

Desktop Deployment Administrator's Guide

*Sun Java™ System Connector
for Microsoft Outlook*

Version 6.0

817-4218-10
February 2004

Copyright © 2004 Sun Microsystems, Inc., 4150 Network Circle, Santa Clara, California 95054, U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more of the U.S. patents listed at <http://www.sun.com/patents> and one or more additional patents or pending patent applications in the U.S. and in other countries.

THIS PRODUCT CONTAINS CONFIDENTIAL INFORMATION AND TRADE SECRETS OF SUN MICROSYSTEMS, INC. USE, DISCLOSURE OR REPRODUCTION IS PROHIBITED WITHOUT THE PRIOR EXPRESS WRITTEN PERMISSION OF SUN MICROSYSTEMS, INC.

U.S. Government Rights - Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and in other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, Sun Java System Connector for Microsoft Outlook, Java, Solaris, JDK, Java Naming and Directory Interface, JavaMail, JavaHelp, J2SE, iPlanet, the Duke logo, the Java Coffee Cup logo, the Solaris logo, the SunTone Certified logo and the Sun ONE logo are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries.

All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon architecture developed by Sun Microsystems, Inc.

Legato and the Legato logo are registered trademarks, and Legato NetWorker, are trademarks or registered trademarks of Legato Systems, Inc. The Netscape Communications Corp logo is a trademark or registered trademark of Netscape Communications Corporation.

The OPEN LOOK and Sun(TM) Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this service manual are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright © 2004 Sun Microsystems, Inc., 4150 Network Circle, Santa Clara, California 95054, Etats-Unis. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plus des brevets américains listés à l'adresse <http://www.sun.com/patents> et un ou les brevets supplémentaires ou les applications de brevet en attente aux Etats - Unis et dans les autres pays.

CE PRODUIT CONTIENT DES INFORMATIONS CONFIDENTIELLES ET DES SECRETS COMMERCIAUX DE SUN MICROSYSTEMS, INC. SON UTILISATION, SA DIVULGATION ET SA REPRODUCTION SONT INTERDITES SANS L'AUTORISATION EXPRESSE, ECRITE ET PREALABLE DE SUN MICROSYSTEMS, INC.

Cette distribution peut comprendre des composants développés par des tierces parties.

Des parties de ce produit pourront être dérivées des systèmes Berkeley BSD licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays et licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, Sun Java System Connector for Microsoft Outlook, Java, Solaris, JDK, Java Naming and Directory Interface, JavaMail, JavaHelp, J2SE, iPlanet, le logo Duke, le logo Java Coffee Cup, le logo Solaris, le logo SunTone Certified et le logo Sun[tm] ONE sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays.

Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.

Le logo Netscape Communications Corp est une marque de fabrique ou une marque déposée de Netscape Communications Corporation.

L'interface d'utilisation graphique OPEN LOOK et Sun(TM) a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de ce manuel d'entretien et les informations qu'il contient sont regis par la législation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes biologiques et chimiques ou du nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des Etats-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régi par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFAÇON.

About This Guide

This guide describes the deployment of Sun Java™ System Connector for Microsoft Outlook. This guide is intended to help understand your deployment choices and options before using the Sun Java System Connector Deployment Toolkit—a collection of software tools for system administrators designed to install and configure the Sun Java System Connector for Microsoft Outlook for individual users.

Topics covered in this chapter include:

- [Who Should Read This Book](#)
- [What You Need to Know](#)
- [How This Book is Organized](#)
- [Document Conventions](#)
- [Where to Find Related Information](#)
- [Where to Find This Book Online](#)

Who Should Read This Book

You should read this book if you are responsible for administering and deploying Sun Java System Connector for Microsoft Outlook at your site.

What You Need to Know

This book assumes that you are responsible for administering and deploying the Connector for Microsoft Outlook software and that you have a general understanding of:

- The Internet and the World Wide Web
- Messaging Server and Calendar Server protocols
- System Administration and Networking on the following platforms:
 - Microsoft Windows 2000
 - Microsoft Windows XP
- Microsoft Outlook
- General Deployment Architectures

How This Book is Organized

This book contains this [About This Guide](#) preface followed by three chapters:

- [Chapter 1, “Introduction and Overview”](#)
- [Chapter 2, “General Guidelines”](#)
- [Chapter 3, “Issues to Address in Planning for a New Mail Server”](#)

Document Conventions

In this guide, file and directory paths are given in the Windows format (with backslashes separating directory or folder names). If you reference other Sun Java System documentation, you may notice that UNIX conventions designate file and directory paths (with front slashes separating directories).

- `Monospaced font` is used for any text that appears on the computer screen or text that you should type. It is also used for filenames, distinguished names, functions, and examples.
- **bold monospaced font** is used to represent text within a code example that you should type.
- *Italicized font* is used to represent text that you enter using information that is unique to your installation (for example, variables). It is used for server paths and names.

For example, you might see file references of the form:

```
ISTOREX.LOG
```

In this situation, *x* is a numerical value for the day of the week.

Italicized font is also used for variables or parameters within the synopsis of a command line utility. For example, the installation package supports the command line utility:

```
/USERNAME=xxx
```

In the above example, the italicized font is an argument for its associated command. The *xxx* refers to the userID on the server.

- Square (or straight) brackets [] are used to enclose optional parameters. For example, you may see the usage for the `setup` command described as follows:

```
installer [options] [arguments]
```

It is possible to run the `installer` command by itself as follows to start the Messaging Server installation:

```
setup
```

However, the presence of *[options]* and *[arguments]* indicate that there are additional optional parameters that may be added to the `setup` command. For example, you could use `setup` command with the `-k` option to keep the installation cache:

```
setup -k
```

Where to Find Related Information

The Sun Java System product suite contains other products such as Sun Java System Messaging Server (formerly Sun ONE™ Messaging Server) and Sun Java System Calendar Server (formerly Sun ONE Calendar Server). Documentation for these and other products can be found at the following URLs:

- Sun Java System Connector for Microsoft Outlook documentation:

http://docs.sun.com/coll/ConnectorMSO_60

- Sun ONE Messaging Server 6.0 documentation:

http://docs.sun.com/coll/S1_MsgServer_60

- Sun ONE Calendar Server 6.0 documentation:

http://docs.sun.com/coll/S1_CalendarServer_60

Where to Find This Book Online

You can find the *Sun Java System Connector for Microsoft Outlook Desktop Deployment Administrator's Guide* online in PDF and HTML formats. This book can be found at the following URL:

<http://docs.sun.com/db/doc/817-4218>

Introduction and Overview

This Guide was developed to help you, the system administrator, understand and plan for the deployment of the Sun Java System Connector for Microsoft Outlook to the end users in your organization. The deployment process can proceed along many different paths depending on your original and destination network configurations, the administrative structure of your organization, and your own informed sense of the extent to which your users can and should be involved in the process of installing and configuring their own desktop software.

Your organization will use Sun Java System Connector software so that your users can use Microsoft Outlook as their e-mail and calendar client while connected to Sun Java System servers. The Connector software must be installed and configured for each of your desktop users to facilitate the necessary ongoing communications between Outlook and the Sun Java System server. Sun also provides a Desktop Deployment Toolkit, a collection of software tools for system administrators designed to simplify both the administrator's work and the user tasks associated with installing and configuring the Sun Java System Connector software for individual users.

The Desktop Deployment Toolkit lets the administrator create customized end-user installation packages for the Connector software, with pre-set configuration parameters to simplify and streamline the user's process, and to enforce any configuration settings the administrator deems necessary or desirable for a particular user or group of users. The Deployment Configuration Program saves those pre-set configuration parameters in an `.ini` text file, and then bundles the `.ini` file with an installation program—the Setup Wizard—for end users. When an end user activates the package, the Setup Wizard reads the `.ini` file to install and configure the Connector software on his or her desktop according to the administrator's specifications.

As you plan for your deployment and use the Deployment Toolkit to prepare installation packets for your users, you will find many choices available for how the new software will be distributed, installed and configured on individual user desktops. Some of your choices will be dictated by logistical imperatives, while other choices will be derived from your personal familiarity with your organization, your network, and your users.

This Guide is intended to help you anticipate these choices, and explain the significance and implications of your options before you start using the Deployment Toolkit. The topics in this Guide are:

- **Chapter 1, “Introduction and Overview”**
 - “Why Use the Deployment Toolkit?”
 - “Deployment Process Per Desktop: Three Tasks”
 - “Deployment Toolkit Components”
- **Chapter 2, “General Guidelines”**
 - “Plan to Migrate Incrementally, in Groups”
 - “Prepare a Comprehensive Deployment Plan”
- **Chapter 3, “Issues to Address in Planning for a New Mail Server”**
 - “Characterize Your Site Configuration(s) and Users”
 - “User Grouping Criteria and Implications”
 - “Desktop Installation Methods”
 - “Interactive User Installation (Self-Service)”
 - “Administrator Performs Installation at Users' Computers”
 - “Automated “Push” via SMS or Other Configuration Management Tools”
 - “Command-Line Switches for Desktop Installation”
 - “Migration of Important Server Data: More Than Just Messages”
 - “Mail Routing During Transition Phase of Server Migration”
 - “Synchronization of Global Address Books During Migration”
 - “New User IDs and Passwords for Sun Java System Servers”
 - “Password-Protected Personal Stores in Outlook”

Why Use the Deployment Toolkit?

With the Deployment Toolkit, an administrator can control a wide range of configuration parameters for desktop users. Mandating many or most configuration settings will bypass the need for users to ponder options, make choices and set values themselves. These automated or semi-automated installations will spare the corporate help desk many calls for guidance, support, and solutions to the inevitable problems that arise when user choices produce unexpected results. Overall, the toolkit substantially reduces the cost, time and effort required to deploy the Sun Java System Connector software.

A system administrator may create different installation packages for different groups of desktop end user—for example, to enforce different configuration schemes for users in the Sales department vs. the Engineering department and so forth, or to offer configuration options to some groups of users while setting fixed parameters (eliminating the choices) for other groups.

If your organization is migrating from Microsoft Exchange, the users' installation packages will also preserve the considerable value of their existing Outlook data stored in .pst files on user desktops, as well as their Notes, Journals and Contacts stored on the Exchange server. The bundled installation packages include a conversion utility that quickly converts all such data to pure Internet addresses, so users will be able to reply to older messages, appointment invitees will receive change notices, and address books and personal distribution lists will remain serviceable after your migration to the Sun Java System server.

Deployment Process Per Desktop: Three Tasks

Deployment of the Sun Java System Connector software to each user desktop requires three distinct tasks:

- **Installation:** The necessary and appropriate software must be physically installed to the Outlook user's desktop. Software installation requires access privileges that often are disallowed to many or most end users. In this case, most enterprises implement a “push” method for software distribution from the system administrator to user desktops that bypasses the requirement for user access privileges. (This “push” method of distribution is explained in more detail below, under “[Desktop Installation Methods](#)”.) If your network serves “locked-down” Windows environments where end users cannot install software, we strongly recommend this sort of automated configuration management as a way to avoid many individual desktop visits.

- **Configuration:** The Sun Java System Connector is installed with an assortment of configuration parameters including the server names and port numbers, user password options, directory search defaults, the log file path, and so forth. While users or administrators can manually configure these settings within Outlook at each desktop, it is far more efficient for administrators to pre-configure these for groups of users and avoid desktop visits.
- **Conversion:** The desktop Setup Wizard can convert Exchange users' Contacts, Journal and Notes data to local (desktop) Personal Folders (.pst) files for the Sun Java System Connector. Any such existing personal data files associated with Microsoft Exchange and Outlook must be converted to be compatible with the Sun Java System server and Connector software. (This task does not apply to new e-mail users who were not previously working with Microsoft Exchange.) If a user has password-protected his or her data files, these conversions will require the password associated with the protected files. The conversion function is processor-intensive and may run on the user's computer for many minutes or even hours if a user has large amounts of data to convert. For this reason the conversion utility lets a user defer the conversion of larger files to a later time, such as during a lunch break or even overnight.

The Deployment Configuration Program lets a system administrator create installation packages that will automate some or all of these tasks for end users, depending on the administrator's deployment strategy for any particular group of users.

Deployment Toolkit Components

The Sun Java System Connector Desktop Deployment Toolkit consists of these components:

- **Deployment Configuration Program:** Sun's tool that lets system administrators create bundled, customized installation packages for end users. These packages can then install and configure the Sun Java System Connector software and, if appropriate, convert data from Exchange local stores.
- **Sun Java System Connector Setup Wizard:** Sun's tool that lets end users install the Sun Java System Connector software, configure its operations and features based on the administrator's settings, and convert existing Outlook data files (.pst files) associated with Exchange into a form that the Sun Java System Connector can use. (The Setup Wizard is one part of the bundled end-user installation package created by the Deployment Configuration Program, as described above.)

- **Sun's Install kit (MSI) for the Sun Java System Connector:** Sun's installation utility for the software that facilitates ongoing, permanent communications between Microsoft Outlook features and the Sun Java System server. This is supplied as part of the package from Sun.
- **Special Kits for using Microsoft System Management Services (SMS) to install the Sun Java System Connector:** Sun utilities that support the “push” functionality of Microsoft's SMS to let a system administrator distribute and install the Sun Java System Connector desktop components to user desktops with minimal or no user involvement. This “push” method of distribution is explained below, under “[Desktop Installation Methods.](#)”

In addition to the above-listed components of the Deployment Toolkit, the items listed below (available from other vendors) may be necessary for your users to install the Sun Java System Connector for Microsoft Outlook:

- **Microsoft installation program for Web Publishing Wizard (WPW):** Microsoft's WPW is a tool used to generate HTML-coded documents, typically in the form of web pages to be viewed in a web browser. But WPW can also be used to “publish” information for other purposes—to create documents containing certain types of data and upload the documents to locations where other applications can find them and extract the pertinent data. The Sun Java System Connector uses WPW this way to facilitate the transfer of users' free/busy data between Outlook and the Sun Java System server, and WPW therefore is a necessary intermediary and a required component of every user's installation of the Sun Java System Connector.

NOTE The WPW, however, is not included in the Deployment Toolkit package because it is a Microsoft product, so you must obtain the Web Publishing Wizard from Microsoft. The installation program for Microsoft's WPW is available as a free download from <http://www.microsoft.com>.

- **Microsoft Install kits (MSIs) for Some Versions of Outlook** (required *only* if some of your users are using Outlook 2000, *not* required if all users are running Outlook 2002): The Sun Java System Connector uses LDAP services to communicate with the Sun Java System directory, and the LDAP protocol is a standard feature of Outlook 2002. The LDAP protocol is only an optional feature in Outlook 2000, not a part of a “standard” Microsoft Office installation. If *any* of your users are using Outlook 2000 you will need the corresponding original Microsoft installation CD(s) or files to install the LDAP component. These kits are *not* included in Sun's Deployment Toolkit package because they are Microsoft products.

Copy these CDs into a directory structure on a shared folder on your network to permit the Setup Wizard to install LDAP without prompting each user to insert the original Outlook or Office CD. You should create a top level directory with no files in it, as shown in [Figure 1-1](#). For each different version of Outlook or Office your users are running, create a subdirectory under that and copy the installation kit into the subdirectory.

Figure 1-1 Recommended Directory Structure for LDAP Source Files

General Guidelines

Unless the scale of your migration is limited to only a handful of users, we strongly recommend that you plan to migrate incrementally, in groups, and prepare a comprehensive Deployment Plan to articulate your migration strategy.

Plan to Migrate Incrementally, in Groups

While small companies may be able to migrate all users to a new server in a single weekend or migration event, most medium and large companies will need to perform their migrations in “batches.”

Even a seamless transition will generate calls to your corporate help desk from some percentage of users, and your help staff would much prefer handling just a handful of these calls per day, distributed over several days. Migrating your universe of users incrementally, by subset groups, should substantially distribute your help desk's load.

Moreover, your organization may have good business reasons to avoid scheduling all users in a single migration event. For example, finance and accounting staff cannot tolerate a disruption at the beginning of a month when they are trying to close the books. Likewise, sales staff should not be disrupted near the end of the quarter when they are striving to meet their quotas, and marketing people need to avoid interruptions near key trade shows or other programs. Migrating users in batches provides flexibility in accommodating these legitimate business needs.

Many organizations designate information-services staff as the first group to migrate, since they typically are the most sophisticated users and therefore provide a solid test of the migration methodology and new system.

Finally, remember that the Deployment Configuration Program lets you configure your users' installation processes differently for different groups of users. Presumably you will want to monitor your users' installations, at least passively, and this will be much easier to do by groups of users who share certain qualities and configuration parameters.

Prepare a Comprehensive Deployment Plan

The process of developing a comprehensive Deployment Plan is a valuable exercise that will force you to consider and accommodate all of the factors likely to influence your organization's migration. Halfway through your deployment is no time to discover that a neglected detail has cost your organization several hundred hours of user productivity, or unnecessary aggravation for your users.

Your Deployment Plan will be an internal document, and as such may be as full of undefined jargon and acronyms as you like. But at a minimum your Plan should accommodate all of the issues identified in this Guide as [Chapter 3, "Issues to Address in Planning for a New Mail Server."](#) Engaging professional services experienced in messaging migration may prove very beneficial.

Issues to Address in Planning for a New Mail Server

This section explains topics that should be addressed in the planning for every migration project.

Characterize Your Site Configuration(s) and Users

Are your users all in one physical, geographic location—all in one building? All on one floor? In one room? Or do you have a global headquarters in St. Louis, branch administrative offices in Tangiers, Barcelona and Oshkosh, and factories in Singapore and Tuscaloosa? In your current e-mail system, how many Exchange servers and users are at each location? After you migrate, how many Sun Java System servers will serve the users at each location?

In your current e-mail system, how are your users assigned to your various Exchange servers? By geography only? By administrative entities within your organization—for example, the Sales Department vs. the Engineering Department vs. Customer Service and so forth? Or by business unit or team—for example, the Product XYZ team vs. the Product ABC team?

What are the education and training backgrounds of your various users? How long have they been working with computers? To what extent are they likely to require administrator or help-desk “hand holding” during the migration?

User Grouping Criteria and Implications

Determine the optimum number of your users to migrate at a time. Your optimum migration group size will depend in part on the volume of data per user on the server. Migration group size should be correlated to the size and availability of your enterprise help desk, since you can assume that at least some percentage of users will call the help desk for assistance.

Your first few migration groups should be smaller than your expected optimum size, since these first groups will likely expose any unforeseen issues with documentation, your communication plan, and so forth before a larger group would generate correspondingly larger consequences. The first few smaller migration groups will also help you predict the demand on your organization's help desk upon the later migration of larger groups.

Finally, it is usually helpful to migrate users in logical groups, related by business function or by administrative entity or proximity, so they can support one another through the process.

Desktop Installation Methods

The Sun Java System Connector Deployment Toolkit contains a variety of tools with operational options that permit considerable flexibility in devising and implementing a suitable migration strategy for most any environment, circumstances and administrator preferences. The topics below describe the most common scenarios, and explain how Sun's migration tools accommodate them.

Interactive User Installation (Self-Service)

The Sun Java System Connector Setup Wizard is designed to be straightforward for end users to run by themselves. The Setup Wizard can be placed on a file server, so it need not be individually installed on end-user workstations. However, the physical installation of the Java System Connector software on user desktops requires access privileges that often are disallowed to many or most end users. If any of your end users do not have installation privileges for their own desktops, you may choose either of the following strategies:

- Visit each user's workstation and use your own administrator privileges to physically install the software to the user's desktop.

- Use a configuration management tool, such as Microsoft's SMS, to “push” the software to multiple users' desktops (explained below in “[Automated “Push” via SMS or Other Configuration Management Tools](#)”).

After the software has been physically copied to a user's desktop, the user can run the Setup Wizard to configure the software and convert existing Personal Folders (.pst) files.

End users who run the conversion program will provide their own credentials for the Sun Java System servers. This method therefore permits conversion of password-protected .pst files (see “[Password-Protected Personal Stores in Outlook](#)” below), and lets users specify which of their personal stores should be converted for use with the new Sun Java System Connector software. (Users can read unconverted e-mail messages, but cannot reply to them because unconverted addresses are unfamiliar to the new server. Users who have some personal stores that are very old, so that the need for a future reply is highly unlikely, may therefore opt to leave such files unconverted. The conversions can run in the background, freeing the user's computer for other work, but the process is likely to slow the performance of other applications.)

The significant downsides of interactive user installation are:

- Increased demand for support from your organization's help desk, which may be considerable depending on your users' technical skills and the complexity of your “before” and “after” network configurations.
- Time and effort you, as an administrator, would have to devote to visiting multiple user workstations to physically copy the software to the users' desktops (for users who are not authorized to perform that task for themselves).

Administrator Performs Installation at Users' Computers

You may want to let some users “self-serve” their own installations, as described above, but assign administrators to visit others' desktops to perform some or all of the installation and configuration tasks for them. This approach can ensure a smooth migration for top executives or less technical users who are ill-prepared to perform the tasks for themselves. Your Deployment Plan should address whether these sorts of administrator visits are warranted for any users in your organization, and for whom.

Automated “Push” via SMS or Other Configuration Management Tools

Software installation on user desktops requires access privileges that often are disallowed to many or most end users. Most administrators of such networks use a configuration management tool, such as Microsoft's SMS, to “push” the software to multiple users' desktops — a method that bypasses the requirement for user access privileges. If your network serves “locked-down” Windows environments, where end users cannot install software, this sort of automated configuration management can spare the administrator many visits to individual user desktops.

To accomplish a “push” distribution, you can use the Deployment Configuration Program to build two different bundled installation packages for each user, to be executed in succession. The first would perform the “push” installation of the necessary Sun Java System software, while the second would run an interactive process by which the user could make choices about the configuration of the installed software and the conversion of his or her own existing data files. This “push” method may even be used to completely automate the conversion process for end users, but would require some scripting since the package must be invoked with information specific to each end user (e.g., the user's Sun Java System credentials).

Your Deployment Configuration Program *Reference* provides instructions for using Microsoft's SMS to implement this “push” method of software distribution. The *Reference* also explains how to use command-line switches with an SMS script to fully automate the process by passing the necessary user passwords, for the user's Personal Folders (.pst) files, to the desktop installation program.

Command-Line Switches for Desktop Installation

The Sun Java System Connector Setup Wizard supports command-line switches that may be used in combination with the other desktop installation methods described above, or with an SMS script as described in the *Sun Java System Connector for Microsoft Outlook Deployment Configuration Program Reference* (under “Application Notes for Special Circumstances”).

The installation package will support these command-line switches:

`/USERNAME=xxx`, where `xxx` is the username on the Sun servers
`/PASSWORD=xxx`, where `xxx` is the password on the Sun servers
`/FULLNAME=xxx`, where `xxx` is the display name of the user
`/EMAILADDRESS=xxx`, where `xxx` is the email address of the user
`/DN=xxx`, where `xxx` is the user DN on the Sun servers
`/NEWPROFILENAME=xxx`, where `xxx` is the name of the created profile
`/SAVEPASSWORD=n`, where `n` = 1 (save) or 0 (don't save)

These switches will be useful if you are converting an Exchange profile:

`/OLDDOMAIN=xxx`, where `xxx` is the Exchange domain
`/OLDUSERNAME=xxx`, where `xxx` is the Exchange user name
`/OLDPASSWORD=xxx`, where `xxx` is the Exchange password

Migration of Important Server Data: More Than Just Messages

Your old server contains valuable information about your users, and an efficient migration will extract and use this information to provision the user accounts on your new Sun Java System server. In addition to your users' old mail messages, your old server contains user calendars, tasks, and personal address books and contacts. The old server also contains user names, primary Internet addresses, Internet aliases, phone numbers, postal addresses, and even descriptive information such as users' departments, titles, and so forth, and also all of your enterprise's public distribution lists.

While a detailed account of server data migration is beyond the scope of this document, you should understand that your old server is a valuable data resource that can be mined to drive user provisioning on the Sun Java System, as well as changes in mail routing. Sun Professional Services can help you to understand and accommodate server data migration in your Deployment Plan, and other third-party companies offer both technology and consulting expertise to facilitate the migration of your server data.

Mail Routing During Transition Phase of Server Migration

Not all of your users will migrate from the old server to the new server at the same time. User accounts on the new server are created and provisioned prior to users' actual migrations. As such, user mailboxes with the same address will reside on both the old and new servers simultaneously during your transition period. Some temporary mail-forwarding rules must therefore be defined to make sure that your users' mail is correctly routed during the transition period.

Even if your organization is implementing new Internet addresses, the old addresses must be maintained on the old server because replies to older messages will be deliverable only if the users' old primary Internet addresses continue to deliver to the correct server. Since all Internet mail for a given domain must go to a single server, specified in an associated MX record, your organization must decide when it will update its MX record to point to the new Sun Java System server.

If the MX record is switched to the Sun Java System server at the beginning of the transition period, you must configure the Sun Java System server so that any mail it cannot deliver to a local mailbox will be sent to the corresponding mailbox on the old server. Moreover, as new users are provisioned on the Sun Java System server, you must define forwarding rules on the new server so that any mail that would normally be delivered to the new mailboxes will instead be forwarded to the corresponding user mailboxes on the old server. As each user migrates to the new server, you must then delete the first forwarding rule on the new server, and define a new rule on the old server to forward all of the user's mail to the corresponding Sun Java System mailbox.

On the other hand, if the MX record will point to the old server until the end of the transition phase, you must configure the old server to send mail it cannot deliver locally to the corresponding user mailboxes on the Sun Java System server. As users migrate to the new server you must then define new rules on the old server to forward mail sent by other users on the old server to the users' new accounts on the Sun Java System server.

Synchronization of Global Address Books During Migration

Larger organizations are likely to require weeks or months to complete a phased migration, and during your transition there will be some users on each of the two systems. Many organizations prefer that all users maintain access to an accurate enterprise directory (white pages, global address book), but accuracy will require regular synchronizations of the two servers' directories as employees are hired, transferred, terminated and so forth. Your Deployment Plan should therefore specify some mechanism for regularly synchronizing the two directories throughout your transition period.

Sun Professional Services can assist in addressing this issue. There are also several products available to perform directory synchronization.

New User IDs and Passwords for Sun Java System Servers

Most network systems are designed to prevent people from discovering user passwords, and this is particularly true of Microsoft Exchange. These security safeguards make it impossible to automatically retain users' existing passwords as they migrate from the old server to the new.

Meanwhile, many organizations prefer to standardize the form of their Internet addresses, or to combine domains during their migration to the Sun Java System. An organization must therefore decide, in advance, how account names and Internet addresses will be derived, and how users' new passwords will be assigned.

The network administrator must also devise a method for communicating these user credentials to both the users and the corporate help desk. One common approach is simply to prepare an e-mail merge, just prior to a group's migration, so that each member of the migrating group receives his or her credentials independently, and just in time for the group's first logins to the new server.

Password-Protected Personal Stores in Outlook

Outlook users can assign passwords to their Personal Folders (.pst) files, but the Sun Java System Connector Setup Wizard needs to open and modify these files in order to convert them for use with the new Connector software and the Sun Java System server. Your end users will therefore have to provide the passwords for any .pst files that they want to convert.

The Setup Wizard will automatically prompt users for the necessary passwords as they are needed, but obviously this will require user involvement that makes a Silent Mode setup impossible. If it is important for you to run the Setup Wizard in Silent Mode, users can be instructed to remove all such passwords during the conversion, or simply let the Wizard run with the passwords in place. If the Setup Wizard runs in Silent Mode and encounters a password-protected file, it will not convert the file, and will report that not all files were converted. Depending on the settings in your administrator's Deployment Configuration tool, the Setup Wizard may also log the event as an error.
