Glossary

A

access control list (ACL) A set of access control entries (ACEs) that is associated with a file or directory that defines the access rights that each user or group has to that object. Pillar Axiom storage systems use ACL permissions as the basis of the security for an object and derive UNIX permission modes from the collection of ACEs. A discretionary access control list (DACL) is one of two types of ACL.

Active Directory A Microsoft technology that enables applications to find, use, and manage directory resources (such as user names, network printers, and permissions). The Pillar Axiom Common Internet File System (CIFS) server authenticates Kerberos clients against an Active Directory™ server in both mixed and native mode.

When the Pillar Axiom system provides a CIFS server, the CIFS client gets the ticket from Kerberos and presents it to the system. When the Pillar Axiom system is a CIFS client, the system gets the ticket from Kerberos and presents it to a customer-supplied domain controller.

See also Kerberos.

Administrator 1 A login account that has the authority to perform all administration and configuration tasks.

Compare Administrator 2.

Compare Monitor (administrator).

Compare Primary system administrator.

Compare Support administrator.

Administrator 2 A login account that has the authority to perform all administrative and configuration tasks, except:

- Create, modify, or delete administrator accounts and File Servers.

- Modify system-wide settings such as Simple Network Management Protocol (SNMP).
- Modify software or hardware configurations.
- Shut down the system.

*Compare Administrator 1.*

*Compare Monitor (administrator).*

*Compare Primary system administrator.*

*Compare Support administrator.*

See also File Server.

See also Simple Network Management Protocol (SNMP).

**Administrator Action (AA)**

A message generated by a Pillar Axiom storage system to notify an administrator of a situation or condition that the administrator needs to resolve. These messages are accessible through the Pillar Axiom 600 user interfaces.

**alert**

A Simple Mail Transfer Protocol (SMTP) email message that notifies recipients of specified system events, such as informational, warning, or critical events. Alerts are optional and supplement normal event logging and Call-Home notification.

See also Call-Home.

See also event severity.

**availability**

A feature of a Pillar Axiom storage system that makes the system fault-tolerant. The system's availability features make customer data highly accessible, even during hardware replacements and non-disruptive software updates.

See also fault tolerance.

See also reliability.

See also Reliability, Availability, Serviceability (RAS).

See also serviceability.

**B**

**bandwidth**

The amount of data that can be transmitted in a fixed amount of time. For a filesystem, bandwidth is expressed in MB/sec (megabytes per second).

See also filesystem.
**beacon**  
A feature within the control units (CUs) of Pilots, Slammers, and Bricks that identifies the CU or a particular field replaceable unit (FRU). When initiated, the system blinks the associated light-emitting diode (LED) or set of LEDs. A reverse beacon blinks everything except the LEDs on the FRU of interest.  
*See also Brick.*  
*See also control unit (CU).*  
*See also field replaceable unit (FRU).*  
*See also light-emitting diode (LED).*  
*See also Pilot.*  
*See also Slammer.*

**block-level snapshot**  
*See Filesystem Copy.*  
*See LUN Copy.*

**Brick**  
A 2U storage enclosure in a Pillar Axiom storage system that connects to one or more Slammers through the Storage System Fabric (SSF). Bricks can be categorized into these types:

- SATA, which contain serial ATA (SATA) RAID controllers and SATA hard disk drives (HDDs).
- SSD, which contain SATA RAID controllers and solid state drives (SSDs).
- FC RAID, which contain Fibre Channel (FC) RAID controllers and FC drives.
- FC Expansion, which contain FC drives.

The RAID controllers in the SATA Bricks, SSD Bricks, and the FC RAID Bricks provide hardware RAID 5 or RAID 10 protection. For SATA (both HDD and SDD), the protection spans six drives. For FC, the protection spans 11 drives.  
*Compare Pilot.*  
*Compare Slammer.*  
*See also FC Expansion Brick.*  
*See also FC RAID Brick.*  
*See also redundant array of independent disks (RAID).*  
*See also SATA Brick.*
See also SSD Brick.
See also Storage System Fabric (SSF).

Call-Home
A feature of a Pillar Axiom storage system that, when enabled, allows the system to notify Pillar World Wide Customer Support Center of critical issues specific to a Pillar Axiom system. No customer data is transmitted. Call-Home transfers files over the Internet using one of the following user-selected methods:

- SCP: Uses the secure copy (SCP) method with 1024-bit encryption and secure keys.
- HTTPS: Uses the Hypertext Transfer Protocol Secure method by sending files directly to Pillar or through a proxy server for security purposes. This method can also be used when the Pillar Axiom system does not have direct access to the Internet.

Capacity
The amount of data that a logical volume (filesystem or LUN) can store. It is expressed as a Quality of Service (QoS) attribute:

- Initial or current capacity, which can grow to the maximum capacity.
- Maximum capacity, which for thinly provisioned volumes is unlimited. For all other volumes, the maximum capacity is the same as the initial capacity.

See also filesystem.
See also LUN.
See also Quality of Service (QoS).

Channel
A collection of data paths in a storage area network (SAN) replication environment. Each path in a channel must use the same protocol, Fibre Channel (FC) or Internet Small Computer System Interface (iSCSI).

Compare path.

Checkpoint
A pair of Clone LUNs, one at the primary site and one at the secondary site, that are created during AxiomONE Replication for SAN operations. Each clone contains
identical data that is an image of the data on the source volume at the time the checkpoint was created. The destination volume is updated to contain the data of the most recent checkpoint, shortly after the checkpoint is created. The system usually takes checkpoints at a specified frequency, but an administrator can take a single manual checkpoint at a specific time. The replication process uses checkpoint information to ensure that the source and destination volumes of a replication pair contain identical data.

*Compare* history checkpoint.

*See also* Pillar Axiom Replication.

*See also* Clone LUN.

*See also* replication pair.

**Clone FS**

A point-in-time, read-write, partial-block snapshot of a filesystem that you intend to split from the original filesystem for immediate access. A Clone FS retains the same QoS parameters as the source filesystem and consumes storage capacity from the Clone FS repository that was allocated for the source filesystem. A Clone FS cannot be scheduled from the Pillar Axiom Storage Services Manager; it is an immediate operation. Clone FSs provide a convenient method to branch from the source data without the need to do a full-block copy operation.

*Compare* Pillar Axiom Replication.

*Compare* Clone LUN.

*Compare* Snap FS.

*Compare* Volume Copy.

*See also* filesystem.

**Clone LUN**

A point-in-time, read-write, partial-block snapshot of a LUN that you intend to split from the original LUN for immediate access. A Clone LUN retains the same QoS parameters as the source LUN and consumes storage capacity from the Clone LUN repository that was allocated for the source LUN. A Clone LUN cannot be scheduled from the Pillar Axiom Storage Services Manager; it is an immediate operation. Clone LUNs provide a convenient method to branch from the source data without the need to do a full-block copy operation. Formerly called a *Snap LUN.*

*Compare* Pillar Axiom Replication.
Compare Clone FS.

Compare Volume Copy.

See also LUN.

**command line interface (CLI)**

A client-based application that administrators can use to run administrative commands from a shell or a script. Through the CLI, administrators can perform administrative tasks. Administrators start a session, submit one or more requests to the Pillar Axiom storage system, and end the session.

Compare graphical user interface (GUI).

See also Pillar Axiom CLI.

See also session.

**Common Internet File System (CIFS)**

A protocol that allows network users in a Windows environment to share and access files that are stored on a Pillar Axiom storage system. The Pillar Axiom implementation of CIFS adheres to the Storage Networking Industry Association (SNIA) CIFS Technical Reference 1.0.

Compare Network File System (NFS).

**community string**

A text string, which can be up to 255 printable characters in length, that acts like a password to control access to Management Information Base (MIB) fields within a Simple Network Management Protocol (SNMP) device.

See also Management Information Base (MIB).

See also Simple Network Management Protocol (SNMP).

**control unit (CU)**

One of the two processing units (CU 0 or CU 1) in Pilot management controllers, Slammer storage controllers, and Brick storage enclosures.

See also Brick.

See also Pilot.

See also Slammer.

**disruptive software update**

An installation of the Pillar Axiom operating systems, applications, and firmware in a way that requires the Pillar Axiom storage system to be quiesced and all user data paths taken offline. Pillar Axiom systems implement disruptive software updates by restarting the entire Pillar
Axiom system to bring up the new software. User applications lose access to the Pillar Axiom storage arrays during the software update.

*Compare* non-disruptive software update.

*See also* update.

**Distributed RAID** A nested RAID structure that enhances performance for random write operations. The performance enhancement is achieved by replacing two modify or write operations with a parallel mirrored-write operation.

*See also* redundant array of independent disks (RAID).

**domain**

1. On the Internet, a set of network addresses that are organized in levels of specificity, as in pillardata.com. For example, the top level of an address identifies the most general part of the address, such as .com (commercial) or .de (Germany).

2. For Windows, a set of network resources for a group of users. Pillar Axiom Common Internet File System (CIFS) servers require a domain name to authenticate CIFS users.

3. For NIS (Network Information System), a collection of computers each of which has knowledge of the entire system of computers.

*See also* Common Internet File System (CIFS).

*See also* Kerberos.

*See also* Network Information Service (NIS).

**Domain Controller (DC)** A networked computer that manages authentication and access to network resources. Common Internet File System (CIFS) users on Windows clients authenticate through a DC. Used also in expressions such as *Primary Domain Controller (PDC)* and *Backup Domain Controller (BDC).*

*Compare* Network Information Service (NIS).

*See also* Common Internet File System (CIFS).

*See also* domain, definition 2.

**Domain Name System (DNS)** A service used on the Internet to translate host or domain names into Internet Protocol (IP) addresses. In a Pillar Axiom storage system, an administrator identifies the IP addresses of one or more DNS servers that a File Server
can use. Also, Pilot management controllers use DNS for sending Call-Home logs.

See also Call-Home, definition 1.

See also domain, definition 1.

See also File Server.

---

### E

**Enclosure Services (ES)**

A Brick field replaceable unit (FRU) that provides fan status, power supply status, and temperature information. The thumbwheel on the FRU enables you to distinguish between Fibre Channel (FC) Expansion and RAID Bricks. For information on how to set the thumbwheel, refer to the appropriate *Pillar Axiom Service Guide*.

See also Brick.

See also FC Expansion Brick.

See also FC RAID Brick.

See also field replaceable unit (FRU).

**Ethernet**

An IEEE 802.3 standard for network transmission. Pillar Axiom storage systems support Fast and Gigabit Ethernet public connections. These connections can be copper or optical.

**event severity**

The importance of events that have occurred within the system. The level of severity ranges from Informational (no action is required) to Critical (immediate action is required). The administrator can set up alerts (email notifications) that notify users when preselected events are triggered.

See also alert.

**export**

A named Network File System (NFS) resource in a filesystem that remote systems can mount. In Pillar Axiom storage systems, Common Internet File System (CIFS) users can access an NFS export if the path name definition for the CIFS share point is the same as that for the export.

Compare share.

See also Common Internet File System (CIFS).

See also filesystem.

See also Network File System (NFS).
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

</tr>
<tr>
<td></td>
<td>FC Expansion Bricks contain 12 FC drives. The firmware marks one of these drives as a spare, sometimes called a <em>floating spare</em>. If one of the other drives fail, a rebuild occurs to the marked hot spare. When the failed drive is replaced, the replacement becomes the new hot spare.</td>
</tr>
</tbody>
</table>
Compare FC RAID Brick.

See also Brick.

**FC RAID Brick**
A 2U storage enclosure that manages a collection of Fibre Channel (FC) drives. An FC RAID Brick serves as a head-of-string controller for one or more FC Expansion Bricks.

FC RAID Bricks contain 12 FC drives. The firmware marks one of these drives as a spare, sometimes called a *floating spare*. If one of the other drives fail, a rebuild occurs to the marked hot spare. When the failed drive is replaced, the replacement becomes the new hot spare.

Compare FC Expansion Brick.

Compare SATA Brick.

Compare SSD Brick.

See also Brick.

**field replaceable unit (FRU)**
A replaceable hardware component in a Pillar Axiom storage system. The Pillar Axiom Storage Services Manager software facilitates hardware maintenance and upgrades and provides step-by-step instructions for the replacement.

**file access**
A Quality of Service (QoS) attribute that translates to an optimization bias:

- **Mixed or Random**: The system reads and writes relatively small chunks and caches data for a longer period.

- **Sequential**: The system reads and writes relatively large chunks and caches data for a shorter period.

See also Quality of Service (QoS).

**File Server**
A network attached storage (NAS) object that is assigned security, network, and protocol access attributes. The attributes apply to all filesystems that are associated with that specific File Server. A Pillar Axiom NAS system requires at least one File Server. Sometimes referred to as a CIFS server or virtual server.

See also filesystem.

See also virtual network interface (VIF).

**file size**
A Quality of Service (QoS) attribute that identifies the typical size of files that are stored in the filesystem:
○ Small, if files are smaller than 20 KB.
○ Medium, if files are between 20 KB and 4 MB.
○ Large, if files are larger than 4 MB.

*See also* filesystem.

*See also* Quality of Service (QoS).

**filesystem**

A logical volume that organizes and catalogs files and assigns resources to a given collection of directories and files in a network attached storage (NAS) system. Administrators can assign different Quality of Service (QoS) attributes to each filesystem. A filesystem must be associated with a File Server.

*Compare* LUN.

*Compare* virtual LUN (VLUN).

*See also* File Server.

*See also* logical volume.

*See also* Quality of Service (QoS).

**Filesystem Copy**

A block-level, full-image copy of a filesystem or Clone FS. This copy can be read from and written to immediately. Quality of Service (QoS) parameters for a Filesystem Copy can differ from the original. Copies use the available storage in the system. Called *Copy Filesystem* in the Pillar Axiom Storage Services Manager.

A duplicate copy requires greater system and storage resources than a Snap FS. To create an archival copy, use an inactive Clone FS.

*Compare* Snap FS.

*See also* Clone FS.

*See also* filesystem.

*See also* inactive clone.

**Forwarding Filesystem (FFS)**

A feature that allows access to filesystems on a remote NAS Slammer control unit (CU). If a request is received on a virtual interface (VIF) for a filesystem that physically resides on a Slammer CU other than the one containing the port for that VIF, the system forwards the request to the remote CU for processing. When the processing is complete, the system returns the results of the request to
the original CU. The original VIF then returns the results to the client.

*See also* virtual network interface (VIF).

**G**

**gateway**

A device that enables traffic to flow from the network to which the Pillar Axiom storage system is connected to other networks. For Slammer storage controllers, Pillar Axiom administrators identify this gateway by its Internet Protocol (IP) address as a File Server parameter. Pilot management controllers and Slammer storage controllers use different gateways for their respective management and data paths.

*See also* File Server.

*See also* route.

**geomap**

A description of the physical layout on the Brick storage enclosures for a given filesystem or LUN. It is maintained internally within a Slammer and is available for inspection through the *axiomcli* interface.

*See also* virtual LUN (VLUN).

**Gigabit Ethernet (GbE)**

A version of Ethernet that supports data transfer rates of 1 billion bits per second. NAS Slammers have two or four Gigabit Ethernet (GbE) ports (all copper or all optical) in each control unit for connecting to customer equipment.

*See also* NAS Slammer.

**graphical user interface (GUI)**

The browser-based application that administrators use to configure and manage a Pillar Axiom storage system. Pillar Axiom Storage Services Manager is the name of the Pillar Axiom GUI.

*Compare* command line interface (CLI).

**growth increment**

The capacity by which a thinly provisioned (sparse) LUN or filesystem is expanded as usage increases. The value of this increment is between 1 and 2 GB and is equal to the product of the following factors:

- The striping factor in the geomap
- Storage redundancy
- RAID type (Fibre Channel or serial ATA)
- MAU
The minimum growth increment cannot be directly configured.

*See also* geomap.

*See also* minimum allocation unit (MAU).

*See also* redundancy.

*See also* stripe.

*See also* thin provisioning.

**H**

**history** A collection of storage blocks associated with a filesystem that is used by the Pillar Axiom MaxRep Replication for NAS utility to track and otherwise manage the replication process. Each volume participating in a replication pair contains such a history.

*See also* Pillar Axiom Replication.

*See also* filesystem.

*See also* replication pair.

**history checkpoint** A completed checkpoint in AxiomONE Replication for SAN operations. A checkpoint is considered a history checkpoint after it has been used to update the destination volume of the replication pair. The Clone LUNs associated with a history checkpoint are retained until the threshold for the maximum number of history clones is reached.

*See also* Pillar Axiom Replication.

*See also* checkpoint.

*See also* Clone LUN.

*See also* replication pair.

**I**

**inactive clone** A point-in-time snapshot of a filesystem or LUN that is hidden from the view of users and, so, cannot be accessed. An inactive clone is generally used for archival purposes and can be used as the source in restore operations. An inactive clone is created when the “Inactive” option is selected at the time the clone is created. For the clone to
become active (accessible to users), the administrator must explicitly activate the clone.

For information on how to activate a clone, refer to the Pillar Axiom Administrator’s Guide or to the Pillar Axiom CLI Guide.

See also Clone FS.
See also Clone LUN.
See also filesystem.
See also LUN.

**initialization**

1. The start-up process in a Pillar Axiom storage system. This process includes discovery of hardware components and synchronization of configuration data among the software processes in the system. Sometimes called boot-up.

2. The process of making unused storage capacity available. For example, when a Brick is added to a Pillar Axiom system, the system initializes ( zeroes) the space provided by the Brick.

**Input/Output Operations per Second (IOPS)**

A filesystem performance measurement for input (read) and output (write) operations. Adding Bricks can increase the IOPS capability of a Pillar Axiom storage system.

See also Brick.
See also filesystem.

**I/O bias**

A Quality of Service (QoS) attribute that identifies the typical file read-write ratio, which translates to an optimization bias for the filesystem:

- Mixed, if the read-write ratio varies.
- Read, if read activity exceeds write activity.
- Write, if write activity exceeds read activity.

See also filesystem.
See also Quality of Service (QoS).

**iSCSI**

Internet SCSI (Small Computer System Interface) protocol, an Internet Protocol (IP) based standard for linking data storage devices over a network and for transferring data by carrying SCSI commands over IP networks. An iSCSI storage area network (SAN) may be composed of native...
iSCSI initiators (such as File Servers) and iSCSI targets (such as disk arrays and tape subsystems). Each iSCSI target is identified by a unique iSCSI qualified name (IQN), and each port on the Slammer is identified by one or more IP addresses.

*Compare Fibre Channel (FC).*

*See also File Server.*

*See also Slammer.*

**isolate**

To stop the active replication of source LUN data to the destination LUN in an AxiomONE Replication for SAN replication pair. After isolation the system no longer generates checkpoints.

*See also Pillar Axiom Replication.*

*See also checkpoint.*

*See also LUN.*

*See also replication pair.*

**J**

**journal**

A sequential record of committed transactions (set of modified blocks) that are guaranteed to be written to the underlying Brick storage. The Pillar Axiom storage system maintains one journal for each filesystem. In the background, the system continuously flushes these journals to permanent storage on the appropriate Bricks.

The system maintains two copies of a journal in battery-backed memory (BBM). The primary copy exists on the same Slammer control unit (CU) on which the filesystem resides. The secondary copy (a mirror) exists in the BBM in the buddy CU to allow recovery in the event of a failure of the owner CU.

*See also Brick.*

*See also pinned data.*

*See also power on with data recovery (PODR).*

*See also Slammer.*
### Kerberos
A secure method for authenticating a request for a service. Kerberos lets a user request an encrypted ticket from an authentication process that is a part of the Key Distribution Centre (KDC), which can then be used to request a particular service from a server. The user's password does not have to pass through the network.

Pillar Axiom administrators can choose to authenticate users by requiring them to request a KDC ticket.

### light-emitting diode (LED)
A device that lights when it receives an electrical signal. Pillar Axiom storage systems use LEDs on the hardware to indicate component statuses, activities, and faults. For example, an amber LED often indicates a failed device. For a complete description of LED status, refer to the *Pillar Axiom Service Guide* appendix.

*See also* beacon.

### link aggregation
A process that groups two or more network connections into a single channel, creating a higher-bandwidth logical link. Link aggregation provides load balancing and fault tolerance for multiple Ethernet links. When link aggregation is enabled for a Pillar Axiom storage system, the aggregated Gigabit Ethernet (GbE) ports on each Slammer control unit (CU) become redundant. Conforms to the IEEE 803.2ad standard Link Aggregation Control Protocol (LACP) standard.

In addition, Pillar Axiom systems can detect link interruptions due to switch port, CU port, or cable failure. This feature permits link loss recovery by allowing a virtual interface (VIF) to migrate (in the case of a switch or cable failure) to another port on the same CU or (in the case of a CU failure) to the partner CU.

*See also* control unit (CU).

*See also* Gigabit Ethernet (GbE).

*See also* Slammer.

### local area network (LAN)
Computers and other devices that span a geographic area of up to a few thousand meters and interact through a
common communications link. Pillar Axiom storage systems provide interfaces to two types of LAN:

- Private management network, which the Pillar Axiom system uses for internal communication.
- Public LAN, which administrators and clients use to access the system.

*Compare* virtual local area network (VLAN).

*See also* private management interface (PMI).

**logical volume**
A named segment of storage in the storage pool. This umbrella term is a logical concept that represents network attached storage (NAS) filesystems and storage area network (SAN) LUNs.

*See also* filesystem.

*See also* LUN.

*See also* volume group.

**lost data**
A condition in which data may not be accessible or available. When this condition exists, the logical volume reports a *lost data* status, which means that the Pillar Axiom storage system cannot guarantee that some data has not been lost. This status can occur, for example, when:

- An extended power outage occurs without the opportunity to shut down the Pillar Axiom system before the Slammer battery dies.
- A Brick failure occurs and the redundant copy of a logical volume on that Brick is marked invalid. On recovery, while copying data from the remaining copy to the recovering copy, a read error occurs.

A lost data status causes the system to take the logical volume offline and to generate an Administrator Action.

*See also* availability.

**LUN**
A logical volume within a storage area network (SAN). Administrators assign storage resources and Quality of Service (QoS) attributes to each logical unit (LUN).

*Compare* filesystem.

*Compare* virtual LUN (VLUN).

*See also* logical volume.
See also Quality of Service (QoS).

**LUN Copy**
A block-level, full-image copy of a LUN or Clone LUN. This copy can be read from and written to immediately. Quality of Service (QoS) parameters for a LUN Copy can differ from the original. Copies use the available storage in the system. Called *Copy LUN* in the Pillar Axiom Storage Services Manager.

A duplicate copy requires greater system and storage resources than the Clone LUN feature. To create an archival copy, use an inactive clone.

*Compare Clone LUN.*

See also inactive clone.

See also LUN.

**M**

**Management Information Base (MIB)**
An information store that provides the current state of a collection of managed network objects and is accessed by means of the Simple Network Management Protocol (SNMP). Access to MIB state information is controlled through the use of a community string.

Pillar Axiom storage systems expose an MIB that corresponds to the physical state of the system, including system status, statistics, and notification information.

*See also community string.*

*See also Simple Network Management Protocol (SNMP).*

**management IP**
The Internet Protocol (IP) address that administrators use to access the Pillar Axiom management interface. This address is often set to a customer-defined address when the Pillar Axiom storage system is first installed.

**minimum allocation unit (MAU)**
The minimum amount of storage that can be allocated from the Pillar Axiom storage pool. The type of storage determines the physical size of a MAU:

- For serial ATA (SATA) Bricks, a MAU is 315 MB.
- For Fibre Channel Bricks, a MAU is 288.75 MB.

**Monitor (administrator)**
A login account that has the authority to perform read-only management tasks in a Pillar Axiom storage system and the ability to modify their own account attributes.
### N

**Name Service Switch (NSS)**

A service that provides ordered access to databases to resolve users, groups, and hosts. An administrator can identify the search order that a File Server uses among these databases and files:

- Network Information Service (NIS) database for host and password resolution.
- Domain Name System (DNS) database for host resolution in non-NIS environments.
- Files (`/etc/passwd`, `/etc/group`, and `/etc/netgroup`) for password resolution in non-NIS environments.

*See also Domain Name System (DNS).*

*See also File Server.*

*See also Network Information Service (NIS).*

**NAS network interface module (NIM)**

A field replaceable unit (FRU) in a Slammer that is dedicated to network attached storage (NAS). A NIM has two or four Gigabit Ethernet ports for local area network (LAN) connectivity. A NAS Slammer holds two such FRUs (one per control unit). A NAS NIM may optionally contain a Fibre Channel (FC) host bus adapter to support FC tape devices and NDMP (Network Data Management Protocol) backup operations.

*Compare SAN network interface module (NIM).*

*See also Slammer.*

*Compare Support administrator.*
### NAS/SAN
The unification of network attached storage (NAS) and storage area network (SAN) environments in a Pillar Axiom storage system, which uses a single storage pool and is controlled by flexible, Quality of Service (QoS)-driven policies. NAS Slammers and SAN Slammers coexist and interoperate to provide NAS and SAN protocol support and access to that storage pool.

*Compare SAN Slammer.*

*See also NAS Slammer.*

### netmask
A pattern that shows how an Internet address is to be divided into network, subnet, and host parts. As a File Server network parameter, it identifies the mask that is assigned to the virtual network interfaces of the File Server.

*Compare virtual network interface (VIF).*

*See also File Server.*

### Network Data Management Protocol (NDMP)
An industry-standard protocol that allows for the use of third-party backup applications to manage the backup and recovery of customer data. An NDMP user account, password, and access port are configured through the Pilot management controller. Pillar Axiom storage systems support NDMP version 4. Refer to [http://www.ndmp.org/info/faq.shtml](http://www.ndmp.org/info/faq.shtml) and to the *Pillar Axiom NDMP Integration Guide for NAS Systems.*

### Network File System (NFS)
A file-sharing protocol that allows users who have Network File System (NFS) client software installed on their workstations to access data that is stored on a Pillar Axiom storage system. Users can manipulate these files as though they were stored locally on their own drive.

Pillar Axiom systems support NFS versions 2 and 3 commands over Transmission Control Protocol (TCP) and User Datagram Protocol (UDP).

*Compare Common Internet File System (CIFS).*

### Network Information Service (NIS)
A network naming and administration service. Administrators can choose to authenticate UNIX, Linux, and Windows Network File System (NFS) clients by means of an NIS database.
Compare Domain Controller (DC).

See also Network File System (NFS).

Network Time Protocol (NTP)

A standard that is used to synchronize computer clock times in a network of computers. The Pilot management controller synchronizes its time with an NTP server outside of the Pillar Axiom storage system. Slammers synchronize their clocks with the Pilot. You can also set the time manually.

See also Pilot.

See also Slammer.

NIS netgroup

A named list of members that are given similar network access. Any member of a netgroup can mount a Network File System (NFS) export point of a File Server, if an administrator has:

- Specified that netgroup as an allowed host.
- Defined Network Information Service (NIS) as one of the Name Service Switch (NSS) search settings for hosts.
- Specified an NIS server that contains an entry for that netgroup.

Administrators can also list netgroups in an exports file as an alternative to NIS user authentication.

See also export.

See also exports file.

See also File Server.

See also Name Service Switch (NSS).

See also Network Information Service (NIS).

non-disruptive software update

An installation of the Pillar Axiom operating systems, applications, and hardware firmware in a way that does not require the Pillar Axiom storage system to be quiesced and all data paths taken offline. Instead, user applications can continue accessing the Pillar Axiom storage arrays without interruption.

Pillar Axiom systems implement non-disruptive software updates by warm starting the Slammer control units (CUs) and restarting the Pilot CUs to bring up the new software. As each Slammer CU warmstarts, there is a temporary protocol service disruption of a few seconds on each CU.
This disruption is typically non-disruptive to most applications and protocols.

Sometimes called NDU (nondisruptive update).

*Compare* disruptive software update.

*See also* Pilot.

*See also* Slammer.

*See also* update.

**non-optimized access (NOA)**

A less efficient access path that is created when a LUN is mounted on the partner Slammer control unit (CU) rather than on the CU that actually owns the LUN.

*Compare* Forwarding Filesystem (FFS).

**O**

**opportunistic lock (oplock)**

In Common Internet File System (CIFS), a specialized form of file lock that allows the CIFS client to cache data. Oplocks are an optional feature when an administrator creates a File Server. Without oplocks, CIFS clients access data files directly.

*See also* Common Internet File System (CIFS).

*See also* File Server.

**P**

**path**

The physical route along which the protocol or data for a logical connection travels. A path connecting a customer hardware device to a Pillar Axiom storage system is dedicated to transporting either user data or management information.

A link between the primary and secondary Pillar Axiom systems in an AxiomONE Replication for SAN configuration.

*Compare* channel.

*See also* route.

*See also* Storage System Fabric (SSF).

**Pillar Axiom CLI**

A client-based application that enables administrative actions by means of commands from a shell. Through this interface, system administrators can configure and manage a Pillar Axiom storage system. This application follows
conventions used by other command line interfaces and supports automation through scripting using standard shells such as Perl and Python.

*Compare command line interface (CLI).*

*Compare graphical user interface (GUI).*

| **Pillar Axiom Dynamic Performance Manager** | A feature of the Pillar Axiom Storage Services Manager that allows administrators to define a set of capacity and performance attributes for logical volumes (filesystems and LUNs).  
*See also Quality of Service (QoS).* |
| **Pillar Axiom Path Manager (APM)** | Optional software installed on a storage area network (SAN) host to manage multiple paths to the Pillar Axiom storage system. |
| **Pillar Axiom Replication** | Optional software that allows administrators to provide for recovery from catastrophic disasters by replicating logical volumes (filesystems and LUNs) onto one or more Pillar Axiom storage systems. This software can keep the content of the replicas synchronized with that of their parent volumes.  
*Pillar Axiom MaxRep Replication for NAS* is available for network attached storage (NAS) environments, while *AxiomONE Replication for SAN* is available for storage area network (SAN) environments.  
*Compare Volume Copy.*  
*See also replica.* |
| **Pillar Axiom SecureWORMfs** | A type of filesystem used to enforce data retention. Data is stored on a Pillar Axiom SecureWORMfs in a protected (non-rewritable) manner.  
*See also filesystem.* |
| **Pilot** | A Pillar Axiom component that is dedicated to administrative and management operations. Administrators connect to Pilot management controllers over the Ethernet. Administrators access the administrative interface through the graphical user interface (GUI) or the command line interface (CLI).  
*Compare Brick.*  
*Compare Slammer.*  
*See also command line interface (CLI).*  
*See also graphical user interface (GUI).* |
Pilot restart

Reinitiation of the Pilot management controller while the rest of the Pillar Axiom storage system continues to function. The management system restarts the Pilot when the system:

- Has detected an internal issue.
- Is performing a non-disruptive software update (data resources remain online).

Pilot restarts do not affect or impact the data path in any way. 
*Compare restart.*

*See also* non-disruptive software update.

pinned data

Any modified data that the system cannot flush from memory to physical storage due to a system or power failure. The Pillar Axiom storage system protects this in-memory data until it can flush the data to physical storage. Administrators can:

- Fix the issue to let the system flush the pinned data.
- Discard the pinned data.

*See also* journal.

policy-based management

A Pillar Axiom administrative mechanism that simplifies resource management. This mechanism allows the creation of policies to deal with situations that are likely to occur. System administrators define Quality of Service (QoS) policies for filesystems and LUNs that define:

- Capacity limits
- Performance targets
- Data protection

Administrators can define other policies to handle:

- Event notifications
- Data replication
- Hardware component failures

port group

A collection of Fibre Channel ports within the Storage System Fabric (SSF) that is used to access the storage arrays.

*See also* Storage System Fabric (SSF).
**power on with data recovery (PODR)**  A power cycle that maintains data intact within the battery-backed memory in the Slammer storage controllers. This term applies most often in the context of a Slammer control unit that has been power cycled without a clean shutdown. It could apply to the entire Pillar Axiom storage system as well.

*See also* journal.

*See also* shutdown.

*See also* Slammer.

**primary site**  The location of the Pillar Axiom storage system that is normally used as the data store for applications in an AxiomONE Replication for SAN replication pair. In normal operation, the primary site is the *source* of the data being replicated. When using replication to re-synchronize data after the secondary site has been used to run the applications, the primary site is the *destination* of the replication activity.

*Compare* secondary site.

*See also* Pillar Axiom Replication.

*See also* replication pair.

**Primary system administrator**  A unique login account that has the authority to perform all administration and configuration tasks. This account cannot be deleted or disabled.

*Compare* Administrator 1.

*Compare* Administrator 2.

*Compare* Monitor (administrator).

*Compare* Support administrator.

**priority**  A Quality of Service (QoS) attribute that affects the location of data for a logical volume (filesystem or LUN) on a drive relative to other logical volume data:

- Premium, the highest possible performance. Applies only to Fibre Channel (FC) Bricks. This priority uses the outer 20% of the FC drives.

- High, which uses the outer 20% of serial ATA (SATA) drives. FC Brick only systems use 20-40% from the outer edge of the drives.
○ Medium, which uses the space in the band that is 20-60% from the outer edge of SATA drives; FC Brick only systems use 40-60%.

○ Low, which uses the space in the band that is 60-80% from the outer edge of drives.

○ Archive, which uses the space in the innermost band of drives (inner 80-100%).

See also Quality of Service (QoS).

private interconnect (PI) The internal switched Fibre Channel fabric that connects the Slammer storage controllers to each other and to the Brick storage enclosures.

See also Storage System Fabric (SSF).

private interconnect module (PIM) The Slammer hardware unit that provides the private interconnect (PI) interface to the Brick storage array. Formerly referred to as an FCIM (Fibre Channel interface module).

private management interface (PMI) The internal switched Ethernet local area network that connects the Pilot control units to the Slammer control units.

Quality of Service (QoS) The set of capacity and performance attributes, including redundancy, that administrators assign to logical volumes (filesystems and LUNs). Administrators can assign different QoS attributes to each logical volume and allocate system resources that are based on user requirements. Capacity and performance settings can be modified at any time.

See also Pillar Axiom Dynamic Performance Manager.

See also capacity.

See also file access.

See also file size.

See also filesystem.

See also I/O bias.

See also LUN.

See also priority.

See also redundancy.
See also service level agreement (SLA).

**quarantine**
The action the Pillar Axiom storage system takes to limit or deny access to individual resources within a filesystem, if those resources should become inconsistent. This condition causes the Pillar Axiom 600 system to log a Call-Home event and to send an alert email notification. Only that portion of the filesystem containing the fault becomes inaccessible; the rest of the filesystem remains online. The Pillar World Wide Customer Support Center will advise appropriate actions to take to recover the failed resources.

See also alert.

See also Call-Home.

See also filesystem.

**quota**
Capacity limits for directories, users, or groups who store data in a filesystem.

See also capacity.

See also filesystem.

R

**RAID group**
A collection of physical drives within a Brick that stores user data. Fibre Channel Bricks provide one RAID group, which consists of 11 drives. SATA and SSD Bricks provide two RAID groups, each of which consists of 6 drives. Sometimes called a Brick LUN or more rarely a data LUN.

See also FC RAID Brick.

See also SATA Brick.

See also SSD Brick.

See also stripe.

**redundancy**
A Quality of Service (QoS) attribute that identifies how many mirror copies of the original data are stored online:

- Standard, which stores original data only.
- Double, which stores original data and one mirror copy.

All values stripe the data over multiple RAID groups.

See also Quality of Service (QoS).

See also stripe.
**redundant array of independent disks (RAID)**

A disk subsystem that consists of a set of drives and a controller that operate as a single logical drive. Pillar Axiom storage systems have multiple RAID controllers (two in each Brick) that provide hardware RAID 5 or Distributed RAID for logical volumes (filesystems and LUNs).

*See also* fault tolerance.

*See also* logical volume.

*See also* Distributed RAID.

**reliability**

A feature of a Pillar Axiom storage system in which dependable system hardware and software consistently serve customer data. The reliability of the system reduces maintenance costs and minimizes service disruptions.

*See also* availability.

*See also* Reliability, Availability, Serviceability (RAS).

*See also* serviceability.

**Reliability, Availability, Serviceability (RAS)**

The ability to serve customer data, to respond to a failure, and to undergo maintenance without a complete system shutdown. Pillar Axiom storage systems were designed with these features in mind to produce a highly reliable, highly available system that is easy to service.

*See also* availability.

*See also* reliability.

*See also* serviceability.

**replica**

A copy of a logical volume (filesystem or LUN). Replicas are generally used for testing and for recovery from file corruption or catastrophic situations. Replicas include all forms of snapshots and clones.

All replicas, *except* those created by the Pillar Axiom Replication utilities, are:

- Created by an explicit one-time operation.
- Performed on the same Pillar Axiom storage system.
- Require no prior configuration.
- Disassociated from and not synchronized with changes to their parent volumes.

Pillar Axiom Replication operations produce copies of the data that, once created, continue to be associated with the
parent volume. This type of replica requires pre-configuration and can be placed on a different system. A synchronization operation reflects in the replica all updates to the parent volume.

See also Pillar Axiom Replication.

See also Clone FS.

See also Clone LUN.

See also Snap FS.

See also Volume Copy.

**replication pair**

1. For AxiomONE Replication for SAN, a relationship established between two LUNs on different Pillar Axiom storage systems. The replication process is asynchronous and automatically transfers to the destination volume all changes made to the source volume.

2. For Pillar Axiom MaxRep Replication for NAS, a relationship established between two filesystems on the same or different Pillar Axiom storage systems. Through the use of a command, the administrator requests that the replication process transfer to the target volume all changes made to the source volume.

See also Pillar Axiom Replication.

See also LUN.

See also filesystem.

**restart**

A process that ensures the Pillar Axiom software components shut down and start back up in an orderly way. The Pilot management software controls this process. During a Pilot restart, all data paths are available. During a full system restart, the data paths are not available.

During startup, the management software obtains heartbeats from the Slammers and verifies the configuration of the Pillar Axiom storage system. Disruptive software updates and explicit system administrator requests initiate restarts.

Compare non-disruptive software update.

Compare warmstart.

See also shutdown.
See also Slammer.

See also Pilot restart.

**restart point**

A block of information that is periodically saved during Pillar Axiom MaxRep Replication for NAS synchronization operations that, if needed, can be used to continue the synchronization process after an interruption. The system records a restart point every minute.

See also Pillar Axiom Replication.

See also replication pair.

**route**

The sequence of hosts, routers, gateways, and other devices that network traffic can take. Pillar Axiom administrators identify at least one gateway for a File Server to use to route messages to other networks.

See also File Server.

See also gateway.

See also sendback routing.

**S**

**SAN network interface module (NIM)**

A field replaceable unit (FRU) in a SAN Slammer that has two Fibre Channel ports for storage area network (SAN) connectivity. A SAN Slammer holds two such FRUs, one for each control unit.

Compare NAS network interface module (NIM).

See also SAN Slammer.

**SAN Slammer**

A Slammer that provides block-based storage services to a storage area network (SAN). A SAN Slammer communicates with customer servers using Small Computer System Interface (SCSI) commands over the customer’s SAN. SAN Slammers support both Fibre Channel and Internet SCSI (iSCSI) technologies.

Compare NAS Slammer.

See also iSCSI.

See also Slammer.

**SATA Brick**

A 2U storage enclosure that manages a collection of serial ATA (SATA) hard disk drives (HDDs).
SATA Bricks contain 13 SATA drives. The 13th drive (in the back) is a hot spare. If one of the 12 regular drives fail, a rebuild occurs to the hot spare. When the failed drive is replaced, a copyback operation is performed from the hot spare to the replacement.

*Compare FC RAID Brick.*

*Compare SSD Brick.*

*See also Brick.*

**secondary site**

The location of the Pillar Axiom storage system that is used as the data store for applications when the primary site is unavailable in an AxiomONE Replication for SAN replication pair. In normal operation, the secondary site is the *destination* of the data being replicated.

When the primary site is again available, replication is resumed in the reverse direction to replicate the updated data back to the primary site of the replication pair. During this operation the secondary site is the *source* of the data being replicated. Once the primary site has been re-synchronized, it can again be used to host the applications.

*Compare primary site.*

*See also Pillar Axiom Replication.*

*See also replication pair.*

**Self-Monitoring, Analysis, and Reporting Technology (SMART)**

A feature of Enhanced Intelligent Drive Electronics (enhanced IDE or EIDE) technology that provides an interface between the basic input/output system (BIOS) of a computer and a drive. In a Pillar Axiom storage system, RAID controllers use SMART to predict whether a drive is in danger of failing, which allows administrators to prevent the failure in a proactive way.

*See also redundant array of independent disks (RAID).*

**sendback routing**

The path a Pillar Axiom storage system uses to reply to an incoming Transfer Control Protocol (TCP) request, the path being the same interface over which the request arrived. Sendback routing is similar to *boomerang* or *reflect mode* routing for host implementations.

*See also route.*

**serial ATA (SATA)**

A standard for connecting drives into computer systems. Drives managed by SATA RAID controllers are based on...
serial instead of parallel signaling technology, which IDE (Intelligent Drive Electronics) drives use.

See also Brick.

See also SATA Brick.

See also SSD Brick.

service level agreement (SLA) Contractually defined performance metrics in which Pillar Data Systems provides technical support, replacement parts, and on-site service to an entitled customer.

See also Quality of Service (QoS).

serviceability An attribute of a Pillar Axiom storage system that eases system maintenance cost and time through such features as self-diagnosing and self-repairing systems, hot-swappable field replaceable units (FRUs), and a guided-maintenance wizard.

See also availability.

See also field replaceable unit (FRU).

See also reliability.

See also Reliability, Availability, Serviceability (RAS).

session The period of time during which a client is logged in to a Pillar Axiom server with the credentials necessary to run commands against the Pillar Axiom storage system. A session begins when the server successfully authenticates the user. The session remains active until the user explicitly ends or quits the session or simply logs out. Often referred to as a command session, login session, or a shell session.

share A named Common Internet File System (CIFS) resource in a filesystem that remote systems can access. In Pillar Axiom storage systems, Network File System (NFS) users can access a CIFS share if the path name definition for the NFS export point is the same as that for the share.

Compare export.

See also Common Internet File System (CIFS).

See also filesystem.

See also Network File System (NFS).

shutdown A process that completes all processes and quiesces all components in the Pillar Axiom storage system. This process allows you to safely remove power and replace hardware components. This process disables all of the data
interfaces on the Slammers and flushes all cached user data to permanent storage.

*Compare warmstart.*

*See also restart.*

**Simple Network Management Protocol (SNMP)**

A standard network protocol that is used to monitor Slammers, Bricks, and the drives within the Bricks. Through SNMP traps, administrators can monitor, for example, central processing unit (CPU) temperature and field replaceable unit (FRU) removal and insertion.

*See also Brick.*

*See also community string.*

*See also field replaceable unit (FRU).*

*See also Management Information Base (MIB).*

*See also Slammer.*

*See also trap host.*

**Slammer**

A 4U, clustered storage subsystem that is the front end to a Pillar Axiom storage system. Slammer storage controllers contain two control units that act in active-active mode to provide data and state mirroring.

*Compare Brick.*

*Compare Pilot.*

*See also control unit (CU).*

*See also NAS Slammer.*

*See also SAN Slammer.*

**Snap FS**

A point-in-time, read-only snapshot of a filesystem, which can be used later to restore the filesystem. A Snap FS has no Quality of Service (QoS) parameters. It consumes storage capacity from the filesystem itself. A Snap FS can be scheduled to occur at any time.

Creating filesystem snapshots is recommended. You can use them to recover accidentally deleted files and for quick filesystem recovery.

*Compare Clone FS.*

*See also capacity.*

*See also filesystem.*
Snap LUN

See Clone LUN.

SSD Brick

A 2U storage enclosure that manages a collection of solid state drives (SDDs). An SSD Brick, which displays as a SATA V2 type in the user interfaces, contains 13 SSD drives that are managed by serial ATA (SATA) RAID controllers. The 13th drive (in the back) is a hot spare. If one of the 12 regular drives fail, a rebuild occurs to the hot spare. When the failed drive is replaced, a copyback operation is performed from the hot spare to the replacement. An SSD Brick is an I/O intensive SATA alternative to Fibre Channel Bricks.

Compare FC RAID Brick.

Compare SATA Brick.

statistics

Collections of data about certain aspects of a Pillar Axiom storage system:

- Performance of backups, logical volumes, and network attached storage (NAS) and storage area network (SAN) protocols.
- Capacity usage.
- System health.

Statistics can be collected and viewed by using the Pillar Axiom Storage Services Manager (GUI). The statistics file collected in this manner can be analyzed with the Statistics Tools, a package that can be downloaded from the GUI.

See also capacity.

See also graphical user interface (GUI).

Storage Class

A categorization of physical storage, each category having distinct characteristics with regard to performance characteristics of data access. Example Storage Classes in a Pillar Axiom system are serial ATA (SATA), Fibre Channel, and solid state drive (SSD). Pillar Axiom 600 systems allow an administrator to explicitly manage volume placement within the overall system storage pool, first by Storage Class and then by relative priority within that Storage Class.

See also FC RAID Brick.

See also priority.

See also SATA Brick.
See also SSD Brick.

Storage System Fabric (SSF)

The protected Fibre Channel fabric internal to Pillar Axiom storage systems that interconnects Bricks and Slammers. The SSF enables communication within the Pillar Axiom system so that all Slammers can connect to any of the Bricks.

See also Brick.

See also Fibre Channel (FC).

See also private interconnect (PI).

See also Slammer.

strip

A contiguous block of storage (an extent) on a single drive. The size in bytes of a strip (referred to as its depth) depends generally on the Storage Class of the Brick. For Fibre Channel Bricks, the strip depth is 64 KB. For SATA and SSD Bricks, the strip depth is 128 KB. However, when the Oracle Automatic Storage Management (ASM) performance profile is used to configure a logical volume, the strip depth is 1 MB.

See also wide stripe.

stripe

For virtual LUNs (VLUNs), a collection of strips spread across a number of RAID groups. The preferred number of RAID groups (sometimes called the striping factor) depends on the Quality of Service (QoS) priority selected for the logical volume (filesystem or LUN).

See also Brick.

See also FC RAID Brick.

See also RAID group.

See also SATA Brick.

See also SSD Brick.

See also Storage Class.

See also strip.

See also virtual LUN (VLUN).

Support administrator

The reserved account for use by Pillar Customer Service or authorized service providers. This account, which cannot be deleted, has special privileges strictly for the purposes of maintenance. This account cannot modify data resources, administrator actions, or administrator accounts.
Compare Administrator 1.

Compare Administrator 2.

Compare Monitor (administrator).

Compare Primary system administrator.

**system status**

One of four possible states of the hardware in a Pillar Axiom storage system:

- Normal. System is in an expected state of operation; no user intervention required.
- Warning. An error condition cannot be corrected, but data is still accessible. User intervention is required.
- Critical. Some system element has been compromised. Data access has been lost to some degree. User intervention is required.
- Unknown. Component is unavailable or offline.

The status of a system has no direct relationship with and does not directly reflect the status of the logical volumes the system contains.

**T**

**thin provisioning**

An approach to storage allocation in which a logical volume (filesystem or LUN) appears to be much larger than the storage actually allocated to it. Additional storage is dynamically allocated when necessary. Administrators interact with thinly provisioned volumes when configuring their capacity and growth increments. These types of volumes are sometimes referred to as *sparse filesystems* and *sparse LUNs*.

*See also filesystem.*

*See also LUN.*

**Transmission Control Protocol (TCP)**

The connection-oriented protocol built on top of Internet Protocol (IP). TCP allows two hosts to connect and exchange streams of data. IP deals with the packets of data. Administrators can elect to allow TCP connections for a File Server in addition to User Datagram Protocol (UDP) connections.

*See also File Server.*
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
</table>
| **trap host** | A management device that receives Simple Network Management Protocol (SNMP) based network packets that contain device statistics or status.  
*See also Simple Network Management Protocol (SNMP).* |
| **Uninterruptible Power Supply (UPS)** | A device that contains a battery that engages when the device senses a loss of power from the primary source. A Pillar Axiom storage system receives Simple Network Management Protocol (SNMP) traps from the UPS device and generates events.  
*See also Simple Network Management Protocol (SNMP).* |
| **update** | A coordinated change in the version of Pillar Axiom software and firmware. The system handles both disruptive and non-disruptive updates and verifies that the software and firmware versions across the system are compatible before allowing the change to proceed. The system also notifies the system administrator if an update will be disruptive to the data paths.  
*See also disruptive software update.*  
*See also non-disruptive software update.* |
| **V** |  |
| **VIF** | *See virtual network interface (VIF).* |
| **virtual local area network (VLAN)** | A logical grouping of devices that are on different physical segments of a local area network (LAN) but communicate as though they are connected on a single segment. Administrators can associate a File Server with a particular VLAN.  
*See also File Server.*  
*See also VLAN tag.* |
| **virtual LUN (VLUN)** | A logical unit of storage where customer data is striped and optionally mirrored across two or more Bricks. In a small system, such as a minimally configured Pillar Axiom 300 system, the mirroring may occur between two primary data segments within a single Brick.  
VLUNs support filesystems, LUNs, clones, and snapshots and are internally managed, block-level structures. System |
administrators manage VLUNs only indirectly when they create or modify logical volumes.

*See also filesystem.*

*See also LUN.*

*See also stripe.*

**virtual network interface (VIF)**

A logical interface for regulating network I/O across different processes that access the same physical interface. A virtual network interface:

- Has an Internet Protocol (IP) address that is unique for the File Server.
- Has a virtual local area network (VLAN) tag identifier that is unique for the File Server and is non-zero if tagging is enabled.
- Identifies a particular network port on a particular control unit (CU) of a Slammer.

The Pillar Axiom storage system creates Common Internet File System (CIFS) and Network File System (NFS) servers on both CUs of the associated Slammer.

*See also control unit (CU).*

*See also File Server.*

*See also Slammer.*

*See also VLAN tag.*

**virtual server**

Sometimes referred to as *VServer.* *See File Server.*

**VLAN tag**

Identifies the virtual local area network (VLAN) identifier (ID) that can be assigned to the virtual network interface (VIF) of a File Server. VLAN IDs 1 through 4094 can optionally be used to connect a VLAN-capable switch to the Pillar Axiom storage system.

*See also File Server.*

*See also virtual local area network (VLAN).*

*See also virtual network interface (VIF).*

**volume**

A fixed amount of storage in a storage pool. A volume can be configured into a filesystem or a LUN. Volumes can be expanded in capacity up to the available physical capacity of the storage pool. Usually referred to as a *logical volume.*

*See also capacity.*
See also filesystem.

See also LUN.

**Volume Copy**

A logical volume (filesystem or LUN) that is created by a `copy LUN` or `copy filesystem` operation through use of the Pillar Axiom command line interface (CLI) or graphical user interface (GUI). A Volume Copy is a block-level, full-image, read-write copy of a logical volume. A Volume Copy is created by an explicit one-time operation, is performed on the same Pillar Axiom storage system, and requires no prior configuration. Volume copies are disassociated from and not synchronized with changes to their parent volumes.

Volume Copy operations produce copies of the data that, once created, are no longer associated with the source volume. Updates to the source volume are not reflected in the replica.

*Compare* Pillar Axiom Replication.

See also Filesystem Copy.

See also LUN Copy.

See also replica.

**volume group**

An object that is used to organize filesystems and LUNs. Volume groups can be nested.

See also filesystem.

See also LUN.

**W**

**warmstart**

A soft reset (not a reload) of the operating system in a Slammer control unit. During a warmstart, the operating system data structures are re-initialized and all customer data is kept intact. Transfer Control Protocol (TCP) connections for network attached storage (NAS) users are reset. A warmstart in a storage area network (SAN) appears as a target reset, which causes all outstanding commands to be retried by the host.

*Compare* restart.

**wide stripe**

A Pillar Axiom storage configuration option that provides a strip depth of 1 MB for a logical volume. A wide stripe minimizes the number of seeks required to service data requests in an Oracle Automatic Storage Management
ASM environment by matching strip size to the application request size. This feature is provided on RAID 5 arrays.

*See also* redundant array of independent disks (RAID).

*See also* strip.

**Windows Internet Naming Service (WINS)**

Windows software that resolves computer names to Internet Protocol (IP) addresses across multiple subnets. When a Pillar Axiom administrator configures the Common Internet File System (CIFS) options for a File Server in NT-type file sharing environments, the administrator specifies the IP address of the WINS server for CIFS authentication.

*See also* Common Internet File System (CIFS).

*See also* File Server.
