## Chapter 1

# Introducing the DB2 Universal Database eWay

This document describes how to install and configure the DB2 Universal Database eWay.

What's in This Chapter

- "About DB2 Universal Database" on page 7
- "About the DB2 Universal Database eWay" on page 8
- "About This Document" on page 8
- "Related Documents" on page 9
- "SeeBeyond Web Site" on page 9
- "Feedback" on page 10

## **1.1** About DB2 Universal Database

A database consists of a collection of information that is organized so that it can be easily accessed, managed, and updated. DB2 Universal Database is a database that handles the development and deployment of critical solutions such as:

- On demand business
- Business intelligence
- Content management
- Enterprise Resource Planning
- Customer Relationship Management

DB2 reduces the complexity of data management by eliminating, simplifying, and automating tasks associated with maintaining an enterprise-class database. It provides a foundation of information integration technologies, including federation, replication, Web services, and XML.

## 1.2 About the DB2 Universal Database eWay

The eWay enables eGate Integrator Projects to exchange data with external DB2 databases. This document describes how to install and configure the eWay.

*Note:* The DB2 Universal Database eWay connects to DB2 via the DataDirect driver which is packaged with the eWay.

## **About This Document**

This guide explains how to install, configure, and operate the SeeBeyond® Integrated Composite Application Network Suite<sup>TM</sup> (ICAN) DB2 eWay Intelligent Adapter, referred to as the DB2 eWay throughout this guide.

## 1.3.1 What's in This Document

This document includes the following chapters:

- **Chapter 1 "Introducing the DB2 Universal Database eWay":** Provides an overview description of the product as well as high-level information about this document.
- **Chapter 2 "Installing the eWay":** Describes the system requirements and provides instructions for installing the DB2 Universal Database eWay.
- **Chapter 3 "Configuring the DB2 eWay":** Provides instructions for configuring the eWay to communicate with your legacy systems.
- Chapter 4 "DB2 Wizard Operation": Provides information about .sag files and using the DB2 Universal Database wizard.
- **Chapter 5 "Implementing the DB2 eWay":** Provides instructions for installing and running the sample Projects.

## 1.3.2 **Scope**

This document describes the process of installing, configuring, and running the DB2 Universal Database eWay.

This document does not cover the Java methods exposed by this eWay. For information on the Java methods, download and view the DB2 Universal Database eWay Javadoc files from the Enterprise Manager.

## 1.3.3 Intended Audience

This guide is intended for experienced computer users who have the responsibility of helping to set up and maintain a fully functioning ICAN Suite system. This person must also understand any operating systems on which the ICAN Suite is to be installed (Windows or UNIX) and must be thoroughly familiar with Windows-style GUI operations.

## 1.3.4 **Document Conventions**

The following writing conventions are observed throughout this document.

Text	Convention	Example
Button, file, icon, parameter, variable, method, menu, and object names.	Bold text	<ul> <li>Click OK to save and close.</li> <li>From the File menu, select Exit.</li> <li>Select the logicalhost.exe file.</li> <li>Enter the timeout value.</li> <li>Use the getClassName() method.</li> <li>Configure the Inbound File eWay.</li> </ul>
Command line arguments and code samples	Fixed font. Variables are shown in <i>bold italic</i> .	bootstrap -p <b>password</b>
Hypertext links	Blue text	http://www.seebeyond.com

Table 1
 Writing Conventions

## 1.3.5 Screenshots

Depending on what products you have installed, and how they are configured, the screenshots in this document may differ from what you see on your system.

## 1.4 **Related Documents**

The following SeeBeyond documents provide additional information about the ICAN product suite:

- eGate Integrator User's Guide
- SeeBeyond ICAN Suite Installation Guide

## 1.5 SeeBeyond Web Site

The SeeBeyond Web site is your best source for up-to-the-minute product news and technical support information. The site's URL is:

http://www.seebeyond.com

## 1.6 Feedback

If you have any feedback on any SeeBeyond documentation, please send an E-mail to:

docfeedback@seebeyond.com

## **Chapter 2**

## Installing the eWay

This chapter describes how to install the DB2 Universal Database eWay.

What's in This Chapter

- "Supported Operating Systems" on page 11
- "System Requirements" on page 12
- "Supported External Applications" on page 12
- "Installing the eWay Product Files" on page 12
- "After You Install" on page 13

## 2.1 Supported Operating Systems

The DB2 Universal eWay is available on the following operating systems:

- Windows Server 2003, Windows XP, and Windows 2000
- HP Tru64 5.1A
- HP-UX 11.0, 11i (PA-RISC), and 11i v2.0 (11.23)
- IBM AIX 5.1L and 5.2
- Sun Solaris 8 and 9
- SuSE Linux Enterprise Server 8 (Intel x86)
- z/OS 1.3 and 1.4

Although the DB2 Universal Database eWay, the Repository, and Logical Hosts run on the platforms listed above, the Enterprise Designer requires the Windows operating system. For more information, see the *eGate Integrator User's Guide*.

#### 2.1.1 WebLogic and WebSphere Application Server Support

In addition to the operating systems listed above, this eWay is also supported on the following application servers:

- WebSphere Application Server, version 5.0
- WebLogic Application Server, version 8.1

These are limited to outbound mode using Java Collaborations. For additional information see the *eGate Integrator User's Guide*.

## 2.2 System Requirements

The system requirements for the DB2 eWay are the same as for eGate Integrator. For information, refer to the *ICAN Installation Guide*. It is also helpful to review the **Readme.txt** for any additional requirements prior to installation. The **Readme.txt** is located on the installation CD-ROM.

*Note:* To enable Web Services, you must install and configure the SeeBeyond ICAN Suite eInsight Business Process Manager.

## 2.3 Supported External Applications

The DB2 eWay supports the following software on external systems:

- DB2 Universal Database (UDB) version 8.1.
- DB2 Universal Database (UDB) version 7.1 when connecting to DB2 running on an OS/390 operating system when using DataDirect drivers.
- DB2 Universal Database (UDB) version V5R1 when connecting to DB2 running on an AS/400 operating system.

## 2.4 Installing the eWay Product Files

During the eGate Integrator installation process, the Enterprise Manager, a web-based application, is used to select and upload eWays (eWay.sar files) from the eGate installation CD-ROM to the Repository.

The installation process includes installing the following components:

- Installing the Repository
- Uploading products to the Repository
- Downloading components (such as Enterprise Designer and Logical Host)
- Viewing product information home pages

Follow the instructions for installing the eGate Integrator in the *ICAN Installation Guide*, and include the following steps:

• On the Enterprise Manager, select the **DB2eWay.sar** (to install the DB2 eWay) file to upload.

- On the Enterprise Manager, select the **FileeWay.sar** (to install the File eWay, used in the sample Project) file to upload.
- On the Enterprise Manager, install the **DB2eWayDocs.sar** (to install the documentation and the sample) file to upload.
- On the Enterprise Manager under the Documentation tab, click on the document link or the sample file link. It is recommended that you extract the sample project file to another location prior to importing it, using the Enterprise Explorer's Import Project tool.
- For additional information on how to use eGate, please see the *eGate Integrator Tutorial*.

Continue installing the eGate Enterprise Designer as instructed.

## 2.5 After You Install

Once the eWay is installed and configured it must then be incorporated into a Project before it can perform its intended functions. See the *eGate Integrator User's Guide* for more information on incorporating the eWay into an eGate Project.

## Configuring the DB2 eWay

This chapter describes how to set the properties of the DB2 eWay.

What's in This Chapter

- "Setting the Properties of the Inbound DB2 eWay on Windows or Unix Operating Systems" on page 15
- "Setting the Environment Properties of the Inbound DB2 eWay on Windows or Unix Operating Systems" on page 16
- "Setting the Properties of the Outbound DB2 eWay on Windows or Unix Operating Systems" on page 17
- "Setting the Environment Properties of the Outbound DB2 eWay on Windows or Unix Operating Systems" on page 20
- "Setting the Properties of the Inbound DB2 eWay Connecting to z/OS or and AS/400 Operating System" on page 23
- "Setting the Environment Properties of the Inbound DB2 eWay Connecting to z/OS or an AS/400 Operating Systems" on page 24
- "Setting the Properties of the Outbound DB2 eWay Connecting to z/OS or an AS/400 Operating System" on page 26
- "Setting the Environment Properties of the Outbound DB2 eWay Connecting to z/OS or an AS/400 Operating Systems" on page 28

## 3.1 Properties of DB2 eWay on Windows or Unix Operating Systems

The following parameter descriptions are used for you to enter the necessary information, on the Properties window, for the eWay to establish a connection to the external application.

## 3.1.1 Setting the Properties of the Inbound DB2 eWay on Windows or Unix Operating Systems

	Properties	۲
Configuration		
🖵 🗀 Parameter Settings	PollMilliseconds 5000	
	PreparedStatement	
[]		
Description (parameter-settings)		
Comments (parameter-settings)		
	Properties	
ок	Cancel	

#### PollMilliseconds

#### Description

Specifies the polling interval between database queries in milliseconds.

#### **Required Values**

A valid numeric value. The default is 5000.

#### PreparedStatement

#### Description

Specifies the Prepared Statement used to query the database.

#### **Required Values**

The Prepared Statement must be the same Prepared Statement you created using the Database OTD Wizard. Only the SELECT statement is allowed. Additionally, no placeholders should be specified and there should not be any "?" in the Prepared Query.

## 3.1.2 Setting the Environment Properties of the Inbound DB2 eWay on Windows or Unix Operating Systems

Properties 🛛 🗙			
Environment Configuration	¥ 12 🕸 🌾

	Properties		
ОК		Cancel	

#### DatabaseName

#### Description

Specifies the name of the database instance.

#### **Required Values**

Any valid string.

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

Any valid string.

#### PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 50000.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

Any valid string.

## 3.1.3. Setting the Properties of the Outbound DB2 eWay on Windows or Unix Operating Systems

The Property settings define the properties used to interact with the external database.

Properties			
Configuration			
DBC Connector settings	ClassName	com.SeeBeyond.jdbcx.db2.DB2DataSource	
	Description	DB2 Connection Pool Datasource	
	InitialPoolSize		
	LoginTimeOut		
	MaxIdleTime

Description (JDBCConnectorSetti			
JDBC Connector settings			
Comments (JDBCConnectorSetti			
	Properties		
ОК	·	Cancel	

Figure 1 The eWay Properties

#### ClassName

#### Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

#### **Required Values**

A valid class name.

The default is **com.SeeBeyond.jdbcx.db2.DB2DataSource**.

## Description

#### Description

Enter a description for the database.

#### **Required Values**

A valid string.

#### InitialPoolSize

#### Description

Enter a number for the physical connections the pool must contain when it is created.

#### **Required Values**

A valid numeric value.

#### LoginTimeOut

#### Description

The number of seconds driver waits before attempting to log in to the database before timing out.

#### **Required Values**

A valid numeric value.

#### MaxIdleTime

#### Description

The maximum number of seconds that a physical connection remains unused before it is closed. 0 (zero) indicates that there is no limit.

#### **Required Values**

A valid numeric value.

#### MaxPoolSize

#### Description

The maximum number of physical connections the pool must keep available at all times. 0 (zero) indicates that there is no maximum.

#### **Required Values**

A valid numeric value.

#### MaxStatements

#### Description

The maximum total number of statements that the pool must keep open. 0 (zero) indicates that the caching of statements is disabled.

#### **Required Values**

A valid numeric value.

#### MinPoolSize

The minimum number of physical connections the pool must keep available at all times. 0 (zero) indicates that there are no physical connections in the pool and new connections will be created as needed.

#### **Required Values**

A valid numeric value.

#### NetworkProtocol

#### Description

The network protocol used to communicate with the server.

#### **Required Values**

Any valid string.

#### PropertyCycle

#### Description

The interval, in seconds, that the pool must wait before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

#### **Required Values**

A valid numeric value.

19

#### RoleName

#### Description

An initial SQL role name.

#### **Required Values**

Any valid string.

## 3.1.4 Setting the Environment Properties of the Outbound DB2 eWay on Windows or Unix Operating Systems

Before deploying your eWay, you must set the properties of the eWay environment using the following descriptions.

Figure 2 Environment Settings of the Outbound DB2 eWay on Windows and Unix

	Properties	8
Environment Configuration	¥ 12 10 1/=	
JDBC Connector settings	DatabaseName	SAMPLE
	Delimiter	#
	Description	DB2 Connection Pool Datasource
	DriverProperties	
	Password	
	PortNumber	50000
	ServerName	
	User	db2admin
Description (JDBCConnectorSetti JDBC Connector settings Comments (JDBCConnectorSetti	Properties	
		Canad
ок		Cancel

#### DatabaseName

#### Description

Specifies the name of the database instance.

#### **Required Values**

Any valid string.

#### Delimiter

#### Description

This is the delimiter character to be used in the DriverProperties prompt.

#### **Required Values**

The default is #.

#### Description

#### Description

Enter a description for the database.

#### **Required Values**

A valid string.

#### **DriverProperties**

#### Description

Use the JDBC driver that is shipped with this eWay. If you need to set any additional properties to assure a connection, you can set them in the driver properties.

#### **Required Values**

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

*Note:* The setSpyAttributes, contained in the following examples (between the last set of double octothorps [##] within each example), are used for debugging purposes and need not be used on every occasion.

#### Windows & Unix example:

setURL#jdbc:Seebeyond:db2://<server>:50000;DatabaseName=<database>##setSpyAt
tributes#log=(file)c:/temp/spy.log;logTName=yes##

#### zOS & AS/400 example:

setURL#jdbc:SeeBeyond:db2://<server>:446;locationName=<location>;collectionId=<
collection>##setLocationName#<location>##setCollectionID#<collection>##setSpyAttr
ibutes#log=(file)c:/temp/spy.log;logTName=yes##

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

Any valid string.

#### PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 50000.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

Any valid string.

## 3.2 Properties of the DB2 eWay Connecting to z/OS or an AS/400 Operating System

The following parameter descriptions are used for you to enter the necessary information, on the Properties window, for the eWay to establish a connection to the external application.

## 3.2.1 Setting the Properties of the Inbound DB2 eWay Connecting to z/OS or and AS/400 Operating System

	Properties	×
Configuration		
└─ 🗀 Parameter Settings	PollMilliseconds 5000	٦
	PreparedStatement	
L]		
Description (parameter-settings)		
Comments (parameter-settings)		
	Properties	
ок	Cancel	

## PollMilliseconds

#### Description

Specifies the polling interval between database queries in milliseconds.

#### **Required Values**

A valid numeric value. The default is 5000.

#### PreparedStatement

#### Description

Specifies the Prepared Statement used to query the database.

#### **Required Values**

The Prepared Statement must be the same Prepared Statement you created using the Database OTD Wizard. Only the SELECT statement is allowed. Additionally, no placeholders should be specified, and there should not be any "?" in the Prepared Query.

## 3.2.2 Setting the Environment Properties of the Inbound DB2 eWay Connecting to z/OS or an AS/400 Operating Systems

	Properties		<b>X</b>
Environment Configuration	¥ [2 🕸 🌾		
Carameter Settings	CollectionId		
	LocationName		
	Password		
	PortNumber	446	
	ServerName		
:	User		
: Description (parameter-settings)			
Comments (parameter-settings)			
	Properties		
ок		Cancel	

## CollectionId

#### Description

Specifies the CollectionID for the DB2 database that is being used on AS400/zOS.

#### **Required Values**

Any valid String.

#### LocationName

#### Description

Specifies the Location Name for the DB2 database that is being used on AS400/zOS.

#### **Required Values**

Any valid String.

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

Any valid String.

#### PortNumber

#### Description

The TCP port number. PortNumber is used for DataSource connections only.

#### **Required Values**

Any valid String. The default port number is 446.

#### ServerName

#### Description

Specifies the name of the database server being used.

#### **Required Values**

Any valid String.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

Any valid String.

## 3.2.3 Setting the Properties of the Outbound DB2 eWay Connecting to z/OS or an AS/400 Operating System

	Pr	operties	
Configuration			
	ClassName	com.SeeBeyond.jdbcx.db2.DB2DataSource	
	Description	DB2 Datasource For AS400/zOS	
	InitialPoolSize

6	RoleName		
Description (JDBCConnectorSetti			
JDBC Connector settings			
Comments (JDBCConnectorSetti			
	Properties		
ок		Cancel	

Figure 3 Outbound DB2 eWay Connecting to an AS400

## ClassName

#### Description

Specifies the Java class in the JDBC driver that is used to implement the ConnectionPoolDataSource interface.

#### **Required Values**

A valid class name.

The default is **com.SeeBeyond.jdbcx.db2.DB2DataSource**.

## Description

#### Description

Enter a description for the database.

#### **Required Values**

A valid string.

## InitialPoolSize

#### Description

Enter a number for the physical connections the pool must contain when it is created.

#### **Required Values**

A valid numeric value.

#### LoginTimeOut

#### Description

The number of seconds the driver waits before attempting to log into the database before timing out.

#### **Required Values**

A valid numeric value.

#### MaxIdleTime

#### Description

The maximum number of seconds that a physical connection remains unused before it is closed. 0 (zero) indicates that there is no limit.

#### **Required Values**

A valid numeric value.

#### MaxPoolSize

#### Description

The maximum number of physical connections the pool keeps available at all times. 0 (zero) indicates that there is no maximum.

#### **Required Value**

A valid numeric value.

#### **MaxStatements**

#### Description

The maximum total number of statements that the pool keeps open. 0 (zero) indicates that the caching of statements is disabled.

#### **Required Values**

A valid numeric value.

## MinPoolSize

The minimum number of physical connections the pool keeps available at all times. 0 (zero) indicates that there should be no physical connections in the pool and the new connections should be created as needed.

#### **Required Values**

A valid numeric value.

#### NetworkProtocol

#### Description

The network protocol used to communicate with the server.

#### **Required Values**

Any valid string.

## PropertyCycle

#### Description

The interval, in seconds, that the pool waits before enforcing the current policy defined by the values of the other connection pool properties in this deployment descriptor.

#### **Required Values**

A valid numeric value.

#### RoleName

#### Description

An initial SQL role name.

#### **Required Values**

Any valid string.

## 3.2.4 Setting the Environment Properties of the Outbound DB2 eWay Connecting to z/OS or an AS/400 Operating Systems

Before deploying your eWay, you must set the properties of the eWay environment using the following descriptions.

#### Figure 4 Properties of the DB2 eWay Connecting to z/OS or an AS/400 Operating System

	Properties	8
Environment Configuration	¥ [2 [%  >=	
DBC Connector settings	CollectionID	
	Delimiter	#
	Description	DB2 Datasource For AS400/zOS
	DriverProperties	
	LocationName	
7	Password	
	PortNumber	446
	ServerName	
	User	
Description (JDBCConnectorSetti JDBC Connector settings Comments (JDBCConnectorSetti	Properties	
ок		Cancel

## CollectionID

#### Description

The collection or group of packages to which a package is bound.

#### **Required Values**

Any valid string.

#### Delimiter

#### Description

This is the delimiter character to be used in the DriverProperties prompt.

#### **Required Values**

The default is #.

#### Description

#### Description

Enter a description for the database.

#### **Required Values**

A valid string.

## **DriverProperties**

#### Description

Use the JDBC driver that is shipped with this eWay. If you need to set any additional properties to assure a connection, you can set them in the driver properties.

#### **Required Values**

Any valid delimiter.

Valid delimiters are: "<method-name-1>#<param-1>#<param-2>##......<param-n>##<method-name-2>#<param-1>#<param-2>#......<param-n>##......##".

For example: to execute the method setURL, give the method a String for the URL "setURL#<url>##".

If you are using Spy Log. Optional:

"setURL#jdbc:SeeBeyond:db2://<server>:446;locationName=<location>;collectionId=<collection>##setLocationName#<location>##setCollectionID#<collection>##setSpyAt tributes#log=(file)c:/temp/spy.log;logTName=yes##"

#### LocationName

#### Description

The name of the DB2 location that you want to access.

#### **Required Values**

Any valid string.

#### Password

#### Description

Specifies the password used to access the database.

#### **Required Values**

Any valid string.

#### PortNumber

#### Description

Specifies the I/O port number on which the server is listening for connection requests.

#### **Required Values**

A valid port number. The default is 446.

#### ServerName

#### Description

Specifies the host name of the external database server.

#### **Required Values**

Any valid string.

#### User

#### Description

Specifies the user name the eWay uses to connect to the database.

#### **Required Values**

Any valid string.

## **DB2 Wizard Operation**

This chapter describes how to use the DB2 eWay Database Wizard to build OTD's.

What's in This Chapter

- "Select Wizard Type" on page 32
- "Connect to Database" on page 33
- "Select Database Objects" on page 33
- "Select Table/Views" on page 34
- "Select Procedures" on page 38
- "Add Prepared Statements" on page 40
- "Specify the OTD Name" on page 42

## 4.1 Using the Database OTD Wizard

The Database OTD Wizard generates OTDs by connecting to external data sources and creating corresponding Object Type Definitions. The OTD Wizard can create OTDs based on any combination of Tables and Stored Procedures or Prepared SQL Statements.

Field nodes are added to the OTD based on the Tables in the external data source. Java method and parameter nodes are added to provide the appropriate JDBC functionality. For more information about the Java methods, refer to your JDBC developer's reference.

*Note:* Database OTD's are not messagable. For more information on messagable OTD's, see the eGate Integrator User's Guide.

#### Select Wizard Type

- 1 On the Enterprise Explorer, right click on the project and select **Create an Object Type Definition** from the shortcut menu.
- 2 From the OTD Wizard Selection window, select the **DB2 Database** and click **Next**. See **Figure 5**.

Steps	Select Wizard Type	
1. Select Wizard Type	OTD Wizard DB2 Database OTD NSSQL Database Sqlserver Database Sybase Database User-Defined OTD WSDL XSD	Description Uses a UDB database to create an OTD Uses a DTD to create an OTD Creates an OTD from NSSQL Database O Uses an Oracle database to create an OT Uses a SQLServer database to create an OT Allows the user to create a custom OTD Wizard for creating WSDL OTD Uses an XSD to create an OTD

SEEBEYOND	Host: testdb2.stc.com:50000

Select Table/Views

1 In the Select Tables/Views window, click Add (see Figure 8).

Figure 8 Select Tables/Views

Steps 1. Select Wizard Type	Select Tables/Views and specify Column information
Connectto Database     Select Database Objects     Select Tables/Views     Select Procedures     Add Prepared Statements     Specify the OTD Name     Review Selections	Name Catalog Schema Type
	Add Remove Description DB_EMPLOYEE:
	S columns selected.     Change Use fully-gualified table/view names in the generated Java code.

2 In the **Add Tables** window, select the type of criteria to be used for your search, consisting of table data, view only data, or both. You can include system tables in your search by selecting the checkbox.

<sup>3</sup> From the **Table/View Name** drop down list, select the location of your database table and click **Search** (see Figure 9). You can search for **Table/View Names** by entering a table name. The use of wildcard characters of '?', and '\*' as part of your Table/View name search allow for greater search capabilities. For example, "AB?CD" or "AB\*CD".

#### Figure 15 Procedure Parameters

- 5 To restore the data type, click **Restore**. When finished, click **OK**.
- 6 To select how you would like the OTD to generate the nodes for the Resultset click Edit **Resultsets**.
- 7 Click **Add** to add the type of Resultset node you would like to generate.

#### Figure 16 Edit Resultset

esultSets:		By Exe	_
ResultSet Name:		Manua Vvith A	iiy .ssistance
Index	Original Name Colun	nn Name	Туре

The DBWizard provides three different ways to generate the ResultSet nodes of a Stored Procedure. They are the "**By Executing**", "**Manually**", and "**With Assistance**" modes.

The "**By Executing**" mode executes the specified Stored Procedure with default values to generate the ResultSet(s). Depending on the business logic of the Stored Procedure, zero or more ResultSets can be returned from the execution. If there are multiple ResultSets and the "**By Executing**" mode does not return all ResultSets, one will use the other modes to generate the ResultSet nodes.

The "With Assistance" mode enables users to specify a query and execute it to generate the ResultSet node. To facilitate this operation, the DBWizard tries to retrieve the content of the specified Stored Procedure and display it. However, content retrieval is not supported by all types of Stored Procedures. We can roughly classify Stored Procedures into two types: SQL and external. SQL Stored Procedures are created using CREATE PROCEDURE SQL statements while external Stored Procedures are created using host languages (e.g. Java). Since external Stored Procedures do not store their execution plans in the database, content retrieval is impossible. When using the "Assist" mode, highlight the execute statement up to and including the table name(s) before executing the query.

The "**Manually**" mode is the most flexible way to generate the result set nodes. It enables users to specify the node name, original column name and data type manually. One drawback of this method is that users need to know the original column names and data types. This is not always possible. For example, the column name of 3\*C in this query.

SELECT A, B, 3\*C FROM table T

is generated by the database. In this case, the "With Assistance" mode is a better choice.

If you modify the ResultSet generated by the "Execute" mode of the Database Wizard you need to make sure the indexes match the Stored Procedure. This assures your ResultSet indexes are preserved.

8 On the Select Procedures and specify Resultset and Parameter Information window click Next to continue.

#### **Add Prepared Statements**

A Prepared Statement OTD represents a SQL statement that has been compiled. Fields in the OTD correspond to the input values that users need to provide.

Prepared statements can be used to perform insert, update, delete and query operations. A prepared statement uses a question mark (?) as a place holder for input. **For example**: insert into EMP\_TAB(Age, Name, Dept No) value(?, ?, ?)

To execute a prepared statement, set the input parameters and call **executeUpdate()** and specify the input values if any.

1 On the **Add Prepared Statements** window, click **Add**.

Steps	Add Prepared Statements	
1. Select Wizard Type 2. Connect to Database	Prepared Statements	
Select Database Objects     Select Tables/Views     Select Tables/Views     Select Procedures     Add Prepared Statements     Specify the OTD Name     Review Selections	Name     SQL Statement       Add     Edit	

#### Figure 17 Prepared Statement

<sup>2</sup> Enter the name of a Prepared Statement or create a SQL statement by clicking in the SQL Statement window. When finished creating the statement, click **Save As** giving the statement a name. This name appears as a node in the OTD. Click **OK** (see Figure 18).

## **Chapter 5**

# Implementing the DB2 eWay

This chapter discusses how to build a DB2 eWay project in a production environment.

What's in This Chapter

- "eInsight Engine and eGate Components" on page 44
- "Using the Sample Project in eInsight" on page 44
- "Using the Sample Project in eGate" on page 55
- "Common DataType Conversions" on page 58
- "Using OTDs with Tables, Views, Stored Procedures, and Prepared Statements" on page 60
- "Alerting and Logging" on page 76

## 5.1 elnsight Engine and eGate Components

You can deploy an eGate component as an Activity in an eInsight Business Process. Once you have associated the desired component with an Activity, the eInsight engine can invoke it using a Web Services interface. Examples of eGate components that can interface with eInsight in this way are:

- Java Messaging Service (JMS)
- Object Type Definitions (OTDs)
- An eWay
- Collaborations
- *Note:* For inbound BPEL Collaborations, use an eGate Scheduler. For more information on Schedulers see "eGate Integrator for eInsight Enterprise Service Bus Users Guide."

## 5.2 Using the Sample Project in elnsight

To begin using the sample eInsight Business Process project, you must import the project and view it from within the Enterprise Designer using the Enterprise Designer

Project Import utility. Import the **DB2\_sampleBPEL.zip** file contained in the eWay sample folder on the installation CD-ROM.

*Note:* eInsight is a Business Process modeling tool. If you have not purchased eInsight, contact your sales representative for information on how to do so.

Before recreating the sample Business Process, review the *eInsight Business Process Manager User's Guide* and the *eGate Integrator Tutorial*.

#### **Importing the Sample Project**

- 1 From Enterprise Designer's Project Explorer pane, right-click the Repository and select **Import**.
- 2 In the Import Manager window, browse to the directory that contains the sample Project zip files.

Sample Projects are contained within the zip file **DB2\_eWay\_Sample**, which is downloaded from the Repository to a folder of your choosing, (see **Installing the eWay** on page 11). Once downloaded, unzip the file and extract the following sample Projects:

- DB2\_sampleBPEL.zip
- DB2\_sampleJCE.zip
- 3 Select a sample Project zip file and click **Import**.
- 4 After importing the file, click **OK** on the Import Status window. You can now import another zip file, or click **Close** to exit the Import Manager window.

#### **The Business Process**

The data used for this sample project is contained within a table called DBEmployee. The table has the following columns:

Column Name	Mapping	Data Type	Data Length
EMPNO	EMPNO	char	6
FIRSTNME	FIRSTNME	varchar	12
MIDINIT	MIDINIT	char	1
LASTNAME	LASTNAME	varchar	15
WORKDEPT	WORKDEPT	char	3
PHONENO	PHONENO	char	4
HIREDATE	HIREDATE	date	4
JOB	JOB	char	8
EDLEVEL	EDLEVEL	smallint	2
SEX	SEX	char	1
BIRTHDATE	BIRTHDATE	date	4

 Table 2
 Sample Project Data

Column Name	Mapping	Data Type	Data Length
SALARY	SALARY	decimal	9
BONUS	BONUS	decimal	9
СОММ	СОММ	decimal	9

The sample project consists of an input file containing data that is passed into a database collaboration, and then written out to an output file

*Note: Refer to the eInsight Business Process Manager User's Guide for specific information on how to create and use a Business Process.* 

You can associate an elnsight Business Process Activity with the eWay, both during the system design phase and during run time. To make this association, select the desired **receive** or **write** operation under the eWay in the Enterprise Explorer and drag it onto the elnsight Business Process canvas. The following operations are available:

- SelectAll
- SelectMultiple
- SelectOne
- Insert
- Update
- Delete

The operation automatically changes to an Activity with an icon identifying the component that is the basis for the Activity.

At run time, the eInsight engine invokes each step in the order that you defined in the Business Process. Using the engine's Web Services interface, the Activity in turn invokes the DB2 eWay. You can open a file specified in the eWay and view its contents before and after the Business Process is executed.

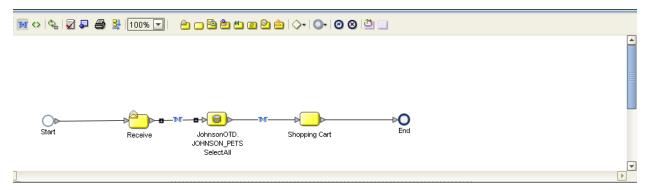

elnsight Operation	Input	Output
SelectAll	where() clause (optional)	Returns all rows that fit the condition of the where() clause
SelectMultiple	number of rows where() clause. Optional	Returns the number of rows specified that fit the condition of the where() clause
SelectOne	number of rows where() clause. Optional	Returns the first row that fits the condition of the where() clause
Insert	definition of new item to be inserted	Returns status.
Update	where() clause	Returns status.
Delete	where() clause	Returns status.

The table below shows the inputs and outputs to each of these eInsight operations:

## 5.2.1 SelectAll

The input to a SelectAll operation is an optional where() clause. The where() clause defines to which criteria rows must adhere to be returned. In the SelectAll operation, all items that fit the criteria are returned. If the where() clause is not specified, all rows are returned.

The figure below shows a sample eInsight Business Process using the SelectAll operation. In this process, the SelectAll operation returns all rows where the ITEM\_ID matches the selected ITEM\_ID to the shopping cart.

The figure below shows the definition of the where() clause for the SelectAll operation.

#### Figure 25 SelectAll Input

## 5.2.2 SelectMultiple

The input to a SelectMultiple operation is the number of rows to be selected and a where() clause. The number of rows indicates how many rows the SelectMultiple operation returns. The where() clause defines to which criteria rows must adhere to be returned.

The figure below shows a sample eInsight Business Process using the SelectMultiple operation. In this process, the SelectMultiple operation returns the first two rows where the ITEM\_ID matches the selected ITEM\_ID to the shopping cart.

The figure below shows the definition of the number of rows and where() clause into the input for the SelectMultiple operation. You could also use an empty string or Item\_ID='123'.

## 5.2.3 SelectOne

The input to a SelectOne operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the SelectOne operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the SelectOne operation. In this process, the SelectOne operation returns the first row where the ITEM\_ID matches the specified ITEM\_ID to the shopping cart.

Figure 30 SelectOne Sample Business Process

#### 5.2.4 Insert

The Insert operation inserts a row. The input to an Insert operation is a where() clause. The where() clause defines to which criteria rows must adhere to be selected for the operation. In the Insert operation, the first row that fits the criteria is returned.

The figure below shows a sample eInsight Business Process using the Insert operation. In this process, the operation inserts a new row into the database to accommodate a new item provided by a vendor.

## 5.2.5 Update

The Update operation updates rows that fit certain criteria defined in a where() clause.

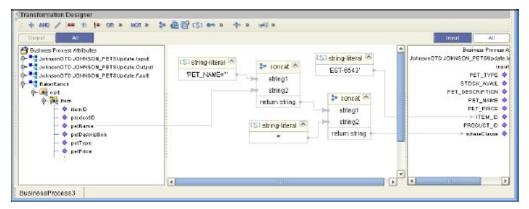

The figure below shows a sample eInsight Business Process using the Update operation. In this process, the operation updates the ITEM\_ID for all items with a certain name to ESR\_6543.

The figure below shows the definition of the where() clause for the Update operation.

Figure 37 Update Input

## 5.2.6 **Delete**

The Delete operation deletes rows that match the criteria defined in a where() clause. The output is a status of how many rows where deleted.

The figure below shows a sample eInsight Business Process using the Delete operation. In this process, the operation deletes rows with a certain product ID from the shopping cart.

*Note:* If a where() clause is not defined, all rows will be deleted.

Figure 39 Delete Sample Business Process

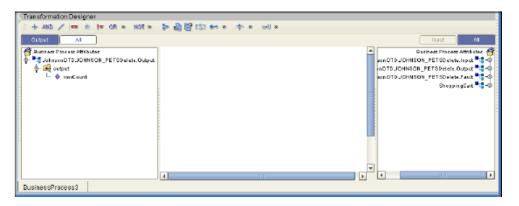

The figure below shows the definition of the where() clause for the Delete operation.

## 5.3 Using the Sample Project in eGate

To import the sample project **DB\_sampleJCE.zip** follow the instructions given in **Importing the Sample Project** on page 45.

## 5.3.1. Working with the Sample Project in eGate

This sample project selects columns from the table DBEmployee and publishes the record to an output file.

The data used for this projects is within a table called DBEmployee. The table contains the following columns:

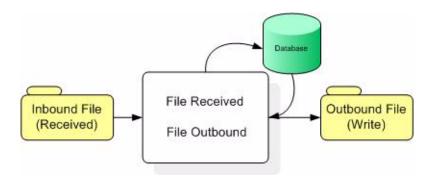

Column Name	Mapping	Data Type	Data Length		
empno	empno	char	6		

Table 3	Sample Pro	iect Data
Iable J	Jampie I IU	JUCI Data

Column Name	Mapping	Data Type	Data Length
FIRSTNME	FIRSTNME	varchar	12
MIDINIT	MIDINIT	char	1
LASTNAME	LASTNAME	varchar	15
WORKDEPT	WORKDEPT	char	3
PHONENO	PHONENO	char	4
HIREDATE	HIREDATE	date	4
JOB	JOB	char	8
EDLEVEL	EDLEVEL	smallint	2
SEX	SEX	char	1
BIRTHDATE	BIRTHDATE	date	4
SALARY	SALARY	decimal	9
BONUS	BONUS	decimal	9
СОММ	СОММ	decimal	9

The sample project consists of an input file containing data that is passed into a collaboration and out to the database from which data is retrieved and passed back into the collaboration and then to an output file.

Figure 42 Database project flow

To work with the sample project, follow the instructions given in the *eGate Integrator Tutorial*.

## 5.3.2. Configuring the eWays

The sample uses an inbound and an outbound File eWay as well as an outbound DB2 eWay. To configure the sample projects eWays, use the following information. For additional information on the DB2 properties, see **Properties of DB2 eWay on Windows or Unix Operating Systems** on page 14.

To configure the Inbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **File1** and **Service1**.
- 2 On the resulting **Templates** window, select **Inbound File eWay** and click **OK**.
- 3 On the **Properties** window, enter the appropriate configurations for the Inbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the DB2 eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between the **Service1** and **DB2** database.
- 2 On the resulting **Templates** window, select the required Outbound or Inbound DB2 connection, and click **OK**.
- 3 On the Properties window, enter the appropriate configurations for the Outbound DB2 eWay and click **OK**. See **Properties of DB2 eWay on Windows or Unix Operating Systems** on page 14. For this sample, the default settings are used.
- 4 When you have completed your selections, click **OK**.

To configure the Outbound File eWay:

- 1 On the Connectivity Map canvas, double click the eWay icon located between **Service1** and **File2** eWay.
- 2 On the resulting **Templates** window, select **Outbound File eWay** and click **OK**.
- 3 On the **Properties** window, enter the appropriate configurations for the Outbound File eWay. See the *File eWay User's Guide* for information on how to specifically configure the File eWay. For this sample, change the Directory field to **<valid path to the directory where the output file is stored>**. The Output File Name to **Output1.dat**. For the remaining parameters, the default settings are used.
- 4 When you have completed your selections, click **OK**.

## 5.3.3. Creating an External Environment

To review the components of the Sample project, there is an Inbound and an Outbound File eWay, an Inbound and an Outbound DB2 eWay, and a Service.

To create the external environment for the Sample project:

5 On the Environment Explorer, highlight and right-click the DB2 profile. Select Properties. Enter the configuration information required for your Outbound or Inbound DB2 eWay. See Properties of DB2 eWay on Windows or Unix Operating Systems on page 14.

## 5.3.4 **Deploying a Project**

To deploy a project, please see the "*eGate Integrators User's Guide*".

## 5.3.5. Running the Sample

For instruction on how to run the Sample project, see the *eGate Integrator Tutorial*.

Once the process has completed, the Output file in the target directory, configured in the Outbound File eWay, will contain all records retrieved from the database.

## 5.4 **Common DataType Conversions**

 Table 4
 The DB2 eWay Insert or Update Operations for Text/String Input Data

DB2 Data Type	OTD/Java Data Type	Java Method or New Constructor to Use (Default: Java Method)	Sample Data

Date	TimeStamp	Date: java.sql.Date.toString()	2003-09-04
Varchar2	String	Direct Assign	Any character
Char	String	Direct Assign	Any character

## 5.5 Using OTDs with Tables, Views, Stored Procedures, and Prepared Statements

Tables, Views, Stored Procedures, and Prepared Statements are manipulated through OTDs. Common operations include insert, delete, update, and query.

## 5.5.1 The Table

A table OTD represents a database table. It consists of fields and methods. Fields correspond to the columns of a table while methods are the operations that you can apply to the OTD. This enables you to perform query, update, insert, and delete SQL operations in a table.

By default, the Table OTD has UpdatableConcurrency and ScrollTypeForwardOnly. The type of result returned by the select() method can be specified using:

- SetConcurrencytoUpdatable
- SetConcurrencytoReadOnly
- SetScrollTypetoForwardOnly
- SetScrollTypetoScrollSensitive
- SetScrollTypetoInsensitive

The methods should be called before executing the select() method. For example,

```
getDBEmp().setConcurToUpdatable();
getDBEmp().setScroll_TypeToScrollSensitive();
getDBEmp().getDB_EMPLOYEE().select("");
```

## The Query Operation

To perform a query operation on a table

- 1 Execute the **select()** method with the "**where**" clause specified if necessary.
- 2 Loop through the ResultSet using the **next()** method.
- 3 Process the return record within a **while()** loop.

For example:

```
package SelectSales;
public class Select
{
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
    com.stc.connector.appconn.file.FileTextMessage
    input,com.stc.connector.appconn.file.FileApplication
    FileClient_1,db_employee.Db_employeeOTD
    db_employee_1,employeedb.Db_employee employeedb_db_employee_1 )
```

throws Throwable { //@map:Db\_employee.select(Text) db employee 1.getDb employee().select( input.getText() ); //while while (db\_employee\_1.getDb\_employee().next()) { //@map:Copy EMP\_NO to Employee\_no employeedb\_db\_employee\_1.setEmployee\_no( java.lang.Integer.toString( db\_employee\_1.getDb\_employee().getEMP\_NO() ) ); //@map:Copy LAST\_NAME to Employee\_lname employeedb\_db\_employee\_1.setEmployee\_lname( db\_employee\_1.getDb\_employee().getLAST\_NAME() ); //@map:Copy FIRST\_NAME to Employee\_fname employeedb\_db\_employee\_1.setEmployee\_fname( db\_employee\_1.getDb\_employee().getFIRST\_NAME() ); //@map:Copy RATE to Rate employeedb\_db\_employee\_1.setRate( java.lang.Double.toString( db\_employee\_1.getDb\_employee().getRATE() ) ); //@map:Copy LAST\_UPDATE to Update\_date employeedb\_db\_employee\_1.setUpdate\_date( db\_employee\_1.getDb\_employee().getLAST\_UPDATE().toString() ); //@map:Copy employeedb\_db\_employee\_1.marshalToString to Text FileClient\_1.setText( employeedb\_db\_employee\_1.marshalToString() ); //@map:FileClient\_1.write FileClient\_1.write(); } }

## The Insert Operation

To perform an insert operation on a table

- 1 Execute the **insert()** method. Assign a field.
- 2 Insert the row by calling **insertRow()**

This example inserts an employee record.

```
//DB_EMPLOYEE.insert
Table_OTD_1.getDB_EMPLOYEE().insert();
```

```
//Copy EMP_NO to EMP_NO
insert_DB_1.getInsert_new_employee().setEmployee_no(
java.lang.Integer.parseInt(
    employeedb_with_top_db_employee_1.getEmployee_no() ) );
//@map:Copy Employee_lname to Employee_Lname
insert_DB_1.getInsert_new_employee().setEmployee_Lname(
    employeedb_with_top_db_employee_1.getEmployee_lname() );
//@map:Copy Employee_fname to Employee_Fname
insert_DB_1.getInsert_new_employee().setEmployee_Fname(
    employeedb_with_top_db_employee().setEmployee_Fname(
    employeedb_with_top_db_employee().setEmployee_Fname(
    employeedb_with_top_db_employee_1.getEmployee_fname() );
```

```
//@map:Copy java.lang.Float.parseFloat(Rate) to Rate
insert_DB_1.getInsert_new_employee().setRate(
java.lang.Float.parseFloat(
employeedb_with_top_db_employee_1.getRate() ) );
//@map:Copy java.sql.Timestamp.valueOf(Update_date) to Update_date
insert_DB_1.getInsert_new_employee().setUpdate_date(
java.sql.Timestamp.valueOf(
employeedb_with_top_db_employee_1.getUpdate_date() ) );
Table_OTD_1.getDB_EMPLOYEE().insertRow();
//Table_OTD_1.commit
Table_OTD_1.commit();
}
```

## The Update Operation

To perform an update operation on a table

- 1 Execute the **update()** method.
- 2 Using a while loop together with **next()**, move to the row that you want to update.
- 3 Assign updating value(s) to the fields of the table OTD
- 4 Update the row by calling **updateRow()**.

```
//SalesOrders_with_top_SalesOrders_1.unmarshalFromString(Text)
 SalesOrders_with_top_SalesOrders_1.unmarshalFromString(
 input.getText() );
//SALES ORDERS.update("SO num =99")
 DB_sales_orders_1.getSALES_ORDERS().update( "SO_num ='01'" );
//while
 while (DB_sales_orders_1.getSALES_ORDERS().next()) {
//Copy SalesOrderNum to SO_num
 DB_sales_orders_1.getSALES_ORDERS().setSO_num(
 SalesOrders_with_top_SalesOrders_1.getSalesOrderNum() );
//Copy CustomerName to Cust_name
 DB_sales_orders_1.getSALES_ORDERS().setCust_name(
 SalesOrders_with_top_SalesOrders_1.getCustomerName() );
//Copy CustomerPhone to Cust_phone
 DB_sales_orders_1.getSALES_ORDERS().setCust_phone(
 SalesOrders_with_top_SalesOrders_1.getCustomerPhone() );
//SALES_ORDERS.updateRow
 DB_sales_orders_1.getSALES_ORDERS().updateRow();
}
//DB_sales_orders_1.commit
 DB_sales_orders_1.commit();
//Copy "Update completed" to Text
 FileClient_1.setText( "Update completed" );
//FileClient 1.write
 FileClient_1.write();
3
```

## The Delete Operation

To perform a delete operation on a table

1 Execute the **delete()** method.

In this example DELETE an employee.

```
//DB_EMPLOYEE.delete("EMP_NO = '".concat(EMP_NO).concat("'"))
Table_OTD_1.getDB_EMPLOYEE().delete( "EMP_NO = '".concat(
   employeedb_with_top_db_employee_1.getEMP_NO() ).concat( "'" ) );
}
```

## 5.5.2. Using Clobs

A Clob (Character Large Object) is a LOB datatype that has content consisting of character data in the database character set. The following describes how to Insert, Update, and Select Clobs using:

- Table OTD
- Prepared Statement OTD
- Procedure OTD

## Inserting a Clob using a Table OTD

To Insert a Clob using a Table OTD, you must:

1 Invoke "Select" to get the ResultSet.

```
//@map:TEST.select("")
TESTCLOB_1.getTEST().select("");
```

2 Move to a new row (to be inserted).

```
//@map:TEST.moveToInsertRow
TESTCLOB_1.getTEST().moveToInsertRow();
```

3 Set the values to the CLOB field.

```
//@map:Copy Text(java.lang.String) to TEXT
TESTCLOB_1.getTEST().setTEXT( input.getText() );
```

4 Insert the row.

```
//@map:TEST.insertRow
TESTCLOB_1.getTEST().insertRow();
```

#### The Complete JCE Code Appears as:

## Inserting a Clob using a Prepared Statement OTD

To Insert a Clob using a Prepared Statement OTD, you must:

1 Set the values to the Prepared Statement parameter.

```
//@map:Copy Text (java.lang.String) to Param1 (Clob Column)
InsertClobPrepStat_1.getInsertClobPrepStat().setParam1(
input.getText() );
```

2 Execute the Prepared Statement

```
//@map:InsertClobPrepStat.executeUpdate
InsertClobPrepStat_1.getInsertClobPrepStat().executeUpdate();
```

#### The Complete JCE Code Appears as:

```
public class CLOB_PREPSTAT_JCE
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
               input, insertClobPrepStat.InsertClobPrepStatOTD
InsertClobPrepStat_1 )
    throws Throwable
    {
        //@map:Copy Text to Param1
        InsertClobPrepStat_1.getInsertClobPrepStat().setParam1(
input.getText() );
        //@map:InsertClobPrepStat.executeUpdate
        InsertClobPrepStat_1.getInsertClobPrepStat().executeUpdate();
   }
}
```

## Inserting a Clob using a Stored Procedure OTD

To Insert a Clob using a Stored Procedure OTD, you must:

1 Set the values to the Stored Procedure OTD arguments.

```
//@map:Copy Text to CLOBVALUE
TEST_CLOB_STORED_PROC_1.getINSERTCLOB().setCLOBVALUE(
input.getText() );
```

2 Execute the Store procedure.

```
//@map:INSERTCLOB.execute
TEST_CLOB_STORED_PROC_1.getINSERTCLOB().execute();
```

#### The Complete JCE Code Appears as:

```
public class TESTCLOB_STOREDPROC
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
             input, tEST_CLOB_STORED_PROC.TEST_CLOB_STORED_PROCOTD
             TEST_CLOB_STORED_PROC_1 )
    throws Throwable
    {
        //@map:Copy Text to CLOBVALUE
        TEST_CLOB_STORED_PROC_1.getINSERTCLOB().setCLOBVALUE(
                                             input.getText() );
       //@map:INSERTCLOB.execute
        TEST_CLOB_STORED_PROC_1.getINSERTCLOB().execute();
   }
}
```

## Updating a Clob using a Table OTD

To Update a Clob using a Table OTD, you must:

1 Invoke "Select" to get the ResultSet.

```
//@map:TEST.select("")
TESTCLOB_1.getTEST().select( "" );
```

2 Move to the to-be-updated row.

```
//@map:TEST.next
TESTCLOB_1.getTEST().next();
```

3 Set the values to the CLOB field.

```
//@map:Copy Text(java.lang.String) to TEXT
TESTCLOB_1.getTEST().setTEXT( input.getText() );
```

4 Update the row.

```
//@map:TEST.insertRow
TESTCLOB_1.getTEST().updateRow();
```

#### The Complete JCE Code Appears as:

```
throws Throwable
{
    //@map:TEST.select("")
    TESTCLOB_1.getTEST().select( "" );
    //@map:TEST.next
    TESTCLOB_1.getTEST().next();
    //@map:Copy Text to TEXT
    TESTCLOB_1.getTEST().setTEXT( input.getText() );
    //@map:TEST.insertRow
    TESTCLOB_1.getTEST().updateRow();
}
```

# Updating a CLOB using a Stored Procedure or Prepared Statement OTD

Updating a CLOB using a Stored Procedure or Prepared Statement is similar to the procedures for Inserting a CLOB. For more information, see **"Inserting a Clob using a Prepared Statement OTD" on page 64** and **"Inserting a Clob using a Stored Procedure OTD" on page 64**.

## Selecting a Clob using a Table OTD

To Select a Clob using a Table OTD, you must:

1 Select desired Rows.

```
//@map:TEST.select("")
TESTCLOB_1.getTEST().select( "" );
```

2 Scroll to the desired row.

```
//@map:TEST.next
TESTCLOB_1.getTEST().next();
```

3 Declare a variable of type java.sql.Clob.

//@map:java.sql.Clob clobValue;
java.sql.Clob clobValue;

*Note:* The getXXX() method of the OTD returns the Clob as java.lang.Object. This needs to be converted to java.sql.Clob before fetching the actual value from the Field. A local variable must be declared to facilitate conversion.

To declare a variable of type java.sql.Clob, you must first:

A Open the Create a Variable window, as seen in Figure 43.

5 Declare the variable of type String.

//@map:String clobValueStr; String clobValueStr;

6 Fetch the Clob value to the String variable.

```
//@map:Copy SubString(1 ,cast clobValue.length to int) to
//clobValueStr
clobValueStr = clobValue.getSubString( 1,(int)clobValue.length() );
```

*Note:* When using the Business Rules Designer, you must add the cast prior to adding the length() method.

Figure 48 displays Fetching the Clob value to the String variable.

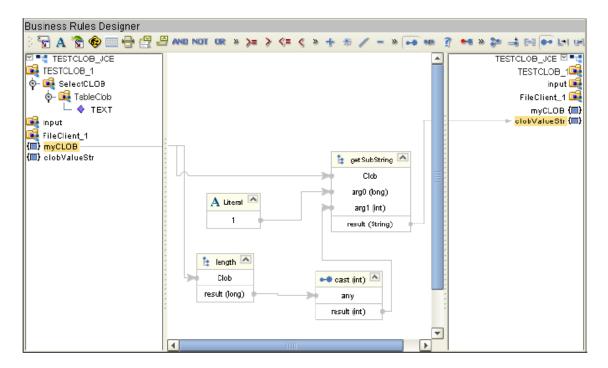

Figure 48 Copy the Clob Value to a String Variable

#### The Complete JCE Code Appears as:

```
public class TESTCLOB JCE
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
                input, tESTCLOB.TESTCLOBOTD TESTCLOB 1 )
    throws Throwable
    {
        //@map:TEST.select("")
        TESTCLOB_1.getTEST().select( "" );
        //@map:TEST.next
        TESTCLOB_1.getTEST().next();
        //@map:java.sql.Clob clobValue;
        java.sql.Clob clobValue;
        //@map:Copy cast TEXT to java.sql.Clob to clobValue
        clobValue = (java.sql.Clob) TESTCLOB_1.getTEST().getTEXT();
        //@map:String clobValueStr;
        String clobValueStr;
        //@map:Copy SubString(1 , cast clobValue.length to
        // int) to clobValueStr
        clobValueStr = clobValue.getSubString( 1,(int)
                                              clobValue.length() );
    }
}
```

## Selecting a Clob using a Prepared Statement

To Select a Clob using a Prepared Statement OTD, you must:

1 Execute the query.

```
//@map:SelectClobPrepStat.executeQuery
SelectClobPrepStat_1.getSelectClobPrepStat().executeQuery();
```

2 Declare the variable of type java.sql.Clob.

```
//@map:java.sql.Clob clobValue;
java.sql.Clob clobValue;
```

```
Note: The getXXX() method of the OTD resultSet returns the clob as java.lang.Object.
This needs to be converted to java.sql.Clob before fetching the actual value from the
Field. A local variable must be declared to facilitate conversion. For additional
details, see the figures found in Selecting a Clob using a Table OTD on page 66.
```

3 Convert (cast) and assign the value of the Clob field to the local variable.

```
//@map:Copy cast TEXT to java.sql.Clob to clobValue
//clobValue = (java.sql.Clob)
SelectClobPrepStat_1.getSelectClobPrepStat().
get$SelectClobPrepStatResults().getTEXT();
```

4 Declare the variable of type String

```
//@map:String clobValueStr;
String clobValueStr;
```

#### 5 Fetch the clob value to the String variable

```
//@map:Copy SubString(1 ,cast clobValue.length to int) to
//clobValueStr
clobValueStr = clobValue.getSubString( 1,(int)
clobValue.length() );
```

#### The Complete JCE Code Appears as:

```
public class SELECTCLOB_PREPSTAT_JCE
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
                     input, selectClobPrepStat.SelectClobPrepStatOTD
                     SelectClobPrepStat_1 )
    throws Throwable
    {
        //@map:SelectClobPrepStat.executeQuery
        SelectClobPrepStat_1.getSelectClobPrepStat().executeQuery();
        //while
        while
(SelectClobPrepStat_1.getSelectClobPrepStat().get$SelectClobPrepStatR
esults().next()) {
            //@map:java.sql.Clob clobValue;
            java.sql.Clob clobValue;
            //@map:Copy cast TEXT to java.sql.Clob to clobValue
            clobValue = (java.sql.Clob)
SelectClobPrepStat_1.getSelectClobPrepStat().get$SelectClobPrepStatRe
sults().getTEXT();
            //@map:String clobValueStr;
            String clobValueStr;
            //@map:Copy SubString(1,cast clobValue.length to int) to
clobValueStr
            clobValueStr = clobValue.getSubString( 1,(int)
clobValue.length() );
        }
    }
}
```

## 5.5.3 The Stored Procedure

A Stored Procedure OTD represents a database stored procedure. The OTD enables you to execute a stored procedure, with fields corresponding to the arguments of a stored procedure and methods representing the operations that you can apply. Remember that while in the Collaboration Editor you can drag and drop nodes from the OTD into the Collaboration Editor.

- *Note:* When creating a Package Stored Procedure in the Database Wizard, you must select *Use fully qualified names*.
- *Note: Stored Procedure Resultsets are supported in Java collaborations only.*

## **Executing Stored Procedures**

The OTD represents the Stored Procedure "LookUpGlobal" with two parameters, an inbound parameter (INLOCALID) and an outbound parameter (OUTGLOBALPRODUCTID). These inbound and outbound parameters are generated by the DataBase Wizard and are represented in the resulting OTD as nodes. Within the Transformation Designer, you can drag values from the input parameters, execute the call, collect data, and drag the values to the output parameters.

Below are the steps for executing the Stored Procedure:

- 1 Specify the input values.
- 2 Execute the Stored Procedure.
- 3 Retrieve the output parameters if any.

#### For example:

```
package Storedprocedure;
public class sp_jce
    public com.stc.codegen.logger.Logger logger;
    public com.stc.codegen.alerter.Alerter alerter;
    public void receive(
com.stc.connector.appconn.file.FileTextMessage
input, com.stc.connector.appconn.file.FileApplication
FileClient_1,employeedb.Db_employee
employeedb_with_top_db_employee_1,insert_DB.Insert_DBOTD insert_DB_1
)
    throws Throwable
    {
//@map:employeedb_with_top_db_employee_1.unmarshalFromString(Text)
        employeedb_with_top_db_employee_1.unmarshalFromString(
input.getText() );
        //@map:Copy java.lang.Integer.parseInt(Employee_no) to
Employee_no
        insert_DB_1.getInsert_new_employee().setEmployee_no(
java.lang.Integer.parseInt(
employeedb with top db employee 1.getEmployee no() ) );
        //@map:Copy Employee_lname to Employee_Lname
        insert_DB_1.getInsert_new_employee().setEmployee_Lname(
employeedb_with_top_db_employee_1.getEmployee_lname() );
        //@map:Copy Employee_fname to Employee_Fname
        insert_DB_1.getInsert_new_employee().setEmployee_Fname(
employeedb_with_top_db_employee_1.getEmployee_fname() );
        //@map:Copy java.lang.Float.parseFloat(Rate) to Rate
```

```
insert_DB_1.getInsert_new_employee().setRate(
java.lang.Float.parseFloat(
employeedb_with_top_db_employee_1.getRate() ) );
        //@map:Copy java.sql.Timestamp.valueOf(Update_date) to
Update_date
        insert_DB_1.getInsert_new_employee().setUpdate_date(
java.sql.Timestamp.valueOf(
employeedb_with_top_db_employee_1.getUpdate_date() ) );
        //@map:Insert_new_employee.execute
        insert_DB_1.getInsert_new_employee().execute();
        //@map:insert DB 1.commit
        insert_DB_1.commit();
        //@map:Copy "procedure executed" to Text
        FileClient_1.setText( "procedure executed" );
        //@map:FileClient 1.write
        FileClient_1.write();
    }
}
```

# Manipulating the ResultSet and Update Count Returned by Stored Procedure

For Stored Procedures that return ResultSets and Update Count, the following methods are provided to manipulate the ResultSet:

- enableResultSetOnly
- enableUpdateCountsOnly
- enableResultSetandUpdateCounts
- resultsAvailable
- next
- getUpdateCount
- available

DB2 stored procedures do not return records as ResultSets, instead, the records are returned through output reference cursor parameters. Reference Cursor parameters are essentially ResultSets.

The **resultsAvailable()** method, added to the OTD, simplifies the whole process of determining whether any results, be it update Counts or ResultSets, are available after a stored procedure has been executed. Although JDBC provides three methods **(getMoreResults(), getUpdateCount()**, and **getResultSet()**) to access the results of a stored procedure call, the information returned from these methods can be quite confusing to the inexperienced Java JDBC programmer and they also differ between vendors. You can simply call **resultsAvailable()** and if Boolean true is returned, you can expect either a valid Update Count when **getUpdateCount()** is called and/or the next ResultSet has been retrieved and made available to one of the ResultSet nodes defined for the Stored Procedure OTD, when that node's **available()** method returns true.

Update Counts information which is returned from Stored Procedures is often insignificant. You should process returned ResultSet information and avoid looping through all of the Update Counts. The following three methods control exactly what information is returned from a stored procedure call. The **enableResultSetsOnly()** method, added to the OTD allows only ResultSets to be returned and thus every **resultsAvailable()** called only returns Boolean true if a ResultSet is available. Likewise, the **enableUpdateCountsOnly()** method causes **resultsAvailable()** to return true only if an Update Count is available. The default case of the **enableResultSetsAndUpdateCount()** method allows both ResultSets and Update Counts to be returned.

*Note:* Because a Stored Procedure returns a Result set based on the input parameter, the execute method may not detect a result set in certain cases. If this occurs, you must use Manual mode.

#### Collaboration usability for a Stored Procedure ResultSet

The Column data of the ResultSets can be dragged-and-dropped from their OTD nodes to the Business Rules. Below is a code snippet that can be generated by the Collaboration Editor:

```
// resultsAvailable() true if there's an update count and/or a result
set available.
// note, it should not be called indiscriminantly because each time
the results pointer is
// advanced via getMoreResults() call.
while (getSPIn().getSpS_multi().resultsAvailable())
    // check if there's an update count
    if (getSPIn().getSpS_multi().getUpdateCount() > 0)
    {
        logger.info("Updated
"+getSPIn().getSpS_multi().getUpdateCount()+" rows");
    }
// each result set node has an available() method (similar to OTD's)
that tells the user
// whether this particular result set is available. note, JDBC does
support access to
// more than one result set at a time, i.e., cannot drag from 2
distinct result sets
// simultaneously
    if (getSPIn().getSpS multi().getNormRS().available())
    while (getSPIn().getSpS_multi().getNormRS().next())
    logger.info("Customer Id =
"+getSPIn().getSpS_multi().getNormRS().getCustomerId());
    logger.info("Customer Name =
"+getSPIn().getSpS_multi().getNormRS().getCustomerName());
    }
    if (getSPIn().getSpS_multi().getDbEmployee().available())
    while (getSPIn().getSpS_multi().getDbEmployee().next())
    logger.info("EMPNO =
"+getSPIn().getSpS_multi().getDbEmployee().getEMPNO());
    logger.info("ENAME =
"+getSPIn().getSpS_multi().getDbEmployee().getENAME());
```

```
logger.info("JOB =
"+getSPIn().getSpS_multi().getDbEmployee().getJOB());
logger.info("MGR =
"+getSPIn().getSpS_multi().getDbEmployee().getMGR());
logger.info("HIREDATE =
"+getSPIn().getSpS_multi().getDbEmployee().getHIREDATE());
logger.info("SAL =
"+getSPIn().getSpS_multi().getDbEmployee().getSAL());
logger.info("COMM =
"+getSPIn().getSpS_multi().getDbEmployee().getCOMM());
logger.info("DEPTNO =
"+getSPIn().getSpS_multi().getDbEmployee().getDEPTNO());
}
```

# *Note: resultsAvailable()* and *available()* cannot be indiscriminately called because each time they move ResultSet pointers to the appropriate locations.

After calling "**resultsAvailable(**)", the next result (if available) can be either a **ResultSet** or an **UpdateCount** if the default "**enableResultSetsAndUpdateCount(**)" was used.

Because of limitations imposed by some DBMSs, it is recommended that for maximum portability, all of the results in a ResultSet object should be retrieved before OUT parameters are retrieved. Therefore, you should retrieve all ResultSet(s) and update counts first followed by retrieving the OUT type parameters and return values.

The following list includes specific ResultSet behavior that you may encounter:

- The method **resultsAvailable()** implicitly calls **getMoreResults()** when it is called more than once. You should not call both methods in your java code. Doing so may result in skipped data from one of the ResultSets when more than one ResultSet is present.
- The methods **available()** and **getResultSet()** can not be used in conjunction with multiple ResultSets being open at the same time. Attempting to open more the one ResultSet at the same time closes the previous ResultSet. The recommended working pattern is:
  - Open one Result Set, ResultSet\_1 and work with the data until you have completed your modifications and updates. Open ResultSet\_2, (ResultSet\_1 is now closed) and modify. When you have completed your work in ResultSet\_2, open any additional ResultSets or close ResultSet\_2.
- If you modify the ResultSet generated by the Execute mode of the Database Wizard, you need to assure the indexes match the stored procedure. By doing this, your ResultSet indexes are preserved.
- Generally, getMoreResults does not need to be called. It is needed if you do not want to use our enhanced methods and you want to follow the traditional JDBC calls on your own.

## 5.6 Alerting and Logging

eGate provides an alerting and logging feature that allows for the monitoring of messages. This feature also captures any adverse messages, in order of severity, based on configured severity level and higher. To enable Logging, please see the *eGate Integrator User's Guide*.
