Part No: 820-7758-11
April 2009

Copyright 2009 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more U.S. patents or pending patent applications in the U.S. and in other countries.

U.S. Government Rights – Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, the Solaris logo, the Java Coffee Cup logo, docs.sun.com, Java, and Solaris are trademarks or registered trademarks of Sun Microsystems, Inc. or its subsidiaries in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc. FireWire is a trademark of Apple Computer, Inc., used under license. Netscape and Netscape Navigator are trademarks or registered trademarks of Netscape Communications Corporation. Mozilla is a trademark or registered trademark of Netscape Communications Corporation in the United States and other countries. PostScript is a trademark or registered trademark of Adobe Systems, Incorporated, which may be registered in certain jurisdictions. OpenGL is a registered trademark of Silicon Graphics, Inc.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this publication are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical or biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright 2009 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plusieurs brevets américains ou des applications de brevet en attente aux Etats-Unis et dans d'autres pays.

Cette distribution peut comprendre des composants développés par des tierces personnes.

Certains composants de ce produit peuvent être dérivées du logiciel Berkeley BSD, licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays; elle est licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, le logo Solaris, le logo Java Coffee Cup, docs.sun.com, Java et Solaris sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc., ou ses filiales, aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc. FireWire est une marque de Applex Computer, Inc., utilisé sous le permis. Netscape est une marque de Netscape Communications Corporation. Netscape Navigator est une marque de Netscape Communications Corporation. Mozilla est une marque de Netscape Communications Corporation aux Etats-Unis et à d'autres pays. PostScript est une marque de fabrique d'Adobe Systems, Incorporated, laquelle pourrait être déposée dans certaines juridictions. OpenGL est une marque d'pos?e de Silicon Graphics, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de cette publication et les informations qu'il contient sont régis par la législation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes chimiques ou biologiques ou pour le nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des Etats-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

Preface

Solaris 10 5/09 What's New summarizes all features in the Solaris™ 10 Operating System (OS) that are new or have been enhanced in the Solaris 10 5/09 OS.

Note – This Solaris release supports systems that use the SPARC® and x86 families of processor architectures: UltraSPARC®, SPARC64, AMD64, Pentium, and Xeon EM64T. The supported systems appear in the *Solaris OS: Hardware Compatibility Lists* at <http://www.sun.com/bigadmin/hcl>. This document cites any implementation differences between the platform types.

In this document these x86 related terms mean the following:

- “x86” refers to the larger family of 64-bit and 32-bit x86 compatible products.
- “x64” points out specific 64-bit information about AMD64 or EM64T systems.
- “32-bit x86” points out specific 32-bit information about x86 based systems.

For supported systems, see the *Solaris OS: Hardware Compatibility Lists*.

Who Should Use This Book

This book provides introductory descriptions of the new Solaris 10 features for users, developers, and system administrators who install and use the Solaris 10 Operating System.

Optional Feature Licensing

Certain optional features and products that are described in this document might require individual licensing for use. Refer to the Software License Agreement.

Related Books

For further information about the features that are summarized in this book, refer to the following Solaris 10 documentation at <http://docs.sun.com/app/docs/prod/solaris.10>.

Related Third-Party Web Site References

Third-party URLs are referenced in this document and provide additional, related information.

Note – Sun is not responsible for the availability of third-party Web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused by or in connection with use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

Documentation, Support, and Training

The Sun web site provides information about the following additional resources:

- [Documentation \(http://www.sun.com/documentation/\)](http://www.sun.com/documentation/)
- [Support \(http://www.sun.com/support/\)](http://www.sun.com/support/)
- [Training \(http://www.sun.com/training/\)](http://www.sun.com/training/)

Typographic Conventions

The following table describes the typographic conventions that are used in this book.

TABLE P-1 Typographic Conventions

Typeface	Meaning	Example
AaBbCc123	The names of commands, files, and directories, and onscreen computer output	Edit your <code>.login</code> file. Use <code>ls -a</code> to list all files. <code>machine_name% you have mail.</code>
AaBbCc123	What you type, contrasted with onscreen computer output	<code>machine_name% su</code> Password:
<i>aabbcc123</i>	Placeholder: replace with a real name or value	The command to remove a file is <code>rm filename</code> .
<i>AaBbCc123</i>	Book titles, new terms, and terms to be emphasized	Read Chapter 6 in the <i>User's Guide</i> . <i>A cache</i> is a copy that is stored locally. Do <i>not</i> save the file. Note: Some emphasized items appear bold online.

Shell Prompts in Command Examples

The following table shows the default UNIX® system prompt and superuser prompt for the C shell, Bourne shell, and Korn shell.

TABLE P-2 Shell Prompts

Shell	Prompt
C shell	machine_name%
C shell for superuser	machine_name#
Bourne shell and Korn shell	\$
Bourne shell and Korn shell for superuser	#

What's New in the Solaris 10 5/09 Release

This document summarizes all features in the Solaris 10 Operating System (OS) that are new or have been enhanced in the current release, the Solaris 10 5/09 release.

For a summary of all features in the Solaris 10 OS that were introduced or enhanced since the Solaris 9 OS was originally distributed in May 2002, see [Solaris 10 5/09 What's New](#).

System Resources Enhancements

The following system resources features and enhancements have been added to the Solaris 10 5/09 release.

Support Added for Using ZFS Clones When Cloning a Zone

If the source and the target zonепaths reside on ZFS and both are in the same pool, a snapshot of the source zonепath is taken and the zoneadm clone uses ZFS to clone the zone.

You can specify to copy a ZFS zonепath instead of specifying to clone the ZFS. If neither the source nor the target zonепath is on ZFS, or if one is on ZFS and the other is not on ZFS, the clone process uses the existing copy technique.

In all cases, the system copies the data from a source zonепath to a target zonепath if using a ZFS clone is not possible.

For more information, see the following:

- [zoneadm\(1M\)](#) man page
- [System Administration Guide: Solaris Containers-Resource Management and Solaris Zones](#)

zoneadm attach -b Option

Use the -b option to specify official or Interim Diagnostics Relief (IDR) patches, to be backed out of a zone during the attach. This option applies only to zone brands that use SVr4 packaging.

For more information, see the following:

- [zoneadm\(1M\)](#) man page
- *System Administration Guide: Solaris Containers-Resource Management and Solaris Zones*

System Administration Enhancements

The following system administration features and enhancements have been added to the Solaris 10 5/09 release.

SMF Services for IPsec

IP security (IPsec) is now managed by the following Solaris Management Facility (SMF) services:

- `svc:/network/ipsec/policy:default` – The `policy` service checks for the `/etc/inet/ipsecinit.conf` file and feeds the data into the IPsec Security Policy Database (SPD). The `policy` service must be started and its file, `/etc/inet/ipsecinit.conf`, must exist for boot-time IPsec policy configuration.
- `svc:/network/ipsec/ike:default` – The `ike` service controls the Internet Key Exchange (IKE) daemon in `iked(1M)`. This service controls `ike` in a manner similar to other daemon-controlled services like `ssh` or `sendmail`.
- `svc:/network/ipsec/manual-key:default` – The `manual-key` service checks for the `/etc/inet/secret/ipseckeys` file and feeds the keys into the IPsec Security Association Database (SADB). Prior to SMF, the mere existence of the `/etc/inet/secret/ipseckeys` file was sufficient, but now the service should also be enabled to load manual IPsec keys.
- `svc:/network/ipsec/ipsecalgs:default` – The `ipsecalgs` service is enabled by default and maps Solaris Cryptographic Framework algorithms to their use in IPsec. Changes enabled with `ipsecalgs(1M)` subsequently refresh the `ipsecalgs` service.

The SMF management brings all the SMF features to IPsec, for example, interface consistency, capability of restarting, and fault-tracking.

Security Enhancements

The following security features and enhancements have been added to the Solaris 10 5/09 release.

NAT-Traversal for IPsec Key Management Developers

The Solaris 10 5/09 release contains a public API for User Datagram Protocol (UDP) sockets that act as IPsec Network Address Translator (NAT) Traversal endpoints.

The `UDP_NAT_T_ENDPOINT` socket option, when enabled, has UDP traffic prefixed with a zero security parameters index (SPI) value of four bytes on outbound traffic and strips zero SPIs on inbound traffic. Inbound traffic bound for such a socket with a nonzero SPI is automatically

transferred to IPsec's Encapsulating Security Payload (ESP) for ESP-in-UDP decapsulation. ESP-in-UDP encapsulation is determined by a property in the IPsec Security Association (SA).

This feature enables IPsec key management software developers to create key management protocols that can transit NAT devices. The Solaris IKE daemon in `iked(1M)` uses this facility and such sockets are displayed using the `pf1les(1M)` command.

Stronger Algorithms for IPsec

The Solaris 10 5/09 release introduces the following algorithms for IPsec and IKE:

- Three larger Diffie-Hellman integer-modulus groups including 2048-bit, 3072-bit, and 4096-bit – The larger Diffie-Hellman groups are available in IKE Phase 1 and Phase 2. The groups are specified by group number 14 for 2048-bit, 15 for 3072-bit, and 16 for 4096-bit, per RFC 3526.
- SHA-2 series of hashes including sha256, sha384, and sha512– SHA-2 using HMAC is available for IPsec's Authentication Header (AH) and ESP, and for IKE during its interactions. SHA-2 is used in IPsec per RFC 4868, with truncated ICV lengths of 16 bytes for SHA256, 24 bytes for SHA384, and 32 bytes for SHA512.

Note – SHA-2 is not available for certificates generated with `ikecert(1M)`.

SunSSH With OpenSSL PKCS#11 Engine Support

This feature enables the SunSSH server and client to use Solaris Cryptographic Framework through the OpenSSL PKCS#11 engine. SunSSH uses cryptographic framework for hardware crypto acceleration of symmetric crypto algorithms which is important to the data transfer speed. This feature is aimed at UltraSPARC® T2 processor platforms with `n2cp(7D)` crypto driver.

UltraSPARC T1 processor platforms are not affected by this feature since the `ncp(7D)` driver does not support symmetric crypto algorithms. Platforms without any hardware crypto plugins are not affected by this feature, regardless of the value set for the `UseOpenSSLEngine` option. The default value of the `UseOpenSSLEngine` option is set to on and the server and client SSH configuration files need not be updated.

SunSSH should be used with Sun Crypto Accelerator 6000 board software version 1.1 with the following patches installed:

- 128365-02 for SPARC-based systems
- 128366-02 for x86-based systems

Note – No patch is available for the Sun Crypto Accelerator 6000 board software version 1.0. To workaround this issue, remove the AES counter modes from the Ciphers option keyword on both the server and the client side.

For more information, see the [ssh_config\(4\)](#) and [sshd_config\(4\)](#)

Device Management Enhancements

The following device management feature has been added to the Solaris 10 5/09 release.

x86: T-State Support for Intel Based Processors

This feature provides the basic CPU Advanced Configuration and Power Interface (ACPI) T-state support. T-state support enables the CPU driver to receive `_TPC` change notifications as a manner of controlling the processor speed. This is frequently done on some systems as a passive cooling mechanism along with the existing CPU ACPI P-States.

For more information, see <http://opensolaris.org/os/community/pm/>.

System Performance Enhancements

The following system performance features and enhancements have been added to the Solaris 10 5/09 release.

Large Segment Offload Support for Intel PCI Express 10Gb NIC Driver

This feature introduces Large Segment Offload (LSO) support for the `ixgbe` driver and some `ixgbe` driver bug fixes. LSO is an important feature for NIC, especially for 10-Gb NIC. LSO can offload the segmentation job on Layer 4 to the NIC driver. LSO improves transmit performance by decreasing CPU overhead. This feature is enabled by default.

Solaris Power Aware Dispatcher and Deep C-State Support

This feature includes the following enhancements:

- Event driven CPU power management – On systems that support Dynamic Voltage and Frequency Scaling (DVFS) by Solaris, the kernel scheduler or dispatcher will schedule threads across the system's CPUs in a manner that coalesces load, and frees up other CPUs to be deeply power managed. CPU power state changes are triggered when the dispatcher recognizes that the utilization across a group of power manageable CPUs has changed in a significant way. This eliminates the need to periodically poll CPU utilizations across the system, and enables the system to save more power when CPUs are not used, while driving performance when CPUs are used. Event driven CPU power management is enabled by default on systems that support DVFS. This feature can be disabled, or the legacy polling-based CPU power management can be used through the `cpupm` keyword in `power.conf(4)`.
- Support for Deep Idle CPU Power Management or deep C-state support on Intel Nehalem-based systems – The project also adds Solaris support for Deep C-states on Intel Nehalem-based systems. This support enables unused CPU resources to be dynamically placed in a state where they consume a fraction of the power consumed in their normal operating state. This feature also provides Solaris support for the power saving feature, as well as the policy implementation that decides when idle CPUs should request deep idle mode. This feature will be enabled by default where supported, and can be disabled through the `cpu-deep-idle` keyword in `power.conf(4)`.
- Observability for Intel's Turbo Mode feature – Intel Nehalem-based systems have the ability to raise the operating frequency of a subset of the available cores when there is enough thermal headroom to do so. This ability temporarily boosts performance, but it is controlled by the hardware and transparent to software. Starting with the Solaris 10 5/09 release, a new `kstat` module observes when the system is entering the turbo mode and at which frequency it operates.

Developer Tools Enhancements

The following developer tools features and enhancements have been added to the Solaris 10 5/09 release.

SunVTS 7.0 Patch Set 5

SunVTS™ 7.0 Patch Set 5 has the following enhancements:

- Infrastructure enhancements:
 - Ability to specify device specific options in a test
 - Creation of generic or host-specific sessions for testing
 - Loop function on a particular test pass
 - Terminal user interface (UI) support for the creation or loading of generic and host-specific sessions

- CPU Diagnostics Enhancements:
 - System test, `systemtest`, performs processor-level isolation in the event of a failure
 - CPU test, `cpustest`, is a multiprocess test. A single test binary can test all the CPUs in the system simultaneously.
- Memory Diagnostics Enhancements:
 - `physmem`-based `ramtest` has the option to read address length in Kbytes, Mbytes, and Gbytes
 - Improved I3 buffer test with added memory, march-test algorithms
- IO Diagnostics Enhancements:
 - New `hlgraphics` test is added for testing graphics cards
 - Users can specify back-to-back loopback option for the `nxge` interface in the network test
 - `Cddvdtest` is enhanced to support different drive speeds
 - `Disktest` is enhanced to support the following features:
 - Tuned to stress USB storage devices
 - Perform disk performance testing
 - Not perform write testing on the root disk
 - Test Solid State Devices (SSD) with test level, wear-leveling mechanism
 - Supports read-and-write buffer cache test

x86: CPU Performance Counter Updates for Intel Processors

Modern microprocessors contain hardware performance counters that enable the measurement of many different hardware events related to CPU behavior. Hardware events include instruction and data cache misses as well as various internal states of the processor. Data from the performance counters can be used to analyze and tune the behavior of software on a particular type of processor. The Solaris 10 5/09 OS provides access to CPU Performance Counters (`cpc`) through the `libcpc(3LIB)` interface and through the `cpurack(1)` and `cpustat(1M)` utilities.

Driver Enhancements

The following driver features and enhancements have been added to the Solaris 10 5/09 release.

hermon Driver

This feature introduces a Solaris driver for the fourth generation of InfiniBand (IB) HCA chips from Mellanox, Ltd. The hermon driver provides IB support for SDR, DDR, and QDR chips for conventional HCAs, EMs, and NEMs for blade environments.

The hermon driver enables higher bandwidth and lower latency in IB transmissions, compared to previous generations of the IB product. The higher bandwidth and lower latency are most

important in high-performance computing (HPC) applications, though the increase in performance is advantageous in all environments.

In addition, the uDAPL library, a critical underpinning of the MPI library, is updated to work with this driver, providing optimal performance with MPI-based applications.

iSCSI Target

Starting with the Solaris 10 5/09 release, iSCSI Target is upgraded to provide new features and functionality.

This iSCSI Target update includes the following performance, scalability, interoperability, and reliability improvements:

- Improved TCP/IP timeout recovery
- iSCSI initiator invoked SCSI RESETs
- Code path and memory leak cleanup
- Improved interoperability with Target Port Group Tags (TPGT), unidirectional and bidirectional CHAP authentication, and RADIUS server support
- Improved Internet Storage Name Service (iSNS) support, including recovery from unavailable iSNS servers
- Updated SCSI-3 Persistent Reserve functionality that enables the use of the functionality in various clustering solutions on both Solaris and other operating systems

The Solaris iSCSI Target release now supports a wide variety of iSCSI initiators for the following operating systems:

- Solaris 10
- OpenSolaris
- Linux: Red Hat Enterprise Linux (RHEL), Suse, and Ubuntu
- VMWare ESX
- Microsoft Windows (XP, Vista, Server 2003, Server 2008, Windows Cluster Server)
- Mac OS X

x86: NetXen 10-GigE Device Driver

The `ntxn(7D)` is a new NIC driver that supports NetXen's PCI Express-based 10-Gigabit Ethernet network interface cards (NIC). Users can access the network through Solaris OS on platforms that have a NetXen NIC installed.

Intel ICH10 and Hartwell NIC Support in E1000g Driver

Starting with the Solaris 10 5/09 release, the ICH10 and Hartwell network interfaces are the default network interface cards (NIC) on some x64 and x86 machines. Users can access the network easily with these network interfaces.

xge Driver Can Enable Multiple Receive Rings and MSI-X

The xge driver enables multiple receive rings and MSI-X if the driver can allocate enough MSI-X vectors on platforms that support MSI-X. The performance of the driver is enhanced by this feature. If the driver is unable to allocate enough MSI-X vectors, the driver continues to work as before in the legacy interrupt mode.

Language Support Enhancements

The following language support enhancement has been added to the Solaris 10 5/09 release.

New Locale Support for Kazakhstan and Ukraine

The Solaris 10 5/09 release now supports the Kazakhstan `kk_KZ.UTF-8` and Ukraine `uk_UA.UTF-8` locales.

Additional Software Enhancements

The following additional software feature has been added to the Solaris 10 5/09 release.

SPARC: Fp-scrubber Daemon

The Fp-scrubber is a user-level daemon that periodically runs nonintrusive tests to validate proper functioning of the floating-point unit (FPU) hardware. When an error is detected by the test, a fault management action is initiated by using the `fmd(1M)` command. The Fp-scrubber daemon supports only UltraSPARC III and UltraSPARC IV class of processors.
