- MySQL Enterprise Monitor did not include a graph to show `max_used_connections` versus `max_connections`.

  This has now been included with the Silver level advisor bundle. (Bug#43583)

- A rule has been added named "Server Restarted" to signal a server restart. This has been added as a Heat Chart advisor to the Silver level advisor bundle. The rule has the following options:

  ```
  Expression: (%Uptime% < THRESHOLD)

  Critical Alert: 600
  Warning Alert: 600
  Info Alert: 600

  Variable: %Uptime%

  Data Item: mysql.status:Uptime

  Instance: local

  Default frequency: 5 minutes
  ```

  (Bug#43243)

- In the Enterprise Dashboard, it was possible to change the last remaining user with a manager role to having an agent role. This led to a problem whereby when attempting to subsequently login to the Dashboard, this caused redirection to the `setup.action` page which presents the Create Administrator facility. However, there was no CONTINUE button on this page, so it was not possible to create the administrative account.

  The Dashboard has now been changed so that the currently logged in user is not able to change their role. (Bug#42436)

- Certain alerts were misleadingly labelled as CRITICAL, and caused people to change settings unnecessarily, thereby adversely affecting their system performace and functionality.

MySQL Enterprise Monitor was changed as follows:

Heat Chart Advisor

- MyISAM Key Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 75 and Info set to 85.
- Query Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 40 and Info set to 50.
- Temporary Tables To Disk Ratio Excessive. Critical threshold removed, others left unchanged.

Memory Usage Advisor

- InnoDB Buffer Cache Has Sub-Optimal Hit Rate. Critical threshold removed, others left unchanged.
- Key Buffer Size May Not Be Optimal For Key Cache. Critical threshold removed, others left unchanged.
- Key Buffer Size May Not Be Optimal For System RAM. Critical threshold removed, others left unchanged.
- Table Cache Not Optimal. Critical threshold removed, Warning set to 60 and Info set to 40.
- Thread Cache Size May Not Be Optimal. Critical threshold removed, Warning set to 75 and Info set to 85.

Performance Advisor

- Binary Log Usage Exceeding Disk Cache Memory Limits. Critical threshold removed, Warning set to 50 and Info set to 70.
- Excessive Disk Temporary Table Usage Detected. Critical threshold removed, others left unchanged.
- InnoDB Buffer Pool Writes May Be Performance Bottleneck. Critical threshold removed, Warning set to 99 and Info set to 99.5.
- InnoDB Log Waits May Be Performance Bottleneck. Critical threshold removed, Warning set to 1 and Info set to 0.5.

(Bug#42089)

- In the Enterprise Dashboard, the **MONITOR** page did not have detailed server meta information. For example, the hostname, datadir, socket and port information were not displayed.

  The interface has now been changed to include the following. Hostname, datadir, socket, and port information has been added to the server meta information on the monitor page. The port and datadir information has been added to the **SETTINGS**, **MANAGE SERVERS** page. Socket and datadir information has been added to the edit server pop-up. (Bug#40787)

- When running multiple instances of the Enterprise Dashboard it could be difficult to determine which instance is currently being logged into.

  This was fixed by adding a name for the server on the login page. The name defaults to the hostname but may be changed in the **SETTINGS** page. (Bug#40642)

- The agent should be able to run as a non-`root` user. However, the startup scripts always started it as `root`.

  The agent chassis now has a new option `--user` to drop privileges after being started as `root`. Note, this does not work when not started as superuser, nor on Windows.

  A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with `root` user privileges. The agent will switch to the user account provided below when started by the `root` user.”

  The dialog also has a text field to enable the entry of the user account.

  A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where xxx is the user account to be used. (Bug#33778)

- The Advisor rule “InnoDB Redo Logs Not Sized Correctly” has been renamed to “InnoDB Transaction Logs Not Sized Correctly”. The rule's Problem Description and Advice text have also been updated accordingly. (Bug#33528)

- You can now configure an individual notification group to be used when sending critical email alerts. You can configure this by selecting the administration checkbox when configuring an individual notification group. For more information, see Section 15.5.5, “Manage Notification Groups”. (Bug#30974)

- The Event Log now tracks both the **CURRENT** and **WORST** states for individual events.
- To enable communication by MySQL Enterprise Service Manager with the MySQL Enterprise website, you can now configure an HTTP Proxy to be used when accessing the Internet. For more information, see Section 15.5.1, “Global Settings”.
- The MySQL Enterprise Dashboard now includes a What's New page that incorporates information automatically from the MySQL Enterprise and MySQL Support websites. For more information, see Section 15.6, “The What's New Page”.

Bugs fixed:

- The installer for MySQL Enterprise Monitor Agent on Linux 64-bit using glibc-2.3 would fail before the installation had completed properly. (Bug#50289)
- The alert for “Connection Usage Excessive” recommended raising `max_connections`. However, if the users raised `max_connections` based only on the advice of the alert, they could potentially exhaust all RAM and SWAP.

  This alert should have made the proviso that `max_connections` be increased only if sufficient free RAM is available to support the additional connections. The alert should also have recommended checking that all connections are correctly closed, and suggest lowering the `wait_timeout` or `interactive_timeout` settings. (Bug#46921)
- The “Slow Query Log Not Enabled” rule was missing a <value> tag in the <thresholdList> block. This caused a stack trace to be generated when the Service Manager started. (Bug#46899)
- Table lock contention rules had inconsistent thresholds.

  The rule `lock_contention_excessive` (part of the Basic subscription) contained the following expression:

  ```
  (%Uptime% > 10800) && (((%Table_locks_waited% /
  (%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
  ```

  This used thresholds of 1/3/5 (for Info/Warning/Critical).

  However, in the rule `table_lock_contention_excessive` (part of the Platinum subscription), the same expression existed but with different thresholds:

  ```
  (%Uptime% > 10800) && (((%Table_locks_waited% /
  (%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
  ```

  In this case the thresholds were 30/60/95. (Bug#46768)
- MySQL Enterprise Monitor 2.1 advisors for Windows suggested using `innodb_flush_method=unbuffered`, which is an undocumented value. Only documented values should have been recommended. (Bug#46709)
- When deleting a server within MySQL Enterprise Dashboard where there was a lot of historical data or a large number of instances being monitored, the deletion process could take some time and affect the loading of all pages within MySQL Enterprise Dashboard The process should no longer affect the performance UI. (Bug#46632)
- The rule names and other content on the **RULES** page could be displayed without the necessary formatting and translation. (Bug#46608)
- You would get a Java `NullPointerException` message if you omitted to select a server before using **ADD SERVER TO GROUP** to add a new server to an existing group. (Bug#46593)
- Initial setup and registration of MySQL Enterprise Monitor could fail on Mac OS X when communicating with the MySQL Enterprise website. (Bug#46571)
- The MySQL Enterprise Service Manager would send one email from each agent when agents were no longer able to write information to the repository. You now get one email containing a list of the affected agents. (Bug#46460)
- The error message shown in the orange dialog when a Rule could not be scheduled showed the Rule's resource key instead of its name. For example:

```
U0146 Unable to schedule rule "binary_logging_is_limited.name" due to
"mysql.MasterStatus.Binlog_Ignore_DB" data not being collected from server
"net-dev2:13306". It may be an unsupported collection for that server.
```

(Bug#46442)

- The length of the MySQL Enterprise Monitor related cookie information caused the web browser to fail with errors such as the following (from Safari 4):

```
Bad Request

Your browser sent a request that this server could not understand.
Size of a request header field exceeds server limit.

Cookie: __utma=183337658.3685800196369993700.1241092024.1248080652.1248188601.199;
__utmc=183337658; __utmz=183337658.1247859315.194.26.ut......
```

(Bug#46348)

- The values reported for the `os.mem.swap_page_out` and `os.mem.swap_page_in` could be identified incorrectly as delta, instead of absolute, values. (Bug#46326)

- When upgrading an agent that uses SSL to connect to MySQL Enterprise Service Manager using a non-standard SSL port (i.e. not 18443), the upgrade would change the SSL port back to the default value. (Bug#46253)

- When upgrading MySQL Enterprise Service Manager any custom properties set within `config.properties` would be lost. Changes are now retained during an upgrade. (Bug#46252)

- When installing MySQL Enterprise Service Manager the disk space requirements could be calcualted incorrectly, which would cause the remainder of the installation to fail. (Bug#46251)

- Installation of MySQL Enterprise Monitor Agent on Solaris 8 or Solaris 9 using the SPARC platform could fail if the latest patches of the SUNW UTF-8 and iconv libraries were not available. This prevented the installer from operating correctly, although the agent would work correctly. The installer for the agent has now been updated to avoid this issue. (Bug#46235)

- In the Enterprise Dashboard, the query summary information pop-up on the BrowseQueries page forced a page reload after any hide. This affected both the user pressing the hide button, as well as the links on the **EXAMPLE** and **EXPLAIN** tabs that caused the query summary information pop-up to be hidden, and the Query Analyzer config pop-up to be shown instead. (Bug#46230)

- The Agent had a memory leak. The memory consumption increased by 35MB every five minutes. (Bug#46222)

- The MySQL server embedded with MySQL Enterprise Service Manager has been updated to MySQL 5.1.37. (Bug#46214)

- After a Service Manager upgrade, if there were migration errors, the message “Upgrade Status: there were errors in migration (details)” was displayed on the **SETTINGS**, **MANAGE SERVERS** page. When the details link was clicked the yellow “An Error Occurred” pop-up was briefly displayed before disappearing, making it impossible to determine the details of the error. (Bug#46181)

- When installing a new Advisor JAR, the contents could overwrite localizations in your current installation. (Bug#46169)

- The threshold information in email alerts listed the thresholds in a seemingly random order, for example:

```
Thresholds
Warning : 1024
Info : 512
Critical : 10240

Thresholds
Info : 70
Critical : 5
Warning : 40

Thresholds
Critical : 75
Warning : 85
Info : 95
```

(Bug#46143)

- In the Enterprise Dashboard, the check boxes within the **CONFIGURE WHAT'S NEW** panel did not function correctly. When deselect-

ing a check box the accompanying text did not become de-emphasized (“grayed out”) as expected, but only changed when another check box was selected. Further, when the checkbox was subsequently selected, the text did not become emphasized until another check box was selected or deselected. This problem was limited to Internet Explorer 8. (Bug#46104)

- In the Enterprise Dashboard, selecting all three checkboxes in the **CONFIGURE QUERY ANALYZER** panel generated an error:

```
The interval “00:00:00,500” could not be parsed. Intervals must be in hh:mm:ss.msec
format.
```

  The error was due to the default value of **AUTO-EXPLAIN THRESHOLD** containing a “,” rather than a “.” character. (Bug#46102)

- The MySQL Enterprise Monitor Agent could return a null value for a valid result set, resulting in incorrect results when using Query Analyzer. (Bug#46095)

- The Rule “Non-Authorized User Has Server Admin Privileges” in the “Security” Advisor checked for the following:

```
Create_user_priv = 'Y'
File_priv = 'Y'
Lock_tables_priv = 'Y'
Reload_priv = 'Y'
Shutdown_priv = 'Y'
Super_priv = 'Y
```

  However, it did not include a check for the condition:

```
Process_priv = 'Y'
```

  (Bug#46071)

- The Query Analyzer Statement Pop-up history graphs were inconsistent with the other graphs. In particular:

  - The series colors were not consistent with other graphs.
  - The graph image was right aligned, but the title was left aligned. When the pop-up was expanded, unnecessary space was located on the left.
  - The Y axis did not have a Range Label.

  (Bug#46066)

- In the Enterprise Dashboard, if a Notification Group was created, and also set to be the “MEM Admin” for cry for help emails, the MEM Admin column showed as "false" in the table overview when the group was saved. However, if the group was then edited and the flag added again, the MEM Admin status was saved. (Bug#46038)

- Links in emails generated from the Query Analyzer were not linking to the Query Analyzer tab correctly. (Bug#46036)

- When a query was clicked on the Query Analyzer page, the Explain Query tab displayed a potentially incorrect value for the Auto-Explain Threshold. The Threshold can actually be set to a user configurable value in Configure Query Analyzer, but the pop-up text did not reflect the currently set value, instead displaying a hard-coded default value. (Bug#46035)

- The Rule “Server Includes A Root User Account” in the “Security” Advisor had a Recommended Action:

```
UPDATE user SET user = 'new_name' WHERE user = 'root'; FLUSH PRIVILEGES;
```

  However, three other rules triggered in the case where “user” was not “root” but had administrative grants. This caused the following alerts to be generated:

  - Non-Authorized User Has DB, Table, Or Index Privileges On All Databases
  - Non-Authorized User Has GRANT Privileges On All Databases
  - Non-Authorized User Has Server Admin Privileges

  (Bug#46023)

- In the Enterprise Dashboard, on the **SETTINGS**, **MANAGE SERVERS** page, the menu item **CONFIGURE QUERY ANALYZER** generated

an unhandled error message if clicked when using the Silver level subscription. Query Analyzer is not available at this subscription level, and the menu option to configure the analyzer should not be shown on this page. (Bug#46016)

- If the Agent and monitored server had time settings that were out of sync the Enterprise Dashboard reported the server as “down”. (Bug#45937)

- On the **WHAT'S NEW?** page of the Enterprise Dashboard, multiple messages were generated for the same error. This cluttered the user interface. (Bug#45927)

- In the Enterprise Dashboard, when using the Safari web browser, the graph selection displayed on the **QUERY ANALYZER** tab was sometimes drawn outside the plot area. (Bug#45926)

- The Enterprise Monitor log was flooded with ERROR/WARN messages when the Service Manager was retrying for a `mysqld` connection:

```
2009-07-02 16:52:23,440  WARN [http-18080-4:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying  30 times or 46 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:24,455  WARN [Purger:com.mysql.sql] java.lang.Exception: MySQL server not
running or accepting connections, retrying  46 times or 151 seconds, whichever expires
first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:25,471  WARN [http-18080-5:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying  28 times or 34 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:26,377  WARN [http-18080-9:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying  33 times or 64 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
```

(Bug#45924)

- In the Enterprise Dashboard the icon file for `event.status.closed` was missing. The problem manifested differently in different browsers. In Internet Explorer 8 the UI cell was empty and no text was displayed. In Firefox 3 the text “event.status.closed” was displayed in the cell. (Bug#45872)

- If the system time zone was different from that set in the Enterprise Dashboard, then there was inconsistency in the way times were displayed on the Query Analyzer page. Some times were displayed in the time zone of the system and some were displayed using the Dashboard time zone setting. (Bug#45858)

- In Enterprise Dashboard, when a range on the graph in the **GRAPHS** tab was selected, the following error message was displayed:

```
Error Message

(Bug#45836)

- If both the **VIEW README** and **LAUNCH MONITOR IN BROWSER** check boxes were selected on the last screen of the Monitor installer, the Dashboard was not brought up in a browser until after the window displaying the "readme" information was closed. (Bug#45795)

- The Agent did not report all the rows from an explain plan where the plan had more than one row. The Dashboard would display information for the first row, but subsequent rows would display NULL. (Bug#45791)

- Custom collections did not override standard collections.

  If a custom collection file was defined, and collections specified which were the same as the defaults but with some extensions, the custom collection did not appear to be processed and so did not override the default collection. (Bug#45755)

- When the Service Manager was restarted, or if the Service Manager was turned off for a brief period, and then turned back on, some graphs, such as Database Activity, showed an erroneous spike in traffic. (Bug#45688)

- Cry for help emails were not sent for events such as the monitored server running out of connections or disk space. In the past these had been sent for any error code < 1026. (Bug#45667)

- If custom collection files were created for the Agent, and references added to the `agent-item-files` variable within the `mysql-monitor-agent.ini` file, on upgrade the following problems occurred:

  1. The `agent-item-files` variable was overwritten, thereby removing the custom entry.

  2. The custom files were deleted, if they were contained in the `share/` directory.

  (Bug#45655)

- In the Enterprise Dashboard, when closing single or multiple Events the following exception was generated:

```
Could not execute JDBC batch update
org.hibernate.exception.SQLStateConverter.convert(SQLStateConverter.java:71)
```

(Bug#45627)

- In the Enterprise Dashboard, the icon displayed for each server on the SETTINGS, MANAGE SERVERS page was incorrectly located. This resulted in fewer servers being displayed per page. (Bug#45564)

- In Enterprise Dashboard, when clicking **CONFIGURE WHAT'S NEW** in the **WHAT'S NEW?** tab, an error occurred. This only happened when using Internet Explorer 8. (Bug#45478)

- After the initial server installation a user may select OpenSSL native integration with Tomcat. This will modify the `apache-tomcat/lib` directory. However, subsequently running an upgrade installer overwrote the `apache-tomcat/lib` directory which had been modified during the OpenSSL native integration. (Bug#45432)

- The query `SELECT * FROM 23lk4kj234;` was reported incorrectly in the Query Analyzer. (Bug#45431)

- When an event was closed a "SUCCESS" SNMP trap was sent, rather than a "CLOSED" SNMP trap. (Bug#45376)

- When MySQL Enterprise Monitor 1.3 was upgraded directly to 2.1, and having requested SSL in the upgrade dialog, SSL did not work in the upgraded Monitor. (Bug#45339)

- When an event was closed, the row in the event table where the event entry was located had its checkbox disabled, even though the event now in that row was open. This happened regardless of whether the CLOSE button, or the **CLOSE** link were used to close the event. (Bug#45250)

- The Notifications list in the Schedules or Edit Schedules pop-ups listed the Notification Groups targets in the order in which they

were created, not alphabetic order. (Bug#45169)

- A small memory leak occurred in the agent when a connection attempt to the dashboard failed. This represented a problem if the agent was unable to connect to the dashboard for a long period of time, as each failure to connect would leak some more memory. (Bug#45164)

- When disabling Query Analyzer while the two sub-options remain enabled for an individual agent, the analyzer, explain and other options would be logged by the agent as critical errors. Now, only the disabling of Query Analyzer is logged as a critical error. The Example Query and Example Explain options are reported as info errors. (Bug#45041)

- The Agent attempted to obtain the Query Analyzer configuration before the Monitor server has created it. This resulted in the Agent generating the following critical error in the log:

```
2009-05-21 15:59:42: (critical) network-io.c:255: successfully reconnected to dashboard at
http://agent:merlin@127.0.0.1:18080/heartbeat
2009-05-21 15:59:47: (critical) agent_mysqld.c:641: successfully connected to database at
127.0.0.1:13306 as user marcos (with password: YES)
2009-05-21 15:59:52: (critical) network-io.c:807: starting task 2 for

(Bug#45016)

- If a migration from 1.3 to 2.0 was initiated and a new server created during the migration, but then deleted before migration was finished, the new server delete operation failed with an Null Pointer Exception (NPE). (Bug#44991)

- If you have the environment variable `http_proxy` set within your environment, when connections from MySQL Enterprise Monitor Agent could be redirected to an external site, instead of sending them to the configured MySQL Enterprise Service Manager. You can disable this behavior by adding the contents of the `agent-mgmt-hostname` configuration option for MySQL Enterprise Monitor Agent to the `no_proxy` variable. (Bug#44893)

- The regular expression used to parse the adaptive hash index section of `SHOW INNODB STATUS` for the cell size/used and node size did not function correctly for versions of monitored server greater than 5.1.28. This was because the section of the expression dealing with “cells used” was removed as part of Bug#36941. (Bug#44853)

- The Rule “InnoDB Buffer Cache Hit Rate Not Optimal” in the “Memory Usage” Advisor did not contain an uptime check. This resulted in premature firing of an info event. (Bug#44770)

- Any `JAVA_OPTS` configuration changes made in the `catalina.sh` file, such as `-Xmx`, `-Xms`, were overwritten when the upgrade installer was run. These values were used for customizing larger installations. (Bug#44740)

- In the Advisor “Administration” the Rule “InnoDB Redo Logs Not Sized Correctly” did not fire correctly. The rule contained the expression:

```
(%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <
LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
```

This was incorrect and needed to be changed to:

```
(%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <=
LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
```

(Bug#44734)

- If the Service Manager was set up to use an HTTP proxy, all traffic attempted to go through the proxy, including the connection to the `mysqld` server running the repository. (Bug#44729)

- The recommendation for the rule `Table Cache Not Optimal` says:

  ```
  Recommended Action
  SET GLOBAL table_cache = (64 + 16);
  ```

  But an error was generated on executing that query:

  ```
  mysql> SET GLOBAL table_cache = (64 + 16);
  ERROR 1193 (HY000): Unknown system variable 'table_cache'

  mysql> select version();
  +------------+
  | version()  |
  +------------+

  ```

  (Bug#44602)

- In Enterprise Dashboard, clicking a query listed on the Query Analyzer page resulted in a delay of around 28 seconds before the pop-up was displayed. (Bug#44601)

- The frequency shown on the **ADVANCED** tab of an **EVENT** pop-up was the default frequency for a rule and not the frequency actually scheduled. (Bug#44591)

- Any changes made to the `config.properties` file, were overwritten by the upgrade installer. (Bug#44526)

- If a customer was using their own SSL certificate, they entered that information in the `server.xml` file. However, running the upgrade installer caused `server.xml`, and any custom certificates, to be replaced. (Bug#44525)

- If you edited the `server.xml` file inside the `tomcat/conf/` folder, and changed the Tomcat port, running the upgrade installer did not show you the new port number, but the one you used at the installation time.

  It also did not remember that you had enabled SSL. (Bug#44444)

- Editing an Advisor and selecting the **USE SNMP TRAPS** checkbox led to confusing behavior. Advisors appeared to be incorrectly enabled or disabled. (Bug#44387)

- The Agent failed to correctly determine the state of the monitored server if the `thread-id`, extracted from the client-server protocol, is greater than 2^32. In the case with a `thread-id` greater than 2^32, the agent incorrectly determined that it was monitoring a remote server. High values of `thread-id` occur when the monitored server has many connections, or if it has been running for an extended period of time. (Bug#44168)

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in `/Library/Java/Extensions`. As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

  This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. (Bug#44157)

- The **WHAT'S NEW** tab can no longer be hidden, as it now provides important information and updates about MySQL and MySQL Enterprise Monitor. (Bug#44107)

- In the Enterprise Dashboard, when the frequency for a rule was changed in ADVISORS, MANAGE RULES, EDIT, incorrect thresholds were saved, leading to erroneous alerts. (Bug#44102)

- MySQL Enterprise Monitor installation sometimes failed, generating the following error:

  ```
  Installing

  Innitializing User accounts. (4/6)

  Error running /opt/mysql/enterprise/monitor/mysql/bin/mysql
  --defaults-file=/opt/mysql/enterprise/monitor/mysql/my.cnf -S
  /opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock -u root -D mysql -e "update user set
  Password = PASSWORD('service_manager') where User = 'root'; update user set User =
  'service_manager' where User = 'root';delete from user where User = '';flush privileges;"
  : ERROR 2002 (HY000): Can't connect to local MySQL server through socket
  '/opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock' (2)
  ```

After displaying this error, the MySQL Enterprise Monitor installer reported that it had “completed”, but the message displayed contained an error message string:

```
Report2.SetInstallerVariable.errorsOnSQLStatementsText
```

(Bug#44038)

- In the Enterprise Dashboard, in the **QUERY ANALYZER** tab, the monitored parameter was not handled correctly during collapse and expansion of the graph. For example, if the graph was monitoring CPU Utilization, and then collapsed and the parameter changed to Database Activity, the monitored parameter reverted to CPU Utilization when the graph was expanded again. (Bug#44029)

- The upgrade installer overwrote any custom settings stored in `WEB-INF/config.properties`. For example it set the database host back to `localhost`. (Bug#44003)

- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. (Bug#43989)

- Some SNMP managers could not detect “Application Error” SNMP notifications.

  This happened because some SNMP managers do not follow the protocol correctly. Some use the `DisplayString` length of 255 as the maximum `OctetString`, but this is in fact unlimited in SMIv1 and 64k in SMIv2.

  To work around this issue it is possible to override the correct behavior to enable non-comformant SNMP Managers to detect all messages. This is achieved by overriding the `OctetString` maximum size by setting a MySQL Enterprise Monitor server property. This is done by entering SQL such as the following:

  ```
  INSERT INTO map_entries VALUES (1,'2048','snmp.octetstring');
  ```

  In this example the value 2048 will be the maximum SNMP `OctetString` size that would sent in any SNMP traps. After setting this property the server will need to be restarted. Note that the value used may need adjusting depending on the behavior of the SNMP manager. (Bug#43970)

- When updating an Agent from 2.0 to 2.1 the `mysql-monitor-agent.ini` was incorrectly updated.

  This happened if the Agent was configured to use SSL to connect to the Enterprise Dashboard, on a port other than 18443. The update installer caused any value specified for the port to be changed to 18443. This did not happen if the Agent was not using SSL. (Bug#43900)

- The Enterprise Dashboard was running abnormally slowly. Clicking on a tab in the Dashboard, or selecting a server from the server tree resulted in a delay of approximately one minute before the results were displayed. (Bug#43866)

- The Agent failed on Linux 32-bit systems with the following error:

  ```
  2009-03-24 16:01:09: (debug) chassis.c:1091: current RLIMIT_NOFILE = 4398046512128 (hard:
  577792033385921489)
  2009-03-24 16:01:09: (debug) chassis.c:1095: trying to set new RLIMIT_NOFILE =
  4398046519296 (hard: 577792033385921489)
  2009-03-24 16:01:09: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192,
  Invalid argument (22). Current limit still 13811918798715880448.
  2009-03-24 16:01:09: (message) MySQL Monitor Agent 2.0.5.7153 started.
  ```

  This happened with the following environment:

  ```
  $ ./mysql-monitor-agent -V
   mysql-proxy 0.7.0
   glib2: 2.16.3
   libevent: 1.4.6-stable
   proxy: 0.7.0
   monitor: 0.7.0
   MySQL Monitor Agent(agent): 2.0.5.7153
   admin: 0.7.0

  $ cat /etc/redhat-release
   Red Hat Enterprise Linux ES release 3 (Taroon Update 5)

  $ uname -a
   Linux xxxx 2.4.21-32.0.1.ELsmp #1 SMP Tue May 17 17:52:23 EDT 2005 i686 i686 i386
  GNU/Linux
  ```

The same error also occurred on CentOS 5.2 32-bit systems. (Bug#43821)

- The Replication Group was renamed back to its default name after a new topology was discovered. (Bug#43816)
- A new topology was not discovered after the previous replication group was renamed. (Bug#43815)
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:       /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

(Bug#43803)

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. (Bug#43773)
- The SNMP trap source IP was always set to 127.0.0.1. (Bug#43738)
- The advisor “Replication - Slave Has Login Accounts With Inappropriate Privileges” contained inappropriate advice information.

The advice message generated was:

```
Server: slave-01
Time: 2009-03-17 12:00:04 GMT
Advisor: Replication - Slave Has Login Accounts With Inappropriate Privileges

Problem Description
Altering and dropping tables on a slave can break replication. Unless the slave also hosts
non-replicated tables, there is no need for accounts with these privileges.

Advice
Revoke the global ALTER and DROP privileges from the following accounts on server slave-01
unless they are absolutely necessary:

user_1@localhost,
user_2@localhost

Recommended Action
REVOKE ALTER, DROP ON *.* FROM user_name@host_name;
FLUSH PRIVILEGES;
```

However, the problems with this advice were:

1. The server was configured `read_only` so it would not be possible to `DROP` or `ALTER` tables unless the user had `SUPER` privilege.
2. MySQL grants were replicated from the master and therefore appeared on the slave. Also, `read_only` ensured the slave could not be changed.

(Bug#43701)

- In Enterprise Dashboard, if on the **MONITOR** page the **CONFIGURE GRAPHS** link was clicked, no changes made, and then the SAVE button clicked, then the following error was generated:

```
U0023 You must provide a non-zero interval
```

(Bug#43682)

- The installer exited with a return code `0`, even if an error was detected and reported to the user during the installation.

```
.../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
/data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport

```

(Bug#43676)

- The Connections graph did not include information from the Thread Cache graph. Connections and Thread Cache were available as separate graphs but it was difficult to compare them. (Bug#43584)

- If it was desired to look at MySQL Enterprise Monitor graphs for time spans of over 24 hours, you had to change from Interval to From/To mode, and specify a fixed From and To period. This was inconvenient compared to simply specifying a greater interval. (Bug#43564)

- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)

- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```
ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...
```

  Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. (Bug#43540)

- The MySQL Enterprise Monitor installer failed to install correctly due to insufficient disk space, even though the installer calculated there was suffcient disk space for the installation. This was due to the installer having out of date information regarding disk space requirements. (Bug#43538)

- After removing enough servers to bring the host count back down to the number covered in the subscription, the Subscription Warnings reflected the new number. However, the warning message displayed:

```
You are currently monitoring 1 host, however your subscription covers only 1. Your
subscription needs to be updated to cover at least 0 additional hosts.
```

  Instead of displaying:

```
Your subscription is up-to-date
You have no warnings at this time.
```

  The former message resulted in confusion. (Bug#43163)

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

  This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

- In the Enterprise Dashboard it is only possible to delete monitored servers if they are stopped. Monitored servers can be deleted in

ETTINGS, MANAGE SERVERS. However, if after stopping the Agent, the Dashboard was not refreshed and the agent was started again, an error was generated saying that the agent was running and could therefore not be deleted. Although correct, this was confusing as the Dashboard showed the Agent as stopped but the delete operation error message showed the Agent as running. (Bug#42983)

- Heat Chart rules could not be disabled or unscheduled. (Bug#42932)
- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

  However, these were not displayed within the Replication tab. (Bug#42811)
- Agent IP address was not included in SNMP traps. It was also not possible to set these Agent IP addresses through a configuration, which would have been useful for situations where the Agent could not determine the monitored server IP address, such as when virtual IP addresses were used. (Bug#42703)
- The Agent would not reconnect to a monitored database if it was started when the monitored server was down. The agent log contained the following error:

  ```
  Can't connect to MySQL server on '127.0.0.1' (0) (mysql-errno = 2003)
  ```

  The agent only sent OS data to the Dashboard. Further, when the monitored server was later started, no attempts to reconnect were logged.

  The problem could be worked around by restarting the agent when the monitored server was running again. (Bug#42581)
- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. (Bug#42452)
- Sun multi-core processors caused all cores to be reported on the meta information page.

  The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)
- The username field for new users was populated by the last username used.

  When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. (Bug#42314)
- The Agent shut down if the wrong username/password was given in the Service Manager. This happened on a fresh installation, when running the Service Manager through the Proxy. When COMPLETE was clicked to finish the installation the error “Cannot open conection” was displayed. The Agent log also contained the following errors:

  ```
  2009-01-20 15:54:16: (critical) <-- received HTTP-status: 401 (failed) for
  'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
  2009-01-20 15:54:16: (critical) shutting down normally

  2009-01-20 15:54:19: (critical) <-- received HTTP-status: 401 (failed) for
  'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
  2009-01-20 15:54:19: (critical) shutting down normally
  ```

  (Bug#42228)
- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

  ```
  innodb_autoextend_increment = 50M
  ```

  This generated the error:

  ```
  16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
  adjusted to 1000
  ```

  This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

  The value in the configuration file should be:

  ```
  innodb_autoextend_increment = 50
  ```

(Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)

- Using a long interval for the long data collection purging (such as 6 weeks), and a short interval for the query analysis purging (such as 1 week) caused the Query Analyzer purge `EXPLAIN` for the `INSERT` ... `SELECT` into the `temp_dc_ng_*_now` table to perform a full scan on the `dc_ng_*_now.end_time` index. For example:

```
explain SELECT instance_attribute_id, end_time, end_time  FROM dc_ng_long_now JOIN
inventory_instance_attributes USING  (instance_attribute_id) JOIN inventory_instances
USING (instance_id) WHERE  dc_ng_long_now.end_time <= 1230814870074 AND
dc_ng_long_now.instance_attribute_id AND type_id in (8, 9, 7, 6) ORDER BY
dc_ng_long_now.end_time ASC LIMIT 10000\G
*************************** 1. row ***************************
           id: 1
  select_type: SIMPLE
        table: dc_ng_long_now
         type: range
possible_keys: PRIMARY,end_time
          key: end_time
      key_len: 8
          ref: NULL
         rows: 8205369
        Extra: Using where; Using index
*************************** 2. row ***************************
           id: 1
  select_type: SIMPLE
        table: inventory_instance_attributes
         type: eq_ref
possible_keys: PRIMARY,instance_id
          key: PRIMARY
      key_len: 4
          ref: mem.dc_ng_long_now.instance_attribute_id
         rows: 1
        Extra:

(Bug#41991)

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `innodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. (Bug#41967)

- It was not possible to change any settings related to Query Analyzer unless at least one MySQL server was already being monitored. (Bug#41875)

- The advisor “User Has Rights To Database That Does Not Exist” generated erroneous alerts.

  If a database was created with an “_” character in the name, and then user privileges granted to this database using the escaped character sequence “_” to prevent wildcards, then the advisor generates an error stating there is no database for the privilege.

  For example, if the following is carried out on the monitored server:

  ```
  CREATE DATABASE test_foo;
  GRANT SELECT ON `test\_foo`.* to testuser@'localhost' identified by 'test';
  ```

  then the advisor warns that these users have rights to a database that does not exist:

  ```
  ''@'%' on DB test_%,
  'test'@'localhost' on DB test_foo,
  'testuser'@'localhost' on DB test_foo
  ```

  (Bug#41717)

- In the Enterprise Dashboard, when a new server group was clicked in the main tab an error message was generated. On checking the Monitor log there were many error messages related to lock timeouts and having to retry transactions. This problem occurred after enabling purging of the Repository. (Bug#41461)

- Running the Service Manager on Mac OS X and monitoring two servers with two agents for at least 16 hours caused the Java process to use 2.08 GB of memory. (Bug#41438)

- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

  ```
  U0002 You must log in to access the requested resource
  ```

  (Bug#41384)

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to enable the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. (Bug#41361)

- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. (Bug#41312)

- Data in the agent resource usage graphs (CPU, RAM) stopped after a full install of a new agent monitoring the same database was carried out. Usage history was available across agent versions for all graphs except the agent resource usage graphs. (Bug#41249)

- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

  The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. (Bug#41232)

- The generic Linux IA64 glibc2.3 Agent installer was missing from the build. (Bug#41224)

- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

  ```
  U0002 You must log in to access the requested resource.
  ```

  This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. (Bug#41032)

- The Enterprise Dashboard displayed a blank entry for **DISK SPACE** in the Meta Info area. This happened on Open Solaris 2008.05. This problem only occurred when using the ZFS file system. (Bug#40907)

- The configuration for Query Analyzer that sets the default for all servers (using the **MAKE THIS THE DEFAULT FOR ALL NEW SERVERS** checkbox) could still applied even when the dialog box was canceled. (Bug#40828)

- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. (Bug#40792)

- The agent installer for HP-UX 11.11 would fail to execute correctly. (Bug#40568, Bug#40566, Bug#37508)
- The graphs for Thread Cache, Connections and Temporary Tables contained incorrect Japanese translations on their Y axis. The Japanese displayed “total connection time (min)” when it should have displayed something else. For example, the Thread Cache graph should have displayed “total/min”. (Bug#40413)
- If the MySQL Enterprise Monitor Agent was unable to execute an `EXPLAIN` on a query, it would report an empty SQL query. The agent will now report the query hash value, which can be used to identify the original query by examining the repository. (Bug#40353)
- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)
- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

  When Query Analysis was turned back on in the user interface, those queries were then displayed. (Bug#40032)
- The Enterprise Dashboard did not display OS data if the Agent was changed from remote to local monitoring. (Bug#39954)
- The agent crashed if `ssh-keygen` was not present and if a wireless card was being used instead of an Ethernet card.

  This only affected Unix based systems, it did not affect Microsoft Windows. (Bug#39938)
- On Mac OS X when a server had more than 4GB RAM available the memory advisor was still triggered. This appeared to be due to an overflowing value. (Bug#39757)
- The Agent received a critical error but did not terminate as expected. The critical error generated was:

  ```
  2008-09-23 09:35:02: (critical) agent_mysqld.c:139: mysql_real_query() failed: Can't find
  file: './mysql/inventory.frm' (errno: 13) (errno=1017)
  ```

  (Bug#39603)
- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

  ```
  Time: 2008-09-17 19:41:08 GMT
  ```

  That was not convenient for users, as their timezones may not have been GMT. (Bug#39504)
- The Agent running on AIX 5.3 did not report CPU data or RAM size, causing the Enterprise Dashboard to crash with a Null Pointer Exception. (Bug#38001)
- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. (Bug#36528)
- In the Enterprise Dashboard, on the **GRAPHS** page, the interface for selecting time intervals was not convenient, and it required multiple clicks to select the desired interval.

  This was fixed by adding a selection of pre-determined time intervals. (Bug#34556)
- Auto-generated replication group names were not translated into Japanese. (Bug#32155)
- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. (Bug#32069)
- The Enterprise Dashboard could communicate with https://enterprise.mysql.com using the customer username and password to download the license key and advisor bundle. However, it could not make use of a proxy to do so. This was a problem as many corporate firewalls required the use of a proxy for all HTTP and HTTPS traffic.

  The work around of having to manually download license keys and advisor bundles by hand was inconvenient. (Bug#31507)
- The agent log does not include a specific note of when the monitoring by the agent was started. An entry `AgentMonitoringService started` is now added to the log. (Bug#30609)
- When the Agent was started as a service on Windows for the first time, the name in the Task Manager window was `MYSQL~1.EXE`. This occurred whether the Agent was started from within the installer or from the Start Menu.

If the service was restarted, the Agent's name changed to the correct value, `mysql-service-agent.exe`. (Bug#30166)

- When configuring a graph, setting a to date to a value prior to the from date, or the from date to a value after the to date will not automatically switch the dates when UPDATE is pressed. (Bug#28473)
- In the Enterprise Dashboard, the user interface permitted you to close an already closed event. This happened if multiple instances of the **EVENTS** tab were created. It was possible to close an event with resolution notes in one instance, and then close the same event again with a different set of resolution notes in the other instance. However, on review, the resolution notes and event closure time stamp recorded, were those of the first closure. (Bug#24107)
- When upgrading a monitored server, the information and configuration of the server would not be updated, leading to rules not being executed or applied correctly. Server's are now re-inventoried according to the specified schedule. For more information, see Remote Server Inventory Schedule. (Bug#24068)
- The Dynamic Link Library (DLL) `libxml2.dll` did not contain version resources. This meant version information was not available to be displayed when the file was examined in Windows Explorer. (Bug#23948)
- It was not possible to rename a notification group. (Bug#22962)
- Failures by MySQL Enterprise Service Manager to send warning emails are now reported both in the logs and in the MySQL Enterprise Dashboard within the **PRODUCT INFO** section of the **SETTINGS** page. For more information, see Section 15.5.7, "The Product Information Screen". (Bug#20478)

D.3. MySQL Connector/ODBC (MyODBC) Change History

D.3.1. Changes in MySQL Connector/ODBC 5.1.8 (Not yet released)

Functionality added or changed:

- Documentation in `.CHM` and `.HLP` format has been removed from the distribution. (Bug#56232)

Bugs fixed:

- For some procedure and parameter combinations `SQLProcedureColumns()` did not work correctly. For example, it could not return records for an existing procedure with correct parameters supplied.

  Further, it returned incorrect data for column 7, `TYPE_NAME`. For example, it returned `VARCHAR(20)` instead of `VARCHAR`. (Bug#57182)
- The MySQL Connector/ODBC MSI installer did not set the `InstallLocation` value in the Microsoft Windows registry. (Bug#56978)
- In bulk upload mode, `SQLExecute` would return `SQL_SUCCESS`, even when the uploaded data contained errors, such as primary key duplication, and foreign key violation. (Bug#56804)
- `SQLDescribeCol` and `SQLColAttribute` could not be called before `SQLExecute`, if the query was parameterized and not all parameters were bound.

  Note, MSDN states that "For performance reasons, an application should not call `SQLColAttribute/SQLDescribeCol` before executing a statement." However, it should still be possible to do so if performance reasons are not paramount. (Bug#56717)
- When `SQLNumResultCols()` was called between `SQLPrepare()` and `SQLExecute()` the driver ran `SET @@sql_select_limit=1`, which limited the resultset to just one row. (Bug#56677)
- After installing MySQL Connector/ODBC, the system DSN created could not be configured or deleted. An error dialog was displayed, showing the error message "Invalid attribute string".

  In this case the problem was due to the fact that the driver could not parse the NULL-separated connection string. (Bug#56233)
- When attempting to install the latest Connector/ODBC 5.1.6 on Windows using the MSI, with an existing 5.1.x version already in-

stalled, the following error was generated:

```
Another version of this product is already installed.  Installation of this version
cannot continue.  To configure or remove the existing version of this product, use
Add/Remove Programs on the Control Panel.
```

Also, the version number displayed in the ODBC Data Source Administrator/Drivers tab did not get updated when removing or installing a new version of 5.1.x. (Bug#54314)

D.3.2. Changes in MySQL Connector/ODBC 5.1.7 (24 August 2010)

Functionality added or changed:

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. (Bug#48603)

Bugs fixed:

- `SQLColAttribute(SQL_DESC_PRECISION...)` function returned incorrect results for type identifiers that have a negative value:

  ```
  #define SQL_LONGVARCHAR       (-1) returned 4294967295
  #define SQL_BINARY            (-2) returned 4294967294
  #define SQL_VARBINARY         (-3) returned 4294967293
  #define SQL_LONGVARBINARY     (-4) returned 4294967292
  #define SQL_BIGINT            (-5) returned 4294967291
  #define SQL_TINYINT           (-6) returned 4294967290
  #define SQL_BIT               (-7) returned 4294967289
  ```

  They were returned as 32-bit unsigned integer values. This only happened on 64-bit Linux. (Bug#55024)

- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug#54206)

- The `SQLColumns` function returned the incorrect transfer octet length into the column `BUFFER_LENGTH` for `DECIMAL` type. (Bug#53235)

- `SQLForeignKeys()` did not return the correct information. The list of foreign keys in other tables should not have included foreign keys that point to unique constraints in the specified table. (Bug#51422)

- In contrast to all other ODBC catalog functions `SQLTablePrivileges` required the user to have `SELECT` privilege on MySQL schemata, otherwise the function returned with an error:

  ```
  SQL Error. Native Code: 1142, SQLState: HY000, Return Code: -1
  [MySQL][ODBC 5.1 Driver][mysqld-5.0.67-community-nt]SELECT command denied to user
  'repadmin'@'localhost' for table 'tables_priv'
  [Error][SQL Error]Error executing SQLTablePrivileges for object cat: myrep, object Name:
  xxxxxxxxxx
  ```

  (Bug#50195)

- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. (Bug#49726)

- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug#49029)

- Bulk upload operations did not work for queries that used parameters. (Bug#48310)

- Retrieval of the current catalog at the moment when a connection was not ready, such as when the connection had been broken or when not all pending results had been processed, resulted in the application crashing. (Bug#46910)

- Describing a view or table caused SQLPrepare to prefetch table data. For large tables this created an intolerable performance hit. (Bug#46411)

- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the

connection string to connect to the database. (Bug#45378)

- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. (Bug#44576)
- Conversions for many types were missing from the file `driver/info.c`. (Bug#43855)
- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. (Bug#43664)
- Executing `SQLForeignKeys` to get imported foreign keys for tables took an excessively long time. For example, getting imported foreign keys for 252 tables to determine parent/child dependencies took about 3 minutes and 14 seconds for the 5.1.5 driver, where-as it took 3 seconds for the 3.5x.x driver. (Bug#39562)
- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. (Bug#37621)
- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

  ```
  ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
  ```

  (Bug#36996)
- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. (Bug#36441)
- On Windows, the SOCKET parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. (Bug#34477)
- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a data type of `BIT`, and any numeric type was used in `SQLBindCol`. (Bug#32821)
- Option for handling bad dates was not available in the GUI. (Bug#30539)

D.3.3. Changes in MySQL Connector/ODBC 5.1.6 (09 November 2009)

Functionality added or changed:

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby enabling faster configuration of a Data Source. (Bug#42905)

Bugs fixed:

- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

  The script error occurred sporadically on the following line of code:

  ```
  SET my_conn = Server.CreateObject("ADODB.Connection")
  my_conn.Open ConnString  <- ERROR
  ```

  The connection was either a DSN or the explicit connection string:

  ```
  Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;OPTION=67108864
  ```

  The error occurred on connections established using either a DNS or a connection string.

  When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

```
MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at
myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB
has caused an access violation exception (0xC0000005) when trying to read from memory
location 0x194dd000 on thread 33
```

(Bug#44971)

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. (Bug#44965)
- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug#42120)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and "Table does not exist" message from MySQL Server. (Bug#41946)
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug#41942)
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug#41256)
- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. (Bug#41081)
- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT(255)` in the table structure. Data was therefore truncated to 255 characters. (Bug#40932)
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

  ```
  SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
  ```

  (Bug#40316)
- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. (Bug#39961)
- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug#39957)
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

  ```
  [MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
  ```

  The fix causes MyODBC to return an error message instead of crashing. (Bug#39831)
- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

  The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. (Bug#39644)
- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug#39561)
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug#39560)
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as "SERVER= localhost" instead of "SERVER=localhost" the following error message will be displayed:

  ```
  [MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
  ```

  (Bug#39085)

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug#38949)
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. (Bug#37649)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug#37278)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug#36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

  ```
  Runtime error '-2147467259 (80004005)':

  [MySQL][ODBC 3.51 Driver]SSL connection error.
  ```

  (Bug#29955)
- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

  When the next update was called the test code would exit with the following error:

  ```
  -2147467259 : Query-based update failed because the row to update could not be found.
  ```

  (Bug#26950)
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug#17679)

D.3.4. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug#37342)
- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug#37254)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug#36293)
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug#36275)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug#36203)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. (Bug#36069)

D.3.5. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. (Bug#35920)
- The driver installer could not create a new DSN if many other drivers were already installed. (Bug#35776)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. (Bug#33910)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)

D.3.6. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change**: You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. (Bug#34672)
- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. (Bug#34522)
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. (Bug#34429)
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. (Bug#34271)
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. (Bug#33918)
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. (Bug#33825)
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. (Bug#33808)
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. (Bug#24535)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)

D.3.7. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been re-

leased. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Explicit descriptors are implemented. (Bug#32064)
- A full implementation of SQLForeignKeys based on the information available from INFORMATION_SCHEMA in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which enables more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug#33897)
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug#33822)
- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. (Bug#33615)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug#33388)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug#33130)
- Retrieving data from a `BLOB` column would fail within `SQLGetData`when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug#32684)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug#28617)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug#19923)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem)

(Bug#12805, Bug#30890)

- Dynamic cursors on statements with parameters were not supported. (Bug#11846)
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug#10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug#6157)

D.3.8. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from Connector/ODBC 3.51.21 and 3.51.22.

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- **Incompatible Change**: Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- **Incompatible Change**: Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change**: Do not permit `SET NAMES` in initial statement and in executed statements.
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. (Bug#32685)
- Added MSI installer for Windows 64-bit. (Bug#31510)

- Implemented support for `SQLCancel()`. (Bug#15601)
- Added support for `SQL_NUMERIC_STRUCT`. (Bug#3028, Bug#24920)
- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug#32596)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug#32161)
- ADO was unable to open record set using dynamic cursor. (Bug#32014)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug#31720)
- Memory usage would increase considerably. (Bug#31115)
- SQL statements are limited to 64KB. (Bug#30983, Bug#30984)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug#29765)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug#29239)
- ADO Not possible to update a client side cursor. (Bug#27961)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug#26985)
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug#16178)
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

D.3.9. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

D.3.10. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

> **Note**
>
> Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. (Bug#27896)
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. (Bug#20127)

D.3.11. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. (Bug#25316)
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. (Bug#25263)
- Transaction support has been added and tested. (Bug#25045)
- Internal function, `my_setpos_delete_ignore()` could cause a crash. (Bug#22796)
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.

- Fixed the binding of certain integer types.

D.3.12. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. (Bug#24876)
- Added initial unicode support in data and metadata. (Bug#24837)
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. (Bug#24485)
- Added loose handling of retrieving some diagnostic data. (Bug#15782)
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. (Bug#24675)
- String query parameters are new escaped correctly. (Bug#19078)

D.3.13. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as SQL_NUMBERIC_STRUCT.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested using `SQLColAttribute`/`SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for SQLDriverConnect.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since DriverManager maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed SQLGetData to clear the NULL indicator correctly during multiple calls.

D.3.14. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR`/`BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow SQLDescribeCol to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed hanlding of numeric pointers in SQLColAttribute.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by SQLGetDiagRec.

D.3.15. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- SQLBindParameter now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

D.3.16. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations, and notes on this release

- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

D.3.17. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

D.3.18. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - `SQLBindParameter`
  - `SQLBindCol`

D.3.19. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

D.3.20. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - `SQLAllocHandle`
  - `SQLCloseCursor`
  - `SQLColAttribute`
  - `SQLColumns`
  - `SQLConnect`
  - `SQLCopyDesc`
  - `SQLDisconnect`
  - `SQLExecDirect`
  - `SQLExecute`
  - `SQLFetch`
  - `SQLFreeHandle`
  - `SQLFreeStmt`
  - `SQLGetConnectAttr`
  - `SQLGetData`
  - `SQLGetDescField`
  - `SQLGetDescRec`
  - `SQLGetDiagField`
  - `SQLGetDiagRec`
  - `SQLGetEnvAttr`
  - `SQLGetFunctions`
  - `SQLGetStmtAttr`
  - `SQLGetTypeInfo`
  - `SQLNumResultCols`
  - `SQLPrepare`
  - `SQLRowcount`
  - `SQLTables`

  The following ODBC API function are implemented, but not yet support all the available attributes/options:

  - `SQLSetConnectAttr`
  - `SQLSetDescField`
  - `SQLSetDescRec`

- `SQLSetEnvAttr`
- `SQLSetStmtAttr`

D.3.21. Changes in MySQL Connector/ODBC 3.51.28 (Not yet released)

Bugs fixed:

- `SQLColAttribute(...SQL_DESC_CASE_SENSITIVE...)` returned `SQL_FALSE` for binary types and `SQL_TRUE` for the rest. It should have returned `SQL_TRUE` for binary types, and `SQL_FALSE` for the rest. (Bug#54212)
- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug#54206)
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug#49029)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and "Table does not exist" message from MySQL Server. (Bug#41946)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug#17679)

D.3.22. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. (Bug#40407)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

  ```
  Runtime error '-2147467259 (80004005)':

  [MySQL][ODBC 3.51 Driver]SSL connection error.
  ```

  (Bug#29955)

D.3.23. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. (Bug#29402)

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug#30770)

- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug#24131)

D.3.24. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug#12805, Bug#30890)

D.3.25. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement**: Accessing a parameer with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stropped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug#34575)
- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- When using ADO, the count of parameters in a query would always return zero. (Bug#33298)
- Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. (Bug#32989)
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

  Note

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

(Bug#31495)

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug#31220)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug#29871)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug#27351)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug#27158)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)
- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug#16653)

D.3.26. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug#32727)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug#32587)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug#32366)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug#3780)

D.3.27. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

  This regression was introduced by Bug#10491.

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. (Bug#32294)
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. (Bug#32253)
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. (Bug#32171)
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug#30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug#13776)

D.3.28. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug#31246)
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug#31055)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug#31009)
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug#30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug#30568)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug#30499)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug#29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column permitted `NULL` values. This was dur to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug#26108)
- MySQL Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug#3456)

D.3.29. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug#30840)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug#30774)
- The wrong column size was returned for binary data. (Bug#30547)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug#30520)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug#14639)
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

D.3.30. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see Section D.3.31, "Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)".

Functionality added or changed:

- Because of Bug#10491 in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

D.3.31. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change**: The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug#28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. (Bug#15326, Bug#10444)
- MySQL Connector/ODBC now supports batched statements. To enable cached statement support, you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or **ALLOW MULTIPLE STATEMENTS** within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug#7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug#6741)
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns . (Bug#9927) (Bug#30081)
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. (Bug#29964)
- Getting table metadata (through the `SQLColumns()` would fail, returning a bad table definition to calling applications. (Bug#29888)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)

- The SQL_COLUMN_TYPE, SQL_COLUMN_DISPLAY and SQL_COLUMN_PRECISION values would be returned incorrectly by SQLColumns(), SQLDescribeCol() and SQLColAttribute() when accessing character columns, especially those generated through concat(). The lengths returned should now conform to the ODBC specification. The FLAG_FIELD_LENGTH option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of utf8 would result in the length being returned incorrectly. (Bug#19345)
- The SQLColumns() function could return incorrect information about TIMESTAMP columns, indicating that the field was not nullable. (Bug#14414)
- The SQLColumns() function could return incorrect information about AUTO_INCREMENT columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- BIT(n) columns are now treated as SQL_BIT data where n = 1 and binary data where n > 1.
- The wrong value from SQL_DESC_LITERAL_SUFFIX was returned for binary fields.
- The SQL_DATETIME_SUB column in SQLColumns() was not correctly set for date and time types.
- The value for SQL_DESC_FIXED_PREC_SCALE was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for SQL_DESC_TYPE was returned for date and time types.
- SQLConnect() and SQLDriverConnect() were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. SQLDriverConnect() now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as PKG packages.
- The wrong value for DECIMAL_DIGITS in SQLColumns() was reported for FLOAT and DOUBLE fields, as well as the wrong value for the scale parameter to SQLDescribeCol(), and the SQL_DESC_SCALE attribute from SQLColAttribute().
- The SQL_DATA_TYPE column in SQLColumns() results did not report the correct value for date and time types.

D.3.32. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as PKG packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug#9498, Bug#6667)
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling SQLGetData() if value is null. Now returns SQL_ERROR w/state 22002.
- The setup library has been split into its own RPM package, to enable installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug#29709)
- MySQL Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. (Bug#28316)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug#27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug#26934)
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. (Bug#16817)
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug#16224)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum permitted ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug#13766)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug#10563)
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. (Bug#10562)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug#9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. (Bug#8860)
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

D.3.33. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug#12918)

Bugs fixed:

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. (Bug#28758)
- Using curors on results sets with multi-column keys could select the wrong value. (Bug#28255)
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug#27723)
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. (Bug#27544)
- SQLTables() did not distinguish tables from views. (Bug#23031)
- Data in `TEXT` columns would fail to be read correctly. (Bug#16917)
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug#16235)
- SQL_WVARCHAR and SQL_WLONGVARCHAR parameters were not properly quoted and escaped. (Bug#16235)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug#15773)
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug#4657)
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

D.3.34. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug#27591)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug#27589)
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug#27220)
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. (Bug#24306)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug#23033)
- The `SQLTransact()` function did not support an empty connection handle. (Bug#21588)
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug#7912)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug#5853)
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug#4518)

D.3.35. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug#19823)
- Added auto is null option to MySQL Connector/ODBC option parameters. (Bug#10910)

- Added auto-reconnect option to MySQL Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. (Bug#26024)
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug#25846)
- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug#22446)
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug#20547)
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug#20459)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug#20208)
- The ODBC driver name and version number were incorrectly reported by the driver. (Bug#19740)
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. (Bug#16535)
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. (Bug#12393)

D.3.36. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

D.3.37. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. (Bug#15635)
- File DSNs could not be saved. (Bug#12019)
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. (Bug#9539)

D.3.38. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug#8198)
- `SQLGetTypoInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary`

for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug#8138)

D.4. MySQL Connector/NET Change History

D.4.1. Changes in MySQL Connector/NET Version 6.3.x

D.4.1.1. Changes in MySQL Connector/NET 6.3.5 (12 October 2010 GA)

Second GA release. Fixes bugs since 6.3.4.

Bugs fixed:

- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug#57265)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug#57092)
- MySQL Connector/NET experienced two problems as follows:

  1. A call to `System.Data.Objects.ObjectContext.DatabaseExists()` returned false, even if the database existed.
  2. A call to `System.Data.Objects.ObjectContext.CreateDatabase()` created a database but with a name other than the one specified in the connection string. It then failed to use it when EDM objects were processed.

  (Bug#56859)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug#56806)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug#56756)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug#56755)
- MySQL Connector/NET 6.1.3 (GA) would not install on a Windows Server 2008 (Web Edition) clean installation. There were two problems:

  - If .NET framework version 4.0 was not installed, installation failed because c:\windows\microsoft.net\v4.0.* did not exist.
  - If .NET 4.0 was subsequently installed, then the following error was generated:

    ```
    InstallFiles: File: MySql.Data.Entity.dll,  Directory: ,  Size: 229888
    MSI (s) (E0:AC) [15:20:26:196]: Assembly Error:The assembly is built by a runtime newer
    than the currently loaded runtime, and cannot be loaded.
    MSI (s) (E0:AC) [15:20:26:196]: Note: 1: 1935 2:  3: 0x8013101B 4: IStream 5: Commit 6:
    MSI (s) (E0:A0) [15:20:26:196]: Note: 1: 1304 2: MySql.Data.Entity.dll
    Error 1304. Error writing to file: MySql.Data.Entity.dll. Verify that you have access to
    that directory.
    ```

  (Bug#56580)

D.4.1.2. Changes in MySQL Connector/NET 6.3.4 (01 September 2010 GA)

First GA release. Fixes bugs since 6.3.3.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug#55701)
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

  ```
  System.OverflowException : Value was either too large or too small for a Double.

  --OverflowException
  ```

```
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug#55644)

- Calling `MySqlDataAdapter.Update(DataTable)` resulted in an unacceptable performance hit when updating large amounts of data. (Bug#55609)
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

(Bug#55170)

- EventLog was not disposed in the SessionState provider. (Bug#52550)
- When attempting to carry out an operation such as:

```
from p in db.Products where p.PostedDate>=DateTime.Now select p;
```

Where `p.PostedDate` is a `DateTimeOffset`, and the underlying column type is a `TIMESTAMP`, the following exception was generated:

```
MySqlException occurred
Unable to serialize date/time value
```

MySQL Connector/NET has now been changed so that all `TIMESTAMP` columns will be surfaced as `DateTime`. (Bug#52550)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug#50671)
- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. (Bug#48243)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug#44715)

D.4.1.3. Changes in MySQL Connector/NET 6.3.3 (27 July 2010 beta)

Second Beta release. Fixes bugs since 6.3.2.

Bugs fixed:

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug#54895)
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug#54863)
- MySQL Connector/NET generated a null reference exception when `TransactionScope` was used by multiple threads. (Bug#54681)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug#54571)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnec-`

tion object. (Bug#54570)

- If MySqlDataAdapter was used with an INSERT command where the VALUES clause contained an expression with parentheses in it, and set the adapter.UpdateBatchSize parameter to be greater than one, then the call to adpater.Update either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)

- The method MySql.Data.Common.QueryNormalizer.CollapseValueList generated an ArgumentOutOfRangeException. (Bug#54152, Bug#53865)

- MySQL Connector/NET did not process Thread.Abort() correctly, and failed to cancel queries currently running on the server. (Bug#54012)

- MySQL Connector/NET 6.3.2 failed to install on Windows Vista. (Bug#53975)

- Garbage Collector disposal of a MySqlConnection object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug#53457)

- MySQL Connector/NET did not throw an EndOfStreamException exception when net_write_timeout was exceeded. (Bug#53439)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug#53357)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug#53174)

- The MySQL Connector/NET installation failed due to machine.config files not being present in configuration folders.

  MySQL Connector/NET has been changed to skip over configuration folders that do not contain a machine.config file. (Bug#52352)

- CHAR(36) columns were not recognized as GUIDs when used in views with entity models. (Bug#52085)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug#49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)

- When batching was used in MySqlDataAdapter, a connection was not opened automatically in MySqlDataAd-

apter.Update(). This resulted in an InvalidOperationException exception being generated, with the message text "connection must be valid and open".

MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug#38411)

- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug#33870)

D.4.1.4. Changes in MySQL Connector/NET 6.3.2 (24 May 2010 beta)

First Beta release. Fixes bugs since 6.3.1.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

- MySQL Connector/NET has been changed to include MySqlDataReader.GetFieldType(string columnname). Further, MySqlDataReader.GetOrdinal() now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- After an exception, the internal datareader, MySqlCommand.Connection.Reader, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message "There is already an open DataReader associated with this Connection which must be closed first." (Bug#55558)
- MySQL Connector/NET generated an exception when used to read a TEXT column containing more than 32767 bytes. (Bug#54040)
- In MySQL Connector/NET, the MySqlConnection.Abort() method contained a try...catch construct, with an empty catch block. This meant that any exception generated at this point would not be caught. (Bug#52769)
- The procedure cache affected the MySQL Connector/NET performance, reducing it by around 65%. This was due to unnecessary calls of String.Format(), related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug#52475)
- If FunctionsReturnString=true was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- In MySQL Connector/NET, the LoadCharsetMap() function of the CharSetMap class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's latin1 character set is the same as the windows-cp1252 character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling ExecuteNonQuery on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

(Bug#51610)

- MySQL Connector/NET 6.3.1 failed to install. (Bug#51407, Bug#51604)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)

D.4.1.5. Changes in MySQL Connector/NET 6.3.1 (02 March 2010 alpha)

Fixes bugs since 6.3.0.

Functionality added or changed:

- Connector/NET was not compatible with Visual Studio wizards that used square brackets to delimit symbols.

  Connector/NET has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. (Bug#35852)

Bugs fixed:

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

  (Bug#51209)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

D.4.1.6. Changes in MySQL Connector/NET 6.3.0 (16 February 2010 alpha)

First alpha release of 6.3.

Functionality added or changed:

- Nested transaction scopes were not supported. MySQL Connector/NET now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary to handle nested scopes with the `RequiresNew` or `Suppress` options. (Bug#45098)
- Support for MySQL Server 4.1 has been removed from MySQL Connector/NET starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

  ```
  Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
  ```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)

D.4.2. Changes in MySQL Connector/NET Version 6.2.x

D.4.2.1. Changes in MySQL Connector/NET 6.2.5 (Not yet released GA)

This release fixes bugs since 6.2.4.

Bugs fixed:

- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug#57265)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug#57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug#56806)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug#56756)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug#56755)

D.4.2.2. Changes in MySQL Connector/NET 6.2.4 (30 August 2010 GA)

This release fixes bugs since 6.2.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug#55701)

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

  (Bug#55644)

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message "There is already an open DataReader associated with this Connection which must be closed first." (Bug#55558)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

  (Bug#55170)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug#54895)

- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug#54863)

- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug#54571)

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)

- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)

- MySQL Connector/NET did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. (Bug#54012)

- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug#53457)

- MySQL Connector/NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug#53439)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug#53357)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug#53174)

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)

- EventLog was not disposed in the SessionState provider. (Bug#52550)

- The procedure cache affected the MySQL Connector/NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug#52475)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)

- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_Sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked` value was manually changed to '0'. (Bug#52175)

- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug#52085)

- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug#50671)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug#49118)

- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. (Bug#48243)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug#44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug#38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug#33870)

D.4.2.3. Changes in MySQL Connector/NET 6.2.3 (10 April 2010 GA)

This release fixes bugs since 6.2.2.

Functionality added or changed:

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug#51610)
- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

  ```
  server=localhost;user=root;compress=;database=test;port=3306;password=123456;
  ```

  (Bug#51209)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug#50344)
- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

  ```
  System.InvalidOperationException was unhandled
    Message="Timeouts are not supported on this stream."
  ```

  (Bug#50321)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

D.4.2.4. Changes in MySQL Connector/NET 6.2.2 (22 December 2009 GA)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)
- MySQL Connector/NET generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
   at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
   at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
   at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.Rollback(Singl
singlePhaseEnlistment)
...
```

(Bug#35330)

- Connection objects were not garbage collected when not in use. (Bug#31996)

D.4.2.5. Changes in MySQL Connector/NET 6.2.1 (16 November 2009 beta)

This release fixes bugs since 6.2.0.

Functionality added or changed:

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. (Bug#48586)

- Prior to MySQL Connector/NET 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

  MySQL Connector/NET 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

  Further details on this can be found in the relevant Microsoft documentation.

- Starting with MySQL Connector/NET 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

  Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.

- MySQL Connector/NET now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section Section 21.2.6, “Connector/NET Connection String Options Reference” and the tutorial Section 21.2.4.7, “Tutorial: Using SSL with MySQL Connector/NET”.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/NET was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug#48460)

- When used, the `Encrypt` connection string option caused a “Keyword not supported” exception to be generated.

  This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. (Bug#48290)

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug#48271)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- MySQL Connector/NET session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. (Bug#47219)

D.4.2.6. Changes in MySQL Connector/NET 6.2.0 (21 October 2009 alpha)

The first alpha release of 6.2.

Bugs fixed:

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

  ```
  Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
  ```

  (Bug#47928)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug#47815)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

  ```
  /home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
  Unsupported or unrecognized project:
  '/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
  ```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

  ```
  /home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
  error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
  override but no suitable property found to override
  ```

  (Bug#47048)

D.4.3. Changes in MySQL Connector/NET Version 6.1.x

D.4.3.1. Changes in MySQL Connector/NET 6.1.6 (Not yet released GA)

This release fixes bugs since 6.1.5.

Bugs fixed:

- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug#57265)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug#57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug#56806)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug#56756)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug#56755)

D.4.3.2. Changes in MySQL Connector/NET 6.1.5 (30 August 2010 GA)

This release fixes bugs since 6.1.4.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug#55701)
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

  (Bug#55644)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

  (Bug#55170)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug#54895)
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug#54863)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug#54571)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
```

```
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug#53457)

- MySQL Connector/NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug#53439)
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug#53357)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug#53174)
- EventLog was not disposed in the SessionState provider. (Bug#52550)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug#52085)
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug#50671)
- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug#49118)

- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. (Bug#48243)
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug#44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug#38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug#33870)

D.4.3.3. Changes in MySQL Connector/NET 6.1.4 (28 April 2010 GA)

This release fixes bugs since 6.1.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)
- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug#51610)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug#50344)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)

- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

D.4.3.4. Changes in MySQL Connector/NET 6.1.3 (16 November 2009 GA)

This release fixes bugs since 6.1.2.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/NET was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug#48460)
- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug#48271)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug#48101)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/NET.

  MySQL Connector/NET was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. (Bug#47985)

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

(Bug#47928)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug#47815)

- Attempting to build MySQL Connector/NET 6.1 `MySQL.Data` from source code on Windows failed with the following error:

```
...\clones\6.1\MySql.Data\Provider\Source\NativeDriver.cs(519,29): error CS0122:
'MySql.Data.MySqlClient.MySqlPacket.MySqlPacket()' is inaccessible due to its protection level
```

(Bug#47354)

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. (Bug#47332)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

(Bug#47048)

D.4.3.5. Changes in MySQL Connector/NET 6.1.2 (08 September 2009 GA)

This is the first GA release of 6.1.

Bugs fixed:

- The MySQL Connector/NET Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. (Bug#47339)
- MySQL Connector/NET generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'MINUTEWHERE SessionId =
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1
Description: An unhandled exception occurred during the execution of the current web
request. Please review the stack trace for more information about the error and where it
originated in the code.

Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL
syntax; check the manual that corresponds to your MySQL server version for the right
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =
1 AND Loc' at line 1
```

(Bug#46939)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

  This was due to the fact that the encoding field had not been initialized correctly. (Bug#46844)
- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug#44985)
- MySQL Connector/NET did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/NET hung for several hours. (Bug#43761)

D.4.3.6. Changes in MySQL Connector/NET 6.1.1 (20 August 2009 beta)

This is the first Beta release of 6.1.

Bugs fixed:

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------
```

```
The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:

```

(Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug#46311)
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug#46308)
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
       SystemArgumentException: DataGridViewComboBoxCell value is not valid.
     To replace this default dialog please handle the DataError Event.
```

(Bug#46100)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
       TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. (Bug#45723)

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
       There is a problem with this Windows Installer package. A DLL required for this
       install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. (Bug#45474)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug#45457)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
       The value given is not an instance of type 'Edm.Int32'
```

(Bug#45077)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug#44455)

- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug#43736)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)

- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

```
       $ nant -buildfile:Client.build
```

  The following error occurred:

```
       BUILD FAILED

       Error loading buildfile.
       Encoding name 'Windows-1252' not supported.
       Parameter name: name
```

(Bug#42411)

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)

- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug#40684)

- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug#36027)

D.4.3.7. Changes in MySQL Connector/NET 6.1.0 (15 July 2009 alpha)

This is the first Alpha release of 6.1.

Functionality added or changed:

- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old guids=true` to the connection string and the old BINARY(16) type will be used instead.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Session State Provider - This enables you to store the state of your website in a MySQL server.
- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.Net administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.

D.4.4. Changes in MySQL Connector/NET Version 6.0.x

D.4.4.1. Changes in MySQL Connector/NET 6.0.8 (Not yet released)

Fixes bugs since 6.0.7.

Bugs fixed:

- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug#57265)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug#57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug#56806)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug#56756)

D.4.4.2. Changes in MySQL Connector/NET 6.0.7 (30 August 2010)

Fixes bugs since 6.0.6.

Bugs fixed:

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
```

```
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug#55644)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug#54895)

- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug#54863)

- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug#54570)

- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpater.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug#54386)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug#54152, Bug#53865)

- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug#53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug#53357)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug#53174)

- EventLog was not disposed in the SessionState provider. (Bug#52550)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug#50671)

- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug#49118)

- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. (Bug#48243)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug#44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug#38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug#33870)

D.4.4.3. Changes in MySQL Connector/NET 6.0.6 (28 April 2010)

Fixes bugs since 6.0.5.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug#52562)
- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug#47467)

Bugs fixed:

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

  ```
  Unable to load object with error: Object reference not
  set to an instance of an object
  ```

  (Bug#55170)
- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug#52769)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug#52187)
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug#51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug#51788)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug#51610)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug#51149)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug#50444)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug#50344)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug#50171)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug#50123)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug#49850)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug#49794)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug#49642)
- When adding a data set in Visual Studio 2008, the following error was generated:

  ```
  Relations couldn't be addded. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
  ```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug#48974)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug#48944)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug#48171)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

  ```
          MySql.Data.MySqlClient.MySqlException was unhandled
          Message="You have an error in your SQL syntax; check the manual that corresponds to your
          MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
          Source="MySql.Data"
          ErrorCode=-2147467259
          Number=1064
          StackTrace:
          à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
          à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
          lastInsertId)
          à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
          à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
          à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
          à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
          à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
        à MySql.Data.MySqlClient.MySqlScript.Execute()
  ```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug#45277)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug#41629)

D.4.4.4. Changes in MySQL Connector/NET 6.0.5 (12 November 2009)

This is a new release, fixing recently discovered bugs.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
        MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/NET was changed so that it was possible to do:

```
        MySqlCommand clone = comm.Clone();
```

  (Bug#48460)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

  Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

  (Bug#48101)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

  (Bug#47048)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
        string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

```
```

This was due to the fact that the encoding field had not been initialized correctly. (Bug#46844)

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

--------------------------------------------------------------------------------

Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

(Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug#46311)
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug#46308)
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25
bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(System.Data.CommandBeha
vior behavior = SequentialAccess) Line 405 + 0xb bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteDbDataReader(System.Data.Comma
ndBehavior behavior = SequentialAccess) Line 884 + 0xb bytesC#
System.Data.dll!System.Data.Common.DbCommand.System.Data.IDbCommand.ExecuteReader(System
.Data.CommandBehavior behavior) + 0xb bytes
System.Data.dll!System.Data.Common.DbDataAdapter.FillInternal(System.Data.DataSet
dataset = {System.Data.DataSet}, System.Data.DataTable[] datatables = null, int
startRecord = 0, int maxRecords = 0, string srcTable = "Table", System.Data.IDbCommand
```

```
        command = {MySql.Data.MySqlClient.MySqlCommand}, System.Data.CommandBehavior behavior) +
        0x83 bytes
        System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet, int
        startRecord, int maxRecords, string srcTable, System.Data.IDbCommand command,
        System.Data.CommandBehavior behavior) + 0x120 bytes
        System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
        0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
        SystemArgumentException: DataGridViewComboBoxCell value is not valid.
      To replace this default dialog please handle the DataError Event.
```

(Bug#46100)

- In MySQL Connector/NET 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true.

  Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. (Bug#45952)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
        TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

  This resulted in the data being unsorted. (Bug#45723)

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug#45699)
- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/NET to generate the error:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
      server version for the right syntax to use near 'SET character_set_results=NULL' at line 1
```

(Bug#45502)

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
        There is a problem with this Windows Installer package. A DLL required for this
        install to complete could not be run. Contact your support personnel or package vendor.
```

  When OK was clicked to acknowledge the error the installer exited. (Bug#45474)

- A MySQL Connector/NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug#45463)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug#45457)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
        The value given is not an instance of type 'Edm.Int32'
```

  (Bug#45077)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug#44985)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug#44455)

- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug#43736)

- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)

- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

```
        $ nant -buildfile:Client.build
```

  The following error occurred:

```
        BUILD FAILED

        Error loading buildfile.
        Encoding name 'Windows-1252' not supported.
        Parameter name: name
```

  (Bug#42411)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
      has no constructors defined MysqlTest
      Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
      likely culprit is 'COMPILE'.
```

  (Bug#42261)

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)

- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug#40684)

- MySQL Connector/NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
```

```
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug#40005)

- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug#36027)

- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

(Bug#34657)

D.4.4.5. Changes in MySQL Connector/NET 6.0.4 (16 June 2009)

This is the first post-GA release, fixing recently discovered bugs.

Bugs fixed:

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
      permitted IP ADDRESS/PORT.
```

  However, MySQL Connector/NET masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

  (Bug#45021)

- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
      Parameter name: length
      at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
      fAlwaysCopy)
      at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
      at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
      MySqlParameterCollection parameters, MySqlPacket packet)
      at MySql.Data.MySqlClient.Statement.BindParameters()
      at MySql.Data.MySqlClient.PreparableStatement.Execute()
      at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior be□havior)
      at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug#44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/NET from source. (Bug#44822)

- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

```
Error in WHERE clause near '@'.
      Unable to parse query text.
```

  (Bug#44512)

- The DataReader in MySQL Connector/NET 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. (Bug#44507)

- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
      Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

  (Bug#44460)

- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)

- MySQL Connector/NET was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug#38700)

D.4.4.6. Changes in MySQL Connector/NET 6.0.3 (28 April 2009)

First GA release.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

  The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

  The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
      ID=4711;'
```

  A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
      EXCEPTION: MySqlException - Parameter '?'' must be defined.
```

  (Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

  When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

  When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug#44123)

D.4.4.7. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new development release, fixing recently discovered bugs.

Bugs fixed:

- MySQL Connector/NET 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

  The following error message was generated:

  ```
  .NET Framework Data Provider for MySQL: The data provider object factory service was not
        found.
  ```

  (Bug#44064)

D.4.4.8. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. (Bug#43574)
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. (Bug#43480)

D.4.4.9. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

D.4.5. Changes in MySQL Connector/NET Version 5.3.x

D.4.5.1. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. (Bug#39072)
- The MySQL Connector/NET installer program ended prematurely without reporting the specific error. (Bug#39019)
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException` . (Bug#38939)
- Possible overflow in `MySqlPacket.ReadLong()`. (Bug#36997)
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. (Bug#36836)

D.4.6. Changes in MySQL Connector/NET Version 5.2.x

D.4.6.1. Changes in MySQL Connector/NET 5.2.8 (Not yet released)

Bugs fixed:

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

  ```
  DataTable schemaPrimaryKeys = connection.GetSchema(
    "Indexes",
  ```

```
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug#48101)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug#47153)
- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug#46620)
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
        MySql.Data.MySqlClient.MySqlException was unhandled
        Message="You have an error in your SQL syntax; check the manual that corresponds to your
        MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
        Source="MySql.Data"
        ErrorCode=-2147467259
        Number=1064
        StackTrace:
        à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
        à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
        lastInsertId)
        à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
        à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
        à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
      à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug#46429)

- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
        Server Error in '/mono' Application

        --------------------------------------------------------------------------------

        The requested feature is not implemented.
        Description: HTTP 500. Error processing request.

        Stack Trace:

        System.NotImplementedException: The requested feature is not implemented.

```

(Bug#46375)

- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
        connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri

0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug#46205, Bug#46359, Bug#41953)
- If the application slept for longer than the specified `net_write_timeout`, and then resumed `Read` operations on a connection, then the application failed silently. (Bug#45978)
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug#43678)
- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

  ```
  $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
  BUILD FAILED

  Error loading buildfile.
  Encoding name 'Windows-1252' not supported.
  Parameter name: name
  ```

  (Bug#42411)

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. (Bug#42110)
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

  ```
  Connection must be valid and open
  ```

(Bug#34657)

D.4.6.2. Changes in MySQL Connector/NET 5.2.7 (15 July 2009)

Bugs fixed:

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug#45699)
- A MySQL Connector/NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug#45463)
- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

  ```
  Only one usage of each socket address (protocol/network address/port) is normally
        permitted IP ADDRESS/PORT.
  ```

  However, MySQL Connector/NET masked this socket exception and displayed an exception with the following text:

  ```
  Unable to connect to any of the specified MySQL hosts.
  ```

  (Bug#45021)
- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/NET from source. (Bug#44822)
- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)
- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

  ```
  Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
        has no constructors defined MysqlTest
        Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
        likely culprit is 'COMPILE'.
  ```

  (Bug#42261)
- MySQL Connector/NET generated the following exception:

  ```
  System.NullReferenceException: Object reference not set to an instance of an object.
        bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
        bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
        bei System.Threading.ExecutionContext.runTryCode(Object userData)
        bei
        System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
        code, CleanupCode backoutCode, Object userData)
        bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
  ```

  (Bug#40005)

- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

  (Bug#39409)

D.4.6.3. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. (Bug#44194)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.

  This can be confirmed by referencing the Microsoft Documentation. (Bug#43990)

- Requests sent to the MySQL Connector/NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug#43553)

- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug#43332)

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

  The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
      FROM my_aspnet_Membership WHERE userId=13
```

  Note that `applicationId` is not used. (Bug#42574)

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. (Bug#41654)

- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug#41452)

- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug#41408)

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/NET, an exception

was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
        Parameter '0' not found in the collection.
```

(Bug#41034)

- The `DATETIME` format contained an erroneous space. (Bug#41021)
- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

  If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

  The exception generated was:

  ```
  The profile default provider was not found.
  ```

  Note that the exception stated: 'the profile **default provider**...', even though a different name was explicitly requested. (Bug#40871)
- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

  However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. (Bug#40139)

D.4.6.4. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

  ```
  "Package Load Failure

  Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
  Version=5.2.4, Culture=neutral, PublicKeyTopen=null' has failed to load properly (GUID =
  {79A115C9-B133-4891-9E7B-242509DAD272}).  Please contact the package vendor for
  assistance.  Application restart is recommended, due to possible environment corruption.
  Would you like to disable loading the package in the future?  You may use
  'devenve/resetskippkgs' to re-enable package loading."
  ```

  (Bug#40726)

D.4.6.5. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. (Bug#40571)
- When working with stored procedures MySQL Connector/NET generated an exception `Unknown "table parameters" in information_schema`. (Bug#40382)
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. (Bug#40231)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained "??" instead of the correct national character symbols. (Bug#40076)
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- After the `ConnectionString` property was initialized using the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug#39728)
- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug#39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug#39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug#39275)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

  Also, if **TABLEADAPTER** was right-clicked and then ADD, QUERY, USE EXISTING STORED PROCEDURES selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug#39252)
- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. (Bug#39072)
- MySQL Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

D.4.6.6. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `Connection-State.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains "`use procedure bodies=true`" then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains "`use procedure bodies=false`", then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- MySQL Connector/NET uninstaller did not clean up all installed files. (Bug#38534)

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
        host=localhost;database=test;uid=*****;pwd=*****;
      connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
        host=localhost;database=test;uid=*****;pwd=*****;
        connect timeout=25;auto enlist=false;pooling=false;
        Allow User Variables=True;Allow User Variables=False;
      Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)
- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug#37469)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug#37239)
- The `autogenerateschema` option produced tables with incorrect collations. (Bug#36444)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

D.4.6.7. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug#37349)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug#36081)
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug#36000)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug#35336)
- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug#35332)

- When retreiving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug#35041)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug#34941)
- When creating a new stored procedures, the new parameter code which permits the use of the `@` symbol would interfere with the specification of a `DEFINER`. (Bug#34940)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. (Bug#34001)
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

D.4.6.8. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. (Bug#34792)
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. (Bug#34699)
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. (Bug#34674)
- A number issues were identified in the case, connection and scema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. (Bug#34495)
- When using web providers, the MySQL Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the memvership provider list. (Bug#34451)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

D.4.6.9. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the

multi-value form if possible.

- DDEX provider now works under Visual Studio 2008 beta 2.
- Added ClearPool and ClearAllPools features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug#34220)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug#34204)
- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)

D.4.7. Changes in MySQL Connector/NET Version 5.1.x

D.4.7.1. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)
- The `DATETIME` format contained an erroneous space. (Bug#41021)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted

"Pooling=True" to "pooling=True".

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)

- MySQL Connector/NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
      bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
      bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
      bei System.Threading.ExecutionContext.runTryCode(Object userData)
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug#40005)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)

- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)

- Calling `MySqlDataAdapter.FillSchema` on a `SELECT` statement that referred to a table that did not exist left the connection in a bad state. After this call, all `SELECT` statements returned an empty result set. If the `SELECT` statement referred to a table that did exist then everything worked as expected. (Bug#30518)

D.4.7.2. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)

- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)

- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

```
        host=localhost;database=test;uid=*****;pwd=*****;
      connect timeout=25; auto enlist=false;pooling=false;
```

  The connection string after closing `MySqlDataReader`:

```
        host=localhost;database=test;uid=*****;pwd=*****;
        connect timeout=25;auto enlist=false;pooling=false;
        Allow User Variables=True;Allow User Variables=False;
      Allow User Variables=True;Allow User Variables=False;
```

  (Bug#37955)

- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. (Bug#37406)

- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug#37398)

- Documentation incorrectly stated that "the DataColumn class in .NET 1.0 and 1.1 does not permit columns with type of UInt16,

UInt32, or UInt64 to be autoincrement columns". (Bug#37350)

- `SemaphoreFullException` is generated when application is closed. (Bug#36688)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

D.4.7.3. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrival = true` and `RequireQuestionAndAnswer = false`. (Bug#36159)
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. (Bug#36157)
- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug#36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)

D.4.7.4. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements.

Bug#34220)

- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug#34204)
- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- MySQL Connector/NET would fail to compile properly with `nant`. (Bug#33508)
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. (Bug#33347)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)

D.4.7.5. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- MySQL Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. (Bug#31703)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Trying to use a connection that was not open could return an ambiguous and misleading error message. (Bug#31262)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)` were not returned as boolean fields. (Bug#27959)
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection

string options. (Bug#27958)

- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

D.4.7.6. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- The Saudi Hijri calendar was not supported. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug#29476)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug#29236)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug#29235)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug#29098)
- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

D.4.7.7. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug#28648)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would

terminate the query/TableAdapter wizard. (Bug#28536)

- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug#28437)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug#28204)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug#26347)

D.4.7.8. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Installation of the MySQL Connector/NET on Windows would fail if VisualStudio had not already been installed. (Bug#28260)
- MySQL Connector/NET would look for the wrong table when executing `User.IsRole().` (Bug#28251)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

D.4.7.9. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

D.4.8. Changes in MySQL Connector/NET Version 5.0.x

D.4.8.1. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that

should be inserted is corrupted and no error is thrown. (Bug#37968)

- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
    host=localhost;database=test;uid=*****;pwd=*****;
    connect timeout=25;auto enlist=false;pooling=false;
    Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)

D.4.8.2. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

D.4.8.3. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

> **Note**
>
> This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- Fixed bug where MySQL Connector/NET was hand building some date time patterns rather than using the patterns provided under CultureInfo. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.

D.4.8.4. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)

- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studion Plugin). (Bug#26147, Bug#27240)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug#25947)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)

D.4.8.5. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `DESCRIBE ....` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug#27221)
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug#27187)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- Exception thrown when using large values in `UInt64` parameters. (Bug#27093)
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/NET 5.0.5. (Bug#26960)

D.4.8.6. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with DeriveParameters now have the name `RETURN_VALUE`.

- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug#26660)
- MySQL Connector/NET would fail to install under Windows Vista. (Bug#26430)
- Opening a connection would be slow due to host name lookup. (Bug#26152)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug#25950)
- Registry would be incorrectly populated with installation locations. (Bug#25928)
- Times with negative values would be returned incorrectly. (Bug#25912)
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. (Bug#25907)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug#25906)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug#25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)
- MySQL Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

D.4.8.7. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

D.4.8.8. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented useg the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from storaed procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns` `GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message (Bug#25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. (Bug#25033)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug#23687)
- Nested transactions (which are unsupported)do not raise an error or warning. (Bug#22400)

D.4.8.9. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug#23758)
- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug#23657)
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug#23538)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug#23268)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug#23245)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/NET 5.0.2 must be installed. (Bug#23071)
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. (Bug#22882)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug#18186)
- MySQL Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug#16126)

D.4.8.10. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- MySQL Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug#22042)
- The `MySqlexception` class is now derived from the `DbException` class. (Bug#21874)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug#18391)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

D.4.8.11. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implemention of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug#6214)

D.4.9. Changes in MySQL Connector/NET Version 1.0.x

D.4.9.1. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug#33682)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

D.4.9.2. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)

D.4.9.3. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug#25912)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)

- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)
- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. (Bug#23758)
- Nested transactions do not raise an error or warning. (Bug#22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

D.4.9.4. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- MySQL Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The DiscoverParameters function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a DateReader error would be raised. (Bug#19481)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. (Bug#18391)

- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to MySqlDbType. (Bug#17749)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug#17736)
- The CommandBuilder ignored Unsigned flag at Parameter creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)
- The connection string parser did not permit single or double quotation marks in the password. (Bug#16659)
- The `MySqlDateTime` class did not contain constructors. (Bug#15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

D.4.9.5. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the `cp932` character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug#13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug#13541)

D.4.9.6. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- MySQL Connector/NET 1.0.5 could not connect on Mono. (Bug#13345)
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug#13276)
- Field names that contained the following characters caused errors: `( )%<>/` (Bug#13036)
- The `nant` build sequence had problems. (Bug#12978)
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. (Bug#12835)

D.4.9.7. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- MySQL Connector/NET could not connect to MySQL 4.1.14. (Bug#12771)
- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. (Bug#12628)
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug#12551, Bug#8724)
- The `cp1250` character set was not supported. (Bug#11621)
- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug#11542)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug#11490)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug#11450)
- MySQL Connector/NET interpreted the new decimal data type as a byte array. (Bug#11294)
- Added support to call a stored function from MySQL Connector/NET. (Bug#10644)
- Connection could fail when .NET thread pool had no available worker threads. (Bug#10637)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug#10281)
- Decimal parameters caused syntax errors. (Bug#10152, Bug#11550, Bug#10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug#9722)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug#8382)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug#7951)
- MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)

D.4.9.8. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug#7755)
- Quote character \222 not quoted in `EscapeString`. (Bug#7724)
- GetBytes is working no more. (Bug#7704)

- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an IDbConnection. (Bug#7258)
- Calling prepare causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

D.4.9.9. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)
- Errors in parsing stored procedure parameters. (Bug#6902)
- InvalidCast when using `DATE_ADD`-function. (Bug#6879)
- Int64 Support in `MySqlCommand` Parameters. (Bug#6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug#6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRange` exception. (Bug#6770)
- Integer "out" parameter from stored procedure returned as string. (Bug#6668)
- An Open Connection has been Closed by the Host System. (Bug#6634)
- Fixed Invalid character set index: 200. (Bug#6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

D.4.9.10. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed (Bug#6649)
- Fixed Charset-map for UCS-2 (Bug#6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug#6429)
- Fixed double type handling in MySqlParameter(string parameterName, object value). (Bug#6428)
- Fixed Installation directory ignored using custom installation (Bug#6329)
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ (Bug#6322)
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

D.4.9.11. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) (Bug#6230)
- Fixed GetBoolean returns wrong values (Bug#6227)
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters (Bug#6217)
- Fixed NET Connector source missing resx files (Bug#6216)
- Fixed System.OverflowException when using `YEAR` data type. (Bug#6036)
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found (Bug#6006)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug#5900)
- Fixed missing Reference in DbType setter (Bug#5897)
- Fixed Parsing the ';' char (Bug#5876)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug#5798)
- IsNullable error (Bug#5796)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug#5621)
- Fixed construtor initialize problems in MySqlCommand() (Bug#5613)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug#5496)

- Fixed Can't display Chinese correctly (Bug#5288)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug#5256)
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed Bug#5458 Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed Bug#5388 DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed Bug#5602 Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed Bug#5392 MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed Bug#5474 cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed Bug#5469 Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

D.4.9.12. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. (Bug#3889)
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

D.4.10. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.

- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver (Bug#4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug#4505)
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. (Bug#4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. (Bug#4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug#4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug#4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug#4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.

- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

D.4.11. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitly (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

D.4.12. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.

- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

D.4.13. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)

- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match SqlClient (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).

- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

D.4.14. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

D.4.15. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.

- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).

- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

D.4.16. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using DBNull.Value instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

D.4.17. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

D.4.18. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

D.4.19. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).

- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

D.5. MySQL Visual Studio Plugin Change History

> **Note**
>
> As of Connector/NET 5.1.2 (14 June 2007), the Visual Studion Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see Section D.4, "MySQL Connector/NET Change History".

D.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

D.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

D.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (04 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

D.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (04 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

D.6. MySQL Connector/J Change History

D.6.1. Changes in MySQL Connector/J 5.1.x

D.6.1.1. Changes in MySQL Connector/J 5.1.14 (Not yet released)

Fixes bugs found since release 5.1.13.

Functionality added or changed:

- Connector/J's load-balancing functionality only allowed the following events to trigger failover:
  - Transaction commit/rollback
  - CommunicationExceptions
  - Matches to user-defined Exceptions using the loadBalanceSQLStateFailover, loadBalanceSQLExceptionSubclassFailover or loadBalanceExceptionChecker property.

  This meant that connections where auto-commit was enabled were not balanced, except for Exceptions, and this was problematic in the case of distribution of read-only work across slaves in a replication deployment.

  The ability to load-balance while auto-commit is enabled has now been added to Connector/J. This introduces two new properties:

  1. loadBalanceAutoCommitStatementThreshold - defines the number of matching statements which will trigger the driver to (potentially) swap physical server connections. The default value (0) retains the previously-established behavior that connections with auto-commit enabled are never balanced.
  2. loadBalanceAutoCommitStatementRegex - the regular expression against which statements must match. The default value (blank) matches all statements.

  Load-balancing will be done after the statement is executed, before control is returned to the application. If rebalancing fails, the driver will silently swallow the resulting Exception (as the statement itself completed successfully). (Bug#55723)

Bugs fixed:

- `DatabaseMetaData.supportsMultipleResultSets()` was hard-coded to return `false`, even though Connector/J supports multiple result sets. (Bug#57380)
- Using the `useOldUTF8Behavior` parameter failed to set the connection character set to `latin1` as required.

  In versions prior to 5.1.3, the handshake was done using `latin1`, and while there was logic in place to explicitly set the character set after the handshake was complete, this was bypassed when `useOldUTF8Behavior` was true. This was not a problem until 5.1.3, when the handshake was modified to use `utf8`, but the logic continued to allow the character set configured during that handshake process to be retained for later use. As a result, `useOldUTF8Behavior` effectively failed. (Bug#57262)
- Invoking a stored procedure containing output parameters by its full name, where the procedure was located in another database, generated the following exception:

  ```
  Parameter index of 1 is out of range (1, 0)
  ```

  (Bug#57022)
- When a JDBC client disconnected from a remote server using `Connection.close()`, the TCP connection remained in the `TIME_WAIT` state on the server side, rather than on the client side. (Bug#56979)
- Leaving Trust/ClientCertStoreType properties unset caused an exception to be thrown when connecting with `useSSL=true`, as no default was used. (Bug#56955)
- When load-balanced connections swap servers, certain session state was copied from the previously active connection to the newly-selected connection. State synchronized included:

- Auto-commit state
- Transaction isolation state
- Current schema/catalog

  However, the read-only state was not synchronized, which caused problems if a write was attempted on a read-only connection. (Bug#56706)

- When using Connector/J configured for failover (jdbc:mysql://host1,host2,... URLs), the non-primary servers re-balanced when the transactions on the master were committed or rolled-back. (Bug#56429)
- An unhandled Null Pointer Exception (NPE) was generated in `DatabaseMetaData.java` when calling an incorrectly cased function name where no permission to access `mysql.proc` was available.

  In addition to catching potential NPEs, a guard against calling JDBC functions with `db_name.proc_name` notation was also added. (Bug#56305)

D.6.1.2. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

Functionality added or changed:

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

  Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed using `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. (Bug#54175)

Bugs fixed:

- The method `unSafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. (Bug#53041)
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. (Bug#52534)
- Logic in implementations of `LoadBalancingConnectionProxy` and `LoadBalanceStrategy` behaved differently as to which `SQLException`s trigger failover to a new host. The former looked at the first two characters of the SQLState:

  ```
  if (sqlState.startsWith("08"))
  ...
  ```

  The latter used a different test:

  ```
  if (sqlEx instanceof CommunicationsException
    || "08S01".equals(sqlEx.getSQLState())) {
  ...
  ```

  This meant it was possible for a new `Connection` object to throw an `Exception` when the first selected host was unavailable. This happened because `MySqlIO.createNewIO()` could throw an `SQLException` with a `SQLState` of “08001”, which did not trigger the “try another host” logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. (Bug#52231)

- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the '\n' character. (Bug#52167)
- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullcatalogmeanscurrent` was `true`, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog

currently attached to. If, however, `nullcatalogmeanscurrent` was set to `false` then a crash resulted.

Connector/J has been changed so that when `NULL` is passed as `PARAM_CAT` it will not crash when `nullcatalogmeanscurrent` is `false`, but rather iterate all catalogs in search of stored procedures. This means that `PARAM_CAT` is no longer hardcoded to `NULL` (see Bug#51904). (Bug#51912)

- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with "/* ping */", to ensure they remained active. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. (Bug#51783)

- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLError.ER_WARNING_NOT_COMPLETE_ROLLBACK`. (Bug#51776)

- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. (Bug#51704)

- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. (Bug#51666)

- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. (Bug#51643)

- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. (Bug#51266)

- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.

  Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. (Bug#43576)

D.6.1.3. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

Bugs fixed:

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. (Bug#51022)

- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 ( Revision: ${svn.Revision} )`. The variable `${svn.Revision}` was not replaced by the SVN revision number. (Bug#50288)

D.6.1.4. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

Functionality added or changed:

- Replication connections, those with URLs that start with jdbc:mysql:replication, now use a jdbc:mysql:loadbalance connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklistTimeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. (Bug#49537)

Bugs fixed:

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. (Bug#50288)
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. (Bug#49745)
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. (Bug#49700)
- The `ExceptionInterceptor` class did not provide a `Connection` context. (Bug#49607)
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. (Bug#48605)
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
   at
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
 at com.mysql.jdbc.jdbc2.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

  (Bug#48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug#48442)
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

  Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug#48172)
- A PermGen memory leaked was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug#36565)
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

  (Bug#32525)

D.6.1.5. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

Bugs fixed:

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug#47494)

D.6.1.6. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

Bugs fixed:

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalTx-ToPhysicalConnection=true`, there is a static map (XIDS_TO_PHYSICAL_CONNECTIONS) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug#46925)

- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

  ```
  INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
  ```

  The exception generated was:

  ```
  java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is
  2).
          at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
  ......
  Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
  which is 2).
          at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:1055)
          at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:956)
          at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:926)
          at com.mysql.jdbc.PreparedStatement.checkBounds(PreparedStatement.java:3657)
          at com.mysql.jdbc.PreparedStatement.setInternal(PreparedStatement.java:3641)
          at
  com.mysql.jdbc.PreparedStatement.setBytesNoEscapeNoQuotes(PreparedStatement.java:3391)
          at
  com.mysql.jdbc.PreparedStatement.setOneBatchedParameterSet(PreparedStatement.java:4203)
          at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1759)
          at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1441)
          at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
          ... 16 more
  ```

  (Bug#46788)

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

  ```
  The last packet successfully received from the server was 1,249,932,468,916 milliseconds
  ago.  The last packet sent successfully to the server was 0 milliseconds ago.
  ```

  (Bug#46637)

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEM`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEM` for first and second column respectively. (Bug#44508)

- SQLException for data truncation error gave the error code as 0 instead of 1265. (Bug#44324)

- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. (Bug#43759)

- Accessing result set columns by name after the result set had been closed resulted in a NullPointerException instead of a SQLException. (Bug#41484)

- `QueryTimeout` did not work for batch statements waiting on a locked table.

  When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. (Bug#34555)

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as "jdbc:mysql://www.mysql.com:12345/my_database" to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the

HOST_PROPERTY_KEY property was found to be “www.mysql.com:12345”.

> **Note**
>
> Connector/J has been fixed so that it will now always fill in the PORT property (using 3306 if not specified), and the HOST property (using localhost if not specified) when parseURL() is called. The driver also parses a list of hosts into HOST.n and PORT.n properties as well as adding a property NUM_HOSTS for the number of hosts it has found. If a list of hosts is passed to the driver, HOST and PORT will be set to the values given by HOST.1 and PORT.1 respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

(Bug#32216)

- Attempting to delete rows using ResultSet.deleteRow() did not delete rows correctly. (Bug#27431)
- The setDate method silently ignored the Calendar parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
   setDate(parameterIndex, x);
}
```

From reviewing the code it was apparent that the Calendar parameter cal was ignored. (Bug#23584)

D.6.1.7. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

Bugs fixed:

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLError.createLinkFailureMessageBasedOnHeuristics(
(ConnectionImpl) this.conn,
System.currentTimeMillis() - 1000,
System.currentTimeMillis() - 2000,
e,
false);
```

returned the following string:

```
The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.
```

(Bug#45419)

- Calling Connection.serverPrepareStatement() variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely TYPE_SCROLL_SENSITIVE. (Bug#45171)
- The result set returned by getIndexInfo() did not have the format defined in the JDBC API specifications. The fourth column, DATA_TYPE, of the result set should be of type BOOLEAN. Connector/J however returns CHAR. (Bug#44869)
- The result set returned by getTypeInfo() did not have the format defined in the JDBC API specifications. The second column, DATA_TYPE, of the result set should be of type INTEGER. Connector/J however returns SMALLINT. (Bug#44868)
- The DEFERRABILITY column in database metadata result sets was expected to be of type SHORT. However, Connector/J returned it as INTEGER.

  This affected the following methods: getImportedKeys(), getExportedKeys(), getCrossReference(). (Bug#44867)
- The result set returned by getColumns() did not have the format defined in the JDBC API specifications. The fifth column, DATA_TYPE, of the result set should be of type INTEGER. Connector/J however returns SMALLINT. (Bug#44865)
- The result set returned by getVersionColumns() did not have the format defined in the JDBC API specifications. The third

column, DATA_TYPE, of the result set should be of type INTEGER. Connector/J however returns SMALLINT. (Bug#44863)

- The result set returned by getBestRowIdentifier() did not have the format defined in the JDBC API specifications. The third column, DATA_TYPE, of the result set should be of type INTEGER. Connector/J however returns SMALLINT. (Bug#44862)

- Connector/J contains logic to generate a message text specifically for streaming result sets when there are CommunicationsException exceptions generated. However, this code was never reached.

  In the CommunicationsException code:

  ```
  private boolean streamingResultSetInPlay = false;

  public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
  long lastPacketReceivedTimeMs, Exception underlyingException) {

  this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
        lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
        this.streamingResultSetInPlay);
  ```

  streamingResultSetInPlay was always false, which in the following code in SQLError.createLinkFailureMessageBasedOnHeuristics() never being executed:

  ```
  if (streamingResultSetInPlay) {
      exceptionMessageBuf.append(
      Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
  } else {
  ...
  ```

  (Bug#44588)

- The SQLError.createLinkFailureMessageBasedOnHeuristics() method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

  Information about when the last packet was successfully received should be provided in all cases. (Bug#44587)

- Statement.getGeneratedKeys() retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug#44056)

- Using useInformationSchema with DatabaseMetaData.getExportedKeys() generated the following exception:

  ```
  com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
  'REFERENCED_TABLE_NAME' in where clause is ambiguous
  ...
  at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
  at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
  at
  com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
  DatabaseMetaDataUsingInfoSchema.java:50)
  at
  com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
  DatabaseMetaDataUsingInfoSchema.java:603)
  ```

  (Bug#43714)

- LoadBalancingConnectionProxy.doPing() did not have blacklist awareness.

  LoadBalancingConnectionProxy implemented doPing() to ping all underlying connections, but it threw any exceptions it encountered during this process.

  With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug#43421)

- The method Statement.getGeneratedKeys() did not return values for UNSIGNED BIGINTS with values greater than Long.MAX_VALUE.

  Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return BigIntegers for the result set returned from getGeneratedKeys(), it will only return them if the value is greater than Long.MAX_VALUE. If your application needs this consistency, it will need to check the class of the return value from .getObject() on the ResultSet returned by Statement.getGeneratedKeys() and if it is not a BigInteger, create one

based on the `java.lang.Long` that is returned. (Bug#43196)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug#43071)
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug#43070)
- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```
java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)
```

  (Bug#42253)

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
 at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
 at java.util.HashMap$KeyIterator.next(Unknown Source)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
 at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
 at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

  (Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug#41730)
- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

  For example, consider the following statement:

```
String sql = "-- Customer's zip code will be fixed\n" +
  "update address set zip_code = 99999\n" +
  "where not regexp '^[0-9]{5}([[.-.]])?([0-9]{4})?$'";
```

  When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```
-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^[0-9]([[.-.]])?([0-9])?$'
```

  (Bug#41566)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

  > **Note**
  >
  > The performance regression in `indexOfIgnoreCaseRespectMarker()`has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

  (Bug#41532)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```
java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)
at com.zimbra.cs.db.DbVolume.constructVolume(DbVolume.java:297)
at com.zimbra.cs.db.DbVolume.get(DbVolume.java:197)
at com.zimbra.cs.db.DbVolume.create(DbVolume.java:95)
at com.zimbra.cs.store.Volume.create(Volume.java:227)

at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)
```

(Bug#41484)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

```
PreparedStatement ps = connection.prepareStatement("INSERT INTO table
  values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
```

(Bug#41448)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

```
Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. (Bug#41416)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

  However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug#41269)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)

- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

(Bug#40772)

- When using `rewriteBatchedStatements=true` with:

```
INSERT INTO table_name_values (...) VALUES (...)
```

Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values
(3,'toto',3),(id,data, ordr) values (' at line 1

```

(Bug#40439)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug#39426)

- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

```
SELECT TRIM(rowid) FROM tbl
```

  Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

  The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

  Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug#38387)

D.6.1.8. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug#42309)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an "S", in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug#40031)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug#39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug#39956)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug#39911)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with "08", it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

  There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue();
```

  This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug#39784)
- When configuring the Java Replication Driver the last slave specified was never used. (Bug#39611)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug#39352)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug#38782)
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data
modification are not allowed.
```

  (Bug#38747)
- Connector/J was unable to connect when using a non-`latin1` password. (Bug#37570)

- The `useOldAliasMetadataBehavior` connection property was ignored. (Bug#35753)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug#35170)
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug#34185)
- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug#33861)

D.6.1.9. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the resul sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` paramaters. (Bug#33678)
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` propery. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

  When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

  ```
  java.sql.SQLException: java.lang.NumberFormatException: For input string:
  ```

  followed by the text of the stored function starting after the argument list. (Bug#35199)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

  ```
  SELECT column AS aliasName from table
  ```

  (Bug#35150)
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented

`com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from ConnectionProperties are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug#34937)

- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). (Bug#34913)
- `RowDataStatic` does't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug#34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug#34703)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug#34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug#34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug#34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug#34093)
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug#33823)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug#33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug#33594)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug#33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

  We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

  We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. (Bug#32877)
- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

  Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

  This bug fix also fixes Bug#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) (Bug#32577, Bug#15604)
- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBounds` exception when

setting the last parameter to null. (Bug#31823)

- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

D.6.1.10. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

(Bug#15604)

D.6.1.11. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

D.6.1.12. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. (Bug#29853)
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client/server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` through the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement`/`PreparedStatement`/`CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

  If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

  If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT`/`REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:

  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

    This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

    If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

  - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

    This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

  Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs` The regex must follow the patterns used for the `java.util.regex`package. The default is to exclude no columns, and include all columns.

  Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as `IN` paramters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)

- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

D.6.1.13. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

D.6.1.14. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change**: Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

  For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

  We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

  `Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.
- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client/server round trips as possible.

D.6.1.15. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

> **Note**
>
> The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

  > **Note**
  >
  > This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the SQLState class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR`/`NVARCHAR` types.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's SQLXML interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

  To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

  - `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
  - `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file

- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).

- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

  The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

  This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file

- Added support for JDBC-4.0's `Wrapper` interface.

D.6.2. Changes in MySQL Connector/J 5.0.x

D.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- Added two configuration parameters:

  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).

- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

  If the driver gives up, it will throw the last-received `SQLException`. (Bug#31053)

- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)

- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)

- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as `IN` paramters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

  This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. (Bug#27916)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

D.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.
- `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and autoReconnect to `true`.
- `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.

- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes ResultSetMetadata.isCaseSensitive() much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to enable tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
  - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling setFetchSize() on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

  > **Note**
  >
  > If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug#29605)
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. (Bug#28956)
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug#28851)
- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

  As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug#28469)

D.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

  If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

  Therefore, for this to work (at all), you must use transactions, even if only reading data.

  Physical connections to the given hosts will not be created until needed.

  The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

  There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

  - `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.

  - `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.

- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.

- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).

- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

  This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

  > **Note**
  >
  > This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

  When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.

- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a ReplicationConnection (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

  In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.

- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

  This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug#28085)

- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. (Bug#27655)

- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug#27655)

- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

  If the comments happen to contain parameter markers (`?`), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

  > **Note**
  >
  > The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

  (Bug#27400)

- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug#27317)

- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug#27317)

- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug#26959)

- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug#26789)

- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug#26592)

- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug#26173)

- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug#25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug#25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug#25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug#25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug#25328)

D.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string:

  ```
  useServerPrepStmts=true
  ```

  The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).
- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat java.util.Date as a java.sql.Timestamp because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed using correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)

- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedState.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)

- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underyling exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a HashMap. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a HashMap, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

D.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimitters to be consistent with the ODBC driver. (Bug#22613)
- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. (Bug#22456)
- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. (Bug#22359)
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug#22297)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures.

)

- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of java.lang.Integer as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. (Bug#21544)
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column (")" exceptions. (Bug#21379)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Driver now supports `{call sp}` (without "()" if procedure has no arguments).

D.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug#20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug#20650)

D.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug#20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug#20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug#20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug#20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` systtem variable to the character set that is used for error messages. (Bug#18086)

- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401)

D.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

D.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://...`. (Bug#14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug#14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug#14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug#14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to Bug#14972). (Bug#14729)
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug#14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `''`, `(int)0` was being used as an argument indirectly using method return value. This signature doesn't exist prior to Java5.) (Bug#14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

  Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug#14729)
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug#14729)
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP`/`DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can

not be used when `useTimezone=true` to convert between server and client time zones.

- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

D.6.3. Changes in MySQL Connector/J 3.1.x

D.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)

D.6.3.2. Changes in MySQL Connector/J 3.1.14 (19 October 2006)

Bugs fixed:

- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it is required to check this property. (Bug#22290)
- Fixed Bug#18258 - DatabaseMetaData.getTables(), columns() with bad catalog parameter threw exception rather than return empty result set (as required by spec). (Bug#22290)
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. (Bug#22290)
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. (Bug#22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug#22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. (Bug#21207)
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). (Bug#21207)
- ResultSet.getSomeInteger() doesn't work for BIT(>1). (Bug#21062)
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). (Bug#20888)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug#20687)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug#20485)

- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug#20479)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug#20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug#19993)
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug#19993)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug#19726)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. (Bug#18880)
- Fixed memory leak with profileSQL=true. (Bug#16987)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. (Bug#16791)

D.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- `Fixed PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug#19615)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT type`. (Bug#19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug#19282)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug#18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug#18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug#18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug#18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug#18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug#17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug#17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug#17587)
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. (Bug#17587)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. (Bug#17450)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug#17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are

used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug#16841)

- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)
- Exception thrown for new decimal type when using updatable result sets. (Bug#14609)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . (Bug#13601)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug#13469)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

  If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug#13469)
- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use “short names” for the built-in log factories, for example, `logger=CommonsLogger` instead of `logger=com.mysql.jdbc.log.CommonsLogger`. (Bug#13469)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug#11874)

D.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug#15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug#15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug#14562)

- `storesLowerCaseIdentifiers()` returns `true` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug#14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug#14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`

    - `storesMixedCaseQuotedIdentifiers()` returns `false`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
- Extraneous sleep on `autoReconnect`. (Bug#13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Do not permit `executeBatch()` for `CallableStatements` with registered `OUT`/`INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

D.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now permits you to specify variables that start with the "`@`" sign. (Bug#13453)
- URL configuration parameters do not permit "`&`" or "`=`" in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html).

  If the "`%`" character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of "`%`" when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to re-

trieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)

- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY`/`VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)
- `getIndexInfo()` (Bug#12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug#12541)
- `getImportedKeys()` (Bug#12541)
- Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug#12541)
- `getCrossReference()` (Bug#12541)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug#12541)
- `getColumns()` (Bug#12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`

  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

  The `catalog` argument in all of these methods now behaves in the following way:

  - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
  - Specifying `""` means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
  - Specifying a catalog works as stated in the API docs.
  - Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

  (Bug#12541)

- `getBestRowIdentifier()` (Bug#12541)
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug#12541)
- `getTables()` (Bug#12541)
- `getPrimaryKeys()` (Bug#12541)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug#12417)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229)
- Properties shared between master and slave with replication connection. (Bug#12218)
- Geometry types not handled with server-side prepared statements. (Bug#12104)
- `maxPerformance.properties` mis-spells "elideSetAutoCommits". (Bug#11976)
- `ReplicationConnection` won't switch to slave, throws "Catalog can't be null" exception. (Bug#11879)
- `Pstmt.setObject(...., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT`/`OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers where within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)

- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotation marks. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

D.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implemention of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

D.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance`: Maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can (Bug#11115)

- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- Added the following configuration bundles, use one or many using the `useConfigs` configuration property:
  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality

  (Bug#11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug#10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug#10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug#10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug#10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug#10496)
- The data type returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug#10485)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotation marks not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public to enable access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some

time, DBMD just missed that fact. (Bug#10155)

- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

D.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning "`%`"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:

  1. Log4j, if it is available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.

  (Bug#9704)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained "`,`" in them would fail. (Bug#9682)

- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug#9682)
- Added support for the c3p0 connection pool's (http://c3p0.sf.net/) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug#9320)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug#9320)
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug#9320)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug#9320)
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug#9319)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319)
- A continuation of Bug#8868, where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236)
- Cannot use `UTF-8` for characterSetResults configuration property. (Bug#9206)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug#9040)
- `ServerPreparedStatements` now correctly “stream” `BLOB`/`CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug#8868)
- `DATE_FORMAT()` queries returned as `BLOB`s from `getObject()`. (Bug#8868)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug#8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug#8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug#8868)
- Check for empty strings (`''`) when converting `CHAR`/`VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug#8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug#8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

D.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatements` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over statement.close() or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(...., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)

- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for "boolean" `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

D.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

D.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all "padding" zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until

they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)

- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql_stmt_execute()". (Bug#5235)
- Handle case when string representation of timestamp contains trailing "`.`" with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

D.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundExceptions`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retreiving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.wasNull()` does not work for primatives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes using `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's "standard" description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)

- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

D.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debuging code (see the `enablePacketDebug` property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug#4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

D.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParamet-`

er(). (Bug#3146)

- Cleaned up detection of server properties. (Bug#3146)
- Correctly detect initial character set for servers >= 4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server >= 4.1.2. (Bug#3146)
- Added gatherPerformanceMetrics property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a NullPointerException in CallableStatement.setOutputParameters().
- Enabled callable statement caching using cacheCallableStmts property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added .toString() functionality to ServerPreparedStatement, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added logSlowQueries property, along with slowQueriesThresholdMillis property to control when a query should be considered "slow."
- Removed wrapping of exceptions in MysqlIO.changeUser().
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, char(), varchar()).
- ServerPreparedStatements weren't actually de-allocating server-side resources when .close() was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

D.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- NULL fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed ConnectionProperties that weren't properly exposed through accessors, cleaned up ConnectionProperties code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning data type YEAR correctly. (Bug#2606)
- Fixed charset conversion issue in getTables(). (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented Connection.prepareCall(), and DatabaseMetaData.getProcedures() and getProcedureColumns(). (Bug#2359)
- Merged prepared statement caching, and .getMetaData() support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in TimeUtil.fastDate/TimeCreate() when unpacking results from server-

side prepared statements. (Bug#2359)

- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month descrepencies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug#1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
- Fixed sending of queries larger than 16M. (Bug#1673)
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.

- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

D.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

D.6.4. Changes in MySQL Connector/J 3.0.x

D.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug#8812)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug#8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug#8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug#7686)

- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug#7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence {fn convert(..., type)} now supports ODBC-style types that are prepended by `SQL_`. (Bug#7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug#7081)
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp`/`Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

D.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1)` -> `BIT`/`Boolean` conversion configurable using `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)
- Off-by-one bug in `Buffer.readString(`*`string`*`)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version >= 4.1.1. (Bug#5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

D.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)
- Parse new time zone variables from 4.1.x servers. (Bug#5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- "Production" is now "GA" (General Availability) in naming scheme of distributions. (Bug#4860, Bug#4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that "like" types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4860, Bug#4138)
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption. (Bug#4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

  > **Warning**
  >
  > This required a change to the `SocketFactory` `connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

  (Bug#4334)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

D.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

D.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)
- Using a `MySQLDatasource` without server name fails. (Bug#3848)

D.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. (Bug#3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Not specifying database in URL caused `MalformedURL` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to permit end users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL >= 4.1.0. (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to SQLState of `23000`.

- Backported “change user” and “reset server state” functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

D.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue http://developer.java.sun.com/developer/bugParade/bugs/4401235.html) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on`/`off` or `1`, `2`, `3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` *or* `utf-8` using the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

D.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for SQLStates. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBounds` when parameter number == number of parameters + 1. (Bug#1958)

- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence {fn convert ... }. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR`/`VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBounds` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)

D.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any oustanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug#1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug#1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246)
- Optimized `CLOB.setChracterStream()`. (Bug#1131)

- Fixed `CLOB.truncate()`. (Bug#1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug#1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword "set" in character columns. (Bug#1099)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble`/`setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug#884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in nonescaped input. (Bug#879)
- When emptying input stream of unused rows for "streaming" result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. (Bug#879)
- Issue exception on `ResultSet.get`*`XXX`*`()` on empty result set (wasn't caught in some cases). (Bug#848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug#848)
- Fixed regression in large split-packet handling. (Bug#848)
- Better diagnostic error messages in exceptions for "streaming" result sets. (Bug#848)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug#688)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug#688)
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug#688)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug#688)
- Fix `UpdatableResultSet` to return values for `get`*`XXX`*`()` when on insert row. (Bug#675)
- Support `InnoDB` contraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#664, Bug#517)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug#664, Bug#517)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug#496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

D.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug#378)

- Fix problem detecting server character set in some cases. (Bug#378)
- Allow multiple calls to `Statement.close()`. (Bug#378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug#378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. . (Bug#378)
- Fix row data decoding error when using *very* large packets. (Bug#378)
- Optimized row data decoding. (Bug#378)
- Issue exception when operating on an already closed prepared statement. (Bug#378)
- Optimized usage of `EscapeProcessor`. (Bug#378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

D.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of 0x5c (`'\'`) character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

D.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return `""` when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

D.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBounds` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.

D.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.

- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to enable control of amount of checking for "correctness" of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

D.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement`/`PreparedStatement.executeBatch()` using `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see `testsuite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

D.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which enables you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See `README` for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in setBinary/Ascii/Character Stream() unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

D.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatemtent.setClob()`, `PreparedStatement.setObject(Clob)`.
- `Connection.isClosed()` no longer "pings" the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing "sensitive" information from them (such as host names, ports, or user names), as well as clearing "sensitive" data structures when possible.

D.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see `README`) Thanks to Doron.
- Testsuite now uses Junit (which you can get from http://www.junit.org.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see `README`).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see `README` for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wyke-

ham-Fiennes.

- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me `<mark@mysql.com>`.
- Performance enchancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

D.6.5. Changes in MySQL Connector/J 2.0.x

D.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See `README` for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, "`"`" will be used as an identifier quote character, otherwise "`'`" will be used.

D.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

D.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

D.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

D.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

D.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).

- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

D.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource`/`ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

D.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Captialize type names when `captializeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- PreparedStatement.setDouble() now uses full-precision doubles (reverting a fix made earlier to truncate them).

- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- PreparedStatement.setBoolean() will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

D.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

D.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has +/-Inf/inf support.
- `getObject()` on `ResultSet` correctly does `TINYINT`->`Byte` and `SMALLINT`->`Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT`/`BLOB`.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

D.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of -/+INF for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.

- Implemented `getBigDecimal()` without scale component for JDBC2.

D.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

D.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

D.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to ResultSet for insertRow() - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed ResultSet to return correct row numbers
- Statement.getUpdateCount() now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

D.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)

- The database no longer needs to specified to connect. (Thanks to Christian Motschke)

D.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

D.6.7. Changes in MySQL Connector/J 1.2.x and lower

D.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

D.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS

- Re-compiled with jikes for valid class files (thanks ms!)

D.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

D.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidriectonally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

D.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

D.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.

- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

D.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

D.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

D.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.

- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

D.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that enables executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

D.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccess error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

D.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

D.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

D.7. MySQL Connector/MXJ Change History

D.7.1. Changes in MySQL Connector/MXJ 5.0.11 (24th November 2009)

Functionality added or changed:

- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded Aspect/J class has been removed.
- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.

Bugs fixed:

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread “Thread-3” java.util.MissingResourceException?: Resource
‘5-0-51a/Windows_7-x86/mysqld-nt.exe’ not found
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:133)
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:107)
at com.mysql.management.util.Streams$1.inner(Streams.java:149) at
com.mysql.management.util.Exceptions$VoidBlock?.exec(Exceptions.java:128)
at com.mysql.management.util.Streams.createFileFromResource(Streams.java:162)
at com.mysql.management.MysqldResource?.makeMysqld(MysqldResource?.java:533)
at com.mysql.management.MysqldResource?.deployFiles(MysqldResource?.java:518)
at com.mysql.management.MysqldResource?.exec(MysqldResource?.java:495)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:216)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:166)
```

  The default `platform-map.properties` file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, `amd64` and `sparcv9` for Solaris, and Mac OS X 64-bit. (Bug#48298)

D.7.2. Changes in MySQL Connector/MXJ 5.0.10 (Never released)

This was an internal only release.

Functionality added or changed:

- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.
- The MySQL binary for Windows targets has been updated to be configurable through the `windows-mysqld-command` property. This is to handle the move in MySQL 5.1.33 from `mysqld-nt.exe` to `mysqld.exe`. The default value is `mysqld.exe`.

D.7.3. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

Functionality added or changed:

- The port used in the `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` port is no longer hard coded. Instead, the code uses the `x-mxj_test_port` property a default value of `3336`
- The utility used to kill MySQL on Windows (`kill.exe`) has been configured to be loaded from the `kill.exe` property, instead of being hard-coded. The corresponding timeout, `KILL_DELAY` has also been moved to the properties file and defaults to 5 minutes.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.

D.7.4. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

Functionality added or changed:

- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.
- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.

D.7.5. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

Functionality added or changed:

- Updated the jar filename to be consistent with the Connector/J jar filename. Files are now formatted as `mysql-connector-mxj-mxj-version`.
- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExammple` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was corrected in Connector/J 5.0.6.
- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.

Bugs fixed:

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

D.7.6. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.

- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preperation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connetor/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

D.7.7. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in mysql_kill; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: MySQL Forums (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Now incoporates Reggie Bernett's `SafeTerminateProcess` and only calls the unsafe TerminateProcess as a final last resort.
- New windows `kill.exe` fixes a bug where mysqld was being force terminated. Issue reported by bruno haleblian and others, see: MySQL Forums.
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.

- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrats that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand to enable setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

D.7.8. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. (Bug#24004)
- Updated `build.xml` to build to handle with different gpl and commercial mysld version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

D.7.9. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

D.7.10. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust be deleting the /tmp/test-c.mxj directory before running tests.
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- moved PID file into datadir
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err
- ServerLauncherSocketFactory now treats URL parameters in the form of `&server.foo=null` as `serverOption-Map.put("foo", null)`
- ServerLauncherSocketFactory.shutdown API change: now takes 2 File parameters (basedir, datadir)

D.7.11. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

D.7.12. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed HelpOptionsParser's need to reference a MysqldResource.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

D.8. MySQL Connector/C++ Change History

D.8.1. Changes in MySQL Connector/C++ 1.1.x

D.8.1.1. Changes in MySQL Connector/CPP 1.1.0 (13th September 2010 GA)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality added or changed:

- **Incompatible Change**: API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

  ```
  sql::ConnectPropertyVal tmp;
  tmp.str.val=passwd.c_str();
  tmp.str.len=passwd.length();
  connection_properties["password"] = tmp;
  ```

  Should be changed to:

  ```
  connection_properties["password"] = sql::ConnectPropertyVal(passwd);
  ```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use boost::scoped_array. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use CMake for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are avalable for `Connection::setClientOption()`.

Bugs fixed:

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug#45846)
- CMake generated an error if configuring an out of source build, that is when CMake not called from the source root directory. (Bug#45843)
- Using Prepared Statements caused corruption of the heap. (Bug#45048)
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. (Bug#44931)
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug#44931)
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.

D.8.2. Changes in MySQL Connector/C++ 1.0.x

D.8.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

  ```
  connection->getMetaData->getSchema();
  ```

  This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.
- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

D.8.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.
- Introduced `ResultSetMetaData::isZerofill()`, which is not in the JDBC specification.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

D.8.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.

- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

D.8.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.

- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

D.8.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

    `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

    `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not

found in `sql::Connection`.

However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

```
examples/connect tcp://host:port user pass database
```

or

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

D.9. MySQL Proxy Change History

D.9.1. Changes in MySQL Proxy 0.8.1 (13 September 2010)

Functionality added or changed:

- Allow interception of `LOAD DATA INFILE` and `SHOW ERRORS` statements.
- The unused `network_mysqld_com_query_result_track_state()` function has been deprecated.
- `chassis_set_fdlimit()` has been deprecated in favor of `chassis_fdlimit_set()`.

- Shutdown hooks were added to free the global memory of third-party libraries such as `openssl`.
- `con->in_load_data_local` has been removed.

Bugs fixed:

- The admin plugin had an undocumented default value for `--admin-password`. (Bug#53429)
- Use of `LOAD DATA LOCAL INFILE` caused the connection between the client and MySQL Proxy to abort. (Bug#51864)
- If the backend MySQL server went down, and then the clock on the MySQL Proxy host went backward (for example, during daylight saving time adjustments), Proxy stopped forwarding queries to the backend. (Bug#50806)
- `network_address_set_address()->network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that a MySQL Proxy plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. (Bug#49099)
- The hard limit was fixed for the case where the fdlimit was set. (Bug#48120)
- MySQL Proxy returned an error message with a nonstandard SQL State when all backends were down:

  ```
  "#07000(proxy) all backends are down"
  ```

  This caused issues for clients with “retry” logic, as they could not handle these “custom” SQL States. (Bug#45417)
- If MySQL Proxy used a UNIX socket, it did not remove the socket file at termination time. (Bug#38415)
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have been updated.

D.9.2. Changes in MySQL Proxy 0.8.0 (21 January 2010)

Functionality added or changed:

- The `--no-daemon` has been renamed to The `--daemon`. By default, MySQL Proxy now starts in foreground mode. Use the `--daemon` option to override this and start in daemon mode.

Bugs fixed:

- A memory leak occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug#50993)
- A segmentation fault occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug#48641)
- MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed through the file. MySQL Proxy now refuses to load a configuration file with unsafe permissions. (Bug#47589)
- Several supplied scripts were updated to account for flag and structure changes:
  - `active-transactions.lua` was updated to use the `resultset_is_needed` flag.
  - `ro-balance.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connection.dst.name` structure.
  - `rw-splitting.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connections` structure.

  (Bug#47349, Bug#45408, Bug#47345, Bug#43424, Bug#42841, Bug#46141)
- The line numbers provided in stack traces were off by one. (Bug#47348)

- MySQL Proxy accepted more than one address in the value of the `--proxy-backend-addresses` option. You should specify one `--proxy-backend-addresses` option for each backend address. (Bug#47273)
- MySQL Proxy returned the wrong version string internally from the `proxy.PROXY_VERSION` constant. (Bug#45996)
- MySQL Proxy could stop accepting network packets if it received a large number of packets. The listen queue has been extended to permit a larger backlog. (Bug#45878, Bug#43278)
- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug#45272)
- MySQL Proxy failed to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. Now Proxy denies `COM_CHANGE_USER` commands when it is connected to MySQL 5.1.14 to 5.1.17 servers by sending back an error: `COM_CHANGE_USER is broken on 5.1.14-.17, please upgrade the MySQL Server`. (Bug#45167)

  See also Bug#25371.
- Logging to `syslog` with the `--log-use-syslog` option did not work. (Bug#36431)
- MySQL Proxy could incorrectly insert `NULL` values into the returned result set, even though non-`NULL` values were returned in the original query. (Bug#35729)
- MySQL Proxy raised an error when processing query packets larger than 16MB. (Bug#35202)

D.9.3. Changes in MySQL Proxy 0.7.2 (30 June 2009)

Bugs fixed:

- On Windows, MySQL Proxy might not find the required modules during initialization. The core code has been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. (Bug#45833)

D.9.4. Changes in MySQL Proxy 0.7.1 (15 May 2009)

Bugs fixed:

- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug#45272)
- The port number was reported incorrectly in `proxy.connection.client.address`. (Bug#43313)
- Result sets with more than 250 fields could cause MySQL Proxy to crash. (Bug#43078)
- MySQL Proxy was unable to increase its own maximum number of open files according to the limit specified by the `--max-open-files` option, if the limit was less than 8192. When set to debug level, Proxy now reports the open files limit and when the limit has been updated. (Bug#42783)
- MySQL Proxy crashed when connecting to a MySQL 4.0 server. Now it generates an error message instead. (Bug#38601)
- When using the `rw-splitting.lua` script, you could get an error when talking to the backend server:

  ```
  2008-07-28 18:00:30: (critical) (read_query) [string
  "/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
  expected, got userdata)
  ```

  This led to Proxy closing the connection to the configured MySQL backend. (Bug#38419)
- When using MySQL Proxy with multiple backends, failure of one backend caused Proxy to disconnect all backends and stop routing requests. (Bug#34793)

D.9.5. Changes in MySQL Proxy 0.7.0 (Not Released)

Functionality added or changed:

- Support for using a configuration file, in addition to the command-line options, has been added. To specify such a file, use the `--defaults-file=file_name` command-line option. See Section 14.6.3, "MySQL Proxy Command Options". (Bug#30206)
- A number of the internal structures developed for use with Lua scripts that work with MySQL Proxy have been updated and harmonized to make their meaning and contents easier to use and consistent across multiple locations.
  - The address information has been updated. Instead of a combined `ip:port` structure that you had to parse to extract the individual informaiton, you can now access that information directly. For example, instead of structures providing a single `.address` item, you now have these items: `name` (the combined `ip:port`), `address` (the IP address), and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of connections.

    Some familiar strucgtures have been updated to acommodate this information:
    - `proxy.connection.client.address` is `proxy.connection.client.src.name`
    - `proxy.connection.server.address` is `proxy.connection.server.dst.name`
  - `proxy.backends` is now in `proxy.global.backends` The `.address` field of each backend is an address-object as described earlier. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
  - The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

    In `read_handshake()`, you access the information through the global `proxy.connction` table:

0.6	0.7
`auth.thread_id`	`proxy.connection.server.thread_id`
`auth.mysqld_version`	`proxy.connection.server.mysqld_version`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`
`auth.scramble`	`proxy.connection.server.scramble_buffer`

    In `read_auth()`, you can use the following:

0.6	0.7
`auth.username`	`proxy.connection.client.username`
`auth.password`	`proxy.connection.client.scrambled_password`
`auth.default_db`	`proxy.connection.client.default_db`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`

  - In the `proxy.queries:append()` function, a third parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the result set in the `read_query_result()` hook, you must set the `resultset_is_needed` flag:

```
proxy.queries:append( 1, ..., { resultset_is_needed = true } )
```

    For more information, see proxy.queries [1444].
  - `proxy.backends` is now in `proxy.global.backends`.

Bugs fixed:

- **Security Enhancement**: Accessing MySQL Proxy using a client or backend from earlier than MySQL 4.1 resulted in Proxy aborting with an assertion. This is because Proxy supports only MySQL 4.1 or higher. Proxy now reports a fault. (Bug#31419)
- MySQL Proxy was configured with the `LUA_PATH` and `LUA_CPATH` directory locations according to the build host rather than the execution host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. (Bug#44877, Bug#44497)
- Using MySQL Proxy with very large return data sets from queries could cause a crash, with or without manipulation of the data set within the Lua engine. (Bug#39332)
- MySQL Proxy terminated if a submitted packet was smaller than expected by the protocol. (Bug#36743)
- When using MySQL Proxy in a master-master replication scenario, Proxy failed to identify failure in one of the replication masters and did not redirect connections to the other master. (Bug#35295)

D.9.6. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write errors.
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

D.9.7. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. (Bug#30867)
- Added support in `read_query_result()` to overwrite the result set.
- By default, MySQL Proxy now starts in daemon mode. Use the new `--no-daemon` option to override this. Added the `--pid-file` option for writing the process ID to a file after becoming a daemon.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added test cases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global Lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed an assertion on `COM_BINLOG_DUMP`. (Bug#29764)

- Fixed an assertion on result-packets like `[field-len | fields | EOF | ERR]`. (Bug#29732)
- Fixed an assertion that MySQL Proxy raised at login time if a client specified no password and no default database. (Bug#29719)
- Fixed an assertion at `COM_SHUTDOWN`. (Bug#29719)
- Fixed a crash if `proxy.connection` is used in `connect_server()`.
- Fixed the `glib2` check to require at least `glib2` 2.6.0.
- Fixed an assertion at connect time when all backends are down.
- Fixed connection stalling if `read_query_result()` raised an assertion.
- Fixed length encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed an assertion when connecting to MySQL 6.0.1.
- Fixed decoding of length-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result sets.
- Fixed a memory leak when `proxy.response.*` is used.

D.9.8. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the Lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate result sets from a script.

Bugs fixed:

- Fixed mysql check in `configure` to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed a compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed a crash on fields longer than 250 bytes when the result set is inspected.
- Fixed a warning if `connect_server()` is not provided.
- Fixed an assertion when an error occurs at initial script exec time.

- Fixed an assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

D.9.9. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake`/`autoconf` support.
- Added CMake support.

Appendix E. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

E.1. Restrictions on Stored Routines, Triggers, and Events

These restrictions apply to the features described in Chapter 18, *Stored Programs and Views*.

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some restrictions specific to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See Section 12.6, “SQL Syntax for Prepared Statements”, for a list of statements supported as prepared statements. Only the statements listed there are supported for stored routines, unless noted otherwise in Section 18.2, “Using Stored Routines (Procedures and Functions)”.
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO *var_list*` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO *var_list*` or by using a cursor and `FETCH` statements. See Section 12.7.3.3, “`SELECT ... INTO` Statement”.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table:`

tbl_name' error occurs, even if the references occur in different statements within the function.

Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see Section 16.4.1.29, “Replication and Triggers”.
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in Section 18.7, “Binary Logging of Stored Programs”.

The `--replicate-wild-do-table=`*db_name.tbl_name* option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

Debugging Considerations

There are no stored routine debugging facilities.

Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers are not supported.
- `FOR` loops are not supported.

Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See Section 18.7, “Binary Logging of Stored Programs”.

Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug#16409, Bug#18896)
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug#16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug#16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug#16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug#22830 for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in the body of an event. For more information, see Section 12.6, “SQL Syntax for Prepared Statements”.

E.2. Restrictions on Signals

`SIGNAL` and `RESIGNAL` are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class `'04'` are not treated specially. They are handled the same as other exceptions.

E.3. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

E.4. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

  A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

  The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

  ```
  SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
  ```

  The optimizer rewrites the statement to a correlated subquery:

  ```
  SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
  ```

  If the inner and outer queries return *M* and *N* rows, respectively, the execution time becomes on the order of O(*M*×*N*), rather than O(*M*+*N*) as it would be for an uncorrelated subquery.

  An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

  ```
  DELETE FROM t WHERE ... (SELECT ... FROM t ...);
  UPDATE t ... WHERE col = (SELECT ... FROM t ...);
  {INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
  ```

  Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

  ```
  UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
  ```

Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For *`expr IN (subquery)`*, *`expr`* can be an *`n`*-tuple (specified using row constructor syntax) and the subquery can return rows of *`n`*-tuples.
  - For *`expr op {ALL|ANY|SOME} (subquery)`*, *`expr`* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

  In other words, for a subquery that returns rows of *`n`*-tuples, this is supported:

  ```
  (val_1, ..., val_n) IN (subquery)
  ```

  But this is not supported:

  ```
  (val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
  ```

  The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.

- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

  ```
  mysql> SELECT * FROM t1
      ->   WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
  ERROR 1235 (42000): This version of MySQL doesn't yet support
   'LIMIT & IN/ALL/ANY/SOME subquery'
  ```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

  An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

  ```
  SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
  ```

  That statement can be rewritten as follows:

  ```
  SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
  ```

  But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

  ```
  SELECT ... WHERE x IN (SELECT f() ...);
  ```

  This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

  For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

  Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a,ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
         AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use `t1` or `t2` first.

- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

E.5. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the FROM clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Section E.4, “Restrictions on Subqueries”.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying ALGORITHM = TEMPTABLE in the view definition.)

You can use DROP TABLE or ALTER TABLE to drop or alter a table that is used in a view definition. No warning results from the DROP or ALTER operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. CHECK TABLE can be used to check for views that have been invalidated by DROP or ALTER operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by PREPARE refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

  ```
  CREATE VIEW v AS SELECT RAND();
  PREPARE s FROM 'SELECT * FROM v';
  ALTER VIEW v AS SELECT NOW();
  EXECUTE s;
  ```

  The result returned by the EXECUTE statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have UNION in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the WHERE clause. Some views that have subqueries in the SELECT list may be updatable.
- You cannot use UPDATE to update more than one underlying table of a view that is defined as a join.
- You cannot use DELETE to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the CREATE VIEW and SELECT privileges), that user will be unable to call SHOW CREATE VIEW on that object unless the user is also granted the SHOW VIEW privilege.

That shortcoming can lead to problems backing up a database with mysqldump, which may fail due to insufficient privileges. This problem is described in Bug#22062.

The workaround to the problem is for the administrator to manually grant the SHOW VIEW privilege to users who are granted CREATE VIEW, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

SHOW CREATE VIEW displays view definitions using an AS *alias_name* clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in CREATE VIEW statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of SHOW CREATE VIEW fail if any column alias exceeds 64 characters. This can cause problems in the following

circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

E.6. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For "external XA," a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For "Internal XA", storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the *`bqual`* part of the *`xid`* value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

E.7. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, and `utf32` character sets have the following restrictions:
  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, "Connection Character Sets and Collations".)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

E.8. Performance Schema Restrictions

Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `SETUP_xxx` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `PERFORMANCE_TIMERS` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

E.9. Limits in MySQL

This section lists current limits in MySQL 5.5.

E.9.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

E.9.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

  The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate 255 × 3 = 765 bytes per value. Consequently, a table cannot contain more than 65,535 / 765 = 85 such columns.

  Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

  `BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

  Declaring columns `NULL` can reduce the maximum number of columns permitted. `NULL` columns require additional space in the row to record whether their values are `NULL`.

  For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
```

```
            + (number of variable-length columns)
```

delete_flag is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. *delete_flag* is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for InnoDB tables, for which storage size is no different for NULL columns than for NOT NULL columns.

The following statement to create table t1 succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    -> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table t2 fails because the columns are NULL and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    -> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an .frm file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the .frm file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- info_length is space needed for “screens.” This is related to MySQL's Unireg heritage.
- create_fields.elements is the number of columns.
- FCOMP is 17.
- n_length is the total length of all column names, including one byte per name as a separator.
- int_length is related to the list of values for ENUM and SET columns.
- com_length is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of ENUM or SET columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - InnoDB permits no more than 1000 columns.
  - InnoDB restricts row size to something less than half a database page (approximately 8000 bytes), not including VARBINARY, VARCHAR, BLOB, or TEXT columns.
  - Different InnoDB storage formats (COMPRESSED, REDUNDANT) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

E.9.3. Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

  On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

  When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

  For more information about this problem, see http://support.microsoft.com/default.aspx?scid=kb;en-us;196271.

- **`DATA DIRECTORY` and `INDEX DIRECTORY`**

  The `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows, because MySQL does not support Windows symbolic links. These options also are ignored on systems that have a nonfunctional `realpath()` call.

- **`DROP DATABASE`**

  You cannot drop a database that is in use by another session.

- **Case-insensitive names**

  File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Section 8.2.2, “Identifier Case Sensitivity”.

- **Directory and file names**

  On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

  The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “`\`” path name separator character**

  Path name components in Windows are separated by the “`\`” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “`/`” characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

  Alternatively, you must double the “`\`” character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
```

- **Problems with pipes**

  Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z` / `CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

  This is mainly a problem when you try to apply a binary log as follows:

  ```
  C:\> mysqlbinlog binary_log_file | mysql --user=root
  ```

  If you have a problem applying the log and suspect that it is because of a `^Z` / `CHAR(24)` character, you can use the following workaround:

  ```
  C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
  C:\> mysql --user=root --execute "source /tmp/bin.sql"
  ```

  The latter command also can be used to reliably read in any SQL file that may contain binary data.

Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 19.20, “The INFORMATION_SCHEMA EVENTS Table”

CREATE EVENT IF NOT EXISTS

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

CREATE FUNCTION

Section 12.1.3, “ALTER FUNCTION Syntax”
Section 12.1.10, “CREATE FUNCTION Syntax”
Section 12.4.3.2, “CREATE FUNCTION Syntax”
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”
Section 12.4.3.3, “DROP FUNCTION Syntax”
Section 22.3, “Adding New Functions to MySQL”
Section 18.7, “Binary Logging of Stored Programs”
Section 22.3.2.5, “Compiling and Installing User-Defined Functions”
Description
Section 8.2.4, “Function Name Parsing and Resolution”
Section 11.14, “Information Functions”
Section 16.4.1.8, “Replication of Invoked Features”
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 18.2.1, “Stored Routine Syntax”
Section 22.3.2.1, “UDF Calling Sequences for Simple Functions”
Section 22.3.2.6, “User-Defined Function Security Precautions”

CREATE INDEX

Section 12.1.6, “ALTER TABLE Syntax”
Section 12.1.11, “CREATE INDEX Syntax”
Section 13.6.4.4, “FOREIGN KEY Constraints”
Section 11.17.6.1, “Creating Spatial Indexes”
Section 11.9, “Full-Text Search Functions”
Section 7.7, “Optimizing for MEMORY Tables”
Section 12.6, “SQL Syntax for Prepared Statements”
Section 5.1.4, “Server System Variables”

Section 12.3.3, “Statements That Cause an Implicit Commit”

CREATE LOGFILE GROUP

Description
Section 19.21, “The INFORMATION_SCHEMA FILES Table”

CREATE OR REPLACE VIEW

Section 12.1.7, “ALTER VIEW Syntax”
Section 12.1.16, “CREATE VIEW Syntax”
Section E.5, “Restrictions on Views”

CREATE PROCEDURE

Section 12.1.4, “ALTER PROCEDURE Syntax”
Section 12.2.1, “CALL Syntax”
Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”
Section 18.7, “Binary Logging of Stored Programs”
Description
Section 11.14, “Information Functions”
Section 16.4.1.8, “Replication of Invoked Features”
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 18.2.1, “Stored Routine Syntax”

CREATE SCHEMA

Section 12.1.8, “CREATE DATABASE Syntax”

CREATE SERVER

Section 12.1.5, “ALTER SERVER Syntax”
Section 12.1.13, “CREATE SERVER Syntax”
Section 13.12.3, “FEDERATED Storage Engine Notes and Tips”
Section 12.4.6.3, “FLUSH Syntax”
Section 13.12.2.2, “Creating a FEDERATED Table Using CREATE SERVER”
Section 7.11.4.1, “How MySQL Uses Memory”
Section 13.12.2, “How to Create FEDERATED Tables”

CREATE TABLE

Section 4.5.1.1, “mysql Options”
Section 12.1.6, “ALTER TABLE Syntax”
Section 13.6.4.3, “AUTO_INCREMENT Handling in InnoDB”
Section 12.1.9, “CREATE EVENT Syntax”
Section 12.1.11, “CREATE INDEX Syntax”
Section 12.1.13, “CREATE SERVER Syntax”
Section 12.1.14.1, “CREATE TABLE ... SELECT Syntax”
Section 12.1.14, “CREATE TABLE Syntax”
Section 12.8.1, “DESCRIBE Syntax”
Section 13.6.4.4, “FOREIGN KEY Constraints”
Section 17.2.4, “HASH Partitioning”

EXPLAIN EXTENDED

Section 7.8.2, “EXPLAIN Output Format”
Section 12.8.2, “EXPLAIN Syntax”
Section 7.13.3, “Engine Condition Pushdown Optimization”
Section 7.13.12, “Optimizing IN/=ANY Subqueries”

EXPLAIN PARTITIONS

Section 12.8.2, “EXPLAIN Syntax”
Section 17.3.4, “Obtaining Information About Partitions”
Section 7.8.1, “Optimizing Queries with EXPLAIN”

EXPLAIN SELECT

Section 7.8.2, “EXPLAIN Output Format”
Section 13.6.8.9, “How to Cope with Deadlocks”
Section 1.7, “How to Report Bugs or Problems”

Section 1.8.4, “MySQL Extensions to Standard SQL”
Section 17.3.4, “Obtaining Information About Partitions”
Section 12.2.10.8, “Subqueries in the FROM Clause”

FETCH

Section 12.7.5.3, “Cursor FETCH Statement”
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”

FLUSH

Section 12.4.6.3, “FLUSH Syntax”
Section 12.4.1.3, “GRANT Syntax”
Section 12.4.6.6, “RESET Syntax”
Description
Section 6.3.1, “Establishing a Backup Policy”
Section 1.8.4, “MySQL Extensions to Standard SQL”
Section 5.4.1, “Privileges Provided by MySQL”
Section 16.4.1.10, “Replication and FLUSH”
Section C.5.4.1.3, “Resetting the Root Password: Generic Instructions”
Section C.5.4.1.2, “Resetting the Root Password: Unix Systems”
Section C.5.4.1.1, “Resetting the Root Password: Windows Systems”
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 2.12.2, “Securing the Initial MySQL Accounts”
Section 5.1.6, “Server Status Variables”
Section 12.3.3, “Statements That Cause an Implicit Commit”

FLUSH BACKUP LOGS

Section 12.4.6.3, “FLUSH Syntax”
Section 21.9.3.55, “mysql_refresh()”

FLUSH BINARY LOGS

Section 5.2.6, “Server Log Maintenance”

FLUSH DES_KEY_FILE

Section 11.13, “Encryption and Compression Functions”

FLUSH HOSTS

Section C.5.2.6, “Host '*host_name*' is blocked”
Section 21.9.3.55, “mysql_refresh()”
Section 7.11.5.2, “How MySQL Uses DNS”
Section 5.1.4, “Server System Variables”

FLUSH LOGS

Section 12.4.6.3, “FLUSH Syntax”
Section 21.9.3.55, “mysql_refresh()”
Section 6.3.3, “Backup Strategy Summary”
Section 6.2, “Database Backup Methods”
Section 6.3.1, “Establishing a Backup Policy”
Section 5.2, “MySQL Server Logs”
Section 16.4.1.10, “Replication and FLUSH”
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”
Section 5.2.6, “Server Log Maintenance”
Section 5.1.9, “Server Response to Signals”
Section 5.2.2, “The Error Log”
Section 5.2.3, “The General Query Log”
Section 16.2.2.1, “The Slave Relay Log”

FLUSH MASTER

Section 12.4.6.3, “FLUSH Syntax”
Section 12.5.1.2, “RESET MASTER Syntax”
Section 12.4.6.6, “RESET Syntax”
Section 16.4.1.10, “Replication and FLUSH”

FLUSH PRIVILEGES

Section C.5.2.4, “Client does not support authentication protocol”
Section 12.4.6.3, “FLUSH Syntax”
Section 21.9.3.55, “mysql_refresh()”
Section 21.9.3.56, “mysql_reload()”
Section 5.5.2, “Adding User Accounts”
Section 5.4.7, “Causes of Access-Denied Errors”
Description
Section 7.11.4.1, “How MySQL Uses Memory”
Section 5.4.2, “Privilege System Grant Tables”
Section 16.4.1.10, “Replication and FLUSH”
Section 5.3.4, “Security-Related mysqld Options”
Section 5.1.2, “Server Command Options”
Section 5.1.9, “Server Response to Signals”
Section 5.5.4, “Setting Account Resource Limits”
Section 1.2, “Typographical and Syntax Conventions”
Section 5.4.6, “When Privilege Changes Take Effect”

FLUSH QUERY CACHE

Section 12.4.6.3, “FLUSH Syntax”
Section 7.9.3.4, “Query Cache Status and Maintenance”

FLUSH SLAVE

Section 12.4.6.3, “FLUSH Syntax”
Section 12.5.2.3, “RESET SLAVE Syntax”
Section 12.4.6.6, “RESET Syntax”
Section 16.4.1.10, “Replication and FLUSH”

FLUSH TABLE

Section 12.4.6.3, “FLUSH Syntax”
Section 7.6.3, “Bulk Data Loading for MyISAM Tables”
Section 7.2.2.1, “Speed of INSERT Statements”

FLUSH TABLES

Section 12.4.6.3, “FLUSH Syntax”
Section 12.2.4, “HANDLER Syntax”
Section 12.2.5.2, “INSERT DELAYED Syntax”
Section 13.9.2, “MERGE Table Problems”
Section 21.9.3.55, “mysql_refresh()”
Section 12.6.4, “Automatic Prepared Statement Repreparation”
Section 7.6.3, “Bulk Data Loading for MyISAM Tables”
Section 6.2, “Database Backup Methods”
Description
Description
Section 7.12.5.2, “General Thread States”
Section 7.4.3.1, “How MySQL Opens and Closes Tables”
Section 7.11.4.1, “How MySQL Uses Memory”
Section 16.1.1, “How to Set Up Replication”
Section 16.1.1.4, “Obtaining the Replication Master Binary Log Coordinates”
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”
Section 7.9.3.4, “Query Cache Status and Maintenance”
Section 16.4.1.10, “Replication and FLUSH”
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”
Section 5.1.4, “Server System Variables”
Section 7.2.2.1, “Speed of INSERT Statements”
Section E.9.3, “Windows Platform Limitations”

FLUSH TABLES WITH READ LOCK

Section 12.4.6.3, “FLUSH Syntax”
Section 12.3.5, “LOCK TABLES and UNLOCK TABLES Syntax”
Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”
Section 16.1.1.5, “Creating a Data Snapshot Using mysqldump”
Section 6.2, “Database Backup Methods”
Description
Section 6.3.1, “Establishing a Backup Policy”
