Oracle Fusion Middleware Application Adapter for PeopleSoft User’s Guide for Oracle WebLogic Server describes how to provide connectivity and integrate with PeopleSoft systems.

Audience

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at http://www.oracle.com/accessibility/.

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/support/contact.html or visit http://www.oracle.com/accessibility/support.html if you are hearing impaired.
Related Documents

For more information, see the following documents in the Oracle Enterprise Repository 11g Release 1 (11.1.1.3.0) documentation set:

- Oracle Fusion Middleware Application Adapters Installation Guide for Oracle WebLogic Server
- Oracle Fusion Middleware Application Adapter Upgrade Guide for Oracle WebLogic Server
- Oracle's Unified Method (OUM)

A wealth of additional Governance information can be found within Oracle's Unified Method (OUM). OUM can be used by Oracle employees, Oracle Partner Network Certified Partners or Certified Advantage Partners, and Clients who either participate in the OUM Customer Program or are engaged on projects where Oracle provides consulting services. OUM is a web-deployed toolkit for planning, executing and controlling software development and implementation projects.

For more information about OUM, see the OUM FAQ at http://my.oracle.com/portal/page/myo/ROOTCORNER/KNOWLEDGEAREAS1/BUSINESS_PRACTICE/Methods/Learn_about_OUM.html

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Oracle WebLogic Server connects to a PeopleSoft system through Oracle Application Adapter for PeopleSoft, which provides connectivity and carries out interactions on a PeopleSoft system. This chapter contains the following topics:

- Section 1.1, "Adapter Features"
- Section 1.2, "PeopleSoft Concepts"
- Section 1.3, "Integration with PeopleSoft"
- Section 1.4, "Adapter Architecture"
- Section 1.5, "BSE Versus Oracle Adapter J2CA Deployment"

### 1.1 Adapter Features

Oracle Application Adapter for PeopleSoft provides a means to exchange real-time business data between PeopleSoft systems and other applications, databases, and external business partner systems. The adapter enables inbound and outbound processing with PeopleSoft. Oracle Application Adapter for PeopleSoft can be deployed as a J2EE Connector Architecture (J2CA) version 1.0 resource adapter. This deployment is referred to as Oracle Adapter J2CA. It can also be deployed as a Web services servlet and is referred to as Oracle Adapter Business Services Engine (BSE).

Oracle Application Adapter for PeopleSoft uses XML messages to enable non-PeopleSoft applications to communicate and exchange transactions with PeopleSoft using services and events. The roles of services and events are outlined as follows:

- **Services**: Enable applications to initiate a PeopleSoft business event.
- **Events**: Enable applications to access PeopleSoft data only when a PeopleSoft business event occurs.

To support event functionality, channels are supported. A **channel** represents configured connections to particular instances of back-end or other types of systems.

The channel is the adapter component that receives events in real time from the enterprise information system (EIS) application. The channel component can be a File reader, an HTTP listener, a TCP/IP listener, or an FTP listener. A channel is always EIS specific. The adapter supports multiple channels for a particular EIS, which enables the user to choose the optimal channel component based on deployment requirements.

Oracle Application Adapter for PeopleSoft provides:
PeopleSoft Concepts

- Synchronous and asynchronous, bidirectional message interactions for PeopleSoft component interfaces and PeopleSoft Application Messaging / Integration Broker.
- Oracle WebLogic Server Adapter Application Explorer (Application Explorer), a GUI tool that explores PeopleSoft metadata and builds XML schemas or Web services.
- XML schemas and WSDL files for the J2CA 1.0 and J2CA 1.5 resource adapter.
- Web services for BSE.

The adapter connects to the PeopleSoft Application Server by accessing APIs for the component interfaces that correspond to its supported business objects. Every component interface contains data and business logic for the business component, thus alleviating a requirement for the adapter to duplicate the processes defined within the business component.

See Also: Oracle Application Server Adapter Concepts Guide

1.2 PeopleSoft Concepts

PeopleSoft enables integration with other applications and systems through its component interface framework and its Integration Broker (in release 8.4) or Application Messaging (in release 8.1) facility. Oracle Application Adapter for PeopleSoft uses the PeopleSoft framework and leverages various integration access methods to provide the greatest amount of flexibility and functionality. Integration access methods supported by Oracle Application Adapter for PeopleSoft include:

- PeopleSoft Java API using component interfaces
- PeopleSoft messages using PeopleSoft Application Messaging / Integration Broker

This section contains the following topics:

- Section 1.2.1, "PeopleSoft Component Interface"
- Section 1.2.2, "PeopleSoft Application Messaging / Integration Broker"

1.2.1 PeopleSoft Component Interface

In the PeopleSoft environment, a component interface is a container for distributing PeopleSoft application data among PeopleSoft logical systems and for exchanging PeopleSoft application data with non-PeopleSoft systems.

The component interface is based on an existing business process within PeopleSoft. An example is a purchase order entry, which can be a PeopleSoft-delivered process or a user-developed process. The component interface also inherits its methods (Add, Update, and so on) and its business logic from the underlying business process.

PeopleSoft delivers generic component interfaces with each of its applications. These are called Enterprise Integration Points (EIP). Customers can also develop their own custom component interfaces, or they can modify EIP as required. Oracle Application Adapter for PeopleSoft supports both types of component interfaces.

1.2.2 PeopleSoft Application Messaging / Integration Broker

PeopleSoft Application Messaging / Integration Broker facilitates the integration of PeopleSoft XML with PeopleSoft. Oracle Application Adapter for PeopleSoft provides a handler that must be configured within the PeopleSoft application gateway using TCP/IP transport services.
1.3 Integration with PeopleSoft

Oracle Application Adapter for PeopleSoft enables you to:

- Access a PeopleSoft component using a component interface. Component methods are referred to as services.
- Receive messages from a PeopleSoft application. Messages are referred to as events.

When you access a PeopleSoft component from another application, you work with:

- Component interfaces. If a component interface does not exist, then create, secure, and test one. If the component interface exists but you modified it, then secure and test it. For more information, see your PeopleSoft documentation. Alternatively, you can secure and test the component interface and create the component interface API after you generate schemas or Web services.
- Component interface APIs. Create an API for the component interface.
- Schemas and Web services. Create schemas or Web services for the component methods.

For more information, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".

To receive a message from PeopleSoft, you work with:

- The Integration environment. Configure and test your PeopleSoft Integration Broker (release 8.4) or Application Messaging environment (release 8.1). To ensure that the environment is properly configured, see your PeopleSoft documentation.
- Message routing. Configure TCP/IP Target Connector (release 8.4), HTTP Target Connector (release 8.4), or TCP/IP Handler (release 8.1).

- Oracle Application Server Adapter Concepts Guide
- Oracle Fusion Middleware Application Adapters Installation Guide for Oracle WebLogic Server

1.4 Adapter Architecture

Oracle Application Adapter for PeopleSoft uses Application Explorer with one of the following components:

- Oracle WebLogic Server Adapter Business Services Engine (BSE)
- Enterprise Connector for J2EE Connector Architecture (J2CA)

Application Explorer (used to configure PeopleSoft connections and create Web services and events) can be configured to work in a Web services environment with BSE. When working in a J2CA environment, the connector uses the Common Client Interface (CCI) to provide integration services using adapters instead of Web services.

This section contains the following topics:

- Section 1.4.1, "Oracle WebLogic Server Adapter Business Services Engine (BSE) Architecture"
- Section 1.4.2, "Oracle WebLogic Server Adapter J2CA Architecture"
1.4.1 Oracle WebLogic Server Adapter Business Services Engine (BSE) Architecture

Figure 1–1 shows the generic architecture for the Oracle Web service adapter for packaged applications. The adapter works with BSE, as deployed to a Web container in a J2EE application server.

Application Explorer, a design-time tool deployed along with BSE, is used to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. Metadata created while you perform these operations are stored in the repository by BSE.

BSE uses SOAP as a protocol for receiving requests from clients, interacting with the EIS, and sending responses from the EIS back to clients.

Note: Do not use a file repository for BSE in production environments.

1.4.2 Oracle WebLogic Server Adapter J2CA Architecture

Figure 1–2 shows the generic architecture for Oracle Adapter J2CA for packaged applications. Oracle Adapter J2CA is deployed to a standard J2CA Container and serves as a host container to the adapters. The connector is configured with a repository. The repository can be a file system or an Oracle database. It is deployed as a RAR file and has an associated deployment descriptor called `ra.xml`. You can create multiple connector factories by editing the Oracle WebLogic Server deployment descriptor `ra.xml`. For more information, see Chapter 3, "Oracle WebLogic Server Deployment and Integration".
Application Explorer, a design tool that works with the connector, is used to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. Metadata created while you perform these operations are stored in the repository by the connector.

**Figure 1–2 Oracle WebLogic Server Adapter J2CA Generic Architecture**

1.5 BSE Versus Oracle Adapter J2CA Deployment

If you are using Oracle Application Adapter for PeopleSoft with Oracle SOA Suite components (for example, BPEL, Mediator, BPM, or OSB), then note that:

- Only Oracle Adapter J2CA deployment supports inbound integration (event notification) with Oracle SOA Suite components.
- Oracle Adapter J2CA and BSE deployments support outbound integration (request-response service) with Oracle SOA Suite components.

The following two factors explain the differences between deploying BSE and Oracle Adapter J2CA. Understanding these factors can help in selecting a deployment option.

1. BSE has the following advantages:
   - Can be deployed in a separate instance of Oracle WebLogic Server.
   - Provides better distribution of load.
   - Conforms more closely to the Service Oriented Architecture (SOA) model for building applications.

2. Oracle Adapter J2CA does provide slightly better performance than BSE.
2.1 Starting Application Explorer

To start Application Explorer:

1. Ensure that Oracle WebLogic Server is started, which is where Application Explorer is deployed.

2. Click the Windows Start menu, select All Programs, Oracle Application Adapters, and then click Application Explorer, as shown in Figure 2–1.

Figure 2–1  Oracle Application Adapters Program Menu
Application Explorer is displayed.
Alternatively, you can run the `ae.bat` file, which is located in the following
directory to start Application Explorer:

Oracle SOA Suite:
`<ORACLE_HOME>\soa\thirdparty\ApplicationAdapters\tools\iwae\bin\ae.bat`

Oracle Service Bus (OSB):
`<OSB_HOME>\Oracle_OSB1\3rdparty\ApplicationAdapters\tools\iwae\bin\ae.bat`

It is a good practice to create a shortcut for the `ae.bat` file on your desktop.
If you are using a UNIX or Linux platform, then you can start Application
Explorer by using the `iwae.sh` file.

Application Explorer starts. You are ready to define new targets to your PeopleSoft system.

---

Note: Before you run the `iwae.sh` file on UNIX or Linux platforms, the permissions must be changed. For example:
```
chmod +x iwae.sh
```

2.2 Configuring Repository Settings

A repository holds information about configuration details, adapter targets, channels,
and other configuration information. For more information on how to configure BSE
and J2CA repository settings, see the Oracle Fusion Middleware Application Adapters
Installation Guide for Oracle WebLogic Server (Section 2.8.4, "Configuring the Database
Repository").

2.3 Creating a Repository Configuration

Before you use Application Explorer with Oracle Application Adapter for PeopleSoft,
you must create a repository configuration. You can create two kinds of repository
configurations, Web services and J2CA, depending on the container to which the
adapter is deployed.

During design time, the repository is used to store metadata created when using
Application Explorer to configure adapter connections, browse EIS objects, configure
services, and configure listeners to listen for EIS events. The information in the
repository is also referenced at run-time.

Web services and BSE refer to the same type of deployment. For more information, see
"Adapter Features" on page 1-1.

This section contains the following topics:

- Section 2.3.1, "Creating a Configuration for BSE"
- Section 2.3.2, "Creating a Configuration for J2CA"
- Section 2.3.3, "Connecting to a BSE or J2CA Configuration"
2.3.1 Creating a Configuration for BSE

To create a repository configuration for BSE using Application Explorer, you must first define a new configuration.

Defining a New Configuration for BSE

To define a new configuration for BSE:

1. Start the Application Explorer.
2. Right-click Configurations and select New.

The New Configuration dialog is displayed, as shown in Figure 2–2.

Figure 2–2 New Configuration Dialog

![New Configuration Dialog]

3. Enter a name for the new configuration (for example, myConfig) and click OK.

The New Configuration dialog is displayed, as shown in Figure 2–3.

Figure 2–3 New Configuration Dialog - Service Provider List and iBSE URL

![New Configuration Dialog - Service Provider List and iBSE URL]

4. From the Service Provider list, select iBSE.
5. In the BSE URL field, accept the default URL or replace it with a different URL with the following format:

   http://host name:port/ibse/IBSEServlet

   Where host name is the system where Oracle WebLogic Server resides and port is the HTTP port for a managed Oracle WebLogic Server (for example, soa_server1).

6. Click OK.

A node representing the new configuration appears beneath the root Configurations node, as shown in Figure 2–4.
2.3.2 Creating a Configuration for J2CA

To create a configuration for Oracle Adapter J2CA using Application Explorer, you must first define a new configuration.

This section contains the following topic:
- Section 2.3.2.1, "HTTP Repository Connection"

To define a new configuration for J2CA:
1. Start the Application Explorer.
2. Right-click Configurations and select New.
   The New Configuration dialog is displayed, as shown in Figure 2–5.

![New Configuration Dialog](image)

3. Enter a name for the new configuration (for example, myConfig) and click OK.
4. From the Service Provider list, select JCA.
5. Click OK.
   A node representing the new configuration appears beneath the root Configurations node, as shown in Figure 2–6.

![New Configuration Node - myConfig](image)

The Oracle Adapter J2CA configuration folder is stored in:

```
<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/config/configuration_name
```

Where `configuration_name` is the name of the configuration you created (for example, myConfig).

### 2.3.2.1 HTTP Repository Connection

J2CA users can create an HTTP repository connection, which enables them to generate and store WSDL documents remotely. Perform the following steps to create an HTTP repository connection in Application Explorer. To use the HTTP repository, ensure that the iwjcaivp test tool(jca-app-adapter-test) is successfully deployed and running.
1. Start the Application Explorer.
2. Right-click the **Configurations** node in the left pane and select **New**.
   The New Configuration dialog opens.
3. Type a name for the configuration and click **OK**.
4. Select **JCA** from the Service Provider list box and enter an HTTP target value in the Home field.
   Use the following format for the HTTP target value:
   
   \[http://host:port/iwafjca/JCAServlet\]
   
   For example:
   
   \[http://iwserv14:8001/iwafjca/JCAServlet\]
5. Click **OK**.
   The new HTTP repository connection is added to the Configurations node.
   Once you connect to the remote server, you can create new Adapter targets, generate WSDL documents, and store them in the remote server.
   **Note:** When you configure an Adapter target with the J2CA HTTP repository, you are not required to restart the Oracle WebLogic Server for runtime purposes.

### 2.3.3 Connecting to a BSE or J2CA Configuration

To connect to a new configuration:

1. Right-click the configuration to which you want to connect, for example, myConfig.
2. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services). The Business Services node is only available for BSE configurations. If you are connected to a J2CA configuration, then the Business Services node is not shown.

Events are not applicable when using a BSE configuration. You can configure events using a J2CA configuration only.

An example of a BSE configuration named myConfig, as shown in **Figure 2–7**.

**Figure 2–7** New BSE Configuration - myConfig Node

- Use the **Adapters** folder to create inbound interaction with PeopleSoft. For example, you use the PeopleSoft node in the Adapters folder to configure a service that updates PeopleSoft.
- Use the **Events** folder (available for J2CA configurations only) to configure listeners that listen for events in PeopleSoft.
■ Use the Business Services folder (available for BSE configurations only) to test Web services created in the Adapters folder. You can also control security settings for the Web services by using the security features of the Business Services folder.

You are now ready to define new targets to PeopleSoft.

2.4 Establishing a Connection (Target) for PeopleSoft

Part of the application definition includes adding a target for Oracle Application Adapter for PeopleSoft. Setting up the target in Application Explorer requires information that is specific to the target.

To browse PeopleSoft business objects, you must create a target for the system you intend to use. The target serves as your connection point and is automatically saved after you create it. You must establish a connection to this system every time you start Application Explorer or after you disconnect from the system.

When you launch Application Explorer, the left pane displays (as nodes) the application systems supported by Application Explorer, based on the adapters that are installed.

This section contains the following topics:

■ Section 2.4.1, "Defining a Target to PeopleSoft"
■ Section 2.4.2, "Connecting to a Defined PeopleSoft Target"
■ Section 2.4.3, "Managing a Target"

2.4.1 Defining a Target to PeopleSoft

To connect to PeopleSoft for the first time, you must define a new target. Oracle Application Adapter for PeopleSoft supports PeopleSoft standard security, in addition to component interface-level security. Once connected to the PeopleSoft application server, application security is managed by user ID, roles and privileges. For more information on PeopleSoft application security, see the appropriate PeopleSoft documentation.

When you define a new target, you must restart the Oracle WebLogic Server to update the repository for run time purposes.

To define a target:

1. In the left pane, expand the Adapters node.

The applications systems supported by Application Explorer appear as nodes based on the adapters that are installed, as shown in Figure 2–8.

Figure 2–8 Adapters List
2. Right-click the **PeopleSoft** node and select **Add Target**.

   The Add Target dialog is displayed. Provide the following information:
   
   a. In the **Name** field, enter a descriptive name for the target, for example, **PSoftTarget**.
   
   b. In the **Description** field, enter a description for the target (optional).
   
   c. From the **Target Type** list, select **Application Server**.
      
      *This is the only possible value for target type.*

3. Click **OK**.

   The Application Server dialog is displayed, as shown in **Figure 2–9**. You must specify connection information for PeopleSoft and the application server that is hosting PeopleSoft.

   **Figure 2–9  Application Server Dialog**

   ![Application Server Dialog](image)

   Fields marked with * are required.

   Provide the following information:
   
   a. In the **Application Server** field, enter the host name or IP address for the computer that is hosting the PeopleSoft application.
   
   b. In the **Port** field, enter the port number where the PeopleSoft application is listening.
   
   c. In the **User** field, enter a valid user ID for the PeopleSoft application.
   
   d. In the **Password** field, enter a valid password for the PeopleSoft application.

4. Click **OK**.

   In the left pane, the new target (**PSoftTarget**) appears under the PeopleSoft node, as shown in **Figure 2–10**.

   **Figure 2–10  Disconnected PeopleSoft Target Node**

   ![Disconnected PeopleSoft Target Node](image)

   You are ready to connect to your PeopleSoft target.
2.4.2 Connecting to a Defined PeopleSoft Target

To connect to an existing target:

1. In the left pane, expand the Adapters node.
2. Expand the PeopleSoft node.
3. Click the target name (for example, PSoftTarget) under the PeopleSoft node.
   The Connection dialog displays the values you entered for connection parameters.
4. Verify your connection parameters.
5. Right-click the target name and select Connect.
   The x icon disappears, indicating that the node is connected. A list of PeopleSoft business objects is displayed, as shown in Figure 2–11.

![PeopleSoft Business Objects](image)

2.4.3 Managing a Target

Although you can maintain multiple open connections to different transaction processing systems, it is recommended that you disconnect from connections not in use. After you disconnect, you can modify an existing target.

You can modify the connection parameters when your system properties change. You also can delete a target. The following procedures describe how to disconnect from a target, edit a target, and delete a target.

This section contains the following topics:

- Section 2.4.3.1, "Disconnecting from a Connection to PeopleSoft"
- Section 2.4.3.2, "Modifying Connection Parameters"
- Section 2.4.3.3, "Deleting a Connection to PeopleSoft"

2.4.3.1 Disconnecting from a Connection to PeopleSoft

To disconnect from a connection to PeopleSoft:

1. Expand the Adapters node.
2. Expand the PeopleSoft node.
3. Right-click the target to which you are connected (for example, PSoftTarget), and select Disconnect, as shown in Figure 2–12.

![Disconnect](image)
Disconnecting from PeopleSoft drops the connection with PeopleSoft, but the node remains.

The x icon appears, indicating that the node is disconnected, as shown in Figure 2–13.

Figure 2–13 Disconnected PeopleSoft Target Node

2.4.3.2 Modifying Connection Parameters

After you create a target for PeopleSoft using Application Explorer, you can edit any of the information that you provided previously.

When modify connection parameters for a defined target, you must restart the Oracle WebLogic Server to update the repository for run time purposes.

To edit a target:

1. Verify that the target you want to edit is disconnected.
2. Right-click the target and select Edit, as shown in Figure 2–14.

Figure 2–14 PSoftTarget Node Menu

The Application Server dialog displays the target connection information.

3. Change the properties in the dialog as required and click OK.

2.4.3.3 Deleting a Connection to PeopleSoft

You can delete a connection, rather than just disconnecting and closing it. When you delete the connection, the node disappears from the list of PeopleSoft connections in the left pane of Application Explorer.

When you delete a connection, you must restart the Oracle WebLogic Server to update the repository for run time purposes.

To delete a connection to PeopleSoft:

1. Locate the target you want to delete.
2. Right-click the target (for example, PsoftTarget), and select Delete, as shown in Figure 2–15.

Figure 2–15 PSoftTarget Node - Delete Option
2.5 Viewing Application System Objects

After you are connected to PeopleSoft, Application Explorer enables you to explore and browse business object metadata. For example, Application Explorer enables you to view PeopleSoft Component Interface and Message metadata stored in the PeopleSoft business object repository.

For Component Interfaces (RPC), the adapter enables Delete, Insert, Query, Update, and Find.

To view application system objects:

1. Click the icon to the left of the target name, for example, PSoftTarget. The target expands and the available system objects are displayed, as shown in Figure 2–16.

2. To expand the desired PeopleSoft repository node, click the icon to the left of the repository name, for example, Component Interfaces.

A list of PeopleSoft Component Interfaces appears. You can now generate schemas.

Note: The Component Interfaces (RPC) node only displays the level 1 Component Interfaces.

2.6 Creating XML Schemas

After you browse the PeopleSoft business object repository, you can generate XML request and response schemas for the object you want to use with your adapter.

This section contains the following topics:

- Section 2.6.1, "Creating XML Request and Response Schemas Against BSE"
- Section 2.6.2, "Creating XML Request and Response Schemas Against the Oracle Adapter J2CA"

2.6.1 Creating XML Request and Response Schemas Against BSE

To create XML request and response schemas for a PeopleSoft Component Interface against a BSE implementation:

1. Expand the PeopleSoft node and then, expand the Component Interfaces node.

2. From the list of Component Interfaces, select LOCATION.

3. Click the Request Schema or Response Schema tab to view the request or response schema information.
The schema you selected is displayed.

After you browse the Component Interfaces and make a selection, the request and response XML schemas are automatically created for that Component Interface and stored in the repository you created.

2.6.2 Creating XML Request and Response Schemas Against the Oracle Adapter J2CA

To create XML request and response schemas for a PeopleSoft Component Interface against an Oracle Adapter J2CA implementation:

1. Expand the PeopleSoft node and then, expand the Component Interfaces node.
2. From the list of Component Interfaces, select LOCATION.
3. Click the Request Schema or Response Schema tab to view the request or response schema information.

The schema you selected is displayed.

After you browse the Component Interfaces and make a selection, the request and response XML schemas are automatically created for that Component Interface and stored in the repository you created.

2.7 Generating a WSDL (J2CA Configurations Only)

The Web Service Definition Language (WSDL) description of a service enables you to make the service available to other services within a host server. You use Application Explorer to create both request-response (outbound) and event notification (inbound) JCA services of the adapter.

**Note:** The Create Inbound JCA Service (Event) option is only available when the selected node supports events.

**Note:** PeopleSoft Component Interfaces only support services. As a result, only outbound WSDL files can be generated.

To generate a WSDL file for request-response service:

1. After you create a schema, right-click the respective object.
   
   The options are displayed, as shown in Figure 2–17.

**Figure 2–17 Create Outbound JCA Service (Request/Response) Option**

2. Select Create Outbound JCA Service (Request/Response).
   
   The Export WSDL dialog is displayed, as shown in Figure 2–18.
3. Accept the default name for the file.
   The `.wsdl` file extension is added automatically. By default, the names of WSDL files generated for request-response services end with `_invoke`, while those generated for event notification end with `_receive`.

4. Click OK.
   The WSDL file is saved in the specified location.

   The procedure for generating WSDL for event notification is similar to request-response. To generate WSDL for event notification, you must first create a channel for every event.

2.8 Creating and Testing a Web Service (BSE Configurations Only)

You can create Web services (also known as a business service) using Application Explorer. The PeopleSoft Component Interface called LOCATION is used as an example in the following procedure.

**Note:** In a J2EE Connector Architecture (J2CA) implementation of adapters, Web services are not available. When the adapters are deployed to use Oracle Adapter J2CA, the Common Client Interface provides integration services using the adapters.
Creating a Web Service

To create a Web service, perform the following steps:

1. Expand the PeopleSoft node and then the Component Interfaces node.
2. From the list of Component Interfaces, select LOCATION.
3. Right-click the node from which you want to create a business service and select Create Web Service, as shown in Figure 2–19.

![Figure 2–19 Create Web Service Option](image)

The Create Web Service dialog is displayed, as shown in Figure 2–20.

![Figure 2–20 Create Web Service Dialog](image)

You can add the business function as a method for a new Web service or as a method for an existing one. Perform the following steps:

a. From the Existing Service Names list, select either <new service> or an existing service.

b. If you are creating a new service, then specify a service name. This name identifies the Web service in the list of services under the Business Services node.

c. Enter a brief description for the service (optional).

4. Click Next.

The license and method dialog is displayed, as shown in Figure 2–21.

![Figure 2–21 License and Method Dialog](image)
Perform the following steps:

a. In the **License Name** field, select one or more license codes to assign to the Web service. To select more than one, hold down the **Ctrl** key and click the licenses.

b. In the **Method Name** field, enter a descriptive name for the method.

c. In the **Method Description** field, enter a brief description of the method.

d. The **DTD Directory** field specifies a destination for your Web service. You may click **Browse** to change the default location.

5. Click **OK**.

Application Explorer switches the view to the **Business Services** node, and the new Web service appears in the left pane.

**Testing a Web Service**

After a Web service is created, you can test it to ensure that it functions properly. A test tool is provided for testing the Web service.

To test a business service:

1. Click the **Business Services** node to access your Web services.

2. Expand the **Services** node.

3. Select the name of the business service you want to test.

   The business service name appears as a link in the right pane.

4. In the right pane, click the named business services link.

   The test option appears in a separate BSE Servlet page. If you are testing a Web service that requires XML input, then an input field appears.

5. Enter the appropriate input.

6. Click **Invoke**.

   The BSE Servlet page displays the results.

**Identity Propagation**

If you test or execute a Web service using a third party XML editor, for example XMLSPY, then the user name and password values that you specify in the SOAP header must be valid and are used to connect to PeopleSoft. The user name and password values that you provided for PeopleSoft during target creation using Application Explorer are overwritten for this Web service request. The following is a sample SOAP header that is included in the WSDL file for a Web service:

```xml
<SOAP-ENV:Header>
  <m:ibsinfo xmlns:m="urn:schemas-iwaysoftware-com:iwse">
    <m:service>String</m:service>
    <m:method>String</m:method>
    <m:license>String</m:license>
    <m:disposition>String</m:disposition>
    <m:Username>String</m:Username>
    <m:Password>String</m:Password>
    <m:language>String</m:language>
  </m:ibsinfo>
</SOAP-ENV:Header>
```
You can remove the `<m:disposition>` and `<m:language>` tags from the SOAP header, since they are not required.

2.9 Configuring an Event Adapter

Events are generated by activity in an application system. You can use events to trigger an action in your application. For example, PeopleSoft may generate an event when customer information is updated. If your application performs an action when this happens, then your application is a consumer of this event.

**Note:** BSE configurations do not support events.

After you create a connection to your application system, you can add events using Application Explorer. To create an event, you must create a channel.

**Note:** If you are using a J2CA configuration, then you must create a new channel for every event object and select this channel when you generate WSDL. Creating a channel is required for J2CA configurations only.

A channel represents configured connections to particular instances of back-end systems. For more information, see “Creating and Editing a Channel” on page 2-15.

2.9.1 Creating and Editing a Channel

The following procedures describe how to create a channel for your event. All defined event ports must be associated with a channel.

When you create, modify, or delete a channel, you must restart the Oracle WebLogic Server to recognize the change and update the repository for run time purposes.

**Note:** If using a J2CA configuration, then you must create a new channel for every event and select this channel when creating an inbound service. Creating a channel is required for J2CA configurations only.

Creating a Channel Using Specific Protocols

You can create the following types of channels using Application Explorer:

- **HTTP**
  
  It is recommended to use HTTP channels with PeopleTools Version 8.4.

- **TCP**
  
  It is recommended to use TCP channels with PeopleTools Version 8.1.

- **File**
  
  It is recommended to use File channels for testing purposes only. Do not use File channels in a production environment.
The following procedures explain how to create these channels.

### 2.9.1.1 Creating an HTTP Channel

To create an HTTP Channel:

1. Click the **Events** node.
2. Expand the **PeopleSoft** node.
   
The ports and channels nodes appear in the left pane.
3. Right-click **Channels** and select **Add Channel**.
   
The Add Channel dialog is displayed, as shown in Figure 2–22.

#### Figure 2–22 Add Channel Dialog

![Add Channel Dialog](image)

Provide the following information:

a. Enter a name for the channel, for example, **PSFT_channel**.

b. Enter a brief description.

c. From the **Protocol** list, select **HTTP Listener**.

4. Click **Next**.
   
The Http Listener dialog is displayed, as shown in Figure 2–23.

---

**Note:** Channels can be configured and started only on the system where the Oracle Application Adapter for PeopleSoft is installed. Configuring and starting a channel for a remote host is not supported.
5. Enter the system information as specified in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Listener port</td>
<td>Port on which to listen for PeopleSoft event data.</td>
</tr>
<tr>
<td>Htts</td>
<td>For a secure HTTP connection, select the Https check box. This option is currently not supported.</td>
</tr>
</tbody>
</table>
| Synchronization Type | Choose from the following synchronization options:  
|                  | ■ REQUEST_RESPONSE  
|                  | ■ REQUEST_ACK  
| Important: The PeopleSoft channel does not work if the synchronization type is set to REQUEST. |
| Encoding Type   | Choose an encoding type to be used from the list. By default, ASCII is selected. |

6. Click OK.

A summary pane is displayed, providing the channel description, channel status, and available ports. All the information is associated with the channel you created.

The channel appears under the channels node in the left pane.

An X over the icon indicates that the channel is currently disconnected. You must start the channel to activate your event configuration.

**Note:** If you are planning to integrate Oracle Application Adapter for PeopleSoft with BPEL inbound or Mediator inbound process components, then do not start the channel. The channel is managed by the run-time server after the BPEL or Mediator process component is deployed. If you start the channel from Application Explorer for testing and debugging purposes, then stop it before run-time (when working with BPEL or Mediator process components).

7. Right-click the channel and select Start.

The channel you created becomes active. The X over the icon in the left pane disappears.

8. To stop the channel, right-click the channel and select Stop.
2.9.1.2 Creating a TCP Channel

1. Click the Events node.

2. Expand the PeopleSoft node.
   The ports and channels nodes appear in the left pane.

3. Right-click Channels and select Add Channel.
   The Add Channel dialog is displayed, as shown in Figure 2–24.

**Figure 2–24 Add Channel Dialog**

Perform the following steps:

a. Enter a name for the channel, for example, PSoftChannel.

b. Enter a brief description.

c. From the Protocol list, select TCP Listener.

4. Click Next.
   The Tcp Listener dialog is displayed, as shown in Figure 2–25.
Figure 2–25  TCP Listener Dialog

Provide the following information:

a. In the Port Number field, specify the port number for your TCP listener (required).

b. In the Host/IP Binding field, specify the host IP for your TCP listener (optional).

Note: Channels can be configured and started only on the system where the Oracle Application Adapter for PeopleSoft is installed. Configuring and starting a channel for a remote host is not supported.

c. From the Synchronization Type list, select from the following synchronization type options:

- REQUEST_RESPONSE
- REQUEST_ACK
- REQUEST

Important: The PeopleSoft channel only works with one of these synchronization types.

d. Is Length Prefix check box: For PeopleSoft events that return data that is not in XML format. The TCP/IP event application must prefix the data with a 4-byte binary length field when writing data to the TCP/IP port.

e. Is XML check box: For PeopleSoft events that return data in XML format. No preparser is required.

f. Is Keep Alive check box: Maintains continuous communication between the event transaction and the channel.

5. Click OK.

The channel appears under the Channels node in the left pane, as shown in Figure 2–26.
6. Right-click the channel node and select Start.

The channel becomes active, as shown in Figure 2–27.

Figure 2–27  Active PeopleSoft Channel Node

An X over the icon disappears.

7. To stop the channel, right-click the connected channel node and select Stop.

The channel becomes inactive and an X appears over the icon.

2.9.1.3 Creating a File Channel

To create a channel for the File listener:

1. Click the Events node.

2. In the left pane, expand the PeopleSoft node.

The ports and channels nodes appear.

3. Right-click Channels and select Add Channel.

The Add Channel dialog is displayed, as shown in Figure 2–28.
Perform the following steps:

a. Enter a name for the channel, for example, **NewFileChannel**.

b. Enter a brief description (optional).

c. From the **Protocol** list, select **File Listener**.

4. Click **Next**.

5. The File Listener dialog is displayed, as shown in **Figure 2–29**.

**Figure 2–29  File Listener Dialog**

Enter the system information as follows:

a. In the **Request** tab, enter values for the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polling Location</td>
<td>Target file system location for the PeopleSoft XML file.</td>
</tr>
<tr>
<td>File Mask</td>
<td>File name to be used for the output file generated by the operation.</td>
</tr>
</tbody>
</table>

b. In the **Response** tab, enter values for the following parameters:
c. In the Advanced tab, enter values for the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronization Type</td>
<td>Choose from the following synchronization options:</td>
</tr>
<tr>
<td></td>
<td>■ REQUEST_RESPONSE</td>
</tr>
<tr>
<td></td>
<td>■ REQUEST_ACK</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> The PeopleSoft channel does not work if the synchronization type is set to REQUEST.</td>
</tr>
<tr>
<td>Response/Ack Directory</td>
<td>Target file system location for the PeopleSoft XML file.</td>
</tr>
<tr>
<td>Error directory</td>
<td>Directory to which documents with errors are written.</td>
</tr>
<tr>
<td>Poll interval (msec)</td>
<td>Interval (in milliseconds) when to check for new input. The default is three seconds. Optional.</td>
</tr>
<tr>
<td>Processing Mode</td>
<td><strong>Sequential</strong> indicates single processing of requests.</td>
</tr>
<tr>
<td></td>
<td><strong>Threaded</strong> indicates processing of multiple requests simultaneously.</td>
</tr>
<tr>
<td>Thread limit</td>
<td>If you selected threaded processing, then indicate the maximum number of requests that can be processed simultaneously.</td>
</tr>
</tbody>
</table>

6. Click OK.

A summary pane is displayed, providing the channel description and channel status. All the information is associated with the channel you created.

The channel appears under the channels node in the left pane. An X over the icon indicates that the channel is currently disconnected. You must start the channel to activate your event configuration.

**Note:** If you are planning to integrate Oracle Application Adapter for PeopleSoft with BPEL inbound or Mediator inbound process components, then do not start the channel. The channel is managed by the run-time server after the BPEL or Mediator process component is deployed. If you start the channel from Application Explorer for testing and debugging purposes, then stop it before run-time (when working with BPEL or Mediator process components).

7. Right-click the channel and select Start.

The channel you created becomes active. The X over the icon in the left pane disappears.

8. To stop the channel, right-click the channel and select Stop.

2.9.1.4 Editing a Channel

You must stop the channel before you can edit it. To edit a channel:

1. In the left pane, locate the channel you want to edit.

2. Right-click the channel and select Edit.

The Edit channels pane is displayed.

3. Make the required changes to the channel configuration and click Finish.
2.9.1.5 Deleting a Channel
You must stop the channel before you can delete it. To delete a channel:

1. In the left pane, locate the channel you want to delete.
2. Right-click the channel and select Delete.
   The channel disappears from the list in the left pane.

2.9.2 Schema Validation
Root validation, namespace validation, and schema validation for inbound processing (events) are supported for the Oracle Application Adapter for PeopleSoft with 11.1.1.2.0 BPEL.

To validate inbound processing using the Oracle Application Adapter for PeopleSoft, perform the following steps. This procedure uses the LOCATION_SYNC.VERSION_1 PeopleSoft Message as an example for inbound processing.

1. Start Application Explorer.
2. Connect to the PeopleSoft target.
3. Expand the Messages node.
4. Verify that you have already created a channel for the PeopleSoft adapter.
5. Right-click the LOCATION_SYNC.VERSION_1 node and select Create Inbound JCA Service (event).
   The Export WSDL dialog opens and includes three check boxes for Root, Namespace, and Schema validation, as shown in Figure 2–30.

Figure 2–30 Export WSDL Dialog

- Selection of multiple validation options is allowed.
- Root validation is used to validate the root element in the inbound XML document.
- Namespace validation is used to validate the namespace in the inbound XML document.
- Schema validation is used to validate the inbound XML document with the schema in the WSDL document.
- During run time, validation is processed based on the validation options that are selected.
- If more than one validation option is selected, during run time if the first validation option fails, then the remaining validation options are not processed.
- Root and namespace validations are considered modest levels of validation. Schema validation is a stricter validation level.
- It is recommended to use root and namespace validation options together, unless the root element and namespace are different between the Messages in the PeopleSoft environment.

6. Generate the WSDL document and create the BPEL process.
7. Trigger the transactions (Messages) from the PeopleTools environment.
This chapter describes Oracle WebLogic Server (OracleWLS) deployment and integration with Oracle Application Adapter for PeopleSoft.

This chapter contains the following topics:

- Section 3.1, "Adapter Integration with Oracle WebLogic Server"
- Section 3.2, "Deployment of Adapter"
- Section 3.3, "Updating Adapter Configuration"

See Also:
- Oracle Application Server Adapter Concepts Guide

3.1 Adapter Integration with Oracle WebLogic Server

Oracle Application Adapter for PeopleSoft is deployed within an OracleWLS container during installation. All client applications run within the OracleWLS environment. In J2CA deployment, the Common Client Interface (CCI) integrates an OracleWLS client application with a resource adapter.

3.2 Deployment of Adapter

Figure 3–1 shows deployment of the J2CA Connector to the Oracle Application Server. In a run-time service scenario, an Enterprise Java Bean, servlet, or Java program client makes CCI calls to J2CA resource adapters. The adapters process the calls as requests and send them to the EIS. The EIS response is then sent back to the client.
3.3 Updating Adapter Configuration

During the J2CA deployment of Oracle Application Adapter for PeopleSoft, OracleWLS generates a deployment descriptor called ra.xml, located in:

```
<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\iwafjca.rar\META-INF
```

Your installation contains more than one file named ra.xml. The OracleWLS deployment descriptor that is described in this section is located in the directory specified above.

**Note:** Multiple managed connection factories are supported only for outbound processing (services).

Creating a Managed Connector Factory Object

The ra.xml descriptor provides OracleWLS-specific deployment information for resource adapters. For example, the jca_sample configuration in Application Explorer is represented in the ra.xml file as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE connector PUBLIC '-//Sun Microsystems, Inc.//DTD Connector 1.0//EN'
'http://java.sun.com/dtd/connector_1_0.dtd'>
<connector>
  <display-name>IWAFJCA10</display-name>
  <vendor-name>IWAY Software</vendor-name>
  <spec-version>1.0</spec-version>
  <eis-type>IWAF</eis-type>
```

</config-property>
<authentication-mechanism>
  <authentication-mechanism-type>BasicPassword</authentication-mechanism-type>
</authentication-mechanism>
<credential-interface>javax.resource.spi.security.PasswordCredential</credential-interface>
</resourceadapter>
</connector>

The parameters defined in the ra.xml file are described in the following table:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IWayHome</td>
<td>The base installation directory for the OracleWLS packaged application adapter.</td>
</tr>
<tr>
<td>IWayConfig</td>
<td>The adapter configuration name as defined in Application Explorer. For example, Oracle Application Adapter for PeopleSoft has a preconfigured jca_sample configuration in Application Explorer.</td>
</tr>
<tr>
<td>IWayRepoURL</td>
<td>The URL to use when opening a connection to the database. This is necessary only when using an Oracle database as the repository.</td>
</tr>
<tr>
<td>IWayRepoUser</td>
<td>User name to use when connecting to the database. This is necessary only when using an Oracle database as the repository.</td>
</tr>
<tr>
<td>IWayRepoPassword</td>
<td>Password. If provided, it overwrites configuration. This is necessary only when using an Oracle database as the repository.</td>
</tr>
<tr>
<td>loglevel</td>
<td>It overwrites the level set by the ManagedConnectorFactory property.</td>
</tr>
</tbody>
</table>

Creating Multiple Managed Connector Factory Objects

To establish multiple managed connector factory objects, you must edit the weblogic-ra.xml file and add more <connection-instance> nodes. This file is located in:

<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/iwafjca.rar/META-INF

For example, the first jca_configuration in Application Explorer is represented in the weblogic-ra.xml file as follows:

```xml
<?xml version="1.0"?>
<weblogic-connector xmlns="http://www.bea.com/ns/weblogic/90">
  <enable-access-outside-app>true</enable-access-outside-app>
  <enable-global-access-to-classes>true</enable-global-access-to-classes>
  <outbound-resource-adapter>
    <default-connection-properties>
      <pool-params>
        <initial-capacity>0</initial-capacity>
      </pool-params>
    </default-connection-properties>
  </outbound-resource-adapter>
</weblogic-connector>
```
<connection-definition-group>
  <connection-factory-interface>javax.resource.cci.ConnectionFactory</connection-factory-interface>
  <connection-instance>
    <jndi-name>eis/OracleJCAAdapter/DefaultConnection</jndi-name>
  </connection-instance>
</connection-definition-group>
</weblogic-connector>

To create multiple managed connector factory objects, you must add new <connection-instance> nodes in the file. For example:

<?xml version="1.0"?>
<weblogic-connector xmlns="http://www.bea.com/ns/weblogic/90">
  <enable-access-outside-app>true</enable-access-outside-app>
  <enable-global-access-to-classes>true</enable-global-access-to-classes>

  <outbound-resource-adapter>
    <default-connection-properties>
      <pool-params>
        <initial-capacity>0</initial-capacity>
      </pool-params>
      <transaction-support>LocalTransaction</transaction-support>
    </default-connection-properties>
    <connection-definition-group>
      <connection-factory-interface>javax.resource.cci.ConnectionFactory</connection-factory-interface>
      <connection-instance>
        <jndi-name>eis/OracleJCAAdapter/DefaultConnection</jndi-name>
      </connection-instance>
      <connection-instance>
        <jndi-name>eis/OracleJCAAdapter/DefaultConnection1</jndi-name>
        <connection-properties>
          <properties>
            <property>
              <name>IWayHome</name>
              <value>C:\oracle\Middleware\Oracle_SOA1\soa\thirdparty\ApplicationAdapters</value>
            </property>
            <property>
              <name>IWayConfig</name>
              <value>jca_sample2</value>
            </property>
            <property>
              <name>IWayRepoURL</name>
              <value></value>
            </property>
            <property>
              <name>IWayRepoUser</name>
              <value></value>
            </property>
            <property>
              <name>IWayRepoPassword</name>
              <value></value>
            </property>
            <property>
              <name>LogLevel</name>
              <value>Debug</value>
            </property>
          </properties>
        </connection-properties>
      </connection-instance>
    </connection-definition-group>
</outbound-resource-adapter>
</weblogic-connector>
If you do not specify a `<property>` element in the `<connection-instance>` section, the value is taken from the `ra.xml` file. You can specify the default properties in the `ra.xml` file and then override them as required in the `weblogic-ra.xml` file. In addition, note that the J2CA configuration (for example, jca_sample2) must already be created in Application Explorer.

**Note:** When you modify the `ra.xml` and `weblogic-ra.xml` files, the application server must be restarted. If the application server is already running, stop the application server and then restart it.

In addition, the `iwafjca.rar` file must be redeployed in the Oracle WebLogic Administration Console to activate these changes.

### Modifying WSDL Files for Additional Connection Factory Values

Application Explorer generates the J2CA properties file using the default connection factory name `eis/OracleJCAAdapter/DefaultConnection`. If you created additional connection factories, the WSDLs generated for the additional configuration and connection factory should be changed to reflect the location field of the `jca:address` section in the J2CA properties file. The default J2CA properties file for the Oracle Application Adapter for PeopleSoft with a configuration of `isdsrv2_conn2` is shown in the following example.

Notice that the J2CA properties file has the following default connection factory:

```
eis/OracleJCAAdapter/DefaultConnection
```

```
<jca:address location="eis/OracleJCAAdapter/DefaultConnection" ConnectionSpec="com.ibi.afjca.cci.IWAFConnectionSpec" cs.AdapterName="PeopleSoft" cs.Config="isdsrv2_conn2" UIConnectionName="Connection1"/>
```

The connection factory value must be changed to the following:

```
eis/OracleJCAAdapter/DefaultConnection1
```

For example:

```
<jca:address location="eis/OracleJCAAdapter/DefaultConnection1" ConnectionSpec="com.ibi.afjca.cci.IWAFConnectionSpec" cs.AdapterName="PeopleSoft" cs.Config="isdsrv2_conn2" UIConnectionName="Connection1"/>
```

Note that only the value for the location field in the `jca:address` section should be modified. Do not modify any other field or section.
Integration With BPEL Service Components in the Oracle SOA Suite

Oracle Application Adapter for PeopleSoft integrates seamlessly with Oracle Business Process Execution Language (BPEL) Process Manager to facilitate Web service integration. Oracle BPEL Process Manager is based on the Service-Oriented Architecture (SOA). It consumes adapter services exposed as Web Service Definition Language (WSDL) documents.

This chapter contains the following topics:

- Section 4.1, "Overview"
- Section 4.2, "Deployment of Adapter"
- Section 4.3, "Configuring a New Application Server Connection"
- Section 4.4, "Designing an Outbound BPEL Process for Service Integration"
- Section 4.5, "Designing an Inbound BPEL Process for Event Integration"

4.1 Overview

To integrate with Oracle SOA Suite, Oracle Application Adapter for PeopleSoft must be deployed in the same WLS container as Oracle BPEL Process Manager. The underlying adapter services must be exposed as WSDL files, which are generated during design time in Oracle Application Adapter Application Explorer (Application Explorer) for both request-response (outbound) and event notification (inbound) services of the adapter. For more information, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".

The generated WSDL files are used to design the appropriate BPEL processes for inbound or outbound adapter services. A completed BPEL process must be successfully compiled in JDeveloper and deployed to a SOA server. Upon deployment to the SOA server, every newly built process is automatically deployed to the Oracle Enterprise Manager Console, where you run, monitor, and administer BPEL processes, and listen to adapter events.

4.2 Deployment of Adapter

During installation, Oracle Application Adapter for PeopleSoft is deployed as a J2CA 1.0 resource adapter within the WLS container. The adapter must be deployed in the same WLS container as Oracle BPEL Process Manager.
4.3 Configuring a New Application Server Connection

To configure a new Application Server connection in Oracle JDeveloper:

1. Open Oracle JDeveloper on your system.

2. From the menu bar, click View and select Application Server Navigator, as shown in Figure 4–1.

![Application Server Navigator](image1)

The Application Server tab is displayed, as shown in Figure 4–2.

![Application Server Tab](image2)

3. Right-click Application Servers, and then select New Application Server. The Create Application Server Connection Wizard is displayed, as shown in Figure 4–3.
4. Accept the default selection (Standalone Server) and click **Next**.
   The Name and Type page is displayed, as shown in **Figure 4–4**.

**Figure 4–4 Name and Type Page**
5. Specify a new name for the Application Server connection and click Next.
   The Authentication page is displayed, as shown in Figure 4–5.

**Figure 4–5 Authentication Page**

6. Specify a valid user name (for example, weblogic) and a password (for example, welcome1) for your new connection.

7. Click Next.
   The Configuration page is displayed, as shown in Figure 4–6.
8. Specify the Oracle WebLogic host name (for example, localhost), which is the machine IP where the process needs to deploy and Oracle WebLogic domain (for example, base_domain).

9. Click Next.

The Test page is displayed, as shown in Figure 4–7.
Figure 4–7  Test Page

10. Click **Test Connection**.

11. Ensure that the test status is successful.

12. Click **Next**.

The Finish page is displayed, as shown in Figure 4–8.
13. Click Finish.

The new Application Server connection is listed in the left pane (Application Server tab), as shown in Figure 4–9.

4.4 Designing an Outbound BPEL Process for Service Integration

The following tools are required to complete your adapter design-time configuration:

- Oracle Adapter Application Explorer (Application Explorer)
- Oracle JDeveloper BPEL Designer (JDeveloper) or Eclipse
Before you design a BPEL process, you must create a schema and generate the respective WSDL file using Application Explorer. For more information, see "Generating WSDL for Request/Response Service" on page 4-8.

### 4.4.1 Generating WSDL for Request/Response Service

To generate WSDL for outbound interaction in Application Explorer:

1. Start Application Explorer and connect to a defined PeopleSoft target or create a new target.
   
   For more information, see "Defining a Target to PeopleSoft" on page 2-6.

2. Expand the PeopleSoft target to which you are connected.

3. Expand Component Interfaces and select LOCATION.

4. Right-click LOCATION, and then select Create Outbound JCA Service (Request/Response), as shown in Figure 4–10.

![Create Outbound JCA Service (Request/Response) Option](image)

The Export WSDL dialog is displayed, as shown in Figure 4–11.
5. Specify an export location on your file system or accept the default path.

The .wsdl file extension is added automatically. By default, the names of WSDL files generated for request-response services end with _invoke.

6. Click OK.

You can now create a new SOA application, which is the first step that is required to define a BPEL outbound process in JDeveloper.

### 4.4.2 Creating a New SOA Application for the Outbound BPEL Process

Perform the following steps to create a new SOA application for the outbound BPEL process:

1. Open Oracle JDeveloper on your system.

2. Click Application in the menu bar and select New from the menu, as shown in Figure 4–12.
Figure 4–12  New Option

The Create SOA Application wizard is displayed, as shown in Figure 4–13.

Figure 4–13  Create SOA Application Wizard

The Create SOA Application wizard is displayed, as shown in Figure 4–13.
3. From the Application Template list, click **SOA Application**.

4. Enter a name for the new SOA application (for example, PSoft_Outbound_BPEL) and click **Next**.

   The Name your project page is displayed, as shown in **Figure 4–14**.

**Figure 4–14  Name Your Project Page**

5. Enter a project name (for example, LOCATION_Invoke) and click **Next**.

   The Configure SOA settings page is displayed, as shown in **Figure 4–15**.
6. From the Composite Template list, select **Empty Composite** and click **Finish**.

The new SOA application (PSoft_Outbound_BPEL) and associated project (LOCATION_Invoke) are added to the Application Navigator tab in the left pane, as shown in Figure 4–16.

**Figure 4–16 New SOA Application and Associated Project**
4.4.3 Defining a BPEL Outbound Process

This section describes how to define a BPEL outbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Outbound BPEL Process Component

Configuring a Third Party Adapter Service Component

Perform the following steps to create a third party adapter service component:

1. Drag and drop the Third Party Adapter component from the Component Palette tab (Service Adapters section) to the External References pane, as shown in Figure 4–17.

![Third Party Adapter Component](image)

The Create Third Party Adapter Service dialog is displayed, as shown in Figure 4–18.
2. Enter a name for the new third party adapter service.

3. Ensure that Reference is selected from the Type list (default).

4. Click the Find existing WSDLs icon, which is located to the right of the WSDL URL field.

   The SOA Resource Browser dialog is displayed, as shown in Figure 4–19.

   \[\text{Figure 4–19 SOA Resource Browser Dialog}\]

5. Browse and select an outbound WSDL file (for example, LOCATION_invoke.wsdl) from the following directory:
6. Click OK.

   The Localize Files dialog is displayed, as shown in Figure 4–20.

   **Figure 4–20  Localize Files Dialog**

   ![Localize Files Dialog]

   File (C:\oracle\middleware\Oracle_SOA\soa\thirdparty\ApplicationAdapters\wsdls\LOCATION_invoke.wsdl) is external to the current project. In order to make this file available to your project at runtime, XDeveloper can now make a local copy of this file and any dependent files that it imports or includes.

   Copy Options: [✓] Maintain original directory structure for imported files

   The following files will be created in directory
   C:\XDeveloper\mywork\PSoff_Outbound_BPEL\LOCATION_Invoke :

   LOCATION_invoke.wsdl
   LOCATION_invoke_request.xsd
   LOCATION_invoke_response.xsd

7. Click OK.

   The outbound WSDL file and associated request and response XML schema files (.xsd) are imported to the project folder that has been created.

   You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 4–21.
8. Click the **Find JCA Files** icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in **Figure 4–22**.

**Figure 4–22 SOA Resource Browser Dialog**

- Browse and select the JCA properties file (for example, LOCATION_invoke.jca) from the following directory:

  `<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls`
10. Click OK.

The following message is displayed, as shown in Figure 4–23.

*Figure 4–23 Copy File Confirmation Message*

![Copy File Confirmation Message](image)

11. Click Yes.

A copy of the JCA properties file is made in the project folder.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 4–24.

*Figure 4–24 Create Third Party Adapter Service Dialog*

![Create Third Party Adapter Service Dialog](image)

12. Click OK.

The third party adapter service component (Location) is created and displayed in the External References pane, as shown in Figure 4–25.
You are now ready to configure an outbound BPEL process component.

**Configuring an Outbound BPEL Process Component**

Perform the following steps to configure an outbound BPEL process component:

1. Drag and drop the **BPEL Process** component from the Component Palette tab (Service Components section) to the Components pane, as shown in Figure 4–26.

The Create BPEL Process dialog is displayed, as shown in Figure 4–27.
2. In the Name field, enter a name to identify the new outbound BPEL process component (for example, location_out).

3. From the Template list, select **Synchronous BPEL Process**.

4. Click the **Browse Input Elements** icon, which is located to the right of the Input field to select the associated XML request schema file.

The Type Chooser dialog is displayed, as shown in Figure 4–28.

---

**Figure 4–27** Create BPEL Process Dialog

![Create BPEL Process Dialog](image)

**Figure 4–28** Type Chooser Dialog

![Type Chooser Dialog](image)
5. Expand Project Schema Files, LOCATION_invoke_request.xsd, and select PS8.
6. Click OK.

You are returned to the Create BPEL Process dialog, as shown in Figure 4–29.

**Figure 4–29  Create BPEL Process Dialog**

7. Click the Browse Output Elements icon, which is located to the right of the Output field to select the associated XML response schema file.

The Type Chooser dialog is displayed, as shown in Figure 4–30.
8. Expand Project Schema Files, LOCATION_invoke_response.xsd, and select PS8.
9. Click OK.
   You are returned to the Create BPEL Process dialog, as shown in Figure 4–31.

10. Click OK.
11. Create a connection between the outbound BPEL process component (location_out) and the third party adapter service component (Location), as shown in Figure 4–32.

**Figure 4–32 Component Connection**

![Diagram showing component connection](image)

12. Double-click the outbound BPEL process component (location_out) in the Components pane.

   The following is displayed, as shown in Figure 4–33.

**Figure 4–33 Outbound BPEL Process Component**

![Diagram showing outbound BPEL process component](image)

13. Drag and drop the **Invoke** activity component to the Components pane and place it between the **receiveInput** activity component and the **replyOutput** activity component, as shown in Figure 4–34.
14. Create a connection between the new Invoke activity component (Invoke_1) and the third party adapter service component (Location), as shown in Figure 4–35.

The Edit Invoke dialog is displayed, as shown in Figure 4–36.
15. Click the **Automatically Create Input Variable** icon, which is located to the right of the Input field to configure a new input variable.

The Create Variable dialog is displayed, as shown in Figure 4–37.

16. Accept the default values that are provided for the new input variable and click **OK**.

You are returned to the Edit Invoke dialog, as shown in Figure 4–38.
17. Click the **Automatically Create Output Variable** icon, which is located to the right of the Output field to configure a new output variable.

   The Create Variable dialog is displayed, as shown in Figure 4–39.

**Figure 4–39  Create Variable Dialog**

18. Accept the default values that are provided for the new output variable and click OK.

   You are returned to the Edit Invoke dialog, as shown in Figure 4–40.
19. Click **Apply** and then **OK**.

The Invoke activity component (Invoke_1) is updated accordingly, as shown in Figure 4–41.
20. Drag and drop the Assign activity component to the Components pane and place it between the Receive activity component (receiveInput) and the Invoke activity component (Invoke_1), as shown in Figure 4–42.

21. Double-click the new Assign activity component (Assign_1). The Assign dialog is displayed, as shown in Figure 4–43.
22. Click the Copy Operation tab.

23. Click the Plus sign icon and select Copy Operation from the list of available operations.

The Create Copy Operation dialog is displayed, as shown in Figure 4–44.

24. In the From pane, expand Variables, InputVariable, and then select payload.
25. In the To pane, expand Variables, Invoke_1_LOCATION_InputVariable, and then select input_LOCATION.

26. Click OK.

You are returned to the Assign dialog, as shown in Figure 4–45.

Figure 4–45  Assign Dialog

27. Click Apply and then OK.

28. Drag and drop the Assign activity component to the Components pane and place it between the Invoke activity (Invoke_1) and the Reply activity (replyOutput), as shown in Figure 4–46.
29. Double-click the new Assign activity component (Assign_2).
   The Assign dialog is displayed, as shown in Figure 4–47.

Figure 4–47 Assign Dialog

30. Click the Copy Operation tab.

31. Click the Plus sign icon and select Copy Operation from the list of available operations.
The Create Copy Operation dialog is displayed, as shown in Figure 4–48.

**Figure 4–48  Create Copy Operation Dialog**

32. In the From pane, expand Variables, Invoke_1_LOCATION_OutputVariable, and then select output_LOCATION.

33. In the To pane, expand Variables, outputVariable, and then select payload.

34. Click OK.

You are returned to the Assign dialog, as shown in Figure 4–49.
35. Click **Apply** and then **OK**.

The completed activity flow is now displayed, as shown in *Figure 4–50*. 

*Figure 4–50 Completed Activity Flow*
36. Double-click `composite.xml` in the left pane, as shown in Figure 4–51.

![Figure 4–51 Composite.xml Tab](Image)

37. Click the Save All icon in the menu bar to save the new outbound BPEL process component that was configured, as shown in Figure 4–52.

![Figure 4–52 Save All Icon](Image)

You are now ready to deploy the BPEL outbound process.

### 4.4.4 Deploying the BPEL Outbound Process

Perform the following steps to deploy the BPEL outbound process.

1. Right-click the project name in the left pane (for example, `LOCATION_Invoke`), select Deploy, and then click `LOCATION_Invoke`, as shown in Figure 4–53.
2. Ensure that Deploy to Application Server is selected.

3. Click Next.

The Deploy Configuration page is displayed, as shown in Figure 4–55.
4. Leave the default values selected and click Next.

   The Select Server page is displayed, as shown in Figure 4–56.

Figure 4–56  Select Server Page
5. Select an available application server that was configured and click **Next**.
   The SOA Servers page is displayed, as shown in **Figure 4–57**.

   **Figure 4–57 SOA Servers Page**

   ![SOA Servers Page](image)

   **Choose the target SOA server(s) and corresponding partitions to which you want to deploy this archive.**

<table>
<thead>
<tr>
<th>SOA Server</th>
<th>Partition</th>
<th>Status</th>
<th>Server URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>soa_server1</strong></td>
<td>default</td>
<td>Running</td>
<td><a href="http://antex-ch-qe1">http://antex-ch-qe1</a>...</td>
</tr>
</tbody>
</table>

6. Select a target SOA server and click **Next**.
   The Summary page is displayed, as shown in **Figure 4–58**.
7. Review and verify all the available deployment information for your project and click Finish.

The process is deployed successfully, as shown in Figure 4–59.

**Figure 4–59 Successful Deployment Message**

4.4.5 Invoking the Input XML Document in the Oracle Enterprise Manager Console

Perform the following steps to invoke the input XML document in the Oracle Enterprise Manager console.

1. Log in to the Oracle Enterprise Manager console by using the following URL:
   
   http://localhost:7001/em

2. Expand your domain in the left pane followed by the SOA folder, as shown in Figure 4–60.
3. Select an available project (for example, PSoft_Outbound_LOCATION_BPEL), as shown in Figure 4–61.

4. Click Test in the right pane.

   The Test Web Service page is displayed, as shown in Figure 4–62.
5. Click the Request tab.

6. Scroll down to the Input Arguments section, as shown in Figure 4–63.

7. Select XML View from the list in the upper-left corner.

8. Provide an appropriate input XML document in the Input Arguments area. For example:

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
        <ci:PS8>
            <ci:component perform="browse">LOCATION</ci:component>
        </ci:PS8>
        </soap:Body>
    </soap:Envelope>
```
Designing an Inbound BPEL Process for Event Integration

9. Click Test Web Service.

The output response is received in the Response tab of the Oracle Enterprise Manager console, as shown in Figure 4–64.

Figure 4–64 Output Response Tab

4.4.6 Testing Outbound BPEL and Mediator Processes

When testing an outbound BPEL process or an outbound Mediator process from the Oracle Enterprise Manager console, do not use the XML envelopes that are generated by these consoles. Instead, remove them and use the XML payloads that are generated from the schemas, which conform to the WSDLs for namespace qualifications.

The Mediator data flows can be tested using the Oracle Enterprise Manager console. When creating a Mediator data flow and interactions, the Web services are created and registered with the Oracle WebLogic Server. For more information on how to create a Mediator outbound process, see Chapter 5, "Integration With Mediator Service Components in the Oracle SOA Suite”.

4.5 Designing an Inbound BPEL Process for Event Integration

This section demonstrates how Oracle Application Adapter for PeopleSoft integrates with PeopleSoft to receive event data. In this example, an PeopleSoft event occurs when a customer record is added to a PeopleSoft system.

The following tools are required to complete your adapter design-time configuration:

- Oracle Adapter Application Explorer (Application Explorer)
- Oracle JDeveloper BPEL Designer (JDeveloper) or Eclipse
Before you design a BPEL process, you must generate the respective WSDL file using Application Explorer. For more information, see "Generating WSDL for Event Integration" on page 4-41.

4.5.1 Generating WSDL for Event Integration

You must create a separate channel for every event and select that channel when you generate WSDL for inbound interaction using Application Explorer.

Note: If two or more events share the same channel, event messages may not be delivered to the right BPEL process.

Creating a Channel

To create a channel:

1. Click the Events node.
2. Expand the PeopleSoft node.
   The ports and channels nodes appear in the left pane, as shown in Figure 4–65.

Figure 4–65 Expanding PeopleSoft Events Node

3. Right-click Channels and select Add Channel.
   The Add Channel dialog is displayed, as shown in Figure 4–66.
Provide the following information:

a. Enter a name for the channel, for example, PSFT_Channel.

b. Enter a brief description (optional).

c. From the Protocol list, select HTTP Listener.

4. Click Next.

5. When the HTTP listener dialog is displayed, enter the system information as specified in the following table:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Listener port</td>
<td>Port on which to listen for PeopleSoft event data.</td>
</tr>
<tr>
<td>Https</td>
<td>For a secure HTTP connection, select the Https check box.</td>
</tr>
<tr>
<td>Synchronization type</td>
<td>Choose from the following synchronization options:</td>
</tr>
<tr>
<td></td>
<td>■ REQUEST_RESPONSE</td>
</tr>
<tr>
<td></td>
<td>■ REQUEST_ACK</td>
</tr>
<tr>
<td>Important:</td>
<td>The PeopleSoft channel does not work if the synchronization type is set to REQUEST.</td>
</tr>
</tbody>
</table>

6. Click OK.

The channel appears under the channels node in the left pane. An X over the icon indicates that the channel is currently disconnected.

**Note:** Do not start the channel, as it is managed by BPEL PM Server. If you start the channel for testing and debugging purposes, stop it before run-time.

**Generating WSDL for Event Notification**

After you create a channel and verify that it is not started, you must generate WSDL for the event using Application Explorer.

1. Start Application Explorer.
2. Expand the **Adapters** node.
   A list of all available adapters is displayed.

3. Expand **PeopleSoft**.

4. Click a target name under the **PeopleSoft** node, for example, **PSFTtarget**.
The Logon pane on the right displays the saved parameters.

5. Verify your connection parameters.

6. Right-click the target name and select **Connect**.
The x icon disappears, indicating that the target is connected, as shown in Figure 4–67.

**Figure 4–67  Connected PSFT Target**

7. Expand **Messages** and select **LOCATION_SYNC.VERSION_1**.

8. Right-click **LOCATION_SYNC VERSION_1**.

**Figure 4–68  Create Inbound JCA Service (Event) Option**

9. Select **Create Inbound JCA Service (Event)**, as shown in Figure 4–68.
The Export WSDL dialog is displayed, as shown in Figure 4–69.
Perform the following steps:

a. In the **Name** field, specify the name of the WSDL file.

   The `.wsdl` file extension is added automatically. By default, the names of WSDL files generated for request-response services end with `_receive`.

b. From the **Channel** list, select the channel you created for this inbound service.

   **Important**: You must create a separate channel for every event. Verify that the channel is stopped before run-time.

c. Three check boxes for Root, Namespace, and Schema validation are also available. Selection of multiple validation options is allowed.

   - Root validation is used to validate the root element in the inbound XML document.
   - Namespace validation is used to validate the namespace in the inbound XML document.
   - Schema validation is used to validate the inbound XML document with the schema in the WSDL document.

During run time, validation is processed based on the validation options that are selected. If more than one validation option is selected, during run time if the first validation option fails, the remaining validation options are not processed. Root and namespace validations are considered modest levels of validation. Schema validation is a stricter validation level. It is recommended...
to use root and namespace validation options together, unless the root element and namespace are different between the Messages in the PeopleSoft environment.

10. Click OK.

You can now create a new SOA application, which is the first step that is required to define a BPEL inbound process in JDeveloper.

4.5.2 Creating a New SOA Application for the Inbound BPEL Process

Perform the following steps to create a new SOA application for the inbound BPEL process:

1. Open Oracle JDeveloper on your system.
2. Click Application in the menu bar and select New from the menu, as shown in Figure 4–70.

The Create SOA Application wizard is displayed, as shown in Figure 4–71.
3. From the Application Template list, click **SOA Application**.

4. Enter a name for the new SOA application (for example, PSoft_Inbound_BPEL) and click **Next**.

   The Name your project page is displayed, as shown in Figure 4–72.
5. Enter a project name (for example, LOCATION_SYNC_Receive) and click Next.
   The Configure SOA settings page is displayed, as shown in Figure 4–73.
6. From the Composite Template list, select **Empty Composite** and click **Finish**.

**Figure 4–74  Application Navigator Tab**

The new SOA application (PSoft_Inbound_BPEL) and associated project (LOCATION_SYNC_Receive) are added to the Application Navigator tab in the left pane, as shown in **Figure 4–74**.

### 4.5.3 Defining a BPEL Inbound Process

This section describes how to define a BPEL inbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Inbound BPEL Process Component

**Creating a Third Party Adapter Service Component**

Perform the following steps to create a third party adapter service component:

1. Drag and drop the **Third Party Adapter** component from the Component Palette tab (Service Adapters section) to the Exposed Services pane, as shown in **Figure 4–75**.

**Figure 4–75  Third Party Adapter Component**
The Create Third Party Adapter Service dialog is displayed, as shown in Figure 4–76.

**Figure 4–76  Create Third Party Adapter Service Dialog**

2. Enter a name for the third party adapter service.
3. Ensure that **Service** is selected from the Type list (default).
4. Click the **Find existing WSDLs** icon, which is located to the right of the WSDL URL field.
   The SOA Resource Browser dialog is displayed, as shown in Figure 4–77.
5. Browse and select an inbound WSDL file (for example, LOCATION_SYNC.VERSION_1_receive.wsdl) from the following directory:

<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls

6. Click OK.

The Localize Files dialog is displayed, as shown in Figure 4–78.
7. Click OK.

The inbound WSDL file and associated receive/request XML schema file (.xsd) are imported to the project folder that has been created.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 4–79.

Figure 4–79 Create Third Party Adapter Service Dialog
8. Click the Find JCA Files icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in Figure 4–80.

Figure 4–80  SOA Resource Browser Dialog

9. Browse and select the JCA properties file (for example, LOCATIONSYNC.VERSION_1_receive.jca) from the following directory:
   `<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls`

10. Click OK.
    The following message is displayed, as shown in Figure 4–81.

Figure 4–81  Copy File Confirmation Message

11. Click Yes.
    A copy of the JCA properties file is made in the project folder.
You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 4–82.

**Figure 4–82 Create Third Party Adapter Service Dialog**

![Create Third Party Adapter Service Dialog](image)

12. Click **OK**.

The third party adapter service component (location_sync) is created and displayed in the Exposed Services pane, as shown in Figure 4–83.
You are now ready to configure an inbound BPEL process component.

**Creating an Inbound BPEL Process Component**

Perform the following steps to create an inbound BPEL process component:

1. Drag and drop the **BPEL Process** component from the Component Palette tab (Service Components section) to the Components pane, as shown in Figure 4–84.

**Figure 4–84  BPEL Process Component**

The Create BPEL Process dialog is displayed, as shown in Figure 4–85.
2. In the Name field, enter a name to identify the new inbound BPEL process component (for example, Location_Sync_Inbound).

3. From the Template list, select **Base on a WSDL**.

4. Uncheck the **Expose as SOAP service** check box.

5. Click the **Find existing WSDLs** icon, which is located to the right of the WSDL URL field.

The SOA Resource Browser dialog is displayed, as shown in Figure 4–86.
6. Browse and select an inbound WSDL file (for example, LOCATION_SYNC.VERSION_1_receive.wsdl) from the default WSDL location.

7. Click **OK**.

   The Localize Files dialog is displayed, as shown in Figure 4–87.

**Figure 4–87  Localize Files Dialog**

- For the selected WSDL file, maintain the original directory structure for imported files.
- The following files will be created in directory:
  - LOCATION_SYNC.VERSION_1_receive_1.wsdl
  - LOCATION_SYNC.VERSION_1_receive_request_1.wsdl
8. Uncheck the **Rename duplicate files** option in the Copy Options area, and then click **OK**.

You are returned to the Create BPEL Process dialog, as shown in **Figure 4–88**.

**Figure 4–88  Create BPEL Process Dialog**

9. Click **OK**.

**Figure 4–89  Created Connection**

10. Create a connection between the third party adapter service component (location_sync) and the inbound BPEL process component (Location_Sync_Inbound), as shown in **Figure 4–89**.

11. Double-click **composite.xml** in the left pane, as shown in **Figure 4–90**.
12. Click the **Save All** icon in the menu bar to save the new inbound BPEL process component that was configured, as shown in Figure 4–91.

You are now ready to deploy the BPEL inbound process.

### 4.5.4 Deploying the BPEL Inbound Process

Perform the following steps to deploy the BPEL inbound process.

1. Right-click the project name in the left pane (for example, LOCATION_SYNC_Receive), select **Deploy**, and then click **LOCATION_SYNC_Receive**, as shown in Figure 4–92.
2. Ensure that **Deploy to Application Server** is selected.
3. Click **Next**.

The Deploy Configuration page is displayed, as shown in Figure 4–94.
4. Leave the default values selected and click **Next**.

   The Select Server page is displayed, as shown in **Figure 4–95**.

**Figure 4–95 Select Server Page**
5. Select an available application server that was configured and click Next. The SOA Servers page is displayed, as shown in Figure 4–96.

*Figure 4–96  SOA Servers Page*

6. Select a target SOA server and click Next. The Summary page is displayed, as shown in Figure 4–97.
7. Review and verify all the available deployment information for your project and click Finish.

   The process is deployed successfully, as shown in Figure 4–98.

Figure 4–98  Successful Deployment Message

Once event messages are triggered through PeopleSoft, successful instances are received in the Oracle Enterprise Manager console.

4.5.5 Triggering an Event in PeopleSoft

Events are generated by activity in an application system. For example, PeopleSoft may generate an event as customer information is updated in the system. The following topics describe how to trigger an event in PeopleSoft and verify the event using Oracle Application Adapter for PeopleSoft.

To trigger an event in PeopleSoft:

1. Log in to PeopleSoft, select PeopleTools, Integration Broker, and then Node Definitions, as shown in Figure 4–99.
Figure 4–99 PeopleTools Node Definitions

2. Enter the node name you are using, for example, EXTERNAL; then click Search, as shown in Figure 4–100.

Figure 4–100 External Node Name

3. Click the Connectors tab, as shown in Figure 4–101.

Figure 4–101 Connectors Tab
4. Enter HTTPTARGET in the Connector ID field; then enter the listener URL and its port in the PRIMARYURL field.

5. To save the configuration, click Save.

6. Select Integration Broker, Integration Setup, and then Services in the left pane.

7. Enter DEPT_SYNC in the Services field, and then click Search, as shown in Figure 4–102.

Figure 4–102 Services

8. Click DEPT_SYNC.VERSION_1 in the Operation tab, as shown in Figure 4–103.

Figure 4–103 Operation Tab

9. Click the Routings tab, as shown in Figure 4–104.
10. Click **ADD_DEPT** in the Routing Definitions section, as shown in *Figure 4–105*.

11. Click the **Connector Properties** tab, as shown in *Figure 4–106*. 
12. Enter the URL and the port number of the HTTP listener in the Connector Properties section and click Save, as shown in Figure 4–107.

13. From Menu in the left pane, select Set Up Financials/Supply Chain, Common Definitions, Location, and then Location, as shown in Figure 4–108.
14. To find the location record you want to update, click Search; then make the changes and click Save, as shown in Figure 4–109.

Figure 4–109 Location Definition Pane

Verifying the Results
To verify your results:
1. Log in to the Oracle Enterprise Manager console by using the following URL:
   
   http://localhost:7001/em

2. Expand your domain in the left pane followed by the SOA folder.

   Figure 4–110  Oracle Enterprise Manager Console

3. Select an available project (for example, PSoft_Inbound_LOCATION_SYNC.VERSION_1_BPEL), as shown in Figure 4–110.
4. Click the **Instances** tab in the right pane, as shown in Figure 4–111. Recently received run-time events are displayed in the Instances tab, as shown in Figure 4–112.

**Figure 4–112 Recently Received Run-time Events**

7. Click the **Audit Trail** tab to view the event message.

The message received from the PeopleSoft system is displayed in the Audit Trail tab.
This chapter describes integration with Mediator service components in the Oracle SOA Suite. It contains the following topics:

- Section 5.1, "Configuring a New Application Server Connection"
- Section 5.2, "Configuring a Mediator Outbound Process"
- Section 5.3, "Configuring a Mediator Inbound Process"

The scenarios shown in this chapter require the following prerequisites.

**Prerequisites**

The following are installation and configuration requirements:

- Oracle Application Adapter for PeopleSoft must be installed on Oracle WebLogic Server.
- PeopleSoft must be configured for inbound and outbound processing.

**See Also:** Oracle Fusion Middleware Application Adapters Installation Guide for Oracle WebLogic Server

The examples in this chapter present the configuration steps necessary for demonstrating service and event integration with PeopleSoft. Prior to using this material, you must be familiar with the following:

- How to configure Oracle Application Adapter for PeopleSoft for services and events. For more information, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
- How to configure a new Application Server and Integration Server connection in Oracle JDeveloper. For more information, see Chapter 4, "Integration With BPEL Service Components in the Oracle SOA Suite".

**Overview of Mediator Integration**

Mediator provides a comprehensive application integration framework. Oracle Application Adapter for PeopleSoft used with Mediator enables you to seamlessly integrate enterprise software, eliminating the need to write custom code. Functional modeling, as opposed to custom coding solutions, allows for software reuse and reduces the complexity and management challenges that arise over the software lifecycle. This integration model consists of two components—high-level integration logic and low-level platform services.

Adapter integration with Oracle WebLogic Server, Mediator is a two-step process:
1. **Design Time:** Oracle Application Adapter for PeopleSoft is configured in Application Explorer for services and events, as described in Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft". Integration logic is modeled in Oracle JDeveloper. Metadata are stored in repositories.

2. **Runtime:** The underlying platform treats this metadata as run-time instructions to enable the communication between participating applications.

### 5.1 Configuring a New Application Server Connection

For more information on how to configure a new Application Server connection in Oracle JDeveloper, see Section 4.3, "Configuring a New Application Server Connection".

### 5.2 Configuring a Mediator Outbound Process

The following example describes how to configure a Mediator outbound process to your PeopleSoft system, using a Mediator project in Oracle JDeveloper.

**Prerequisites**

Before you design a Mediator outbound process, you must generate the respective WSDL file using Application Explorer. For more information, see "Generating WSDL for Request/Response Service" on page 4-8.

#### 5.2.1 Creating a New SOA Application for the Outbound Mediator Process

Perform the following steps to create a new SOA application for the outbound Mediator process:

1. Open Oracle JDeveloper on your system.
2. Click **Application** in the menu bar and select **New** from the menu, as shown in Figure 5–1.
Figure 5–1  New Option

The Create SOA Application wizard is displayed, as shown in Figure 5–2.

Figure 5–2  Create SOA Application Wizard
3. From the Application Template list, click **SOA Application**.

4. Enter a name for the new SOA application (for example, PSoft_Outbound_Mediator) and click **Next**.

The Name your project page is displayed, as shown in **Figure 5–3**.

**Figure 5–3 Name Your Project Page**

![Name Your Project Page](image)

5. Enter a project name (for example, LOCATION_Invoke) and click **Next**.

The Configure SOA settings page is displayed, as shown in **Figure 5–4**.
6. From the Composite Template list, select **Empty Composite** and click **Finish**.

The new SOA application (PSoft_Outbound_Mediator) and associated project (LOCATION_Invoke) are added to the Application Navigator tab in the left pane, as shown in Figure 5–5.
5.2.2 Defining a Mediator Outbound Process

This section describes how to define a Mediator outbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Outbound Mediator Process Component
3. Configuring the Routing Rules

Configuring a Third Party Adapter Service Component

Perform the following steps to create a third party adapter service component:

1. Drag and drop the **Third Party Adapter** component from the Component Palette tab (Service Adapters section) to the External References pane, as shown in Figure 5–6.

*Figure 5–6  Third Party Adapter Component*

The Create Third Party Adapter Service dialog is displayed, as shown in Figure 5–7.
2. Enter a name for the new third party adapter service.

3. Ensure that Reference is selected from the Type list (default).

4. Click the Find existing WSDLs icon, which is located to the right of the WSDL URL field.

   The SOA Resource Browser dialog is displayed, as shown in Figure 5–8.

**Figure 5–8 SOA Resource Browser Dialog**

5. Browse and select an outbound WSDL file (for example, LOCATION_invoke.wsdl) from the following directory:
6. Click OK.
   The Localize Files dialog is displayed, as shown in Figure 5–9.

Figure 5–9  Localize Files Dialog

7. Click OK.
   The outbound WSDL file and associated request and response XML schema files (.xsd) are imported to the project folder that has been created.

   You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 5–10.
8. Click the **Find JCA Files** icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in Figure 5–11.

**Figure 5–11  SOA Resource Browser Dialog**

9. Browse and select the JCA properties file (for example, LOCATION_invoke.jca) from the following directory:

   `<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls`

10. Click **OK**.
The following message is displayed, as shown in Figure 5–12.

**Figure 5–12  Copy File Confirmation Message**

The jca file LOCATION_invoke.jca is external to the current project. In order to make this file available to your project at runtime, JDeveloper can now make a local copy. Do you want to copy file to LOCATION_invoke_3P.jca?

11. Click Yes.

A copy of the JCA properties file is made in the project folder.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 5–13.

**Figure 5–13  Create Third Party Adapter Service Dialog**

12. Click OK.

The third party adapter service component (Location) is created and displayed in the External References pane, as shown in Figure 5–14.
You are now ready to configure an outbound Mediator process component.

**Configuring an Outbound Mediator Process Component**

Perform the following steps to configure an outbound Mediator process component:

1. Drag and drop the Mediator component from the Component Palette tab (Service Components section) to the Components pane, as shown in Figure 5–15.

The Create Mediator dialog is displayed, as shown in Figure 5–16.
2. In the Name field, enter a name to identify the new outbound Mediator process component (for example, LOCATION_Mediator).

3. From the Template list, select **Synchronous Interface**.

4. Click the **Browse Input Elements** icon, which is located to the right of the Input field to select the associated XML request schema file.

The Type Chooser dialog is displayed, as shown in Figure 5–17.
5. Expand **Project WSDL Files**, **LOCATION_invoke.wsdl**, **Inline Schemas**, **schema**, and select **PS8**.

6. Click **OK**.

   You are returned to the Create Mediator dialog, as shown in **Figure 5–18**.
7. Click the **Browse Output Elements** icon, which is located to the right of the Output field to select the associated XML response schema file. The Type Chooser dialog is displayed, as shown in **Figure 5–19**.

**Figure 5–19  Type Chooser Dialog**

8. Expand **Project WSDL Files**, **LOCATION_invoke.wsdl**, **Inline Schemas**, **schema**, and select **PS8**.

9. Click **OK**.

You are returned to the Create Mediator dialog, as shown in **Figure 5–20**.
10. Click OK.

11. Create a connection between the outbound Mediator process component (LOCATION_Mediator) and the third party adapter service component (Location), as shown in Figure 5–21.

You are now ready to configure the routing rules.
Configuring the Routing Rules

Perform the following steps to configure routing rules for the Mediator outbound process component:

1. Double-click the outbound Mediator process component (LOCATION_Mediator) in the Components pane, as shown in Figure 5–22.

![Figure 5–22 Outbound Mediator Process Component](image)

The Routing Rules dialog is displayed, as shown in Figure 5–23.

![Figure 5–23 Routing Rules Dialog](image)

2. In the <<Filter Expression>> area, click the **Select an existing mapper file or create a new one** icon to the right of the Transform Using field.

The Request Transformation Map dialog is displayed, as shown in Figure 5–24.
3. Select the Create New Mapper File option and click OK. The PS8_To_PS8.xsl tab is displayed, as shown in Figure 5–25.

4. Map the ci:PS8 source element to the ci:PS8 target element. The Auto Map Preferences dialog is displayed, as shown in Figure 5–26.

5. Retain the default values and click OK.
6. Click the LOCATION_Mediator.mplan tab, as shown in Figure 5–27.

Figure 5–27 LOCATION_Mediator.mplan Tab

You are returned to the Routing Rules dialog, as shown in Figure 5–28.

Figure 5–28 Routing Rules Dialog

7. In the Synchronous Reply area, click the Select an existing mapper file or create a new one icon to the right of the Transform Using field.

The Reply Transformation Map dialog is displayed, as shown in Figure 5–29.

Figure 5–29 Reply Transformation Map Dialog

8. Select the Create New Mapper File option and click OK.

The PS8_To_PS8_2.xsl tab is displayed, as shown in Figure 5–30.

The Auto Map Preferences dialog is displayed, as shown in Figure 5–31.

10. Retain the default values and click OK.

The mapping is completed, as shown in Figure 5–32.
11. Click the **Save All** icon in the menu bar to save the new outbound Mediator process component that was configured, as shown in Figure 5–33.

**Figure 5–33  Save All Icon**

You are now ready to deploy the Mediator outbound process.

### 5.2.3 Deploying the Mediator Outbound Process

Perform the following steps to deploy the Mediator outbound process.

1. Right-click the project name in the left pane (for example, LOCATION_Invoke), select **Deploy**, and then click **LOCATION_Invoke**, as shown in Figure 5–34.

**Figure 5–34  Deploy Option**

The Deployment Action page is displayed, as shown in Figure 5–35.
2. Ensure that **Deploy to Application Server** is selected.
3. Click **Next**.

   The Deploy Configuration page is displayed, as shown in Figure 5–36.
4. Leave the default values selected and click **Next**. The Select Server page is displayed, as shown in **Figure 5–37**.
5. Select an available application server that was configured and click Next.

The SOA Servers page is displayed, as shown in Figure 5–38.

**Figure 5–38 SOA Servers Page**

![SOA Servers Page](image)

6. Select a target SOA server and click Next.

The Summary page is displayed, as shown in Figure 5–39.
7. Review and verify all the available deployment information for your project and click **Finish**.

The process is deployed successfully, as shown in Figure 5–40.

**Figure 5–40  Successful Deployment Message**

![Successful Deployment Message](image)

### 5.2.4 Invoking the Input XML Document in the Oracle Enterprise Manager Console

Perform the following steps to invoke the input XML document in the Oracle Enterprise Manager console.

1. Logon to the Oracle Enterprise Manager console by using the following URL:
   
   http://localhost:7001/em

2. Expand your domain in the left pane followed by the **SOA** folder, as shown in Figure 5–41.
3. Select an available project (for example, PSoft_Outbound_LOCATION_Mediator).

4. Click Test in the right pane, as shown in Figure 5–42.

   The Test Web Service page is displayed, as shown in Figure 5–43.
5. Click the Request tab.

6. Scroll down to the Input Arguments section, as shown in Figure 5–44.

7. Select XML View from the list in the upper-left corner.

For example:

```xml
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
    <ci:PS8>
      <ci:component name="TODAY">SHARE</ci:component>
      <ci:component name="LOCATION">ALBERTA</ci:component>
    </ci:PS8>
  </soap:Body>
</soap:Envelope>
```
5.3 Configuring a Mediator Inbound Process

The following example describes how to configure a Mediator inbound process to your PeopleSoft system, using a Mediator project in Oracle JDeveloper.

**Prerequisites**

Before you design a Mediator inbound process, you must generate the respective WSDL file using Application Explorer. For more information, see “Generating WSDL for Event Integration” on page 4-41.

5.3.1 Creating a New SOA Application for the Inbound Mediator Process

Perform the following steps to create a new SOA application for the inbound Mediator process:

1. Open Oracle JDeveloper on your system.
2. Click Application in the menu bar and select New from the menu, as shown in Figure 5–46.
Figure 5–46  New Option

The Create SOA Application wizard is displayed, as shown in Figure 5–47.

Figure 5–47  Create SOA Application Wizard

The Create SOA Application wizard is displayed, as shown in Figure 5–47.
3. From the Application Template list, click **SOA Application**.

4. Enter a name for the new SOA application (for example, PSoft_Inbound_Mediator) and click **Next**.
   
The Name your project page is displayed, as shown in **Figure 5–48**.

**Figure 5–48 Name Your Project Page**

5. Enter a project name (for example, LOCATION_SYNC_Receive) and click **Next**.
   
The Configure SOA settings page is displayed, as shown in **Figure 5–49**.
6. From the Composite Template list, select **Empty Composite** and click **Finish**.

The new SOA application (PSoft_Inbound_Mediator) and associated project (LOCATION_SYNC_Receive) are added to the Application Navigator tab in the left pane, as shown in Figure 5-50.
5.3.2 Defining a Mediator Inbound Process

This section describes how to define a Mediator inbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Inbound Mediator Process Component With a File Adapter
3. Configuring the Routing Rules

**Configuring a Third Party Adapter Service Component**

Perform the following steps to create a third party adapter service component:

1. Drag and drop the Third Party Adapter component from the Component Palette tab (Service Adapters section) to the Exposed Services pane, as shown in Figure 5–51.

**Figure 5–51  Third Party Adapter Component**

The Create Third Party Adapter Service dialog is displayed, as shown in Figure 5–52.
2. Enter a name for the third party adapter service.

3. Ensure that Service is selected from the Type list (default).

4. Click the Find existing WSDLs icon, which is located to the right of the WSDL URL field.

   The SOA Resource Browser dialog is displayed, as shown in Figure 5–53.
Figure 5–53  SOA Resource Browser Dialog

5. Browse and select an inbound WSDL file (for example, LOCATION_SYNC.VERSION_1_receive.wsdl) from the following directory:
   \<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls

6. Click OK.
   The Localize Files dialog is displayed, as shown in Figure 5–54.
7. Click **OK**.

The inbound WSDL file and associated receive/request XML schema file (.xsd) are imported to the project folder that has been created.

You are returned to the Create Third Party Adapter Service dialog, as shown in **Figure 5–55**.

---

**Figure 5–54 Localize Files Dialog**

![Localize Files Dialog](image1)

**Figure 5–55 Create Third Party Adapter Service Dialog**

![Create Third Party Adapter Service Dialog](image2)
8. Click the **Find JCA Files** icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in Figure 5–56.

![Figure 5–56 SOA Resource Browser Dialog](image)

9. Browse and select the JCA properties file (for example, LOCATION_SYNC.VERSION_1_receive.jca) from the following directory:

   `<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/wsdl`

10. Click **OK**.

    The following message is displayed, as shown in Figure 5–57.

![Figure 5–57 Copy File Confirmation Message](image)

11. Click **Yes**.

    A copy of the JCA properties file is made in the project folder.
You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 5–58.

**Figure 5–58  Create Third Party Adapter Service Dialog**

![Create Third Party Adapter Service Dialog]

12. Click **OK**.

The third party adapter service component (location_sync) is created and displayed in the Exposed Services pane, as shown in Figure 5–59.
You are now ready to configure an inbound Mediator process component.

**Configuring an Inbound Mediator Process Component With a File Adapter**

Perform the following steps to configure an inbound Mediator process component with a File adapter.

1. Drag and drop the Mediator component from the Component Palette tab (Service Components section) to the Components pane, as shown in Figure 5–60.

The Create Mediator dialog is displayed, as shown in Figure 5–61.
2. In the Name field, enter a name to identify the new inbound Mediator process component (for example, LOCATION_SYNC_Mediator).

3. From the Template list, select Define Interface Later.

4. Click the OK.

   The new Mediator process component is added to the Components pane, as shown in Figure 5–62.

5. Drag and drop the File Adapter component from the Service Adapters pane to the External References pane.

   The Adapter Configuration Wizard is displayed, showing the Welcome page, as shown in Figure 5–63.
6. Click Next.
   The Service Name page is displayed, as shown in Figure 5–64.
7. Type a name for the new File adapter in the Service Name field and click **Next**. The Adapter Interface page is displayed, as shown in **Figure 5–65**.
8. Ensure that the Define from operation and schema (specified later) option is selected.

9. Click Next.

The Operation page is displayed, as shown in Figure 5–66.
10. Select **Write File** from the list of Operation Type options and specify an Operation Name (for example, Write).

11. Click **Next**.

The File Configuration page is displayed, as shown in Figure 5–67.
12. Specify a location on your file system where the output file is written.

13. In the File Naming Convention field, specify a name for the output file.

14. Click Next.

   The Messages page is displayed, as shown in Figure 5–68.
15. Click **browse for schema file**, which is located to the right of the URL field. The Type Chooser dialog is displayed, as shown in Figure 5–69.
16. Expand Project WSDL Files, LOCATION_SYNC.VERSION_1_receive.wsdl, Inline Schemas, and schema.

17. Select the available schema (for example, LOCATION_SYNC)

18. Click OK.

You are returned to the Messages page, as shown in Figure 5–70.
19. Click **Next**.

The Finish page is displayed, as shown in Figure 5–71.
20. Click Finish.

21. Create a connection between the inbound Mediator process component and the third party adapter service component, as shown in Figure 5–72.

**Figure 5–72 Created Connection**

22. Create a connection between the inbound Mediator process component and the File adapter component, as shown in Figure 5–73.
You are now ready to configure the routing rules.

**Configuring the Routing Rules**
Perform the following steps to configure routing rules for the Mediator inbound process component:

1. Double-click the inbound Mediator process component in the Components pane, as shown in Figure 5–74.

**Figure 5–74 Inbound Mediator Process Component**

The Routing Rules dialog is displayed, as shown in Figure 5–75.
2. In the <<Filter Expression>> area, click the **Select an existing mapper file or create a new one** icon to the right of the Transform Using field.

The Request Transformation Map dialog is displayed, as shown in **Figure 5–76**.

3. Select the **Create New Mapper File** option and click **OK**.

The LOCATION_SYNC_To_LOCATION_SYNC.xsl tab is displayed, as shown in **Figure 5–77**.

The Auto Map Preferences dialog is displayed, as shown in **Figure 5–78**.
5. Retain the default values and click **OK**.

The mapping is now complete, as shown in Figure 5–79.

6. Click the **Save All** icon in the menu bar to save the new inbound Mediator process component that was configured, as shown in Figure 5–80.
You are now ready to deploy the Mediator inbound process. You can follow the same procedure that is described in "Deploying the BPEL Inbound Process" on page 4-58.

Once event messages are triggered through PeopleSoft, output XML is received in the location that was specified for the File adapter component. For more information on how to trigger events in PeopleSoft, see "Triggering an Event in PeopleSoft" on page 4-62.
Integration With BPM Service Components in the Oracle SOA Suite

Oracle Application Adapter for PeopleSoft integrates seamlessly with Oracle Business Process Management (BPM) to facilitate Web service integration. Oracle BPM is based on the Service-Oriented Architecture (SOA). It consumes adapter services exposed as Web Service Definition Language (WSDL) documents.

This chapter contains the following topics:

- Section 6.1, "Overview"
- Section 6.2, "Deployment of Adapter"
- Section 6.3, "Configuring a New Application Server Connection"
- Section 6.4, "Designing an Outbound BPM Process Using Transformations for Service Integration"
- Section 6.5, "Designing an Inbound BPM Process Using Transformations for Event Integration"

6.1 Overview

To integrate with Oracle BPM, Oracle Application Adapter for PeopleSoft must be deployed in the same WLS container as Oracle BPM. The underlying adapter services must be exposed as WSDL files, which are generated during design time in Oracle Adapter Application Explorer (Application Explorer) for both request-response (outbound) and event notification (inbound) services of the adapter. For more information, see "Generating a WSDL (J2CA Configurations Only)" on page 2-11.

The generated WSDL files are used to design the appropriate BPM processes for inbound or outbound adapter services. A completed BPM process must be successfully compiled in JDeveloper and deployed to a BPM server. Upon deployment to the BPM server, every newly built process is automatically deployed to the Oracle Enterprise Manager console, where you run, monitor, and administer BPM processes, and listen to adapter events.

6.2 Deployment of Adapter

During installation, Oracle Application Adapter for PeopleSoft is deployed as a J2CA 1.0 resource adapter within the WLS container. The adapter must be deployed in the same WLS container as Oracle BPM.
6.3 Configuring a New Application Server Connection

For more information on how to configure a new Application Server connection in Oracle JDeveloper, see Section 4.3, "Configuring a New Application Server Connection".

6.4 Designing an Outbound BPM Process Using Transformations for Service Integration

The following tools are required to complete your outbound design-time configuration:

- Oracle Adapter Application Explorer (Application Explorer)
- Oracle JDeveloper BPM Designer (JDeveloper) or Eclipse

**Note:** The examples in this chapter demonstrate the use of JDeveloper.

Before you design a BPM process, you must generate the respective WSDL file using Application Explorer. For more information, see "Generating WSDL for Request/Response Service" on page 4-8.

6.4.1 Creating an Empty Composite for BPM

Perform the following steps to create an empty composite for BPM:

1. Create a new BPM application.
2. Enter a name for the new BPM application and click Next, as shown in Figure 6–1.
The Name your project page is displayed, as shown in Figure 6–2.
3. Enter a project name (for example, PSoft_JCA_Outbound) and click **Next**. The Configure SOA settings page is displayed, as shown in **Figure 6–3**.

**Figure 6–3  Configure SOA Settings Page**

![Configure SOA Settings Page](image)

4. From the Composite Template list, select **Empty Composite** and click **Finish**.

### 6.4.2 Defining a BPM Outbound Process

This section describes how to define a BPM outbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Outbound BPM Process Component
3. Creating a File Adapter for the Write Operation

**Configuring a Third Party Adapter Service Component**

Perform the following steps to create a third party adapter service component:

1. Drag and drop the **Third Party Adapter** component from the Service Adapters pane to the External References pane, as shown in **Figure 6–4**.
2. Enter a name for the third party adapter service.

3. Ensure that Reference is selected from the Type list (default).

4. Click the Find existing WSDLs icon, which is located to the right of the WSDL URL field.

   The SOA Resource Browser dialog is displayed, as shown in Figure 6–6.
5. Browse and select an outbound PeopleSoft WSDL file from the following directory:

<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/wsdls

6. Click OK.

The Localize Files dialog is displayed, as shown in Figure 6–7.

7. Click OK.
The outbound WSDL file and associated request and response XML schema files (.xsd) are imported to the project folder that has been created.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 6–8.

**Figure 6–8 Create Third Party Adapter Service Dialog**

8. Click the **Find JCA file** icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in Figure 6–9.
9. Browse and select the JCA properties file from the following directory:

<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/wsdl

10. Click OK.

The following message is displayed, as shown in Figure 6–10.

![Copy File Confirmation]

11. Click Yes.

A copy of the JCA properties file is made in the project folder.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 6–11.
12. Click OK.

The third party adapter service component (CC_GD) is created and displayed in the External References pane, as shown in Figure 6–12.

**Figure 6–12  Third Party Adapter Service Component**

You are now ready to configure an outbound BPM process component.

**Configuring an Outbound BPM Process Component**

Perform the following steps to configure an outbound BPM process component:

1. Drag and drop the BPMN Process component from the Service Components pane to the Components pane, as shown in Figure 6–13.
The Create BPMN Process dialog is displayed, as shown in Figure 6–14.

Figure 6–14  Create BPMN Process Dialog

The BPMN Process component is created, as shown in Figure 6–15.

2. Accept the default option that is selected in the left pane (Default Process) and click Finish.

The BPMN Process component is created, as shown in Figure 6–15.
3. Double-click the BPMN Process component in the Components pane.
   The BPMN process is displayed, as shown in Figure 6–16.

4. Click the Activity icon, as shown in Figure 6–17.
5. Drop the Activity icon on the wire between the Start and End event components, as shown in Figure 6–18.

The Properties - Activity dialog is displayed, as shown in Figure 6–19.
6. Click the **Implementation** tab.

7. Select **Service Task** from the Implementation Type list, as shown in Figure 6–20.
8. Select Service Call from the Implementation list, as shown in Figure 6–21.
9. Click the Browse icon to the right of the Name field, as shown in Figure 6–22.

The Type dialog is displayed, as shown in Figure 6–23.
10. Select the Third Party Service that has been created for PeopleSoft (for example, Location) and click OK.

You are returned to the Properties - Activity dialog, as shown in Figure 6–24.

11. Select the Use Associations option that is located under Data Associations.

12. Click the Edit Data Associations icon.

The Data Associations dialog is displayed, as shown in Figure 6–25.
13. Right-click the Process node in the right pane and select Add.

The Create Data Object dialog is displayed, as shown in Figure 6–26.

14. Enter a name in the Name field (for example, Request) and click Browse more types to the right of the Type field.

The Browse Types dialog is displayed, as shown in Figure 6–27.
15. Select <Component> from the Type list, as shown in Figure 6–28.

Figure 6–28  Browse Types - <Component>

![Browse Types](image)

16. Select the first component (for example, PS8) and click OK.

You are returned to the Create Data Object dialog, as shown in Figure 6–29.

Figure 6–29  Create Data Object Dialog

![Create Data Object](image)

17. Click OK.

The Data Object (for example, Request) that has been created is displayed under the Process node in the Data Associations dialog, as shown in Figure 6–30.

Figure 6–30  Data Associations Dialog

![Data Associations](image)
18. Create another Data Object by right-clicking the Process node in the right pane and selecting Add, as shown in Figure 6–31.

Figure 6–31  Add Option in Data Associations Dialog

The Create Data Object dialog is displayed, as shown in Figure 6–32.

Figure 6–32  Create Data Object Dialog

19. Enter a name in the Name field (for example, Response) and click Browse more types to the right of the Type field.

The Browse Types dialog is displayed, as shown in Figure 6–33.
20. Select `<Component>` from the Type list, as shown in Figure 6–34.

21. Select the second component (for example, PS81) and click OK.

You are returned to the Create Data Object dialog, as shown in Figure 6–35.
22. Click **OK**.

The Data Object (for example, Response) that has been created is displayed under the Process node in the Data Associations dialog, as shown in Figure 6–36.

23. Select the Request Data Object under the Process node in the right pane and drag it to the field below the Inputs area, as shown in Figure 6–37.

24. Select the Response Data Object under the Process node in the right pane and drag it to the field below the Outputs area, as shown in Figure 6–38.
25. Click OK.

You are returned to the Properties - Activity dialog, as shown in Figure 6–39.

Figure 6–39  Properties - Activity Dialog

26. Click OK.

The Service Task is created between the Start and End Event components, as shown in Figure 6–40.
27. Save the process and double-click the Start event component. The Properties - Start dialog is displayed, as shown in Figure 6–41.

28. Click the **Implementation** tab, as shown in Figure 6–42.
29. Click the **Plus** icon to the right of the Arguments Definition field.

The Create Argument dialog is displayed, as shown in Figure 6–43.

**Figure 6–43  Create Argument Dialog**

30. Enter a name in the Name field (for example, argument1) and click **Browse more types** to the right of the Type field.

The Browse Types dialog is displayed, as shown in Figure 6–44.
31. Select `<Component>` from the Type list, as shown in Figure 6–45.

32. Select the first component (for example, PS8) and click OK.
You are returned to the Create Argument dialog, as shown in Figure 6–46.
33. Click OK.
   You are returned to the Properties - Start dialog, as shown in Figure 6-47.

34. Select the Use Associations option that is located under Data Associations.

35. Click the Edit Data Associations icon.
   The Data Associations dialog is displayed, as shown in Figure 6-48.

36. Select the Request Data Object under the Process node in the right pane and drag it to the field below the Outputs area.
37. Click OK.

You are returned to the Properties - Activity dialog, as shown in Figure 6–49.

38. Click OK.

You are returned to the Process workspace area, as shown in Figure 6–50.
39. Double-click composite.xml in the left pane.

**Figure 6–50 Process Workspace Area**

40. Click the Save All icon in the menu bar to save the new outbound BPM process component that was configured.

You are now ready to create a File adapter for the write operation.

**Creating a File Adapter for the Write Operation**

Perform the following steps to create a File adapter for the write operation:

1. Drag and drop the File Adapter component from the Service Adapters pane to the External References pane, as shown in Figure 6–51.

**Figure 6–51 File Adapter Component**

The Adapter Configuration Wizard is displayed, as shown in Figure 6–52.
2. Click Next.

The Service Name page is displayed, as shown in Figure 6–53.
3. Type a name for the new File adapter in the Service Name field and click **Next**.
The Adapter Interface page is displayed, as shown in Figure 6–54.
4. Ensure that the **Define from operation and schema (specified later)** option is selected.

5. Click **Next**.

   The Operation page is displayed, as shown in Figure 6–55.
6. Select **Write File** from the list of Operation Type options and specify an Operation Name (for example, Write).

7. Click **Next**.
   The File Configuration page is displayed, as shown in **Figure 6–56**.
8. Specify a location on your file system where the output file is written.

9. In the File Naming Convention field, specify a name for the output file.

10. Click Next.

The Messages page is displayed, as shown in Figure 6–57.
11. Click **Browse**, which is located to the right of the URL field.

   The Type Chooser dialog is displayed, as shown in Figure 6–58.

**Figure 6–58 Type Chooser Dialog**

12. Expand **Project Schema Files** and **LOCATION_invoke_response.xsd**.
13. Select the available schema (for example, PS8).

14. Click **OK**.

You are returned to the Messages page, as shown in Figure 6–59.

**Figure 6–59  Messages Page**

![Messages Page](image)

15. Click **Next**.

The Finish page is displayed, as shown in Figure 6–60.
16. Click Finish.
   
   The File Adapter service is created in the External References pane, as shown in Figure 6–61.

Figure 6–61  File Adapter Service

17. Double-click the BPMN Process component.
The BPMN process is displayed, as shown in Figure 6–62.

**Figure 6–62 BPMN Process**

18. Click the Activity icon.

19. Drop the Activity icon on the wire between the Service Task and End event components, as shown in Figure 6–63.

**Figure 6–63 Activity Icon**

The Properties - Activity dialog is displayed, as shown in Figure 6–64.
20. Click the Implementation tab.

21. Select Service Task from the Implementation Type list, as shown in Figure 6–65.
22. Select Service Call from the Implementation list, as shown in Figure 6–66.
23. Click the Browse icon to the right of the Name field, as shown in Figure 6–67.

The Type dialog is displayed, as shown in Figure 6–68.
24. Select the service for write operation that has been created (for example, Write_file) and click **OK**.

You are returned to the Properties - ServiceTask1 dialog, as shown in **Figure 6–69**.

25. Select the **Use Transformations** option that is located under Data Associations.

26. Click the **Edit XSL Transformations** icon.

The Transformations dialog is displayed, as shown in **Figure 6–70**.
27. Click the **Plus** icon.

The Transformation dialog is displayed, as shown in **Figure 6–71**.

**Figure 6–71  Transformation Dialog**

28. Select the **Response** Data Object that was created from the Sources list, as shown in **Figure 6–72**.
29. Click the Plus icon so that the Data Object 'Response' is added to the Selected Elements area.

30. Accept the default value that is selected in the Target list, as shown in Figure 6–73.
31. Enter a name (for example, transformation) in the Create field and click OK. You are returned to the Transformations dialog, as shown in Figure 6–74.

32. Click OK. You are returned to the Properties - ServiceTask1 dialog, as shown in Figure 6–75.
33. Click OK.

The transformation.xsl tab is displayed, as shown in Figure 6–76.

34. Automap the Source and Target elements.

The Auto Map Preferences dialog is displayed, as shown in Figure 6–77.
35. Accept the default values and click **OK**.

   The transformation is completed, as shown in **Figure 6–78**.

36. Save the transformation.

37. Return to the Process workspace area, as shown in **Figure 6–79**.
The ServiceTask1 component is created between the ServiceTask component and the End event component.

38. Save the process.

39. Double-click the **End** event component.

   The Properties - End dialog is displayed, as shown in Figure 6–80.

40. Click the **Implementation** tab.

**Figure 6–80  Properties - End Dialog**

41. Select **None** from the Implementation Type list, as shown in Figure 6–81.
42. Click **OK**.
   You are returned to the Process workspace area, as shown in Figure 6–82.

43. Save the Process and double-click the **composite.xml** file, as shown in Figure 6–83.
44. Click the **Save All** icon in the menu bar to save the new outbound BPM process component that was configured.

You are now ready to deploy the outbound BPM process.

### 6.4.3 Deploying the BPM Outbound Process

Perform the following steps to deploy the BPM outbound process.

1. Right-click the project name in the left pane (for example, **PSoft_JCA_Outbound**), select **Deploy**, and then click **PSoft_JCA_Outbound**, as shown in Figure 6–84.

The Deployment Action page is displayed, as shown in Figure 6–85.
2. Ensure that **Deploy to Application Server** is selected.

3. Click **Next**.

   The Deploy Configuration page is displayed, as shown in **Figure 6–86**.
4. Leave the default values selected and click Next.

The Select Server page is displayed, as shown in Figure 6–87.

Figure 6–87 Select Server Page
5. Select an available application server that was configured and click **Next**.
   The SOA Servers page is displayed, as shown in **Figure 6–88**.

**Figure 6–88  SOA Servers Page**

6. Select a target SOA server and click **Next**.
   The Summary page is displayed, as shown in **Figure 6–89**.
7. Review and verify all the available deployment information for your project and click **Finish**.

   The process is deployed successfully, as shown in Figure 6–90.

**Figure 6–90  Successful Deployment Message**

---

6.4.4 Invoking the Input XML Document in the Oracle Enterprise Manager Console

Perform the following steps to invoke the input XML document in the Oracle Enterprise Manager console.

1. Logon to the Oracle Enterprise Manager console, as shown in Figure 6–91.

**Figure 6–91  Logon to Oracle Enterprise Manager Console**
2. Expand your domain in the left pane followed by the SOA folder.
3. Select an available project (for example, PSoft_JCA_Outbound).
4. Click Test.
5. Click the Request tab.
6. Provide an appropriate input value in the Value field and click Test Web Service.
   A response is received in the Response tab to indicate that invocation was successful in the Oracle Enterprise Manager console.
7. Navigate to the defined output directory on your file system and open the XML response document that was received.
   The XML response document contains the generated output with values.

6.5 Designing an Inbound BPM Process Using Transformations for Event Integration

This section demonstrates how Oracle Application Adapter for PeopleSoft integrates with PeopleSoft to receive event data.

The following tools are required to complete your adapter design-time configuration:
- Oracle Adapter Application Explorer (Application Explorer)
- Oracle JDeveloper BPM Designer (JDeveloper) or Eclipse

**Note:** The examples in this chapter demonstrate the use of JDeveloper.

Before you design a BPM process, you must generate the respective WSDL file using Application Explorer. For more information, see “Generating WSDL for Event Integration” on page 4-41.

6.5.1 Creating an Empty Composite for BPM

Perform the following steps to create an empty composite for BPM:
1. Create a new BPM application.
2. Enter a name for the new BPM application and click Next, as shown in Figure 6–92.

Figure 6–92 Name Your Application Page

The Name your project page is displayed, as shown in Figure 6–93.
3. Enter a project name (for example, PSoft_JCA_Inbound) and click Next. The Configure SOA settings page is displayed, as shown in Figure 6–94.

Figure 6–94 Configure SOA Settings Page
4. From the Composite Template list, select **Empty Composite** and click **Finish**.

### 6.5.2 Defining a BPM Inbound Process

This section describes how to define a BPM inbound process, which consists of the following stages:

1. Configuring a Third Party Adapter Service Component
2. Configuring an Inbound BPM Process Component
3. Creating a File Adapter for the Write Operation

#### Configuring a Third Party Adapter Service Component

Perform the following steps to create a third party adapter service component:

1. Drag and drop the **Third Party Adapter** component from the Service Adapters pane to the Exposed References pane, as shown in Figure 6–95.

**Figure 6–95  Third Party Adapter Component**

The Create Third Party Adapter Service dialog is displayed, as shown in Figure 6–96.
2. Enter a name for the third party adapter service.
3. Ensure that Service is selected from the Type list (default).
4. Click the Find existing WSDLs icon, which is located to the right of the WSDL URL field.

   The SOA Resource Browser dialog is displayed, as shown in Figure 6–97.

---

**Figure 6–97  SOA Resource Browser Dialog**

![SOA Resource Browser Dialog](image)
5. Browse and select an inbound WSDL file from the following directory:

   `<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsdls`

6. Click OK.
   
   The Localize Files dialog is displayed, as shown in Figure 6–98.

   **Figure 6–98 Localize Files Dialog**

   ![Localize Files Dialog](image)

7. Click OK.

   The inbound WSDL file and associated receive_request XML schema file (.xsd) are imported to the project folder that has been created.

   You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 6–99.
8. Click the Find JCA file icon, which is located to the right of the JCA File field. The SOA Resource Browser dialog is displayed, as shown in Figure 6–100.

9. Browse and select the JCA properties file from the following directory:

<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\wsds
10. Click OK.

The following message is displayed, as shown in Figure 6–101.

**Figure 6–101  Copy File Confirmation Message**

![Copy File Confirmation Message](image)

11. Click Yes.

A copy of the JCA properties file is made in the project folder.

You are returned to the Create Third Party Adapter Service dialog, as shown in Figure 6–102.

**Figure 6–102  Create Third Party Adapter Service Dialog**

![Create Third Party Adapter Service Dialog](image)

12. Click OK.

The third party adapter service component (location_sync) is created in the Exposed References pane, as shown in Figure 6–103.
You are now ready to configure an inbound BPM process component.

**Configuring an Inbound BPM Process Component**

Perform the following steps to configure an inbound BPM process component:

1. Drag and drop the **BPMN Process** component from the Service Components pane to the Components pane, as shown in Figure 6–104.

The Create BPMN Process dialog is displayed, as shown in Figure 6–105.
2. Select the From Pattern option in the left pane and ensure that Manual Process is selected in the Patterns area.

3. Click Finish.

The BPMN Process component is created, as shown in Figure 6–106.

**Figure 6–106  BPMN Process Component**

4. Double-click the BPMN Process component in the Components pane.

The BPMN process is displayed, as shown in Figure 6–107.
5. Right-click UserTask and select Delete from the menu.
6. Double-click the Start event component, as shown in Figure 6–108.

The Properties - Start dialog is displayed, as shown in Figure 6–109.
7. Click the **Implementation** tab, as shown in Figure 6–110.

8. Select **Message** from the Implementation Type list, as shown in Figure 6–111.
9. Select **Interface from Catalog** from the Implementation list.

10. Click the **Browse** icon to the right of the Name field, as shown in Figure 6–112.
11. Select the Third Party Service that has been created and click **OK**.

You are returned to the Properties - Start dialog, as shown in Figure 6–114.
12. Select the **Use Associations** option that is located under Data Associations.

13. Click the **Edit Data Associations** icon. The Data Associations dialog is displayed, as shown in Figure 6–115.

14. Right-click the **Process** node in the right pane and select **Add**. The Create Data Object dialog is displayed, as shown in Figure 6–116.
15. Enter a name in the Name field (for example, location_sync_in) and click Browse more types to the right of the Type field.

The Browse Types dialog is displayed, as shown in Figure 6–117.

16. Select <Component> from the Type list, as shown in Figure 6–118.
17. Select the first component (for example, LOCATION_SYNC) and click OK.
You are returned to the Create Data Object dialog, as shown in Figure 6–119.

Figure 6–119 Create Data Object Dialog

18. Click OK.
The Data Object (for example, location_sync_in) that has been created is displayed under the Process node in the Data Associations dialog, as shown in Figure 6–120.
19. Select the location_sync_in Data Object under the Process node in the right pane and drag it to the field below the Outputs area.

20. Click OK.

You are returned to the Properties - Start dialog, as shown in Figure 6–121.
21. Click **OK**.

You are returned to the Process workspace area, as shown in Figure 6–122.

22. Double-click **composite.xml** in the left pane.

**Figure 6–122  Process Workspace Area**

23. Click the **Save All** icon in the menu bar to save the new inbound BPM process component that was configured.

You are now ready to create a File adapter for the write operation.
Creating a File Adapter for the Write Operation
Perform the following steps to create a File adapter for the write operation:

1. Drag and drop the File Adapter component from the Service Adapters pane to the External References pane, as shown in Figure 6–123.

The Adapter Configuration Wizard is displayed, as shown in Figure 6–124.

2. Click Next.

The Service Name page is displayed, as shown in Figure 6–125.
3. Type a name for the new File adapter in the Service Name field and click **Next**.

The Adapter Interface page is displayed, as shown in **Figure 6–126**.
4. Ensure that the **Define from operation and schema (specified later)** option is selected.

5. Click **Next**.

The Operation page is displayed, as shown in **Figure 6–127**.
6. Select **Write File** from the list of Operation Type options and specify an Operation Name (for example, Write).

7. Click **Next**.

The File Configuration page is displayed, as shown in Figure 6–128.
8. Specify a location on your file system where the output file is written.
9. In the File Naming Convention field, specify a name for the output file.
10. Click Next.

The Messages page is displayed, as shown in Figure 6–129.
11. Click **browse for schema file**, which is located to the right of the URL field. The Type Chooser dialog is displayed, as shown in **Figure 6–130**.

*Figure 6–130  Type Chooser Dialog*
12. Expand Project Schema Files and LOCATION_SYNC.VERSION_1_receive_request.xsd.

13. Select the available schema (for example, LOCATION_SYNC).

14. Click OK.

You are returned to the Messages page, as shown in Figure 6–131.

**Figure 6–131  Messages Page**

![Messages Page](image)

15. Click Next.

The Finish page is displayed, as shown in Figure 6–132.
16. Click Finish.

The File Adapter service is created in the External References pane, as shown in Figure 6–133.

Figure 6–133 File Adapter Service
17. Double-click the BPMN Process component.

The BPMN process is displayed, as shown in Figure 6–134.

Figure 6–134 BPMN Process

18. Click the Activity icon.

19. Drop the Activity icon on the wire between the Start and End event components, as shown in Figure 6–135.

Figure 6–135 Activity Icon

The Properties - Activity dialog is displayed, as shown in Figure 6–136.
20. Click the **Implementation** tab, as shown in **Figure 6–137**.

21. Select **Service Task** from the Implementation Type list, as shown in **Figure 6–138**.
22. Select **Service Call** from the Implementation list.

23. Click the **Browse** icon to the right of the Name field, as shown in Figure 6–139.

The Type dialog is displayed, as shown in Figure 6–140.
24. Select the service for write operation that has been created (for example, PSoft_File_Adapter) and click OK.

You are returned to the Properties - Activity dialog, as shown in Figure 6–141.

25. Select the Use Transformations option that is located under Data Associations.

26. Click the Edit XSL Transformations icon.
The Transformations dialog is displayed, as shown in Figure 6–142.

**Figure 6–142 Transformations Dialog**

The Transformation dialog is displayed, as shown in Figure 6–143.

**Figure 6–143 Transformation Dialog**

27. Click the Plus icon.

The Transformation dialog is displayed, as shown in Figure 6–143.

28. Select the location_sync_in Data Object that was created from the Sources list.
29. Click the **Plus** icon so that the Data Object 'location_sync_in' is added to the Selected Elements area, as shown in Figure 6–144.

*Figure 6–144  Selected Elements Area*

30. Accept the default value that is selected in the Target list, as shown in Figure 6–145.
31. Enter a name (for example, loc) in the Create field and click OK.
You are returned to the Transformations dialog, as shown in Figure 6–146.

32. Click OK.
You are returned to the Properties - Activity dialog, as shown in Figure 6–147.
33. Click OK.

The loc.xsl tab is displayed, as shown in Figure 6–148.

34. Automap the Source and Target elements.

The Auto Map Preferences dialog is displayed, as shown in Figure 6–149.
35. Accept the default values and click **OK**.

   The transformation is completed, as shown in Figure 6–150.

   **Figure 6–149  Auto Map Preferences Dialog**

   ![Auto Map Preferences Dialog](image)

   36. Save the transformation.

   37. Return to the Process workspace area, as shown in Figure 6–151.
The ServiceTask component is created between the Start event component and the End event component.

38. Save the Process and double-click the composite.xml file.

39. Click the Save All icon in the menu bar to save the new inbound BPM process component that was configured, as shown in Figure 6–152.

You are now ready to deploy the BPM inbound process. You can follow the same procedure that is described in "Deploying the BPEL Inbound Process" on page 4-58. Once event messages are triggered through PeopleSoft, output XML is received in the location that was specified for the File adapter component. For more information on how to trigger events in PeopleSoft, see "Triggering an Event in PeopleSoft" on page 4-62.
7

Configuring Outbound and Inbound Processing Using Oracle Service Bus

Oracle Application Adapter for PeopleSoft integrates seamlessly with Oracle Service Bus (OSB) to facilitate Web service integration. OSB is based on the Service-Oriented Architecture (SOA). It consumes adapter services exposed as Web Service Definition Language (WSDL) documents.

This chapter contains the following topics:

- Section 7.1, "Overview of Application Adapter Integration with Oracle Service Bus"
- Section 7.2, "Configuring Outbound Processing Using Oracle Service Bus (J2CA Configuration)"
- Section 7.3, "Configuring Inbound Processing Using Oracle Service Bus (J2CA Configuration)"
- Section 7.4, "Configuring Outbound Processing Using Oracle Service Bus (BSE Configuration)"

7.1 Overview of Application Adapter Integration with Oracle Service Bus

To integrate with Oracle Service Bus (OSB), Oracle Application Adapter for PeopleSoft must be deployed in the same Oracle WebLogic Server as OSB. The underlying adapter services must be exposed as WSDL files, which are generated during design time in Oracle Adapter Application Explorer (Application Explorer) for both request-response (outbound) and event notification (inbound) services of the adapter.

7.2 Configuring Outbound Processing Using Oracle Service Bus (J2CA Configuration)

This section describes how to configure outbound processing using Oracle Service Bus for J2CA configurations.

This section includes the following topics:

- Section 7.2.1, "Starting Oracle Service Bus and Creating Project Folders"
- Section 7.2.2, "Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus"
- Section 7.2.3, "Publishing a WSDL From Application Explorer to Oracle Service Bus"
- Section 7.2.4, "Configuring a File Type Business Service"
7.2.1 Starting Oracle Service Bus and Creating ProjectFolders

Perform the following steps to start Oracle Service Bus and create project folders:

1. Start the Oracle WebLogic Server for the Oracle WebLogic Server domain that you have configured.

2. Open the Oracle Service Bus Console in a Web browser by entering the following URL:

   http://hostname:port/sbconsole

   Where hostname is the name of the machine where Oracle WebLogic Server is running and port is the port for the domain you are using. The port for the default domain is 7001.

   The Oracle Service Bus Console logon page is displayed.

3. Log on to the Oracle Service Bus Console using a valid user name and password.

   The Oracle Service Bus Console home page is displayed, as shown in Figure 7–1.

4. Click Create in the Change Center area to start a new Oracle Service Bus session, as shown in Figure 7–2.
5. Click **Project Explorer** in the left pane, as shown in Figure 7–3.

The Project Explorer page is displayed, as shown in Figure 7–4.

6. Provide a valid name for the new project and click **Add Project**.
   The project is successfully created and listed.

7. Click on the created project.
   The project page is displayed.
8. In the Enter New Folder Name field, type **Business Service** and click **Add Folder**, as shown in Figure 7–5.

9. In the Enter New Folder Name field, type **Proxy Service** and click **Add Folder**.

10. In the Enter New Folder Name field, type **wsdls** and click **Add Folder**.
    The Business Service, Proxy Service, and wsdls folders are listed in the left pane below the project node, as shown in Figure 7–6.

![Figure 7–6 Project Node](image)

### 7.2.2 Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus

Before starting and using Application Explorer to publish a WSDL directly to the Oracle Service Bus (OSB) Console (project/folder), OSB users must perform the following steps:

1. Open the command prompt window.
2. Navigate to the following directory:
   ```
   <OSB_Home>\user_projects\domains\base_domain\bin
   ```
3. Execute **setDomainEnv.cmd** (Windows) or **./setDomainEnv.sh** (UNIX/Linux).
   This command sets the class path for Application Explorer to access the Oracle WebLogic Server APIs to publish the WSDLs to the OSB Console.
4. Do not close the command prompt window.
5. Navigate to the following directory:
   ```
   <OSB_Home>\3rdparty\ApplicationAdapters\tools\iwae\bin
   ```
6. Execute **ae.bat** (Windows) or **iwae.sh** (UNIX/Linux) to start Application Explorer.
   You are now ready to publish WSDLs from Application Explorer to the OSB Console.

### 7.2.3 Publishing a WSDL From Application Explorer to Oracle Service Bus

Perform the following steps to publish a WSDL from Application Explorer to Oracle Service Bus:

1. Start Application Explorer, connect to a J2CA configuration, and connect to a PeopleSoft target.
   
   For more information, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
2. Expand Component Interfaces.

3. Right-click the DEPT business object and select Create Outbound JCA Service(Request/Response) from the menu, as shown in Figure 7–7.

**Figure 7–7 Create Outbound JCA Service(Request/Response) Option**

The Export WSDL dialog is displayed, as shown in Figure 7–8.

**Figure 7–8 Export WSDL Dialog**

4. In the Name field, a default file name for the WSDL file is provided. You can accept the default or provide your own.

5. Select the Export to OSB option.

6. In the Location field, enter the folder name in Oracle Service Bus where you want to publish the WSDL document.
The location is composed of an Oracle Service Bus project name and optionally, one or more folder names. The project name and any folder names must be separated by a forward slash character “/”.

7. In the Host field, enter the name of the machine where Oracle Service Bus is installed.

8. In the Port field, enter the port that is being used by Oracle Service Bus.

9. In the User field, enter your username to access Oracle Service Bus.

10. In the Password field, enter your password to access Oracle Service Bus.

11. Click OK.

The WSDL is published to the location specified in the Export WSDL dialog and is now available for use with a Business Service or Proxy Service in Oracle Service Bus.

12. Open the Oracle Service Bus Console and select the created WSDL folder in the left pane (for example, wsdls), as shown in Figure 7–9.

**Figure 7–9 WSDL Folder**

[Image: Project Explorer with WSDL folder listed]

13. Ensure that the exported WSDL is listed, as shown in Figure 7–10.

**Figure 7–10 Exported WSDL**

[Image: WSDL list with exported WSDLs]

14. Click the icon that corresponds to the exported WSDL in the Actions column.

The Generate WSDL and Service page is displayed, as shown in Figure 7–11.
15. Provide a new WSDL name and a new service name in the corresponding fields, as shown in Figure 7–12.

16. In the Location area, select an available project and the sub-folder that is designated for Business Services.
17. Click Generate.

If the WSDL and Service resources are successfully created, the following message is displayed, as shown in Figure 7–13.

![Figure 7–13 Resources Created Successfully Message](image)

**Figure 7–13 Resources Created Successfully Message**

WSDL and Service Resources were generated successfully.

### 7.2.4 Configuring a File Type Business Service

Perform the following steps to configure a File type Business Service:

1. Select the **Business Service** folder you created in the left pane, as shown in Figure 7–14.

![Figure 7–14 Business Service Folder](image)

2. In the right pane, select **Business Service** from the Create Resource menu, as shown in Figure 7–15.

![Figure 7–15 Business Service](image)

The General Configuration page is displayed, as shown in Figure 7–16.
3. Provide a name for the Business Service and from the Service Type area select **Messaging Service**.

4. Click Next.

   The Message Type Configuration page is displayed, as shown in Figure 7–17.

5. Select **XML** as the Request Message Type and **None** as the Response Message Type.
6. Click Next.

The Transport Configuration page is displayed, as shown in Figure 7–18.

**Figure 7–18  Transport Configuration Page**

7. Select file from the Protocol list.

8. Enter the path to a destination folder on your file system in the Endpoint URI field and click Add.

9. Click Next, as shown in Figure 7–19.

**Figure 7–19  Transport Configuration Page**

The FILE Transport Configuration page is displayed, as shown in Figure 7–20.
10. Enter the prefix and suffix for the output file to be received and click Next.
   The Message Handling and Advanced Settings page is displayed, as shown in Figure 7–21.

**Figure 7–21  Message Handling and Advanced Settings Page**

<table>
<thead>
<tr>
<th>Create a Business Service (PSFT_Sanity/BusinessService/File_output)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Message Handling</strong></td>
</tr>
<tr>
<td>There are no basic configuration options.</td>
</tr>
<tr>
<td><strong>Advanced Settings</strong></td>
</tr>
</tbody>
</table>

11. Click Next.
   The following Summary page is displayed, as shown in Figure 7–22.
12. Review all the information for your Business Service and click **Save**.

13. Check if the success message is displayed once it is saved, as shown in **Figure 7–23**.

**Figure 7–23  Success Message**

- The Service "File_output" was created successfully.

- **PSFT_Sanity/BusinessService**
  - References: 2 Ref(s)
  - Referenced By: 1 Ref(s)
  - Description: - no description -

**Folders**

- **Enter New Folder Name:** [field]
  - Add Folder [button]
7.2.5 Configuring a Proxy Service

Perform the following steps to configure a Proxy Service:

1. Select the **Proxy Service** folder you created in the left pane, as shown in Figure 7–24.

**Figure 7–24  Proxy Service**

![Project Explorer](image)

2. In the right pane, select **Proxy Service** from the Create Resource menu. The General Configuration page is displayed, as shown in Figure 7–25.
3. Provide a name for the Proxy Service and from the Service Type area select Any XML Service.
4. Click Next, as shown in **Figure 7–26**.

**Figure 7–26  Transport Configuration Page**

5. Select file from the Protocol list.
6. Enter the path to an input folder on your file system in the Endpoint URI field.
7. Click Next, as shown in **Figure 7–27**.

9. Click Next, as shown in Figure 7–28.

10. Accept the default values and click Next.

   The following Summary page is displayed, as shown in Figure 7–29.
11. Review all the information for your Proxy Service and click **Save**.
12. Check if the success message is displayed, as shown in **Figure 7–30**.

**Figure 7–30  Success Message**

- The Service 'Dept_query_ob_PS' was created successfully.

### PSFT_Sanity/ProxyService

  - **Enter New Folder Name:**

**7.2.6 Configuring a Pipeline**

Perform the following steps to configure a Pipeline:
1. Click the **Edit Message Flow** icon in the row of the Proxy Service you created, as shown in Figure 7–31.

**Figure 7–31  Edit Message Flow Icon**

The Edit Message Flow workspace area is displayed, as shown in Figure 7–32.

**Figure 7–32  Edit Message Flow Workspace Area**

2. Click the **Proxy Service** icon and select **Add Pipeline Pair** from the menu, as shown in Figure 7–33.

**Figure 7–33  Add Pipeline Pair**

3. Click the **Request Pipeline** icon and select **Add Route** from the menu, as shown in Figure 7–34.
The RouteNode1 icon is added below the Request Pipeline icon.

4. Click the RouteNode1 icon and select Edit Route from the menu, as shown in Figure 7–35.

The Edit Stage Configuration workspace area is displayed, as shown in Figure 7–36.
5. Click **Add an Action**, select **Communication** from the menu, and click **Routing**.

![Figure 7–36 Edit Stage Configuration Workspace Area](image)

6. Click `<Service>`, as shown in Figure 7–37.

   The Select Service dialog is displayed, as shown in Figure 7–38.

![Figure 7–37 Route Destination](image)
7. Select a WSDL type Business Service and click **Submit**.

   You are returned to the Edit Stage Configuration workspace area, as shown in **Figure 7–39**.

   **Figure 7–39 Edit Stage Configuration Workspace Area**

8. Select the name of the PeopleSoft business object (for example, DEPT) as the operational attribute from the list, as shown in **Figure 7–40**.
9. Click Save.

10. Click the Response Pipeline icon and select Add Stage from the menu, as shown in Figure 7–41.
    The Stage1 icon is added below the Response Pipeline icon.
11. Click the **Stage1** icon and select **Edit Stage** from the menu, as shown in Figure 7–42.

The Edit Stage Configuration workspace area is displayed, as shown in Figure 7–43.

12. Click **Add an Action**, select **Communication** from the menu, and click **Publish**.
Figure 7–44  Edit Stage Configuration Workspace Area

13. Click <Service>, as shown in Figure 7–44.
   The Select Service dialog is displayed, as shown in Figure 7–45.

Figure 7–45  Select Service Dialog

14. Select a File type Business Service and click Submit.
   You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–46.
15. Click Save.

You are returned to the Edit Message Flow workspace area, as shown in Figure 7–47.

16. Click Save.
17. Check if the success message is displayed and click **Activate** in the Change Center, as shown in Figure 7–48.

The Activate Session page is displayed, as shown in Figure 7–49.

18. Click **Submit**.

19. Check if the View Configuration Changes page is displayed, as shown in Figure 7–50.
20. Copy and paste an input XML file in the input folder you have configured, as shown in Figure 7–51.

![Input XML File](image)

21. Output is received in the configured output location.

### 7.3 Configuring Inbound Processing Using Oracle Service Bus (J2CA Configuration)

This section describes how to configure inbound processing using Oracle Service Bus for J2CA configurations.

This section includes the following topics:

- Section 7.3.1, “Starting Oracle Service Bus and Creating Project Folders”
- Section 7.3.2, “Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus”
- Section 7.3.3, “Publishing a WSDL From Application Explorer to Oracle Service Bus”
- Section 7.3.4, “Configuring a File Type Business Service”
7.3.1 Starting Oracle Service Bus and Creating Project Folders

Perform the following steps to start Oracle Service Bus and create project folders:

1. Start the Oracle WebLogic Server for the Oracle WebLogic Server domain that you have configured.

2. Open the Oracle Service Bus Console in a Web browser by entering the following URL:

   http://hostname:port/sbconsole

   Where hostname is the name of the machine where Oracle WebLogic Server is running and port is the port for the domain you are using. The port for the default domain is 7001.

   The Oracle Service Bus Console logon page is displayed.

3. Log on to the Oracle Service Bus Console using a valid user name and password.

   The Oracle Service Bus Console home page is displayed, as shown in Figure 7–52.

4. Click Create in the Change Center area to start a new Oracle Service Bus session, as shown in Figure 7–53.
5. Click **Project Explorer** in the left pane, as shown in Figure 7–54.

Figure 7–54  Project Explorer Option

The Project Explorer page is displayed, as shown in Figure 7–55.

Figure 7–55  Project Explorer Page

6. Provide a valid name for the new project and click **Add Project**.
   The project is successfully created and listed.

7. Click on the created project.
   The project page is displayed.

Figure 7–56  Enter New Folder Name Field

8. In the Enter New Folder Name field, type **Business Service** and click **Add Folder**, as shown in Figure 7–56.

9. In the Enter New Folder Name field, type **Proxy Service** and click **Add Folder**.

10. In the Enter New Folder Name field, type **wsdls** and click **Add Folder**.
    The Business Service, Proxy Service, and wsdls folders are listed in the left pane below the project node, as shown in Figure 7–57.
7.3.2 Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus

Before starting and using Application Explorer to publish a WSDL directly to the Oracle Service Bus (OSB) Console (project/folder), OSB users must perform the following steps:

1. Open the command prompt window.
2. Navigate to the following directory:
   `<OSB_Home>\user_projects\domains\base_domain\bin`
3. Execute `setDomainEnv.cmd` (Windows) or `. ./setDomainEnv.sh` (UNIX/Linux). This command sets the class path for Application Explorer to access the Oracle WebLogic Server APIs to publish the WSDLs to the OSB Console.
4. Do not close the command prompt window.
5. Navigate to the following directory:
   `<OSB_Home>\3rdparty\ApplicationAdapters\tools\iwae\bin`
6. Execute `ae.bat` (Windows) or `iwae.sh` (UNIX/Linux) to start Application Explorer. You are now ready to publish WSDLs from Application Explorer to the OSB Console.

7.3.3 Publishing a WSDL From Application Explorer to Oracle Service Bus

Perform the following steps to publish a WSDL from Application Explorer to Oracle Service Bus:

1. Start Application Explorer, connect to a J2CA configuration, and connect to a PeopleSoft target.
   For more information, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
2. Expand Messages.
3. Right-click the `DEPT_SYNC.VERSION.1` business object and select Create Inbound JCA Service(Event) from the menu, as shown in Figure 7–58.
The Export WSDL dialog is displayed, as shown in Figure 7–59.

**Figure 7–59  Export WSDL Dialog**

4. In the Name field, a default file name for the WSDL file is provided. You can accept the default or provide your own.

5. Select a configured channel from the Channel list.
   
   The Validation options can be used for schema validation scenarios, but are optional.

6. Select the Export to OSB option.
7. In the Location field, enter the folder name in Oracle Service Bus where you want to publish the WSDL document.
   The location is composed of an Oracle Service Bus project name and optionally, one or more folder names. The project name and any folder names must be separated by a forward slash character “/”.

8. In the Host field, enter the name of the machine where Oracle Service Bus is installed.

9. In the Port field, enter the port that is being used by Oracle Service Bus.

10. In the User field, enter your username to access Oracle Service Bus.

11. In the Password field, enter your password to access Oracle Service Bus.

12. Click OK.
   The WSDL is published to the location specified in the Export WSDL dialog and is now available for use with a Business Service or Proxy Service in Oracle Service Bus.

13. Open the Oracle Service Bus Console and select the created WSDL folder in the left pane (for example, wsdls), as shown in Figure 7–60.

Figure 7–60   WSDL Folder

14. Ensure that the exported WSDL is listed, as shown in Figure 7–61.

Figure 7–61   Exported WSDL

15. Click the icon that corresponds to the exported WSDL in the Actions column.
   The Generate WSDL and Service page is displayed, as shown in Figure 7–62.
16. Provide a new WSDL name and a new service name in the corresponding fields.

17. In the Location area, select an available project and the sub-folder that is designated for Proxy Services.

18. Click Generate.
   If the WSDL and Service resources are successfully created, a message is displayed, as shown in Figure 7–63.

**Figure 7–63  Resources Successfully Created Message**

19. Click Proxy Service under Project Explorer and check if the generated WSDL and Proxy Service are listed, as shown in Figure 7–64.
7.3.4 Configuring a File Type Business Service

Perform the following steps to configure a File type Business Service:

1. Select the Business Service folder you created in the left pane, as shown in Figure 7–65.

2. In the right pane, select Business Service from the Create Resource menu, as shown in Figure 7–66.
3. Provide a name for the Business Service and from the Service Type area select **Messaging Service**.

4. Click Next.

The Message Type Configuration page is displayed, as shown in **Figure 7–68**.
5. Select **XML** as the Request Message Type and **None** as the Response Message Type.

6. Click **Next**.

The Transport Configuration page is displayed, as shown in Figure 7–69.

7. Select **file** from the Protocol list.
8. Enter the path to a destination folder on your file system in the Endpoint URI field and click Add.

9. Click Next.
   
   The FILE Transport Configuration page is displayed, as shown in Figure 7–70.

**Figure 7–70  FILE Transport Configuration Page**

7.3.5 Configuring a Pipeline

Perform the following steps to configure a Pipeline:

1. Click the **Edit Message Flow** icon in the row of the Proxy Service you created, as shown in **Figure 7–74**.

![Figure 7–74  Edit Message Flow Icon](image)

The Edit Message Flow workspace area is displayed, as shown in **Figure 7–75**.

![Figure 7–75  Edit Message Flow Workspace Area](image)

2. Right-click the displayed Proxy Service icon and select **Add Route** from the menu. The RouteNode1 icon is added below the Request Pipeline icon.
3. Click the RouteNode1 icon and select Edit Route from the menu, as shown in Figure 7–76.

The Edit Stage Configuration workspace area is displayed, as shown in Figure 7–77.

4. Click Add an Action, select Communication from the menu, and click Routing.
5. Click `<Service>`, as shown in Figure 7–78.
   The Select Service dialog is displayed, as shown in Figure 7–79.

6. Select the File type Business Service and click **Submit**.
   You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–80.
7. Click Save.
   You are returned to the Edit Message Flow workspace area, as shown in Figure 7–81.

8. Click Save.

9. Check if the success message is displayed and click Activate in the Change Center, as shown in Figure 7–82.
The Activate Session page is displayed, as shown in Figure 7–83.

12. Trigger an event from the PeopleSoft system and check if the output is received in the configured output location.
7.4 Configuring Outbound Processing Using Oracle Service Bus (BSE Configuration)

This section describes how to configure outbound processing using Oracle Service Bus for BSE configurations.

This section includes the following topics:

- Section 7.4.1, "Starting Oracle Service Bus and Creating Project Folders"
- Section 7.4.2, "Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus"
- Section 7.4.3, "Publishing a WSDL From Application Explorer to Oracle Service Bus"
- Section 7.4.4, "Configuring a File Type Business Service"
- Section 7.4.5, "Configuring a WSDL Type Business Service"
- Section 7.4.6, "Configuring a Proxy Service"
- Section 7.4.7, "Configuring a Pipeline"

7.4.1 Starting Oracle Service Bus and Creating Project Folders

Perform the following steps to start Oracle Service Bus and create project folders:

1. Start the Oracle WebLogic Server for the Oracle WebLogic Server domain that you have configured.
2. Open the Oracle Service Bus Console in a Web browser by entering the following URL:

   \[http://hostname:port/sbconsole\]

   Where \(hostname\) is the name of the machine where Oracle WebLogic Server is running and \(port\) is the port for the domain you are using. The port for the default domain is 7001.

   The Oracle Service Bus Console logon page is displayed.

3. Log on to the Oracle Service Bus Console using a valid user name and password.

   The Oracle Service Bus Console home page is displayed, as shown in Figure 7–1.
4. Click **Create** in the Change Center area to start a new Oracle Service Bus session, as shown in Figure 7–2.

5. Click **Project Explorer** in the left pane, as shown in Figure 7–3.

The Project Explorer page is displayed, as shown in Figure 7–4.
6. Provide a valid name for the new project and click **Add Project**.
   The project is successfully created and listed.

7. Click on the created project.
   The project page is displayed.

8. In the Enter New Folder Name field, type **Business Service** and click **Add Folder**, as shown in Figure 7–5.

9. In the Enter New Folder Name field, type **Proxy Service** and click **Add Folder**.
10. In the Enter New Folder Name field, type **wsdls** and click **Add Folder**.
    The Business Service, Proxy Service, and wsdls folders are listed in the left pane below the project node, as shown in Figure 7–6.

### 7.4.2 Setting the Class Path for Application Explorer to Integrate With Oracle Service Bus

Before starting and using Application Explorer to publish a WSDL directly to the Oracle Service Bus (OSB) Console (project/folder), OSB users must perform the following steps:
1. Open the command prompt window.

2. Navigate to the following directory:
   
   `<OSB_Home>\user_projects\domains\base_domain\bin`

3. Execute `setDomainEnv.cmd` (Windows) or `.setDomainEnv.sh` (UNIX/Linux).
   This command sets the class path for Application Explorer to access the Oracle
   WebLogic Server APIs to publish the WSDLs to the OSB Console.

4. Do not close the command prompt window.

5. Navigate to the following directory:
   
   `<OSB_Home>\3rdparty\ApplicationAdapters\tools\iwae\bin`

6. Execute `ae.bat` (Windows) or `iwae.sh` (UNIX/Linux) to start Application Explorer.
   You are now ready to publish WSDLs from Application Explorer to the OSB
   Console.

### 7.4.3 Publishing a WSDL From Application Explorer to Oracle Service Bus

This section describes how to publish a WSDL from Application Explorer (BSE
configuration) to Oracle Service Bus.

1. Start Application Explorer, connect to a BSE configuration, and connect to a
   PeopleSoft target, as shown in Figure 7–91.

   **Figure 7–91 BSE Configuration**

   ![BSE Configuration](image)

2. Expand the **Component Interfaces** node and select the **DEPT** component
   interface.

3. Right-click the **DEPT** component interface and select **Create Web Service** from the
   menu.

   The Create Web Service dialog is displayed, as shown in Figure 7–92.
4. Enter a service name and click Next.
5. Click OK on the next dialog that is displayed.

   Application Explorer switches the view to the Business Services node, and the new Web service appears in the left pane, as shown in Figure 7–93.

6. Right-click the new Web service and select Export WSDL from the menu.

   The Export WSDL dialog is displayed, as shown in Figure 7–94.
Figure 7–94  Export WSDL Dialog

7. In the Name field, a default file name for the WSDL file is provided. You can accept the default or provide your own.

8. In the Location field, enter the location where you want to publish the WSDL document.

   The location is composed of an Oracle Service Bus project name and optionally, one or more folder names. The project name and any folder names must be separated by a forward slash character “/”.

9. In the Host field, enter the name of the machine where Oracle WebLogic Server is running.

10. In the Port field, enter the port for the domain you are using.

11. In the User field, enter your username to access Oracle Service Bus.

12. In the Password field, enter your password to access Oracle Service Bus.

13. Click OK.

   The WSDL is published to the location specified in the Export WSDL dialog and is now available for use with a Business Service or Proxy Service in Oracle Service Bus.

7.4.4 Configuring a File Type Business Service

   This section describes how to configure a File type Business Service using the Oracle Service Bus Console.

   1. Select the Business Service folder you created in the left pane, as shown in Figure 7–95.
2. In the right pane, select **Business Service** from the Create Resource menu. The General Configuration page is displayed, as shown in Figure 7–96.

3. Provide a name for the Business Service and from the Service Type area select **Messaging Service**.

4. Click **Next**.

   The Message Type Configuration page is displayed, as shown in Figure 7–97.
5. Select **XML** as the Request Message Type and **None** as the Response Message Type.

6. Click **Next**.

   The Transport Configuration page is displayed, as shown in Figure 7–98.

**Figure 7–98 Transport Configuration Page**

7. Select **file** from the Protocol list.

8. Enter the path to a destination folder on your file system in the Endpoint URI field and click **Add**.

9. Click **Next**.

   The FILE Transport Configuration page is displayed, as shown in Figure 7–99.
10. Enter the prefix and suffix for the output file to be received and click **Next**.

The Summary page is displayed, as shown in Figure 7–100.

11. Review all the information for your Business Service and click **Save**.

### 7.4.5 Configuring a WSDL Type Business Service

This section describes how to configure a WSDL type Business Service using the Oracle Service Bus Console.

1. Select the **Business Service** folder you created in the left pane, as shown in Figure 7–101.
2. In the right pane, select Business Service from the Create Resource menu. The General Configuration page is displayed, as shown in Figure 7–102.

3. Provide a name for the Business Service and from the Service Type area select WSDL Web Service.

4. Click Browse.
   The Select a WSDL dialog is displayed, as shown in Figure 7–103.
5. Select a BSE WSDL that you published for Oracle Application Adapter for PeopleSoft using Application Explorer and click Submit.

The Select a WSDL Definition dialog is displayed, as shown in Figure 7–104.

Figure 7–104  Select a WSDL Definition Dialog
6. Select the WSDL definition under the Ports section and click **Submit**.

You are returned to the General Configuration page where the WSDL you selected is now available, as shown in Figure 7–105.

10. Click Next.

The Summary page is displayed, as shown in Figure 7–116.
11. Review all the information for your Proxy Service and click **Save**.

### 7.4.7 Configuring a Pipeline

This section describes how to configure a Pipeline using the Oracle Service Bus Console.

1. Click the **Edit Message Flow** icon in the row of the Proxy Service you created, as shown in **Figure 7–117**.
Figure 7–117  Edit Message Flow Icon

The Edit Message Flow workspace area is displayed.

2. Click the Proxy Service icon and select Add Pipeline Pair from the menu, as shown in Figure 7–118.

Figure 7–118  Add Pipeline Pair Option

3. Click the Request Pipeline icon and select Add Stage from the menu, as shown in Figure 7–119.
Figure 7–119  Add Stage Option

The Stage1 icon is added below the Request Pipeline icon, as shown in Figure 7–120.

Figure 7–120  Stage 1 Icon

4. Click the Stage1 icon and select Edit Stage from the menu.

The Edit Stage Configuration workspace area is displayed, as shown in Figure 7–121.
5. Click Add an Action, select Reporting from the menu, and click Log, as shown in Figure 7–122.

![Figure 7–122 Log Action Configuration Page](image)

6. Click <Expression> to edit the expression.
   The XQuery/XSLT Expression Editor is displayed, as shown in Figure 7–123.
7. In the XQuery Text area, type $inbound.

8. Click Validate and then Save.
   
   You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–124.

9. Type any annotation/comments in the text box (for example, **********input processing**********).

10. Select Error from the severity level list.

11. Add one more Log action as shown in Figure 7–125.
A new Log configuration is added, as shown in Figure 7–126.

12. Click `<Expression>` to edit the expression.

   The XQuery/XSLT Expression Editor is displayed, as shown in Figure 7–127.
13. In the XQuery Text area, type $body.

14. Click Validate and then Save.

You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–128.

15. Type any annotation/comments in the text box (for example, **********Request Body**********).
16. Select Error from the severity level list.

17. Click Validate and then Save.

**Figure 7–129  Add Route Option**

18. Click the PipelinePairNode1 icon and select Add Route from the menu, as shown in Figure 7–129.

**Figure 7–130  Edit Route Option**

19. Click the RouteNode1 icon and select Edit Route from the menu, as shown in Figure 7–130.
Figure 7–131  Routing Option

20. Click Add an Action, select Communication from the menu, and click Routing, as shown in Figure 7–131.

The Route Node configuration page is displayed, as shown in Figure 7–132.

Figure 7–132  Route Node Configuration Page

21. Click <Service>.

The Select Service dialog is displayed, as shown in Figure 7–133.
22. Select a WSDL type Business Service and click Submit.
    You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–134.

**Figure 7–134  Edit Stage Configuration Workspace Area**

23. Select DEPT as the operational attribute from the list.

24. Click Validate and then Save.
25. In the Response Actions area, click Add an Action, select Reporting from the menu, and click Log, as shown in Figure 7–135.

The Log configuration page is displayed, as shown in Figure 7–136.

26. Click <Expression> to edit the expression.

The XQuery/XSLT Expression Editor is displayed, as shown in Figure 7–137.
27. In the XQuery Text area, type `$outbound`.

28. Click **Validate** and then **Save**.

   You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–138.

29. Type any annotation/comments in the text box (for example, `**********output processing**********`).

30. Select **Error** from the severity level list.

31. Click **Validate** and then **Save**.
32. Click the **Response Pipeline** icon and select **Add Stage** from the menu, as shown in Figure 7–139.

The Stage1 icon is added below the Response Pipeline icon, as shown in Figure 7–140.

### Figure 7–140  Stage 1 Icon

33. Click the **Stage1** icon and select **Edit Stage** from the menu.

The Edit Stage Configuration workspace area is displayed, as shown in Figure 7–141.
34. Click **Add an Action**, select **Communication** from the menu, and click **Publish**.

   The Publish configuration page is displayed, as shown in Figure 7–142.

35. Click **<Service>**.

   The Select Service dialog is displayed, as shown in Figure 7–143.
36. Select a File type Business Service and click Submit.
You are returned to the Edit Stage Configuration workspace area, as shown in Figure 7–144.

41. Type any annotation/comments in the text box (for example, response body).

42. Select Error from the severity level list.

43. Click Validate and then Save.

The pipeline configuration is now completed, as shown in Figure 7–148.
44. Click Save.

45. Click **Activate** in the Change Center area to activate your changes in the Oracle Service Bus session, as shown in **Figure 7–149**.

**Figure 7–149 Change Center Area**

46. Copy and paste an input XML file in the input folder you have configured to receive an output XML file in the destination folder.
This chapter explains the limitations and workarounds when connecting to PeopleSoft. It contains the following topics:

- Section 8.1, “Troubleshooting”
- Section 8.2, “BSE Error Messages”

The adapter-specific errors listed in this chapter can arise whether using the adapter with an Oracle Adapter J2CA or with an Oracle Adapter Business Services Engine (BSE) configuration.

8.1 Troubleshooting

This topic provides troubleshooting information for PeopleSoft, separated into four categories:

- Application Explorer
- PeopleSoft
- Oracle Adapter J2CA
- Oracle Adapter Business Services Engine (BSE)

**Note:** Log file information that can be relevant in troubleshooting can be found in the following locations:

- The Oracle Adapter J2CA trace information can be found under the following directory:
  
  ```
  <ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\config\config_name\log
  ```

- BSE trace information can be found under the following directory:
  
  ```
  <ADAPTER_HOME>\user_projects\domains\base_domain\servers\soa_server1\stage\ibse\ibse.war\ibselogs
  ```

- The log file for Application Explorer can be found under the following directory:
  
  ```
  <ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\tools\iwae\bin
  ```
Application Explorer

To use Application Explorer on Windows for debugging or testing purposes:

1. Ensure that Oracle WebLogic Server is started, which is where Application Explorer is deployed.

2. Start Application Explorer by clicking the Windows Start menu, selecting All Programs, Oracle Application Adapters, and clicking Application Explorer, as shown in Figure 8–1.

Figure 8–1 Oracle Application Adapters Program Menu

You can also start Application Explorer by executing the `ae.bat` file, which is located in the following directory:

`<ADAPTER_HOME>/soa/thirdparty/ApplicationAdapters/tools/iwae/bin/ae.bat`

It is a good practice to create a shortcut for the `ae.bat` file on your desktop.

If you are using a UNIX or Linux platform you can start Application Explorer by executing the `iwae.sh` file.

8-4 Oracle Fusion Middleware Application Adapter for PeopleSoft User's Guide for Oracle WebLogic Server
8.2 BSE Error Messages

This topic discusses the different types of errors that can occur when processing Web services through Oracle WebLogic Server Adapter Business Services Engine (BSE).

8.2.1 General Error Handling in BSE

BSE serves as both a SOAP gateway into the adapter framework and as the engine for some of the adapters. In both design time and run-time, various conditions can cause errors in BSE when Web services that use adapters run. Some of these conditions and resulting errors are exposed the same way, regardless of the specific adapter; others are exposed differently, based on the adapter being used. This topic explains what you can expect when you encounter some of the more common error conditions on an adapter-specific basis.

Usually, the SOAP gateway (agent) inside BSE passes a SOAP request message to the adapter required for the Web service. If an error occurs, how it is exposed depends on the adapter and the API or interfaces that the adapter uses. The APIs are generated from PeopleTools and are specific to the PeopleTools release. A few scenarios cause the SOAP gateway to generate a SOAP fault. In general, anytime the SOAP agent inside BSE receives an invalid SOAP request, a SOAP fault element is generated in the SOAP response. The SOAP fault element contains fault string and fault code elements. The fault code contains a description of the SOAP agent error.

The following SOAP response document results when BSE receives an invalid SOAP request:

```xml
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Client</faultcode>
      <faultstring>Parameter node is missing</faultstring>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
In this example, BSE did not receive an element in the SOAP request message that is mandatory for the WSDL for this Web service.

8.2.2 Adapter-Specific Error Handling

When an adapter raises an exception during run-time, the SOAP agent in BSE produces a SOAP fault element in the generated SOAP response. The SOAP fault element contains fault code and fault string elements. The fault string contains the native error description from the adapter target system. Since adapters use the target system interfaces and APIs, whether an exception is raised depends on how the target systems interface or API treats the error condition. If a SOAP request message is passed to an adapter by the SOAP agent in BSE, and that request is invalid based on the WSDL for that service, the adapter may raise an exception yielding a SOAP fault.

While it is almost impossible to anticipate every error condition that an adapter may encounter, the following is a description of how adapters handle common error conditions and how they are then exposed to the Web services consumer application.

Oracle Application Adapter for PeopleSoft Invalid SOAP Request

If the PeopleSoft agent receives a SOAP request message that does not conform to the WSDL for the Web service being executed, then the following SOAP response is generated.

```
<SOAP-ENV:Envelope xmlns:xsi="http://www.w3.org/1999/XMLSchema-instance"
xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsd="http://www.w3.org/1999/XMLSchema">
  <SOAP-ENV:Body>
    <m:CARRIERResponse xmlns:m="urn:schemas-iwaysoftware-com:iwse"
     xmlns="urn:schemas-iwaysoftware-com:iwse" cid="2A3CB42703EB20203F91951B89F3C5AF">
      <PS8>
        <error>Cannot find Component Interface {VARRIER} (91,2) Initialization failed (90,7) Not Authorized (90,6) Failed to execute PSSession request Cannot find Component Interface {VARRIER} (91,2)</error>
      </PS8>
    </m:CARRIERResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Empty Result From PeopleSoft Request

If Oracle Application Adapter for PeopleSoft executes a component interface as a Web service using input parameters passed in the SOAP request that do not match records in PeopleSoft, then the following SOAP response is generated.

```
<SOAP-ENV:Envelope xmlns:xsi="http://www.w3.org/1999/XMLSchema-instance"
xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsd="http://www.w3.org/1999/XMLSchema">
  <SOAP-ENV:Body>
    <m:CARRIERResponse xmlns:m="urn:schemas-iwaysoftware-com:iwse"
     xmlns="urn:schemas-iwaysoftware-com:iwse" cid="2A3CB42703EB20203F91951B89F3C5AF">
      <PS8>
        <error>No rows exist for the specified keys. [CARRIER] (91,50) Failed to execute PSBusComp request</error>
      </PS8>
    </m:CARRIERResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
Failure to Connect to PeopleSoft

If Oracle Application Adapter for PeopleSoft cannot connect to PeopleSoft, then the following SOAP response is generated.

```xml
<?xml version="1.0" encoding="ISO-8859-1" ?>
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Server</faultcode>
      <faultstring>java.lang.Exception: Error Logon to PeopleSoft System</faultstring>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Invalid SOAP Request

If Oracle WebLogic Server Application Adapter receives a SOAP request message that does not conform to the WSDL for the Web services being executed, then the following SOAP response is generated.

```xml
<?xml version="1.0" encoding="ISO-8859-1" ?>
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Server</faultcode>
      <faultstring>RPC server connection failed: Connection refused: connect</faultstring>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Empty Result From Oracle WebLogic Server Application Adapter Request

If the adapter executes a SOAP request using input parameters passed that do not match records in the target system, then the following SOAP response is generated.

```xml
  <SOAP-ENV:Body>
    <m:RunDBQueryResponse xmlns:m="urn:schemas-iwaysoftware-com:iwse" xmlns:urn:schemas-iwaysoftware-com:iwse cId="2A3CB42703EB20203F91951B89F3C5AF"><RunDBQueryResult run="1" />
    </m:RunDBQueryResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Note: The condition for this adapter does not yield a SOAP fault.
This chapter describes advanced user tools. It contains the following topics:

- **Section 9.1, "Web Services Policy-Based Security"**
- **Section 9.2, "Migrating Repositories"**

### 9.1 Web Services Policy-Based Security

Oracle Adapter Application Explorer (Application Explorer) provides a security model called Web services policy-based security. The following topics describe how the feature works and how to configure it.

Web services provide a layer of abstraction between the back-end business logic and the user or application running the Web service. Easy application integration is enabled. However, the issue of controlling the use and implementation of critical and sensitive business logic that is run as a Web service is raised.

Application Explorer controls the use of Web services that use adapters, using a feature called policy-based security. This feature enables an administrator to apply policies to business services (Web services) to deny or permit their execution.

A policy is a set of privileges dealing with the execution of a business service that can be applied to an existing or new business service. When you set specific rights or privileges inside a policy, you do not have to re-create privileges for every business service that has security concerns in common with other business services. Instead, you reuse a policy on multiple business services.

The goal of the feature is to secure requests at both the transport and the SOAP request level transmitted on the wire. Some of the policies do not deal with security issues directly, but do affect the run-time behavior of the Web services to which they have been applied.

The BSE administrator creates an "instance" of a policy type, names it, associates individual users or groups (a collection of users), and then applies that policy to one or more business services.

You can assign a policy to a business service, or to a method within a business service. If a policy is only applied to a method, other methods in that business service will not be governed by it. However, if a policy is applied to the business service, all methods are governed by it. At run-time, the user ID and password that are sent to BSE in the SOAP request message are checked against the list of users for all policies applied to that specific business service. The policy type that is supported is Resource Execution, which dictates who can or cannot execute the business service.

When a policy is not applied, the default value for a business service is to "grant all". For example, anybody can execute the business service, until the Resource Execution
policy is associated to the business service. At that time, only those granted execution permissions, or users not part of the group that has been denied execution permissions, have access to the business service.

9.1.1 Configuring Web Services Policy-Based Security

The following procedures describe how to configure Web services policy-based security.

**Creating and Associating a User with a Policy**

Before you create instances of policies, you must have a minimum of one user or one group to associate to an instance. You can create users and groups using Application Explorer.

1. Start Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. For more information on how to create a new configuration, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
3. Select Connect.

   Nodes appear for Adapters and Business Services (also known as Web services), as shown in Figure 9–1.

**Figure 9–1 Sample Configuration Node**

![Sample Configuration Node Diagram]

   a. Expand the Business Services node.
   b. Expand the Configuration node.
   c. Expand the Security node.
   d. Expand the Users and Groups node, as shown in Figure 9–2.

**Figure 9–2 New User Option**

![New User Option Diagram]

4. Right-click Users and click New User.

   The New User dialog is displayed, as shown in Figure 9–3.
Figure 9–3  New User Dialog

- In the **Name** field, enter a user ID.
- In the **Password** field, enter the password associated with the user ID.
- In the **Description** field, enter a description of the user (optional).

5. Click **OK**.

Figure 9–4  Users Node

The new user is added under the Users node, as shown in Figure 9–4.

Creating a Group to Use With a Policy

To create a group to use with a policy:

1. Start Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. For more information on how to create a new configuration, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
3. Select **Connect**.

Nodes appear for Adapters and Business Services (also known as Web services), as shown in Figure 9–5.

Figure 9–5  Web Services

- Expand the **Business Services** node.
- Expand the **Configuration** node.
- Expand the **Security** node.
- Expand the **Users and Groups** node.
4. Right-click Groups and select New Group, as shown in Figure 9–6.
   The New Group dialog is displayed, as shown in Figure 9–7.

![Figure 9–7 New Group Dialog](image)

   a. In the Name field, enter a name for the group.
   b. In the Description field, enter a description for the group (optional).
   c. From the available list of users in the left pane, select one or more users and add them to the Selected list by clicking the double right-facing arrow.

5. When you have selected at least one user, click OK.
   The following shows the new group added under the Groups node, as shown in Figure 9–8.

![Figure 9–8 New Group](image)

Creating an Execution Policy
An execution policy governs who can execute the business services to which the policy is applied.

To create an execution policy:
1. Start Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. For more information on how to create a new configuration, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".
3. Select Connect.

Nodes appear for Adapters and Business Services (also known as Web services), as shown in Figure 9–9.

**Figure 9–9 Web Services**

- Expand the **Business Services** node.
- Expand the **Configuration** node.
- Expand the **Security** node.
- Expand the **Policies**.

4. Right-click **Policies** and select **New Policy**, as shown in Figure 9–10.

The New policy dialog is displayed, as shown in Figure 9–11.

**Figure 9–11 New Policy Dialog**

Provide the following information:

- **Name** field, enter a name for the policy.
- From the Type list, select **Execution**.
- In the Description field, enter a description for the policy (optional).
d. From the available list of users in the left pane, select one or more users and add them to the **Selected** list by clicking the double right-facing arrow.

---

**Note:** This user ID is checked against the value in the user ID element of the SOAP header sent to BSE in a SOAP request.

---

5. When you have selected at least one user, click **OK**.
6. Click **Next**.

The New Policy permissions dialog is displayed, as shown in **Figure 9–12**.

**Figure 9–12  New Policy Permissions Dialog**

7. To grant permission to a user or group to execute a business service, select the user or group and move them into the **Execution Granted** list by selecting the double left-facing arrow.

8. To deny permission to a user or group to execute a business service, select the user or group and move them into the Execution Denied list by selecting the double right-facing arrow.

9. Click **OK**.

The following pane summarizes your configuration, as shown in **Figure 9–13**.

**Figure 9–13  Policy Permissions Summary**

- **Name**  test
- **Type**  Execution
- **Description**
- **User and Group Restrictions**
  - group.test Execution Granted

**Using the IP and Domain Restrictions Policy Type**

You configure the IP and Domain Restriction policy type slightly differently from other policy types. The IP and Domain Restriction policy type controls connection access to BSE and therefore need not be applied to individual Web services. You need not create a policy; however, you must enable the Security Policy option in Application Explorer.
1. Start Application Explorer.

2. Right-click the configuration to which you want to connect, for example, SampleConfig. For more information on how to create a new configuration, see Chapter 2, "Configuring Oracle Application Adapter for PeopleSoft".

3. Select Connect.

   Nodes appear for Adapters and Business Services (also known as Web services), as shown in Figure 9–14.

**Figure 9–14 Web Services**

![SampleConfig](image1)

   Perform the following steps:

   a. Expand the Business Services node.

   b. Expand the Configuration node.

   c. Expand the Security node.

4. Right-click IP and Domain and select New IP and Domain Restriction, as shown in Figure 9–15.

**Figure 9–15 IP and Domain Node**

![Groups](image2)

   The New IP and Domain Restriction dialog is displayed, as shown in Figure 9–16.

**Figure 9–16 New IP and Domain Restriction Dialog**

![New IP and Domain Restriction](image3)

   Perform the following steps:

   a. In the IP(Mask)/Domain field, enter the IP or domain name using the following guidelines.
If you select **Single** (Computer) from the **Type** list, you must provide the IP address for that computer. If you only know the DNS name for the computer, click **DNS Lookup** to obtain the IP Address based on the DNS name.

If you select **Group** (of Computers), you must provide the IP address and subnet mask for the computer group.

If you select **Domain**, you must provide the domain name.

**b.** From the **Type** list, select the type of restriction.

**c.** In the **Description** field, enter a description (optional).

**d.** To grant access, select the **Grant Access** check box.

5. Click **OK**.

The new domain is added under the IP and Domain node.

The following pane summarizes your configuration, as shown in **Figure 9–17**.

---

**Figure 9–17  IP and Domain Permissions Configuration**

- **IP Address(Mask)/Domain** www.yahoo.com
- **Type** Domain
- **Access** Denied

---

### 9.2 Migrating Repositories

During design time, the Oracle repository is used to store metadata created when using Application Explorer to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. The information in the repository is also referenced at run-time. For management purposes, you can migrate BSE and J2CA repositories that are configured for Oracle to new destinations without affecting your existing configuration. For example, you may want to migrate a repository from a test environment to a production environment.

**Migrating a BSE Repository**

To migrate a BSE repository:

1. Copy the BSE control service URL, for example:

   http://localhost:8001/ibse/IBSEServlet/admin/iwcontrol.ibs

2. Open a third party XML editor, for example, XMLSpy.

3. From the menu bar, click **SOAP**.

   A list of options appears, as shown in **Figure 9–18**.
4. Select **Create new SOAP request**.

   The WSDL file location dialog is displayed, as shown in Figure 9–19.

   **Figure 9–19 WSDL File Location Dialog**

   Perform the following steps:
   
   a. In the **Choose a file** field, paste the BSE control service URL.
   
   b. Append `?wsdl` to the URL, for example:
      
      `http://localhost:8001/ibse/IBSEServlet/admin/iwcontrol.ibs?wsdl`

5. Click **OK**.

   The soap operation name dialog is displayed, listing the available control methods, as shown in Figure 9–20.

   **Figure 9–20 Soap Operation Name Dialog**

6. Select the **MIGRATEREPO(MIGRATEREPO parameters)** control method and click **OK**.

   **Note**: The **MIGRATEREPO(MIGRATEREPO parameters)** control method is available from the BSE administration console. This control method migrates all Web services to the new (empty) repository. You can choose to migrate select Web services only.
The following window is displayed. It shows the structure of the SOAP envelope, as shown in Figure 9–21.

**Figure 9–21  SOAP Envelope Structure**

7. Locate the **Text view** icon in the toolbar, as shown in Figure 9–22.

**Figure 9–22  Text View Icon**

8. To display the structure of the SOAP envelope as text, click the **Text view** icon. The `<SOAP-ENV:Header>` tag is not required and can be deleted from the SOAP envelope.

9. Locate the following section:

```xml
<m:MIGRATEREPO xmlns:m="urn:schemas-iwaysoftware-com:jul2003:ibse:config"
version="">
<m:repositorysetting>
m:rconn>oracle</m:rconn>
m:rdriver>String</m:rdriver>
m:ruser>String</m:ruser>
m:rpwd>String</m:rpwd>
</m:repositorysetting>
m:.servicename>String</m:servicename>
</m:MIGRATEREPO>
```

Perform the following steps:

a. For the `<m:rconn>` tag, replace the String placeholder with a repository URL where you want to migrate your existing BSE repository.

   The Oracle repository URL has the following format:
   
   jdbc:oracle:thin:@[host]:[port]:[sid]
b. For the `<m:rdriver>` tag, replace the String placeholder with the location of your Oracle driver.

c. For the `<m:ruser>` tag, replace the String placeholder with a valid user name to access the Oracle repository.

d. For the `<m:rpwd>` tag, replace the String placeholder with a valid password to access the Oracle repository.

10. Perform one of the following migration options.

   - If you want to migrate a single Web service from the current BSE repository, enter the Web service name in the `<m:servicename>` tag, for example:
     
     `<m:servicename>PeopleSoftService1</m:servicename>`

   - If you want to migrate multiple Web services from the current BSE repository, duplicate the `<m:servicename>` tag for each Web service, for example:
     
     `<m:servicename>PeopleSoftService1</m:servicename>
     <m:servicename>PeopleSoftService2</m:servicename>`

   - If you want to migrate all Web services from the current BSE repository, remove the `<m:servicename>` tag.

11. From the menu bar, click SOAP and select **Send request to server**, as shown in Figure 9–23.

    **Figure 9–23  SOAP Menu**

    | SOAP | Tools | Window | Help |
    |------|-------|--------|------|
    |      |       |        |      |
    | Create new SOAP request | Send request to server | Change SOAP request parameters |

    Your BSE repository and any Web services you specified are now migrated to the new Oracle repository URL you specified.

**Migrating a J2CA Repository**

To migrate a J2CA repository:

1. Navigate to the location of your J2CA configuration directory where the repository schemas and other information is stored, for example:

   `<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\config\JCA_CONFIG`

   Where `JCA_CONFIG` is the name of your J2CA configuration.

2. Locate and copy the `repository.xml` file.

3. Place this file in a new J2CA configuration directory to migrate the existing repository.

   Your J2CA repository is migrated to the new J2CA configuration directory.
This appendix describes how to generate component interface APIs to use with Oracle Application Adapter for PeopleSoft. It contains the following topics:

- Section A.1, "Building the PeopleSoft API Java Programs"
- Section A.2, "Compiling the PeopleSoft API Java Programs"

A.1 Building the PeopleSoft API Java Programs

Whether you are using an Enterprise Integration Point (EIP) supplied by PeopleSoft or a customized component interface, you must create a PeopleSoft API to enable communications with the PeopleSoft application. The API is a collection of Java class files that reside on the client system and mediate between the client application layer and PeopleSoft.

Before using your component interface, you must apply security to it and test it.

To build a PeopleSoft API Java program:

1. Open the PeopleSoft Application Designer, as shown in Figure A–1.
2. From the PeopleSoft Application Designer, open a component interface.
3. Click the right pane and select **PeopleSoft APIs** from the **Build** menu.

The Build PeopleSoft API Bindings dialog prompts you for the types of bindings to create, as shown in Figure A–2.
4. Because you are creating Java files, ensure you deselect COM Type Library Build.

5. Ensure that Java Classes Build is selected, and then select a directory on your local system where the Java files are to be placed, for example, `c:\psoft8_components`.

   - To build all API files, select the default, All (potentially a large number), and click OK.

   PeopleSoft generates the files. This takes a few minutes. After the process is complete, a message appears in the output window.

   You are now ready to compile the Java files. For more information, see "Compiling the PeopleSoft API Java Programs" on page A-5.

The following pane illustrates the GP_PYE_ERN_DED_ASGN component interface from the HR 8.1 application, as shown in Figure A–3.
To create APIs for a specific component interface or interfaces, click **None**.

This clears the selected APIs, so you can select the appropriate APIs for your component interface. These APIs begin with the name of your component interface. There may be fewer than five, or more than 50 APIs, for a particular component interface.

The following dialog displays the following APIs, including generic component interface properties, as shown in **Figure A–4**.
In addition to the APIs for the selected component interface, you also must generate the API files for the following generic component interface properties:

CompIntfcPropertyInfo
CompIntfcPropertyInfoCollection

You may select these items in the same step as the component interface build, or you may select them separately.

b. Click OK.

PeopleSoft generates the files. This takes a few minutes. After the process is complete, a message appears in the output window. You are now ready to compile the Java files. For more information, see "Compiling the PeopleSoft API Java Programs" on page A-5.

A.2 Compiling the PeopleSoft API Java Programs

PeopleSoft places the Java programs to compile in the directory called psoft8_components\PeopleSoft\Generated\CompIntfc.

Where psoft8_components is the directory specified during the build process.

If you chose to generate all APIs, the systems creates a second directory, psoft8_components\PeopleSoft\Generated\PeopleSoft. You are not required to access it.

The process for compiling the PeopleSoft API Java programs depends on whether you are compiling on the system where you installed Application Explorer or on another system.
Before you compile the Java programs, you require the PeopleSoft Java Object Adapter, the `psjoa.jar` file that resides on your PeopleSoft Application Server under the `PS_HOME\Web\psjoa` directory. This is the file that you placed in the adapter lib directory during installation.

**If you are compiling on the same system where you installed Application Explorer**

Point to the `psjoa.jar` file or copy it to the directory where you placed the Java API files, for example, `c:\pssoft8_components`.

**If you are compiling on a system other than the one where you installed Application Explorer**

Perform the following steps:

1. Obtain a copy of the `psjoa.jar` file from the PeopleSoft Application Server. Ensure that the `psjoa.jar` file is in the Java class path before you compile the programs.

2. Compile the Java programs and ensure that you include the `\PeopleSoft\Generated\CompIntfc` path. The path is case-sensitive.

   The following Windows batch file, run from the `psoft8_components` directory, properly compiles the Java APIs. The code assumes that `psjoa.jar` was placed in `psoft8_components`.

   ```batch
   @echo off
   set JAVA_HOME=\my-java-home\bin;%PATH%
   set CLASSPATH=\my-java-home\lib\tools.jar;psjoa.jar;%CLASSPATH%
   javac -classpath %CLASSPATH% .\PeopleSoft\Generated\CompIntfc\*.java
   ```

   Where `<my-java-home>` is the fully qualified path name of your Java home directory.

   This code places the class files in the same directory with the Java files, but you can choose a different location depending on your site requirements.

3. Compress the class files into a JAR file.

   The following Windows batch file, if run from the `psoft8_components` directory, creates a correct JAR file:

   ```batch
   @echo off
   set JAVA_HOME= my-java-home
   set PATH=\my-java-home\bin;%PATH%
   set CLASSPATH=\my-java-home\lib\tools.jar;%CLASSPATH%
   jar cvf my-jar-file.jar .\PeopleSoft\Generated\CompIntfc\*.class
   ```

   Where appropriate, substitutions are made for `my-java-home` and `my-jar-file`.

4. To verify that your JAR file is correct, open it with the WinZip application, as shown in Figure A–5.

---

**Note:** There are two Java programs for every API file that you selected when you built the Java programs. For more information, see “Building the PeopleSoft API Java Programs” on page A-1.
Figure A–5 PeopleSoft Jar Files

If the JAR file does not use the case-sensitive PeopleSoft\Generated\CompIntfc\ path, you must go back and correct it.

5. Place the JAR file in the adapters common lib directory, which enables the Oracle Application Adapter for PeopleSoft to communicate with the PeopleSoft component interface.

<ADAPTER_HOME>\soa\thirdparty\ApplicationAdapters\lib

**Note:** If you run on UNIX, perform the compile and JAR steps on Windows and then move the file to your UNIX system. The JAR file is binary. If you use an FTP-based tool to move your JAR file from Windows to UNIX, the file format must be set to binary.
This appendix describes how to configure and test a TCP/IP or HTTP target connector and a TCP/IP handler for PeopleSoft. It contains the following topics:

- Section B.1, "Configuring the TCP/IP or HTTP Target Connector for PeopleSoft 8.4"
- Section B.2, "Configuring the TCP/IP Target Connector"
- Section B.3, "Configuring the Node for the TCP/IP 8.4 Connector"
- Section B.4, "Configuring the TCP/IP Handler for PeopleSoft 8.1"
- Section B.5, "Testing Your PeopleSoft Configuration"

The information in this appendix assumes that you are familiar with PeopleSoft Integration Broker (in release 8.4) or Application Messaging (in release 8.1). For more information, see Appendix D, "Using PeopleSoft Integration Broker". For a complete description before you work with Oracle Application Adapter for PeopleSoft, see your PeopleSoft documentation.

---

**Note:** In PeopleSoft release 8.1, the messaging architecture is called Application Messaging and includes Application Messaging Gateway. In release 8.4, the messaging architecture is called Integration Broker, which includes Integration Gateway. When discussing release-independent issues, this section uses release 8.4 terminology. When discussing release-specific issues, it uses release-specific terminology.

---

**B.1 Configuring the TCP/IP or HTTP Target Connector for PeopleSoft 8.4**

The procedures in this topic assume that your Integration Broker environment is configured and tested. For more information, see Appendix D, "Using PeopleSoft Integration Broker".

1. Configure the gateway for the TCP/IP Target Connector or HTTP Target Connector. For more information, see "Configuring the TCP/IP Target Connector" on page B-2.

---

**Note:** This step is optional when configuring the HTTP Connector. The HTTP Target Connector is supplied with your PeopleSoft application, and no special configuration steps are required. If you choose, you may configure default connection values on the Gateway. You can override these values when you configure the node.
2. Configure the node. For more information, see "Configuring the Node for the TCP/IP 8.4 Connector" on page B-3.

Note: Starting with release 8.4, the Integration Broker is delivered with an HTTP Outbound Connector. For more information, see "Configuring the HTTP Connector" on page B-8.

### B.2 Configuring the TCP/IP Target Connector

To configure the gateway for the TCP/IP Target Connector:

1. In a Web browser, open your PeopleSoft release 8.4 application.

2. In the menu pane, expand PeopleTools, then expand Integration Broker, and click Gateways.

3. Open the LOCAL Gateway ID.

   A pane similar to the following Gateway ID pane is displayed, as shown in Figure B–1.

**Figure B–1 Gateway ID Pane**

4. If you do not see the TCPIPTARGET84 Connector ID, click Load and scroll to locate TCPIPTARGET84 in the list.

   If TCPIPTARGET84 still does not appear, the connector class file was not installed in the Integration Gateway.

   Perform the following steps:

   a. Click the Properties URL for TCPIPTARGET84.
The Properties pane for TCPIPTARGET84 is displayed, as shown in Figure B–2. Default values appear for the host and the port. For complex business situations, you can override this setting on the individual node.

**Figure B–2  Properties Pane**

b. Enter the values for the host and the port for the system on which your PeopleSoft XML listener is listening for incoming messages.

5. Click OK.

The Gateway window is displayed.

6. Scroll to the bottom of the window and click **Save**.

You have finished configuring the gateway for the TCP/IP Target Connector.

### B.3 Configuring the Node for the TCP/IP 8.4 Connector

To configure the node for the TCP/IP 8.4 Connector:

1. In the Menu pane, select **PeopleTools, Integration Broker**, and then click **Node Definitions**.

2. Select the node that you want to configure.

**Note:** This procedure uses a node called EXTERNAL. For more information about creating and using nodes, see Appendix D, "Using PeopleSoft Integration Broker" or your PeopleSoft documentation.

Perform the following steps:
a. Select External from the Node Type list.

b. Select Implicit from the Routing Type list.

3. Select the Connectors tab, as shown in Figure B–3.

Figure B–3 Connectors Tab

Perform the following steps:

a. Select TCPIPTARGET84 as the Connector ID.

   Default values appear for the host and the port.

b. Enter the values for the host and the port for the system and port that route XML to Oracle WebLogic Server. You can accept or override the default values for individual nodes.

c. Click Save.

4. If you are warned that you are changing the connector, click OK.

5. Select the Transactions tab, as shown in Figure B–4.
Perform the following steps:

a. If there are no transactions, click **Add Transaction** to add the message with which you are working. In this procedure, the node is already configured with the LOCATION_SYNC message.

b. To view transaction details for the LOCATION_SYNC message, click **Edit**. The Transaction Detail tab appears, as shown in **Figure B–5**.
c. Add the message with which you are working.

d. Verify that the Routing Type is Implicit.

6. Click Save.

7. Return to the Transactions tab.

Perform the following steps:

a. Edit additional transactions by clicking Edit and navigating to the Transaction Detail tab.

b. In the Transaction Detail tab, select Inactive from the Status list.

Inactive status is for initial testing only. After you test your configuration, you may change the status to Active and have as many nodes and transactions as required to satisfy your business requirements.

8. Click Save.

You can now send XML messages to your PeopleSoft XML listener.

B.3.1 Configuring the HTTP Target Connector

The HTTP Target Connector is supplied with your PeopleSoft application, and no special configuration steps are required. If you choose, you may configure default connection values on the Gateway. You can override these values when you configure the node. To configure the gateway for the HTTP Target Connector:

1. In a Web browser, open your PeopleSoft 8.4 application.

2. In the Menu pane, expand PeopleTools, then expand Integration Broker, and click Gateways.
3. Open the LOCAL Gateway ID.

A pane similar to the following Gateway ID pane is displayed, as shown in Figure B–6.

Figure B–6 HTTP Target Connector Gateway ID Pane

4. If you do not see the HTTPTARGET Connector ID, click Load.

If it does not appear, your Gateway was not installed properly. Check with your PeopleSoft system administrator.

5. Click the Properties URL for HTTPTARGET.

The Properties pane for HTTPTARGET displays default values, as shown in Figure B–7.
6. Scroll to the bottom and enter a value for the PRIMARYURL.

This is the default HTTP address (system and port) on which your PeopleSoft XML listener is listening for incoming messages.

**Note:** For complex business situations, you can override this setting on the individual node.

7. Click OK.

The Gateway window is displayed.

8. Scroll to the bottom of the window and click Save.

You have finished configuring the gateway for the HTTP Target Connector.

---

**B.3.2 Configuring the HTTP Connector**

Starting with release 8.4, the Integration Broker is delivered with an HTTP Outbound Connector. This connector can be used in place of the TCP/IP 8.4 connector for sending messages to Oracle WebLogic Server.

To configure the node to use the HTTP Connector:
Figure B–8 Connector Configuration Pane

1. In the Menu pane, expand PeopleTools, Integration Broker, and then click Node Definitions, as shown in Figure B–8.

2. Select the node that you want to configure.

   **Note:** This procedure uses a node called EXTERNAL. For more information about creating and using nodes, see Appendix D, "Using PeopleSoft Integration Broker" or your PeopleSoft documentation.

Perform the following steps:

a. From the **Node Type** list, select External.

b. From the **Routing Type** list, select Implicit.
Figure B–9  PeopleSoft Integration Broker Connectors Tab

3. Select the Connectors tab, as shown in Figure B–9.

Perform the following steps:

a. Change the Connector ID to **HTTPTARGET**.

b. Enter a value for each property based on the following:

<table>
<thead>
<tr>
<th>Property ID</th>
<th>Property Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>HEADER</td>
<td>sendUncompressed</td>
<td>Y</td>
</tr>
<tr>
<td>HTTPPROPERTY</td>
<td>Method</td>
<td>POST</td>
</tr>
<tr>
<td>PRIMARYURL</td>
<td>URL</td>
<td>URL and the port of the HTTP listener</td>
</tr>
</tbody>
</table>

**Note:** For complex business situations you can configure multiple nodes and multiple listeners.

4. Click **Save**.

5. If you are warned that you are changing the Connector, click **OK**.

6. Select the Transactions tab, as shown in Figure B–10.
7. If there are no transactions, click **Add Transaction**.

   In this procedure, the node is already configured with the `LOCATION_SYNC` message.

   The Transaction Detail tab appears, as shown in **Figure B–11**.
You can add the message with which you are working.

a. Verify that the Routing Type is Implicit.

b. Click Save.

8. Return to the Transaction List. Perform the following steps:

   a. If there are other transactions, edit them.

   b. Set the status to Inactive.

   Inactive status is for initial testing only. After you test your configuration, you may change the status to Active and have as many nodes and transactions as required to satisfy your business requirements.

9. Click Save on the Transaction List.

You can now send XML messages to your PeopleSoft XML listener.

B.4 Configuring the TCP/IP Handler for PeopleSoft 8.1

The following procedure assumes that your Application Messaging environment is properly configured and tested. For more information, see Appendix D, "Using PeopleSoft Integration Broker".

To configure the TCP/IP Handler for PeopleSoft 8.1 to send messages to Oracle WebLogic Server:

1. In a Web browser, launch the PeopleSoft 8.1 Gateway Configuration servlet interface.

2. If the Simple File Handler is currently loaded, unload and delete it before proceeding.
You must see an empty Handler directory, as shown in Figure B–12.

![Figure B–12 Empty Handler Directory](image1)

3. Click Add handler, as shown in Figure B–13.

![Figure B–13 Loaded Add Handler Directory](image2)

Perform the following steps:

a. Enter the full path of TCPIPHandler81 (case-sensitive):

   psft.pt8.tcphandler.TCPIPHandler81

b. Click Save.

4. Click Load.

   The PeopleSoft Handler Directory window is displayed.

5. Click Configure.

   The TCPIP81 Handler Directory window is displayed.

6. Click Add a TCPIP81 node.

   **Note:** The screens illustrating this procedure show a node named EXTERNAL. For more information about creating and using nodes, see Appendix D, "Using PeopleSoft Integration Broker" or your PeopleSoft documentation.
The Add TCPIP81 Handler window is displayed, as shown in Figure B–14.

Figure B–14   Add TCPIP81 Handler Window

7. Enter the requested values based on the information in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node Name</td>
<td>EXTERNAL</td>
<td>The name of the TCP/IP node.</td>
</tr>
<tr>
<td>Host Name</td>
<td>172.19.25.152</td>
<td>The system on which your PeopleSoft XML listener is listening for incoming messages.</td>
</tr>
<tr>
<td>Port</td>
<td>3694</td>
<td>The port on which your PeopleSoft XML listener is listening for incoming messages.</td>
</tr>
<tr>
<td>Trace Directory</td>
<td>/tmp</td>
<td>The directory where a trace file is created when errors occur in message delivery.</td>
</tr>
</tbody>
</table>

The system does not validate your entries.

8. Click **Save**.

The TCPIP81 Handler Directory window is displayed, as shown in Figure B–15.
9. For your changes to take effect, click Back to Handler Directory to return to the PeopleSoft 8.1 Handler Directory window.

10. Click Unload and re-Load TCPIPHandler81.

You can now send messages from PeopleSoft to Oracle Application Adapter for PeopleSoft.

B.5 Testing Your PeopleSoft Configuration

PeopleSoft 8.1 and 8.4 provide a ping node mechanism for testing your configuration. The mechanism functions identically in both versions.

Test your configuration to ensure that:

- Oracle WebLogic Server is up and running.
- The server name and port number for PeopleSoft and Oracle WebLogic Server match.
- The default page for HTTP exists.

To test a PeopleSoft configuration:

1. In a Web browser, open your PeopleSoft application.
2. Navigate to the message monitoring menu.
   For PeopleSoft 8.4:
   a. In the menu pane, expand PeopleTools, Integration Broker, and Monitor.
   b. Select Monitor Message.
   For PeopleSoft 8.1:
   a. In the menu pane, expand Home, PeopleTools, Application Message Monitor, and Use.
   b. Select Application Message Monitor.
3. Click the Node Status tab, as shown in Figure B–16.
Perform the following steps:

a. From the Message Node Name list, select your node.

b. Click Ping Node.

If you properly configured both PeopleSoft and Oracle WebLogic Server, you receive a Success message.

An error indicates a configuration problem. For more information, see the Integration Broker error log.
This appendix describes how to create new and modify existing component interfaces for use with Oracle Application Adapter for PeopleSoft. It also describes how to apply security to those component interfaces and how to test them.

You can:
- Use component interfaces supplied by PeopleSoft with your application.
- Component interfaces also are known as Enterprise Integration Points (EIP).
- Modify an existing component interface.
- Create a new component interface.

Before using your component interface you must apply security to it and test it.

After securing and testing a component interface, you must generate its API. For more information, see Appendix A, "Generating Component Interface APIs".

---

**Note:** This section is intended as a helpful supplement; it is not a substitute for PeopleSoft documentation. For complete and up-to-date information about PeopleSoft component interfaces, see the PeopleSoft Online Library for your PeopleSoft system.

---

This appendix contains the following topics:

- **Section C.1, "Working With Properties"**
- **Section C.2, "Securing a Component Interface"**
- **Section C.3, "Testing a Component Interface"**

### C.1 Working With Properties

You create component interfaces using the PeopleSoft Application Designer. For more information about Application Designer, see your PeopleSoft documentation.

You can add properties from the records in the component view. You can delete a property in the component interface that you do not want to expose. You can rename properties by clicking the property and then clicking again until you can enter a new name. If you rename a property, it can be referenced in the component interface only by the new name, not by the underlying component name.

Properties may have various icons adjacent to them. For example, EMPLID has an icon indicating that it is a key field from the underlying record. NAME has an icon...
indicating that it is an alternate key field from the underlying record. For a complete list of property icons, see the PeopleBooks documentation.

### C.1.1 Creating a New Component Interface

To create a component interface:

1. Open the PeopleSoft Application Designer.
2. Select **New** from the **File** menu.

   The New dialog is displayed, as shown in **Figure C–1**.

**Figure C–1 New Dialog**

Perform the following steps:

a. Select **Component Interface**.

b. Click **OK**.

   The Select Source Component for Component Interface dialog is displayed, as shown in **Figure C–2**.
3. Highlight the component to use as a basis for the component interface and click **Select**.

The Application Designer dialog is displayed, as shown in Figure C–3.

**Figure C–3 Application Designer Dialog**

---

**Note:** If the component interface is large, expose the component properties manually.
4. To create the component interface without displaying properties and to expose component properties manually, click **No**.

Perform the following steps:

a. Drag the relevant fields from the left pane to the right pane.

b. To select various functions to perform, right-click either the right or left pane, depending on which pane is active, as shown in Figure C–4.

For a complete list of functions, see the PeopleBooks documentation.

5. To create the component interface and display the properties of the underlying component interface, click **Yes**.

**Figure C–4 Application Designer Component Interface**

**Standard Methods**

The standard methods for the component interface are:

- Create
- Find
- Get
- Save

Only those methods in the underlying component are available. For example, if the underlying component does not contain Add capabilities, Create is not available.

**C.1.2 Viewing or Changing Available Methods**

To view or change available methods:

1. Display the Component Interface Properties dialog, as shown in Figure C–5.
C.2 Securing a Component Interface

You must set up security for the component interface before you can begin testing.

C.2.1 Configuring Component Interface Security for PeopleSoft Version 8.1x

The following procedure describes how to configure component interface security for PeopleSoft Version 8.1 in 2- and 3-tier mode.

To configure component interface security:

2. Click the Standard Methods tab.
3. Select the desired methods.
Securing a Component Interface

**Figure C–6  Component Interface Security Options**

1. From the Use menu, select Permission Lists, Component Interface, and then click Update/Display, as shown in Figure C–6.

   The Permission Lists dialog is displayed, as shown in Figure C–7.

   **Figure C–7  Permission Lists Dialog**

Before Security can be set, you must identify the permission lists.

2. Select the relevant permission list and click OK.

   For more information on permission lists, see the PeopleBooks documentation.

   The Permissions Lists pane is displayed, as shown in Figure C–8.
3. Insert the new component interface that you created.

4. Click **Edit**.

   When you select the component interface, all available methods appear, including user-defined methods. You can specify whether this particular Permission List must have full or partial access.

   The ALLPORTL Permission List has full access to all methods, as shown in Figure C–9.
5. Select the desired level of access.

6. Click OK.

### C.2.2 Configuring Component Interface Security for PeopleSoft Version 8.4 or Higher

The following procedure describes how to configure component interface security for PeopleSoft Version 8.4 or higher.

To configure interface security:
Figure C–10  Configure Component Interface Security

1. Expand PeopleTools, Security, User Profiles, and Permissions & Roles and then click Permission Lists, as shown in Figure C–10.

2. Click Search.
   The Permission Lists Search pane is displayed.

3. Select the relevant permission list, as shown in Figure C–11.
4. Click the right arrow next to the Sign-on Times tab. The Component Interfaces tab appears, as shown in Figure C–12.
5. Click the **Component Interfaces** tab.

6. Click + to add a new row to the Component Interfaces list.

   A field appears where you can enter the component interface name, as shown in **Figure C–13**.
7. Enter the component interface name and click **Edit**.
   
   This example uses the component interface AR_ITEM_AGENT, as shown in Figure C–14.
8. From the lists, select the desired access level for each method.

9. Click OK.

The Permissions list window is displayed, as shown in Figure C–15.
C.3 Testing a Component Interface

Oracle Application Adapter for PeopleSoft uses PeopleSoft metadata and component interfaces; therefore, it can accommodate new or modified component interfaces. The adapter makes no assumptions about component interfaces except that they are logical and valid. Each component interface must be tested before being used as a source for the adapter.

If changes are made to the underlying application by the user or by a PeopleSoft upgrade and the changes invalidate a component interface, the user must repair the invalid component interface before the adapter uses it.

To test a component interface:

1. In Application Designer, select **Test Component Interface** from the **Tools** menu.

   The Component Interface Tester dialog is displayed, as shown in Figure C–16.

10. Scroll down in the right pane and click **Save**.
2. If required, click the Component Interface Tester dialog to bring it to the foreground.

3. To test the component interface, use one of the following methods.
   - To test the component interface using the Find method, click **Find**.
     
     The Component Interface Tester - Find Results dialog displays all of the possible entries for the underlying component, as shown in Figure C–17. If there are more than 300 entries, a message appears.
In the left pane of the Find Results dialog, select a field.

To display the relevant data for that particular field, click **Get Selected**.

The Find Results dialog is displayed, as shown in **Figure C–18**.
If the security settings permit, you can change the values in the individual fields.

4. To test the component interface using the Get method, perform the following steps:
   a. Enter the existing key(s).
   b. Click Get Existing.
   
   This returns the exposed properties for the key that you entered. You can change values if Update access was specified.

Alternatively, you can test using the Create method, as shown in Figure C–19.
Perform the following steps:

a. Enter all required key values.

b. Click Create New.

When you enter valid values in Create keys, a pane showing the JOBCODE data is displayed after the Table name is expanded with default data in place, as shown in Figure C–20.
You can change fields at this point. Changes are validated against the component’s underlying business logic.

c. After you finish making changes, right-click the top item in the pane.

5. To save your changes, click Save.

The keys used to create the record can be used with the Get method for viewing data. The data that was added can be viewed in the PeopleSoft Component as shown in the following example. The Effective Date is one of the default values.

You have finished testing the component interface. Before using the component interface, you must generate its API. For more information, see Appendix A, "Generating Component Interface APIs".
Using PeopleSoft Integration Broker

This appendix describes how to configure and test PeopleSoft Integration Broker (release 8.4) and PeopleSoft Application Messaging (release 8.1) using a PeopleSoft-supplied File Output interface. In PeopleSoft release 8.1, the messaging architecture is called Application Messaging and includes Application Messaging Gateway. In release 8.4, the messaging architecture is called Integration Broker, which includes Integration Gateway. When discussing release-generic issues, this section uses release 8.4 terminology. When discussing release-specific issues, it uses release-specific terminology.

Note: This section is not a substitute for PeopleSoft documentation. For more complete and up-to-date information on PeopleSoft Messaging and Integration Broker, see the PeopleSoft Online Library for your PeopleSoft system.

This appendix contains the following topics:

- Section D.1, "PeopleSoft Integration Broker"
- Section D.2, "Configuring Application Messaging in PeopleSoft Release 8.1"
- Section D.3, "Viewing the PeopleCode for a Message"
- Section D.4, "Testing the Integration Broker"
- Section D.5, "Using Outbound Synchronous Messages"
- Section D.6, "Generating Events Using PeopleTools Tutorial"

D.1 PeopleSoft Integration Broker

PeopleSoft Integration Broker provides a mechanism for communicating with the outside world using XML files. Communication can take place between different PeopleSoft applications or between PeopleSoft and third-party systems.

To subscribe to data, third-party applications can accept and process XML messages posted by PeopleSoft using the available PeopleSoft connectors or by adding a custom built connector to the Integration Gateway. This topic primarily covers publishing outbound asynchronous messages from a PeopleSoft system to a third-party application using the delivered File Output connector. For information on outbound synchronous messages, see "Using Outbound Synchronous Messages" on page D-24.

To send a message, you must properly configure various internal structures and processes. The following descriptions are generally release-generic. Detailed differences between releases 8.1 and 8.4 are discussed in other topics.
■ Message
A Message is a container for the data that goes into the XML. It contains basic structural information, such as records and fields. The Message must be in an Active status to send the XML file.

■ Message Channel
The Message Channel is a mechanism for structuring records into logical groupings. Each Message can belong to only one Message Channel. The Message Channel must be in an Active (Run) status for the Message to be delivered.

In release 8.1, the Message Channel also provides preliminary routing instructions; you can specify which Message Nodes handle the message. Each Message Channel can route messages to multiple Message Nodes.

■ Message Node
Message node functionality changed from 8.1 to 8.4:

In release 8.1, the primary function of the Message Node is to specify which Gateway receives the messages.

In release 8.4, much of the "intelligence" that was built into the Message Channel moved to the Message Node. This provides additional flexibility over release 8.1. You can specify which messages the Message Node can handle. In addition, the Gateway Connector is bound to the Message Node. Each Message Node can route messages to only one Connector.

■ Integration Gateway
The Integration Gateway is a program that runs on the PeopleSoft Web Server. It is the physical hub between PeopleSoft and the third-party system.

■ Target Connector/Handler
Connectors are Java programs that run under the control of the Integration Gateway and control the final output destination of the XML file. PeopleSoft release 8.4 comes with several connectors including HTTP, FTP, SMTP, JMS, POP3, and a Simple File connector that places the file in a directory on the Web Server. This section discusses the Simple File connector.

■ PeopleCode
PeopleCode is the programming tool provided with PeopleTools that enables you to create complex application functionality. A message can only be initiated using specific PeopleCode instructions. This code is typically triggered by an application event, such as creating a new database entry through an online panel or through a batch job.

Most of the examples in this section use the LOCATION_SYNC message, which is a PeopleSoft Enterprise Integration Point (EIP) and is supplied with most PeopleSoft applications. If LOCATION_SYNC is not part of your package, you may use any supplied message.

D.1.1 Configuring Integration Broker in PeopleSoft 8.4
You can configure PeopleSoft 8.4 to send an asynchronous outbound message to the File Output connector.

To configure application messaging in PeopleSoft 8.4:

1. Ensure that the message is active and is routed to the proper Message Channel.
2. Configure the Message Channel.
3. Configure the IntegrationGateway.properties file to communicate with your PeopleSoft 8.4 application.
4. Configure the Integration Gateway and File Output connector.
5. Create and configure a new Gateway node.

These tasks are described in detail in the following procedures.

**Ensuring the Message Is Active and Is Routed Correctly**
To ensure that the message is active and is routed to the proper Message Channel:

1. Open Application Designer.
2. On the File menu, point to Open, click Message, and then open the LOCATIONSYNC message, as shown in Figure D–1.

**Figure D–1  LOCATIONSYNC Message**

3. To view the fields that are included in the Message, highlight LOCATION_TBL.
4. Right-click LOCATION_TBL and select Properties.

The Message Properties dialog is displayed, as shown in Figure D–2.
5. Select the **Use** tab.

6. Ensure the **Active** check box is selected.

   The message is routed to the Message Channel, `ENTERPRISE_SETUP`, and the default message version is `VERSION_1` (messages can have multiple versions).

7. Click **OK** and then save the message.

   You have finished ensuring that the message is active and is routed correctly.

### Configuring the IntegrationGateway.properties File

To configure the `IntegrationGateway.properties` file:

1. Open the `IntegrationGateway.properties` file using the editor of your choice.

2. Find the section of the file that specifies the JOLT connect string setting for the default application server. This is usually near line 75, and looks similar to the following:

   ```
   ## JOLT connect string setting for optional Default Application Server. Do NOT specify a NODENAME.
   #
   # Example:
   #ig.isc.serverURL=//MYSERVER:9000
   #ig.isc.userid=MYUSERID
   #ig.isc.password=MYPASSWORD
   #ig.isc.toolsRel=8.40
   ```

3. Uncomment (or copy and uncomment) the four lines that specify the connection.

4. Enter the appropriate information.
In the following example, the tools release is 8.40.09:

ig.isc.serverURL=//isdsrv14:9000
ig.isc.userid=VP1
ig.isc.password=VP1
ig.isc.toolsRel=8.40.09

The PeopleSoft tools release must be precise to the last decimal.

---

**Note:** With release 8.42, the password must be stored in an encrypted format. PeopleSoft provides a script called PSCipher.bat (PSCipher.sh on UNIX) to accomplish encryption. Typically, this script is located in the path of the IntegrationGateway.properties file. Follow the instructions supplied by PeopleSoft to run this script.

---

You have finished configuring the IntegrationGateway.properties file.

**Configuring the Integration Gateway and the File Output Connector**

To configure the Integration Gateway and the File Output Connector:

1. In a Web browser, open your PeopleSoft 8.4 application in 4-tier mode.
2. In the Menu pane, expand PeopleTools, Integration Broker, and then click Gateways.
3. Open the LOCAL Gateway ID and enter the following Gateway URL:

   host name/PSIGN/PeopleSoftListeningConnector

   Where host name is the name of your PeopleSoft Web Server.
4. Click Refresh.

   A message appears stating the outcome of the refresh process, as shown in Figure D–3.
5. Click OK and scroll down to click **Save**.
   
   You must click Save before continuing.

6. Click the **Properties** link for the FILEOUTPUT Connector ID.
   
   The Properties window for the FILEOUTPUT Connector is displayed.

7. Accept or overwrite the default values.
   
   The FilePath PROPERTY from the `c:\temp default` was changed to `d:\ps\cache`, as shown in **Figure D–4**.
8. To return to the Gateway window, click OK.

9. Scroll down and click Save.

You have finished configuring the Integration Gateway and the File Output Connector.

### Creating and Configuring a New Gateway Node

To create and configure a new Gateway Node:

1. In the Menu pane, expand PeopleTools, Integration Broker, and then, click Node Definitions.

2. Select the Add a New Value tab.

3. In the Node Name field, enter a node name.

   It is recommended that you name your first (trial) message node EXTERNAL. After successfully configuring and sending messages using this node, you can create additional message nodes with names appropriate for your application.

4. Click Add.

   The Node Info tab becomes available, as shown in Figure D–5.
Perform the following steps:

a. In the **Description** field, enter an appropriate description.

b. From the **Node Type** list, select **EXTERNAL**.

c. From the **Routing Type** list, select **Implicit**.

5. Select the **Connectors** tab.

The Connectors tab becomes available, as shown in **Figure D–6**.
Figure D–6 Connectors Tab

Perform the following steps:

a. Specify **LOCAL** for the **Gateway ID**.

b. Specify **FILEOUTPUT** for the **Connector ID**.

c. Accept or overwrite the default Gateway property values.

6. Click **Save**.

7. To specify the transactions to route messages to your node, select the **Transactions** tab and click **Add Transaction**.

The Node Transactions pane is displayed, as shown in Figure D–7.
Perform the following steps:

a. From the **Transaction Type** list, select **Outbound Asynchronous**.

b. In the **Request Message** field, specify **LOCATION_SYNC**.

c. In the **Request Message Version** field, specify **VERSION_1**.

8. Click **Add**.

The Transaction Detail pane is displayed, as shown in Figure D–8.
Perform the following steps:

a. Verify that the **Routing Type** is **Implicit**.

b. Click **Save**, then click the **Return to Transaction List** link.

c. To ensure that your data entry is not lost, click **Save** again.

You have finished creating and configuring the new Gateway Node.

For more information, see "Viewing the PeopleCode for a Message" on page D-26.

**D.2 Configuring Application Messaging in PeopleSoft Release 8.1**

You can configure PeopleSoft 8.1 to send an asynchronous outbound message to the Simple File Handler.

To configure application messaging in PeopleSoft 8.1:

1. Create and configure a new Message Node.
2. Ensure the message is active and is routed to the proper Message Channel.
3. Configure the Message Channel.
4. Configure the Simple File Handler in the Gateway.

These tasks are described in detail in the following procedures.

**Creating and Configuring a New Message Node**

To create and configure a new message node:

1. Select **New** from the File menu and click **Message Node**.

A Message Node window is displayed, as shown in **Figure D-9**.
2. Right-click anywhere inside the white space and select **Insert Location**.

   The Location URL box is displayed, as shown in Figure D–10.

![Figure D–10 Location URL Box](image)

3. Enter the following URL for the PeopleSoft Application Gateway (handler directory):

   ```
   host name:port/servlets/psft.pt8.gateway.GatewayServlet
   ```

   Where `host name` is the host name of your PeopleSoft Web server and `port` is the socket on which the server is listening. The characters you enter after `host name` are case-sensitive.
4. Click OK.

5. Display the Message Node Properties dialog, as shown in Figure D–11.

**Figure D–11 Message Node Properties Dialog**

Perform the following steps:

- **a.** Select the Use tab.

- **b.** In the text boxes, enter the PeopleTools and Application Version numbers.

- **c.** Click OK.

6. Display the Save As dialog, as shown in Figure D–12.
7. To save the Message Node, click OK.
   It is recommended that you name your first (trial) message node EXTERNAL. After successfully configuring and sending messages using this node, you can create additional message nodes with names appropriate for your application.
   If you intend to migrate this message node to a different PeopleSoft environment (for example, from Test to QA), you can create a PeopleSoft project and insert the Message Node into the project.
   You have finished creating and configuring the message node.

**Ensuring the Message Is Active and Is Routed Correctly**

To ensure that the message is active and is routed to the proper message channel:

1. Open Application Designer.
2. On the File menu, point to Open, click Message, and open the LOCATION_SYNC message, as shown in Figure D–13.
3. To view the fields that are included in the message, highlight LOCATION_TBL.

4. Right-click LOCATION_TBL and select Properties.

The Message Properties dialog is displayed, as shown in Figure D–14.
Perform the following steps:

a. Select the Use tab.

b. Ensure the Status check box is selected, which indicates that the message is active.

c. From the Message Channel list, select ENTERPRISE_SETUP.

d. From the Default Version list, select VERSION_1 (messages can have multiple versions).

5. Click OK.

6. Save the message.

Configuring the Message Channel

To configure the message channel:

1. From the File menu, choose Open and click Message Channel.

2. To open the ENTERPRISE_SETUP Message Channel, select ENTERPRISE_SETUP.

3. Right-click ENTERPRISE_SETUP and select Properties.

The Message Channel Properties dialog is displayed, as shown in Figure D–15.
Perform the following steps:

a. Select the Use tab.

b. Ensure that the Message Channel status is set to Run.

c. Click OK.

4. From the left pane, select the Routing Rules tab. The pane is blank, as shown in Figure D–16.

5. Right-click the pane and select Insert Message Node.
The Insert Message Node dialog is displayed, as shown in Figure D–17.

Figure D–17  Insert Message Node Dialog

Perform the following steps:

a. Select the message node that you created in "Creating and Configuring a New Message Node" on page D-11, for example, EXTERNAL.

b. Click Insert.

6. Click Cancel.

Information appears on the Routing Rules tab, as shown in Figure D–18.

Figure D–18  Routing Rules Tab

Perform the following steps:

a. Right-click the message node and point to Routing Direction.
b. From the Routing Direction menus, select Publish To.

7. Save the Message Channel, and if you require it, place it in your project. You have finished configuring the Message Channel.

Configuring the Simple File Handler in the Gateway

To configure the Simple File Handler in the Gateway:

1. In a Web browser, launch the PeopleSoft 8.1 configuration servlet interface (also known as the server gateway) by entering the following URL:

   ```
   host name:port/servlets/gateway.administration
   ```

   Where `host name` is the name of the application server that hosts PeopleSoft and `port` is the port number on which the application server is listening.

   The Handler Directory window is displayed, as shown in Figure D–19.

   **Figure D–19  Handler Directory Window**

   ![Figure D–19 Handler Directory Window](image)

2. Click Add Handler.

   The Add Handler window is displayed, as shown in Figure D–20.

   **Figure D–20  Add Handler Window**

   ![Figure D–20 Add Handler Window](image)

3. Enter the full name of the Simple File Handler class, `psft.pt8.filehandler.SimpleFileHandler`.

   **Note:** The name is case-sensitive.
4. Click **Save**.

   The Handler Directory window is displayed, as shown in Figure D–21.

   **Figure D–21 Handler Directory Window**

   ![Handler Directory Window](image)

5. To load the handler, click **Load**.

   After the handler loads, "Loaded successfully" appears in the Status column.

6. Click **Configure**.

   The Simple File Handler Directory window is displayed, as shown in Figure D–22.

   **Figure D–22 Simple File Handler Directory Window**

   ![Simple File Handler Directory](image)

7. Click **Add a file handler node**.

   The Add File Handler window is displayed, as shown in Figure D–23.
8. In the Node Name field, enter the name of the message node that you created in "Creating and Configuring a New Message Node" on page D-11, for example, EXTERNAL.

D.3 Viewing the PeopleCode for a Message

Messages are initiated by the PeopleCode that is attached to a record. Usually, this record is one of the records associated with the message itself.

1. Open Application Designer, as shown in Figure D–24.
2. On the Record Fields tab, select the LOCATION_TBL record.

3. Select the PeopleCode display option.

4. Select the Save Post Change (SPO) box for the LOCATION field.

The following window displays the PeopleCode that initiates a LOCATION_SYNC message, as shown in Figure D–25.

For more information about PeopleCode, consult your PeopleSoft Online Library.

You have finished viewing the PeopleCode for a message. You can now test Integration Broker (in PeopleSoft 8.4) or Application Messaging (in PeopleSoft 8.1).

D.4 Testing the Integration Broker

To test the Integration Broker by generating a message, you can navigate to the Location Transaction window and add, update, or delete a location entry in your application. Depending on your application, the way you navigate varies.

An example that illustrates a Financials 8.4 application where a new location with a SetID of SHARE and a Location Code of TEST001 was added, as shown in Figure D–26.
Figure D–26  Financials 8.4 Application

A portion of the XML output is shown in Figure D–27.

Figure D–27  XML Output
If you cannot send a message successfully, PeopleSoft provides a set of tools for monitoring the progress of your messages. In release 8.1, you use a tool called the Application Messaging Monitor. In release 8.4, you use the Monitor Menu in the Integration Broker.

For a complete description on how to isolate and resolve problems with your messaging environment, consult your PeopleSoft Online Library. If you are still unable to send your XML file, the PeopleSoft Customer Connection can help solve your problem.

D.5 Using Outbound Synchronous Messages

Starting with PeopleTools 8.4, you can send outbound synchronous messages. From a high-level point of view, the primary difference between outbound synchronous and asynchronous is that with outbound asynchronous, the transaction is completed whether the message is actually sent or received.

For synchronous outbound messages:

- The transaction must wait for a response from the external system before continuing.
- The transaction must process the response message.
- The external system must ensure that the response message is correctly formatted.

Oracle Application Adapter for PeopleSoft can work with PeopleSoft outbound synchronous messages. Outbound synchronous messages involve additional configuration steps, both within PeopleSoft and in Oracle WebLogic Server. This topic briefly describes the configuration requirements within PeopleSoft.

Note: The instructions in this topic build upon the instructions for outbound asynchronous messages. It is strongly recommended that you familiarize yourself with outbound asynchronous messaging before attempting outbound synchronous. For more information on outbound asynchronous messages, see "Configuring Integration Broker in PeopleSoft 8.4" on page D-2.

Ensure that both outbound and inbound messages are created and active. PeopleSoft provides template examples called IB_INST_VER_SYNC_MSG and IB_INST_VER_RESP_MSG. For information on examining these messages, see "Ensuring the Message Is Active and Is Routed Correctly" on page D-3.

D.5.1 Configuring Outbound Synchronous Messages

You can use an existing node, or you can create a new node to configure outbound synchronous messages. For more information on creating and configuring a node, see "Creating and Configuring a New Gateway Node" on page D-7. In either case, you must set up your outbound synchronous transaction.

The following example uses a node and transaction delivered by PeopleSoft. However, this example is for illustrative purposes only and does not actually work as delivered.
without additional steps. As of Financials release 8.42, there are no preconfigured outbound synchronous transactions that you can use for testing purposes.

**Configuring an Outbound Synchronous Message**

To configure an outbound synchronous message:

1. Navigate to the Node Definitions page and open the **PT_LOCAL** node.
2. Click the **Transactions** tab.

   The Transactions pane is displayed, as shown in Figure D–28.

**Figure D–28  Transactions Pane**

One outbound synchronous message, **IB_INST_VER_SYNC_MSG**, appears in the Transaction Type list.

3. Click the **Edit** link in the **IB_INST_VER_SYNC_MSG** row.

   The following pane is displayed, as shown in Figure D–29.
4. Click the Messages tab.

Both request and response messages appear. The target system must ensure that the response message follows the format of the request message. As the target system is your Oracle WebLogic Server, you must transform the XML that is sent and returned from your final destination.

**Note:** You must use the PeopleSoft-supplied HTTP target connector when you are working with synchronous outbound messages. You cannot use the TCPIP84TARGET connector for outbound synchronous messages.

### D.5.2 Viewing the PeopleCode for a Synchronous Message

The sample PeopleCode in the following example is for a synchronous outbound message. It differs from asynchronous outbound in that it must handle a response message.

**Viewing the PeopleCode for a Financials Synchronous Outbound Message**

The following sample code is supplied with the Financials application and is associated with the two messages IB_INST_VER_SYNC_MSG and IB_INST_VER_RESP_MSG.

To view the code, perform the following steps:

1. From Application Designer, open the PSINST_VER record.
2. Select the PeopleCode display option.
3. Select the Field Change (FCh) box for the IB_SEND_SOS_BTN field.
D.6 Generating Events Using PeopleTools Tutorial

This section provides a tutorial that walks you through the PeopleSoft event generation process using PeopleTools version 8.48 and 8.49. The tutorial uses the PeopleTools version 8.48.02 and 8.90 Financial / SCM application. As a result, if you are using a different platform, then correlate the terms and commands specific to that operating system. For more information, refer to the appropriate user guide for each specific component.

D.6.1 Configuring PeopleSoft Services

This section describes how to configure PeopleSoft services.

Adding a Remote Node

To add a remote node:

1. Logon to PeopleSoft using the browser-based GUI (Pure Internet Architecture).
2. Select PeopleTools, Integration Broker, Integration Setup, followed by Nodes.

The Node Definitions tab is displayed, as shown in Figure D–31.

![Figure D–30 Field Change Box](image.png)
3. Perform the following steps:
   a. In the Node Name field, type a name for the new node definition, for example, EXTERNAL.
   b. In the Description field, type a brief description for the new node definition.
   c. From the Node Type drop-down list, select External.
   d. From the Authentication Option drop-down list, ensure that the default option, none, is selected.
   e. In the Default User ID field, type the user ID that is being used by the PeopleSoft system, for example, PS.
   f. Select the Active Node check box.

4. Click the Connectors tab.
   The Connectors tab is displayed, as shown in Figure D–32.

5. Perform the following steps:
   a. In the Gateway ID field, type LOCAL.
   b. In the Connector ID field, type HTTPTARGET.
   c. For the PRIMARYURL value, enter the host and port number of the PeopleSoft adapter instance that is used to listen for events.
d. Leave the default values for the remaining properties.

6. Save your changes.

Selecting a Service

To select a service:

1. Select **PeopleTools, Integration Broker, Integration Setup**, followed by **Services**.
2. Search for the DEPT_SYNC service and select it.
   
   The DEPT_SYNC Services pane is displayed, as shown in **Figure D–33**.

**Figure D–33  DEPT_SYNC Services Pane**

![DEPT_SYNC Services Pane](image)

3. From the Existing Operations section on the lower-left, click the **DEPT_SYNC.VERSION_1** service operation.

   The Service Operation - General pane is displayed, as shown in **Figure D–34**.

**Figure D–34  Service Operation - General Pane**

![Service Operation - General Pane](image)
4. Click the **Active** check box.

5. Click the **Routings** tab to add a new routing, as shown in Figure D–35.

**Figure D–35 Routings Tab**

6. In the Routing Name field, type a name for the new routing, for example, **ADD_DEPT**.

7. Click **Add**.

8. Click the **Routing Definitions** tab to add a new routing definition, as shown in Figure D–36.

**Figure D–36 Routing Definitions Tab**

9. Perform the following steps:
   
   a. In the Sender Node field, type **PSFT_HR**, which is the default PeopleSoft node that publishes the message.
   
   b. In the Receiver Node field, type **EXTERNAL**, which is the new node that has been created to subscribe the message published by PeopleSoft.

10. Click the **Connector Properties** tab, as shown in Figure D–37.
11. Perform the following steps:
   a. In the Gateway ID field, type LOCAL.
   b. In the Connector ID field, type HTTPTARGET.
   c. For the PRIMARYURL value, enter the host and port number of the PeopleSoft adapter instance that is used to listen for events.

12. Click Save and then click Return.

   You are returned to the Routing Definitions pane. Notice that the new routing definition (ADD_DEPT) is now added to the list, as shown in Figure D–38.

13. Click Save to save the details of the Service Operation.

14. Click the Return to Service link to return to the Services pane.

15. Click Save on the Services pane.

**Activating the Gateway**

To activate the gateway:

1. Select PeopleTools, Integration Broker, Configuration, followed by Gateways.
2. Search for the Integration Gateway ID, for example, Local and select it.

   The Gateways pane is displayed, as shown in Figure D–39.
3. Click Ping Gateway.

A new browser window is displayed, which shows that the gateway is active, as shown in Figure D–40.

4. Close the new browser window to return to the Gateways pane, as shown in Figure D–41.

5. Ensure that HTTPTARGET is listed in the Connectors section. If it is not listed, click Load Gateway Connectors to refresh the available connectors.

Activating the Domain

To activate the domain:

1. Select PeopleTools, Integration Broker, Configuration, followed by Quick Configuration.

The Quick Configuration pane is displayed, as shown in Figure D–42.
2. Ensure that the domain is active.

Activating the Service
To activate the service:

   The Services pane is displayed, as shown in Figure D–43.

2. Ensure that the service is active.

Activating the Service Operation (Queue and Message Node)
To activate the service operation:

   The Services pane is displayed, as shown in Figure D–44.

   **Figure D–44 Services Pane**

   ![Services Pane](image)

2. From the Existing Operations section on the lower-left, click the DEPT_SYNC.VERSION_1 service operation.

   The Service Operation - General pane is displayed, as shown in Figure D–45.

   **Figure D–45 Service Operation - General Pane**

   ![Service Operation - General Pane](image)

3. In the message information section on the bottom of the page, note the value in the Queue Name field of the service operation, as shown in Figure D–46.

   **Figure D–46 Message Information Section**

   ![Message Information Section](image)

4. Click the View Queue link.

   The Queue Definitions pane is displayed, as shown in Figure D–47.

   ![Queue Definitions Pane](image)
5. Ensure that the Queue Status drop-down list has Run selected.

6. Click Return to return to the Service operation pane.

7. Click the Routings tab, as shown in Figure D–48.

**Figure D–48 Routings Tab**

8. Ensure that the routings are active.

9. Click the Return to Service link on the bottom of the pane to return to the Services pane.

10. Click Return to Search to go to the Services search pane.

In the above steps, if the status has been activated in any of the panes for any of the components, then make sure to save the status at the appropriate pane and the respective components.

11. Select PeopleTools, Integration Broker, Configuration, Integration Setup, Services, followed by Nodes.

The Node Definitions pane is displayed, as shown in Figure D–49.
12. Ensure that the status of the External node is active.
This completes the configuration on the PeopleSoft side.

D.6.2 Triggering the Event in PeopleSoft

This section describes how to trigger the event in PeopleSoft.

**Triggering the Event**

To trigger the event:

1. Logon to PeopleSoft using the browser-based GUI (Pure Internet Architecture).
2. Navigate to **Main Menu, Set up HRMS, Foundation Tables**, followed by **Departments**.
   The Departments pane is displayed, as shown in Figure D–50.

![Departments Pane](image)

**Figure D–50  Departments Pane**

3. Click the **Add a New Value** tab, as shown in Figure D–51.
4. Enter the appropriate value in the SetID and Department fields.
5. Click Add.

The Department Profile tab is displayed, as shown in Figure D–52.

6. Provide the necessary information according to your requirements to create a new Department record.
7. Click Save at the bottom of the pane when you are finished.

**D.6.3 Verifying the Event Results**

This section describes how to verify the event results.

**Verifying the Results**

To verify the results:

1. Logon to PeopleSoft using the browser-based GUI (Pure Internet Architecture).
2. Navigate to **Main Menu**, **PeopleTools**, **Integration Broker**, **Service Operation Monitor**, followed by **Asynchronous Services**.

   The Monitor Overview tab is displayed, as shown in Figure D–53.

   **Figure D–53  Monitor Overview Tab**

   ![Monitor Overview Tab](image1)

   Here you can view the results of the events at the queue level.

3. Click the number link (5) queue (Enterprise_Setup) in the Result section.

   The Operation Instances tab is displayed, as shown in Figure D–54.

   **Figure D–54  Operation Instances Tab**

   ![Operation Instances Tab](image2)

   Notice that a new record for the event (department) is available.

4. Click the **Details** link on the lower-right.

   A new browser window (Asynchronous Details) is displayed, as shown in Figure D–55.
Notice that the status of the transaction is **DONE** for the Publishing and Subscriber nodes.
adapter
Provides universal connectivity by enabling an electronic interface to be accommodated (without loss of function) to another electronic interface.

agent
Supports service protocols in listeners and documents.

business service
Also known as a Web service. A Web service is a self-contained, modularized function that can be published and accessed across a network using open standards. It is the implementation of an interface by a component and is an executable entity.

channel
Represents configured connections to particular instances of back-end systems. A channel binds one or more event ports to a particular listener managed by an adapter.

listener
A component that accepts requests from client applications.

port
Associates a particular business object exposed by the adapter with a particular disposition. A disposition is a URL that defines the protocol and location of the event data. The port defines the end point of the event consumption.
