Preface

Both novice users and those familiar with the SunOS operating system can use online man pages to obtain information about the system and its features. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

Overview

The following contains a brief description of each man page section and the information it references:

- Section 1 describes, in alphabetical order, commands available with the operating system.
- Section 1M describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.
- Section 2 describes all of the system calls. Most of these calls have one or more error returns. An error condition is indicated by an otherwise impossible returned value.
- Section 3 describes functions found in various libraries, other than those functions that directly invoke UNIX system primitives, which are described in Section 2.
- Section 4 outlines the formats of various files. The C structure declarations for the file formats are given where applicable.
- Section 5 contains miscellaneous documentation such as character-set tables.
- Section 6 contains available games and demos.
- Section 7 describes various special files that refer to specific hardware peripherals and device drivers. STREAMS software drivers, modules and the STREAMS-generic set of system calls are also described.
- Section 9 provides reference information needed to write device drivers in the kernel environment. It describes two device driver interface specifications: the Device Driver Interface (DDI) and the Driver/Kernel Interface (DKI).
- Section 9E describes the DDI/DKI, DDI-only, and DKI-only entry-point routines a developer can include in a device driver.
- Section 9F describes the kernel functions available for use by device drivers.
- Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section. See the `intro` pages for more information and detail about each section, and [man\(1\)](#) for more information about man pages in general.

NAME	This section gives the names of the commands or functions documented, followed by a brief description of what they do.								
SYNOPSIS	This section shows the syntax of commands or functions. When a command or file does not exist in the standard path, its full path name is shown. Options and arguments are alphabetized, with single letter arguments first, and options with arguments next, unless a different argument order is required. The following special characters are used in this section: <table><tr><td>[]</td><td>Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.</td></tr><tr><td>. . .</td><td>Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename...".</td></tr><tr><td> </td><td>Separator. Only one of the arguments separated by this character can be specified at a time.</td></tr><tr><td>{ }</td><td>Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.</td></tr></table>	[]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.	. . .	Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename...".		Separator. Only one of the arguments separated by this character can be specified at a time.	{ }	Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.
[]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.								
. . .	Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename...".								
	Separator. Only one of the arguments separated by this character can be specified at a time.								
{ }	Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.								
PROTOCOL	This section occurs only in subsection 3R to indicate the protocol description file.								
DESCRIPTION	This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss OPTIONS or cite EXAMPLES. Interactive commands, subcommands, requests, macros, and functions are described under USAGE.								
IOCTL	This section appears on pages in Section 7 only. Only the device class that supplies appropriate parameters to the ioctl(2) system call is called <code>ioctl</code> and generates its own								

	heading. <code>ioctl</code> calls for a specific device are listed alphabetically (on the man page for that specific device). <code>ioctl</code> calls are used for a particular class of devices all of which have an <code>io</code> ending, such as <code>mtio(7I)</code>.
OPTIONS	This section lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.
OPERANDS	This section lists the command operands and describes how they affect the actions of the command.
OUTPUT	This section describes the output – standard output, standard error, or output files – generated by the command.
RETURN VALUES	If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1, these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared void do not return values, so they are not discussed in RETURN VALUES.
ERRORS	On failure, most functions place an error code in the global variable <code>errno</code> indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the conditions that cause each error. When more than one condition can cause the same error, each condition is described in a separate paragraph under the error code.
USAGE	This section lists special rules, features, and commands that require in-depth explanations. The subsections listed here are used to explain built-in functionality: - Commands - Modifiers - Variables - Expressions - Input Grammar

EXAMPLES	This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command-line entry and machine response is shown. Whenever an example is given, the prompt is shown as <code>example%</code> , or if the user must be superuser, <code>example#</code> . Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS, and USAGE sections.
ENVIRONMENT VARIABLES	This section lists any environment variables that the command or function affects, followed by a brief description of the effect.
EXIT STATUS	This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion, and values other than zero for various error conditions.
FILES	This section lists all file names referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.
ATTRIBUTES	This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. See attributes(5) for more information.
SEE ALSO	This section lists references to other man pages, in-house documentation, and outside publications.
DIAGNOSTICS	This section lists diagnostic messages with a brief explanation of the condition causing the error.
WARNINGS	This section lists warnings about special conditions which could seriously affect your working conditions. This is not a list of diagnostics.
NOTES	This section lists additional information that does not belong anywhere else on the page. It takes the form of an aside to the user, covering points of special interest. Critical information is never covered here.
BUGS	This section describes known bugs and, wherever possible, suggests workarounds.

REFERENCE

Introduction

Name Intro – introduction to functions and libraries

Description This section describes functions found in various Solaris libraries, other than those functions described in Section 2 of this manual that directly invoke UNIX system primitives. Function declarations can be obtained from the `#include` files indicated on each page. Pages are grouped by library and are identified by the library name (or an abbreviation of the library name) after the section number. Collections of related libraries are grouped into six volumes as described below. A seventh volume (listed first) contains pages describing the contents of each shared library and each header used by the functions, macros, and external variables described in the remaining five volumes.

Library Interfaces and Headers This volume describes the contents of each shared library and each header used by functions, macros, and external variables described in the remaining six volumes.

(3LIB) The libraries described in this section are implemented as shared objects.

Descriptions of shared objects can include a definition of the global symbols that define the shared objects' public interface, for example `SUNW_1.1`. Other interfaces can exist within the shared object, for example `SUNWprivate.1.1`. The public interface provides a stable, committed set of symbols for application development. The private interfaces are for internal use only, and could change at any time.

(3LIBUCB) The SunOS/BSD Compatibility libraries described in this section are implemented as a shared object. See (3LIB) above.

(3HEAD) The headers described in this section are used by functions, macros, and external variables. Headers contain function prototypes, definitions of symbolic constants, common structures, preprocessor macros, and defined types. Each function described in the remaining five volumes specifies the headers that an application must include in order to use that function. In most cases only one header is required. These headers are present on an application development system; they do have to be present on the target execution system.

Basic Library Functions The functions described in this volume are the core C library functions that are basic to application development.

(3C) These functions, together with those of Section 2, constitute the standard C library, `libc`, which is automatically linked by the C compilation system. The standard C library is implemented as a shared object, `libc.so`. See [libc\(3LIB\)](#) and the “C Compilation System” chapter of the *ANSI C Programmer's Guide* for a discussion. Some functions behave differently in standard-conforming environments. This behavior is noted on the individual manual pages. See [standards\(5\)](#).

The `libpthread` and `libthread` libraries are filter libraries on `libc` that are used for building multithreaded applications: `libpthread` implements the POSIX (see [standards\(5\)](#)) threads interface, whereas `libthread` implements the Solaris threads interface. See MULTITHREADED APPLICATIONS, below.

- (3C_DB) These functions constitute the threads debugging library, `libc_db`. This library is implemented as a shared object, `libc_db.so`, but is not automatically linked by the C compilation system. Specify `-lc_db` on the `cc` command line to link with this library. See [libc_db\(3LIB\)](#).
- (3MALLOC) These functions constitute the various memory allocation libraries: `libmalloc`, `libbsdmalloc`, `libmapmalloc`, `libmtmalloc`, and `libumem`. Each of these libraries is implemented as a shared object (`libmalloc.so`, `libbsdmalloc.so`, `libmapmalloc.so`, `libmtmalloc.so`, and `libumem.so`). These libraries are not automatically linked by the C compilation system. Specify `-lmalloc`, `-lbsdmalloc`, `-lmapmalloc`, `-lmtmalloc`, and `-lumem` to link with, respectively, `libmalloc`, `libbsdmalloc`, `libmapmalloc`, `libmtmalloc`, and `libumem`. See [libmalloc\(3LIB\)](#), [libbsdmalloc\(3LIB\)](#), [libmapmalloc\(3LIB\)](#), [libmtmalloc\(3LIB\)](#), and [libumem\(3LIB\)](#).
- (3UCB) These functions constitute the source compatibility (with BSD functions) library. It is implemented as a shared object, `libucb.so`, but is not automatically linked by the C compilation system. Specify `-lucb` on the `cc` command line to link with this library, which is located in the `/usr/ucb` subdirectory. Headers for this library are located within `/usr/ucbinclude`. See [libucb\(3LIBUCB\)](#).

Networking Library Functions

The functions described in this volume comprise the various networking libraries.

- (3COMMPUTIL) These functions constitute the communication protocol parser utilities library, `libcommputil`. This library is implemented as a shared object, `libcommputil.so`, but it is not automatically linked by the C compilation system. Specify `-lcommputil` on the `cc` command line to link with this library. See [libcommputil\(3LIB\)](#).
- (3DLPI) These functions constitute the data link provider interface library, `libdlpi`. This library is implemented as a shared object, `libdlpi.so`, but it is not automatically linked by the C compilation system. Specify `-ldlpi` on the `cc` command line to link with this library. See [libdlpi\(3LIB\)](#).
- (3GSS) The functions in this library are the routines that comprise the generic security services API library. This library is implemented as a shared

object, `libgss.so`, but it is not automatically linked by the C compilation system. Specify `-lgss` on the `cc` command line to link with this library. See [libgss\(3LIB\)](#).

(3LDAP) These functions constitute the lightweight directory access protocol library, `libldap`. This library is implemented as a shared object, `libldap.so`, but is not automatically linked by the C compilation system. Specify `-lldap` on the `cc` command line to link with this library. See [ldap\(3LDAP\)](#).

(3NSL) These functions constitute the network service library, `libnsl`. This library is implemented as a shared object, `libnsl.so`, but is not automatically linked by the C compilation system. Specify `-lnsl` on the `cc` command line to link with this library. See [libnsl\(3LIB\)](#).

Many base networking functions are also available in the X/Open networking interfaces library, `libxnet`. See section (3XNET) below for more information on the `libxnet` interfaces.

(3RESOLV) These functions constitute the resolver library, `libresolv`. This library is implemented as a shared object, `libresolv.so`, but is not automatically linked by the C compilation system. Specify `-lresolv` on the `cc` command line to link with this library. See [libresolv\(3LIB\)](#).

(3RPC) These functions constitute the remote procedure call libraries, `librpcsvc` and `librpcsoc`. The latter is provided for compatibility only; new applications should not link to it. Both libraries are implemented as shared objects, `librpcsvc.so` and `librpcsoc.so`, respectively. Neither library is automatically linked by the C compilation system. Specify `-lrpcsvc` or `-lrpcsoc` on the `cc` command line to link with these libraries. See [librpcsvc\(3LIB\)](#) and [librpcsoc\(3LIBUCB\)](#).

(3SASL) These functions constitute the simple authentication and security layer library, `libsasl`. This library is implemented as a shared object, `libsasl.so`, but it is not automatically linked by the C compilation system. Specify `-lsasl` on the `cc` command line to link with this library. See [libsasl\(3LIB\)](#).

(3SIP) These functions constitute the session initiation protocol library, `libsip`. This library is implemented as a shared object, `libsip.so`, but it is not automatically linked by the C compilation system. Specify `-lsip` on the `cc` command line to link with this library. See [libsip\(3LIB\)](#).

(3SLP) These functions constitute the service location protocol library, `libslp`. This library is implemented as a shared object, `libslp.so`, but it is not automatically linked by the C compilation system. Specify `-lslp` on the `cc` command line to link with this library. See [libslp\(3LIB\)](#).

- (3SOCKET) These functions constitute the sockets library, `libsocket`. This library is implemented as a shared object, `libsocket.so`, but is not automatically linked by the C compilation system. Specify `-lsocket` on the `cc` command line to link with this library. See [libsocket\(3LIB\)](#).
- (3XNET) These functions constitute X/Open networking interfaces which comply with the X/Open CAE Specification, Networking Services, Issue 4 (September, 1994). This library is implemented as a shared object, `libxnet.so`, but is not automatically linked by the C compilation system. Specify `-lxnet` on the `cc` command line to link with this library. See [libxnet\(3LIB\)](#) and [standards\(5\)](#) for compilation information.

Under all circumstances, the use of the Sockets API is recommended over the XTI and TLI APIs. If portability to other XPGV4v2 (see [standards\(5\)](#)) systems is a requirement, the application must use the `libxnet` interfaces. If portability is not required, the sockets interfaces in `libsocket` and `libnsl` are recommended over those in `libxnet`. Between the XTI and TLI APIs, the XTI interfaces (available with `libxnet`) are recommended over the TLI interfaces (available with `libnsl`).

Curses Library Functions

The functions described in this volume comprise the libraries that provide graphics and character screen updating capabilities.

- (3CURSES) The functions constitute the following libraries:
- `libcurses` These functions constitute the curses library, `libcurses`. This library is implemented as a shared object, `libcurses.so`, but is not automatically linked by the C compilation system. Specify `-lcurses` on the `cc` command line to link with this library. See [libcurses\(3LIB\)](#).
 - `libform` These functions constitute the forms library, `libform`. This library is implemented as a shared object, `libform.so`, but is not automatically linked by the C compilation system. Specify `-lform` on the `cc` command line to link with this library. See [libform\(3LIB\)](#).
 - `libmenu` These functions constitute the menus library, `libmenu`. This library is implemented as a shared object, `libmenu.so`, but is not automatically linked by the C compilation system. Specify `-lmenu` on the `cc` command line to link with this library. See [libmenu\(3LIB\)](#).
 - `libpanel` These functions constitute the panels library, `libpanel`. This library is implemented as a shared

object, `libpanel.so`, but is not automatically linked by the C compilation system. Specify `-lpanel` on the `cc` command line to link with this library. See [libpanel\(3LIB\)](#).

(3PLOT) These functions constitute the graphics library, `libplot`. This library is implemented as a shared object, `libplot.so`, but is not automatically linked by the C compilation system. Specify `-lplot` on the `cc` command line to link with this library. See [libplot\(3LIB\)](#).

(3XCURSES) These functions constitute the X/Open curses library, located in `/usr/xpg4/lib/libcurses.so`. This library provides a set of internationalized functions and macros for creating and modifying input and output to a terminal screen. Included in this library are functions for creating windows, highlighting text, writing to the screen, reading from user input, and moving the cursor. X/Open Curses is designed to optimize screen update activities. The X/Open Curses library conforms fully with Issue 4 of the X/Open Extended Curses specification. See [libcurses\(3XCURSES\)](#).

Realtime Library Functions The functions described in this volume constitute the realtime libraries.

(3AIO) These functions constitute the asynchronous I/O library, `liaio`. This library is implemented as a shared object, `libaio.so`, but is not automatically linked by the C compilation system. Specify `-laio` on the `cc` command line to link with this library. See [libaio\(3LIB\)](#).

(3RT) These functions constitute the POSIX.4 realtime library, `librt`. It is implemented as a shared object, `librt.so`, but is not automatically linked by the C compilation system. Specify `-lrt` on the `cc` command line to link with this library. Note that the former name for this library, `libposix4`, is maintained for backward compatibility but should be avoided. See [librt\(3LIB\)](#).

Extended Library Functions The functions described in this volume comprise various specialized libraries that are not limited to the following:

(3BSM) These functions constitute the basic security library, `libbsm`. This library is implemented as a shared object, `libbsm.so`, but is not automatically linked by the C compilation system. Specify `-libsm` on the `cc` command line to link with this library. See [libbsm\(3LIB\)](#).

(3CFGADM) These functions constitute the configuration administration library, `libcfgadm`. This library is implemented as a shared object, `libcfgadm.so`, but is not automatically linked by the C compilation system. Specify `-lcfgadm` on the `cc` command line to link with this library. See [libcfgadm\(3LIB\)](#).

- (3CONTRACT) These functions constitute the contract management library, `libcontract`. This library is implemented as a shared object, `libcontract.so`, but is not automatically linked by the C compilation system. Specify `-lcontract` on the `cc` command line to link with this library. See [libcontract\(3LIB\)](#).
- (3CPC) These functions constitute the CPU performance counter library, `libcpc`, and the process context library, `libpctx`. These libraries are implemented as shared objects, `libcpc.so` and `libpctx.so`, respectively, but are not automatically linked by the C compilation system. Specify `-lcpc` or `-lpctx` on the `cc` command line to link with these libraries. See [libcpc\(3LIB\)](#) and [libpctx\(3LIB\)](#).
- (3DAT) These functions constitute the direct access transport library, `libdat`. This library is implemented as a shared object, `libdat.so`, but is not automatically linked by the C compilation system. Specify `-ldat` on the `cc` command line to link with this library. See [libdat\(3LIB\)](#).
- (3DEVID) These functions constitute the device ID library, `libdevid`. This library is implemented as a shared object, `libdevid.so`, but is not automatically linked by the C compilation system. Specify `-ldevid` on the `cc` command line to link with this library. See [libdevid\(3LIB\)](#).
- (3DEVINFO) These functions constitute the device information library, `libdevinfo`. This library is implemented as a shared object, `libdevinfo.so`, but is not automatically linked by the C compilation system. Specify `-ldevinfo` on the `cc` command line to link with this library. See [libdevinfo\(3LIB\)](#).
- (3DMI) These functions constitute the DMI libraries, `libdmi`, `libdmici`, and `libdmimi`. These libraries are implemented as shared objects, `libdmi.so`, `libdmici.so`, and `libdmimi.so`, respectively, but are not automatically linked by the C compilation system. Specify `-ldmi`, `-ldmici`, or `-ldmimi` on the `cc` command line to link with these libraries. See [libdmi\(3LIB\)](#), [libdmici\(3LIB\)](#), and [libdmimi\(3LIB\)](#).
- (3ELF) These functions constitute the ELF access library, `libelf`, (Extensible Linking Format). This library provides the interface for the creation and analyses of “elf” files; executables, objects, and shared objects. `libelf` is implemented as a shared object, `libelf.so`, but is not automatically linked by the C compilation system. Specify `-lelf` on the `cc` command line to link with this library. See [libelf\(3LIB\)](#).
- (3EXACCT) These functions constitute the extended accounting access library, `libexacct`, and the project database access library, `libproject`. These libraries are implemented as shared objects, `libexacct.so` and `libproject.so`, respectively, but are not automatically linked by the C

- compilation system. Specify `-lexacct` or `-lproject` on the `cc` command line to link with these libraries. See [libexacct\(3LIB\)](#) and [libproject\(3LIB\)](#).
- (3FM) These functions constitute the fault management events library. This library is implemented as a shared object, `libfmevent.so`, but is not automatically linked by the C compilation system. Specify `-lfmevent` on the `cc` command line to link with this library. See [libfmevent\(3LIB\)](#).
- (3GEN) These functions constitute the string pattern-matching and pathname manipulation library, `libgen`. This library is implemented as a shared object, `libgen.so`, but is not automatically linked by the C compilation system. Specify `-lgen` on the `cc` command line to link with this library. See [libgen\(3LIB\)](#).
- (3HBAAPI) These functions constitute the common fibre channel HBA information library, `libhbaapi`. This library is implemented as a shared object, `libhbaapi.so`, but is not automatically linked by the C compilation system. Specify `-lhbaapi` on the `cc` command line to link with this library. See [libhbaapi\(3LIB\)](#).
- (3KSTAT) These functions constitute the kernel statistics library, which is implemented as a shared object, `libkstat.so`, but is not automatically linked by the C compilation system. Specify `-lkstat` on the `cc` command line to link with this library. See [libkstat\(3LIB\)](#).
- (3KVM) These functions allow access to the kernel's virtual memory library, which is implemented as a shared object, `libkvm.so`, but is not automatically linked by the C compilation system. Specify `-lkvm` on the `cc` command line to link with this library. See [libkvm\(3LIB\)](#).
- (3LAYOUT) These functions constitute the layout service library, which is implemented as a shared object, `liblayout.so`, but is not automatically linked by the C compilation system. Specify `-llayout` on the `cc` command line to link with this library. See [liblayout\(3LIB\)](#).
- (3LGRP) These functions constitute the locality group library, which is implemented as a shared object, `liblgrp.so`, but is not automatically linked by the C compilation system. Specify `-llgrp` on the `cc` command line to link with this library. See [liblgrp\(3LIB\)](#).
- (3M) These functions constitute the mathematical library, `libm`. This library is implemented as a shared object, `libm.so`, but is not automatically linked by the C compilation system. Specify `-lm` on the `cc` command line to link with this library. See [libm\(3LIB\)](#).
- (3MAIL) These functions constitute the user mailbox management library, `libmail`. This library is implemented as a shared object, `libmail.so`, but

- is not automatically linked by the C compilation system. Specify `-lmail` on the `cc` command line to link with this library. See [libmail\(3LIB\)](#).
- (3MP) These functions constitute the integer mathematical library, `libmp`. This library is implemented as a shared object, `libmp.so`, but is not automatically linked by the C compilation system. Specify `-lmp` on the `cc` command line to link with this library. See [libmp\(3LIB\)](#).
- (3MPAPI) These functions constitute the Common Multipath Management library, `libMPAPI`. This library is implemented as a shared object, `libMPAPI.so`, but is not automatically linked by the C compilation system. Specify `-lMPAPI` on the `cc` command line to link with this library. See [libMPAPI\(3LIB\)](#).
- (3MVEC) These functions constitute the vector mathematical library, `libmvec`. This library is implemented as a shared object, `libmvec.so`, but is not automatically linked by the C compilation system. Specify `-lmvec` on the `cc` command line to link with this library. See [libmvec\(3LIB\)](#).
- (3NVPAIR) These functions constitute the name–value pair library, `libnvpair`. This library is implemented as a shared object, `libnvpair.so`, but is not automatically linked by the C compilation system. Specify `-lnvpair` on the `cc` command line to link with this library. See [libnvpair\(3LIB\)](#).
- (3PAM) These functions constitute the pluggable authentication module library, `libpam`. This library is implemented as a shared object, `libpam.so`, but is not automatically linked by the C compilation system. Specify `-lpam` on the `cc` command line to link with this library. See [libpam\(3LIB\)](#).
- (3PAPI) These functions constitute the Free Standards Group Open Printing API (PAPI) library, `libpapi`. This library is implemented as a shared object, `libpapi.so`, but is not automatically linked by the C compilation system. Specify `-lpapi` on the `cc` command line to link with this library. See [libpapi\(3LIB\)](#).
- (3PICL) These functions constitute the PICL library, `libpicl`. This library is implemented as a shared object, `libpicl.so`, but is not automatically linked by the C compilation system. Specify `-lpicl` on the `cc` command line to link with this library. See [libpicl\(3LIB\)](#) and [libpicl\(3PICL\)](#).
- (3PICLTREE) These functions constitute the PICL plug-in library, `libpicltree`. This library is implemented as a shared object, `libpicltree.so`, but is not automatically linked by the C compilation system. Specify `-lpicltree` on the `cc` command line to link with this library. See [libpicltree\(3LIB\)](#) and [libpicltree\(3PICLTREE\)](#).
- (3POOL) These functions constitute the pool configuration manipulation library, `libpool`. This library is implemented as a shared object, `libpool.so`, but

- is not automatically linked by the C compilation system. Specify `-lpool` on the `cc` command line to link with this library. See [libpool\(3LIB\)](#).
- (3PROJECT) These functions constitute the project database access library, `libproject`. This library is implemented as a shared object, `libproject.so`, but is not automatically linked by the C compilation system. Specify `-lproject` on the `cc` command line to link with this library. See [libproject\(3LIB\)](#).
- (3RSM) These functions constitute the remote shared memory library, `librsm`. This library is implemented as a shared object, `librsm.so`, but is not automatically linked by the C compilation system. Specify `-lrsm` on the `cc` command line to link with this library. See [librsm\(3LIB\)](#).
- (3SCF) These functions constitute the object-caching memory allocation library, `libscf`. This library is implemented as a shared object, `libscf.so`, but is not automatically linked by the C compilation system. Specify `-lscf` on the `cc` command line to link with this library. See [libscf\(3LIB\)](#).
- (3SEC) These functions constitute the file access control library, `libsec`. This library is implemented as a shared object, `libsec.so`, but is not automatically linked by the C compilation system. Specify `-lsec` on the `cc` command line to link with this library. See [libsec\(3LIB\)](#).
- (3SECDB) These functions constitute the security attributes database library, `libsecdb`. This library is implemented as a shared object, `libsecdb.so`, but is not automatically linked by the C compilation system. Specify `-lsecdb` on the `cc` command line to link with this library. See [libsecdb\(3LIB\)](#).
- (3SMARTCARD) These functions constitute the smartcard library, `libsmartcard`. This library is implemented as a shared object, `libsmartcard.so`, but is not automatically linked by the C compilation system. Specify `-lsmartcard` on the `cc` command line to link with this library. See [libsmartcard\(3LIB\)](#).
- (3SNMP) These functions constitute the SNMP libraries, `libssagent` and `libssasnp`. These libraries are implemented as shared objects, `libssagent.so` and `libssasnp.so`, respectively, but are not automatically linked by the C compilation system. Specify `-lssagent` or `-lssasnp` on the `cc` command line to link with these libraries. See [libssagent\(3LIB\)](#) and [libssasnp\(3LIB\)](#).
- (3SYSEVENT) These functions constitute the system event library, `libsysevent`. This library is implemented as a shared object, `libsysevent.so`, but is not automatically linked by the C compilation system. Specify `-lsysevent` on the `cc` command line to link with this library. See [libsysevent\(3LIB\)](#).

	(3TECLA)	These functions constitute the interactive command-line input library, <code>libtecla</code> . This library is implemented as a shared object, <code>libtecla.so</code> , but is not automatically linked by the C compilation system. Specify <code>-ltecla</code> on the <code>cc</code> command line to link with this library. See libtecla(3LIB) .
	(3TNF)	These functions constitute the TNF libraries, <code>libtnf</code> , <code>libtnfctl</code> , and <code>libtnfprobe</code> . These libraries are implemented as shared objects, <code>libtnf.so</code> , <code>libtnfctl.so</code> , and <code>libtnfprobe.so</code> , respectively, but are not automatically linked by the C compilation system. Specify <code>-ltnf</code> , <code>-ltnfctl</code> , or <code>-ltnfprobe</code> on the <code>cc</code> command line to link with these libraries. See libtnfctl(3TNF) and libtnfctl(3LIB) .
	(3TSOL)	These functions constitute the Trusted Extensions library, <code>libtsol</code> , and the Trusted Extensions network library, <code>libtsnet</code> . These libraries are implemented as shared objects, <code>libtsol.so</code> and <code>libtsnet.so</code> , but are not automatically linked by the C compilation system. Specify <code>-ltsol</code> or <code>-ltsnet</code> on the <code>cc</code> command line to link with these libraries. See libtsol(3LIB) and libtsnet(3LIB) .
	(3UUID)	These functions constitute the universally unique identifier library, <code>libuuid</code> . This library is implemented as a shared object, <code>libuuid.so</code> , but is not automatically linked by the C compilation system. Specify <code>-luuid</code> on the <code>cc</code> command line to link with this library. See libuuid(3LIB) .
	(3VOLMGT)	These functions constitute the volume management library, <code>libvolmgt</code> . This library is implemented as a shared object, <code>libvolmgt.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lvolmgt</code> on the <code>cc</code> command line to link with this library. See libvolmgt(3LIB) .
	(3WSREG)	These functions constitute the product install registry library, <code>libwsreg</code> . This library is implemented as a shared object, <code>libwsreg.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lwsreg</code> on the <code>cc</code> command line to link with this library. See libwsreg(3LIB) .
	(3XTSOL)	These functions constitute the Trusted Extensions to the X windows library, <code>libXtsol</code> . This library is implemented as a shared object, <code>libXtsol.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lX11</code> and then <code>-lXtsol</code> on the <code>cc</code> command line to link with this library. See libXtsol(3LIB) .
Multimedia Library Functions	(3MLIB)	These functions constitute the mediaLib library, <code>libmLib</code> . This library is implemented as a shared object, <code>libmLib.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lmLib</code> on the <code>cc</code> command line to link with this library. See libmLib(3LIB) .

Definitions A character is any bit pattern able to fit into a byte on the machine. In some international languages, however, a “character” might require more than one byte, and is represented in multi-bytes.

The null character is a character with value 0, conventionally represented in the C language as `\0`. A character array is a sequence of characters. A null-terminated character array (a *string*) is a sequence of characters, the last of which is the null character. The null string is a character array containing only the terminating null character. A null pointer is the value that is obtained by casting `0` into a pointer. C guarantees that this value will not match that of any legitimate pointer, so many functions that return pointers return `NULL` to indicate an error. The macro `NULL` is defined in `<stdio.h>`. Types of the form `size_t` are defined in the appropriate headers.

Multithreaded Applications Both POSIX threads and Solaris threads can be used within the same application. Their implementations are completely compatible with each other; however, only POSIX threads guarantee portability to other POSIX-conforming environments.

The `libpthread(3LIB)` and `libthread(3LIB)` libraries are implemented as filters on `libc(3LIB)`.

When compiling a multithreaded application, the `-mt` option must be specified on the command line.

There is no need for a multithreaded application to link with `-lthread`. An application must link with `-lpthread` only when POSIX semantics for `fork(2)` are desired. When an application is linked with `-lpthread`, a call to `fork()` assumes the behavior `fork1(2)` rather than the default behavior that forks all threads.

When compiling a POSIX-conforming application, either the `_POSIX_C_SOURCE` or `_POSIX_PTHREAD_SEMANTICS` option must be specified on the command line. For POSIX.1c-conforming applications, define the `_POSIX_C_SOURCE` flag to be `>= 199506L`:

```
cc -mt [ flag... ] file... -D_POSIX_C_SOURCE=199506L -lpthread
```

For POSIX behavior with the Solaris `fork()` and `fork1()` distinction, compile as follows:

```
cc -mt [ flag... ] file... -D_POSIX_PTHREAD_SEMANTICS
```

For Solaris threads behavior, compile as follows:

```
cc -mt [ flag... ] file...
```

Unsafe interfaces should be called only from the main thread to ensure the application's safety.

MT-Safe interfaces are denoted in the ATTRIBUTES section of the functions and libraries manual pages (see `attributes(5)`). If a manual page does not state explicitly that an interface is MT-Safe, the user should assume that the interface is unsafe.

Realtime Applications The environment variable `LD_BIND_NOW` must be set to a non-null value to enable early binding. Refer to the “When Relocations are Processed” chapter in *Linker and Libraries Guide* for additional information.

Files	<i>INCDIR</i>	usually <code>/usr/include</code>
	<i>LIBDIR</i>	usually either <code>/lib</code> or <code>/usr/lib</code> (32-bit) or either <code>/lib/64</code> or <code>/usr/lib/64</code> (64-bit)
	<i>LIBDIR</i> /*.so	shared libraries

Linker and Libraries Guide

Performance Profiling Tools

ANSI C Programmer's Guide

Diagnostics For functions that return floating-point values, error handling varies according to compilation mode. Under the `-Xt` (default) option to `cc`, these functions return the conventional values `0`, `±HUGE`, or `NaN` when the function is undefined for the given arguments or when the value is not representable. In the `-Xa` and `-Xc` compilation modes, `±HUGE_VAL` is returned instead of `±HUGE`. (`HUGE_VAL` and `HUGE` are defined in `math.h` to be infinity and the largest-magnitude single-precision number, respectively.)

Notes None of the functions, external variables, or macros should be redefined in the user's programs. Any other name can be redefined without affecting the behavior of other library functions, but such redefinition might conflict with a declaration in an included header.

The headers in *INCDIR* provide function prototypes (function declarations including the types of arguments) for most of the functions listed in this manual. Function prototypes allow the compiler to check for correct usage of these functions in the user's program. The `lint` program checker can also be used and will report discrepancies even if the headers are not included with `#include` statements. Definitions for Sections 2 and 3C are checked automatically. Other definitions can be included by using the `-l` option to `lint`. (For example, `-lm` includes definitions for `libm`.) Use of `lint` is highly recommended. See the `lint` chapter in *Performance Profiling Tools*.

Users should carefully note the difference between `STREAMS` and *stream*. `STREAMS` is a set of kernel mechanisms that support the development of network services and data communication drivers. It is composed of utility routines, kernel facilities, and a set of data structures. A *stream* is a file with its associated buffering. It is declared to be a pointer to a type `FILE` defined in `<stdio.h>`.

In detailed definitions of components, it is sometimes necessary to refer to symbolic names that are implementation-specific, but which are not necessarily expected to be accessible to an application program. Many of these symbolic names describe boundary conditions and system limits.

In this section, for readability, these implementation-specific values are given symbolic names. These names always appear enclosed in curly brackets to distinguish them from symbolic names of other implementation-specific constants that are accessible to application programs by headers. These names are not necessarily accessible to an application program through a header, although they can be defined in the documentation for a particular system.

In general, a portable application program should not refer to these symbolic names in its code. For example, an application program would not be expected to test the length of an argument list given to a routine to determine if it was greater than `{ARG_MAX}`.

REFERENCE

Library Interfaces and Headers

Name acct.h, acct – per-process accounting file format

Synopsis `#include <sys/types.h>`
`#include <sys/acct.h>`

Description Files produced as a result of calling `acct(2)` have records in the form defined by `<sys/acct.h>`, whose contents are:

```
typedef ushort_t  comp_t;  /* pseudo "floating point"
                           representation */
                           /* 3 bit base-8 exponent in the high */
                           /* order bits, and a 13-bit fraction */
                           /* in the low order bits. */

struct    acct
{
    char    ac_flag;        /* Accounting flag */
    char    ac_stat;        /* Exit status */
    uid_t   ac_uid;         /* Accounting user ID */
    gid_t   ac_gid;         /* Accounting group ID */
    dev_t   ac_tty;         /* control tty */
    time_t  ac_btime;       /* Beginning time */
    comp_t  ac_uteime;       /* accounting user time in clock ticks */
    comp_t  ac_stime;       /* accounting system time in clock ticks */
    comp_t  ac_etime;       /* accounting total elapsed time in clock
                           ticks */

    comp_t  ac_mem;         /* memory usage in clicks (pages) */
    comp_t  ac_io;          /* chars transferred by read/write */
    comp_t  ac_rw;          /* number of block reads/writes */
    char    ac_comm[8];     /* command name */
};

/*
 * Accounting Flags
 */

#define AFORK    01        /* has executed fork, but no exec */
#define ASU      02        /* used super-user privileges */
#define ACCTF    0300      /* record type */
#define AEXPND   040       /* Expanded Record Type – default */
```

In `ac_flag`, the `AFORK` flag is turned on by each `fork` and turned off by an `exec`. The `ac_comm` field is inherited from the parent process and is reset by any `exec`. Each time the system charges the process with a clock tick, it also adds to `ac_mem` the current process size, computed as follows:

(data size) + (text size) / (number of in-core processes using text)

The value of `ac_mem / (ac_stime + ac_uteime)` can be viewed as an approximation to the mean process size, as modified by text sharing.

The structure `tacct`, (which resides with the source files of the accounting commands), represents a summary of accounting statistics for the user id `ta_uid`. This structure is used by the accounting commands to report statistics based on user id.

```
/*
 * total accounting (for acct period), also for day
 */
struct tacct {
    uid_t      ta_uid;      /* user id */
    char       ta_name[8];  /* login name */
    float      ta_cpu[2];   /* cum. cpu time in minutes, */
                          /* p/np (prime/non-prime time) */
    float      ta_kcore[2]; /* cum. kcore-minutes, p/np */
    float      ta_con[2];   /* cum. connect time in minutes,
                          p/np */
    float      ta_du;       /* cum. disk usage (blocks)*/
    long       ta_pc;       /* count of processes */
    unsigned short ta_sc;   /* count of login sessions */
    unsigned short ta_dc;   /* count of disk samples */
    unsigned short ta_fee;  /* fee for special services */
};
```

The `ta_cpu`, `ta_kcore`, and `ta_con` members contain usage information pertaining to prime time and non-prime time hours. The first element in each array represents the time the resource was used during prime time hours. The second element in each array represents the time the resource was used during non-prime time hours. Prime time and non-prime time hours may be set in the `holidays` file (see [holidays\(4\)](#)).

The `ta_kcore` member is a cumulative measure of the amount of memory used over the accounting period by processes owned by the user with uid `ta_uid`. The amount shown represents kilobyte segments of memory used, per minute.

The `ta_con` member represents the amount of time the user was logged in to the system.

Files `/etc/acct/holidays` prime/non-prime time table

See Also [acctcom\(1\)](#), [acct\(1M\)](#), [acctcon\(1M\)](#), [acctmerg\(1M\)](#), [acctprc\(1M\)](#), [acctsh\(1M\)](#), [prtacct\(1M\)](#), [runacct\(1M\)](#), [shutacct\(1M\)](#), [acct\(2\)](#), [exec\(2\)](#), [fork\(2\)](#)

Notes The `ac_mem` value for a short-lived command gives little information about the actual size of the command, because `ac_mem` may be incremented while a different command (for example, the shell) is being executed by the process.

Name aio.h, aio – asynchronous input and output

Synopsis `#include <aio.h>`

Description The `<aio.h>` header defines the `aio_cb` structure which includes the following members:

<code>int</code>	<code>aio_fildes</code>	file descriptor
<code>off_t</code>	<code>aio_offset</code>	file offset
<code>volatile void*</code>	<code>aio_buf</code>	location of buffer
<code>size_t</code>	<code>aio_nbytes</code>	length of transfer
<code>int</code>	<code>aio_reqprio</code>	request priority offset
<code>struct sigevent</code>	<code>aio_sigevent</code>	signal number and value
<code>int</code>	<code>aio_lio_opcode</code>	operation to be performed

This header also includes the following constants:

<code>AIO_ALLDONE</code>	A return value indicating that none of the requested operations could be canceled since they are already complete.
<code>AIO_CANCELED</code>	A return value indicating that all requested operations have been canceled.
<code>AIO_NOTCANCELED</code>	A return value indicating that some of the requested operations could not be canceled since they are in progress.
<code>LIO_NOP</code>	A lio_listio(3RT) element operation option indicating that no transfer is requested.
<code>LIO_NOWAIT</code>	A lio_listio() synchronization operation indicating that the calling thread is to continue execution while the lio_listio() operation is being performed, and no notification is given when the operation is complete.
<code>LIO_READ</code>	A lio_listio() element operation option requesting a read.
<code>LIO_WAIT</code>	A lio_listio() synchronization operation indicating that the calling thread is to suspend until the lio_listio() operation is complete.
<code>LIO_WRITE</code>	A lio_listio() element operation option requesting a write.

See Also [lseek\(2\)](#), [read\(2\)](#), [write\(2\)](#), [fsync\(3C\)](#), [libaio\(3LIB\)](#), [lio_listio\(3RT\)](#)

/*
 * Define archive formats for extended attributes.
 *
 * Extended attributes are stored in two pieces.
 * 1. An attribute header which has information about
 *    what file the attribute is for and what the attribute
 *    is named.
 * 2. The attribute record itself. Stored as a normal file type
 *    of entry.
 * Both the header and attribute record have special modes/typeflags
 * associated with them.
 *
 * The names of the header in the archive look like:
 * /dev/null/attr.hdr
 *
 * The name of the attribute looks like:
 * /dev/null/attr.
 *
 * This is done so that an archiver that doesn't understand these formats
 * can just dispose of the attribute records unless the user chooses to
 * rename them via cpio -r or pax -i
 */

```

```

* The format is composed of a fixed size header followed
* by a variable sized xattr_buf. If the attribute is a hard link
* to another attribute, then another xattr_buf section is included
* for the link.
*
* The xattr_buf is used to define the necessary "pathing" steps
* to get to the extended attribute. This is necessary to support
* a fully recursive attribute model where an attribute may itself
* have an attribute.
*
* The basic layout looks like this.
*
* -----
* |                               |
* |           xattr_hdr           |
* |                               |
* |-----|
* |-----|
* |                               |
* |           xattr_buf           |
* |                               |
* |-----|
* |-----|
* |                               |
* |   (optional link info)        |
* |                               |
* |-----|
* |-----|
* |                               |
* |   attribute itself            |
* |   stored as normal tar        |
* |   or cpio data with           |
* |   special mode or             |
* |   typeflag                    |
* |                               |
* |-----|
*
*/
#define XATTR_ARCH_VERS "1.0"

/*
* extended attribute fixed header
*
* h_version          format version.
* h_size             size of header + variable sized data sections.
* h_component_len    Length of entire pathing section.
* h_link_component_len Length of link component section. Again same

* _XATTR_CPIO_MODE ORED into the mode field in both
* character and binary versions of the archive format
*/
#define _XATTR_CPIO_MODE      0xB000

```

Name ar.h, ar – archive file format

Synopsis `#include <ar.h>`

Description The archive command `ar` is used to combine several files into one. Archives are used mainly as libraries to be searched by the link editor `ld`.

Each archive begins with the archive magic string.

```
#define ARMAG    "!<arch>\n"    /* magic string */
#define SARMAG    8              /* length of magic string */
```

Following the archive magic string are the archive file members. Each file member is preceded by a file member header which is of the following format:

```
#define ARFMAG    "\n"          /* header trailer string */

struct ar_hdr      /* file member header */
{
    char    ar_name[16];        /* '/' terminated file member name */
    char    ar_date[12];        /* file member date */
    char    ar_uid[6];          /* file member user identification */
    char    ar_gid[6];          /* file member group identification */
    char    ar_mode[8];         /* file member mode (octal) */
    char    ar_size[10];        /* file member size */
    char    ar_fmag[2];         /* header trailer string */
};
```

All information in the file member headers is in printable ASCII. The numeric information contained in the headers is stored as decimal numbers (except for *ar_mode* which is in octal). Thus, if the archive contains printable files, the archive itself is printable.

If the file member name fits, the *ar_name* field contains the name directly, and is terminated by a slash (/) and padded with blanks on the right. If the member's name does not fit, *ar_name* contains a slash (/) followed by a decimal representation of the name's offset in the archive string table described below.

The *ar_date* field is the modification date of the file at the time of its insertion into the archive. Common format archives can be moved from system to system as long as the portable archive command `ar` is used.

Each archive file member begins on an even byte boundary; a newline is inserted between files if necessary. Nevertheless, the size given reflects the actual size of the file exclusive of padding.

Notice there is no provision for empty areas in an archive file.

Each archive that contains object files (see [a.out\(4\)](#)) includes an archive symbol table. This symbol table is used by the link editor `ld` to determine which archive members must be loaded

during the link edit process. The archive symbol table (if it exists) is always the first file in the archive (but is never listed) and is automatically created and/or updated by ar.

The archive symbol table has a zero length name (that is, ar_name[0] is '/'), ar_name[1]==' ', etc.). All "words" in this symbol table have four bytes, using the machine-independent encoding shown below. All machines use the encoding described here for the symbol table, even if the machine's "natural" byte order is different.

	0	1	2	3
0x01020304	01	02	03	04

The contents of this file are as follows:

- 1. The number of symbols. Length: 4 bytes.
- 2. The array of offsets into the archive file. Length: 4 bytes * "the number of symbols".
- 3. The name string table. Length: ar_size - 4 bytes * ("the number of symbols" + 1).

As an example, the following symbol table defines 4 symbols. The archive member at file offset 114 defines *name*. The archive member at file offset 122 defines *object*. The archive member at file offset 426 defines *function* and the archive member at file offset 434 defines *name2*.

Example Symbol Table	Offset	+0	+1	+2	+3	
	0	4				4 offset entries
	4	114				name
	8	122				object
	12	426				function
	16	434				name2
	20	n	a	m	e	
	24	\0	o	b	j	
	28	e	c	t	\0	
	32	f	u	n	c	
	36	t	i	o	n	
	40	\0	n	a	m	
	44	e	2	\0		

The string table contains exactly as many null terminated strings as there are elements in the offsets array. Each offset from the array is associated with the corresponding name from the string table (in order). The names in the string table are all the defined global symbols found in the common object files in the archive. Each offset is the location of the archive header for the associated symbol.

If some archive member's name is more than 15 bytes long, a special archive member contains a table of file names, each followed by a slash and a new-line. This string table member, if present, will precede all "normal" archive members. The special archive symbol table is not a "normal" member, and must be first if it exists. The `ar_name` entry of the string table's member header holds a zero length name `ar_name[0]=='/'`, followed by one trailing slash (`ar_name[1]=='/'`), followed by blanks (`ar_name[2]==' '`, etc.). Offsets into the string table begin at zero. Example *ar_name* values for short and long file names appear below.

Offset	+0	+1	+2	+3	+4	+5	+6	+7	+8	+9
0	f	i	l	e	_	n	a	m	e	_
10	s	a	m	p	l	e	/	\n	l	o
20	n	g	e	r	f	i	l	e	n	a
30	m	e	x	a	m	p	l	e	/	\n
Member Name					ar_name					
short-name					short-name/		Not in string table			
file_name_sample					/0		Offset 0 in string table			
longerfilenameexample					/18		Offset 18 in string table			

See Also [ar\(1\)](#), [ld\(1\)](#), [strip\(1\)](#), [a.out\(4\)](#)

Notes The `strip` utility will remove all archive symbol entries from the header. The archive symbol entries must be restored with the `-ts` options of the `ar` command before the archive can be used with the link editor `ld`.

Name assert.h, assert – verify program assertion

Synopsis #include <assert.h>

Description The <assert.h> header defines the `assert()` macro. It refers to the macro `NDEBUG` which is not defined in the header. If `NDEBUG` is defined as a macro name before the inclusion of this header, the `assert()` macro is defined simply as:

```
#define assert(ignore)((void) 0)
```

Otherwise, the macro behaves as described in [assert\(3C\)](#).

The `assert()` macro is redefined according to the current state of `NDEBUG` each time <assert.h> is included.

The `assert()` macro is implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [assert\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name complex.h, complex – complex arithmetic

Synopsis #include <complex.h>

Description The <complex.h> header defines the following macros:

- `complex` Expands to `_Complex`.
- `_Complex_I` Expands to a constant expression of type `const float _Complex`, with the value of the imaginary unit (that is, a number `i` such that $i^2=-1$).
- `imaginary` Expands to `_Imaginary`.
- `_Imaginary_I` Expands to a constant expression of type `const float _Imaginary` with the value of the imaginary unit.
- `I` Expands to either `_Imaginary_I` or `_Complex_I`. If `_Imaginary_I` is not defined, `I` expands to `_Complex_I`.

An application can undefine and then, if appropriate, redefine the `complex`, `imaginary`, and `I` macros.

Usage Values are interpreted as radians, not degrees.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [cabs\(3M\)](#), [cacos\(3M\)](#), [cacosh\(3M\)](#), [carg\(3M\)](#), [casin\(3M\)](#), [casinh\(3M\)](#), [catan\(3M\)](#), [catanh\(3M\)](#), [ccos\(3M\)](#), [ccosh\(3M\)](#), [cexp\(3M\)](#), [cimag\(3M\)](#), [clog\(3M\)](#), [conj\(3M\)](#), [cpow\(3M\)](#), [cproj\(3M\)](#), [creal\(3M\)](#), [csin\(3M\)](#), [csinh\(3M\)](#), [csqrt\(3M\)](#), [ctan\(3M\)](#), [ctanh\(3M\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Notes The choice of `I` instead of `i` for the imaginary unit concedes to the widespread use of the identifier `i` for other purposes. The application can use a different identifier, say `j`, for the imaginary unit by following the inclusion of the <complex.h> header with:

```
#undef I
#define j _Imaginary_I
```

An `I` suffix to designate imaginary constants is not required, as multiplication by `I` provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is `float`, so that use of `I` for algorithmic or notational convenience does not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro `I` introduces an imaginary type, by explicitly defining `I` to be `_Imaginary_I` or `_Complex_I`.

Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro `_Imaginary_I` provides a test for whether imaginary types are supported. The `cis()` function (`cos(x) + I*sin(x)`) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

Name cpio.h, cpio – cpio archive values

Synopsis #include <cpio.h>

Description Values needed by the `c_mode` field of the `cpio` archive format are described as follows:

Name	Description
C_IRUSR	Read by owner
C_IWUSR	Write by owner
C_IXUSR	Execute by owner
C_IRGRP	Read by group
C_IWGRP	Write by group
C_IXGRP	Execute by group
C_IROTH	Read by others
C_IWOTH	Write by others
C_IXOTH	Execute by others
C_ISUID	Set user ID
C_ISGID	Set group ID
C_ISVTX	On directories, restricted deletion flag
C_ISDIR	Directory
C_ISFIFO	FIFO
C_ISREG	Regular file
C_ISBLK	Block special
C_ISCHR	Character special
C_ISCTG	Reserved
C_ISLNK	Symbolic link
C_ISSOCK	Socket

The header defines the symbolic constant:

MAGIC "070707"

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [pax\(1\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name dirent.h, dirent – format of directory entries

Synopsis #include <dirent.h>

Description The internal format of directories is unspecified. The <dirent.h> header defines the following type:

DIR A type representing a directory stream.

The header also defines the structure dirent, which includes the following members:

```
ino_t d_ino       /* file serial number */
char d_name[]     /* name of entry */
```

The type ino_t is defined as described in <sys/types.h>. See [types\(3HEAD\)](#).

The character array d_name is of unspecified size, but the number of bytes preceding the terminating null byte must not exceed {NAME_MAX}.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [closedir\(3C\)](#), [opendir\(3C\)](#), [readdir\(3C\)](#), [rewinddir\(3C\)](#), [seekdir\(3C\)](#), [telldir\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name errno.h, errno – system error numbers

Synopsis #include <errno.h>

Description The <errno.h> header provides a declaration for `errno` and gives positive values for the symbolic constants listed on the [Intro\(2\)](#) manual page.

Usage Values for `errno` are required to be distinct positive values rather than non-zero values.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [Intro\(2\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name fcntl.h, fcntl – file control options

Synopsis #include <fcntl.h>

Description The <fcntl.h> header defines the following requests and arguments for use by the functions [fcntl\(2\)](#), [open\(2\)](#), and [openat\(2\)](#).

Values for *cmd* used by `fcntl()` (the following values are unique):

F_DUPFD	Duplicate file descriptor.
F_DUP2FD	Similar to F_DUPFD, but always returns <i>arg</i> .
F_GETFD	Get file descriptor flags.
F_SETFD	Set file descriptor flags.
F_GETFL	Get file status flags.
F_SETFL	Set file status flags.
F_GETOWN	Get process or process group ID to receive SIGURG signals.
F_SETOWN	Set process or process group ID to receive SIGURG signals.
F_FREESP	Free storage space associated with a section of the ordinary file <i>files</i> .
F_GETLK	Get record locking information.
F_GETLK64	Equivalent to F_GETLK, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.
F_SETLK	Set record locking information.
F_SETLK64	Equivalent to F_SETLK, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.
F_SETLKW	Set record locking information; wait if blocked.
F_SETLKW64	Equivalent to F_SETLKW, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.
F_SHARE	Set share reservation.
F_UNSHARE	Remove share reservation.

File descriptor flags used for `fcntl()`:

FD_CLOEXEC	Close the file descriptor upon execution of an <code>exec</code> function (see exec(2)).
------------	---

Values for `l_type` used for record locking with `fcntl()` (the following values are unique):

F_RDLCK	Shared or read lock.
---------	----------------------

<code>F_UNLCK</code>	Unlock.
<code>F_WRLCK</code>	Exclusive or write lock.

Values for `f_access` used for share reservations with `fcntl()` (the following values are unique):

<code>F_RDACC</code>	Read-only share reservation.
<code>F_WRACC</code>	Write-only share reservation.
<code>F_RWACC</code>	Read and write share reservation.

Values for `f_deny` used for share reservations with `fcntl()` (the following values are unique):

<code>F_COMPAT</code>	Compatibility mode share reservation.
<code>F_RDDNY</code>	Deny other read access share reservations.
<code>F_WRDNY</code>	Deny other write access share reservations.
<code>F_RWDNY</code>	Deny other read or write access share reservations.
<code>F_NODNY</code>	Do not deny other read or write access share reservations.

File creation and assignment flags are used in the *oflag* argument by `open()` and `openat()`. All of these values are bitwise distinct:

<code>O_CREAT</code>	Create file if it does not exist.
<code>O_EXCL</code>	Exclusive use flag.
<code>O_NOCTTY</code>	Do not assign controlling tty.
<code>O_TRUNC</code>	Truncate flag.
<code>O_XATTR</code>	When opening a file, this flag affects the way in which relative paths are resolved by <code>open()</code> and <code>openat()</code> . With this flag set, the <i>path</i> argument is resolved as an extended attribute reference on either the current working directory (if <code>open()</code>) or of the file referenced by the file descriptor argument of <code>openat()</code> .

File status flags used for `fcntl()`, `open()`, and `open()`:

<code>O_APPEND</code>	Set append mode.
<code>O_NDELAY</code>	Non-blocking mode.
<code>O_NONBLOCK</code>	Non-blocking mode (POSIX; see standards(5)).
<code>O_DSYNC</code>	Write I/O operations on the file descriptor complete as defined by synchronized I/O data integrity completion.

<code>O_RSYNC</code>	Read I/O operations on the file descriptor complete at the same level of integrity as specified by the <code>O_DSYNC</code> and <code>O_SYNC</code> flags. If both <code>O_DSYNC</code> and <code>O_RSYNC</code> are set in <i>oflag</i> , all I/O operations on the file descriptor complete as defined by synchronized I/O data integrity completion. If both <code>O_SYNC</code> and <code>O_RSYNC</code> are set in <i>oflag</i> , all I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.
<code>O_SYNC</code>	When opening a regular file, this flag affects subsequent writes. If set, each <code>write(2)</code> will wait for both the file data and file status to be physically updated. Write I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.

Mask for use with file access modes:

<code>O_ACCMODE</code>	Mask for file access modes.
------------------------	-----------------------------

File access modes used for `fcntl()`, `open()`, and `openat()`:

<code>O_RDONLY</code>	Open for reading only.
<code>O_RDWR</code>	Open for reading and writing.
<code>O_WRONLY</code>	Open for writing only.

The following constants are used by system calls capable of resolving paths relative to a provided open file descriptor:

<code>AT_FDCWD</code>	Special value to pass in place of a file descriptor to inform the called routine that relative path arguments should be resolved from the current working directory.
<code>AT_SYMLINK_NOFOLLOW</code>	Flag passed to <code>fstatat(2)</code> and <code>fchownat(2)</code> to change the behavior of these functions when they are given a file as an argument that is a symbolic link. In this case the functions operate on the symbolic link file rather than the file the link references.
<code>AT_REMOVEDIR</code>	Flag passed to <code>unlinkat(2)</code> to tell it to assume that its path argument refers to a directory and to attempt to remove this directory.

The `flock` structure describes a file lock. It includes the following members:

```
short  l_type; /* Type of lock */
short  l_whence; /* Flag for starting offset */
off_t  l_start; /* Relative offset in bytes */
off_t  l_len; /* Size; if 0 then until EOF */
long   l_sysid; /* Returned with F_GETLK */
```

```
pid_t    l_pid;    /* Returned with F_GETLK */
```

The structure `fshare` describes a file share reservation. It includes the following members:

```
short    f_access; /* Type of reservation */
short    f_deny;   /* Type of reservations to deny */

```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [creat\(2\)](#), [exec\(2\)](#), [fcntl\(2\)](#), [open\(2\)](#), [fdatasync\(3RT\)](#), [fsync\(3C\)](#), [fsattr\(5\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Notes Data is successfully transferred for a write operation to a regular file when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

Data is successfully transferred for a read operation when an image of the data on the physical storage medium is available to the requesting process.

Synchronized I/O data integrity completion (see [fdatasync\(3RT\)](#)):

- For reads, the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests will be successfully transferred prior to reading the data.
- For writes, the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred, and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

Synchronized I/O file integrity completion (see [fsync\(3C\)](#)):

- Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) will be successfully transferred prior to returning to the calling process.

Name fenv.h, fenv – floating-point environment

Synopsis #include <fenv.h>

Description The <fenv.h> header defines the following data types through typedef:

fenv_t	Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.
fexcept_t	Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value can be set by the user to affect the subsequent behavior of floating-point arithmetic.

The <fenv.h> header defines the following constants if and only if the implementation supports the floating-point exception by means of the floating-point functions `feclearexcept()`, `fegetexceptflag()`, `feraiseexcept()`, `fesetexceptflag()`, and `fetestexcept()`. Each expands to an integer constant expression with values such that bitwise-inclusive ORs of all combinations of the constants result in distinct values.

```
FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW
```

The <fenv.h> header defines the following constant, which is simply the bitwise-inclusive OR of all floating-point exception constants defined above:

```
FE_ALL_EXCEPT
```

The <fenv.h> header defines the following constants. Each expands to an integer constant expression whose values are distinct non-negative values.

```
FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD
```

The <fenv.h> header defines the following constant, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified `fenv_t`. It can be used as an argument to the functions within the <fenv.h> header that manage the floating-point environment.

```
FE_DFL_ENV
```

The `FENV_ACCESS` pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma occurs either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined.

If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

Usage This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559: 1989 standard, and other similar floating-point state information. Also, it is designed to facilitate code portability among all systems. Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, or depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.
- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros might expand to constants corresponding to the values of `FLT_ROUNDS`, they are not required to do so. For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
```

```
void h(double);
/* ... */
g(x + 1);
h(x + 1);
/* ... */
}
```

If the function `g()` might depend on status flags set as a side effect of the first `x+1`, or if the second `x+1` might depend on control modes set as a side effect of the call to function `g()`, then the application must contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

Name float.h, float – floating types

Synopsis #include <float.h>

Description The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

- s sign (± 1)
- b base or radix of exponent representation (an integer > 1)
- e exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$)
- p precision (the number of base- b digits in the significand)
- f_k non-negative integers less than b (the significand digits)

In addition to normalized floating-point numbers ($f_1 > 0$ if $x \neq 0$), floating types might be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x \neq 0$, $e = e_{\min}$, $f_1 = 0$) and unnormalized floating-point numbers ($x \neq 0$, $e = e_{\min}$, $f_1 = 0$), and values that are not floating-point numbers, such as infinities and NaNs. A *NaN* is an encoding signifying Not-a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a floating-point exception; a *signaling NaN* generally raises a floating-point exception when occurring as an arithmetic operand.

The accuracy of the library functions in [math.h\(3HEAD\)](#) and [complex.h\(3HEAD\)](#) that return floating-point results is defined on the [libm\(3LIB\)](#) manual page.

All integer values in the <float.h> header, except FLT_ROUNDS, are constant expressions suitable for use in #if preprocessing directives; all floating values are constant expressions. All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

The rounding mode for floating-point addition is characterized by the value of FLT_ROUNDS:

- 1 Indeterminable.
- 0 Toward zero.
- 1 To nearest.
- 2 Toward positive infinity.
- 3 Toward negative infinity.

The values of operations with floating operands and values subject to the usual arithmetic conversions and of floating constants are evaluated to a format whose range and precision

might be greater than required by the type. The use of evaluation formats is characterized by the architecture-dependent value of `FLT_EVAL_METHOD`:

- 1 Indeterminable.
- 0 Evaluate all operations and constants just to the range and precision of the type.
- 1 Evaluate operations and constants of type float and double to the range and precision of the double type; evaluate long double operations and constants to the range and precision of the long double type.
- 2 Evaluate all operations and constants to the range and precision of the long double type.

The values given in the following list are defined as constants.

- Radix of exponent representation, b .

`FLT_RADIX`

- Number of base-`FLT_RADIX` digits in the floating-point significand, p .

`FLT_MANT_DIG`

`DBL_MANT_DIG`

`LDBL_MANT_DIG`

- Number of decimal digits, n , such that any floating-point number in the widest supported floating type with $p_{\max}$ radix b digits can be rounded to a floating-point number with n decimal digits and back again without change to the value.

`DECIMAL_DIG`

- Number of decimal digits, q , such that any floating-point number with q decimal digits can be rounded into a floating-point number with p radix b digits and back again without change to the q decimal digits.

`FLT_DIG`

`DBL_DIG`

`LDBL_DIG`

- Minimum negative integer such that `FLT_RADIX` raised to that power minus 1 is a normalized floating-point number, $e_{\min}$.

`FLT_MIN_EXP`

`DBL_MIN_EXP`

`LDBL_MIN_EXP`

- Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers.

`FLT_MIN_10_EXP`

`DBL_MIN_10_EXP`

`LDBL_MIN_10_EXP`

- Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable finite floating-point number, $e_{\max}$.

FLT_MAX_EXP
DBL_MAX_EXP
LDBL_MAX_EXP

- Maximum integer such that 10 raised to that power is in the range of representable finite floating-point numbers.

FLT_MAX_10_EXP
DBL_MAX_10_EXP
LDBL_MAX_10_EXP

The values given in the following list are defined as constant expressions with values that are greater than or equal to those shown:

- Maximum representable finite floating-point number.

FLT_MAX
DBL_MAX
LDBL_MAX

The values given in the following list are defined as constant expressions with implementation-defined (positive) values that are less than or equal to those shown:

- The difference between 1 and the least value greater than 1 that is representable in the given floating-point type, b^{1-p} .

FLT_EPSILON
DBL_EPSILON
LDBL_EPSILON

- Minimum normalized positive floating-point number, $b^{e_{\min}-1}$.

FLT_MIN
DBL_MIN
LDBL_MIN

Name floatingpoint.h, floatingpoint – IEEE floating point definitions

Synopsis #include <floatingpoint.h>

Description This file defines constants, types, and functions used to implement standard floating point according to ANSI/IEEE Std 754-1985. The functions are implemented in libc. The included header file <sys/ieee.h> defines certain types of interest to the kernel.

IEEE Rounding Modes	fp_direction_type	The type of the IEEE rounding direction mode. Note: the order of enumeration varies according to hardware.
	fp_precision_type	The type of the IEEE rounding precision mode, which only applies on systems that support extended precision such as machines based on the Intel 80387 FPU or the 80486. SIGFPE handling:
	sigfpe_code_type	The type of a SIGFPE code.
	sigfpe_handler_type	The type of a user-definable SIGFPE exception handler called to handle a particular SIGFPE code.
	SIGFPE_DEFAULT	A macro indicating the default SIGFPE exception handling, namely to perform the exception handling specified by the user, if any, and otherwise to dump core using abort(3C) .
	SIGFPE_IGNORE	A macro indicating an alternate SIGFPE exception handling, namely to ignore and continue execution.
	SIGFPE_ABORT	A macro indicating an alternate SIGFPE exception handling, namely to abort with a core dump.
IEEE Exception Handling	N_ IEEE_EXCEPTION	The number of distinct IEEE floating-point exceptions.
	fp_exception_type	The type of the N_ IEEE_EXCEPTION exceptions. Each exception is given a bit number.
	fp_exception_field_type	The type intended to hold at least N_ IEEE_EXCEPTION bits corresponding to the IEEE exceptions numbered by fp_exception_type. Thus fp_inexact corresponds to the least significant bit and fp_invalid to the fifth least significant bit. Note: some operations may set more than one exception.
IEEE Formats and Classification	single; extended; quadruple	Definitions of IEEE formats.
	fp_class_type	An enumeration of the various classes of IEEE values and symbols.
IEEE Base Conversion	The functions described under floating_to_decimal(3C) and decimal_to_floating(3C) satisfy not only the IEEE Standard, but also the stricter requirements of correct rounding for all arguments.	

<code>DECIMAL_STRING_LENGTH</code>	The length of a <code>decimal_string</code> .
<code>decimal_string</code>	The digit buffer in a <code>decimal_record</code> .
<code>decimal_record</code>	The canonical form for representing an unpacked decimal floating-point number.
<code>decimal_form</code>	The type used to specify fixed or floating binary to decimal conversion.
<code>decimal_mode</code>	A struct that contains specifications for conversion between binary and decimal.
<code>decimal_string_form</code>	An enumeration of possible valid character strings representing floating-point numbers, infinities, or NaNs.

Files `/usr/include/sys/ieee754.h`

Name fmtmsg.h, fmtmsg – message display structures

Synopsis #include <fmtmsg.h>

Description The <fmtmsg.h> header defines the following macros, which expand to constant integer expressions:

- MM_HARD Source of the condition is hardware.
- MM_SOFT Source of the condition is software.
- MM_FIRM Source of the condition is firmware.
- MM_APPL Condition detected by application.
- MM_UTIL Condition detected by utility.
- MM_OPYSYS Condition detected by operating system.
- MM_RECOVER Recoverable error.
- MM_NRECOV Non-recoverable error.
- MM_HALT Error causing application to halt.
- MM_ERROR Application has encountered a non-fatal fault.
- MM_WARNING Application has detected unusual non-error condition.
- MM_INFO Informative message.
- MM_NOSEV No severity level provided for the message.
- MM_PRINT Display message on standard error.
- MM_CONSOLE Display message on system console.

The table below indicates the null values and identifiers for [fmtmsg\(3C\)](#) arguments. The <fmtmsg.h> header defines the macros in the Identifier column, which expand to constant expressions that expand to expressions of the type indicated in the Type column:

Argument	Type	Null-Value	Identifier
<i>label</i>	char*	(char*) NULL	MM_NULLLBL
<i>severity</i>	int	0	MM_NULLSEV
<i>class</i>	long	0L	MM_NULLMC
<i>text</i>	char*	(char*) NULL	MM_NULLTXT
<i>action</i>	char*	(char*) NULL	MM_NULLACT
<i>tag</i>	char*	(char*) NULL	MM_NULLTAG

The `<fmtmsg.h>` header also defines the following macros for use as return values for `fmtmsg()`:

<code>MM_OK</code>	The function succeeded.
<code>MM_NOTOK</code>	The function failed completely.
<code>MM_NOMSG</code>	The function was unable to generate a message on standard error, but otherwise succeeded.
<code>MM_NOCON</code>	The function was unable to generate a console message, but otherwise succeeded.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [fmtmsg\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name fnmatch.h, fnmatch – filename-matching types

Synopsis `#include <fnmatch.h>`

Description The `<fnmatch.h>` header defines the following constants:

- `FNМ_НOMATCH` The string does not match the specified pattern.
- `FNМ_PATHNAME` Slash in string only matches slash in pattern.
- `FNМ_PERIOD` Leading period in string must be exactly matched by period in pattern.
- `FNМ_NOESCAPE` Disable backslash escaping.
- `FNМ_NOSYS` Reserved.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [fnmatch\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name ftw.h, ftw – file tree traversal

Synopsis `#include <ftw.h>`

Description The `<ftw.h>` header defines the FTW structure that includes the following members:

```
int base
int level
```

The `<ftw.h>` header defines macros for use as values of the third argument to the application-supplied function that is passed as the second argument to `ftw()` and `nftw()` (see [ftw\(3C\)](#)):

```
FTW_F      file
FTW_D      directory
FTW_DNR    directory without read permission
FTW_DP     directory with subdirectories visited
FTW_NS     unknown type; stat() failed
FTW_SL     symbolic link
FTW_SLN    symbolic link that names a nonexistent file
```

The `<ftw.h>` header defines macros for use as values of the fourth argument to `nftw()`:

```
FTW_PHYS    Physical walk, does not follow symbolic links. Otherwise, nftw() follows links
             but does not walk down any path that crosses itself.
FTW_MOUNT   The walk does not cross a mount point.
FTW_DEPTH   All subdirectories are visited before the directory itself.
FTW_CHDIR   The walk changes to each directory before reading it.
```

The `<ftw.h>` header defines the `stat` structure and the symbolic names for `st_mode` and the file type test macros as described in `<sys/stat.h>`.

Inclusion of the `<ftw.h>` header might also make visible all symbols from `<sys/stat.h>`.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [ftw\(3C\)](#), [stat.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name glob.h, glob – pathname pattern-matching types

Synopsis #include <glob.h>

Description The <glob.h> header defines the structures and symbolic constants used by the [glob\(3C\)](#).

The structure type `glob_t` contains the following members:

```
size_t gl_pathc      /* count of paths matched by pattern */
char   **gl_pathv    /* pointer to a list of matched
                      pathnames */
size_t gl_offs       /* lots to reserve at the beginning
                      of gl_pathv */
```

The following constants are provided as values for the `flags` argument:

<code>GLOB_APPEND</code>	Append generated pathnames to those previously obtained.
<code>GLOB_DOOFFS</code>	Specify how many null pointers to add to the beginning of <code>gl_pathv</code> .
<code>GLOB_ERR</code>	Cause <code>glob()</code> to return on error.
<code>GLOB_MARK</code>	Each pathname that is a directory that matches pattern has a slash appended.
<code>GLOB_NOCHECK</code>	If pattern does not match any pathname, then return a list consisting of only pattern.
<code>GLOB_NOESCAPE</code>	Disable backslash escaping.
<code>GLOB_NOSORT</code>	Do not sort the pathnames returned.

The following constants are defined as error return values:

<code>GLOB_ABORTED</code>	The scan was stopped because <code>GLOB_ERR</code> was set or <code>(*errfunc)()</code> returned non-zero.
<code>GLOB_NOMATCH</code>	The pattern does not match any existing pathname, and <code>GLOB_NOCHECK</code> was not set in flags.
<code>GLOB_NOSPACE</code>	An attempt to allocate memory failed.
<code>GLOB_NOSYS</code>	Reserved.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [glob\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name grp.h, grp – group structure

Synopsis #include <grp.h>

Description The <grp.h> header declares the structure group, which includes the following members:

```
char *gr_name      /* name of the group */
gid_t gr_gid       /* numerical group ID */
char **gr_mem      /* pointer to a null-terminated array of
                    character pointers to member names */
```

The gid_t type is defined as described in <sys/types.h> (see [types\(3HEAD\)](#)).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [getgrnam\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name iconv.h, iconv – codeset conversion facility

Synopsis #include <iconv.h>

Description The <iconv.h> header defines the following type:

iconv_t Identifies the conversion from one codeset to another.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [iconv\(3C\)](#), [iconv_close\(3C\)](#), [iconv_open\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name if.h, if – sockets local interfaces

Synopsis `#include <net/if.h>`

Description The `<net/if.h>` header defines the `if_nameindex` structure, which includes the following members:

```
unsigned if_index    /* numeric index of the interface */
char     *if_name    /* null-terminated name of the interface */
```

The `<net/if.h>` header defines the following macro for the length of a buffer containing an interface name (including the terminating null character):

`IF_NAMESIZE` interface name length

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [if_nametoindex\(3XNET\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name inet.h, inet – definitions for internet operations

Synopsis #include <arpa/inet.h>

Description The <arpa/inet.h> header defines the type `in_port_t`, the type `in_addr_t`, and the `in_addr` structure, as described in [in.h\(3HEAD\)](#).

Inclusion of the <arpa/inet.h> header may also make visible all symbols from [in.h\(3HEAD\)](#).

The following are declared as functions, and may also be defined as macros:

```
in_addr_t      inet_addr(const char *);
in_addr_t      inet_lnaof(struct in_addr);
struct in_addr inet_makeaddr(in_addr_t, in_addr_t);
in_addr_t      inet_netof(struct in_addr);
in_addr_t      inet_network(const char *);
char           *inet_ntoa(struct in_addr);
```

Default For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section 3N of the reference manual; see [Intro\(3\)](#) and [standards\(5\)](#)), the following may be declared as functions, or defined as macros, or both:

```
uint32_t      htonl(uint32_t);
uint16_t      htons(uint16_t);
uint32_t      ntohl(uint32_t);
uint16_t      ntohs(uint16_t);
```

Standard conforming For applications that require standard-conforming behavior (those that use the socket interfaces described in section 3XN of the reference manual; see [Intro\(3\)](#) and [standards\(5\)](#)), the following may be declared as functions, or defined as macros, or both:

```
in_addr_t      htonl(in_addr_t);
in_port_t      htons(in_port_t);
in_addr_t      ntohl(in_addr_t);
in_port_t      ntohs(in_port_t);
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name in.h, in – Internet Protocol family

Synopsis #include <netinet/in.h>

Description The <netinet/in.h> header defines the following types through typedef:

`in_port_t` An unsigned integral type of exactly 16 bits.

`in_addr_t` An unsigned integral type of exactly 32 bits. The <netinet/in.h> header defines the `in_addr` structure that includes the following member:

The <netinet/in.h> header defines the `in_addr` structure that includes the following member:

`in_addr_t` `s_addr`

The <netinet/in.h> header defines the type `sa_family_t` as described in [socket.h\(3HEAD\)](#).

The <netinet/in.h> header defines the following macros for use as values of the *level* argument of `getsockopt()` and `setsockopt()`:

`IPPROTO_IP` Dummy for IP

`IPPROTO_ICMP` Control message protocol

`IPPROTO_TCP` TCP

`IPPROTO_UDP` User datagram protocol The <netinet/in.h> header defines the following macros for use as destination addresses for `connect()`, `sendmsg()`, and `sendto()`:

`INADDR_ANY` Local host address

`INADDR_BROADCAST` Broadcast address

The <netinet/in.h> header defines the `sockaddr_in` structure that is used to store addresses for the Internet protocol family. Values of this type must be cast to `struct sockaddr` for use with the socket interfaces.

Default For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section (3SOCKET) of the reference manual; see [Intro\(3\)](#) and [standards\(5\)](#)), the <netinet/in.h> header defines the `sockaddr_in` structure that includes the following members:

`sa_family_t` `sin_family`
`in_port_t` `sin_port`
`struct in_addr` `sin_addr`
`char` `sin_zero[8]`

Standard conforming For applications that require standard-conforming behavior (those that use the socket interfaces described in section (3XNET) of the reference manual; see [Intro\(3\)](#) and [standards\(5\)](#)), the <netinet/in.h> header defines the sockaddr_in structure that includes the following members:

```
sa_family_t    sin_family
in_port_t      sin_port
struct in_addr sin_addr
unsigned char   sin_zero[8]
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name `inttypes.h`, `inttypes` – fixed size integer types

Synopsis `#include <inttypes.h>`

Description The `<inttypes.h>` header includes the `<stdint.h>` header.

The `<inttypes.h>` header includes a definition of the following type:

`imaxdiv_t` structure type that is the type of the value returned by the `imaxdiv()` function.

The following macros are defined. Each expands to a character string literal containing a conversion specifier, possibly modified by a length modifier, suitable for use within the format argument of a formatted input/output function when converting the corresponding integer type. These macros have the general form of PRI (character string literals for the `fprintf()` and `fwprintf()` family of functions) or SCN (character string literals for the `fscanf()` and `fwscanf()` family of functions), followed by the conversion specifier, followed by a name corresponding to a similar type name in `<stdint.h>`. In these names, *N* represents the width of the type as described in `<stdint.h>`. For example, `PRIdFAST32` can be used in a format string to print the value of an integer of type `int_fast32_t`.

The `fprintf()` macros for signed integers are:

```
PRIdN  PRIdLEASTN  PRIdFASTN  PRIdMAX  PRIdPTR
PRIiN  PRIiLEASTN  PRIiFASTN  PRIiMAX  PRIiPTR
```

The `fprintf()` macros for unsigned integers are:

```
PRIoN  PRIoLEASTN  PRIoFASTN  PRIoMAX  PRIoPTR
PRIuN  PRIuLEASTN  PRIuFASTN  PRIuMAX  PRIuPTR
PRIxN  PRIxLEASTN  PRIxFASTN  PRIxMAX  PRIxPTR
PRIXN  PRIXLEASTN  PRIXFASTN  PRIXMAX  PRIXPTR
```

The `fscanf()` macros for signed integers are:

```
SCNdN  SCNdLEASTN  SCNdFASTN  SCNdMAX  SCNdPTR
SCNiN  SCNiLEASTN  SCNiFASTN  SCNiMAX  SCNiPTR
```

The `fscanf()` macros for unsigned integers are:

```
SCNoN  SCNoLEASTN  SCNoFASTN  SCNoMAX  SCNoPTR
SCNuN  SCNuLEASTN  SCNuFASTN  SCNuMAX  SCNuPTR
SCNxN  SCNxLEASTN  SCNxFASTN  SCNxMAX  SCNxPTR
```

For each type that the implementation provides in `<stdint.h>`, the corresponding `fprintf()` and `fwprintf()` macros must be defined. The corresponding `fscanf()` and `fwscanf()` macros must be defined as well, unless the implementation does not have a suitable modifier for the type.

Usage The purpose of `<inttypes.h>` is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, with a typedef, integer types of various sizes. Implementations are free to typedef them as ISO C standard integer types or extensions that they support. Consistent use of this header greatly increases the portability of applications across platforms.

Examples **EXAMPLE 1** Use of Macro

The following code uses one of the macros available through `<inttypes.h>`.

```
#include <inttypes.h>
#include <wchar.h>
int main(void)
{
    uintmax_t i = UINTMAX_MAX; // This type always exists.
    wprintf("The largest integer value is %020"
            PRIxMAX, "\n", i);
    return 0;
}
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [imaxdiv\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name ipc.h, ipc – XSI interprocess communication access structure

Synopsis #include <sys/ipc.h>

Description The <sys/ipc.h> header is used by three mechanisms for interprocess communication (IPC): messages, semaphores, and shared memory. All use a common structure type, ipc_perm, to pass information used in determining permission to perform an IPC operation.

The ipc_perm structure contains the following members:

```
uid_t uid      /* owner's user ID */
gid_t gid      /* owner's group ID */
uid_t cuid     /* creator's user ID */
gid_t cgid     /* creator's group ID */
mode_t mode    /* read/write permission
```

The uid_t, gid_t, mode_t, and key_t types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

Definitions are provided for the constants listed below.

Mode bits:

- IPC_CREAT Create entry if key does not exist.
- IPC_EXCL Fail if key exists.
- IPC_NOWAIT Error if request must wait.

Keys:

- IPC_PRIVATE Private key.

Control commands:

- IPC_RMID Remove identifier.
- IPC_SET Set options.
- IPC_STAT Get options.

Name iso646.h, iso646 – alternative spellings

Synopsis `#include <iso646.h>`

Description The `<iso646.h>` header defines the following macros (on the left) that expand to the corresponding tokens (on the right):

<code>and</code>	<code>&&</code>
<code>and_eq</code>	<code>&=</code>
<code>bitand</code>	<code>&</code>
<code>bitor</code>	<code> </code>
<code>compl</code>	<code>~</code>
<code>not</code>	<code>!</code>
<code>not_eq</code>	<code>!=</code>
<code>or</code>	<code> </code>
<code>or_eq</code>	<code> =</code>
<code>xor</code>	<code>^</code>
<code>xor_eq</code>	<code>^=</code>

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [attributes\(5\)](#), [standards\(5\)](#)

Name langinfo.h, langinfo – language information constants

Synopsis #include <langinfo.h>

Description The <langinfo.h> header contains the constants used to identify items of langinfo data (see [nl_langinfo\(3C\)](#)). The type of the constant, nl_item, is defined as described in <nl_types.h>.

The following constants are defined. The entries under Category indicate in which [setlocale\(3C\)](#) category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	codeset name
D_T_FMT	LC_TIME	string for formatting date and time
D_FMT	LC_TIME	date format string
T_FMT	LC_TIME	time format string
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string
AM_STR	LC_TIME	ante-meridiem affix
PM_STR	LC_TIME	post-meridiem affix
DAY_1	LC_TIME	name of the first day of the week (for example, Sunday)
DAY_2	LC_TIME	name of the second day of the week (for example, Monday)
DAY_3	LC_TIME	name of the third day of the week (for example, Tuesday)
DAY_4	LC_TIME	name of the fourth day of the week (for example, Wednesday)
DAY_5	LC_TIME	name of the fifth day of the week (for example, Thursday)
DAY_6	LC_TIME	name of the sixth day of the week (for example, Friday)
DAY_7	LC_TIME	name of the seventh day of the week (for example, Saturday)
ABDAY_1	LC_TIME	abbreviated name of the first day of the week
ABDAY_2	LC_TIME	abbreviated name of the second day of the week
ABDAY_3	LC_TIME	abbreviated name of the third day of the week

Constant	Category	Meaning
ABDAY_4	LC_TIME	abbreviated name of the fourth day of the week
ABDAY_5	LC_TIME	abbreviated name of the fifth day of the week
ABDAY_6	LC_TIME	abbreviated name of the seventh day of the week
ABDAY_7	LC_TIME	abbreviated name of the seventh day of the week
MON_1	LC_TIME	name of the first month of the year
MON_2	LC_TIME	name of the second month
MON_3	LC_TIME	name of the third month
MON_4	LC_TIME	name of the fourth month
MON_5	LC_TIME	name of the fifth month
MON_6	LC_TIME	name of the sixth month
MON_7	LC_TIME	name of the seventh month
MON_8	LC_TIME	name of the eighth month
MON_9	LC_TIME	name of the ninth month
MON_10	LC_TIME	name of the tenth month
MON_11	LC_TIME	name of the eleventh month
MON_12	LC_TIME	name of the twelfth month
ABMON_1	LC_TIME	abbreviated name of the first month
ABMON_2	LC_TIME	abbreviated name of the second month
ABMON_3	LC_TIME	abbreviated name of the third month
ABMON_4	LC_TIME	abbreviated name of the fourth month
ABMON_5	LC_TIME	abbreviated name of the fifth month
ABMON_6	LC_TIME	abbreviated name of the sixth month
ABMON_7	LC_TIME	abbreviated name of the seventh month
ABMON_8	LC_TIME	abbreviated name of the eighth month
ABMON_9	LC_TIME	abbreviated name of the ninth month
ABMON_10	LC_TIME	abbreviated name of the tenth month
ABMON_11	LC_TIME	abbreviated name of the eleventh month
ABMON_12	LC_TIME	abbreviated name of the twelfth month

Constant	Category	Meaning
ERA	LC_TIME	era description segments
ERA_D_FMT	LC_TIME	era date format string
ERA_D_T_FMT	LC_TIME	era date and time format string
ERA_T_FMT	LC_TIME	era time format string
ALT_DIGITS	LC_TIME	alternative symbols for digits
RADIXCHAR	LC_NUMERIC	radix character
THOUSEP	LC_NUMERIC	separator for thousands
YESEXPR	LC_MESSAGES	affirmative response expression
NOEXPR	LC_MESSAGES	negative response expression
YESSTR	LC_MESSAGES	affirmative response for yes/no queries
NOSTR	LC_MESSAGES	negative response ro yes/no queries
CRNCYSTR	LC_MONETARY	local currency symbol, preceded by '-' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character

If the locale's values for `p_cs_precedes` and `n_cs_precedes` do not match, the value of `nl_langinfo(CRNCYSTR)` is unspecified.

The `<langinfo.h>` header declares the following as a function:

```
char *nl_langinfo(nl_item);
```

Inclusion of `<langinfo.h>` header may also make visible all symbols from `<nl_types.h>`.

Usage Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of `langinfo` data. In particular, the `strftime(3C)` function should be used to access date and time information defined in category `LC_TIME`. The `localeconv(3C)` function should be used to access information corresponding to `RADIXCHAR`, `THOUSEP`, and `CRNCYSTR`.

Attributes See `attributes(5)` for descriptions of the following attributes:

International Language Environments Guide

Name libbsdmalloc – memory allocator interface library

Synopsis `cc [ flag... ] file... -lbsdmalloc [ library... ]`
`#include <stdlib.h>`

Description Functions in this library provide a collection of `malloc` routines that use BSD semantics.

Interfaces The shared object `libbsdmalloc.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

```

free                                malloc
realloc

```

Name libc – C library

Description Functions in this library provide various facilities defined by System V, ANSI C, POSIX, and so on. See [standards\(5\)](#). In addition, those facilities previously defined in the internationalization and the wide-character libraries are now defined in this library, as are the facilities previously defined in the multithreading libraries, `libthread` and `libpthread`.

Interfaces The shared object `libc.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libc_db – threads debugging library

Synopsis

```
cc [ flag ... ] file ... -lc_db [ library ... ]
#include <proc_service.h>
#include <thread_db.h>
```

Description The libc_db library provides support for monitoring and manipulating threads-related aspects of a multithreaded program. There are at least two processes involved, the controlling process and one or more target processes. The controlling process is the libc_db client, which links with libc_db and uses libc_db to inspect or modify threads-related aspects of one or more target processes. The target processes must be multithreaded processes that use libc. The controlling process might or might not be multithreaded itself.

The most commonly anticipated use for libc_db is that the controlling process will be a debugger for a multithreaded program, hence the "db" in libc_db.

The libc_db library is dependent on the internal implementation details of libc. It is a "friend" of libc in the C++ sense, which is precisely the "value added" by libc_db. It encapsulates the knowledge of libc internals that a debugger needs to manipulate the threads-related state of a target process.

To be able to inspect and manipulate target processes, libc_db makes use of certain process control primitives that must be provided by the process using libc_db. The imported interfaces are defined in [proc_service\(3PROC\)](#). In other words, the controlling process is linked with libc_db and calls routines in libc_db. In turn, libc_db calls certain routines that it expects the controlling process to provide. These process control primitives allow libc_db to:

- Look up symbols in a target process.
- Stop and continue individual lightweight processes (LWPs) within a target process.
- Stop and continue an entire target process.
- Read and write memory and registers in a target process.

Initially, a controlling process obtains a handle for a target process. Through that handle it can then obtain handles for the component objects of the target process, its threads, its synchronization objects, and its thread-specific-data keys.

When libc_db needs to return sets of handles to the controlling process, for example, when returning handles for all the threads in a target process, it uses an iterator function. An iterator function calls back a client-specified function once for each handle to be returned, passing one handle back on each call to the callback function. The calling function also passes another parameter to the iterator function, which the iterator function passes on to the callback function. This makes it easy to build a linked list of thread handles for a particular target process. The additional parameter is the head of the linked list, and the callback function simply inserts the current handle into the linked list.

Callback functions are expected to return an integer. Iteration terminates early if a callback function returns a non-zero value. Otherwise, iteration terminates when there are no more handles to pass back.

Interfaces The shared object `libc_db.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libcommputil – communication protocol parser utilities library

Synopsis `cc [ flag... ] file... -lcommputil [ library... ]`
`#include <sdp.h>`

Description The communication protocol parser utilities library is a placeholder for public interfaces that facilitate parsing of various communication protocols. Functions in this library parse the SDP (Session Description Protocol) description, check for syntax conformance, and generate SDP descriptions.

SDP (Session Description Protocol), described in RFC 4566, describes multimedia sessions for the purposes of session announcement, session invitation, and other forms of multimedia session initiation. SDP is used to convey session information in Session Initiation Protocol (SIP), Streaming Media (Real Time Streaming Protocol, RTSP), email, and World Wide Web and Multicast Session Announcement.

Interfaces The shared object `libcommputil.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libcontract – contract management library

Synopsis `cc [flag...] 'getconf LFS_CFLAGS' file... -lcontract [library...]
#include <libcontract.h>`

Description Functions in this library provide various interfaces to interact with the [contract\(4\)](#) file system. The header provides structure and function declarations for all library interfaces.

Interfaces The shared object `libcontract.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libcurses, libtermcap, libtermLib – screen handling and optimization library

Synopsis cc [*flag*...] *file*... -lcurses [*library*...]

Description Functions in the libcurses library provide a terminal-independent method of updating character screens with reasonable optimization. The libtermcap and libtermLib libraries are identical to libcurses and are maintained for backward compatibility.

See [libcurses\(3XCURSES\)](#) for information about the curses library that conforms to X/Open Curses, Issue 4, Version 2.

Interfaces The shared objects libcurses.so.1, libtermcap.so.1, and libtermLib.so.1 provide the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libdat – direct access transport library

Synopsis `cc [ flag... ] file... -ldat [ library... ]`
`#include <dat/udat.h>`

Description The libdat library provides an application with the User Direct Access Programming Library (uDAPL) 1.2 functions to access the underlying RDMA-able interconnects. Different uDAPL service providers listed in the DAT static registry [dat.conf\(4\)](#) can be registered during runtime with the DAT library. After an application opens an interface adapter belonging to a particular service provider, all function calls will be redirected to that service provider's library.

Interfaces The shared object `libdat.so.1` provides the public interfaces defined below for applications. See [Intro\(3\)](#) for additional information on shared object interfaces.

The shared object `libdat.so.1` also provides the public interfaces defined below for service providers.

<code>dat_registry_add_provider</code>	<code>dat_registry_remove_provider</code>
--	---

Files `/usr/lib/libdat.so.1` shared object
`/usr/lib/64/libdat.so.1` 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWudaplu (user) SUNWudaplr (root)

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard: uDAPL, 1.1, 1.2
MT-Level	Unsafe

See Also [datadm\(1M\)](#), [Intro\(3\)](#), [dat.conf\(4\)](#), [attributes\(5\)](#)

Notes The libdat library supports service providers written according to the uDAPL 1.2 specification. A service provider library has to be a dynamic loadable shared object with two public entry points exported:

`dat_provider_init` `dat_provider_fini`

In terms of installation, the service provider package should include a [service_provider.conf\(4\)](#) file. The [datadm\(1M\)](#) administrative configuration program should be used to add and remove service provider's entries in the system-wide [dat.conf\(4\)](#).

Name libdbm – database subroutines library

Synopsis `cc [ flag... ] -I /usr/ucbinclude file... -L /usr/libucb \`
`-R /usr/libucb -ldb [ library... ]`

Description Functions in this library maintain key/content pairs in a database. The functions will handle very large (a billion blocks) databases and will access a keyed item in one or two file system accesses.

Interfaces The shared object `libdbm.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libdevinfo – device information library

Synopsis `cc [ flag... ] file... -ldevinfo [ library... ]`
`#include <libdevinfo.h>`

Description Functions in this library access device configuration information.

Device configuration data is organized as a tree of device nodes, defined as `di_node_t` in the `libdevinfo` interfaces. Each `di_node_t` represents a physical or logical (pseudo) device. Three types of data are associated with device nodes:

- data defined for all device nodes (attributes)
- properties specific to each device
- minor node data

All device nodes have a set of common attributes, such as a node name, an instance number, and a driver binding name. Common device node attributes are accessed by calling interfaces listed on the [di_binding_name\(3DEVINFO\)](#) manual page. Each device node also has a physical path, which is accessed by calling [di_devfs_path\(3DEVINFO\)](#).

Properties provide device specific information for device configuration and usage. Properties can be defined by software (`di_prop_t`) or by firmware (`di_prom_prop_t`). One way to access each `di_prop_t` is to make successive calls to [di_prop_next\(3DEVINFO\)](#) until `DI_PROP_NIL` is returned. For each `di_prop_t`, use interfaces on the [di_prop_bytes\(3DEVINFO\)](#) manual page to obtain property names and values. Another way to access these properties is to call [di_prop_lookup_bytes\(3DEVINFO\)](#) to find the value of a property with a given name. Accessing a `di_prom_prop_t` is similar to accessing a `di_prop_t`, except that the interface names start with `di_prom_prop` and additional calls to [di_prom_init\(3DEVINFO\)](#) and [di_prom_fini\(3DEVINFO\)](#) are required.

Minor nodes contain information exported by the device for creating special files for the device. Each device node has 0 or more minor nodes associated with it. A list minor nodes (`di_minor_t`) can be obtained by making successive calls to [di_minor_next\(3DEVINFO\)](#) until `DI_MINOR_NIL` is returned. For each minor node, [di_minor_devt\(3DEVINFO\)](#) and related interfaces are called to get minor node data.

Using `libdevinfo` involves three steps:

- Creating a snapshot of the device tree
- Traversing the device tree to get information of interest
- Destroying the snapshot of the device tree

A snapshot of the device tree is created by calling [di_init\(3DEVINFO\)](#) and destroyed by calling [di_fini\(3DEVINFO\)](#). An application can specify the data to be included in the snapshot (full or partial tree, include or exclude properties and minor nodes) and get a handle to the root of the device tree. See [di_init\(3DEVINFO\)](#) for details. The application then traverses the device tree in the snapshot to obtain device configuration data.

The device tree is normally traversed through parent-child-sibling linkage. Each device node contains references to its parent, its next sibling, and the first of its children. Given the `di_node_t` returned from `di_init()`, one can find all children by first calling `di_child_node(3DEVINFO)`, followed by successive calls to `di_sibling_node(3DEVINFO)` until `DI_NODE_NIL` is returned. By following this procedure recursively, an application can visit all device nodes contained in the snapshot. Two interfaces, `di_walk_node(3DEVINFO)` and `di_walk_minor(3DEVINFO)` functions are provided to facilitate device tree traversal. The `di_walk_node()` function visits all device nodes and executes a user-supplied callback function for each node visited. The `di_walk_minor()` function does the same for each minor node in the device tree.

An alternative way to traverse the device tree is through the per-driver device node linkage. Device nodes contain a reference to the next device node bound to the same driver. Given the `di_node_t` returned from `di_init()`, an application can find all device nodes bound to a driver by first calling `di_drv_first_node(3DEVINFO)`, followed by successive calls to `di_drv_next_node(3DEVINFO)` until `DI_NODE_NIL` is returned. Traversing the per-driver device node list works only when the snapshot includes all device nodes.

See `di_init(3DEVINFO)` for examples of `libdevinfo` usage. See *Writing Device Drivers* for information about Solaris device configuration.

Interfaces The shared object `libdevinfo.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Examples **EXAMPLE 1** Information accessible through libdevinfo interfaces

The following example illustrates the kind of information accessible through libdevinfo interfaces for a device node representing a hard disk (sd2):

Attributes

```
node name:  sd
instance:   2
physical path: /sbus@1f,0/espdma@e,8400000/esp@e,8800000/sd@2,0
```

Properties

```
target=2
lun=0
```

Minor nodes

EXAMPLE 1 Information accessible through libdevinfo interfaces (Continued)

```
(disk partition /dev/dsk/c0t2d0s0)
  name:      a
  dev_t:     0x0080010 (32/16)
  spectype:  IF_BLK (block special)
(disk partition /dev/rdisk/c0t2d0s2)
  name:      c,raw
  dev_t:     0x0080012 (32/18)
  spectype:  IF_CHR (character special)
```

Writing Device Drivers

Name libdl – dynamic linking library

Synopsis `cc [ flag... ] file... -ldl [ library... ]`

Description Historically, functions in `libdl` provided for dynamic linking support. This functionality now resides in [libc\(3LIB\)](#).

This library is maintained to provide backward compatibility for both runtime and compilation environments. The shared object is implemented as a filter on the runtime linker. See [ld.so.1\(1\)](#). New application development need not specify `-ldl`.

Interfaces The shared object `libdl.so.1` provides the following public interfaces. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>dladdr</code>	<code>dladdr1</code>
<code>dlclose</code>	<code>dlclose</code>
<code>dlderror</code>	<code>dldinfo</code>
<code>dldlopen</code>	<code>dldlopen</code>
<code>dldsym</code>	

Files `/lib/libdl.so.1` shared object

Name libdlpi – Data Link Provider Interface (DLPI) library

Synopsis `cc [ flag... ] file... -ldlpi [ library... ]`
`#include <libdlpi.h>`

Description The libdlpi library provides functions that support a programming interface for DLPI applications. The functions support only DLPI Version 2 devices in connectionless mode.

Interfaces The shared object libdlpi.so.1 provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

dlpi_arptype	dlpi_bind
dlpi_close	dlpi_disabmulti

Name libdoor – doors library

Synopsis `cc [ flag... ] file... -ldoor [ library... ]`
`#include <door.h>`

Description The functions in this library provide programmatic access to doors, including the ability to create and call them. Doors are a fast light-weight RPC mechanism for secure control transfer between processes on the same machine. Conceptually, a thread in one process can issue a call using a door descriptor that causes code to be executed in another process and then returns using the traditional synchronous RPC model. Doors can also be used to pass data and file descriptors between processes.

Interfaces The shared object `libdoor.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>door_bind</code>	<code>door_call</code>
<code>door_create</code>	<code>door_cred</code>

Name libdtrace – DTrace dynamic tracing software library

Description Functions in this library define the interface for interacting with the DTrace dynamic tracing software, including the D language compiler and facilities for enabling probes and consuming trace data.

Interfaces The interfaces provided by libdtrace.so.1 are currently private to the implementation of the Solaris system and DTrace subsystem and are subject to change at any time without notice. Applications using these interfaces might fail to run on future releases. Refer to the *Solaris Dynamic Tracing Guide* for a description of the public documented interfaces available for the DTrace facility.

Files /usr/lib/libdtrace.so.1 shared object
 /usr/lib/64/libdtrace.so.1 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdtrc
Interface Stability	Private
MT-Level	Unsafe

Name libelf – ELF access library

Synopsis `cc [ flag... ] file... -lelf [ library... ]`
`#include <libelf.h>`

Description Functions in this library provide routines to manipulate ELF (Executable and Linking Format) object files, archive files, and archive members. The header provides type and function declarations for all library services.

Interfaces The shared object `libelf.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libexacct – extended accounting file access library

Synopsis `cc [ flag... ] file... -lexacct [ library... ]`
`#include <exacct.h>`

Description Functions in this library define the interface for reading and writing extended accounting (exacct) files. The `<exacct.h>` header provides type and function declarations for all library services, as well as for the characteristics of accounting files generated by the Solaris kernel.

Interfaces The shared object `libexacct.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Notes The SUNWosdem package provides source code for the exdump utility that uses the libxacct APIs to dump the contents of extended accounting files. The source code can be compiled in the directory `/usr/demo/libxacct`.

Name libfmevent – fault management events library

Synopsis

```
cc [ flag... ] file... -L/usr/lib/fm -lfmevent -lnvpair [ library... ]
#include <fm/libfmevent.h>
#include <libnvpair.h>
```

Description This library allows a process to subscribe to a subset of fault management protocol events published by the fault management daemon.

Interfaces The shared object `libfmevent.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Solaris Security for Developers Guide

Name libhbaapi – Common Fibre Channel HBA information library

Synopsis `cc [ flag... ] file... -lhbaapi [ library... ]`
`#include <hbaapi.h>`

Description The functions in this library access Fibre Channel HBA data.

Fibre Channel HBA information is provided through a standard interface in a vendor independent manner. This common interface provides access to the following information:

- Local HBA attributes
- Local HBA port attributes and statistics
- Mapping between FCP-2 discovered devices and operating system SCSI information
- Discovered devices port attributes
- SCSI commands for discovered FCP-2 devices (Report LUNS, Read Capacity, and Inquiry)
- Common Transport commands to discover Fabric details

Interfaces The shared object `libhbaapi.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>HBA_CloseAdapter</code>	<code>HBA_FreeLibrary</code>
<code>HBA_GetAdapterAttributes</code>	<code>HBA_GetAdapterName</code>

Usage Client applications link with the Common Library (using `-lHBAAPI`) to access the interfaces. The Common Library dynamically loads individual Vendor-Specific Libraries (VSL) listed in `/etc/hba.conf` described on the [hba.conf\(4\)](#).

Using the `libhbaapi` involves the following steps:

1. Optionally determining the version of the library by calling `HBA_GetVersion(3HBAAPI)`.
2. Initializing the Common Library by calling `HBA_LoadLibrary(3HBAAPI)`.
3. Determine the number of HBAs known to the common library by calling `HBA_GetNumberOfAdapters(3HBAAPI)`.
4. Determine each HBA name in turn by calling `HBA_GetAdapterName(3HBAAPI)`.
5. Open each HBA in turn by calling `HBA_OpenAdapter(3HBAAPI)`.
6. Operate on a given HBA by calling the following:
 - `HBA_GetAdapterAttributes(3HBAAPI)`
 - `HBA_GetAdapterPortAttributes(3HBAAPI)`
 - `HBA_GetDiscoveredPortAttributes(3HBAAPI)`
 - `HBA_GetPortAttributesByWWN(3HBAAPI)`
 - `HBA_SendCTPassThru(3HBAAPI)`
 - `HBA_SendCTPassThruV2(3HBAAPI)`
 - `HBA_GetEventBuffer(3HBAAPI)`
 - `HBA_SetRNIDMgmtInfo(3HBAAPI)`
 - `HBA_GetRNIDMgmtInfo(3HBAAPI)`
 - `HBA_SendRNID(3HBAAPI)`
 - `HBA_SendRNIDV2(3HBAAPI)`
 - `HBA_RefreshInformation(3HBAAPI)`

- [HBA_RefreshAdapterConfiguration\(3HBAAPI\)](#)
- [HBA_GetVendorLibraryAttributes\(3HBAAPI\)](#)
- [HBA_GetWrapperLibraryAttributes\(3HBAAPI\)](#)
- [HBA_ResetStatistics\(3HBAAPI\)](#)
- [HBA_GetFcpTargetMapping\(3HBAAPI\)](#)
- [HBA_GetFcpTargetMappingV2\(3HBAAPI\)](#)
- [HBA_GetFcpPersistentBinding\(3HBAAPI\)](#)
- [HBA_SendScsiInquiry\(3HBAAPI\)](#)
- [HBA_SendReportLUNs\(3HBAAPI\)](#)
- [HBA_ScsiReportLUNsV2\(3HBAAPI\)](#)
- [HBA_SendReadCapacity\(3HBAAPI\)](#)
- [HBA_SendRLS\(3HBAAPI\)](#)

7. Close open HBAs by calling [HBA_CloseAdapter\(3HBAAPI\)](#).
8. Unload the library by calling [HBA_FreeLibrary\(3HBAAPI\)](#).

Errors Errors are generally returned from the underlying VSL and can include any of the following values:

<code>HBA_STATUS_OK</code>	Request completed successfully. (No Error)
<code>HBA_STATUS_ERROR</code>	Non-specific error encountered.
<code>HBA_STATUS_ERROR_NOT_SUPPORTED</code>	The VSL does not support this interface.
<code>HBA_STATUS_ERROR_INVALID_HANDLE</code>	The <i>handle</i> argument does not refer to an open HBA handle.
<code>HBA_STATUS_ERROR_ARG</code>	An argument in the request was invalid.
<code>HBA_STATUS_ERROR_ILLEGAL_WWN</code>	A WWN in the request was not recognized.
<code>HBA_STATUS_ERROR_ILLEGAL_INDEX</code>	An index in the request was not recognized.
<code>HBA_STATUS_ERROR_MORE_DATA</code>	A larger buffer is required to complete the requested operation.
<code>HBA_STATUS_ERROR_STALE_DATA</code>	The state of the HBA has changed, possibly due to Dynamic Reconfiguration or devices being added or removed. The caller should call HBA_RefreshInformation(3HBAAPI) and reissue any discovery logic to reset all indexes related to this HBA.
<code>HBA_STATUS_SCSI_CHECK_CONDITION</code>	A SCSI check-condition was encountered during the I/O operation. Not all VSLs report this error value. Some might return <code>HBA_STATUS_ERROR</code> when a check-condition is encountered, or <code>HBA_STATUS_OK</code> .

HBA_STATUS_ERROR_BUSY	The requested device is busy. A retry might be effective.
HBA_STATUS_ERROR_TRY_AGAIN	The requested I/O timed out. A retry might be effective.
HBA_STATUS_ERROR_UNAVAILABLE	The requested HBA has been removed or deactivated.

All other error values are reserved.

[T11 FC-MI Specification](#)

Name libidnkit – IDN conversion library

Synopsis `cc [ flag... ] file... -lidnkit [ library... ]`
`#include <idn/api.h>`

Description Functions in this library provide conversions between ACE string and multibyte character string of the current locale or a specified codeset. They support various manipulations of internationalized domain names, including encoding conversion and name preparation. They are designed according to IDNA framework where each application must do necessary preparations for the internationalized domain names before passing them to the resolver. The library provides easy-to-use, high-level interfaces to help applications with the preparation.

The libidnkit library internally uses [iconv\(3C\)](#) to provide encoding conversion from UTF-8 to the local encoding (such as ISO8859-1, usually determined by the current locale), and from the local encoding to UTF-8.

Interfaces The shared object `libidnkit.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>idn_decodename</code>	<code>idn_decodename2</code>
<code>idn_enable</code>	<code>idn_encodename</code>
<code>idn_nameinit</code>	

Files `/usr/lib/libidnkit.so.1` shared object
`/usr/lib/64/libidnkit.so.1` 64-bit shared object

Name libintl – internationalization library

Synopsis

```
cc [ flag... ] file... -lintl [ library... ]
#include <libintl.h>
#include <locale.h> /* needed for dcgettext() only */
```

Description Historically, functions in this library provided wide character translations. This functionality now resides in [libc\(3LIB\)](#).

This library is maintained to provide backward compatibility for both runtime and compilation environments. The shared object is implemented as a filter on `libc.so.1`. New application development need not specify `-lintl`.

Interfaces The shared object `libintl.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>bindtextdomain</code>	<code>dcgettext</code>
<code>dgettext</code>	<code>gettext</code>
<code>textdomain</code>	

Files `/lib/libintl.so.1` a filter on `/lib/libc.so.1`
`/lib/64/libintl.so.1` a filter on `/lib/64/libc.so.1`

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
MT-Level	Safe with exceptions

See Also [pvs\(1\)](#), [Intro\(3\)](#), [gettext\(3C\)](#), [libc\(3LIB\)](#), [attributes\(5\)](#)

Name libkrb5 – MIT Kerberos 5 library

Synopsis `cc -I/usr/include/kerberosv5 [ flag... ] file... -lkrb5 [ library... ]`
`#include <krb5.h>`
`#include <com_err.h>`

Description The functions in this library are the routines that comprise the MIT Kerberos 5 library.

Interfaces The shared object `libkrb5.so` provides the public interface defined below.

The `krb5` library is provided as a convenience to allow native `krb5` applications to be built and to run. Compatibility between Solaris releases of the `krb5` interface is not guaranteed. For new applications that require these features, [libgss\(3LIB\)](#) is recommended.

For detailed documentation on the `krb5` interface, see the MIT Kerberos 5 web site at <http://web.mit.edu/kerberos>.

The `krb5_cc_gen_new` routine, listed in `krb5.h` section, is flawed and should be avoided. Until a new routine is available from MIT, the following can be done:

```
char ccname[40];
int tmpfd;

snprintf(ccname, sizeof(ccname), "FILE:/tmp/krb5cc_%d_XXXXXX",
         geteuid());

if ((tmpfd = mkstemp(ccname+strlen("FILE:")))==-1) {
    log("mkstemp(): %.100s", strerror(errno));
    problem = errno;
    goto fail;
}

if (fchmod(tmpfd, S_IRUSR | S_IWUSR) == -1) {
    log("fchmod(): %.100s", strerror(errno));
    close(tmpfd);
    problem = errno;
    goto fail;
}

close(tmpfd);
problem = krb5_cc_resolve(authctxt->krb5_ctx, ccname, &ccache);
...
fail:
```

The `krb5_string_to_key` and `krb5_string_to_key` routines, listed in `krb5.h` section, are part of the old cryptosystem and should not be used in new apps.

See Also [Intro\(3\)](#), [attributes\(5\)](#)

Name liblgrp – locality group library

Synopsis `cc [ flag... ] file... -llgrp [ library... ]`
`#include <sys/lgrp_user.h>`

Description The functions in this library traverse the lgroup (locality group) hierarchy, discover its contents, and set a thread's affinity for an lgroup. A locality group represents the set of CPU-like and memory-like hardware devices that are at most some locality apart from each other.

Interfaces The shared object `liblgrp.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>lgrp_affinity_get</code>	<code>lgrp_affinity_set</code>
<code>lgrp_children</code>	<code>lgrp_cookie_stale</code>

Name libm – C math library

Synopsis c99 [*flag...*] *file...* -lm [*library...*]

Description Functions in this library provide common elementary mathematical functions and floating point environment routines defined by System V, ANSI C, POSIX, and so on. See [standards\(5\)](#). Additional functions in this library provide extended support for handling floating point exceptions.

Interfaces The shared object libm.so.2 provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

------------------------	------------------------

Accuracy ISO/IEC 9899:1999, also known as C99, specifies the functions listed in the following tables and states that the accuracy of these functions is “implementation-defined”. The information below characterizes the accuracy of these functions as implemented in `libm.so.2`. For each function, the tables provide an upper bound on the largest error possible for any argument and the largest error actually observed among a large sample of arguments. Errors are expressed in “units in the last place”, or ulps, relative to the exact function value for each argument (regarding the argument as exact). Ulp depends on the precision of the floating point format: if y is the exact function value, x and x' are adjacent floating point numbers such that $x < y < x'$, and x'' is the computed function value, then provided x , x' , and x'' all lie in the same binade, the error in x'' is $|y - x''| / |x - x'|$ ulps. In particular, when the error is less than one ulp, the computed value is one of the two floating point numbers adjacent to the exact value.

The bounds and observed errors listed below apply only in the default floating point modes. Specifically, on SPARC, these bounds assume the rounding direction is round-to-nearest and non-standard mode is disabled. On x86, the bounds assume the rounding direction is round-to-nearest and the rounding precision is round-to-64-bits. Moreover, on x86, floating point function values are returned in a floating point register in extended double precision format, but the bounds below assume that the result value is then stored to memory in the format corresponding to the function's type. On x64, the bounds assume the rounding

direction in both the x87 floating point control word and the MXCSR is round-to-nearest, the rounding precision in the x87 control word is round-to-64-bits, and the FTZ and DAZ modes are disabled.

The error bounds listed below are believed to be correct, but smaller bounds might be proved later. The observed errors are the largest ones currently known, but larger errors might be discovered later. Numbers in the notes column refer to the notes following the tables.

Real Functions

function	(ulps)	observed (ulps)	notes
tgamma1	1.0	< 1	

Notes:

- [1] On SPARC and x64, `sqrtf`, `sqrt`, and `sqrtl` are correctly rounded in accordance with IEEE 754. On x86, `sqrtl` is correctly rounded, `sqrtf` is correctly rounded provided the result is narrowed to single precision as discussed above, but `sqrt` might not be correctly rounded due to “double rounding”: when the intermediate value computed to extended precision lies exactly halfway between two representable numbers in double precision, the result of rounding the intermediate value to double precision is determined by the round-ties-to-even rule. If this rule causes the second rounding to round in the same direction as the first, the net rounding error can exceed 0.5 ulps. (The error is bounded instead by $0.5 \cdot (1 + 2^{-11})$ ulps.)
- [2] Error bounds for `lgamma` and `lgammal` apply only for positive arguments.

Complex functions The real-valued complex functions `cabsf`, `cabs`, `cabsl`, `cargf`, `carg`, and `cargl` are equivalent to the real functions `hypotf`, `hypot`, `hypotl`, `atan2f`, `atan2`, and `atan2l`, respectively. The error bounds and observed errors given above for the latter functions also apply to the former.

The complex functions listed below are complex-valued. For each function, the error bound shown applies separately to both the real and imaginary parts of the result. (For example, both the real and imaginary parts of `cacosf(z)` are accurate to within 1 ulp regardless of their magnitudes.) Similarly, the largest observed error shown is the largest error found in either the real or the imaginary part of the result.

Single precision complex functions (SPARC and x64)

	error bound	largest error	
function	(ulps)	observed (ulps)	notes
cacosf, cacoshf	1	< 1	[1]

ctanl, ctanhl	13	5	

Notes:

- [1] The complex hyperbolic trigonometric functions are equivalent by symmetries to their circular trigonometric counterparts. Because the implementations of these functions exploit these symmetries, corresponding functions have the same error bounds and observed errors.
- [2] For large arguments, the results computed by cpowf, cpow, and cpowl can have unbounded relative error. It might be possible to give error bounds for specific domains, but no such bounds are currently available. The observed errors shown are for the domain $\{(z, w) : \max(|\operatorname{Re} z|, |\operatorname{Im} z|, |\operatorname{Re} w|, |\operatorname{Im} w|) \leq 1\}$.

Files `/lib/libm.so.2` shared object
 `/lib/64/libm.so.2` 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWlibmsr
MT-Level	Safe with exceptions

As described on the [lgamma\(3M\)](#) manual page, `gamma()` and `lgamma()` and their `float` and `long double` counterparts are Unsafe. All other functions in `libm.so.2` are MT-Safe.

See Also [Intro\(3\)](#), [lgamma\(3M\)](#), [math.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name libmail – user mailbox lockfile management library

Synopsis `cc [ flag... ] file... -lmail [ library... ]`
`#include <maillock.h>`

Description Interfaces in this library provide functions for managing user mailbox lockfiles.

Interfaces The shared object `libmail.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

```
maillock                                mailunlock
touchlock

Name libmd – Message Digest library

Synopsis `cc [ flag... ] file... -lmd [ library... ]`
`#include <md4.h>`
`#include <md5.h>`
`#include <sha1.h>`
`#include <sha2.h>`

Description Functions in this library provide hashing routines for MD4 (RFC1320), MD5 (RFC1321), SHA1 (RFC3174), SHA256 (FIPS 180-2), SHA384 (FIPS 180-2), SHA512 (FIPS 180-2).

Interfaces The shared object `libmd.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

MD4Final	MD4Init
MD4Update	md5_calc
MD5Final	MD5Init
MD5Update	SHA1Final
SHA1Init	SHA1Update
SHA2Final	SHA2Init
SHA2Update	

Security The MD4 and MD5 algorithms are currently considered weak for cryptographic use. The algorithms should be used only for compatibility with legacy systems or protocols.

The SHA1 algorithm is also believed to have some weaknesses. Migration to one of the SHA2 algorithms—including SHA256, SHA386 or SHA512—is highly recommended when compatibility with data formats and on wire protocols is permitted.

Files `/lib/libmd.so.1` shared object

Name libmenu – menus library

Synopsis `cc [ flag... ] file... -lmenu [ library... ]`

Description Functions in this library provide menus using [libcurses\(3LIB\)](#) routines.

Interfaces The shared object `libmenu.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>current_item</code>	<code>free_item</code>
<code>free_menu</code>	<code>item_count</code>
<code>item_description</code>	<code>item_index</code>
<code>item_init</code>	<code>item_name</code>
<code>item_opts</code>	<code>item_opts_off</code>
<code>item_opts_on</code>	<code>item_term</code>
<code>item_userptr</code>	<code>item_value</code>
<code>item_visible</code>	<code>menu_back</code>
<code>menu_driver</code>	<code>menu_fore</code>
<code>menu_format</code>	<code>menu_grey</code>
<code>menu_init</code>	<code>menu_items</code>
<code>menu_mark</code>	<code>menu_opts</code>
<code>menu_opts_off</code>	<code>menu_opts_on</code>
<code>menu_pad</code>	<code>menu_pattern</code>
<code>menu_sub</code>	<code>menu_term</code>
<code>menu_userptr</code>	<code>menu_win</code>
<code>new_item</code>	<code>new_menu</code>
<code>pos_menu_cursor</code>	<code>post_menu</code>
<code>scale_menu</code>	<code>set_current_item</code>
<code>set_item_init</code>	<code>set_item_opts</code>
<code>set_item_term</code>	<code>set_item_userptr</code>
<code>set_item_value</code>	<code>set_menu_back</code>
<code>set_menu_fore</code>	<code>set_menu_format</code>
<code>set_menu_grey</code>	<code>set_menu_init</code>

set_menu_items	set_menu_mark
set_menu_opts	set_menu_pad
set_menu_pattern	set_menu_sub
set_menu_term	set_menu_userptr
set_menu_win	set_top_row
top_row	unpost_menu

Files /usr/lib/libmenu.so.1 shared object
/usr/lib/64/libmenu.so.1 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTETYPE	ATTRIBUTEVALUE
Availability	SUNWcsl (32-bit)
	SUNWcslx (64-bit)
MT-Level	Unsafe

Name libmllib – mediaLib library

Synopsis `cc [flag...] file... -lmllib [library...]
#include <mllib.h>`

Description Interfaces in this library provide functions for multimedia processing. When executed on an UltraSPARC platform, these functions take advantage of the VIS Instruction Set. When executed on an AMD64 platform, these functions take advantage of the MMX/SSE/SSE2 instructions.

Interfaces The shared object `libmllib.so.2` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

- System Functions
- `mllib_free`
 - `mllib_malloc`
 - `mllib_memcpy`
 - `mllib_memmove`
 - `mllib_memset`
 - `mllib_realloc`
 - `mllib_version`
- Algebra Functions
- `mllib_MatrixAdd_S16C_Mod`
 - `mllib_MatrixAdd_S16C_S16C_Mod`
 - `mllib_MatrixAdd_S16C_S16C_Sat`
 - `mllib_MatrixAdd_S16C_S8C_Mod`
 - `mllib_MatrixAdd_S16C_S8C_Sat`
 - `mllib_MatrixAdd_S16C_Sat`
 - `mllib_MatrixAdd_S16C_U8C_Mod`
 - `mllib_MatrixAdd_S16C_U8C_Sat`
 - `mllib_MatrixAdd_S16_Mod`

[mediaLib User's Manual](#)

Name libmllib_mt – multi-threaded mediaLib

Synopsis `cc [ flag... ] file... -lmllib_mt -lmllib [ library... ]`
`#include <mllib.h>`

Description Interfaces in this library provide functions for multimedia processing. Multi-threaded (MT) mediaLib is a software layer developed on top of mediaLib using OpenMP. When it is used with a large data set on a multi-processor system, MT mediaLib will partition data into subsets and process the subsets in parallel, thus greatly improving performance of applications that use mediaLib.

Interfaces The shared object `libmllib_mt.so.2` provides the same public interfaces as those defined in [libmllib\(3LIB\)](#). See [Intro\(3\)](#) for additional information on shared object interfaces.

Usage There are two ways to use MT mediaLib.

1. Pre-load a multi-threaded mediaLib library during runtime by setting the `LD_PRELOAD` environment variable as follows before starting your application, in Bourne/Korn shell:

```
LD_PRELOAD=libmllib_mt.so
export LD_PRELOAD
```

or in C shell:

```
setenv LD_PRELOAD libmllib_mt.so
```

In this way, you can take advantage of MT mediaLib without rebuilding your application.

2. Link your application with a multi-threaded mediaLib library directly as shown under SYNOPSIS. In this way, an MT mediaLib library is always used whenever your application is started.

The parallelization of MT mediaLib is controlled, in part, by the `PARALLEL` environment variable. You can change its setting to adjust the degree of parallelization before starting your application, in Bourne/Korn shell:

```
PARALLEL=n
export PARALLEL
```

or in C shell:

```
setenv PARALLEL n
```

where `n` is a positive integer for number of threads. Note that other factors also affect the degree of parallelization in MT mediaLib.

Name libmp – multiple precision library

Synopsis `cc [ flag... ] file... -lmp [ library... ]`
`#include <mp.h>`

Description Functions in this library provide various multiple precision routines.

Interfaces The shared object `libmp.so.2` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>mp_gcd</code>	<code>mp_itom</code>
<code>mp_madd</code>	<code>mp_mcmp</code>
<code>mp_mdiv</code>	<code>mp_mfree</code>
<code>mp_min</code>	<code>mp_mout</code>
<code>mp_msqrt</code>	<code>mp_msub</code>
<code>mp_mtox</code>	<code>mp_mult</code>
<code>mp_pow</code>	<code>mp_rpow</code>
<code>mp_sdiv</code>	<code>mp_xtom</code>

Name libMPAPI, libmpapi – Common Multipath Management library

Synopsis `cc [ flag... ] file... -lMPAPI [ library... ]`
`#include <mpapi.h>`

Description The functions in this library allow a management application to administer the multipath devices and associated resources through standard interfaces, independent of a vendor-unique multipathing solution.

Interfaces The shared object `libMPAPI.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

- `MP_AssignLogicalUnitToTPG`
- `MP_CancelOverridePath`
- `MP_CompareOIDs`
- `MP_DeregisterForObjectPropertyChanges`
- `MP_DeregisterForObjectVisibilityChanges`
- `MP_DeregisterPlugin`
- `MP_DisableAutoFailback`
- `MP_DisableAutoProbing`
- `MP_DisablePath`
- `MP_EnableAutoFailback`
- `MP_EnableAutoProbing`
- `MP_EnablePath`
- `MP_FreeOidList`
- `MP_GetAssociatedPathOidList`
- `MP_GetAssociatedPluginOid`
- `MP_GetAssociatedTPGOidList`
- `MP_GetDeviceProductOidList`
- `MP_GetDeviceProductProperties`
- `MP_GetInitiatorPortOidList`
- `MP_GetInitiatorPortProperties`
- `MP_GetLibraryProperties`
- `MP_GetMPLogicalUnitProperties`
- `MP_GetMPLuOidListFromTPG`
- `MP_GetMultipathLus`
- `MP_GetObjectType`
- `MP_GetPathLogicalUnitProperties`
- `MP_GetPluginOidList`
- `MP_GetPluginProperties`
- `MP_GetProprietaryLoadBalanceOidList`
- `MP_GetProprietaryLoadBalanceProperties`
- `MP_GetTargetPortGroupProperties`
- `MP_GetTargetPortOidList`
- `MP_GetTargetPortProperties`
- `MP_RegisterForObjectPropertyChanges`

- MP_RegisterForObjectVisibilityChanges
- MP_RegisterPlugin
- MP_SetFailbackPollingRate
- MP_SetLogicalUnitLoadBalanceType
- MP_SetOverridePath
- MP_SetPathWeight
- MP_SetPluginLoadBalanceType
- MP_SetProbingPollingRate
- MP_SetProprietaryProperties
- MP_SetTPGAccess

Usage Client applications link with the Common Library (using -lMPAPI) to access the interfaces. The Common Library dynamically loads an individual vendor-provided plugin library that is available through [MP_RegisterPlugin\(3MPAPI\)](#) on the host system.

Using libMPAPI involves the following steps:

1. Optionally calling `MP_GetLibraryProperties()` to retrieve the properties of the Common Library.
2. Calling `MP_GetPluginOidList()` to retrieve the registered plugin libraries.
3. Optionally calling `MP_GetPluginProperties()` to retrieve the properties of the plugin library.
4. Retrieve discovery information and property information on multipath devices and associated resources by calling the following:
 - `MP_GetAssociatedPathOidList()`
 - `MP_GetAssociatedTPGOidList()`
 - `MP_GetDeviceProductOidList()`
 - `MP_GetDeviceProductProperties()`
 - `MP_GetInitiatorPortOidList()`
 - `MP_GetInitiatorPortProperties()`
 - `MP_GetMPLuOidListFromTPG()`
 - `MP_GetMPLogicalUnitProperties()`
 - `MP_GetMultipathLus()`
 - `MP_GetPathLogicalUnitProperties()`
 - `MP_GetProprietaryLoadBalanceOidList()`
 - `MP_GetProprietaryLoadBalanceProperties()`
 - `MP_GetTargetPortGroupProperties()`
 - `MP_GetTargetPortOidList()`
 - `MP_GetTargetPortProperties()`
5. Register and deregister for property and visibility changes on multipath devices and associated resources by calling:
 - `MP_RegisterForObjectPropertyChanges()`
 - `MP_RegisterForObjectVisibilityChanges()`

- `MP_DeregisterForObjectPropertyChanges()`
 - `MP_DeregisterForObjectVisibilityChanges()`
6. Perform administrative operations on multipath devices and associated resources by calling:
- `MP_AssignLogicalUnitToTPG()`
 - `MP_CancelOverridePath()`
 - `MP_DisableAutoFailback()`
 - `MP_DisableAutoProbing()`
 - `MP_DisablePath()`
 - `MP_EnableAutoFailback()`
 - `MP_EnableAutoProbing()`
 - `MP_EnablePath()`
 - `MP_SetLogicalUnitLoadBalanceType()`
 - `MP_SetOverridePath()`
 - `MP_SetPathWeight()`
 - `MP_SetPluginLoadBalanceType()`
 - `MP_SetFailbackPollingRate()`
 - `MP_SetProbingPollingRate()`
 - `MP_SetProprietaryProperties()`
 - `MP_SetTPGAccess()`

Errors Errors are generally returned from the underlying VSL and can include any of the following values:

<code>MP_STATUS_SUCCESS</code>	This status value is returned when the requested operation is successfully carried out.
<code>MP_STATUS_INVALID_PARAMETER</code>	This status value is returned when parameters passed to an API are detected to be invalid or inappropriate for a particular API parameter. If the parameter is an object ID, this status indicates that the object type subfield is defined in this specification, but is not appropriate for this API
<code>MP_STATUS_UNKNOWN_FN</code>	This status value is returned when a client function passed into the API is not a previously registered or known function.
<code>MP_STATUS_FAILED</code>	This status value is returned when the requested operation could not be carried out.
<code>MP_STATUS_INSUFFICIENT_MEMORY</code>	This status value is returned when the API could [not] allocate the memory required to complete the requested operation.

<code>MP_STATUS_INVALID_OBJECT_TYPE</code>	This status value is returned when an object ID includes a type subfield that is not defined in this specification.
<code>MP_STATUS_OBJECT_NOT_FOUND</code>	This status value is returned when the object associated with the ID specified in the API could not be located, or has been deleted. Note that an invalid object type is covered by <code>MP_STATUS_INVALID_OBJECT_TYPE</code> so this status is limited to an invalid object owner identifier or sequence number.
<code>MP_STATUS_UNSUPPORTED</code>	This status value is returned when the implementation does not support the requested function.
<code>MP_STATUS_FN_REPLACED</code>	This status value is returned when a client function passed into the API replaces a previously registered function.
<code>MP_STATUS_ACCESS_STATE_INVALID</code>	This status value is returned when a device processing <code>MP_SetTPGAccess</code> returns a status indicating that the caller is attempting to establish an illegal combination of access states.
<code>MP_STATUS_PATH_NONOPERATIONAL</code>	This status is returned when communication cannot be established with the path selected by the caller.
<code>MP_STATUS_TRY_AGAIN</code>	This status is returned when the plugin or driver is unable to complete the request, but might be able to complete it later.
<code>MP_STATUS_NOT_PERMITTED</code>	The operation is not permitted in the current configuration, but might be permitted in other configurations.

Name libnsl – network services library

Synopsis `cc [ flag... ] file... -lnsl [ library... ]`

Description Functions in this library provide routines that provide a transport-level interface to networking services for applications, facilities for machine-independent data representation, a remote procedure call mechanism, and other networking services useful for application programs.

Some symbols are not intended to be referenced directly. Rather, they are exposed because they are used elsewhere through a private interface. One such example is the set of symbols beginning with the `_xti` prefix. Those symbols are used in implementing the X/Open Transport Interface (XTI) interfaces documented in `libxnet`. See [libxnet\(3LIB\)](#).

Interfaces The shared object `libnsl.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libnvpair – name-value pair library

Synopsis `cc [ flag... ] file... -lnvpair [ library... ]`
`#include <libnvpair.h>`

Description The libnvpair library exports a set of functions for managing name-value pairs.

The library defines four opaque handles:

<code>nvpair_t</code>	handle to a name-value pair
<code>nvlist_t</code>	handle to a list of name-value pairs
<code>nv_alloc_t</code>	handle to a pluggable allocator
<code>nv_alloc_ops_t</code>	handle to pluggable allocator operations

The library supports the following operations:

- Allocate and free an `nvlist_t`.
- Specify the allocator to be used when manipulating an `nvlist_t`.
- Add and remove an `nvpair_t` from a list.
- Search `nvlist_t` for a specified name pair.
- Pack an `nvlist_t` into a contiguous buffer.
- Expand a packed nvlist into a searchable `nvlist_t`.

Interfaces The shared object `libnvpair.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libpapi – Free Standards Group Open Printing API (PAPI) library functions

Synopsis `cc [flag...] file... -lpapi [library...]
#include <papi.h>`

Description Functions in this library provide an interface for interaction with print services as described in v1.0 of the Free Standards Group (FSG) Open Printing API (PAPI).

This particular implementation of the PAPI includes naming support as described in the [printers.conf\(4\)](#) and [printers\(4\)](#) manual pages. It also supplies support for interaction with local LP services, remote LPD services, and remote IPP services through the use of loadable modules that export the same interface. These modules should not be linked with directly, but can be used directly at runtime through the use of LD_PRELOAD for debugging purposes.

Interfaces The shared object `libpapi.so.0` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libpctx – process context library

Synopsis `cc [ flag... ] file... -lpctx [ library... ]`

Description Functions in this library provide a simple means to access the underlying facilities of [proc\(4\)](#) to allow a controlling process to manipulate the state of a controlled process.

This library is primarily for use in conjunction with the [libcpc\(3LIB\)](#) library. Used together, these libraries allow developers to construct tools that can manipulate CPU performance counters in other processes. The [cputrack\(1\)](#) utility is an example of such a tool.

Interfaces The shared object `libpctx.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libpkcs11 – PKCS#11 Cryptographic Framework library

Synopsis `cc [ flag... ] file... -lpkcs11 [ library... ]`
`#include <security/cryptoki.h>`
`#include <security/pkcs11.h>`

Description The libpkcs11 library implements the RSA Security Inc. PKCS#11 Cryptographic Token Interface (Cryptoki), v2.20 specification by using plug-ins to provide the slots.

Each plug-in, which also implements RSA PKCS#11 v2.20, represents one or more slots.

The libpkcs11 library provides a special slot called the meta slot. The meta slot provides a virtual union of capabilities of all other slots. When available, the meta slot is always the first slot provided by libpkcs11.

The meta slot feature can be configured either system-wide or by individual users.

System-wide configuration for meta slot features is done with the [cryptoadm\(1M\)](#) utility. User configuration for meta slot features is performed with environment variables.

By default, the following is the system-wide configuration for meta slot. Meta slot is enabled. Meta slot provides token-based object support with the Software RSA PKCS#11 softtoken ([pkcs11_softtoken\(5\)](#)). Meta slot is allowed to move sensitive token objects to other slots if that is necessary to perform an operation.

Users can overwrite one or more system-wide configuration options for meta slot using these environment variables.

The `${METASLOT_OBJECTSTORE_SLOT}` and `${METASLOT_OBJECTSTORE_TOKEN}` environment variables are used to specify an alternate token object store. A user can specify either slot-description in `${METASLOT_OBJECTSTORE_SLOT}` or token-label in `${METASLOT_OBJECTSTORE_TOKEN}`, or both. Valid values for slot-description and token-label are available from output of the command:

```
cryptoadm list -v
```

The `${METASLOT_ENABLED}` environment variable is used to specify whether the user wants to turn the metaslot feature on or off. Only two values are recognized. The value “true” means meta slot will be on. The value “false” means meta slot will be off.

The `${METASLOT_AUTO_KEY_MIGRATE}` environment variable is used to specify whether the user wants sensitive token objects to move to other slots for cryptographic operations. Only two values are recognized. The value “true” means meta slot will migrate sensitive token objects to other slots if necessary. The value “false” means meta slot will not migrate sensitive token objects to other slots even if it is necessary.

When the meta slot feature is enabled, the slot that provides token-based object support is not shown as one of the available slots. All of its functionality can be used with the meta slot.

This library filters the list of mechanisms available from plug-ins based on the policy set by [cryptoadm\(1M\)](#).

This library provides entry points for all PKCS#11 v2.20 functions. See the RSA PKCS#11 v2.20 specification at <http://www.rsasecurity.com>.

Plug-ins are added to `libpkcs11` by the `pkcs11conf` class action script during execution of `pkgadd(1M)`. The available mechanisms are administered by the `cryptoadm(1M)` utility.

Plug-ins must have all of their library dependancies specified, including `libc(3LIB)`. Libraries that have unresolved symbols, including those from `libc`, will be rejected and a message will be sent to `syslog(3C)` for such plug-ins.

Due to U.S. Export regulations, all plug-ins are required to be cryptographically signed using the `elfsign` utility.

Any plug-in that is not signed or is not a compatible version of PKCS#11 will be dropped by `libpkcs11`. When a plug-in is dropped, the administrator is alerted by the `syslog(3C)` utility.

The `<security/pkcs11f.h>` header contains function definitions. The `<security/pkcs11t.h>` header contains type definitions. Applications can include either of these headers in place of `<security/pkcs11.h>`, which contains both function and type definitions.

Interfaces The shared object `libpkcs11.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

SUNW Extensions SUNW_C_GetMechSession SUNW_C_KeyToObject

Files /usr/lib/libpkcs11.so.1 shared object
 /usr/lib/64/libpkcs11.so.1 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	See below.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
MT-Level	See below.

The SUNW Extension functions are Evolving. The PKCS#11 Standard functions are Standard: PKCS#11 v2.20.

The SUNW Extension functions are MT-Safe. The PKCS#11 Standard functions are MT-Safe with exceptions. See Section 6.5.2 of RSA PKCS#11 v2.20.

See Also [cryptoadm\(1M\)](#), [pkgadd\(1M\)](#), [Intro\(3\)](#), [SUNW_C_GetMechSession\(3EXT\)](#), [syslog\(3C\)](#), [attributes\(5\)](#), [pkcs11_kernel\(5\)](#), [pkcs11_softtoken\(5\)](#)

RSA PKCS#11 v2.20 <http://www.rsasecurity.com>

Notes If an application calls `C_WaitForSlotEvent()` without the `CKF_DONT_BLOCK` flag set, `libpkcs11` must create threads internally. If, however, `CKF_LIBRARY_CANT_CREATE_OS_THREADS` is set, `C_WaitForSlotEvent()` returns `CKR_FUNCTION_FAILED`.

The PKCS#11 library does not work with Netscape 4.x but does work with more recent versions of Netscape and Mozilla.

Because `C_Initialize()` might have been called by both an application and a library, it is not safe for a library or its plugins to call `C_Finalize()`. A library can be finished calling functions from `libpkcs11`, while an application might not.

Name libplot, lib300, lib300s, lib4014, lib450, libvt0 – graphics interface libraries

Synopsis `cc [ flag... ] file... -lplot [ library... ]`
`#include <plot.h>`

Description Functions in this library generate graphics output.

Interfaces The shared object `libplot.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libpool – pool configuration manipulation library

Synopsis `cc [ flag... ] file... [ library... ]`
`#include <pool.h>`

Description The functions in this library define the interface for reading and writing resource pools configuration files, as well as that for committing an existing configuration to becoming the running OS configuration (with respect to partitioning subsystems). The `<pool.h>` header provides type and function declarations for all library services.

The resource pools facility brings together process-bindable resources into a common abstraction called a pool. Processor sets and other entities can be configured, grouped, and labelled in a persistent fashion such that workload components can be associated with a subset of a system's total resources. The libpool library provides a C language API for accessing this functionality, while `pooladm(1M)`, `poolbind(1M)`, and `poolcfg(1M)` make this facility available through command invocations from a shell. Each of those manual pages describes aspects of the pools facility; this page describes the properties available to the various entities managed within the pools facility. These entities include the system, pools, and the pset resources for processor sets.

When the pools facility is enabled on a system, the behavior of the following functions is modified.

System Call	Error Value
<code>pset_assign(pset!=PS_QUERY)</code>	ENOTSUP
<code>pset_bind(pset!=PS_QUERY)</code>	ENOTSUP
<code>pset_create()</code>	ENOTSUP
<code>pset_destroy()</code>	ENOTSUP
<code>pset_setattr()</code>	ENOTSUP

Each active entity within the resource pools framework can have an arbitrary collection of named, typed properties associated with it. Properties supported by the pools framework are listed, with descriptions, under each entity below. In general, resource properties can be one of five types: boolean (`bool`), signed (`int64`) and unsigned (`uint64`) integers, floating point (`double`), and string values.

All entities and resources support a string property for commenting purposes; this property is available for use by management applications to record descriptions and other administrator oriented data. The comment field is not used by the default pools commands, except when a configuration is initiated by the `poolcfg` utility, in which case an informative message is placed in the `system.comment` property for that configuration.

System	Property name	Type	Description
	<code>system.allocate-method</code>	string	Allocation method to use when this configuration is instantiated
	<code>system.bind-default</code>	bool	If specified pool not found, bind to pool with 'pool.default' property set to true
	<code>system.comment</code>	string	User description of system
	<code>system.name</code>	string	User name for the configuration
	<code>system.version</code>	int64	libpool version required to manipulate this configuration
	<code>system.pool.d.log-level</code>	string	pool.d logging level
	<code>system.pool.d.log-location</code>	string	pool.d logging location
	<code>system.pool.d.history-file</code>	string	pool.d decision history location
	<code>system.pool.d.monitor-interval</code>	uint64	pool.d monitoring sample interval
	<code>system.pool.d.objectives</code>	string	pool.d objectives for a system.

The `system.allocate-method`, `system.bind-default`, `system.comment`, `system.name`, `system.pool.d.log-level`, `system.pool.d.log-location`, `system.pool.d.history-file`, `system.pool.d.monitor-interval`, and `system.pool.d.objectives` properties are writable; the `system.version` property is not.

The `system.allocate-method` property accepts only two values, “importance based” and “surplus to default”. The default value for this property is “importance based”. The property is optional and if it is not present the library will allocate resources as though it were present and had the default value. These strings are defined in `<pool.h>` as `POA_IMPORTANCE` and `POA_SURPLUS_TO_DEFAULT`.

If “importance based” allocation is defined, then during a commit the library will allocate resources to pools using an algorithm that observes minimum and maximum constraints for resources but favors those resources with greater importance.

If “surplus to default” is defined, then during a commit the library will allocate minimum resources to all resource sets apart from default which will receive any surplus.

The `system.bind-default` property defaults to true. This property interacts with the `project.pool` resource control to specify the binding behavior for processes associated with a project. If `project.pool` is not specified, then this property has no effect. If `project.pool` is specified and the specified pool exists, this property has no effect. If the specified pool does not exist, perhaps because of a reconfiguration, then this property controls the binding behavior for the project member. If `system.bind-default` is true, then the project member is bound to the default pool (identified as the pool for which `pool.default` is true); otherwise the project

member is refused access to the system. Care should be taken with the pools configuration if this property is set to false, so as to avoid denying users access to the system.

The various `pool`d properties are used to configure the operation of `pool`d(1M).

The `system.pool`d.`log-level` property is used to specify the level of detail provided in log messages. Valid values are: `ALERT`, `CRIT`, `ERR`, `WARNING`, `NOTICE`, `INFO`, and `DEBUG`.

`ALERT` provides the least level of detail, `DEBUG` the greatest. See `syslog`(3C) for more information about the meaning of these debug levels. If this property is not specified, the default value `NOTICE` is used.

The `system.pool`d.`log-location` property is used to specify the location of the logfiles generated by `pool`d. The special value of “`syslog`” indicates that logged messages should be written to `syslog` (). If this property is not specified, the default location `/var/log/pool` is used.

The `system.pool`d.`history-file` specifies the location of the decision history file which is used by `pool`d to improve the quality of its decision making over time. If this property is not specified, the default location `/var/adm/pool` is used.

The `system.pool`d.`monitor-interval` property specifies the monitoring interval (in milliseconds) to be used by `pool`d when sampling utilization statistics. If this property is not specified, the default value of 15 seconds is used.

The `system.pool`d.`objectives` property specifies any system wide objectives. An objectives property has the following syntax:

```
objectives = objective [; objective]*
objective = [n:] keyword [op] [value]
```

All objectives are prefixed with an optional importance. The importance acts as a multiplier for the objective and thus increases the significance of its contribution to the objective function evaluation. If no importance is specified, the default value is 1.

The “`wt-load`” objective is the only objective to which a system element can be set. This objective favors configurations that match resource allocations to resource utilization. A resource set that uses more resources will be given more resources when this objective is active. An administrator should use this objective when he is relatively satisfied with the constraints established using the minimum and maximum properties and would like the `DRP` to manipulate resources freely within those constraints.

Pools	Property name	Type	Description
	<code>pool.active</code>	<code>bool</code>	Mark this pool as active, if true.
	<code>pool.comment</code>	<code>string</code>	User description of pool.

Property name	Type	Description
<code>pool.default</code>	<code>bool</code>	Mark this pool as the default pool, if true; see <code>system.bind-default</code> property.
<code>pool.importance</code>	<code>int64</code>	Relative importance of this pool; for possible resource dispute resolution.
<code>pool.name</code>	<code>string</code>	User name for pool; used by <code>setproject(3PROJECT)</code> as value for 'project.pool' project attribute in <code>project(4)</code> database.
<code>pool.scheduler</code>	<code>string</code>	Scheduler class to which consumers of this pool will be bound. This property is optional and if not specified, the scheduler bindings for consumers of this pool are not affected.
<code>pool.sys_id</code>	<code>int64</code>	System-assigned pool ID.
<code>pool.temporary</code>	<code>bool</code>	Mark this pool as a temporary resource; if true, this pool can exist only in the dynamic configuration and cannot be committed to a configuration file.

The `pool.default`, `pool.sys_id`, and `pool.temporary` properties are not writable; all other listed properties are writable.

If `pool.scheduler` is specified, it must be set to the name of a valid scheduling class for the system. See the `-c` option for `prctl(1)` for a list of valid class names.

Processor Sets

Property name	Type	Description
<code>pset.comment</code>	<code>string</code>	User description of resource.
<code>pset.default</code>	<code>bool</code>	Marks default processor set.
<code>pset.load</code>	<code>uint64</code>	The load for this processor set.
<code>pset.max</code>	<code>uint64</code>	Maximum number of CPUs permitted in this processor set.
<code>pset.min</code>	<code>uint64</code>	Minimum number of CPUs permitted in this processor set.
<code>pset.name</code>	<code>string</code>	User name for resource.
<code>pset.size</code>	<code>uint64</code>	Current number of CPUs in this processor set.
<code>pset.sys_id</code>	<code>int64</code>	System-assigned processor set ID.

Property name	Type	Description
pset.temporary	bool	Mark this processor set as a temporary resource; if true, this processor set can exist only in the dynamic configuration and cannot be committed to a configuration file.
pset.type	string	Names resource type; value for all processor sets is pset.
pset.units	string	Identifies meaning of size-related properties; value for all processor sets is population.
pset.poolid.objectives	string	Specifies the poolid objectives for a pset.

The pset.comment, pset.max, pset.min, pset.name, and pset.poolid.objectives properties are writable; the pset.default, pset.load, pset.size, pset.sys_id, pset.temporary, pset.type, and pset.units properties are not.

The pset.load property represents the load on a processor set. The lowest value for this property is 0. The value of pset.load increases in a linear fashion with the load on the set, as measured by the number of jobs in the system run queue.

The pset.poolid.objectives property specifies an objective which is specific to a particular pset. See the system.poolid.objectives entry for the specification of this property's syntax.

There are two types of objectives that can be set on a pset:

locality	This objective influences the impact that locality, as measured by lgroup data, has upon the chosen configuration. This objective can take one of three values:	
	tight	If set, configurations that maximize resource locality are favored.
	loose	If set, configurations that minimize resource locality are favored.
	none	This is the default value for this objective. If set, configuration favorability is uninfluenced by resource locality.
utilization	This objective favors configurations that allocate resources to partitions that are failing to preserve the specified utilization objective.	

- These objectives are specified in terms of an operator and a value. The operators are
- < The "less than" operator is used to indicate that the specified value should be treated as a maximum target value.
 - > The "greater than" operator is used to indicate that the specified value should be treated as a minimum target value.

- ~ The “about” operator is used to indicate that the specified value should be treated as a target value about which some fluctuation is acceptable.

Only one objective of each type of operator can be set. For example, if the ~ operator is set, the < and > operators cannot be set. It is possible to set a < and a > operator together; the values will be validated to ensure that they do not overlap.

Processors	Property name	Type	Description
	<code>cpu.comment</code>	string	User description of CPU.
	<code>cpu.pinned</code>	bool	CPU pinned to this processor set.
	<code>cpu.status</code>	int64	Processor status, on-line, offline or interrupts disabled.
	<code>cpu.sys_id</code>	int64	System-assigned processor ID.

The `cpu.comment`, `cpu.pinned`, and `cpu.status` properties are writeable.

The `cpu.status` property can be set only to the following values:

- `off-line` Set the CPU offline.
- `on-line` Set the CPU online.
- `no-intr` Disable interrupt processing on the CPU.

These values are defined in `<sys/processor.h>` as the `PS_OFFLINE`, `PS_ONLINE`, and `PS_NOINTR` macros.

Interfaces The shared object `libpool.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

See Also [Intro\(3\)](#), [pool_component_info\(3POOL\)](#), [pool_conf_open\(3POOL\)](#), [pool_conf_to_elem\(3POOL\)](#), [pool_create\(3POOL\)](#), [pool_error\(3POOL\)](#), [pool_get_binding\(3POOL\)](#), [pool_get_property\(3POOL\)](#), [pool_get_resource\(3POOL\)](#), [pool_resource_create\(3POOL\)](#), [pool_value_alloc\(3POOL\)](#), [pool_walk_pools\(3POOL\)](#), [attributes\(5\)](#), [smf\(5\)](#)

Notes Functions in `libpool` can be used to manipulate static configurations even when the pools facility is not enabled. See [pooladm\(1M\)](#) and [pool_set_status\(3POOL\)](#) for more information about enabling the pools facility. The pools facility must be enabled, however, to modify the dynamic configuration.

Since the Resource Pools facility is an [smf\(5\)](#) service, it can also be enabled and disabled using the standard Service Management Facility (SMF) interfaces.

Name libproject – project database access library

Synopsis `cc [ flag... ] file... -lproject [ library... ]`
`#include <project.h>`

Description Functions in this library provide various interfaces to extract data from the [project\(4\)](#) database. The header provides structure and function declarations for all library interfaces.

Interfaces The shared object `libproject.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libpthread – POSIX threads library

Synopsis `cc -mt [ flag... ] file... -lpthread [ -lrt library... ]`

Description Historically, functions in this library provided POSIX threading support. See [standards\(5\)](#). This functionality now resides in [libc\(3LIB\)](#).

This library is maintained to provide backward compatibility for both runtime and compilation environments. The shared object is implemented as a filter on `libc.so.1`. New application development needs to specify `-lpthread` only to obtain POSIX semantics for [fork\(2\)](#) that assumes the behavior of [fork1\(2\)](#) rather than the default behavior that forks all threads.

Interfaces The shared object `libpthread.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name librt, libposix4 – POSIX.1b Realtime Extensions library

Synopsis `cc [ flag... ] file... -lrt [ library... ]`

Description Functions in this library provide most of the interfaces specified by the POSIX.1b Realtime Extension. See [standards\(5\)](#). Specifically, this includes the interfaces defined under the Asynchronous I/O, Message Passing, Process Scheduling, Realtime Signals Extension, Semaphores, Shared Memory Objects, Synchronized I/O, and Timers options. The interfaces defined under the Memory Mapped Files, Process Memory Locking, and Range Memory Locking options are provided in [libc\(3LIB\)](#).

See the man pages for the individual interfaces in section 3RT for information on required headers.

The name `libposix4` is maintained for backward compatibility and should be avoided. `librt` is the preferred name for this library.

Interfaces The shared objects `librt.so.1` and `libposix4.so.1` provide the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>aio_cancel</code>	<code>aio_error</code>
<code>aio_fsync</code>	<code>aio_read</code>
<code>aio_return</code>	<code>aio_suspend</code>

Name librtld_db – runtime linker debugging library

Synopsis `cc [ flag ... ] file ... -lrtld_db [ library ... ]`
`#include <proc_service.h>`
`#include <rtld_db.h>`

Description Functions in this library are useful for building debuggers for dynamically linked programs. For a full description of these interfaces refer to the [Linker and Libraries Guide](#).

To use librtld_db, applications need to implement the interfaces documented in [ps_pread\(3PROC\)](#) and [proc_service\(3PROC\)](#).

Interfaces The shared object `librtld_db.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Linker and Libraries Guide

Name libsassl – simple authentication and security layer library

Synopsis `cc [ flag... ] file... -lsasl [ library... ]`
`#include <sasl/sasl.h>`
`#include <sasl/prop.h>`
`#include <sasl/saslutil.h>`

Description SASL is a security framework used by connection-oriented network applications primarily for authentication. Another way to describe SASL is that it is a glue layer between a network application and some security mechanisms that allow applications to authenticate each other and provide additional security services such as data encryption. As a glue layer, SASL hides the interface specifics of the security mechanism from the application, which allows greater portability and flexibility as new security mechanisms are implemented. SASL is similar to the GSS-API in that it provides a layer of abstraction between an application and one or more security mechanisms.

libsassl provides both an API for applications and an SPI for various plug-ins. To link with this library, specify `-lsasl` on the `cc` command line.

Interfaces The shared object `libsassl.so.1` and associated include files provide the public interfaces defined below. The `*_t` interfaces are function prototypes for callbacks that are defined in the public SASL header files. While libsassl provides default versions for some of the callbacks, this structure allows an application to define its own version of the some of the callback functions.

See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libssagent – Sun Solstice Enterprise Agent library

Synopsis cc [*flag*...] *file*... -lssagent [*library*..]

Description The libssagent library is a high level API library that is dependent on libssasnm. This library contains the starting point of the request-driven engine that always runs in the background within the subagent. It receives SNMP requests, evaluates variables, calls the appropriate functions, and sends the correct responses.

Interfaces The shared object libssagent.so.1 provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libssasnm – Sun Solstice Enterprise SNMP library

Synopsis `cc [ flag... ] file... -lssasnm [ library.. ]`

Description The libssasnm library provides low-level SNMP API functions.

- ASN.1 serialization (encoding/decoding) module
- SNMP PDU development routines
- SNMP session module
- Low level SNMP based API functions
- Error-handling module
- Trace (debugging) module

Interfaces The shared object `libssasnm.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Name libsysevent – system event interface library

Synopsis `cc [ flag... ] file... -lsysevent [ library... ]`
`#include <sysevent.h>`

Description Functions in this library extract specific identifier, publisher, and attribute information from a system event (sysevent) handle, defined as `sysevent_t`, and allow privileged user-level applications to queue system events for delivery to the system event daemon, [syseventd\(1M\)](#).

The libsysevent interfaces do not work at all in non-global zones.

Interfaces The shared object `libsysevent.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>sysevent_bind_handle</code>	<code>sysevent_free</code>

Name libtecla – interactive command line input library

Synopsis `cc [ flag... ] file... -ltecla [ library... ]`
`#include <libtecla.h>`

Description This library provides programs with interactive command line editing facilities, similar to those of the UNIX `tcsh` shell. In addition to simple command-line editing, it supports recall of previously entered command lines, TAB completion of file names or other tokens, and in-line wildcard expansion of filenames. The internal functions that perform file-name completion and wild-card expansion are also available externally for optional use by the calling program.

Thread Safety The terminfo functions `setupterm(3CURSES)`, `tigetstr(3CURSES)`, `tigetnum(3CURSES)`, and `tputs(3CURSES)` are not reentrant. This condition, however, should not prevent use of this library in threaded applications, since few applications will want to interact with multiple terminals.

Interfaces The shared object `libtecla.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

Files `/usr/lib/libtnfctl.so.1` shared object
`/usr/lib/64/libtnfctl.so.1` 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWtnfc (32-bit) SUNWtnfcx (64-bit)
MT-Level	MT-Safe with exceptions

See Also [pvs\(1\)](#), [Intro\(3\)](#), [libtnfctl\(3TNF\)](#), [tracing\(3TNF\)](#), [attributes\(5\)](#)

Notes This API is MT-Safe. Multiple threads can concurrently operate on independent `tnfctl` handles, which is the typical behavior expected. `libtnfctl` does not support multiple threads operating on the same `tnfctl` handle. If this is desired, it is the client's responsibility to implement locking to ensure that two threads that use the same `tnfctl` handle are not simultaneously present in a `libtnfctl` interface.

Name libtsalarm – Telco-Alarm library

Synopsis `cc [ flag... ] file... -ltsalarm [ library... ]`
`#include <tsalarm.h>`

Description Functions in this library are used to interface with the service processor through telco-alarm LDC channel to get or set status of telco alarms.

Interfaces The shared object `libtsalarm.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

`tsalarm_get` `tsalarm_set`

Files `/usr/platform/`uname -i`/lib/libtsalarm.so.1`
shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

Availability	SUNWscpu, SUNWsra (32-bit) SUNWscpux (64-bit)
MT-Level	Safe with exceptions

See Also [pvs\(1\)](#), [Intro\(3\)](#), [attributes\(5\)](#)

Name libumem – object-caching memory allocation library

Synopsis `cc [ flag... ] file... -lumem [ library... ]`
`#include <umem.h>`

Description Functions in this library provide fast, scalable object-caching memory allocation with multithreaded application support. In addition to the standard [malloc\(3C\)](#) family of functions and the more flexible [umem_alloc\(3MALLOC\)](#) family, libumem provides powerful object-caching services as described in [umem_cache_create\(3MALLOC\)](#).

The libumem library also provides extensive debugging support, including detection of memory leaks, buffer overruns, multiple frees, use of uninitialized data, use of freed data, and many other common programming errors. See [umem_debug\(3MALLOC\)](#).

Interfaces The shared object `libumem.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>calloc</code>	<code>free</code>
<code>malloc</code>	<code>memalign</code>
<code>realloc</code>	<code>umem_alloc</code>
<code>umem_cache_alloc</code>	<code>umem_cache_create</code>
<code>umem_cache_destroy</code>	<code>umem_cache_free</code>

Name libusb – user-space USB device management library

Synopsis `cc [flag...] -I/usr/sfw/include file... -L/usr/sfw/lib \
-R /usr/sfw/lib -lusb [library...]
#include <usb.h>`

Description The libusb library contains interfaces for managing USB devices without a kernel driver. It is an open-source API supported on Linux, MacOS X, and NetBSD. See <http://libusb.sourceforge.net>.

The current implementation is version 0.1.8 of the libusb API.

Complete documentation for this library can be found at
/usr/sfw/share/doc/libusb/libusb.txt.

Interfaces The shared object libusb.so.1 provides the following public interfaces. See [Intro\(3\)](#) for additional information on shared object interfaces.

usb_bulk_read	usb_bulk_write
usb_claim_interface	usb_clear_halt
usb_close	usb_control_msg
usb_find_busses	usb_find_devices
usb_get_busses	usb_get_descriptor_by_endpoint
usb_get_descriptor	usb_get_string
usb_get_string_simple	usb_init
usb_interrupt_read	usb_interrupt_write
usb_open	usb_release_interface
usb_reset	usb_resetep
usb_set_altinterface	usb_set_configuration
usb_set_debug	usb_strerror

Files /usr/sfw/lib/libusb.so.1	shared object
/usr/sfw/lib/libusb_plugins	implementation-specific libusb modules
/usr/sfw/bin/libusb-config	script to determine linking environment

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWlibusb, SUNWlibusbut, SUNWlibugenusb
Interface Stability	External
MT-Level	Unsafe

See Also [Intro\(3\)](#), [attributes\(5\)](#)
<http://libusb.sourceforge.net>

Name libuuid – UUID library

Synopsis `cc [ flag... ] file... -luuid [ library... ]`
`#include <uuid/uuid.h>`

Description The functions in this library perform operations on a universally unique identifier (UUID).

Interfaces The shared object `libuuid.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>uuid_clear</code>	<code>uuid_compare</code>
<code>uuid_copy</code>	<code>uuid_generate</code>
<code>uuid_generate_random</code>	<code>uuid_generate_time</code>
<code>uuid_is_null</code>	<code>uuid_parse</code>
<code>uuid_time</code>	<code>uuid_unparse</code>

Files `/lib/libuuid.so.1` shared object
`/lib/64/libuuid.so.1` 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	Committed
MT-Level	Safe

See Also [Intro\(3\)](#), [uuid_clear\(3UUID\)](#), [attributes\(5\)](#)

Name libvolmgt – volume management library

Synopsis `cc [ flag... ] file... -lvolmgt [ library... ]`
`#include <volmgt.h>`

Description Functions in this library provide access to the volume management services.

Interfaces The shared object `libvolmgt.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>media_findname</code>	<code>media_getattr</code>
<code>media_getid</code>	<code>media_setattr</code>
<code>volmgt_acquire</code>	<code>volmgt_check</code>
<code>volmgt_feature_enabled</code>	<code>volmgt_inuse</code>

<code>volmgt_root</code>	<code>volmgt_running</code>
<code>volmgt_symdev</code>	<code>volmgt_symname</code>

Files `/usr/lib/libvolmgt.so.1` shared object
`/usr/lib/64/libvolmgt.so.1` 64-bit shared object

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit)
	SUNWcslx (64-bit)
MT-Level	Safe with exceptions

See Also [pvs\(1\)](#), [Intro\(3\)](#), [media_findname\(3VOLMGT\)](#), [attributes\(5\)](#)

Notes The MT-Level for this library of interfaces is Safe, except for [media_findname\(3VOLMGT\)](#), which is Unsafe.

Name libw – wide character library

Synopsis `cc [flag...] file... [library...]
#include <wchar.h>`

Description Historically, functions in this library provided wide character translations. This functionality now resides in [libc\(3LIB\)](#).

This library is maintained to provide backward compatibility for both runtime and compilation environments. The shared object is implemented as a filter on `libc.so.1`. New application development need not specify `-lw`.

Interfaces The shared object `libw.so.1` provides the public interfaces defined below. See [Intro\(3\)](#) for additional information on shared object interfaces.

<code>fgetwc</code>	<code>fgetws</code>	<code>fputwc</code>

Name limits.h, limits – implementation-defined constants

Synopsis `#include <limits.h>`

Description The `<limits.h>` header defines various symbolic names. Different categories of names are described below.

The names represent various limits on resources that the implementation imposes on applications. Symbolic constant names beginning with `_POSIX` can be found in [unistd.h\(3HEAD\)](#).

Applications should not assume any particular value for a limit. An application wishing to avail itself of the full amount of a resource available on an implementation can make use of the value given in `limits.h` on that particular implementation by using the symbolic names listed below. Many of the listed limits are not invariant, and at runtime, the value of the limit might differ from those given in this header, for the following reasons:

- The limit is pathname-dependent.
- The limit differs between the compile and runtime machines.

For these reasons, an application can use the [fpathconf\(2\)](#), [pathconf\(2\)](#), and [sysconf\(3C\)](#) functions to determine the actual value of a limit at runtime.

Runtime Invariant Values (Possibly Indeterminate)	AIO_LISTIO_MAX	Maximum number of I/O operations in a single list I/O call supported by the implementation.
	AIO_MAX	Maximum number of outstanding asynchronous I/O operations supported by the implementation.
	AIO_PRIO_DELTA_MAX	The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.
	ARG_MAX	Maximum length of argument to the exec(2) functions including environment data.
	ATEXIT_MAX	Maximum number of functions that can be registered with atexit(3C) .
	CHILD_MAX	Maximum number of simultaneous processes per real user ID.
	CLK_TCK	Number of clock ticks per second returned by the times(2) function.
	DELAYTIMER_MAX	Maximum number of timer expiration overruns.
	HOST_NAME_MAX	Maximum length of a host name (not including the terminating null) as returned from the gethostname(3C) function.

IOV_MAX	Maximum number of <code>iovec</code> structures that one process has available for use with read(2) or write(2) .
LOGIN_NAME_MAX	Maximum length of a login name.
MQ_OPEN_MAX	The maximum number of open message queue descriptors a process is allowed to hold.
LOGIN_NAME_MAX	Maximum length of a login name.
MQ_OPEN_MAX	The maximum number of open message queue descriptors a process is allowed to hold.
MQ_PRIO_MAX	The maximum number of message priorities supported by the implementation.
OPEN_MAX	Maximum number of files that one process can have open at any one time.
PAGESIZE	Size in bytes of a page.
PAGE_SIZE	Equivalent to <code>PAGESIZE</code> . If either <code>PAGESIZE</code> or <code>PAGE_SIZE</code> is defined, the other is defined with the same value.
PASS_MAX	The maximum number of significant bytes in a password, not including the terminating null.
PTHREAD_DESTRUCTOR_ITERATIONS	Maximum number of attempts made to destroy a thread's thread-specific data values on thread exit.
PTHREAD_KEYS_MAX	Maximum number of data keys that can be created by a process.
PTHREAD_STACK_MIN	Minimum size in bytes of thread stack storage.
PTHREAD_THREADS_MAX	Maximum number of threads that can be created per process.
RE_DUP_MAX	The number of repeated occurrences of a BRE permitted by the regexec(3C) and regcomp(3C) functions when using the interval notation $\{ \backslash(m,n) \}$.
RTSIG_MAX	Maximum number of realtime signals reserved for application use in this implementation.
SEM_NSEMS_MAX	Maximum number of semaphores that a process can have.
SEM_VALUE_MAX	The maximum value a semaphore can have.

	SIGQUEUE_MAX	Maximum number of queued signals that a process can send and have pending at the receiver(s) at any time.
	SS_REPL_MAX	The maximum number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
	STREAM_MAX	The number of streams that one process can have open at one time. If defined, it has the same value as FOPEN_MAX.
	SYMLoop_MAX	Maximum number of symbolic links that can be reliably traversed in the resolution of a pathname in the absence of a loop.
	TIMER_MAX	Maximum number of timers per process supported by the implementation.
	TRACE_EVENT_NAME_MAX	Maximum length of the trace event name.
	TRACE_NAME_MAX	Maximum length of the trace generation version string or of the trace stream name.
	TRACE_SYS_MAX	Maximum number of trace streams that may simultaneously exist in the system.
	TRACE_USER_EVENT_MAX	Maximum number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
	TTY_NAME_MAX	Maximum length of terminal device name.
	TZNAME_MAX	Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
Pathname Variable Values	The values in the following list can be constants within an implementation or can vary from one pathname to another. For example, file systems or directories can have different characteristics. The value supported for a specific pathname is provided by the pathconf(2) function.	
	FILESIZEBITS	Minimum number of bits needed to represent, as a signed integer value, the maximum size of a regular file allowed in the specified directory.
	LINK_MAX	Maximum number of links to a single file.
	MAX_CANON	Maximum number of bytes in a terminal canonical input line.

MAX_INPUT	Minimum number of bytes for which space is available in a terminal input queue; therefore, the maximum number of bytes a conforming application may require to be typed as input before reading them.
NAME_MAX	Maximum number of bytes in a filename (not including terminating null).
PATH_MAX	Maximum number of bytes in a pathname, including the terminating null character.
PIPE_BUF	Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
POSIX_ALLOC_SIZE_MIN	Minimum number of bytes of storage actually allocated for any portion of a file.
POSIX_REC_INCR_XFER_SIZE	Recommended increment for file transfer sizes between the POSIX_REC_MIN_XFER_SIZE and POSIX_REC_MAX_XFER_SIZE values.
POSIX_REC_MAX_XFER_SIZE	Maximum recommended file transfer size.
POSIX_REC_MIN_XFER_SIZE	Minimum recommended file transfer size.
POSIX_REC_XFER_ALIGN	Recommended file transfer buffer alignment.
SYMLINK_MAX	Maximum number of bytes in a symbolic link.

Runtime Increaseable Values

The magnitude limitations in the following list are fixed by specific implementations. An application should assume that the value supplied by `<limits.h>` in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation can increase the value relative to that supplied by `<limits.h>` for that implementation. The actual value supported by a specific instance is provided by the [sysconf\(3C\)](#) function.

BC_BASE_MAX	Maximum obase values allowed by the bc(1) utility.
BC_DIM_MAX	Maximum number of elements permitted in an array by the <code>bc</code> utility.
BC_SCALE_MAX	Maximum scale value allowed by the <code>bc</code> utility.
BC_STRING_MAX	Maximum length of a string constant accepted by the <code>bc</code> utility.
CHARCLASS_NAME_MAX	Maximum number of bytes in a character class name.
COLL_WEIGHTS_MAX	Maximum number of weights that can be assigned to an entry of the LC_COLLATE order keyword in the locale definition file.
EXPR_NEST_MAX	Maximum number of expressions that can be nested within parentheses by the expr(1) utility.

EXPR_NEST_MAX	Maximum number of expressions that can be nested within parentheses by the <code>expr</code> utility.
LINE_MAX	Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <code><newline></code> .
NGROUPS_MAX	Maximum number of simultaneous supplementary group IDs per process.
RE_DUP_MAX	Maximum number of repeated occurrences of a regular expression permitted when using the interval notation <code>\{m,n\}</code> .

Maximum Values The symbolic constants in the following list are symbolic names for the most restrictive value for certain features on an implementation supporting the POSIX Timers option.

_POSIX_CLOCKRES_MIN	The resolution of the <code>CLOCK_REALTIME</code> clock, in nanoseconds.
---------------------	--

Minimum Values The symbolic constants in the following list are symbolic names for the most restrictive value for certain features on an implementation conforming to various POSIX and Single Unix Specification requirements. See [standards\(5\)](#).

_POSIX_AIO_LISTIO_MAX	The number of I/O operations that can be specified in a list I/O call.
_POSIX_AIO_MAX	The number of outstanding asynchronous I/O operations.
_POSIX_ARG_MAX	Maximum length of argument to the exec(2) functions including environment data.
_POSIX_CHILD_MAX	Maximum number of simultaneous processes per real user ID.
_POSIX_DELAYTIMER_MAX	The number of timer expiration overruns.
_POSIX_HOST_NAME_MAX	Maximum length of a host name (not including the terminating null) as returned from the gethostname(3C) function.
_POSIX_LINK_MAX	Maximum number of links to a single file.
_POSIX_LOGIN_NAME_MAX	The size of the storage required for a login name, in bytes, including the terminating null.
_POSIX_MAX_CANON	Maximum number of bytes in a terminal canonical input queue.
_POSIX_MAX_INPUT	Maximum number of bytes allowed in a terminal input queue.

<code>_POSIX_MQ_OPEN_MAX</code>	The number of message queues that can be open for a single process.
<code>_POSIX_MQ_PRIO_MAX</code>	The maximum number of message priorities supported by the implementation.
<code>_POSIX_NAME_MAX</code>	Maximum number of bytes in a filename (not including terminating null).
<code>_POSIX_NGROUPS_MAX</code>	Maximum number of simultaneous supplementary group IDs per process.
<code>_POSIX_OPEN_MAX</code>	Maximum number of files that one process can have open at any one time.
<code>_POSIX_PATH_MAX</code>	Maximum number of bytes in a pathname.
<code>_POSIX_PIPE_BUF</code>	Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
<code>_POSIX_RE_DUP_MAX</code>	The number of repeated occurrences of a BRE permitted by the <code>regex()</code> and <code>regcomp()</code> functions when using the interval notation $\{ \backslash(m,n) \}$
<code>_POSIX_RTSIG_MAX</code>	The number of realtime signal numbers reserved for application use.
<code>_POSIX_SEM_NSEMS_MAX</code>	The number of semaphores that a process can have.
<code>_POSIX_SEM_VALUE_MAX</code>	The maximum value a semaphore can have.
<code>_POSIX_SIGQUEUE_MAX</code>	The number of queued signals that a process can send and have pending at the receiver(s) at any time.
<code>_POSIX_SSIZE_MAX</code>	The value that can be stored in an object of type <code>ssize_t</code> .
<code>_POSIX_STREAM_MAX</code>	The number of streams that one process can have open at one time.
<code>_POSIX_SS_REPL_MAX</code>	The number of replenishment operations that can be simultaneously pending for a particular sporadic server scheduler.
<code>_POSIX_SYMLINK_MAX</code>	The number of bytes in a symbolic link.

<code>_POSIX_SYMLINK_MAX</code>	The number of symbolic links that can be traversed in the resolution of a pathname in the absence of a loop.
<code>_POSIX_THREAD_DESTRUCTOR_ITERATIONS</code>	The number of attempts made to destroy a thread's thread-specific data values on thread exit.
<code>_POSIX_THREAD_KEYS_MAX</code>	The number of data keys per process.
<code>_POSIX_THREAD_THREADS_MAX</code>	The number of threads per process.
<code>_POSIX_TIMER_MAX</code>	The per-process number of timers.
<code>_POSIX_TRACE_EVENT_NAME_MAX</code>	The length in bytes of a trace event name.
<code>_POSIX_TRACE_NAME_MAX</code>	The length in bytes of a trace generation version string or a trace stream name.
<code>_POSIX_TRACE_SYS_MAX</code>	The number of trace streams that can simultaneously exist in the system.
<code>_POSIX_TRACE_USER_EVENT_MAX</code>	The number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event <code>POSIX_TRACE_UNNAMED_USER_EVENT</code> .
<code>_POSIX_TTY_NAME_MAX</code>	The size of the storage required for a terminal device name, in bytes, including the terminating null.
<code>_POSIX_TZNAME_MAX</code>	Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
<code>_POSIX2_BC_BASE_MAX</code>	Maximum obase values allowed by the bc utility.
<code>_POSIX2_BC_DIM_MAX</code>	Maximum number of elements permitted in an array by the bc utility.
<code>_POSIX2_BC_SCALE_MAX</code>	Maximum scale value allowed by the bc utility.
<code>_POSIX2_BC_STRING_MAX</code>	Maximum length of a string constant accepted by the bc utility.
<code>_POSIX2_CHARCLASS_NAME_MAX</code>	Maximum number of bytes in a character class name.
<code>_POSIX2_COLL_WEIGHTS_MAX</code>	Maximum number of weights that can be assigned to an entry of the LC_COLLATE order keyword in the locale definition file.

<code>_POSIX2_EXPR_NEST_MAX</code>	Maximum number of expressions that can be nested within parentheses by the <code>expr</code> utility.
<code>_POSIX2_LINE_MAX</code>	Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <code><newline></code> .
<code>_POSIX2_RE_DUP_MAX</code>	Maximum number of repeated occurrences of a regular expression permitted when using the interval notation <code>\{m,n\}</code> .
<code>_XOPEN_IOV_MAX</code>	Maximum number of <code>iovec</code> structures that one process has available for use with read(2) or write(2) .
<code>_XOPEN_NAME_MAX</code>	Maximum number of bytes in a filename (not including the terminating null).
<code>_XOPEN_PATH_MAX</code>	Maximum number of bytes in a pathname.

Numerical Limits The values in the following lists shall be defined in `<limits.h>` and are constant expressions suitable for use in `#if` preprocessing directives. Moreover, except for `CHAR_BIT`, `DBL_DIG`, `DBL_MAX`, `FLT_DIG`, `FLT_MAX`, `LONG_BIT`, `WORD_BIT`, and `MB_LEN_MAX`, the symbolic names are defined as expressions of the correct type.

If the value of an object of type `char` is treated as a signed integer when used in an expression, the value of `CHAR_MIN` is the same as that of `SCHAR_MIN` and the value of `CHAR_MAX` is the same as that of `SCHAR_MAX`. Otherwise, the value of `CHAR_MIN` is 0 and the value of `CHAR_MAX` is the same as that of `UCHAR_MAX`.

<code>CHAR_BIT</code>	Number of bits in a type <code>char</code> .
<code>CHAR_MAX</code>	Maximum value of type <code>char</code> .
<code>CHAR_MIN</code>	Minimum value of type <code>char</code> .
<code>DBL_DIG</code>	Digits of precision of type <code>double</code> .
<code>DBL_MAX</code>	Maximum decimal value of a <code>double</code> .
<code>DBL_MIN</code>	Minimum decimal value of a <code>double</code> .
<code>FLT_DIG</code>	Digits of precision of type <code>float</code> .
<code>FLT_MAX</code>	Maximum decimal value of a <code>float</code> .
<code>FLT_MIN</code>	Minimum decimal value of a <code>float</code> .

INT_MIN	Minimum value of type int.
INT_MAX	Maximum value of an int.
LLONG_MIN	Minimum value of type long long.
LLONG_MAX	Maximum value of type long long.
LONG_BIT	Number of bits in a long.
LONG_MIN	Minimum value of type long.
LONG_MAX	Maximum value of a long.
MB_LEN_MAX	Maximum number of bytes in a character, for any supported locale.
SCHAR_MIN	Minimum value of type signed char.
SCHAR_MAX	Maximum value of type signed char.
SHRT_MIN	Minimum value of type short.
SHRT_MAX	Maximum value of type short.
SSIZE_MAX	Maximum value of an object of type ssize_t.
TMP_MAX	Minimum number of unique filename generated by tmpnam(3C) . Maximum number of times an application can call <code>tmpnam()</code> reliably.
UCHAR_MAX	Maximum value of type unsigned char.
UINT_MAX	Maximum value of type unsigned.
ULLONG_MAX	Maximum value of type unsigned long long.
ULONG_MAX	Maximum value of type unsigned long.
USHRT_MAX	Maximum value for a type unsigned short.
WORD_BIT	Number of bits in a word or type int.

Other Invariant Values The following constants are defined in `<limits.h>`.

CHARCLASS_NAME_MAX	Maximum number of bytes in a character class name.
LOGNAME_MAX	The maximum number of bytes supported in a user's login name.
NL_ARGMAX	Maximum value of digit in calls to the printf(3C) and scanf(3C) functions.
NL_LANGMAX	Maximum number of bytes in a LANG name.
NL_MSGMAX	Maximum message number.
NL_NMAX	Maximum number of bytes in an N-to-1 collation mapping.
NL_SETMAX	Maximum set number.

NL_TEXTMAX	Maximum number of bytes in a message string.
NZERO	Default process priority.

See Also [fpathconf\(2\)](#), [pathconf\(2\)](#), [sysconf\(3C\)](#), [standards\(5\)](#)

Name locale.h, locale – category macros

Synopsis #include <locale.h>

Description The <locale.h> header provides a definition for the `lconv` structure, which includes the following members. (See the definition of `LC_MONETARY` in [locale\(5\)](#).)

```
char      *currency_symbol
char      *decimal_point
char      frac_digits
char      *grouping
char      *int_curr_symbol
char      int_frac_digits
char      int_n_cs_precedes
char      int_n_sep_by_space
char      int_n_sign_posn
char      int_p_cs_precedes
char      int_p_sep_by_space
char      int_p_sign_posn
char      *mon_decimal_point
char      *mon_grouping
char      *mon_thousands_sep
char      *negative_sign
char      n_cs_precedes
char      n_sep_by_space
char      n_sign_posn
char      *positive_sign
char      p_cs_precedes
char      p_sep_by_space
char      p_sign_posn
char      *thousands_sep
```

The <locale.h> header defines `NULL` (as defined in <stddef.h>) and the following as macros:

```
LC_ALL
LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME
```

The preceding expand to distinct integer constant expressions, for use as the first argument to the `setlocale()` function. See [setlocale\(3C\)](#).

Additional macro definitions, beginning with the characters `LC_` and an uppercase letter, can also be specified here.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name math.h, math – mathematical declarations

Synopsis #include <math.h>

Description The <math.h> header includes definitions for the following types:

`float_t` A real-floating type at least as wide as `float`.

`double_t` A real-floating type at least as wide as `double`, and at least as wide as `float_t`.

If `FLT_EVAL_METHOD` equals 0, `float_t` and `double_t` are `float` and `double`, respectively. If `FLT_EVAL_METHOD` equals 1, they are both `double`. If `FLT_EVAL_METHOD` equals 2, they are both `long double`. Other values of `FLT_EVAL_METHOD` are implementation-defined.

The <math.h> header provides the following constants. The values are of type `double` and are accurate within the precision of the `double` type.

`M_E` The base of natural logarithms (e).

`M_LOG2E` The base-2 logarithm of e .

`M_LOG10E` The base-10 logarithm of e .

`M_LN2` The natural logarithm of 2.

`M_LN10` The natural logarithm of 10.

`M_PI` π , the ratio of the circumference of a circle to its diameter.

`M_PI_2` $\pi/2$.

`M_PI_4` $\pi/4$.

`M_1_PI` $1/\pi$.

`M_2_PI` $2/\pi$.

`M_2_SQRTPI` 2 over the square root of π .

`M_SQRT2` The positive square root of 2.

`M_SQRT1_2` The positive square root of 1/2.

The <math.h> header defines the following symbolic constants:

`MAXFLOAT` The maximum value of a non-infinite single-precision floating point number.

`HUGE_VAL` A positive `double` expression, not necessarily representable as a float. Used as an error value returned by the mathematics library. `HUGE_VAL` evaluates to +infinity on systems supporting IEEE Std 754-1985.

`HUGE_VALF` A positive `float` constant expression. Used as an error value returned by the mathematics library. `HUGE_VALF` evaluates to +infinity on systems supporting IEEE Std 754-1985.

HUGE_VALL	A positive long double constant expression. Used as an error value returned by the mathematics library. HUGE_VALL evaluates to +infinity on systems supporting IEEE Std 754-1985.
INFINITY	A constant expression of type float representing positive or unsigned infinity, if available; else a positive constant of type float that overflows at translation time.
NAN	A constant expression of type float representing a quiet NaN. This symbolic constant is only defined if the implementation supports quiet NaNs for the float type.

The following macros are defined for number classification. They represent the mutually-exclusive kinds of floating-point values. They expand to integer constant expressions with distinct values

```
FP_INFINITE
FP_NAN
FP_NORMAL
FP_SUBNORMAL
FP_ZERO
```

The following optional macros indicate whether the `fma()` family of functions are fast compared with direct code:

```
FP_FAST_FMA
FP_FAST_FMAF
FP_FAST_FMAL
```

The `FP_FAST_FMA` macro is defined to indicate that the `fma()` function generally executes about as fast as, or faster than, a multiply and an add of double operands. The other macros have the equivalent meaning for the float and long double versions.

The following macros expand to integer constant expressions whose values are returned by `ilogb(x)` if x is zero or NaN, respectively. The value of `FP_ILOGB0` is either `{INT_MIN}` or `-{INT_MAX}`. The value of `FP_ILOGBNAN` is either `{INT_MAX}` or `{INT_MIN}`.

```
FP_ILOGB0
FP_ILOGBNAN
```

The following macros expand to the integer constants 1 and 2, respectively:

```
MATH_ERRNO
MATH_ERREXCEPT
```

The following macro expands to an expression that has type `int` and the value `MATH_ERREXCEPT`:

```
math_errhandling
```

The value of the macro `math_errhandling` is constant for the duration of the program. If a macro definition is suppressed or a program defines an identifier with the name `math_errhandling`, the behavior is undefined.

The `<math.h>` header defines the following external variable:

```
extern int signgam;
```

The `<math.h>` header defines the structure and constants used by the [matherr\(3M\)](#) error-handling mechanisms.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [Intro\(3\)](#), [fenv.h\(3HEAD\)](#), [libm\(3LIB\)](#), [limits.h\(3HEAD\)](#), [matherr\(3M\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name mman.h, mman – memory management declarations

Synopsis #include <sys/mman.h>

Description The <sys/mman.h> header supports the following options:

- the Memory Mapped Files option
- the Shared Memory Objects option
- the Process Memory Locking option
- the Memory Protection option
- the Synchronized Input and Output option

For Memory Mapped Files and Shared Memory Objects options, the following protection options are defined:

PROT_READ	Page can be read.
PROT_WRITE	Page can be written.
PROT_EXEC	Page can be executed.
PROT_NONE	Page cannot be accessed.

The following *flag* options are defined:

MAP_SHARED	Share changes.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

The flags immediately following are defined for `msync()`. See [msync\(3C\)](#).

MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate mappings.

The symbolic constants immediately following are defined for the `mlockall()` function. See [mlockall\(3C\)](#).

MCL_CURRENT	Lock currently mapped pages.
MCL_FUTURE	Lock pages that become mapped.

The symbolic constant `MAP_FAILED` is defined to indicate a failure from the `mmap()` function. See [mmap\(2\)](#).

The `mode_t`, `off_t`, and `size_t` types are defined as described in <sys/types.h>. See [types\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [mmap\(2\)](#), [mprotect\(2\)](#), [munmap\(2\)](#), [madvise\(3C\)](#), [mlock\(3C\)](#), [mlockall\(3C\)](#), [msync\(3C\)](#), [shm_open\(3RT\)](#), [shm_unlink\(3RT\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name `monetary.h`, `monetary` – monetary types

Synopsis `#include <monetary.h>`

Description The `<monetary.h>` header defines the following types:

`size_t` As described in [stddef.h\(3HEAD\)](#).

`ssize_t` As described in [types.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [stddef.h\(3HEAD\)](#), [strfmon\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name mqueue.h, mqueue – message queues

Synopsis #include <mqueue.h>

Description The <mqueue.h> header defines the mqd_t type, which is used for message queue descriptors. This will not be an array type. A message queue descriptor may be implemented using a file descriptor, in which case applications can open up to at least OPEN_MAX file and message queues.

The <mqueue.h> header defines the sigevent structure (as described in <signal.h>, see [signal.h\(3HEAD\)](#)) and the mq_attr structure, which is used in getting and setting the attributes of a message queue. Attributes are initially set when the message queue is created. A mq_attr structure has the following members:

long	mq_flags	message queue flags
long	mq_maxmsg	maximum number of messages
long	mq_msgsize	maximum message size
long	mq_curmsgs	number of messages currently queued

Inclusion of the <mqueue.h> header may make visible symbols defined in the headers <fcntl.h>, <signal.h>, <sys/types.h>, and <time.h>.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [fcntl.h\(3HEAD\)](#), [signal.h\(3HEAD\)](#), [time.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name msg.h, msg – message queue structures

Synopsis #include <sys/msg.h>

Description The <sys/msg.h> header defines the following data types through typedef:

msgqnum_t used for the number of messages in the message queue

msglen_t used for the number of bytes allowed in the message queue

These types are unsigned integer types that are able to store values at least as large as a type unsigned short.

The <sys/msg.h> header defines the following constant as a message operation flag:

MSG_NOERROR no error if big message

The msqid_ds structure contains the following members:

struct ipc_perm	msg_perm	Operation permission structure.
msgqnum_t	msg_qnum	Number of messages currently on queue.
msglen_t	msg_qbytes	Maximum number of bytes allowed on queue.
pid_t	msg_lspid	Process ID of last msgsnd(2).
pid_t	msg_lrpid	Process ID of last msgrcv(2).
time_t	msg_stime	Time of last msgsnd().
time_t	msg_rtime	Time of last msgrcv().
time_t	msg_ctime	Time of last change.

The pid_t, time_t, key_t, size_t, and ssize_t types are defined as described in <sys/types.h>. See [types\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [msgctl\(2\)](#), [msgget\(2\)](#), [msgrcv\(2\)](#), [msgsnd\(2\)](#), [ipc.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name ndbm.h, ndbm – definitions for ndbm database operations

Synopsis #include <ndbm.h>

Description The <ndbm.h> header defines the `datum` type as a structure that includes at least the following members:

```
void    *dptr    /* pointer to the application's data */
size_t  dsize    /* size of the object pointed to by dptr */
```

The `size_t` type is defined through `typedef` as described in <stddef.h>.

The <ndbm.h> header defines the `DBM` type through `typedef`.

The following constants are defined as possible values for the *store_mode* argument to `dbm_store()`:

`DBM_INSERT` Insertion of new entries only.
`DBM_REPLACE` Allow replacing existing entries.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [ndbm\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name netdb.h, netdb – definitions for network database operations

Synopsis #include <netdb.h>

Description The <netdb.h> header defines the type `in_port_t` and the type `in_addr_t` as described in [in.h\(3HEAD\)](#).

The <netdb.h> header defines the `hostent` structure that includes the following members:

```
char *h_name          /* official name of the host */
char **h_aliases       /* pointer to an array of pointers to
                        alternative host names, terminated
                        by a null pointer */

int  h_addrtype       /* address type */
int  h_length         /* length, in bytes, of the address */
char **h_addr_list     /* pointer to an array of pointers to
                        network addresses (in network byte
                        order) for the host, terminated by a
                        null pointer */
```

The <netdb.h> header defines the `netent` structure that includes the following members:

```
char      *n_name      /* official, fully-qualified */
                        (including the domain) name
                        of the network */
char      **n_aliases /* pointer to an array of pointers to
                        alternative network names, terminated */
                        by a null pointer */

int        n_addrtype  /* the address type of the network */
in_addr_t n_net       /* the network number, in host byte order */
```

The <netdb.h> header defines the `protoent` structure that includes the following members:

```
char *p_name          /* official name of the protocol */
char **p_aliases      /* pointer to an array of pointers to
                        alternative protocol names, terminated
                        by a null pointer */

int  p_proto          /* protocol number */
```

The <netdb.h> header defines the `servent` structure that includes the following members:

```
char *s_name          /* official name of the service */
char **s_aliases      /* pointer to an array of pointers to
                        alternativeservice names, terminated by
                        a null pointer */

int  s_port           /* port number at which the service
                        resides, in network byte order */

char *s_proto         /* name of the protocol to use when
                        contacting the service */
```

The <netdb.h> header defines the macro `IPPORT_RESERVED` with the value of the highest reserved Internet port number.

The <netdb.h> header provides a declaration for `h_errno`:

```
extern int h_errno;
```

The <netdb.h> header defines the following macros for use as error values for `gethostbyaddr()` and `gethostbyname()`:

```
HOST_NOT_FOUND      NO_DATA
NO_RECOVERY          TRY_AGAIN
```

Inclusion of the <netdb.h> header may also make visible all symbols from [in.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [Intro\(3\)](#), [endhostent\(3NSL\)](#), [endhostent\(3XNET\)](#), [endnetent\(3SOCKET\)](#), [endnetent\(3XNET\)](#), [endprotoent\(3SOCKET\)](#), [endprotoent\(3XNET\)](#), [endservent\(3SOCKET\)](#), [endservent\(3XNET\)](#), [in.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name nl_types.h, nl_types – native language data types

Synopsis #include <nl_types.h>

Description This header contains the following definitions:

nl_catd	Used by the message catalog functions catopen, catgets and catclose to identify a catalog.
nl_item	Used by nl_langinfo to identify items of langinfo data. Values for objects of type nl_item are defined in <langinfo.h>.
NL_SETD	Used by gencat when no \$set directive is specified in a message text source file. This constant can be used in subsequent calls to catgets as the value of the set identifier parameter.
NL_MSGMAX	Maximum number of messages per set.
NL_SETMAX	Maximum number of sets per catalog.
NL_TEXTMAX	Maximum size of a message.

See Also [gencat\(1\)](#), [catgets\(3C\)](#), [catopen\(3C\)](#), [nl_langinfo\(3C\)](#), [langinfo.h\(3HEAD\)](#)

Name poll.h, poll – definitions for the poll() function

Synopsis #include <poll.h>

Description The <poll.h> header defines the pollfd structure, which includes the following members:

int fd the following descriptor being polled
short events the input event flags (see below)
short revents the output event flags (see below)

The <poll.h> header defines the following type through typedef:

nfds_t an unsigned integer type used for the number of file descriptors

The implementation supports one or more programming environments in which the width of nfds_t is no greater than the width of type long. The names of these programming environments can be obtained using the confstr() function or the getconf utility. See [confstr\(3C\)](#) and [getconf\(1\)](#).

The following symbolic constants are defined, zero or more of which can be OR'ed together to form the events or revents members in the pollfd structure:

POLLIN Data other than high-priority data can be read without blocking.
POLLRDNORM Normal data can be read without blocking.
POLLRDBAND Priority data can be read without blocking.
POLLPRI High priority data can be read without blocking.
POLLOUT Normal data can be written without blocking.
POLLWRNORM Equivalent to POLLOUT.
POLLWRBAND Priority data can be written.
POLLERR An error has occurred (revents only).
POLLHUP Device has been disconnected (revents only).
POLLNVAL Invalid fd member (revents only).

The significance and semantics of normal, priority, and high-priority data are file and device-specific.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

Name pthread.h, pthread – threads

Synopsis #include <pthread.h>

Description The <pthread.h> header defines the following symbols:

PTHREAD_BARRIER_SERIAL_THREAD
PTHREAD_CANCEL_ASYNCHRONOUS
PTHREAD_CANCEL_ENABLE
PTHREAD_CANCEL_DEFERRED
PTHREAD_CANCEL_DISABLE
PTHREAD_CANCELED
PTHREAD_COND_INITIALIZER
PTHREAD_CREATE_DETACHED
PTHREAD_CREATE_JOINABLE
PTHREAD_EXPLICIT_SCHED
PTHREAD_INHERIT_SCHED
PTHREAD_MUTEX_DEFAULT
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_INITIALIZER
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_RECURSIVE
PTHREAD_ONCE_INIT
PTHREAD_PRIO_INHERIT
PTHREAD_PRIO_NONE
PTHREAD_PRIO_PROTECT
PTHREAD_PROCESS_SHARED
PTHREAD_PROCESS_PRIVATE
PTHREAD_SCOPE_PROCESS
PTHREAD_SCOPE_SYSTEM

The types listed below are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

pthread_attr_t
pthread_barrier_t
pthread_barrierattr_t
pthread_cond_t
pthread_condattr_t
pthread_key_t
pthread_mutex_t
pthread_mutexattr_t
pthread_once_t
pthread_rwlock_t
pthread_rwlockattr_t
pthread_spinlock_t
pthread_t

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name pwd.h, pwd – password structure

Synopsis #include <pwd.h>

Description The <pwd.h> header provides a definition for struct passwd, which includes the following members:

```
char *pw_name      user's login name
uid_t pw_uid       numerical user ID
gid_t pw_gid       numerical group ID
char *pw_dir       initial working di rectory
char *pw_shell     program to use as shell
```

The gid_t and uid_t types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [getpwnam\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name regex.h, regex – regular expression matching types

Synopsis #include <regex.h>

Description The <regex.h> header defines the structures and symbolic constants used by the regcomp(), regexexec(), regerror(), and regfree() functions. See [regcomp\(3C\)](#).

The structure type regex_t contains the following member:

size_t re_nsub number of parenthesized subexpressions

The type size_t is defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

The type regoff_t is defined as a signed integer type that can hold the largest value that can be stored in either a type off_t or type ssize_t. The structure type regmatch_t contains the following members:

regoff_t rm_so	byte offset from start of string to start of substring
regoff_t rm_eo	byte offset from start of string of the first character after the end of substring

Values for the *cflags* parameter to the regcomp function are as follows:

REG_EXTENDED	use extended regular expressions
REG_ICASE	ignore case in match
REG_NOSUB	report only success or fail in regexexec()
REG_NEWLINE	change the handling of NEWLINE character

Values for the *eflags* parameter to the regexexec() function are as follows:

REG_NOTBOL	The circumflex character (^), when taken as a special character, does not match the beginning of string.
REG_NOTEOL	The dollar sign (\$), when taken as a special character, does not match the end of string.

The following constants are defined as error return values:

REG_NOMATCH	regexexec() failed to match.
REG_BADPAT	Invalid regular expression.
REG_ECOLLATE	Invalid collating element referenced.
REG_ECTYPE	Invalid character class type referenced.
REG_EESCAPE	Trailing '\' in pattern.
REG_ESUBREG	Number in \\digit invalid or in error.
REG_EBRACK	“[]” imbalance.

REG_EPAREN	“\(\)” or “()” imbalance.
REG_EBRACE	“\{\}” imbalance.
REG_BADBR	Content of “\{\}” invalid: not a number, number too large, more than two numbers, first larger than second.
REG_ERANGE	Invalid endpoint in range expression.
REG_ESPACE	Out of memory.
REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
REG_ENOSYS	Reserved.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [regcomp\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name resource.h, resource – definitions for resource operations

Synopsis #include <sys/resource.h>

Description The <sys/resource.h> header defines the symbolic constants listed below as possible values of the *which* argument of `getpriority()` and `setpriority()`. See [getpriority\(3C\)](#).

PRIO_PROCESS identifies the *who* argument as a process ID

PRIO_PGRP identifies the *who* argument as a process group ID

PRIO_USER identifies the *who* argument as a user ID

The following type is defined through typedef:

`rlim_t` unsigned integer type used for limit values

The following symbolic constants are defined:

RLIM_INFINITY a value of `rlim_t` indicating no limit

RLIM_SAVED_MAX a value of type `rlim_t` indicating an unrepresentable saved hard limit

RLIM_SAVED_CUR a value of type `rlim_t` indicating an unrepresentable saved soft limit

The symbolic constants listed below are defined as possible values of the *who* parameter of `getrusage()`. See [getrusage\(3C\)](#).

RUSAGE_SELF returns information about the current process

RUSAGE_CHILDREN returns information about children of the current process

The <sys/resource.h> header defines the `rlimit` structure, which includes the following members:

```
rlim_t rlim_cur /* the current (soft) limit */
rlim_t rlim_max /* the hard limit */
```

The <sys/resource.h> header defines the `rusage` structure, which includes the following members:

```
struct timeval ru_utime /* user time used */
struct timeval ru_stime /* system time used */
```

The `timeval` structure is defined as described in <sys/time.h>.

The symbolic constants listed below are defined as possible values for the *resource* argument of `getrlimit()` and `setrlimit()`. See [getrlimit\(2\)](#).

RLIMIT_CORE limit on size of core dump file

RLIMIT_CPU limit on CPU time per process

RLIMIT_DATA limit on data segment size

- RLIMIT_FSIZE limit on file size
- RLIMIT_NOFILE limit on number of open files
- RLIMIT_STACK limit on stack size
- RLIMIT_AS limit on address space size

The `id_t` type is defined through `typedef` as described in `<sys/types.h>`. See [types.h\(3HEAD\)](#).

Inclusion of the `<sys/resource.h>` header can also make visible all symbols from `<sys/time.h>`. See [time.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [getrlimit\(2\)](#), [getpriority\(3C\)](#), [time.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name sched.h, sched – execution scheduling

Synopsis #include <sched.h>

Description The <sched.h> header defines the sched_param structure, which contains the scheduling parameters required for implementation of each supported scheduling policy. This structure contains the following member:

```
int    sched_priority    process execution scheduling priority
```

Each process is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.

The scheduling policies are indicated by the values of the following symbolic constants:

SCHED_FIFO	Processes are scheduled according to the First-In-First-Out (FIFO) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will proceed until completion.
SCHED_RR	Processes are scheduled according to the Round-Robin (RR) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will execute for a time period, returned by sched_rr_get_interval(3RT) or by the system.
SCHED_IA	Processes are scheduled according to the Inter-Active Class (IA) policy as described in prctl(2) .
SCHED_OTHER	Processes are scheduled according to another policy not described above.

The values of these constants are distinct.

Inclusion of the <sched.h> header will make visible symbols defined in the header <time.h>.

See Also [prctl\(2\)](#), [sched_rr_get_interval\(3RT\)](#), [time.h\(3HEAD\)](#)

Name search.h, search – search tables

Synopsis #include <search.h>

Description The <search.h> header defines the ENTRY type for structure ent ry, which includes the following members:

```
char *key
void *data
```

and defines ACTION and VISIT as enumeration data types through type definitions as follows:

```
enum { FIND, ENTER } ACTION;
enum { preorder, postorder, endorder, leaf } VISIT;
```

The size_t type is defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [hsearch\(3C\)](#), [insque\(3C\)](#), [lsearch\(3C\)](#), [tsearch\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name select.h, select – select types

Synopsis #include <sys/select.h>

Description The <sys/select.h> header defines the `timeval` structure, which includes the following members:

```
time_t      tv_sec      /* seconds */
suseconds_t tv_usec     /* microseconds */
```

The `time_t` and `suseconds_t` types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

The `sigset_t` type is defined as described in [signal.h\(3HEAD\)](#).

The `timespec` structure is defined as described in <time.h>. See [time.h\(3HEAD\)](#).

The <sys/select.h> header defines the `fd_set` type as a structure.

The following is defined as a macro:

`FD_SETSIZE` Maximum number of file descriptors in an `fd_set` structure.

Inclusion of the <sys/select.h> header can make visible all symbols from the headers <signal.h>, <sys/time.h>, and <time.h>.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [select\(3C\)](#), [signal.h\(3HEAD\)](#), [time.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name semaphore.h, semaphore – semaphores

Synopsis #include <semaphore.h>

Description The <semaphore.h> header defines the `sem_t` type, used in performing semaphore operations. The semaphore can be implemented using a file descriptor, in which case applications are able to open up at least a total of `{OPEN_MAX}` files and semaphores. The symbol `SEM_FAILED` is defined (see [sem_open\(3RT\)](#)).

Inclusion of the <semaphore.h> header can make visible symbols defined in the headers <fcntl.h> and <sys/types.h>. See [fcntl.h\(3HEAD\)](#) and [types.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [fcntl.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [sem_destroy\(3RT\)](#), [sem_getvalue\(3RT\)](#), [sem_init\(3RT\)](#), [sem_open\(3RT\)](#), [sem_post\(3RT\)](#), [sem_timedwait\(3RT\)](#), [sem_unlink\(3RT\)](#), [sem_wait\(3RT\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name sem.h, sem – semaphore facility

Synopsis #include <sys/sem.h>

Description The <sys/sem.h> header defines the following constants and structures.

Semaphore operation flags:

SEM_UNDO Set up adjust on exit entry.

Command definitions for the `semctl()` function are provided as listed below. See [semctl\(2\)](#).

GETNCNT Get `semncnt`.

GETPID Get `sempid`.

GETVAL Get `semval`.

GETALL Get all cases of `semval`.

GETZCNT Get `semzcnt`.

SETVAL Set `semval`.

SETALL Set all cases of `semval`.

The `semid_ds` structure contains the following members:

```
struct ipc_perm sem_perm    /* operation permission structure */
unsigned short sem_nsems    /* number of semaphores in set */
time_t         sem_otime    /* last semop() time */
time_t         sem_ctime    /* last time changed by semctl() */
```

The `pid_t`, `time_t`, `key_t`, and `size_t` types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

A semaphore is represented by an anonymous structure containing the following members:

```
unsigned short semval    /* semaphore value */
pid_t         sempid    /* process ID of last operation */
unsigned short semncnt   /* number of processes waiting for semval
                        to become greater than current value */
unsigned short semzcnt   /* number of processes waiting for semval
                        to become 0 */
```

The `sembuf` structure contains the following members:

```
unsigned short sem_num    /* semaphore number */
short         sem_op      /* semaphore operation */
short         sem_flg     /* operation flags */
```

All of the symbols from <sys/ipc.h> are defined when this header is included. See [ipc.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [semctl\(2\)](#), [semget\(2\)](#), [semop\(2\)](#), [ipc.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name setjmp.h, setjmp – stack environment declarations

Synopsis #include <setjmp.h>

Description The <setjmp.h> header defines the array types jmp_buf and sigjmp_buf. Applications must define the appropriate feature test macro to enable the visibility of the symbols in this header.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [_longjmp\(3C\)](#), [setjmp\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name shm.h, shm – shared memory facility

Synopsis #include <sys/shm.h>

Description The <sys/shm.h> header defines the following symbolic constants:

SHM_RDONLY attach read-only (else read-write)

SHM_RND round attach address to SHMLBA

The <sys/shm.h> header defines the following symbolic value:

SHMLBA segment low boundary address multiple

The following data types are defined through typedef:

shmatt_t Unsigned integer used for the number of current attaches that must be able to store values at least as large as a type unsigned short.

The shmid_ds structure contains the following members:

```
struct ipc_perm shm_perm      /* operation permission structure */
size_t          shm_segsz      /* size of segment in bytes */
pid_t          shm_lpid        /* process ID of last shared memory
                               operation */
pid_t          shm_cpid        /* process ID of creator */
shmatt_t        shm_nattch     /* number of current attaches */
time_t          shm_atime      /* time of last shmat() */
time_t          shm_dtime      /* time of last shmdt() */
time_t          shm_ctime      /* time of last change by shmctl() */
```

The pid_t, time_t, key_t, and size_t types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

In addition, all of the symbols from <sys/ipc.h> are defined when this header is included.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [shmctl\(2\)](#), [shmget\(2\)](#), [shmop\(2\)](#), [ipc.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name siginfo.h, siginfo – signal generation information

Synopsis #include <siginfo.h>

Description If a process is catching a signal, it might request information that tells why the system generated that signal. See [sigaction\(2\)](#). If a process is monitoring its children, it might receive information that tells why a child changed state. See [waitid\(2\)](#). In either case, the system returns the information in a structure of type `siginfo_t`, which includes the following information:

```
int          si_signo      /* signal number */
int          si_errno      /* error number */
int          si_code       /* signal code */
union sigval si_value      /* signal value */
```

`si_signo` contains the system-generated signal number. For the [waitid\(2\)](#) function, `si_signo` is always `SIGCHLD`.

If `si_errno` is non-zero, it contains an error number associated with this signal, as defined in `<errno.h>`.

`si_code` contains a code identifying the cause of the signal.

If the value of the `si_code` member is `SI_NOINFO`, only the `si_signo` member of `siginfo_t` is meaningful, and the value of all other members is unspecified.

User Signals If the value of `si_code` is less than or equal to 0, then the signal was generated by a user process (see [kill\(2\)](#), [_lwp_kill\(2\)](#), [sigqueue\(3RT\)](#), [sigsend\(2\)](#), [abort\(3C\)](#), and [raise\(3C\)](#)) and the `siginfo` structure contains the following additional information:

```
pid_t        si_pid       /* sending process ID */
uid_t        si_uid       /* sending user ID */
ctid_t       si_ctid      /* sending contract ID */
zoneid_t     si_zoneid    /* sending zone ID */
```

If the signal was generated by a user process, the following values are defined for `si_code`:

<code>SI_USER</code>	The implementation sets <code>si_code</code> to <code>SI_USER</code> if the signal was sent by kill(2) , sigsend(2) , raise(3C) or abort(3C) .
<code>SI_LWP</code>	The signal was sent by _lwp_kill(2) .
<code>SI_QUEUE</code>	The signal was sent by sigqueue(3RT) .
<code>SI_TIMER</code>	The signal was generated by the expiration of a timer created by timer_settime(3RT) .
<code>SI_ASYNCIO</code>	The signal was generated by the completion of an asynchronous I/O request.
<code>SI_MSGQ</code>	The signal was generated by the arrival of a message on an empty message queue. See mq_notify(3RT) .

`si_value` contains the application specified value, which is passed to the application's signal-catching function at the time of the signal delivery if `si_code` is any of `SI_QUEUE`, `SI_TIMER`, `SI_ASYNCIO`, or `SI_MESGQ`.

System Signals Non-user generated signals can arise for a number of reasons. For all of these cases, `si_code` contains a positive value reflecting the reason why the system generated the signal:

Signal	Code	Reason
SIGILL	ILL_ILLOPC	illegal opcode
	ILL_ILLOPN	illegal operand
	ILL_ILLADR	illegal addressing mode
	ILL_ILLTRP	illegal trap
	ILL_PRVOPC	privileged opcode
	ILL_PRVREG	privileged register
	ILL_COPROC	co-processor error
	ILL_BADSTK	internal stack error
SIGFPE	FPE_INTDIV	integer divide by zero
	FPE_INTOVF	integer overflow
	FPE_FLTDIV	floating point divide by zero
	FPE_FLTOVF	floating point overflow
	FPE_FLTUND	floating point underflow
	FPE_FLTRES	floating point inexact result
	FPE_FLTINV	invalid floating point operation
	FPE_FLTSUB	subscript out of range
SIGSEGV	SEGV_MAPERR	address not mapped to object
	SEGV_ACCERR	invalid permissions for mapped object
SIGBUS	BUS_ADRALN	invalid address alignment
	BUS_ADRERR	non-existent physical address
	BUS_OBJERR	object specific hardware error
SIGTRAP	TRAP_BRKPT	process breakpoint
	TRAP_TRACE	process trace trap

SIGCHLD	CLD_EXITED	child has exited
	CLD_KILLED	child was killed
	CLD_DUMPED	child terminated abnormally
	CLD_TRAPPED	traced child has trapped
	CLD_STOPPED	child has stopped
	CLD_CONTINUED	stopped child had continued
SIGPOLL	POLL_IN	data input available
	POLL_OUT	output buffers available
	POLL_MSG	input message available
	POLL_ERR	I/O error
	POLL_PRI	high priority input available
	POLL_HUP	device disconnected

Signals can also be generated from the resource control subsystem. Where these signals do not already possess kernel-level `siginfo` codes, the `siginfo si_code` will be filled with `SI_RCTL` to indicate a kernel-generated signal from an established resource control value.

Signal	Code	Reason
SIGXRES	SI_RCTL	resource-control generated signal
SIGHUP		
SIGTERM		

The uncatchable signals `SIGSTOP` and `SIGKILL` have undefined `siginfo` codes.

Signals sent with a `siginfo` code of `SI_RCTL` contain code-dependent information for kernel-generated signals:

Code	Field	Value
SI_RCTL	hr_time si_entity	process-model entity of control

In addition, the following signal-dependent information is available for kernel-generated signals:

Signal	Field	Value
SIGILL	caddr_t si_addr	address of faulting instruction
SIGFPE		
SIGSEGV	caddr_t si_addr	address of faulting memory reference
SIGBUS		
SIGCHLD	pid_t si_pid	child process ID
	int si_status	exit value or signal
SIGPOLL	long si_band	band event for POLL_IN, POLL_OUT, or POLL_MSG

See Also [_lwp_kill\(2\)](#), [kill\(2\)](#), [setrctl\(2\)](#), [sigaction\(2\)](#), [sigsend\(2\)](#), [waitid\(2\)](#), [abort\(3C\)](#), [aio_read\(3RT\)](#), [mq_notify\(3RT\)](#), [raise\(3C\)](#), [signal.h\(3HEAD\)](#), [sigqueue\(3RT\)](#), [timer_create\(3RT\)](#), [timer_settime\(3RT\)](#)

Notes For SIGCHLD signals, if `si_code` is equal to `CLD_EXITED`, then `si_status` is equal to the exit value of the process; otherwise, it is equal to the signal that caused the process to change state. For some implementations, the exact value of `si_addr` might not be available; in that case, `si_addr` is guaranteed to be on the same page as the faulting instruction or memory reference.

Name signal.h, signal – base signals

Synopsis `#include <signal.h>`

Description A signal is an asynchronous notification of an event. A signal is said to be generated for (or sent to) a process when the event associated with that signal first occurs. Examples of such events include hardware faults, timer expiration and terminal activity, as well as the invocation of the [kill\(2\)](#) or [sigsend\(2\)](#) functions. In some circumstances, the same event generates signals for multiple processes. A process may request a detailed notification of the source of the signal and the reason why it was generated. See [siginfo.h\(3HEAD\)](#).

Signals can be generated synchronously or asynchronously. Events directly caused by the execution of code by a thread, such as a reference to an unmapped, protected, or bad memory can generate SIGSEGV or SIGBUS; a floating point exception can generate SIGFPE; and the execution of an illegal instruction can generate SIGILL. Such events are referred to as traps; signals generated by traps are said to be synchronously generated. Synchronously generated signals are initiated by a specific thread and are delivered to and handled by that thread.

Signals may also be generated by calling [kill\(\)](#), [sigqueue\(\)](#), or [sigsend\(\)](#). Events such as keyboard interrupts generate signals, such as SIGINT, which are sent to the target process. Such events are referred to as interrupts; signals generated by interrupts are said to be asynchronously generated. Asynchronously generated signals are not directed to a particular thread but are handled by an arbitrary thread that meets either of the following conditions:

- The thread is blocked in a call to [sigwait\(2\)](#) whose argument includes the type of signal generated.
- The thread has a signal mask that does not include the type of signal generated. See [pthread_sigmask\(3C\)](#). Each process can specify a system action to be taken in response to each signal sent to it, called the signal's disposition. All threads in the process share the disposition. The set of system signal actions for a process is initialized from that of its parent. Once an action is installed for a specific signal, it usually remains installed until another disposition is explicitly requested by a call to either [sigaction\(\)](#), [signal\(\)](#) or [sigset\(\)](#), or until the process [execs\(\)](#). See [sigaction\(2\)](#) and [signal\(3C\)](#). When a process [execs](#), all signals whose disposition has been set to catch the signal will be set to SIG_DFL. Alternatively, a process may request that the system automatically reset the disposition of a signal to SIG_DFL after it has been caught. See [sigaction\(2\)](#) and [signal\(3C\)](#).

SIGNAL DELIVERY A signal is said to be delivered to a process when a thread within the process takes the appropriate action for the disposition of the signal. Delivery of a signal can be blocked. There are two methods for handling delivery of a signal in a multithreaded application. The first method specifies a signal handler function to execute when the signal is received by the process. See [sigaction\(2\)](#). The second method uses [sigwait\(2\)](#) to create a thread to handle the receipt of the signal. The [sigaction\(\)](#) function can be used for both synchronously and asynchronously generated signals. The [sigwait\(\)](#) function will work only for asynchronously generated signals, as synchronously generated signals are sent to the thread that caused the event. The [sigwait\(\)](#) function is the recommended for use with a multithreaded application.

SIGNAL MASK Each thread has a signal mask that defines the set of signals currently blocked from delivery to it. The signal mask of the main thread is inherited from the signal mask of the thread that created it in the parent process. The selection of the thread within the process that is to take the appropriate action for the signal is based on the method of signal generation and the signal masks of the threads in the receiving process. Signals that are generated by action of a particular thread such as hardware faults are delivered to the thread that caused the signal. See [pthread_sigmask\(3C\)](#) or [sigprocmask\(2\)](#). See [alarm\(2\)](#) for current semantics of delivery of SIGALRM. Signals that are directed to a particular thread are delivered to the targeted thread. See [pthread_kill\(3C\)](#). If the selected thread has blocked the signal, it remains pending on the thread until it is unblocked. For all other types of signal generation (for example, [kill\(2\)](#), [sigsend\(2\)](#), terminal activity, and other external events not ascribable to a particular thread) one of the threads that does not have the signal blocked is selected to process the signal. If all the threads within the process block the signal, it remains pending on the process until a thread in the process unblocks it. If the action associated with a signal is set to ignore the signal then both currently pending and subsequently generated signals of this type are discarded immediately for this process.

The determination of which action is taken in response to a signal is made at the time the signal is delivered to a thread within the process, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated.

The signals currently defined by `<signal.h>` are as follows:

Name	Value	Default	Event
SIGHUP	1	Exit	Hangup (see termio(7I))
SIGINT	2	Exit	Interrupt (see termio(7I))
SIGQUIT	3	Core	Quit (see termio(7I))
SIGILL	4	Core	Illegal Instruction
SIGTRAP	5	Core	Trace or Breakpoint Trap
SIGABRT	6	Core	Abort
SIGEMT	7	Core	Emulation Trap
SIGFPE	8	Core	Arithmetic Exception
SIGKILL	9	Exit	Killed
SIGBUS	10	Core	Bus Error
SIGSEGV	11	Core	Segmentation Fault
SIGSYS	12	Core	Bad System Call

Name	Value	Default	Event
SIGPIPE	13	Exit	Broken Pipe
SIGALRM	14	Exit	Alarm Clock
SIGTERM	15	Exit	Terminated
SIGUSR1	16	Exit	User Signal 1
SIGUSR2	17	Exit	User Signal 2
SIGCHLD	18	Ignore	Child Status Changed
SIGPWR	19	Ignore	Power Fail or Restart
SIGWINCH	20	Ignore	Window Size Change
SIGURG	21	Ignore	Urgent Socket Condition
SIGPOLL	22	Exit	Pollable Event (see streamio(7I))
SIGSTOP	23	Stop	Stopped (signal)
SIGTSTP	24	Stop	Stopped (user) (see termio(7I))
SIGCONT	25	Ignore	Continued
SIGTTIN	26	Stop	Stopped (tty input) (see termio(7I))
SIGTTOU	27	Stop	Stopped (tty output) (see termio(7I))
SIGVTALRM	28	Exit	Virtual Timer Expired
SIGPROF	29	Exit	Profiling Timer Expired
SIGXCPU	30	Core	CPU time limit exceeded (see getrlimit(2))
SIGXFSZ	31	Core	File size limit exceeded (see getrlimit(2))
SIGWAITING	32	Ignore	Reserved
SIGLWP	33	Ignore	Reserved
SIGFREEZE	34	Ignore	Check point Freeze
SIGTHAW	35	Ignore	Check point Thaw
SIGCANCEL	36	Ignore	Reserved for threading support
SIGLOST	37	Exit	Resource lost (for example, record-lock lost)
SIGXRES	38	Ignore	Resource control exceeded (see setrctl(2))
SIGJVM1	39	Ignore	Reserved for Java Virtual Machine 1
SIGJVM2	40	Ignore	Reserved for Java Virtual Machine 2

Name	Value	Default	Event
SIGRTMIN	*	Exit	First real time signal
(SIGRTMIN+1)	*	Exit	Second real time signal
. . .			
(SIGRTMAX-1)	*	Exit	Second-to-last real time signal
SIGRTMAX	*	Exit	Last real time signal

The symbols SIGRTMIN through SIGRTMAX are evaluated dynamically to permit future configurability.

Applications should not use any of the signals marked “reserved” in the above table for any purpose, to avoid interfering with their use by the system.

SIGNAL DISPOSITION A process using a [signal\(3C\)](#), [sigset\(3C\)](#) or [sigaction\(2\)](#) system call can specify one of three dispositions for a signal: take the default action for the signal, ignore the signal, or catch the signal.

Default Action: SIG_DFL A disposition of SIG_DFL specifies the default action. The default action for each signal is listed in the table above and is selected from the following:

- Exit** When it gets the signal, the receiving process is to be terminated with all the consequences outlined in [exit\(2\)](#).
- Core** When it gets the signal, the receiving process is to be terminated with all the consequences outlined in [exit\(2\)](#). In addition, a “core image” of the process is constructed in the current working directory.
- Stop** When it gets the signal, the receiving process is to stop. When a process is stopped, all the threads within the process also stop executing.
- Ignore** When it gets the signal, the receiving process is to ignore it. This is identical to setting the disposition to SIG_IGN.

Ignore Signal: SIG_IGN A disposition of SIG_IGN specifies that the signal is to be ignored. Setting a signal action to SIG_IGN for a signal that is pending causes the pending signal to be discarded, whether or not it is blocked. Any queued values pending are also discarded, and the resources used to queue them are released and made available to queue other signals.

Catch Signal: function address A disposition that is a function address specifies that, when it gets the signal, the thread within the process that is selected to process the signal will execute the signal handler at the specified address. Normally, the signal handler is passed the signal number as its only argument. If the disposition was set with the [sigaction\(2\)](#) function, however, additional arguments can be requested. When the signal handler returns, the receiving process resumes execution at the

point it was interrupted, unless the signal handler makes other arrangements. If an invalid function address is specified, results are undefined.

If the disposition has been set with the `sigset()` or `sigaction()`, the signal is automatically blocked in the thread while it is executing the signal catcher. If a `longjmp()` is used to leave the signal catcher, then the signal must be explicitly unblocked by the user. See [setjmp\(3C\)](#), [signal\(3C\)](#) and [sigprocmask\(2\)](#).

If execution of the signal handler interrupts a blocked function call, the handler is executed and the interrupted function call returns `-1` to the calling process with `errno` set to `EINTR`. If the `SA_RESTART` flag is set, however, certain function calls will be transparently restarted.

Some signal-generating functions, such as high resolution timer expiration, asynchronous I/O completion, inter-process message arrival, and the [sigqueue\(3RT\)](#) function, support the specification of an application defined value, either explicitly as a parameter to the function, or in a `sigevent` structure parameter. The `sigevent` structure is defined by `<signal.h>` and contains at least the following members:

Member	Member	
Type	Name	Description
int	sigev_notify	Notification type
int	sigev_signo	Signal number
union sigval	sigev_value	Signal value

The `sigval` union is defined by `<signal.h>` and contains at least the following members:

Member	Member	
Type	Name	Description
int	sival_int	Integer signal value
void *	sival_ptr	Pointer signal value

The `sigev_notify` member specifies the notification mechanism to use when an asynchronous event occurs. The `sigev_notify` member may be defined with the following values:

SIGEV_NONE	No asynchronous notification is delivered when the event of interest occurs.
SIGEV_SIGNAL	A queued signal, with its value application-defined, is generated when the event of interest occurs.

SIGEV_PORT An asynchronous notification is delivered to an event port when the event of interest occurs. The `sival_ptr` member points to a `port_notify_t` structure (see [port_associate\(3C\)](#)). The event port identifier as well as an application-defined cookie are part of the `port_notify_t` structure.

Your implementation may define additional notification mechanisms.

The `sigev_signo` member specifies the signal to be generated.

The `sigev_value` member references the application defined value to be passed to the signal-catching function at the time of the signal delivery as the `si_value` member of the `siginfo_t` structure.

The `sival_int` member is used when the application defined value is of type `int`, and the `sival_ptr` member is used when the application defined value is a pointer.

When a signal is generated by [sigqueue\(3RT\)](#) or any signal-generating function which supports the specification of an application defined value, the signal is marked pending and, if the `SA_SIGINFO` flag is set for that signal, the signal is queued to the process along with the application specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. If the `SA_SIGINFO` flag is not set for that signal, later occurrences of that signal's generation, when a signal is already queued, are silently discarded.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [lockd\(1M\)](#), [Intro\(2\)](#), [alarm\(2\)](#), [exit\(2\)](#), [fcntl\(2\)](#), [getrlimit\(2\)](#), [ioctl\(2\)](#), [kill\(2\)](#), [pause\(2\)](#), [setrctl\(2\)](#), [sigaction\(2\)](#), [sigaltstack\(2\)](#), [sigprocmask\(2\)](#), [sigsend\(2\)](#), [sigsuspend\(2\)](#), [sigwait\(2\)](#), [port_associate\(3C\)](#), [pthread_create\(3C\)](#), [pthread_kill\(3C\)](#), [pthread_sigmask\(3C\)](#), [setjmp\(3C\)](#), [siginfo.h\(3HEAD\)](#), [signal\(3C\)](#), [sigqueue\(3RT\)](#), [sigsetops\(3C\)](#), [thr_create\(3C\)](#), [thr_kill\(3C\)](#), [thr_sigsetmask\(3C\)](#), [ucontext.h\(3HEAD\)](#), [wait\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Notes The dispositions of the `SIGKILL` and `SIGSTOP` signals cannot be altered from their default values. The system generates an error if this is attempted.

The `SIGKILL`, `SIGSTOP`, and `SIGCANCEL` signals cannot be blocked. The system silently enforces this restriction.

The `SIGCANCEL` signal cannot be directed to an individual thread using [pthread_kill\(3C\)](#), but it can be sent to a process using [kill\(2\)](#), [sigsend\(2\)](#), or [sigqueue\(3RT\)](#).

Whenever a process receives a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal, regardless of its disposition, any pending SIGCONT signal are discarded.

Whenever a process receives a SIGCONT signal, regardless of its disposition, any pending SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals is discarded. In addition, if the process was stopped, it is continued.

SIGPOLL is issued when a file descriptor corresponding to a STREAMS file has a “selectable” event pending. See [Intro\(2\)](#). A process must specifically request that this signal be sent using the `I_SETSIG` ioctl call. Otherwise, the process will never receive SIGPOLL.

If the disposition of the SIGCHLD signal has been set with `signal` or `sigset`, or with `sigaction` and the `SA_NOCLDSTOP` flag has been specified, it will only be sent to the calling process when its children exit; otherwise, it will also be sent when the calling process's children are stopped or continued due to job control.

The name SIGCLD is also defined in this header and identifies the same signal as SIGCHLD. SIGCLD is provided for backward compatibility, new applications should use SIGCHLD.

The disposition of signals that are inherited as SIG_IGN should not be changed.

Signals which are generated synchronously should not be masked. If such a signal is blocked and delivered, the receiving process is killed.

Name socket.h, socket – Internet Protocol family

Synopsis #include <sys/socket.h>

Description The <sys/socket.h> header defines the unsigned integral type `sa_family_t` through typedef.

The <sys/socket.h> header defines the `sockaddr` structure that includes the following members:

```
sa_family_t  sa_family    /* address family */
char         sa_data[]    /* socket address (variable-length
                           data) */
```

libxnet Interfaces The <sys/socket.h> header defines the `msghdr` structure for libxnet interfaces that includes the following members:

```
void         *msg_name    /* optional address */
socklen_t    msg_namelen  /* size of address */
struct iovec *msg_iov     /* scatter/gather array */
int          msg_iovlen   /* members in msg_iov */
void         *msg_control  /* ancillary data, see below */
socklen_t    msg_controllen /* ancillary data buffer len */
int          msg_flags     /* flags on received message */
```

The <sys/socket.h> header defines the `cmsghdr` structure for libxnet that includes the following members:

```
socklen_t    cmsg_len     /* data byte count, including hdr */
int          cmsg_level   /* originating protocol */
int          cmsg_type     /* protocol-specific type */
```

Ancillary data consists of a sequence of pairs, each consisting of a `cmsghdr` structure followed by a data array. The data array contains the ancillary data message, and the `cmsghdr` structure contains descriptive information that allows an application to correctly parse the data.

The values for `cmsg_level` will be legal values for the `level` argument to the `getsockopt()` and `setsockopt()` functions. The `SCM_RIGHTS` type is supported for level `SOL_SOCKET`.

Ancillary data is also possible at the socket level. The <sys/socket.h> header defines the following macros for use as the `cmsg_type` values when `cmsg_level` is `SOL_SOCKET`.

SCM_RIGHTS Indicates that the data array contains the access rights to be sent or received.

SCM_UCRED Indicates that the data array contains a `ucred_t` to be received. The `ucred_t` is the credential of the sending process at the time the message was sent. This is a Sun-specific, Evolving interface. See [ucred_get\(3C\)](#).

The IPv4 data formats generally use the same values for data passed back in `cmsghdr` as for `setsockopt()` to enable the feature. The IPv4 data formats are listed below with the associated payload for each.

```
IPPROTO_IP
IP_RECVDSTADDR
    ipaddr_t, IP address

IPPROTO_IP
IP_RECVOPTS
    variable-length IP options, up to 40 bytes

IPPROTO_IP
IP_RECVIF
    uint_t, ifIndex number

IPPROTO_IP
IP_RECVSLLA
    struct sockaddr_dl, link layer address

IPPROTO_IP
IP_RECVTTL
    uint8_t

SOL_SOCKET
SO_RECVUCRED
    ucred_t — cmsghdr.cmsg_type is SCM_UCRED, not SO_RECVUCRED
```

The IPv6 data formats use different values for enabling the option and for passing the value back to the application. The IPv6 data formats are listed below with the associated payload for each.

```
IPPROTO_IPV6
IPV6_RECVPKTINFO
    in_pktinfo, cmsg_type IPV6_PKTINFO

IPPROTO_IPV6
IPV6_RECVTCLASS
    uint_t, cmsg_type IPV6_TCLASS

IPPROTO_IPV6
IPV6_RECVPATHMTU
    ip6_mtuinfo, cmsg_type IPV6_PATHMTU

IPPROTO_IPV6
IPV6_RECVHOPLIMIT
    uint_t, cmsg_type IPV6_HOPLIMIT

IPPROTO_IPV6
IPV6_RECVHOPOPTS
```

variable-length IPv6 options, `cmsg_type` `IPV6_HOPOPTS`

`IPPROTO_IPV6`

`IPV6_RECVDSTOPTS`

variable-length IPv6 options, `cmsg_type` `IPV6_DSTOPTS`

`IPPROTO_IPV6`

`IPV6_RECVRTHDR`

variable-length IPv6 options, `cmsg_type` `IPV6_RTHDR`

`IPPROTO_IPV6`

`IPV6_RECVRTHDRDSTOPTS`

variable-length IPv6 options, `cmsg_type` `IPV6_DSTOPTS`

The `<sys/socket.h>` header defines the following macros to gain access to the data arrays in the ancillary data associated with a message header:

`MSG_DATA(cmsg)`

If the argument is a pointer to a `cmsghdr` structure, this macro returns an unsigned character pointer to the data array associated with the `cmsghdr` structure.

`MSG_NXTHDR(mhdr, cmsg)`

If the first argument is a pointer to a `msghdr` structure and the second argument is a pointer to a `cmsghdr` structure in the ancillary data, pointed to by the `msg_controll` field of that `msghdr` structure, this macro returns a pointer to the next `cmsghdr` structure, or a null pointer if this structure is the last `cmsghdr` in the ancillary data.

`MSG_FIRSTHDR(mhdr)`

If the argument is a pointer to a `msghdr` structure, this macro returns a pointer to the first `cmsghdr` structure in the ancillary data associated with this `msghdr` structure, or a null pointer if there is no ancillary data associated with the `msghdr` structure.

`MSG_SPACE(len)`

Given the length of an ancillary data object, `MSG_SPACE()` returns the space required by the object and its `cmsghdr` structure, including any padding needed to satisfy alignment requirements. This macro can be used, for example, to allocate space dynamically for the ancillary data. This macro should not be used to initialize the `cmsg_len` member of a `cmsghdr` structure. Use the `MSG_LEN()` macro instead.

`MSG_LEN(len)`

Given the length of an ancillary data object, `MSG_LEN()` returns the value to store in the `cmsg_len` member of the `cmsghdr` structure, taking into account any padding needed to satisfy alignment requirements.

The `<sys/socket.h>` header defines the `linger` structure that includes the following members:

```
int    l_onoff    /* indicates whether linger option is enabled */
int    l_linger   /* linger time, in seconds */
```

The `<sys/socket.h>` header defines the following macros:

<code>SOCK_DGRAM</code>	Datagram socket
<code>SOCK_STREAM</code>	Byte-stream socket
<code>SOCK_SEQPACKET</code>	Sequenced-packet socket

The `<sys/socket.h>` header defines the following macro for use as the *level* argument of `setsockopt()` and `getsockopt()`.

<code>SOL_SOCKET</code>	Options to be accessed at socket level, not protocol level.
-------------------------	---

The `<sys/socket.h>` header defines the following macros for use as the *option_name* argument in `getsockopt()` or `setsockopt()` calls:

<code>SO_DEBUG</code>	Debugging information is being recorded.
<code>SO_ACCEPTCONN</code>	Socket is accepting connections.
<code>SO_BROADCAST</code>	Transmission of broadcast messages is supported.
<code>SO_REUSEADDR</code>	Reuse of local addresses is supported.
<code>SO_KEEPAIVE</code>	Connections are kept alive with periodic messages.
<code>SO_LINGER</code>	Socket lingers on close.
<code>SO_OOBINLINE</code>	Out-of-band data is transmitted in line.
<code>SO_SNDBUF</code>	Send buffer size.
<code>SO_RCVBUF</code>	Receive buffer size.
<code>SO_ERROR</code>	Socket error status.
<code>SO_TYPE</code>	Socket type.
<code>SO_RECVUCRED</code>	Request the reception of user credential ancillary data. This is a Sun-specific, Evolving interface. See ucred_get(3C) .
<code>SO_MAC_EXEMPT</code>	Mandatory Access Control (MAC) exemption for unlabeled peers. This option is available only if the system is configured with Trusted Extensions.
<code>SO_ALLZONES</code>	Bypass zone boundaries (privileged).

The `<sys/socket.h>` header defines the following macros for use as the valid values for the `msg_flags` field in the `msghdr` structure, or the `flags` parameter in `recvfrom()`, `recvmsg()`, `sendto()`, or `sendmsg()` calls:

<code>MSG_TRUNC</code>	Control data truncated.
<code>MSG_EOR</code>	Terminates a record (if supported by the protocol).

- MSG_OOB Out-of-band data.
- MSG_PEEK Leave received data in queue.
- MSG_TRUNC Normal data truncated.
- MSG_WAITALL Wait for complete message.

The <sys/socket.h> header defines the following macros:

- AF_UNIX UNIX domain sockets
- AF_INET Internet domain sockets

The <sys/socket.h> header defines the following macros:

- SHUT_RD Disables further receive operations.
- SHUT_WR Disables further send operations.
- SHUT_RDWR Disables further send and receive operations.

libsocket Interfaces The <sys/socket.h> header defines the msghdr structure for libsocket interfaces that includes the following members:

```
void            *msg_name            /* optional address */
socklen_t       msg_namelen          /* size of address */
struct iovec    *msg_iov            /* scatter/gather array */
int             msg_iovlen          /* # elements in msg_iov */
caddr_t         msg_accrights        /* access rights sent/received */
```

The *msg_name* and *msg_namelen* parameters specify the destination address when the socket is unconnected. The *msg_name* can be specified as a NULL pointer if no names are desired or required. The *msg_iov* and *msg_iovlen* parameters describe the scatter-gather locations, as described in [read\(2\)](#). The *msg_accrights* parameter specifies the buffer in which access rights sent along with the message are received. The *msg_accrightslen* specifies the length of the buffer.

Name spawn.h, spawn – spawn

Synopsis #include <spawn.h>

Description The <spawn.h> header defines the `posix_spawnattr_t` and `posix_spawn_file_actions_t` types used in performing spawn operations.

The <spawn.h> header defines the flags that can be set in a `posix_spawnattr_t` object using the `posix_spawnattr_setflags()` function:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK

Inclusion of the <spawn.h> header can make visible symbols defined in the <sched.h>, <signal.h>, and <sys/types.h> headers.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [sched.h\(3HEAD\)](#), [semaphore.h\(3HEAD\)](#), [signal.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name stat.h, stat – data returned by stat system call

Synopsis #include <sys/types.h>
#include <sys/stat.h>

Description The system calls `stat()`, `lstat()` and `fstat()` return data in a `stat` structure, which is defined in <stat.h>.

The constants used in the `st_mode` field are also defined in this file:

```
#define      S_IFMT                /* type of file */
#define      S_IAMB                /* access mode bits */
#define      S_IFIFO              /* fifo */
#define      S_IFCHR              /* character special */
#define      S_IFDIR              /* directory */
#define      S_IFNAM              /* XENIX special named file */
#define      S_INSEM              /* XENIX semaphore subtype of IFNAM */
#define      S_INSHD              /* XENIX shared data subtype of IFNAM */
#define      S_IFBLK              /* block special */
#define      S_IFREG              /* regular */
#define      S_IFLNK              /* symbolic link */
#define      S_IFSOCK             /* socket */
#define      S_IFDOOR             /* door */
#define      S_ISUID              /* set user id on execution */
#define      S_ISGID              /* set group id on execution */
#define      S_ISVTX              /* save swapped text even after use */
#define      S_IREAD              /* read permission, owner */
#define      S_IWRITE             /* write permission, owner */
#define      S_IEXEC              /* execute/search permission, owner */
#define      S_ENFMT              /* record locking enforcement flag */
#define      S_IRWXU              /* read, write, execute: owner */
#define      S_IRUSR              /* read permission: owner */
#define      S_IWUSR              /* write permission: owner */
```

```
#define      S_IXUSR          /* execute permission: owner */
#define      S_IRWXG          /* read, write, execute: group */
#define      S_IRGRP          /* read permission: group */
#define      S_IWGRP          /* write permission: group */
#define      S_IXGRP          /* execute permission: group */
#define      S_IRWXO          /* read, write, execute: other */
#define      S_IROTH          /* read permission: other */
#define      S_IWOTH          /* write permission: other */
#define      S_IXOTH          /* execute permission: other */
```

The following macros are for POSIX conformance (see [standards\(5\)](#)):

```
#define      S_ISBLK(mode)    block special file
#define      S_ISCHR(mode)    character special file
#define      S_ISDIR(mode)    directory file
#define      S_ISFIFO(mode)   pipe or fifo file
#define      S_ISREG(mode)    regular file
#define      S_ISSOCK(mode)   socket file
```

The following symbolic constants are defined as distinct integer values outside of the range [0, 999 999 999], for use with the `futimens()` and `utimensat()` functions:

```
#define      UTIME_NOW        use the current time
#define      UTIME_OMIT       no time change
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Committed
Standard	See standards(5) .

Name statvfs.h, statvfs – VFS File System information structure

Synopsis #include <sys/statvfs.h>

Description The <sys/statvfs.h> header defines the statvfs structure, which includes the following members:

```

unsigned long f_bsize      /* file system block
                           size */
unsigned long f_frsize    /* fundamental file system block
                           size */
fsblkcnt_t   f_blocks     /* total number of blocks on file
                           system in units of f_frsize */
fsblkcnt_t   f_bfree      /* total number of free blocks */
fsblkcnt_t   f_bavail     /* number of free blocks available
                           to non-privileged process */
fsfilcnt_t   f_files      /* total number of file serial
                           numbers */
fsfilcnt_t   f_ffree      /* total number of free file serial
                           numbers */
fsfilcnt_t   f_favail     /* number of file serial numbers
                           available to non-privileged
                           process */
unsigned long f_fsid       /* process file system ID */
unsigned long f_flag       /* bit mask of f_flag values */
unsigned long f_namemax    /* maximum filename length */

```

The fsblkcnt_t and fsfilcnt_t types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

The following flags for the f_flag member are defined:

```

ST_RDONLY    read-only file system
ST_NOSUID    does not support setuid()/setgid() semantics

```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

Name `stdbool.h`, `stdbool` – boolean type and values

Synopsis

```
#include <stdbool.h>
```

Description The `<stdbool.h>` header defines the following macros:

<code>bool</code>	expands to <code>_Bool</code>
<code>true</code>	expands to the integer constant 1
<code>false</code>	expands to the integer constant 0
<code>__bool_true_false_are_defined</code>	expands to the integer constant 1

An application can undefine and then possibly redefine the macros `bool`, `true`, and `false`.

Attributes See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [attributes\(5\)](#), [standards\(5\)](#)

Name `stddef.h`, `stddef` – standard type definitions

Synopsis `#include <stddef.h>`

Description The `<stddef.h>` header defines the following macros:

<code>NULL</code>	Null pointer constant.
<code>offsetof(type, member-designator)</code>	Integer constant expression of type <code>size_t</code> , the value of which is the offset in bytes to the structure member (<code>member-designator</code>), from the beginning of its structure (<code>type</code>).

The `<stddef.h>` header defines the following types:

<code>ptrdiff_t</code>	Signed integer type of the result of subtracting two pointers.
<code>wchar_t</code>	Integer type whose range of values can represent distinct wide-character codes for all members of the largest character set specified among the locales supported by the compilation environment: the null character has the code value 0 and each member of the portable character set has a code value equal to its value when used as the lone character in an integer character constant.
<code>size_t</code>	Unsigned integer type of the result of the <code>sizeof</code> operator.

The implementation supports one or more programming environments in which the widths of `ptrdiff_t`, `size_t`, and `wchar_t` are no greater than the width of type `long`. The names of these programming environments can be obtained using the [confstr\(3C\)](#) function or the [getconf\(1\)](#) utility.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name stdint.h, stdint – integer types

Synopsis #include <stdint.h>

Description The <stdint.h> header declares sets of integer types having specified widths, and defines corresponding sets of macros. It also defines macros that specify limits of integer types corresponding to types defined in other standard headers.

The “width” of an integer type is the number of bits used to store its value in a pure binary system; the actual type can use more bits than that (for example, a 28-bit type could be stored in 32 bits of actual storage). An N -bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to $2^{N-1}-1$, while an N -bit unsigned type has values in the range 0 to 2^N-1 .

Types are defined in the following categories:

- integer types having certain exact widths
- integer types having at least certain specified widths
- fastest integer types having at least certain specified widths
- integer types wide enough to hold pointers to objects
- integer types having greatest width

Some of these types may denote the same type.

Corresponding macros specify limits of the declared types and construct suitable constants.

For each type described herein that the implementation provides, the <stdint.h> header declares that typedef name and defines the associated macros. Conversely, for each type described herein that the implementation does not provide, the <stdint.h> header does not declare that typedef name, nor does it define the associated macros. An implementation provides those types described as required, but need not provide any of the others (described as optional).

Integer Types When typedef names differing only in the absence or presence of the initial *u* are defined, they denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999 standard, Section 6.2.5; an implementation providing one of these corresponding types must also provide the other.

In the following descriptions, the symbol N represents an unsigned decimal integer with no leading zeros (for example, 8 or 24, but not 04 or 048).

Exact-width integer types

The typedef name `int $N$ _t` designates a signed integer type with width N , no padding bits, and a two's-complement representation. Thus, `int8_t` denotes a signed integer type with a width of exactly 8 bits.

The typedef name `uint $N$ _t` designates an unsigned integer type with width N . Thus, `uint24_t` denotes an unsigned integer type with a width of exactly 24 bits.

The following types are required:

```
int8_t
int16_t
int32_t
uint8_t
uint16_t
uint32_t
```

If an implementation provides integer types with width 64 that meet these requirements, then the following types are required:

```
int64_t
uint64_t
```

In particular, this is the case if any of the following are true:

- The implementation supports the `_POSIX_V6_ILP32_OFFBIG` programming environment and the application is being built in the `_POSIX_V6_ILP32_OFFBIG` programming environment (see the Shell and Utilities volume of IEEE Std 1003.1-200x, c99, Programming Environments).
- The implementation supports the `_POSIX_V6_LP64_OFF64` programming environment and the application is being built in the `_POSIX_V6_LP64_OFF64` programming environment.
- The implementation supports the `_POSIX_V6_LPBIG_OFFBIG` programming environment and the application is being built in the `_POSIX_V6_LPBIG_OFFBIG` programming environment.

All other types of this form are optional.

Minimum-width integer types

The typedef name `int_leastN_t` designates a signed integer type with a width of at least *N*, such that no signed integer type with lesser size has at least the specified width. Thus, `int_least32_t` denotes a signed integer type with a width of at least 32 bits.

The typedef name `uint_leastN_t` designates an unsigned integer type with a width of at least *N*, such that no unsigned integer type with lesser size has at least the specified width. Thus, `uint_least16_t` denotes an unsigned integer type with a width of at least 16 bits.

The following types are required:

```
int_least8_t
int_least16_t
int_least32_t
int_least64_t
uint_least8_t
uint_least16_t
uint_least32_t
uint_least64_t
```

All other types of this form are optional.

Fastest minimum-width integer types

Each of the following types designates an integer type that is usually fastest to operate with among all integer types that have at least the specified width.

The designated type is not guaranteed to be fastest for all purposes; if the implementation has no clear grounds for choosing one type over another, it will simply pick some integer type satisfying the signedness and width requirements.

The typedef name `int_fastN_t` designates the fastest signed integer type with a width of at least *N*. The typedef name `uint_fastN_t` designates the fastest unsigned integer type with a width of at least *N*.

The following types are required:

```
int_fast8_t
int_fast16_t
int_fast32_t
int_fast64_t
uint_fast8_t
uint_fast16_t
uint_fast32_t
uint_fast64_t
```

All other types of this form are optional.

Integer types capable of holding object pointers

<code>intptr_t</code>	Designates a signed integer type with the property that any valid pointer to void can be converted to this type, then converted back to a pointer to void, and the result will compare equal to the original pointer.
<code>uintptr_t</code>	Designates an unsigned integer type with the property that any valid pointer to void can be converted to this type, then converted back to a pointer to void, and the result will compare equal to the original pointer.

On standard-conforming systems, the `intptr_t` and `uintptr_t` types are required; otherwise, they are optional.

Greatest-width integer types

<code>intmax_t</code>	Designates a signed integer type capable of representing any value of any signed integer type.
<code>uintmax_t</code>	Designates an unsigned integer type capable of representing any value of any unsigned integer type.

These types are required.

Applications can test for optional types by using the corresponding limit macro from Limits of Specified-Width Integer Types.

Limits of
Specified-Width
Integer Types

The following macros specify the minimum and maximum limits of the types declared in the `<stdint.h>` header. Each macro name corresponds to a similar type name in Integer Types.

Each instance of any defined macro is replaced by a constant expression suitable for use in `#if` preprocessing directives. This expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value is equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

Limits of exact-width integer types

- Minimum values of exact-width signed integer types:
`{INTN_MIN}` Exactly $-(2^{N-1})$
- Maximum values of exact-width signed integer types:
`{INTN_MAX}` Exactly $2^{N-1} - 1$
- Maximum values of exact-width unsigned integer types:
`{UINTN_MAX}` Exactly $2^N - 1$

Limits of minimum-width integer types

- Minimum values of minimum-width signed integer types:
`{INT_LEASTN_MIN}` $-(2^{N-1} - 1)$
- Maximum values of minimum-width signed integer types:
`{INT_LEASTN_MAX}` $2^{N-1} - 1$
- Maximum values of minimum-width unsigned integer types:
`{UINT_LEASTN_MAX}` $2^N - 1$

Limits of fastest minimum-width integer types

- Minimum values of fastest minimum-width signed integer types:
`{INT_FASTN_MIN}` $-(2^{N-1} - 1)$
- Maximum values of fastest minimum-width signed integer types:
`{INT_FASTN_MAX}` $2^{N-1} - 1$
- Maximum values of fastest minimum-width unsigned integer types:
`{UINT_FASTN_MAX}` $2^{N-1} - 1$

Limits of integer types capable of holding object pointers

- Minimum value of pointer-holding signed integer type:
`{INTPTR_MIN}` $-(2^{15} - 1)$

- Maximum value of pointer-holding signed integer type:
`{INTPTR_MAX}` $2^{15} - 1$
- Minimum value of pointer-holding signed integer type:
`{UNIPTR_MAX}` $2^{16} - 1$

Limits of greatest-width integer types

- Minimum value of greatest-width signed integer type:
`{INTMAX_MIN}` $-(2^{63} - 1)$
- Maximum value of greatest-width signed integer type:
`{INTMAX_MAX}` $2^{63} - 1$
- Maximum value of greatest-width unsigned integer type:
`{UINTMAX_MAX}` $2^{64} - 1$

Limits of Other Integer Types The following macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros is replaced by a constant expression suitable for use in `#if` preprocessing directives. This expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value is equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

Limits of `ptrdiff_t`:

`{PTRDIFF_MIN}` -65535
`{PTRDIFF_MAX}` +65535

Limits of `sig_atomic_t`:

`{SIG_ATOMIC_MIN}` See below.
`{SIG_ATOMIC_MAX}` See below.

Limits of `size_t`:

`{SIZE_MAX}` 65535

Limits of `wchar_t`:

`{WCHAR_MIN}` See below.
`{WCHAR_MAX}` See below.

Limits of `wint_t`:

`{WINT_MIN}` See below.

`{WINT_MAX}` See below.

If `sig_atomic_t` (see the `<signal.h>` header) is defined as a signed integer type, the value of `{SIG_ATOMIC_MIN}` is no greater than -127 and the value of `{SIG_ATOMIC_MAX}` is no less than 127. Otherwise, `sig_atomic_t` is defined as an unsigned integer type, the value of `{SIG_ATOMIC_MIN}` is 0, and the value of `{SIG_ATOMIC_MAX}` is no less than 255.

If `wchar_t` (see the `<stddef.h>` header) is defined as a signed integer type, the value of `{WCHAR_MIN}` is no greater than -127 and the value of `{WCHAR_MAX}` is no less than 127. Otherwise, `wchar_t` is defined as an unsigned integer type, and the value of `{WCHAR_MIN}` is 0 and the value of `{WCHAR_MAX}` is no less than 255.

If `wint_t` (see the `<wchar.h>` header) is defined as a signed integer type, the value of `{WINT_MIN}` is no greater than -32767 and the value of `{WINT_MAX}` is no less than 32767. Otherwise, `wint_t` is defined as an unsigned integer type, and the value of `{WINT_MIN}` is 0 and the value of `{WINT_MAX}` is no less than 65535.

Macros for Integer Constant Expressions

The following macros expand to integer constant expressions suitable for initializing objects that have integer types corresponding to types defined in the `<stdint.h>` header. Each macro name corresponds to a similar type name listed under minimum-width integer types and greatest-width integer types.

Each invocation of one of these macros expands to an integer constant expression suitable for use in `#if` preprocessing directives. The type of the expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. The value of the expression is that of the argument. The argument in any instance of these macros is a decimal, octal, or hexadecimal constant with a value that does not exceed the limits for the corresponding type.

Macros for minimum-width integer constant expressions

The macro `INTN_C(value)` expands to an integer constant expression corresponding to the type `int_leastN_t`. The macro `UINTN_C(value)` expands to an integer constant expression corresponding to the type `uint_leastN_t`. For example, if `uint_least64_t` is a name for the type unsigned long long, then `UINT64_C(0x123)` might expand to the integer constant `0x123ULL`.

Macros for greatest-width integer constant expressions

The following macro expands to an integer constant expression having the value specified by its argument and the type `intmax_t`:

`INTMAX_C(value)`

The following macro expands to an integer constant expression having the value specified by its argument and the type `uintmax_t`:

UINTMAX_C(*value*)

Name stdio.h, stdio – standard buffered input/output

Synopsis #include <stdio.h>

Description The <stdio.h> header defines the following macros as positive integer constant expressions:

BUFSIZ	size of <stdio.h> buffers
_IOFBF	input/output fully buffered
_IOLBF	input/output line buffered
_IONBF	input/output unbuffered
L_ctermid	maximum size of character array to hold ctermid() output
L_tmpnam	maximum size of character array to hold tmpnam() output
SEEK_CUR	seek relative to current position
SEEK_END	seek relative to end-of-file
SEEK_SET	seek relative to start-of-file

The following macros are defined as positive integer constant expressions that denote implementation limits:

{FILENAME_MAX}	Maximum size in bytes of the longest filename string that the implementation guarantees can be opened.
{FOPEN_MAX}	Number of streams that the implementation guarantees can be open simultaneously. The value is at least eight.
{TMP_MAX}	Minimum number of unique filenames generated by tmpnam(). Maximum number of times an application can call tmpnam() reliably. The value of {TMP_MAX} is at least 25. On XSI-conformant systems, the value of {TMP_MAX} is at least 10000.

The following macro name is defined as a negative integer constant expression:

EOF end-of-file return value

The following macro name is defined as a null pointer constant:

NULL null pointer

The following macro name is defined as a string constant:

P_tmpdir default directory prefix for tmpnam()

The following is defined as expressions of type “pointer to FILE” point to the FILE objects associated, respectively, with the standard error, input, and output streams:

stderr standard error output stream

`stdin` standard input stream
`stdout` standard output stream

The following data types are defined through typedef:

`FILE` structure containing information about a file
`fpos_t` non-array type containing all information needed to specify uniquely every position within a file
`va_list` as described in `<stdarg.h>`
`size_t` as described in `<stddef.h>`

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

Name `stdlib.h`, `stdlib` – standard library definitions

Synopsis `#include <stdlib.h>`

Description The `<stdlib.h>` header defines the following macros:

- `EXIT_FAILURE` Unsuccessful termination for `exit()`; evaluates to a non-zero value. See [exit\(3C\)](#).
- `EXIT_SUCCESS` Successful termination for `exit()`; evaluates to 0.
- `NULL` Null pointer.
- `{RAND_MAX}` Maximum value returned by `rand()`; at least 32767. See [rand\(3C\)](#).
- `{MB_CUR_MAX}` Integer expression whose value is the maximum number of bytes in a character specified by the current locale.

The following data types are defined through typedef:

- `div_t` structure type returned by the `div()` function
- `ldiv_t` structure type returned by the `ldiv()` function
- `lldiv_t` structure type returned by the `lldiv()` function
- `size_t` as described in `<stddef.h>`
- `wchar_t` as described in `<stddef.h>`

See [div\(3C\)](#), which covers `div()`, `ldiv()`, and `lldiv()`, and [stddef.h\(3HEAD\)](#).

In addition, the symbolic names and macros listed below are defined as in `<sys/wait.h>`, for use in decoding the return value from `system()`. See [wait.h\(3HEAD\)](#) and [system\(3C\)](#).

- `WNOHANG`
- `WUNTRACED`
- `WEXITSTATUS`
- `WIFEXITED`
- `WIFSIGNALED`
- `WIFSTOPPED`
- `WSTOPSIG`
- `WTERMSIG`

Name stropts.h, stropts – STREAMS interface (STREAMS)

Synopsis #include <stropts.h>

Description The <stropts.h> header defines the `bandinfo` structure, which includes the following members:

```
unsigned char bi_pri    /* priority band */
int          bi_flag    /* flushing type */
```

The <stropts.h> header defines the `strpeek` structure that includes the following members:

```
struct strbuf ctlbuf    /* control portion of the message */
struct strbuf databuf   /* data portion of the message */
t_uscalar_t  flags      /* RS_HIPRI or 0 */
```

The <stropts.h> header defines the `strbuf` structure that includes the following members:

```
int maxlen    /* maximum buffer length */
int len       /* length of data */
char *buf     /* pointer to buffer */
```

The <stropts.h> header defines the `strfdinsert` structure that includes the following members:

```
struct strbuf ctlbuf    /* control portion of the message */
struct strbuf databuf   /* data portion of the message */
t_uscalar_t  flags      /* RS_HIPRI or 0 */
int          fildes      /* file descriptor of the other STREAM */
int          offset      /* relative location of the stored value */
```

The <stropts.h> header defines the `striocctl` structure that includes the following members:

```
int ic_cmd      /* ioctl() command */
int ic_timeout  /* timeout for response */
int ic_len      /* length of data */
char *ic_dp     /* pointer to buffer */
```

The <stropts.h> header defines the `strrecvfd` structure that includes the following members:

```
int  fda        /* received file descriptor */
uid_t uid       /* UID of sender */
gid_t gid       /* GID of sender */
```

The `uid_t` and `gid_t` types are defined through `typedef` as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

The <stropts.h> header defines the `t_scalar_t` and `t_uscalar_t` types, respectively, as signed and unsigned opaque types of equal length of at least 32 bits.

The `<stropts.h>` header defines the `str_list` structure that includes the following members:

```
int          sl_nmods      /* number of STREAMS module names */
struct str_mlist *sl_modlist /* STREAMS module names */
```

The `<stropts.h>` header defines the `str_mlist` structure that includes the following member:

```
char l_name[FMNAMESZ+1]    a STREAMS module name
```

The following macros are defined for use as the request argument to `ioctl()`:

<code>I_PUSH</code>	Push a STREAMS module.
<code>I_POP</code>	Pop a STREAMS module.
<code>I_LOOK</code>	Get the top module name.
<code>I_FLUSH</code>	Flush a STREAM.
<code>I_FLUSHBAND</code>	Flush one band of a STREAM.
<code>I_SETSIG</code>	Ask for notification signals.
<code>I_GETSIG</code>	Retrieve current notification signals.
<code>I_FIND</code>	Look for a STREAMS module.
<code>I_PEEK</code>	Peek at the top message on a STREAM.
<code>I_SRDOPT</code>	Set the read mode.
<code>I_GRDOPT</code>	Get the read mode.
<code>I_NREAD</code>	Size the top message.
<code>I_FDINSERT</code>	Send implementation-defined information about another STREAM.
<code>I_STR</code>	Send a STREAMS <code>ioctl()</code> .
<code>I_SWROPT</code>	Set the write mode.
<code>I_GWROPT</code>	Get the write mode.
<code>I_SENDFD</code>	Pass a file descriptor through a STREAMS pipe.
<code>I_RECVFD</code>	Get a file descriptor sent via <code>I_SENDFD</code> .
<code>I_LIST</code>	Get all the module names on a STREAM.
<code>I_ATMARK</code>	Is the top message “marked”?
<code>I_CKBAND</code>	See if any messages exist in a band.
<code>I_GETBAND</code>	Get the band of the top message on a STREAM.

<code>I_CANPUT</code>	Is a band writable?
<code>I_SETCLTIME</code>	Set close time delay.
<code>I_GETCLTIME</code>	Get close time delay.
<code>I_LINK</code>	Connect two STREAMs.
<code>I_UNLINK</code>	Disconnect two STREAMs.
<code>I_PLINK</code>	Persistently connect two STREAMs.
<code>I_PUNLINK</code>	Dismantle a persistent STREAMS link.

The following macro is defined for use with `I_LOOK`:

`FMNAMESZ` minimum size in bytes of the buffer referred to by the `arg` argument

The following macros are defined for use with `I_FLUSH`:

<code>FLUSHR</code>	flush read queues
<code>FLUSHW</code>	flush write queues
<code>FLUSHRW</code>	flush read and write queues

The following macros are defined for use with `I_SETSIG`:

<code>S_RDNORM</code>	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.
<code>S_RDBAND</code>	A message with a non-zero priority band has arrived at the head of a STREAM head read queue.
<code>S_INPUT</code>	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.
<code>S_HIPRI</code>	A high-priority message is present on a STREAM head read queue.
<code>S_OUTPUT</code>	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
<code>S_WRNORM</code>	Equivalent to <code>S_OUTPUT</code> .
<code>S_WRBAND</code>	The write queue for a non-zero priority band just below the STREAM head is no longer full.
<code>S_MSG</code>	A STREAMS signal message that contains the <code>SIGPOLL</code> signal reaches the front of the STREAM head read queue.
<code>S_ERROR</code>	Notification of an error condition reaches the STREAM head.
<code>S_HANGUP</code>	Notification of a hangup reaches the STREAM head.

S_BANDURG When used in conjunction with **S_RDBAND**, **SIGURG** is generated instead of **SIGPOLL** when a priority message reaches the front of the **STREAM** head read queue.

The following macro is defined for use with **I_PEEK**:

RS_HIPRI Only look for high-priority messages.

The following macros are defined for use with **I_SRDOPT**:

RNORM Byte-**STREAM** mode, the default.

RMSGD Message-discard mode.

RMSGN Message-non-discard mode.

RPROTNORM Fail `read()` with `[EBADMSG]` if a message containing a control part is at the front of the **STREAM** head read queue.

RPROTDAT Deliver the control part of a message as data when a process issues a `read()`

RPROTDIS Discard the control part of a message, delivering any data part, when a process issues a `read()`

The following macro is defined for use with **I_SWOPT**:

SNDZERO Send a zero-length message downstream when a `write()` of 0 bytes occurs.

The following macros are defined for use with **I_ATMARK**:

ANYMARK Check if the message is marked.

LASTMARK Check if the message is the last one marked on the queue.

The following macro is defined for use with **I_UNLINK**:

MUXID_ALL Unlink all **STREAM**s linked to the **STREAM** associated with `fildes`.

The following macros are defined for `getmsg()`, `getpmsg()`, `putmsg()`, and `putpmsg()`:

MSG_ANY Receive any message.

MSG_BAND Receive message from specified band.

MSG_HIPRI Send/receive high-priority message.

MORECTL More control information is left in message.

MOREDATA More data is left in message.

The `<stropts.h>` header can make visible all of the symbols from `<unistd.h>`.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [close\(2\)](#), [fcntl\(2\)](#), [getmsg\(2\)](#), [ioctl\(2\)](#), [open\(2\)](#), [pipe\(2\)](#), [poll\(2\)](#), [putmsg\(2\)](#), [read\(2\)](#), [write\(2\)](#), [signal\(3C\)](#), [types.h\(3HEAD\)](#), [unistd.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name syslog.h, syslog – definitions for system error logging

Synopsis #include <syslog.h>

Description The <syslog.h> header defines the following symbolic constants, zero or more of which can be OR'ed together to form the `logopt` option of `openlog()`:

LOG_PID Log the process ID with each message.

LOG_CONS Log to the system console on error.

LOG_NDELAY Connect to syslog daemon immediately.

LOG_ODELAY Delay open until `syslog()` is called.

LOG_NOWAIT Do not wait for child processes.

The following symbolic constants are defined as possible values of the *facility* argument to `openlog()`:

LOG_KERN reserved for message generated by the system

LOG_USER message generated by a process

LOG_MAIL reserved for message generated by mail system

LOG_NEWS reserved for message generated by news system

LOG_UUCP reserved for message generated by UUCP system

LOG_DAEMON reserved for message generated by system daemon

LOG_AUTH reserved for message generated by authorization daemon

LOG_CRON reserved for message generated by clock daemon

LOG_LPR reserved for message generated by printer system

LOG_LOCAL0 reserved for local use

LOG_LOCAL1 reserved for local use

LOG_LOCAL2 reserved for local use

LOG_LOCAL3 reserved for local use

LOG_LOCAL4 reserved for local use

LOG_LOCAL5 reserved for local use

LOG_LOCAL6 reserved for local use

LOG_LOCAL7 reserved for local use

The following is declared as a macro for constructing the *maskpri* argument to `setlogmask()`. The following macro expands to an expression of type `int` when the argument *pri* is an expression of type `int`:

`LOG_MASK(pri)` a mask for priority *pri*

The following constants are defined as possible values for the *priority* argument of `syslog()`:

`LOG_EMERG` A panic condition was reported to all processes.
`LOG_ALERT` A condition that should be corrected immediately.
`LOG_CRIT` A critical condition.
`LOG_ERR` An error message.
`LOG_WARNING` A warning message.
`LOG_NOTICE` A condition requiring special handling.
`LOG_INFO` A general information message.
`LOG_DEBUG` A message useful for debugging programs.

Name tar.h, tar – extended tar definitions

Synopsis #include <tar.h>

Description The <tar.h> header defines header block definitions as follows.

General definitions:

Name	Value	Description
TMAGIC	"ustar"	ustar plus null byte
TMAGLEN	6	length of the above
TVERSION	"00"	00 without a null byte
TVERSLEN	2	length of the above

Typeflag field definitions:

Name	Value	Description
REGTYPE	'0'	regular file
AREGTYPE	'\0'	regular file
LNKTYPE	'1'	link
SYMTYPE	'2'	symbolic link
CHRTYPE	'3'	character special
BLKTYPE	'4'	block special
DIRTYPE	'5'	directory
FIFOTYPE	'6'	FIFO special
CONTTYPE	'7'	reserved

Mode field bit definitions (octal):

Name	Value	Description
TSUID	04000	set UID on execution
TSGID	02000	set GID on execution
TSVTX	01000	on directories, restricted deletion flag

Name	Value	Description
TUREAD	00400	read by owner
TUWRITE	00200	write by owner special
TUEXEC	00100	execute/search by owner
TGREAD	00040	read by group
TGWRITE	00020	write by group
TGEXEC	00010	execute/search by group
TOREAD	00004	read by other
TOWRITE	00002	write by other
TOEXEC	00001	execute/search by other

Types used in ancillary files:

Name	Value	Description
ACL_HDR	'A'	Access Control List
LBL_TYPE	'L'	Trusted Extensions file label
DIR_TYPE	'D'	Trusted Extensions directory label

Attribute types used in Trusted Solaris ancillary files that are interpreted by Trusted Extensions for backward compatibility:

Name	Value	Description
SLD_TYPE	'S'	Single-level directory component
PATH_TYPE	'P'	Path component
MLD_TYPE	'M'	Multi-level directory component
FILE_TYPE	'F'	Must handle files differently
APRIV_TYPE	'P'	Allowed privileges data type in file
FPRIV_TYPE	'p'	Forced privileges data type in file
COMP_TYPE	'C'	Path components, use for MLD
ATTR_FLAG_TYPE	'F'	File attribute flag bytes data type
LK_COMP_TYPE	'K'	Link data path component

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	See below.

The general definitions, the `typeflag` field definitions, and the `mode` field bit definitions are Standard. The types used in ancillary files and the attribute types used in Trusted Solaris ancillary files are Evolving.

See Also [pax\(1\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name tcp.h, tcp – definitions for the Internet Transmission Control Protocol (TCP)

Synopsis #include <netinet/tcp.h>

Description The <netinet/tcp.h> header defines the following macro for use as a socket option at the IPPROTO_TCP level:

TCP_NODELAY Avoid coalescing of small segments.

The macro is defined in the header. The implementation need not allow the value of the option to be set with setsockopt () or retrieved with getsockopt () .

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [getsockopt\(3XNET\)](#), [socket.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name termios.h, termios – define values for termios

Synopsis #include <termios.h>

Description The <termios.h> header contains the definitions used by the terminal I/O interfaces. See [termios\(3C\)](#) and [termio\(7I\)](#) for an overview of the terminal interface.

The termios Structure The following data types are defined through typedef:

- cc_t used for terminal special characters
- speed_t used for terminal baud rates
- tcflag_t used for terminal modes

The above types are all unsigned integer types.

The implementation supports one or more programming environments in which the widths of cc_t, speed_t, and tcflag_t are no greater than the width of type long. The names of these programming environments can be obtained using the [confstr\(3C\)](#) function or the [getconf\(1\)](#) utility.

The termios structure is defined and includes the following members:

```
tcflag_t c_iflag      /* input modes */
tcflag_t c_oflag      /* output modes */
tcflag_t c_cflag      /* control modes */
tcflag_t c_lflag      /* local modes */
cc_t      c_cc[NCCS]  /* control characters */
```

A definition is provided for:

NCCS size of the array c_cc for control characters

The following subscript names for the array c_cc are defined:

Subscript Usage	Subscript Usage	
Canonical Mode	Non-Canonical Mode	Description
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value

Subscript Usage	Subscript Usage	
Canonical Mode	Non-Canonical Mode	Description
VQUIT	VQUIT	QUIT character
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value

The subscript values are unique, except that the VMIN and VTIME subscripts can have the same values as the VEOF and VEOL subscripts, respectively.

The header file provides the flags described below.

Input Modes The `c_iflag` field describes the basic terminal input control:

BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

Output Modes The `c_oflag` field specifies the system treatment of output:

OPOST	Post-process output.
ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.

OFILL	Use fill characters for delay.
NLDLY	Select newline delays:
NL0	newline type 0
NL1	newline type 1
CRDLY	Select carriage-return delays:
CR0	carriage-return delay type 0
CR1	carriage-return delay type 1
CR2	carriage-return delay type 2
CR3	carriage-return delay type 3
TABDLY	Select horizontal-tab delays:
TAB0	horizontal-tab delay type 0
TAB1	horizontal-tab delay type 1
TAB2	horizontal-tab delay type 2
TAB3	expand tabs to spaces
BSDLY	Select backspace delays:
BS0	backspace-delay type 0
BS1	backspace-delay type 1
VTDLY	Select vertical-tab delays:
VT0	vertical-tab delay type 0
VT1	vertical-tab delay type 1
FFDLY	Select form-feed delays:
FF0	form-feed delay type 0
FF1	form-feed delay type 1

Baud Rate Selection The input and output baud rates are stored in the `termios` structure. These are the valid values for objects of type `speed_t`. The following values are defined, but not all baud rates need be supported by the underlying hardware.

B0	Hang up
B50	50 baud
B75	75 baud
B110	110 baud

B134	134.5 baud
B150	150 baud
B200	200 baud
B300	300 baud
B600	600 baud
B1200	1 200 baud
B1800	1 800 baud
B2400	2 400 baud
B4800	4 800 baud
B9600	9 600 baud
B19200	19 200 baud
B38400	38 400 baud

Control Modes The `c_cflag` field describes the hardware control of the terminal; not all values specified are required to be supported by the underlying hardware:

CSIZE	Character size:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits
CSTOPB	Send two stop bits, else one.
CREAD	Enable receiver.
PARENB	Parity enable.
PARODD	Odd parity, else even.
HUPCL	Hang up on last close.
CLOCAL	Ignore modem status lines.

The implementation supports the functionality associated with the symbols CS7, CS8, CSTOPB, PARODD, and PARENB.

Local Modes The `c_lflag` field of the argument structure is used to control various terminal functions:

ECHO	Enable echo.
------	--------------

- ECHOE Echo erase character as error-correcting backspace.
- ECHOK Echo KILL.
- ECHONL Echo NL.
- ICANON Canonical input (erase and kill processing).
- IEXTEN Enable extended input character processing.
- ISIG Enable signals.
- NOFLSH Disable flush after interrupt or quit.
- TOSTOP Send SIGTTOU for background output.

Attribute Selection The following symbolic constants for use with `tcsetattr()` are defined:

- TCSANOW Change attributes immediately.
- TCSADRAIN Change attributes when output has drained.
- TCSAFLUSH Change attributes when output has drained; also flush pending input.

Line Control The following symbolic constants for use with `tcflush()` are defined:

- TCIFLUSH Flush pending input.
- TCIOFLUSH Flush both pending input and untransmitted output.
- TCOFLUSH Flush untransmitted output.

The following symbolic constants for use with `tcflow()` are defined:

- TCIOFF Transmit a STOP character, intended to suspend input data.
- TCION Transmit a START character, intended to restart input data.
- TCOOFF Suspend output.
- TCOON Restart output.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

Name tgmath.h, tgmath – type-generic macros

Synopsis #include <tgmath.h>

Description The <tgmath.h> header includes the headers <math.h> and <complex.h> and defines several type-generic macros.

Of the functions contained within the <math.h> and <complex.h> headers without an `f` (float) or `l` (long double) suffix, several have one or more parameters whose corresponding real type is `double`. For each such function except `modf(3M)`, there is a corresponding type-generic macro. The parameters whose corresponding real type is `double` in the function synopsis are generic parameters. Use of the macro invokes a function whose corresponding real type and type domain are determined by the arguments for the generic parameters.

Use of the macro invokes a function whose generic parameters have the corresponding real type determined as follows:

- First, if any argument for generic parameters has type `long double`, the type determined is `long double`.
- Otherwise, if any argument for generic parameters has type `double` or is of integer type, the type determined is `double`.
- Otherwise, the type determined is `float`.

For each unsuffixed function in the <math.h> header for which there is a function in the <complex.h> header with the same name except for a `c` prefix, the corresponding type-generic macro (for both functions) has the same name as the function in the <math.h> header. The corresponding type-generic macro for `fabs()` and `cabs()` is `fabs()`.

<math.h> Function	<complex.h> Function	Type-Generic Macro
<code>acos()</code>	<code>cacos()</code>	<code>acos()</code>
<code>asin()</code>	<code>casin()</code>	<code>asin()</code>
<code>atan()</code>	<code>catan()</code>	<code>atan()</code>
<code>acosh()</code>	<code>cacosh()</code>	<code>acosh()</code>
<code>asinh()</code>	<code>casinh()</code>	<code>asinh()</code>
<code>atanh()</code>	<code>catanh()</code>	<code>atanh()</code>
<code>cos()</code>	<code>ccos()</code>	<code>cos()</code>
<code>sin()</code>	<code>csin()</code>	<code>sin()</code>
<code>tan()</code>	<code>ctan()</code>	<code>tan()</code>
<code>cosh()</code>	<code>ccosh()</code>	<code>cosh()</code>

<math.h> Function	<complex.h> Function	Type-Generic Macro
sinh()	csinh()	sinh()
tanh()	ctanh()	tanh()
exp()	cexp()	exp()
log()	clog()	log()
pow()	cpow()	pow()
sqrt()	csqrt()	sqrt()
fabs()	cfabs()	fabs()

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the <math.h> header without a c-prefixed counterpart in the <complex.h> header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

atan2()	fma()	llround()	remainder()
cbrt()	fmax()	log10()	remquo()
ceil()	fmin()	log1p()	rint()
copysign()	fmod()	log2()	round()
erf()	frexp()	logb()	scalbn()
erfc()	hypot()	lrint()	scalbln()
exp2()	ilogb()	lround()	tgamma()
expm1()	ldexp()	nearbyint()	trunc()
fdim()	lgamma()	nextafter()	
floor()	llrint()	nexttoward()	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the <complex.h> header that is not a c-prefixed counterpart to a function in the <math.h> header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

carg()
cimag()
conj()
cproj()
creal()

Use of the macro with any real or complex argument invokes a complex function.

Usage Functions invoked by use of type-generic macros are invoked with the declarations listed below.

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

The following are the type-generic macros that invoke the functions that are invoked with the preceding declarations.

Macro	Use Invokes
exp(n)	exp(n), the function
acosh(f)	acoshf(f)
sin(d)	sin(d), the function
atan(ld)	atanl(ld)
log(fc)	clogf(fc)
sqrt(dc)	csqrt(dc)
pow(ldc,f)	cpowl(ldc, f)
remainder(n,n)	remainder(n, n), the function
nextafter(d,f)	nextafter(d, f), the function
nexttoward(f,ld)	nexttowardf(f, ld)
copysign(n,ld)	copysignl(n, ld)
ceil(fc)	undefined behavior
rint(dc)	undefined behavior
fmax(ldc,ld)	undefined behavior
carg(n)	carg(n), the function
cproj(f)	cprojf(f)
creal(d)	creal(d), the function
cimag(ld)	cimagl(ld)
cabs(fc)	cabsf(fc)

Macro	Use Invokes
carg(dc)	carg(dc), the function
cproj(ldc)	cproj(ldc)

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [modf\(3M\)](#), [complex.h\(3HEAD\)](#), [math.h\(3HEAD\)](#), [cabs\(3M\)](#), [fabs\(3M\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name timeb.h, timeb – additional definitions for date and time

Synopsis `#include <sys/timeb.h>`

Description The `<sys/timeb.h>` header defines the `timeb` structure, which includes the following members:

```
time_t      time          /* the seconds portion of the current time */
unsigned short millitm    /* the milliseconds portion of the current time */
short       timezone      /* the local timezone in minutes west of Greenwich */
short       dstflag       /* TRUE if Daylight Savings Time is in effect */
```

The `time_t` type is defined as described in `<sys/types.h>`.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [time.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name time.h, time – time types

Synopsis #include <time.h>

Description The <time.h> header declares the structure tm, which includes the following members:

```
int tm_sec      /* seconds [0,60] */
int tm_min      /* minutes [0,59] */
int tm_hour     /* hour [0,23] */
int tm_mday     /* day of month [1,31] */
int tm_mon      /* month of year [0,11] */
int tm_year     /* years since 1900 */
int tm_wday     /* day of week [0,6] (Sunday =0) */
int tm_yday     /* day of year [0,365] */
int tm_isdst    /* daylight savings flag */
```

The value of tm_isdst is positive if Daylight Saving Time is in effect, 0 if Daylight Saving Time is not in effect, and negative if the information is not available.

The <time.h> header defines the following symbolic names:

NULL	Null pointer constant.
CLOCKS_PER_SEC	A number used to convert the value returned by the clock() function into seconds. See clock(3C) .
CLOCK_PROCESS_CPUTIME_ID	The identifier of the CPU-time clock associated with the process making a clock() or timer*() function call.
CLOCK_THREAD_CPUTIME_ID	The identifier of the CPU-time clock associated with the thread making a clock() or timer*() function call.

The <time.h> header declares the timespec structure, which has the following members:

```
time_t tv_sec    /* seconds */
long    tv_nsec  /* nanoseconds */
```

The <time.h> header declares the itimerspec structure, which has the following members:

```
struct timespec it_interval /* timer period */
struct timespec it_value    /* timer expiration */
```

The following manifest constants are defined:

CLOCK_REALTIME	The identifier of the system-wide realtime clock.
TIMER_ABSTIME	Flag indicating time is absolute. For functions taking timer objects, this refers to the clock associated with the timer.
CLOCK_MONOTONIC	The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set with clock_settime() and that cannot have backward clock jumps. The maximum possible clock jump

is implementation-defined. See [clock_gettime\(3RT\)](#).

The `clock_t`, `size_t`, `time_t`, `clockid_t`, and `timer_t` types are defined as described in `<sys/types.h>`. See [types.h\(3HEAD\)](#).

Although the value of `CLOCKS_PER_SEC` is required to be 1 million on all standard-conforming systems, it can be variable on other systems, and it should not be assumed that `CLOCKS_PER_SEC` is a compile-time constant.

The `<time.h>` header provides a declaration for `getdate_err`.

The following are declared as variables:

```
extern int daylight;
extern long timezone;
extern char *tzname[];
```

Inclusion of the `<time.h>` header can make visible all symbols from the `<signal.h>` header.

Usage The range [0,60] for `tm_sec` allows for the occasional leap second.

`tm_year` is a signed value; therefore, years before 1900 can be represented.

To obtain the number of clock ticks per second returned by the `times()` function, applications should call `sysconf(_SC_CLK_TCK)`. See [times\(2\)](#) and [sysconf\(3C\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name times.h, times – file access and modification times structure

Synopsis #include <sys/times.h>

Description The <sys/times.h> header defines the structure tms, which is returned by times() and includes the following members:

```
clock_t tms_utime    /* user CPU time */
clock_t tms_stime    /* system CPU time */
clock_t tms_cutime   /* user CPU time of terminated
                     child processes */
clock_t tms_cstime   /* system CPU time of terminated
                     child processes */
```

The clock_t type is defined as described in <sys/types.h>.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

See Also [times\(2\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name types32.h, types32 – fixed-width data types

Synopsis #include <sys/types32.h>

Description The following fixed-width data types defined in <sys/types32.h> correspond to the sign and sizes of types in the 32-bit environment that can be used for compatibility and interoperability purposes in either the 32-bit or 64-bit environment.

typedef	int32_t	blkcnt32_t
typedef	uint32_t	caddr32_t
typedef	int32_t	clock32_t
typedef	int32_t	daddr32_t
typedef	uint32_t	dev32_t
typedef	uint32_t	fsblkcnt32_t
typedef	uint32_t	fsfilcnt32_t
typedef	int32_t	gid32_t
typedef	int32_t	id32_t
typedef	uint32_t	ino32_t
typedef	int32_t	key32_t
typedef	uint32_t	major32_t
typedef	uint32_t	minor32_t
typedef	uint32_t	mode32_t
typedef	uint32_t	nlink32_t
typedef	int32_t	pid32_t
typedef	uint32_t	rlim32_t
typedef	uint32_t	size32_t
typedef	int32_t	ssize32_t
typedef	time32_t	int32_t
typedef	uid32_t	int32_t

Name types.h, types – primitive system data types

Synopsis #include <sys/types.h>

Description The data types defined in <sys/types.h> are as follows:

32-bit Solaris The data types listed below are defined in <sys/types.h> for 32-bit Solaris.

```
typedef struct    { int r[1]; } *physadr;
typedef long      clock_t;
typedef long      daddr_t;
typedef char *    caddr_t;
typedef unsigned char  uchar;
typedef unsigned short ushort;
typedef unsigned int   uint;
typedef unsigned long  ulong_t;
typedef unsigned long  ino_t;
typedef long          uid_t;
typedef long          gid_t;
typedef ulong_t       nlink_t;
typedef ulong_t       mode_t;
typedef short         cnt_t;
typedef long          time_t;
typedef int           label_t[10];
typedef ulong_t       dev_t;
typedef long          off_t;
typedef long          pid_t;
typedef long          paddr_t;
typedef int           key_t;
typedef unsigned char use_t;
typedef short         sysid_t;
typedef short         index_t;
typedef short         lock_t;
typedef unsigned int   size_t;
typedef long          clock_t;
typedef long          pid_t;
```

64-bit Solaris The data types listed below are defined in <sys/types.h> for 64-bit Solaris.

```
typedef long      blkcnt_t
typedef long      clock_t
typedef long      daddr_t
typedef ulong_t   dev_t
typedef ulong_t   fsblkcnt_t
typedef ulong_t   fsfilcnt_t
typedef int       gid_t
typedef int       id_t
typedef long      ino_t
typedef int       key_t
typedef uint_t    major_t
```

```

typedef      uint_t      minor_t
typedef      uint_t      mode_t
typedef      uint_t      nlink_t
typedef      int         pid_t
typedef      ptrdiff_t   inptr_t
typedef      ulong_t     rlim_t
typedef      ulong_t     size_t
typedef      uint_t      speed_t
typedef      long        ssize_t
typedef      long        suseconds_t
typedef      uint_t      tcflag_t
typedef      long        time_t
typedef      int         uid_t
typedef      int         wchar_t

```

Preprocessor Symbols For 32-bit programs, pointers and the C data types `int` and `long` are all 32-bit quantities. For 64-bit programs, pointers and the C data type `long` are defined as 64-bit quantities.

The preprocessor symbol `_ILP32`, made visible by the inclusion of `<sys/types.h>`, can be used with the preprocessor `#ifdef` construct to define sections of code that will be compiled only as part of a 32-bit version of a given C program.

The preprocessor symbol `_LP64` can be used in the same way to define sections of code that will be compiled only as part of a 64-bit version of a given C program. See **EXAMPLES**.

This header incorporates definitions of other preprocessor symbols that can be useful when keeping code portable between different instruction set architectures.

`_LITTLE_ENDIAN`

`_BIG_ENDIAN`

The natural byte order of the processor. A pointer to an `int` points to the least/most significant byte of that `int`.

`_STACK_GROWS_UPWARD`

`_STACK_GROWS_DOWNWARD`

The processor specific direction of stack growth. A push onto the stack increases/decreases the stack pointer, so it stores data at successively higher/lower addresses.

`_CHAR_IS_UNSIGNED`

`_CHAR_IS_SIGNED`

The C Compiler implements objects of type `char` as unsigned or signed respectively. This is really an implementation choice of the compiler, but it is specified in the ABI and tends to be uniform across compilers for an instruction set architecture.

`_CHAR_ALIGNMENT`

`_SHORT_ALIGNMENT`

`_INT_ALIGNMENT`

`_LONG_ALIGNMENT`

`_LONG_LONG_ALIGNMENT`

<code>_DOUBLE_ALIGNMENT</code>	
<code>_LONG_DOUBLE_ALIGNMENT</code>	
<code>_POINTER_ALIGNMENT</code>	
<code>_FLOAT_ALIGNMENT</code>	The ABI defines alignment requirements of each of the primitive object types. Some, if not all, might be hardware requirements as well. The values are expressed in bytes.
<code>_MAX_ALIGNMENT</code>	The most stringent alignment requirement as specified by the ABI. Equal to the maximum of all the above <code>_XXX_ALIGNMENT</code> values.
<code>_LONG_LONG_ALIGNMENT_32</code>	The 32-bit ABI supported by a 64-bit kernel may have different alignment requirements for primitive object types. The value of this identifier is expressed in bytes.

Usage The `daddr_t` type is used for disk addresses except in an inode on disk. Times are encoded in seconds since 00:00:00 UTC, January 1, 1970. The major and minor parts of a device code specify kind and unit number of a device and are installation-dependent. Offsets are measured in bytes from the beginning of a file.

The `label_t[ ]` types are used to save the processor state while another process is running.

Examples **EXAMPLE 1** Use of preprocessor symbol `_LP64`.

In the following example, the preprocessor symbol `_LP64` defines sections of code that will be compiled only as part of a 64-bit version of the given C program.

```
#include <sys/types.h>
...

#ifdef _LP64
    printf("The data model is LP64 in this environment\n");
#else
#ifdef _ILP32
    printf("The data model is ILP32 in this environment\n");
#else
#error "Unknown data model!"
#endif
#endif
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Stable

See Also [types32.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name ucontext.h, ucontext – user context

Synopsis #include <ucontext.h>

Description The <ucontext.h> header defines the ucontext_t type as a structure that includes at least the following members:

```
ucontext_t  uc_link
sigset_t    uc_sigmask
stack_t     uc_stack
mcontext_t  uc_mcontext
```

The uc_link member is a pointer to the context that to be resumed when this context returns. If uc_link is equal to 0, this context is the main context and the process exits when this context returns.

The uc_sigmask member defines the set of signals that are blocked when this context is active. See [sigprocmask\(2\)](#).

The uc_stack member defines the stack used by this context. See [sigaltstack\(2\)](#).

The uc_mcontext member contains the saved set of machine registers and any implementation-specific context data. Portable applications should not modify or access uc_mcontext.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [getcontext\(2\)](#), [sigaction\(2\)](#), [sigaltstack\(2\)](#), [sigprocmask\(2\)](#), [makecontext\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name uio.h, uio – definitions for vector I/O operations

Synopsis `#include <sys/uio.h>`

Description The `<sys/uio.h>` header defines the `iovec` structure, which includes the following members:

```
void    *iov_base    /* base address of a memory region
                      for input or output */
size_t  iov_len      /* size of the memory pointed to by
                      iov_base */
```

The `<sys/uio.h>` header uses the `iovec` structure for scatter/gather I/O.

The `ssize_t` and `size_t` types are defined as described in `<sys/types.h>`.

Usage The symbol `{IOV_MAX}` defined in `<limits.h>` should always be used to learn about the limits on the number of scatter/gather elements that can be processed in one call, instead of assuming a fixed value.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [read\(2\)](#), [write\(2\)](#), [limits.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name ulimit.h, ulimit – ulimit commands

Synopsis #include <ulimit.h>

Description The <ulimit.h> header defines the following symbolic constants used by the `ulimit()` function.

UL_GETFSIZE Get maximum file size.

UL_SETFSIZE Set maximum file size.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [ulimit\(2\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name un.h, un – definitions for UNIX-domain sockets

Synopsis `#include <sys/un.h>`

Description The `<sys/un.h>` header defines the `sockaddr_un` structure that includes the following members:

```
sa_family_t  sun_family  /* address family */
char         sun_path[]  /* socket pathname */
```

The `sockaddr_un` structure is used to store addresses for UNIX domain sockets. Values of this type must be cast to `struct sockaddr` for use with the socket interfaces.

The `<sys/un.h>` header defines the type `sa_family_t` as described in [socket.h\(3HEAD\)](#).

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name unistd.h, unistd – standard symbolic constants and types

Synopsis #include <unistd.h>

Description The <unistd.h> header defines the symbolic constants and structures which are not already defined or declared in some other header. The contents of this header are shown below.

Version Test Macros The following symbolic constants are defined (with fixed values):

_POSIX_VERSION	Integer value indicating version of the POSIX standard (C language binding). See standards(5) .
_POSIX2_VERSION	Integer value indicating version of the POSIX.2 standard (Commands).
_POSIX2_C_VERSION	Integer value indicating version of the POSIX.2 standard (C language binding).
_XOPEN_VERSION	Integer value indicating version of the XPG to which system conforms.
_XOPEN_XCU_VERSION	Integer value indicating the version of the XCU specification to which the implementation conforms. If this constant is not defined, use the sysconf(3C) function to determine which features are supported. This constant is not defined for the SUSv3 environment.

Mandatory Symbolic Constants The following symbolic constants, if defined in <unistd.h>, have a value of -1, 0, or greater, unless otherwise specified below. If these are undefined, the [fpathconf\(2\)](#), [pathconf\(2\)](#), or [sysconf\(3C\)](#) functions can be used to determine whether the option is provided for a particular invocation of the application.

If a symbolic constant is defined with the value -1, the option is not supported. Headers, data types, and function interfaces required only for the option need not be supplied. An application that attempts to use anything associated only with the option is considered to be requiring an extension.

If a symbolic constant is defined with a value greater than zero, the option is always supported when the application is executed. All headers, data types, and functions are present and operate as specified.

If a symbolic constant is defined with the value zero, all headers, data types, and functions are present. The application can check at runtime to see whether the option is supported by calling `fpathconf()`, `pathconf()`, or `sysconf()` with the indicated *name* parameter.

Unless explicitly specified otherwise, the behavior of functions associated with an unsupported option is unspecified, and an application that uses such functions without first checking `fpathconf()`, `pathconf()`, or `sysconf()` is considered to be requiring an extension.

<code>_POSIX_ADVISORY_INFO</code>	Implementation supports the Advisory Information option.
<code>_POSIX_ASYNCHRONOUS_IO</code>	Implementation supports the Asynchronous Input and Output option.
<code>_POSIX_BARRIERS</code>	Implementation supports the Barriers option.
<code>_POSIX_CLOCK_SELECTION</code>	Implementation supports the Clock Selection option.
<code>_POSIX_CPUTIME</code>	Implementation supports the Process CPU-Time Clocks option.
<code>_POSIX_FSYNC</code>	Implementation supports the File Synchronisation option.
<code>_POSIX_IPV6</code>	Implementation supports the IPv6 option.
<code>_POSIX_JOB_CONTROL</code>	Implementation supports job control.
<code>_POSIX_MAPPED_FILES</code>	Implementation supports the Memory Mapped Files option.
<code>_POSIX_MEMLOCK</code>	Implementation supports the Process Memory Locking option.
<code>_POSIX_MEMLOCK_RANGE</code>	Implementation supports the Range Memory Locking option.
<code>_POSIX_MEMORY_PROTECTION</code>	Implementation supports the Memory Protection option.
<code>_POSIX_MESSAGE_PASSING</code>	Implementation supports the Message Passing option.
<code>_POSIX_MONOTONIC_CLOCK</code>	Implementation supports the Monotonic Clock option.
<code>_POSIX_PRIORITY_SCHEDULING</code>	Implementation supports the Process Scheduling option.
<code>_POSIX_RAW_SOCKETS</code>	Implementation supports the Raw Sockets option.
<code>_POSIX_READER_WRITER_LOCKS</code>	Implementation supports the Read-Write Locks option.
<code>_POSIX_REALTIME_SIGNALS</code>	Implementation supports the Realtime Signals Extension option.
<code>_POSIX_REGEX</code>	Implementation supports the Regular Expression Handling option.
<code>_POSIX_SAVED_IDS</code>	The <code>exec</code> functions (see exec(2)) save the effective user and group.

<code>_POSIX_SEMAPHORES</code>	Implementation supports the Semaphores option.
<code>_POSIX_SHARED_MEMORY_OBJECTS</code>	Implementation supports the Shared Memory Objects option.
<code>_POSIX_SHELL</code>	Implementation supports the POSIX shell.
<code>_POSIX_SPAWN</code>	Implementation supports the Spawn option.
<code>_POSIX_SPIN_LOCKS</code>	Implementation supports the Spin Locks option.
<code>_POSIX_SPORADIC_SERVER</code>	Implementation supports the Process Sporadic Server option.
<code>_POSIX_SYNCHRONIZED_IO</code>	Implementation supports the Synchronized Input and Output option.
<code>_POSIX_THREAD_ATTR_STACKADDR</code>	Implementation supports the thread stack address attribute option.
<code>_POSIX_THREAD_ATTR_STACKSIZE</code>	Implementation supports the thread stack size attribute option.
<code>_POSIX_THREAD_CPU_TIME</code>	Implementation supports the Thread CPU-Time Clocks option.
<code>_POSIX_THREAD_PROCESS_SHARED</code>	Implementation supports the process-shared synchronization option.
<code>_POSIX_THREAD_SAFE_FUNCTIONS</code>	Implementation supports the thread-safe functions option.
<code>_POSIX_THREAD_SPORADIC_SERVER</code>	Implementation supports the Thread Sporadic Server option.
<code>_POSIX_THREADS</code>	Implementation supports the threads option.
<code>_POSIX_TIMERS</code>	Implementation supports the Timers option.
<code>_POSIX_TIMEOUTS</code>	Implementation supports the Timeouts option.
<code>_POSIX_TRACE</code>	Implementation supports the Trace option.
<code>_POSIX_TRACE_EVENT_FILTER</code>	Implementation supports the Trace Event Filter option.
<code>_POSIX_TRACE_INHERIT</code>	Implementation supports the Trace Inherit option.
<code>_POSIX_TRACE_LOG</code>	Implementation supports the Trace Log option.
<code>_POSIX_TYPED_MEMORY_OBJECTS</code>	Implementation supports the Typed Memory Objects option.

<code>_POSIX_V6_ILP32_OFF32</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> , <code>long</code> , and <code>pointer</code> types and an <code>off_t</code> type using at least 64 bits.
<code>_POSIX_V6_ILP32_OFFBIG</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> , <code>long</code> , and <code>pointer</code> types and an <code>off_t</code> type using at least 64 bits.
<code>_POSIX_V6_LP64_OFF64</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> and 64-bit <code>long</code> , <code>pointer</code> , and <code>off_t</code> types.
<code>_POSIX_V6_LPBIG_OFFBIG</code>	Implementation provides a C-language compilation environment with an <code>int</code> type using at least 32 bits and <code>long</code> , <code>pointer</code> , and <code>off_t</code> types using at least 64 bits.
<code>_POSIX_XOPEN_STREAMS</code>	Implementation supports the XSI STREAMS Option Group.
<code>_POSIX2_C_BIND</code>	Implementation supports the C Language Binding option.
<code>_POSIX2_C_DEV</code>	Implementation supports the C Language Development Utilities option.
<code>_POSIX2_CHAR_TERM</code>	Implementation supports at least one terminal type.
<code>_POSIX2_LOCALEDEF</code>	Implementation supports the creation of locales by the <code>localedef(1)</code> utility.
<code>_POSIX2_PBS</code>	Implementation supports the Batch Environment Services and Utilities option.
<code>_POSIX2_PBS_ACCOUNTING</code>	Implementation supports the Batch Accounting option.
<code>_POSIX2_PBS_CHECKPOINT</code>	Implementation supports the Batch Checkpoint/Restart option.
<code>_POSIX2_PBS_LOCATE</code>	Implementation supports the Locate Batch Job Request option.
<code>_POSIX2_PBS_MESSAGE</code>	Implementation supports the Batch Job Message Request option.
<code>_POSIX2_PBS_TRACK</code>	Implementation supports the Track Batch Job Request option.
<code>_POSIX2_SW_DEV</code>	Implementation supports the Software Development Utilities option.

<code>_POSIX2_UPE</code>	Implementation supports the User Portability Utilities option.
<code>_XBS5_ILP32_OFF32</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> , <code>long</code> , <code>pointer</code> and <code>off_t</code> types.
<code>_XBS5_ILP32_OFFBIG</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> , <code>long</code> and <code>pointer</code> types and an <code>off_t</code> type using at least 64 bits.
<code>_XBS5_LP64_OFF64</code>	Implementation provides a C-language compilation environment with 32-bit <code>int</code> and 64-bit <code>long</code> , <code>pointer</code> and <code>off_t</code> types.
<code>_XBS5_LPBIG_OFFBIG</code>	Implementation provides a C-language compilation environment with an <code>int</code> type using at least 32 bits and <code>long</code> , <code>pointer</code> and <code>off_t</code> types using at least 64 bits.
<code>_XOPEN_ENH_I18N</code>	Implementation supports the Issue 4, Version 2 Enhanced Internationalization Feature Group.
<code>_XOPEN_LEGACY</code>	Implementation supports the Legacy Feature Group.
<code>_XOPEN_REALTIME</code>	Implementation supports the X/Open Realtime Feature Group.
<code>_XOPEN_SHM</code>	Implementation supports the Issue 4, Version 2 Shared Memory Feature Group.
<code>_XOPEN_UNIX</code>	X/Open CAE Specification, January 1997, System Interfaces and Headers, Issue 5 (ISBN: 1-85912-181-0, C606).
<code>_XOPEN_XPG3</code>	X/Open Specification, February 1992, System Interfaces and Headers, Issue 3 (ISBN: 1-872630-37-5, C212); this specification was formerly X/Open Portability Guide, Issue 3, Volume 2, January 1989, XSI System Interface and Headers (ISBN: 0-13-685843-0, XO/XPG/89/003).
<code>_XOPEN_XPG4</code>	X/Open CAE Specification, July 1992, System Interfaces and Headers, Issue 4 (ISBN: 1-872630-47-2, C202).

Execution-time Symbolic Constants If any of the following constants are not defined in the header `<unistd.h>`, the value varies depending on the file to which it is applied.

If any of the following constants are defined to have value `-1` in the header `<unistd.h>`, the implementation will not provide the option on any file; if any are defined to have a value other than `-1` in the header `<unistd.h>`, the implementation will provide the option on all applicable files.

All of the following constants, whether defined in `<unistd.h>` or not, can be queried with respect to a specific file using the `pathconf()` or `fpathconf()` functions.

<code>_POSIX_ASYNC_IO</code>	Asynchronous input or output operations can be performed for the associated file.
<code>_POSIX_PRIO_IO</code>	Prioritized input or output operations can be performed for the associated file.
<code>_POSIX_SYNC_IO</code>	Synchronized input or output operations can be performed for the associated file.

Constants for Functions The following constant is defined:

`NULL` Null pointer.

The following symbolic constants are defined for the [access\(2\)](#) function:

<code>R_OK</code>	Test for read permission.
<code>W_OK</code>	Test for write permission.
<code>X_OK</code>	Test for execute (search) permission.
<code>F_OK</code>	Test for existence of file.

The constants `F_OK`, `R_OK`, `W_OK`, and `X_OK`, and the expressions `R_OK | W_OK`, `R_OK | X_OK`, and `R_OK | W_OK | X_OK` all have distinct values.

The following symbolic constants are defined for the [lockf\(3C\)](#) function:

<code>F_ULOCK</code>	Unlock a previously locked region.
<code>F_LOCK</code>	Lock a region for exclusive use.
<code>F_TLOCK</code>	Test and lock a region for exclusive use.
<code>F_TEST</code>	Test a region for other processes locks.

The following symbolic constants are defined for the [lseek\(2\)](#) and [fcntl\(2\)](#) functions (they have distinct values):

<code>SEEK_SET</code>	Set file offset to <i>offset</i> .
<code>SEEK_CUR</code>	Set file offset to current plus <i>offset</i> .
<code>SEEK_END</code>	Set file offset to EOF plus <i>offset</i> .

The following symbolic constants are defined for the `confstr(3C)` function for both SPARC and x86:

<code>_CS_LFS64_CFLAGS</code>	<code>_CS_LFS64_LDFLAGS</code>
<code>_CS_LFS64_LIBS</code>	<code>_CS_LFS64_LINTFLAGS</code>
<code>_CS_LFS_CFLAGS</code>	<code>_CS_LFS_LDFLAGS</code>
<code>_CS_LFS_LIBS</code>	<code>_CS_LFS_LINTFLAGS</code>
<code>_CS_PATH</code>	<code>_CS_POSIX_V6_ILP32_OFF32_CFLAGS</code>
<code>_CS_POSIX_V6_ILP32_OFF32_LDFLAGS</code>	<code>_CS_POSIX_V6_ILP32_OFF32_LIBS</code>
<code>_CS_POSIX_V6_ILP32_OFF32_LINTFLAGS</code>	<code>_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS</code>
<code>_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS</code>	<code>_CS_POSIX_V6_ILP32_OFFBIG_LIBS</code>
<code>_CS_POSIX_V6_ILP32_OFFBIG_LINTFLAGS</code>	<code>_CS_POSIX_V6_WIDTH_RESTRICTED_ENV</code>
<code>_CS_XBS5_ILP32_OFF32_CFLAGS</code>	<code>_CS_XBS5_ILP32_OFF32_LDFLAGS</code>
<code>_CS_XBS5_ILP32_OFF32_LIBS</code>	<code>_CS_XBS5_ILP32_OFF32_LINTFLAGS</code>
<code>_CS_XBS5_ILP32_OFFBIG_CFLAGS</code>	<code>_CS_XBS5_ILP32_OFFBIG_LDFLAGS</code>
<code>_CS_XBS5_ILP32_OFFBIG_LIBS</code>	<code>_CS_XBS5_ILP32_OFFBIG_LINTFLAGS</code>

The following symbolic constants are defined for the `confstr()` function for SPARC only:

<code>_CS_POSIX_V6_LP64_OFF64_CFLAGS</code>	<code>_CS_POSIX_V6_LP64_OFF64_LDFLAGS</code>
<code>_CS_POSIX_V6_LP64_OFF64_LIBS</code>	<code>_CS_POSIX_V6_LP64_OFF64_LINTFLAGS</code>
<code>_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS</code>	<code>_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS</code>
<code>_CS_POSIX_V6_LPBIG_OFFBIG_LIBS</code>	<code>_CS_POSIX_V6_LPBIG_OFFBIG_LINTFLAGS</code>
<code>_CS_XBS5_LP64_OFF64_CFLAGS</code>	<code>_CS_XBS5_LP64_OFF64_LDFLAGS</code>
<code>_CS_XBS5_LP64_OFF64_LIBS</code>	<code>_CS_XBS5_LP64_OFF64_LINTFLAGS</code>
<code>_CS_XBS5_LPBIG_OFFBIG_CFLAGS</code>	<code>_CS_XBS5_LPBIG_OFFBIG_LDFLAGS</code>
<code>_CS_XBS5_LPBIG_OFFBIG_LIBS</code>	<code>_CS_XBS5_LPBIG_OFFBIG_LINTFLAGS</code>

The following symbolic constants are defined for the `sysconf(3C)` function:

<code>_SC_2_C_BIND</code>	<code>_SC_2_C_DEV</code>
---------------------------	--------------------------

_SC_2_C_VERSION	_SC_2_FORT_DEV
_SC_2_FORT_RUN	_SC_2_LOCALEDEF
_SC_2_PBS	_SC_2_PBS_ACCOUNTING
_SC_2_PBS_CHECKPOINT	_SC_2_PBS_LOCATE

The constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` can be defined to have the same value.

The following symbolic constants are defined for the `fpathconf(2)` function:

<code>_PC_2_SYMLINKS</code>	<code>_PC_ALLOC_SIZE_MIN</code>
<code>_PC_ASYNC_IO</code>	<code>_PC_CHOWN_RESTRICTED</code>
<code>_PC_FILESIZEBITS</code>	<code>_PC_LINK_MAX</code>
<code>_PC_MAX_CANON</code>	<code>_PC_MAX_INPUT</code>
<code>_PC_NAME_MAX</code>	<code>_PC_NO_TRUNC</code>
<code>_PC_PATH_MAX</code>	<code>_PC_PIPE_BUF</code>
<code>_PC_PRIO_IO</code>	<code>_PC_REC_INCR_XFER_SIZE</code>
<code>_PC_REC_MAX_XFER_SIZE</code>	<code>_PC_REC_MIN_XFER_SIZE</code>
<code>_PC_REC_XFER_ALIGN</code>	<code>_PC_SYMLINK_MAX</code>
<code>_PC_SYNC_IO</code>	<code>_PC_TIMESTAMP_RESOLUTION</code>
<code>_PC_VDISABLE</code>	<code>_PC_XATTR_ENABLED</code>
<code>_PC_XATTR_EXISTS</code>	

The following symbolic constants are defined for file streams:

<code>STDIN_FILENO</code>	File number (0) of <code>stdin</code> .
<code>STDOUT_FILENO</code>	File number (1) of <code>stdout</code> .
<code>STDERR_FILENO</code>	File number (2) of <code>stderr</code> .

The following pathnames are defined:

<code>GF_PATH</code>	Pathname of the group file.
<code>PF_PATH</code>	Pathname of the passwd file.

Name utime.h, utime – access and modification times structure

Synopsis `#include <utime.h>`

Description The `<utime.h>` header declares the structure `utimbuf`, which includes the following members:

```
time_t actime    /* access time */
time_t modtime   /* modification time */
```

The times are measured in seconds since the Epoch.

The type `time_t` is defined as described in `<sys/types.h>`.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [utime\(2\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name utmpx.h, utmpx – user accounting database definitions

Synopsis #include <utmpx.h>

Description The <utmpx.h> header defines the utmpx structure, which includes the following members:

```
char          ut_user[]; /* user login name */
char          ut_id[];   /* unspecified initialization */
               /* process identifier */
char          ut_line[]; /* device name */
pid_t         ut_pid;    /* process ID */
short         ut_type;   /* type of entry */
```

for X/Open compilation environments:

```
struct ut_exit_status ut_exit; /* process termination/exit status*/
```

for all other compilation environments:

```
struct exit_status    ut_exit; /* process termination/exit status*/

struct timeval        ut_tv;    /* time entry was made */
int                   ut_session; /* session ID, used for windowing */
short                 ut_syslen; /* significant length of ut_host */
               /* including terminating null */
char                  ut_host[]; /* remote host name */
```

The pid_t type is defined through typedef as described in <sys/types.h>.

The timeval structure is defined as described in <sys/time.h>.

Inclusion of the <utmpx.h> header can also make visible all symbols from <sys/time.h>.

The following symbolic constants are defined as possible values for the ut_type member of the utmpx structure:

EMPTY	No valid user accounting information.
BOOT_TIME	Identifies time of system boot.
OLD_TIME	Identifies time when system clock changed.
NEW_TIME	Identifies time after system clock changed.
USER_PROCESS	Identifies a process.
INIT_PROCESS	Identifies a process spawned by the init process.
LOGIN_PROCESS	Identifies the session leader of a logged-in user.
DEAD_PROCESS	Identifies a session leader who has exited.

Name `utsname.h`, `utsname` – system name structure

Synopsis `#include <sys/utsname.h>`

Description The `<sys/utsname.h>` header defines the structure `utsname`, which includes the following members:

```
char sysname[]      /* name of this implementation of the
                    /* operating system */
char nodename[]     /* name of this node within an
                    /* implementation-defined communications
                    /* network */
char release[]      /* current release level of this
                    /* implementation */
char version[]      /* current version level of this
                    /* release */
char machine[]      /* name of the hardware type on which
                    /* the system is running */
```

The character arrays are of unspecified size, but the data stored in them is terminated by a null byte.

Name values.h, values – machine-dependent values

Synopsis `#include <values.h>`

Description This file contains a set of manifest constants, conditionally defined for particular processor architectures.

The model assumed for integers is binary representation (one's or two's complement), where the sign is represented by the value of the high-order bit.

BITS (type)	The number of bits in a specified type (for example, int).
HIBITS	The value of a short integer with only the high-order bit set.
HIBITL	The value of a long integer with only the high-order bit set.
HIBITI	The value of a regular integer with only the high-order bit set.
MAXSHORT	The maximum value of a signed short integer.
MAXLONG	The maximum value of a signed long integer.
MAXINT	The maximum value of a signed regular integer.
MAXFLOAT, LN_MAXFLOAT	The maximum value of a single-precision floating-point number, and its natural logarithm.
MAXDOUBLE, LN_MAXDOUBLE	The maximum value of a double-precision floating-point number, and its natural logarithm.
MINFLOAT, LN_MINFLOAT	The minimum positive value of a single-precision floating-point number, and its natural logarithm.
MINDOUBLE, LN_MINDOUBLE	The minimum positive value of a double-precision floating-point number, and its natural logarithm.
FSIGNIF	The number of significant bits in the mantissa of a single-precision floating-point number.
DSIGNIF	The number of significant bits in the mantissa of a double-precision floating-point number.

See Also [Intro\(3\)math.h\(3HEAD\)](#)

Name wait.h, wait – wait status

Synopsis #include <sys/wait.h>

Description When a process waits for status from its children using either the [wait\(3C\)](#) or [waitpid\(3C\)](#) function, the status returned can be evaluated with the following macros, defined in <sys/wait.h>. These macros evaluate to integral expressions. The *stat* argument to these macros is the integer value returned from `wait()` or `waitpid()`.

<code>WCOREDUMP(stat)</code>	If the value of <code>WIFSIGNALED(stat)</code> is non-zero, this macro evaluates to a non-zero value if a core image of the terminated child was created.
<code>WEXITSTATUS(stat)</code>	If the value of <code>WIFEXITED(stat)</code> is non-zero, this macro evaluates to the exit code that the child process passed to <code>_exit()</code> (see exit(2)) or exit(3C) , or the value that the child process returned from <code>main</code> .
<code>WIFCONTINUED(stat)</code>	Evaluates to a non-zero value if status was returned for a child process that has continued.
<code>WIFEXITED(stat)</code>	Evaluates to a non-zero value if status was returned for a child process that terminated normally.
<code>WIFSIGNALED(stat)</code>	Evaluates to a non-zero value if status was returned for a child process that terminated due to the receipt of a signal.
<code>WIFSTOPPED(stat)</code>	Evaluates to a non-zero value if status was returned for a child process that is currently stopped.
<code>WSTOPSIG(stat)</code>	If the value of <code>WIFSTOPPED(stat)</code> is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.
<code>WTERMSIG(stat)</code>	If the value of <code>WIFSIGNALED(stat)</code> is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.

The <sys/wait.h> header defines the symbolic constants listed below for use with [waitpid\(3C\)](#).

<code>WNOHANG</code>	Do not hang if no status is available; return immediately.
<code>WUNTRACED</code>	Report status of stopped child process.

The symbolic constants listed below are defined as possible values for the *options* argument to [waitid\(2\)](#).

<code>WEXITED</code>	Wait for processes that have exited.
<code>WSTOPPED</code>	Status is returned for any child that has stopped upon receipt of a signal.
<code>WCONTINUED</code>	Status is returned for any child that was stopped and has been continued.
<code>WNOHANG</code>	Return immediately if there are no children to wait for.

WNOWAIT Keep the process whose status is returned in `infop` in a waitable state.

The type `idtype_t` is defined as an enumeration type whose possible values include the following:

`P_ALL`
`P_PID`
`P_PGID`

The `id_t` and `pid_t` types are defined as described in `<sys/types.h>`.

The `siginfo_t` type is defined as described in `<signal.h>`.

The `rusage` structure is defined as described in `<sys/resource.h>`.

Inclusion of the `<sys/wait.h>` header can also make visible all symbols from `<signal.h>` and `<sys/resource.h>`.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [exit\(2\)](#), [waitid\(2\)](#), [exit\(3C\)](#), [wait\(3C\)](#), [waitpid\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name wchar.h, wchar – wide-character handling

Synopsis #include <wchar.h>

Description The <wchar.h> header defines the following types:

- wchar_t As described in <stddef.h>.
- wint_t An integer type capable of storing any valid value of wchar_t or WEOF.
- wctype_t A scalar type of a data object that can hold values which represent locale-specific character classification.
- mbstate_t An object type other than an array type that can hold the conversion state information necessary to convert between sequences of (possibly multi-byte) characters and wide characters. If a codeset is being used such that an mbstate_t needs to preserve more than two levels of reserved state, the results are unspecified.
- FILE As described in <stdio.h>.
- size_t As described in <stddef.h>.
- va_list As described in <stdarg.h>.

The implementation supports one or more programming environments in which the width of wint_t is no greater than the width of type long. The names of these programming environments can be obtained using the [confstr\(3C\)](#) function or the [getconf\(1\)](#) utility.

The <wchar.h> header defines the following macros:

- WCHAR_MAX The maximum value representable by an object of type wchar_t.
- WCHAR_MIN The minimum value representable by an object of type wchar_t.
- WEOF Constant expression of type wint_t that is returned by several WP functions to indicate end-of-file.
- NULL As described in <stddef.h>.

The tag tm is declared as naming an incomplete structure type, the contents of which are described in the header <time.h>.

Inclusion of the <wchar.h> header can make visible all symbols from the headers <ctype.h>, <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

Name wctype.h, wctype – wide-character classification and mapping utilities

Synopsis #include <wctype.h>

Description The <wctype.h> header defines the following types:

- wint_t As described in <wchar.h>.
- wctrans_t A scalar type that can hold values that represent locale-specific character mappings.
- wctype_t As described in <wchar.h>.

The <wctype.h> header defines the following macro name:

WEOF Constant expression of type wint_t that is returned by several MSE functions to indicate end-of-file.

For all functions described in this header that accept an argument of type wint_t, the value is representable as a wchar_t or equals the value of WEOF. If this argument has any other value, the behavior is undefined.

The behavior of these functions is affected by the LC_CTYPE category of the current locale.

Inclusion of the <wctype.h> header can make visible all symbols from the headers <ctype.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>.

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

See Also [iswalpha\(3C\)](#), [iswctype\(3C\)](#), [locale.h\(3HEAD\)](#), [setlocale\(3C\)](#), [stdarg\(3EXT\)](#), [stddef.h\(3HEAD\)](#), [stdio.h\(3HEAD\)](#), [stdlib.h\(3HEAD\)](#), [string.h\(3HEAD\)](#), [time.h\(3HEAD\)](#), [towctrans\(3C\)](#), [tolower\(3C\)](#), [toupper\(3C\)](#), [wctrans\(3C\)](#), [wctype\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

Name wordexp.h, wordexp – word-expansion types

Synopsis #include <wordexp.h>

Description The <wordexp.h> header defines the structures and symbolic constants used by the wordexp() and wordfree() functions. See [wordexp\(3C\)](#).

The structure type wordexp_t contains the following members:

```
size_t we_wordc      /* count of words matched by words */
char   **we_wordv    /* pointer to list of expanded words */
size_t we_offs       /* slots to reserve at the beginning
                      of we_wordv */
```

The *flags* argument to the wordexp() function is the bitwise-inclusive OR of the following flags:

WRDE_APPEND	Append words to those previously generated.
WRDE_DOOFFS	Number of null pointers to prepend to we_wordv.
WRDE_NOCMD	Fail if command substitution is requested.
WRDE_REUSE	The pwordexp argument was passed to a previous successful call to wordexp(), and has not been passed to wordfree(). The result is the same as if the application had called wordfree() and then called wordexp() without WRDE_REUSE.
WRDE_SHOWERR	Do not redirect stderr to /dev/null.
WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.

The following constants are defined as error return values:

WRDE_BADCHAR	One of the unquoted characters—<newline>, ' ', '&', ';', '<', '>', '(', ')', '{', '}'—appears in words in an inappropriate context.
WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
WRDE_NOSPACE	Attempt to allocate memory failed.
WRDE_NOSYS	Reserved.
WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.

The <wordexp.h> header defines the following type:

```
size_t    As described in <stddef.h>.
```

Attributes See [attributes\(5\)](#) for descriptions of the following attributes:
