzip because it does not work with long filenames or extensions.

  For example, for Linux and UNIX, use tar.

  Ensure that the tool you are using preserves the permissions of the files.

- Oracle Recovery Manager (RMAN) to back up database-based metadata repositories.

- Oracle WebLogic Server Pack and Unpack Utility

  The pack command creates a template archive (.jar) file that contains a snapshot of either an entire domain or a subset of a domain. You can use a template that contains a subset of a domain to create a Managed Server domain directory hierarchy on a remote computer.

  Alternatively, you can use a template that contains an entire domain to create the domain on a remote computer.
Overview of the Backup Strategies

If you want to retain your backups for a longer duration, you may want to back up to tape, for example using Oracle Secure Backup.

You can also configure Oracle WebLogic Server to make backup copies of the configuration files. This facilitates recovery in cases where configuration changes need to be reversed or in the unlikely case that configuration files become corrupted. When the Administration Server starts, it saves a JAR file named config-booted.jar that contains the configuration files. When you make changes to the configuration files, the old files are saved in the configArchive directory under the domain directory, in a JAR file with a sequentially numbered name such as config-1.jar. However, the configuration archive is always local to the Administration Server host. It is a best practice to back up the archives to an external location.

13.3.1 Types of Backups

You can backup your Oracle Fusion Middleware environment offline or online:

- **An offline backup** means that you must shut down the environment before backing up the files. When you perform an offline backup, the Administration Server, all Managed Servers in the domain, and all system components in the Oracle instances should be shut down.

  Back up the environment offline immediately after installation and after applying any patches or upgrades.

- **An online backup** means that you do not shut down the environment before backing up the files. To avoid an inconsistent backup, do not make any configuration changes until the backup is completed. To ensure that no changes are made in the WebLogic Server domain, lock the WebLogic Server configuration, as described in Section 3.4.2.

You can perform backups on your full Oracle Fusion Middleware environment, or on the run-time artifacts, those files that change frequently.

To perform a full backup, you should back up the static files and directories, as well as run-time artifacts.

**Static files and directories** are those that do not change frequently. These include:

- The Middleware home (MW_HOME). MW_HOME consists of an Oracle home and a WebLogic Server home. It can also contain the user_projects directories, which contains Oracle WebLogic Server domains, and an Oracle instance home, which are not static files.

- OralInventory

- OralInst.loc and oratab files, which are located in the following directory:

  /etc

- The beahomelist file, which is located at:

  (UNIX) user_home/bea/beahomelist
  (Windows) C:\bea\beahomelist

- On Windows, the following registry key:

  HKEY_LOCAL_MACHINE\Software\oracle

See Also: Oracle Fusion Middleware Creating Templates and Domains
Using the Pack and Unpack Commands
In addition, for system components, such as Oracle Web Cache, you must back up the following Windows Registry key:

```
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services
```

**Run-time artifacts** are those files that change frequently. Back up these files when you perform a full backup and on a regular basis. Run-time artifacts include:

- Domain directories of the Administration Server and the Managed Servers (by default, a domain directory resides in MW_HOME, but it can be configured by the user to point to a different location)

  In most cases, you do not need to back up Managed Server domain directories separately because the Administration Server contains information about all of the Managed Servers in its domain.

- All Oracle instance homes, which reside, by default, in the MW_HOME but can be configured to be in a different location

- Application artifacts, such as .ear or .war files

  You do not need to backup application artifacts in a Managed Server domain because they can be pulled from the Administration Server during Managed Server startup.

- Database artifacts such as the MDS repository

- Any database-based metadata repositories used by Oracle Fusion Middleware. You use Oracle Recovery Manager (RMAN) to back up an Oracle database.

- Persistent stores, such as JMS Providers and transaction logs, which reside, by default in the user_projects directory, but can be configured in a different location. However, note the limitation described in Section 14.2.

### 13.3.2 Recommended Backup Strategy

This section outlines the recommended strategy for performing backups. Using this strategy ensures that you can perform the recovery procedures in this book.

- **Perform a full offline backup:** This involves backing up the entities described in Section 13.3.1. Perform an offline full backup at the following times:
  - Immediately after you install Oracle Fusion Middleware.
  - Immediately after an operating system software upgrade.

- **Perform an online backup of run-time artifacts:** This involves backing up the run-time artifacts described in Section 13.3.1. Backing up the run-time artifacts enables you to restore your environment to a consistent state as of the time of your most recent configuration and metadata backup. To avoid an inconsistent backup, do not make any configuration changes until backup completes. Perform an online backup of run-time artifacts at the following times:
  - On a regular basis. Oracle recommends that you back up run-time artifacts nightly.
  - Prior to making configuration changes to a component or cluster.
  - After making configuration changes to a component or cluster.
  - Prior to deploying a custom Java EE application to a Managed Server or cluster.
– After a major change to the deployment architecture, such as creating servers or clusters.

- **Perform an offline backup of static files and directories**: This involves backing up the static files and directories described in Section 13.3.1. Perform an offline backup of static files and directories at the following times:
  - After patching your Oracle Fusion Middleware environment. This backup serves as the basis for subsequent online backups.
  - After upgrading your Oracle Fusion Middleware environment. This backup serves as the basis for subsequent online backups.

### 13.4 Overview of Recovery Strategies

Recovery strategies enable you to recover from critical failures that involve actual data loss. Depending on the type of loss, they can involve recovering any combination of the following types of files:

- Oracle software files
- Configuration files
- Metadata Repository files
- Oracle system files
- Windows Registry key
- Application artifacts

You can recover your Oracle Fusion Middleware environment while Oracle Fusion Middleware is offline.

To recover your Oracle Fusion Middleware environment, you can use:

- File copy utilities such as copy, xcopy or tar.
  
  When you restore the files, use your preferred tool to extract the compressed files.
  
  For example, for online recovery on Windows, use copy; for offline recovery on Windows, use copy, xcopy, or jar. Do not use Winzip because it does not work with long filenames or extensions.
  
  For example, for Linux and UNIX, use tar.

- Oracle Recovery Manager (RMAN) to recover database-based metadata repositories.

### 13.4.1 Types of Recovery

You can recover your Oracle Fusion Middleware environment in part or in full. You can recover the following:

- A domain
- The WebLogic Administration Server
- A Managed Server
- The Middleware home
- An Oracle instance home
- A component, such as Oracle HTTP Server or Oracle Web Cache
A cluster
Deployed applications

13.4.2 Recommended Recovery Strategies

Note the following key points about recovery:

- Your Oracle Fusion Middleware environment must be offline while you are performing recovery.
- Rename important existing files and directories before you begin restoring the files from backup so that you do not unintentionally override necessary files.
- Although, in some cases, it may appear that only one or two files are lost or corrupted, you should restore the directory structure for the entire element, such as an Oracle instance home or a component, rather than just restoring one or two files. In this way, you are more likely to guarantee a successful recovery.
- Recover the database to the most current state, using point-in-time recovery (if the database is configured in Archive Log Mode). This is typically a time right before the database failure occurred.

13.5 Backup and Recovery Recommendations for Oracle Fusion Middleware Components

The following sections describe backup and recovery recommendations for specific Oracle Fusion Middleware components:

- Backup and Recovery Recommendations for Oracle SOA Suite
- Backup and Recovery Recommendations for Oracle WebCenter
- Backup and Recovery Recommendations for Oracle Identity Management
- Backup and Recovery Recommendations for Oracle JRF Installations
- Backup and Recovery Recommendations for Web Tier Installations
- Backup and Recovery Recommendations for Oracle Portal, Oracle Forms Services, and Oracle Reports Installations

For the steps you take to back up your environment, see Section 14.3. For the steps you take to recover a component, see Chapter 15.

13.5.1 Backup and Recovery Recommendations for Oracle SOA Suite

The following sections describe backup and recovery recommendations for Oracle SOA Suite:

- Backup and Recovery Recommendations for Oracle BPEL Process Manager
- Backup and Recovery Recommendations for Oracle Business Activity Monitoring
- Backup and Recovery Recommendations for Oracle B2B
- Backup and Recovery Recommendations for Oracle Business Rules
- Backup and Recovery Recommendations for Oracle WebLogic Server JMS

You can configure Oracle SOA Suite so that the Administration Server is on a separate host from the Managed Servers. You do this by using the ant-soa-util.xml script that is provided. In this case, the domain is an Administration Server-only domain and no Managed Servers share the domain directory with the Administration Server. For
example, a domain contains two Managed Servers, one of which contains Oracle SOA Suite, but neither of the Managed Server's directories are on the same host as the Administration Server.

In this case, you must back up the Administration Server domain as well as the following directory for all Managed Servers:

```
DOMAIN_HOME/config/soa-infra
```

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.5.

### 13.5.1.1 Backup and Recovery Recommendations for Oracle BPEL Process Manager

This section describes the Oracle BPEL Process Manager data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.5.

#### Configuration Files

Configuration files are stored in the database.

#### Database Repository Dependencies

Process definition and configuration files are stored in the MDS schema. The dehydration store is stored in the BPEL schema.

#### Backup Recommendations

Back up the database after any configuration changes, including changes to global fault policies, callback classes for workflows and resource bundles that can potentially be outside the suitcase. Also back up the database after deploying a new composite or redeploying a composite.

If this is an Administration Server-only domain, as described in Section 13.5.1, back up the following directory:

```
DOMAIN_HOME/config/soa-infra
```

#### Recovery Recommendations

Recover the database to the most recent point in time, if needed. Point-in-time recovery ensures that the latest process definitions and in-flight instances are restored. However, this may result in reexecution of the process steps. Oracle recommends that you strive for idempotent Oracle BPEL Process Manager processes. If the system contains processes that are not idempotent, you must clean them up from the dehydration store before starting Oracle Fusion Middleware. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

Because instances obtain the process definition and artifacts entirely from the database, there is no configuration recovery needed after the database is recovered to the most current state; instances should continue to function correctly.

For redeployed composites, a database recovery ensures consistency between the dehydrated in-flight processes and their corresponding definition since the process definition is stored in database repository where dehydrated instances get stored as well.
13.5.1.2 Backup and Recovery Recommendations for Oracle Business Activity Monitoring

This section describes the Oracle Business Activity Monitoring data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.5.

**Configuration Files**

- `MW_HOME/soa_ORACLE_HOME/bam`
- `DOMAIN_HOME/config/fmwconfig/servers/AdminServer/adml/server-oracle_bamweb-11.0.xml`
- `DOMAIN_HOME/config/fmwconfig/servers/AdminServer/adml/server-oracle_bamservice-11.0.xml`
- `DOMAIN_HOME/config/fmwconfig/servers/bam-server-name/adml/server-oracle_bamweb-11.0.xml`
- `DOMAIN_HOME/config/fmwconfig/servers/bam-server-name/adml/server-oracle_bamservice-11.0.xml`

**Database Repository Dependencies**

ORABAM schema.

**Backup Recommendations**

Back up the Middleware home, the domain and the database containing the ORABAM schema.

If this is an Administration Server-only domain, as described in Section 13.5.1, back up the following directory:

- `DOMAIN_HOME/config/soa-infra`

**Recovery Recommendations**

Recover the Managed Server or the Middleware home, or both, depending on the extent of failure.

Recover the database to the most recent point in time, if needed.

13.5.1.3 Backup and Recovery Recommendations for Oracle B2B

This section describes the Oracle B2B data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.5.

**Configuration Files**

- `DOMAIN_HOME/config/soa-infra/configuration/b2b-config.xml`

**Database Repository Dependencies**

MDS schema.

**Backup Recommendations**

Back up the Administration Server domain, the Oracle home if changes are made to the Oracle B2B configuration file, and the database containing the MDS schema.

If this is an Administration Server-only domain, as described in Section 13.5.1, back up the following directory:
Recovery Recommendations
Recover the Managed Server where the soa-infra application is deployed.
Recover the database to the most recent point in time, if needed.
After recovery, if the file Xengine.tar.gz is not unzipped, unzip the files. For example:

```bash
cd $B2B_ORACLE_HOME/soa/thirdparty/edifecs
tar xzvf XEngine.tar.gz
```

13.5.1.4 Backup and Recovery Recommendations for Oracle Business Rules
This section describes the Oracle Business Rules data that must be backed up and restored.
For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.5.

Configuration Files

```
DOMAIN_HOME/config/soa-infra/configuration/businessrules-config.xml
```

Database Repository Dependencies

MDS schema.

Backup Recommendations
Back up the Administration Server domain and the database containing the MDS schema.
If this is an Administration Server-only domain, as described in Section 13.5.1, back up the following directory:

```
DOMAIN_HOME/config/soa-infra
```

Recovery Recommendations
Recover the Managed Server where the soa-infra application is deployed.
Recover the database to the most recent point in time, if needed.

13.5.1.5 Backup and Recovery Recommendations for Oracle WebLogic Server JMS
This section describes the Oracle WebLogic Server JMS data that must be backed up and restored.
For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3.

Configuration Files

```
DOMAIN_HOME/config/jms
```

If a JMS uses a file-system accessible stores, the default file-system store is either in a user-configured location that is specified in config.xml, or in this location:

```
DOMAIN_HOME/servers/server_name/data/store/default
```

Database Repository Dependencies
If a JMS uses a JDBC accessible store, back up the database.
Backup Recommendations

Back up the domain and the JMS file persistent store if it is not located within the domain.

Back up the schema in the database if JDBC-based persistent store is configured. Note the following:

- Always try to keep JMS data as current as possible. This can be achieved by using the point-in-time recovery capabilities of Oracle Database (in the case of database-based persistence) or using a highly available RAID backed storage device (for example, SAN/NAS).

- If, for whatever reason, you need to restore JMS data to a previous point in time, there are potential implications. Restoring the system state to a prior point in time not only can cause duplicate messages, but can also cause lost messages. The lost messages are messages that were enqueued before or after the system restore point time, but never processed. If the persistent store is a custom store that is dedicated to JMS use, then you can delete the entire store.

Use the following procedure before recovery to drain messages in the JMS queue after persistent-store recovery to avoid processing duplicate messages:

1. Log into the Oracle WebLogic Server Administration Console.
2. Before recovery, configure JMS server to pause Production, Insertion, and consumption operations at boot-time to ensure that no new messages are produced or inserted into the destination or consumed from the destination before you drain stale messages. To do this:
   a. Expand Services, then Messaging, and then JMS Servers.
   b. On the Summary of JMS Servers page, click the JMS server you want to configure for message pausing.
   c. On the Configuration: General page, click Advanced to define the message pausing options. Select Insertion Paused At Startup, Production Paused At Startup, and Consumption Paused At Startup.
   d. Click Save.
   e. To activate these changes, in the Change Center of the Administration Console, click Activate Changes.

Use the following procedure after recovery:

1. After recovering the persistent store, start the Managed Servers.
2. Drain the stale messages from JMS destinations, by taking the following steps:
   a. Expand Services, then Messaging, and then JMS Modules.
   b. Select a JMS module, then select a destination.
   c. Select Monitoring, then Show Messages
      Click Delete All.
3. Resume operations, by taking the following steps:
   a. Expand Services, then Messaging, and then JMS Servers.
   b. On the Summary of JMS Servers page, click the JMS server you want to configure for message pausing.
c. On the Configuration: General page, click **Advanced**. Select **Insertion Paused At Startup**, **Production Paused At Startup**, and **Consumption Paused At Startup**.

d. Click **Save**.

e. To activate these changes, in the Change Center of the Administration Console, click **Activate Changes**.

If the store is not dedicated to JMS use, use the Oracle WebLogic Server JMS message management administrative tooling. This tooling can perform import, export, move, and delete from the Administration Console, MBeans, and WLST.

For applications that use publish and subscribe in addition to queuing, you should manipulate topic subscriptions in addition to queues.

- All JMS data should be backed up continuously and synchronously. Do not use asynchronous snapshots:
  - For Oracle Database-based persistence, use RMAN for backups.
  - For file-based persistence, if you are using a SAN/NAS device, then use snapshot mechanism to take a consistent JMS data backup.
  - If you are using a storage device that does not support block-level snapshot capabilities, then you must shutdown the JMS server to be able to take a consistent backup. This is to ensure that the persistence store is not being written to while the copy operation is being performed. In a clustered environment, you can do so by shutting down one server at time, backing it up and restarting it. You also can create a script to perform these operations using WLST.

**Recovery Recommendations**

Recover the domain.

If the JMS file persistent store is file-based, recover it from backup. If the JMS file persistent store is database-based, recover the database to the most recent point in time, if needed.

### 13.5.2 Backup and Recovery Recommendations for Oracle WebCenter

The following sections describe backup and recovery recommendations for Oracle WebCenter:

- **Backup and Recovery Recommendations for Oracle WebCenter**
- **Backup and Recovery Recommendations for Oracle WebCenter Portlets**
- **Backup and Recovery Recommendations for Oracle WebCenter Discussions Server**
- **Backup and Recovery Recommendations for Oracle WebCenter Wiki and Blog Server**

#### 13.5.2.1 Backup and Recovery Recommendations for Oracle WebCenter

This section describes the Oracle WebCenter data that must be backed up and restored.

For the steps you need to take to recover components, see **Section 15.2.6** and **Section 15.3.3**. For the steps specific to recovering from loss of host, see **Section 15.3.3.7**.
Configuration Files
All configuration files are bundled in the EAR file, which is located in the domain.

Database Repository Dependencies
WEBCENTER and MDS schemas

Backup Recommendations
Back up the domain and the database containing the WEBCENTER and MDS schemas.

Recovery Recommendations
Recover the Oracle WebCenter domain.
Recover the database containing the WEBCENTER and MDS schemas to the most recent point in time, if needed.

13.5.2.2 Backup and Recovery Recommendations for Oracle WebCenter Portlets
This section describes the Oracle WebCenter Portlets data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.7.

Configuration Files
All configuration files are bundled in the EAR file, which is located in the domain.

Database Repository Dependencies
PORTLET

Backup Recommendations
Back up the Oracle WebCenter domain and the database containing the PORTLET schema.

Recovery Recommendations
Recover the Oracle WebCenter domain.
Recover the database to the most recent point in time, if needed.

13.5.2.3 Backup and Recovery Recommendations for Oracle WebCenter Discussions Server
This section describes the Oracle WebCenter Discussions server data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.7.

Configuration Files
Some configuration files are either bundled in the EAR file, which is located in the domain or the files are located elsewhere in the domain. Other configuration files are located in:

```
DOMAIN_HOME/fmwconfig/server/<server_name>/owc_discussions
```
Database Repository Dependencies
JIVE schema.

Backup Recommendations
Back up the Oracle WebCenter domain and the database containing the JIVE schema.

Recovery Recommendations
Recover the Oracle WebCenter domain.
Recover the database to the most recent point in time, if needed.

13.5.2.4 Backup and Recovery Recommendations for Oracle WebCenter Wiki and Blog Server
This section describes the Oracle WebCenter Wiki and Blog Server data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.7.

Configuration Files
Configuration files are bundled in the WAR file, which is located in the domain.

Database Repository Dependencies
WIKI schema.

Backup Recommendations
Back up the Oracle WebCenter domain and the database containing the WIKI schema.

Recovery Recommendations
Recover the Oracle WebCenter domain.
Recover the database to the most recent point in time, if needed.

13.5.2.5 Backup and Recovery Recommendations for Oracle Content Server
For information about backing up and recovering Oracle Content Server, see Getting Started with Content Server which is available at:
http://download.oracle.com/docs/cd/E10316_01/owc.htm

Database Repository Dependencies
OCSERVER schema.

13.5.3 Backup and Recovery Recommendations for Oracle Identity Management
The following sections describe backup and recovery recommendations for Oracle Identity Management:

- Backup and Recovery Recommendations for Oracle Internet Directory
- Backup and Recovery Recommendations for Oracle Virtual Directory
- Backup and Recovery Recommendations for Oracle Directory Integration Platform
- Backup and Recovery Recommendations for Oracle Directory Services Manager
- Backup and Recovery Recommendations for Oracle Identity Federation
13.5.3.1 Backup and Recovery Recommendations for Oracle Internet Directory
This section describes the Oracle Internet Directory data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.1.

Configuration Files
- ORACLE_INSTANCE/config/tnsnames.ora
- ORACLE_INSTANCE/OID/admin
- ORACLE_INSTANCE/OID/ldap/server/plugin
- ORACLE_INSTANCE/OID/component_name
- ORACLE_INSTANCE/config/OID/component_name

Database Repository Dependencies
ODS and ODSSM schemas.

Backup Recommendations
Back up the Oracle Internet Directory component directory and Oracle Internet Directory's configuration files from the Oracle instance home. Back up the database containing the ODS and ODSSM schemas.

Recovery Recommendations
Recover the Oracle Internet Directory specific files into Oracle Internet Directory's component directory of the restored Oracle instance home.
Recover the database to the most recent point in time, if needed.

13.5.3.2 Backup and Recovery Recommendations for Oracle Virtual Directory
This section describes the Oracle Virtual Directory data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.2.

Configuration Files
- ORACLE_INSTANCE/OVD/component_name
- ORACLE_INSTANCE/config/OVD/component_name
- ORACLE_INSTANCE/diagnostics/logs/OVD/component_name

Database Repository Dependencies
None.

Backup Recommendations
Back up the Oracle Virtual Directory component directory and Oracle Virtual Directory's configuration files from the Oracle instance home.

Recovery Recommendations
Restore the Oracle Virtual Directory's configuration files into the Oracle Virtual Directory component directory of the restored Oracle instance home.
13.5.3.3 Backup and Recovery Recommendations for Oracle Directory Integration Platform
This section describes the Oracle Directory Integration Platform data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.3.

Configuration Files
dip-config.xml, which is part of the Oracle Directory Integration Platform application. It is backed up when you back up the Administration Server domain.

Database Repository Dependencies
ODSSM schema, used by Oracle Internet Directory.

Backup Recommendations
Back up the Administration Server domain and Oracle Internet Directory and its dependencies.

Recovery Recommendations
Recover the Managed Server where the Oracle Directory Integration Platform application is deployed.
Recover Oracle Internet Directory.

13.5.3.4 Backup and Recovery Recommendations for Oracle Directory Services Manager
This section describes the Oracle Directory Services Manager data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.4.

Configuration Files
Oracle Directory Services Manager, which is the graphical user interface for Oracle Internet Directory and Oracle Virtual Directory, does not have configuration files, but keeps track of host and port information of Oracle Internet Directory and Oracle Virtual Directory in serverlist.txt, which is part of the application .ear:

MW_HOME/user_projects/domains/domain_name/servers/server_name/tmp/_WL_user/odsm_11.1.1.0.0/nx1i7i/war/WEB-INF/serverlist.txt

Database Repository Dependencies
None.

Backup Recommendations
Back up the domain.

Recovery Recommendations
To restore Oracle Directory Services Manager, enter the user name and password to connect to Oracle Internet Directory or Oracle Virtual Directory.
13.5.3.5 Backup and Recovery Recommendations for Oracle Identity Federation

This section describes the Oracle Identity Federation data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.5.

Configuration Files

```
DOMAIN_HOME/servers/server_name/stage/OIF/11.1.0.0/OIF/configuration
```

Database Repository Dependencies

OIF schema.

Backup Recommendations

Back up the Administration Server domain and the database containing the OIF schema.

Recovery Recommendations

Recover the Managed Server where the Oracle Identity Federation application is deployed.

Recover the database to the most recent point in time, if needed.

13.5.4 Backup and Recovery Recommendations for Oracle JRF Installations

The following topics describe backup and recovery recommendations for components that are installed with more than one type of installation:

- Backup and Recovery Recommendations for Oracle Web Services Manager
- Backup and Recovery Recommendations for Oracle Platform Security Services

13.5.4.1 Backup and Recovery Recommendations for Oracle Web Services Manager

This section describes the Oracle Web Services Manager data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3.

Configuration Files

```
DOMAIN_HOME/config/fmwconfig/policy-accessor-config.xml
```

Database Repository Dependencies

If a database-based MDS repository is used, Oracle Web Services Manager uses a partition in the MDS schema.

Backup Recommendations

Back up Oracle Web Services Manager configuration files.

If Oracle Web Services Manager uses a file-based MDS repository, back it up using a file copy mechanism. If it uses a database-based MDS repository, back up the database using RMAN.
**Recovery Recommendations**

Restore Oracle Web Services Manager configuration files.

If Oracle Web Services Manager uses a file-based MDS repository, restore it from the backup. If it uses a database-based MDS repository, recover the database to the most recent point in time, if needed.

### 13.5.4.2 Backup and Recovery Recommendations for Oracle Platform Security Services

This section describes the Oracle Platform Security Services data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.9.1.

**Configuration Files**

```
DOMAIN_HOME/config/fmwconfig/jps-config.xml
```

**Database Repository Dependencies**

None.

**Backup Recommendations**

Back up the Administration Server domain.

**Recovery Recommendations**

Restore the jps-config.xml file.

---

### 13.5.5 Backup and Recovery Recommendations for Web Tier Installations

The following sections describe backup and recovery recommendations for Web Tier installations:

- **Backup and Recovery Recommendations for Oracle HTTP Server**
- **Backup and Recovery Recommendations for Oracle Web Cache**

#### 13.5.5.1 Backup and Recovery Recommendations for Oracle HTTP Server

This section describes the Oracle HTTP Server data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.8.1.

**Configuration Files**

```
ORACLE_INSTANCE/config/OHS/component_name
ORACLE_INSTANCE/diagnostics/logs/OHS/component_name
```

**Database Repository Dependencies**

None.

**Backup Recommendations**

Back up the Oracle HTTP Server Oracle instance home.
Recovery Recommendations
Restore the Oracle HTTP Server-specific files into its Oracle instance home.

13.5.5.2 Backup and Recovery Recommendations for Oracle Web Cache
This section describes the Oracle Web Cache data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.8.2.

Configuration Files
- ORACLE_INSTANCE/config/WebCache/component_name
- ORACLE_INSTANCE/diagnostics/logs/WebCache/component_name

Database Repository Dependencies
None.

Backup Recommendations
Back up the Oracle Web Cache Oracle instance home.

Recovery Recommendations
Restore the Oracle Web Cache-specific files into its Oracle instance home.

13.5.6 Backup and Recovery Recommendations for Oracle Portal, Oracle Forms Services, and Oracle Reports Installations

The following sections describe backup and recovery recommendations for these components:

- Backup and Recovery Recommendations for Oracle Portal
- Backup and Recovery Recommendations for Oracle Forms Services
- Backup and Recovery Recommendations for Oracle Reports
- Backup and Recovery Recommendations for Oracle Business Intelligence Discoverer

13.5.6.1 Backup and Recovery Recommendations for Oracle Portal
This section describes the Oracle Portal data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.10.1.

Configuration Files
- MW_HOME/user_projects/domains/domain_name/servers/server_name/stage/portal/portal/configuration/appConfig.xml
- MW_HOME/user_projects/domains/domain_name/servers/server_name/stage/portal/portal/configuration/portal_dads.conf
- MW_HOME/user_projects/domains/domain_name/servers/server_name/stage/portal/portal/configuration/portal_plsql.conf
- MW_HOME/user_projects/domains/domain_name/servers/server_name/stage/portal/portal/configuration/portal_cache.conf
**Database Repository Dependencies**

**Backup Recommendations**
Back up the WebLogic Server domain and the Oracle instance containing Oracle Portal, as well as the database containing the schemas.

**Recovery Recommendations**
Recover the WebLogic Server domain and the Oracle instance containing Oracle Portal, as well as the database containing the schemas.

Recover the database to the most recent point in time, if needed.

### 13.5.6.2 Backup and Recovery Recommendations for Oracle Forms Services
This section describes the Oracle Forms Services data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.10.4.

**Configuration Files**
- **Forms Component:**
  ORACLE_INSTANCE/config/Forms/forms
  ORACLE_INSTANCE/Forms/forms

- **Forms Common Component:**
  ORACLE_INSTANCE/config/Forms/frcommon
  ORACLE_INSTANCE/Forms/frcommon

Forms Java EE application and external files:
  wls_managed_server/stage/formsapp

**Database Repository Dependencies**
Any user-configured database for Oracle Forms Services applications.

**Backup Recommendations**
Back up the Oracle instance home where Oracle Forms Services is located.

**Recovery Recommendations**
Restore the configuration files.

### 13.5.6.3 Backup and Recovery Recommendations for Oracle Reports
This section describes the Oracle Reports data that must be backed up and restored.

For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.10.3.

**Configuration Files**
For Reports Server:
Backup and Recovery Recommendations for Oracle Fusion Middleware Components

Introducing Backup and Recovery

For Oracle Reports Servlet:

ORACLE_INSTANCE/config/ReportsServer/server_name/rwserver.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/jdbcpds.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/xmlpds.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/textpds.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/rwnetwork.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/pcscomponent.conf
ORACLE_INSTANCE/config/ReportsServer/server_name/component-logs.xml
ORACLE_INSTANCE/config/ReportsServer/server_name/logging.xml

For Oracle Reports Servlet:

DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/cgimd.dat
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/rwservert.properties
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/jdbcpds.conf
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/xmlpds.conf
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/textpds.conf
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/rwnetwork.conf
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/logging.xml
DOMAIN_HOME/servers/server_namestage/reports/reports/configuration/logmetadata.xml

For Oracle Reports Bridge:

ORACLE_INSTANCE/config/ReportsBridge/bridge_name/rwbridge.conf
ORACLE_INSTANCE/config/ReportsBridge/bridge_name/rwnetwork.conf
ORACLE_INSTANCE/config/ReportsBridge/bridge_name/component-logs.xml
ORACLE_INSTANCE/config/ReportsBridge/bridge_name/loggin.xml
ORACLE_INSTANCE/config/ReportsBridge/bridge_name/pcscomponent.xml

For Oracle Reports Tool:

ORACLE_INSTANCE/config/ReportsTools/rwbuilder.conf
ORACLE_INSTANCE/config/ReportsTools/rwnetwork.conf
ORACLE_INSTANCE/config/ReportsTools/jdbcpds.conf
ORACLE_INSTANCE/config/ReportsTools/xmlpds.conf
ORACLE_INSTANCE/config/ReportsTools/textpds.conf
ORACLE_INSTANCE/config/ReportsTools/pcscomponent.xml
ORACLE_INSTANCE/config/ReportsTools/rwservert.properties
ORACLE_INSTANCE/config/ReportsTools/cgicmd.dat
ORACLE_INSTANCE/config/ReportsTools/component-logs.xml
ORACLE_INSTANCE/config/ReportsTools/logging.xml

Other directories and files:

ORACLE_INSTANCE/reports/server/*.dat
ORACLE_INSTANCE/reports/cache/
ORACLE_INSTANCE/reports/fonts/
ORACLE_INSTANCE/reports/plugins/resource
ORACLE_INSTANCE/diagnostics/logs/reports/ReportsServer
ORACLE_INSTANCE/diagnostics/logs/reports/ReportsBridge
ORACLE_INSTANCE/diagnostics/logs/reports/ReportsTools
(UNIX) ORACLE_INSTANCE/config/reports/bin/rw*.sh
(Windows) ORACLE_INSTANCE\config\reports\bin\rw*.bat
(UNIX) ORACLE_INSTANCE/config/reports/bin/reports.sh
(Windows) ORACLE_INSTANCE\config\reports\bin\reports.bat
(UNIX) ORACLE_INSTANCE/config/reports/bin/namingservice.sh
(Windows) ORACLE_INSTANCE\config\reports\bin\namingservice.bat
Database Repository Dependencies
You can configure Oracle Reports to store job-related information, such as scheduled job data, past job data, or job status data in a database.

Backup Recommendations
Back up the Oracle instance home where Oracle Reports is located.
If a database is configured for Oracle Reports, back up the database.

Recovery Recommendations
Restore the configuration files.
If a database is configured for Oracle Reports, recover the database to most recent point in time, if needed.

13.5.6.4 Backup and Recovery Recommendations for Oracle Business Intelligence Discoverer
This section describes the Oracle Business Intelligence Discoverer data that must be backed up and restored.
For the steps you need to take to recover components, see Section 15.2.6 and Section 15.3.3. For the steps specific to recovering from loss of host, see Section 15.3.3.10.2.

Configuration Files
ORACLE_INSTANCE/config/PreferenceServer/disco-comp-name/pref.txt
ORACLE_INSTANCE/config/PreferenceServer/disco-comp-name/.reg_key.dc

DOMAIN_HOME/servers/server_name/stage/discoverer/discoverer/configuration/configuration.xml
DOMAIN_HOME/config/config.xml
DOMAIN_HOME/config/emwconfig/servers/server_name/logging.xml
ORACLE_INSTANCE/diagnostics/logs/PreferenceServer/Discoverer_instance_name/console*
ORACLE_INSTANCE/diagnostics/logs/PreferenceServer/Discoverer_instance_name/log*
DOMAIN_HOME/servers/server_name/logs/discoverer/diagnostic=*.xml
DOMAIN_HOME/servers/server_name/logs/discoverer/diagnostics=*.xml
DOMAIN_HOME/servers/server_name/logs/discoverer/WLS_DISCO-diagnostic=*.xml

Database Repository Dependencies
DISCOVERER and DISCOVERER_PS schemas

Backup Recommendations
Back up the Oracle BI Discoverer Oracle instance home and the database containing the DISCOVERER and DISCOVERER_PS schemas.

Recovery Recommendations
Restore the configuration files to the Oracle BI Discoverer Oracle instance home.
Recover the database to the most recent point in time, if needed.

13.6 Assumptions and Restrictions
The following assumptions and restrictions apply to the backup and recovery procedures in this book. Also see the restrictions listed in Section 14.2.
- File systems and files can only be restored as of the last "good" backup. There is no support for roll forward recovery to the current point in time.

- All of the files required for recovery are maintained within the Middleware home, Oracle instance home, and Oracle Inventory (for loss of host use cases) directories. Generally, as long as no administration changes, such as configuration changes, deployments, redeployments, or patching, have been done since the last backup, it is always safe to restore the file system pertaining to a particular component to a previous point in time using the last "good" backup. Thus, new backups must always performed after any administration changes.

- Only the user who installs the product or a user who has access privileges to the directories where Oracle Fusion Middleware has been installed should be able to execute backup and recovery operations.

- If a single Managed Server and Administration Server are running in different hosts and the Managed Server is not in a cluster, you must use the pack and unpack commands on the Managed Server to pick up the correct configuration.

- If you have multiple Managed Servers running on different hosts (not in a cluster), the domain should be configured to use an external LDAP for policy store instead of using file-base policy store.

- If the Administration Server is on a different host than the Managed Servers, the domain should be configured to use an external LDAP for policy store instead of using file-base policy store.

**See Also:** If you are using Cold Failover Cluster or Disaster Recovery, refer to the *Oracle Fusion Middleware High Availability Guide* for additional information.
This chapter describes recommended backup strategies for Oracle Fusion Middleware and the procedures for backing up Oracle Fusion Middleware.

This chapter includes the following topics:

- Overview of Backing Up Your Environment
- Limitations and Restrictions for Backing Up Data
- Performing a Backup
- Creating a Record of Your Oracle Fusion Middleware Configuration

## 14.1 Overview of Backing Up Your Environment

As described in Section 13.3.2, you should use the following recommended strategy for backing up your Oracle Fusion Middleware environment:

- If you are performing an online backup, do not make any configuration changes until the backup is completed. To ensure that no changes are made in the WebLogic Server domain, lock the WebLogic Server configuration, as described in Section 3.4.2.

- Perform a full offline backup immediately after you install Oracle Fusion Middleware. See Section 14.3.1 for information on performing a full backup.

- Perform backups of run-time artifacts after every administrative change or on a regular basis. Oracle recommends that you back up run-time artifacts nightly. See Section 14.3.2 for information on performing a backup of run-time artifacts.

- Perform a new full backup after a major change, such as any upgrade or patch, or if any of the following files are modified:
  - `MW_HOME/wlserver_n/common/bin/nodemanager.properties`
  - `MW_HOME/wlserver_n/common/bin/wlsifconfig.sh`
  - `MW_HOME/wlserver_n/common/bin/setPatchEnv.sh`
  - `MW_HOME/wlserver_n/common/bin/commEnvg.sh`

  See Section 14.3.1 for information on performing a full backup.

- Continue to perform backups of run-time artifacts on a regular basis after you establish a new full backup. Oracle recommends that you back up run-time artifacts nightly. See Section 14.3.2 for information on performing a backup of run-time artifacts.

- Create a record of your Oracle Fusion Middleware environment. See Section 14.4.
When you create the backup, name the archive file with a unique name. Consider appending the date and time to the name. For example, if you create a backup of the Middleware home on March 30, 2009, name the backup:

```
mw_home_backup_033009.tar
```

The flowchart in Figure 14–1 provides an overview of how to decide which type of backup is appropriate for a given circumstance.

### Figure 14–1 Decision Flow Chart for Type of Backup

1. Oracle Fusion Middleware Installation and Configuration Completed
   - Full OffLine Backup of Oracle Fusion Middleware
     - Oracle Fusion Middleware Running
       - Major Changes (Upgrade, Patch)?
         - Yes
           - Administrative Changes?
             - Yes
               - Regular Scheduled Backup?
                 - Yes
                   - Online Backup of Runtime Artifacts
                 - No
                   - No
                     - Online Backup of Runtime Artifacts
       - No
         - No
           - Online Backup of Runtime Artifacts

### 14.2 Limitations and Restrictions for Backing Up Data

Note the following points:

- LDAP backups: If you use the built-in LDAP, do not update the configuration of a security provider while a backup of LDAP data is in progress. If a change is made, for example, if an administrator adds a user, while you are backing up the ldap directory tree, the backups in the ldapfiles subdirectory could become inconsistent. Refer to [WebLogic Server Managing Server Startup and Shutdown](#) for detailed LDAP backup procedures.
Persistent stores: A persistent store provides a built-in, high-performance storage solution for WebLogic Server subsystems and services that require persistence. For example, it can store persistent JMS (Java Messaging Service) messages or durable subscriber information, as well as temporarily store messages sent to an unavailable destination using the Store-and-Forward feature. The persistent store supports persistence to a file-based store (File Store) or to a JDBC-enabled database (JDBC Store). The default store maintains its data in a data\store\default directory inside the servername subdirectory of a domain's root directory.

It is currently not possible to take consistent backup of persistent stores for a system that uses JMS and transaction logs. This is because the transaction logs can only be file-based and the JMS can be either file-based or it can reside in the database. For highest reliability, use a highly available, fault-tolerant storage (for example, SAN) for JMS and transaction log file stores.

For clustered servers, Oracle WebLogic Server enables you to migrate a failing server, including the Transaction Recovery Service, to a new system. When the server migrates to another system, it must be able to locate the transaction log records to complete or recover transactions. Transaction log records are stored in the default persistent store for the server.

If you plan to migrate clustered servers in the event of a failure, you must set up the default persistent store so that it stores records in a shared storage system that is accessible to any potential system to which a failed migratable server might be migrated. For highest reliability, use a shared storage solution (for example, SAN) or an Oracle database that is highly available and supports a point-in-time recovery. This solution is also recommended for all the JMS modules.

Audit Framework: If you have configured Oracle Fusion Middleware Audit Framework to write data to a database, you should not back up the local files in the bus stop. (Auditable events from each component are stored in a repository known as a bus stop; each Oracle WebLogic Server has its own bus-stop. Data can be persisted in this file, or uploaded to a central repository at which point the records are available for viewing and reporting.)

If you back up the local files, duplicate records are uploaded to the database. That is, they are uploaded to the database when the bus stop is created and then will be uploaded again when you restore the files.

The default locations for bus stop local files are:
- For Java components:

  \$MW_HOME/user_projects/domains/domain_name/servers/server_name/logs/auditlogs/component_type

- For system components, such as Oracle HTTP Server or Oracle Internet Directory:

  ORACLE_INSTANCE/auditlogs/component_type/component_name

For more information about Oracle Fusion Middleware Audit Framework and the bus stop, see "Administration for Security Auditing" in the Oracle Fusion Middleware Security Guide.

### 14.3 Performing a Backup

You can perform the following types of backups:

- Full offline backup. See Section 14.3.1.
Performing a Backup

14.3.1 Performing a Full Offline Backup

To perform a full offline backup, you copy the directories that contain Oracle Fusion Middleware files.

Archive and compress the source Middleware home, using your preferred tool for archiving. Ensure that the tool you are using preserves the permissions of the files.

For example, for online backups on Windows, use copy; for offline backups on Windows, use copy, xcopy, or jar. Do not use Winzip because it does not work with long filenames or extensions.

For example, for Linux and UNIX, use tar.

The following example shows how to archive and compress the source on UNIX:

```bash
cd Source_Middleware_Home
tar cf - * | gzip > Middleware_Home.tar.gz
```

The tar utility may issue warnings if the sticky bit is set on some files. You can safely ignore these warnings.

Do not use the jar utility to archive and compress the file system. This avoids warnings or errors from the zip tool about zipping open files (for example, the ORACLE_HOME/jdk files).

Take the following steps:

1. To avoid an inconsistent backup, do not make any configuration changes until the backup is completed. To ensure that no changes are made in the WebLogic Server domain, lock the WebLogic Server configuration, as described in Section 3.4.2.

2. Back up the Middleware home (MW_HOME) on all hosts. For example:

   ```bash
tar -cf mw_home_backup_033009.tar MW_HOME/*
   ```

3. If the domain is not located within the Middleware home, back up the Administration Server domain separately. This backs up Java components such as Oracle SOA Suite and Oracle WebCenter.

   For example:

   ```bash
tar -cf domain_home_backup_033009.tar MW_HOME/user_projects/domains/domain_name/*
   ```

In most cases, you do not need to back up the Managed Server domain directories separately, because the Administration Server domain contains information about the Managed Servers in its domain. The recommended recovery procedures for Managed Servers call for restoring the Middleware home and using the pack and unpack utilities. Note the following exceptions:

- For Oracle Portal, Oracle Reports, Oracle Forms Services, and Oracle Business Intelligence Discoverer, you must back up the Managed Server domain directories in addition to the Administration Server domain.

- You can configure Oracle SOA Suite so that the Administration Server is on a separate host from the Managed Servers. You do this by using the ant-soa-util.xml script that is provided. In this case, the domain is an Administration Server-only domain and no Managed Servers share the domain directory with the Administration Server. For example, a domain contains two Managed Servers, one of which contains Oracle SOA Suite, but
neither of the Managed Server’s directories are on the same host as the Administration Server.

In this case, you must back up the Administration Server domain, as well as the following directory for all Managed Servers:

\texttt{DOMAIN\_HOME/config/soa-infra}

4. If the Oracle instance home is not located within the Middleware home, back up the Oracle instance home. The Oracle instance home contains configuration information about system components, such as Oracle HTTP Server or Oracle Internet Directory. (See Section 3.5.2 for a list of system components.)

   For example:

   \texttt{tar -cf sc\_home\_backup\_033009\_tar ORACLE\_INSTANCE/\*}

5. If a Managed Server is not located within the domain, back up the Managed Server directory. For example:

   \texttt{tar -cf mg1\_home\_backup\_033009\_tar M\_HOME/user\_projects/domains/d\_domain\_name/servers/server\_name/\*}

6. Back up the OraInventory directory. For example:

   \texttt{tar -cf Inven\_home\_backup\_033009 /scratch/oracle/OraInventory}

7. Back up OraInst.loc and oratab files, which are located in the following directory:

   /etc

8. Back up the database repositories using the Oracle Recovery Manager (RMAN). For detailed steps, see the Oracle Database Backup and Recovery User’s Guide, which is available at:

   http://www.oracle.com/technology/documentation/database.html

9. On Windows, export the following registry key:

   \texttt{HKEY\_LOCAL\_MACHINE\Software\oracle}

   In addition, for system components, such as Oracle Web Cache, export the following Windows Registry key:

   \texttt{HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Services}

   To export a key, use the following command:

   \texttt{regedit /E FileName Key}

   For example:

   \texttt{regedit /E C:\oracleregistry.reg HKEY\_LOCAL\_MACHINE/oracle}

   You can also use the Registry Editor to export the key. See the Registry Editor Help for more information.

10. Create a record of your Oracle Fusion Middleware environment. See Section 14.4.

**14.3.2 Performing an Online Backup of Run-Time Artifacts**

You should perform a backup of run-time artifacts on a regular basis and at the times described in Section 13.3.2.
To back up run-time artifacts:

1. To avoid an inconsistent backup, do not make any configuration changes until the backup is completed. To ensure that no changes are made in the WebLogic Server domain, lock the WebLogic Server configuration, as described in Section 3.4.2.

2. Back up the Administration Server domain directories. This backs up Java components such as Oracle SOA Suite and Oracle WebCenter. For example:
   ```bash
tar -cf domain_home_backup_033009.tar $MW_HOME/user_projects/domains/domain_name/*
```

   For Oracle Portal, Oracle Reports, Oracle Forms Services, and Oracle Business Intelligence Discoverer, you must back up the Managed Server domain directories, in addition to the Administration Server domain.

3. Back up the Oracle instance home. This backs up the system components, such as Oracle HTTP Server. For example:
   ```bash
tar -cf sc_home_backup_033009.tar $ORACLE_INSTANCE/*
```

4. Back up the database repositories using the Oracle Recovery Manager (RMAN). For detailed steps, see the Oracle Database Backup and Recovery User’s Guide, which is available at:
   
   http://www.oracle.com/technology/documentation/database.html

5. Create a record of your Oracle Fusion Middleware environment. See Section 14.4.

### 14.4 Creating a Record of Your Oracle Fusion Middleware Configuration

In the event that you need to restore and recover your Oracle Fusion Middleware environment, it is important to have all the necessary information at your disposal. This is especially true in the event of a hardware loss that requires you to reconstruct all or part of your Oracle Fusion Middleware environment on a new disk or host.

You should maintain an up-to-date record of your Oracle Fusion Middleware environment that includes the information listed in this section. You should keep this information both in hardcopy and electronic form. The electronic form should be stored on a host or e-mail system that is completely separate from your Oracle Fusion Middleware environment.

Your Oracle Fusion Middleware hardware and software configuration record should include:

- The following information for each host in your environment:
  - Host name
  - Virtual host name (if any)
  - Domain name
  - IP address
  - Hardware platform
  - Operating system release level and patch information

- The following information for each Oracle Fusion Middleware installation in your environment:
  - Installation type (for example, Oracle SOA Suite)
- Host on which the installation resides
- User name, userid number, group name, groupid number, environment profile, and type of shell for the operating system user that owns the Oracle home (\etc\passwd and \etc\group entries)
- Directory structure, mount points, and full path for the Middleware home, Oracle home, Oracle WebLogic Server domain home (if it does not reside in the user_projects directory in the Middleware home), and the Oracle instance home
- Amount of disk space used by the installation
- Port numbers used by the installation

- The following information for the Metadata Repository:
  - Host name
  - Database version and patch level
  - Base language
  - Character set
  - Global database name
  - SID
This chapter describes recommended recovery strategies and procedures for recovering Oracle Fusion Middleware from different types of failures and outages.

This chapter includes the following topics:

- Overview of Recovering Your Environment
- Recovering After Data Loss, Corruption, Media Failure, or Application Malfunction
- Recovering After Loss of Host

15.1 Overview of Recovering Your Environment

This section provides an overview of recovery strategies for outages that involve actual data loss or corruption, host failure, or media failure where the host or disk cannot be restarted and are permanently lost. This type of failure requires some type of data restoration before the Oracle Fusion Middleware environment can be restarted and continue with normal processing.

**Note:** The procedures in this chapter assume that no administrative changes were made since the last backup. If administrative changes were made since the last backup, they must be reapplied after recovery is complete.

When you restore the files, use your preferred tool to extract the compressed files.

For example, for online recovery on Windows, use copy; for offline recovery on Windows, use copy, xcopy, or jar. Do not use Winzip because it does not work with long filenames or extensions.

For example, for Linux and UNIX, use tar.

Do not use the jar utility to archive and compress the file system. This avoids warnings or errors from the zip tool about zipping open files (for example, the ORACLE_HOME/jdk files).

Ensure that the tool you are using preserves the permissions and timestamps of the files.

Rename existing files and directories before you begin restoring the files from backup so that you do not unintentionally override necessary files.
15.2 Recovering After Data Loss, Corruption, Media Failure, or Application Malfunction

This section describes recovery strategies for outages that involve actual data loss or corruption, or media failure where the disk cannot be restored. It also describes recovery strategies for applications that are no longer functioning properly. This type of failure requires some type of data restoration before the Oracle Fusion Middleware environment can be restarted and continue with normal processing. It contains the following topics:

- Recovering a Middleware Home
- Recovering an Oracle WebLogic Server Domain
- Recovering an Oracle Instance Home
- Recovering the Administration Server Configuration
- Recovering a Managed Server
- Recovering Components
- Recovering a Cluster
- Recovering Applications
- Recovering a Database

15.2.1 Recovering a Middleware Home

You can recover a Middleware home that was corrupted or from which files were deleted.

1. Stop all relevant processes. That is, stop all processes that are running from that Middleware home.

   For example, stop the Oracle WebLogic Server Administration Server processes and the Node Manager processes.

2. Recover the Middleware home directory from backup. For example:

   ```
   cd MW_HOME
   (UNIX) tar -xf mw_home_backup_033009.tar
   (Windows) jar xtf mw_home_backup_033009.jar
   ```

3. Start all relevant processes. That is, start all processes that run in the Middleware home. For example, start the Administration Server:

   ```
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

15.2.2 Recovering an Oracle WebLogic Server Domain

You can recover an Oracle WebLogic Server domain that was corrupted or deleted from the file system.

---

**Caution:** Performing a domain-level recovery can impact other aspects of a running system and all of the configuration changes performed after the backup was taken will be lost.
To recover an Oracle WebLogic Server domain that was corrupted or deleted from the file system:

1. Stop all relevant processes. That is, stop all processes that are related to the domain. For example, stop the Administration Server and Managed Servers. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script to stop the Administration Server:

   ```bash
   DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
   ```

2. Recover the domain directory from backup:

   ```bash
   cd DOMAIN_HOME
   (UNIX) tar -xf domain_backup_033009.tar
   (Windows) jar xtf domain_backup_033009.jar
   ```

3. Start all relevant processes. That is, start all processes that are related to the domain. For example, start the Administration Server:

   ```bash
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

### 15.2.3 Recovering an Oracle Instance Home

An Oracle instance home contains configuration information for system components, such as Oracle HTTP Server or Oracle Internet Directory. (See Section 3.5.2 for a list of system components.) The following topics describe how to recover an Oracle instance home:

- **Recovering After Oracle Instance Home Deleted from File System**
- **Recovering After Oracle Instance Home Deregistered**

#### 15.2.3.1 Recovering After Oracle Instance Home Deleted from File System

To recover an Oracle instance home that was corrupted or deleted from the file system:

1. Stop all relevant processes. That is, kill all processes that are related to that Oracle instance

2. Recover the Oracle instance home directory from a backup file. For example:

   ```bash
   cd ORACLE_INSTANCE
   (UNIX) tar -xf sc_home_backup_033009.tar
   (Windows) jar xtf sc_home_backup_033009.jar
   ```

3. Start all relevant processes. That is, start all processes that are related to that Oracle instance:

   ```bash
   opmnctl startall
   ```

#### 15.2.3.2 Recovering After Oracle Instance Home Deregistered

To recover an Oracle instance home that was deregistered from the domain:

1. Recover the Oracle instance home directory from a backup file. For example, on Linux:

   ```bash
   cd ORACLE_INSTANCE
   tar -xf Instance_home_backup_033009.tar
   ```
2. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command. For example:

```
opmnctl registerInstance -adminHost admin_server_host
    -adminPort admin_server_port -adminUsername username
    -adminPassword password
    -oracleInstance ORACLE_INSTANCE_dir -oracleHome ORACLE_HOME_dir
    -instanceName Instance_name -wlserverHome Middleware_Home
```

### 15.2.4 Recovering the Administration Server Configuration

If the Administration Server configuration has been lost because of file deletion or file system corruption, the Administration Server console continues to function if it was already started when the problem occurred. The Administration Server directory is regenerated automatically, except for security information. As a result, whenever you start the Administration Server, it prompts for a user name and password. To prevent this, you can recover the configuration.

---

**Caution:** Performing a domain-level recovery can impact other aspects of a running system and all of the configuration changes performed after the backup was taken will be lost.

---

To recover the Administration Server configuration:

1. Stop all processes, including the Administration Server, Managed Servers, and Node Manager if they are started. You can use the Oracle WebLogic Server Administration Console, WLST, or a script. For example, to stop the Administration Server on Linux, use the following script:

   ```
   DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
   ```

2. Recover the Administration Server configuration by recovering the domain home backup to a temporary location. Then, restore the config directory to the following location:

   ```
   DOMAIN_HOME/config
   ```

3. Start the Administration Server. You can use WLST or the following script:

   ```
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

4. Verify that the Administration Server starts properly and is accessible.

On the next configuration change, the configuration from the Administration Server is pushed to the Managed Servers. On each Managed Server restart, the configuration is pulled from the Administration Server.

### 15.2.5 Recovering a Managed Server

You can recover a Managed Server's files, including its configuration files if they are deleted or corrupted.

The following topics describe how to recover a Managed Server's files:

- Recovering a Managed Server When It Cannot Be Started
- Recovering a Managed Server When It Does Not Function Correctly
Recovering After Data Loss, Corruption, Media Failure, or Application Malfunction

Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory

This section pertains when Oracle SOA Suite is configured in a domain and no Managed Servers share the domain directory with the Administration Server.

15.2.5.1 Recovering a Managed Server When It Cannot Be Started

In this scenario, the Managed Server does not operate properly or cannot be started because the configuration has been deleted or corrupted or the configuration was mistakenly changed and you cannot ascertain what was changed.

To recover a Managed Server when it cannot be started:

1. If the Administration Server is not reachable, recover the Administration Server, as described in Section 15.2.4.

2. If the Managed Server fails to start or if the file system is lost, take the following steps:
   a. Recover the Middleware home from the backup, if required.
      
      `tar -xf mw_home_backup_033009.tar`

   b. Create a domain template jar file for the Administration Server, using the pack utility. For example:
      
      `pack.sh -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name -template=/scratch/temp.jar -template_name=test_install -template_author=myname -log=/scratch/logs/my.log -managed=true`

      Specifying the -managed=true option packs up only the Managed Servers. If you want to pack the entire domain, omit this option.

   c. Unpack the domain template jar file, using the unpack utility:
      
      `unpack.sh -template=/scratch/aime1/ms.jar -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name -log=/scratch/logs/new.log -log_priority=info`

   d. Ensure that the application artifacts are accessible from the Managed Server host. That is, if the application artifacts are not on the same server as the Managed Server, they must be in a location accessible by the Managed Server.

   e. Start the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:
      
      `DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url username password`

Note:

- For stage mode applications, the Administration Server takes care of pushing the bits to the stage directories in the Managed Server.

- For no-stage and external-stage mode applications, ensure that application files are available in the stage directories of the Managed Server.

See Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for information about stage, no-stage, and external-stage mode applications.
The Managed Server connects to the Administration Server and updates its configuration changes.

15.2.5.2 Recovering a Managed Server When It Does Not Function Correctly

In this scenario, the Managed Server is running, but the file system for the Managed Server has been lost or corrupted:

To recover the Managed Server:

1. Stop the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

   ```sh
   DOMAIN_HOME/bin/stopManagedWeblogic.sh managed_server_name admin_url username password
   ```

2. Recover the Middleware home from the backup, if required:

   ```sh
tar -xf mw_home_backup_033009.tar
   ```

3. Create a domain template jar file for the Administration Server, using the pack utility. For example:

   ```sh
   pack.sh -domain=/scratch/Oracle/Middleware/user_projects/domains/WLS_SOAWC
            -template=/scratch/temp.jar -template_name=test_install
            -template_author=mynname -log=/scratch/logs/my.log -managed=true
   ```

   Specifying the `-managed=true` option packs up only the Managed Servers. If you want to pack the entire domain, omit this option.

4. Unpack the domain template jar file, using the unpack utility:

   ```sh
   unpack.sh -template=/scratch/aime1/ms.jar
              -domain=/scratch/Oracle/Middleware/user_projects/domains/WLS_SOAWC
              -log=/scratch/logs/new.log -log_priority=info
   ```

5. Ensure that the application artifacts are accessible from the Managed Server host. That is, if the application artifacts are not on the same server as the Managed Server, they must be in a location accessible by the Managed Server.

   **Note:**

   - For stage mode applications, the Administration Server takes care of pushing the bits to the stage directories in the Managed Server.
   - For no-stage and external-stage mode applications, ensure that application files are available in the stage directories of the Managed Server.

   See *Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server* for information about deploying applications.

6. Restart the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

   ```sh
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url username password
   ```
15.2.5.3 Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory

When Oracle SOA Suite is configured in a domain and no Managed Servers share the domain directory with the Administration Server, you must restore the Managed Server directory. For example, a domain contains two Managed Servers, one of which contains Oracle SOA Suite, but neither of the Managed Server's directories are in the same directory structure as the Administration Server.

In this case, you must restore the Managed Server from backup:

1. Restore the Managed Server from backup:
   
   ```
   cd ManagedServer_Home
   tar -xf managed_server_backup_033009.tar
   ```

2. Restart the Managed Server:
   
   ```
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name
   ```

15.2.6 Recovering Components

The following topics describe how to recover a component:

- Recovering After a Component's Files Are Deleted or Corrupted
- Recovering a Component That Is Not Functioning Properly After Configuration Change
- Recovering Components After Cluster Configuration Change

15.2.6.1 Recovering After a Component's Files Are Deleted or Corrupted

You can recover a component's files if they are deleted or corrupted. The steps you take depend on the type of component:

- For a Java component, such as Oracle SOA Suite, you recover the Managed Server, as described in Section 15.2.5.

- For system components, such as Oracle HTTP Server or Oracle Web Cache:

  1. Stop the component. For example, to stop Oracle HTTP Server:

     ```
     opmnctl stopproc ias-component=component_name
     ```

     For information on stopping components, see Section 4.3.

  2. Recover the component-specific files from backup. Section 13.5 lists the directories and files needed for each component. For example, to recover Oracle HTTP Server files, you recover the following directories:

     ```
     ORACLE_INSTANCE/config/OHS/component_name
     ORACLE_INSTANCE/diagnostics/logs/OHS/component_name
     ```

  3. Start the component. For example, to start Oracle HTTP Server:

     ```
     opmnctl startproc ias-component=component_name
     ```

     For information on starting components, see Section 4.3.
15.2.6.2 Recovering a Component That Is Not Functioning Properly After Configuration Change

You can recover a component that cannot be started or is not functioning properly because the component's configuration was changed and committed. You may not be able to ascertain what change is causing the problem and you want to revert to an earlier version.

The steps you take depend on the type of component:

- For a Java component, such as Oracle SOA Suite, you recover the Managed Server, as described in Section 15.2.5.
- For system components, such as Oracle HTTP Server:
  1. Stop the component. For example, to stop Oracle HTTP Server:
     
     ```
     opmnctl stopproc ias-component=component_name
     ```
     
     For information on stopping components, see Section 4.3.
  2. Recover the component-specific files from backup. Section 13.5 lists the directories and files needed for each component. For example, to recover Oracle HTTP Server files, you recover the following directories:
     
     ```
     ORACLE_INSTANCE/config/OHS/component_name
     ORACLE_INSTANCE/diagnostics/logs/OHS/component_name
     ```
  3. Start the component. For example, to start Oracle HTTP Server:
     
     ```
     opmnctl startproc ias-component=component_name
     ```
     
     For information on starting components, see Section 4.3.

15.2.6.3 Recovering Components After Cluster Configuration Change

You can recover components in a cluster that cannot be started or are not functioning properly because the configuration was changed and committed at the cluster level. You may not be able to ascertain what change is causing the problem and you want to revert to an earlier version.

---

**Caution:** Performing a domain-level recovery can impact other aspects of a running system and all of the configuration changes performed after the backup was taken will be lost.

---

To recover the components:

1. Stop all processes, such as the Managed Servers and the Administration Server. You can use the Oracle WebLogic Server Administration Console, WLST or a script. For example, to stop the Administration Server on Linux, use the following script:

   ```
   DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
   ```

2. Recover the Administration Server configuration by recovering the domain home backup to a temporary location. Then, restore the config directory to the following location:

   ```
   DOMAIN_HOME/config
   ```

3. Start the Administration Server. You can use WLST or the following script:
Recovering After Data Loss, Corruption, Media Failure, or Application Malfunction

4. Start the cluster. You can use the Oracle WebLogic Server Administration Console or WLST. For example, to use the WLST start command:

```
start('clusterName', 'Cluster')
```

The latest configuration is pulled from the Administration Server to every member of the cluster.

15.2.7 Recovering a Cluster

The following topics describe how to recover a cluster:

- Recovering a Cluster After Deletion or Cluster-Level Configuration Changes
- Recovering a Cluster After Membership Is Mistakenly Modified

15.2.7.1 Recovering a Cluster After Deletion or Cluster-Level Configuration Changes

In this scenario, the cluster has been erroneously deleted or the cluster-level configuration, such as the JMS configuration or container-level data sources, was mistakenly changed and committed. The server cannot be started or does not operate properly or the services running inside the server are not starting. You cannot ascertain what was changed.

![Caution](image)

Caution: Performing a domain-level recovery can impact other aspects of a running system and all of the configuration changes performed after the backup was taken will be lost.

If the configuration changes are few, then the easiest way is to redo the configuration changes. If that is not feasible, use the following procedure to recover the configuration:

1. Stop the cluster. You can use the Oracle WebLogic Server Administration Console or WLST. For example, to use WLST:

```
stop('clusterName', 'Cluster')
```

2. Stop the Administration Server. You can use WLST or the following script:

```
DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
```

3. Recover the Administration Server configuration by recovering the domain home backup to a temporary location. Then, restore the config directory to the following location:

```
DOMAIN_HOME/config
```

4. Start the Administration Server. You can use WLST or the following script:

```
DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
-Dweblogic.management.password=password
-Dweblogic.system.StoreBootIdentity=true
```

5. Start the cluster. You can use the Oracle WebLogic Server Administration Console or WLST. For example, to use WLST:
15.2.7.2 Recovering a Cluster After Membership Is Mistakenly Modified

You can recover a cluster when the cluster’s membership has been mistakenly modified. For example, if you inadvertently delete a member from the cluster, you can restore the member to the cluster.

To recover the cluster membership:

1. Stop all processes, such as the Managed Servers and the Administration Server. You can use the Oracle WebLogic Server Administration Console, WLST or a script. For example, to stop the Administration Server on Linux, use the following script:

   ```
   DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
   ```

2. Recover the Administration Server configuration by recovering the domain home backup to a temporary location. Then, restore the config directory to the following location:

   ```
   DOMAIN_HOME/config
   ```

3. Start the Administration Server. You can use WLST or the following script:

   ```
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

   The deleted member is now back in the cluster.

4. Start all processes, such as the Managed Servers. You can use WLST or a script. For example, to start the Administration Server on Linux, use the following script:

   ```
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url
   ```

5. Start the cluster. You can use the Oracle WebLogic Server Administration Console or WLST. For example, to use WLST:

   ```
   start('clusterName', 'Cluster')
   ```

   The deleted member is now part of the cluster.

6. Start all cluster members if they are not started:

   ```
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url
   ```

15.2.8 Recovering Applications

The following topics describe how to recover an application:

- Recovering Application Artifacts
- Recovering a Redeployed Application That Is No Longer Functional
- Recovering an Undeployed Application
15.2.8.1 Recovering Application Artifacts

If an application’s artifacts, such as the .ear file, have been lost or corrupted, you can recover the application.

To recover the application:

1. Start the Managed Server to which the application was deployed. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

```
DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name
admin_url
username
cpassword
```

This synchronizes the configuration with the Administration Server.

On each Managed Server restart, the configuration and application artifacts are pulled from the Administration Server.

15.2.8.2 Recovering a Redeployed Application That Is No Longer Functional

If a Java EE application was redeployed to a Managed Server (whether or not the Managed Server is part of a cluster) and the application is no longer functional, you can recover it.

To recover the application:

1. Recover the application files from backup, if needed.

2. Redeploy the old version of the application from the backup.

You cannot just copy the original ear file. Even if the original ear file (from the backup) is copied back to the Managed Server stage directory and you restart the Managed Server, the application is still not recovered. You must redeploy the original version.

15.2.8.3 Recovering an Undeployed Application

If a deployed application was undeployed from Oracle WebLogic Server, you can recover it.

To recover the application:

1. Recover the application files from backup, if needed.

2. Redeploy the old version of the application from the backup. If the application was deployed to a cluster, redeploy the application to the same cluster.
You cannot just copy the original ear file. Even if the original ear file (from the backup) is copied back to the Managed Server stage directory and you restart the Managed Server, the application is still not recovered. You must redeploy the original version.

15.2.8.4 Recovering a Composite Application

A new version of a composite application (such as SOA application) was redeployed to a Managed Server or cluster. The application is no longer functional.

To recover the application:

1. Recover the application files from backup, if needed.
2. Redeploy the old version of the application. If the application was deployed to a cluster, redeploy the application to the same cluster.

15.2.9 Recovering a Database

If your database that contains your metadata repository, including the MDS Repository, is corrupted, you can recover it using RMAN. You can recover the database at the desired granularity, either a full recovery or a tablespace recovery.

For best results, recover the database to the most current state, using point-in-time recovery (if the database is configured in Archive Log Mode.) This ensures that the latest data is recovered. For example:

```
rman> restore database;
rman> recover database;
```

See Appendix D for the schemas used by each component.

For detailed steps, see the Oracle Database Backup and Recovery User’s Guide, which is available at:

http://www.oracle.com/technology/documentation/database.html

15.3 Recovering After Loss of Host

This section describes how to recover your Oracle Fusion Middleware environment after losing the original operating environment. For example, you could have a serious system malfunction or loss of media. The sections includes the following topics:

- Recovering After Loss of Administration Server Host
- Recovering After Loss of Managed Server Host
- Recovering After Loss of Component
- Additional Actions for Recovering Entities After Loss of Host
- Recovering After Loss of Host for a Database

Note: When you are recovering in the case of loss of host, you must restore the files using the same path as on the original host.

15.3.1 Recovering After Loss of Administration Server Host

If you lose a host that contains the Administration Server, you can recover it to the same host or a different host, as described in the following topics:
Recovering After Loss of Host

- Recovering the Administration Server to the Same Host
- Recovering the Administration Server to a Different Host

15.3.1.1 Recovering the Administration Server to the Same Host

In this scenario, you recover the Administration Server either to the same host after the operating system has been reinstalled or to a new host that has the same host name. For example, the Administration Server is running on Host A and the Managed Server is running on Host B. Host A has failed for some reason and the Administration Server needs to be recovered.

To recover the Administration Server:

1. Attempt to start the Administration Server. You can use WLST, or the following script:
   
   ```
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

   If the Administration Server starts, you do not need to take any further steps.

2. If the Administration Server fails to start, take the following steps on Host A:

   a. Stop all relevant processes. That is, stop all processes that are related to the domain. For example, stop the Administration Server and Managed Servers. You can use WLST or the following script to stop the Administration Server:

   ```
   DOMAIN_HOME/bin/stopWeblogic.sh username password admin_url
   ```

   b. Recover the Middleware home, if needed:

   ```
   tar -xf mw_home_backup_033009.tar
   ```

   c. If the domain directory does not reside in the Middleware home, recover the domain directory from backup:

   ```
   cd DOMAIN_HOME
   tar -xf domain_backup_033009.tar
   ```

   d. Start the Administration Server. You can use WLST or the following script:

   ```
   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true
   ```

   e. Start the Node Manager:

   ```
   java weblogic.WLST
   wls:/offline> startNodeManager()
   ```

   Now you can start and stop the Managed Server on Host B using the Administration Console running on Host A.

15.3.1.2 Recovering the Administration Server to a Different Host

In this scenario, the Administration Server is running on Host A and the Managed Server is running on Host B. Host A has failed for some reason and the Administration Server needs to be moved to Host C.

1. Recover the Middleware home to Host C (new Host where the Administration Server will be recovered).
Recovering After Loss of Host

2. If the domain directory does not reside in the Middleware home, recover the domain directory from backup:

   cd DOMAIN_HOME
   tar -xf domain_backup_033009.tar

3. Start the Node Manager on Host C if it was configured on the original host:

   java weblogic.WLST
   wls:/offline> startNodeManager()

4. Start the Administration Server. You can use WLST or the following script:

   DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
   -Dweblogic.management.password=password
   -Dweblogic.system.StoreBootIdentity=true

5. Ensure that additional application artifacts are available. For example, if the deployment mode is no-stage or external stage, applications may reside in directories outside of the domain directory. Make your application files available to the new Administration Server by copying them from backups or by using a shared disk. Your application files should be available in the same relative location on the new file system as on the file system of the original Administration Server.

   If the application is staged, the Administration Server copies the application bits to the staged directories on the Managed Server hosts.

6. Update Oracle Inventory, as described in Section 15.3.4.4.

7. Edit the targets.xml file for Fusion Middleware Control, as described in Section 15.3.4.2.

8. Oracle Management Service, which is part of Fusion Middleware Control, is on the original host and is recovered to the new host when you restore the Administration Server. Oracle Management Agent connects to Oracle Management Service to monitor certain components. If your environment contains components, such as Oracle Internet Directory and Oracle Virtual Directory, that use Oracle Management Agent, but they are located on a different host, you must take the following steps on each host containing the components. For example, the Administration Server was on Host A, but is restored, along with Oracle Management Service, to Host B. Oracle Internet Directory is on Host C and Oracle Virtual Directory is on Host D. You must take these steps on both Host C and Host D.

   a. Edit the following file:

      (UNIX) ORACLE_INSTANCE/EMAGENT/emagent_name/sysman/config/emd.properties
      (Windows) ORACLE_INSTANCE\EMAGENT\emagent_name\sysman\config\emd.properties

      Update the following entries, replacing the host name with the new host for the Administration Server:

      emdWalletSrcUrl=http://newhost.domain.com:port/em/wallets/emd
      REPOSITORY_URL=http://newhost.domain.com:port/em/upload/

   b. Shut down and restart the EM Agent process:

      cd $ORACLE_INSTANCE/EMAGENT/emagent_dir
      ./emctl stop agent
      ./emctl start agent
Recovering After Loss of Host

Recovering Your Environment

15.3.2 Recovering After Loss of Managed Server Host

If you lose a host that contains a Managed Server, you can recover it to the same host or a different host, as described in the following topics:

- Recovering a Managed Server to the Same Host
- Recovering a Managed Server to a Different Host
- Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory

This section pertains when Oracle SOA Suite is configured in a domain and no Managed Servers share the domain directory with the Administration Server.

15.3.2.1 Recovering a Managed Server to the Same Host

In this scenario, you recover a Managed Server to the same host after the operating system has been reinstalled or to a new host that has the same host name. The Administration Server is running on Host A and the Managed Server is running on Host B. Host B failed for some reason and the Managed Server needs to be recovered to Host B.

1. Start the Node Manager on Host B:

   ```
   java weblogic.WLST
   wls:/offline> startNodeManager()
   ```

2. Start the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

   ```
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name
   admin_url username password
   ```

   If the Managed Server starts, it connects to the Administration Server and updates its configuration changes. You do not need to take any further steps.

3. If the Managed Server fails to start or if the file system is lost, take the following steps:

   a. Stop the Node Manager:

      ```
      java weblogic.WLST
      wls:/offline> stopNodeManager()
      ```

   b. Recover the Middleware home to Host B from the backup, if required:

      ```
      tar -xf mw_home_backup_033009.tar
      ```

   c. If the Managed Server contains Oracle Portal, Oracle Reports, Oracle Forms Services, or Oracle Business Intelligence Discoverer, and the Managed Server domain directories reside outside of the Middleware home, restore the domain, in addition to the Middleware home. For example:

   ```
   ./emctl status agent
   ```

   The status command will show the REPOSITORY_URL pointing to the new host.

   Now you can start and stop the Managed Server on Host B using the Administration Console running on Host C.

   If you are recovering the Administration Server for a Web Tier installation, see Section 15.3.4 for information about additional actions you must take.
cd Domain_Home
tar -xf domain_home_backup_033009.tar

Go to Step e.

d. If the Managed Server does not contain the components listed in Step c, take the following steps:

- Create a domain template jar file for the Administration Server running in Host A, using the pack utility. For example:

  pack.sh -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name
  -template=/scratch/temp.jar -template_name=test_install
  -template_author=myname -log=/scratch/logs/my.log -managed=true

  Specifying the -managed=true option packs up only the Managed Servers. If you want to pack the entire domain, omit this option.

- Unpack the domain template jar file in Host B, using the unpack utility:

  unpack.sh -template=/scratch/aime1/ms.jar
  -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name
  -log=/scratch/logs/new.log -log_priority=info

e. Ensure that the application artifacts are accessible from the Managed Server host. That is, if the application artifacts are not on the same server as the Managed Server, they must be in a location accessible by the Managed Server.

---

Note:

- For applications that are deployed in no-stage or external stage mode, copy the application artifacts from Administration Server host directory.

- For applications that are deployed in stage mode, the Administration server copies the application bits to the staged directories on the managed server hosts.

See Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for information about deploying applications.

---

f. If the Node Manager is not started, start it:

  java weblogic.WLST
  wls:/offline> startNodeManager()

g. Start the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

  $DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name
  admin_url username password

  The Managed Server connects to the Administration Server and updates its configuration changes.

15.3.2.2 Recovering a Managed Server to a Different Host

In this scenario, the Administration Server is running on Host A and the Managed Server is running on Host B. Host B failed for some reason and the Managed Server needs to be recovered to Host C.
Recovering After Loss of Host

Recovering Your Environment

15-17

Take the following steps:

1. Recover the MW_HOME for the Managed Server to Host C.
   
   tar -xf mw_home_backup_033009.tar

2. If the Managed Server contains Oracle Portal, Oracle Reports, Oracle Forms Services, or Oracle Business Intelligence Discoverer, and the Managed Server domain directories reside outside of the Middleware home, restore the domain, in addition to the Middleware home. For example:

   cd Domain_Home
   tar -xf domain_home_backup_033009.tar

   Go to Step 4.

3. If the Managed Server does not contain the components listed in Step 2, take the following steps:

   a. Create a domain template jar file from the Administration Server running in Host A, using the pack utility. For example:

      pack.sh -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name
      -template=/scratch/temp.jar -template_name=test_install
      -template_author=myname -log=/scratch/logs/my.log -managed=true

      Specifying the -managed=true option packs up only the Managed Servers. If you want to pack the entire domain, omit this option.

   b. Unpack the domain template jar file on Host C, using the unpack utility:

      unpack.sh -template=/scratch/aimel/ms.jar
      -domain=/scratch/Oracle/Middleware/user_projects/domains/domain_name
      -log=/scratch/logs/new.log -log_priority=info

      If you are recovering to a different domain home, use the -app_dir switch in the unpack command.

4. Ensure that the application artifacts are accessible from the Managed Server host. That is, if the application artifacts are not on the same server as the Managed Server, they must be in a location accessible by the Managed Server.

   Note:

   - For applications that are deployed in no-stage or external stage mode, copy the application artifacts from Administration Server host directory.

   - For applications that are deployed in stage mode, the Administration server copies the application bits to the staged directories on the managed server hosts.

   See Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server for information about deploying applications.

5. Start the Node Manager on Host C, if it is not started:

   Important: Recover the Middleware home to the same location as the original.
6. Using WLST, connect to the Administration Server and then enroll the Node Manager running in new host with the Administration Server:

```java
connect('username', 'password', 'http://<host>:<port>

nmEnroll('MW_HOME/user_projects/domains/domain_name',
'MW_HOME/wlservr/_n/common/nodemanager')
```

7. Change the Managed Server configuration to point to the new host:

   a. In the WebLogic Server Administration Console, create a machine, which is a logical representation of the computer that hosts one or more WebLogic Servers, and point it to the new host. (From the Home page, select Machines. Then, click New.) Follow the directions in the Administration Console help.

      If you identify the Listen Address by IP address, you must disable Host Name Verification on the Administration Servers that access Node Manager. For more information and instructions, see "Using Hostname Verification" in Oracle Fusion Middleware Securing Oracle WebLogic Server.

   b. Change the Managed Server configuration to point to the new machine. (From the left pane of the Console, expand Environment and then Servers. Then, select the name of the server. Select the Configuration tab, then the General tab. In the Machine field, select the machine to which you want to assign the server.)

      Change Listen Address to the new host. (If the listening address was set to blank, you do not need to change it.)

8. Start the Managed Server. You can use the Oracle WebLogic Server Administration Console, WLST, or the following script:

   ```sh
   DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name
   admin_url username password
   ```

   The Managed Server connects to the Administration Server and updates its configuration changes.

9. Update Oracle Inventory, as described in Section 15.3.4.4.

10. Edit the targets.xml file for Fusion Middleware Control, as described in Section 15.3.4.2.

Now you can start and stop the Managed Server on Host C using the Administration Server running on Host A.

### 15.3.2.3 Recovering an Oracle SOA Suite Managed Server That Has a Separate Directory

When Oracle SOA Suite is configured in a domain and no Managed Servers share the domain directory with the Administration Server, you must restore the Managed Server directory. For example, a domain contains two Managed Servers, one of which contains Oracle SOA Suite, but neither of the Managed Server's directories are in the same directory structure as the Administration Server.

You use the following steps when you are restoring to the same host or a different host:

1. Restore the Managed Server from backup:

   ```sh
   cd ManagedServer_HOME
   ```
15.3.3 Recovering After Loss of Component

If you lose a host that contains a component (and its Managed Server, if applicable), you can recover it to the same host or a different host, as described in the following topics:

- Recovering a Java Component to the Same Host
- Recovering a Java Component to a Different Host
- Recovering a System Component to the Same Host
- Recovering a System Component to a Different Host

15.3.3.1 Recovering a Java Component to the Same Host

To recover a Java component, such as Oracle SOA Suite:

1. Recover the Managed Server, as described in Section 15.2.5.1.

However, note that some components require additional steps, which are described in subsequent sections.

15.3.3.2 Recovering a Java Component to a Different Host

To recover a Java component, such as Oracle SOA Suite:

1. Recover the Managed Server, as described in Section 15.3.2.2.
2. Edit the targets.xml file for Fusion Middleware Control, as described in Section 15.3.4.2.

However, note that some components require additional steps, which are described in subsequent sections.

15.3.3.3 Recovering a System Component to the Same Host

To recover a system component, such as Oracle HTTP Server, you take the following general steps. However, note that some components require additional steps.

1. Stop all relevant processes. That is, stop all processes that are related to the component. For example, to stop Oracle HTTP Server:

   `opmnctl stopproc ias-component=component_name`

   For information on stopping components, see Section 4.3.

2. Recover the component-specific files from backup. Section 13.5 lists the directories and files needed for each component. For example, to recover Oracle HTTP Server files, you recover the following directories:

   `ORACLE_INSTANCE/config/OHS/component_name`
   `ORACLE_INSTANCE/diagnostics/logs/OHS/component_name`

3. If the Oracle instance home has been deregistered from the Administration Server, register the Oracle instance:

   `opmnctl registerInstance -adminHost admin_server_host`
If only the file system is being recovered, you do not need to register the Oracle instance.

4. Start all relevant processes, as explained in Section 4.3.

### 15.3.3.4 Recovering a System Component to a Different Host

To recover a system component, such as Oracle HTTP Server, you take the following general steps. However, note that most components require additional steps, which are described in separate sections.

1. Recover the Middleware home, as described in Section 15.2.1.
2. Start all relevant processes. Section 4.3 explains how to start components.
3. Update the registration of the Oracle instance with the Administration Server, using the `opmnctl updateinstanceregistration` command on the new host. For example:

   ```
   opmnctl updateinstanceregistration -adminHost admin_server_host
   ```

   This command updates OPMN's instance.properties file.

4. Update the registration of the component with the Administration Server, using the `opmnctl updatecomponentregistration` command on the new host. For example, to update the registration for Oracle Virtual Directory, use the following command:

   ```
   opmnctl updatecomponentregistration -Host new_host -Port nonSSLPort
   -componentName ovd1 -componentType OVD
   ```

5. Edit the targets.xml file for Fusion Middleware Control, as described in Section 15.3.4.2.

Depending on the components, you may need to take additional actions. See the subsequent sections for more information.

### 15.3.3.5 Recovering Oracle SOA Suite After Loss of Host

Note that when Oracle SOA Suite is configured in a domain and no Managed Servers share the domain directory with the Administration Server, take the steps described in Section 15.3.2.3. Otherwise, follow the steps in this section.

To recover the Oracle SOA Suite Managed Server to the same host after loss of host:

1. Recover the Managed Server, as described in Section 15.3.2.1.

To recover the Oracle SOA Suite Managed Server to a different host after loss of host:

1. Before you recover, update the WSDL file to point to the new hostname and port.
2. Recover the Managed Server, as described in Section 15.3.2.2.
3. After you recover the Oracle SOA Suite Managed Server, take the following actions:
   - If the ant command is used to deploy composites, edit the `deploy-sar.xml` file, which is located in:
     
     (UNIX) `ORACLE_HOME/bin`
     (Windows) `ORACLE_HOME\bin`
In the following line, replace the previous host name with the new host name:

```xml
<property name="wlsHost" value="newhostname"/>
```

If a Load Balancer is used, do not modify this property. Instead, register the new host with the Load Balancer.

- Change the host name in the soa-infra MBean:
  
  a. In Fusion Middleware Control, navigate to the Managed Server.
  
  b. From the WebLogic Server menu, choose **System MBean Browser**.
  
  c. Expand **Application Defined MBeans**, then **oracle.as.soainfra.config**, then **Server: server_name** and then **SoaInfraConfig**. Select **soa-infra**.
  
  d. In the Attributes tab, click **ServerURL**. If the ServerURL attribute contains a value, change the host name to the new host name.
  
  e. Click **Apply**.

- Redeploy all applications which have the WSDL files updated to the new host name.

**Note:** If there is no Load Balancer configured with the environment and Oracle SOA Suite needs to be recovered to a different host, then in-flight instances that are pending a response from task flow and asynchronous responses are not recovered. Oracle recommends that you use a Load Balancer to ensure that you can recover to a different host.

If a Load Balancer is configured with the environment, follow steps in **Section 15.3.2.2**. Then, take the following additional steps:

1. Log in to the Oracle WebLogic Server Administration Server.
2. In Domain Structure, navigate to Servers. For each Managed Server, select the Protocol tab, then the HTTP tab.
3. For **Frontend Host**, enter the new host name.
4. For **Frontend HTTP Port** and **Frontend HTTPs Port**, if applicable, enter the new port number.
5. Restart each Managed Server.

### 15.3.3.6 Recovering Oracle Business Activity Monitoring to a Different Host

To recover Oracle Business Activity Monitoring to a different host:

1. Recover the Managed Server, as described in **Section 15.3.2.2**.

### 15.3.3.7 Recovering Oracle WebCenter to a Different Host

To recover Oracle WebCenter to a different host:

1. Recover the Managed Server, as described in **Section 15.3.2.2**.

### 15.3.3.8 Recovering Web Tier Components to a Different Host

The Web Tier consists of Oracle HTTP Server and Oracle Web Cache. The following topics describe how to recover these components:
15.3.3.8.1 Recovering Oracle HTTP Server to a Different Host

To recover Oracle HTTP Server to a different host:

1. Recover the component as described in Section 15.3.3.4.
2. Recover Oracle Management Agent, as described in Section 15.3.4.3.
3. Modify the ServerName entry in the following file to have the new hostname:
   
   (UNIX) `ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf`
   (Windows) `ORACLE_INSTANCE\config\OHS\ohs_name\httpd.conf`

15.3.3.8.2 Recovering Oracle Web Cache to a Different Host

To recover Oracle Web Cache to a different host:

1. Recover the component as described in Section 15.3.3.4.
2. Recover Oracle Management Agent, as described in Section 15.3.4.3.
3. Edit the `webcache.xml` file, replacing the previous host name with the new host name. The file is located in:
   
   (UNIX) `ORACLE_INSTANCE/config/WebCache/webcache_name`
   (Windows) `ORACLE_INSTANCE\config\WebCache\webcache_name`

15.3.3.9 Recovering Identity Management Components to a Different Host

For most Identity Management components, you recover the Managed Server, as described in Section 15.3.2.2.

Some components require additional steps to recover the components to a different host, as described in the following topics:

- Recovering Oracle Internet Directory to a Different Host
- Recovering Oracle Virtual Directory to a Different Host
- Recovering Oracle Directory Integration Platform to a Different Host
- Recovering Oracle Directory Services Manager to a Different Host
- Recovering Oracle Identity Federation to a Different Host

15.3.3.9.1 Recovering Oracle Internet Directory to a Different Host

To recover Oracle Internet Directory to a different host:

1. Recover the component as described in Section 15.3.3.4.
2. On UNIX and Linux systems, before you attempt to start Oracle Internet Directory, set the following to have root permission:
   
   `ORACLE_HOME/bin/oidldapd`
   
   For example:
   
   `chown root oidldapd`
   `chmod 4710 oidldapd`
3. Recover Oracle Management Agent, as described in Section 15.3.4.3.
4. If the Managed Server on which Oracle Directory Services Manager is deployed is moved to a different host and if SSL is enabled, you must delete the following file on the new host:

```
DOMAIN_HOME/servers/wls_ods1/tmp/_WL_user/odsm_11.1.1.1.0/randomid/war/conf/odsm.cer
```

Oracle Directory Services Manager uses this file as its key store and trust store and the password is stored in JKS. However, when Oracle Directory Services Manager is copied to another host and is started, it generates a different password than odsm.cer. If you delete the file, Oracle Directory Services Manager creates a new file when it starts.

15.3.3.9.2 Recovering Oracle Virtual Directory to a Different Host To recover Oracle Virtual Directory to a different host:

1. Recover the component as described in Section 15.3.3.4.
2. Recover Oracle Management Agent, as described in Section 15.3.4.3.

15.3.3.9.3 Recovering Oracle Directory Integration Platform to a Different Host To recover Oracle Directory Integration Platform to a different host:

1. Recover the Managed Server, as described in Section 15.3.2.2.
2. Before starting the Managed Server, restore the files in the following directory:

```
DOMAIN_HOME/servers/wls_ods1/stage/DIP/11.1.1.1.0/
```

3. Start the Managed Servers and Oracle instances.
4. If Oracle Internet Directory is also moved to a different host, execute the following commands immediately after the Managed Server and the Oracle instance are started:

```
set ORACLE_HOME Oracle_home_path
set WLS_HOME WLS_Home_path
cd ORACLE_HOME/bin
./manageDIPServerConfig set -h dip_server_host -p dip_server_port
-D weblogic_user -attribute oidhostport -value oid_host:oid_ssl_port
```

The manageDIPServerConfig command prompts you for a password.

For example:

```
./manageDIPServerConfig set -h hostname -p 19523 -D weblogic
-attribute oidhostport -value hostname.domain.com:24163
```

5. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command on the new host. For example:

```
opmnctl registerInstance -adminHost admin_server_host
-adminPort admin_server_port -adminUsername username
-adminPassword password
-wlsrverHome wlsrver_home_location
```

15.3.3.9.4 Recovering Oracle Directory Services Manager to a Different Host To recover Oracle Directory Services Manager to a different host:

1. Recover the component as described in Section 15.3.3.4.
15.3.3.9.5 Recovering Oracle Identity Federation to a Different Host

Because Oracle Identity Federation provides SSO functionality, if the host name on which Oracle Identity Federation runs is changed as part of loss of host recovery, it impacts remote partners. In that case, remote partners must make changes regarding the host name to continue to operate. It may take many days for remote partners to update their data and this will cause production delays that are unacceptable. Oracle strongly recommends that you do not change the host name of a standalone Oracle Identity Federation server.

If a load balancer is part of the environment and the host where Oracle Identity Federation is being recovered is in the list of VIPs, then no host name changes are required.

In the case of a standalone installation of Oracle Identity Federation, Oracle recommends using a new host with the same name to minimize the impact. However, if, for whatever reason, you need to use a different host name for recovering Oracle Identity Federation, then the host name needs to be updated manually for Oracle Identity Federation and remote partners.

To recover Oracle Identity Federation to a different host:

1. Recover the Managed Server, as described in Section 15.3.2.2.
2. Recover Oracle Management Agent, as described in Section 15.3.4.3.
3. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command on the new host. For example:

   ```
   opmnctl registerInstance -adminHost admin_server_host -adminPort admin_server_port -adminUsername username -adminPassword password -wlserverHome wlserver_home_location
   ```

4. Provide the updated data to remote partners.
5. Modify the host name using Fusion Middleware Control:
   a. In the navigation pane, expand the farm and then Identity and Access.
   b. Select the Oracle Identity Federation instance.
   c. From the Oracle Identity Federation menu, choose Administration, then Server Properties.
      The Server Properties page is displayed.
   d. For Host, replace the old host name with the new host name.
   e. For Port, replace the port number if it has changed.
   f. For SOAP Port, replace the port number if it has changed.
   g. Click Apply.
   h. Restart the Managed Server to which Oracle Identity Federation is deployed:

      ```
      DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url username password
      ```

6. If Oracle Identity Federation is acting as an SSL server, you must replace the SSL certificate presented by Oracle Identity Federation to clients with a new one that has the new hostname. Otherwise, hostname verification by clients may fail.
15.3.3.10 Recovering Oracle Portal, Oracle Reports, Oracle Forms Services, and Oracle Business Intelligence Discoverer to a Different Host

The following topics describe how to recover these components to a different host:

- Recovering Oracle Portal to a Different Host
- Recovering Oracle Business Intelligence Discoverer to a Different Host
- Recovering Oracle Reports to a Different Host
- Recovering Oracle Forms Services to a Different Host

15.3.3.10.1 Recovering Oracle Portal to a Different Host

To recover Oracle Portal to a different host:

1. Restore the Middleware home, domain directory, and the Oracle instance directory to the new host. See Section 15.3.2.2 for more information.

2. Recover Oracle Management Agent, as described in Section 15.3.4.3.

3. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command on the new host. For example:

   ```
   opmnctl registerInstance -adminHost admin_server_host
   -adminPort admin_server_port -adminUsername username
   -adminPassword password
   -wlserverHome wlserver_home_location
   ```

4. Modify the following files, replacing the old host name with the new host name:

   - `ORACLE_INSTANCE/config/OHS/ohs_name/httpd.conf`
   - `ORACLE_INSTANCE/config/OHS/ohs_name/moduleconf/portal.conf`

5. Run the ssoreg script, which is located in:

   ```
   Identity_Management_ORACLE_HOME/sso/bin
   ```

   Use the following command:

   ```
   ssoreg.sh -site_name newhost:http_listen_port
   -mod_osso_url http://newhost:http_listen_port -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file any_new_file_path
   -admin_info cn=orcladmin -virtualhost -remote_midtier
   ```

   For example:

   ```
   ssoreg.sh -site_name example.com:8090
   -mod_osso_url http://example.com:8090 -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file /tmp/loh_osso.conf
   -admin_info cn=orcladmin -virtualhost -remote_midtier
   ```

6. Copy the file from the previous step to the new host.

7. In the new host, modify the OssoConfigFile section in the following file to include the path of the file in step 5:

   ```
   ORACLE_INSTANCE/config/OHS/ohs1/moduleconf/mod_osso.conf
   ```

   For example:

   ```
   <IfModule mod_osso.c>
   OssoIpCheck off
   OssoSecureCookies off
   ```
8. Edit the following files, replacing the previous host name with the new host name:

- **webcache.xml**. This file is located in:
  - (UNIX) `ORACLE_INSTANCE/config/WebCache/webcache_name`
  - (Windows) `ORACLE_INSTANCE\config\WebCache\webcache_name`

  Replace all occurrences of the previous host name with the new host name.

- **instance.properties**. The file is located in:
  - (UNIX) `ORACLE_INSTANCE/config/OPMN/opmn`
  - (Windows) `ORACLE_INSTANCE\config\OPMN\opmn`

  In the following line, replace the previous host name with the new host name if the Administration Server host name has changed.

  ```
  adminHost=host_name
  ```

9. If the published host used to access Oracle Portal is changing, take the following steps. This could happen if you have a single node install which contains both Oracle Web Cache and WLS_PORTAL, and those processes need to move to a different host. Another scenario is when you have Oracle Web Cache running on a node remotely from WLS_PORTAL, and Oracle Web Cache needs to move to a different host. In both these cases, take the following steps to update the Published Host information within Oracle Portal. (Note: If you have a load balancer or reverse proxy configuration, the steps are not needed.)

   a. Recursively delete all content from the following directory, but do not delete the directory itself:

   ```
   ORACLE_INSTANCE/portal/cache
   ```

   b. Log in to Fusion Middleware Control. Expand the farm and right-click Portal. Then, choose **Settings**, then **Wire Configuration**.

   c. In the Portal Midtier section, update **Published Host** with the new host name.

   d. In the Oracle Web Cache section, update **Host** with the new host name.

10. Restart the WLS_PORTAL instance.

---

15.3.3.10.2 Recovering Oracle Business Intelligence Discoverer to a Different Host

To recover Oracle Business Intelligence Discoverer to a different host:

1. Recover the Managed Server as described in Section 15.3.2.2.

2. Recover Oracle Management Agent, as described in Section 15.3.4.3.

3. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl `registerInstance` command on the new host. For example:

   ```
   opmnctl registerInstance -adminHost admin_server_host
   -adminPort admin_server_port -adminUsername username
   -adminPassword password
   -wlserverHome wlserver_home_location
   ```

4. Edit the following files, replacing the previous host name with the new host name:

   - **module_disco.conf**. This file is located in:
Recovering After Loss of Host

Recovering Your Environment 15-27

- webcache.xml. This file is located in:
  - (UNIX) $ORACLE_INSTANCE/config/OHS/ohs_name/moduleconf
  - (Windows) $ORACLE_INSTANCE\config\OHS\ohs_name\moduleconf

- Replace all occurrences of the previous host name with the new host name.

5. Run the ssoreg script, which is located in:
   - Identity_Management/ORACLE_HOME/sso/bin

   Use the following command:
   ```bash
   ssoreg.sh -site_name newhost:http_listen_port
   ```
   -mod_osso_url http://newhost:http_listen_port -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file any_new_file_path
   -admin_info cn=orcladmin -virtualhost -remote_midtier

   For example:
   ```bash
   ssoreg.sh -site_name example.com:8090
   ```
   -mod_osso_url http://example.com:8090 -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file /tmp/loh_osso.conf
   -admin_info cn=orcladmin -virtualhost -remote_midtier

6. Copy the file from the previous step to the new host.

7. In the new host, modify the OssoConfigFile section in the following file to include the path of the file in step 5:
   - ORACLE_INSTANCE/config/OHS/ohs1/moduleconf/mod_osso.conf

   For example:
   ```xml
   <IfModule mod_osso.c>
   OssoIpCheck off
   OssoSecureCookies off
   OssoIdleTimeout off
   OssoConfigFile /tmp/path_of_file_created
   </IfModule>
   ```

15.3.3.10.3 Recovering Oracle Reports to a Different Host To recover Oracle Reports to a different host:

1. Recover the Managed Server as described in Section 15.3.2.2.
2. Recover Oracle Management Agent, as described in Section 15.3.4.3.
3. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command on the new host. For example:
   ```bash
   opmnctl registerInstance -adminHost admin_server_host
   -adminPort admin_server_port -adminUsername username
   -adminPassword password
   -wlserverHome wlserver_home_location
   ```

4. Edit the following files, replacing the previous host name with the new host name:
   - reports_install.properties. The file is located in:
     - (UNIX) $ORACLE_INSTANCE/reports
     - (Windows) $ORACLE_INSTANCE\reports
Edit the parameters SERVER_NAME, OHS_HOST and REPORTS_MANAGED_WLS_HOST.

- `webcache.xml`. This file is located in:
  - (UNIX) `ORACLE_INSTANCE/config/WebCache/webcache_name`
  - (Windows) `ORACLE_INSTANCE\config\WebCache\webcache_name`

Replace all occurrences of the previous host name with the new host name.

- `instance.properties`. The file is located in:
  - (UNIX) `ORACLE_INSTANCE/config/OPMN/opmn`
  - (Windows) `ORACLE_INSTANCE\config\OPMN\opmn`

In the following line, replace the previous host name with the new host name if the Administration Server host name has changed.

```
adminHost=host_name
```

- `reports_ohs.conf`. The file is located in:
  - (UNIX) `ORACLE_INSTANCE/config/OHS/ohs_name/moduleconf`
  - (Windows) `ORACLE_INSTANCE\config\OHS\ohs_name\moduleconf`

- `rwservlet.properties`. The file is located in:
  - (UNIX) `MW_HOME/user_projects/domains/domain_name/servers/WLS_REPORTS/stage/reports/reports/configuration`
  - (Windows) `MW_HOME\user_projects\domains\domain_name\servers\WLS_REPORTS\stage\reports\reports\configuration`

In the file, modify the `<server>` element to use the new host name.

5. In the following directory, rename the subdirectory to have the new host name:

```
(UNIX) ORACLE_INSTANCE/diagnostics/logs/ReportsServer
(Windows) ORACLE_INSTANCE\diagnostics\logs\ReportsServer
```

6. In the following directory, rename the `old_host_name.dat` file to the new host name:

```
(UNIX) ORACLE_INSTANCE/reports/server
(Windows) ORACLE_INSTANCE\reports\server
```

7. In the following directory, rename the subdirectory to have the new host name:

```
(UNIX) ORACLE_INSTANCE/config/ReportsServer
(Windows) ORACLE_INSTANCE\config\ReportsServer
```

8. Run the ssoreg script, which is located in:

```
Identity_Management_ORACLE_HOME/ssc/bin
```

Use the following command:

```
ssoreg.sh -site_name newhost:http_Listen_Port
        -mod_osso_url http://newhost:http_Listen_Port
        -config_mod_osso TRUE
        -oracle_home_path $ORACLE_HOME
        -config_file any_new_file_path
        -admin_info cn=orcladmin -virtualhost -remote_midtier
```

For example:

```
ssoreg.sh -site_name example.com:8090
        -mod_osso_url http://example.com:8090
        -config_mod_osso TRUE
```
Recovering After Loss of Host

Recovering Your Environment

9. Copy the file from the previous step to the new host.
10. In the new host, modify the OssoConfigFile section in the following file to include the path of the file in step 8:

   ORACLE_INSTANCE/config/OHS/ohs1/moduleconf/mod_osso.conf

   For example:

   <IfModule mod_osso.c>
   OssoIpCheck off
   OssoSecureCookies off
   OssoIdleTimeout off
   OssoConfigFile /tmp/path_of_file_created

15.3.3.10.4 Recovering Oracle Forms Services to a Different Host

   To recover Oracle Forms Services to a different host:

   1. Recover the Managed Server as described in Section 15.3.2.2.

   2. Recover Oracle Management Agent, as described in Section 15.3.4.3.

   3. Register the Oracle instance, along with all of its components, with the Administration Server, using the opmnctl registerInstance command on the new host. For example:

   opmnctl registerInstance -adminHost admin_server_host
   -adminPort admin_server_port -adminUsername username
   -adminPassword password
   -wlserverHome wlserver_home_location

   4. Edit the following files, replacing the previous host name with the new host name:

      - webcache.xml. This file is located in:
        (UNIX) ORACLE_INSTANCE/config/WebCache/webcache_name
        (Windows) ORACLE_INSTANCE\config\WebCache\webcache_name

        Replace all occurrences of the previous host name with the new host name.

      - instance.properties. The file is located in:
        (UNIX) ORACLE_INSTANCE/config/OPMN/opmn
        (Windows) ORACLE_INSTANCE\config\OPMN\opmn

        In the following line, replace the previous host name with the new host name if the Administration Server host name has changed.

        adminHost=host_name

      - forms.conf. The file is located in:
        (UNIX) ORACLE_INSTANCE/config/OHS/ohs_name/moduleconf
        (Windows) ORACLE_INSTANCE\config\OHS\ohs_name\moduleconf

        Replace the host name in the parameter WebLogicHost with the name of the new host.

   5. On the Administration Server host, edit the following file:

      DOMAIN_HOME/opmn/topology.xml
Add properties for the `<ias-component id>` element for Oracle Forms Services. The following example shows the element after you modify it:

```xml
</ias-component>
<ias-component id="forms" type="FormsComponent">
<em-properties>
  <property name="OracleHome" value="/path_to_oracle_home"/>
  <property name="instName" value="instance_name"/>
  <property name="EMTargetType" value="oracle_forms"/>
  <property name="version" value="11.1.1"/>
</em-properties>
</ias-component>
```

6. On the host where the Oracle instance has been recovered, update the registration of the component with the Administration Server, using the `opmnctl updatecomponentregistration` command on the new host.

   For example:

   ```bash
   opmnctl updatecomponentregistration -Host new_host -Port nonSSLPort
   -componentName forms -componentType FormsComponent
   ```

7. Run the `ssoreg` script, which is located in:

   `Identity_Management_ORACLE_HOME/sso/bin`

   Use the following command:

   ```bash
   ssoreg.sh -site_name newhost:http_listen_port
   -mod_osso_url http://newhost:http_listen_port -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file any_new_file_path
   -admin_info cn=orcladmin -virtualhost -remote_midtier
   ```

   For example:

   ```bash
   ssoreg.sh -site_name example.com:8090
   -mod_osso_url http://example.com:8090 -config_mod_osso TRUE
   -oracle_home_path $ORACLE_HOME -config_file /tmp/loh_osso.conf
   -admin_info cn=orcladmin -virtualhost -remote_midtier
   ```

8. Copy the file from the previous step to the new host.

9. In the new host, modify the OssoConfigFile section in the following file to include the path of the file in step 7:

   `ORACLE_INSTANCE/config/OHS/ohs1/moduleconf/mod_osso.conf`

   For example:

   ```xml
   <IfModule mod_osso.c>
   OssoIpCheck off
   OssoSecureCookies off
   OssoIdleTimeout off
   OssoConfigFile /tmp/path_of_file_created
   ```

### 15.3.4 Additional Actions for Recovering Entities After Loss of Host

Depending on the entity that you are recovering, you may need to take additional actions after loss of host. The sections about each entity may require you to follow one or more of the following procedures. If so, that is noted in the section describing how to recover the entity.

- Recovering Fusion Middleware Control to a Different Host
15.3.4.1 Recovering Fusion Middleware Control to a Different Host

When you recover Fusion Middleware Control to a different host, you take the following steps:

1. Update the hostname in the following file:

   ```
   $MW_HOME/user_projects/domains/domain_name/servers/AdminServer/tmp/_WL_user/em/hsz5x1/META-INF/emoms.properties
   ```

   In the file, change the hostname for the following properties:

   ```
   mas.conn.url
   oracle.sysman.emSDK.svlt.ConsoleServerHost
   ```

2. Edit the following file:

   (UNIX)  ```
   /ORACLE_INSTANCE/EMAGENT/emagent_name/sysman/config/emd.properties
   ```
   (Windows)  ```
   \ORACLE_INSTANCE\EMAGENT\emagent_name\sysman\config\emd.properties
   ```

   In the file, edit the following entry for each component monitored by Oracle Management Agent, replacing the host name:

   ```
   REPOSITORY_URL=http://newhost.domain.com:port/em/upload/
   ```

15.3.4.2 Editing the targets.xml File for Fusion Middleware Control

When you recover a component to a different host, you must update the targets.xml file for Fusion Middleware Control. The file is located at:

```
$MW_HOME/user_projects/domains/domain_name/sysman/state/targets.xml
```

In the file, change the host name to the new host name for components that are recovered to a different host.

15.3.4.3 Recovering Oracle Management Agent When Components Are Recovered to a Different Host

For many components, when you recover to a different host, as in the case of loss of host, you must take actions to recover Oracle Management Agent so that Fusion Middleware Control can manage the components. This pertains to the following installation types and components:

- Identity Management components
- Oracle Identity Federation
- Oracle Portal
- Oracle Business Intelligence Discoverer
- Oracle Forms Services
- Oracle Reports

To recover Oracle Management Agent, take the following actions:

1. Edit the following file:
In the file, edit the following element, replacing the host name:

```
<Target TYPE="host" NAME="newhost.domain.com"
       DISPLAY_NAME="newhost.domain.com"/>
```

2. Edit the following file:

(UNIX)  ORACLE_INSTANCE/EMAGENT/emagent_name/sysman/emd/targets.xml
(Windows)  ORACLE_INSTANCE\EMAGENT\emagent_name\sysman\emd\targets.xml

Update the following entry, replacing the host name:

```
EMD_URL=http://newhost.domain.com:port/emd/main
```

3. Start Oracle Management Agent, using the following command:

```
opmnctl startproc ias-component=EMAGENT
```

4. Start the Administration Server:

```
DOMAIN_HOME/bin/startWebLogic.sh -Dweblogic.management.username=username
-Dweblogic.management.password=password
-Dweblogic.system.StoreBootIdentity=true
```

Starting the Administration Server also starts Fusion Middleware Control.

### 15.3.4.4 Updating Oracle Inventory

For many components, when you recover to a different host, as in the case of loss of host, you need to update the Oracle inventory. To do so, execute the following script:

```
ORACLE_HOME/oui/bin/attachHome.sh
```

In addition, you must update beahomelist to edit the location of a Middleware home. Edit the following file to update the Middleware home information:

(UNIX)  user_home/bea/beahomelist
(Windows)  C:\bea\beahomelist

### 15.3.4.5 Recover the Windows Registry

When you recover any component to a different host on Windows, as in the case of loss of host, you need to recover the following Windows Registry key.

```
HKEY_LOCAL_MACHINE\Software\oracle
```

In addition, when you recover system components, such as Oracle Web Cache, you must recover the following Windows Registry key:

```
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services
```

To import a key that you have previously exported, use the following command:

```
regedit /I <FileName>
```

For example:

```
regedit /I C:\oracleregistry.reg
```

You can also use the Registry Editor to import the key. See the Registry Editor Help for more information.
15.3.5 Recovering After Loss of Host for a Database

If the host that contained your database is lost, you can recover it using RMAN. You can recover the database at the desired granularity, either a full recovery or a tablespace recovery.

For example:

```bash
rman> restore database;
rman> recover database;
```

For best results, recover the database to the most current state, using point-in-time recovery (if the database is configured in Archive Log Mode.) This ensures that the latest data is recovered. Note the following:

- See Appendix D for the schemas used by each component.
- For Oracle BPEL Process Manager, point-in-time recovery ensures that the latest process definitions and in-flight instances are restored. However, this may result in reexecution of the process steps. Oracle recommends that you strive for idempotent Oracle BPEL Process Manager processes. If the system contains processes that are not idempotent, you must clean them up from the dehydration store before starting Oracle Fusion Middleware. See Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite for more information.

For detailed steps, see the Oracle Database Backup and Recovery User’s Guide, which is available at:

http://www.oracle.com/technology/documentation/database.html
This part describes how to copy all or part of your Oracle Fusion Middleware environment.

It contains the following chapters:

- Chapter 16, "Scaling Your Environment"
- Chapter 17, "Cloning Oracle Fusion Middleware"
You can expand your environment by adding Managed Servers, expanding your domain to include other products, creating a cluster of Managed Servers, or cloning existing Middleware homes and Oracle homes, as described by the following topics:

- **Overview of Scaling Your Environment**
- **Extending a Domain to Support Additional Components**
- **Adding Additional Managed Servers to a Domain**
- **Creating Clusters**
- **Cloning a Middleware Home, Oracle Home, or Component**

### 16.1 Overview of Scaling Your Environment

**Scalability** is the ability of a system to provide throughput in proportion to, and limited only by, available hardware resources. A scalable system is one that can handle increasing numbers of requests without adversely affecting response time and throughput.

The growth of computational power within one operating environment is called vertical scaling. Horizontal scaling is leveraging multiple systems to work together on a common problem in parallel.

Oracle Fusion Middleware scales both vertically and horizontally. Horizontally, Oracle Fusion Middleware can increase its throughput with several Managed Servers grouped together to share a workload. Also, Oracle Fusion Middleware provides great vertical scalability, allowing you to add more Managed Servers or components in the same host.

**High availability** refers to the ability of users to access a system. Deploying a high availability system minimizes the time when the system is down, or unavailable and maximizes the time when it is running, or available. Oracle Fusion Middleware is designed to provide a wide variety of high availability solutions, ranging from load balancing and basic clustering to providing maximum system availability during catastrophic hardware and software failures.

High availability solutions can be divided into two basic categories: local high availability and disaster recovery.

**See Also:** Oracle Fusion Middleware High Availability Guide for more information about high availability
16.2 Extending a Domain to Support Additional Components

When you create an Oracle WebLogic Server domain, you create it using a particular domain template. That template supports a particular component or group of components, such as the Oracle SOA Suite. If you want to add other components, such as Oracle WebCenter, to that domain, you can extend the domain by creating additional Managed Servers in the domain, using a domain template for the component which you wish to add.

When you extend a domain, the domain must be offline.

To extend a domain, you use the Oracle WebLogic Server Configuration Wizard from an Oracle home into which the desired component has been installed. Then, you select the domain that you want to extend and the component you want to add.

Table 16–1 shows which components you can add to an existing domain and the domain templates needed.

**Table 16–1 Supported Domain Extensions**

<table>
<thead>
<tr>
<th>Existing Domain Template</th>
<th>Components That Can Be Added</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle SOA Suite</td>
<td>Any Oracle SOA Suite component.</td>
</tr>
<tr>
<td></td>
<td>Any Oracle WebCenter component. Extend with Oracle WebCenter domain template.</td>
</tr>
<tr>
<td></td>
<td>Any Web Tier component. Extend with Web Tier domain template.</td>
</tr>
<tr>
<td>Oracle Identity Management</td>
<td>Any Identity Management component.</td>
</tr>
<tr>
<td></td>
<td>Any Web Tier component. Extend with Web Tier domain template.</td>
</tr>
<tr>
<td>Oracle Portal, Oracle Reports, Oracle Forms Services, Oracle Business Intelligence Discoverer</td>
<td>Any of these components.</td>
</tr>
<tr>
<td></td>
<td>Any Web Tier component. Extend with Web Tier domain template.</td>
</tr>
</tbody>
</table>

For example, to extend a domain that initially was created to support Oracle SOA Suite so that it can now also support Oracle WebCenter:

1. Use RCU to add any required schemas for the component, as described in *Oracle Fusion Middleware Repository Creation Utility User’s Guide*.
2. Install Oracle WebCenter, as described in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.
3. From an Oracle home that was installed for the component you want to add, (for example, for Oracle WebCenter), invoke the Configuration Wizard, using the following command:

   (UNIX) `ORACLE_HOME/common/bin/config.sh`

   (Windows) `ORACLE_HOME\common\bin\config.cmd`

   The Configuration Wizard’s Welcome screen is displayed.
4. Select **Extend an existing WebLogic Domain**.
5. Click **Next**.
   The Select a WebLogic Domain Directory screen is displayed.
6. Select the directory for the domain to which you want to add the components.
7. Click **Next**.
The Select Extension Source screen is displayed.

8. Select the source from which this domain will be extended. For example, select Oracle WebCenter Spaces.

9. Click Next.

The Conflict Detected dialog box is displayed.

10. Select Keep existing component and Apply this selection if further conflicts are detected. Click OK.

The Configure JDBC Data Sources screen is displayed.

11. Enter the following information:
   - For Vendor, select Oracle.
   - For Driver, select Oracle's Driver (Thin) for Service connections; Versions:9.0.1,9.2.0,10,11.
   - For Schema Owner, do not enter anything. Each data source uses the user name specified in the table.
   - If you used the same password when you created the schemas, select all of the schemas and enter the password in Schema Password. Alternatively, you can specify different passwords for each data source by selecting each schema individually and entering the password.
   - With all of the schemas selected, for DBMS/Service, enter the SID of the database.
   - With all of the schemas selected, for Host Name, enter the host name of the database.
   - With all of the schemas selected, for Port, enter the listening port of the database.

12. Click Next.

The Customize Server and Cluster Configuration screen is displayed.

13. In this and the following customization screens, you can choose to customize. to do so, click Yes. If you do not want to customize the settings, click No.

14. Click Next.

15. Click Next.

The Review WebLogic Domain screen is displayed.

16. In the Review WebLogic Domain screen, review the information on the screen and if it is correct, click Next.

The Extend WebLogic Domain screen is displayed.

17. Click Extend.

18. When the operation completes, click Done.

16.3 Adding Additional Managed Servers to a Domain

You can add Managed Servers to a domain to increase the capacity of your system. The Managed Server can be added to a cluster.
When a Managed Server is added to a cluster, it inherits the applications and services that are targeted to the cluster. When a Managed Server is added to a domain, it does not automatically inherit the applications and services from the template.

To add a Managed Server to a domain, you can use the Oracle WebLogic Server Administration Console or WLST.

**See:** Administration Console Online Help and Oracle Fusion Middleware WebLogic Scripting Tool Command Reference for complete information about adding Managed Servers.

To add a Managed Server to a domain using Oracle WebLogic Server Administration Console:

1. Display the Administration Console, as described in Section 3.4.1.
2. Lock the Oracle WebLogic Server configuration, as described in Section 3.4.2.
3. In the left pane, expand Environment, then select Servers.
4. In the Servers table, click New.
   The Create a New Server: Server Properties page is displayed.
5. Enter the following information:
   - For Name, enter a name for the server. Each server within a domain must have a name that is unique for all configuration objects in the domain. Within a domain, each server, computer, cluster, JDBC connection pool, virtual host, and any other resource type must be named uniquely and must not use the same name as the domain.
   - For Listen Address, if you want to limit the valid addresses for a server instance, enter an IP address or DNS name. Otherwise, URLs to the server can specify any of the host computer’s IP address, any DNS name that maps to one of the IP addresses, or the localhost string.
   - For Listen Port, enter the port number from which you want to access the server instance. If you run multiple server instances on a single computer, each server must use its own listen port.
   - Specify whether or not this server will be a standalone server or will belong to an existing cluster or a new cluster.
     - If this server is to be a standalone server, select **No, this is a stand-alone server**.
     - If this server is to be part of an existing cluster, select **Yes, make this server a member an existing cluster**. Then, select the cluster. This option is not shown if there are no existing clusters.
     - If this server is to be part of a new cluster, select **Yes, create a new cluster for this server**.
6. Click Next.
   The Review Choices page is displayed.
7. Review the information. If it is correct, click Finish.
8. Apply JRF to the Managed Server or cluster as described in Section 16.3.1.
16.3.1 Applying Oracle JRF to a Managed Server or Cluster

Oracle JRF (Java Required Files) consists of those components not included in the Oracle WebLogic Server installation that provide common functionality for Oracle business applications and application frameworks.

JRF consists of a number of independently developed libraries and applications that are deployed into a common location. The components that are considered part of Java Required Files include Oracle Application Development Framework shared libraries and ODL logging handlers.

You must apply JRF to a Managed Server or cluster in certain circumstances. You can only apply JRF to Managed Servers that are in a domain in which JRF was configured. That is, you must have selected Oracle JRF in the Configuration Wizard when you created or extended the domain.

Note the following points about when you apply JRF:

- When you add a Managed Server to an existing cluster that is already configured with JRF, you do not need to apply JRF to the Managed Server.
- When you add a Managed Server to a domain and the Managed Server requires JRF services, but the Managed Server is not part of a cluster, you must apply JRF to the Managed Server.
- When you create a new cluster and the cluster requires JRF, you must apply JRF to the cluster.
- You do not need to apply JRF to Managed Servers that are added by product templates during the template extension process (though you must select JRF in the Configuration Wizard).

You use the custom WLST command `applyJRF` to configure the Managed Servers or cluster with JRF. To use the custom WLST commands, you must invoke the WLST script from an Oracle home in which the Oracle Fusion Middleware component has been installed. See Section 3.5.1.1 for more information.

The format of the `applyJRF` command is:

```
applyJRF(target={server_name | cluster_name | *}, domainDir=domain_path, [shouldUpdateDomain= {true | false}])
```

You can use the `applyJRF` command online or offline:

- In online mode, the JRF changes are implicitly activated if you use the `shouldUpdateDomain` option with the value `true` (which is the default.) In online mode, this option calls the online WLST `save()` and `activate()` commands.
- In offline mode, you must restart the Administration Server and the Managed Servers or cluster. (In offline mode, if you specify the `shouldUpdateDomain` option with the value `true`, this option calls the WLST `updateDomain()` command.)

To configure a Managed Server with JRF, use the following command:

```
applyJRF(target='server1', domainDir='/scratch/Oracle/Middleware/user_projects/domains/domain1')
```

To configure all Managed servers in the domain with JRF, specify an asterisk (*) as the value of the `target` option.

To configure a cluster with JRF, use the following command:

```
applyJRF(target='cluster', domainDir='/scratch/Oracle/Middleware/user_
16.4 Creating Clusters

A WebLogic Server cluster consists of multiple WebLogic Server server instances running simultaneously and working together to provide increased scalability and reliability. A cluster appears to clients to be a single WebLogic Server instance. The server instances that constitute a cluster can run on the same computer, or be located on different computers. You can increase a cluster’s capacity by adding additional server instances to the cluster on an existing computer, or you can add computers to the cluster to host the incremental server instances. Each server instance in a cluster must run the same version of WebLogic Server.

You can create a cluster of Managed Servers using WLST, the Oracle WebLogic Server Administration Console, or Fusion Middleware Control. This section describes how to create a cluster using Fusion Middleware Control.

To create a cluster of two Managed Servers, soa_server1 and soa_server2, take the following steps:

1. From the Farm menu, choose Create/Delete Components.
   The Fusion Middleware Components page is displayed.

2. Choose Create, then WebLogic Cluster.
   The Create WebLogic Cluster page is displayed.

3. For Name, enter a name for the cluster.

4. In the Cluster Messaging Mode section, select one of the following:
   - Unicast. Then, for Unicast Broadcast Channel, enter a channel. This channel is used to transmit messages within the cluster.
   - Multicast. Then, for Multicast Broadcast Channel, enter a channel. A multicast address is an IP address in the range from 224.0.0.0 to 239.255.255.255. For Multicast Port, enter a port number.

Note: You must ensure that the multicast address is not in use.

5. In the Servers section, select one or more servers to be added to the cluster. In this scenario, select soa_server1 and soa_server2.

6. Click Create.

Now, you have a cluster with two members, soa_server1 and soa_server2.

See Also: Oracle Fusion Middleware Using Clusters for Oracle WebLogic Server for more information about clusters
16.5 Cloning a Middleware Home, Oracle Home, or Component

You can clone a Middleware home, an Oracle home, or an Oracle Internet Directory or Oracle Virtual Directory component. Cloning is the process of copying an existing entity to a different location while preserving its configuration. Some situations in which cloning Oracle Fusion Middleware is useful are:

- Creating a Middleware home or Oracle home that is a copy of a production, test, or development farm. Cloning enables you to create a new Middleware home or Oracle home with all patches applied to it in a single step. This is in contrast to separately installing, configuring and applying any patches to separate Oracle homes.

- Preparing a "gold" image of a patched home and deploying it to many hosts.

For information about how to clone a Middleware home or an Oracle home, see Chapter 17.
You can clone a Middleware home or an Oracle home, as well as Oracle Internet Directory and Oracle Virtual Directory.

This chapter includes the following topics:

- Introduction to Cloning
- What You Can Clone
- Understanding the Cloning Process
- Cloning Syntax
- Cloning Oracle Fusion Middleware Entities
- Considerations and Limitations for Cloning

17.1 Introduction to Cloning

Cloning is the process of copying an existing entity to a different location while preserving its state. Some situations in which cloning Oracle Fusion Middleware is useful are:

- Creating a Middleware home or Oracle home that is a copy of a production, test, or development environment. Cloning enables you to create a new Middleware home or an Oracle home with all patches applied to it in a single step. This is in contrast to separately installing, configuring and applying any patches to separate Oracle homes.

- Preparing a “gold” image of a patched home and deploying it to many hosts.

The cloned entity behaves the same as the source entity. For example, a cloned Oracle home can be deinstalled or patched using the installer. It can also be used as the source for another cloning operation.

17.2 What You Can Clone

You can clone the following, on the same host or a different host:

- Middleware home: You can apply the clone of the Middleware home to the same host or a different host. The clone must be on the same operating system as the source.

- Oracle home: You can apply the clone of an Oracle home to the same Middleware home or to a different Middleware home, which can be on the same host or a different host. The clone must be on the same operating system as the source.
If you are applying the clone of an Oracle SOA Suite or Oracle WebCenter Oracle home, ensure that the same type of Oracle home is not present in that Middleware home. That is, you can have only one Oracle SOA Suite Oracle home in a Middleware home and you can have only one Oracle WebCenter Oracle home in a Middleware home.

- Oracle Internet Directory: You can clone Oracle Internet Directory to a different Oracle instance, in the same Middleware home or a different Middleware home, on the same host or a different host. You cannot clone it to the same Oracle instance.

- Oracle Virtual Directory: You can clone Oracle Virtual Directory to a different Oracle instance, in the same Middleware home or a different Middleware home, on the same host or a different host. You cannot clone it to the same Oracle instance.

See Section 17.6 for details of considerations and limitations affecting specific components.

### 17.3 Understanding the Cloning Process

When you clone an entity of Oracle Fusion Middleware, the cloning process takes a snapshot of the information required for cloning. The following topics describe the cloning process:

- **Source Preparation Phase**

- **Cloning Phase**

#### 17.3.1 Source Preparation Phase

At the source, you run the createClone command, specifying the Middleware home, Oracle home, or component that you want to clone. The program prepares the source for cloning and creates an archive. It also records the file permissions of the Middleware home or Oracle home.

By default, if you are creating a clone of a Middleware home, the archive contains all of the Oracle homes and Oracle WebLogic Server homes in the Middleware home.

If you are creating a clone of an Oracle home, the archive contains the Oracle home.

If you are creating a clone of Oracle Virtual Directory or Oracle Internet Directory, the archive contains the component.

#### 17.3.2 Cloning Phase

At the destination, you run a clone command, specifying either the Middleware home or Oracle home and the destination. The clone program checks to see that the prerequisites are met at the destination. It extracts the files from the archive file and registers the Oracle homes with the installer and registers WebLogic Server homes with the Middleware home.

The clone program then restores the file permissions and relinks any files if that is necessary.

### 17.4 Cloning Syntax

Cloning uses a Java program, which is located in:

(UNIX) `ORACLE_HOME/jlib/cloningclient.jar`
Cloning Syntax

The syntax is:

```
java [-d64] -jar ORACLE_HOME/jlib/cloningclient.jar cloning_command options
```

Use the -d64 option to the java command if the operating system is Sun Solaris SPARC (64-bit).

---

**Note:** If you are applying the clone of a Middleware home or an Oracle home on a host that does not yet have Oracle Fusion Middleware installed, the host must have JDK 1.6 or higher installed. In addition, the PATH, CLASSPATH, and JAVA_HOME environment variables must point to the JDK.

---

Cloning Commands

This section describes the cloning commands. The options are described in the tables that follow the syntax.

Note that all cloning commands ask you if you want to continue whenever the -silent true option is not used. To continue, you must type Yes, which is not case sensitive. Any words other than Yes causes the cloning command to return an error. Also note that, even in silent mode, the commands prompt for passwords if they are not provided where they are needed.

**createClone**

Creates an archive file of a Middleware home, an Oracle home, or a component.

The syntax differs depending on what you are cloning.

The syntax for creating a clone of a Middleware home or Oracle home is:

```
createClone -archiveLocation archive_location
 {-sourceMWHomeLoc MW_HOME | sourceOracleHomeLoc src_OH_1[, src_OH_2 ...]}
 [-excludeOracleHomes {true | false}]  
 [-invPtrLoc Oracle_InventoryLocation]
 [-mwHomeValidation {true | false}]
 [-excludePattern pattern_in_double_quotes]
 [-excludePatternFile file_path]
 [-logDirLoc log_dir_path]
 [-silent {true | false}]
```

The syntax for creating a clone of a component is:

```
createClone -archiveLocation archive_location
 -sourceInstanceHomeLoc src_instance_path
 -sourceComponentName src_component_name
 [-logDirLoc log_dir_path]
 [-silent {true | false}]
```

You cannot create a clone of a component in the same operation as when you create a clone of a Middleware home and Oracle home.

**listCloneArchive**

Lists the source ID (a unique representation of each entry). You use the source ID in the applyClone command. The syntax is:

```
listCloneArchive -archiveLocation archive_location [-logDirLoc log_dir_path]
```
applyClone
Applies the clone. If you are cloning a Middleware home, you can apply the clone to the same host or a different host. If you are cloning an Oracle home, you can apply the clone to the same Middleware home or a different middleware home (on the same host or a different host). If you are cloning Oracle Virtual Directory or Oracle Internet Directory, you can apply the clone to a different Oracle instance, in the same Middleware home or a different Middleware home (on the same host or a different host). You cannot clone it to the same Oracle instance.

The syntax differs depending on what you are cloning.

The syntax for applying the clone of a Middleware home or Oracle home is:

```
applyClone -archiveLocation archive_location
  -targetLocation target_location
  [-sourceID source_id[,source_id...]]
  [-mwHomeValidation {true | false}]
  [-executeSysPrereqs {true | false}]
  [-logDirLoc log_dir_path]
  [-javaHome java_home_location]
  [-silent {true | false}]
```

The syntax for applying the clone of a component, such as Oracle Internet Directory or Oracle Virtual Directory is:

```
applyClone -archiveLocation archive_location
  [-sourceID source_id]
  -targetComponentName trgt_component_name
  -targetInstanceHomeLoc trgt_Instance_path
  [-targetInstanceName trgt_Instance_name]
  [-targetMWHomeLoc trgt_location]
  [-targetOracleHomeLoc trgt_ORACLE_HOME_path]
  [-silent {true | false}]
  [ <Domain Detail> ]
  {<Oracle Internet Directory Detail> | <Oracle Virtual Directory Detail> }
```

<Domain Detail> =
```
- domainHostName domain_host_name
- domainPortNo domain_port_number
- domainAdminUserName domain_admin_username
- domainAdminPassword domain_admin_password
```

<Oracle Internet Directory Detail> =
```
- dbHostName database_host_name
- dbPortNo database_port_number
- dbServiceName databaseServiceName
- namespace namespace
- odsSchemaPassword ods_schema_password
- odssmSchemaPassword odssmSchema_password
- oidAdminPassword oid_admin_password
[-oidNonSSLPort oid_port ]
[-oidSSLPort oid_ssl_port ]
```

<Oracle Virtual Directory Detail> =
```
- namespace namespace
- ovdAdmin ovd_admin_name
- ovdAdminPassword ovd_admin_password
- isOvdAdminSSLEnable true_or_false
[-isOvdHttpSSLEnable true_or_false ]
[-ovdAdminPort ovd_admin_port ]
[-ovdHttpPort ovd_http_port ]
```
Table 17–1 describes the options for using the createClone command for a Middleware home or Oracle home.

<table>
<thead>
<tr>
<th>Options</th>
<th>Shortcut</th>
<th>Description</th>
<th>Mandatory or Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>-archiveLocation</td>
<td>-al</td>
<td>The absolute path of the archive location. Use this option to specify the location of the archive file to be created with the createClone command.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>-excludeOracleHomes</td>
<td>-exoh</td>
<td>Option to specify whether all Oracle homes present in the Middleware home will be excluded. To exclude the Oracle homes, specify this option with the value true. You can use this option only when you use the -sourceMWHomeLoc option.</td>
<td>Optional</td>
</tr>
<tr>
<td>-excludePattern</td>
<td>-exp</td>
<td>The pattern of the files that should be excluded from the archive. You specify the files by providing a pattern of the file names. The pattern must be enclosed in quotation marks. For example: &quot;<em>.log,</em>.bak&quot; You can use this option with excludePatternFile or separately.</td>
<td>Optional</td>
</tr>
<tr>
<td>-excludePatternFile</td>
<td>-expf</td>
<td>The path of a file that contains the pattern of the files to be excluded from the archive. For example, create a file named excl_pat.txt and pass its path to this option. Insert the patterns in the file, as shown in the following example: *.log *.bak # My comments You can use this option with excludePattern or separately.</td>
<td>Optional</td>
</tr>
<tr>
<td>-invPtrLoc</td>
<td>-invLoc</td>
<td>The absolute path to the Oracle Inventory pointer. Use this option when creating a clone of an Oracle home, if the inventory location is not in the default location, so that the operation can read the Oracle homes present in the inventory. You can use this option only when you use the -sourceMWHomeLoc option. If you specify -excludeOracleHomes, this parameter is ignored. (On Linux, the default location is /etc/oraInst.loc.)</td>
<td>Optional, if the inventory is in the default location or the excludeOracleHomes option is used. Otherwise, it is mandatory.</td>
</tr>
<tr>
<td>-logDirLoc</td>
<td>-ldl</td>
<td>The location of an existing directory. A new log file is created in the directory. The default is the system Temp location.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 17–1 (Cont.) Options for the createClone Command for a Middleware Home or Oracle Home

<table>
<thead>
<tr>
<th>Options</th>
<th>Shortcut</th>
<th>Description</th>
<th>Mandatory or Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>-mwHomeValidation</td>
<td>-mwhv</td>
<td>Specifies whether or not the operation checks that the parent of the Oracle home is the Middleware home. The default is that it checks for the parent. To specify that it does not check, specify this option with the value of false.</td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the Oracle home contains Oracle SOA Suite, Oracle WebCenter, Oracle Forms Services, Oracle Reports, or Oracle Business Intelligence Discoverer, the parent of the Oracle home must be the Middleware home.</td>
<td></td>
</tr>
<tr>
<td>-silent</td>
<td>NA</td>
<td>Specifies whether or not the clone operation operates silently. That is, it does not prompt for confirmation. The default is that the operation prompts for confirmation. To specify that it not prompt for confirmation, specify this option with the value of true.</td>
<td>Optional</td>
</tr>
<tr>
<td>-sourceMWHomeLoc</td>
<td>-smw</td>
<td>The absolute path of the Middleware home. Use this option to specify the Middleware home to be archived. You can only specify one Middleware home.</td>
<td>Either this option or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you specify this option and -sourceOracleHomeLoc, only the Oracle homes present in the specified Middleware home and listed in the option -sourceOracleHomeLoc will be archived, along with the Oracle WebLogic Server binary files.</td>

<td>Optional, if the targetInstanceHomeLoc directory exists. In this case, the operation retrieves the name from the configuration.</td>
</tr>
<tr>
<td>-targetInstanceHomeLoc</td>
<td>-tih</td>
<td>The absolute path of the target Oracle instance. If the Oracle instance directory does not exist at that location, the command creates the directory. The same type of component should not already exist in the Oracle instance.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
Cloning Syntax

Oracle Fusion Middleware Administrator’s Guide

- `targetOracleHomeLoc` - `toh`  
  The absolute path of the target Oracle home.  
  The target Oracle home must exist and it must be an Identity Management Oracle home. That is, it must contain the binaries for Oracle Internet Directory or Oracle Virtual Directory.

- `silent` - `NA`  
  Specifies whether or not the clone operation operates silently. That is, it does not prompt for confirmation. The default is that the operation prompts for confirmation. To specify that it not prompt for confirmation, specify this option with the value of `true`.

Domain-Specific Options

- `targetMWHomeLoc` - `tmw`  
  The absolute path of the target Middleware home.
  If you provide this option, the Middleware home must be the parent of the `targetOracleHomeLoc`.

- `domainHostName` - `domainhost`  
  The name of the host on which the domain is configured.
  Use this option if you want to register the component with the domain.

- `domainPortNo` - `domainport`  
  The port number of the domain.
  Use this option if you want to register the component with the domain.
  The domain port number is listed in the following file as the adminPort.

  `ORACLE_INSTANCE/config/OPMN/opmn/instance.properties`

  For example:

  `adminPort=7001`

- `domainAdminUserName` - `domainuser`  
  The name of the administrative user for the domain.
  Use this option if you want to register the component with the domain.

- `domainAdminPassword` - `domainpass`  
  The password for the administrative user for the domain.
  Use this option if you want to register the component with the domain.

Oracle Internet Directory Options

- `dbHostName` - `dbhost`  
  The host name on which the database is running, which can be found in the tnsnames.ora file.

- `dbPortNo` - `dbport`  
  The port number of the database listener, which can be found in the tnsnames.ora file.
Table 17–5 (Cont.) Options for the applyClone Command for Components

<table>
<thead>
<tr>
<th>Options</th>
<th>Shortcut</th>
<th>Description</th>
<th>Mandatory or Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>-dbServiceName</td>
<td>-dservice</td>
<td>The service name for the database, which can be found in the tnsnames.ora file.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
| -namespace                  | -namespace | The namespace mapping to a distinguished name (DN). For example:  
                             |                         | dc=us,dc=oracle,dc=com                                                                                                                                  | Mandatory             |
| -odsSchemaPassword          | -odspass   | The password for the ODS schema, which is the schema that contains metadata for Oracle Internet Directory. If it is not provided, the operation prompts for a password. | Optional              |
| -odssmSchemaPassword        | -odssmpass | The password for the schema odssm, which is used to access server manageability information for Oracle Internet Directory from the database. If it is not provided, the operation prompts for a password. | Optional              |
| -oidAdminPassword           | -oidadminpass | The password for the Oracle Internet Directory administrator. If it is not provided, the operation prompts for a password.                                                                                   | Optional              |
| -oidNonSSLPort              | -oidport   | The non-SSL port for Oracle Internet Directory. If you do not provide a port number or if the port number you provide is not available, the applyClone operation uses an available port. | Optional              |
| -oidSSLPort                 | -oidsport  | The SSL port for Oracle Internet Directory. If you do not provide a port number or if the port number you provide is not available, the applyClone operation uses an available port. | Optional              |

Oracle Virtual Directory Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Shortcut</th>
<th>Description</th>
<th>Mandatory or Optional</th>
</tr>
</thead>
</table>
| -namespace                  | -namespace | The namespace mapping to a distinguished name (DN). For example:  
                             |                         | dc=us,dc=oracle,dc=com                                                                                                                                  | Mandatory             |
| -ovdAdmin                   | -ovdadmin  | The administrator name for Oracle Virtual Directory. For example, cn=orcladmin.                                                                                                                         | Mandatory             |
| -ovdAdminPassword           | -ovdadminpass | The password for the administrator for Oracle Virtual Directory.                                                                                                                                       | Mandatory             |
| -isOvdAdminSSLEnable        | -isovdadminssl | Specifies whether or not the Oracle Virtual Directory administration is enabled for SSL. Valid values are true (enabled) or false (not enabled.)                                                                 | Optional              |
| -isOvdHttpSSLEnable         | -isovdhttpsssl | Use this parameter only if you need the HTTP/DSML gateway port for Oracle Virtual Directory. Valid values are true (enabled) or false (not enabled.)                                                                 | Optional              |
17.5 Cloning Oracle Fusion Middleware Entities

The general steps for cloning, whether you are cloning Middleware home, an Oracle home, or a component, are similar. The general steps are described in Section 17.3.

The following sections describe how you clone these entities:

- Cloning a Middleware Home
- Cloning Oracle Homes
- Cloning Oracle Internet Directory
- Cloning Oracle Virtual Directory

17.5.1 Cloning a Middleware Home

You can clone a Middleware home, which can contain one or more Oracle homes and an Oracle WebLogic Server home.

Note:

- The cloning operation archives only those Oracle homes that lie within a Middleware home. It does not clone Oracle homes that are located outside of the Middleware home.
- You can clone only one Middleware home at a time.
- To create an archive of a Middleware home, Oracle WebLogic Server must be installed in the Middleware home.
- On Windows, ensure that no Oracle WebLogic Server processes are running in the source Middleware home.
17.5.1.1 Cloning Only a Middleware Home
You can clone only a Middleware home, excluding its Oracle homes.

To clone only the Middleware home and none of its Oracle homes:

1. At the source Middleware home, execute the createClone command, using the following syntax:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation archive_location
   -sourceMWHomeLoc MW_HOME
   -excludeOracleHomes true
   ```
   For example, to create an archive of a Middleware home that is located at `/scratch/oracle/Middleware1` and to exclude Oracle homes, use the following command:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation /tmp/mw_clone.jar
   -sourceMWHomeLoc /scratch/Oracle/Middleware1
   -excludeOracleHomes true
   ```

2. If you are cloning the Middleware home to a different host, copy the files to that system. Copy the archive, as well as the cloningclient.jar file.

3. At the target, extract the files from the archive using the applyClone command. Specify the value `all` for the sourceID option. Use the following syntax:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation archive_location
   -targetLocation target_MW_home
   -sourceID all
   ```
   For example, to apply the clone to the directory `/scratch/oracle/MW_Home_clone`, use the following command:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation /tmp/mw_clone.jar
   -targetLocation /scratch/oracle/MW_Home_clone
   -sourceID all
   ```

17.5.1.2 Cloning a Middleware Home and All of Its Oracle Homes
To clone a Middleware home and all of its Oracle homes, but excluding the log files and files with the suffix `.bak`:

1. At the source Middleware home, execute the createClone command, using the following syntax:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation archive_location
   -sourceMWHomeLoc MW_HOME
   -excludePattern "pattern"
   [-invPtrLoc Oracle_Inventory_location]
   ```
   For example, to clone a Middleware home that is located at `/scratch/oracle/Middleware1` and to exclude log files, use the following command:
   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation /tmp/mw_clone.jar
   -sourceMWHomeLoc /scratch/Oracle/Middleware1
   -excludePattern "*.log,*.bak"
   [-invPtrLoc /scratch/oracle/oraInst.loc]
   ```

2. If you are cloning the Middleware home to a different host, copy the files to that system. Copy the archive, as well as the cloningclient.jar file.
3. At the target, extract the files from the archive using the applyClone command. Specify the value all for the sourceID option. Use the following syntax:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation archive_location
   -targetLocation target_MW_home -sourceID all
```

For example, to apply the clone to the directory /scratch/oracle/MW_Home_clone, use the following command:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation /tmp/mw_clone.jar
   -targetLocation /scratch/oracle/MW_Home_clone -sourceID all
```

The Middleware home is restored at /scratch/oracle/MW_Home_clone and all of the Oracle homes are restored under it with the same name as that of source Oracle home name.

17.5.1.3 Cloning a Middleware Home and Only Some of Its Oracle Homes

You can clone a Middleware home and some of its Oracle homes, excluding other Oracle homes.

For example, if you have a Middleware home that has three Oracle homes. You want to clone only two of those Oracle home, OH1 and OH2. You do not want to clone OH3. Take the following steps:

1. At the source Middleware home, execute the createClone command, using the following syntax:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation archive_location
   -sourceMWHomeLoc MW_HOME
   -sourceOracleHomeLoc ORACLE_HOME1,ORACLE_HOME2
```

For example, to create an archive of a Middleware home that is located at /scratch/oracle/Middleware1 and to clone only two of the three Oracle homes, use the following command:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation /tmp/mw_clone.jar
   -sourceMWHomeLoc /scratch/Oracle/Middleware1
   -sourceOracleHomeLoc /scratch/Oracle/Middleware1/OH1,/scratch/Oracle/Middleware1/OH2
```

2. If you are cloning the Middleware home to a different host, copy the files to that system. Copy the archive, as well as the cloningclient.jar file.

3. At the target, extract the files from the archive using the applyClone command. Specify the value all for the sourceID option. Use the following syntax:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation archive_location
   -targetLocation target_MW_home -sourceID all
```

For example, to apply the clone to the directory /scratch/oracle/MW_Home_clone, use the following command:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation /tmp/mw_clone.jar
   -targetLocation /scratch/oracle/MW_Home_clone -sourceID all
```
17.5.2 Cloning Oracle Homes

When you clone an Oracle home, you copy the contents of the Oracle home. This is useful when you want a copy of an Oracle home to which patches have been applied. You can clone multiple Oracle homes at the same time.

Note the following:

- If you are cloning an Oracle home to another host, you must copy the cloningclient.jar file from the source to the target host. The Java JDK, version 1.6.4 or later, must be available on that host.
- The directory that you specify for the cloned Oracle home must not exist.
- You can apply the clone to the same Middleware home or a different Middleware home.
- If the Oracle home contains Oracle SOA Suite, Oracle WebCenter, Oracle Forms Services, Oracle Reports, or Oracle Business Intelligence Discoverer, the parent of the Oracle home must be the Middleware home.
- If you are applying the clone of an Oracle SOA Suite or Oracle WebCenter Oracle home, ensure that the same type of Oracle home is not present in that Middleware home. That is, you can have only one Oracle SOA Suite Oracle home in a Middleware home and you can have only one Oracle WebCenter Oracle home in a Middleware home.
- If you are applying the clone of an Identity Management or Web Tier Oracle home, you can restore it to a directory that is not a Middleware home by using the -mwHomeValidation option with a value of false.

To clone two Oracle homes, soa_oh1, and idm_oh1:

1. At the source Oracle home, execute the createClone command, using the following syntax:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation archive_location
   -sourceOracleHomeLoc ORACLE_HOME1,ORACLE_HOME2
   [-invPtrLoc Oracle_Inventory_location]
   ```

   For example, to clone two Oracle homes, soa_oh1, and idm_oh1, located at /scratch/Oracle/Middleware1, use the following command:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation /tmp/oh_clone.jar
   -sourceOracleHomeLoc /scratch/Oracle/Middleware1/soa_oh1,/scratch/Oracle/Middleware1/idm_oh1
   [-invPtrLoc /scratch/oracle/oraInst.loc]
   ```

   To specify that the operation does not validate that the parent of an Oracle home is a Middleware home, use the mwHomeValidation option with the value of false.

2. Use the listCloneArchive command to list the sourceIDs of the Oracle homes to be cloned. Note that this lists all sourceIDs in the archive. Use the following syntax:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation archive_location
   ```

   For example:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation /tmp/oh_clone.jar
   Log File : */tmp/CLONE2009-04-07_10-36-38AM-LOG/CLONE2009-04-07_
Cloning Oracle Fusion Middleware Entities

10-36-38AM.log".
10-36-38AM.error".

2009-04-07_10-36-38AM: INFO: CLONE-21039 Gathering all sourceid from
archive.
Oracle home archive # 1, sourceid =oraclehome1@soa_oh1,
  home location =/scratch/Oracle/Middleware/soa_oh1
Oracle home archive # 2, sourceid =oraclehome1@idm_oh1,
  home location =/scratch/Oracle/Middleware/idm_oh1

3. If you are cloning the Oracle home to a different host, copy the files to that system.
   Copy the archive, as well as the cloningclient.jar file.

4. At the target, extract the files from the archive using the applyClone command.
   Specify the value of the sourceIDs for each Oracle home. Use the following syntax:

   java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
       -archiveLocation archive_location
       -targetLocation target_ORACLE_HOME1,target_ORACLE_HOME1,
       -sourceID OH1_sourceID,OH2_sourceID

   For example, to apply the clone to the
directories/scratch/Oracle/Middleware1/soa_oh1_cl and
/scratch/Oracle/Middleware1/soa_oh2_cl, use the following command:

   java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
       -archiveLocation /tmp/oh_clone.jar
       -targetLocation /scratch/Oracle/Middleware1/soa_oh1",
       /scratch/Oracle/Middleware1/soa_oh2_cl
       -sourceID oraclehome1@soa_oh1,oraclehome2@idm_oh1

17.5.3 Cloning Oracle Internet Directory

You can clone Oracle Internet Directory to the same host or a different host, the same
Middleware home or a different Middleware home, or a different Oracle instance. You
cannot clone it to the same Oracle instance.

You must apply the clone to an Oracle home that contains the binaries for Identity
Management.

To clone Oracle Internet Directory:

1. At the source Middleware home, execute the createClone command, using the
   following syntax:

   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
       -archiveLocation archive_location
       -sourceInstanceHomeLoc ORACLE_INSTANCE
       -sourceComponentName component_name

   For example, to clone Oracle Internet Directory instance named oid1 in the Oracle
instance located in /scratch/Oracle/Middleware/im_1, use the following
command:

   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
       -archiveLocation /tmp/oid1.jar
       -sourceInstanceHomeLoc /scratch/Oracle/Middleware1/im_1
       -sourceComponentName oid1
2. Use the listCloneArchive command to list the sourceIDs of the Oracle Internet Directory component to be cloned. Note that this command lists all sourceIDs in the archive. Use the following syntax:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation archive_location
```

For example:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation /tmp/oid1.jar
```

3. If you are cloning Oracle Internet Directory to a different host, copy the files to that system. Copy the archive, as well as the cloningclient.jar file.

4. At the target, extract the files from the archive using the applyClone command. Use the following syntax:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation archive_location [-sourceId source_id]
   [-targetMWHomeLoc trgty_location]
   -targetOracleHomeLoc trgty_ORACLE_HOME_path
   [-targetInstanceHomeLoc trgty_ORACLE_INSTANCE_path]
   [-targetInstanceName trgty_ORACLE_INSTANCE_name]
   -targetComponentName trgty_component_name
   [-domainHostName domain_host_name]
   [-domainPortNo domain_port_number]
   [-domainAdminUserName domain_admin_username]
   [-domainAdminPassword domain_admin_password]
   -dbHostName database_host_name
   -dbPortNo database_port_number
   -dbServiceName databaseServiceName
   -odsSchemaPassword ods_schema_password
   -odssmSchemaPassword odssmSchema_password
   -namespace namespace
   -oidAdminPassword oid_admin_password
   [-oidNonSSLPort oid_port]
   [-oidSSLPort oid_ssl_port]
```

For example, to apply the clone to the Oracle instance im_2 and name the cloned Oracle Internet Directory instance oid_cl, use the following command:

```
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation /tmp/oid1.jar
   -sourceId im_1@oid1
   -targetMWHomeLoc /scratch/Oracle/Middleware
   -targetOracleHomeLoc /scratch/Oracle/Middleware/Oracle_IM2
   -targetInstanceHomeLoc /scratch/Oracle/Middleware/im_2
   -targetInstanceName im_1
   -targetComponentName oid_cl
   -domainHostName myhost
   -domainPortNo 7001
   -domainAdminUserName domain_admin_username
   -domainAdminPassword domain_admin_password
   -dbHostName database_host_name
   -dbPortNo 1521
   -dbServiceName orcl
   -odsSchemaPassword ods_schema_password
   -odssmSchemaPassword odssmSchema_password
   -namespace namespace
   -oidAdminPassword oid_admin_password
```
17.5.4 Cloning Oracle Virtual Directory

You can clone Oracle Virtual Directory to the same host or a different host, the same Middleware home or a different Middleware home, or a different Oracle instance. You cannot clone it to the same Oracle instance.

You must apply the clone to an Oracle home that contains the binaries for Identity Management.

To clone Oracle Virtual Directory:

1. At the source Middleware home, execute the createClone command, using the following syntax:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation archive_location
   -sourceInstanceHomeLoc ORACLE_INSTANCE
   -sourceComponentName component_name
   ```

   For example, to clone Oracle Virtual Directory instance named ovd1 in the Oracle instance located in /scratch/Oracle/Middleware/im_1, use the following command:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar createClone
   -archiveLocation /tmp/ovd1.jar
   -sourceInstanceHomeLoc /scratch/Oracle/Middleware/im_1
   -sourceComponentName ovd1
   ```

2. Use the listCloneArchive command to list the sourceIDs of the Oracle Virtual Directory component to be cloned. Note that this lists all sourceIDs in the archive. Use the following syntax:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation archive_location
   ```

   For example:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar listCloneArchive
   -archiveLocation /tmp/ovd1.jar
   ```

3. If you are cloning Oracle Virtual Directory to a different host, copy the files to that system. Copy the archive, as well as the cloningclient.jar file.

4. At the target, extract the files from the archive using the applyClone command. Use the following syntax:

   ```
   java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
   -archiveLocation archive_location
   [-sourceId source_id]
   [-targetMWHomeLoc trgt_location]
   [-targetOracleHomeLoc trgt_ORACLE_HOME_path]
   [-targetInstanceHomeLoc trgt_ORACLE_INSTANCE_path]
   [-targetInstanceName trgt_ORACLE_INSTANCE_name]
   [-targetComponentName trgt_component_name]
   [-domainHostName myhost ]
   [-domainPortNo 7001 ]
   [-domainAdminUsername domain_admin_username]
   [-domainAdminPassword domain_admin_password]
   [-namespace namespace]
   [-isOvdAdminSSLEnable true_or_false]
   [-ovdAdmin ovd_admin_name]
   [-ovdAdminPassword ovd_admin_password]
   [-isOvdHttpSSLEnable true_or_false ]
   ```
Considerations and Limitations for Cloning

For example, to apply the clone to the Oracle instance `im_2` and name the cloned Oracle Virtual Directory instance `ovd_cl`, use the following command:

```java
java -jar ORACLE_HOME/jlib/cloningclient.jar applyClone
    -archiveLocation /tmp/ovd1.jar
    -sourceId im_1@oid1
    -targetMWHomeLoc /scratch/Oracle/Middleware
    -targetOracleHomeLoc /scratch/Oracle/Middleware/Oracle_IM2
    -targetInstanceHomeLoc /scratch/Oracle/Middleware/im_2
    -targetInstanceName im_2
    -targetComponentName ovd_cl
    -domainHostName myhost
    -domainPortNo 7001
    -domainAdminUserName domain_admin_username
    -domainAdminPassword domain_admin_password
    -namespace namespace
    -isOvdAdminSSLEnable true
    -ovdAdmin ovd_admin_name
    -ovdAdminPassword ovd_admin_password
```

17.6 Considerations and Limitations for Cloning

Note the following important additional considerations about cloning:

- Cloning does not carry over all the dependencies of the source Oracle home, such as loadable modules or application-specific libraries to the cloned home, because cloning proceeds by copying the entire source Oracle home to the destination Oracle home. Any files outside the source Oracle home are not automatically copied. Hence, any applications that refer to files outside the source Oracle home may not work properly in the cloned home.

- If you created symbolic links to files or applications outside the source Oracle home, you must re-create the link manually in the cloned home for your applications to work properly.

- When you clone a Middleware home, only the read-only portions of the Middleware home are cloned. Any user configuration files, such as the `user_projects` directory, are excluded from the cloned image. The WebLogic Server domain is not cloned.

- If a cloning operation fails, but it results in the Oracle home being registered with Oracle Inventory, you cannot use the same Oracle home in subsequent cloning operations. Either use another directory and name for the Oracle home in subsequent cloning operations or deinstall the Oracle home before attempting another cloning operation.

- If you are applying the clone of a Middleware home or an Oracle home on a host that does not yet have Oracle Fusion Middleware installed, the host must have JDK 1.6 or higher installed. In addition, the `PATH`, `CLASSPATH`, and `JAVA_HOME` environment variables must point to the JDK.
This part contains the following appendixes:

- Appendix A, "Oracle Fusion Middleware Command-Line Tools"
- Appendix B, "URLs for Components"
- Appendix C, "Port Numbers"
- Appendix D, "Metadata Repository Schemas"
- Appendix E, "Using Oracle Fusion Middleware Accessibility Options"
- Appendix F, "Examples of Administrative Changes"
- Appendix G, "Viewing Release Numbers and Applying Patches"
- Appendix H, "Oracle Wallet Manager and orapki"
- Appendix I, "Troubleshooting Oracle Fusion Middleware"
# Oracle Fusion Middleware Command-Line Tools

This appendix summarizes the command-line tools that are available in Oracle Fusion Middleware.

<table>
<thead>
<tr>
<th>Command</th>
<th>Path</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulkdelete</td>
<td>UNIX: <code>ORACLE_HOME/ldap/bin/bulkdelete.sh</code> &lt;br&gt;Windows: <code>ORACLE_HOME/ldap/bin/bulkdelete.bat</code></td>
<td>Delete a subtree efficiently in Oracle Internet Directory. &lt;br&gt;<strong>See:</strong> Oracle Fusion Middleware User Reference for Oracle Identity Management</td>
</tr>
<tr>
<td>bulkload</td>
<td>UNIX: <code>ORACLE_HOME/ldap/bin/bulkload.sh</code> &lt;br&gt;Windows: <code>ORACLE_HOME/ldap/bin/bulkload.bat</code></td>
<td>Create Oracle Internet Directory entries from data residing in or created by other applications. &lt;br&gt;<strong>See:</strong> Oracle Fusion Middleware User Reference for Oracle Identity Management</td>
</tr>
<tr>
<td>bulkmodify</td>
<td>UNIX: <code>ORACLE_HOME/bin/bulkmodify</code> &lt;br&gt;Windows: <code>ORACLE_HOME/bin/bulkmodify</code></td>
<td>Modify a large number of existing Oracle Internet Directory entries in an efficient way. &lt;br&gt;<strong>See:</strong> Oracle Fusion Middleware User Reference for Oracle Identity Management</td>
</tr>
<tr>
<td>catalog</td>
<td>UNIX: <code>ORACLE_HOME/ldap/bin/catalog.sh</code> &lt;br&gt;Windows: <code>ORACLE_HOME/ldap/bin/catalog.bat</code></td>
<td>Add and delete catalog entries in Oracle Internet Directory. &lt;br&gt;<strong>See:</strong> Oracle Fusion Middleware User Reference for Oracle Identity Management</td>
</tr>
<tr>
<td>chgiphost</td>
<td>UNIX: <code>ORACLE_HOME/chgip/scripts/chgiphost.sh</code> &lt;br&gt;Windows: <code>ORACLE_HOME/chgip/scripts/chgiphost.bat</code></td>
<td>Changes the network configuration of Oracle HTTP Server and Oracle Web Cache. &lt;br&gt;<strong>See:</strong> Section 12.1.2</td>
</tr>
<tr>
<td>eulbuilder.jar</td>
<td>UNIX: <code>ORACLE_HOME/bin/eulbuilder.jar</code> &lt;br&gt;Windows: <code>ORACLE_HOME/bin/eulbuilder.jar</code></td>
<td>Discoverer EUL Java command-line interface. Create and manipulate Discoverer EULs without installing Oracle Discoverer Administrator. &lt;br&gt;<strong>See:</strong> Oracle Business Intelligence Discoverer EUL Command Line for Java User’s Guide</td>
</tr>
<tr>
<td>iasua</td>
<td>UNIX: <code>ORACLE_HOME/upgrade/iasua.sh</code> &lt;br&gt;Windows: <code>ORACLE_HOME/upgrade/iasua.bat</code></td>
<td>Oracle Fusion Middleware Upgrade Assistant. &lt;br&gt;<strong>See:</strong> Oracle Fusion Middleware Upgrade Planning Guide</td>

This appendix provides the URLs needed to access Oracle Fusion Middleware components.

Table B–1 shows the URLs, and the default user to access components after installation.

The URLs in the table are shown with the default ports. The components in your environment might use different ports. To determine the port numbers, from the WebLogic Domain menu in Fusion Middleware Control, select Port Usage.

Unless otherwise noted, the password for each user is the password supplied during installation or the password you assigned to the user when you either created the user or changed the user's password.

This appendix provides information about Oracle Fusion Middleware port numbers. It contains the following topics:

- Port Numbers by Component
- Port Numbers (Sorted by Number)

## C.1 Port Numbers by Component

This section provides the following information for each Oracle Fusion Middleware service that uses a port:

- **Component or Service**: The name of the component and service.
- **Default Port Number**: The first port number Oracle Fusion Middleware attempts to assign to a service. It is usually the lowest number in the allotted port range. If the port is in use, the next available port number, within the allotted range, is assigned.
- **Allotted Port Range**: The set of port numbers Oracle Fusion Middleware attempts to use when assigning a port.

Port numbers for Oracle WebLogic Server servers are assigned sequentially for each server created. For example, the first server is assigned the port 7001, the second 7002. Managed Servers created during installation and configuration for particular components may have specific default port numbers.

Table C-1 shows the default port number and the port number range for components, sorted alphabetically by component.

<table>
<thead>
<tr>

Oracle Metadata Repository is an Oracle database that contains additional schemas to support Oracle Fusion Middleware and its components. This appendix provides information about those schemas.

This appendix contains the following topics:

- Metadata Repository Schema Descriptions
- Metadata Repository Schemas, Tablespaces, and Datafiles

### D.1 Metadata Repository Schema Descriptions

Table D–1 lists the schemas used by Oracle Fusion Middleware components, sorted alphabetically by component. Note that the schema names are prefixed by the prefix you supplied when you ran the Repository Creation Utility.

<table>
<thead>
<tr>
<th>Component</th>
<th>Schema</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle BPEL Process Manager</td>
<td>MDS SOAINFRA</td>
<td>MDS contains process definitions and configuration information. SOAINFRA contains instance and metadata database objects for Oracle Business Activity Monitoring and Oracle BPEL Process Manager.</td>
</tr>
<tr>
<td>Oracle Business Activity Monitoring</td>
<td>ORABAM MDS</td>
<td>Contains instance and metadata database objects for Oracle Business Activity Monitoring.</td>
</tr>
<tr>
<td>Oracle B2B</td>
<td>SOAINFRA</td>
<td>Contains the design and run-time repository. The design repository has modeling metadata and profile data for an integration. These describe the behavior of the integration and sequence of steps required to execute the business process. The modeling and profile metadata is the design of the integration prior to deployment and execution. Once the integration is deployed, the run-time repository contains the metadata required to execute the integration as well as the business process instance, event instances, role instances, and other data created during execution.</td>
</tr>
<tr>
<td>Oracle Business Intelligence</td>
<td>BISERVER BISCHEDULER BISCORECARD BIPUBLISHER</td>
<td>Contains metadata for Business Intelligence Server.</td>

## D.2 Metadata Repository Schemas, Tablespaces, and Datafiles

Table D–2 lists the tablespace and default datafile for each Metadata Repository schema. It is sorted alphabetically by schema name. Note that the default datafiles are prefixed by the prefix you assigned the schemas in RCU.

In addition to the tablespaces listed, the tablespace IAS_TEMP is always created when you create a schema with RCU. Its datafile is iastemp.dbf.
<table>

This appendix includes information about using Oracle Fusion Middleware accessibility options. It includes:

- Install and Configure Java Access Bridge (Windows Only)
- Enabling Fusion Middleware Control Accessibility Mode
- Fusion Middleware Control Keyboard Navigation

E.1 Install and Configure Java Access Bridge (Windows Only)

If you are installing on a Windows computer, you can install and configure Java Access Bridge for Section 508 Accessibility:

1. Download Java Access Bridge from the following URL:
   
   http://java.sun.com/javase/technologies/accessibility/accessbridge/

2. Install Java Access Bridge.

3. Copy the access-bridge.jar and jaccess-1_4.jar files from your installation location to the jre/lib/ext directory.

4. Copy the WindowsAccessBridge.dll, JavaAccessBridge.dll, and JAWTAccessBridge.dll files from your installation location to the jre/bin directory.

5. Copy the accessibility.properties file to the jre/lib directory.

E.2 Enabling Fusion Middleware Control Accessibility Mode

The following sections provide information on the benefits of running Fusion Middleware Control in accessibility mode, as well as instructions for enabling accessibility mode:

- Making HTML Pages More Accessible
- Viewing Text Descriptions of Fusion Middleware Control Charts

E.2.1 Making HTML Pages More Accessible

In Fusion Middleware Control, you can enable screen reader support. Screen reader support improves behavior with a screen reader. This is accomplished by adding
accessibility-specific constructs to the HTML, and by altering some navigation elements on the pages.

To enable screen reader mode in Fusion Middleware Control:

1. Choose Setup, then My Preferences, then Accessibility. The Accessibility Preference page is displayed.

2. Select one or both of the following options:
   - I use a screen reader: Accessibility-specific constructs are added to improve behavior with a screen reader.
   - Show me the Accessibility Preference dialog when I log in: When you log in, the Accessibility Preference dialog is displayed, with the following options:
     - I use a screen reader
     - Do not show me these options again

When you select Screen Reader Support, Fusion Middleware Control renders the Web pages so that they can be read by a screen reader. For example, each node in the navigation tree includes a Select button.

The following figure shows the navigation pane and the Administration Server Performance Summary after enabling screen reader support:

---

**E.2.2 Viewing Text Descriptions of Fusion Middleware Control Charts**

Throughout Fusion Middleware Control, charts are used to display performance data. For most users, these charts provide a valuable graphical view of the data that can reveal trends and help identify minimum and maximum values for performance metrics.

However, charts do not convey information in a manner that can be read by a screen reader. To remedy this problem, you can configure Fusion Middleware Control to provide a complete textual representation of each performance chart. When you enable screen reader mode, Fusion Middleware Control displays the information in tables, instead of charts.

To view a representation of the data in a table, instead of a chart, without enabling screen reader mode, click Table View below a chart.
E.3 Fusion Middleware Control Keyboard Navigation

This section describes the keyboard navigation in Fusion Middleware Control.

Much of the keyboard navigation is the same whether or not you use screen reader mode.

Generally, you use the following keys to navigate:

- **Tab key**: Move to the next control, such as a dynamic target menu, navigation tree, content pane, or tab in a page. Tab traverses the page left to right, top to bottom. Use Shift + Tab to move to the previous control.
- **Up and Down Arrow keys**: Move to the previous or next item in the navigation tree, menu, or table. Down Arrow also opens a menu.
- **Left and Right Arrow keys**: Collapse and expand an item in the navigation tree or a submenu.
- **Esc**: Close a menu.
- **Spacebar**: Activate a control. For example, in a check box, spacebar toggles the state, checking or unchecking the box. On a link, spacebar navigates to the target of the link.
- **Enter**: Activate a button.

Table E–1 shows some common tasks and the keyboard navigation used.

<table>
<thead>
<tr>
<th>Task</th>
<th>Navigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move to next control, such as navigation tree or menu</td>

</tbody>
</table>
Examples of Administrative Changes

This appendix provides examples of administrative changes that can be performed on an Oracle Fusion Middleware environment. It is a companion to Part IV, "Advanced Administration: Backup and Recovery" in this book, and to the Disaster Recovery section in Oracle Fusion Middleware High Availability Guide.

It contains the following topics:

- How to Use This Appendix
- Examples of Administrative Changes (by Component)

F.1 How to Use This Appendix

Some administrative operations cause configuration changes to your Oracle Fusion Middleware environment. These are called administrative changes, and include deploying and undeploying applications, adding or deleting Managed Servers or components, changing ports, creating and deleting users, and changing passwords. As an administrator, you should be aware when administrative changes occur, because you may need to back up your environment or perform some synchronization procedures.

This appendix provides examples of administrative changes, listed by component. You can use this as a guide for performing the following procedures:

- Backup and Recovery
  Oracle recommends you perform a backup after each administrative change to your environment. You can use this appendix to determine the types of administrative changes that require you to back up your environment.

  See Also: Part IV, "Advanced Administration: Backup and Recovery"

- Disaster Recovery Synchronization Between the Primary and Standby Sites
  When you implement Disaster Recovery, you must update standby sites when you make an administrative change to your environment. You can use this appendix to determine the types of administrative changes that require you to update your standby sites.

  See Also: Oracle Fusion Middleware High Availability Guide
### F.2 Examples of Administrative Changes (by Component)

Table F–1 provides examples of administrative changes, by component. Consult your component documentation to learn more about these operations.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
| Oracle HTTP Server | Oracle HTTP Server administrative and configuration operations performed using Fusion Middleware Control, such as configuring modules, such as `mod_wl_ohs`, and creating virtual hosts  
Manual edits to Oracle HTTP Server configuration files  
Oracle HTTP Server administrative and configuration operations, such as registering a component with a domain, using the `opmnctl` utility |
| Oracle Internet Directory | Oracle Internet Directory administrative and configuration operations, such as running the `oidpasswd` utility (password management), and installing and removing components |
| Oracle Forms Services | Oracle Forms Services administrative and configuration operations performed using Fusion Middleware Control |
| Oracle Portal | Oracle Portal administrative and configuration operations performed using Fusion Middleware Control  
Oracle Portal administrative and configuration operations using the Administration screen in the Portal User Interface  
Manual edits to Oracle Portal configuration files  
Running the `ptlconfig` script  
Running any Portal-specific scripts that modify the database-side configuration for Portal, for example, disabling Oracle Web Cache or changing some background job frequencies in Portal |
| Oracle BPEL Process Analytics | Oracle BPEL Process Analytics administrative and configuration operations performed using Fusion Middleware Control |
| Oracle Reports Services | Oracle Reports Services administrative and configuration operations performed using Fusion Middleware Control, such as operations on the "Reports/Configuration" page  
Manual edits to Oracle Reports Services configuration files  
When the Reports server receives a job insert or update, such as when adding a new job or moving a job from one queue to another. Note: Oracle recommends that you perform backup and file synchronization more frequently when running Oracle Reports Services. |
| Oracle Web Cache | Oracle Web Cache configuration properties performed using Fusion Middleware Control. (Web Cache menu, then Administration). |
| Oracle WebLogic Server Administration Console | Domain-wide or component-specific administrative and configuration operations performed using the Administration Console, such as changing passwords, deploying and undeploying applications, and operations that result in configuration file changes |
This appendix describes how to view Oracle Fusion Middleware release numbers and how to use the opatch command line to apply patches to Oracle Fusion Middleware.

This appendix contains the following topics:

- Release Number Format
- Viewing the Software Inventory and Release Numbers
- Applying Patches

### G.1 Release Number Format

To understand the release level nomenclature used by Oracle, examine the example of an Oracle Fusion Middleware release number shown in Figure G–1.

#### Figure G–1  Example of an Oracle Fusion Middleware Release Number

In Figure G–1, each digit is labeled:

- Major Oracle platform number
  This is the most general identifier. It represents a major new edition (or version) of an application, such as Oracle database server or Oracle Fusion Middleware, and indicates that the release contains significant new functionality.

- Database maintenance release number
  This digit represents a maintenance release level. Some new features may also be included.

- Oracle Fusion Middleware release number
  This digit reflects the release level of Oracle Fusion Middleware.

- Component-specific release number

---

**Viewing Release Numbers and Applying Patches**  G-1
This digit identifies a release level specific to a component. Different components can have different numbers in this position depending upon, for example, component patch sets or interim releases.

- **Platform-specific release number**
  This digit identifies a platform-specific release.

## G.2 Viewing the Software Inventory and Release Numbers

The following sections describe how to obtain the release numbers of Oracle Fusion Middleware:

- **Viewing Oracle Fusion Middleware Installation Release Numbers**
- **Viewing Component Release Numbers**
- **Viewing Oracle Internet Directory Release Numbers**
- **Viewing Metadata Repository Release Numbers**

### G.2.1 Viewing Oracle Fusion Middleware Installation Release Numbers

All Oracle Fusion Middleware installations have a release number. This number is updated when you apply a patch set release or upgrade the installation.

You can view the release number of an Oracle Fusion Middleware installation using Oracle Universal Installer, as follows:

1. Launch Oracle Universal Installer:
   - (UNIX) `ORACLE_HOME/oui/bin/runInstaller.sh`
   - (Windows) `ORACLE_HOME/oui/bin/setup.exe`
2. Click **Installed Products** to open the Inventory Page.
3. In the Inventory Page, expand **Oracle Homes**. You will see entries for all installations on your host.
4. Expand the Oracle home entry for the installation you are interested in.
5. You will see an entry with the release number for your original installation, followed by entries for any patch sets that have been applied.

### G.2.2 Viewing Component Release Numbers

All Oracle Fusion Middleware components have a release number and many contain services that have release numbers. These numbers may be updated when you apply a patch set release or upgrade the installation.

You can view the release number of components and their services in the following ways:

- **On the File System**
- **Using Oracle Universal Installer**

**On the File System**

You can view component release numbers as follows on UNIX:

```
cd ORACLE_HOME/inventory
ls -d Components/*/*/
```
Using Oracle Universal Installer
If you installed Oracle Fusion Middleware using Oracle Universal Installer, you can view component release numbers as follows:

1. Launch Oracle Universal Installer:
   (UNIX) \ORACLE_HOME/oui/bin/runInstaller.sh
   (Windows) \ORACLE_HOME\oui\bin\setup.exe

2. Click Installed Products to open the Inventory Page.
3. In the Inventory Page, expand Oracle Homes. You will see entries for all installations on your host.
4. Expand the Oracle home entry for the installation you are interested in.
5. You will see an entry with the release number for your original installation, followed by entries for any patch sets that have been applied.
6. Expand the initial entry to view the component release numbers at installation time. If you have subsequent patch set entries, expand them to see the component release numbers updated for each patch set.

G.2.3 Viewing Oracle Internet Directory Release Numbers
Oracle Internet Directory has a server release number, which is the version of the binaries. It also has schema and context versions. All of these numbers correspond to the Oracle Fusion Middleware installation release number through the third digit. These numbers may be updated when you apply a patch set release or upgrade the installation.

Viewing the Oracle Internet Directory Server Release Number
The Oracle Internet Directory server release number is the version of the binaries. You can view the Oracle Internet Directory server release number as follows:

1. Make sure the ORACLE_HOME environment variable is set.
2. Run the following command:
   (UNIX) \ORACLE_HOME/bin/oidldapd -version
   (Windows) \ORACLE_HOME\bin\oidldapd -version

Viewing the Oracle Internet Directory Schema and Context Versions
You can view the Oracle Internet Directory schema and context versions in this file:

(UNIX) \ORACLE_HOME/ldap/schema/versions.txt
(Windows) \ORACLE_HOME\ldap\schema\versions.txt

The contents of this file are kept up-to-date, however, you can also query the schema and context release from Oracle Internet Directory, just to be sure.

To view the schema version:

1. Make sure the ORACLE_HOME environment variable is set.
2. Run the following command:
   ldapsearch -h oid_host -p oid_port -D "cn=orcladmin"
   -q -b "cn=base,cn=oracleschemaversion"
   -s base "objectclass="*" orclproductversion

   Because you use the -q option, the command prompts you for your password.
Applying Patches

The output will be in this form:
```
cn=BASE,cn=OracleSchemaVersion
orclproductversion=90500
```

To view the context version:

1. Make sure the ORACLE_HOME environment variable is set.
2. Run the following command:
   ```
   ldapsearch -h oid_host -p oid_port -D "cn=orcladmin"
   -q -b "cn=oraclecontext" -s base "objectclass=*" orclversion
   ```

Because you use the -q option, the command prompts you for your password.

The output will be in this form:
```
cn=oraclecontext
orclversion=101200
```

G.2.4 Viewing Metadata Repository Release Numbers

The Metadata Repository is an Oracle Database database that has a release number. This number is updated when you apply a patch set release or upgrade the database.

You can view the Metadata Repository release number using SQL*Plus as follows (you can be connected to the database as any user to issue these commands):

```sql
SQL> COL PRODUCT FORMAT A40
SQL> COL VERSION FORMAT A15
SQL> COL STATUS FORMAT A15
SQL> SELECT * FROM PRODUCT_COMPONENT_VERSION;
```

<table>
<thead>
<tr>
<th>PRODUCT</th>
<th>VERSION</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>NLSRTL</td>
<td>10.1.4.0.2</td>
<td>Production</td>
</tr>

G.3 Applying Patches

To apply patches, you use the following tools:

- OPatch, a utility that allows the application and rollback of interim patches to most Oracle products, such as Oracle Fusion Middleware. For the latest information about the opatch utility, and to check for updates, refer to Oracle MetaLink at
  ```
  http://www.oracle.com/support/metalink/index.html
  ```

- SmartUpdate, a standalone Java application that you can run independently of any software to upgrade Oracle WebLogic Server installations quickly and easily with maintenance patches and maintenance packs. When you install a product for the first time, Smart Update is automatically installed when you install Oracle WebLogic Server.

  For more information about using Smart Update and the products that Smart Update supports, see Oracle Smart Update Installing Patches and Maintenance Packs.

Note the following points about patching the MDS repository:
An MDS repository must be registered with a domain before it is patched. Otherwise, the applied patches cannot be rolled back and no additional patches can be applied.

You can apply patches to the following:

- The MDS metadata
- An MDS jar file
- An MDS shared library
- An MDS schema in the database-based metadata repository. The patch can include additive changes such as adding a new column or increasing the size of a column. Note that you cannot rollback this type of patch.
- The MDS database PL/SQL in the database-based metadata repository. The patch can include changes to a PL/SQL package or new PL/SQL packages and procedures.
- An MDS schema or PL/SQL in the database-based metadata repository that requires a corresponding MDS JAR file patch.

The following sections describe how to use OPatch:

- OPatch Requirements
- Running the OPatch Utility

**G.3.1 OPatch Requirements**

The OPatch utility has the following requirements:

- Perl environment, included with Oracle Fusion Middleware or downloaded with a patch set.

- The Oracle home environment variable (ORACLE_HOME) must point to a valid Oracle home directory and match the value used during installation of the Oracle home directory.

- If the -invPtrLoc command-line argument was used during installation, then it must be used when using the OPatch utility. Oracle recommends the use of the default central inventory for a platform.

- The jar, java, ar, cp, and make commands must be available in the PATH statement. The commands are not available for all platforms.

- The library path must be set correctly for Oracle Real Application Clusters environments. Refer to the FAQ document in the opatch/doc directory for additional information.

See Also: For the latest information about the OPatch utility, and to check for updates, refer to OracleMetaLink at http://www.oracle.com/support/metalink/index.html

**G.3.2 Running the OPatch Utility**

The OPatch utility is located in the ORACLE_HOME/OPatch directory. The following shows the syntax for the OPatch utility:

`path_to_opatch/opatch option -command_line_arguments`

In the preceding example:
Applying Patches

- **option**—the OPatch option. Values are described in **Table G–1**.
- **command_line_arguments**—the command-line arguments for each option. Values are described in the following sections.

<table>
<thead>
<tr>
<th><strong>Option</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>apply</strong></td>
<td>Installs an interim patch. See Section G.3.2.1.</td>
</tr>
<tr>
<td><strong>lsinventory</strong></td>
<td>Lists what is currently installed on the system. See Section G.3.2.2.</td>
</tr>
<tr>
<td><strong>query</strong></td>
<td>Queries a given patch for specific details. See Section G.3.2.3.</td>
</tr>
<tr>
<td><strong>rollback</strong></td>
<td>Removes an interim patch. See Section G.3.2.4.</td>
</tr>
<tr>
<td><strong>version</strong></td>
<td>Prints the current version of the patch tool. See Section G.3.2.5.</td>
</tr>
</tbody>
</table>

To view additional information for any option, use the following command:

```
path_to_OPath/opatch option -help
```

If using Perl, then use the following command:

```
perl opatch.pl option -help
```

### G.3.2.1 apply Option

The **apply** option applies an interim patch to a specified Oracle home. The ORACLE_HOME environment variable must be set to the Oracle home to be patched. The following syntax is used for this option:

```
path_to_OPath/opatch apply patch_location [-delay value] [-force] \
[-invPtrLoc path] [-jdk location] [-jre location] [-local] \
[-minimize_downtime] [-no_bug_superset] [-no_inventory] \
[-oh ORACLE_HOME_location] \
[-post options_to_be_passed_into_post [-opatch_post_end]]\ 
[-pre options_to_be_passed_into_pre [-opatch_pre_end]] \ 
[-retry value] [-silent] [-verbose]
```

The following table lists the command-line arguments for the **apply** option:

<table>
<thead>
<tr>
<th><strong>Argument</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>delay</strong></td>
<td>Specifies how many seconds to wait before attempting to lock the inventory in the case of a previous failure.</td>
</tr>
<tr>
<td><strong>force</strong></td>
<td>Removes conflicting patches from the system. If a conflict exists which prevents the patch from being applied, then the -force argument can be used to apply the patch.</td>
</tr>
<tr>
<td><strong>invPtrLoc</strong></td>
<td>Specifies the location of the oraInst.loc file. This argument is needed when the -invPtrLoc argument was used during installation. Oracle recommends the use of the default central inventory for a platform.</td>
</tr>
<tr>
<td><strong>jdk</strong></td>
<td>Specifies the location of a particular JDK (jar) to use instead of the default location under the Oracle home directory.</td>
</tr>
<tr>
<td><strong>jre</strong></td>
<td>Specifies the location of a particular JRE (Java) to use instead of the default location under the Oracle home directory.</td>
</tr>
</tbody>
</table>
Applying Patches

Viewing Release Numbers and Applying Patches

G.3.2.2 lsinventory Option

The lsinventory option reports what has been installed on the system for a particular Oracle home directory, or for all installations. The following syntax is used for this option:

```
path_to_opatch/opatch lsinventory [-all] [-detail] [-invPrtLoc path] \ 
[-jre location] [-oh ORACLE_HOME_LOCATION]
```
The following table lists the command-line arguments for the `lsinventory` option:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Reports the name and installation directory for each found Oracle home directory.</td>
</tr>
<tr>
<td>detail</td>
<td>Reports the installed products and other details. This argument cannot be used with the <code>-all</code> argument.</td>
</tr>
<tr>
<td>invPtrLoc</td>
<td>Specifies the location of the <code>oraInst.loc</code> file. This argument is needed when the <code>invPtrLoc</code> command-line argument was used during installation.</td>
</tr>
<tr>
<td>jre</td>
<td>Specifies the location of a particular JRE (Java) to use instead of the default location under the Oracle home directory.</td>
</tr>
<tr>
<td>oh</td>
<td>Specifies the Oracle home directory to use instead of the default directory.</td>
</tr>
</tbody>
</table>

The following is a sample output of `opatch lsinventory -detail`:

```
ORACLE_HOME LOCATION
----------- --------
Home1      /private/phi_local/OraHome1
        There is no Interim Patch
Home2      /private/phi_local/OraHome2
        There is no Interim Patch
Home3      /private/phi_local/OraHome6
        Installed Patch List:
        ======================  
        2) Patch 80 applied on Fri Jul 01 16:15:52 PDT 2006  [ Base Bug(s): 80 81 ]
```

**G.3.2.3 query Option**

The `query` option queries a specific patch for specific details. It provides information about the patch and the system being patched. The following syntax is used for this option:

```
path_to_opatch/opatch query [-all] [-get_base_bug] [-get_component] \ 
[-invPtrLoc path] [-get_date] [-get_os] [-get_system_change] [-is_rolling] \
```

The following table lists the command-line arguments for the `query` option:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Retrieves all information about a patch. This is equivalent to setting all command-line arguments.</td>
</tr>
<tr>
<td>get_base_bug</td>
<td>Describes the base bugs fixed by a patch.</td>
</tr>
<tr>
<td>get_component</td>
<td>Describes the Oracle components, optional or required, for a patch.</td>
</tr>
<tr>
<td>get_date</td>
<td>Provides the build date of a patch.</td>
</tr>
<tr>
<td>get_os</td>
<td>Provides the operating system description supported by a patch.</td>
</tr>
<tr>
<td>get_system_change</td>
<td>Describes the changes that will be made to the system by a patch. This argument is not available.</td>
</tr>
</tbody>
</table>
G.3.2.4 rollback Option

The rollback option removes a specific interim patch from the appropriate Oracle home directory. The following syntax is used for this option:

```
path_to_opatch/opatch rollback -id patch_id -ph patch_directory \ 
[-delay value] [-invPtrLoc path] [-jdk location] [-jre location] \ 
[-local] [-oh ORACLE_HOME_location] \ 
[-post options_to_be_passed_into_post [-opatch_post_end]] \ 
[-pre options_to_be_passed_into_pre [-opatch_pre_end]] [-retry value] \ 
[-silent] [-verbose]
```

The following table lists the command-line arguments for the rollback option:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>invPtrLoc</td>
<td>Specifies the location of the oraInst.loc file. This argument is needed when the invPtrLoc command-line argument was used during installation. Oracle recommends the use of the default central inventory for a platform.</td>
</tr>
<tr>
<td>is_rolling</td>
<td>Specifies if the patch is a rolling patch for Oracle Real Application Clusters. The set of patches need not be applied to the whole cluster at the same time. The patches can be applied to a select set of nodes at a time.</td>
</tr>
</tbody>
</table>

### G.3.2.4 rollback Option

The rollback option removes a specific interim patch from the appropriate Oracle home directory. The following syntax is used for this option:

```
path_to_opatch/opatch rollback -id patch_id -ph patch_directory \ 
[-delay value] [-invPtrLoc path] [-jdk location] [-jre location] \ 
[-local] [-oh ORACLE_HOME_location] \ 
[-post options_to_be_passed_into_post [-opatch_post_end]] \ 
[-pre options_to_be_passed_into_pre [-opatch_pre_end]] [-retry value] \ 
[-silent] [-verbose]
```

The following table lists the command-line arguments for the rollback option:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>invPtrLoc</td>
<td>Specifies the location of the oraInst.loc file. This argument is needed when the invPtrLoc command-line argument was used during installation. Oracle recommends the use of the default central inventory for a platform.</td>
</tr>
<tr>
<td>is_rolling</td>
<td>Specifies if the patch is a rolling patch for Oracle Real Application Clusters. The set of patches need not be applied to the whole cluster at the same time. The patches can be applied to a select set of nodes at a time.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies how many seconds the OPatch utility should wait before attempting to lock inventory again, if the -retry argument is used with the apply option.</td>
</tr>
<tr>
<td>id</td>
<td>Indicates the patch to be rolled back. Use the -lsinventory option to display all patch identifiers. To successfully rollback a patch, the patch identifier must be supplied.</td>
</tr>
<tr>
<td>invPtrLoc</td>
<td>Specifies the location of the oraInst.loc file. This argument is needed when the -invPtrLoc command-line argument was used during installation. Oracle recommends the use of the default central inventory for a platform.</td>
</tr>
<tr>
<td>jdk</td>
<td>Specifies the location of a particular JDK (jar) to use instead of the default location under the Oracle home directory.</td>
</tr>
<tr>
<td>jre</td>
<td>Specifies the location of a particular JRE (Java) to use instead of the default location under the Oracle home directory.</td>
</tr>
<tr>
<td>local</td>
<td>Specifies that the OPatch utility patch the local node and update the inventory of the local node. It does not propagate the patch or inventory update to other nodes.</td>
</tr>
<tr>
<td>oh</td>
<td>Specifies the Oracle home directory to use instead of the default directory.</td>
</tr>
<tr>
<td>opatch_post_end</td>
<td>Marks the end of the post options. This argument is used with the post argument. If this argument is not used, then everything after post is passed into post.</td>
</tr>
<tr>
<td>opatch_pre_end</td>
<td>Marks the end of the pre options. This argument is used with the pre argument. If this argument is not used, then everything after pre is passed into pre.</td>
</tr>
</tbody>
</table>
G.3.2.5 version Option

The version option shows the current version number of the OPatch utility. The following syntax is used for this option:

```
path_to_opatch/opatch version
```
Oracle Wallet Manager and orapki

Oracle Application Server 10g provided two utilities for managing wallets and certificates:

- Oracle Wallet Manager, a graphical user interface tool to manage PKI certificates
- The orapki utility, a command-line tool to manage certificate revocation lists (CRLs), create and manage Oracle wallets, and create signed certificates for testing purposes

Additionally, Oracle Application Server 10g provided the SSL Configuration Tool.

Oracle Fusion Middleware 11g Release 1 (11.1.1) provides:

- Additional orapki features
- The ability to manage JKS-based keystores, wallets, and certificates using Fusion Middleware Control
- Both command-line and graphical user interfaces to configure SSL

Use this appendix to learn about orapki updates, and to help transition to the new certificate, wallet management, and SSL configuration tools provided in 11g Release 1 (11.1.1). The appendix contains these topics:

- New orapki Features
- Using the orapki Utility for Certificate Validation and CRL Management
- Equivalent Features for Oracle Wallet Manager
- Equivalent Features for orapki
- Equivalent Features for the SSL Configuration Tool

**See Also:** *Oracle Application Server Administrator’s Guide* for Release 10g for details of Oracle Wallet Manager and orapki usage.

**Note:** The orapki utility is located in `$ORACLE_HOME/bin`.

### H.1 New orapki Features

The orapki command-line utility contains these new features in Oracle Fusion Middleware 11g Release 1 (11.1.1):

- orapki Usage Examples
- New CRL Management Features
New orapki Features

- New Version 3 Certificate Support
- Trust Chain Export
- Wallet Password Change
- Converting Between Oracle Wallet and JKS Keystore

H.1.1 orapki Usage Examples

Here are a few examples of using orapki:

```bash
# Create root wallet (for example, CA wallet)
orapki wallet create -wallet ./root -pwd mypasswd

# Add a self-signed certificate (CA certificate) to the root wallet
orapki wallet add -wallet ./root -dn 'CN=root_test,C=US' -keysize 1024 -self_signed -validity 3650 -pwd mypasswd

# Export self-signed certificate from the wallet
orapki wallet export -wallet ./root -dn 'CN=root_test,C=US' -cert ./root/b64certificate.txt -pwd mypasswd

# Create a user wallet (for example, a customer wallet)
orapki wallet create -wallet ./user -pwd mypasswd

# Add a certificate request
orapki wallet add -wallet ./user -dn 'CN=user_test,C=US' -keysize 1024 -pwd mypasswd

# Export the certificate request
orapki wallet export -wallet ./user -dn 'CN=user_test,C=US' -request ./user/creq.txt -pwd mypasswd

# Create a certificate (issued by CA)
orapki cert create -wallet ./root -request ./user/creq.txt -cert ./user/cert.txt -validity 3650 -pwd mypasswd

# Add a trusted certificate (CA certificate) to the wallet
orapki wallet add -wallet ./user -trusted_cert -cert ./root/b64certificate.txt -pwd mypasswd

# Add a user certificate
orapki wallet add -wallet ./user -user_cert -cert ./user/cert.txt -pwd mypasswd

# Display contents of wallet
orapki wallet display -wallet ./root -pwd mypasswd
```

H.1.2 New CRL Management Features

orapki supports several new command options to work with CRLs:

Creating a CRL
You use orapki crl create to create a CRL.
See Section H.2.6.3, "orapki crl create."

Revoking a Certificate
You use orapki crl revoke to revoke a certificate.
See Section H.2.6.8, "orapki crl revoke."
Verifying a CRL Signature
You use orapki crl verify to verify a CRL signature.
See Section H.2.6.11, "orapki crl verify."

Checking if a Certificate is Revoked in a CRL
You use orapki crl status to check if a certificate is revoked.
See Section H.2.6.9, "orapki crl status."

H.1.3 New Version 3 Certificate Support
orapki provides:
- The ability to add a subject key identifier extension to a certificate request
- The ability to add a version3 self-signed certificate to a wallet
See Section H.2.6.12, "orapki wallet add" for information about these features.

H.1.4 Trust Chain Export
You use orapki wallet export_trust_chain to export a chain of trust (certificate chain) for a user.
See Section H.2.6.17, "orapki wallet export_trust_chain."

H.1.5 Wallet Password Change
You use orapki wallet change_pwd to change a wallet password.
See Section H.2.6.13, "orapki wallet change_pwd."

H.1.6 Converting Between Oracle Wallet and JKS Keystore
You can convert a JKS keystore to an Oracle wallet, and convert an Oracle wallet to JKS.

Converting JKS to Oracle Wallet
Use this command to migrate entries from JKS store to p12 wallet:
```
jks_to_pkcs12 -wallet wallet -pwd pwd -keystore keystore
-jkspwd jkspwd [-aliases [alias:alias..]]
```
where the parameters are as follows:
- `wallet` is the wallet location; entries from the JKS keystore will be migrated to this wallet.
- `pwd` is the wallet password.
- `keystore` is the keystore location; this JKS will be migrated to the p12 wallet.
- `jkspwd` is the JKS password.
- `aliases` are optional. If specified, only entries corresponding to the specified alias are migrated. If not specified, all the entries are migrated.

To illustrate this command, start by creating a self-signed JKS keystore:
```
keytool -genkey -alias myalias -keyalg RSA -keysize 1024 -dname CN=root,C=US
-validity 3650 -keystore ./ewallet.jks -storetype jks -storepass password
-keypass password
```
Next, create an Oracle wallet:

```bash
orapki wallet create -wallet ./ -pwd password
```

Migrate the JKS keystore entries to the wallet:

```bash
orapki wallet jks_to_pkcs12 -wallet ./ -pwd password -keystore ./ewallet.jks -jkspwd password
```

**Note:** In this example the wallet was newly created and is empty. However, in practice the wallet need not be empty when you use this command; pre-existing entries are preserved.

### Converting Oracle Wallet to JKS

Use this command to migrate entries from a p12 wallet to a JKS keystore:

```bash
pkcs12_to_jks -wallet p12wallet -pwd p12pwd
[-jksKeyStoreLoc jksKSloc -jksKeyStorepwd jksKS_pwd]
[-jksTrustStoreLoc jksTrustKloc -jksTrustStorepwd jksTrustK_pwd]
```

where the parameters are as follows:

- **wallet** is the p12 wallet location
- **pwd** is the wallet password
- **jksKeyStoreLoc** is the JKS keystore location
- **jksKeyStorepwd** is the JKS keystore password
- **jksTrustStoreLoc** is the JKS truststore location
- **jksTrustStorepwd** is the JKS truststore password

**Note:** Passwords must have a minimum length of eight characters and contain alphabetic characters combined with numbers or special characters.

This example migrates all wallet entries to the same JKS keystore:

```bash
orapki wallet pkcs12_to_jks -wallet ./ -pwd mypasswd -jksKeyStoreLoc ./ewallet.jks -jksKeyStorepwd mypasswd2
```

This example migrates keys and trusted certificate entries into separate JKS keystores:

```bash
orapki wallet pkcs12_to_jks -wallet ./ -pwd mypasswd -jksKeyStoreLoc ./ewalletK.jks -jksKeyStorepwd mypasswd2
-jksTrustStoreLoc ./ewalletT.jks -jksTrustStorepwd mypasswd2
```

### H.2 Using the orapki Utility for Certificate Validation and CRL Management

This section contains these topics:

- orapki Overview
- Displaying orapki Help
- Creating Signed Certificates for Testing Purposes
Managing Oracle Wallets with the orapki Utility
Managing Certificate Revocation Lists (CRLs) with orapki Utility
orapki Utility Commands Summary

H.2.1 orapki Overview

The orapki utility is provided to manage public key infrastructure (PKI) elements, such as wallets and certificate revocation lists, on the command line so the tasks it performs can be incorporated into scripts. This enables you to automate many of the routine tasks of maintaining a PKI.

This command-line utility can be used to perform the following tasks:

- Creating signed certificates for testing purposes
- Managing Oracle wallets:
  - Creating and displaying Oracle wallets
  - Adding and removing certificate requests
  - Adding and removing certificates
  - Adding and removing trusted certificates
- Managing certificate revocation lists (CRLs):
  - Renaming CRLs with a hash value for certificate validation
  - Uploading, listing, viewing, and deleting CRLs in Oracle Internet Directory

orapki allows you to import certificates in both DER and PEM formats.

H.2.1.1 orapki Utility Syntax

The basic syntax of the orapki command-line utility is as follows:

```
orapki module command -parameter value
```

In the preceding command, `module` can be `wallet` (Oracle wallet), `crl` (certificate revocation list), or `cert` (PKI digital certificate). The available commands depend on the `module` you are using. For example, if you are working with a `wallet`, then you can add a certificate or a key to the wallet with the `add` command. The following example adds the user certificate located at `/private/lhale/cert.txt` to the wallet located at `ORACLE_HOME/wallet/ewallet.p12`:

```
orapki wallet add -wallet ORACLE_HOME/wallet/ewallet.p12
-user_cert -cert /private/lhale/cert.txt
```

H.2.2 Displaying orapki Help

You can display all the orapki commands that are available for a specific mode by entering the following at the command line:

```
orapki mode help
```

For example, to display all available commands for managing certificate revocation lists (CRLs), enter the following at the command line:

```
orapki crl help
```
H.2.3 Creating Signed Certificates for Testing Purposes

This command-line utility provides a convenient, lightweight way to create signed certificates for testing purposes. The following syntax can be used to create signed certificates and to view certificates:

To create a signed certificate for testing purposes:

```
orapki cert create [-wallet wallet_location] -request certificate_request_location -cert certificate_location -validity number_of_days [-summary]
```

This command creates a signed certificate from the certificate request. The `-wallet` parameter specifies the wallet containing the user certificate and private key that will be used to sign the certificate request. The `-validity` parameter specifies the number of days, starting from the current date, that this certificate will be valid. Specifying a certificate and certificate request is mandatory for this command.

To view a certificate:

```
orapki cert display -cert certificate_location [-summary | -complete]
```

This command enables you to view a test certificate that you have created with orapki. You can choose either `-summary` or `-complete`, which determines how much detail the command will display. If you choose `-summary`, the command will display the certificate and its expiration date. If you choose `-complete`, it will display additional certificate information, including the serial number and public key.

H.2.4 Managing Oracle Wallets with the orapki Utility

The following sections describe the syntax used to create and manage Oracle wallets with the orapki command-line utility. You can use these orapki utility wallet module commands in scripts to automate the wallet creation process.

- Creating and Viewing Oracle Wallets with orapki
- Adding Certificates and Certificate Requests to Oracle Wallets with orapki
- Exporting Certificates and Certificate Requests from Oracle Wallets with orapki

Note: The `-wallet` parameter is mandatory for all wallet module commands.

H.2.4.1 Creating and Viewing Oracle Wallets with orapki

To create an Oracle wallet:

```
orapki wallet create -wallet wallet_location
```

This command will prompt you to enter and re-enter a wallet password. It creates a wallet in the location specified for `-wallet`.

Note: Using the `-summary`, `-complete`, or `-wallet` command options is always optional. A command will still run if these command options are not specified.
To create an Oracle wallet with auto-login enabled:
```
orapki wallet create -wallet wallet_location -auto_login
```
This command creates a wallet with auto-login enabled, or it can also be used to enable auto-login on an existing wallet. If the `wallet_location` already contains a wallet, then auto-login will be enabled for it. To disable the auto-login feature, delete `cwallet.sso`.

**Note:** For wallets with the auto-login feature enabled, you are prompted for a password only for operations that modify the wallet, such as add.

To view an Oracle wallet:
```
orapki wallet display -wallet wallet_location
```
This command displays the certificate requests, user certificates, and trusted certificates contained in the wallet.

### H.2.4.2 Adding Certificates and Certificate Requests to Oracle Wallets with orapki

#### To add a certificate request to an Oracle wallet:
```
orapki wallet add -wallet wallet_location -dn user_dn -keysize 512|1024|2048|4096
```
This command adds a certificate request to a wallet for the user with the specified distinguished name (`user_dn`). The request also specifies the requested certificate’s key size (512, 1024, or 2048 bits). To sign the request, export it with the export option. See Section H.2.4.3, "Exporting Certificates and Certificate Requests from Oracle Wallets with orapki."

#### To add a trusted certificate to an Oracle wallet:
```
orapki wallet add -wallet wallet_location -trusted_cert -cert certificate_location
```
This command adds a trusted certificate, at the specified location (``cert certificate_location``), to a wallet. You must add all trusted certificates in the certificate chain of a user certificate before adding a user certificate, or the command to add the user certificate will fail.

#### To add a root certificate to an Oracle wallet:
```
orapki wallet add -wallet wallet_location -dn certificate_dn -keysiz 512|1024|2048 -self_signed -validity number_of_days
```
This command creates a new self-signed (root) certificate and adds it to the wallet. The `-validity` parameter (mandatory) specifies the number of days, starting from the current date, that this certificate will be valid. You can specify a key size for this root certificate (`-keysize`) of 512, 1024, 2048, or 4096 bits.

#### To add a user certificate to an Oracle wallet:
```
orapki wallet add -wallet wallet_location -user_cert -cert certificate_location
```
This command adds the user certificate at the location specified with the `cert certificate_location` parameter to the Oracle wallet at the `wallet_location`. Before you add a user certificate to a wallet, you must add all the trusted certificates that make up the...
certificate chain. If all trusted certificates are not installed in the wallet before you add the user certificate, then adding the user certificate will fail.

**H.2.4.3 Exporting Certificates and Certificate Requests from Oracle Wallets with orapki**

To export a certificate from an Oracle wallet:

```
orapki wallet export -wallet wallet_location -dn certificate_dn -cert certificate_filename
```

This command exports a certificate with the subject's distinguished name (-dn) from a wallet to a file that is specified by -cert.

To export a certificate request from an Oracle wallet:

```
orapki wallet export -wallet wallet_location -dn certificate_request_dn -request certificate_request_filename
```

This command exports a certificate request with the subject's distinguished name (-dn) from a wallet to a file that is specified by -request.

**H.2.5 Managing Certificate Revocation Lists (CRLs) with orapki Utility**

CRLs must be managed with orapki. This utility creates a hashed value of the CRL issuer's name to identify the CRLs location in your system. If you do not use orapki, your Oracle server cannot locate CRLs to validate PKI digital certificates. The following sections describe CRLs, how you use them, and how to use orapki to manage them:

- Section H.2.5.1, "About Certificate Validation with Certificate Revocation Lists"
- Section H.2.5.2, "Certificate Revocation List Management"

**H.2.5.1 About Certificate Validation with Certificate Revocation Lists**

The process of determining whether a given certificate can be used in a given context is referred to as certificate validation. Certificate validation includes determining that:

- A trusted certificate authority (CA) has digitally signed the certificate.
- The certificate's digital signature corresponds to the independently-calculated hash value of the certificate itself and the certificate signer's (CA's) public key.
- The certificate has not expired.
- The certificate has not been revoked.

The SSL network layer automatically performs the first three validation checks, but you must configure certificate revocation list (CRL) checking to ensure that certificates have not been revoked. CRLs are signed data structures that contain a list of revoked certificates. They are usually issued and signed by the same entity who issued the original certificate.

**H.2.5.1.1 What CRLs Should You Use?** You should have CRLs for all of the trust points that you honor. The trust points are the trusted certificates from a third-party identity that is qualified with a level of trust. Typically, the certificate authorities you trust are called trust points.

**H.2.5.1.2 How CRL Checking Works** Certificate revocation status is checked against CRLs which are located in file system directories, Oracle Internet Directory, or downloaded...
from the location specified in the CRL Distribution Point (CRL DP) extension on the certificate. If you store your CRLs on the local file system or in the directory, then you must update them regularly. If you use CRL DPs then CRLs are downloaded each time a certificate is used so there is no need to regularly refresh the CRLs.

The server searches for CRLs in the following locations in the order listed. When the system finds a CRL that matches the certificate CA’s DN, it stops searching.

1. Local file system

   The system checks the sqlnet.ora file for the SSL_CRL_FILE parameter first, followed by the SSL_CRL_PATH parameter. If these two parameters are not specified, then the system checks the wallet location for any CRLs.

   Note: if you store CRLs on your local file system, then you must use the orapki utility to periodically update them. See Section H.2.5.2.1, “Renaming CRLs with a Hash Value for Certificate Validation.”

2. Oracle Internet Directory

   If the server cannot locate the CRL on the local file system and directory connection information has been configured in the ORACLE_HOME/ldap/admin/ldap.ora file, then the server searches in the directory. It searches the CRL subtree by using the CA’s distinguished name (DN) and the DN of the CRL subtree.

   The server must have a properly configured ldap.ora file to search for CRLs in the directory. It cannot use the Domain Name System (DNS) discovery feature of Oracle Internet Directory. Also note that if you store CRLs in the directory, then you must use the orapki utility to periodically update them. See Section H.2.5.2.2, “Uploading CRLs to Oracle Internet Directory.”

3. CRL DP

   If the CA specifies a location in the CRL DP X.509, version 3, certificate extension when the certificate is issued, then the appropriate CRL that contains revocation information for that certificate is downloaded. Currently, Oracle Advanced Security supports downloading CRLs over HTTP and LDAP.

---

**Notes:**

- For performance reasons, only user certificates are checked.
- Oracle recommends that you store CRLs in the directory rather than the local file system.

---

**H.2.5.2 Certificate Revocation List Management**

Before you can enable certificate revocation status checking, you must ensure that the CRLs you receive from the CAs you use are in a form (renamed with a hash value) or in a location (uploaded to the directory) in which your system can use them. Oracle Advanced Security provides a command-line utility, orapki, that you can use to perform the following tasks:

- Renaming CRLs with a Hash Value for Certificate Validation
- Uploading CRLs to Oracle Internet Directory
- Listing CRLs Stored in Oracle Internet Directory
- Viewing CRLs in Oracle Internet Directory
- Deleting CRLs from Oracle Internet Directory
You can also use LDAP command-line tools to manage CRLs in Oracle Internet Directory.

**See Also:** Command-Line Tools Overview in the *Oracle Fusion Middleware User Reference for Oracle Identity Management* for information about LDAP command-line tools and their syntax.

### H.2.5.2.1 Renaming CRLs with a Hash Value for Certificate Validation

When the system validates a certificate, it must locate the CRL issued by the CA who created the certificate. The system locates the appropriate CRL by matching the issuer name in the certificate with the issuer name in the CRL.

When you specify a CRL storage location for the Certificate Revocation Lists Path field in Oracle Net Manager (sets the SSL_CRL_PATH parameter in the sqlnet.ora file), use the orapki utility to rename CRLs with a hash value that represents the issuer's name. Creating the hash value enables the server to load the CRLs.

On UNIX systems, orapki creates a symbolic link to the CRL. On Windows systems, it creates a copy of the CRL file. In either case, the symbolic link or the copy created by orapki are named with a hash value of the issuer's name. Then when the system validates a certificate, the same hash function is used to calculate the link (or copy) name so the appropriate CRL can be loaded.

Depending on your operating system, enter one of the following commands to rename CRLs stored in the file system.

**To rename CRLs stored in UNIX file systems:**

```
orapki crl hash -crl crl_filename [-wallet wallet_location] -symlink crl_directory [-summary]
```

**To rename CRLs stored in Windows file systems:**

```
orapki crl hash -crl crl_filename [-wallet wallet_location] -copy crl_directory [-summary]
```

In the preceding commands, `crl_filename` is the name of the CRL file, `wallet_location` is the location of a wallet that contains the certificate of the CA that issued the CRL, and `crl_directory` is the directory in which the CRL is located.

Using `-wallet` and `-summary` are optional. Specifying `-wallet` causes the tool to verify the validity of the CRL against the CA's certificate prior to renaming the CRL. Specifying the `-summary` option causes the tool to display the CRL issuer's name.

### H.2.5.2.2 Uploading CRLs to Oracle Internet Directory

Publishing CRLs in the directory enables CRL validation throughout your enterprise, eliminating the need for individual applications to configure their own CRLs. All applications can use the CRLs stored in the directory in which they can be centrally managed, greatly reducing the administrative overhead of CRL management and use.

The user who uploads CRLs to the directory by using orapki must be a member of the directory group `CRLAdmins (cn=CRLAdmins,cn=groups,%s_OracleContextDN%)`. This is a privileged operation because these CRLs are

---

**Note:** CRLs must be updated at regular intervals (before they expire) for successful validation. You can automate this task by using orapki commands in a script.
Using the orapki Utility for Certificate Validation and CRL Management

accessible to the entire enterprise. Contact your directory administrator to be added to this administrative directory group.

To upload CRLs to the directory, enter the following at the command line:

```
orapki crl upload -crl crl_location -ldap hostname:ssl_port -user username [-wallet wallet_location] [-summary]
```

In the preceding command, `crl_location` is the file name or URL in which the CRL is located, `hostname` and `ssl_port` (SSL port with no authentication) are for the system on which your directory is installed, `username` is the directory user who has permission to add CRLs to the CRL subtree, and `wallet_location` is the location of a wallet that contains the certificate of the CA that issued the CRL.

Using `-wallet` and `-summary` are optional. Specifying `-wallet` causes the tool to verify the validity of the CRL against the CA's certificate prior to uploading it to the directory. Specifying the `-summary` option causes the tool to print the CRL issuer's name and the LDAP entry in which the CRL is stored in the directory.

---

**Note:**

- The `orapki` utility will prompt you for the directory password when you perform this operation.
- Ensure that you specify the directory SSL port on which the Diffie-Hellman-based SSL server is running. This is the SSL port that does not perform authentication. Neither the server authentication nor the mutual authentication SSL ports are supported by the `orapki` utility.

---

**H.2.5.2.3 Listing CRLs Stored in Oracle Internet Directory** You can display a list of all CRLs stored in the directory with `orapki`, which is useful for browsing to locate a particular CRL to view or download to your local system. This command displays the CA who issued the CRL (Issuer) and its location (DN) in the CRL subtree of your directory.

To list CRLs in Oracle Internet Directory, enter the following at the command line:

```
orapki crl list -ldap hostname:ssl_port
```

In the preceding command, the `hostname` and `ssl_port` are for the system on which your directory is installed. Note that this is the directory SSL port with no authentication as described in the preceding section.

**H.2.5.2.4 Viewing CRLs in Oracle Internet Directory** You can view specific CRLs that are stored in Oracle Internet Directory in a summarized format or you can request a complete listing of revoked certificates for the specified CRL. A summary listing provides the CRL issuer's name and its validity period. A complete listing provides a list of all revoked certificates contained in the CRL.

To view a summary listing of a CRL in Oracle Internet Directory, enter the following at the command line:

```
orapki crl display -crl crl_location [-wallet wallet_location] -summary
```

In the preceding command, `crl_location` is the location of the CRL in the directory. It is convenient to paste the CRL location from the list that displays when you use the `orapki crl list` command. See "Section H.2.5.2.3, "Listing CRLs Stored in Oracle Internet Directory".  

To view a list of all revoked certificates contained in a specified CRL, which is stored in Oracle Internet Directory, enter the following at the command line:

```
ora.pat crl display -crl crl_location [-wallet wallet_location] -complete
```

For example, the following `ora.pat` command:

```
orapki crl display -crl $T_WORK/pki/wlt_crl/nzcrl.txt -wallet $T_WORK/pki/wlt_crl -complete
```

produces the following output, which lists the CRL issuer's DN, its publication date, date of its next update, and the revoked certificates it contains:

```
issuer = CN=root,C=us, thisUpdate = Sun Nov 16 10:56:58 PST 2003,
nextUpdate = Mon Sep 30 11:56:58 PDT 2013, revokedCertificates =
{(serialNo = 153328337134593999575438325845117876415,
revocationDate = Sun Nov 16 10:56:58 PST 2003)}
CRL is valid
```

Using the `-wallet` option causes the `ora.pat crl display` command to validate the CRL against the CA's certificate.

Depending on the size of your CRL, choosing the `-complete` option may take a long time to display.

You can also use Oracle Directory Manager, a graphical user interface tool that is provided with Oracle Internet Directory, to view CRLs in the directory. CRLs are stored in the following directory location:

```
CN=CRLValidation,CN=Validation,CN=PKI,CN=Products,CN=OracleContext
```

**H.2.5.2.5 Deleting CRLs from Oracle Internet Directory** The user who deletes CRLs from the directory by using `ora.pat` must be a member of the directory group `CRLAdmins`. See Section H.2.5.2.2, "Uploading CRLs to Oracle Internet Directory" for information about this directory administrative group.

To delete CRLs from the directory, enter the following at the command line:

```
orapki crl delete -issuer issuer_name -ldap hostname:ssl_port
-user username [-summary]
```

In the preceding command, `issuer_name` is the name of the CA who issued the CRL, the `hostname` and `ssl_port` are for the system on which your directory is installed, and `username` is the directory user who has permission to delete CRLs from the CRL subtree. Note that this must be a directory SSL port with no authentication. See Section H.2.5.2.2, "Uploading CRLs to Oracle Internet Directory" for more information about this port.

Using the `-summary` option causes the tool to print the CRL LDAP entry that was deleted.

For example, the following `ora.pat` command:

```
orapki crl delete -issuer 'CN=root,C=us'
-ldap machine1:3500 -user cn=orcladmin -summary
```

produces the following output, which lists the location of the deleted CRL in the directory:

```
Deleted CRL at cn=root
cd45860c.rN,cn=CRLValidation,cn=Validation,cn=PKI,cn=Products,cn=OracleContext
```
H.2.6 orapki Utility Commands Summary

This section lists and describes the following orapki commands:

- orapki cert create
- orapki cert display
- orapki crl create
- orapki crl delete
- orapki crl display
- orapki crl hash
- orapki crl list
- orapki crl revoke
- orapki crl status
- orapki crl upload
- orapki crl verify
- orapki wallet add
- orapki wallet change_pwd
- orapki wallet create
- orapki wallet display
- orapki wallet export
- orapki wallet export_trust_chain

H.2.6.1 orapki cert create

The following sections describe this command.

H.2.6.1.1 Purpose

Use this command to create a signed certificate for testing purposes.

H.2.6.1.2 Syntax

orapki cert create [-wallet wallet_location]
-request certificate_request_location
-cert certificate_location -validity number_of_days [-summary]

- The -wallet parameter specifies the wallet containing the user certificate and private key that will be used to sign the certificate request.
- The -request parameter (mandatory) specifies the location of the certificate request for the certificate you are creating.
- The -cert parameter (mandatory) specifies the directory location in which the tool places the new signed certificate.
- The -validity parameter (mandatory) specifies the number of days, starting from the current date, that this certificate will be valid.

H.2.6.2 orapki cert display

The following sections describe this command.

H.2.6.2.1 Purpose

Use this command to display details of a specific certificate.

H.2.6.2.2 Syntax

orapki cert display -cert certificate_location
The `--cert` parameter specifies the location of the certificate you want to display.

You can use either the `--summary` or the `--complete` parameter to display the following information:
- `--summary` displays the certificate and its expiration date
- `--complete` displays additional certificate information, including the serial number and public key

**H.2.6.3 orapki crl create**
The following sections describe this command.

**H.2.6.3.1 Purpose** Use this command to create a CRL.

**H.2.6.3.2 Syntax**
```
orapki crl create [-crl [url|filename]]
[-wallet [cawallet]]
[-nextupdate [days]]
[-pwd pwd]
```

- `--crl` is the location where the CRL will be created (for example ./nzcrl.txt)
- `--wallet` is the cawallet, which contains self-signed certificate and corresponding private key
- `--nextupdate` is the number of days until the next update
- `--pwd` is the password of cawallet

**H.2.6.4 orapki crl delete**
The following sections describe this command.

**H.2.6.4.1 Purpose** Use this command to delete CRLs from Oracle Internet Directory. Note that the user who deletes CRLs from the directory by using orapki must be a member of the CRLAdmins (cn=CRLAdmins,cn=groups,%s_OracleContextDN%) directory group.

**H.2.6.4.2 Syntax**
```
orapki crl delete -issuer issuer_name
-ldap hostname:ssl_port -user username [--summary]
```

- The `--issuer` parameter specifies the name of the certificate authority (CA) who issued the CRL.
- The `--ldap` parameter specifies the hostname and SSL port for the directory in which the CRLs are to be deleted. Note that this must be a directory SSL port with no authentication. See Section H.2.5.2.2, "Uploading CRLs to Oracle Internet Directory" for more information about this port.
- The `--user` parameter specifies the username of the directory user who has permission to delete CRLs from the CRL subtree in the directory.
- The `--summary` parameter is optional. Using it causes the tool to print the CRL LDAP entry that was deleted.

**H.2.6.5 orapki crl display**
The following sections describe this command.
H.2.6.5  Purpose  Use this command to display specific CRLs that are stored in Oracle Internet Directory.

H.2.6.5.2  Syntax  
orapki crl display -crl crl_location
    [-wallet wallet_location] [-summary|-complete]

- The -crl parameter specifies the location of the CRL in the directory. It is convenient to paste the CRL location from the list that displays when you use the orapki crl list command. See Section H.2.6.7, "orapki crl list".
- The -wallet parameter (optional) specifies the location of the wallet that contains the certificate of the certificate authority (CA) who issued the CRL. Using it causes the tool to verify the validity of the CRL against the CA's certificate prior to displaying it.
- Choosing either the -summary or the -complete parameters displays the following information:
  - -summary provides a listing that contains the CRL issuer's name and the CRL's validity period
  - -complete provides a list of all revoked certificates that the CRL contains. Note that this option may take a long time to display, depending on the size of the CRL.

H.2.6.6  orapki crl hash
The following sections describe this command.

H.2.6.6.1  Purpose  Use this command to generate a hash value of the certificate revocation list (CRL) issuer to identify the location of the CRL in your file system for certificate validation.

H.2.6.6.2  Syntax  
orapki crl hash -crl crl_filename|URL
    [-wallet wallet_location] [-symlink|-copy] crl_directory [-summary]

- The -crl parameter specifies the filename that contains the CRL or the URL in which it can be found.
- The -wallet parameter (optional) specifies the location of the wallet that contains the certificate of the certificate authority (CA) who issued the CRL. Using it causes the tool to verify the validity of the CRL against the CA's certificate prior to uploading it to the directory.
- Depending on your operating system, use either the -symlink or the -copy parameter:
  - On UNIX: Use -symlink to create a symbolic link to the CRL at the crl_directory location
  - On Windows: Use -copy to create a copy of the CRL at the crl_directory location
- The -summary parameter (optional) causes the tool to display the CRL issuer's name.

H.2.6.7  orapki crl list
The following sections describe this command.
H.2.6.7.1 **Purpose** Use this command to display a list of CRLs stored in Oracle Internet Directory. This is useful for browsing to locate a particular CRL to view or download to your local file system.

H.2.6.7.2 **Syntax** `orapki crl list -ldap hostname:ssl_port`

The `-ldap` parameter specifies the hostname and SSL port for the directory server from which you want to list CRLs. Note that this must be a directory SSL port with no authentication. See Section H.2.5.2.2, "Uploading CRLs to Oracle Internet Directory" for more information about this port.

H.2.6.8 **orapki crl revoke**
The following sections describe this command.

H.2.6.8.1 **Purpose** Use this command to revoke a certificate.

H.2.6.8.2 **Syntax**
```
orapki crl revoke [-crl [url|filename]]
[-wallet [cawallet]]
[-cert [revokecert]]
[-pwd pwd]
```

where:
- `-crl` specifies the CRL as either a URL or a filename
- `-wallet` is the cawallet, which contains self-signed certificate and corresponding private key
- `-cert`: certificate to be revoked
- `-pwd` is the password of cawallet.

H.2.6.9 **orapki crl status**
The following sections describe this command.

H.2.6.9.1 **Purpose** Use this command to check if a certificate is revoked in a CRL.

H.2.6.9.2 **Syntax**
```
orapki crl status [-crl [url|filename]]
[-cert [cert]]
```

- `-crl` specifies the CRL as either a URL or a filename
- `-cert` is the CA’s certificate

H.2.6.10 **orapki crl upload**
The following sections describe this command.

H.2.6.10.1 **Purpose** Use this command to upload certificate revocation lists (CRLs) to the CRL subtree in Oracle Internet Directory. Note that you must be a member of the directory administrative group CRLAdmins (cn=CRLAdmins, cn=groups, %s_OracleContextDN%) to upload CRLs to the directory.

H.2.6.10.2 **Syntax**
```
orapki crl upload -crl crl_location
-ldap hostname:ssl_port -user username
[-wallet wallet_location] [-summary]
```
- The `-crl` parameter specifies the directory location or the URL of the CRL that you are uploading to the directory.
- The `-ldap` parameter specifies the hostname and SSL port for the directory to which you are uploading the CRLs. Note that this must be a directory SSL port with no authentication. See Section H.2.5.2.2, "Uploading CRLs to Oracle Internet Directory" for more information about this port.
- The `-user` parameter specifies the username of the directory user who has permission to add CRLs to the CRL subtree in the directory.
- The `-wallet` parameter specifies the location of the wallet that contains the certificate of the certificate authority (CA) who issued the CRL. This is an optional parameter. Using it causes the tool to verify the validity of the CRL against the CA's certificate prior to uploading it to the directory.
- The `-summary` parameter is also optional. Using it causes the tool to display the CRL issuer's name and the LDAP entry in which the CRL is stored in the directory.

H.2.6.11 orapki crl verify
The following sections describe this command.

H.2.6.11.1 Purpose Use this command to verify a CRL signature.

H.2.6.11.2 Syntax orapki crl verify [-crl [url|filename]] [-cert [cacert]]
where:
- `-crl` specifies the CRL as either a URL or a filename
- `-cert` specifies the certificate to be checked

H.2.6.12 orapki wallet add
The following sections describe this command.

H.2.6.12.1 Purpose Use this command to add certificate requests and certificates to an Oracle wallet.

H.2.6.12.2 Syntax To add certificate requests:

orapki wallet add -wallet wallet_location -dn user_dn -keysize 512|1024|2048
- The `-wallet` parameter specifies the location of the wallet to which you want to add a certificate request.
- The `-dn` parameter specifies the distinguished name of the certificate owner.
- The `-keysize` parameter specifies the key size for the certificate.
- To sign the request, export it with the export option. See Section H.2.6.16, "orapki wallet export".

To add trusted certificates:

orapki wallet add -wallet wallet_location -trusted_cert -cert certificate_location
- The `-trusted_cert` parameter causes the tool to add the trusted certificate, at the location specified with `-cert`, to the wallet.
To add root certificates:

```
orapki wallet add -wallet wallet_location -dn certificate_dn -keysize 512|1024|2048 -self_signed -validity number_of_days
```

- The `-self_signed` parameter causes the tool to create a root certificate.
- The `-validity` parameter is mandatory. Use it to specify the number of days, starting from the current date, that this root certificate will be valid.

To add user certificates:

```
orapki wallet add -wallet wallet_location -user_cert -cert certificate_location
```

- The `-user_cert` parameter causes the tool to add the user certificate at the location specified with the `-cert` parameter to the wallet. Before you add a user certificate to a wallet, you must add all the trusted certificates that make up the certificate chain. If all trusted certificates are not installed in the wallet before you add the user certificate, then adding the user certificate will fail.

To add a subject key identifier extension to a certificate request:

```
orapki wallet add -wallet wallet_location -dn user_dn -keysize 512|1024|2048 -addext_ski
```

To add a Version 3 self-signed certificate to a wallet:

```
orapki wallet add -wallet wallet_location -dn certificate_dn -keysize 512|1024|2048 -self_signed -validity number_of_days -addext_ski
```

H.2.6.13 orapki wallet change_pwd

The following sections describe this command.

H.2.6.13.1 Purpose

Use this command to change the password for an Oracle wallet.

H.2.6.13.2 Syntax

```
orapki wallet change_pwd [-wallet [wallet_location]] [-oldpwd oldpassword] [-newpwd newpassword]
```

- The `-wallet` parameter specifies the location of the wallet whose password you want to change.
- The `-oldpwd` parameter specifies the existing wallet password.
- The `-newpwd` parameter specifies the new wallet password.

H.2.6.14 orapki wallet create

The following sections describe this command.

H.2.6.14.1 Purpose

Use this command to create an Oracle wallet or to set auto-login on for an Oracle wallet.

H.2.6.14.2 Syntax

```
orapki wallet create -wallet wallet_location [-auto_login]
```

- The `-wallet` parameter specifies a location for the new wallet or the location of the wallet for which you want to turn on auto-login.
- The `-auto_login` parameter creates an auto-login wallet, or it turns on automatic login for the wallet specified with the `-wallet` option.
H.2.6.15 orapki wallet display
The following sections describe this command.

H.2.6.15.1 Purpose Use this command to view the certificate requests, user certificates, and trusted certificates in an Oracle wallet.

H.2.6.15.2 Syntax orapki wallet display -wallet wallet_location
- The -wallet parameter specifies a location for the wallet you want to open if it is not located in the current working directory.

H.2.6.16 orapki wallet export
The following sections describe this command.

H.2.6.16.1 Purpose Use this command to export certificate requests and certificates from an Oracle wallet.

H.2.6.16.2 Syntax orapki wallet export -wallet wallet_location -dn certificate_dn -cert certificate_filename
- The -wallet parameter specifies the directory where the wallet, from which you want to export the certificate, is located.
- The -dn parameter specifies the distinguished name of the certificate.
- The -cert parameter specifies the path and filename of the file that contains the exported certificate.

To export a certificate request from an Oracle wallet:

orapki wallet export -wallet wallet_location -dn certificate_request_dn -request certificate_request_filename
- The -request parameter specifies the path and filename of the file that contains the exported certificate request.

H.2.6.17 orapki wallet export_trust_chain
The following sections describe this command.

H.2.6.17.1 Purpose Use this command to export a chain of trust (certificate chain) for a user.

H.2.6.17.2 Syntax orapki wallet export_trust_chain [-wallet [wallet]] [-certchain [filename]] [-dn [user_cert_dn]] [-pwd pwd]
- The -wallet parameter specifies the location of the wallet from which you want to export the certificate chain.
- The -certchain parameter specifies the name of the file to contain the exported certificate chain.
- The -dn parameter specifies the distinguished name of the entry to be exported.
- The -pwd specifies the wallet password.
### H.3 Equivalent Features for Oracle Wallet Manager

Table H–1 shows the wallet management features provided by Oracle Wallet Manager, and the commands or options that provide equivalent functionality in 11g Release 1 (11.1.1).

#### Table H–1 Mapping for Oracle Wallet Manager Features for Wallets

<table>
<thead>

Equivalent Features for orapki

Location of Default Wallet

The default location of the wallet depends on the ORACLE_HOME setting:

- When ORACLE_HOME is set, the default wallet location is $ORACLE_HOME/owm/wallets/username.
- When ORACLE_HOME is not set, the default wallet location is CurrentDir/owm/wallets/username.

H.4 Equivalent Features for orapki

Table H–4 shows the features provided by the orapki utility for certificates, and the equivalent commands or options in 11g Release 1 (11.1.1).

</table>
This appendix provides information on how to troubleshoot problems that you might encounter when using Oracle Fusion Middleware. It contains the following topics:

- Diagnosing Oracle Fusion Middleware Problems
- Common Problems and Solutions
- Troubleshooting Fusion Middleware Control
- Need More Help?

I.1 Diagnosing Oracle Fusion Middleware Problems

Oracle Fusion Middleware components generate log files containing messages that record all types of events, including startup and shutdown information, errors, warning messages, access information on HTTP requests, and additional information. The log files can be used to identify and diagnose problems. See Chapter 10, "Managing Log Files and Diagnostic Data" for more information about using and reading log files.

I.2 Common Problems and Solutions

This section describes common problems and solutions. It contains the following topics:

- Using a Different Version of Spring
- ClassNotFound Errors When Starting Managed Servers

I.2.1 Using a Different Version of Spring

When you configure a Managed Server with JRF, Spring 2.0.6 is installed and is placed in the Oracle WebLogic Server system classpath. If a custom application running in a JRF environment requires a different version of Spring, you must use the Filtering ClassLoader mechanism to specify the version of Spring.

Oracle WebLogic Server provides the FilteringClassLoader mechanism so that you can configure deployment descriptors to explicitly specify that certain packages should always be loaded from the application, rather than being loaded by the system classloader. This allows you to use alternate versions of applications such as Spring or Ant.

For more information about using the FilteringClassLoader mechanism, see "Using a Filtering ClassLoader" in the Oracle Fusion Middleware Developing Applications for Oracle WebLogic Server.
I.2.2 ClassNotFound Errors When Starting Managed Servers

If a Managed Server is started by Node Manager (as is the case when the servers are started by the Oracle WebLogic Server Administration Console or Fusion Middleware Control), you may receive this error if Node Manager has not been configured to use the start scripts when starting Managed Servers. See Section 4.2.4 for information about resolving this problem.

I.3 Troubleshooting Fusion Middleware Control

The following sections describe problems and issues when using Fusion Middleware Control:

- Troubleshooting the Display of Performance Metrics and Charts in Fusion Middleware Control
- Securing the Connection from Fusion Middleware Control to Oracle WebLogic Server Administration Console

I.3.1 Troubleshooting the Display of Performance Metrics and Charts in Fusion Middleware Control

If you are using Fusion Middleware Control to manage system components, then you might encounter situations where the performance metrics and charts do not display properly for certain managed targets.

The following sections provide information about managed targets and describe some common troubleshooting tasks to perform if Fusion Middleware Control displays errors when attempting to display performance metrics, such as response time and load metrics:

- What Are Agent-Monitored Targets?
- Setting Monitoring Credentials for All Agent-Monitored Targets in a Farm
- Changing the Monitoring Credentials for a Specific Agent-Monitored Target
- Verifying or Changing the Oracle Management Agent URL

I.3.1.1 What Are Agent-Monitored Targets?

To discover and view the following components with Fusion Middleware Control, an Oracle Management Agent must be available and running:

- Oracle Reports
- Oracle Internet Directory
- Oracle Virtual Directory
- Oracle Directory Integration Platform
- Oracle Identity Federation

These components can be referred to as agent-monitored targets.

When you install and configure an Oracle Fusion Middleware environment that includes these components, a management agent, Oracle Management Agent, is also installed and running in the Oracle instance.

In contrast, Java components and some system components can be managed by Fusion Middleware Control without a management agent.
For more information about the Oracle Management Agent, refer to the Oracle Enterprise Manager documentation on the Oracle Technology Network (OTN):
http://www.oracle.com/technology/documentation/oem.html

I.3.1.2 Setting Monitoring Credentials for All Agent-Monitored Targets in a Farm
To make it easier to manage the monitoring credentials for all of your agent-monitored targets, you can use the Monitoring Credentials page to set the monitoring credentials for all of the agent-monitored targets in the farm:

1. From the Farm menu, select Monitoring Credentials.
2. Enter the user name and password of an Oracle WebLogic Server user account that has at least the monitoring level of privileges.

When you set the monitoring credentials on this page, you override all the monitoring credentials for the agent-monitored targets in the farm. However, after you set the monitoring credentials for all the targets, you can override the credentials for a specific target by using the Agent-Monitored Targets page, as described in Section I.3.1.2.

I.3.1.3 Changing the Monitoring Credentials for a Specific Agent-Monitored Target
To manage a target (an Oracle Fusion Middleware component), the Oracle Management Agent uses an Oracle WebLogic Server administration account to connect to the target. After it connects to the target, the Oracle Management Agent can gather performance metrics and send them back to the Fusion Middleware Control where they appear on monitoring pages and in performance charts.

This administration account and its password are called the monitoring credentials for an agent-monitored target.

If the monitoring credentials for a particular target are changed in Oracle WebLogic Server, then the Oracle Management Agent can no longer obtain the performance metrics. As a result, no metrics for the target will appear on the Fusion Middleware Control pages and the performance charts will not render.

To fix this problem, you can modify the monitoring credentials of the Agent-Monitored target in Fusion Middleware Control:

1. From the Farm menu, select Monitoring Credentials.
   The Monitoring Credentials page is displayed.
2. Click Agent-Monitored Targets.
   The Agent-Monitored Targets page is displayed.
3. Click the Configure icon for the target that you need to modify.
4. On the Configuration page, locate the monitoring credentials fields and change the credentials to match those of an Oracle WebLogic Server user account that has at least the "monitoring" level of privileges.

I.3.1.4 Verifying or Changing the Oracle Management Agent URL
If the performance metrics for all of the agent-monitored targets in the farm are unavailable, and you have verified that the monitoring credentials for the agent-monitored targets is correct, then you might have to modify the URL used by the Oracle Management Agent to communicate with Fusion Middleware Control.

This situation can occur if you have backed up your environment and restored it to another host, or if you have moved your test environment to a production environment. In either case, the host name required in the Oracle Management Agent
URL must be changed before the Oracle Management Agent can once again communicate with Fusion Middleware Control.

To modify the Oracle Management Agent URL:

1. From the Farm menu, select Monitoring Credentials.
The Monitoring Credentials page is displayed.
2. Click Agent-Monitored Targets.
The Agent-Monitored Targets page is displayed.
3. Click the Configure icon for one of the agent-monitored targets listed on the page.
4. Change the Oracle Management Agent URL.

I.3.2 Securing the Connection from Fusion Middleware Control to Oracle WebLogic Server Administration Console

By default, if you access Oracle WebLogic Server Administration Console from Fusion Middleware Control, the connection is a non-SSL connection. To access the Oracle WebLogic Server Administration Console using an SSL connection, you need to access it manually using the SSL port. Alternatively, you can enable a secure Administration port.

See "Understanding Network Channels" in the Oracle Fusion Middleware Configuring Server Environments for Oracle WebLogic Server for information about the admin channel and how to establish a channel.

If you want to enable a secure mode of communication with the Administration Server domain and to disable all other non-secure modes, you may need to perform the following explicit steps to enable Oracle Management Agent to monitor agent-monitored targets in Fusion Middleware Control. (See Section I.3.1.1 for information about agent-monitored targets.) These steps are needed only if you are using the default self-signed certificates on the Administration Server instance or other signed certificates whose Certification Authorities (CAs) are not available in the default trust store of the JVM used by Oracle Management Agent.

In this case, take the following steps:

1. Stop the Oracle Management Agent using the following command:

   `ORACLE_HOME/bin/emctl stop agent`

2. Export the certificate from Oracle WebLogic Server:

   When prompted, enter the password.

3. Update the JDKs default trust store (`JAVA_HOME/jre/lib/security/cacerts`) with the certificate. (This is the JDK being used by Oracle Management Agent.)

   `keytool -import -alias demoidentity -trustcacerts -file /temp/wlcert -keystore JAVA_HOME/jre/lib/security/cacerts -storepass password`

   When asked if you trust this certificate, enter yes.

4. Start the Oracle Management Agent using the following command:

   `ORACLE_HOME/bin/emctl start agent`
I.4 Need More Help?

You can find more solutions on OracleMetaLink, http://metalink.oracle.com. If you do not find a solution for your problem, log a service request.

You can also use the Remote Diagnostic Agent, as described in Section I.4.1.

See Also: Oracle Fusion Middleware Release Notes, available on the Oracle Technology Network:

http://www.oracle.com/technology/documentation/index.html

I.4.1 Using Remote Diagnostic Agent

Remote Diagnostic Agent (RDA) is a command-line diagnostic tool that provides a comprehensive picture of your environment. Additionally, RDA can provide recommendations on various topics, for example configuration and security. This aids you and Oracle Support in resolving issues.

RDA is designed to be as unobtrusive as possible; it does not modify systems in any way. A security filter is provided if required.

For more information about RDA, see the readme file, which is located at:
