Preface

The Sun ZFS Storage 7x20 Appliance Installation Guide contains installation, cabling and initial configuration documentation for Oracle's Sun ZFS Storage 7120, 7320, 7420 and 7700 NAS appliances.

This documentation is also available while using the appliance Browser User Interface (BUI), accessible via the Help button. The appliance documentation may be updated using the System Upgrade procedure documented in the System Service Manual.

Who Should Use This Book

This guide is for users and system administrators who install and use the Sun ZFS Storage 7x20 NAS appliances.

Related Documentation

Refer to the following documentation for administration information, hardware overviews, service procedures and software update notes.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.
Introduction

The Sun ZFS Storage 7000 family of products provide efficient file and block data services to clients over a network, and a rich set of data services that can be applied to the data stored on the system.

Platforms

- 7120
- 7320
- 7420

Legacy platforms are documented in the 7110, 7210, 7310, 7410, J4400/J4500 sections of the Sun Storage 7000 Unified Storage System Service Manual.

Expansion Storage

- Sun Disk Shelf
Protocols

Sun ZFS Storage appliances include support for a variety of industry-standard client protocols, including:

- SMB
- NFS
- HTTP and HTTPS
- WebDAV
- iSCSI
- FC
- SRP
- iSER
- FTP
- SFTP

Key Features

Sun ZFS Storage systems also include new technologies to deliver the best storage price/performance and unprecedented observability of your workloads in production, including:

- Analytics, a system for dynamically observing the behavior of your system in real-time and viewing data graphically
- The ZFS Hybrid Storage Pool, composed of optional Flash-memory devices for acceleration of reads and writes, low-power, high-capacity disks, and DRAM memory, all managed transparently as a single data hierarchy

Data Services

To manage the data that you export using these protocols, you can configure your Sun ZFS Storage system using the built-in collection of advanced data services, including:

- RAID-Z (RAID-5 and RAID-6), mirrored, and striped disk configurations
- Unlimited read-only and read-write snapshots, with snapshot schedules
- Data deduplication
- Built-in data compression
- Remote replication of data for disaster recovery
- Active-active clustering for high availability (7310, 7320, 7410, and 7420)

LICENSE NOTICE: Remote Replication and Cloning may be evaluated free of charge, but each feature requires that an independent license be purchased separately for use in production. After the evaluation period, these features must either be licensed or deactivated. Oracle reserves the right to audit for licensing compliance at any time. For details, refer to the "Oracle Software License Agreement ("SLA") and Entitlement for Hardware Systems with Integrated Software Options."
Availability

To maximize the availability of your data in production, Sun ZFS Storage appliances include a complete end-to-end architecture for data integrity, including redundancies at every level of the stack. Key features include:

- Predictive self-healing and diagnosis of all system hardware failures: CPUs, DRAM, I/O cards, disks, fans, power supplies
- ZFS end-to-end data checksums of all data and metadata, protecting data throughout the stack
- RAID-6 (double- and triple-parity) and optional RAID-6 across disk shelves
- Active-active clustering for high availability (7310, 7320, 7410, and 7420)
- Link aggregations and IP multipathing for network failure protection
- I/O Multipathing between the controller and disk shelves
- Integrated software restart of all system software services
- Phone-Home of telemetry for all software and hardware issues
- Lights-out Management of each system for remote power control and console access

Browser User Interface (BUI)

The browser user interface

The BUI is the graphical tool for administration of the appliance. The BUI provides an intuitive environment for administration tasks, visualizing concepts, and analyzing performance data.
The management software is designed to be fully featured and functional on a variety of web browsers.

Direct your browser to the system using either the IP address or host name you assigned to the NET-0 port during initial configuration as follows: https://ipaddress:215 or https://hostname:215. The login screen appears.

The online help linked in the top right of the BUI is context-sensitive. For every top-level and second-level screen in the BUI, the associated help page appears when you click the Help button.

### Command Line Interface (CLI)

The CLI is designed to mirror the capabilities of the BUI, while also providing a powerful scripting environment for performing repetitive tasks. The following sections describe details of the CLI. When navigating through the CLI, there are two principles to be aware of:

- Tab completion is used extensively: if you are not sure what to type in any given context, pressing the Tab key will provide you with possible options. Throughout the documentation, pressing Tab is presented as the word “tab” in bold italics.

- Help is always available: the help command provides context-specific help. Help on a particular topic is available by specifying the topic as an argument to help, for example `help commands`. Available topics are displayed by tab-completing the help command, or by typing `help topics`.

You can combine these two principles, as follows:

```bash
dory:> help tab
builtins  commands  general  help  properties  script
```
Introduction

This section addresses how to physically install the system chassis into a rack, connect controllers in a cluster, and expand storage. The following topics are described.

- Overview
- 7x20 controller installation tasks
- Sun Disk Shelf installation tasks
- Cabling
- Powering on the appliance
- Initial configuration

Refer to the following sections for legacy platform installation instructions.

- 7x10 installation tasks
- J4400/J4500 Disk Shelf Installation
Precautions

Observe the following cautions when installing any Sun ZFS Storage 7x20 controller or cabinet.

- Always load equipment into a rack from the bottom up so that it will not become top-heavy and tip over. Deploy the anti-tip bar to prevent the rack from tipping during equipment installation.
- Ensure that the temperature in the rack does not exceed the controller’s maximum ambient rated temperatures. Consider the total airflow requirements of all equipment installed in the rack to ensure that the equipment is operated within its specified temperature range.
- For best results, only qualified Oracle service personnel should perform cluster installation and configuration. Contact Oracle Service for assistance.

Prerequisites

Refer to the Quick Setup poster that shipped with the product or the following hardware service sections for an overview of your system controller or cabinet.

- 7120 Overview - view component diagrams and specifications
- 7320 Overview - view component diagrams and specifications, and cluster options
- 7420 Overview - view component diagrams, specifications, and cluster options

If you intend to install disk shelves into the same rack, refer to the Disk Shelf Installation section for how to install them into the bottom of your rack.

Legacy platform overviews are provided in the 7110 Overview, 7210 Overview, 7310 Overview, 7410 Overview sections.

For controller installation, check that your rack is compatible with the slide rail and cable management assembly options as follows:

- The structure is a four-post rack with mounting at both front and back. Two-post racks are not compatible.
- The horizontal opening and unit vertical pitch conforms to ANSI/EIA 310-D-1992 or IEC 60927 standards.
- The distance between the front and back mounting planes is between 24 in and 36 in (610 mm to 915 mm).
- The distance to the front cabinet door, providing clearance depth in front of the front mounting plane, is at least 1 in (25.4 mm).
The distance to the back cabinet door, providing clearance depth behind the front mounting plane, is at least 31.5 in (800 mm) with the cable management assembly, or 27.5 in (700 mm) without the cable management assembly.

The distance between structural supports and cable troughs, providing clearance width between the front and back mounting planes, is at least 18 in (456 mm).

For cabinet installation, you will need a total distance of at least 15 ft/4.5 m for safe maneuvering when you roll the cabinet off the shipping pallet.

### Controller, Cabinet and Disk Shelf Installation Tasks

The following sections provide installation tasks with enumerated steps.

- 7x20 controller installation tasks
- Sun Disk Shelf installation tasks
- 7x10 controller installation tasks

### 7x20 Controllers

#### 7x20 Controller Installation Tasks

This section provides enumerated steps for installing the Sun ZFS Storage 7120, 7320 or 7420 controllers into a rack using the rail assembly in the rack mount kit. Note that if your rack mount kit shipped with installation instructions, use those instructions instead.

Observe the following cautions:

- Always load equipment into a rack from the bottom up so that it will not become top-heavy and tip over. Deploy the anti-tip bar to the prevent the rack from tipping during equipment installation.
- Ensure that the temperature in the rack will not exceed the controller’s maximum ambient rated temperatures. Consider the total airflow requirements of all equipment installed in the rack to ensure that the equipment is operated within its specified temperature range.

### Prerequisites

Refer to the Quick Setup poster that shipped with the product or the following sections for an overview of your controller.

- 7120 Overview - view component diagrams and specifications
- 7320 Overview - view component diagrams and specifications
Tools and Equipment Needed

To install the system, you need the following tools:

- No. 2 Phillips screwdriver
- ESD mat and grounding strap
- Pencil, stylus, or other pointed device, for pushing front panel buttons

You also need a system console device, such as one of the following:

- Sun workstation
- ASCII terminal
- Terminal server
- Patch panel connected to a terminal server

Tasks

7x20 Controllers Tasks

- Installing Mounting Brackets on the Controller Chassis

If the mounting brackets are shipped inside the slide rails, you must remove them before beginning this procedure, as follows.

- Unpack the slide rails and locate the slide rail lock at the front of the assembly.
- Squeeze and hold the tabs at top and bottom of the lock (1) while you pull the mounting bracket out to the stop.
- Push the mounting bracket release button toward the front of the mounting bracket (2) while withdrawing the bracket from the assembly.

The following graphic illustrates the procedure for disassembling the 7120/7320 rail kit.
The following graphic illustrates the procedure for disassembling the 7420 rail kit.
1 Position a mounting bracket against the chassis so that the slide rail lock is at the front of the chassis, and the keyed openings on the mounting bracket are aligned with the locating pins on the side of the chassis.

The following graphic illustrates how to attach the 7120/7320 mounting brackets.
The following graphic illustrates how to attach the 7420 mounting brackets.

2 With the heads of the four chassis locating pins protruding though the four keyed openings in the mounting bracket, pull the mounting-bracket toward the front of the chassis until the mounting-bracket clip locks into place with an audible click.

3 Verify that all mounting pins are securely fastened to the chassis.

4 Repeat to install the remaining mounting bracket on the other side of the chassis.

▼ Installing the Controller Chassis into the Rack Slide Rails

This procedure requires a minimum of two people because of the weight of the chassis. Attempting this procedure alone could result in equipment damage or personal injury. Always load equipment into rack from the bottom up.
1. If you are using a universal 19-inch cabinet, snap an M6 square cage nut into the top and bottom holes of the location where you will be installing the rail plate as shown.

2. Position a slide rail assembly in your rack so that the brackets at each end of the slide rail assembly are on the outside of the front and back rack posts. The following graphic illustrates...
3 Attach each slide rail assembly to the rack posts, but do not tighten the screws completely.
From the front of the rack, set the proper width of the rails with the rail-width spacer (1).

5  Tighten the screws on the brackets.

6  Remove the spacer and confirm that the rails are attached tightly to the rack.
7 If your rack includes an anti-tip foot, extend it from the bottom of the rack.

8 Lower the rack stabilization feet if you have not already done so.

9 Push the slide rails into the slide rail assemblies in the rack as far as possible.
10 Raise the chassis so that the back ends of the mounting brackets are aligned with the slide rail and insert the chassis into the slide rails, pushing the chassis slowly, until the mounting brackets meet the slide rail stops (~12 in or 30 cm). You will hear an audible click.

The following graphic illustrates the 7120/7320 chassis insertion and slide rail locks usage.
The following graphic illustrates 7420 chassis insertion.

▼ Installing the Cable Management Assembly
This procedure is completed from the back of the equipment rack.
1. Attach the cable management assembly (CMA) rail extension to the left slide rail until the extension locks into place.

2. Insert the CMA mounting bracket connector into the right slide rail until the connector locks into place.
3 Insert the right CMA slide rail connector (1) into the right slide rail assembly (2) until the connector locks into place.
4 Insert the left CMA slide rail connector (1) into the rail extension on the left slide rail assembly (2) until the connector locks into place.
After you install and route the cables through the assembly, attach the hook and loop straps (1) to secure the cables. Then attach the right and left outer latches to support the assembly.

Sun Disk Shelf

Precautions

Observe the following cautions when installing a Sun Disk Shelf into a rack using the rail assembly in the bolt-on rack mount kit. Note that if your rack mount kit shipped with installation instructions, use those instructions instead.

- Always load equipment into a rack from the bottom up so that it will not become top-heavy and tip over. Deploy the anti-tip bar to prevent the rack from tipping during equipment installation.
- Ensure that the temperature in the rack does not exceed the controller’s maximum ambient rated temperatures. Consider the total airflow requirements of all equipment installed in the rack to ensure that the equipment is operated within its specified temperature range.
Prerequisites

Refer to the poster that shipped with the product or the following section for an overview of your disk shelf.
- Sun Disk Shelf Overview - view component diagrams and specifications

Tools and Equipment Needed

To install the shelf, you need the following tools:
- You will need a No. 2 Phillips head screwdriver that is a minimum of 4 inches long.
- A mechanical lift is highly recommended because the chassis can weigh between 91-170 lbs. (42-77kg). At least three people are required: two to install the shelf or controller and one spotter to engage the rails.
- If a mechanical lift is not available, remove the power supplies, SIM boards and hard disk drives to reduce the weight, see Sun Disk Shelf Maintenance Procedures and Controller Maintenance Procedures for instructions.

Use one of the following racks for the Sun Disk Shelf.
- Sun Rack 900/1000 cabinet
- Sun Fire cabinet
- Sun StorEdge Expansion cabinet
- Sun Rack II 1042/1242 cabinet
- Any 19-inch wide, 4-post, EIA-compatible rack or cabinet with a front-to-back depth between vertical cabinet rails of 61 cm to 91 cm (24 in. to 36 in.). The cabinet can have threaded or unthreaded cabinet rails.

Position the rack where the shelf is to be installed adjacent to the rack where the controller is installed, if separate. Stabilize the cabinet and lock the casters.

Tasks

Sun Disk Shelf Tasks

Installing the Sun Disk Shelf into the Rack Slide Rails

1. Starting at the bottom of the cabinet, locate the appropriate rack unit (RU) height. Install Disk Shelves below controllers to prevent rack from tipping. The Sun Disk Shelf requires four standard mounting units (4RU) of vertical space in the cabinet.
2 If you are using a universal 19-inch or Sun Rack II cabinet, snap an M6 square cage nut into the 4U location where you will be installing the system. Install in the top and bottom holes.

3 Install appropriate rail plates in four locations on the rack (2 front and 2 back) by aligning the two pins on the rail plate with holes on the cabinet rails.
4 Insert M6 screws in the top and bottom holes of each rail plate and tighten (8 total places).

5 Install each rail by first aligning the front pins of the rack adapter plates with corresponding holes in the front of the rail, then adjust the rail to fit the rack and insert the pins from the rear rack adapter plates into the corresponding holes of the rail.
6 Install four 8-32 screws into the four remaining front and rear holes of each rack rail (16 total).
7 Using a mechanical lift or two people, one at each side of the shelf or controller, carefully lift and rest the shelf on the bottom ledge of the left and right rails. The following graphic illustrates the chassis insertion.

8 Carefully slide the shelf into the cabinet until the front flanges of the shelf touch the vertical face of the rack.

9 Tighten the captive screws on each side of the front of the shelf to secure the shelf to the rack.

10 At the back of the disk shelf, slide a system locking clip onto each lower corner of the chassis.

- Cabling Diagrams
Cabling

Cabling Diagrams

The diagrams in the sections that follow illustrate how to properly connect storage controllers or cabinets, either in standalone or clustered configurations, to one or more disk shelves or expansion cabinets. Use the images as a key to understanding how the abstracted diagrams correspond to actual hardware:

- Connecting Expansion Storage to the 7120
- Connecting Expansion Storage to the 7320
- Connecting Expansion Storage to the 7320 Cluster
- Connecting Expansion Storage to the 7420 (2 HBAs)
- Connecting Expansion Storage to the 7420 (3 HBAs)
- Connecting Expansion Storage to the 7420 (4 HBAs)
- Connecting Expansion Storage to the 7420 Cluster (2 HBAs)
- Connecting Expansion Storage to the 7420 Cluster (3 HBAs)
- Connecting Expansion Storage to the 7420 Cluster (4 HBAs)

Oftentimes, the need to expand storage requires the addition of another HBA to your storage controller. While in single-head configurations, this is not possible to do without disrupting service. In a clustered configuration, the heads can be powered down individually for servicing and reconnected to the new storage chain. For instructions, refer to the following sections.

- Expanding from 2 to 3 HBAs
Expanding from 3 to 4 HBAs

To view cabling diagrams for legacy platforms, refer to the following sections.

- Connecting Expansion Storage to the 7210
- Connecting Expansion Storage to the 7310
- Connecting Expansion Storage to the 7310 Cluster
- Connecting Expansion Storage to the 7410 (2 HBAs)
- Connecting Expansion Storage to the 7410 (3 HBAs)
- Connecting Expansion Storage to the 7410 Cluster (2 HBAs)
- Connecting Expansion Storage to the 7410 Cluster (3 HBAs)

720 Cabling

Connecting Expansion Storage to the Sun ZFS Storage 7120

The Sun ZFS Storage 7120 can support up to two Sun Disk shelves. The figures below show the complete set of supported configurations, as well as steps to migrate from one state to another.

Sun ZFS Storage 7120

**NOTE:** Cabling diagrams are not representative of proper slot location for HBAs.

Powering On and Configuring the System

Power

Powering On and Configuring the Appliance

This section provides instructions for configuring the primary network interface using the preinstalled Sun ZFS Storage 7000 command line interface (CLI). After you configure the primary interface, configure the remaining system parameters using the browser user interface (BUI) from any client on the same network.

Prerequisites

Refer to the Installation section for detailed instructions to install your system in the rack. Complete the system cabling according to the Cabling Diagrams section.

Gather the following information in preparation for configuring an Ethernet interface on the storage controller.

- IP address
- IP netmask
- Host name
- Domain Name Server (DNS) domain name
- DNS server IP address
- Default router IP address
- Password

If you will access the appliance through an administrative client, configure the administrative client with the following settings:

- 8N1: eight data bits, no parity, one stop bit
- 9600 baud
- Disable hardware flow control (CTS/RTS)
■ Disable software flow control (XON/XOFF)

Refer to the Quick Setup poster that shipped with the product or the following sections for an overview of your system controller:

■ 7120 Overview
■ 7320 Overview
■ 7420 Overview

**Connecting to ILOM**

In rare cases, faults associated with uncorrectable CPU errors are not diagnosable or displayed in the controller. These faults will be preserved by and observable on the ILOM. Connect to the server ILOM (Service Processor) on the server platform to diagnose hardware faults that do not appear in the BUI.

In a cluster environment, an ILOM connection should be made to each controller.

The server ILOM provides options for (i) network and (ii) serial port connectivity. Network connection is the preferred choice, as the ILOM serial port does not always allow adequate means of platform data collection.

**WARNING**: Failure to configure ILOM connectivity may lead to longer than necessary hardware fault diagnosis and resolution times.

**Tasks**

**Power Tasks**

**Powering On the Appliance**

You can access the system by connecting an administrative client to the serial management port on the controller. Alternatively, if there is a Dynamic Host Configuration Protocol (DHCP) server on the network, you can access the system by connecting the network management port to your network.

Note that if you are installing a cluster, configure only one controller initially. The software propagates the configuration to the peer controller during cluster initialization. After the cluster is initialized, you can administer the system from either storage controller. However, do not attempt initial configuration on both controllers independently. Refer to the Cluster documentation for more information.

1. To perform initial configuration using serial, connect a serial cable from the SER MGT port on the back panel of the controller to the serial port on the administrative client. Use a DB9 to RJ45 adapter if necessary.
To perform initial configuration using Ethernet, connect an Ethernet cable from the NET MGT port on the back panel of the controller to your network.

Connect an Ethernet cable from your network to the NET0 port on the back panel of the controller.

For 7120, 7320 and 7420, power on any disk shelves attached to the storage system by plugging the two power cords into the universal power connectors, connecting the cords to the external power source and turning on the disk shelf power switches. Wait several minutes until the power indicators are lit a steady green.

For 7120, 7320 and 7420, connect power cables to power supply 0 and power supply 1 on the storage controller(s) and wait until the Power/OK LED on the front panel next to the Power button lights and remains lit (approximately two minutes).

Open a terminal window or terminal emulator and issue the appropriate command, as follows:

For a serial port concentrator connect (for example, using telnet), and use root as the user name and replace `serial-concentrator portnumber` with the appropriate value, for example: `telnet serial-concentrator portnumber`

For a network connection, connect using SSH and use root as the user name and determine the IP address by accessing your DHCP server for the address assigned to the Service Processor MAC address (see the label on the storage controller), for example: `ssh root@192.168.128.256`

Type the password `changeme` when prompted.

At the command prompt, type `start /SP/console`.

Type `y` to confirm that you want to start the console.

Press any key to begin configuring the appliance. The shell interface configuration screen appears. NET-0 at the top of the screen should be underlined.

Verify the information on the screen, or enter values that do not appear.

Apply the values by pressing ESC-1 or the F1 key or by pressing Enter after confirming the password. The final shell configuration screen appears, confirming that your appliance is ready for further configuration using the BUI.

**Completing Configuration**

Configure the remaining system parameters through the CLI after logging in, or through a browser running on any client on the same network as the initial interface. The management software is designed to be fully featured and functional on a variety of web browsers.
1 Direct your browser to the system using either the IP address or host name you assigned to the NET0 port as follows: https://ipaddress:215 or https://hostname:215. The login screen appears.

2 Type root into the Username field and the administrative password that you entered into the appliance shell kit interface and press the Enter key. The Welcome screen appears.

3 To begin configuring the system, click Start on the Welcome screen. You are guided through the Initial Configuration of the remaining network interfaces, DNS, time settings, directory service and storage.

Next Steps
- Initial Configuration

Initial Configuration

The initial configuration consists of six configuration steps.

1. Network
2. DNS
3. Time
4. Name Services (NIS, LDAP, Active Directory)
5. Storage
6. Registration & Support

**Prerequisites**

The initial configuration of the system is conducted after powering it on for the first time and establishing a connection, as documented in the Installation section.

*Note* that the option to perform initial configuration of a cluster is only available in the BUI. If electing this option, read the clustering documentation before beginning initial configuration for detailed additional steps that are required for successful cluster setup. Pay careful attention to the Clustering Considerations for Networking section. Alternatively, cluster-capable appliances may be initially configured for standalone operation using the following procedure, and re-configured for cluster operation at a later time.

**Summary**

This procedure will configure networking connectivity, several client network services, and the layout of the storage pool for standalone operation. When completed, the appliance is ready for use - but will not have any shares configured for remote clients to access. To create shares or revisit settings, refer to the Shares and Configuration sections.

This procedure may be repeated at a later time by clicking the "INITIAL SETUP" button on the Maintenance > System screen or by entering the `maintenance system setup` context in the CLI.
BUI

The BUI initial configuration is the preferred method and provides a screen for each of the initial configuration steps.

Click Start to begin basic configuration of network, time directory and support services. Click Commit to save the configuration and go to the next screen. Arrows beneath the Commit button can be used to revisit previous steps, and change the configuration if desired.

Configuring Management Port

All standalone controllers should have at least one NIC port configured as a management interface. Select the Allow Admin option in the BUI to enable BUI connections on port 215 and CLI connections on ssh port 22.

All cluster installations should have at least one NIC port on each controller configured as a management interface as described above. In addition, the NIC instance number must be unique on each controller.

CLI

Alternatively, use the CLI to step through the initial configuration sections. Each step begins by printing its help, which can be reprinted by typing help. Use the done command to complete each step.
Performing Initial Configuration with the CLI

Login using the password you provided during Installation:

```
caji console login: root
Password: Last login: Sun Oct 19 02:55:31 on console
```

To setup your system, you will be taken through a series of steps; as the setup process advances to each step, the help message for that step will be displayed.

Press any key to begin initial configuration ...

In this example, the existing settings are checked (which were obtained from the DHCP server), and accepted by typing done. To customize them at this point, enter each context (datalinks, devices and interfaces) and type help to see available actions for that context. See the Network section for additional documentation. Pay careful attention to the Clustering Considerations for Networking section if you will configure clustering.

```
aksh: starting configuration with "net" ...
```

Configure Networking. Configure the appliance network interfaces. The first network interface has been configured for you, using the settings you provided at the serial console.

Subcommands that are valid in this context:

- `datalinks` => Manage datalinks
- `devices` => Manage devices
- `interfaces` => Manage interfaces
- `help [topic]` => Get context-sensitive help. If [topic] is specified, it must be one of "builtins", "commands", "general", "help" or "script".
- `show` => Show information pertinent to the current context
- `abort` => Abort this task (potentially resulting in a misconfigured system)
- `done` => Finish operating on "net"

```
caji:maintenance system setup net> devices show
Devices:

<table>
<thead>
<tr>
<th>DEVICE</th>
<th>UP</th>
<th>MAC</th>
<th>SPEED</th>
</tr>
</thead>
<tbody>
<tr>
<td>nge0</td>
<td>true</td>
<td>0:14:4f:8d:59:aa</td>
<td>1000 Mbit/s</td>
</tr>
<tr>
<td>nge1</td>
<td>false</td>
<td>0:14:4f:8d:59:ab</td>
<td>0 Mbit/s</td>
</tr>
<tr>
<td>nge2</td>
<td>false</td>
<td>0:14:4f:8d:59:ac</td>
<td>0 Mbit/s</td>
</tr>
<tr>
<td>nge3</td>
<td>false</td>
<td>0:14:4f:8d:59:ad</td>
<td>0 Mbit/s</td>
</tr>
</tbody>
</table>
```

```
caji:maintenance system setup net> datalinks show
Datalinks:
```

Chapter 4 • Powering On and Configuring the System 77
Configure DNS. Configure the Domain Name Service.

Subcommands that are valid in this context:

- **help [topic]** => Get context-sensitive help. If [topic] is specified, it must be one of "builtins", "commands", "general", "help", "script" or "properties".
- **show** => Show information pertinent to the current context
- **commit** => Commit current state, including any changes
- **abort** => Abort this task (potentially resulting in a misconfigured system)
- **done** => Finish operating on "dns"
- **get [prop]** => Get value for property [prop]. ("help properties" for valid properties.) If [prop] is not specified, returns values for all properties.
- **set [prop]** => Set property [prop] to [value]. ("help properties" for valid properties.) For properties taking list values, [value] should be a comma-separated list of values.

```
caji:maintenance system setup dns> show
Properties:
<status> = online
  domain = sun.com
  servers = 192.168.1.4
```

```
caji:maintenance system setup dns> set domain=sf.fishworks.com
domain = sf.fishworks.com (uncommitted)
```

```
caji:maintenance system setup dns> set servers=192.168.1.5
servers = 192.168.1.5 (uncommitted)
```

```
caji:maintenance system setup dns> commit
```

```
caji:maintenance system setup dns> done
```

Configure Network Time Protocol (NTP) to synchronize the appliance time clock. See the NTP section for additional documentation.
Configure Time. Configure the Network Time Protocol.

Subcommands that are valid in this context:

- **help [topic]** => Get context-sensitive help. If [topic] is specified, it must be one of "builtins", "commands", "general", "help", "script" or "properties".
- **show** => Show information pertinent to the current context
- **commit** => Commit current state, including any changes
- **abort** => Abort this task (potentially resulting in a misconfigured system)
- **done** => Finish operating on "ntp"
- **enable** => Enable the ntp service
- **disable** => Disable the ntp service
- **get [prop]** => Get value for property [prop]. ("help properties" for valid properties.) If [prop] is not specified, returns values for all properties.
- **set [prop]** => Set property [prop] to [value]. ("help properties" for valid properties.) For properties taking list values, [value] should be a comma-separated list of values.

```
caji:maintenance system setup ntp> set servers=0.pool.ntp.org
servers = 0.pool.ntp.org (uncommitted)
caji:maintenance system setup ntp> commit
aksh: done with "ntp", advancing configuration to "directory" ...
```

Refer to the NIS, LDAP and Active Directory sections for additional documentation.

Configure Name Services. Configure directory services for users and groups. You can configure and enable each directory service independently, and you can configure more than one directory service.

Subcommands that are valid in this context:

- **nis** => Configure NIS
- **ldap** => Configure LDAP
- **ad** => Configure Active Directory
- **help [topic]** => Get context-sensitive help. If [topic] is specified, it must be one of "builtins", "commands", "general", "help" or "script".
- **show** => Show information pertinent to the current context
- **abort** => Abort this task (potentially resulting in a misconfigured system)
done => Finish operating on "directory"

caji:maintenance system setup directory> nis
caji:maintenance system setup directory nis> show
Properties:
  <status> = online
  domain = sun.com
  broadcast = true
  ypservers =

caji:maintenance system setup directory nis> set domain=fishworks
  domain = fishworks (uncommitted)
caji:maintenance system setup directory nis> commit
caji:maintenance system setup directory nis> done
aksh: done with "directory", advancing configuration to "support" ...

Configure storage pools that are characterized by their underlying data redundancy, and provide space that is shared across all filesystems and LUNs. See the Storage section for additional documentation.

Configure Storage.

Subcommands that are valid in this context:

  help [topic] => Get context-sensitive help. If [topic] is specified, it must be one of "builtins", "commands", "general", "help", "script" or "properties".
  show => Show information pertinent to the current context
  commit => Commit current state, including any changes
  done => Finish operating on "storage"
  config <pool> => Configure the storage pool
  unconfig => Unconfigure the storage pool
  add => Add additional storage to the storage pool
  import => Search for existing or destroyed pools to import
  scrub <start|stop> => Start or stop a scrub
  get [prop] => Get value for property [prop]. ("help properties" for valid properties.) If [prop] is not specified, returns values for all properties.
  set pool=[pool] => Change current pool

caji:maintenance system setup storage> show
Properties:
  pool = pool-0
  status = online
  profile = mirror
Post-Installation Controller Update

Maintaining controller software in advance of putting your appliance into production enables you to reap the greatest benefits of recent software enhancements. In many cases, a simple software update will resolve an issue observed in testing or provide you with new enhancements that improve productivity. Update storage controllers to the latest software and associated firmware using the following process.

1. Ensure that any resilvering operations have completed by checking the Configuration > Storage screen.
2. Ensure that there are no active problems on the Maintenance > Problems screen.
3. Verify that hardware firmware updates are not in progress on the Maintenance > System screen.
4. Read the Release Notes associated with the software update and address any release-specific prerequisites.
5. Click the "Sign In" link at http://support.oracle.com.
The Oracle Single Sign-On screen appears.

6. Log in using your Oracle account credentials.

7. Download the desired software update.
   The file is downloaded locally.

8. Unzip the downloaded file using an archive manager or by issuing the `unzip` command.
   The file is expanded into the `All_Supported_Platforms` directory.

9. To upload and apply the update, use the Updating via the BUI or Updating via the CLI procedures in the Maintenance > System online help page.
