## Introduction

This chapter introduces you to this user's guide, its general purpose and scope, and its organization. It also provides sources of related documentation and information.

**Note:** For Java only: If you are upgrading from a previous version, all Collaborations that use ETDs from the EDIFACT ETD Library must be recompiled after you install this new version of the ETD Library.

# 1.1 User's Guide Purpose and Scope

This document acquaints you with the SeeBeyond Technology Corporation™ (SeeBeyond™) UN/EDIFACT ETD Library, which is a feature of the SeeBeyond e\*Gate Integrator system, and tells you how to install and use the UN/EDIFACT ETD Library.

This manual includes:

- Overview of UN/EDIFACT, including examples of a batch message and a segment table
- Procedures for installing UN/EDIFACT files and where to find them after installation
- Lists of sample file and directory names in the UN/EDIFACT ETD Library

**Important:** Any operation explanations given here are generic, for reference purposes only, and do not necessarily address the specifics of setting up and/or operating individual e\*Gate systems.

## 1.2 Intended Audience

The reader of this guide is presumed to be a developer or system administrator with responsibility for maintaining the e\*Gate system, to have moderate to advanced level knowledge of Windows operations and administration, and to be thoroughly familiar with Windows-style GUI operations.

## 1.3 **Document Organization**

This document is organized topically as follows:

- Chapter 1 "Introduction" gives a general preview of this document, its purpose, scope, and organization.
- Chapter 2 "Overview of UN/EDIFACT" provides an overview of UN/EDIFACT, including examples of a batch message and a segment table, along with additional information about their components, structure, and validation rules.
- Chapter 3 "UN/EDIFACT Template Installation" explains how to install UN/EDIFACT files and where to find them after installation.
- Chapter 4 "UN/EDIFACT ETD Library" lists sample file and directory names in the UN/EDIFACT ETD Library.

#### **Additional Conventions**

**Windows Systems** — The e\*Gate system is fully compliant with both Windows NT and Windows 2000 platforms. When this document references Windows, such statements apply to both platforms.

**UNIX Systems** — This guide uses the backslash ("\") as the separator within path names. If you are working on a UNIX system, please make the appropriate substitutions.

e\*Gate is fully compatible with Compaq Tru64 V4.0F, V5.0A, and V5.1A.

See the *e\*Insight eBusiness Integration Suite Primer* for a complete list of e\*Gate-related documentation. You can also refer to the appropriate Microsoft Windows or UNIX documents, if necessary.

## 1.4 SeeBeyond Web Site

The SeeBeyond Web site is your best source for up-to-the-minute product news and technical support information. The site's URL is:

http://www.seebeyond.com

## Overview of UN/EDIFACT

This chapter presents an overview of UN/EDIFACT, including examples of a batch message and a segment table, along with additional information about their components, structure, and validation rules.

## 2.1 UN/EDIFACT Components

UN/EDIFACT stands for United Nations/Electronic Data Interchange for Administration, Commerce and Transport. It is a standard, developed for the electronic exchange of machine-readable information between businesses.

The UN/EDIFACT Working Group (EWG) develops, maintains, interprets, and promotes the proper use of the UN/EDIFACT standard. UN/EDIFACT is broadly used in Europe and other parts of the world.

UN/EDIFACT messages are structured according to very strict rules. Messages are in ASCII format. The standard defines all these message elements, their sequence, and also their grouping.

The UN/EDIFACT ETD Library allows e\*Gate and e\*Xchange customers to easily visualize the structures within a graphical user interface and to build up business rules (Collaborations) through drag and drop technology.

#### **Monk ETD files**

Monk ETD (.ssc) files define the structure and syntax of message formats that are used to identify, validate, and translate message data content. An ETD library includes ETD files for industry standard message formats. The UN/EDIFACT ETD Library includes ETD files for all messages in UN/EDIFACT versions D95A through D01C.

In the UN/EDIFACT ETD Library, there is a separate subdirectory for each Monk version of UN/EDIFACT, for example: edifact\_d99a, edifact\_d99b. Each version directory contains all transaction sets for that version (for more information, see "ETD Libraries" on page 20). ETD files for segments contained in the transaction sets are in their own subdirectory, so the user can select from only the transaction sets, unless further drill-down is desired.

#### Java ETD files

Java ETD (.xsc) files define the structure and syntax of message formats that are used to identify, validate, and translate message data content. Java ETDs also contain .jar files, which function much like Zip files in that they compress and store Java .class files. The .class files support the .xsc structure (message, parsing, and validation). Java also uses a Standard Exchange Format (SEF) file, which allows users to add extra validation scripts.

Since Java ETDs function differently than the Monk ETDs, a separate UN/EDIFACT ETD Library, with separate subdirectories for each Java version of UN/EDIFACT must also be maintained, for example: edifact\_d99a, edifact\_d99b. Each version directory contains all transaction sets for that version.

#### Monk UN/EDIFACT messages

UN/EDIFACT publishes the messages for each version separately from the envelopes (header and trailer segments) that are used with those messages.

The messages are published on the Web at:

#### http://www.gefeg.com/en/standard/edifact/index.htm

The envelopes are published on the Web at:

#### http://www.gefeg.com/jswg/

A new version of UN/EDIFACT messages is released twice a year, containing most of the messages in the previous version, plus any new messages that have been approved by the standards organization. The envelopes are updated with a new version infrequently.

## Java UN/EDIFACT messages

Java uses a secondary UN/EDIFACT format that is different from the standard UN/EDIFACT format. The secondary format uses a SEF file, which has structure, as well as methods and functions that can act upon the message.

## 2.1.1 Message Structure

The term *message structure* (also called a transaction set structure) refers to the way in which data elements are organized and related to each other for a particular EDI transaction.

In e\*Gate, a message structure is called an Event Type Definition (ETD). Each message structure (ETD) consists of the following:

Physical hierarchy

The predefined way in which envelopes, segments, and data elements are organized to describe a particular UN/EDIFACT EDI transaction.

Delimiters

The specific predefined characters that are used to mark the beginning and end of envelopes, segments, and data elements.

#### Properties

The characteristics of a data element, such as the length of each element, default values, and indicators that specify attributes of a data element—for example, whether it is required, optional, or repeating.

For example, the transaction set structure of invoices that you send to trading partners defines the header, trailer, segment, and data element required by invoice transactions. Installation of UN/EDIFACT ETD Library templates for a specific version includes transaction set structures for each of the transactions available in that version. You can use these structures as provided, or customize them to suit your business needs.

e\*Gate uses the message structure to interpret the actual message coming in or going out. There is a message structure for each UN/EDIFACT transaction.

The list of transactions provided is different for each version of UN/EDIFACT.

## 2.1.2 Messages

As an example, Table 1 below lists the batch messages, along with their function, that are defined in version D00A:

**Table 1** Batch Messages Defined in Version D00A

Name	Function		
APERAK	Application error and acknowledgement message		
AUTHOR	Authorization message		
BALANC	Balance message		
BANSTA	Banking status message		
BAPLIE	Bayplan/stowage plan occupied and empty locations message		
BAPLTE	Bayplan/stowage plan total numbers message		
BERMAN	Berth management message		
BMISRM	Bulk marine inspection summary report message		
BOPBNK	Bank transactions and portfolio transactions report message		
BOPCUS	Balance of payment customer transaction report message		
BOPDIR	Direct balance of payment declaration message		
BOPINF	Balance of payment information from customer message		
BUSCRD	Business credit report message		
CALINF	Vessel call information message		
CASINT	Request for legal administration action in civil proceedings message		
CASRES	Legal administration response in civil proceedings message		
CHACCO	Chart of accounts message		
CLASET	Classification information set message		
CNTCND	Contractual conditions message		

 Table 1
 Batch Messages Defined in Version D00A (Continued)

Name	Function		
COACSU	Commercial account summary message		
COARRI	Container discharge/loading report message		
CODECO	Container gate-in/gate-out report message		
CODENO	Permit expiration/clearance ready notice message 5		
COEDOR	Container stock report message		
COHAOR	Container special handling order message		
COLREQ	Request for a documentary collection message		
COMDIS	Commercial dispute message		
CONAPW	Advice on pending works message		
CONDPV	Direct payment valuation message		
CONDRA	Drawing administration message		
CONDRO	Drawing organization message		
CONEST	Establishment of contract message		
CONITT	Invitation to tender message		
CONPVA	Payment valuation message		
CONQVA	Quantity valuation message		
CONRPW	Response of pending works message		
CONTEN	Tender message		
CONWQD	Work item quantity determination message		
COPAYM	Contributions for payment		
COPARN	Container announcement message		
COPINO	Container pre-notification message		
COPRAR	Container discharge/loading order message		
COREOR	Container release order message		
COSTCO	Container stuffing/stripping confirmation message		
COSTOR	Container stuffing/stripping order message		
CREADV	Credit advice message		
CREEXT	Extended credit advice message		
CREMUL	Multiple credit advice message		
CUSCAR	Customs cargo report message		
CUSDEC	Customs declaration message		
CUSEXP	Customs express consignment declaration message		
CUSPED	Periodic customs declaration message		
CUSREP	Customs conveyance report message		
CUSRES	Customs response message

```

The "S" column indicates whether the loop or segment is "M" (mandatory) or "C" (conditional).

The "R" column indicates the maximum number of repetitions of the segment or loop.

The "A"(A-umlaut) can be interpreted as a horizontal line; it indicates the first and last segments in a loop.

The "¿," "³," and "Ù" characters at the end of some lines indicate the first, continuing, and last segments of a loop respectively. Where there are more than one "³" at the end of a line, there are nested loops.

## 2.1.4 Loops

A loop consists of two or more data segments that contain a block of information (for example: company name, street address, mailing address, city, state, and zip code) that can repeat multiple times.

- Locate the fields by specifying:
  - Transaction set (for example, APERAK)
  - Loop (for example, segment group 1)
  - Which occurrence of the loop
  - Segment (for example, DOC)
  - Field number (for example, DOC00)
  - Which occurrence of the segment (if repeating)

## 2.1.5 Envelopes

UN/EDIFACT publishes the envelope segments in the separate syntax document with independent version numbers. For example, there is a version 3 and a version 4, either of which can be used with any version of the messages. v3 and v4 are two separate interchange envelope syntax versions, and do not dictate the message modes (batch and interactive). v3 is outdated and only handles batch messages, whereas v4 can handle batch or interactive messages.

**Note:** Interactive messages first appeared in the D96B message directory release.

X	12	ENVELOPE	VELOPE UN/EDIFACT UN/EDIFACT UN/EDIFACT UN/EDIFACT Interactive Mes			
start	end		start	end	start	end
ISA	IEA	Interchange Envelope	UNA/UNB	UNZ	UNA/UIB	UIZ
GS	GE	Functional Group Envelope	UNG	UNE	N/A	N/A
ST	SE	Message Envelope	UNH	UNT	UIH	UIT

**Table 2** X12-UN/EDIFACT Envelope Comparison

## **UNA** segment

All UN/EDIFACT message templates have a UNA segment, but these segments are optional and seldom used. The UNA segment can be found in the segment template in the 'template' subdirectory in case it is needed. It is used to send unusual delimiter characters.

The string has a mandatory fixed length of 9 characters. The first three are "UNA," immediately followed by the 6 characters as defined in ISO 9735.

The UNA segment template is a fixed length with segment ID = UNA, followed by 6 one-byte fields labelled "delimiter<n>."

## **Control messages**

Control messages (versus business messages) are also published separately with the syntax document. There is a **CONTRL** message for both v3 and v4 batch envelopes only.

Each version of the UN/EDIFACT ETD Library includes both a v3 **CONTRL** and a v4 **CONTRL** message. The user can select which one to use.

#### 2.1.6 **Delimiters**

Java

The delimiters in Java are dynamically set.

#### Monk

The structures in the Monk UN/EDIFACT ETD Library use the following default delimiters:

- Component = : (colon)
- Element = + (plus)
- Decimal = . (period)
- Release Mark = ? (question mark)
- Reserved for Future Use = \* (asterisk)

*Note:* The Reserved for Future Use delimiter is used for repetition.

Segment = ' (single quote)

In Monk, if you need different delimiters, open the message in the **ETD Editor** and choose the **File > Default Delimiters** menu option to change the delimiters.

## 2.1.7 ETD Libraries

The UN/EDIFACT ETD Library contains a separate sub-directory for each version of UN/EDIFACT, and within each version directory, all the segment templates are kept in a sub-directory. Because of this, the user only has to select from the messages, and not from the segments.

To search for Java files in directories

<egate>/server/registry/repository/default/etd/templates/edifact\_dnnn/v3 or

<egate>/server/registry/repository/default/etd/templates/edifact/edifact\_dnnn/v4

*Important:* The Java .xsc files are read only. You should not attempt to edit .xsc files.

If you need to make changes to a Java file (.xsc or .jar), modify the SEF file, which is a text file, and regenerate.

#### To Modify a SEF file

- 1 With the Java ETD Editor open, select **File > New**.
- 2 From the **New Event Type Definition** window choose the **SEFWizard** and click **OK**.
- 3 Step through the SEFWizard until the **SEF Wizard Step 1** dialog box appears.
  - A Select a SEF file, by either using the **Browse** button to locate an existing file or entering a new name in the **SEF File Name** box.
  - B In the **Optional Set Description File Name** box, use the **Browse** button to locate an existing description file or enter a new name in the box.
  - C In the **Optional SEC Description File Name** box, use the **Browse** button to locate an existing SEC file or enter a new name in the box.
  - D In the **Package Name** box, enter a package name for this SEF file; for example: **custominPackage**.
  - E To make SEF files more compact, they do not have descriptions. If you need information added to the node names, use the **Use Descriptive Node Names** radio buttons to add a description to the node names. The default is **Yes**.
  - F When satisfied with the information you have entered on this dialog box, click **Next**.
- 4 When the **SEF Wizard Step 2** dialog box appears, review the wizard's summary. If the information is correct, click **Finish** to generate an Event Type Definition and its associated Java classes.

*Note:* If the information is not correct, click *Back* to change your selections.

#### To search for Monk files in directories

<egate>/server/registry/repository/default/monk\_scripts/templates/edifact/edifact\_dnnn/v3

Of

<egate>/server/registry/repository/default/monk\_scripts/templates/edifact/edifact\_dnnn/v4

#### To edit Monk library structures

Open and "save as" to your schema, then cut unused segments.

#### 2.1.8 UN/EDIFACT Versus X12

Since the 1960s, more and more industries use EDI. Although some have invented their own sets of standardized data formats, the following sets are the accepted standards:

- ASC X12 is used within the United States
- UN/EDIFACT is used across international industries

## 2.1.9 **Security**

EDI-INT is an international standard for secure EDI transmissions, both UN/EDIFACT and X12. It is emerging as a widespread EDI security standard. It has the following features:

- Uses HTTP and PKI
- MIME and public key cryptography
- Many options

**Note:** This is only related to the data transmission and not to the parsing of the UN/EDIFACT message itself.

For additional information:

http://www.ietf.cnri.reston.va.us/ids.by.wg/ediint.html

# 2.2 Examples of EDI Usage

This section provides an overview of EDI payment processing, followed by a description of the types of EDI transactions, then examples of credit transfer scenarios.

**Note:** This is just an example of how UN/EDIFACT and payments processing is used. Not everything said here applies to all UN/EDIFACT messages.

## 2.2.1 Overview of EDI Payments Processing

EDI payments processing is a combination of collections and disbursements, with the processing taking the form of debits and credits. It can also include a related bank balance, as well as transaction and account analysis reporting mechanisms.

Most of the other EDI trading partner communications are handled either directly between the parties or indirectly through their respective value-added networks (VANs).

Making an electronic payment requires a financial intermediary, usually the bank or banks that hold deposit accounts of the two parties.

## **Exchange of remittance information**

EDI involves the exchange of remittance information along with the order to pay. In the United States this can become complex as two standards are involved in the transaction. Think of the remittance information as an electronic check stub, which can follow one of the following paths to complete the transaction:

- Directly between trading partners or through their respective EDI VAN mailboxes
- Through the banking system, with the beneficiary receiving notice from his bank

 By the originator to the originator's bank as an order to pay, which in turn reports to the beneficiary

## Routing of remittance information

The trading partners and the capabilities of their respective banks determine the routing of the electronic check stub, and whether the payment is a debit authorized by the payor and originated by the beneficiary or a credit transfer originated by the payor.

Other opportunities to exchange information between a bank and its customer include:

- Daily reports of balances and transactions
- Reports of lockbox and electronic funds transfer (EFT) remittances received by the bank
- Authorizations issued to the bank to honor debit transfers
- Monthly customer account analysis statements
- Account reconcilement statements
- Statements of the demand deposit account

## **Exchange of payment orders**

A subset of EDI, the electronic payment mechanism activates the exchange of payment orders; value transfers from one account to another, including the related remittance information in standardized machine-processable formats. The electronic payment can be either:

- Credit transfer, initiated by the payor
  - or
- Debit transfer, initiated by the payee as authorized by the payor

Regardless of how the credit transfer was initiated, the payor sends a payment order to its bank in one of two forms:

- X12 Payment Order/Remittance Advice (transaction set 820)
- UN/EDIFACT PAYEXT message

The bank then adds data in a format prescribed in the United States by the National Automated Clearing House Association (NACHA) and originates the payment through the Automated Clearing House (ACH) system.

## Functions a payment must perform

A corporate-to-corporate payment *must* perform two functions:

- Transfer value
- Move remittance data from the payor to the payee

When a credit transfer occurs, the mandatory functions raise the issue of how the funds and remittance information will travel, which is either:

Together through the banking system or

Separated and traveling by different routes

## Formats for transporting a payment

The X12 820 and the UN/EDIFACT PAYEXT are data formats for transporting a payment order from the originator to its bank. This payment order is either an:

- Instruction to the originator's bank to originate a credit transfer
- Instruction to its trading partner to originate a debit transfer against the payor's bank account

Once this decision has been made, the 820 or PAYEXT transports the remittance information to the beneficiary. As stated above, this transfer can either be through the banking system or via a route that is separate from the transport of funds.

**Note:** Whenever the 820 or PAYEXT remittance information is not transferred with the funds, the 820 or PAYEXT (information only) can be transmitted directly from the originator to the beneficiary. It can also be transmitted through an intermediary, such as a VAN.

## Issuance of a payment order

Before funds can be applied against an open accounts receivable, the beneficiary must reconcile the two streams—the payment advice from the receiving bank and the remittance information received through a separate channel—which were separated during the transfer. If this reconciliation does not take place and if the amount of funds received differs from the amount indicated in the remittance advice, the beneficiary's accounts receivable ledger will suffer from a multitude of problems.

The value transfer begins when the originator issues a payment order to the originator's bank. If a credit transfer is specified, the originator's bank charges the originator's bank account and pays the set sum to the beneficiary's bank for credit to the account of the beneficiary.

The originator becomes the same party as the beneficiary when the payment order specifies a debit transfer. When this happens, the beneficiary's bank originates the value transfer, the payor's account is debited (charged) for a set amount, which is credited to the originator's (beneficiary's) bank account. Either prior to or concurrent with a presentment of a debit transfer, the payor must issue approval to its bank to honor the debit transfer. This debit authorization or approval can take one of the following forms:

- Individual item approval
- Blanket approval of all incoming debits with an upper-dollar limit

- Blanket approval for a particular trading partner to originate any debit
- Some combination of the above

## 2.2.2 Payment-Related EDI Transactions

X12 and UN/EDIFACT route the Payment Order/Remittance Advice from the originator to the beneficiary in a different manner. X12 uses an end-to-end method whereas UN/EDIFACT uses a point-to-point method.

#### X12

X12 uses an end-to-end method to route the 820 Payment Order/Remittance Advice from the originator company through the banks to the beneficiary. The 820 is wrapped in an ACH banking transaction for the actual funds transfer between the banks. For an X12-UN/EDIFACT Payment Order/Remittance Advice comparison, see **Table 3 on page 25**. **Table 4 on page 26** lists other related X12-UN/EDIFACT transactions.

#### **UN/EDIFACT**

UN/EDIFACT uses different messages for each of these point-to-point transmissions, and separates the banking (Payment Order) function from the financial (Remittance Advice) function. This, in effect, creates the following distinct functions:

- The originator company uses the Payment Order to notify its bank that a funds transfer should take place (PAYEXT, PAYMUL).
- The originator company uses the Remittance Advice to notify the beneficiary of the payment (REMADV from originator, CREADV/DEBADV to beneficiary).
- The EFT actually moves the monetary value from one bank to another bank (ACH in the United States; SWIFT or CHIPS in Europe). For an X12-UN/EDIFACT Payment Order/Remittance Advice comparison, see Table 3 below. Table 4 lists other related X12-UN/EDIFACT transactions.

**Table 3** X12-UN/EDIFACT Payment Order/Remittance Advice Comparison

Step	X12	Description of Action	UN/EDIFACT	Step
1	820	Payment Order from originator to its bank	PAYEXT, PAYMUL	1
1	820	Remittance Advice from originator to be passed on to beneficiary	REMADV	2
2	820	Remittance advice to beneficiary	CREADV, Debadv	2
3	ACH containing 820	EFT between banks	SWIFT, CHIPS in Europe; ACH in the U.S.	3

**Table 4** Other Related Transactions

X12	Transaction	UN/EDIFACT
828	Debit Authorization	AUTHOR
829	Payment Cancellation Request	FINCAN
831	Application Control Totals	(none)

## 2.2.3 Understanding Enveloping Scenarios

We will use two credit transfer scenarios to give you a better understanding of the addressing issue:

- Point-to-point
- End-to-end

These scenarios involve two corporate trading partners and their respective banks:

- Company 1
- Company 2
- Bank 1
- Bank 2

Company 1 (the originator) issues a Payment Order (credit transfer) through Bank 1, which in turn routes the payment through the ACH to Bank 2 (the beneficiary's bank). Bank 2 then credits the account and passes the remittance details to its customer, Company 2 (the beneficiary).

Figure 1 Example Payment Scenario

Although trading partners prefer to consider this payment mechanism as an end-toend operation, the banking system's mechanism is actually a series of point-to-point transactions, mainly:

- From the originator to the originator's bank
- From the originator's bank to the beneficiary's bank
- From the beneficiary's bank to the beneficiary

In the 820 or PAYEXT, the identity of the originator, the originator's bank, the beneficiary's bank, and the beneficiary are established in the header of the transaction set (message) itself. Table 5, below, shows X12 and UN/EDIFACT headers.

X12 **UN/EDIFACT** Envelope start end start end **ISA IEA** Interchange Envelope UNA/ UNZ UNB GS GE **UNG** UNE Functional Group Envelope ST SE UNH Message Envelope UNT

 Table 5
 Sample X12 and UN/EDIFACT Headers

## Point-to-point scenario

In our example point-to-point scenario, the steps are as follows:

- 1 Company 1 sends a payment file to Bank 1 using an X12 ISA (or UN/EDIFACT UNB) interchange header in which:
- Sender ID = Company 1
- Receiver ID = Bank 1
- 2 Bank 1 replaces Company 1's ISA (UNB) with its own ISA as follows:
  - Sender ID = Bank 1
  - Receiver ID = Bank 2
- 3 Bank 2 receives the payment file, and creates a new ISA to send the contents to Company 2 that shows:
- Sender ID = Bank B
- Receiver ID = Company B

Because the interchange control header (ISA or UNB) changes at each point, it is important that the functional group header (X12 GS or UN/EDIFACT UNG) is not changed.

*Note:* The UN/EDIFACT functional group header (UNG) is optional.

Maintaining the functional group guarantees that the payment file retains the Company 2 information. As some originators do not care what happens to the original ISA, it is imperative that each bank in the chain ensure that the X12 GS contains 820s (or PAYEXTs) that are destined for only one Company 2. This rule makes it so that the banks only have to look at the ISA for addressing information, and the receiving company can respond with a Functional Acknowledgment (X12 997 or UN/EDIFACT CONTL) to the originator.

## **End-to-end scenario**

In our example end-to-end scenario, the steps are:

- 1 Company 1 sends a payment file to Bank 1 using an ISA in which:
- Sender ID = Company 1
- Receiver ID = Company 2
- 2 Bank 1 does not disturb the ISA, which continues to show:
  - Sender ID = Company 1
  - Receiver ID = Company 2
- 3 Bank 2 does not disturb the ISA, which continues to show:
  - Sender ID = Company 1
  - Receiver ID = Company 2

**Note:** Banks usually recommend end-to-end scenarios.

In this scenario, both the originator and the beneficiary's bank are prohibited from altering the ISA/IEA interchange envelope information. This makes it mandatory for the originating company to create an ISA envelope, and a separate transmission, for each destination end point. Unfortunately, this could potentially mean hundreds of such end points in each accounts payable cycle.

X12 recommends using the point-to-point addressing in the interchange header and end-to-end addressing in the functional group header.

SeeBeyond's EDI enveloping features in the e\*Xchange product automatically remove both the interchange and functional group envelopes and re-create the point-to-point envelopes. Special handling is required to override this default.

## 2.2.4 Payment Acknowledgments

The acknowledgment of the receipt of a payment order is an important issue. Most corporate originators want to receive at least a Functional Acknowledgment (CONTRL or 997) from the beneficiary of the payment. The CONTRL is created using the data about the identity and address of the originator found in the ISA and/or GS segments.

*Note:* In UN/EDIFACT, CONTRL is a point-to-point acknowledgment.

For examples of UN/EDIFACT and X12 acknowledgments, see Table 6.

**Table 6** Types of UN/EDIFACT and X12 Acknowledgments

UN/EDIFACT	Envelope	X12
CONTRL	System Level Acknowledgment (receipt)	TA1
CONTRL	Function Acknowledgment (point-to-point)	997
	Application Advice (end-to-end)	824

## 2.3 Implementation

This section discusses implementation in e\*Gate.

## 2.3.1 Implementation in e\*Gate

The five key terms of EDI processing logic are listed in Table 7 below. In order to be clear about the meaning of terms, we can distinguish five parts of EDI processing logic:

**Table 7** Key Terms of EDI Processing

Term	Description	Language Analogy	e*Gate Collaboration Scripts
Structures	Format, segments, loops	Syntax	ETD files or structures
Validations	Data contents "edit" rules	Semantics	Validation scripts
Translations	Re-formatting or conversion	Translation	Translation scripts
Enveloping	Header and trailer segments	Envelopes	Part of translation
Acks	Acknowledgments	Return receipt	e*Way scripts

The UN/EDIFACT ETD Library supplies UN/EDIFACT structures, that is, the first row in the above table. Other parts of the SeeBeyond product suite support the other functions.

*Note:* Translations are also known as mappings.

#### **Structures**

In e\*Gate, all UN/EDIFACT transactions for all UN/EDIFACT versions are pre-built and part of the UN/EDIFACT structure library.

#### Monk customization

To customize the Monk structure, use the e\*Gate Monk Event Type Definition Editor.

**Note:** For more information on the Monk Event Type Definition Editor, see the **e\*Gate Integrator User's Guide**.

#### Java customization

To customize the Java structure (for example: adding a segment or loop), you must use third party tools, such as the EDISIM tool (Foresight Corporation), to generate a SEF file. You would then use the e\*Gate Java Event Type Definition Editor and the SEFWizard to generate the .xsc and .jar files.

**Note:** For more information on the Java Event Type Definition Editor and the SEFWizard, see the **e\*Gate Integrator User's Guide**.

## Validations, translations, enveloping, and acknowledgments

e\*Gate does not contain any pre-built Monk validations, translations, enveloping, or acknowledgments. These scripts can be built in the Monk Collaboration Rules Editor graphical user interface (GUI), which provides a user-friendly drag-and-drop front end for creating Monk scripts.

e\*Gate does not contain any pre-built Java validations, translations, enveloping, or acknowledgments. These business rules can be built in the Java Collaboration Editor GUI, which provides a user-friendly drag-and-drop front end for creating Java business rules.

e\*Gate UN/EDIFACT Java ETDs have validations and translations, but a validation does not generate an acknowledgment transaction. Instead, it generates a string.

*Note:* In e\*Gate, translations are called Collaborations.

# **UN/EDIFACT Template Installation**

This chapter tells you how to install UN/EDIFACT files and where they are installed.

**Note:** For Java only: If you are upgrading from a previous version, all Collaborations that use ETDs from the EDIFACT ETD Library must be recompiled after you install this new version of the ETD Library.

# 3.1 Supported Operating Systems

The UN/EDIFACT ETD Library is available on the following operating systems:

- Windows 2000, Windows XP, and Windows Server 2003
- HP Tru64 V5.1A
- HP-UX 11.0 and HP-UX 11i (PA-RISC)
- IBM AIX 5.1L and AIX 5.2
- Red Hat Linux Advanced Server 2.1 (Intel *x*86)
- Sun Solaris 8 and Solaris 9
- Japanese Windows XP, Windows 2000, and Windows Server 2003
- Japanese HP-UX 11.0 and HP-UX 11i (PA-RISC)
- Japanese Solaris 8 and Solaris 9

## 3.2 System Requirements

To use the UN/EDIFACT ETD Library, you need the following:

- An e\*Gate Participating Host.
- A TCP/IP network connection.
- 1.79 GB of disk space to install all the UN/EDIFACT ETD Libraries. The Java libraries are very large; for example, approximately 175 MB is required to install the Java and Monk libraries for d01a.

**Note:** Additional disk space is required to process and queue the data that UN/EDIFACT processes; the amount necessary will vary based on the type and size of the data being processed.

## 3.2.1 External System Requirements

The UN/EDIFACT ETD Library supports the following external systems:

- EDIFACT\_d95a
- EDIFACT\_d95b
- EDIFACT\_d96a
- EDIFACT\_d96b
- EDIFACT\_d97a
- EDIFACT\_d97b
- EDIFACT\_d98a
- EDIFACT\_d98b
- EDIFACT\_d99a
- EDIFACT\_d99b
- EDIFACT\_d00a
- EDIFACT\_d00b
- EDIFACT\_d01a
- EDIFACT\_d01b
- EDIFACT\_d01c
- EDIFACT\_v3
- EDIFACT\_v4

**Note:** Normally UN/EDIFACT has two releases per year—one for the first half of the year and one for the second half. Each release comes out a month before the half-year. However, EDIFACT\_d02a was not ready for release in December 2001. In its place, EDIFACT\_d01c was released as an interim release.

## 3.3 Installing UN/EDIFACT ETD Templates

This section explains how to install the UN/EDIFACT ETD template files. Installing them performs the following:

- Installs the UN/EDIFACT add-on applications components.
- Installs add-on package files on the local client subdirectories and in the specified e\*Gate Registry Repository.
- Installs the Java and Monk template files only in the specified Registry.

The UN/EDIFACT Add-ons are located on two CD-ROMs:

UN/EDIFACT Templates Disc 1

UN/EDIFACT Templates Disc 2

Table 8 lists which UN/EDIFACT ETD Libraries are located on which CD-ROM.

 Table 8
 Location of UN/EDIFACT ETD Libraries on CD-ROMs

Disc 1		Disc 2	
EDIFACT_d95a	EDIFACT_d98a	EDIFACT_d00a	EDIFACT_V3
EDIFACT_d95b	EDIFACT_d98b	EDIFACT_d00b	EDIFACT_V4
EDIFACT_d96a	EDIFACT_d99a	EDIFACT_d01a	
EDIFACT_d96b	EDIFACT_d99b	EDIFACT_d01b	
EDIFACT_d97a	EDIFACT_V3	EDIFACT_d01c	
EDIFACT_d97b	EDIFACT_V4		

#### 3.3.1 Windows

#### **Before installation**

- Exit all Windows programs before running the setup program, including any anti-virus applications.
- You must have Administrator privileges to install this product.

## Installation procedure

#### To install the UN/EDIFACT ETD templates on Windows

- 1 Log on to the workstation on which you want to install the UN/EDIFACT templates.
- 2 Insert the installation CD-ROM into the CD-ROM drive.

*Note:* The UN/EDIFACT ETD Library add-ons can be found on UN/EDIFACT Templates Discs 1 and 2.

- 3 If the CD-ROM drive's Autorun feature is enabled, the setup application should launch automatically. Otherwise, use the Windows Explorer or the Control Panel's **Add/Remove Applications** feature to launch the file **setup.exe** on the CD-ROM drive.
- 4 The InstallShield setup application launches. Follow the on-screen instructions until you come to the **User Information** dialog box. Type your name and company name and then click **Next**.
- 5 When the **Please choose the product to install** dialog box appears, select the appropriate product and click **Next**.
- 6 The **Please choose the product to install** dialog box remains open with **Add-ons** selected. Click **Next**.

- 7 The Check Setup Information dialog box appears. Confirm your selections and click Next.
- 8 Follow the online prompts in the InstallShield Wizard to navigate through the introductory screens and to accept the license agreement.
- 9 When the **User Information** dialog box appears, type your name and company name, and then click **Next**.
- 10 The Choose Destination Location dialog box appears. The setup utility recommends the appropriate destination folder; we strongly recommend that you do not change the default. Click **Next**.

*Note:* Spaces are not valid characters in e\*Gate path names.

11 When the **Select Components** dialog box appears, highlight **ETD Libraries**, and then click **Change**. This allows you to select the UN/EDIFACT ETD templates that you want to install.

*Note:* Do not select the check box.

When the **Select Sub-components** dialog box appears, select the UN/EDIFACT ETD templates that you want to install. Each library (for example: EDIFACT ETD Library Version d01b) contains both the Java and the Monk templates. You must include the v3 and v4 templates.

Select Sub-components × Select the components you want to install, clear the components you do not want to install. Sub-components 0 K 🔼 EDIFACT ETD Library 4.5.3 Version d98a. □ EDIFACT ETD Library 4.5.3 Version d98b 0 K □ EDIFACT ETD Library 4.5.3 Version d99a 0 K If any UN/EDIFACT □ EDIFACT ETD Library 4.5.3 Version d99b 0 K template is selected, the ☑ EDIFACT ETD Library 4.5.3 Version v3 1728 K v3 and v4 templates must-☑ EDIFACT ETD Library 4.5.3 Version v4 143 K also be selected. Description-EDIFACT ETD Library Version v4 Space Required: 1872 K 3958020 K Space Available: Continue

Figure 2 Select Sub-components Dialog Box

**Note:** Select the various check boxes and look in the **Description** region to see exactly what that particular library holds.

You *must* install v3 and v4 because the information these envelopes hold is required for UN/EDIFACT messages. The UN/EDIFACT ETD Library Version v3 and v4 are two separate interchange envelope syntax versions (see "Existing v3 Envelope Names" on page 40), such as the header envelope that accompanies every UN/EDIFACT message. The v3 templates only handle batch messages while the v4 templates can handle batch or interactive messages. As they do not change over time, only one template library has been created for each of them.

For more information on enveloping UN/EDIFACT files, see the United Nations Web site under "Additional information" on page 37.

- 13 After making your selections, click **Continue**, as shown above. The **Select Components** dialog box reappears. Click **Next** to continue.
- 14 Some add-ons have dependencies. If you select an add-on with dependencies, the Check Add-ons Dependencies Information dialog box opens. It informs you of additional components that will be selected if you have not already selected them. To change any settings, click Back. If satisfied, click Next.
- 15 The **Select Program Folder** dialog box appears. Choose a program folder (the default is **SeeBeyond eBusiness Integration Suite**) and click **Next**.
- 16 When the **Check Setup Information** dialog box appears, confirm your selections and click **Next**.

Note: Be sure to install all of the template files in the suggested installation directory. The installation utility detects and suggests the appropriate installation directory.

Unless you are directed to do so by SeeBeyond support personnel, do not change the suggested installation directory setting.

- 17 When prompted for the Registry Host on which these add-ons should be installed, enter the Registry Host's name (if installing to a Distributed Registry system, enter the primary Registry Host's name) and click **Next**.
- 18 The **Administrator Account Information** dialog box appears.
  - In the **Username** box, type the name of the e\*Gate "Administrator" user. Unless you have created additional "administrative" accounts, use the default name **Administrator**.
  - In the **Password** and **Confirm** boxes, type and verify the appropriate password.

**Note:** e\*Gate user names and passwords are case-sensitive. For additional information on the Administrator and passwords, see the e\*Gate Integrator System **Administration and Operations Guide**.

When ready, click **Next**.

19 Select the platforms that the selected Registry Host(s) support and click **Next**. The installation utility begins installing add-on files and committing them to the e\*Gate Registry. The amount of time this process takes depends upon the number and size of add-ons you are installing.

20 Follow the on-screen prompts to complete the installation. Then repeat this process to install the UN/EDIFACT ETD Libraries that are located on the other CD-ROM. For details about e\*Gate installation, see the *SeeBeyond ICAN Suite Installation Guide*.

**Note:** After completing the installation, the install wizard prompts you to restart your computer. You must restart your computer before using e\*Gate. However, it is not necessary to restart your computer at this time.

#### 3.3.2 **UNIX**

When copying the generated files from Sun/UNIX to Windows, make sure the file names *remain lower-case*. Some Windows tools are particular about case conversions (for example, WinZip). File transfer protocol (FTP) does not have case problems.

**Note:** The basic installation procedure for Compaq Tru64 systems is essentially the same as installing the UN/EDIFACT templates on a UNIX system.

#### Before installation

You do not need root privileges to install the UN/EDIFACT ETD template libraries. Log in under the user name that you want to own the UN/EDIFACT ETD templates. Be sure that this user has sufficient privilege to create files in the e\*Gate directory tree.

## Installation procedure

To install the UN/EDIFACT ETD templates on a UNIX system

- 1 Log in on the workstation containing the CD-ROM drive, and insert the installation CD-ROM into the drive.
- 2 If necessary, mount the CD-ROM drive.
- 3 At the shell prompt, type:

#### cd /cdrom

4 Start the installation script by typing:

#### setup.sh

A menu of options appears.

- 5 Select the **e\*Gate Addon Applications** option.
- 6 Follow the rest of the on-screen instructions to install the UN/EDIFACT template files. For details about e\*Gate installation, see the *SeeBeyond ICAN Suite Installation Guide*.

Note: Be sure to install the template files in the suggested installation directory. The installation utility detects and suggests the appropriate installation directory.

Unless you are directed to do so by SeeBeyond support personnel, do not change the suggested installation directory setting.

#### Additional information

For more information, see the United Nations URL on the World Wide Web, dealing with the UN/EDIFACT standards. This Internet site is:

http://www.unece.org/trade/untdid/welcome.htm

Look under Section 5 in the left pane.

*Note:* These URL directions reflect the United Nations Web site setup at this publication. If the site has changed setup and/or URL, see the current United Nations home page for directions.

#### Files and Directories Created by the Installation 3.4

The UN/EDIFACT ETD templates installation on Windows places files within the e\*Gate directory tree, on the Participating Host and committed to the **default** schema on the Registry Host.

The UNIX installation places the files in the same path locations and directories as the Windows installation. All file names are also the same. For more information about the UN/EDIFACT ETD Library, see Chapter 4.

# **UN/EDIFACT** directories

UN/EDIFACT uses the term "directory" to refer to each version of the standard. This is not to be confused with the usual sense of file system 'directories' in the following discussion.

The e\*Gate UN/EDIFACT ETD Library is organized into subdirectories as follows: There is a parent directory for all UN/EDIFACT versions (for example, in Monk: eGate\Server\registry\repository\default\monk\_scripts\templates\edifact). Under that there is a directory for each version, such as edifact\_d95a, edifact\_d95b, ... edifact d01c, and so on. Under each version directory there are subdirectories for segment definitions and v3 and v4 envelopes. All messages are in the version directory, and all segments are in the templates directory, as illustrated in Table 9. In Java, the directory structure for the UN/EDIFACT versions is different than Monk (for example, in Java: eGate\Server\registry\repository\default\etd\templates\edifact). The Java UN/EDIFACT ETD directory structure is illustrated in Table 10 on page 39.

**Table 9** UN/EDIFACT ETD Library Directory Structure for Monk

Directories	Directory Contents	
edifact_d95a		
\templates	Segment definitions	
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d95b		
\templates	Segment definitions

edifact_v4			
CONTRL \templates	Control definitions v4 Envelope segment definitions		
"Cimplates	Transope segment demindons		

When message, segment, and envelope data elements are stored as files they are preceded by or appended with the following characters:

- Messages are appended with .ssc.
- Segments are preceded with es\_ and appended with .ssc.
- v3 and v4 control envelopes are appended with .ssc.
- v3 and v4 segment envelopes are preceded with **es**\_ and appended with **.ssc**.

To learn more about these specialized template files, open and examine them, using the ETD Editor feature in e\*Gate. For complete information on the purpose and function of each template, see the United Nations' World Wide Web site shown under "Additional information" on page 37.

 Table 10
 UN/EDIFACT ETD Library Directory Structure for Java

Directories	Directory Contents	
edifact_d95a		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d95b		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d96a		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d01a		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d01b		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	
edifact_d01c		
\v3	Batch messages using v3 envelope	
\v4	Batch and interactive messages using v4 envelope	

Java messages are stored as files with the following characters:

- Messages are appended with .xsc.
- Compressed Java class files are appended with .jar.

**Note:** When building Collaboration Rules scripts with Java ETDs, if there is data mapped to a field in a Java template and there are optional fields on the same level with no data mapped to them, the output will include delimiters for the optional fields.

# **UN/EDIFACT ETD Library**

This chapter lists sample file and directory names in the UN/EDIFACT ETD Library; it also describes how to test data in specific files.

# 4.1 UN/EDIFACT Files and Directories

This section introduces the different types of UN/EDIFACT data elements, the files that hold the elements, and the directories that contain the files in SeeBeyond's UN/EDIFACT ETD Library. It also provides links to the tables in this chapter that list the data elements and files alphabetically and gives a breakdown of the files in each directory.

# 4.1.1 UN/EDIFACT Batch, Interactive, and Envelope File Names

UN/EDIFACT message names all have six alphabetic characters, while UN/EDIFACT segment names are all three characters long.

UN/EDIFACT data has:

- Six-letter message names
- Three-letter segment names

The messages and segments must be combined with the v3 and v4 envelopes in order for an electronic computer-to-computer transmission of data to take place. Each of these data elements, along with their function, is listed alphabetically in the tables in this section.

# 4.1.2 Existing v3 Envelope Names

A v3 envelope only contains batch envelope segments. The v3 envelope file names do not change very often. See the following tables for a listing of the v3 envelope names and their functions:

- Figure 3 on page 41
- Table 11 on page 41
- Table 12 on page 41

*Note:* These envelopes can be used with any version of the UN/EDIFACT ETD messages.

The v3 header and trailer envelope segments have set locations within the EDI structure, and must appear in the order as shown below. The lines on the left side of the diagram show how headers and footers work in pairs (see Figure 3).

Figure 3 v3 Envelope Segments

**Table 11** v3 Control Message

v3 Control Message Name	v3 Control Message Function	
CONTRL	Syntactically acknowledges or rejects, with error indication, a received interchange, functional group, or message.

UNS	Section Control	

Table 12 v3 Batch Segments (Continued)

v3 Segment Name	v3 Segment Function	
UNT	Message Trailer	
UNZ	Interchange Trailer	

**Note:** UNA is optional and seldom used.

# 4.1.3 Existing v4 Envelope Names

A v4 envelope can have either batch or interactive envelope segments. For an interactive envelope to be used, one or more dialogues must occur either concurrently or sequentially between two or more parties. A dialogue consists of a pair of interleaved UN/EDIFACT interchanges:

- Initiator interchange
- Responder interchange

The v4 envelope file names do not change very often. See the following tables for a listing of the v4 batch and interactive envelope names and their functions:

- Figure 4 on page 43
- Figure 5 on page 43
- Table 13 on page 44
- Table 14 on page 44

*Note:* These envelopes can be used with any version of the UN/EDIFACT ETD messages.

The v4 batch header and trailer envelope segments have set locations within the EDI structure, and must appear in the order as shown below. The lines on the left side of the diagram show how headers and footers work in pairs (see Figure 4).

Figure 4 v4 Batch Envelope Segments

*Note:* The v4 batch envelope segments are the same as the v3 batch envelope segments.

The v4 interactive header and trailer envelope segments have set locations within the EDI structure, and must appear in the order as shown below. The lines on the left side of the diagram show how headers and footers work in pairs (see Figure 5).

Figure 5 v4 Interactive Envelope Segments

 Table 13
 v4 Control Message

v4 Control Message Name	v4 Control Message Function
AUTACK	Authentication function. Authenticates sent, or provides secure acknowledgment of received interchanges, groups, messages, or packages. It is sent by either the originator of at least one UN/EDIFACT structure or by a party authorized by the originator to act in its behalf.
	Acknowledgment function. An acknowledgment message sent by either the recipient of one or more secure UN/ EDIFACT structures or by a party authorized by the recipient to act in its behalf.
	Note that the acknowledgment function applies only to UN/EDIFACT structures that have been secured.
CONTRL (for batch EDI)	Syntactically acknowledges or rejects, with error indication, a received interchange, functional group, message, or package.
	<ul> <li>A maximum of two CONTRL messages, the first of which is optional, can be sent in response to a received interchange:</li> <li>After an interchange, the first message provides an indication of the receipt.</li> <li>After the syntax check of the subject interchange, the second message reports the action taken.</li> </ul>
KEYMAN	Provides certificate management and a security key. There are two types of keys:  • A secret key that is used with symmetric algorithms.  • A public or private key used with asymmetric algorithms.

**Note:** UNA is optional and seldom used.

# **Editors and Java Methods**

This chapter introduces the e\*Gate Event Type Definition (ETD) and Collaboration Rules Editors and how they are used in conjunction with UN/EDIFACT; it also lists the Java methods associated with UN/EDIFACT.

**Note:** For detailed information about the ETD and Collaboration Rules Editors, see the e\*Gate Integrator User's Guide.

# 5.1 Using the ETD Editor to View and Test an .xsc File

Use the Java ETD Editor (make sure that Java has been selected as the default editor) to load and view an .xsc file. You cannot edit the file; however, you can view the ETD's structure. In an UN/EDIFACT .xsc file, the elements always begin with an "E."

For example:

**E0001 1 SyntIden** (the first element of the composite "S001")

**Note:** If an item starts with a Loop in an .xsc file, it is a segment loop (for example: LoopRFF\_5\_Refe).

# To open an .xsc file

Remember, Java must be selected as the default editor.

- 1 In the ETD Editor, choose **File** and then click **Open**.
- 2 Navigate to the appropriate directory. For example: etd\templates\edifact\edifact\_d01a\v3
- 3 Select an .xsc file and click **Open**. See Figure 6.

**Note:** The root name of the node carries "Outer" on the end of it, the same value as was used in the command-line utility.

ETD Editor: EDF\_D01C\_BAPLTE\_BaypPlanTotaNumbMess.xsc (Sandbox) \_ | X <u>File</u> <u>E</u>dit <u>H</u>elp Event Type Properties -EDF\_D01C\_BAPLTE\_BaypPlanTotaNumbMessOuter EDF\_D01C\_BAPLTE\_BaypPlanTotaNumbMessOuter B EDF\_D01C\_BAPLTE\_B€ EDF\_D01C\_BAPLTE\_BaypPlanTotaNumbMessOute ⊞ ™® UNA ServStriAdvi ⊕ "C UNB\_InteHead modify voidMatch F childMax undefined ± UNZ\_InteTrai Internal Templates childMin undefined countSegments Bayplan/stowage plan total numbers message · reset available defaultValue next defaultBytes - receive defaultEncoding ASCII receive encoding send enumType ⊕ send false exact --- rawInput fixedValue topic format publications false group subscriptions inputMatch ---- marshal EDF\_D01C\_BAPLTE\_BaypPlanTotaNumbMessOuter javaName unmarshal јачаТуре com.stc.edifact v3 d01c.EDF D01C BAPLTE BaypF undefined length writeProperty lengthFrom undefined - validate External Templates lengthSize undefined ± S validate setDefaultEdifactDelimiters maxOccurs getSegmentTerminator member setSeamentTerminator minOccurs undefined ■ getElementSeparator offset setElementSeparator optional false getSubelementSeparator order sequence ± setSubelementSeparator override getRepetitionSeparator precedence reference scavOutput false scavenger structure CLASS ocal delimiters 8/28/2002 12 32 PM

**Figure 6** Example of an .xsc File in the ETD Editor

# To test Java and Monk ETDs against sample data using the Java and Monk ETD Editors

For information on how to test Java and Monk ETDs, see the *e\*Gate Integrator User's Guide*.

**Note:** Java ETDs of version 4.5.1 or earlier cannot be tested using the Java ETD Editor. If your ETDs are version 4.5.1 or earlier, see the **UN/EDIFACT ETD Library User's Guide**, release 4.5.1, for instructions on how to perform command-line based testing.

# 5.1.1 Delimiters in an .xsc File

UN/EDIFACT uses six delimiters. These delimiters, which the user can get and set from Java, are:

- Component data element separator
- Data element separator
- Decimal notation

- Release indicator
- Reserved for future use
- Segment terminator

To see an example of these elements, see the .xsc example shown in Figure 6 on page 47. For example: setDefaultEdifactDelimiters.

# 5.1.2 Using the Collaboration Rules Editor to Validate an .xsc file

The elements that are part of an .xsc file can be dragged and dropped when two or more .xsc files are opened in the Collaboration Rules Editor (see the *e\*Gate Integrator User's Guide* for more information). A field in the Source pane can be dragged to a field in the Destination Events pane. This action, when highlighted in the Business Rules pane, displays the rule in the Rule Properties pane.

The "validate" method nodes in an .xsc file can be used to validate an UN/EDIFACT message at run time. The methods return a string containing description(s) about any invalid data elements, segments, segment loops, envelopes, and so forth. Although validation should be used to ensure that data is good, be aware that validation significantly impacts performance.

# 5.1.3 Customizing a Java ETD

Currently SeeBeyond does not support the editing of pre-built Java ETDs. However, e\*Gate offers a feature that allows you to convert existing Monk ETDs (.ssc files) to Java-enabled ETDs (.xsc files). This feature is the SSC Wizard.

### To create a customized Java ETD

- 1 Create a corresponding Monk ETD, or use the Monk version of the Java ETD if available.
- 2 Customize the Monk ETD (.ssc file) using the e\*Gate ETD Editor.
- 3 Convert the Monk ETD to a Java ETD using the e\*Gate SSC Wizard.

When the conversion is done, you have three files:

- The original Monk ETD (.ssc file)
   Keep this file in case further customization is needed.
- The Java version of the ETD (.xsc file)
- The corresponding .jar file

If you need to make further changes to the ETD, make the changes in the .ssc file and run the conversion again.

For specific instructions on using the e\*Gate ETD Editor or the SSC Wizard, refer to the *e\*Gate Integrator User's Guide*.

# 5.2 UN/EDIFACT Java Methods

The templates in the UN/EDIFACT ETD Library contain the methods that allow you to set and get the delimiters, which in turn extend the functionality of the EDIFACT ETD Library.

# 5.2.1 Methods to Set or Get Delimiters

Each .xsc file (for example: com.stc.edifact\_v3\_d95B.EDF\_...Outer, which could represent

com.stc.edifact\_v3\_d95B.EDF\_D01A\_BAPLTE\_BaypPlanTotalNumbMessOuter) serves as the class for the following methods. Use these methods to set or get the default delimiters for each UN/EDIFACT ETD Template Library.

The com.stc.edifact\_v3\_d95B.EDF\_...Outer class extends com.stc.jcsre.EDFETDImpl and implements com.stc.jcsre.ETD.

The **com.stc.edifact\_v3\_d95B.EDF\_...Outer** methods are:

- setDefaultEdifactDelimiters on page 49
- getSegmentTerminator on page 50
- setSegmentTerminator on page 51
- getElementSeparator on page 51
- setElementSeparator on page 52
- getSubelementSeparator on page 52
- setSubelementSeparator on page 53
- getRepetitionSeparator on page 54
- setRepetitionSeparator on page 54

The UN/EDIFACT ETD Library also includes the following custom Java methods for testing the validation Collaboration:

- validate (no parameters) on page 55
- validate (one parameter) on page 55

# setDefaultEdifactDelimiters

#### Description

Sets the current delimiters to the default UN/EDIFACT delimiters:

```
segmentTerminator = '
elementSeparator = +
subelementSeparator = *
```

### **Syntax**

```
public void setDefaultEdifactDelimiters()
```

#### **Parameters**

None

#### setDefaultEdifactDelimiters Constants

None

#### Returns

Void

#### **Throws**

None

### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
myETD.setDefaultEdifactDelimiters();
```

# getSegmentTerminator

# Description

Gets the segmentTerminator character.

#### **Syntax**

```
public char getSegmentTerminator()
```

# **Parameters**

None

### getSegmentTerminator Constants

None

#### Returns

#### char

Returns the segment terminator character.

#### **Throws**

None

#### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char segTerm=myETD.getSegmentTerminator();
```

# set Segment Terminator

# Description

Sets the segmentTerminator character.

### **Syntax**

```
public void setSegmentTerminator(char c)
```

#### **Parameters**

Name	Туре	Description
С	char	The segmentTerminator character to be set.

# setSegmentTerminator Constants

None

**Returns** 

Void

**Throws** 

None

# **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char c='~';
myETD.setSegmentTerminator(c);
```

# get Element Separator

# Description

Gets the elementSeparator character.

#### **Syntax**

```
public char getElementSeparator()
```

#### **Parameters**

None

# getElementSeparator Constants

None

#### Returns

#### char

Returns the element separator character.

#### **Throws**

None

### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char elmSep=myETD.getElementSeparator();
```

# set Element Separator

# Description

Sets the elementSeparator character.

#### **Syntax**

```
public void setElementSeparator(char c);
```

#### **Parameters**

Name	Туре	Description
С	char	The elementSeparator character to be set.

# setElementSeparator Constants

None

#### **Returns**

Void

#### **Throws**

None

#### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char c='+';
myETD.setElementSeparator(c);
```

# getSubelementSeparator

# Description

Gets the subelementSeparator character.

#### **Syntax**

```
public char getSubelementSeparator()
```

#### **Parameters**

None

### getSubelementSeparator Constants

None

#### Returns

#### char

Returns the getSubelement character.

#### **Throws**

None

# **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char subeleSep=myETD.getSubelementSeparator();
```

# setSubelementSeparator

# Description

Sets the SubelementSeparator character.

# **Syntax**

```
public void setSubelementSeparator(char c)
```

#### **Parameters**

Name	Туре	Description
С	char	The SubelementSeparator character to be set.

# setSubelementSeparator Constants

None

### **Returns**

Void

#### **Throws**

None

# **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char c=':';
myETD.setSubelementSeparator(c);
```

# getRepetitionSeparator

# Description

Gets the RepetitionSeparator character.

#### **Syntax**

```
public char getRepetitionSeparator()
```

#### **Parameters**

None

# getRepetitionSeparator Constants

None

#### **Returns**

#### char

Returns the getRepetitionSeparator character.

### **Throws**

None

# **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char repSep=myETD.getRepetitionSeparator();
```

# set Repetition Separator

# Description

Sets the RepetitionSeparator character.

#### **Syntax**

```
public void setRepetitionSeparator(char c)
```

#### **Parameters**

Name	Туре	Description
С	char	The RepetitionSeparator character to be set.

# setRepetitionSeparator Constants

None

#### Returns

Void

#### **Throws**

None

### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
char c='*';
myETD.setRepetitionSeparator(c);
```

# validate (no parameters)

# Description

Validates the ETD content in memory.

#### **Syntax**

```
public java.lang.String validate()
```

#### **Parameters**

None.

#### validate Constants

None.

# Returns

#### java.lang.String

A description of the errors found in the data. If there are no errors, the string is null.

#### **Throws**

None.

#### **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
string msg=myETD.validate();
```

# validate (one parameter)

# Description

Validates the ETD content, either immediately after unmarshaling or in memory. When the parameter is false, this method works in the same way as validate (with no parameters). When the parameter is true, this can be used to validate length information in the input data file.

# **Syntax**

public String validate(boolean original)

#### **Parameters**

Name	Туре	Description
original	boolean	If true, validates the ETD content right after unmarshaling. If false, validates the ETD in memory.

#### validate Constants

None.

#### **Returns**

#### String

A description of the errors found in the data. If there are no errors, the string is null.

# **Throws**

None

# **Examples**

```
com.stc.edifact_v3_d95B.EDF_..._.Outer myETD=new com.stc.edifact_v3_d95B.
EDF_..._Outer();
.....
string msg=myETD.validate(true);
```
