[1] `self rel` currently includes "`urn:oracle:webcenter:people:person:list:list`" instead of the correct "`urn:oracle:webcenter:people:person:list`". For the `@connections` default list, it currently includes "`urn:oracle:webcenter:people:person:list:connections`".

urn:oracle:webcenter:people:person:listNames

The `listNames` response contains the names of existing connections lists as well as the URIs for use in retrieving the lists (GET) and creating connections lists (`POST`).

Navigation Paths to listNames

This section shows how the client can navigate through the hypermedia to access the `listNames` resource:

```
resourceIndex
   person
      listNames
```

Supported Methods for listNames

The following methods are supported by the `listNames` resource:

- `GET`
  - **request**
  - **response**: **Body:** 0 or more `listName` items
- `POST`
  - **request—Body:** `listName`
  - **response—Body:** `listName`

See Also: For information about `listName`, see "urn:oracle:webcenter:people:person:listName".

Resource Types Linked to from listNames

Table 42–11 lists the resource types that the client can link to from the `listNames` resource.

Table 42–11 Related Resource Types for listNames

rel	resourceType
self	urn:oracle:webcenter:people:person:listNames

urn:oracle:webcenter:people:person:listName

The `listName` response contains the names of connections lists and URIs for use in accessing the connections lists.

Navigation Paths to listName

This section shows how the client can navigate through the hypermedia to access the `listName` resource:

```
resourceIndex
   person
      listNames
         listName
```

Writable Elements for listName

Table 42–12 lists the writable elements for the `listName` resource.

Table 42–12 Writable Elements for listName

Element	Type	Required	Constraints	Description
`name`	String	Yes	1 or more characters	A single list name

Resource Types Linked to from listName

Table 42–13 lists the resource types that the client can link to from the `listName` resource.

Table 42–13 Related Resource Types for listName

rel	resourceType
self urn:oracle:webcenter:people:person:list	urn:oracle:webcenter:people:person:list
urn:oracle:webcenter:activities:stream:list	urn:oracle:webcenter:activities:stream

urn:oracle:webcenter:people:person:list:member

The `member` response contains URIs for use in deleting a connection from a connections list.

Navigation Paths to member

This section shows how the client can navigate through the hypermedia to access the `member` resource:

```
resourceIndex
```

```
person
   list
      member
```

Supported Methods for member

The following method is supported by the `member` resource:

- `DELETE`
  - **request**

Writable Elements for member

Table 42–14 lists the writable elements for the `member` resource. Writable elements for `member` are used when you add a connection to a list or invite a user to be a connection. The `member` resource itself is for deleting connections, and does not use writable elements.

Table 42–14 Writable Elements for member

Element	Type	Required	Constraints	Description
`guid`	String	Yes	1 or more characters	GUID of the user
`message`	String	No	0 or more characters	Invitation message Use this only when inviting users to be connections (that is POSTing to the `@connections` list, not to user-created connections lists).

urn:oracle:webcenter:people:person:status

The `status` response contains URIs for use in retrieving (`GET`) and updating (`PUT`) the profile status message of a specified user.

Navigation Paths to status

This section shows how the client can navigate through the hypermedia to access the `status` resource:

```
resourceIndex
   people
      person
         status
```

Supported Methods for status

The following methods are supported by the `status` resource:

- `GET`
  - **request**
  - **response—Body:** `status`
- `PUT`
  - **request—Body:** `status`
  - **response—Body:** `status`

Writable Elements for status

Table 42–15 lists the writable elements for the `status` resource.

Table 42–15 Writable Elements for status

Element	Type	Required	Constraints	Description
`note`	String	Yes	1 or more characters	Content of status message

Resource Types Linked to from status

Table 42–16 lists the resource types that the client can link to from the `status` resource.

Table 42–16 Related Resource Types for status

rel	resourceType
self	urn:oracle:webcenter:people:person:status

urn:oracle:webcenter:people:invitations

The `invitations` response contains URIs for use in retrieving invitations (`GET`). You can also send an invitation (`POST`) to another user.

Navigation Paths to invitations

This section shows how the client can navigate through the hypermedia to access the `invitations` resource:

```
resourceIndex
   invitations
```

If you are not already connected to a user, you can also navigate to the invitations resource from that user's profile in order to invite them to connect. This path is only used for POSTing.

```
resourceIndex
   person
      invitations
```

Supported Methods for invitations

The following methods are supported by the `invitations` resource:

- `GET`
  - **Request—Parameters:** `q`

    To retrieve invitations sent to the current user, the format of `q` is:

    ```
    q=[invitee:equals:@me]
    ```

    To retrieve invitations sent from the current user, the format of `q` is:

    ```
    q=[invitor:equals:@me]
    ```

  - **Response—Body:** 1 or more invitations
- `POST`
  - **Request—Body:** `invitation`
  - **Response—Body:** `invitation`

Writable Elements for invitations

Table 42–17 lists the writable elements for the `invitations` resource.

Table 42–17 Writable Elements for invitations

Element	Type	Required	Constraints	Description
`message`	String	No	1 or more characters	Message attached to the invitation

Resource Types Linked to from invitations

Table 42–18 lists the resource types that the client can link to from the `invitations` resource:

Table 42–18 Related Resource Types for invitations

rel	resourceType
self	urn:oracle:webcenter:people:invitation

urn:oracle:webcenter:people:invitation

The `invitation` response contains URIs for use in deleting (`DELETE`) invitations you have sent, or deleting (`DELETE`) or updating (`PUT`) invitations you have received.

Navigation Paths to invitation

This section shows how the client can navigate through the hypermedia to access the `invitation` resource:

```
resourceIndex
   invitations
      invitation
```

Supported Methods for invitation

The following methods are supported by the `invitation` resource:

- `PUT`
  - **Request—Body:** `invitation`
  - **Response—Body:** `invitation`
- `DELETE`
  - **Request**

Writable Elements for invitation

Table 42–19 lists the writable elements for the `invitation` resource.

Table 42–19 Writable Elements for invitation

Element	Type	Required	Constraints	Description
`status`	String	Yes (PUT)	ACCEPTED IGNORED	The status of the invitation. **Note:** When you accept or ignore an invitation, it is removed from your list of invitations.

Read-only Elements for invitation

Table 42–20 lists the read-only elements for the `invitation` resource.

Table 42–20 Read-only Elements for invitation

Element	Type	Description
`id`	String	Unique ID of the invitation
`invitee`	personReference	User to whom the invitation is sent
`invitor`	personReference	User from whom the invitation is sent
`sentDate`	Date (String)[1]	Date the invitation was sent

[1] Data types, such as `DATE` and `BOOLEAN`, are stored in the API as `STRING`.

Resource Types Linked to from invitation

Table 42–21 lists the resource types that the client can link to from the `invitation` response.

self	urn:oracle:webcenter:people:invitation

42.3 Feedback REST APIs

Use the Feedback REST APIs to read and delete feedback. This section provides information about the REST APIs to use to perform these actions. It includes the following subsections:

- Section 42.3.1, "Feedback Entry Point"
- Section 42.3.2, "Feedback Resource Type Taxonomy"
- Section 42.3.3, "Feedback Security Considerations"
- Section 42.3.4, "Feedback Resource Types"

42.3.1 Feedback Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. For the People Connections service, each feature has its own `link` element. To find the entry points for the Feedback feature of the People Connections service, find the `link` elements with a `resourceType` of:

```
urn:oracle:webcenter:feedback
```

The corresponding `href` or `template` element provides the URI entry point, which returns all received feedback for the current user. The client sends HTTP requests to this entry point to work with the Feedback feature of the People Connections service.

> **See Also:** For more information about the Resource Index, see Section 54.5.1, "The Resource Index."
>
> For more information about resource types, see Section 54.5.2.1, "Resource Type."

42.3.2 Feedback Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 42.3.4, "Feedback Resource Types."

the resource type taxonomy for the Feedback feature of the People Connections service is:

```
urn:oracle:webcenter:feedback
   urn:oracle:webcenter:feedback:message
```

42.3.3 Feedback Security Considerations

You must be logged in to the REST service to access any of the People Connections REST APIs. After that, the underlying service handles permission checking and the like.

> **See Also:** For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

42.3.4 Feedback Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- "urn:oracle:webcenter:feedback"
- "urn:oracle:webcenter:feedback:message"

urn:oracle:webcenter:feedback

The `feedback` response contains URIs for use in reading Feedback messages.

Navigation Paths to feedback

This section shows how the client can navigate through the hypermedia to access the `feedback` resource:

```
resourceIndex
   feedback

resourceIndex
   person
      feedback
```

Supported Methods for feedback

The following methods are supported by the `feedback` resource:

- `GET`
  - **request—Parameters:** `startIndex`, `itemsPerPage`

    > **See Also:** For information about REST API parameters, such as `startIndex` and `itemsPerPage`, see "Common Request Query Parameters".

  - **response—Body:** `message`

See Also: For information about `message`, see "urn:oracle:webcenter:feedback:message".

- `POST` – If permitted, lets you add feedback for a target user. This method is only available if the current user is connected to and has permission to add feedback for the target user.
  - **request - body**: feedback

```
<message resourceType="urn:oracle:webcenter:feedback:message">
    <body>test from REST API</body>
    <receivedUser>
    <guid>4F16DD80393611DFBF895F177662C511</guid>
    </receivedUser>
</message>
```

Resource Types Linked to from feedback

Table 42–22 lists the resource types that the client can link to from the `feedback` resource.

Table 42–22 Related Resource Types for feedback

rel	resourceType
self urn:oracle:webcenter:feedback:all-received	urn:oracle:webcenter:feedback
self urn:oracle:webcenter:feedback:all-given	urn:oracle:webcenter:feedback
	urn:oracle:webcenter:feedback:message

urn:oracle:webcenter:feedback:message

The `message` response contains the feedback message data and URIs for use in deleting a Feedback message.

Navigation Paths to message

This section shows how the client can navigate through the hypermedia to access the `message` resource:

```
resourceIndex
   feedback
      message

resourceIndex
   person
      feedback
         message
```

Supported Methods from message

The following method is supported by the `message` resource:

- `DELETE`
  - **request**

Read-only Elements for message

Table 42–23 lists the read-only elements for the `message` resource.

Table 42–23 Read-only Elements for message

Element	Type	Description
`body`	String	Message content
`id`	String	Unique ID of the message
`author`	personReference	User who created the message
`created`	Date (String)[1]	Date the message was created
receivedUser	**personReference**	A person reference to the user who received the feedback

[1] Data types, such as `DATE` and `BOOLEAN`, are stored in the API as `STRING`.

Resource Types Linked to from feedback

Table 42–24 lists the resource types that the client can link to from the `feedback` resource.

Table 42–24 Related Resource Types for message

rel	resourceType
self	urn:oracle:webcenter:feedback:message

42.4 Message Board REST APIs

Use the Message Board REST APIs to post, read, and delete messages to a user's or a space message board.

This section provides information about the REST APIs to use to perform these actions. It includes the following subsections:

- Section 42.4.1, "Message Board Entry Point"
- Section 42.4.2, "Message Board Resource Type Taxonomy"
- Section 42.4.3, "Message Board Security Considerations"
- Section 42.4.4, "Message Board Resource Types"

42.4.1 Message Board Entry Point

Each REST service has a `link` element within the Resource Index that provides the entry point for that service. For the People Connections service, each feature has its own `link` element. To find the entry points for the Message Board feature of the People Connections service, find the `link` elements with a `resourceType` of:

```
urn:oracle:webcenter:messageBoard
```

> **Note:** As well as an entry point from the Resource Index, to navigate to an individual user's message board, the Message Board feature also has an entry point from a space response for the space message board.

The corresponding `href` or `template` element provides the URI entry point, which returns the Message Board for the current user. The client sends HTTP requests to this entry point to work with the Message Board feature of the People Connections service.

See Also: For more information about the Resource Index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

42.4.2 Message Board Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 42.4.4, "Message Board Resource Types."

The resource type taxonomy for the Message Board feature of the People Connections service is:

```
urn:oracle:webcenter:messageBoard
   urn:oracle:webcenter:messageBoard:message
```

42.4.3 Message Board Security Considerations

You must be logged in to the REST service to access any of the People Connections REST APIs. After that, the underlying service handles permission checking and the like.

See Also: For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

42.4.4 Message Board Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- "urn:oracle:webcenter:messageBoard"
- "urn:oracle:webcenter:messageBoard:message"

urn:oracle:webcenter:messageBoard

The `messageBoard` response contains URIs for use in reading (`GET`) and posting (`POST`) space and individual user Message Board messages.

Navigation Paths to messageBoard

This section shows how the client can navigate through the hypermedia to access the `messageBoard` resource:

```
resourceIndex
   messageBoard

resourceIndex
   person
      messageBoard

resourceIndex
   spaces
      space
         messageBoard
```

Supported Methods for messageBoard

The following methods are supported by the `messageBoard` resource:

- `GET`
  - **request—Parameters:** `startIndex`, `itemsPerPage`

    See Also: For information about REST API parameters, such as `startIndex` and `itemsPerPage`, see "Common Request Query Parameters".

  - **response—Body:** message

    Note: The REST `GET` command for reading (retrieving) messages retrieves all shown messages. Messages that are hidden through the application user interface are not retrieved. For information about hiding and showing messages, see "Working with Message Board Task Flows," in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

- `POST`
  - **request—Body:** `message`

    The POST for messages supports including a link URL in the message.

    See Also: For information about message, see "urn:oracle:webcenter:messageBoard:message".

Read-only Elements for messageBoard

Table 42–25 lists the read-only elements for the `messageBoard` resource.

Table 42–25 Read-only Elements for message

Element	Type	Description
`messageType`	String	Returns `link` if the message has a link. Otherwise, returns `null`.
`link`	String	Contains link data for messages with links: `name`, `url`, `icon`, `description`, `mimeType`, `objectId`, `objectType`, `serviceId`.

Resource Types Linked to from messageBoard

Table 42–26 lists the resource types that the client can link to from the `messageBoard` resource.

Table 42–26 Related Resource Types for messageBoard

rel	resourceType
self	urn:oracle:webcenter:messageBoard
	urn:oracle:webcenter:messageBoard:message

urn:oracle:webcenter:messageBoard:message

The `message` response contains the Message Board message data and URIs for use in reading (`GET`), revising (`PUT`), and deleting (`DELETE`) a space or individual user Message Board message.

Navigation Paths to message

This section shows how the client can navigate through the hypermedia to access the `message` resource:

```
resourceIndex
   messageBoard
      message

resourceIndex
   person
      messageBoard
         message

resourceIndex
   spaces
      space
         messageBoard
            message
```

Supported Methods for message

The following methods are supported by the `message` resource:

- `GET`
  - **request**
  - **response—Body:** `message`
- `PUT`
  - **request—Body:** `message`
  - **response—Body:** `message`
- `DELETE`
  - **request**

Writable Elements for message

Table 42–27 lists the writable elements for the `message` resource.

Table 42–27 Writable Elements for message

Element	Type	Required	Constraints	Description
`body`	String	Yes	1 or more characters	message content

Read-only Elements for message

Table 42–28 lists the read-only elements for the `message` resource.

Table 42–28 Read-only Elements for message

Element	Type	Description
`id`	String	Unique ID of the message
`author`	personReference	User who created the message
`created`	Date (String)[1]	Date the message was created

[1] Data types, such as `DATE` and `BOOLEAN`, are stored in the API as `STRING`.

Resource Types Linked to from message

Table 42–29 lists the resource types that the client can link to from the `message` resource.

Table 42–29 Related Resource Types for message

rel	resourceType
self	urn:oracle:webcenter:messageBoard:message

42.5 Creating an Invitation

This section illustrates how to invite another user to join your connections list using the People Connections Service REST API. After the invitation is made, the invitee is given the option to accept or not. This example also illustrates how to delete an invitation.

This section includes the following subsections:

- Section 42.5.1, "Creating an Invitation"
- Section 42.5.2, "Deleting an Invitation"

42.5.1 Creating an Invitation

1. The first step, as always with the REST APIs, is to retrieve the resource index:

   ```
   GET http://<host:port>/rest/api/resourceIndex
   ```

2. Next, find the person to whom you want to connect. To do this:

   1. In the resource index listing, scan for the link with the following resource type:

      ```
      urn:oracle:webcenter:people:person
      ```

   2. Execute a search for the user who you wish to invite. In this example, the user is named Monty.

      ```
      GET http://<host:port>/rest/api/people?q=loginid:equals:monty&utoken=ASDF
      ```

   3. Locate Monty's GUID in the response, as shown in Figure 42–1.

Figure 42–1 Response With User's GUID

```
</links>
<connected>false</connected>
<displayName>monty</displayName>
<guid>1AE5AF102E2611E09F062B573E287934</guid>
<id>monty</id>
−<name>
  <formatted>monty</formatted>
</name>
```

   4. Save the GUID so that you can use it to connect to the user.

3. Now that you have the invitee's GUID, you must find the resource to which you would like to add him. In this case, you want to add him to your own `connections` list.

   To find your `connections` list, first, scan the People Connections documentation (this chapter) for "`connections`." You will discover in Table 42–9, " Related

Resource Types for person" that `connections` are linked to from the `person` resource. For convenience, this table is shown in Figure 42–2.

Figure 42–2 Finding the connections Link

rel	resourceType
self	urn:oracle:webcenter:people:person
alternate	urn:oracle:webcenter:spaces:profile (HTML)
urn:oracle:webcenter:people:person:list:connections	urn:oracle:webcenter:people:person:list
	urn:oracle:webcenter:people:person:listNames
	urn:oracle:webcenter:people:person:status
urn:oracle:webcenter:activities:stream:person	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream:connections	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream	urn:oracle:webcenter:activities:stream
	urn:oracle:webcenter:messageBoard
urn:oracle:webcenter:feedback:all-given	urn:oracle:webcenter:feedback
urn:oracle:webcenter:feedback:all-received	urn:oracle:webcenter:feedback

Now that you know that `connections` are linked to from the `person` resource, you need to find the `person` resource. As the URN indicates, you get to the `person` resource from the `people` resource, as described in the following steps.

4. Return to the resource index (or use a cached version of the `resourceIndex` from your previous visit):

   ```
   GET http://<host:port>/rest/api/resourceIndex
   ```

5. Scan for the `people` resource, and you will find:

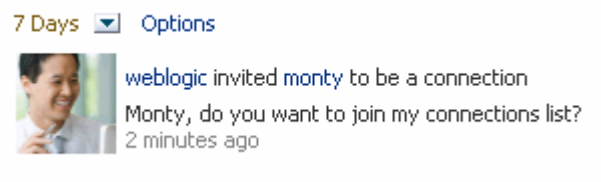
   ```
   urn:oracle:webcenter:people
   ```

6. Use the link in the `people` resource to access *your* lists:

   ```
   GET http://<host:port>/rest/api/people/@me/lists/@self?utoken=ASDF
   ```

7. Scan the returned links for the `resourceType` and `rel` listed in Table 42–9:

   ```
   resourceType="urn:oracle:webcenter:people:person:list
   rel="urn:oracle:webcenter:people:person:list:connections
   ```



8. Make the invitation by using the URI to your `connections` list to execute a `POST`:

   ```
   POST http://<host:port>/rest/api/people/@me/lists/@connections?utoken=ASDF

   Headers --  Accept:application/json, Content-Type:application/json
   Body -- {"message":"Monty, do you want to join my connections
   list?","guid":"1AE5AF102E2611E09F062B573E287934"}
   ```

9. Now, if you log in to Monty's account and you can see the invitation has been added, as shown in Figure 42–3.

Figure 42–3 Activity Stream Showing Invitation

42.5.2 Deleting an Invitation

After you initiate an invitation, you can view the invitation from your account by specifying `invitor:equals:@me`. For example:

```
GET
http://<host:port>/rest/api/people/invitations?q=invitor:equals:@me&utoken=ASDF
```

Each invitation element listed in the response contains a link that supports the DELETE operation and that looks something like this:

```
<links>
<link resourceType="urn:oracle:webcenter:people:invitation"
rel="self"
href="http://host_name:port_name/rest/api/people/invitations/
     e9073cdb-56ab-423d-8b1f-1220c802bdd4?
     utoken="FN0SEFwX42OCntwtx9a1dSbhqocO_w**"
     capabilities="urn:oracle:webcenter:delete"/>
</links>
```

The invitee can also delete an invitation from his or her own account. The invitee can get a list of his or her invitations by specifying:

```
GET
http://<host:port>/rest/api/people/invitations?q=invitee:equals:@me&utoken=ASDF
```

Note that the response from a DELETE is simply a status code of 204.

Part VII

Helping Users Find Content

Part VII contains the following chapters:

- Chapter 43, "Integrating the Links Service"
- Chapter 44, "Integrating the Tags Service"
- Chapter 45, "Integrating the Search Service"
- Chapter 46, "Integrating the Activity Graph Service"

43 Integrating the Links Service

This chapter explains how to integrate the Links service in a WebCenter Portal: Framework application at design time.

For more information about managing and including links, see:

- "Setting up the WebCenter Portal Repository" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Links Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

This chapter includes the following sections:

- Section 43.1, "Introduction to the Links Service"
- Section 43.2, "Basic Configuration for the Links Service"
- Section 43.3, "Advanced Information for the Links Service"

43.1 Introduction to the Links Service

This section provides overview information about the Links service features and requirements. It includes the following subsections:

- Section 43.1.1, "Understanding the Links Service"
- Section 43.1.2, "Requirements for the Links Service"
- Section 43.1.3, "What Happens at Runtime"

43.1.1 Understanding the Links Service

The Links service provides a way to view, access, and associate related information. For example, in a list of project assignments, you can link to the specifications relevant to each assignment. In a discussion thread about a problem with a particular task, you can link to a document that provides a detailed description of how to perform that task.

The Links service provides a means for the application developer to set up source objects (for example, the Discussions service) and target objects (for example, a document), thus enabling your users to create links between the two objects.

There are three actions associated with the Links service: create, delete, and manage. The manage action includes the create and delete actions.

The following custom JSF components are included in the service:

- **Links Detail Button**: This displays an icon and (optionally) a hyperlink that users click to open the Links Panel. To use the Links Detail Button, you must also include the Links - Dialog task flow as a region on the page.
- **Links Detail Menu Item**: This adds a menu item that opens the Links Panel. You can embed this item in an ADF menu. To use the Links Detail Menu Item, you must also include the Links - Dialog task flow as a region on the page.
- **Links Status Icon**: This has two versions:

  The gray **Links** icon (Figure 43–1) indicates that no links are present in the Links dialog.

Figure 43–1 The Links Icon (No Links Present)

  The gold **Links** icon (Figure 43–2) indicates that links are present in the Links dialog.

Figure 43–2 The Links Icon (Links Present)

You can link **from** the following objects:

- Announcements
- Discussions
- Documents
- Events
- Lists
- Pages
- Any object that has a custom JSF component (such as the Links Detail button) bound to it

You can link **to** the following **new** objects:

- Discussions
- Documents
- Events
- Notes
- URLs

You can link **to** the following **existing** objects:

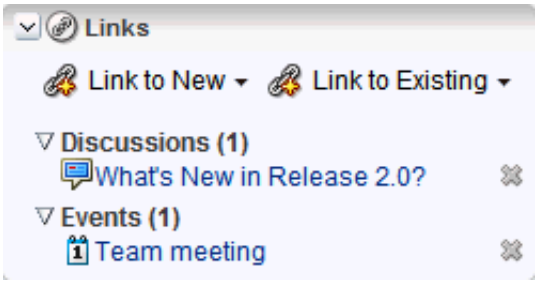
- Announcements
- Discussions
- Documents
- Events

Note: The Lists and Notes services are available in WebCenter Portal: Spaces only.

Links are *not* available for the other WebCenter Portal services, such as Mail and People Connections.

The Links service supports bidirectional links between objects. For example, when you create a link from a discussion topic to a document, a link from the document back to the discussion topic also is created. Similarly, when you *delete* the link from the discussion topic to a document, the link from the document back to the discussion topic is automatically deleted. Bidirectional linking is not available for URLs, notes, and specific list rows.

43.1.2 Requirements for the Links Service



Links automatically recognize any WebCenter Portal service in your application. After you have configured a service in your application, you can add links. However, links work only on secured pages. Links icons do not appear on unsecured pages. For more information, see Section 43.2.3, "Setting Security for the Links Service."

43.1.3 What Happens at Runtime

Linking provides an easy way for you to share information with your social network. Linking can help you realize a significant reduction of wasted time and effort normally spent looking for information.

The Links service exposes its features through a Links dialog (Figure 43–3), accessible wherever the **Links** icon (Figure 43–1) appears in your application.

Figure 43–3 Links Dialog

With the Links service, you can do the following:

- Link an object (such as a page) to an existing object (such as a discussion topic) by clicking the **Link** icon, selecting **Link to Existing**, choosing the resource **Discussions**. Optionally, you can choose a specific forum and click the topic title to choose a link.
- Link an object (such as a discussion topic) to a new object (such as a new note or URL) by clicking the **Link** icon for discussion topic, selecting **Link to New**, and choosing either **Note** or **URL**.
- Create multiple links from one object.
- Delete a link.

For more information about the Links service at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

43.2 Basic Configuration for the Links Service

This section describes the steps required for adding the Links service to your application. It includes the following subsections:

- Section 43.2.1, "Setting up Connections for the Links Service"
- Section 43.2.2, "Adding the Links Service at Design Time"
- Section 43.2.3, "Setting Security for the Links Service"
- Section 43.2.4, "Troubleshooting the Links Service"

43.2.1 Setting up Connections for the Links Service

The Links service requires a connection to the database where the WebCenter Portal schema is installed. The link map (that is, relationship information such as what object is linked to what other object) is stored in the database.

For details about setting up a database connection, see Section 7.2.2, "Setting Up a Database Connection."

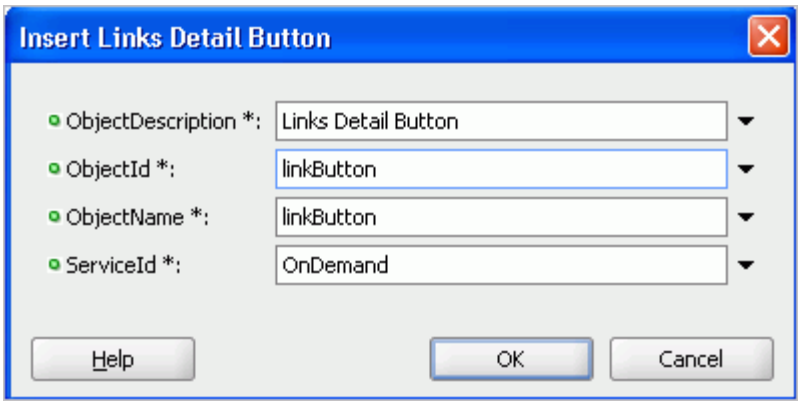
43.2.2 Adding the Links Service at Design Time

This section explains a basic incorporation of the Links service. It includes the following subsections:

- Section 43.2.2.1, "Links Service Task Flows."
- Section 43.2.2.2, "How to Add the Links Service to your Application."

43.2.2.1 Links Service Task Flows

The Links service includes one task flow: Links Dialog.



43.2.2.2 How to Add the Links Service to your Application

To add the Links Dialog task flow to your Framework application:

1. Follow the steps described in Chapter 3, "Preparing Your Development Environment" to create a customizable page in your application.
2. Ensure that you have set up the database connection to a database with the WebCenter Portal schema installed (Section 43.2.1).
3. Open the page on which you want to add the Links service.
4. In the Component Palette, click **WebCenter Portal - Links Service**.
5. Drag and drop the **Links Detail Button** component onto your page inside the `panelGroupLayout`.

   The button is placed inside of a `panelGroupLayout` for the purposes of this example only. It is not required that you always place the button inside a `panelGroupLayout`.
6. In the Insert Links Detail Button dialog (Figure 43–4), enter a unique object description, ID, and name.

Figure 43–4 Insert Links Detail Button Wizard

The properties in this dialog include:

- **objectDescription**: The description of the object to which you are binding the Links Detail Button
- **objectId**: A unique ID that identifies the object to which you are binding the Links Detail Button
- **objectName**: The name of the object to which you are binding the Links Detail Button
- **serviceId**: An application-wide ID that identifies your application

7. In the **ServiceId** field, enter `OnDemand`.

> **Note:** The Links service combines the `serviceId` and `objectId` to uniquely identify the object to which you bind the Links Detail Button.

8. Click **OK**.

   The new button displays in your page source (Figure 43–5).

Figure 43–5 The Link Detail Button in Your Page Source

```
<af:form><af:panelGroupLayout id="top" layout="horizontal" halign="end"
inlineStyle="background-color:cyan;width:100%">
    <rel:linksDetailButton objectDescription="Link Details Button"
                           serviceId="OnDemand" objectId="linkButton"
                           objectName="linkButton"/>
</af:panelGroupLayout>
```

9. In the Resource Palette, open **My Catalogs**, then open the **Task Flows** folder.
10. Drag and drop the **Links Dialog** task flow next to the Link Detail button on your page, and select **Region** from the context menu.
11. Save and run your page to the browser.

43.2.3 Setting Security for the Links Service

The Links service requires secured pages. Links icons do not appear on unsecured pages.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see Section 69.3, "Configuring ADF Security."

43.2.4 Troubleshooting the Links Service

This section describes common problems and solutions for the Links service.

Problem

The **Links** icon does not appear.

Solution

The Links service requires a database connection to the WebCenter Portal schema, where links information is stored. Make sure that you have created the connection to the database and made it available in the Application Resources panel of the Application Navigator. If the connection is available in the Resource Palette but not in Application Resources, then simply drag the connection from the Resource Palette to the Connections folder in Application Resources.

Problem

Existing links appear, but you are not able to create new links or delete existing links.

Solution

The `RelationshipPermission` permission is automatically granted to authorized users when a service is consumed. Verify that this permission has been granted. For information, see Section 69.3.2, "Automated Security Grants for WebCenter Portal Services."

43.3 Advanced Information for the Links Service

This section describes optional features available with this service. It includes the following subsection:

- Section 43.3.1, "Using the Links Service REST APIs"

43.3.1 Using the Links Service REST APIs

WebCenter Portal provides REST APIs to support the Links service. Use the Links service REST APIs to post links between two objects. For example, you could create a link between an event and a document in a space.

This section describes the REST APIs associated with the Links service. It includes the following subsections:

- Section 43.3.1.1, "Links Entry Point"
- Section 43.3.1.2, "Links Resource Type Taxonomy"
- Section 43.3.1.3, "Security Considerations"
- Section 43.3.1.4, "Links Resource Types"

For an introduction to the REST APIs, see Chapter 54, "Using Oracle WebCenter Portal REST APIs."

43.3.1.1 Links Entry Point

Each REST service has a link element within the resource index that provides the entry point for that service. To find the entry point for the Links service, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:links
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Links service.

For more information about the resource index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

43.3.1.2 Links Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 54.5.2.1, "Resource Type."

The taxonomy for the Links service is:

```
urn:oracle:webcenter:links
   urn:oracle:webcenter:links:results
```

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

43.3.1.3 Security Considerations

Authentication is required before using Links REST API methods.

For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

43.3.1.4 Links Resource Types

This section provides information about each resource type. It includes the following subsection:

- Section 43.3.1.4.1, "urn:oracle:webcenter:links:results"

43.3.1.4.1 urn:oracle:webcenter:links:results Use this resource type to identify the URI to use to create (`POST`) a link between two objects

The request is represented by the URL, and the response is a link, each with metadata to help the end user choose an item to drill down and cross links to the owning REST services, if available. If the owning REST service is unavailable, then an HREF link is provided.

Navigation Paths to results

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   links
```

```
      results

resourceindex
   spaces
      spaces:resourceindex
         spaces:links
            results
```

Supported Methods for results

The following method is supported by this resource:

- `POST`
  - **request - body:** a source and a target object, each of which has a `serviceId`, `resourceId`, and `resourceName`; if the target is a URL link, then the target object also contains a `resourceUrl`, **Parameters**: `serviceId`, `resourceId`, `resourceName`
  - **response - body:** Status of "204 No Content" if successful, or "403 Forbidden" if the user has no permission to create a link

where:

- `serviceId={serviceId}`

  Optional: The service ID of the item, such as `services.oracle.webcenter.collab.calendar.community`

- `resourceId={resourceId}`

  The resource ID, such as `s833cddc4_caa5_416c_87e9_d702ef870b43;;3b0c6edb`

- `resourceName={resourceName}`

  The resource name, such as `New Event`.

For more information, see Section 54.5.2.5, "Templates."

Resource Types Linked to From results

Table 43–1 lists the resource types that the client can link to from this resource.

Table 43–1 Related Resource Types for links

rel	resourceType
self	urn:oracle:webcenter:links:results

Integrating the Tags Service

This chapter explains how to integrate the Tags service in a WebCenter Portal: Framework application at design time.

For more information about managing and including tags, see:

- "Setting up the WebCenter Portal Repository" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Tags Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

> **See Also:** You must register a resource viewer to enable custom resources to be rendered using Search or Tags, or to make the resources linkable to and from each other. For more information, see Section 7.3, "Extending Your Framework Application with Custom Components."

This chapter includes the following sections:

- Section 44.1, "Introduction to the Tags Service"
- Section 44.2, "Basic Configuration for the Tags Service"
- Section 44.3, "Advanced Information for the Tags Service"

44.1 Introduction to the Tags Service

Tags enable users to apply their own meaningful terms to items, making those items more easily discoverable in search results and the Tag Center. The Tag Center is a page that displays the interactions among all the tags, tagged items, and their taggers in an application.

Having multiple users tag objects contributes to the collective knowledge, which makes searching much more relevant. WebCenter Portal search takes advantage of the knowledge captured by tagging by indicating the relevance of results based on the quality and frequency of their applied tags.

Tags let the *users* of data (instead of the *publishers* of data) classify information. In this way, tags act as a personal productivity tool and a method to increase searchability for everyone.

For example, suppose your application includes a component that provides a view of departmental human resources contacts. If you enable tags for this component, then a user who comes to it can bookmark it for themselves and assign tags like HR or contacts or department to help others find it as well.

The Tags service is available for pages, documents, and custom objects. Creating a tag automatically publishes the event to the Activity Stream.

44.1.1 Understanding the Tags Service

You can apply one or more meaningful terms, called *tags*, to remind yourself and alert other users of the content they might expect to find at the tagged location. Anywhere you see the **Tags** icon (Figure 44–1), you can apply a tag.

Figure 44–1 The Tags Icon

Tags let you apply your own classifications to items. For example, you could apply the tag `phone` to a product page that provides useful information about new phones. When you or other users search for phone, the tagged page displays in the search results.

When you access the Tag Center, you see all users who applied the same tag anywhere else in the application. Within the Tag Center, a tag cloud (Figure 44–2) displays all currently applied tags.

Figure 44–2 A Tag Cloud

A tag cloud is a visual depiction of all tags. Tags are presented according to the frequency of their use—the larger the font, the more the tag has been applied to items. Click a tag in the tag cloud to run a search that returns a list of all items that use the tag.

44.1.2 Requirements for the Tags Service

The Tags service requires that you set up the WebCenter Portal schema and create a database connection to the schema. Tag information is stored in the database. For details, see Section 7.2.2, "Setting Up a Database Connection."

> **Note:** Typically, when you add tags in a Framework application, you also should add a search toolbar to enable searching for the objects with the tags. To add the search toolbar, follow the instructions in Section 45.2.3, "Adding the Search Service at Design Time."

The Tags service requires security. If users are not authenticated, then they cannot tag objects. If the application is not secured, then pages are not returned in search results for tagged items.

To enable the ability to tag *documents*, you must have the Document Manager task flow in the Framework application. For more information, see Chapter 30, "Integrating the Documents Service."

44.1.3 What Happens at Runtime

At runtime, when you search for a tag word, results are returned in the Tagged Items section of the search results. By default, tagged items that are accessed through their tags are rendered in a full screen replacing the same window.You can override this and have it open in a popup window.

You can tag custom components, find those tags either through a search or in the Tag Center, and access tagged items through their associated tags.

For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. The Tags service uses this framework to allow acting on a search result. For more information, see Section 7.3, "Extending Your Framework Application with Custom Components."

For more information about the service at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

44.2 Basic Configuration for the Tags Service

This section describes required steps for adding this service to your application. It includes the following subsections:

- Section 44.2.1, "Setting up Connections for the Tags Service"
- Section 44.2.2, "Adding the Tags Service at Design Time"
- Section 44.2.3, "Setting Security for the Tags Service"

44.2.1 Setting up Connections for the Tags Service

The Tags service requires a connection to the database with the WebCenter Portal schema installed.

For details about setting up a database connection, see Section 7.2.2, "Setting Up a Database Connection."

44.2.2 Adding the Tags Service at Design Time

To enable basic tagging, you must add either the **Tagging Button** component or the **Tagging Menu Item** component and the Tagging - Dialog task flow. In addition, to tag *custom* objects, you must register a resource viewer to visualize the tagged component when it is discovered by users.

This section describes how to enable tagging by adding the **Tagging Button** and the Tagging - Dialog task flow. It includes the following subsections:

- Section 44.2.2.1, "Tags Service Components"
- Section 44.2.2.2, "Tags Service Task Flows"
- Section 44.2.2.3, "How to Add the Tags Service to your Page"
- Section 44.2.2.4, "How to Modify the Tags Service Task Flow Parameters"

44.2.2.1 Tags Service Components

The following JSF components are included in the service:

- **Tagging Button**: When you add a Tagging Button, a Tags link on the page enables you to invoke the Tag This Item (or Tag This Page) dialog at runtime.
- **Tagging Menu Item**: When you add a Tagging Menu Item, a menu option on the page enables you to invoke the Tag This Item (or Tag This Page) dialog at runtime.

You can configure attributes in the Tags components. For example, the `SharedParam` attribute lets you disable the **Shared** checkbox. (With the `default` value, the checkbox is enabled, so users can check it or uncheck it at will. With the `always` value, the checkbox is disabled in the true state, so all tags are public. With the `never` value, the checkbox is disabled in the false state, so all tags are private.) As another example, the `ResourceScope` attribute lets users tag objects in a different scope, such as a list of search results with the Tagging button next to each result, where the search is done in the default scope but the results could be in other scopes. For more information about the component attributes, see the online help.

44.2.2.2 Tags Service Task Flows

Table 44–1 lists the Tags service task flows.

Table 44–1 Tags Service Task Flows

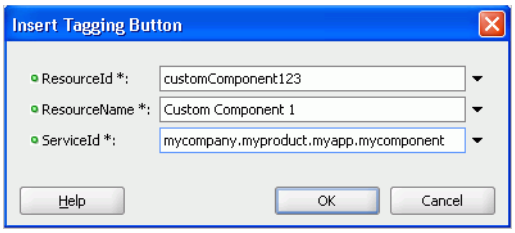
Task Flow	Definition
Tagging - Dialog	This task flow displays a dialog that appears to tag a particular object. This does not have any visible user interface rendering when dropped onto a page. It only becomes visible when the tagging button is clicked.
Tagging - Personal View	This task flow shows the tags created by the current user, objects tagged by those tags, and a cloud view of the tags. A service ID input parameter enables you to view tagged items of interest. Because this is a non-public task flow, it requires authentication.
Tagging - Related Links	For an object identified by a unique ID, this task flow lists all the other objects that are tagged with similar tags. The other objects listed include those that are similarly tagged; that is, their tag "sets" have an intersection of at least one. The list is ordered by the number of tags in the intersection.
Tagging - Tag Cloud	This task flow displays a tag cloud, which is a visual depiction of all the tags used. Tags are presented according to the frequency of their use. More frequently used tags display in bold fonts and varying font sizes—the larger the font, the more the tag has been applied. When you click a tag in the tag cloud, you are redirected to Tag Center, where that tag is selected. This task flow appears on a page with tagged items. It provides Resource Action Handling (RAH) links for all tags in the page.
Tagging - Tag Selection	Similar to the Tag Cloud task flow, the Tag Selection task flow also displays a tag cloud. However, when you select a tag, it marks the tag as selected, and you see the results in the Related Resources task flow. You are not redirected to the Tag Center. With this task flow and the Tagging - Tagged Items task flow, you can click a tag in the tag cloud to see the items that use the tag. (In other words, selecting a tag in the Tagging - Tag Cloud task flow sends the tag word as an event to all interested event consumers, such as the Tagging - Tagged Items task flow.)

Table 44–1 (Cont.) Tags Service Task Flows

Task Flow	Definition
Tagging - Tagged Items	This task flow displays items pages, or documents that have been tagged. It can refine itself to show only the items tagged with the tag passed to it. This task flow can listen for events sent by the Tagging - Tag Cloud task flow.

See Also: Section 44.2.2.4, "How to Modify the Tags Service Task Flow Parameters"

44.2.2.3 How to Add the Tags Service to your Page



To add the Tags service to your WebCenter Portal: Framework application:

1. Follow the steps described in Chapter 3, "Preparing Your Development Environment" to create a customizable page in your application.
2. Ensure that you have set up a database connection to a database with the WebCenter Portal schema installed.
3. Open the page where you included the search toolbar.
4. On the Component Palette (All Pages), select the **Tagging Button** and drop it on the page, inside a `PanelGroupLayout`. Make it the first child of the `PanelGroupLayout` by placing it to the left of the search toolbar. The Tagging Button enables users to start tagging.
5. Fill out the Insert Tagging Button dialog. Table 44–2 provides descriptions and example values for the fields in the dialog.

Table 44–2 Fields in the Insert Tagging Button Dialog

Field	Description
`ResourceId`	The ID that uniquely identifies the object to which you are binding the Tagging Button. The value in this field need not be static. For example, you could use EL to insert a unique value for each row in a table. For example: ▪ To tag pages, enter `#{facesContext.viewRoot.viewId}` ▪ To tag custom components, enter `customComponent123`
`ResourceName`	The name of the object to which you are binding the Tagging Button. The value in this field need not be static. For example, you could use EL to insert a unique value for each row in a table. ▪ To tag pages, enter `#{facesContext.viewRoot.viewId}` ▪ To tag custom components, enter `Custom Component 1`
`ServiceId`	An application-wide ID. (With custom components, you add this to `service-definition.xml` when adding the resource viewer.) ▪ To tag pages, enter `oracle.webcenter.page` ▪ To tag custom components, enter `mycompany.myproduct.myapp.mycomponent`

Figure 44–3 Insert Tagging Button Dialog for a Custom Component

6. Click **OK**.

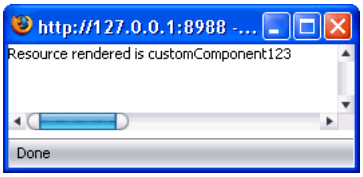
> **Note:** The Tagging Button includes additional properties you can set. For example, `SharedParam` lets you disable the **Shared** checkbox. (With the `default` value, the checkbox is enabled, so users can check it or uncheck it at will. With the `always` value, the checkbox is disabled in the true state, so all tags are public. With the `never` value, the checkbox is disabled in the false state, so all tags are private.)

7. From the Resource Palette, expand **WebCenter Portal - Services Catalog** and **Task Flows**.
8. Drag and drop **Tagging Dialog** from the Resource Palette on the page, optionally adding a redirection URL for anonymous page login.
9. When prompted, select **Region** as the way to create the task flow.
10. For custom resources, follow the steps described in Section 7.3, "Extending Your Framework Application with Custom Components" to register a resource viewer. For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. The Tags service uses this framework to allow acting on a search result.

In the Source view where you added the Tags service, you should see something similar to Example 44–1.

Example 44–1 Tagging Button and Tagging - Dialog Task Flow Source

```
<af:form id="f1">
        <af:region value="#{bindings.searchtoolbar1.regionModel}" id="r1"/>
        <tag:taggingButton resourceId="#{facesContext.viewRoot.viewId}"
                           serviceId="oracle.webcenter.page"
                           resourceName="#{facesContext.viewRoot.viewId}"
                           id="tb1"/>
        <af:region value="#{bindings.tagginglaunchdialog1.regionModel}"
                   id="r2"/>
      </af:form>
```



> **Note:** Even if there are multiple Tagging Buttons on the page, only one Tagging Dialog `af:region` is needed.

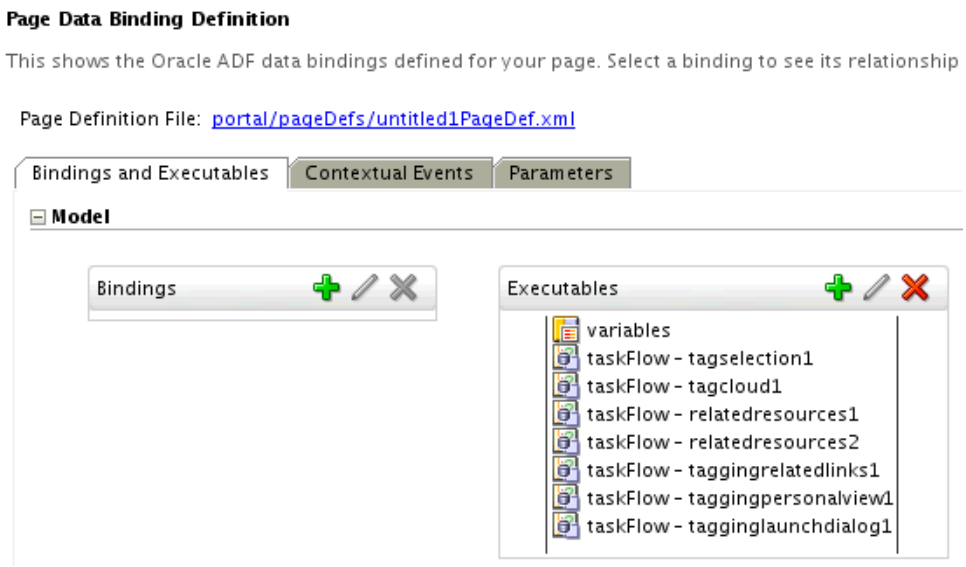
Run the page with the **Tagging Button** and Tagging - Dialog task flow. When the page renders in the browser, click the **Tags** link.

1. When the dialog appears, enter the tag `home` and click **Save**. Note that every user of the system can perform this same operation and assign the same tag, which means that you get a weighted collection of tags.

2. In the search toolbar, type the search term `home`, and click the **Search** icon.
3. You should see `home` as a search result under Tags and `Custom Component 1` as a search result under Tagged Items.
4. Click `Custom Component 1` and a dialog appears with the resource viewer you just created (Figure 44–4).

Figure 44–4 Resource Viewer

44.2.2.4 How to Modify the Tags Service Task Flow Parameters



Some Tags service task flows have optional task flow binding parameters.

> **Note:** You should not change the Tags service task flow properties unless you want to show items from a different resource or different service.

To see and adjust task flow binding parameter values after you have placed a task flow on a page:

1. Navigate to the Edit Task Flow Binding dialog by clicking the **Bindings** tab at the bottom of the page (next to the **Source** tab).
2. Under **Executables**, you'll see the task flow you added. Figure 44–5 shows an example of Tags task flows in the Executables section.

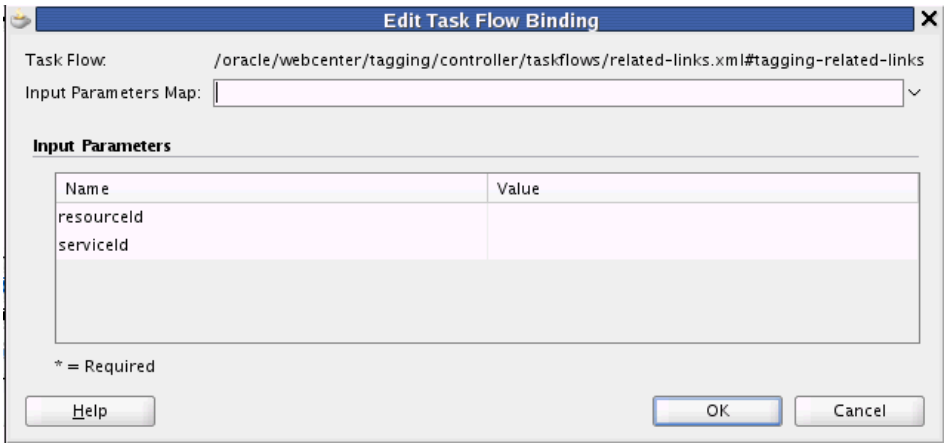


Figure 44–5 Page Data Binding Definition

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.

4. In the Edit Task Flow Binding dialog Figure 44–6, revise the binding parameter values as required.

Figure 44–6 Edit Task Flow Binding Dialog for Tags - Related Links Task Flow

5. When you are finished, click **OK.**
6. Save and run your page to see the results.

Table 44–3 describes the properties that are unique to the Tags service task flows.

Table 44–3 Tags Service Task Flow Parameters

Property	Description	Task Flow
`resourceId`	Unique ID of the item or resource within a given service that is used to find similarly tagged items. This value is set automatically. Do not change this value unless you want to show items similar to a different resource.	Tagging - Related Links
`serviceId`	This parameter has a different meaning for the Related Links task flow and the Personal View task flow. ▪ In Related Links, it is a `resourceId/serviceId` pair that defines the item that has related links. This value is set automatically. Do not change this value unless you want to show items similar to a different resource belonging to a different service. ▪ In Personal View, it limits the tags to this service; for example, `oracle.webcenter.page`.	Tagging - Related Links Tagging - Personal View
`resourceScope`	Scope of tags. This value is set automatically (either `#{spaceContext.currentSpaceGUID}` or something like `s8bba98ff_4cbb_40b8_beee_296c916a23ed`). Do not change this value.	Tagging - Tag Cloud Tagging - Tag Selection Tagging - Tagged Items
`redirectURL`	Optional redirection URL for anonymous page login. This must include the `/faces` prefix; for example, `/faces#{facesContext.viewRoot.viewId}` If null or empty, then no login is displayed.	Tagging - Dialog

44.2.3 Setting Security for the Tags Service

The Tags service requires security. If users are not authenticated, then they cannot tag objects. If the application is not secured, then pages are not returned in search results for tagged items.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see Section 69.3, "Configuring ADF Security."

> **Note:** You must register a resource viewer to allow custom objects to be found using Search or Tags. For information about how the resource viewer's `authorizerClass` determines whether users can view the resource, see Section 7.3, "Extending Your Framework Application with Custom Components."

44.3 Advanced Information for the Tags Service

This section describes optional features available with this service. It includes the following subsections:

- Section 44.3.1, "Using the Tags Service Java APIs"
- Section 44.3.2, "Using the Tags Service REST APIs"
- Section 44.3.3, "Optional Way to Show Tags on Pages"
- Section 44.3.4, "Using the Resource Action Handling Framework to Tag Custom Objects"
- Section 44.3.5, "Troubleshooting the Tags Service"

> **Note:** You can turn up logging levels for the tagging component (as you can with other components) in the `logging.xml` file, found under the WLS home.

44.3.1 Using the Tags Service Java APIs

Custom components can implement the Tags service APIs to create a tagging back end compatible with the WebCenter Portal REST APIs or Tags service task flows and components.

For more information on the Java APIs, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

44.3.2 Using the Tags Service REST APIs

WebCenter Portal provides REST APIs to support the Tags service. Use the Tags service REST APIs to do the following:

- Find all tags or find a subset of tags by criteria
- Get a specific tag
- Delete tags
- Update or rename tags
- Get tagged items
- Untag an item
- Add a new tagged item
- Change tags for a tagged item
- Find all tagged items or find tagged items by a filter, such as a date or a tag word

- Get related user by tag

This section describes the REST APIs associated with the Tags service. It includes the following subsections:

- Section 44.3.2.1, "Tags Entry Point"
- Section 44.3.2.2, "Tags Resource Type Taxonomy"
- Section 44.3.2.3, "Security Considerations"
- Section 44.3.2.4, "Tags Resource Types"

For an introduction to the REST APIs, see Section 54, "Using Oracle WebCenter Portal REST APIs."

44.3.2.1 Tags Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. To find the entry point for the Tags service, find the link element with a `resourceType` of one of the following:

- `urn:oracle:webcenter:tagging:tags`
- `urn:oracle:webcenter:tagging:taggeditems`
- `urn:oracle:webcenter:tagging:users`

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Tags service.

For more information about the Resource Index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

44.3.2.2 Tags Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 54.5.2.1, "Resource Type."

The taxonomy for the Tags service is:

```
urn:oracle:webcenter:tagging:tags
   urn:oracle:webcenter:tagging:tag
urn:oracle:webcenter:tagging:taggedItems
   urn:oracle:webcenter:tagging:taggedItem
urn:oracle:webcenter:tagging:users
```

Under users, you can add the resource type for that object, such as peopleprofile.

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

Collection resources in the tags resources support pagination (`itemsPerPage` and `startIndex` for tags and users and `itemsPerPage` for taggedItems). Other query parameters (`search` and `projection`) are not supported.

44.3.2.3 Security Considerations

Authentication is required before using Tags REST API methods.

For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

44.3.2.4 Tags Resource Types

This section provides information about each resource type. It includes the following subsections:

- Section 44.3.2.4.1, "urn:oracle:webcenter:tagging:tags"
- Section 44.3.2.4.2, "urn:oracle:webcenter:tagging:tag"
- Section 44.3.2.4.3, "urn:oracle:webcenter:tagging:taggedItems"
- Section 44.3.2.4.4, "urn:oracle:webcenter:tagging:taggedItem"
- Section 44.3.2.4.5, "urn:oracle:webcenter:tagging:users"

44.3.2.4.1 urn:oracle:webcenter:tagging:tags Use this resource type to identify the URI to use to read (`GET`) tags. The response from a `GET` operation includes all tags, a specific tag, a subset of tags, or a tag related to a specific list of tags or users.

Navigation Paths to tags

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   tags

resourceindex
   spaces
      spaces:resourceindex
         spaces:tags
```

Supported Methods for tags

The following methods are supported by this resource:

- `GET`
  - **request - body:** none, **Parameters**: `keyword`, `serviceId`, `relatedId`, `user`, `startIndex`, `itemsPerPage`, `shared`, `tags`, `users`
  - **response - body:** tag

where:

- `keyword={keyword for substring match}`

  The keyword for substring matches.

- `serviceId={serviceId}`

  The service ID for which you want to find tags. (null for all)

- `relatedId= {related Tag Id}`
- `user={...}`

  The user ID to find tags for. If null, this uses the logged-in user.

- `shared = {true/false}`

  Returns personal or system tags.

- `tags={TAG}+{TAG}+...+{TAG}`

  Filter by these tags separated by URL-encoded spaces ('+').

- `users = {USER}+{USER}+...+{USER)`

Filter by these users separated by URL-encoded spaces ('+').

For more information, see Section 54.5.2.5, "Templates."

Table 44–4 shows the available parameter combinations for each operation.

Table 44–4 Tags GET Parameters

API Method	tags	tagWords	UserId	UserFilter	ServiceId	shared	scope	keyword
findRelatedSystemTags	X	X		X			X	
findPopularTagsCommon			X		X	X		X
findPopularTags (with GUID)			X			X	X	X
findPopularTags			X			X		X

Resource Types Linked to From tags

Table 44–5 lists the resource types that the client can link to from this resource.

Table 44–5 Related Resource Types for tags

rel	resourceType
self	urn:oracle:webcenter:tagging:tags
Previous/Next	urn:oracle:webcenter:tagging:tags

44.3.2.4.2 urn:oracle:webcenter:tagging:tag Use this resource type to identify the URI to use to read (`GET`), rename (`PUT`), and delete (`DELETE`) a tag. The response from a `GET` operation includes all tags, a specific tag, a subset of tags, or a tag related to a specific list of tags or users.

Navigation Paths to tag

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   tags
      tag

resourceindex
   spaces
      spaces:resourceindex
         spaces:tags
            spaces:tag
```

Supported Methods for tag

The following methods are supported by this resource:

- `GET`
  - **request - body:** none, **Parameters**: none
  - **response - body:** tag
- `PUT`
  - **request - body:** tag
  - **response - body:** tag
- `DELETE`

- **request - body:** none
- **response - body:** none

```
<tag>
<name>newId</name>
</tag>
```

Resource Types Linked to From tag

Table 44–5 lists the resource types that the client can link to from this resource.

Table 44–6 Related Resource Types for tag

rel	resourceType
self	urn:oracle:webcenter:tagging:tag
	urn:oracle:webcenter:tagging:taggedItems
	urn:oracle:webcenter:tagging:users
	urn:oracle:webcenter:tagging:tags

44.3.2.4.3 urn:oracle:webcenter:tagging:taggedItems Use this resource type to identify the URI to use to read tagged items and their related resources (`GET`) or to add tagged items (`POST`).

The response from a `GET` operation includes a tagged item or all tagged items, which can be filtered by date, tag words, and so on. Each tag includes links used to operate on that tag. The response from a `POST` operation includes the tagged items that were created in this collection of tags and a link to operate on them.

Navigation Paths to taggedItems

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   taggedItems

resourceindex
   spaces
      spaces:resourceindex
         spaces:taggedItems
```

Supported Methods for taggedtems

The following methods are supported by this resource:

- `POST`
  - **request - body:** taggedItem
  - **response - body:** taggedItem

```
<taggedItem>
<serviceId>oracle.webcenter.page</serviceId>
<resourceId>/oracle/webcenter/page/somepath/someotherpath/a.jspx</resourceId>
<tags>foo bar boo far</tags>
<resourceTitle>This is renamed by me to be foofoo</resourceTitle>
<scopeGuid>(optional) scope for the item</scopeGuid>
<shared>(optional) make the item private </shared>
</taggedItem>
```

- `GET`
  - **request - body:** none, **Parameters**: `serviceId`, `keyword`, `tags`, `users`, `dt`, `shared`, `itemsPerPage`
  - **response - body:** tagged items

where:

- `serviceId={serviceId}`

  The service ID of the item.

- `keyword={keyword}`

  A keyword in the resource title.

- `tags={TAG}+{TAG}+...+{TAG}`

  Filter by these tags, separated by URL-encoded spaces ('+').

- `users={USER}+{USER}+...+{USER}`

  Filter by these users, separated by URL-encoded spaces ('+').

- `dt={DD-MM-CCYY}`

  Filter bookmarks by this date, which defaults to the most recent date on which bookmarks were saved.

- `shared = {true/false}`

  System or personal resources only.

For more information, see Section 54.5.2.5, "Templates."

Table 44–7 shows the available parameter combinations for each operation.

Table 44–7 TaggedItems Parameters

API Method	serviceId	resourceId	date	shared	tagWords	userFilter	keyword	scope
findRelatedSystemResources	X	X						
findUpdatedResources			X					X
findSystemResources				X	X	X		X
findFilterPersonalResources	X						X	X
findPersonalResources				X	X	X		X
findFilteredPersonalResources (no keyword)	X							X

Resource Types Linked to From taggedItems

Table 44–8 lists the resource types that the client can link to from this resource.

Table 44–8 Related Resource Types for taggedItems

rel	resourceType
self	urn:oracle:webcenter:tagging:taggedItems
Previous/Next	urn:oracle:webcenter:tagging:taggedItems

44.3.2.4.4 urn:oracle:webcenter:tagging:taggedItem Use this resource type to identify the URI to use to read tagged items and their related resources (`GET`), add tagged items

(POST), update tags for a tagged item (PUT), and remove all tags from an item (DELETE).

The response from a GET operation includes a tagged item or all tagged items, which can be filtered by date, tag words, and so on. Each tag includes links used to operate on that tag. The response from a POST operation includes the tagged item that was created in this collection of tags and a link to operate on that tagged item.

Navigation Paths to taggedItem

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   taggedItem

resourceindex
   spaces
      spaces:resourceindex
         spaces:taggedItem
```

Supported Methods for taggedItem

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters**: serviceId, keyword, tags, users, dt, shared, itemsPerPage
  - **response - body:** tagged item
- PUT
  - **request - body:** taggedItem
  - **response - body:** taggedItem

```
<taggedItem>
<tags>foo bar boo far</tagWords>
</taggedItem>
```

- DELETE
  - **request - body:** none
  - **response - body:** none

Resource Types Linked to From taggedItem

Table 44–8 lists the resource types that the client can link to from this resource.

Table 44–9 Related Resource Types for taggedItem

rel	resourceType
self	urn:oracle:webcenter:tagging:taggedItem
	urn:oracle:webcenter:tagging:taggedItems
alternate	The resource type depends on the type of resource tagged; for example, a page would be urn:oracle:webcenter:page:page

44.3.2.4.5 urn:oracle:webcenter:tagging:users Use this resource type to get a list of people related to a given list of tags.

Navigation Paths to users

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   taggingusers

resourceindex
   spaces
      spaces:resourceindex
         spaces:taggingusers
```

Supported Methods for users

The following methods are supported by this resource:

- `GET`
  - **request - body:** none, **Parameters**: `startIndex`, `itemsPerPage`, `tags`, `users`
  - **response - body:** people profile

where:

- `tags={TAG}+{TAG}+...+{TAG}`

  Filter by these tags separated by URL-encoded spaces ('+').

- `users = {USER}+{USER}+...+{USER)`

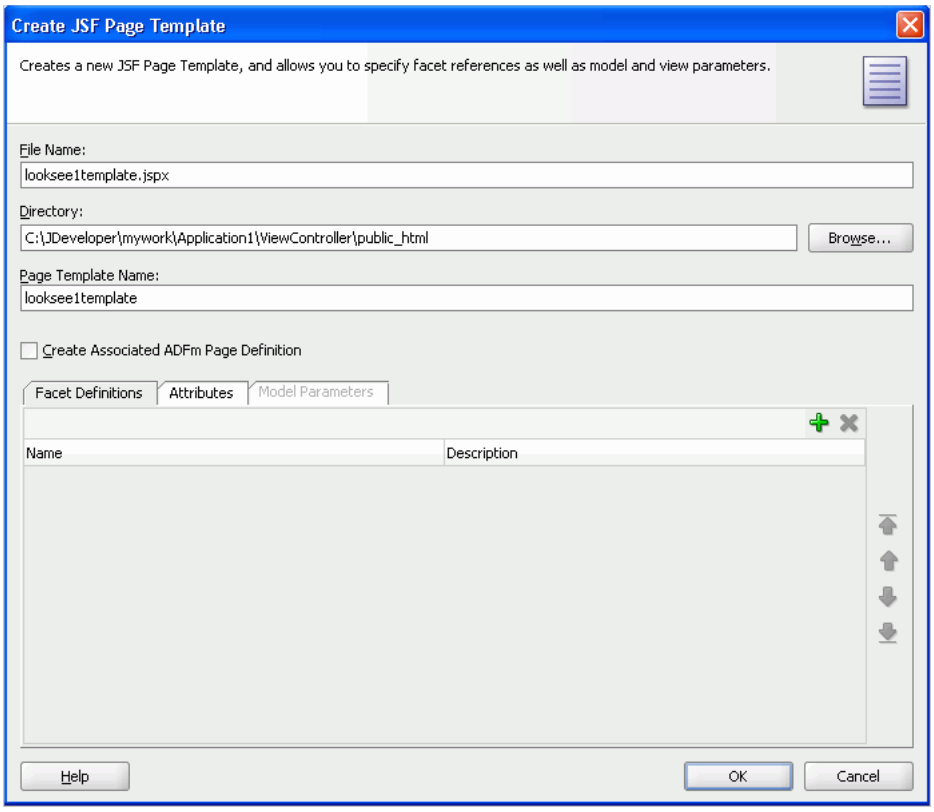
  Filter by these users separated by URL-encoded spaces ('+').

For more information, see Section 54.5.2.5, "Templates."

Resource Types Linked to From users

Table 44–5 lists the resource types that individual users can link to from this resource.

Table 44–10 Related Resource Types for users



rel	resourceType
self	urn:oracle:webcenter:tagging:users
Previous/Next	urn:oracle:webcenter:tagging:users

44.3.3 Optional Way to Show Tags on Pages

While it is possible to add the Tagging Button and task flows on a page-by-page basis, typically you want to add the search toolbar and tags as part of a page template that you can apply whenever building a page that requires it. To add tags through a page template:

1. Open the project where you plan to create pages with the Tags service.
2. Right-click the project name and select **New** from the context menu.
3. Under **Categories**, select **JSF** and, under **Items**, select **JSF Page Template**.
4. For **File Name**, enter `looksee1template`.

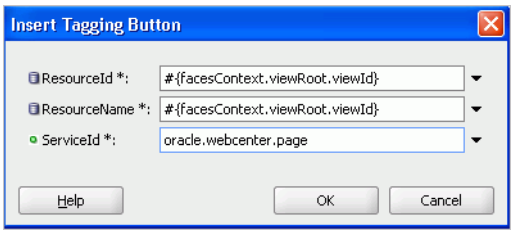
Figure 44–7 Create JSF Page Template Dialog

5. Click **OK**.
6. Go to the Source view and modify the code to be similar to that in Example 44–2.

Example 44–2 Sample JSF Page Template

```
<af:pageTemplateDef var="attrs">
  <af:xmlContent>
    <component xmlns="http://xmlns.oracle.com/adf/faces/rich/component">
      <display-name>looksee1template1</display-name>
      <facet>
        <facet-name>content</facet-name>
      </facet>
    </component>
  </af:xmlContent>
  <af:panelGroupLayout layout="vertical">
    <!-- Our toolbar -->
    <af:panelGroupLayout id="toolbar" layout="horizontal" halign="end"
                         inlineStyle="background-color:cyan;width:100%">
    </af:panelGroupLayout>
    <af:panelStretchLayout startWidth="300"
                           inlineStyle="height:600px; width:100%;">
      <f:facet name="start">
        <af:panelSplitter id="sidebar" orientation="vertical">
          <f:facet name="first">
            </f:facet>
          <f:facet name="second">
          </f:facet>
        </af:panelSplitter>
      </f:facet>
```

```
      <f:facet name="center">
        <af:facetRef facetName="content"/>
      </f:facet>
    </af:panelStretchLayout>
  </af:panelGroupLayout>
</af:pageTemplateDef>
```



7. On the Component Palette, select the **Tagging Button** and drop it on the page, inside the `PanelGroupLayout`. Make it the first child of the `PanelGroupLayout`.
8. Fill out the Insert Tagging Button dialog as shown in Figure 44–8.

   Table 44–11 provides descriptions and example values for the fields in the dialog.

Table 44–11 Fields in the Insert Tagging Button Dialog for a Page

Field	Description
`ResourceId`	Unique identifier of your page. In this case, because the resource ID is meant for a page, enter `#{facesContext.viewRoot.viewId}`.
`ResourceName`	Name of the page. In this case, enter `#{facesContext.viewRoot.viewId}`. (You can enter a more user-friendly name.)
`ServiceId`	Service identifier that you add to `service-definition.xml` when adding the resource viewer. In this case, enter `oracle.webcenter.page`. Note: Because `oracle.webcenter.page` is available in the Page service library, nothing must be added to `service-definition.xml`.

Figure 44–8 Insert Tagging Button Dialog for a Page

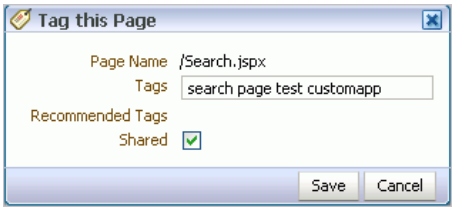
9. Click **OK**.
10. From the Resource Palette, expand the **WebCenter Portal - Services Catalog** and the **Task Flows**.
11. Drag **Tagging Dialog** from the Resource Palette and drop it on the page inside of the `panelGroupLayout`.
12. When prompted, select **Region** as the way to create the task flow.
13. Drag **Search Toolbar** and drop it after the **Tagging Dialog** you just added to the page template in the `panelGroupLayout`.
14. When prompted, select **Region** as the way to create the task flow.
15. Drag **Document Library - Recent Documents** and drop it in the second facet of the `panelSplitter` with identifier `sidebar`.

16. When prompted, select **Region** as the way to create the task flow.
17. In the Edit Task Flow Binding dialog, for `connectionName`, enter the name of the connection to your document library's content repository; for example, `${'MyFileSystem'}`. For information on how to set up a connection to your content repository, see Section 27.2, "Configuring Content Repository Connections."
18. The source for your page template should now look similar to Example 44–3.

Example 44–3 JSF Page Template with Tags and Search

```
<af:pageTemplateDef var="attrs">
  <af:xmlContent>
    <component xmlns="http://xmlns.oracle.com/adf/faces/rich/component">
      <display-name>looksee1template1</display-name>
      <facet>
       <facet-name>content</facet-name>
      </facet>
    </component>
  </af:xmlContent>
  <af:panelGroupLayout layout="vertical">
   <!-- Our toolbar -->
   <af:panelGroupLayout id="top" layout="horizontal" halign="end"
              inlineStyle="background-color:cyan;width:100%">
    <tag:taggingButton resourceId="#{facesContext.viewRoot.viewId}"
                    resourceName="#{facesContext.viewRoot.viewId}"
                       serviceId="oracle.webcenter.page"/>
     <af:region value="#{bindings.tagginglaunchdialog1.regionModel}"
                id="tagginglaunchdialog1"/>
     <af:region value="#{bindings.searchtoolbar1.regionModel}"
                id="searchtoolbar1"/>
   </af:panelGroupLayout>
    <af:panelStretchLayout startWidth="300"
                          inlineStyle="height:600px; width:100%;">
     <f:facet name="start">
     <af:panelSplitter orientation="vertical">
      <f:facet name="first">
       <af:region value="#{bindings.taskservicetaskflowdefinition1.regionModel}"
                  id="taskservicetaskflowdefinition1"
                  inlineStyle="position:absolute; left:0px; width:100%;
                   height:100%"/>
      </f:facet>
      <f:facet name="second">
       <af:region value="#{bindings.doclibrecentdocuments1.regionModel}"
                  id="doclibrecentdocuments1"/>
      </f:facet>
       </af:panelSplitter>
      </f:facet>
      <f:facet name="center">
       <af:facetRef facetName="content"/>
      </f:facet>
    </af:panelStretchLayout>
   </af:panelGroupLayout>
  </af:pageTemplateDef>
```

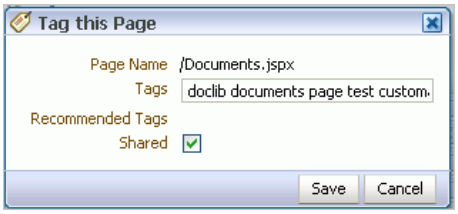
19. Create two new pages based upon the page template you just created. In the Create JSF Page dialog, select `looksee1template1` from the **Use Page Template** list.



- Create a page called `Search.jspx` and add the **Search** task flow in the center facet.
- Create a page called `Documents.jspx` and add the **Document Library - List View** task flow as the center facet. In the Edit Task Flow Binding dialog, for `connectionName`, enter the name of the connection to your document library's content repository; for example, `${'MyFileSystem'}`. For information on how to set up a connection to your content repository, see Section 27.2, "Configuring Content Repository Connections."

20. Save your pages.

To run your pages with tags:



1. In the Applications Navigator, run the `Search.jspx` page.
2. After you log in and the page comes up, click the **Tags** link.
3. In the Tag this Page dialog, enter `search page test customapp` for **Tags** (Figure 44–9).

Figure 44–9 Tag this Page Dialog for Search Page

4. Click **Save**.
5. Navigate to `Documents.jspx` (or run it separately).
6. Click the **Tags** link.
7. In the Tag this Page dialog, enter `doclib documents page test customapp` for **Tags** (Figure 44–10).

Figure 44–10 Tag this Page Dialog for Documents Page

8. Click **Save**.
9. In the search toolbar for the `Documents.jspx` page, enter `search` and click the **Search** icon.
10. Under **Tags**, click `search`.

44.3.4 Using the Resource Action Handling Framework to Tag Custom Objects

For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. For example, rows in a table can be tagged.

To register a resource viewer, see Section 7.3, "Extending Your Framework Application with Custom Components."

44.3.5 Troubleshooting the Tags Service

This section provides troubleshooting tips on implementing the Tags service. It includes the following subsections:

- Section 44.3.5.1, "Tag Center Results Do Not Appear When Tag Is Clicked"
- Section 44.3.5.2, "The Tag Center Does Not Display Tagged Documents"
- Section 44.3.5.3, "The Tagging Button Does Not Display On Page"
- Section 44.3.5.4, "Clicking a Tagged Resource Does Not Go To The Correct Page"

44.3.5.1 Tag Center Results Do Not Appear When Tag Is Clicked

Problem

A resource to which a user has View permission has been tagged, but the user cannot see the resource in the Tag Center.

Solution

1. In `service-definition.xml`, verify that the resource type has the Resource Authorizer configured properly.
2. Enable logging for the Resource Authorizer to ensure that it is giving you permission to see the required objects.

44.3.5.2 The Tag Center Does Not Display Tagged Documents

Problem

Tagged WebCenter Portal Content Server documents do not appear in the Tag Center.

Solution

Check the version listed for the WebCenter Portal component in the Content Server. The result set name changed in WebCenter Portal release 11.1.1.6.0.

44.3.5.3 The Tagging Button Does Not Display On Page

Problem

The Tagging Button component is dropped on a page, but it does not show up.

Solution

- The Tagging Button requires the Tagging Dialog task flow to be present on the page. Drop this task flow on the page or page template.
- The Tagging Button requires a valid database connection. Ensure that there is a database connection present.

44.3.5.4 Clicking a Tagged Resource Does Not Go To The Correct Page

Problem

When clicking a tagging resource in Tag Center, users are not redirected to the correct page.

Solution

All tagging links are generated through the Resource Action Handling (RAH) framework. Ensure that RAH is configured properly.

- Check `service-definition.xml` for that resource type to see if a resource viewer is configured properly.
- Ensure that the `resourceID` and `serviceID` parameters passed for this resource are correct.

> **See Also:** Section 7.3, "Extending Your Framework Application with Custom Components"

45 Integrating the Search Service

This chapter explains how to integrate the Search service in a WebCenter Portal: Framework application at design time.

For more information about managing and including search, see:

- "Managing Oracle SES Search in WebCenter Portal" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Search Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

This chapter includes the following sections:

- Section 45.1, "Introduction to Search"
- Section 45.2, "Basic Configuration for the Search Service"
- Section 45.3, "Advanced Information for the Search Service"

45.1 Introduction to Search

WebCenter Portal's search provides a unified, extensible framework that enables the discovery of information through an intuitive user interface. It honors application security settings by returning only the results a user is authorized to view. Users can save their searches for reuse, including searches with complex search refinement conditions.

WebCenter Portal provides two ways of searching your application:

- Oracle Secure Enterprise Search (SES) adapter
- Oracle WebCenter Portal live search adapters

In addition, the Documents service provides its own search engine for file searches. This saves time and increases the relevancy of results by narrowing the scope of a search to files.

> **See Also:** Section 14.4, "Using Portal Navigation to Create a Sitemap" for information about integrating an external search engine in your application

45.1.1 Understanding the Search Service

With Framework applications, Oracle Secure Enterprise Search (SES) is set as the default and preferred search platform. Oracle SES provides unified ranking results for the following resources:

- Documents, including wikis and blogs

- Announcements and Discussions
- Spaces, lists, page content, and people resources in WebCenter Portal: Spaces

> **Note:** WebCenter Portal: Spaces applications include the Oracle SES crawler that indexes spaces, lists, pages, and people resources in Spaces. This crawler is not supported in Framework applications.

Oracle SES search is beneficial for the following reasons:

- Oracle SES search provides unified ranking results, with the most relevant items appearing first.
- Oracle SES search allows search of repositories outside of WebCenter Portal. Oracle SES results appear in the same result set as WebCenter Portal's search results.
- Oracle SES search supports the Search service REST APIs and data control for customizing your search interface.

45.1.1.1 Understanding Search with the Oracle SES Adapter

Supported Oracle SES versions include 10.1.8.4.x and later. Oracle strongly recommends using Oracle SES release 11.1.2.2. Search with Oracle SES requires additional configuration in Oracle SES Administration, Oracle WebCenter Content: Content Server, and Oracle WebCenter Portal's Discussion Server.

> **See Also:** Section 45.3.4, "Configuring Search with the Oracle SES Adapter"

45.1.1.2 Understanding Search with WebCenter Portal's Search Adapters

Although Oracle SES is the preferred search platform for best performance, you can manually override search with Oracle SES and have Framework applications search using WebCenter Portal's original search adapters. WebCenter Portal's search adapters span all enabled and searchable services, such as documents, tags, people, and pages.

> **See Also:** Section 45.3.5, "Configuring Search with WebCenter Portal's Search Adapters"

45.1.1.3 Click Actions on Search Results

If no Resource Action Handling is specified in the Framework application, then the default action when a search result is clicked is to render the search result in a new browser window. Also, results from services that provide resource viewers, such as Documents, Discussions or Announcements, open in their resource viewers. For more information about resource viewers and the Resource Action Handling framework, see Section 7.3, "Extending Your Framework Application with Custom Components."

45.1.2 What Happens at Runtime

At run time, users can perform global (application-wide) searches from the Search task flow or from the Search toolbar and refine and save searches.

For more information about WebCenter Portal's search at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

45.2 Basic Configuration for the Search Service

This section provides the steps for adding the Search service to your application. It includes the following subsections:

- Section 45.2.1, "Configuration Roadmap - Oracle SES"
- Section 45.2.2, "Setting up Connections for Oracle SES"
- Section 45.2.3, "Adding the Search Service at Design Time"
- Section 45.2.4, "Setting Security for the Search Service"

45.2.1 Configuration Roadmap - Oracle SES

Use the roadmap in this section as a guide through the configuration process.

> **Note:** If you override search with Oracle SES to use the original WebCenter Portal live search adapters, then no Oracle SES configuration is required. Skip ahead to section Section 45.2.3, "Adding the Search Service at Design Time."

Figure 45–1 and Table 45–1 provide an overview of the prerequisites and tasks required to get Oracle SES working in Framework applications.

Figure 45–1 Configuring Oracle SES for Framework Applications

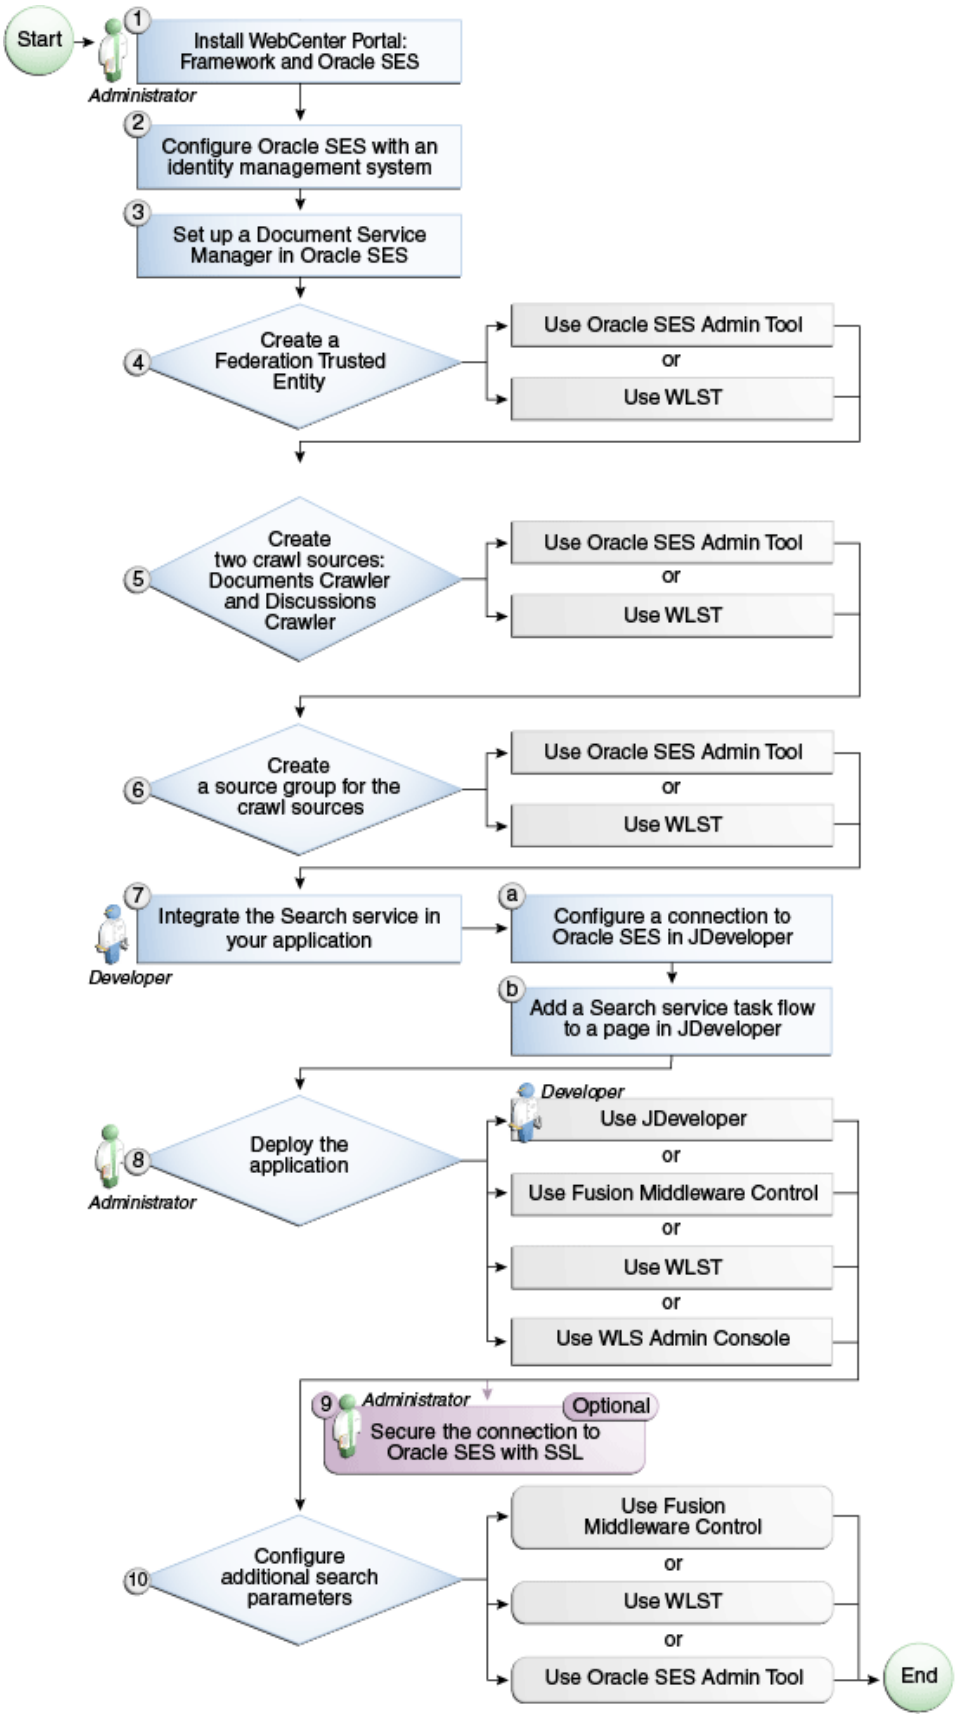


Table 45–1 Configuring Oracle SES for Framework Applications

Actor	Task	Sub-task
Administrator	1. Install WebCenter Portal and Oracle SES	
	2. Configure Oracle SES with an identity management system	
	3. Set up a Document Service Manager in Oracle SES	
	4. Create a Federation Trusted Entity using one of the following tools: ■ Oracle SES Admin Tool ■ WLST	
	5. Create two crawl sources: Documents Crawler and Discussions Crawler using one of the following tools: ■ Oracle SES Admin Tool ■ WLST	
	6. Create a source group for the crawl sources using one of the following tools: ■ Oracle SES Admin Tool ■ WLST	
Developer	7. Integrate the Search service in your application	7.a Configure a connection to Oracle SES in JDeveloper 7.b Add a Search service task flow to a page in JDeveloper
Developer or Administrator	8. Deploy the application using one of the following tools: ■ JDeveloper (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator) ■ WLS Admin Console (Administrator)	
Administrator	9. (Optional) Secure the connection to Oracle SES with SSL	
Administrator	10. Configure additional search parameters using one of the following tools: ■ Fusion Middleware Control ■ WLST ■ WLS Admin Console	

45.2.2 Setting up Connections for Oracle SES

To search with Oracle SES, you must add the Oracle SES connection in the application. For more information, see Section 45.3.4, "Configuring Search with the Oracle SES Adapter."

> **Note:** You can create a connection to Oracle SES to search repositories outside WebCenter Portal and override using Oracle SES as the default search crawler with Fusion Middleware Control or WLST. This allows users to search other Framework application resources, such as people.

1. Add the search toolbar to a page, following Section 45.2.3, "Adding the Search Service at Design Time."
2. Set up a connection to Oracle SES. In the Application Navigator, expand **Application Resources**. Right-click the **Connections** node, select **New Connection**, and then **Oracle Secure Enterprise Search**.

   Select to create the connection in either the Application Resources or IDE connections. A connection in Application Resources is available only for that application, while a connection in IDE connections is available for all applications you create. If you plan to use the connection in other applications, then select IDE connections to avoid the need to re-create it.

   > **Note:** If you create the connection in IDE, then the connection must be added to the application later. For example, in the Resource Palette under IDE connections, right-click the connection and select **Add to Application**.

   Enter values for the fields in the dialog. For example:

   a. For **Connection Name**, enter a meaningful name, for example, `SESconnection`. This name cannot be changed after it is created. (To use a different connection name, create a new connection.)

   b. For **SOAP URL**, enter the URL for the Oracle SES Web Services endpoint, for example:

      `http://`*`host:port`*`/search/query/OracleSearch`

   c. Under **Federation Trusted Entity**, for **Entity Name**, enter the trusted entity defined for this application on the Oracle SES instance; for example, `wcsearch`.

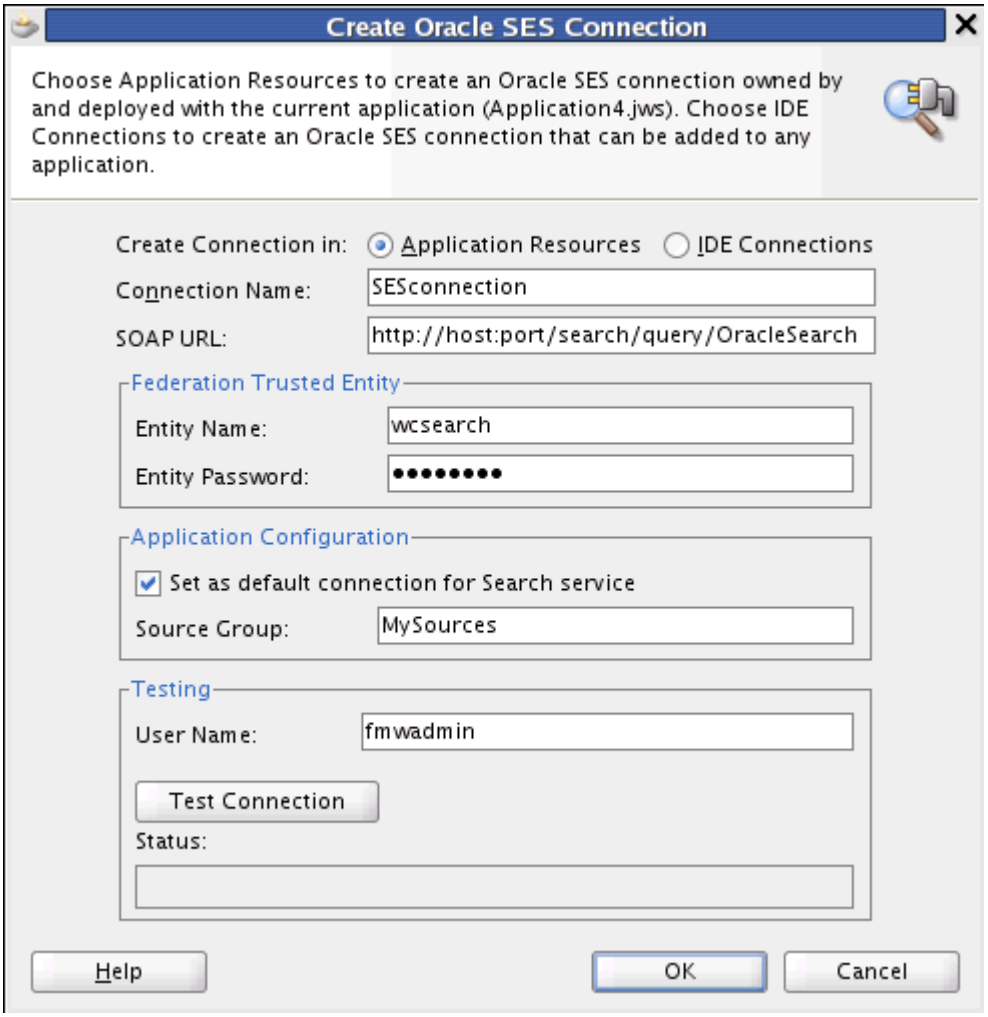
      A trusted entity allows the application to authenticate itself to Oracle SES and assert its users when making queries on Oracle SES. This trusted entity can be any user that either exists on the identity management server behind Oracle SES or is created internally in Oracle SES. You can find (or create) the trusted entity on the **Global Settings - Federation Trusted Entities** page of Oracle SES.

   d. For **Entity Password**, enter the password of the Federation Trusted Entity user.

   e. Under **Application Configuration**, select the box for **Set as default connection for the Search service**.

      This ensures that your application uses that connection to access Oracle SES. The Search service uses only one Oracle SES connection.

Note: After you create a connection as the default connection, you cannot edit it so that it is *not* the default. To use a different default connection, you must create a new connection and mark that as the default connection.



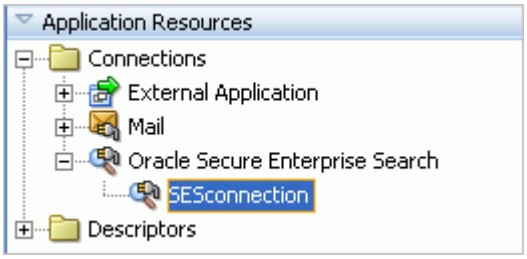
f. For **Source Group**, enter the Oracle SES source group in which to search. If a value is not provided, then all crawl sources in the Oracle SES instance are searched.

Note: Source groups present a good way to segment your searchable data on Oracle SES. Given an Oracle SES instance that keeps a search index on all corporate data, you can use source groups to make only a portion of your corporate data available to WebCenter Portal's search. For more information on creating source groups, see *Oracle SES Administrator's Guide*.

g. Under **Testing**, for **User name**, enter the name of a user present in both the Oracle Identity Management server configured for your application and the Oracle Identity Management server configured for Oracle SES.

You should see something similar to Figure 45–2.

Figure 45–2 Create Oracle SES Connection Dialog



Click **Test Connection** and check the status.

If the connection is successful, then click **OK**.

After you have included the Oracle SES connection in your application, you should see it in your Application Resources panel, as shown in Figure 45–3.

Figure 45–3 Oracle SES Connection in Application Resources

The Oracle SES connection is now included in the `connections.xml` file and is the default connection in the `adf-config.xml` file, as shown in Example 45–1.

Example 45–1 Oracle SES Connection in adf-config.xml

```
<ses-properties>
  <connection>SESconnection</connection>
  <data-group>MySources</data-group>
</ses-properties>
```

> **Note:** After a Framework application has been deployed to an Oracle WebLogic managed server, you can configure it using WLST or Fusion Middleware Control. For more information, see *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

45.2.3 Adding the Search Service at Design Time

This section describes the Search service task flows and explains how to integrate the Search service into your application. It includes the following subsections:

- Section 45.2.3.1, "Search Service Task Flows"
- Section 45.2.3.2, "How to Add the Search Service to Your Page"
- Section 45.2.3.3, "How to Modify the Search Service Task Flow Parameters"

45.2.3.1 Search Service Task Flows

Table 45–2 lists the Search service task flows.

Table 45–2 Search Service Task Flows

Task Flow	Definition
Search	This task flow provides a rich search experience with features for refining and saving search results.
Search - Saved Searches	This task flow enables you to create a simple launch pad for running saved searches within the application.
Search Preferences	This task flow enables users to select which WebCenter Portal services to search.
Search Toolbar	This task flow enables users to enter simple search criteria and run the search from the application. Search results are rendered as links.

45.2.3.2 How to Add the Search Service to Your Page

The Search Toolbar task flow offers the easiest way to add the Search service to your application. To add the Search Toolbar task flow to your Framework application:

1. Follow the steps described in Chapter 3, "Preparing Your Development Environment" to create a customizable page in your application.

> **Note:** ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see Section 69.3, "Configuring ADF Security."

2. Open the page on which to add the Search service.
3. In the Resource Palette, expand **My Catalogs**, **WebCenter Portal - Services Catalog**, and **Task Flows**.

4. Drag and drop the **Search Toolbar** task flow onto the page.
5. When prompted, select **Region** as the way to create the task flow.

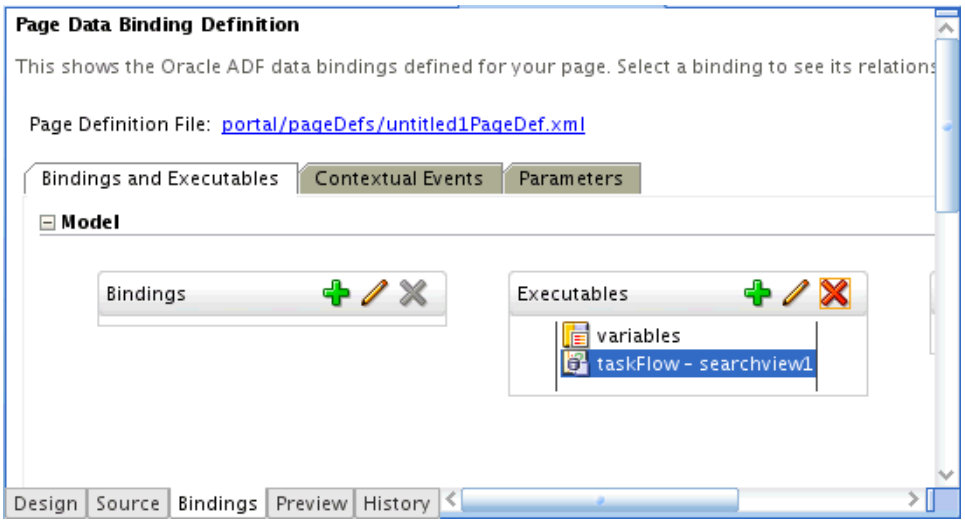
   If a prompt to confirm the ADF library appears, click **Add Library**.
6. Run your page with the search toolbar on it.

   In the Application Navigator, right-click this application and select **Run**. It may take a few moments for the operation to complete.

   Enter the user name and credentials that you created when you defined security.

> **Note:** To return results, the Search service requires that other WebCenter Portal services are included in the application.

45.2.3.3 How to Modify the Search Service Task Flow Parameters



With the Search service task flow parameters, you can customize the appearance and behavior of a task flow instance. For example, you can restrict search results to include only specific services, document types, and spaces, or you can change the size of the search box.

> **See Also:** "How to Set Parameters to Narrow Search" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* for detailed information about customizing the Search service with task flow parameters

To see and adjust task flow binding parameter values after you have placed a task flow on a page:

1. Navigate to the Edit Task Flow Binding dialog by clicking the **Bindings** tab at the bottom of the page containing the task flow (next to the **Source** tab).
2. Under **Executables**, you'll see the task flow you added. Figure 45–4 shows an example of a Search task flow in the Executables section.

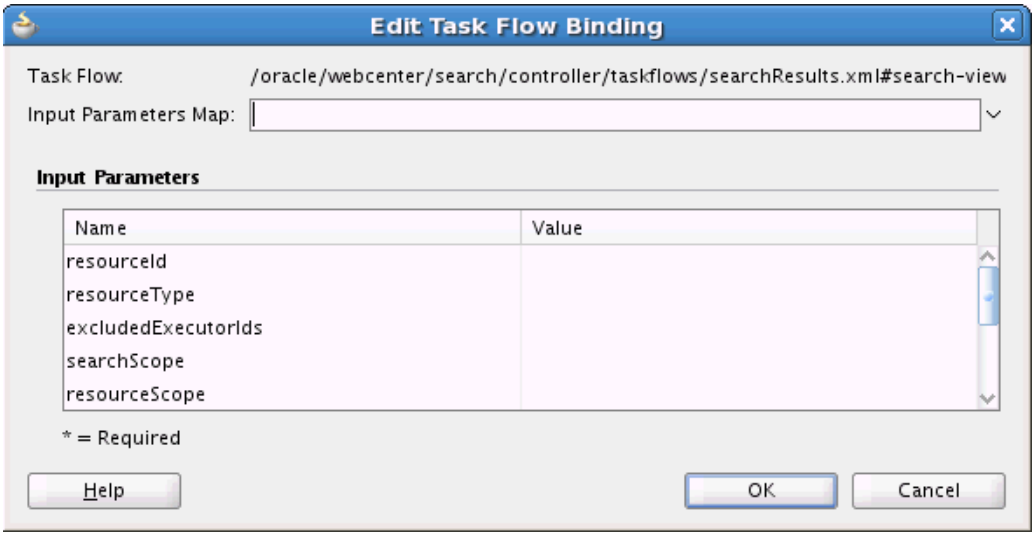


Figure 45–4 Page Data Binding Definition

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.

4. In the Edit Task Flow Binding dialog Figure 45–5, revise the binding parameter value by double-clicking the field and either changing the existing value or adding a new one.

Figure 45–5 Edit Task Flow Binding Dialog for Search Task Flow

5. When you are finished, click **OK.**
6. Save and run your page to see the results.

Table 45–3 describes the properties that are unique to the Search service task flows.

Table 45–3 Search Service Task Flow Parameters

Property	Description	Task Flow
`customAttributes`	List of custom attributes to show when displaying search results. To include one or more custom attributes in the search results, set this to a list of custom attribute names, separated by commas. An optional label prefix may be provided with the custom attribute name to display instead of its associated custom attribute name. Use the format: label:name.	Search Search Toolbar
`hideRefiners`	List of refiners to hide when displaying search results. To hide one or more refiners, set this to a list of refiner names, separated by commas (choose from creator, date, space, content, and tags).	Search Search Toolbar
`keywordsInputRendered`	Show or hide the input box. Set to true (default) to show the input box, or set to false to hide it.	Search

Table 45–3 (Cont.) Search Service Task Flow Parameters

Property	Description	Task Flow
`mimeType`	List of MIME types to limit the search. To limit the search to certain document types, set this to the list of MIME types of the documents (such as PDF, PPT, DOC), separated by commas. This also can be set to the Documents service with oracle.webcenter.doclib. **Note**: To limit search to Microsoft Word documents and WebCenter Portal pages, set this parameter to application/msword, and set the `serviceIds` parameter to oracle.webcenter.doclib,oracle.webcenter.page. **See Also**: "Searching Specific Document Types" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*	Search Search Toolbar
`searchScope`	List of unique IDs to limit the search scope. To limit the search to a list of spaces, set this to the list of GUIDs of the spaces, separated by commas. For example: `#{spaceContext.currentSpaceGUID}` or `s8bba98ff_4cbb_40b8_beee_296c916a23ed`	Search Search Toolbar
`resourceScope`	Unique ID to limit the search scope. To limit the search to a particular space, set this to the GUID of the space. For example: #{spaceContext.currentSpaceGUID} or s8bba98ff_4cbb_40b8_beee_296c916a23ed **Note:** This parameter has been deprecated. It is included for backward-compatibility only.	Search
`searchBoxSize`	Value to limit the size of the search box. The default value is 42. Enter a lower number (for example, 30) to shorten the length of the search box. This also changes the size of the search box in the Search task flow.	Search Toolbar
`serviceIds`	List of IDs of services or executors to include when displaying search results. To display only people profiles and documents in the Content Server, set this parameter to `oracle.webcenter.peopleconnections.profile, oracle.webcenter.doclib`. If nothing is specified, then all services are searched. For a list of service IDs, see Table G–7, " Service IDs".	Search Search Toolbar
`resourceId`	Either search keywords or the saved search GUID. **Note:** This parameter is for internal use only. Do not change this value unless you want coded search main views. If you do change this value, then you must also specify `resourceType`.	Search

Table 45–3 (Cont.) Search Service Task Flow Parameters

Property	Description	Task Flow
`resourceType`	Marker specifying whether the `resourceId` parameter searches keywords or saved search GUID. **Note:** This value is set automatically and is for internal use only. Do not change it unless you want coded search main views.	Search
`scope`	List of unique objects to limit the search scope. **Note:** This parameter has been deprecated. Use the `searchScope` parameter instead. (If a value is set for this parameter, then any value in `searchScope` is ignored.)	Search Toolbar

Note: The All Saved Searches and the Search Preferences task flows do not have any unique properties.

45.2.4 Setting Security for the Search Service

The Oracle SES adapter must be configured with an identity management system to validate and authenticate users. This is necessary for searches to return only results that the user is allowed to view based on access privileges. Because WebCenter Portal uses identity propagation when communicating with Oracle SES, WebCenter Portal's user base must match that in Oracle SES. One way this can happen is by configuring WebCenter Portal and Oracle SES to the same identity management system. For detailed information, see the section "Oracle SES - Configuration" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

WebCenter Portal's original search adapters rely on individual services to ensure that the user performing the search can view results. Search results are returned based on user privileges. When unauthenticated, queries return only public content. Only authenticated users of an ADF-secured Framework application can save searches.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see Section 69.3, "Configuring ADF Security."

45.3 Advanced Information for the Search Service

This section describes optional features available with this service. It includes the following subsections:

- Section 45.3.1, "Adding the Search Task Flow"
- Section 45.3.2, "Adding the Search - Saved Searches Task Flow"
- Section 45.3.3, "Adding the Search Preferences Task Flow"
- Section 45.3.4, "Configuring Search with the Oracle SES Adapter"
- Section 45.3.5, "Configuring Search with WebCenter Portal's Search Adapters"
- Section 45.3.6, "Using the Search Service Java APIs"
- Section 45.3.7, "Using the Search Service REST APIs"
- Section 45.3.8, "Using the Search Service Data Control"

- Section 45.3.9, "Building Adapters for the Search Service"
- Section 45.3.10, "Customizing the Search UI Without WebCenter Portal's Search Service APIs"
- Section 45.3.11, "Troubleshooting the Search Service"

> **Note:** The Search service REST APIs and data controls are available only for search using Oracle SES. They are not supported with search using WebCenter Portal's original search adapters.

45.3.1 Adding the Search Task Flow

To add the Search task flow to your application, follow the instructions provided for the Search Toolbar task flow in Section 45.2.3, "Adding the Search Service at Design Time," but instead, drag and drop the Search task flow onto the page.

To run the page with the Search view:

1. In the Application Navigator, right-click the page and select **Run**. As long as the application has been ADF-secured, you should see a login page. It may take a few moments for the operation to complete.
2. If you configured ADF security, then enter the user name and password that you provided and click **Submit**.
3. Enter some search criteria in the field and click the **Search** icon. You may get few, if any, results if the application is not populated with much besides the Search service itself.

45.3.2 Adding the Search - Saved Searches Task Flow

You can add the Search - Saved Searches task flow to provide a simple launch pad for running saved searches within the application. To add this task flow to your Framework application, follow the instructions provided for the Search Toolbar task flow in Section 45.2.3, "Adding the Search Service at Design Time," but instead, drag and drop the Search - Saved Searches task flow onto the page.

The task flow renders links that, when clicked, run a saved search.

45.3.3 Adding the Search Preferences Task Flow

The Search Preferences task flow enables users to control which WebCenter Portal services are searched. By default, all enabled services are selected to be searched. Users can disable any service from which they do not want to see search results. Users also can select the order of services in their search results. For example, they may find that search results from the Documents service prove more useful that search results from other services.

To add the Search Preferences task flow to your application, follow the instructions provided for the Search Toolbar task flow in Section 45.2.3, "Adding the Search Service at Design Time," but instead, drag and drop the Search Preferences task flow onto the page.

45.3.4 Configuring Search with the Oracle SES Adapter

WebCenter Portal: Framework applications automatically set Oracle Secure Enterprise Search (SES) as the default search adapter, but additional configuration is required in Oracle SES, Oracle WebCenter Content: Content Server, and Oracle WebCenter Portal's

Discussion Server. See the section "Managing the Search Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* for detailed information about the steps to set up search with the Oracle SES adapter.

After you have completed all configuration steps, validate the inclusion of Oracle SES results in WebCenter Portal's search.

1. In the Application Navigator, right-click the page you created with the Search Toolbar, and click **Run**.

   As long as the application has been ADF-secured, you should see a login page. It may take a few moments for the operation to complete.

2. Enter the user name and credentials that you created when you defined security.

3. Click **Submit**.

   When the page loads, you should see your search toolbar.

   Figure 45–6 shows a sample results page for the search term *webcenter*, before Oracle SES has crawled anything.

Figure 45–6 Search Results

Figure 45–7 shows a sample results page after Oracle SES has been configured and crawled.

Figure 45–7 Global Search Results

See Also: Oracle SES documentation provided on the Oracle Fusion Middleware documentation library (in WebCenter Portal's product area)

45.3.5 Configuring Search with WebCenter Portal's Search Adapters

You can manually override search with Oracle SES and have Framework applications search using WebCenter Portal's original search adapters. WebCenter Portal's search adapters span all enabled and searchable services, such as documents, tags, people, and pages.

To enable search with WebCenter Portal's search adapters, edit the `adf-config.xml` file either to change all enable attributes in `crawl-properties` to false (Example 45–2) or to comment out the `crawl-properties` entirely (Example 45–3).

Example 45–2 Crawl Properties in adf-config.xml Set to False

```
  <searchC:adf-search-config
xmlns="http://xmlns.oracle.com/webcenter/search/config">
    <display-properties>
      <common numSavedSearches="5"/>
      <region-specific>
        <usage id="simpleSearchResultUIMetadata" numServiceRows="5"/>
```

```
        <usage id="searchResultUIMetadata" numServiceRows="5"/>
        <usage id="localToolbarRegion" numServiceRows="5"/>
      </region-specific>
    </display-properties>
    <execution-properties timeoutMs="7000" prepareTimeoutMs="3000"/>
    <crawl-properties fullCrawlInterval="P5D" enableWcServicesCrawl="false"
                      enableWcDiscussionsCrawl="false" enableWcUcmCrawl="false"/>
    <ses-properties>
      <connection/>
      <data-group/>
    </ses-properties>
  </searchC:adf-search-config>
```

Example 45–3 Crawl Properties in adf-config.xml Commented Out

```
  <searchC:adf-search-config
xmlns="http://xmlns.oracle.com/webcenter/search/config">
    <display-properties>
      <common numSavedSearches="5"/>
      <region-specific>
        <usage id="simpleSearchResultUIMetadata" numServiceRows="5"/>
        <usage id="searchResultUIMetadata" numServiceRows="5"/>
        <usage id="localToolbarRegion" numServiceRows="5"/>
      </region-specific>
    </display-properties>
    <execution-properties timeoutMs="7000" prepareTimeoutMs="3000"/>
    <!--
    <crawl-properties fullCrawlInterval="P5D" enableWcServicesCrawl="true"
                      enableWcDiscussionsCrawl="true" enableWcUcmCrawl="true"/>
    -->
    <ses-properties>
      <connection/>
      <data-group/>
    </ses-properties>
  </searchC:adf-search-config>
```

45.3.6 Using the Search Service Java APIs

Custom components can implement Search service APIs to expose their content to WebCenter Portal's search.

For more information, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

45.3.7 Using the Search Service REST APIs

WebCenter Portal provides REST APIs to support the Search service. Use the Search service REST APIs to post, read, update, and delete searches. You can specify keywords and the scope of the search; for example, the iPhone could search for "smith" in all spaces, documents and wiki pages. The API also lets you build a customized search user interface on top of the Search service.

This section describes the REST APIs associated with the Search service. It includes the following subsections:

- Section 45.3.7.1, "Search Entry Point"
- Section 45.3.7.2, "Search Resource Type Taxonomy"
- Section 45.3.7.3, "Security Considerations"

- Section 45.3.7.4, "Search Resource Types"

For an introduction to the REST APIs, see Chapter 54, "Using Oracle WebCenter Portal REST APIs."

45.3.7.1 Search Entry Point

Each REST service has a link element within the resource index that provides the entry point for that service. To find the entry point for the Search service, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:search
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Search service.

For more information about the resource index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

45.3.7.2 Search Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 54.5.2.1, "Resource Type."

The taxonomy for the Search service is:

```
urn:oracle:webcenter:search
   urn:oracle:webcenter:search:results
```

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

Collection resources in the search resources support pagination (`startIndex` and `itemsPerPage`). Other query parameters are not supported (that is, `search` and `projection`).

45.3.7.3 Security Considerations

Authentication is required before using Search REST API methods.

For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

45.3.7.4 Search Resource Types

This section provides information about each resource type. It includes the following subsection:

- Section 45.3.7.4.1, "urn:oracle:webcenter:search:results"

45.3.7.4.1 urn:oracle:webcenter:search:results Use this resource type to identify the URI to use to read (`GET`) a query containing keywords and attribute-specific criteria.

The request is represented by the URL and the response is a list of search results, each with metadata to help the end user choose an item to drill down, as well as cross links to the owning REST services, if available. If the owning REST service is unavailable, then an HREF link is provided.

The response XML can be paginated with standard URL parameters, and appropriate previous and next links provided along with a general template (with the query prepopulated) for the consuming application to do its own custom pagination.

Navigation Paths to results

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   search

resourceindex
   spaces
      spaces:resourceindex
         spaces:search
```

Supported Methods for results

The following methods are supported by this resource:

- `GET`
  - **request - body:** none, **Parameters**: `serviceId`, `q`, `scopeGuid`, `refiners`, `startIndex` (pagination), `itemsPerPage` (pagination)
  - **response - body:** search results, and refiners (if `refiners=true`)

where:

- `serviceId={serviceId1}[,{serviceId2}...]`

  Optional: This narrows the search to one or more WebCenter Portal services, such as oracle.webcenter.doclib or oracle.webcenter.page. For example, setting this to oracle.webcenter.doclib searches only documents. If omitted, this searches all services.

  See Also: Table G–7, " Service IDs" for a list of service IDs

- `q={queryString}`

  Searches may be specified using the following format

  `[[`*`field1`*`:[`*`operand`*`]][:]`*`value1`*`[;`*`field2`*`:`*`operand`*`:`*`value2`*`]]`

  Where multiple clauses are joined by an implicit `AND` and are syntactically separated by the ";" semicolon. Square brackets `[]` denote optional values. Each clause can be one of the following types:

  - `keywords` - simple string with no ":" colon separator
  - `attribute1:value1` - shortcut for a clause meaning attribute1 equals value1
  - `attribute1:operand1:value1` - a clause capturing a Boolean condition between attribute1 and value1

  Search attributes include the following, but can be *any* attribute name:

  - `title` - Name or title of the item
  - `description` - Description of the item
  - `creator` - Creator or contributors of the item
  - `date` - Date on which the item was last modified

  - `tags` - Tag words that the item may have (applicable to pages)

  The attributes can be returned in search results, where `data=field1[,field2]`

  Legal operands:

  - `equals` - Strings and Numbers
  - `contains` - Strings
  - `gt` (greater than) - Numbers
  - `gte` (greater than or equals) - Numbers
  - `lt` (less than) - Numbers
  - `lte` (less than or equals) - Numbers

- `scopeGuid={...}`

  Optional: The GUID associated with the scope.

- `refiners={true|false}`

  Optional: Whether to fetch refiners. If omitted, the default value is false.

Example 45–4 Search REST Commands

```
http://examplehost:8888/rest/api/searchresults?q=document&serviceId=oracle.webcenter.doclib,oracle.webcenter.page&utoken={utoken}

http://examplehost:8888/rest/api/searchresults?q={keywords};dDocName:contains:handbook&data=dDocName,dOriginalName
```

For more information, see Section 54.5.2.5, "Templates."

Writable Elements for results

Table 45–4 lists the writable elements for this resource.

Table 45–4 Writable Elements for results

Element	Type	Required	Constraints	Description
`author`	String		1 or more characters	Name of the query author
`resourceId`				
`serviceId`				
`title`				
`description`	String	No	1 or more characters	Description of the query
`lastModifiedDate`				
`size`				

Resource Types Linked to From results

Table 45–5 lists the resource types that the client can link to from this resource.

Table 45–5 Related Resource Types for search

rel	resourceType
self	

45.3.8 Using the Search Service Data Control

Use the Search service data control to build a customized search user interface with a Framework application or a custom task flow. Deploying this task flow into an ADF library allows for a portable consumption of the task flow; for example, you could add it to a WebCenter Portal: Spaces application Resource Catalog to build site templates.

45.3.8.1 Search Data Control Methods, Attributes, and Classes

The Search data control contains the `searchSes` method. Table 45–6 describes its parameters for setting search refiners and limiting the scope of the search.

Table 45–6 searchSes Input Parameters

Parameter	Required?	Type	Description
`scopeGuid`	No	String	GUID value to filter results by spaces.
`serviceId`	No	String	The service ID of the item; for example, oracle.webcenter.doclib searches only documents. If omitted, this searches across all services.
`keywords`	Yes	String	Search terms.
`predicates`	No	List	Collection of predicates.
`fetchRefiners`	No	Boolean	Whether to fetch refiners. If omitted, the default value is false.
`startIndex`	Yes	Integer	Specifies the index of the first matching result that should be included in the result set (0-n ... zero based). This is used for pagination.
`itemsPerPage`	Yes	Integer	Number of results to display.

The `searchSes` method returns:

- Collection of SearchServiceDCRows objects
- Collection of SearchServiceDCRefiner objects

45.3.8.1.1 SearchServiceDCRows

- author
- comments
- createDate
- description
- iconPath
- language
- largeIconPath
- lastModifiedDate
- resourceId
- scopeGuid
- serviceId
- size
- tagWords

- title
- type
- urlSearchServiceDCRefiner

45.3.8.1.2 SearchServiceDCRefiner

element

45.3.8.1.3 SearchServiceDCRefinement

- keywords
- scopeGuid
- serviceId
- Collection of predicates

45.3.8.2 Integrating the Search Data Control

To use the Search data control:

1. In JDeveloper, create a Framework application with an Oracle SES connection. After the connection is available, the Search Data Control is listed in the Data Controls palette.
2. Drag and drop the `searchSes` method from `SearchServiceDC`.
3. Choose **ADF Parameter Form**, and the Edit Form Fields dialog opens. Click **OK**.
4. Drag the rows accessor, from the `SearchServiceDCResult` return object type, onto the form, and choose **Table - ADF Read-only Table**. Click **OK**.
5. Run the page, enter appropriate values. For example:
   - `keywords`: any search term
   - `startIndex`: 0
   - `itemsPerPage`: 10

For information about adding data controls to your application, see Section 7.1.2, "Understanding WebCenter Portal APIs."

45.3.9 Building Adapters for the Search Service

You can use search adapters to add other sources to your search results. WebCenter Portal framework automatically discovers these search adapters and consolidates them in formulating search results in your application. Subsequently, when you expose your custom component to the Search service in your application, it is included in the federated search.

This section describes how to extend WebCenter Portal's search through search adapters. It includes the following subsections:

- Section 45.3.9.1, "How to Add a Search Source"
- Section 45.3.9.2, "How to Register a Custom Adapter"
- Section 45.3.9.3, "Search Adapter Attributes"
- Section 45.3.9.4, "What Happens at Runtime"

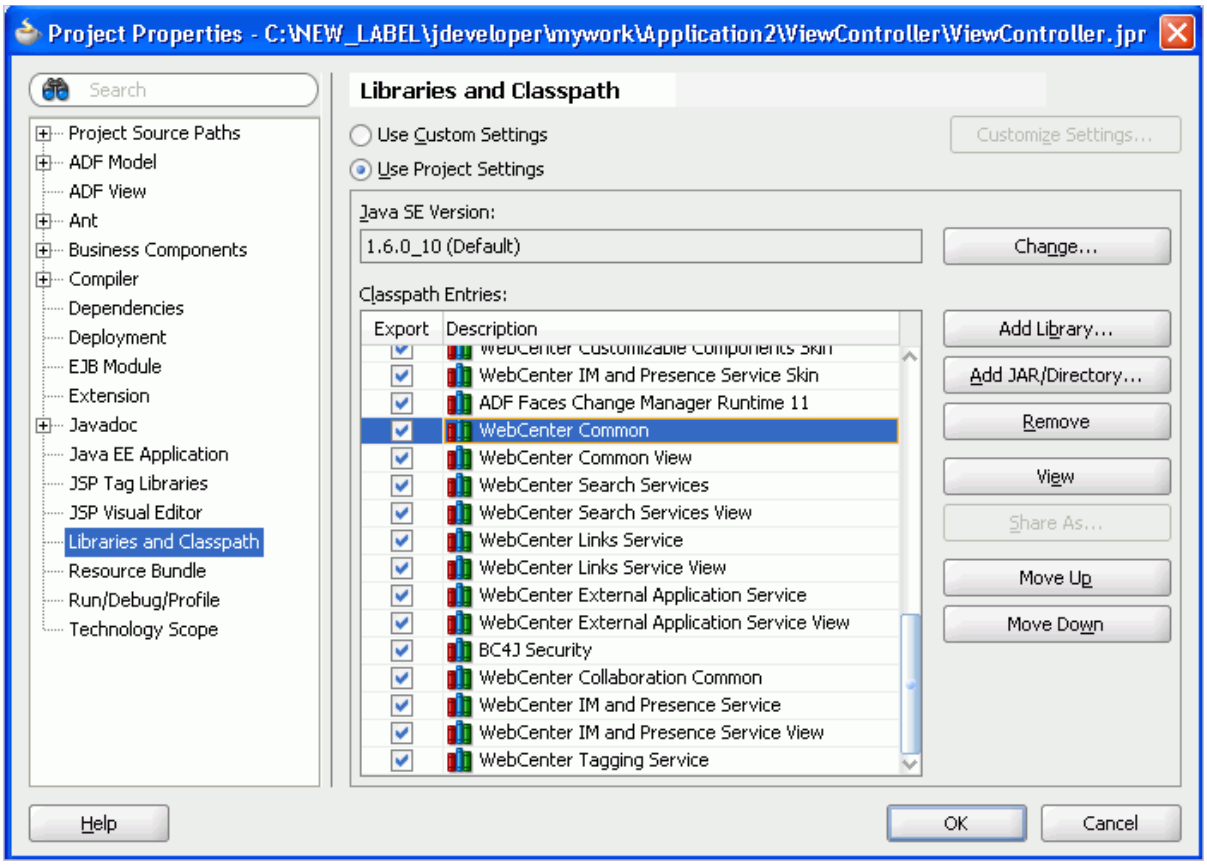
45.3.9.1 How to Add a Search Source

To add a new search source, you must create Java classes for the new source to manage the incoming queries and return search results. After you add the necessary Java classes to your application, you must register them with the Search service.

When performing a search, the search framework calls `QueryManager.createRowQueryHandler` with a query object and a `List<QName>` that describes the columns sought. In return, the framework receives a `QueryHandler<Row>`.

A `QueryHandler` can be a `QueryFederator` or a `QueryExecutor`. A `QueryFederator` is just a collection of other `QueryHandlers`. With the `QueryFederator`, the framework can get a list of the child `QueryHandlers` and keep recursing until all `QueryExecutors` are found.

The framework calls the `execute` method on the `QueryExecutor` to get a `QueryResult<Row>`, which is an extension of `java.util.Iterator<Row>` that iterates and retrieves rows of results.



One possible implementation would be to create these classes:

- `SampleQueryManager` ...
- `SampleRowQueryExecutor` ...
- `SampleRowQueryResult` ...
- `SampleRow` ...

To add a new search source with a similar query manager:

1. In Oracle JDeveloper, open the application in which to add the search source.
2. Confirm that the WebCenter Common library is included in your project:
   a. In the Application Navigator, right-click your project and select **Project Properties** and then **Libraries and Classpath**.
   b. If the **WebCenter Common** library is not included, as shown in Figure 45–8, then click **Add Library** and select it.

Figure 45–8 WebCenter Common Library

c. Click **OK**.

3. Create a class called `SampleQueryManager.java` (Example 45–5).

Example 45–5 SampleQueryManager.java

```
package mycompany.myproduct.myapp.mycomponent.query;
import java.util.List;
import oracle.webcenter.search.QName;
import oracle.webcenter.search.Query;
import oracle.webcenter.search.QueryExecutor;
import oracle.webcenter.search.QueryManager;
import oracle.webcenter.search.Row;
public class SampleQueryManager
  implements QueryManager
{
  public SampleQueryManager()
  {
  }
  public QueryExecutor<Row> createRowQueryHandler(Query query,
                                                  List<QName> columns)
  {
    return new SampleRowQueryExecutor(query, columns);
  }
}
```

4. Create a class called `SampleRowQueryExecutor.java` (Example 45–6).

Example 45–6 SampleRowQueryExecutor.java

```
package mycompany.myproduct.myapp.mycomponent.query;
import java.text.DateFormat;
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.ArrayList;
import java.util.HashMap;
import java.util.Iterator;
import java.util.List;

```

5. Create a class called `SampleRowQueryResult.java` (Example 45–7).

Example 45–7 SampleRowQueryResult.java

```
package mycompany.myproduct.myapp.mycomponent.query;
import java.util.Iterator;
import oracle.webcenter.search.util.WrapperQueryResult;
import oracle.webcenter.search.Row;
public class SampleRowQueryResult extends WrapperQueryResult<Row>
{
  public SampleRowQueryResult(Iterator<Row> rows)
  {
    super(rows);
  }
}
```

6. Create a class called `SampleRow.java` (Example 45–8).

Example 45–8 SampleRow.java

```
package mycompany.myproduct.myapp.mycomponent.query;
import java.text.DateFormat;
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.Calendar;
import java.util.Date;
import java.util.HashMap;
import java.util.Iterator;
import java.util.Map;
import oracle.webcenter.search.QName;
import oracle.webcenter.search.Row;
import static oracle.webcenter.search.AttributeConstants.DCMI_EXTENT;
import static oracle.webcenter.search.AttributeConstants.DCMI_MODIFIED;
import static oracle.webcenter.search.AttributeConstants.DCMI_CREATOR;
import static oracle.webcenter.search.AttributeConstants.DCMI_TITLE;
import static oracle.webcenter.search.AttributeConstants.DCMI_URI;
import static oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER;
import static oracle.webcenter.search.AttributeConstants.WPSAPI_ICON_PATH;
public class SampleRow implements Row
{
  private Map<QName, Object> m_storage = new HashMap<QName, Object>();
  private DateFormat m_dateFormat = new SimpleDateFormat("yyyy-MM-dd");
  SampleRow(String id, String title,
            String creator, String lastModified,
            int size)
  {
    m_storage.put(DCMI_IDENTIFIER, id);
    // Only if you have an external URL to go to
    // m_storage.put(DCMI_URI, "http://my.external.url");
    m_storage.put(DCMI_TITLE, title);
    m_storage.put(DCMI_CREATOR, creator);
    // The below path points to a path accessible in the classpath to an icon
    m_storage.put(WPSAPI_ICON_PATH, "/adf/webcenter/search_qualifier.png");
    try
    {
      Date date = m_dateFormat.parse(lastModified);
      Calendar cal = Calendar.getInstance();
      cal.setTime(date);
      m_storage.put(DCMI_MODIFIED, cal);
    }
    catch (ParseException e)
    {
      e.printStackTrace();
    }
    m_storage.put(DCMI_EXTENT, new Long(size));
  }
  public Object getObject(QName columnName)
  {
    return m_storage.get(columnName);
  }
  public Iterator<QName> getColumns()
  {
    return m_storage.keySet().iterator();
  }
}
```

45.3.9.2 How to Register a Custom Adapter

To register your query manager with the Search service, you must edit the `service-definition.xml` file. The `SampleQueryManager` line exposes the custom adapter's query manager implementation to the Search service so that the custom adapter is included with any search user interface.

The entry should be similar to Example 45–9.

Example 45–9 Sample Query Manager Entry in service-definition.xml

```
<service-definition id="mycompany.myproduct.myapp.mycomponent"
   version="11.1.1.0.0">
  <resource-view taskFlowId="/somepath/somefile.xml#someId"
                 authorizerClass="some.service.id.Authorizer1"/>
  <name>Custom Component 1</name>
  <description>Description for Custom Component 1</description>
  <search-definition xmlns="http://xmlns.oracle.com/webcenter/search"
      id="mycompany.myproduct.myapp.mycomponent.query" version="11.1.1.0.0">
  <query-manager-class>
mycompany.myproduct.myapp.mycomponent.query.SampleQueryManager
  </query-manager-class>
  </search-definition>
</service-definition>
```

For more information about the `resource-view` tag (and WebCenter Portal's Resource Action Handling framework), see Section 7.3, "Extending Your Framework Application with Custom Components."

45.3.9.3 Search Adapter Attributes

This section describes the attributes available for searching a service. It includes the following subsections:

- Section 45.3.9.3.1, "Searchable Attributes"
- Section 45.3.9.3.2, "Keywords"
- Section 45.3.9.3.3, "Date Condition"
- Section 45.3.9.3.4, "Complex Date Condition"
- Section 45.3.9.3.5, "Person Condition"
- Section 45.3.9.3.6, "Complex Person Condition"
- Section 45.3.9.3.7, "Access"
- Section 45.3.9.3.8, "Selectable Attributes"

45.3.9.3.1 Searchable Attributes WebCenter Portal's search user interface exposes searches based on three fields: keywords, date, and person. Each service, in its own search implementation, honors these fields to the best of its capabilities. At minimum, it supports the keywords field. When you define your own search adapter, you must honor these fields to the best of your adapter's capabilities, as described in Section 45.3.9.3.8, "Selectable Attributes."

45.3.9.3.2 Keywords By default, the keyword field is in `oracle.webcenter.search.TextPredicate`. The field can comprise multiple words, with the service determining how to interpret multiple words. The Search service does not tokenize before the call comes to the service, but here are some guidelines:

- If two or more tokens are enclosed within quotes, then they should be interpreted as one word.
- Unless the `OR` operator is explicitly set, it is assumed that the default conjunction among the words in the keywords field is `AND`.

45.3.9.3.3 Date Condition For Search service to support filtering of query results by last modified date, the service implementation of the WPSAPI must support the use of `oracle.webcenter.search.AttributePredicate`, accessible from the query object, that uses `oracle.webcenter.search.AttributeConstants.DCMI_MODIFIED`. The supported comparators must include the following:

- `oracle.webcenter.search.ComparatorConstants.GREATER_THAN`
- `oracle.webcenter.search.ComparatorConstants.GREATER_THAN_OR_EQUALS`

They may also include the following:

- `oracle.webcenter.search.ComparatorConstants.EQUALS`
- `oracle.webcenter.search.ComparatorConstants.NOT_EQUALS`
- `oracle.webcenter.search.ComparatorConstants.LESS_THAN`
- `oracle.webcenter.search.ComparatorConstants.LESS_THAN_OR_EQUALS`

The literals for comparison should be of type `java.util.Calendar`.

45.3.9.3.4 Complex Date Condition You can use the `BETWEEN` clause for dates. The complex date condition, instead of being a simple `AttributePredicate`, is a `ComplexPredicate` that contains one `GREATER_THAN AttributePredicate` and one `LESS_THAN AttributePredicate` with an `AND` conjunction operator. This `ComplexPredicate` must apply the `AND` operator with the rest of the fields (that is, keywords and person).

To differentiate between this case and the default case, service authors must check on the type of the predicate that is meant for the date condition. If it is an `AttributePredicate`, then it is the default case. If it is a `ComplexPredicate`, then it is a special case.

45.3.9.3.5 Person Condition For Search to support filtering of query results by person, the service implementation of the WPSAPI must support `oracle.webcenter.search.AttributePredicate`, accessible from the query object, that uses `oracle.webcenter.search.AttributeConstants.WPSAPI_MODIFIER`.

The comparators supported must include the following:

- `oracle.webcenter.search.ComparatorConstants.EQUALS`
- `oracle.webcenter.search.ComparatorConstants.CONTAINS`
- `oracle.webcenter.search.ComparatorConstants.STARTS_WITH`
- `oracle.webcenter.search.ComparatorConstants.ENDS_WITH`

The literals for comparison should be of type `java.lang.String`.

45.3.9.3.6 Complex Person Condition Service authors must check on the type of predicate that is meant for the person condition. An `AttributePredicate` is the default case.

45.3.9.3.7 Access The Search service (as a caller) expects that the query's `getPredicate()` method likely returns an `oracle.webcenter.search.ComplexPredicate` that joins an `oracle.webcenter.search.TextPredicate` holding the keyword, and an `oracle.webcenter.search.ComplexPredicate` holding the date condition, and an `oracle.webcenter.search.AttributePredicate` holding the person condition.

45.3.9.3.8 Selectable Attributes The following selectable attributes/columns should be supported by your search adapter in its search implementation:

- **Title** (Required)

  For each resource returned, the Search service user interface can display the title column, if provided. It is strongly recommended that the title column comes with the QName `AttributeConstants.DCMI_TITLE`.

- **Resource ID** (Required)

  For resources to communicate a unique identifier that allows the Search service to render a link to navigate to the resource view (or any declared views) of the service, the column with the name `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` must be returned as a column accessible from a row within the `QueryResult<Row>`.

  The Search service extracts the `DCMI_IDENTIFIER` column and feeds it into the resource viewer as the value of the `resourceId` parameter when the link is clicked.

  If your resource view (or any declared views) requires multiple columns in the primary key, then try to bundle all of them into a composite string value for the `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` column. The Search service treats that opaquely and passes it to your resource view, within which it may deconstruct the string into the various parts of the primary key.

- **Resource Type**

  For each resource returned, the Search service user interface can display the type column, if provided. The type column comes with the QName `AttributeConstants.DCMI_TYPE`. If the `DCMI_TYPE` column is not found, then the value of the `DCMI_FORMAT` column is used in its place. In your resource viewer, you can make use of the resource type to aid in the rendering of a resource.

- **Resource URL** (in place of Resource ID)

  In the absence of an `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` column, WebCenter Portal's Search service constructs the link from the value of the column specified by `oracle.webcenter.search.AttributeConstants.DCMI_URI`. With absolute URLs, the `DCMI_URI` can launch a link from the search results to the URL.

  This allows for services, such as the Documents service and the Page service, to invoke the browser plug-in to render various results link targets, instead of invoking a resource view.

- **Last Modified Date**

For each resource returned, the Search service user interface can display the last modified date column, if provided. To mirror the searchable attribute of the last modified date, it is important that users can see the last modified date as a returned column in the search result.

For most users, the last modified date is more relevant than the creation date. To have better consistency between the searchable attributes and the selectable attributes (so that users know what date to search with after seeing some values in the columns), it is strongly recommended that service authors return `AttributeConstants.DCMI_MODIFIED` rather than `AttributeConstants.DCMI_CREATED`. The last modified date is of type `java.util.Calendar`.

- **Creator**

  For each resource returned, the Search service user interface can display the creator and last modified by column, if provided. The search user interface combines them in the same column as a list of contributors for the found resource. The QNames to use are `AttributeConstants.DCMI_CREATOR` and `AttributeConstants.WPSAPI_MODIFIED`, respectively. The creator is of type `java.lang.String`.

- **Icon**

  For each resource returned, the Search service user interface can display the icon column, if provided. The icon column comes with the QName `AttributeConstants.WPSAPI_ICON_PATH` and corresponds to a valid path to an icon file that is accessible in the class path. The icon path is of type `java.lang.String`.

- **Size**

  For each resource returned, the Search service user interface can display the size column, if provided. The size column comes with the QName `AttributeConstants.DCMI_EXTENT` and corresponds to the size of the resource found. The size is of type `java.lang.Number`.

45.3.9.4 What Happens at Runtime

When you perform a search from the main view or toolbar, it should seamlessly include your new search source. For testing purposes, be sure to enter criteria that yields a result in your newly-added search source.

WebCenter Portal's Search service invokes a resource viewer using the Resource Action Handling framework. For information about registering a resource viewer to allow custom components to be found using Search, see Section 7.3, "Extending Your Framework Application with Custom Components."

45.3.10 Customizing the Search UI Without WebCenter Portal's Search Service APIs

You can develop a custom search user interface in a Framework application without WebCenter Portal's Search service API, but still with Oracle SES as the application's search engine by using the Oracle SES Web Service Query API to do search functions. Also, action handling for search results can be managed with WebCenter Portal's Resource Action Handling framework, so that when an application resource (for example, a document) is clicked in the search results, the resource is shown in the viewer of the resource (for example, the Documents resource viewer). Moreover, if the application uses WebCenter Portal Navigation, then certain resource types can be shown in the navigation node of the resource.

This section describes the required steps to enable Resource Action Handling for handling search result action.

1. Use the Document Service Manager provided by WebCenter Portal to crawl documents.

   See Also: Section "Setting Up Oracle SES to Search Documents" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*

   The Document Services Manager creates an attribute called `wc_url` in the Oracle SES index for each document. The value of the `wc_url` attribute is a URL that goes to the Resource Action Handling module of the application. The URL uses the value of the `WebCenter URL Prefix` parameter in the Document Service instance as the prefix.

   Set the parameter value as the host and port where the application is deployed, plus the context root; for example:

   ```
   http://myhost:8888/DocumentsServer
   ```

2. Use the `wc_url` attribute for action handling in the search UI.

   Typically, the search UI uses the URL attribute for action handling. To use Resource Action Handling for action handling of search results of the Documents resource type, use the `wc_url` attribute. Note that only search results with the Documents resource type have the `wc_url` attribute. Therefore, this must be done conditionally in the search UI code.

3. Specify WebCenter Portal's Resource Action Handling class for click action of search result.

   When a search result is clicked, the resource is rendered in the resource viewer of the resource, if available. The current search results page is over-written. Use Resource Action Framework to change this behavior.

   Update the `adf-config.xml` file of the application to specify the Resource Action Handling class to use.

   Example 45–10 shows how to use `PopUpResourceActionViewHandler` to show the resource in a popup window when a search result is clicked.

Example 45–10 Specifying PopUp Behavior Handler

```
xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  <wpsC:adf-service-config
xmlns="http://xmlns.oracle.com/webcenter/framework/service">
    <resource-handler
class="oracle.webcenter.framework.resource.view.PopUpResourceActionHandler"/>
  </wpsC:adf-service-config>
```

   Example 45–11 shows how to use `NavigationResourceActionHandler` to show the resource in the navigation node of the resource when a search result is clicked.

Example 45–11 Specifying the Navigation Handler

```
xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  <wpsC:adf-service-config
xmlns="http://xmlns.oracle.com/webcenter/framework/service">
    <resource-handler
```

```
class="oracle.webcenter.portalframework.sitestructure.handler.NavigationResourceAc
tionHandler"/>
  </wpsC:adf-service-config>
```

45.3.11 Troubleshooting the Search Service

This section describes common problems and solutions for the Search service.

Problem

There is a set timeout for querying each service. If a particular service does not return search results in the allotted time, then it times out. The Announcements and Discussions services are susceptible to timeouts. (In WebCenter Portal: Spaces, pages and spaces could have timeouts from search execution.)

Solution

To improve performance at design time, you can increase the values (in milliseconds) of `timeoutMs` and prepare `TimeoutMs` in `adf-config.xml`. The following is the relevant fragment of `adf-config.xml`, found in the Application Resources panel in the `ADF META-INF` folder:

```
<execution-properties timeoutMs="3000"prepare TimeoutMs="1000"/>
```

At runtime, you can configure timeouts using WLST or Fusion Middleware Control.

46

Integrating the Activity Graph Service

This chapter explains how to integrate the Activity Graph service in a WebCenter Portal: Framework application at design time.

This chapter includes the following sections:

- Section 46.1, "Introduction to the Activity Graph Service"
- Section 46.2, "Basic Configuration for the Activity Graph Service"
- Section 46.3, "Advanced Information for the Activity Graph Service"
- Section 46.4, "Extending the Activity Graph Service"
- Section 46.5, "Troubleshooting the Activity Graph Service"

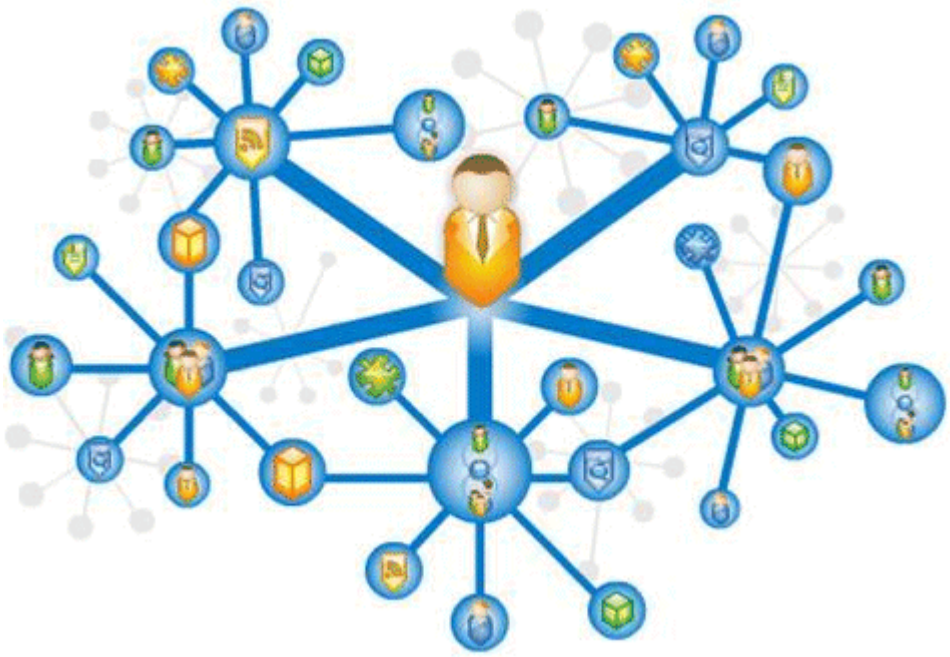
For more information about managing and using the Activity Graph service, see:

- "Managing the Activity Graph Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- "Working with the Activity Graph Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

46.1 Introduction to the Activity Graph Service

The advent of Enterprise 2.0 has enabled users to contribute content at unprecedented rates. In view of this, there is now a need for better information retrieval technologies that are seamlessly integrated with Enterprise 2.0 products, such as Framework applications. The Activity Graph service provides the solution by leveraging collective intelligence to benefit search and social applications.

This section provides an overview of the Activity Graph service, its task flows, its benefits, and the underlying architecture. It includes the following subsections:



- Section 46.1.1, "Understanding the Activity Graph Service"
- Section 46.1.2, "Requirements for the Activity Graph Service"
- Section 46.1.3, "What Happens at Runtime"

46.1.1 Understanding the Activity Graph Service

The Activity Graph service provides suggestions of people that a user may be interested in connecting with, based on existing connections and shared interaction with objects within the application. It also directs users to spaces or content that may be of interest, based on similar interactions with those spaces or items that the user is currently viewing.

The Activity Graph service presents these suggestions based on data gathered and analyzed by the Activity Graph engine. The Activity Graph engine provides a central repository for actions that are collected by enterprise applications. Thinking in terms of a mathematical graph, application users and the enterprise content with which they interact are *nodes*, and the actions between users and between users and content are *directed edges* (Figure 46–1).

Figure 46–1 An Activity Graph

In an enterprise, this analysis of the interaction of people with other people and with content produces similarity scores for making contextual recommendations based on an extensible set of actions, such as viewing, editing, tagging, and so on. For online vendors, for example, such contextual recommendations help provide a selection of suggested additional purchases. In a social networking environment, recommendations suggest additional connections to make based on the friends of the friends you have already connected with.

The Activity Graph engine also calculates an activity rank for content and passes this information to Oracle Secure Enterprise Search to enable more relevant content to appear higher in search results. For more information see the section "Setting Up Activity Rank for Oracle Secure Enterprise Search" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Node Classes

Activity graph nodes are grouped into classes. The default *node classes* for WebCenter Portal are:

- Users (`WC.user`)
- Spaces (`WC.group-space`)
- Documents (`WC.document`)
- Wiki Pages (`WC.wiki-page`)

- Blogs (`WC.blog`)
- Discussion Topics (`WC.topic`)

If you want to extend the Activity Graph engine to integrate with other applications, then you can create custom node classes for the objects in those applications. For more information, see Section 46.4.1, "Defining Custom Node Classes."

Actions

An *action* is a specific type of event. It has a source and a target. For example, if a user, say Monty, looks at a document, that is a `view` action with Monty as the source and the document as the target. Other actions between users and items include `create`, `like`, and `tag`. Actions can also occur between two users, for example, when two users `connect` with each other.

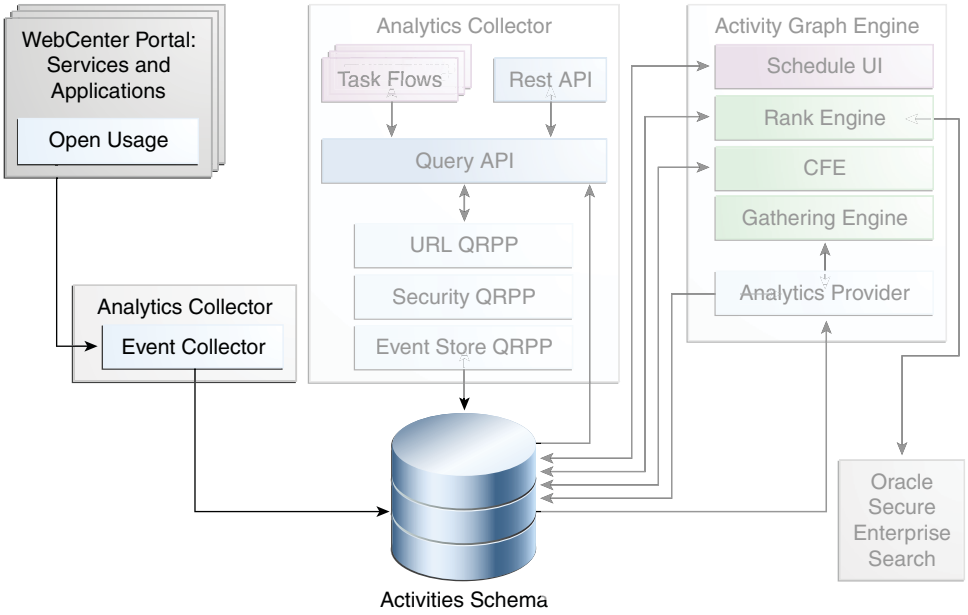


Table 46–1 lists the default actions defined for WebCenter Portal.

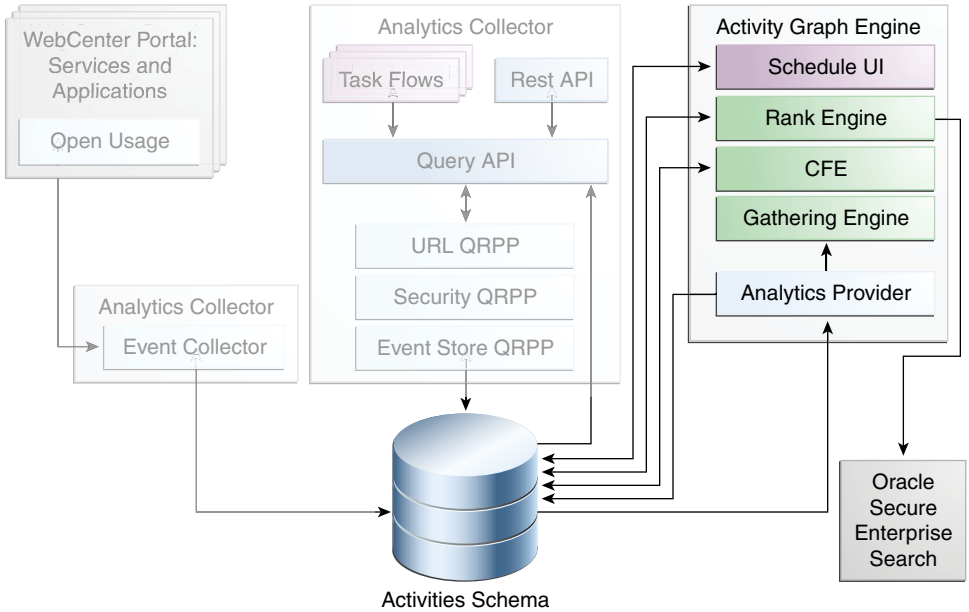
Table 46–1 WebCenter Portal Default Actions

Action URN	Description
`connect`	Connecting with another user.
`create`	Creating a space, document, wiki page, blog, topic, or message.
`edit`	For all items except spaces: ■ Checking in a new version of document ■ Editing a wiki page or blog ■ Replying to a topic ■ Editing a message For spaces: ■ All of the above plus ■ Creating, editing, or deleting a page ■ Creating, editing, or deleting a list ■ Creating, editing, or deleting an event
`comment`	Commenting on a document, wiki, or blog
`like`	Liking a document, wiki, blog, or message
`tag`	Tagging a document, wiki, or blog
`view`	Viewing a space page, document, wiki page, blog entry, or discussion topic
`download`	Downloading a document, wiki, or blog
`edit-count`	Checking in a new version of a document, editing a wiki page or blog, replying to a topic, editing a message
`view-count`	Viewing a document, wiki page, blog, or discussion topic



When one of these WebCenter Portal actions occurs, for example, Monty `view`ing his document, it is picked up by the Events Collector, a component of WebCenter Portal's Analytics, and placed in an event table in the Activities database (Figure 46–2).

Figure 46–2 Data Collection by WebCenter Portal's Analytics

When the activity data gathering process starts, Analytics Activity Provider reads actions from the Analytics event tables and uses a registered set of mappings to generate activities (Figure 46–3). An *activity* is one occurrence of an action and is used to determine *relations*, aggregated occurrences of actions, which are stored in the relation tables. For example, the fact that Monty has viewed this particular document five times is a relation. Information in the relation tables is used to determine recommendations and search ranks.

Figure 46–3 Data Gathering by the Activity Graph Engine

If you want to integrate the Activity Graph engine with other applications, then you can create custom actions for the actions that users perform in those applications. For more information, see Section 46.4.2, "Defining Custom Actions."

Similarity Calculations

The Activity Graph Query API is a Java API, used by the Activity Graph service task flows, that queries the relation tables for recommendations using a recipe (Figure 46–4). A *recipe* is a weighted list of similarity calculations. A *similarity calculation* provides a similarity score (a number between zero and one) that designates how similar two objects are to each other given a specific criterion. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

Figure 46–4 Recommendations Calculation by the Activity Graph Service

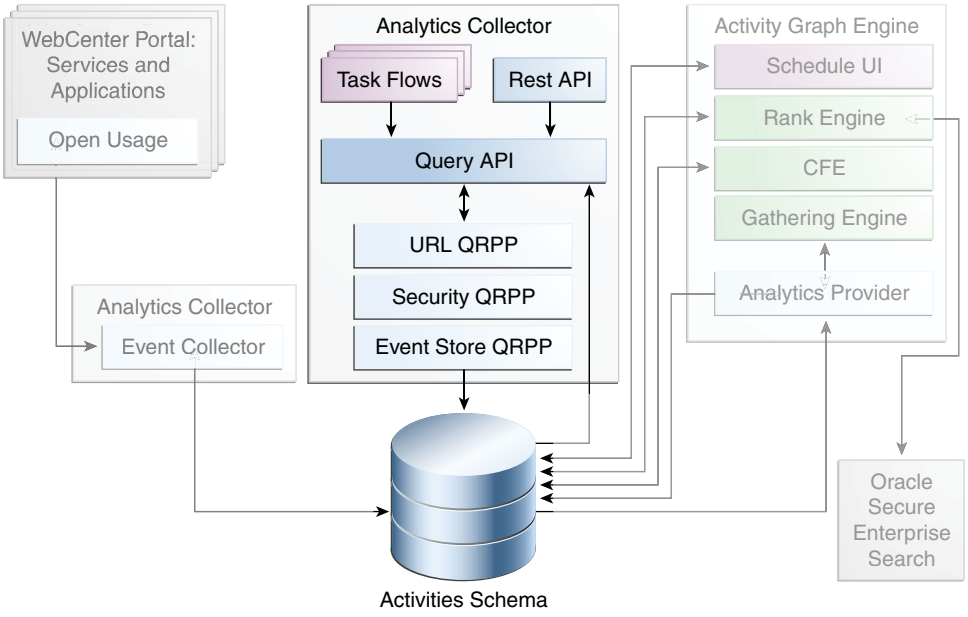


Table 46–2 lists the similarity calculations used by the Activity Graph service task flows (for information about the task flows, see Section 46.2.3.1, "Activity Graph Service Task Flows").

Table 46–2 Activity Graph Service Similarity Calculations

URN	Applies to	Description	Used by Task Flow
`item-edit`	Documents Wiki pages Blogs Topics	Users who edited the current item also edited the recommended item	Similar Items
`item-like`	Documents Wiki pages Blogs Topics	Users who liked the current item also liked the recommended item	Similar Items
`item-comment`	Documents Wiki pages Blogs Topics	Users who commented on the current item also commented on the recommended item	Similar Items

Table 46–2 (Cont.) Activity Graph Service Similarity Calculations

URN	Applies to	Description	Used by Task Flow
`item-tag`	Documents Wiki pages Blogs Topics	Users who tagged the current item also tagged the recommended item	
`item-all`	Documents Wiki pages Blogs Topics	Users who interacted in any way with the current item, including viewing it, also interacted in some way with the recommended item	Similar Items
`gs-edit`	Spaces	Users who participated in the current space also participated in the recommended space	Similar Spaces
`gs-all`	Spaces	Users who interacted in any way with the current space, including viewing pages or content in the space, also interacted in some way with the recommended space	Similar Spaces
`user-connect`	Users	The current user shares a number of connections with the recommended user	Recommended Connections
`user-edit`	Users	The current user edited some items that the recommended user also edited	Recommended Connections
`user-like`	Users	The current user likes some items that the recommended user also likes	Recommended Connections
`user-comment`	Users	The current user commented some items that the recommended user also commented on	Recommended Connections
`user-tag`	Users	The current user tagged some items that the recommended user also tagged	Recommended Connections
`user-all`	Users	The current user interacted in some way, including viewing, with some items that the recommended user also interacted with	Recommended Connections

You can edit these similarity calculations to change the weightings. If you want to integrate the Activity Graph engine with other applications, then you can create additional similarity calculations. For more information, see Section 46.4.3, "Defining Custom Similarity Calculations.".

Query Result Post-Processors (QRPPs)

After the initial list of recommendations for a particular object is generated, the results can be filtered into something more appropriate and useful to present to users. This is achieved using Query Result Post-Processors (QRPPs). QRPPs take the current list of recommendation results return a modified list as output. A QRPP may filter out recommendations, for example by removing recommendations for objects that the current user is not permitted to see, or may add or modify result metadata.

WebCenter Portal provides three QRPPs (run in the following order):

- **WebCenter Portal Security QRPP**—Filters out recommendations for objects for which the current user does not have view permissions by calling the Resource Authorizer, which is the same WebCenter Portal component used by the Search service for view authorization.
- **Analytics Metadata QRPP**—Retrieves additional metadata, for example, description and icon URL, for each recommended object from the Analytics tables.
- **WebCenter Portal URL QRPP**—Retrieves a URL for each recommended object by calling the Resource Action Handler, which is the same WebCenter Portal component used by the Search service.

You can create your own QRPPs to further filter the results or to integrate the Activity Graph engine with other applications. For more information, see Section 46.4.6, "Registering Custom QRPPs."

Activity Graph Service Task Flows

Recommendations are presented to users via the Activity Graph service task flows. The Activity Graph service provides the following task flows:

- **Recommended Connections**—Recommends users that the current user may want to connect with based on his or her current connections and shared interactions with objects in the application.
- **Similar Spaces**—Suggests spaces with which users have interacted in a similar way as the current space.
- **Similar Items**—Suggests items with which users have interacted in a similar way as the current item.

For more information, see Section 46.2.3.1, "Activity Graph Service Task Flows."

46.1.2 Requirements for the Activity Graph Service

The Activity Graph service requires that the Activity Graph engine has been installed and configured. For more information, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

In addition, in your application you must create a connection to WebCenter Portal's schema and to the Activities database. For more information, see Section 7.2.2, "Setting Up a Database Connection."

The application must be configured to send usage events to the Analytics Event Collector. For more information, see the section "Registering an Analytics Collector for

Your Application" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Before the Activity Graph service can make recommendations, the Activity Graph engines must have been run at least once to gather the data and calculate similarity scores. For more information see the section "Preparing Data for the Activity Graph Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The items suggested in the Similar Items task flow depend on the services that are available in your application. For example, documents are only recommended if the Documents service is available. For information about making a service available in your application, refer to the appropriate chapter for that service. An item can also be filtered out of the recommendations by the Resource Authorizer of the service that owns the item.

46.1.3 What Happens at Runtime

At runtime, the context is provided for the Activity Graph service task flow:

- For the Recommended Connections task flow, the context is the current user.
- For the Similar Spaces task flow, the context is the current space.
- For the Similar Items task flow, the context is a WebCenter Portal resource, provided through task flow input parameters or through ADF UI events.

The task flow then queries the Activity Graph database for recommendations through the Activity Graph Query API, using the recipe provided in the task flow parameters. The list of recommendations returned from the Query API may be filtered by QRPPs before being listed in the task flow.

For more information about the service at runtime, see the section "Working with the Activity Graph Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

46.2 Basic Configuration for the Activity Graph Service

This section describes required steps for adding the Activity Graph service to your application. It includes the following subsections:

- Section 46.2.1, "Configuration Roadmap for the Activity Graph Service"
- Section 46.2.2, "Setting Up Connections for the Activity Graph Service"
- Section 46.2.3, "Adding the Activity Graph Service at Design Time"

46.2.1 Configuration Roadmap for the Activity Graph Service

The flow chart (Figure 46–5) and table (Table 46–3) in this section provide an overview of the prerequisites and tasks required to get the Activity Graph service working in Framework applications.

Figure 46–5 Configuring the Activity Graph Service for WebCenter Portal: Framework Applications

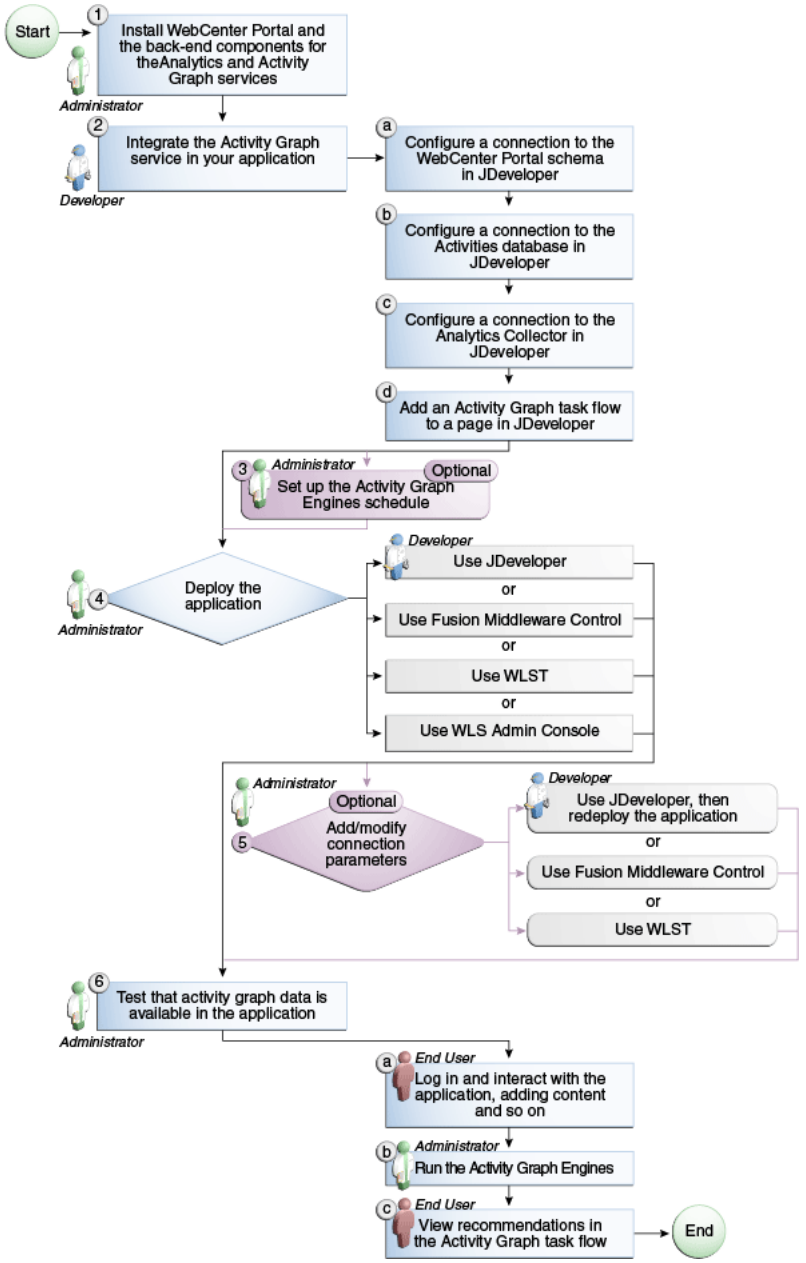

Table 46–3 Configuring the Activity Graph Service for WebCenter Portal: Framework Applications

Actor	Task	Sub-task
Administrator	**1.** Install WebCenter Portal and the back-end components for the Analytics and Activity Graph services	
Developer	**2.** Integrate the Activity Graph service in your application	**2.a** Configure a connection to WebCenter Portal's schema in JDeveloper **2.b** Configure a connection to the Activities database in JDeveloper **2.c** Configure a connection to the Analytics Collector in JDeveloper **2.d** Add an Activity Graph task flow to a page in JDeveloper
Administrator	**3.** (Optional) Set up the Activity Graph Engines schedule	
Developer/ Administrator	**4.** Deploy the application using one of the following tools: ■ JDeveloper (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator) ■ WLS Admin Console (Administrator)	
	5. (Optional) Add/modify connection parameters using one of the following tools: ■ JDeveloper, then redeploy the application (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator)	
End User/ Administrator	**6.** Test that activity graph data is available in the application	**6.a** Log in and interact with the application, for example, by adding content (End User) **6.b** Run the Activity Graph Engines (Administrator) **6.c** View recommendations in the Activity Graph task flow, for example, the Recommended Connections task flow on your Profile page (End User)

46.2.2 Setting Up Connections for the Activity Graph Service

The Activity Graph service requires a the following connections:

- **WebCenter Portal schema**—This connection is used by the WebCenter Portal Security and WebCenter Portal URL QRPPs when querying the WebCenter Portal Resource Authorizer and Resource Action Handler respectively. For information about how to create this connection, see Section 7.2.2, "Setting Up a Database Connection."
- **Activities schema**—This connection is used to query recommendations and obtain metadata for results. This is the same connection as used by the Analytics Event Collector and the Activity Graph engine. If you have an existing connection, then that connection is used. If you do not have an existing connection, then you must

create one. For information about how to create this connection, see Section 7.2.2, "Setting Up a Database Connection."

- **Analytics Event Collector**—This connection is used to send usage events to the Analytics Event Collector. For more information, see the section "Registering an Analytics Collector for Your Application" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

> **Note:** While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.2.3 Adding the Activity Graph Service at Design Time

This section provides descriptions of the Activity Graph service task flows and steps you through the addition of the Activity Graph service to your application. It includes the following subsections:

- Section 46.2.3.1, "Activity Graph Service Task Flows"
- Section 46.2.3.2, "How to Add Activity Graph Service Task Flows to a Page"
- Section 46.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters"
- Section 46.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters"

46.2.3.1 Activity Graph Service Task Flows

This section describes and illustrates the task flows available through the Activity Graph service.

Table 46–4 lists the task flows provided by the Activity Graph service.

Table 46–4 Activity Graph Service Task Flows

Task Flow	Description
Recommended Connections	This task flow enables viewing and connecting to users whom the Activity Graph engine has calculated to be similar to the current user. For more information, see Section 46.2.3.1.1, "The Recommended Connections Task Flow."
Similar Spaces	This task flow enables viewing and interacting with spaces that the Activity Graph engine has calculated to be potentially of interest to the current user. For more information, see Section 46.2.3.1.2, "The Similar Spaces Task Flow."
Similar Items	This task flow enables viewing and interacting with the WebCenter Portal items that the Activity Graph engine has calculated to be potentially of interest to the current user. For more information, see Section 46.2.3.1.3, "The Similar Items Task Flow."

46.2.3.1.1 The Recommended Connections Task Flow

The Recommended Connections task flow enables viewing and connecting to users who have been calculated to be similar to the current user.

The Recommended Connections task flow is available by default on each user's Profile page.

For information about how to use this task flow at runtime, see the section "Working with the Recommended Connections Task Flow" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 46–5 shows the similarity calculations and their weightings used in the default recipe for the Recommended Connections task flow. You can change this recipe by editing the `similarityURNList` task flow binding parameter. For more information, see Section 46.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters."

Table 46–5 Default Recipe for Recommended Connections

Similarity Calculation	Weight
user-connect	100
user-edit	50
user-like	50
user-comment	10
user-tag	10
user-all	1

The user with the highest overall recommendation score is displayed first in the task flow. For each recommended user, if the highest scoring related similarity calculation has an associated reason string, that string is displayed underneath the user's name and description to provide details for why the user was recommended.

If no reason string is defined for the top similarity function, nothing is displayed. You can edit the similarity calculation reason strings, or provide additional strings. For more information, see the section "Customizing Reason Strings for Similarity Calculations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.2.3.1.2 The Similar Spaces Task Flow

The Similar Spaces task flow enables viewing and interacting with spaces that have been calculated to be potentially of interest to users of the current space. The suggested spaces are not specific to the current user, however the task flow lists only those spaces that the current user has permission to see.

For information about how to use this task flow at runtime, see the section "Working with the Similar Spaces Task Flow" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 46–6 shows the similarity calculations and their weightings used in the default recipe for the Similar Spaces task flow. You can change this recipe by editing the `similarityURNList` task flow binding parameter. For more information, see Section 46.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters."

Table 46–6 Default Recipe for Similar Spaces

Similarity Calculation	Weight
gs-edit	10
gs-all	1

The space with the highest overall recommendation score is displayed first in the task flow. For each recommended space, if the highest scoring related similarity calculation has an associated reason string, that string is displayed underneath the space's name and description.

If no reason string is defined for the top similarity calculation, nothing is displayed. You can edit the similarity calculation reason strings, or provide additional strings. For more information, see the section "Customizing Reason Strings for Similarity Calculations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.2.3.1.3 The Similar Items Task Flow The Similar Items task flow enables viewing and interacting with the WebCenter Portal items that the Activity Graph engine has calculated to be potentially of interest to users of the currently selected item. The suggested items are not specific to the current user, however the task flow lists only those items that the current user has permission to see.

Items of interest may include a wiki page, a blog post, a document, or a discussion topic.

The Similar Items task flow determines the context for its recommendations based on items selected on other task flows on the page. This information is provided through task flow input parameters (typically using an EL expression) or through the `WebCenterResourceSelected` ADF UI event. The task flows that determine the context of the Similar Items task flow are:

- Documents service task flows:
  - Recent Documents
  - Document List Viewer
  - Document Navigator
  - Document Explorer
  - Folder Viewer
  - Document Manager
  - Document Browser
- Discussions Manager task flow

The Similar Items task flow is included in the Document Explorer Related Items pane for files to show items similar to the currently viewed file. For more information, see the section "Viewing and Adding Tags, Links, and Recommendations to a File" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

For information about how to use this task flow at runtime, see the section "Working with the Similar Items Task Flow" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 46–7 shows the similarity calculations and their weightings used in the default recipe for the Similar Items task flow. You can change this recipe by editing the `similarityURNList` task flow binding parameter. For more information, see Section 46.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters."

Table 46–7 Default Recipe for Similar Items

Similarity Calculation	Weight
item-edit	100

Table 46–7 (Cont.) Default Recipe for Similar Items

Similarity Calculation	Weight
item-like	50
item-comment	20
item-tag	10
item-all	1

The item with the highest overall recommendation score is displayed first in the task flow. For each recommended item, if the highest scoring related similarity calculation has an associated reason string, that string is displayed underneath the item's name and description to provide details for why the item was recommended.

If no reason string is defined for the top similarity function, nothing is displayed. You can edit the similarity calculation reason strings, or provide additional strings. For more information, see the section "Customizing Reason Strings for Similarity Calculations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.2.3.2 How to Add Activity Graph Service Task Flows to a Page

The section describes how to add the Recommended Connections task flow to an application page. The steps provided here are the same for all Activity Graph service task flows.

To add the Recommended Connections task flow to your Framework application:

1. Prepare your application as described in Section 46.1.2, "Requirements for the Activity Graph Service."
2. Open the page on which you want to add the task flow.
3. In the Resource Palette, open **My Catalogs**, then **WebCenter Portal - Services Catalog**, then the **Task Flows** folder.
4. Drag and drop the Recommended Connections task flow (or whichever Activity Graph service task flow you prefer) onto the JSF (`.jspx`) page.
5. Select **Region** from the resulting context menu.

   You may be prompted to add the Activity Graph service ADF library (`activitygraph-service-view.jar`) to the project. Confirm by clicking **Add Library**. This operation may take a moment to complete.
6. In the Edit Task Flow Binding dialog, enter values for the parameters, or accept the defaults.

   For more information, see Section 46.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters."
7. Click **OK**.

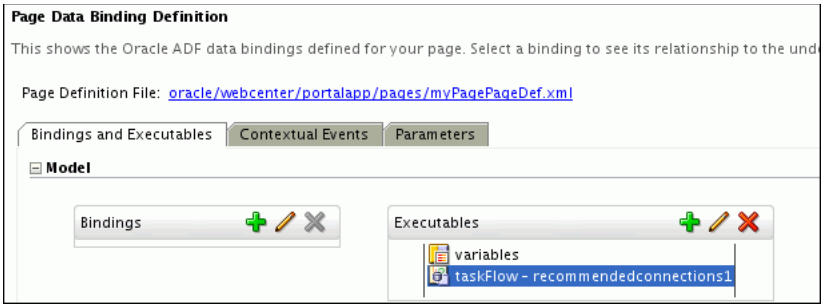
   The task flow is added to the page, and the project's libraries are configured to run the task flow.
8. Save and run your page.

46.2.3.3 How to Modify Activity Graph Service Task Flow Parameters

Each Activity Graph service task flow has a set of required and optional task flow binding parameters. These provide a means of capturing information that is useful to the task flow's successful function.

In addition to providing required values for successful task flow rendering, you can use task flow binding parameters to customize the appearance and behavior of a task flow instance. For example, you can use parameter values to determine whether headers and footers are rendered, the number of rows and columns of information to show, whether to apply a filter to returned data, and the like.

You can provide task flow binding parameter values when you drag and drop a task flow onto an application page. Doing so opens the Task Flow Bindings dialog (for more information, see Section 46.2.3.2, "How to Add Activity Graph Service Task Flows to a Page").



You can also adjust task flow binding parameter values after you have placed a task flow on a page.

To access the Edit Task Flow Binding dialog:

1. Click the **Bindings** tab at the bottom of the page (next to the **Source** tab) to go to the Bindings view.
2. Under **Executables**, you'll see the task flow you added.

   Figure 46–6 shows an example of a Recommended Connections task flow in the Executables section.

Figure 46–6 Recommended Connections in the Page Data Binding Definition

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.
4. In the Edit Task Flow Binding dialog (Figure 46–7), revise the binding parameter values as required (for more information, see Section 46.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters").

Figure 46–7 Edit Task Flow Binding Dialog for Recommended Connections

5. When you are finished, click **OK.**
6. Save and run your page to see the results.

46.2.3.4 Activity Graph Service Task Flows and Task Flow Parameters

Table 46–8 lists and describes task flow binding parameters applicable to the Activity Graph service.

Table 46–8 Activity Graph Service Task Flow Binding Parameters

Parameter	Task Flows	Description
`resourceId`	Recommended Connections Similar Spaces Similar Items	The ID of the person, space, or item to use as a context for recommendations. For connections, the default value is the expression language token for the currently logged in user. For spaces, the default value is the expression language token for the resource ID of the space containing the task flow. For items, the value is derived from the selection event.
`classURN`	Similar Items	The node class of the context. By default the information is derived from the selection event.
`objectName`	Similar Spaces Similar Items	The name of the space or item to use as a context for recommendations. For spaces, the default value is the expression language token for the resource ID of the space containing the task flow. For items, the value is derived from the selection event.

Table 46–8 (Cont.) Activity Graph Service Task Flow Binding Parameters

Parameter	Task Flows	Description
`recipe`	Recommended Connections Similar Spaces Similar Items	A comma separated list of registered similarity calculation = weight pairs. The list determines what recommendations appear and how they are ordered. The default recipes for each task flow are listed in Section 46.2.3.1, "Activity Graph Service Task Flows."
`classURNRestrictions`	Similar Items	A comma separated list of the node classes of objects to exclude from the recommendations. By default this is empty, meaning that there are no restrictions on which classes of objects may be returned.
`excludeObjectActions`	Recommended Connections Similar Spaces Similar Items	A comma separated list of registered actions. The task flow will not show people, spaces, or items on which the logged in user took any of the listed actions. For example, the default value for the Similar Items task flow is create, edit, comment, tag, meaning that users are not recommended items which they themselves created, edited, commented on, or tagged. The WebCenter Portal default actions are listed in Table 46–1.
`serviceId`	Similar Items	Used in conjunction with `resourceId`, and optionally `resourceType`, as an alternative to `classURN` for identifying the node class of an object.
`resourceType`	Similar Items	Used in conjunction with `resourceId` and `serviceId`, as an alternative to `classURN` for identifying the node class of a WebCenter Portal object. For example `resourceType` is used by the Documents service to identify whether an object is a wiki, blog, or document.
`suppressPopup`	Similar Items	Determines whether links in the task flow launch content in inline popups (`false`) or in browser windows (`true`). The default value is `false`.

46.3 Advanced Information for the Activity Graph Service

This section describes advanced features available with the Activity Graph service. It includes the following subsections:

- Section 46.3.1, "Using the Activity Graph Data Control"

- Section 46.3.2, "Using the Activity Graph Service REST APIs"

46.3.1 Using the Activity Graph Data Control

The Activity Graph service provides a data control that enables you to create your own user interface (task flows) for the service.

The Activity Graph data control exposes two methods to query Activity Graph for suggestions of similar items and similar users, and one method to record items the user is not interested in.

- `getSimilarObjects`—Returns a list of `SuggestionWrappers` for a given source and similarity calculation, with choices for complex similarity calculation recipes and filtering of node classes and actions.
- `recordNotInterested`—Records that the user is not interested in a given object.

> **Note:** For convenience, the `getSimilarObjects` method takes string arguments instead of the list and map arguments used at the lower levels of the APIs, since that is typically how you would configure them as task flow input parameters.

Typically, there are three things that you need to bind your data control to a method: a `MethodAction`, a `MethodIterator` to iterate through the results of the method, and a `Tree` to pick attributes of the resulting data structure. You can create these manually in a page definition file, or more easily, use the wizards that JDeveloper provides.

To add the Activity Graph data control to your project:

1. Add the **RecommendationDataControl** to your project (either by selecting it in the catalog, right-clicking and choosing **Add to Project** or by dragging and dropping it onto a JSP page (`.jspx`) in your project).
2. Drag an ADF Table to a JSP page.
3. When prompted, check the **bind to datasource** checkbox.
4. Navigate to the **RecommendationDataControl** and select the SuggestionWrapper result from the API method you desire. This will automatically create a method action binding and an iterator to the resultant collection.
5. Select the nodes that you want to expose. This will automatically create a Tree to access values in the suggestion.
6. Configure the parameters for the method action, typically these will be expressions that you would have defined as pageFlowScope variables.
   - `classURN`—The URN of the node class of the source for the recommendation.
   - `objectURN`—The URN of the source for the recommendation.
   - `userCredentialClass`—if null, the WebCenter Portal user type is used.
   - `recipe`—a comma separated list of similarity calculations to be used and their associated weights. For example:
     - For a Similar Items task flow:

       ```
       item-edit=100,item-like=50,item-comment=20,item-tag=10,item-all=1
       ```

     - For a Recommended Connections task flow:

```
user-connect=100,user-edit=50,user-like=50,user-comment=10,user-tag=10,
user-all=1
```

– For a Similar Spaces task flow:

```
gs-edit=10,gs-all=1
```

- `classURNRestrictionList`—a comma separated list of classes to filter the results.
- `excludeObjectActionList`—a comma separated list of action URNs to use to filter the results.
- maxResults—the maximum number of recommendations to return

46.3.2 Using the Activity Graph Service REST APIs

WebCenter Portal provides REST APIs to support the Activity Graph service. Use the Activity Graph service REST APIs to create your own interface for providing recommendations for connections, spaces, and items.

This section describes the REST APIs associated with the Activity Graph service. It includes the following subsections:

- Section 46.3.2.1, "Activity Graph Entry Point"
- Section 46.3.2.2, "Activity Graph Resource Type Taxonomy"
- Section 46.3.2.3, "Security Considerations"
- Section 46.3.2.4, "Activity Graph Resource Types"

For an introduction to the REST APIs, see Chapter 54, "Using Oracle WebCenter Portal REST APIs."

46.3.2.1 Activity Graph Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. For the Activity Graph service there are two entry points: one for recommendations and one for items. To find the entry points for the Activity Graph service, find the link element with one of the following `resourceTypes`:

```
urn:oracle:webcenter:activitygraph:recommendations
urn:oracle:webcenter:activitygraph:items
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Activity Graph service.

For more information about the Resource Index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

46.3.2.2 Activity Graph Resource Type Taxonomy

When the client has identified the entry point to use, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 46.3.2.2, "Activity Graph Resource Type Taxonomy."

The taxonomy for the Activity Graph service is:

```
urn:oracle:webcenter:activitygraph:recommendations
   urn:oracle:webcenter:activitygraph:recommendations:recommendation
```

```
urn:oracle:webcenter:activitygraph:items
   urn:oracle:webcenter:activitygraph:items:item
```

46.3.2.3 Security Considerations

There are no specific security considerations for this service. For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

46.3.2.4 Activity Graph Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- Section 46.3.2.4.1, "urn:oracle:webcenter:activitygraph:recommendations"
- Section 46.3.2.4.2, "urn:oracle:webcenter:activitygraph:recommendations:recommendation"
- Section 46.3.2.4.3, "urn:oracle:webcenter:activitygraph:items"
- Section 46.3.2.4.4, "urn:oracle:webcenter:activitygraph:items:item"

46.3.2.4.1 urn:oracle:webcenter:activitygraph:recommendations Use this resource to identify the URI to use to retrieve (`GET`) recommended connections, spaces, or items based on their similarity to the specified object. The response from a `GET` operation includes each object in the requested list, and each object includes links used to operate on that object.

Nodes in the activity graph are identified by a combination of node class URN and object URN.

For example, to identify the user, monty, you can specify:

- `classURN=WC.user`
- `objectURN=monty`

The nodes provided out of the box are all WebCenter Portal resources (users, documents, spaces, and so on) and so have WebCenter Portal service and resource IDs. The Activity Graph REST APIs provide another way for you to identify these out of the box nodes using the `serviceId` and `objectURN` (which contains the resource ID).

For example, to identify the user, monty, you can specify:

- `serviceId=oracle.webcenter.people`
- `objectURN=monty`

If a service's objects are further classified by resource type, for example, the Documents service, you must also specify the resource type.

For example, to identify a particular document, you can specify:

- `serviceId=oracle.webcenter.doclib`
- `resourceType=document`
- `objectURN=document1`

Any new node classes that are created (that is, non-native WebCenter Portal objects) should be identified using node class and object URNs.

Navigation Paths to recommendations

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
   recommendations
```

Supported Methods for recommendations

The following methods are supported by this resource:

- GET
  - **request - Parameters:** `startIndex`, `itemsPerPage`, `utoken`

    For information about these common parameters, see "Common Request Query Parameters".

    The following additional parameters are available:

    * `classURN`—the node class URN that identifies the type of the object for which you are requesting recommendations. For example `WC.user`, `WC.group-space`.
    * `objectURN`—the object URN that provides a unique identifier for the object for which you are requesting recommendations. For example `monty`, `1000`.
    * `recipe`—a semicolon-separated list of similarity URNs and optional associated weights (indicated by a colon) that is used to determine which objects to recommend. For example, `gs-edit:10;gs-all:1`
    * `classURNRestrictions`—a comma-separated list of types of objects, identified by node class URN, to exclude from the recommendations
    * `excludeObjectActions`—a comma-separated list of actions, identified by action URN, used to exclude objects from the recommendations if the current user has performed that action on the object. For example, if the client is retrieving recommended spaces, the `gs-edit` action could be specified to exclude spaces that the current user has edited (since the user already knows about those spaces).
    * `serviceId`—the WebCenter Portal service ID that identifies the type of object for which you are requesting recommendations (you can use this instead of `classURN` for out of the box objects).
    * `resourceType`—The WebCenter Portal resource type of the object for which you are requesting recommendations, used in combination with `serviceId` if necessary.
    * `userCredentialClassURN`—the node class URN of the user exercising the REST API. The default value is `WC.user`. If you are integrating the Activity Graph engine with another application, this may need to be a different node class.
  - **response - body:** 0 or more recommendations

For more information, see Section 54.5.2.5, "Templates."

Resource Types Linked to from recommendations

Table 46–9 lists the resource types that the client can link to from this resource.

Table 46–9 Related Resource Types for recommendations

rel	resourceType
self	urn:oracle:webcenter:activitygraph:recommendations

46.3.2.4.2 urn:oracle:webcenter:activitygraph:recommendations:recommendation The recommendation response contains the recommended objects and the URIs for use in accessing those objects.

Navigation Paths to recommendation

This section shows how the client can navigate through the hypermedia to access the recommendation resource:

```
resourceIndex
   recommendations
      recommendation
```

Read-only Elements for recommendation

Table 46–10 lists the read-only elements for the recommendations resource.

Table 46–10 Read-only Elements for recommendation

Element	Type	Description
score	Float	The overall score of this recommendation relative to the other recommendations in the list. This is the weighted sum of the component scores associated with each of the similarity URNs that comprise the recipe and is a floating point number between 0 and 1.
item	urn:oracle:webcenter:activitygraph:items:item	The recommended user, item, or space.
componentScores	A list of `componentScore` elements	A list of the component scores associated with the different similarity URNs in the recipe for the recommendation. A component score may have a reason and a link which can be used to retrieve the common items that the user and the recommended object have interacted with.

46.3.2.4.3 urn:oracle:webcenter:activitygraph:items Use this resource to identify the URI to use to retrieve (`GET`) objects that the source object and recommended object have in common. You can use this to determine the reasons why a particular object was recommended. The response from a `GET` operation includes each item in this collection of items, and each item includes links used to operate on that item.

Navigation Paths to items

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
   items
```

Supported Methods for items

The following methods are supported by this resource:

- `GET`

– **request - Parameters:** `startIndex`, `itemsPerPage`, `utoken`

  For information about these common parameters, see "Common Request Query Parameters".

  The following additional parameters are available:

  * `similarityURN`—the URN of the similarity calculation to be used determine which objects are similar to the recommended object. For example `item-tag`, `gs-edit`, `user-connect`
  * `srcClassURN`—the node class URN that identifies the type of the object that was used to request the recommendations. For example `WC.user`, `WC.group-space`.
  * `srcObjectURN`—the URN of the object that was used to request the recommendations. For example `monty`, `1000`.
  * `trgClassURN`—the node class URN that identifies the type of the recommended object
  * `trgObjectURN`—the object URN that provides a unique identifier for the recommended object
  * `userCredentialClassURN`—the node class URN of the user exercising the REST API. The default value is `WC.user`. If you are integrating the Activity Graph engine with another application, this may need to be a different node class.

– **response - body:** 1 or more items

For more information, see Section 54.5.2.5, "Templates."

Resource Types Linked to from items

Table 46–11 lists the resource types that the client can link to from this resource.

Table 46–11 Related Resource Types for items

rel	resourceType
self	urn:oracle:webcenter:activitygraph:items

46.3.2.4.4 urn:oracle:webcenter:activitygraph:items:item Use this resource type to identify the URI to use to update (`PUT`) a recommendation to indicate user interest in the recommended object.

Navigation Paths to item

This section shows how the client can navigate through the hypermedia to access the item resource:

```
resourceIndex
   recommendations
      recommendation
         item
resourceIndex
   items
      item
```

Supported Methods for item

The following method is supported by this resource type:

- `PUT`

- **Request—Body:** item
- **Response—Body:** item

Writable Elements for item

Table 46–12 lists the writable elements for this resource type.

Table 46–12 Writable Elements for item

Element	Type	Required	Constraints	Description
status	String	Yes	interested not interested	Whether the user is interested in the object

Read-only Elements for item

Table 46–13 lists the read-only elements for this resource type. Not all of these elements are available for all objects.

Table 46–13 Read-only Elements for item

Element	Type	Description
classURN	String	Node class of the object
objectURN	String	Identifier for the object
name	String	Name of the object
description	String	Description of the object
modified	Date	Date on which the object was last updated
modifiedByUser	PersonReference	User information about the user who last updated the object, including GUID, ID, display name, and a link to the profile icon
author	PersonReference	User information about the user who created the object, including GUID, ID, display name, and a link to the profile icon

Resource Types Linked to from item

Table 46–14 lists the resource types that the client can link to from this resource.

Table 46–14 Related Resource Types for item

rel	resourceType
self	urn:oracle:webcenter:activitygraph:items:item
via	`resourceType` of the underlying object

46.4 Extending the Activity Graph Service

Out of the box, Activity Graph includes metadata definitions for mapping WebCenter Portal service event data to WebCenter Portal's Analytics. This metadata is automatically loaded the first time the Activity Graph engines application starts.

You can extend Activity Graph metadata to change how actions are gathered from WebCenter Portal's Analytics by manipulating XML files. The XML files can be exported, edited in a text editor, and then imported.

To update Activity Graph metadata definitions, you must first export them to a local XML file:

- For information about exporting the Activity Graph metadata definitions, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- For information about exporting Analytics mapping metadata definitions, see the section "Exporting Provider Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

After exporting the metadata definitions to an appropriate file, you can then edit the file in an editor of your choice to add your own definitions. When you have made your changes, you must import the metadata file back to the managed server. For information about importing Activity Graph metadata definition files, see the section "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- Section 46.4.1, "Defining Custom Node Classes"
- Section 46.4.2, "Defining Custom Actions"
- Section 46.4.3, "Defining Custom Similarity Calculations"
- Section 46.4.4, "Defining Custom Rank Calculations"
- Section 46.4.5, "Registering Custom Activity Providers"
- Section 46.4.6, "Registering Custom QRPPs"

46.4.1 Defining Custom Node Classes

The Activity Graph metadata provide definitions for the node classes that represent WebCenter Portal objects, such as users, spaces, and documents. For more information and for a list of the default node classes supported by WebCenter Portal, see "Node Classes".

You can define your own node classes, for other WebCenter Portal objects or for objects from other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define a node class for service requests.

To define a custom node class:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new node class. For each custom node class, you must specify:
   - `URN`—An attribute of the `nodeClass` element, this is a string that uniquely identifies the node class
   - `nodeType`—A sub-element that indicates whether objects defined by the node class are items or users. Valid values are `Item` or `User`.

- `numericURNs`—A sub-element that indicates whether or not the URNs of the objects of this class are numeric. This enables you to integrate Activity Graph more efficiently with applications that use numeric IDs. Valid values are `true` or `false`.
- `properties`—A list of name, value pairs. A node class's properties are available at runtime to provide additional metadata about the class. For example, all out-of-the-box WebCenter Portal objects modeled in Activity Graph define properties for `serviceID` and `resourceType`, which are used by the Activity Graph task flows to tailor the display of recommendations based on their service and resource type:

```
<properties>
  <property name="oracle.webcenter.resourceType" value="wiki" />
  <property name="oracle.webcenter.serviceID"
value="oracle.webcenter.doclib" />
</properties>
```

Example 46–1 Node Class Definition

```
<nodeClasses>
  <nodeClass URN="WC.wiki-page">
    <nodeType>Item<nodeType>
    <properties>
      <property name="oracle.webcenter.resourceType" value="wiki" />
      <property name="oracle.webcenter.serviceID" value="oracle.webcenter.doclib"
/>
    </properties>
  </nodeClass>
</nodeClasses>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.4.2 Defining Custom Actions

Activity Graph includes metadata definitions for the actions that occur in Framework applications. For more information, see "Actions".

You can define your own actions, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define new actions for opening a service request, assigning a service request to a customer service representative, and closing a service request.

To define a custom action:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new action. For each custom action, you must specify:
   - `URN`—An attribute of the `action` element, this is a string that uniquely identifies the action

- `actionType`—A sub-element. Valid values are:
  - `Simple`—These actions are useful for counting. They have no other metadata besides the source, the target, and the occurred time. For example, WebCenter Portal comes with a preregistered `view-count` simple action whose associated relation value increases each time the person clicks on the same item, but also decays over time.
  - `Boolean`—These actions are useful when you just want to know whether something has happened or not, but not how many times it has happened. Boolean actions have one additional Boolean as metadata. For example, WebCenter Portal comes with a Boolean `view` action whose associated relation value doesn't increase each time the person clicks on the same item. It just records whether a person has clicked on a specific item or not.
  - `Non-negative Integer`—Actions that have one additional integer as metadata, where the integer cannot be negative. Rating (assigning a number of stars) is the typical example.
  - `Integer`—Actions that have one additional integer as metadata. This can be used for ratings that allow negative values.
- `symmetric`—A sub-element that indicates whether the source and target of the action are interchangeable. An example of a symmetric action is the `connect` action, which occurs when two users connect in the People Connections service. Valid values are `true` or `false`.
- `sourceType`—A sub-element that identifies the type of object that performs the action. Valid values are `User` or `Item`.
- `targetType`—A sub-element that identifies the type of object on which the action is performed. Valid values are `User` or `Item`.
- `relationType`—A sub-element. Valid values are `Sum` or `LastAssigned`. `Sum` actions increment each time they occur, for example the `edit-count` action. `LastAssigned` actions keep whatever value was passed in the most recent occurrence of the action. Non-counting simple actions like `create` and `edit` are `LastAssigned`. An example of a `LastAssigned Integer` action would be a rating action.
- `relationDecayPeriod`—(Optional) A sub-element that identifies the amount of time, in days, after which the action starts to lose (or decay) value. When computing the relation value, the value of each action is multiplied by the decay factor every decay period following the occurrence of the action.
- `relationDecayFactor`—(Optional) A sub-element that is a floating value between 0 and 1 that determines how much the action's value decreases (or decays) after the decay period. When computing the relation value, the value of each action is multiplied by the decay factor every decay period following the occurrence of the action.

Example 46–2 Action Definition

```
<actions>
  ...
  <action URN="connect">
    <actionType>Boolean</actionType>
    <symmetric>true</symmetric>
    <sourceType>User</sourceType>
    <targetType>User</targetType>
    <relationType>LastAssigned</relationType>
```

```
    <relationIsNonNegative>true</relationIsNonNegative>
  </action>
  ...
  <action URN="edit-count">
    <actionType>Simple</actionType>
    <symmetric>false</symmetric>
    <sourceType>User</sourceType>
    <targetType>Item</targetType>
    <relationType>Sum</relationType>
    <relationDecayPeriod>1</relationDecayPeriod>
    <relationDecayFactor>0.97</relationDecayFactor>
  </action>
  ...
</actions>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.4.3 Defining Custom Similarity Calculations

Activity Graph includes metadata definitions for the similarity calculations that are used by WebCenter Portal. For more information, see "Similarity Calculations".

You can define your own similarity calculations, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define an `item-assign` similarity calculations for to help recommend other service requests that were assigned to the same person.

To define a custom similarity calculation:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new similarity calculation. For each similarity calculation, you must specify:
   - `URN`—An attribute of the similarityCalculation element that is a string that uniquely identifies the similarity calculation.
   - `similarityFunction`—A sub-element that identifies the function that measures the similarity of items. There is currently only one supported similarity function: `Tanimoto`. This function measures similarity between two items as the ratio of the number of common actions to the total number of actions on those items.
   - `domainClasses`—A sub-element that identifies the node classes for which similarity scores are calculated. These are the targets of the actions represented in the similarity calculation's relation combination.
   - `backgroundClasses`—A sub-element that identifies the node classes that are the sources of the actions in the similarity calculation's relation combination.

- `relationCombination`—A sub-element that defines a new relation by combining one or more registered relations. There are two types of relation combination:
  - `Boolean OR` (used by all WebCenter Portal out-of-the-box similarity calculations) The resulting relation combination has a value of `1` (meaning true) if any of the component relations have a positive value, and `0` (meaning false) otherwise.
  - `Weighted Sum` (used by all WebCenter Portal out-of-the-box rank calculations) The resulting relation combination is a weighted sum of the values for each of its component relations.

  For each component relation, specify:
  - `actionURN`—the URN of the action for the component relation
  - `use inverse`—set to `false` (the default) to use the component relation to calculate similarity directly for the target objects, or `true` to use the component relation to calculate similarity for the source objects rather than the target objects. For example, if the `view` relation has the source object (`user`) viewing a target object (`document`), then to calculate similarity for documents, set `use inverse=false`. To calculate similarity for source objects (users), set `use inverse=true`.
  - `weight`—(for `Weighted Sum` relation combinations) the weight to apply to the component relation represented as a floating-point number

Example 46–3 Similarity Calculation Definition

```
<similarityCalculations>
  <similarityCalculation URN="item-edit">
    <similarityFunction>Tanamoto</similarityFunction>
    <domainClasses>
      <URN>document:wcServiceID=oracle.webcenter.doclib</URN>
      <URN>wiki-page:wcServiceID=oracle.webcenter.wiki</URN>
      <URN>blog:wcServiceID=oracle.webcenter.wiki</URN>
      <URN>topic:wcServiceID=oracle.webcenter.collab.forum</URN>
    </domainClasses>
    <backgroundClasses>
      <URN>user:wcServiceID=oracle.webcenter.people</URN>
    </backgroundClasses>
    <relationCombination type="BOOLEAN_OR">
      <component inverse="false" actionURN="create" />
      <component inverse="false" actionURN="comment" />
      <component inverse="false" actionURN="edit" />
    </relationCombination>
  </similarityCalculation>
</similarityCalculations>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.4.4 Defining Custom Rank Calculations

Activity Graph includes metadata definitions for the rank calculations that are used by the Activity Graph Rank Engine to calculate the importance of nodes in the activity graph. For more information, see the section "Setting Up Activity Rank for Oracle

Secure Enterprise Search" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

You can define your own rank calculations, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal.

To define a custom rank calculation:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new rank calculation. For each rank calculation, you must specify:
   - `URN`—An attribute of the `rankCalculation` element, this is a string that uniquely identifies the rank calculation.
   - `domainClasses`—A sub-element that identifies a list of node classes to which the rank calculation applies.
   - `relationCombination`—A sub-element that defines a new relation by combining one or more registered relations. There are two types of relation combination:
     - `Boolean OR` (used by all WebCenter Portal out-of-the-box similarity calculations) The resulting relation combination has a value of `1` (meaning true) if any of the component relations have a positive value, and `0` (meaning false) otherwise.
     - `Weighted Sum` (used by all WebCenter Portal out-of-the-box rank calculations) The resulting relation combination is a weighted sum of the values for each of its component relations.

     For each component relation, specify:
     - `actionURN`—the URN of the action for the component relation
     - `use inverse`—set to `false` (the default) to use the component relation to calculate similarity directly for the target objects, or `true` to use the component relation to calculate similarity for the source objects rather than the target objects. For example, if the `view` relation has the source object (`user`) viewing a target object (`document`), then to calculate similarity for documents, set `use inverse=false`. To calculate similarity for source objects (users), set `use inverse=true`.
     - `weight`—(for `Weighted Sum` relation combinations) the weight to apply to the component relation represented as a floating-point number
   - `resultAcceptorClass`—A sub-element that identifies the fully qualified class name for the class that implements the `IRankResultAcceptor` interface. This class receives a set of object rankings from the Rank Engine and stores them in a search engine where they can later be used to influence search query ranking. WebCenter Portal includes one rank acceptor out of the box, which will persist ranks to Oracle Secure Enterprise Search.

Example 46–4 Rank Calculation Definition

```
<rankCalculations>
  <rankCalculation URN="activity-rank">
    <domainClasses>
```

```
      <URN>WC.user</URN>
      <URN>WC.document</URN>
      <URN>WC.wiki-page</URN>
      <URN>WC.blog</URN>
    </domainClasses>
    <relationCombination type="WEIGHTED_SUM">
      <component actionURN="connect" weight="10.0" />
      <component actionURN="edit" weight="20.0" inverse="true" />
      <component actionURN="view-count" weight="1.0" />
      <component actionURN="create" weight="100.0" inverse="true" />
      <component actionURN="create" weight="100.0" />
      <component actionURN="edit-count" weight="20.0" />
      <component actionURN="download" weight="5.0" />
      <component actionURN="tag" weight="10.0" />
      <component actionURN="comment" weight="10.0" />
    </relationCombination>
    <resultAcceptorClass>
      oracle.webcenter.activitygraph.providers.rankAcceptors.ses.SesRankResultAcceptor
    </resultAcceptorClass>
  </rankCalculation>
</rankCalculations>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.4.5 Registering Custom Activity Providers

Activity providers are used by the Activity Graph engine during the gathering process to generate activities from recorded occurrences of actions. For example, the Analytics Activity Provider reads actions from the Analytics event tables and uses a registered set of mappings to generate activities. These activities are then used to determine relations, which are used in turn to determine recommendations and search ranks.

If you want to integrate other applications with the Activity Graph engine, you can create your own activity providers to generate activities from those applications.

To make a custom activity provider available to the Activity Graph engine, you must register it by adding an activity provider assignment to the Activity Graph metadata definitions. An activity provider assignment maps the triple of the `action`, `srcClass`, and `trgClass` to the Java class that implements the activity provider.

> **Note:** If more than one triple maps to the same provider class, there must be a provider assignment for each triple. For example, the out-of-the-box metadata declares a number of provider assignments mapping all triples to a single class, `AnalyticsActivityProvider`.

To register a custom activity provider:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new activity provider assignment. For each activity provider assignment, you must specify:

- `action`—An attribute of the `providerAssignment` element, this specifies which action is being mapped to the `providerClass`. Specify one registered action.
- `srcClass`—An attribute of the `providerAssignment` element, this specifies which source class is being mapped to the `providerClass`. Specify one registered node class.
- `trgClass`—An attribute of the `providerAssignment` element, this specifies which target class is being mapped to the `providerClass`. Specify one registered node class.
- `providerClass`—A sub-element that identifies the fully qualified name of the Java class that implements the activity provider for the specified action, source class, and target class triple.

Example 46–5 Activity Provider Assignment Definition

```
<providerAssignments>
  <providerAssignment action="connect" srcClass="WC.user" trgClass="WC.user">
    <providerClass>
     oracle.webcenter.activitygraph.providers.activityProviders.analytics.AnalyticsActivityProvider
    </providerClass>
  </providerAssignment>
</providerAssignments>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.4.6 Registering Custom QRPPs

WebCenter Portal provides several QRPPs to filter recommendation results. For more information, see "Query Result Post-Processors (QRPPs)".

You can create your own QRPPs to further filter recommendation results or to provide display metadata for recommendations when you are integrating the Activity Graph engine with other applications. To make a QRPP available to the Activity Graph engine, you must register it by adding a QRPP registration to the Activity Graph metadata definitions.

To register a custom QRPP:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to register the new QRPP. For each QRPP, you must specify:
   - `URN`—An attribute of the `QRPP` element, this is a string that uniquely identifies the QRPP.
   - `priority`—An attribute of the `QRPP` element, this is an integer indicating the order in which the QRPP should be run in relation to the other registered QRPPs.
   - `description`—A sub-element that provides a brief description of what the QRPP does.

- `providerClass`—A sub-element that identifies the fully qualified name of the Java class that implements the QRPP.

Example 46–6 QRPP Definition

```
<QRPPs>
  <QRPP priority="1" URN="WebCenter Portal Security QRPP">
    <description>
      Uses the WebCenter Portal Resource Authorizer to perform security filtering.
    </description>
    <providerClass>
      oracle.webcenter.activitygraph.providers.qrpps.security.WCSecurityQueryResultPostProcessor
    </providerClass>
  </QRPP>
</QRPPs>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

46.5 Troubleshooting the Activity Graph Service

This section provides information to assist you in troubleshooting problems you may encounter while using the Activity Graph service.

The following troubleshooting solutions assume that:

- The Activity Graph engine is deployed correctly
- The `WC_Utilities` managed server is up and running
- The property `openusage enabled` is `true`

46.5.1 Troubleshooting the Activity Graph Service Task Flows (All Task Flows)

Problem

Recommendations are not shown in the task flows even after valid user activity.

Solution

Check whether the events are being captured by the Analytics Event Collector. You can verify this by checking the collector logs. If the logs do not show the events being captured, the problem is with the Analytics Event Collector.

For more information, see the section "Validating Analytic Event Collection" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Problem

The Analytics Event Collector logs show that events are being captured but recommendations are not shown in the task flows.

Solution

Check the last run time of the Activity Graph engine on the Activity Graph Schedule and Status Page. You may need to adjust the schedule or launch an immediate run in order to gather and analyze recent events.

Problem

The Activity Graph engine has run successfully recently, but recommendations are not shown in the task flows.

Solution

Verify the relation tables in the Activities database (`ActivitiesDS`) for the presence of any data. If the Activity Graph engines are working correctly, these relation tables should have some data in them. If data is present in the tables and there are still no recommendations in the task flows, then the task flows might be broken.

46.5.2 Troubleshooting the Recommended Connections Task Flow

Problem

Some users are not shown as recommended connections in spite of valid user interactions.

Solution

This might happen if WebCenter Portal: Spaces and the services are not wired with the same OID. In this case, users who are not present in the OID to which the services are wired will not be suggested recommendation connections. The same users should be present in both the OIDs, or the WebCenter Portal: Spaces and services should be wired to the same OID.

46.5.3 Troubleshooting the Similar Spaces Task Flow

Problem

A space is not suggested in the Similar Spaces task flow even after a successful user interaction.

Solution

Check to see that the logged in user has permissions to access the space by finding the space in the Browse Spaces task flow.

46.5.4 Troubleshooting the Similar Items Task Flow

For recommended items to be displayed in the Similar Items task flow, the item for which the recommended items are to be displayed should be selected in another task flow on the page (for example, the Document Manager task flow).

Problem

An item is not suggested in the Similar Items task flow even after valid user interaction.

Solution

This could be because the current user does not have view privileges on the item. This is the correct behavior. Users should not see recommendations for items on which they do not have sufficient privileges. If the user should be able to see the item, grant the user sufficient privileges.

Problem

Specific types of items are not being displayed (for example, documents, wikis, and blogs are seen in the task flow, but not discussions).

Solution

Check the status of the specific service. If the service is unavailable items from that service will not be displayed in the Similar Items task flow.

Problem

Items are suggested only for some users; other users do not get any suggested items in the Similar Items task flow.

Solution

This might happen if WebCenter Portal: Spaces and the services are not wired with the same OID. In this case, users who not present in the OID to which the services are wired will not see suggested items from that service. The same users should be present in both the OIDs, or the WebCenter Portal: Spaces and services should be wired to the same OID.

Part VIII

Helping Users Keep Track

Part VIII contains the following chapters:

- Chapter 47, "Integrating the Analytics Service"
- Chapter 48, "Integrating the Lists Service"
- Chapter 49, "Integrating Notifications"
- Chapter 50, "Integrating the Recent Activities Service"
- Chapter 51, "Integrating the Worklist Service"
- Chapter 52, "Integrating the Events Service"
- Chapter 53, "Integrating the RSS Service"

47

Integrating the Analytics Service

The Analytics service enables you to display usage and performance metrics for Framework applications. This chapter describes how to integrate the Analytics service into applications built using Oracle WebCenter Portal: Framework.

This chapter includes the following sections:

- Section 47.1, "Introduction to the Analytics Service"
- Section 47.2, "Basic Configuration for the Analytics Service"
- Section 47.3, "Building Analytics Reports"

For information about using any of the analytics task flows, see Chapter "Working with the Analytics Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

For a detailed list of database tables and parameters, see Appendix I, "WebCenter Portal Analytics Database Schema."

47.1 Introduction to the Analytics Service

The Analytics service offers real-time usage and activity reporting for your portal. This section provides an overview of the Analytics service, its task flows, and its usages. It includes the following subsections:

- Section 47.1.1, "Understanding the Analytics Service"
- Section 47.1.2, "Requirements for the Analytics Service"
- Section 47.1.3, "What Happens at Runtime"

47.1.1 Understanding the Analytics Service

The Analytics service allows administrators and users to track and analyze traffic and usage in WebCenter Portal application. The Analytics service provides the following basic functionality:

- **Usage Tracking Metrics**: The Analytics service collects and reports metrics for common portal functions, including community, page, portlet, and document hits.
- **Behavior Tracking**: The Analytics service can be used to analyze WebCenter Portal metrics to determine usage patterns, such as page visit duration and usage over time.
- **User Profile Correlation**: The Analytics service can be used to correlate metric information with user profile information. Usage tracking reports can be viewed and filtered by user profile data such as country, company or title.

- **Custom Reporting:** Developers and business users can build custom reports that query the analytics data. For more details, see Section 47.3.1, "Using SQL Data Controls".

Table 47–1 lists the analytics task flows available with WebCenter Portal. These task flows work similarly for Spaces and Framework applications. For detailed information about these task flows and how to use them, see "Understanding Analytics Task Flows in Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 47–1 Analytics Task Flows Available in JDeveloper

Task Flows	Description
WebCenter Portal Traffic	A summarized view for common events within the portal.
Page Traffic	Displays the number of page hits and the number of unique users that visited any page within the portal.
Login Metrics	Reports portal logins.
Portlet Traffic	Displays usage data for a portlet.
Portlet Response Time	Displays performance data for a portlet.
Portlet Instance Traffic	Displays usage data for a portlet instance*.
Portlet Instance Response Time	Displays performance data for a portlet instance*.
Search Metrics	Tracks portal searches.
Document Metrics	Tracks document views.
Wiki Metrics	Tracks most popular/least popular wikis.
Blog Metrics	Tracks most popular/least popular blogs.
Discussion Metrics	Tracks most popular/least popular discussions.

* If the same portlet is displayed on several different pages, each placement is known as a portlet instance.

47.1.2 Requirements for the Analytics Service

The Analytics service requires that the *analytics schema* (`ACTIVITIES`) is installed and up and running. In addition, Oracle WebCenter Portal's *Analytics Collector* must be up and running on the `WC_Utilities` managed server. For detailed installation instructions, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

On install, the Analytics Collector is configured to receive events out-of-the-box, using installation defaults. If the default values are not suitable for your installation or you want to deploy Analytics Collectors in a cluster, you may need to configure different values using WLST or Fusion Middleware Control. For more details, see "Configuring Analytics Collector Settings" *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To display usage and performance metrics through analytics task flows you must enable event generation for your Framework application and configure a connection to the analytics database (`ACTIVITIES`). For details on how to do this in JDeveloper, see Section 47.2.2, "Setting up Connections for the Analytics Service".

47.1.3 What Happens at Runtime

At runtime, user activity in your Framework application generates event data. For example, every time a user logins in, reads a discussion topic, views a document, and

so on, the event is recorded. The OpenUsage API sends event metrics to the Analytics Collector using UDP (User Datagram Protocol) and the event data is stored in the analytics database (ACTIVITIES).

In a non-clustered environment the Framework application is configured with the location of the collector, and all events are transmitted to that location.

In a clustered environment both the Framework application and Analytics Collector are configured with a cluster-specific channel name. Each collector periodically broadcasts a heartbeat with its location to the cluster-specific channel. The Framework application listens to the channel for these collector heartbeats, and when it hears one, adds the collector to its list of known collectors. When the Framework application sends an event it randomly selects a collector from its list and sends the event to that collector. If a collector stops (either being stopped purposefully or failing) it stops broadcasting a heartbeat. When the Framework application stops hearing the heartbeat it removes the collector from its list and stops sending events to that collector. If the Framework application does not hear any collector heartbeats it does not send any events.

Analytics task flows and custom analytics reports (based on SQL data controls) that are included in Framework applications display the metrics collected for standard events by querying the analytics database at runtime. For more information about the task flows at runtime, see "Working with Analytics Task Flows" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

47.2 Basic Configuration for the Analytics Service

This section describes how to include the Analytics service in your Framework applications.

This section contains the following subsections:

- Section 47.2.1, "Configuration Roadmap for the Analytics Service"
- Section 47.2.2, "Setting up Connections for the Analytics Service"
- Section 47.2.3, "Adding Analytics Event Code to Your Application"
- Section 47.2.4, "Configuring a Namespace for Analytics Customizations in MDS"
- Section 47.2.5, "Adding Analytics Task Flows at Design Time"
- Section 47.2.6, "Setting up Security for Analytics Task Flows and Usage Data"

See also, Section 47.1.2, "Requirements for the Analytics Service".

47.2.1 Configuration Roadmap for the Analytics Service

The flow chart depicted in Figure 47–1 and Table 47–2 in this section provide an overview of the prerequisites and tasks required to get the Analytics service working in Framework applications.

Figure 47–1 Configuring the Analytics Service for Framework applications

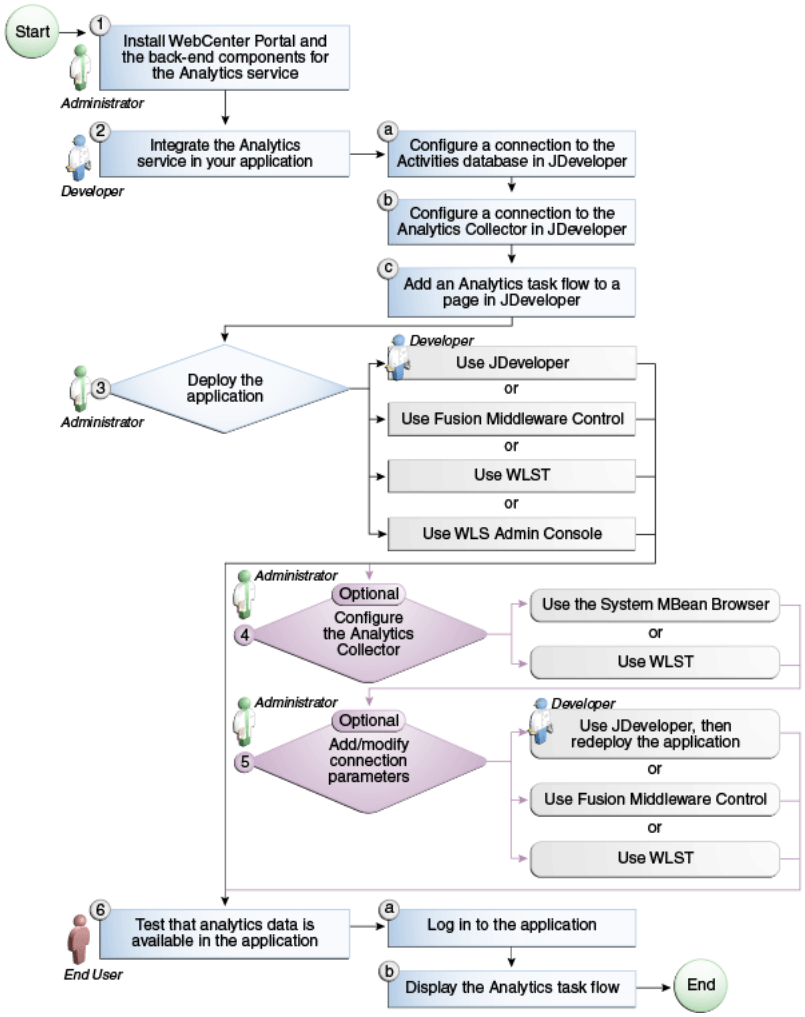


Table 47–2 Configuring the Analytics Service for Framework applications

Actor	Task	Sub-task
Administrator	**1.** Install Oracle WebCenter Portal: Framework and the back-end components for the Analytics service	
Developer	**2.** Integrate the Analytics service in your Framework application	**2.a** Configure a connection to the Activities database in JDeveloper **2.b** Configure a connection to the Analytics Collector in JDeveloper **2.c** Add an analytics task flow to a page in JDeveloper

Table 47–2 (Cont.) Configuring the Analytics Service for Framework applications

Actor	Task	Sub-task
Developer/ Administrator	**3.** Deploy the Framework application using one of the following tools: ■ JDeveloper (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator) ■ WLS Admin Console (Administrator)	
Administrator	**4.** (Optional) Configure the Analytics Collector using either of the following tools: ■ System MBean Browser ■ WLST	
Developer	**5.** (Optional) Instrument events for pages and portlets using JDeveloper, then redeploy the application.	
Developer/ Administrator	**6.** (Optional) Add/modify connection parameters using one of the following tools: ■ JDeveloper, then redeploy the application (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator)	
End User	**7.** Test that analytics data is available in the Framework application	**6.a** Log in to the Framework application **6.b** Display the analytics task flow

47.2.2 Setting up Connections for the Analytics Service

The Analytics service requires that the Framework application is connected to the analytics database (`ACTIVITIES`). You must also configure the Framework application to send event information to a specific Analytics Collector.

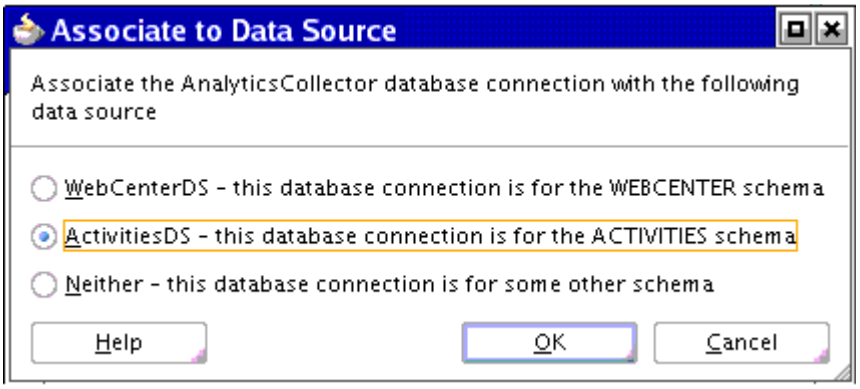
> **Note:** While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Fusion Middleware Control. For more information, see "Managing the Analytics Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- Section 47.2.2.1, "How to Set Up a Connection to the Analytics Database"
- Section 47.2.2.2, "How to Set Analytics Collector Properties"
- Section 47.2.2.3, "How to Set Up a Connection to the Analytics Collector"

47.2.2.1 How to Set Up a Connection to the Analytics Database

The Analytics service requires a connection to the analytics database (`ACTIVITIES`) where analytics event data is stored.



To set up the analytics database connection:

1. Ensure that the `ACTIVITIES` database is up and running.

   See Section 47.1.2, "Requirements for the Analytics Service".

2. In the Application Navigator, expand the Applications Resources panel.
3. Right-click **Connections**, then choose **New Connection**, and then **Database**.
4. In the Create Database Connection dialog, enter the following information for the database connection:
   - **Connection Name:** *`connectionName`* (for example, `myAnalyticsDatabaseConnection`
   - **Connection Type:** `Oracle (JDBC)`
   - **Username:** *`username`* (a user with access to the database)
   - **Password:** *`password`* (the specified user's password)
   - **Host Name:** *`host`* (where the analytics database is installed, for example `localhost`)
   - **JDBC Port:** *`port`* (for example, `1521`)
   - **SID:** *`sid`* (system identifier for the database)
5. Click **Test Connection**, and if it is successful, then click **OK**.
6. In the Associate to Data Source dialog, choose **ActivitiesDS** (Figure 47–2).

Figure 47–2 Connecting to the Analytics Database

   This creates a data-source to the `ACTIVITIES` schema so that you can test analytics in your Framework application at design-time.

7. Click **OK**.

   The connection appears as a node in the Application Resources pane, under Connections.

47.2.2.2 How to Set Analytics Collector Properties

Out-of-the-box, the Analytics Collector is installed on the `WC_Utilities` managed server and is configured to receive events using the following default values:

Analytics Collector Configuration	Default Value
Collector Host Name	`localhost`
Default Port	`31314`
Maximum Port Number	`31314`
Broadcast Type	`Multicast`
Clustering	`Disabled`
Cluster Name	- `null`
Cluster Broadcast Frequency	- `10 seconds`

If these defaults are not suitable for your installation, your administrator can configure suitable values using WLST or the Fusion Middleware Control. For more information, see "Configuring Analytics Collector Settings" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

47.2.2.3 How to Set Up a Connection to the Analytics Collector

The Analytics service requires a connection to the Analytics Collector that is collecting WebCenter Portal events and OpenUsage must be enabled in the Framework application.

Use the following OpenUsage JVM properties to set properties for the Analytics service:

- `oracle.wc.openusage.`**`enabled`** - Specifies whether to send analytics events raised using OpenUsage APIs to the Analytics Collector. Valid values are `true` and `false`. The default value is `false`.
- `oracle.wc.openusage.`**`unicast`** - Specifies whether events are sent to a clustered Analytics Collector in multicast mode or whether a single Analytics Collector using unicast communication is required. Valid values are `true` and `false`. The default value is `true` (unicast).
- `oracle.wc.openusage.`**`clustername`** - Name of the collector cluster or the host name of an Analytics Collector. Currently, clusters are not supported so specify only the host name here. The default value is `localhost`.
- `oracle.wc.openusage.`**`collectorport`** - Port on which the Analytics Collector listens for events. The default value is `31314`.
- `oracle.wc.openusage.`**`timeout`** Period of time (in seconds) used to determine availability of the collector service in multicast mode. The default value is 30 seconds.

To set Analytics Collector JVM properties:

1. In JDeveloper, choose **Run**, **Active Run Configuration**, and then **Manage Run Configurations** from the main menu.
2. In the Project Properties dialog, select the **Default** run configuration, and then click **Edit**.
3. In the **Launch Settings** section, add the following OpenUsage options to the **Java Options** field as follows:

```
-Doracle.wc.openusage.enabled=true
-Doracle.wc.openusage.clustername=localhost
-Doracle.wc.openusage.collectorport=31314
-Doracle.wc.openusage.unicast=true
```

```
-Doracle.wc.openusage.timeout=30
```

> **Note:** In the current release the `oracle.wc.openusage.unicast` value must be set to `true`. The Analytics Collector cannot be clustered in this release, so multicast is not supported.

Ensure that the values you provide, shown here in bold, match your Analytics Collector installation.

4. Click **OK** to save the default run configuration, and then click **OK** again.

These steps enable OpenUsage in the Integrated WebLogic Server for the current Framework application. If the Integrated WebLogic Server is currently running you must restart it to pick up the new settings. See also, Section 70.2, "Deploying a Framework Application to the Integrated WebLogic Server".

47.2.3 Adding Analytics Event Code to Your Application

Most events are configured out-of-the-box, so no additional coding is required in your application to send events. The only exception is page view events, which require additional code, as described in Section 47.2.3.1, "Including Event Code for Page Views."

47.2.3.1 Including Event Code for Page Views

To send page events, you must add event code to each page. Following is an example using a client JavaScript event on the page which, in turn, calls the Java Analytics API to send the actual event. To implement this example, you add the following code just below the `<af:document>` tag, replacing the `pageName` value with the name of the page for which you are sending events:

```
  <af:resource type="javascript">
       function initPageLoadEvent(event {)
            AdfCustomEvent.queue(event.getSource(),
                 "generatePageEvent",
                 {pageName:"Page and Login Statistics"},
                 true);
            event.cancel();
       }
  </af:resource>
<af:clientListener method="initPageLoadEvent" type="load"/>
<af:serverListener type="generatePageEvent"
                   method="#{AnalyticsInstrumentation.sendPageEvent}"/>
```

The example above generates a client event when the ADF document gets loaded, then the defined server listener actually sends the event. Here is the java bean that sends the event:

```
public void sendPageEvent (ClientEvent event) {
     // Checks whether Analytics events must be sent
     if (!AnalyticsUtil.isSendingEvents())
         return;

     HTTPServletRequest request = (HTTPServletRequest)
FacesContext.getCurrentInstance().getExternalContext().getRequest();
     String requestUser = request.getRemoteUser = request.getRemoteUser();

     //SEND PAGE VIEW EVENT
```

```
     String pageName = (String)event.getParameters().get("pageName");
     if(pageName == null || pageName.isEmpty() || requestUser == null)
        return;

     AnalyticsUtil.sendPageViewEvent(FacesContext.getCurrentInstance().
getViewRoot..getViewId(), //viewID
                                     "PortalApp", //spaceDisplayName
                                     requestUser, //username
                                     0,
                                     pageName,
                                     false,
                                     request);
```

47.2.4 Configuring a Namespace for Analytics Customizations in MDS

Analytics task flows use MDS to store customizations made by the user and these customizations are stored in an MDS namespace specific to analytics. If you want to enable user customizations for analytics task flows in your Framework application, you must configure a namespace for the analytics metadata in `adf-config.xml`.

> **Note:** In addition, each task flow must specify a unique MDS document in which to its store user customizations details. See Section 47.2.5.4, "How to Allow End Users to Customize Analytics Task Flows at Runtime".

To configure a namespace for analytics metadata:

1. Open `adf-config.xml`.

   Use the Application Resources panel to navigate to this file. The file is located in the `Descriptors\ADF META-INF` folder.

2. Under the `<metadata-namespaces>` element, add the following XML fragment:

   ```
   <namespace path="/oracle/webcenter/analytics/scopedMD"
   metadata-store-usage="WebCenterFileMetadataStore"/>
   ```

3. Save the file.

See also, Chapter 23, "Performing Composer-Specific MDS Configurations".

47.2.5 Adding Analytics Task Flows at Design Time

This section describes the Analytics service task flows and how to add analytics task flows to your application. It includes the following subsections:

- Section 47.2.5.1, "Analytics Task Flows"
- Section 47.2.5.2, "How to Add Analytics Task Flows to a Page"
- Section 47.2.5.3, "How to Modify Analytics Task Flow Parameters"
- Section 47.2.5.4, "How to Allow End Users to Customize Analytics Task Flows at Runtime"
- Section 47.2.5.5, "Analytics Task Flows and Task Flow Parameters"

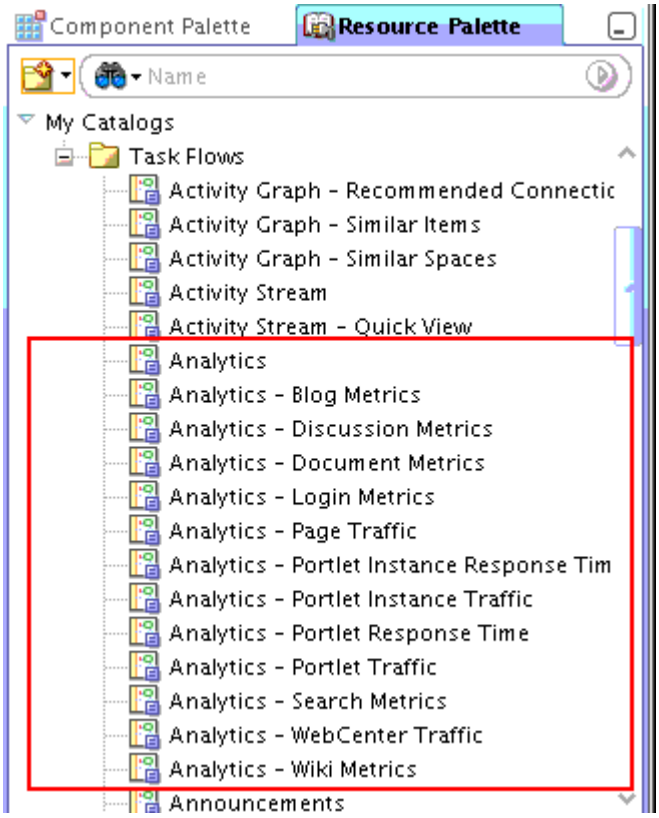
47.2.5.1 Analytics Task Flows

Table 47–3 lists the analytics task flows available with WebCenter Portal. For detailed information about these task flows and the type of information that users can see at runtime, see "Understanding Analytics Task Flows in Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 47–3 Analytics Task Flows Available in JDeveloper

Analytics Task Flows	Description
WebCenter Portal Traffic	A summarized view for common events within the portal.
Page Traffic	Displays the number of page hits and the number of unique users that visited any page within the portal.
Login Metrics	Reports portal logins.
Portlet Traffic	Displays usage data for a portlet.
Portlet Response Time	Displays performance data for a portlet.
Portlet Instance Traffic	Displays usage data for a portlet instance*.
Portlet Instance Response Time	Displays performance data for a portlet instance*.
Search Metrics	Tracks portal searches.
Document Metrics	Tracks document views.
Wiki Metrics	Tracks most popular/least popular wikis.
Blog Metrics	Tracks most popular/least popular blogs.
Discussion Metrics	Tracks most popular/least popular discussions.

47.2.5.2 How to Add Analytics Task Flows to a Page



To add an analytics task flow to your Framework application:

1. Prepare your application as described in Section 47.1.2, "Requirements for the Analytics Service".
2. Ensure that your application includes the services for which analytics event data is available, that is, portlets, discussions, documents, and search.

   Note: If no usage data exists when you run the application, analytics task flows displays the message: `No data to display`

3. Open the JSF page (.jspx) on which you want to add the task flow.
4. In the Resource Palette, open the **WebCenter Portal Services Catalog**, then open the **Task Flows** folder (Figure 47–3).

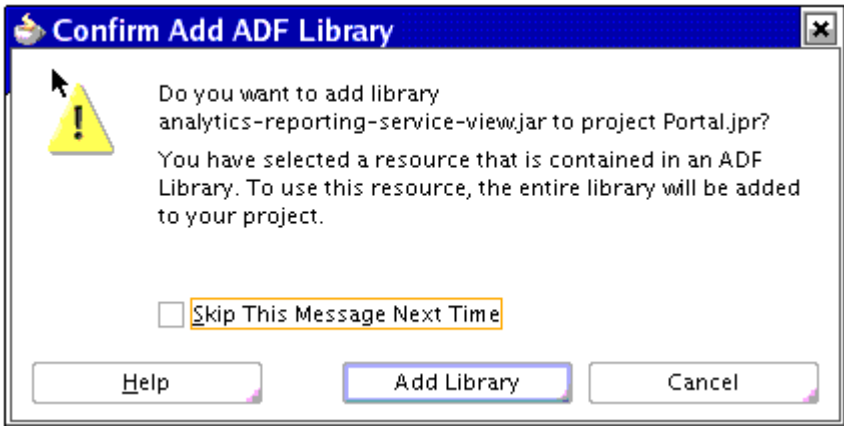


Figure 47–3 Analytics Task Flows Available Through the Resource Palette

5. Drag and drop an **Analytics** task flow onto your page inside the `<af:form>` tag.
6. Choose **Region** from the Create context menu.

   You may be prompted to add the ADF library for the Analytics service (`analytics-reporting-service-view.jar`) to the project. Confirm by clicking **Add Library** (Figure 47–4).

Figure 47–4 Adding the ADF Library for the Analytics Service

7. In the **Edit Task Flow Binding** dialog, enter values for analytics task flow parameters:
   - `applicationName` - Required

- `analyticsResourceId` - Required
- `analyticsReportTitle` - Optional
- `maxDataPointsPerSeries` - Optional

For more information, see Section 47.2.5.5, "Analytics Task Flows and Task Flow Parameters".

8. Click **OK**.

   The task flow is added to the page, and the ViewController project's libraries are configured to run the task flow.

9. Save your project and run the page to see the task flow running in the Framework application.

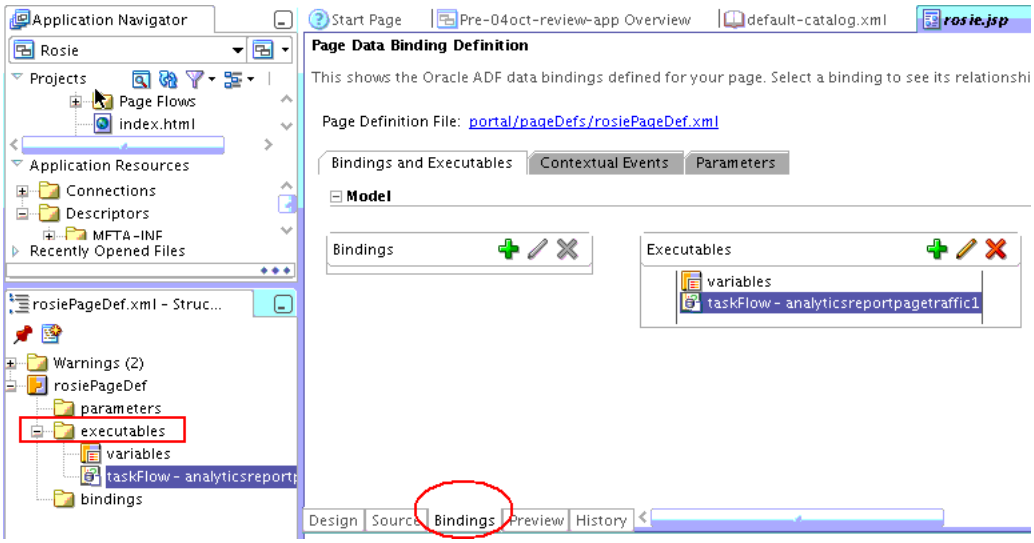
   If no usage data exists when you run the application, analytics task flows display the message: `No data to display`

   You may create some data for the analytics task flow to display by performing actions that relate to the task flow you are testing. For example, to test discussion metrics, create and view discussions, to test page metrics, create and view pages, and so on.

47.2.5.3 How to Modify Analytics Task Flow Parameters

Each analytics task flow has a set of required and optional task flow binding parameters. Required parameters are not mandatory but enable you to capture information that is essential to the task flow's successful function. For example, if you want user customizations for a particular task flow instance to be stored in MDS you must specify the MDS document required.

In addition, you can use task flow binding parameters to customize the appearance and behavior of a task flow instance. For example, you can use parameter values to specify a display title above your analytics data.



You can provide task flow binding parameter values when you drag and drop a task flow onto an application page. Doing so opens the Task Flow Bindings dialog (for more information, see Section 47.2.5.2, "How to Add Analytics Task Flows to a Page").

You can also adjust task flow binding parameter values after you have placed a task flow on a page at run time. For details, see "Setting Analytics Task Flow Properties" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To access the Edit Task Flow Binding dialog:

1. Click the **Bindings** tab at the bottom of the page (next to the **Source** tab) to go to the Bindings view.
2. Under **Executables**, you will see a list of task flows added to the page. Select the analytics task flow (Figure 47–5).

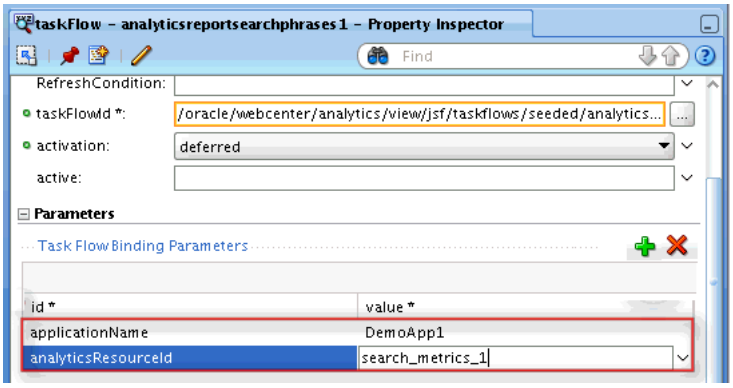


Figure 47–5 Accessing Input Parameters for Analytics Task Flows

3. Next to the Executables heading, click the **Edit selected element** icon (a pencil).
4. In the Edit Task Flow Binding dialog (Figure 47–6), specify the binding parameter values as required

   For more information, see Section 47.2.5.5, "Analytics Task Flows and Task Flow Parameters".

Figure 47–6 Adding Binding Parameters for Analytics Task Flows

5. When you are finished, save the page and run your page to see the results.

47.2.5.4 How to Allow End Users to Customize Analytics Task Flows at Runtime

If you want to enable user customizations for a particular task flow instance you must specify the MDS document where customizations are stored using the `Analytics Resource Id` parameter.

The ID must be unique, so consider using a consistent naming pattern such as `<app_name>_<page_name>_<task_flow>_<sequence>`. For example, set the `analyticsResourceId` parameter for a Page Traffic task flow to `myapp_analyticspage_pagetraffic_1`.

For details, see Section 47.2.5.3, "How to Modify Analytics Task Flow Parameters".

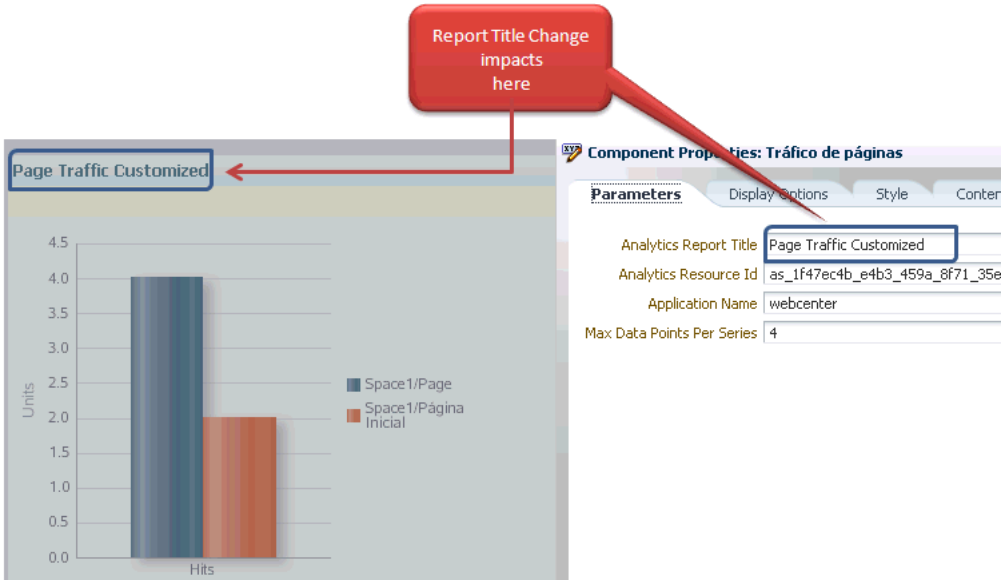
47.2.5.5 Analytics Task Flows and Task Flow Parameters

Table 47–4 lists and describes task flow binding parameters applicable to the Analytics service.

Table 47–4 Analytics Task Flow Binding Parameters

Parameter (* = required)	Task Flows	Description
`analyticsReportTitle`	All	Specifies the display title that appears above the analytics data, that is, you can override the default report title. See also, Figure 47–7, "analyticsReportTitle - Example".
`analyticsResourceId*`	All	Specifies the MDS document that will be generated to store user customizations/application customizations for the task flow instance in MDS. For example: `mymainloginmetrics`
`applicationName*`	All	Specifies the name of the Framework application for which you want to display analytics data. For example: `MyPortalApplication` The analytics database can be used to store event data from multiple applications so this parameter is required to identify which application data to display. If omitted, the task flow display analytics data for all applications.
`maxDataPointsPerSeries`	All	Indicates the maximum number of data points to be displayed in a bar or line chart. Enter a value between 1 and 1000. The default value is 25. Increasing the number of data points can increase the time it takes to display the chart. See also, Figure 47–8, "maxDataPointsPerSeries - Example".

Figure 47–7 analyticsReportTitle - Example



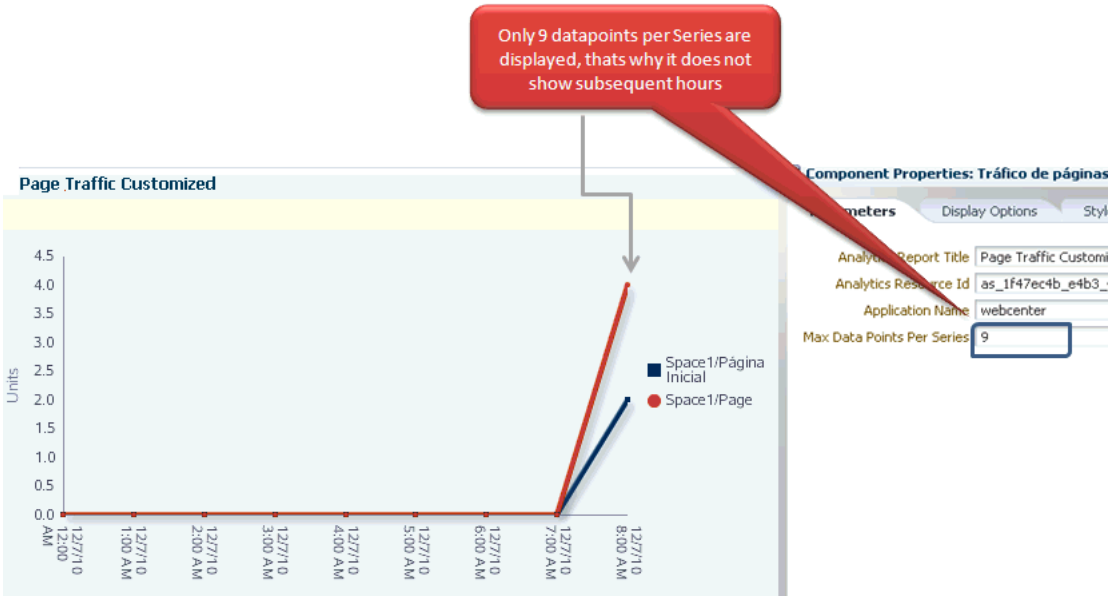


Figure 47–8 maxDataPointsPerSeries - Example

47.2.6 Setting up Security for Analytics Task Flows and Usage Data

Analytics task flows are intended to make usage metrics visible to a limited set of administrative users who perform particular business functions, such as capacity planning, quality of service (QoS) analysis, return on investment (ROI) analysis, "best bet" customization for Search, and so on.

Analytics usage data is valuable for portal analysis but might be regarded as private or sensitive to portal users. For example, the Search, Document, and Portlet reports can be configured to display activity metrics for a particular user, based on user properties such as E-mail Address, First Name, or Last Name.

To protect security and privacy interests associated with analytics task flows and custom reports:

- Manage administrative access to the analytics task flows, custom reports, and any page that displays sensitive usage data.

  To ensure that only a limited number of administrative users can add analytics task flows to pages, create reports based on custom analytics data controls, or view pages set up to display sensitive usage metrics, create a new administrative group and manage group membership accordingly.

- Manage user access to analytics task flows.

  Ensure analytics task flows and custom reports do not contain private or sensitive data unless such a view is particularly intended. If the metrics in the report do contain private or sensitive data, configure security so that only appropriate, specified users have access to the task flow or the page.

  For example, at design-time, developers can expose the analytics task flows to non-admin users by granting them appropriate privileges to the page. In addition, developers can customize the reports pre-deployment, to hide or show and predefine certain report options (such as time frame, chart type, user property filter, group by option, and so on). Administrators will be able to perform the same tasks at runtime, that is, grant page access and customize the information that

displays. Non-admin users can still personalize the reports they are allowed to see, but they cannot change customizations made by the administrator.

- Ensure that unauthenticated users are never allowed to add analytics task flows to pages or see sensitive data.

47.3 Building Analytics Reports

Out-of-the-box analytics task flows present common analytics event metrics in a specific display format. If you want to present analytics data in a different way or display custom event data, you can build a custom analytics report using SQL.

This section contains the following subsections:

- Section 47.3.1, "Using SQL Data Controls"
- Section 47.3.2, "SQL Statements for Out-of-the-Box Analytics Reports"
- Section 47.3.3, "Sample Queries for User Metrics"
- Section 47.3.4, "Sample Analytics Database Queries for Specific Metrics"

For a detailed list of database tables and parameters, see Appendix I, "WebCenter Portal Analytics Database Schema."

47.3.1 Using SQL Data Controls

Use SQL data controls to define, in an SQL query statement, the information you want to retrieve from the analytics database. When you expose data controls on a page you can choose whether the analytics data presents in a graph, table or a form, and you can also configure the bind parameters and other display options.

You can use JDeveloper to build SQL data controls at design-time. For detailed information about data controls, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

You can also create data controls in a running Framework application if runtime resource management features are enabled. To do this in the Spaces application, see "Creating a SQL Data Control" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. To create a data control in other Framework applications, see "Managing Application Resources" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Use a SQL data control to fetch data from the analytics database and display analytics data in your Framework application. Figure 47–9 shows the sample SQL statement below in a Create/Edit SQL Data Control dialog in Spaces. A database connection to the analytics database (`ActivitiesDS`) is required, and you must provide a valid database password.

Sample SQL: Page Hits by Day

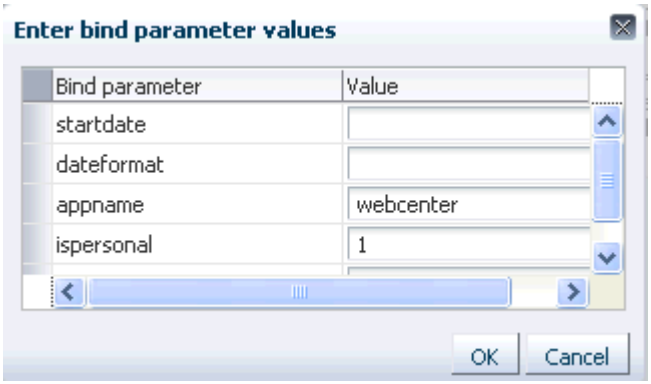
```
SELECT space.name_, page.name_, space.id, page.id, count(1), fact.page_,
page.resourceid_
  FROM  asfact_wc_pagevie_0 fact, asdim_wc_groupsp_0 space, asdim_wc_pages_0 page,
asdim_wc_applica_0 app
  WHERE space.id = fact.groupspace_
    and page.id = fact.page_
    and app.id = fact.application_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
```

```
    and page.personal_ = :ispersonal
    and space.name_ is not null
    and page.name_ is not null
    and space.id is not null
    and page.id is not null
    and fact.page_ is not null
    and page.resourceid_ is not null
GROUP BY space.name_, page.name_, space.id, page.id, fact.page_, page.resourceid_
ORDER BY count(1) desc
```

Figure 47–9 Creating SQL Data Control Dialog in Spaces

You can add as many bind parameters as required. When you add parameters, you can restrict the data retrieved from the data source based on the parameter values you specify. As this example is for the Spaces application, the name of the application is set to `webcenter` and personal pages (pages in the Home space) are included in the report shown in Figure 47–10.

Figure 47–10 Setting Report Parameters



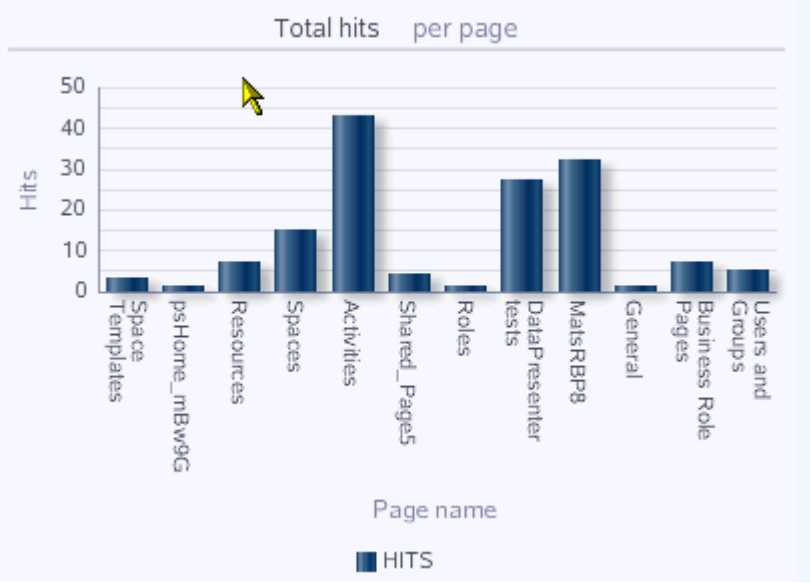


Table 47–5 Report Parameters

Parameter	Default Value	Description
`appname`	`webcenter`	The corresponding application name, always `webcenter` for Spaces. Other Framework application will have a different name.
`ispersonal`	`0 or 1`	For Spaces, determines whether or not pages created in the Home space are included in the report.
`dateformat`	`mm/dd/yyyy hh24`	Any valid pattern for dates in an Oracle database. Every component of the pattern is optional since it depends on the data you want to retrieve.
`startdate`	`01/01/2010`	Determines a start date for the data required.
`enddate`	`01/01/2011`	Determines an end date for the data required.

Figure 47–9 shows the custom report displayed as a graph.

Figure 47–11 Sample Analytics Report - Page Hits by Day

47.3.2 SQL Statements for Out-of-the-Box Analytics Reports

This section provides SQL statements that can be used as a starting point for custom reports. You can customize these statements in many ways by providing additional filters, groupings, and so on.

- Analytics SQL: WebCenter Portal Traffic
- Analytics SQL: Page Traffic
- Analytics SQL: Login Metrics
- Analytics SQL: Space Traffic
- Analytics SQL: Space Response Time
- Analytics SQL: Portlet Traffic
- Analytics SQL: Portlet Instance Traffic

- Analytics SQL: Portlet Response Time
- Analytics SQL: Portlet Instance Response Time
- Analytics SQL: Search Metrics
- Analytics SQL: Document Metrics
- Analytics SQL: Wiki Metrics
- Analytics SQL: Blog Metrics
- Analytics SQL: Discussion Metrics

For a detailed list of database tables and parameters, see Appendix I, "WebCenter Portal Analytics Database Schema."

47.3.2.1 Analytics SQL: WebCenter Portal Traffic

```
SELECT 'Spaces' Name, count(1) Hits
  FROM asfact_wc_groupsp_0 fact, asdim_wc_groupsp_0 space, asdim_wc_applica_0 app
  WHERE space.id = fact.groupspace_
    and app.id = fact.application_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname and space.personal_ = :ispersonal
UNION ALL
  SELECT 'Pages' Name, count(1) Hits
  FROM asfact_wc_pagevie_0 fact , asdim_wc_pages_0 page , asdim_wc_applica_0 app
  WHERE page.id = fact.page_
    and app.id = fact.application_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
    and page.personal_ = :ispersonal
UNION ALL
  SELECT 'Portlets' Name, count(1) Hits
  FROM asfact_wc_portlet_0 fact, asdim_wc_applica_0 app
  WHERE app.id = fact.application_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
UNION ALL
  SELECT 'Logins' Name, count(1) Hits
  FROM asfact_wc_logins_0 fact , asdim_wc_applica_0 app
  WHERE app.id = fact.application_

47.3.3 Sample Queries for User Metrics

This section provides example queries for user-specific metrics. It includes the following samples:

- Sample SQL: Filter by User Property
- Sample SQL: Group by User Property

For a detailed list of database tables and parameters and information on user properties, seeSection I.5, "Analytics User Properties" in Appendix I, "WebCenter Portal Analytics Database Schema.".

47.3.3.1 Sample SQL: Filter by User Property

The following query returns the names of the pages accessed by users in the Sales department, and the number of views for each of those pages.

```
SELECT p.name_ as page, count(*) as views
  FROM asfact_wc_pagevie_0 f
    JOIN asdim_wc_pages_0 p on f.page_ = p.id
    JOIN asdim_userpropertyvalues pv on f.userid = pv.userid
    JOIN asdim_userproperties pr on pv.propertyid = pr.id
  WHERE pr.name = 'DEPARTMENT'
    and pv.value = 'Sales'
GROUP BY p.name_
```

47.3.3.2 Sample SQL: Group by User Property

The following query returns the total number of page views broken down into departments.

```
SELECT pv.value as department, count(*) as views
  FROM asfact_wc_pagevie_0 f
    JOIN asdim_userpropertyvalues pv on f.userid = pv.userid
    JOIN asdim_userproperties pr on pv.propertyid = pr.id
  WHERE pr.name = 'DEPARTMENT'
GROUP BY pv.value
```

47.3.4 Sample Analytics Database Queries for Specific Metrics

This section provides example queries for specific metrics. It includes the following samples:

- Sample SQL: User Activities
- Sample SQL: Space Activities
- Sample SQL: Space Activities for a Specific Time Period
- Sample SQL: Activity for a Service During a Specific Time Period
- Sample SQL: Search Phrases
- Sample SQL: Page Views

For a detailed list of database tables and parameters, see Appendix I, "WebCenter Portal Analytics Database Schema."

47.3.4.1 Sample SQL: User Activities

The following query returns a list of all the activities executed by a specific user during a specific time period.

```
SELECT 'Logins' AS Activity, count(*) AS Events
  FROM asfact_wc_logins_0 f
    JOIN asdim_time t ON f.timeid = t.id
    JOIN asdim_users u ON f.userid = u.id
  WHERE u.userid = 'user1'
    AND f.timeid >= (SELECT id
                     FROM asdim_time
                     WHERE year = 2011
                       AND monthofyear = 0
                       AND dayofmonth = 1
                       AND hourofday = 0)
    AND f.timeid <  (SELECT id
                     FROM asdim_time

user1     240
user2     193
```

47.3.4.5 Sample SQL: Search Phrases

The following query returns the phrases searched during a specific time and lists how many times each search was executed.

```
SELECT s.phrase_ AS "Search Phrase", count(*) AS "Times"
FROM asfact_wc_searche_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
  JOIN asdim_wc_searche_0 s ON f.searched_phrase_ = s.id
WHERE u.userid = 'user1'
  AND f.timeid >= (select id
                   from asdim_time
                   where year = 2011
                     and monthofyear = 0
                     and dayofmonth = 1
                     and hourofday = 0)
    AND f.timeid <  (select id
                   from asdim_time
                   where year = 2011
                     and monthofyear = 1
                     and dayofmonth = 1
                     and hourofday = 0)
GROUP BY u.userid, s.phrase_
ORDER BY count(*) DESC, s.phrase_
```

Sample Report Output

```
Search Phrase      Times
-----------------------
product prices         4
sales report 2011      1
```

47.3.4.6 Sample SQL: Page Views

The following query returns the pages viewed by a specific user during a specific time period.

```
SELECT u.userid AS "User", count(*) AS "Views"
FROM asfact_wc_pagevie_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
  JOIN asdim_wc_pages_0 p ON f.page_ = p.id
  JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ = 'Space 1'
  AND p.name_ = 'Page 1'
  AND f.timeid >= (select id
                   from asdim_time
                   where year = 2011
                     and monthofyear = 0
                     and dayofmonth = 1
                     and hourofday = 0)
  AND f.timeid <  (select id
                   from asdim_time
                   where year = 2011
                     and monthofyear = 1
                     and dayofmonth = 1
                     and hourofday = 0)
```

```
GROUP BY u.userid
ORDER BY count(*) DESC
```

Sample Report Output

```
User    Views
--------------
user3     245
user1     190
user2      65
```

48 Integrating the Lists Service

This chapter provides an overview of the Lists service and describes how to integrate the Lists service with a Framework application. It includes the following sections:

- Section 48.1, "Introduction to the Lists Service"
- Section 48.2, "Basic Configuration for the Lists Service"
- Section 48.3, "Adding Lists to a Resource Catalog"
- Section 48.4, "Using the Lists Service REST APIs"
- Section 48.5, "Troubleshooting the Lists Service"

48.1 Introduction to the Lists Service

This section provides an overview of the Lists service features and requirements. It includes the following subsections:

- Section 48.1.1, "Understanding the Lists Service"
- Section 48.1.2, "What Happens to the Lists Service at Runtime"

48.1.1 Understanding the Lists Service

The Lists service provides a means of creating lists and exposing them for placement on application pages at runtime. At design time, you can make the Lists task flow available in your runtime Resource Catalog. At runtime, users can add the task flow from the Catalog to a page and use the task flow to create lists.

At design time, you can add a code snippet to the Resource Catalog to ensure that populated lists are added to the Catalog at runtime, making them available for placement on your application pages.

By default, only users assigned the seeded role `Administrator` have manage permission on lists. This means at runtime such users can create, edit, and delete lists and edit list data. The default permission can be changed at deployment in `jazn-data.xml` or by using Enterprise Manager or the Application Policy Manager. Authorized users can change this permission at runtime at the component level (for more information, see Chapter 24, "Modifying Default Security Behavior of Composer Components"). Only role-based permission is supported.

48.1.2 What Happens to the Lists Service at Runtime

At runtime, the Lists task flow provides controls for creating lists and adding list data. For information about these controls, see the sections, "Creating and Managing Lists,"

and "Adding and Managing List Data," in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

> **Tip:** To enable users to work with lists at runtime, they must be explicitly permitted to do so. For more information, see Section 48.2.3, "Enabling Users to Work with Lists at Runtime."

48.2 Basic Configuration for the Lists Service

This section describes the steps required for adding the Lists service to your application. It includes the following subsections:

- Section 48.2.1, "Setting Up Connections for the Lists Service"
- Section 48.2.2, "Adding the Lists Service at Design Time"
- Section 48.2.3, "Enabling Users to Work with Lists at Runtime"

48.2.1 Setting Up Connections for the Lists Service

The Lists service requires a connection to the database where the `WEBCENTER`is installed. The Lists service stores all list data in the database. For details about setting up a database connection to the database where the `WEBCENTER` is installed, see Section 7.2.2, "Setting Up a Database Connection."

> **Note:** For details about installing the database and the `WEBCENTER`, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

48.2.2 Adding the Lists Service at Design Time

This section explains a basic integration of the Lists service. It includes the following subsections:

- Section 48.2.2.1, "Lists Service Task Flows"
- Section 48.2.2.2, "How to Add the Lists Service to your Application"

48.2.2.1 Lists Service Task Flows

The Lists service includes one task flow: Lists (Figure 48–1).

Figure 48–1 A List Rendered in the Lists Task Flow

For information about the Lists task flow, see Section 48.1.2, "What Happens to the Lists Service at Runtime."

48.2.2.2 How to Add the Lists Service to your Application

To add the Lists task flow to your Framework application:

1. Follow the steps described in Section 7.2, "Preparing Your Framework Application to Consume Services." to implement security and create a new customizable page in your application.
2. Create a JSF page on which to add the Lists task flow.
3. Configure security on the page.

   See Also: For more information, see Chapter 24, "Modifying Default Security Behavior of Composer Components."

4. In the Resource Palette, open **My Catalogs**, then **WebCenter Portal - Services Catalog**, then the **Task Flows** folder.
5. Drag and drop the **Lists** task flow onto your page, and select **Region** from the context menu.
6. Save and run your page to the browser.

48.2.3 Enabling Users to Work with Lists at Runtime

Out of the box, only the application administrator can work with lists. For users to see and work with lists at runtime, they must explicitly be granted, minimally, the permission `ListPermission:view`. At runtime, application administrators can assign this permission through the Role Manager task flow.

For example, to grant view access to lists to all authenticated users, the administrator can create the role `AllUsers` in the Role Manager task flow, add `authenticated-role` as a member, and grant view access on Lists.

If you plan to add the Lists service to your application, then you must also add the Role Manager task flow. If your application is based on a WebCenter , then the Role Manager task flow is available out of the box on the **Security** tab in **Administration** pages. At runtime, you can navigate to this page using the following URL:

`http://`*`host:port/appcontxtroot`*`/faces/admin`

Note: Roles and permissions created and granted through the Role Manager at design time are not packaged in the application and are not available after deployment. The provisioning steps described in this section must be taken after deployment.

See Also: For information about the Role Manager task flow, see Section 69.4, "Using the Role Manager Task Flow."

48.3 Adding Lists to a Resource Catalog

If properly configured, the Resource Catalog makes populated lists available at runtime, enabling authorized users to add them to pages in edit mode. The procedure for adding components to an existing resource catalog or creating a custom catalog are described in Chapter 16, "Creating and Managing Resource Catalogs." This section provides an example of a code snippet to use to add lists to a resource catalog (Example 48–1).

Note: The values in uppercase are message keys for translated strings.

Example 48–1 Code to Add Lists to a Resource Catalog

```
<customFolder id="groupLists" visible="#{true}"
          factoryClass="oracle.webcenter.list.view.rc.ListServiceContextFactory">
     <attributes>
       <attribute value="LISTS_CUSTOM_FOLDER.TITLE" attributeId="Title"
          isKey="true"/>
       <attribute value="LISTS_CUSTOM_FOLDER.DESCRIPTION"
          attributeId="Description" isKey="true"/>
       <attribute value="LISTS_CUSTOM_FOLDER.KEYWORDS"
          attributeId="Subject" isKey="true"/>
       <attribute value="oracle.webcenter.list"
          attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
       <attribute value="/adf/webcenter/folderlists_qualifier.png"
          attributeId="IconURI"/>
     </attributes>
</customFolder>
```

48.4 Using the Lists Service REST APIs

Oracle WebCenter Portal provides REST APIs to allow access to Lists functionality through interfaces other than the provided task flows. You can use the Lists service REST APIs to perform the following actions:

- Work with lists in a space, such as retrieving a list of lists or adding a new list
- Work with one list, such as retrieving or updating list metadata, or deleting the list
- Work with rows in a list
- Work with a list row, such as retrieving, updating, or deleting the row
- Work with list columns, such as adding a column
- Work with a list column, such as retrieving, updating, or deleting the column

This section describes the associated with the Lists service. It includes the following subsections:

- Section 48.4.1, "Entry Point for Lists"
- Section 48.4.2, "Lists Resource Type Taxonomy"
- Section 48.4.3, "Lists Security Considerations"
- Section 48.4.4, "Lists Resource Types"

> **See Also:** For an introduction to the REST APIs, see Chapter 54, "Using Oracle WebCenter Portal REST APIs."

48.4.1 Entry Point for Lists

To get to the REST entry point for lists in a space of the Spaces application, you must navigate to a specific space to see a link to lists in that space. For all the lists in a space, find the link elements with a `resourceType` of:

```
urn:oracle:webcenter:space:lists
```

The corresponding `href` or `template` element provides the URI entry point, which retrieves the lists in the space.

> **See Also:** For more information about the Resource Index, see Section 54.5.1, "The Resource Index."
>
> For more information about resource types, see Section 54.5.2.1, "Resource Type."

48.4.2 Lists Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. The resource type taxonomy for lists is:

```
urn:oracle:webcenter:space:lists
urn:oracle:webcenter:space:list
     urn:oracle:webcenter:space:list:rows
     urn:oracle:webcenter:space:list:row
     urn:oracle:webcenter:space:list:columns
     urn:oracle:webcenter:space:list:column
```

48.4.3 Lists Security Considerations

You must be logged in to the REST service to access any of the Lists REST APIs. After that, the underlying service handles permission checking.

> **See Also:** For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

48.4.4 Lists Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- Section 48.4.4.1, "urn:oracle:webcenter:space:lists"
- Section 48.4.4.2, "urn:oracle:webcenter:space:list"

- Section 48.4.4.3, "urn:oracle:webcenter:space:list:rows"
- Section 48.4.4.4, "urn:oracle:webcenter:space:list:row"
- Section 48.4.4.5, "urn:oracle:webcenter:space:list:columns"
- Section 48.4.4.6, "urn:oracle:webcenter:space:list:column"

48.4.4.1 urn:oracle:webcenter:space:lists

The `lists` response provides a means of retrieving the lists in a given space (`GET`) and adding lists to a space (`POST`). This section includes the following subsections:

- Section 48.4.4.1.1, "Navigation Paths to lists"
- Section 48.4.4.1.2, "Supported Methods for lists"
- Section 48.4.4.1.3, "Resource Types Linked to from lists"

48.4.4.1.1 Navigation Paths to lists This section shows how the client can navigate through the hypermedia to access the `lists` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
          urn:oracle:webcenter:space:resourceindex
               urn:oracle:webcenter:space:lists
```

48.4.4.1.2 Supported Methods for lists The `lists` resource type supports the following methods:

- Method (lists): `GET`
- Method (lists): `POST`

Method (lists): `GET`

This method retrieves the lists in a space.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists?q=name:equals:Pr
  ojectIssues&utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: none
- Request headers: [Accept = `application/xml | application/json`]
- Request parameters - `startIndex`, `itemsPerPage`, `q`, `projection`
  - `q` parameter for query, format `'q=attribute:operator:value'`, for example:

    ```
    'q=name:equals:ProjectIssues'
    ```

    * Supported operators for Strings: `equals`, `not.equals`, `contains`, `starts.with`
    * Supported operators for Dates: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`
    * May specify several conditions separated by semicolon (;)
- Searchable attributes (Table 48–1)

Table 48–1 Searchable Attributes for lists GET Method

Element	Type	Description
name	string	Name of list
description	string	Description of list
creator	string	User who created list
created	date	Date the list was created
modifier	string	User who modified list
modified	date	Date the list was last modified

- Response status: `200` [OK]
- Response body: `<lists>`
- Example:

```
<lists resourceType="urn:oracle:webcenter:space:lists">
     <links>
          <link resourceType="urn:oracle:webcenter:list:lists"
               rel="self" href="opaque"/>
          <link template="opaque?startIndex={startIndex}&
               itemsPerPage={itemsPerPage}&q={searchTerms}&
               projection={projection}
               &stoken=FDgsOu7a2NTTM1cLJvnpkDXfihtHx5Q*"
               resourceType="urn:oracle:webcenter:list:lists"/>
     </links>
     <items>
          <list resourceType="urn:oracle:webcenter:space:list">
               <links>
                    <link resourceType="urn:oracle:webcenter:list" rel="self"
                         href="opaque"
                         capabilities="urn:oracle:webcenter:update
                         urn:oracle:webcenter:delete"/>
                    <link resourceType="urn:oracle:webcenter:list:rows"
                         href="opaque"
                         capabilities="urn:oracle:webcenter:create"/>
                    <link template="opaque?
                         startIndex={startIndex}&
                         itemsPerPage={itemsPerPage}&q={searchTerms}&
                         stoken=FDgsOu7a2NTTM1cLJvnpkDXfihtHx5Q*"
                         resourceType="urn:oracle:webcenter:list:rows"/>
                    <link resourceType="urn:oracle:webcenter:list:columns"
                         href="opaque"
                         capabilities="urn:oracle:webcenter:create"/>
               </links>
               <id>/oracle/webcenter/list/scopedMD/
                    se0dea180_e2c1_45ac_b08b_
                    ba2c0b26aa72/lists/ProjectIssues.xml</id>
               <name>Project Issues</name>
               <description/>
          </list>
     </items>
</lists>
```

Method (lists): `POST`

This method creates a list in a space.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists?utoken=FKld8lalI
  3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: `<list>`
- Writable elements (Table 48–2)

Table 48–2 Create List Writable Elements

Element	Type	Constraints	Description
name[1]	string	—	Name of list
description	string	—	Description of list
columns[1]	`urn:oracle:webcenter:space:list:columns`	1 to 30	List columns

[1] Denotes required element

- Example:

```
<list>
     <name>RestExample</name>
     <description>Created using rest api</description>
     <columns>
          <items>
               <metaColumn>
                    <name>No.</name>
                    <dataType>number</dataType>
               </metaColumn>
               <metaColumn>
                    <name>Description</name>
                    <dataType>string</dataType>
               </metaColumn>
          </items>
     </columns>
</list>
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `201` [Created]
- Response body: `<list>`
- Retrieved elements (Table 48–3)

Table 48–3 Retrieved Elements from lists

Element	Type	Description
id	string	List ID
name	string	List name
description	string	List description
scope.guid	string	GUID of space to which the list belongs
scope.name	string	Name of the space to which the list belongs
creator	string	Name of the user who created the list
created	date	Date the list was created

Table 48–3 (Cont.) Retrieved Elements from lists

Element	Type	Description
modifier	string	Name of the user who last modified the list
modified	date	Date the list was last modified
columns	urn:oracle:webcenter:space:list:columns	List columns

- Example:

```
<list resourceType="urn:oracle:webcenter:space:list">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list" rel="self"
               href="http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/
               lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_
               83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_
               fb03874979c0.xml)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**"
               capabilities="urn:oracle:webcenter:read
               urn:oracle:webcenter:update urn:oracle:webcenter:delete"/>
          <link template="http://dadvmh0330.us.oracle.com:8889
               /rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/
               s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
               417b_a35f_fb03874979c0.xml)/rows?

          </list>
```

48.4.4.1.3 Resource Types Linked to from lists Table 48–4 lists the resource types that the client can link to from the `lists` resource.

Table 48–4 Resource Types Linked to from lists

rel	resourceType
self	`urn:oracle:webcenter:space:lists`
	`urn:oracle:webcenter:space:list`

48.4.4.2 urn:oracle:webcenter:space:list

The `list` response provides a means of retrieving, updating, and deleting an individual list. This section includes the following subsections:

- Section 48.4.4.2.1, "Navigation Paths to list"
- Section 48.4.4.2.2, "Supported Methods for list"
- Section 48.4.4.2.3, "Resource Types Linked to from list"

48.4.4.2.1 Navigation Paths to list This section shows how the client can navigate through the hypermedia to access the `list` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
          urn:oracle:webcenter:space:resourceindex
               urn:oracle:webcenter:space:lists
                    urn:oracle:webcenter:space:list
```

48.4.4.2.2 Supported Methods for list The list resource type supports the following methods:

- Method (list): `GET`
- Method (list): `PUT`
- Method (list): `DELETE`

Method (list): `GET`

Use this method to retrieve a list.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: none
- Request headers: [Accept = `application/xml | application/json`]
- Response status: `200` [OK]
- Response body: `<list>`
- Retrieved elements (Table 48–5)

Table 48–5 Retrieved Elements for list

Element	Type	Description
id	string	ID of the list
name	string	Name of the list
description	string	Description of the list
scope.guid	string	GUID of the space to which the list belongs
scope.name	string	Name of the space to which the list belongs
creator	string	User who created the list
created	Date	Date on which the list was created
modifier	string	User who last modified the list
modified	Date	Date on which the list was last modified
columns	`urn:oracle:webcenter:space:list:columns`	The columns that make up the list

- For example:

```
<list resourceType="urn:oracle:webcenter:space:list">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list" rel="self"
               href="http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/
               lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_

</list>
```

Method (list): `PUT`

Use this method to update a list name or description.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
  er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_
  4d49_9354_5fb62dc3514d.xml)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: `<list>`
- Writable elements for list (Table 48–6)

Table 48–6 Writable Elements for list

Element	Type	Required	Constraints	Description
name[1]	string	Yes	1 or more characters	Name of this list
description	string	No	none	Description of this list

[1] Denotes required element

- For example:

  ```
  <list>
       <name>RestExampleUpdate</name>
  ```

```
    <description>Updated using rest api</description>
</list>
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `200` [OK]
- Response body: `<list>`

Method (list): `DELETE`

Use this method to delete a list.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Response status: `204` [No Content]
- Response body: none

48.4.4.2.3 Resource Types Linked to from list Table 48–7 lists the resource types that the client can link to from the `list` resource.

Table 48–7 Resource Types Linked to from list

rel	resourceType
self	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:rows`
	`urn:oracle:webcenter:space:list:columns`

48.4.4.3 urn:oracle:webcenter:space:list:rows

The `rows` response provides a means of retrieving and adding rows to a list. This section includes the following subsections:

- Section 48.4.4.3.1, "Navigation Paths to rows"
- Section 48.4.4.3.2, "Supported Methods for rows"
- Section 48.4.4.3.3, "Resource Types Linked to from rows"

48.4.4.3.1 Navigation Paths to rows This section shows how the client can navigate through the hypermedia to access the `rows` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
          urn:oracle:webcenter:space:resourceindex
               urn:oracle:webcenter:space:lists
                    urn:oracle:webcenter:space:list
                         urn:oracle:webcenter:space:list:rows
```

48.4.4.3.2 Supported Methods for rows The rows resource type supports the following methods:

- Method (rows): `GET`

- Method (rows): POST

Method (rows): GET

Use this method to retrieve list rows.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)/rows?q=lco_9bdd1418_6004_40ba_a052_04e8335b7ee8:equals:2&utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Request headers: [Accept = `application/xml | application/json`]
- Request parameters - `startIndex`, `itemsPerPage`, `q`, `projection`
  - `q` parameter for query, format `'q=columnId:operator:value'`, for example:

    ```
    'q=lco_9bdd1418_6004_40ba_a052_04e8335b7ee8:equals:2'
    ```

    * Supported operators for `Strings`: `equals`, `not.equals`, `contains`, `starts.with`
    * Supported operators for `Numbers`, `Dates`: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`
    * May specify several conditions separated by semi-colon (;)
- Searchable attributes for rows: Rows are searchable by column values.
- Response status: `200` [OK]
- Response body: `<rows>`
- For example:

```
<rows resourceType="urn:oracle:webcenter:space:list:rows">
     <links>
          <link template="http://dadvmh0330.us.oracle.com:8889/
               rest/api/spaces/vs1/lists/(/oracle/webcenter/list/
               scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_
               c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/rows?
               utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**&
               startIndex={startIndex}&itemsPerPage={itemsPerPage}&
               q={searchTerms}&utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**"
               resourceType="urn:oracle:webcenter:space:list:rows" rel="self"

                         </columns>
                    </row>
               </items>
          </rows>
```

Method (rows): `POST`

Use this method to create a row in a list.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
  er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_
  4d49_9354_5fb62dc3514d.xml)/rows?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: `<row>`
- Writable elements (Table 48–8)

Table 48–8 Writable Elements for rows

Element	Type	Constraints	Description
columns.column.id[1]	string	—	Column ID
columns.column.value[1]	string	Valid value for column data type	Column value

[1] Denotes required element

- For example:

```
<row>
     <columns>
          <column>
               <id>lco_9bdd1418_6004_40ba_a052_04e8335b7ee8</id>
               <value>1</value>
          </column>
          <column>
               <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
               <value>test</value>
          </column>
     </columns>
</row>
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `201` [Created]
- Response body: `<row>`
- Retrieved elements (Table 48–9)

Table 48–9 Retrieved Elements for rows

Element	Type	Description
id	string	Row ID
list id	string	List ID
scope	string	GUID of space to which list belongs
creator	string	Person who created the list
created	date	Date the list was created
modifier	string	Last user to modify the list
modified	date	Date the list was last modified
columns	—	Column values

- For example:

```
<row resourceType="urn:oracle:webcenter:space:list:row">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list:row" rel="self"

    </row>
```

48.4.4.3.3 Resource Types Linked to from rows Table 48–10 lists the resource types that the client can link to from the `rows` resource.

Table 48–10 Resource Types Linked to from rows

rel	resourceType
self	`urn:oracle:webcenter:space:list.rows`
parent	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:row`

48.4.4.4 urn:oracle:webcenter:space:list:row

The `row` response provides a means of retrieving and adding, and deleting an individual list row. This section includes the following subsections:

- Section 48.4.4.4.1, "Navigation Paths to row"
- Section 48.4.4.4.2, "Supported Methods for row"
- Section 48.4.4.4.3, "Resource Types Linked to from row"

48.4.4.4.1 Navigation Paths to row This section shows how the client can navigate through the hypermedia to access the `row` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
          urn:oracle:webcenter:space:resourceindex
               urn:oracle:webcenter:space:lists
                    urn:oracle:webcenter:space:list
                         urn:oracle:webcenter:space:list:rows
                              urn:oracle:webcenter:space:list:row
```

48.4.4.4.2 Supported Methods for row The row resource type supports the following methods:

- Method (row): `GET`

- Method (row): PUT
- Method (row): DELETE

Method (row): GET

Use this method to retrieve data from a list row.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_a60e6e08668c)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Request headers: [Accept = application/xml | application/json]
- Response status: 200 [OK]
- Response body: <row>
- Retrieved elements (Table 48–11)

Table 48–11 Retrieved Elements for row

Element	Type	Description
id	string	ID of the row
listId	string	ID of the parent list
scope	string	GUID of the space to which the list belongs
creator	string	User who created the row
created	Date	Date on which the row was created
modifier	string	User who last modified the row
modified	Date	Date on which the row was last modified
columns	urn:oracle:webcenter:space:list:columns	Column values

- For example:

```
<row resourceType="urn:oracle:webcenter:space:list:row">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list:row"
               rel="self" href="http://dadvmh0330.us.oracle.com:8889/
               rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD
               /s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_

            </column>
        </columns>
</row>
```

Method (row): `PUT`

Use this method to update row data.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
417b_a35f_fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_
a60e6e08668c)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: `<row>`
- Writable elements (Table 48–12)

Table 48–12 Writable Elements for row

Element	Type	Constraints	Description
columns.column.id[1]	string	—	Column ID
columns.column.value[1]	string	valid value for column data type	Column value

[1] Denotes required element

- For example:

```
<row>
    <columns>
        <column>
            <id>lco_9bdd1418_6004_40ba_a052_04e8335b7ee8</id>
            <value>1</value>
        </column>
        <column>
            <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
            <value>test</value>
        </column>
    </columns>
</row>
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `200` [OK]
- Response body: `<row>`

Method (row): `DELETE`

Use this method to delete a list row.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
```

```
er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
417b_a35f_fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_
a60e6e08668c)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Response status: `204` [No Content]
- Response body: none

48.4.4.4.3 Resource Types Linked to from row Table 48–13 lists the resource types that the client can link to from the `row` resource.

Table 48–13 Resource Types Linked to from row

rel	resourceType
self	`urn:oracle:webcenter:space:list:row`

48.4.4.5 urn:oracle:webcenter:space:list:columns

The `columns` response provides a means of retrieving and adding list columns. This section includes the following subsections:

- Section 48.4.4.5.1, "Navigation Paths to columns"
- Section 48.4.4.5.2, "Supported Methods for columns"
- Section 48.4.4.5.3, "Resource Types Linked to from columns"

48.4.4.5.1 Navigation Paths to columns This section shows how the client can navigate through the hypermedia to access the `columns` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
          urn:oracle:webcenter:space:resourceindex
               urn:oracle:webcenter:space:lists
                    urn:oracle:webcenter:space:list
                         urn:oracle:webcenter:space:list:columns
```

48.4.4.5.2 Supported Methods for columns The `columns` resource type supports the following methods:

- Method (columns): `GET`
- Method (columns): `POST`

Method (columns): `GET`

Use this method to retrieve columns in a list.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
417b_a35f_fb03874979c0.xml)/columns?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Request headers: [Accept = `application/xml | application/json`]
- Request parameters: none
- Response status: `200` [OK]

- Response body: `<metaColumns>`
- For example:

```
<metaColumns resourceType="urn:oracle:webcenter:space:list:columns">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list:columns"
               rel="self" href="http://dadvmh0330.us.oracle.com:8889/
               rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/
               s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
               417b_a35f_fb03874979c0.xml)/columns?
               utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**"
               capabilities="urn:oracle:webcenter:read
               urn:oracle:webcenter:create"/>
          <link resourceType="urn:oracle:webcenter:space:list"
               rel="urn:oracle:webcenter:parent"
               href="http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/
               lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_
               f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_

                         capabilities="urn:oracle:webcenter:read
                         urn:oracle:webcenter:update
                         urn:oracle:webcenter:delete"/>
               </links>
               <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
               <name>Description</name>
               <dataType>string</dataType>
```

```
                    <required>false</required>
                    <maxLength>500</maxLength>
                    <displayLength>20</displayLength>
                    <allowLinks>false</allowLinks>
                    <editLines>1</editLines>
                </metaColumn>
            </items>
        </metaColumns>
```

Method (columns): `POST`

Use this method to create a column in a list.

- Resource URI, for example:

  ```
  http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/columns?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
  ```

- Request body: `<metaColumn>`
- Writable elements (Table 48–14)

Table 48–14 Writable Elements for columns

Element	Type	Constraints	Description
name[1]	string	—	The name of the column
dataType[1]	string	▪ `string` ▪ `number` ▪ `datetime` ▪ `boolean` ▪ `person` ▪ `image` ▪ `richtext`	The data type of the column
required	boolean	▪ `true` ▪ `false`	Whether a value is required for the column
defaultValue	data type of column	Object must match data type	The default value of the column
maxLength	int	Valid only for `string` data type	The maximum length for a string value
rangeLow	int	Valid only for `number` data type	The low range value for a `number` data type
rangeHigh	int	Valid only for `number` data type	The high range value for a `number` data type
format	string	For `number` data type: ▪ number ▪ currency ▪ percent For `datetime` data type: ▪ date ▪ time ▪ both	The format of the column

Table 48–14 (Cont.) Writable Elements for columns

Element	Type	Constraints	Description
allowLinks	boolean	▪ `true` ▪ `false` Valid only for `string` data type	Whether a hyperlink can be specified for a column value
linkTarget	string	▪ `_blank` ▪ `_self` Valid only if `allowLinks=true`	`_blank` opens link in a new window, `_self` opens link in the same window
editLines	int	Valid only for `string` data type	The number of lines when editing a column value (default=1)
peopleScope	string	▪ GLOBAL ▪ SUB_SCOPE Valid only for `person` data type	Whether valid users are all users in directory or members of the space that contains the list
displayWidth	int	—	Display width of column in pixels
hint	string	—	Hint displayed to help user when entering column value

[1] Denotes required element

- For example:

```
<metaColumn>
     <name>Notes</name>
     <dataType>richtext</dataType>
</metaColumn
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `201` [Created]
- Response body: `<metaColumn>`
- Retrieved elements (Table 48–15)

Table 48–15 Retrieved Elements from columns

Element	Type	Description
id	string	Column ID
name	string	The name of the column
dataType	string	The data type of the column
required	boolean	Whether a value is required for the column
defaultValue	data type of column	The default value of the column
maxLength	int	The maximum length for a string value
rangeLow	int	The low range value for a `number` data type
rangeHigh	int	The high range value for a `number` data type
format	string	The format of the column
allowLinks	boolean	Whether a hyperlink can be specified for a column value
linkTarget	string	`_blank` opens link in a new window, `_self` opens link in the same window

Table 48–15 (Cont.) Retrieved Elements from columns

Element	Type	Description
editLines	int	The number of lines when editing a column value (default=1)
peopleScope	string	Whether valid users are all users in directory or members of the space that contains the list
displayWidth	int	Display width of column in pixels
hint	string	Hint displayed to help user when entering column value

- For example:

```
<metaColumn resourceType="urn:oracle:webcenter:space:list:column">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list:column"
               rel="self" href="http://dadvmh0330.us.oracle.com:8889/
               rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/
               s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/
               ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/columns/
               (lco_fe2b9856_32f3_449a_a277_18dc7f6a779e)?
               utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**"
               capabilities="urn:oracle:webcenter:read
               urn:oracle:webcenter:update urn:oracle:webcenter:delete"/>
     </links>
     <id>lco_fe2b9856_32f3_449a_a277_18dc7f6a779e</id>
     <name>Notes</name>
     <dataType>richtext</dataType>
     <required>false</required>
     <displayLength>20</displayLength>
     <allowLinks>false</allowLinks>
</metaColumn>
```

48.4.4.5.3 Resource Types Linked to from columns Table 48–16 lists the resource types that the client can link to from the `columns` resource.

Table 48–16 Resource Types Linked to from columns

rel	resourceType
self	`urn:oracle:webcenter:space:list.columns`
parent	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:column`

48.4.4.6 urn:oracle:webcenter:space:list:column

The `column` response provides a means of retrieving, adding, and deleting an individual list column. This section includes the following subsections:

- Section 48.4.4.6.1, "Navigation Paths to column"
- Section 48.4.4.6.2, "Supported Methods for column"
- Section 48.4.4.6.3, "Resource Types Linked to from column"

48.4.4.6.1 Navigation Paths to column This section shows how the client can navigate through the hypermedia to access the `column` resource:

```
urn:oracle:webcenter:resourceindex
     urn:oracle:webcenter:spaces
```

```
urn:oracle:webcenter:space:resourceindex
     urn:oracle:webcenter:space:lists
          urn:oracle:webcenter:space:list
               urn:oracle:webcenter:space:list:columns
                    urn:oracle:webcenter:space:list:column
```

48.4.4.6.2 Supported Methods for column The column resource type supports the following methods:

- Method (column): `GET`
- Method (column): `PUT`
- Method (column): `DELETE`

Method (column): `GET`

Use this method to retrieve a list column.

- Resource URI. for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/columns/(lco_fe2b9856_32f3_449a_a277_18dc7f6a779e)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Request headers: [Accept = `application/xml | application/json`]
- Response status: `200` [OK]
- Response body: `<metaColumn>`
- Retrieved elements (Table 48–17)

Table 48–17 column Retrieved Elements

Element	Type	Description
id	string	Column ID
name	string	The name of the column
dataType	string	The data type of the column
required	boolean	Whether a value is required for the column
defaultValue	data type of column	The default value of the column
maxLength	int	The maximum length for a string value
rangeLow	int	The low range value for a `number` data type
rangeHigh	int	The high range value for a `number` data type
format	string	The format of the column
allowLinks	boolean	Whether a hyperlink can be specified for a column value
linkTarget	string	`_blank` opens link in a new window, `_self` opens link in the same window
editLines	int	The number of lines when editing a column value (default=1)

Table 48–17 (Cont.) column Retrieved Elements

Element	Type	Description
peopleScope	string	Whether valid users are all users in directory or members of the space that contains the list
displayWidth	int	Display width of column in pixels
hint	string	Hint displayed to help user when entering column value

- For example:

```
<metaColumn resourceType="urn:oracle:webcenter:space:list:column">
     <links>
          <link resourceType="urn:oracle:webcenter:space:list:column"
               rel="self" href="http://dadvmh0330.us.oracle.com:8889/
               rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/
               s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/
               ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/
               columns/(lco_fe2b9856_32f3_449a_a277_18dc7f6a779e)?
               utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**"
               capabilities="urn:oracle:webcenter:read
               urn:oracle:webcenter:update urn:oracle:webcenter:delete"/>
     </links>
     <id>lco_fe2b9856_32f3_449a_a277_18dc7f6a779e</id>
     <name>Notes</name>
     <dataType>richtext</dataType>
     <required>false</required>
     <displayLength>20</displayLength>
     <allowLinks>false</allowLinks>
</metaColumn>
```

Method (column): `PUT`

Use this method to update column data.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcent
er/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_
417b_a35f_fb03874979c0.xml)/columns/(lco_fe2b9856_32f3_449a_a277_
18dc7f6a779e)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: `<metacolumn>`
- Writable elements (Table 48–18)

Table 48–18 column Writable Elements

Element	Type	Constraints	Description
name[1]	string	—	The name of the column
dataType[1]	string	▪ `string` ▪ `number` ▪ `datetime` ▪ `boolean` ▪ `person` ▪ `image` ▪ `richtext`	The data type of the column
required	boolean	▪ `true` ▪ `false`	Whether a value is required for the column
defaultValue	data type of column	Object must match data type	The default value of the column
maxLength	int	Valid only for `string` data type	The maximum length for a string value
rangeLow	int	Valid only for `number` data type	The low range value for a `number` data type
rangeHigh	int	Valid only for `number` data type	The high range value for a `number` data type
format	string	For `number` data type: ▪ number ▪ currency ▪ percent For `datetime` data type: ▪ date ▪ time ▪ both	The format of the column
allowLinks	boolean	▪ `true` ▪ `false` Valid only for `string` data type	Whether a hyperlink can be specified for a column value
linkTarget	string	▪ `_blank` ▪ `_self` Valid only if `allowLinks=true`	`_blank` opens link in a new window, `_self` opens link in the same window
editLines	int	Valid only for `string` data type	The number of lines when editing a column value (default=1)
peopleScope	string	▪ `GLOBAL` ▪ `SUB_SCOPE` Valid only for `person` data type	Whether valid users are all users in directory or members of the space that contains the list
displayWidth	int	—	Display width of column in pixels
hint	string	—	Hint displayed to help user when entering column value

[1] Denotes required element

- For example:

```
<metaColumn>
     <name>Comments</name>
     <dataType>richtext</dataType>
</metaColumn>
```

- Request headers: `Content-Type = application/xml | application/json`, [Accept = `application/xml | application/json`]
- Response status: `200` [OK]
- Response body: `<metaColumn>`

Method (column): `DELETE`

Use this method to delete a list column.

- Resource URI, for example:

```
http://dadvmh0330.us.oracle.com:8889/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/columns/(lco_fe2b9856_32f3_449a_a277_18dc7f6a779e)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Response status: `204` [No Content]
- Response body: none

48.4.4.6.3 Resource Types Linked to from column Table 48–19 lists the resource types that the client can link to from the `column` resource.

Table 48–19 Resource Types Linked to from column

rel	resourceType
self	`urn:oracle:webcenter:space:list:column`

48.5 Troubleshooting the Lists Service

Problem

The List task flow shows an error that the WebCenter Portal's repository is not available.

Solution

The database connection is likely not configured. For more information, see Section 7.2.2, "Setting Up a Database Connection."

Problem

A 401 Unauthorized error appears.

Solution

It is likely that security is not set up for the application. Or it may be that there was insufficient permission to perform the attempted task.

49 Integrating Notifications

Notifications provides a means of subscribing to services and application objects and, when those objects change, receiving notification across one or more selected messaging channels. This chapter describes how to integrate Notifications with your Framework applications. It includes the following sections:

- Section 49.1, "Introduction to Notifications"
- Section 49.2, "Basic Configuration for Notifications"
- Section 49.3, "Advanced Information for Notifications"

49.1 Introduction to Notifications

This section provides an overview of Notifications. It includes the following subsections:

- Section 49.1.1, "Understanding Notifications"
- Section 49.1.2, "Requirements for Notifications"
- Section 49.1.3, "What Happens with Notifications at Runtime?"

49.1.1 Understanding Notifications

Notifications provides an automated means of triggering notices about subscribed services and objects across different messaging channels. Messages are triggered when the application services and objects to which a user has subscribed change. For example, a user can subscribe to a document and receive notification when another user changes the document.

Messaging channels can include phone text (SMS), mail, or Worklist, depending on what messaging servers are available and how the application administrator configures Notifications. For example, users can receive a mail message when a particular document changes, a text message when someone responds to a particular discussion topic, a Worklist alert when the user receives an invitation to connect. All messages contain links that take the user to the scene of the change.

Participating services and objects include People Connections (Connections, Message Board, and Feedback), Discussions, and Documents (including Wikis and Blogs).

Table 49–1 describes the types of activities that can trigger a notification and indicates the level at which the subscription is made.

Table 49–1 Activities that Can Trigger Notifications

Activity	Level
A user sends you an invitation to connect	Application
A user posts a message to your Message Board	Application
A user likes your Message Board post (messages explicitly set on a Message Board and not those added from Publisher to the Activity Stream)	Application
A user comments on your Message Board post (messages explicitly set on a Message Board and not those added from Publisher to the Activity Stream)	Application
A user posts feedback for you	Application
A user replies to a discussion topic	Object
A user comments on a discussion topic	Object
A user deletes a discussion topic	Object
A user comments on a document	Object
A user likes a document	Object
A user updates a document	Object
A user deletes a document	Object
A user comments on a wiki document	Object
A user likes a wiki document	Object
A user updates a wiki document	Object
A user deletes a wiki document	Object
A user comments on a blog entry	Object
A user likes a blog entry	Object
A user updates a blog entry	Object
A user deletes a blog entry	Object

Notifications leverages message delivery platforms available in WebCenter, such as the User Messaging Service (UMS) or the Mail service, to deliver the messages it generates. The Mail service furnishes the default messaging delivery mechanism, though you can instead use the BPEL connection provided through the Worklist service to widen a user's choice of channels to phone text, mail, and the Worklist.

You can set defaults for application-level subscriptions for all users through an XML configuration file (`notification-service-settings.xml`). You create your own version of this default file, and then use it to supersede the file of the same name that is provided for this purpose out of the box.

49.1.2 Requirements for Notifications

Before your application can work with the Notifications service, you must specify the Notification namespace in the application's `adf-config.xml` file. For more information, see Section 49.2.1, "Adding the Notifications Namespace."

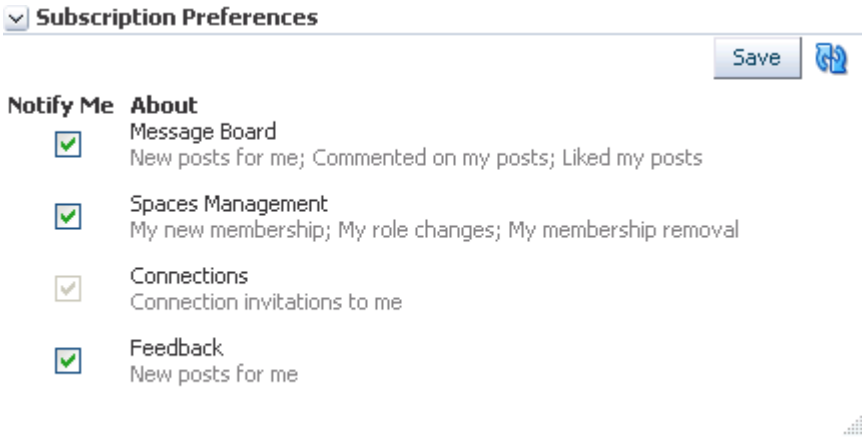
Subscription capability is built into the services that support it and do not require additional configuration.

Notifications messaging capability relies on the presence of a configured Mail or Worklist connection to enable delivery of notifications messages. For Notifications messaging, you must explicitly configure the application to use either the BPEL server

that is configured for the Worklist service or the Mail server that is configured for the Mail service. For more information, see Section 49.2.2, "Creating a Notifications Connection to a Mail Server," and Section 49.2.3, "Creating a Notifications Connection to a BPEL Server."

To set application defaults for all users for application-level subscription preferences, you must provide your own version of the default file `notification-service-settings.xml`. For more information, see Section 49.2.4, "Setting Application Defaults for Notifications."

For Notifications to function properly, its task flows must reside on a secured page. This is because the current user must be known through authentication in order to track and report on subscribed actions. If the page or application that contains Notifications is not secured, you will encounter exception errors. For more information, see Section 49.2.6, "Setting Security for Notifications."



49.1.3 What Happens with Notifications at Runtime?

At runtime, users set up their preferred messaging channels through UMS Preferences. For more information, see the section "Establishing and Managing Your Messaging Channels and Filters" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

> **Note:** In designing your application, you must provide users with a way to access UMS preferences. For example, you can add a link to them in your UI, or you can point users to the Worklist task flow, which includes a link to them.

Users establish their application-level subscriptions through the Notifications task flow *Subscription Preferences* (Figure 49–1).

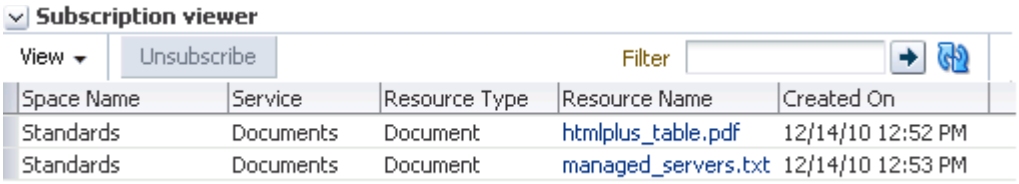


Figure 49–1 Subscription Preferences Task Flow

Users establish their object-level subscriptions by subscribing to the object directly.

Users manage their application-level subscriptions through the Subscription Preferences task flow and their object-level subscriptions through the Notifications task flow *Subscription Viewer* (Figure 49–2).

Figure 49–2 Subscription Viewer Task Flow

See Also: For more information about Notifications task flows, see Section 49.2.5.1, "Notifications Task flows."

49.2 Basic Configuration for Notifications

Notifications leverages your Mail or Worklist service connection to provide messaging channels for user notifications. If you plan to use the Mail server, then a connection to a mail server for the Mail service is required, but no further configuration is necessary for Notifications. If you plan to use the same BPEL connection for Notifications that is used by the Worklist service, you must add this configuration to the `adf-config.xml` file.

This section provides an overview of those connections and configurations and the process of adding Notifications task flows to an application page. It includes the following subsections:

- Section 49.2.1, "Adding the Notifications Namespace"
- Section 49.2.2, "Creating a Notifications Connection to a Mail Server"
- Section 49.2.3, "Creating a Notifications Connection to a BPEL Server"
- Section 49.2.4, "Setting Application Defaults for Notifications"
- Section 49.2.5, "Adding Notifications Task Flows to Your Application"
- Section 49.2.6, "Setting Security for Notifications"

49.2.1 Adding the Notifications Namespace

To establish the Notifications namespace with your application, add the following code to the `adf-config` element at the top of the file (Example 49–1):

Tip: You can find the `adf-config.xml` file in the Application Resources panel, under **Descriptors**, in the **ADF META-INF** folder.

Example 49–1 Configuring the Application to Recognize Notifications Configuration

```
xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
```

For example (bold) (Figure 49–2):

Example 49–2 Notifications Configuration in the adf-config Element

```
<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
     xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
     xmlns:sec="http://xmlns.oracle.com/adf/security/config"
     xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
     xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
     xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
```

```
xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"
xmlns:relC="http://xmlns.oracle.com/webcenter/relationship/config"
…
```

49.2.2 Creating a Notifications Connection to a Mail Server

To enable users to select a mail messaging channel, you must configure a connection to a Mail server (for more information, see Section 36.2.2, "Setting up Connections for the Mail Service"). Once this is established, you add the following entry in the `adf-config.xml` file to associate the Mail server with Notifications (Example 49–3).

Example 49–3 Associating a Mail Server with Notifications in adf-config.xml

```
<notificationC:adf-notification-config
          xmlns="http://xmlns.oracle.com/webcenter/notification/config">
     <ConnectionType>MAIL</ConnectionType>
     <ConnectionName>someMailConnection</ConnectionName>
</notificationC:adf-notification-config>
```

Where `ConnectionName` is the name of a configured Mail server.

Example 49–4 presents a code sample, with the previous code sample in place (bold).

Example 49–4 A Mail Connection for Notifications in adf-config.xml

```
<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
     xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
     xmlns:sec="http://xmlns.oracle.com/adf/security/config"
     xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
     xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
     xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
     xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
     xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
     xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"
     xmlns:relC="http://xmlns.oracle.com/webcenter/relationship/config"
     xmlns:collabC="http://xmlns.oracle.com/webcenter/collab/config"
     xmlns:listC="http://xmlns.oracle.com/webcenter/list/config"
     xmlns:rcs="http://xmlns.oracle.com/adf/rcs/adf-config"
     xmlns:rcv="http://xmlns.oracle.com/adf/rcs/viewer/adf-config"xmlns:tagC=
          "http://xmlns.oracle.com/webcenter/tagging/config"
     xmlns:doclibC="http://xmlns.oracle.com/webcenter/doclib/config">
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
     <adf-property name="adfAppUID" value="ps3stage2app-7762"/>
</adf:adf-properties-child>
<sec:adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
     <CredentialStoreContext
          credentialStoreClass="oracle.adf.share.security.providers.jps.
          CSFCredentialStore"
          credentialStoreLocation="../../src/META-INF/jps-config.xml"/>
     <sec:JaasSecurityContext
          initialContextFactoryClass="oracle.adf.share.security.
          JAASInitialContextFactory"
          jaasProviderClass="oracle.adf.share.security.providers.jps.
          JpsSecurityContext" authorizationEnforce="true"
          authenticationRequire="true"/>
</sec:adf-security-child>
```

```
<wpsC:adf-service-config>
     <wpsC:data-source jndi-name="java:/comp/env/jdbc/WebCenterDSDS"/>
</wpsC:adf-service-config>
<notificationC:adf-notification-config
          xmlns="http://xmlns.oracle.com/webcenter/notification/config">
     <ConnectionType>MAIL</ConnectionType>
     <ConnectionName>someMailConnection</ConnectionName>
</notificationC:adf-notification-config>
<searchC:adf-search-config
          xmlns="http://xmlns.oracle.com/webcenter/search/config">
…
```

49.2.3 Creating a Notifications Connection to a BPEL Server

To furnish users with the option to select mail, phone text, or Worklist messaging channels, you must configure a connection to a BPEL server (for more information, see Section 51.3.1, "Setting up Connections for the Worklist Service"). Notifications leverages the BPEL server that is specified for the Worklist service to provide multiple messaging channels for the notifications it generates. Once a connection to a BPEL server is established, you add the following entry in the `adf-config.xml` file to associate the BPEL server with Notifications (Example 49–5).

Example 49–5 Configuring Notifications to Use the BPEL Server for Messaging

```
<notificationC:adf-notification-config
          xmlns="http://xmlns.oracle.com/webcenter/notification/config">
     <ConnectionType>BPEL</ConnectionType>
     <ConnectionName>worklistConnection</ConnectionName>
     <SenderEmailAddress>example@company.com<SenderEmailAddress>
     <SenderSMSAddress>12345</SenderSMSAddress>
</notificationC:adf-notification-config>
```

Where:

- **ConnectionName** is the name you provided for the BPEL server when you set up that connection for the Worklist service.
- **SenderEMailAddress** is a mail address from which all Notifications messages are sent. The sender mail address must match at least one driver that is configured to send messages from a corresponding domain.
- **SenderSMSAddress** is the four- to six-digit number that is used by the User Messaging Server (UMS) as the driver from which all Notifications messages are sent. The sender SMS address must match at least one driver that is configured to send messages from a corresponding domain.

Example 49–6 presents a code sample, with the previous code sample in place (bold).

Example 49–6 Notifications Entries in the adf-config.xml File

```
<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
     xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
     xmlns:sec="http://xmlns.oracle.com/adf/security/config"
     xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
     xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
     xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
     xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
     xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
     xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"
```

```
     xmlns:relC="http://xmlns.oracle.com/webcenter/relationship/config"
     xmlns:collabC="http://xmlns.oracle.com/webcenter/collab/config"
     xmlns:listC="http://xmlns.oracle.com/webcenter/list/config"
     xmlns:rcs="http://xmlns.oracle.com/adf/rcs/adf-config"
     xmlns:rcv="http://xmlns.oracle.com/adf/rcs/viewer/adf-config"xmlns:tagC=
          "http://xmlns.oracle.com/webcenter/tagging/config"
     xmlns:doclibC="http://xmlns.oracle.com/webcenter/doclib/config">
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
     <adf-property name="adfAppUID" value="ps3stage2app-7762"/>
</adf:adf-properties-child>
<sec:adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
     <CredentialStoreContext
          credentialStoreClass="oracle.adf.share.security.providers.jps.
          CSFCredentialStore"
          credentialStoreLocation="../../src/META-INF/jps-config.xml"/>
     <sec:JaasSecurityContext
          initialContextFactoryClass="oracle.adf.share.security.
          JAASInitialContextFactory"
          jaasProviderClass="oracle.adf.share.security.providers.jps.
          JpsSecurityContext" authorizationEnforce="true"
          authenticationRequire="true"/>

          xmlns="http://xmlns.oracle.com/webcenter/search/config">
…
```

49.2.4 Setting Application Defaults for Notifications

This section provides information about the XML file you use to set application-level defaults for all users for Notifications. It includes the following subsections:

- Section 49.2.4.1, "What You Should Know About Subscription Defaults"
- Section 49.2.4.2, "Setting Notifications Subscription Defaults"

49.2.4.1 What You Should Know About Subscription Defaults

Administrator-level subscription preferences are set in a custom XML file that you create and then use to supersede the file that is provided in the `notification-repository.jar` for this purpose out of the box (`notification-service-settings.xml`). The settings in the custom XML file are analogous to the application-level subscriptions settings available to users through the Subscription Preferences task flow.

Each setting provides the following attributes:

- `id`—for specifying the service ID:
  - `oracle.webcenter.peopleconnections.connections`, the Connections feature of the People Connections service

  - `oracle.webcenter.peopleconnections.wall`, the Message Board feature of the People Connections service
  - `oracle.webcenter.peopleconnections.kudos`, the Feedback feature of the People Connections service

- `subscription-enabled`—For specifying the default value for the preference option: `true` or `false`

  Tip: Rather than enabling or disabling the entire subscription capability, the `subscription-enabled` attribute merely sets the initial state of the preference option. For example, if `subscription-enabled="true"`, then the associated subscription option is checked by default in the Subscription Preferences task flow. If `subscription-enabled="false"`, then the associated subscription option is not checked by default in the task flow.

- `end-user-configurable`—For enabling users to change the established default or preventing users from doing so: `true` or `false`

These attributes work together to determine the initial state of the Subscription Preferences task flow.

Table 49–2 illustrates the effect of custom administrator-level subscriptions settings on the appearance of the Subscription Preferences task flow.

Table 49–2 Effect of Administrator Defaults on Subscriptions Preferences

subscription-enabled[1]	end-user-configurable	Option in Preferences
True	True	Rendered normally, checkbox is checked
True	False	Grayed out, checkbox is checked
False	True	Rendered normally, checkbox is clear
False	False	Hidden, checkbox is hidden

[1] Rather than enabling or disabling the entire subscription capability, the `subscription-enabled` attribute merely sets the initial state of the subscription.

Tip: The most typical scenario for most notifications is `False`, `True`, `Rendered normally, checkbox is clear`.

Table 49–3 lists the types of actions that can trigger an application-level notification and associates them with their related service ID.

Table 49–3 Application-Level Activities that Can Trigger Notifications

Activity	Related Service ID
A user sends you an invitation to connect	`oracle.webcenter.peopleconnections.connections`
A user posts a message to your Message Board	`oracle.webcenter.peopleconnections.wall`
A user likes your post on another user's Message Board	`oracle.webcenter.peopleconnections.wall`
A user comments on your post on another user's Message Board	`oracle.webcenter.peopleconnections.wall`
A user posts feedback for you	`oracle.webcenter.peopleconnections.kudos`

49.2.4.2 Setting Notifications Subscription Defaults

To set defaults for application-level Subscription preferences:

1. Navigate to a directory with a path that contains `/oracle/webcenter/notification`, and create the folder `custom`.

   Tip: The directory structure can start or end with any directory or directories, as long as it has `/oracle/webcenter/notification/custom` in the path.

2. In the `custom` folder, or in any subdirectory under `/oracle/webcenter/notification/custom/`, create the file `notification-service-settings.xml`.

3. In the XML file, enter values for all application-level subscription options.

   Example 49–7 provides sample content for an application-wide subscription preferences setting file and an example of each required option.

Example 49–7 Sample Subscriptions Settings XML File

```
<notification-service_settings xmlns="http://xmlns.oracle.com/webcenter/notification">
  <subscription-settings>
    <service id="oracle.webcenter.peopleconnections.connections" subscription-enabled="true"
      end-user-configurable="false"/>
    <service id="oracle.webcenter.peopleconnections.wall" subscription-enabled="false"
      end-user-configurable="true"/>
    <service id="oracle.webcenter.peopleconnections.kudos" subscription-enabled="false"
      end-user-configurable="true"/>
  </subscription-settings>
</notification-service_settings>
```

Note: If an option is not provided, the default values `false/false` are assigned for the service.

4. Run the WLST command `importMetadata`, and import the directory content into your metadata store.

   See Also: For information about the `importMetadata` command (and other WLST commands), see the section "importMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

   For example:

   ```
   wls: /wc_domain/serverConfig> importMetadata(application='webcenter',
     server='serverName', fromLocation='directoryPath', docs='/**')
   ```

   Where:

   - *`application`* is the name that identifies your application
   - *`serverName`* is the name of the server on which the application is running
   - *`directoryPath`* is the directory path under which `oracle/webcenter/notification/custom/<any_sub_dir_after_this>/notification-service-settings.xml` is located.

For example, if the directory path to `notification-service-settings.xml` is `/scratch/mydir/oracle/webcenter/notification/custom`, enter `/scratch/mydir` for `directoryPath`.

- *`docs`* identifies the content to be imported, in this example, the path and files that fall under those specified for `directoryPath`.

Table 49–4 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.connections`.

Table 49–4 Effects of Subscription Configurations for Connections

subscription-enabled	end-user-configurable	Effect
true	true	■ The subscribing user receives a notification message when another user sends him an invitation to connect. ■ The user can change this default.
true	false	■ The subscribing user receives a notification message when another user sends him an invitation to connect. ■ The user cannot change this default.[1]
false	true	■ The subscribing user does not receive a notification message when another user sends him an invitation to connect. ■ The user can change this default.
false	false	■ The subscribing user does not receive a notification message when another user sends him an invitation to connect. ■ The option for changing this default is hidden.

[1] This is the out-of-the-box default

Table 49–5 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.wall`.

Table 49–5 Effects of Subscription Configurations for Message Board

subscription-enabled	end-user-configurable	Effect
true	true	■ The subscribing user receives a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post. ■ The user can change this default.

Table 49–5 (Cont.) Effects of Subscription Configurations for Message Board

subscription-enabled	end-user-configurable	Effect
true	false	▪ The subscribing user receives a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post. ▪ The user cannot change this default.
false	true	▪ The subscribing user does not receive a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post. ▪ The user can change this default.
false	false	▪ The subscribing user does not receive a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post. ▪ The option for changing this default is hidden.

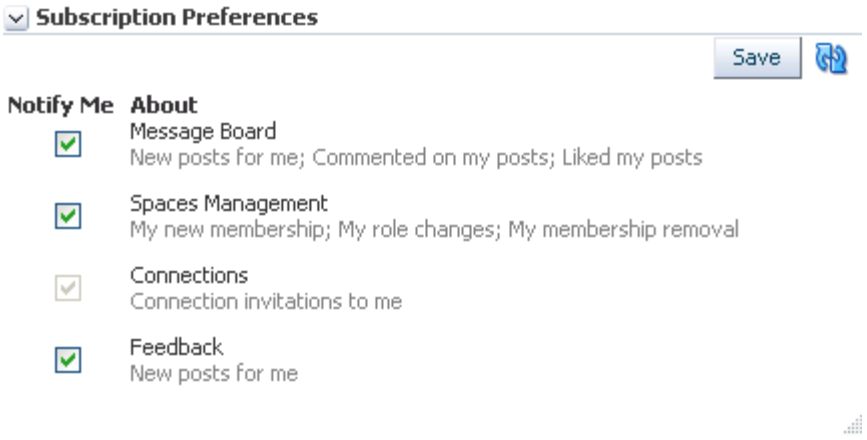
Table 49–6 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.kudos`.

Table 49–6 Effect of Subscription Configurations for Feedback

subscription-enabled	end-user-configurable	Effect
true	true	▪ The subscribing user receives a notification message when another user leaves feedback for him. ▪ The user can change this default.
true	false	▪ The subscribing user receives a notification message when another user leaves feedback for him. ▪ The user cannot change this default.
false	true	▪ The subscribing user does not receive a notification message when another user leaves feedback for him. ▪ The user can change this default.
false	false	▪ The subscribing user does not receive a notification message when another user leaves feedback for him. ▪ The option for changing this default is hidden.

49.2.5 Adding Notifications Task Flows to Your Application

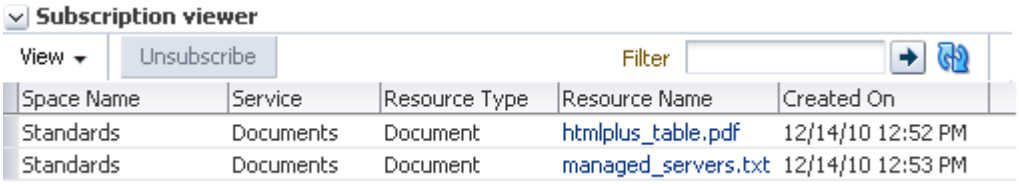
This section provides a brief overview of Notifications task flows and describes how to add them to your application pages. It includes the following subsections:



- Section 49.2.5.1, "Notifications Task flows"
- Section 49.2.5.2, "How to Add a Notifications Task Flow to a Page"

49.2.5.1 Notifications Task flows

Notification Services exposes two task flows for managing user subscriptions:



- Subscription Preference provides controls for taking, viewing, and unsubscribing from application-level subscriptions (Figure 49–3)

Figure 49–3 Subscription Preferences Task Flow

- Subscription Viewer provides controls for viewing and unsubscribing from object-level subscriptions (Figure 49–4).

Figure 49–4 Subscription Viewer Task Flow

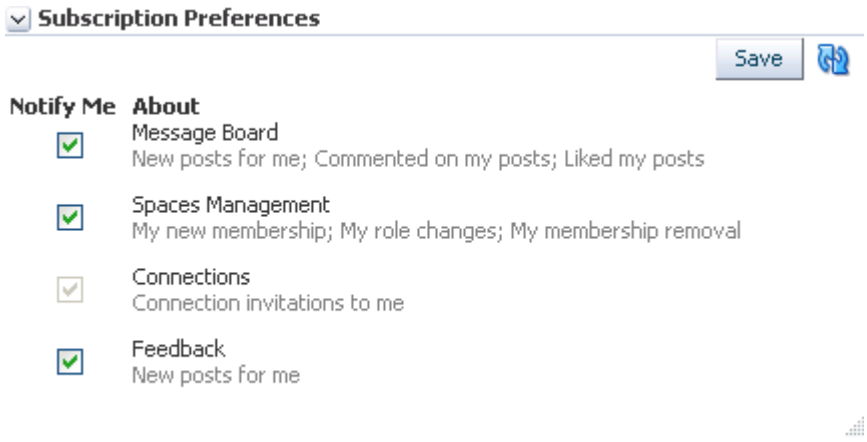
49.2.5.2 How to Add a Notifications Task Flow to a Page

To add a Notifications task flow to a page:

1. Follow the steps in Section 7.2.1, "How to Prepare Your Application to Consume Services" to implement security and create a customizable page in your application.
2. Open the page on which to add the task flow.
3. In the Resource Palette, in the My Catalogs pane, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
4. Drag the task flow onto a page region, then choose **Region** from the pop-up list.
5. In the Confirm Add ADF Library dialog, click **Add Library** to add all required libraries for the component.
6. For Subscription Preferences only, optionally, in the Edit Task Flow Binding dialog, provide a path to your input parameter map and values for the task flow's input parameters, and click **OK**.

   See Also: For information about Subscription Preferences task flow input parameters, see Section 49.2.5.3, "Subscription Preferences Task Flow Input Parameters."

   The task flow displays on the page. For example, in the Source view, you will see the content depicted in Example 49–8.



Example 49–8 Source View Content of the Subscription Preferences Task Flow

```
<af:region value="#{bindings.SubscriptionPreferences1.regionModel}" id="r1"/>
```

7. In the Confirm Add Form Element dialog, click **No**, to avoid wrapping a form element around the task flow.
8. Save your project, then run your page to a browser.

   The task flow appears in your browser (Figure 49–5).

Figure 49–5 Subscription Preferences Task Flow

49.2.5.3 Subscription Preferences Task Flow Input Parameters

The Subscription Preferences task flow has input parameters that you can use to control the behavior of a given task flow instance. Table 49–7 lists and describes the input parameters associated with this task flow.

Table 49–7 Subscription Preferences Task Flow Input Parameters

Input Parameter	Description
`hideActions`	A control for showing or hiding the **Save** button and **Refresh** icon on the task flow ▪ `${true}` to hide these controls ▪ `${false}` to show them (default)
`scopeName`	The name of the scope for which to set subscription preferences.

49.2.6 Setting Security for Notifications

Notifications must know the identity of a user to preserve the user's Notifications settings and to track the user's activities on subscribed services and objects. To that end, you must at least configure your application to authenticate users such that they have distinct identities for the purposes of personalization and user preferences.

For details on how to implement a basic security solution for your Framework application, see Section 69.3, "Configuring ADF Security." For details on how to implement a complete security solution for your Framework application, see Chapter 69, "Securing Your WebCenter Portal: Framework Application."

After you configure ADF security for your application, you can open the `jazn-data.xml` file and modify your sample user's privileges for each task flow. To

open the ADF Security Policies Editor, locate the file in the Application Resources panel and double-click its name. You can further configure grants in this view.

Note: To successfully grant user permissions for Notifications, you must configure user permissions after deployment.

49.3 Advanced Information for Notifications

This section provides information about the APIs that are available for use with Notifications. It includes the following subsections:

- Section 49.3.1, "Using Notifications Java APIs"
- Section 49.3.2, "Using Notifications Data Controls"

49.3.1 Using Notifications Java APIs

This section provides an overview of Notifications Java APIs. It includes the following subsections:

- Section 49.3.1.1, "Configuration Settings Required to Use Notifications Java APIs"
- Section 49.3.1.2, "Introduction to Notifications Java APIs"
- Section 49.3.1.3, "How to Set up Your Application to Use Notifications Java APIs"

See Also: For detailed information about the Notifications Java APIs, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

49.3.1.1 Configuration Settings Required to Use Notifications Java APIs

To use Notifications Java APIs, you must have the following entries in your `adf-config.xml` file:

```
<namespace path="/oracle/webcenter/page/scopedMD"
     metadata-store-usage="WebCenterFileMetadataStore"/>
<namespace path="/pageDefs" metadata-store-usage="WebCenterFileMetadataStore"/>
```

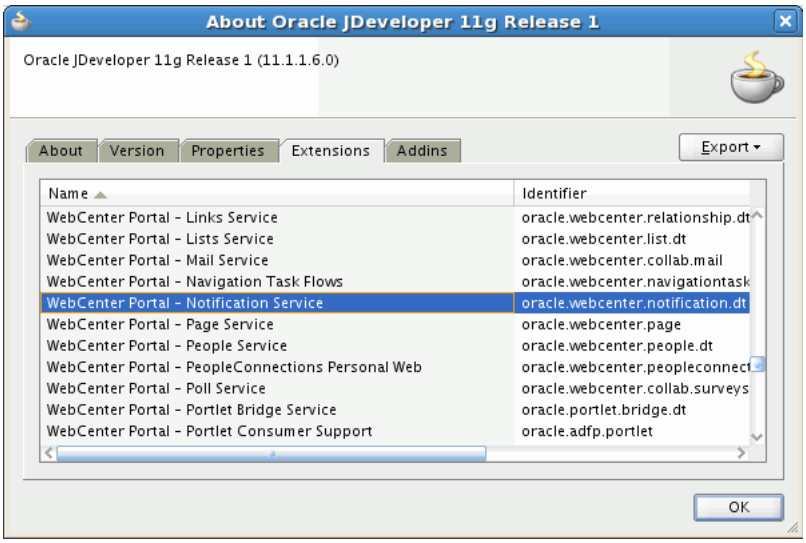
If these entries are not present in `adf-config.xml`, you can add them using your preferred text editor.

49.3.1.2 Introduction to Notifications Java APIs

Notifications Java APIs are located in the class `oracle.webcenter.notification`. Within the class, `SubscriptionManager` provides the interface for creating and managing user subscriptions using the following Java APIs:

- `FilterOption`—Provides the filter criteria. Use an instance of this class while querying a user's subscriptions.
- `NotificationServiceFactory`—Factory for creating and retrieving instances that correspond to Notifications interfaces. This is the entry point to the Notifications API.
- `SortOption`—Defines the sort attributes for fetching subscriptions. Use an instance of this class in `SubscriptionManager` methods to query a user's subscriptions.
- `Subscription`—Contains information about a user's subscription. Subscriptions for a user are created via the method that is exposed by `SubscriptionManager`.

Instances of this class are returned by the methods exposed in `SubscriptionManager`.



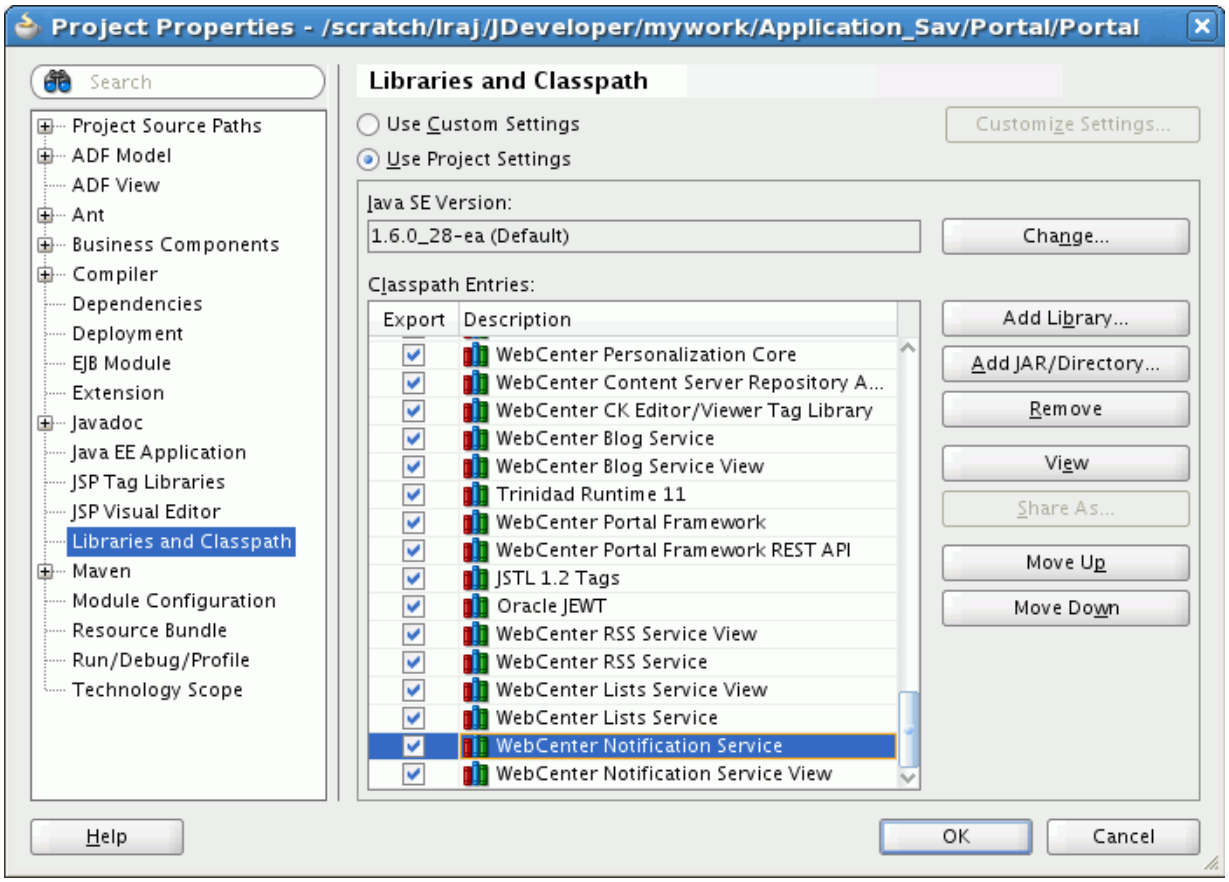
- `SubscriptionPreference`—Represents application- or scope-level subscriptions as a preference and enables setting and unsetting of subscriptions for the corresponding service.

> **See Also:** For detailed information about the Notifications Java APIs, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

49.3.1.3 How to Set up Your Application to Use Notifications Java APIs

To use the Notifications Java APIs, WebCenter Portal extension must be present in your JDeveloper application. In JDeveloper, go to the **Help - About** menu, and click the **Extensions** tab. Look for the Service, as shown in Figure 49–6. For information about adding the WebCenter Portal extension, see Chapter 3, "Preparing Your Development Environment."

Figure 49–6 JDeveloper Extensions



After confirming that Notifications is included with the WebCenter Portal extension, you must add the Notifications libraries to the project if they are not already present.

To add Notifications libraries to your project:

1. Right-click your project and select **Project Properties** and then **Libraries and Classpath**.
2. Click **Add Library** and select the **WebCenter Notification Service** and **WebCenter Notification Service View** libraries (Figure 49–7).
3. Click **OK**.

Figure 49–7 Libraries and Classpath in Project Properties

4. Click **OK**.

49.3.2 Using Notifications Data Controls

Notifications provides a data control that enables you to create your own visualization of the subscription management functionality. This section provides an overview of the data control **Notification Subscription Data Control**, and lists and describes its supported methods, attributes, and classes.

> **See Also:** For information about using data controls in a Framework application, see Section 7.1.3, "Using WebCenter Portal Data Controls."

This section includes the following subsections:

- Section 49.3.2.1, "Adding a Data Control to Your Project"
- Section 49.3.2.2, "Understanding the Notification Subscription Data Control"
- Section 49.3.2.3, "Notification Subscription Data Control Methods and Attributes"
- Section 49.3.2.4, "Notification Subscription Data Control Classes"

49.3.2.1 Adding a Data Control to Your Project

Add a data control to your project by right-clicking it in the Resource Palette and selecting **Add to Project** from the resulting context menu. Once added, you can browse the data control's methods and attributes by expanding it in the Data Controls panel in the Application Navigator.

Add a data control to an application page by dragging it onto the page from the Data Controls panel.

> **See Also:** For information about using data controls in a Framework application, see Section 7.1.3, "Using WebCenter Portal Data Controls."

49.3.2.2 Understanding the Notification Subscription Data Control

The Notification Subscription Data Control enables you to create a custom UI that is equivalent to the Subscription Preferences and Subscription Viewer task flows should these prove insufficient for your requirements.

You can use the data control as a means of adding application-level subscription preferences. For example, if you have developed your own preferences mechanism in your application, you can use the data control to add subscription preferences to that existing mechanism rather than using the Subscription Preferences task flow directly. Or you can build a custom subscription viewer UI, where all of the current user's object-level subscriptions are listed.

49.3.2.3 Notification Subscription Data Control Methods and Attributes

This section lists and describes the methods exposed in the Notification Subscription Data Control. It includes the following subsections:

- Section 49.3.2.3.1, "Method: getUserSubscriptionPreferences"
- Section 49.3.2.3.2, "Method: getScopeSubscriptionPreferences"
- Section 49.3.2.3.3, "Method: saveUserSubscriptionPreferences"
- Section 49.3.2.3.4, "Method: saveScopeSubscriptionPreferences"
- Section 49.3.2.3.5, "Method: getSubscriptions"
- Section 49.3.2.3.6, "Method: unsubscribe"

49.3.2.3.1 Method: getUserSubscriptionPreferences This method returns application-level subscription preferences for the current user.

Input Parameters

None

Return Values

Returns a collection of `SubscriptionPreference` objects. The `SubscriptionPreference` object indicates the user's preference for each service.

49.3.2.3.2 Method: getScopeSubscriptionPreferences This method returns the scope level subscription preferences for the current user.

This method is primarily useful in a Spaces application. In a Framework application, it is expected that the scope will always be the default scope, that is, the application. For the default scope, this method returns application-level preferences.

Input Parameters

The input parameter `scopeGuid` takes a value of type `String`. The value specifies the GUID of the scope for which the user's scope-level preferences are returned. In a Spaces application, the scope referenced here is equivalent to a *space*.

Return Values

Returns a collection of `SubscriptionPreference` objects. Each object indicates the current user's subscription preferences for each service within the specified scope.

49.3.2.3.3 Method: saveUserSubscriptionPreferences This method enables the application to commit and save changes to the user's application-level preferences. For example, if the user subscribes to all available services, then these changes can be committed by binding this method to the appropriate component on the UI (for example, an **Apply** button).

Input Parameters

None

Return Values

None

49.3.2.3.4 Method: saveScopeSubscriptionPreferences This method enables the application to commit and save changes to the user's scope-level preferences. For example, if the user subscribes to all the available services in the given scope, then these changes can be committed and saved by binding this method to the appropriate component on the UI (for example, an **Apply** button).

Input Parameters

The input parameter `scopeGUID` takes a value of type `String`. The value specifies the GUID of the scope for which the modified preferences are to be saved.

Return Values

None

49.3.2.3.5 Method: getSubscriptions The primary method for returning a list of the current user's object-level subscriptions. You can use this method to build a custom Subscription Viewer UI for showing all of a user's object-level subscriptions.

Input Parameters

Table 49–8 lists and describes the input parameters supported by this method.

Table 49–8 Input Parameters Supported by the method getSubscriptions

Input Parameter	Description
`FilterOption`	An object that contains filter conditions for querying a user's subscriptions. `FilterOption` supports filtering based on space name (Spaces only) and object name.
`SortOption`	An object that contains the sort or ordering condition for querying subscriptions. It supports sorting by object name, scope name (Spaces only), or the creation date of subscription.
`offset`	This input parameter takes an integer as a value. The offset for querying subscriptions. This is typically used while fetching the result set with pagination.
`fetchSize`	This input parameter takes an integer as a value. The maximum number of rows to be returned in one call.

Return Values

Returns a collection of `Subscription` objects matching the filter criteria and other input parameters in the order specified by the sort option.

49.3.2.3.6 Method: unsubscribe Used to unsubscribe from, or remove, a specific subscription. This method is typically used to add the unsubscribe action to the Subscription Viewer UI, where object-level subscriptions are exposed.

Note that unsubscribing from a particular service at the application and space level, or at either level, can be achieve by setting the appropriate flag in `SubscriptionPreference` and saving those via the appropriate `save*()` method listed above. The `Unsubscribe` method is useful within Subscription Viewer functionality.

Input Parameters

Table 49–9 lists and describes the input parameters supported by this method.

Table 49–9 Input Parameters Supported by the method Unsubscribe

Input Parameter	Description
`scopeGuid`	Takes a value of type `String`. The value specifies the GUID of the scope for which the user's scope-level preferences are returned. In a Spaces application, the scope referenced here is equivalent to a *space*.
`serviceId`	The ID of the unsubscribed service Valid service IDs include: ▪ `oracle.webcenter.collab.forum` ▪ `oracle.webcenter.doclib`
`objectId`	The GUID of the unsubscribed object.

Return Values

None

49.3.2.4 Notification Subscription Data Control Classes

The Notification Subscriptions Data Control exposes two classes as return values:

- `SubscriptionPreference`
- `Subscription`

49.3.2.4.1 SubscriptionPreference The class `SubscriptionPreference` represents application- or scope-level subscriptions as a preference and enables setting and unsetting of subscriptions for the corresponding service (this is followed by save call on the data control).

Table 49–10 lists and describes the properties associated with the `SubscriptionPreference` class.

Table 49–10 Properties Associated with the SubscriptionPreference Class

Property	Description
`hintsText`	A string containing the concatenation of all the applicable activities (description) within the service that generates notifications This is useful to display on the UI to tell the user what he is subscribing to.

Table 49–10 (Cont.) Properties Associated with the SubscriptionPreference Class

Property	Description
`serviceIcon`	An icon for the service
`serviceId`	ID of the corresponding service
`serviceName`	Display name of the service
`subscriptionEnabled`	A flag that indicates whether the subscription is enabled This attribute also has a setter to support the check/uncheck or select/deselect operation on the UI.
`userOverrideAllowed`	A flag that indicates whether to allow the user to override the default setting

49.3.2.4.2 Subscription The class `Subscription` is purely read-only and represents space- (Spaces only) and object-level subscriptions.

Table 49–11 lists and describes the properties associated with the **Subscription** class.

Table 49–11 Properties Associated with the Subscription Class

Property	Description
`creationDate`	The datetime this subscription was created
`objectId`	The ID of the object, if this represents object level subscription, otherwise `null`.
`objectName`	The name of the object, if this represents object level subscription, otherwise `null`.
`objectType`	The object type (as defined by the corresponding service) when this subscription represents object level subscriptions, otherwise `null`.
`scopeGuid`	The GUID of the scope or space.
`scopeName`	The display name of the scope or space.
`serviceId`	The ID of the service for this subscription object.
`serviceName`	The name of the service.
`userId`	The ID of the user who created this subscription.

50

Integrating the Recent Activities Service

This chapter describes how to integrate the Recent Activities service into your WebCenter Portal: Framework application. This service enables you to display the most recent changes to the services in your application.

This chapter includes the following sections:

- Section 50.1, "Introduction to the Recent Activities Service"
- Section 50.2, "Basic Configuration for the Recent Activities Service"
- Section 50.3, "Advanced Information for the Recent Activities Service"

For information about using the Recent Activities service, see Chapter "Working with the Recent Activities Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

50.1 Introduction to the Recent Activities Service

Oracle WebCenter Services are preconfigured to work with the Recent Activities service. Recent Activities enable users to view the most recent changes to the services in your application. For example, once you add the Documents service, it automatically produces the information that the Recent Activities service will use to display the most recent changes to the document library. This service is useful to your users who want a quick and easy way to view any additions or changes to a particular area of the application.

The Recent Activities service can track information from the following WebCenter Services:

- Documents added by the Documents service
- Announcements created by the Announcements service
- Discussion Forums created by the Discussions service
- Pages created or modified by the Page service
- List definitions created or modified by the Lists service

For more information about these services, see Chapter 33, "Integrating the Announcements Service," Chapter 34, "Integrating the Discussions Service," Chapter 30, "Integrating the Documents Service," and Chapter 19, "Enabling Runtime Creation and Management of Pages."

This section contains the following subsections:

- Section 50.1.1, "Understanding the Recent Activities Service"
- Section 50.1.2, "What Happens at Runtime"

50.1.1 Understanding the Recent Activities Service

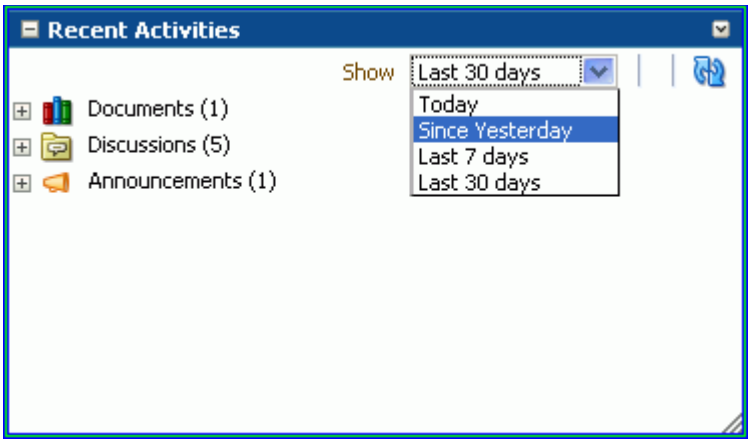
The Recent Activities service provides a summary view of recent changes to a variety of services. You can specify the range of time to consider recent by selecting a time range from a list at the top of the task flow. Recorded activities include additions or revisions of pages, documents, discussion forums, and the like.

By default, the Recent Activities service works with the Documents, Announcements, Discussions, and Page services. You can narrow the services that the Recent Activities service tracks. For more information about this setting, see the next section, Section 50.3, "Advanced Information for the Recent Activities Service." You can also learn more about using Oracle WebCenter Portal: Services in Section 2.4, "Introducing Oracle WebCenter Portal: Services."

The Recent Activities service compares somewhat to Activity Stream (for more information, see Section 38.1.1.1, "Activity Stream"). Both track the application activities of integrated services, though Activity Stream tracks a broader range of services. For example, Recent Activities tracks the Documents, Announcements, Discussions, and Page services. Activity Stream tracks these services as well as People Connections and Wikis and Blogs. Recent Activities tracks activities no matter who performs the action. Activity Stream tracks activities performed by a user's connections and includes information about who performed the activity. Recent Activities does not include names.

The basic difference between these two services can be summarized as follows: Recent Activities provides an overview of what is happening in an application. Activity Stream provides an overview of what is happening with a user's connections.

50.1.2 What Happens at Runtime



At runtime, the Recent Activities task flow fetches latest information about the services that are configured and running in your application. Figure 50–1 shows an example of the Recent Activities task flow at runtime, and displays the following activities that have occurred in the application since yesterday:

- one document has been uploaded or added using the Documents service
- five discussion threads have been modified or added using the Discussions service
- one announcement has been modified or added using the Announcements service

The time range choices (Last 30 days, Today, Since Yesterday, and so on) display based on the default values set for the Recent Activities Time Range parameter values at design time (see Table 50–1).

The Recent Activities service uses the search capabilities of WebCenter to query activities for specified periods. Search capabilities are implemented across the following WebCenter Portal service: Documents, Announcements, Discussions, and Pages. These services, if configured in an application, respond to queries of the Recent Activities service and return items pertinent to the search criteria. Responses to queries (search results) are always based on the search predicate, `DCMI_MODIFIED > [start time]`. Here `start time` is one of the time periods that you configured in the Edit Task Flow Binding dialog at design time. You can select a select a time period in the **Show** dropdown list at runtime.

Figure 50–1 Recent Activities Service at Runtime

50.2 Basic Configuration for the Recent Activities Service

This section describes how to add the Recent Activities service to your Framework application.

This section contains the following subsections:

- Section 50.2.1, "Setting up Connections for the Recent Activities Service"
- Section 50.2.2, "Adding the Recent Activities Service at Design Time"
- Section 50.2.3, "Modifying Recent Activities Service Task Flow Parameters"
- Section 50.2.4, "Setting Security for the Recent Activities Service"

50.2.1 Setting up Connections for the Recent Activities Service

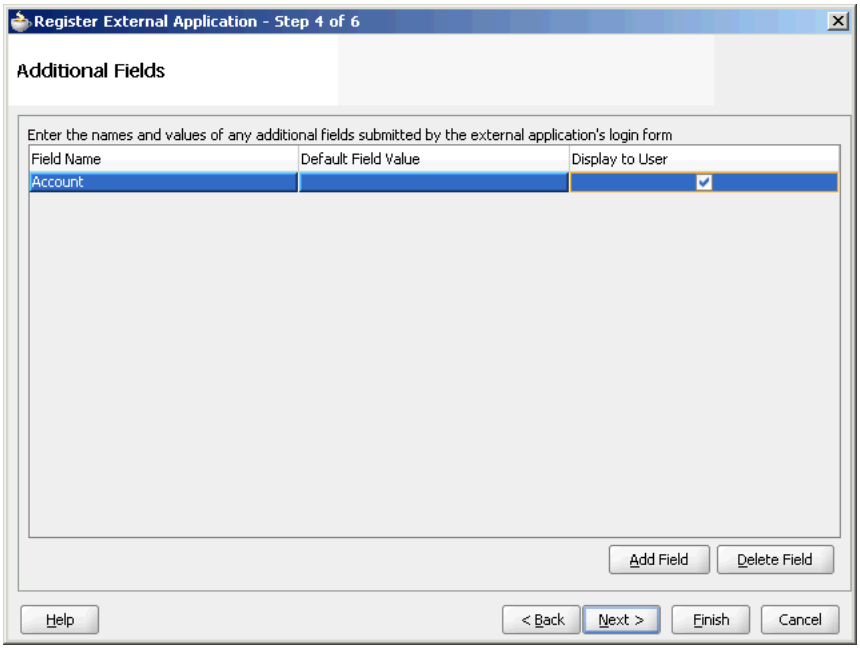
You do not need to set up specific connections for the Recent Activities service. You only need to ensure that the service(s) you are tracking with the Recent Activities service is configured. For more information about setting up connections for other services, see the individual services chapters in this guide.

50.2.2 Adding the Recent Activities Service at Design Time

To use the Recent Activities service, you must add its task flow to your application. Ensure that you have at least one of the services it tracks in your application. There is a single Recent Activities task flow available in the WebCenter Portal - Services Catalog, which you can add to your application to display information about services in your application to your users.

The Recent Activities service automatically picks up other services in your application and looks for recent activities within these services. Before running your application containing the Recent Activities service, however, you may want to ensure your application contains at least one of the services you wish to monitor.

To add the Recent Activities task flow to your application:



1. Follow the steps in Section 7.2.1, "How to Prepare Your Application to Consume Services" to implement security and create a customizable page in your Framework application.
2. Open the source of the customizable page.

3. Ensure that your application includes at least one of the services that the Recent Activities service tracks.

   Note: If you run an application that does not contain one of these services, the Recent Activities service displays an error saying `Warning: Unable to obtain recent activity data`.

4. Create a new external application by right-clicking the **ViewController** project in your application, then choosing **New**.
5. In the New Gallery, under General, select **External Applications**, then select **External Application** from the Items list.
6. Click **OK**.
7. In the **Application Name** field, enter a name for your application, such as `MyExternalApplication`, then click **Next**.
8. On the **General** page, leave the **Login URL** field empty.
9. In the **User Name/ID Field Name** field, enter a user name. The user name should match the login credentials of the servers you are tracking. For example, if you are tracking the Documents service with Oracle Content Server, the login credentials must match those of the user on Oracle Content Server.
10. In the **Password Field Name** field, enter a password.
11. Under Authentication Details, choose **POST**, then click **Next**.
12. On the **Additional Fields** page, click the **Add Field** button.
13. For the Field Name, enter `Account`.
14. Select the **Display to User** checkbox.

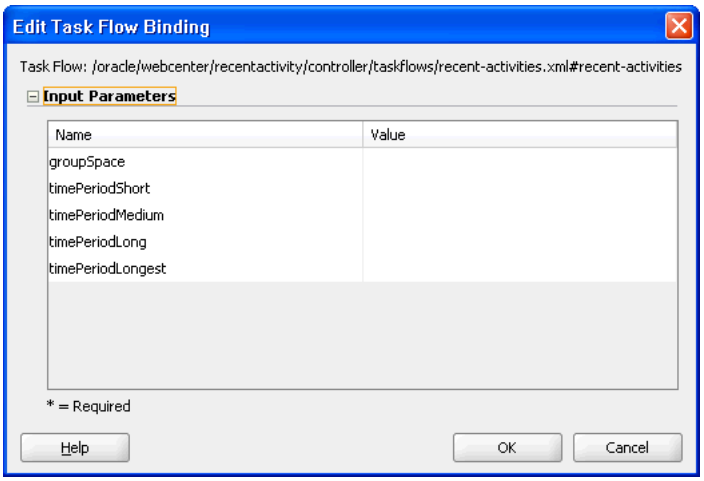


Figure 50–2 Additional Fields Page

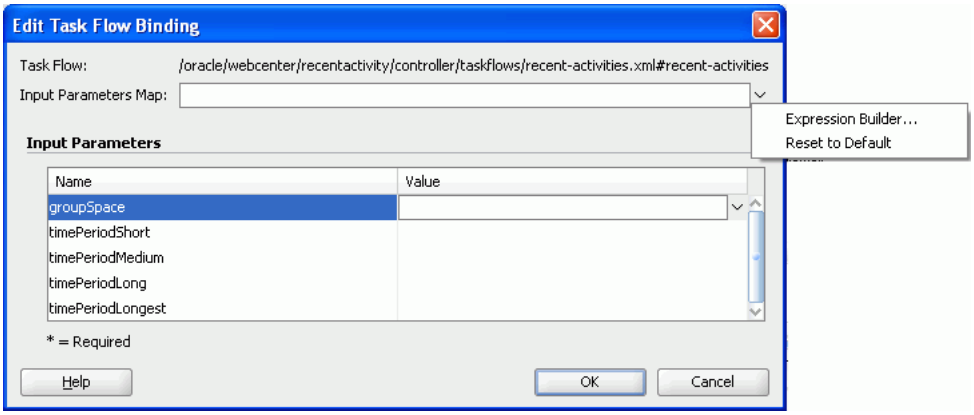
15. Click **Finish**.

16. In the Resource Palette, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
17. Click **Recent Activities** and drag it onto your page after the `<af:form>` tag, and choose **Region**.

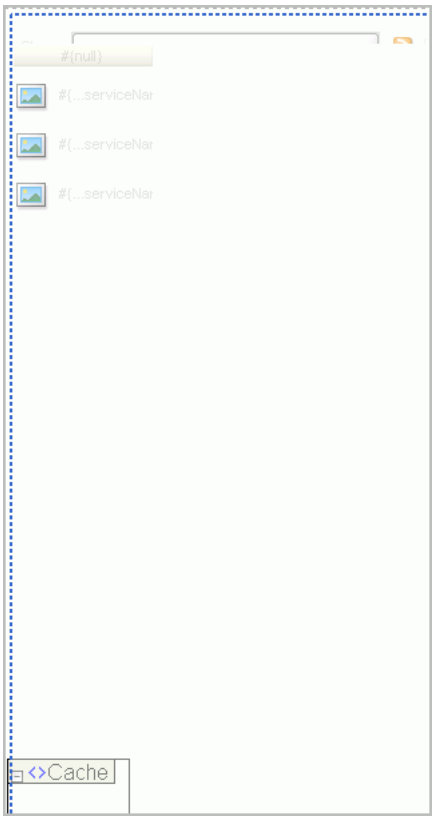
Figure 50–3 Edit Task Flow Binding Dialog



In the Edit Task Flow Binding dialog shown in Figure 50–4, you can set the values for the time range that displays at runtime. This time range controls what activities display, as you will see in the next section. If you leave these parameters empty, the Recent Activities service will use the default values of the service.

Table 50–1 describes the possible values for these parameters. The default values specified in this table come from the `adf-config.xml` file, as described in Section 50.3.1, "Refining the Behavior of the Recent Activities Service."

Table 50–1 Recent Activities Time Range Parameter Values



Parameter	Values
`groupSpace`	Leave the value of this parameter as `null`. Note: This parameter is only used within the Spaces application and is not relevant in non-scoped applications.
`timePeriodShort`	Default value: `Today` Possible values: `Today`, `Yesterday`, or a `Time in Minutes`
`timePeriodMedium`	Default value: `Since Yesterday` Possible values: `Today`, `Yesterday`, or a `Time in Minutes`
`timePeriodLong`	Default value: `10080` (10080 minutes is equivalent to 7 days.) Possible values: `Today`, `Yesterday`, or a `Time in Minutes`
`timePeriodLongest`	Default value: `43200` (43200 minutes is equivalent to 30 days.) Possible values: `Today`, `Yesterday`, or a `Time in Minutes`

Figure 50–4 Example of the Edit Task Flow Binding Dialog for the Recent Activities Service

18. Click **OK**. The binding displays on your page, as shown in Figure 50–5.

Figure 50–5 The Recent Activities Task Flow on a Page in the Design View

19. Save your project and run your page to the browser.

Note: When you add the Recent Activities task flow to your page, you will see a task flow parameter called **groupSpace**. The default value of this parameter is `null`, which tells the task flow to search the entire application for recent activities.

50.2.3 Modifying Recent Activities Service Task Flow Parameters

The Recent Activities service task flows have required and optional task flow binding parameters. You can adjust the parameter values when you drop the task flows onto a page or after you have placed a task flow on a page. For information about modifying parameters, see Section 33.2.2.3, "How to Modify Announcements Service Task Flow Parameters." The procedure for modifying parameters is identical across all task flows.

50.2.4 Setting Security for the Recent Activities Service

The Recent Activities service uses the security applied to the underlying services being analyzed. So, the information returned by the services only contains content for which the current user has at least View privileges. For example, a user who does not have View privileges to view content in a document library will not see recently added documents in the Recent Activities view. Similarly, a public user will only see activities returned on services exposed to the public, and do not require authentication to view.

50.3 Advanced Information for the Recent Activities Service

This section explains that in addition to the task flow parameters, you can further refine the behavior of the Recent Activities service. It also describes how you can obtain RSS news feed for your Recent Activities service.

This section contains the following subsections:

- Section 50.3.1, "Refining the Behavior of the Recent Activities Service"
- Section 50.3.2, "Obtaining RSS News Feed URL for the Recent Activities Service"

50.3.1 Refining the Behavior of the Recent Activities Service

You can change a variety of the Recent Activities service parameters after you have added it to your application. When you add the task flow to your page, you also automatically add the following entry to the `adf-config.xml` file, located in the Application Resources panel, under **Descriptors**, in the **ADF META-INF** folder:

```
  <recentactivityC:adf-recent-activity-config
 xmlns="http://xmlns.oracle.com/webcenter/recentactivity/config">
     <display-properties numServiceRows="25" shortPeriod="TODAY"
                         mediumPeriod="YESTERDAY" longPeriod="10080"
                         longestPeriod="43200"/>
    <services-filter>
      <exclude/>
    </services-filter>
  </recentactivityC:adf-recent-activity-config>
```

You can change the settings described in Table 50–2 in this entry.

Table 50–2 Recent Activities Settings in the adf-config.xml File

Setting	Description
`numServiceRows`	Default value: `25` The maximum number of rows displayed for a single service. If there are more recent activity results than this, the most recent ones up to this number are returned. For example, if there are 32 recently modified documents and this setting is 25 then only the most recent 25 will show up in the results.

Table 50–2 (Cont.) Recent Activities Settings in the adf-config.xml File

Setting	Description
`shortPeriod`	Default value: `Today` See Table 50–1. This setting is the same as the `timePeriodShort` task flow parameter, and is used when the task flow parameter is not specified.
`mediumPeriod`	Default value: `Yesterday` See Table 50–1. This setting is the same as the `timePeriodMedium` task flow parameter and is used when the task flow parameter is not specified.
`longPeriod`	Default value: `10080` (Last 7 Days) See Table 50–1. This setting is the same as the `timePeriodLong` task flow parameter and is used when the task flow parameter is not specified.
`longestPeriod`	Default value: `43200` (Last 30 Days) See Table 50–1. This setting is the same as the `timePeriodLongest` task flow parameter and is used when the task flow parameter is not specified.

`services-filter`	Default value: `null`
	Use this tag to filter out services you do not wish to track with this service. The following example omits any changes to the Page service from displaying in the Recent Activities service:
	`<services-filter>`
	`  <exclude>oracle.webcenter.page</exclude>`
	`</services-filter>`
	By default, no services are omitted.

50.3.2 Obtaining RSS News Feed URL for the Recent Activities Service

You can expose WebCenter Portal: Spaces functionality in a Framework application. Your Framework application users can find out what is happening in a specific group space through RSS news feeds.

Configure RSS news feeds for the Recent Activities service to enable users to view group space recent activities from within a portal. To obtain the group space RSS news feed URL for the Recent Activities service, use either of the following WebCenter Portal: Spaces APIs:

- `getServiceRssFeedURL`
- `GetServiceRssFeedURLbyGUID`

To obtain an RSS feed URL, you must identify the group space (by name or GUID) and specify the service required (by service ID). The service ID for the Recent Activities service is `GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID`. For information about how to use these APIs, see Section 57.2.5.3.9, "Retrieving RSS Feed URLs for Space Services."

51

Integrating the Worklist Service

This chapter describes how to integrate the Worklist service into your application. Worklists enable users to view and take action on all tasks and notifications from a BPEL (Business Process Execution Language) server all in one place.

This chapter includes the following sections:

- Section 51.1, "Introduction to the Worklist Service"
- Section 51.2, "Roadmap - Configuring the Worklist Service for WebCenter Portal: Framework Applications"
- Section 51.3, "Basic Configuration for the Worklist Service"
- Section 51.4, "Advanced Information for the Worklist Service"

For information about managing and using the Worklist service, see:

- Chapter "Managing the Worklist Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- Chapter "Working with the Worklist Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

51.1 Introduction to the Worklist Service

The Worklist service enables you to show Business Process Execution Language (BPEL) Worklist items assigned to the currently authenticated user. The BPEL Worklist items are open BPEL tasks from one or more BPEL Worklist Repositories to which your application is connected. The Worklist displays BPEL Worklist items that are a result of a task invoked as part of a BPEL Workflow process, or are a result of a message being sent to the Worklist channel on the Oracle User Messaging Service.

This section contains the following subsections:

- Section 51.1.1, "Understanding Worklists"
- Section 51.1.2, "Requirements for the Worklist Service"
- Section 51.1.3, "What Happens at Runtime"

51.1.1 Understanding Worklists

The Worklist service provides a personal, at-a-glance view of business processes that require your users' attention. These can include a request for document review or other types of business processes that come directly from your enterprise applications.

Worklist items come from a variety of sources. Some Worklist items are kicked off by events that are associated with an externally defined workflow. A workflow maps the

route an item follows once an event kicks off. This type of workflow is defined in a Worklist BPEL server, such as Oracle BPM Worklist.

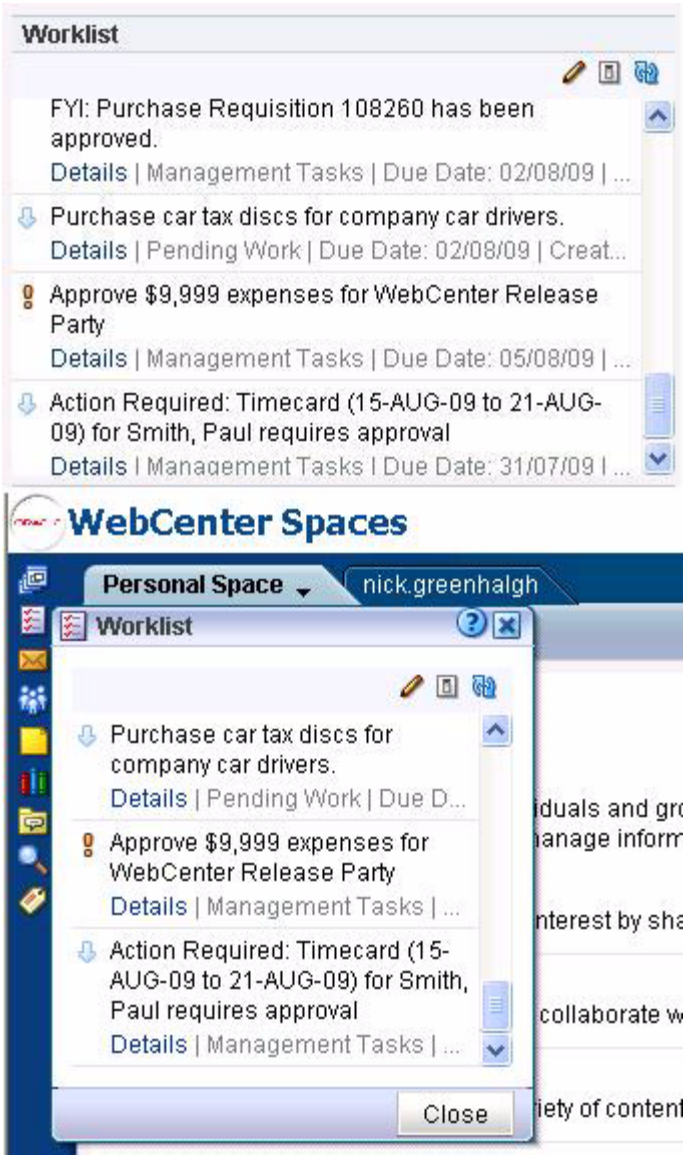
Messages, alerts, and notifications might also come from the User Messaging Service (UMS). The Worklist task flow includes a control for accessing messaging preferences on this server. Use these controls to specify the channels over which to receive Oracle User Messaging Service messages and to define messaging filters.

> **See Also:** *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* for more information about the service at runtime.

51.1.2 Requirements for the Worklist Service

To use the Worklist service, you must have a BPEL server installed. For information on installing BPEL for the Worklist service, see the "Back-End Requirements for the Worklist Service" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

For the Worklist to properly function, it must reside on a secured page, as the service uses the currently authenticated user to access the BPEL server. If the page or application that contains the Worklist service is not secured, you will encounter exception errors.



51.1.3 What Happens at Runtime

At runtime, the Worklist task flow fetches latest Worklist workflow items from BPEL workflows configured in the BPEL server. For more information, see the chapter "Working with the Worklist Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To get a list of the items assigned to a user, the Worklist service uses the WebService access function of the public BPM client API. The Worklist service uses SAML authentication to authorize the logged-in user to fetch the list of latest items from the BPEL repository. The Worklist service fetches 25 most recent items for each Worklist connection, and determines the order of these items by using a predicate on the `TaskQueryService` API. For more information, see "Building a Custom Worklist Client" in *Oracle Fusion Middleware Developer's Guide for Oracle SOA Suite*.

Figure 51–1 shows the Worklists service at runtime.

Figure 51–1 Worklist Service at Runtime

51.2 Roadmap - Configuring the Worklist Service for WebCenter Portal: Framework Applications

Figure 51–2 and Table 51–1 in this section provide an overview of the prerequisites and tasks required to get the Worklist service working in Framework applications.

Figure 51–2 Configuring the Worklist Service for WebCenter Portal: Framework Applications

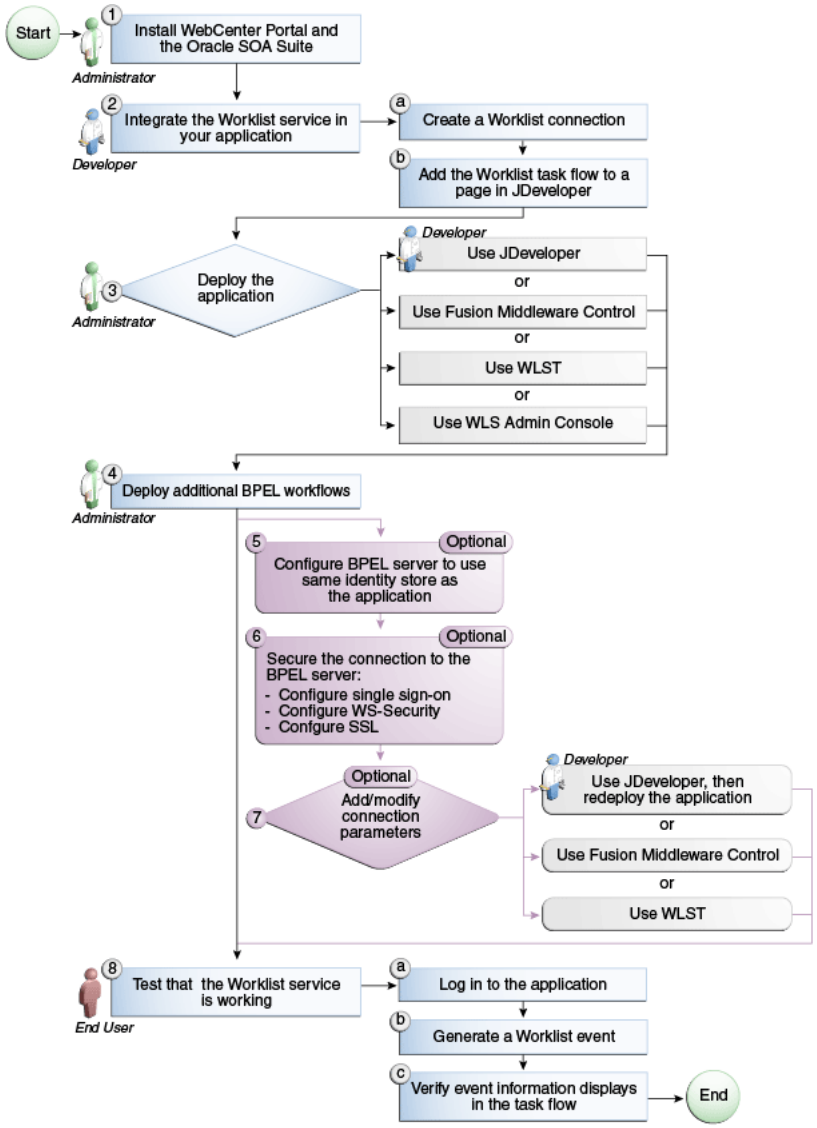


Table 51–1 Configuring the Worklist Service for WebCenter Portal: Framework Applications

Actor	Task	Sub-Task
Administrator	**1.** Install Oracle WebCenter Portal and the Oracle SOA Suite	
Developer	**2.** Integrate the Worklist service in your Framework application	**2.a** Create a Worklist connection **2.b** Add the Worklist task flow to a page in JDeveloper

Table 51–1 (Cont.) Configuring the Worklist Service for WebCenter Portal: Framework Applications

Actor	Task	Sub-Task
Developer/Administrator	**3.** Deploy the Framework application using one of the following tools: ■ JDeveloper (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator) ■ WLS Admin Console (Administrator)	
Administrator	**4.** Deploy additional BPEL workflows using the Oracle BPM Worklist application	
Administrator	**5.** (Optional): Configure BPEL server to use same identity store as the application	
Administrator	**6.** (Optional): Secure the connection to the BPEL server	**6.a** Configure single sign-on **6.b** Configure WS-Security **6.c** Configure SSL
Developer/Administrator	**7.** (Optional): Add/modify connection parameters using one of the following tools: ■ JDeveloper, then redeploy the application (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator)	
End User	**8.** Test that the Worklist service is working	**8.a** Log in to the Framework application **8.b** Generate a worklist event **8.c** Verify event information displays in the task flow

51.3 Basic Configuration for the Worklist Service

This section describes how to set up a connection for the Worklist service and add the task flow to your Framework application.

This section contains the following subsections:

- Section 51.3.1, "Setting up Connections for the Worklist Service"
- Section 51.3.2, "Adding the Worklist Service at Design Time"
- Section 51.3.3, "Setting Security for the Worklist Service"

51.3.1 Setting up Connections for the Worklist Service

To use the Worklist service, you must establish a connection to one or more BPEL servers. This section describes these connections and how to create them in a Framework application.

51.3.1.1 Worklist Service Connections

The Worklist service relies on a BPEL server. Once you create a connection using the Create Worklist Connection dialog, the connection is registered in your application's `connections.xml` and referenced in your application's `adf-config.xml`. You can see the connections to your BPEL Worklist Repositories in the Application Resources pane.

> **Note:** While you can set up the connections to back-end servers at design time in Oracle JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

51.3.1.2 How to Set Up Connections for the Worklist Service

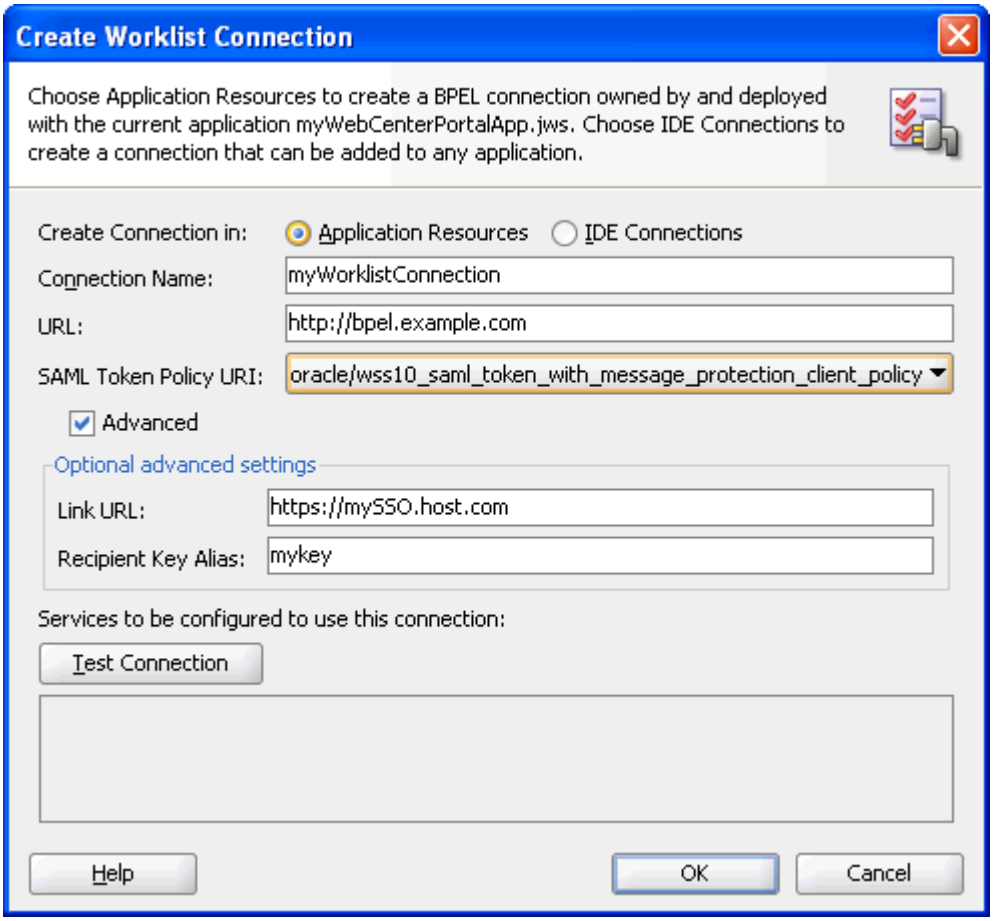
The Worklist service provides a task flow that you can add to your application at design time or at runtime. Before you can run the task flow, you create a connection from your application to a BPEL server.

> **Note:** The application you use must be prepared for service consumption. For information about doing so, see Chapter 7, "Preparing Your Application for WebCenter Portal Services."

To set up the connection for the Worklist service:

1. In the Application Resources panel for your application, right-click **Connections**, then choose **New Connection> Worklist**.
2. In the Create Worklist Connection dialog, choose whether to create the connection in the Application Resources (only the current application can use this connection) or IDE Connections (other applications you create can use the same connection).
3. In the **Connection Name** field, enter a name for your connection. This name will be used as the display name of the Worklist server.

   > **Note:** At runtime, when users view their worklist items, they can choose to group the items by "Worklist Server." The Worklist Server name used is the name you enter in the Connection Name field.



4. In the **URL** field, enter the location of your BPEL/SOA server, such as `http://bpel.example.com`. This is the URL for the managed server running the SOA processes.
5. Select the **SAML Token Policy URI** to use for this server (Figure 51–3).

   SAML (Security Assertion Markup Language) is an XML-based standard for passing security tokens defining authentication and authorization rights. An attesting entity (that already has trust relationship with the receiver) vouches for the verification of the subject by method called sender-vouches. Options available are:

   - SAML Token Client Policy (**oracle/wss10_saml_token_client_policy**) - Select to verify your basic configuration without any additional security. This is the default setting.

- SAML Token With Message Client Policy (**oracle/wss10_saml_token_with_message_protection_client_policy**) - Select to increase the security using SAML-based BPEL Web Services. If selected, you must configure keys stores both in your Framework application and in the BPEL application. For more information about this configuration, see the "Configuring Policies" in the *Oracle Application Server Web Services Security Guide*.

Figure 51–3 Create Worklist Connection Dialog

6. To enable advanced settings, select **Advanced**:

   - In the **Link URL** field, specify the URL used to link to the BPEL server. Only required if it is different to the BPEL SOAP URL, for example, when SSO or HTTPS is configured. Use the format: `protocol://host:port`.

     For example, `http://mySSO.host.com:7777`.

     This URL is used to build SSO- or HTTPS-enabled URL links to worklist items. Whereas the URL property of the Worklist service is used to access the BPEL Task Query Service, which for performance reasons does not need to go through HTTPS or an SSO server.

   - In the **Recipient Key Alias** field, enter the recipient key alias to be used for message protected SAML policy authentication. Only required when the BPEL server connection is using a SAML token policy for authentication and the application's Worklist service is using multiple BPEL server connections. For information about working with recipient key alias and WS-security, see the

chapter "Configuring WS-Security" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

7. Click **Test Connection** to validate the URL.
8. Click **OK**.

   The new connection displays in the Application Resources panel under **Connections**.

51.3.2 Adding the Worklist Service at Design Time

This section describes the Worklist task flow and how to add it to your application.

51.3.2.1 Worklist Service Task Flows

There is one task flow associated with the Worklist service, called "Worklist." You can find this task flow in the WebCenter Portal - Services Catalog in the Resource Palette.

51.3.2.2 How to Add the Worklist Service to your Application

You can add the Worklist service to your application before or after you have created your connection. However, you must set up your connection before you run the service.

To add the Worklist task flow to your application:

1. Follow the steps in Section 7.2.1, "How to Prepare Your Application to Consume Services" to implement security and create a customizable page in your application.
2. Open the page where you wish to add the Worklist task flow.
3. In the Resource Palette, in the My Catalogs pane, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
4. Drag the worklist task flow onto the desired region on the page, then choose **Region** from the pop-up list. The task flow displays on the page. For example, in the Source view, you will see Figure 51–4.

Figure 51–4 Worklist Task Flow in the Page Source

```
<f:facet name="first">
    <af:region value="#{bindings.worklist1.regionModel}"
               id="worklist1"/>
  </f:facet>
```

5. Save your project, then run your page to a browser. The Worklist service displays in your browser.

51.3.3 Setting Security for the Worklist Service

The Worklist service displays the tasks for the currently authenticated user. So, for users to store and retrieve Worklist tasks on the BPEL server from your application, you must set up security on the application (as described in Section 7.2.1.1, "Implementing Security for Services"). The user names need to either exist in a shared user directory (LDAP), or set up similarly (same user name) on both the Framework application and the BPEL Server. For example, if the user `rsmith` needs to use the Worklist service in your Framework application to store and retrieve tasks from the

BPEL server, you must ensure that the user `rsmith` exists on both the BPEL server and within your application.

To enable users to perform actions on assigned Worklist tasks, you can configure SSO. If you do not configure SSO, the users will be prompted to log into the Worklist Task Details page on the BPEL server. For more information, see the *Oracle Containers for J2EE Security Guide*.

Only authenticated users can view Worklist tasks on the BPEL server to which they have permissions to view. If the application end user does not supply appropriate credentials, or if the page containing the Worklist service is not secured, she will not see any Worklist items stored on the BPEL server and exception errors may occur.

51.4 Advanced Information for the Worklist Service

The Worklist service collates all the Worklist items for the authenticated user from all connections in your application defined for the Worklist service. You can use the create connection method described in Section 51.3.1.2, "How to Set Up Connections for the Worklist Service" to create additional connections, or right-click the connection name in the Application Resources list and choose **Delete** to remove a connection.

52 Integrating the Events Service

This chapter explains how to integrate the Events service into a WebCenter Portal: Framework application at design time.

This chapter includes the following sections

- Section 52.1, "Introduction to the Events Service"
- Section 52.2, "Basic Configuration for the Events Service"
- Section 52.3, "Using the Events Service REST APIs"
- Section 52.4, "Troubleshooting the Events Service"

For information about managing and including events, see:

- "Managing the Events Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- "Working with the Events Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

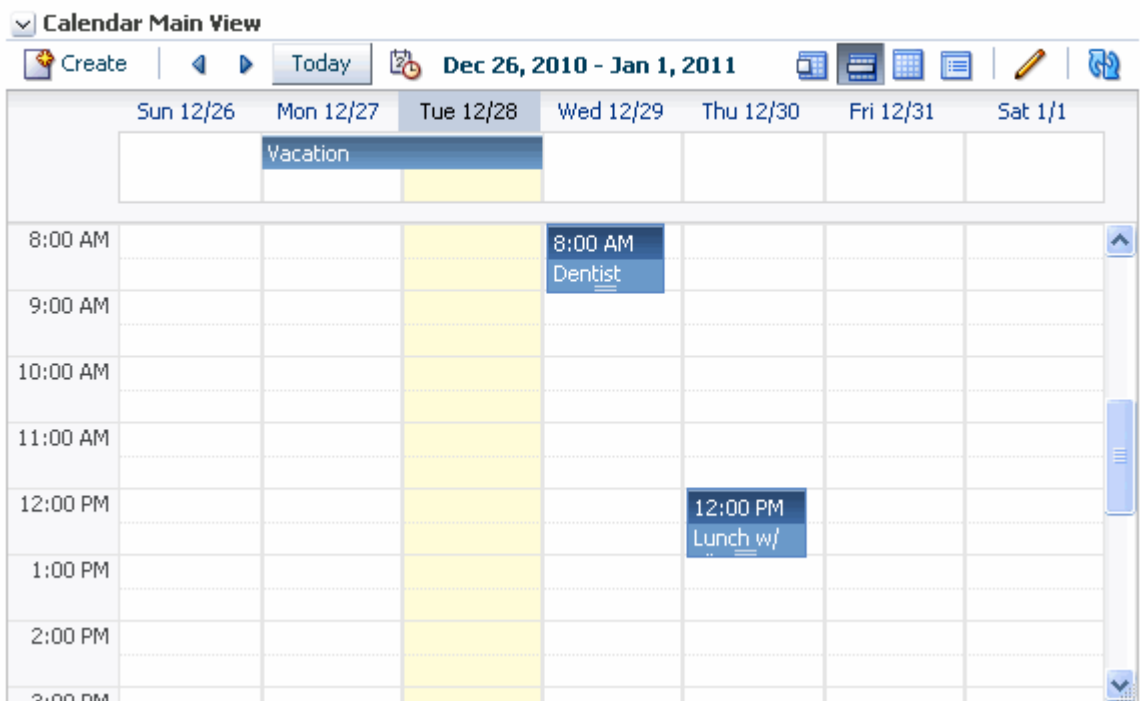
52.1 Introduction to the Events Service

In Framework applications, the Events service provides access to your personal Microsoft Exchange calendar.

This section includes to following subsections:

- Section 52.1.1, "Understanding the Events Service"
- Section 52.1.2, "Requirements for the Events Service"
- Section 52.1.3, "What Happens at Runtime"

52.1.1 Understanding the Events Service



With the Events service, users can:

- Display their Microsoft Exchange calendars in the Framework application.
- Create, edit, and delete events in their Exchange calendars.
- Change the view of the Events task flow to view calendar events by month, week, or day, or as a list.
- Personalize the Events task flow to display events based on the start time, secondary time zone, list type, and list count

The Events service is integrated with many WebCenter Portal services, such as Links, Mail, and Search.

Figure 52–1 shows an example of a personal calendar in a Framework application.

Figure 52–1 Personal Calendar

52.1.2 Requirements for the Events Service

The Events service integrates with Microsoft Exchange Server to provide access to personal calendars. You must install and configure the appropriate server.

For information about installing and configuring Exchange Server, see "Events Service Prerequisites" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

52.1.3 What Happens at Runtime

At runtime, users can view events from their Microsoft Exchange calendars.

For more information about the service at runtime, see the chapter "Working with the Events Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Note: *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* discusses both personal events and space events. Only the information on personal events applies to Framework applications.

52.2 Basic Configuration for the Events Service

This section includes the following subsections:

- Section 52.2.1, "Configuration Roadmap for the Events Service"
- Section 52.2.2, "Setting Up a Connection for the Events Service"

- Section 52.2.3, "Adding the Events Service at Design Time"
- Section 52.2.4, "Setting Security for the Events Service"

52.2.1 Configuration Roadmap for the Events Service

The flow chart (Figure 52–2) and table (Table 52–1) in this section provide an overview of the prerequisites and tasks required to get the Events service working in Framework applications.

Figure 52–2 Configuring the Events Service for WebCenter Portal: Framework Applications

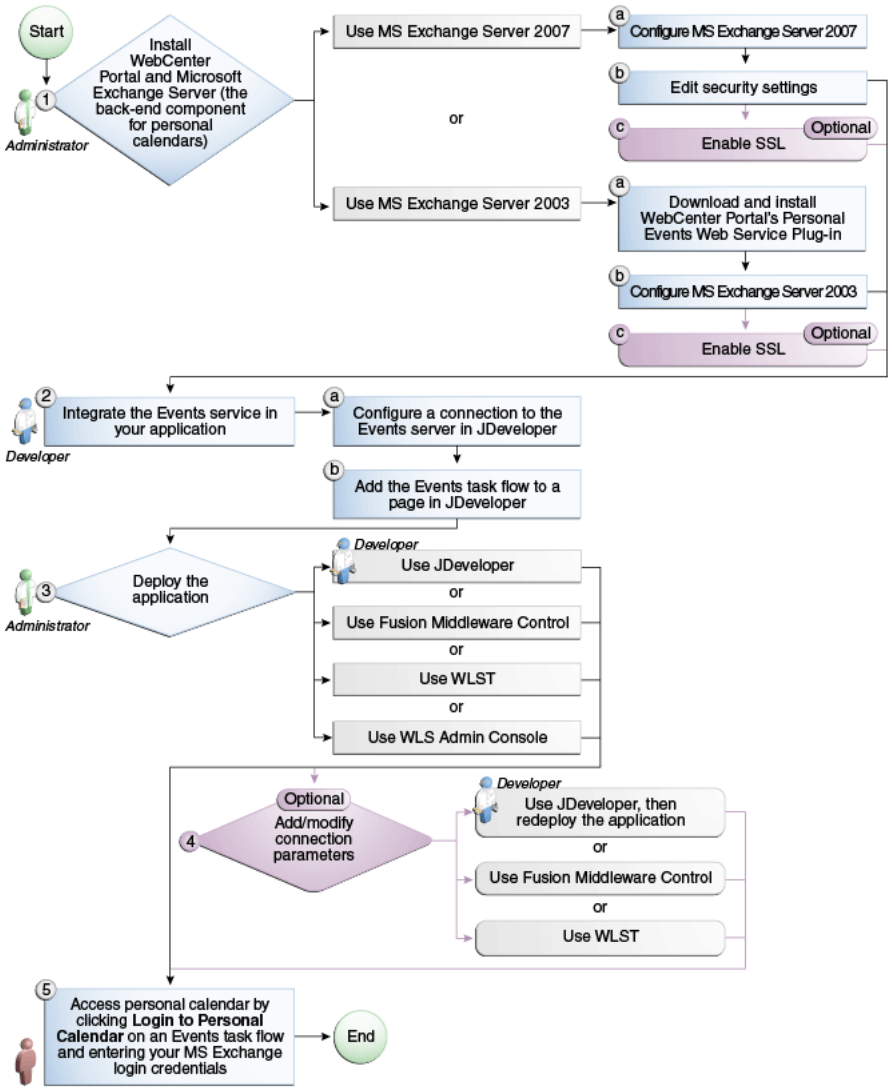


Table 52–1 Configuring the Events Service for WebCenter Portal: Framework Applications

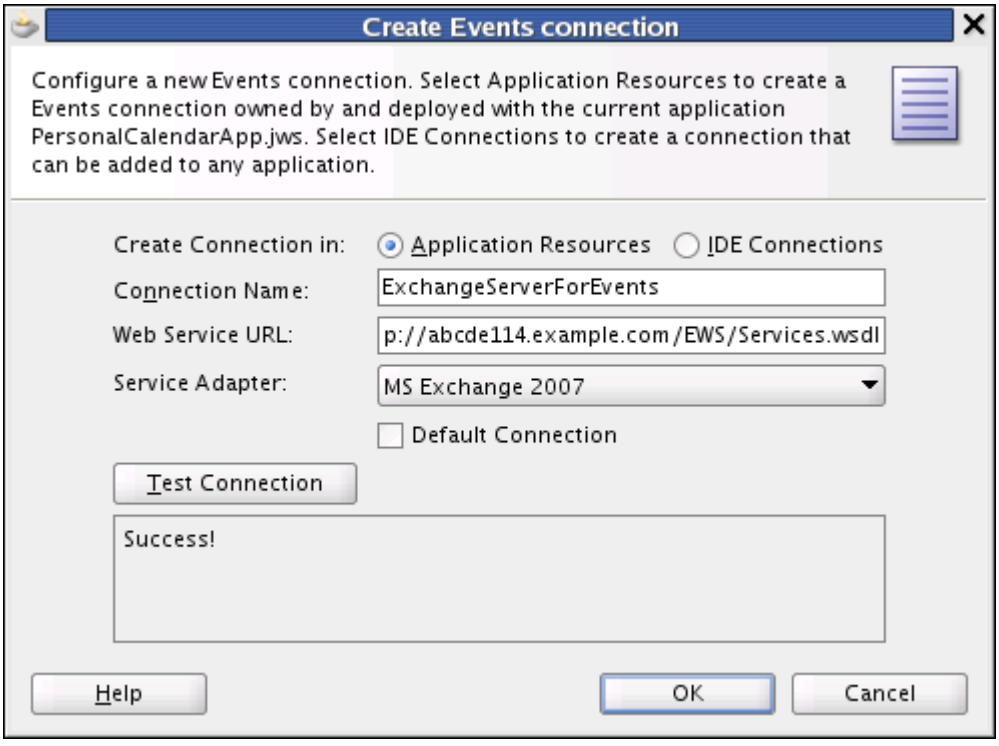
Actor	Task	Sub-task	Notes
Administrator	**1.** Install WebCenter Portal and Microsoft Exchange Server		MS Exchange Server is the back-end component for personal calendars
	■ Use MS Exchange Server 2007	**1.a** Configure MS Exchange Server 2007 **1.b** Edit security settings **1.c** (Optional) Enable SSL	
	■ Use MS Exchange Server 2003	**1.a** Download and install WebCenter Portal's Personal Events Web Service Plug-in **1.b** Configure MS Exchange Server 2003 **1.c** (Optional) Enable SSL	
Developer	**2.** Integrate the Events service in your application	**2.a** Configure a connection to the events server in JDeveloper **2.b** Add an Events task flow to a page in JDeveloper	
Developer/ Administrator	**3.** Deploy the application using one of the following tools: ■ JDeveloper (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator) ■ WLS Admin Console (Administrator)		
Developer/ Administrator	**4.** Add/modify connection parameters using one of the following tools: ■ JDeveloper, then redeploy the application (Developer) ■ Fusion Middleware Control (Administrator) ■ WLST (Administrator)		
End User	**5.** Access personal calendar		Click **Login to Personal Calendar** on the Events task flow and enter your MS Exchange login credentials

52.2.2 Setting Up a Connection for the Events Service

To take advantage of the Events service, you must first create a connection to the Exchange server from your Framework application. To do this, ensure that you have the connection information for the server.

You can register several server connections for the Events service, but only one connection is active at a time.



Note: While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the section "Registering Events Servers Using Fusion Middleware Control" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To set up a connection for the Events service:

1. In JDeveloper, open the application in which you plan to consume the Events service.
2. To create a connection that is available to all applications, in the Resource Palette, click the **New** icon and choose **New Connection** and then **WebCenter Personal Event Connection**.

   To create a connection that is available to the current application only, in the Application Resources panel of the Application Navigator, right-click **Connections** and choose **New Connection** and then **WebCenter Personal Event Connection**.
3. In the Create Events Connection dialog, in the **Connection Name** field, enter a meaningful name, for example `ExchangeServerForEvents` (Figure 52–3).

Figure 52–3 Create Events Connection Dialog

4. In the **Web Service URL** field, enter the URL of the web service exposing the event application. Use the format:

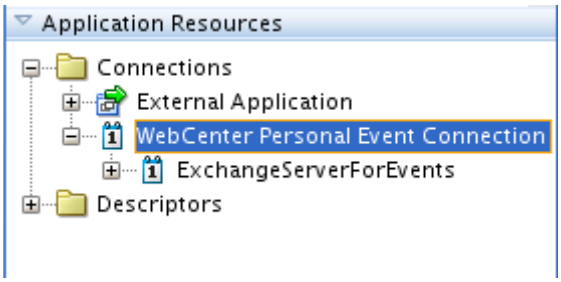
   protocol`://`*host*`:`*port*`/`*appWebServiceInterface*`/`*WSName*

   For example:

```
http://myexchange.com:80/ExchangeWS/PersonalEventsWebService.asmx
http://myexchange.com:80/EWS/Services.wsdl
```

5. From the **Service Adapter** dropdown list, select the version of the Microsoft Exchange server to connect to:
   - **MSExchange2003**
   - **MSExchange2007**
6. Select **Default Connection** to use this connection for the Events service. You can have multiple connections, but only one can be active (default).

   Note: After you create a connection as the active connection, you cannot edit it so that it is not the default. To use a different active connection, you must create a new connection and mark that as the default connection.



7. Click **Test Connection**, and if it is successful, then click **OK**.

   If the test is not successful, check the settings and try again.
8. If you created the connection in the Resource Palette, you must add it to the application.

   In the Resource Palette, under IDE Connections, right-click the connection and choose **Add to Application**.

   The connection is listed in the Application Resources panel of the Application Navigator (Figure 52–4). An external application connection is also created to store the user names and passwords of users who connect to the Exchange server.

Figure 52–4 Application Resources - Personal Event Connection

52.2.3 Adding the Events Service at Design Time

This section includes the following subsections:

- Section 52.2.3.1, "Events Task Flows"
- Section 52.2.3.2, "How to Add the Events Service to Your Application"

52.2.3.1 Events Task Flows

The Events service task flows enable you to add a main view or quick view of events to a page.

Table 52–2 Events Service Task Flows

Task Flow	Description
Calendar Main View	This task flow displays a calendar of events and provides users with options to view events in day, week, month, or list view.
Calendar Mini View	This task flow displays a calendar, similar to Calendar Main View, however, it requires less space. Only users with permission to edit the page and task flow can configure the event view (available in day or list view).

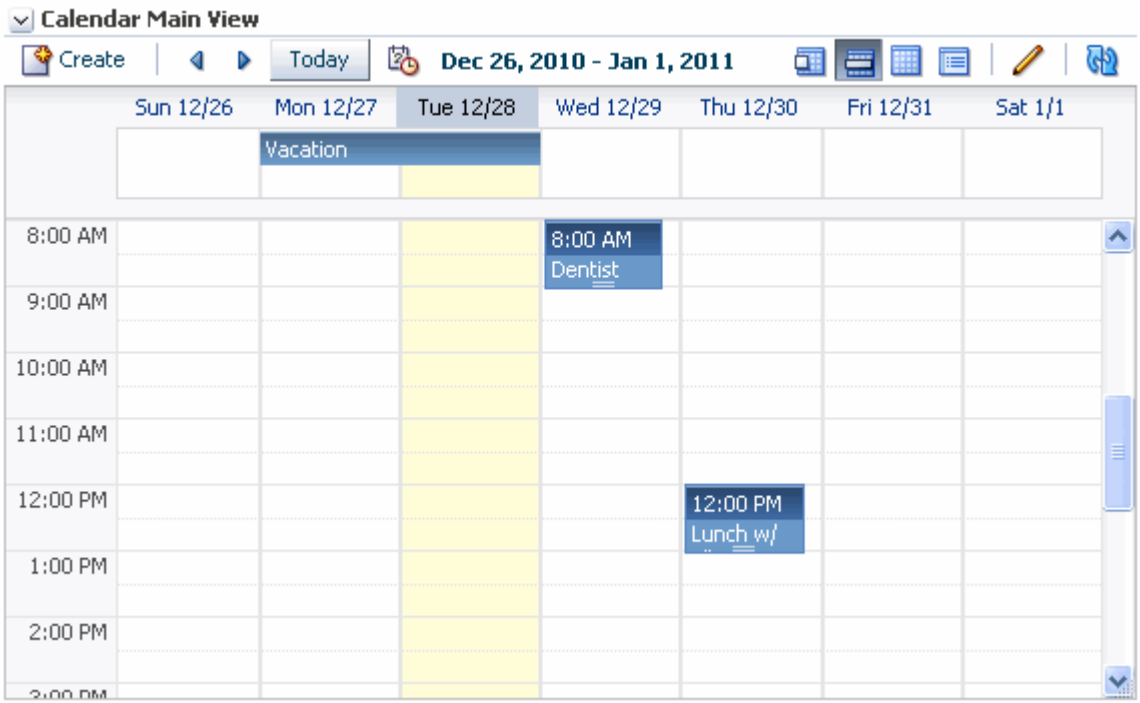
52.2.3.2 How to Add the Events Service to Your Application

To add an Events task flow to your application:

1. Follow the steps described in Section 7.2, "Preparing Your Framework Application to Consume Services," to implement security and create a new customizable page in your application.
2. Open the page on which you want to add the task flow.
3. In the Resource Palette, expand **My Catalogs**, **WebCenter Portal - Services Catalog**, and **Task Flows**.
4. Drag **Calendar Main View** or **Calendar Mini View** and drop it onto the page, inside the `af:form` tags.
5. When prompted, select **Region** as the way to create the task flow.
6. The Events task flows are contained within the `event-view.jar` library, so click **Add Library** to add the library to your project. This operation may take a moment to complete.
7. Click **OK**.
8. Save and run your page.

   Figure 52–5 shows the Calendar Main View task flow at runtime.

Figure 52–5 Calendar Main View Task Flow



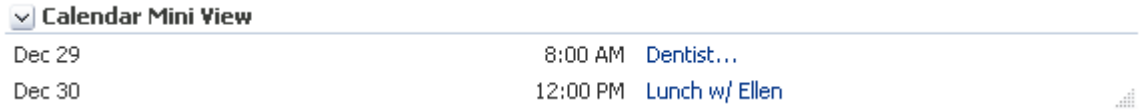


Figure 52–6 shows the Calendar Mini View task flow at runtime.

Figure 52–6 Calendar Mini View Task Flow

52.2.4 Setting Security for the Events Service

When you create the connection to the Microsoft Exchange Server for the Events service, an external application connection is also created. This external application connection is created to store the user name and password of users in the Microsoft Exchange Server. For more information, see Section 52.2.2, "Setting Up a Connection for the Events Service."

52.3 Using the Events Service REST APIs

WebCenter Portal provides REST APIs to support the Events service. Use the Events service REST APIs to create your own interface for providing access to space events.

> **Note:** The Events service REST APIs are available for space events only. You cannot use REST APIs to work with personal events.

This section describes the REST APIs associated with the Events service. It includes the following subsections:

- Section 52.3.1, "Events Entry Point"

- Section 52.3.2, "Events Resource Type Taxonomy"
- Section 52.3.3, "Security Considerations"
- Section 52.3.4, "Events Resource Types"

52.3.1 Events Entry Point

The entry point for the Events service can be reached only through a space. First you need to navigate to the appropriate space and then find the link element with a `resourceType` of:

```
urn:oracle:webcenter:events:gsEvents
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Events service.

For more information about the Resource Index, see Section 54.5.1, "The Resource Index."

For more information about resource types, see Section 54.5.2.1, "Resource Type."

52.3.2 Events Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resources types, see the appropriate section in Section 52.3.4, "Events Resource Types."

The taxonomy for the Events service is:

```
urn:oracle:webcenter:events:gsEvents
  urn:oracle:webcenter:events:gsEvent
urn:oracle:webcenter:events:gsCategories
  urn:oracle:webcenter:events:gsCategory
```

52.3.3 Security Considerations

There are no specific security considerations for this service. For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

52.3.4 Events Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- Section 52.3.4.1, "urn:oracle:webcenter:events:gsEvents"
- Section 52.3.4.2, "urn:oracle:webcenter:events:gsEvent"
- Section 52.3.4.3, "urn:oracle:webcenter:events:gsCategories"
- Section 52.3.4.4, "urn:oracle:webcenter:events:gsCategory"

52.3.4.1 urn:oracle:webcenter:events:gsEvents

Use this resource to identify the URI to use to retrieve (`GET`) and create (`POST`) space events. The response from a `GET` operation includes each space event in this collection of events, and each event includes links used to operate on that event. The response from a `POST` operation includes the event that was created in this collection of events and a link to operate on that event.

Navigation Paths to gsEvents

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
   spaces
      gsEvents
```

Supported Methods for gsEvents

The following methods are supported by this resource:

- `GET`
  - **request - body:** none, **Parameters:** `startIndex`, `itemsPerPage`, `utoken`

    For information about these common parameters, see "Common Request Query Parameters".

    The following additional parameters are available:

    * `startDate`—the date from which to start listing space events
    * `endDate`—the date at which to stop listing space events

    For the start and end dates, use the format `YYYY-MM-DD`, for example `2011-09-01`. You can also specify a time (for example, `2011-09-01T09:00:00`) and a timezone sign (for example, for UTC, `2011-09-01T09:00:00Z`).
  - **response - body:** 0 or more events
- `POST`
  - **request - body:** event
  - **response - body:** event

Resource Types Linked to From gsEvents

Table 52–3 lists the resource types that the client can link to from this resource.

Table 52–3 Related Resource Types for gsEvents

rel	resourceType
self	urn:oracle:webcenter:events:gsEvents

52.3.4.2 urn:oracle:webcenter:events:gsEvent

Use this resource type to identify the URI to use to read (`GET`), update (`PUT`), or delete (`DELETE`) a specific space event. The response from a `GET` operation includes the specific event identified by the URI. The response from a `PUT` operation includes the modified version of the event identified by the URI. The response from a `DELETE` operation is a 204.

Navigation Paths to gsEvent

```
resourceIndex
   spaces
      gsEvents
         gsEvent
```

Supported Methods for gsEvent

The following methods are supported by this resource:

- `GET`
  - **request - body:** none
  - **response - body:** event
- `PUT`
  - **request - body:** event
  - **response - body:** event
- `DELETE`
  - **request - body:** none
  - **response - body:** none

Writable Elements for gsEvent

Table 52–4 lists the writable elements for this resource.

Table 52–4 Writable Elements for gsEvent

Element	Type	Required	Constraints	Description
`category`	String	No	The name of an event category defined for the space	The category to which the event belongs
`details`	String	No	1 or more characters	Additional details about the event
`endTime`	Date	Yes	YYYY-MM-DDT HH:MM:SS `endTime` must be greater than or equal to `startTime`	The date and time at which the event ends
`location`	String	No	1 or more characters	The location at which the event takes place
`priority`	String?	No	1 - Highest 2 - High 3 - Normal 4 - Low 5 - Lowest	The priority of the event, which determines where it appears when events clash
`startTime`	Date	Yes	YYYY-MM-DDT HH:MM:SS	The date and time at which the event starts
`summary`	String	Yes	1 or more characters	A brief description of the event to serve as the title of the event

Read-only Elements for gsEvent

Table 52–5 lists the read-only elements for this resource.

Table 52–5 Read-only Elements for gsEvent

Element	Type	Description
`author`	personReference	User who created the event
`created`	Date	Date on which the event was created
`duration`	String	The length (in minutes) of the event
`groupSpace`	groupSpaceReference	The space to which the event belongs
`id`	String	Unique ID of the event
`isAllDayEvent`	Boolean	Indicates whether the event takes place over an entire day
`modified`	Date	Date on which the event was last updated
`modifiedByUser`	personReference	User who last updated the event

Resource Types Linked to from gsEvent

Table 52–6 lists the resource types that the client can link to from this resource.

Table 52–6 Related Resource Types for gsEvent

rel	resourceType
self	urn:oracle:webcenter:events:gsEvent

52.3.4.3 urn:oracle:webcenter:events:gsCategories

Use this resource to identify the URI to use to retrieve (`GET`) and create (`POST`) space event categories. The response from a `GET` operation includes each category in this collection of categories, and each category includes links used to operate on that category. The response from a `POST` operation includes the category that was created in this collection of categories and a link to operate on that category.

Navigation Paths to gsCategories

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
   spaces
      gsCategories
```

Supported Methods for gsCategories

The following methods are supported by this resource:

- `GET`
  - **request - body:** none
  - **response - body:** 0 or more categories
- `POST`
  - **request - body:** category
  - **response - body:** category

Resource Types Linked to From gsCategories

Table 52–7 lists the resource types that the client can link to from this resource.

Table 52–7 Related Resource Types for gsCategories

rel	resourceType
self	urn:oracle:webcenter:events:gsCategories

52.3.4.4 urn:oracle:webcenter:events:gsCategory

Use this resource type to identify the URI to use to read (`GET`), update (`PUT`), or delete (`DELETE`) a specific space event category. The response from a `GET` operation includes the specific category identified by the URI. The response from a `PUT` operation includes the modified version of the category identified by the URI. The response from a `DELETE` operation is a 204.

Navigation Paths to gsCategory

This section shows how the client can navigate through the hypermedia to access the gsCategory resource:

```
resourceIndex
   spaces
      gsCategories
         gsCategory
```

Supported Methods for gsCategory

The following methods are supported by this resource type:

- `GET`
  - **request - body:** none
  - **response - body:** category
- `PUT`
  - **request - body:** none
  - **response - body:** category
- `DELETE`
  - **request - body:** none
  - **response - body:** none

Writable Elements for gsCategory

Table 52–8 Writable Elements for gsCategory

Element	Type	Required	Constraints	Description
`name`	String	Yes	1 or more characters	The name of the category

Resource Types Linked to from gsCategory

Table 52–9 lists the resource types that the client can link to from this resource.

Table 52–9 Related Resource Types for gsCategory

rel	resourceType
self	urn:oracle:webcenter:events:gsCategory

52.4 Troubleshooting the Events Service

This section provides information to assist you in troubleshooting problems you may encounter while using the Events service.

Problem

Error message displayed in calendar taskflow:

```
Personal Event Service is not configured properly. Rectify the service
configuration and then click Try Again.
```

Solution

Confirm that you have created a Personal Event Connection. For more information, see Section 52.2.2, "Setting Up a Connection for the Events Service."

Problem

After logging into the calendar with the right credentials, you continue to see the **Login to Personal Calendar** link rather than your events.

Solution

Confirm that the page on which calendar taskflow is added is a secured page. Anonymous users cannot log into the Personal Event Calendar server.

53 Integrating the RSS Service

The RSS service enables your application users to add and view RSS 2.0 formatted feeds within your application. This chapter describes how to integrate the RSS Viewer into a Framework application at design time.

This chapter includes the following sections:

- Section 53.1, "Introduction to the RSS Service"
- Section 53.2, "Basic Configuration for the RSS Service"

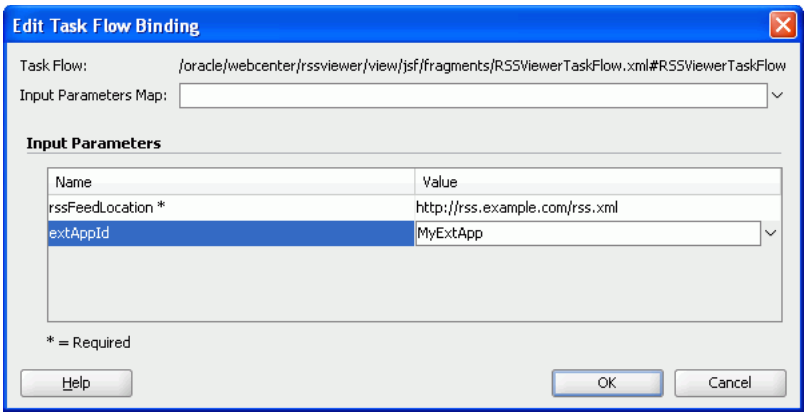
For more information about managing and including RSS feeds, see:

- "Managing the RSS Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the RSS Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

53.1 Introduction to the RSS Service

Really Simple Syndication (RSS) provides a means of accessing the content of many different web sites from a single location—a news reader. Oracle WebCenter Portal provides the RSS service that encompasses the RSS Viewer and the service to show RSS feeds from various WebCenter Portal services. The RSS Viewer enables you to view external news feeds from different web sites from within your Framework applications.

This section provides an overview of the features and requirements of the RSS service. It includes the following subsections:



- Section 53.1.1, "Understanding the RSS Service"
- Section 53.1.2, "Requirements for the RSS Service"
- Section 53.1.3, "What Happens at Runtime"

53.1.1 Understanding the RSS Service

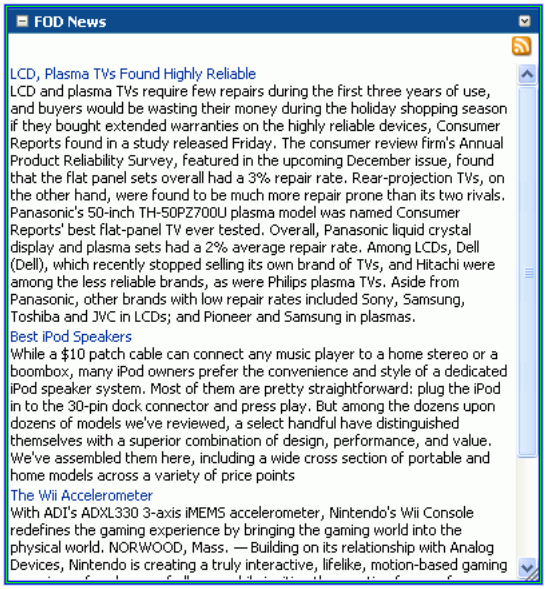
To display news feeds from external sources on your application pages, you add the RSS Viewer task flow and specify the URL for the required RSS feed, as shown in Figure 53–1. Your application users can then view the RSS feed at runtime.

For accessing secure application content, the RSS Viewer task flow supports integration with external applications to provide credential mapping services to authenticate with a remote feed. For information about using external applications, see Section 69.13, "Working with External Applications."

Figure 53–1 RSS Details Specified at Design Time

53.1.2 Requirements for the RSS Service

The RSS service does not require any back-end server. You do not need to set up a connection to use this service. However, you can set up a proxy server for the RSS service, if required.



53.1.3 What Happens at Runtime

At runtime, RSS news feeds are displayed from the RSS feed location specified at design time. Users can click the RSS icon on the top-right corner of the application page to open the URL specified as the RSS feed location.

Any user who has permissions to modify the application page can access the RSS Viewer parameters and change the URL of the RSS feed that is rendered.

For information about the RSS service at runtime, see the "Working with the RSS Service" chapter in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

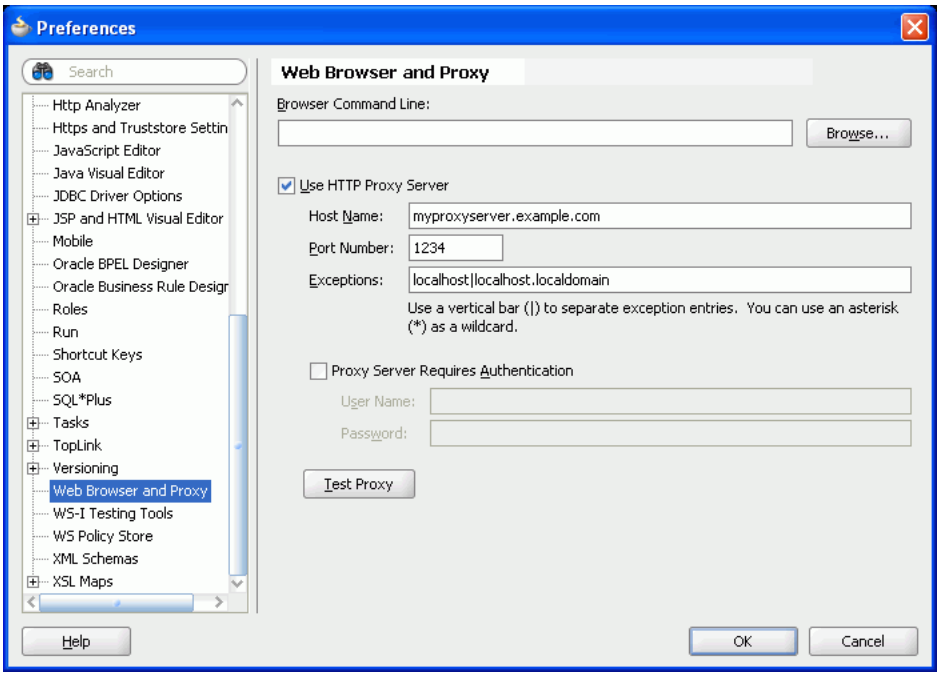
Figure 53–2 RSS Feed at Runtime

53.2 Basic Configuration for the RSS Service

This section describes how to set up the proxy server for the RSS service and add the RSS Viewer task flow to your Framework application.

This section includes the following subsections:

- Section 53.2.1, "Setting Up a Proxy Server for the RSS Service"
- Section 53.2.2, "Adding the RSS Service at Design Time"
- Section 53.2.3, "Setting Security for the RSS Viewer Service"



53.2.1 Setting Up a Proxy Server for the RSS Service

The RSS service does not require any connections. You can simply point to the URL of the RSS feed. However, if you want to point to an RSS feed that is external to your intranet and application, you may need to set up a proxy server for your application.

To set up a proxy server for the RSS service:

1. In Oracle JDeveloper, from the **Tools** menu, choose **Preferences**.
2. In the Preferences dialog, scroll down the list on the left side and select **Web Browser and Proxy**.
3. In the right pane, under Web Browser and Proxy, select **Use HTTP Proxy Server** and enter the host name and port number of your proxy server, and note any exceptions (Figure 53–3).
4. Click **OK**.

Figure 53–3 Setting Up a Proxy Server

53.2.2 Adding the RSS Service at Design Time

This section describes the RSS Viewer task flow and how to add it to your application.

This section contains the following subsections:

- Section 53.2.2.1, "About RSS Viewer Task Flow"
- Section 53.2.2.2, "How to Add the RSS Viewer Task Flow to Your Application"
- Section 53.2.2.3, "How to Modify RSS Viewer Task Flow Parameters"

53.2.2.1 About RSS Viewer Task Flow

The RSS service has a single task flow called RSS Viewer, which you can add to your application to enable your users to access an RSS feed. You can add multiple instances of the task flow to your application and use the Edit Task Flow Binding dialog to point to multiple RSS feed locations.

53.2.2.2 How to Add the RSS Viewer Task Flow to Your Application

To add the RSS Viewer task flow to your application:

1. Follow the steps in Section 7.2.1, "How to Prepare Your Application to Consume Services" to implement security, and create a customizable page in your application, if necessary.
2. Open the customizable page on which you want to add the RSS Viewer task flow.
3. If the RSS feed you want to use requires authentication, create an external application. If it does not require authentication, proceed to Step 4.

> **Note:** For more information about external applications, refer to Section 69.13, "Working with External Applications."

4. In the Resource Palette, open the **WebCenter Portal - Services Catalog**, then expand the **Task Flows** folder.
5. Click **RSSViewer**, drag it to your page in the Design view, and choose **Region**.
6. In the Edit Task Flow Binding dialog, specify the URL of the RSS feed. If an external application is used for authenticating the RSS feed, specify its name (the application name, not the application display name), as shown in Figure 53–4.

Figure 53–4 Example of the Edit Task Flow Binding Dialog for the RSS Service

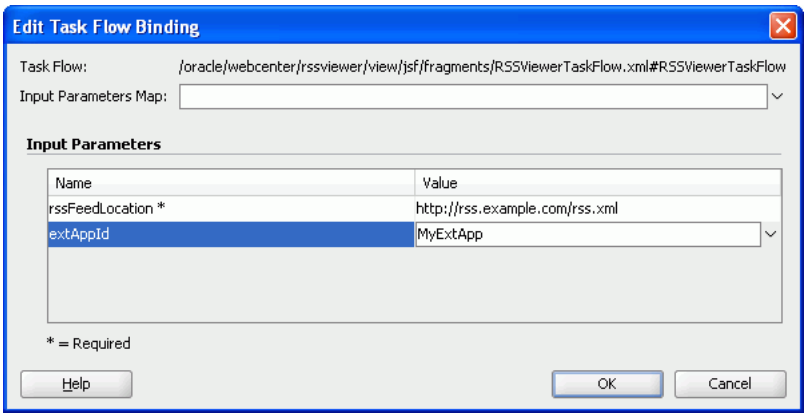


Table 53–1 describes the possible values for the RSS Viewer task flow binding parameters.

Table 53–1 RSS Viewer Task Flow Binding Parameters

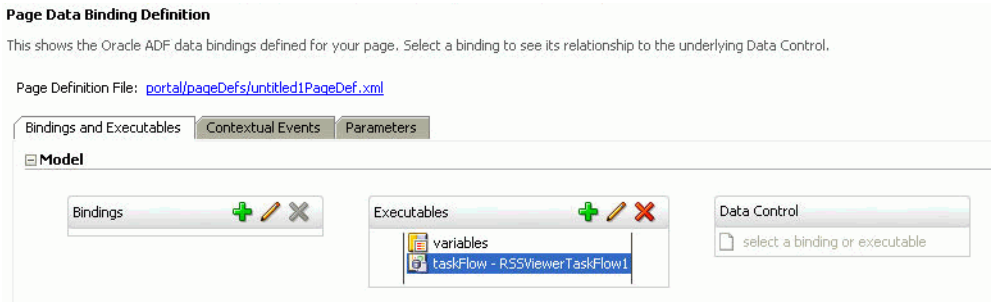
Parameter	Value
`rssFeedLocation`	Enter the location of the RSS feed. For example, to use the Oracle Press Releases RSS feed, enter: `${'http://www.oracle.com/rss/rss_ocom_pr.xml'}`
`extAppId`	Enter the name of the external application you want to use to authenticate the Framework application with the RSS feed. If the RSS feed does not require authentication, you do not need to set up and identify an external application for this service.

7. Click **OK** and save your page. The binding displays on your page.

   If you look at the Source tab of your page, you can see the RSS Viewer task flow in the page source, as shown in Example 53–1.

Example 53–1 RSS Viewer Task Flow in the Page Source

```
<af:form id="f1">
     <af:region value="#{bindings.RSSViewerTaskFlow1.regionModel}" id="r1"/>
     <af:region value="#{bindings.RSSViewerTaskFlow2.regionModel}" id="r2"/>
</af:form>
```



53.2.2.3 How to Modify RSS Viewer Task Flow Parameters

The RSS Viewer task flow has required and optional task flow binding parameters.

You can adjust the parameter values when you drop the task flow onto a page or after you have placed a task flow on a page:

1. Click the **Bindings** tab at the bottom of the page (next to the **Source** tab).
2. Under **Executables**, the RSS Viewer task flow you added is listed (Figure 53–5).

Figure 53–5 Page Data Binding Definition

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.
4. In the Edit Task Flow Binding dialog, revise the binding parameter values as required.
5. When you are finished, click **OK.**
6. Save and run your page to see the results.

53.2.3 Setting Security for the RSS Viewer Service

To use the RSS service with a public RSS feed, you do not need to set security. To use the RSS service with an RSS feed that requires authentication, you can set up an external application for your Framework application that sets up either user credentials or public credentials for accessing the RSS feed.

Note: For secure application content, your news reader must support BASIC authentication.

For more information about using external applications, see Section 69.13, "Working with External Applications."

Only authenticated users can view secure RSS feeds. If a user is not authenticated and the RSS feed is secured, the user will not see any content in the RSS Viewer unless the external application specifies public credentials.

Note: When you add the RSS Viewer task flow to your Framework application, the View grant is automatically added to the `authenticated-role`.

Part IX

Extending Your WebCenter Portal Application

Part IX contains the following chapters:

- Chapter 54, "Using Oracle WebCenter Portal REST APIs"
- Chapter 55, "Integrating Other Oracle Applications"
- Chapter 56, "Extending the Spaces Application Using JDeveloper"
- Chapter 57, "Integrating with Oracle WebCenter Portal: Spaces"

54

Using Oracle WebCenter Portal REST APIs

Oracle WebCenter Portal provides a set of REST APIs for retrieving and modifying server data. This chapter discusses the WebCenter Portal REST APIs.

This chapter includes the following sections:

- Section 54.1, "Introduction to REST"
- Section 54.2, "Understanding the Username-Based Security Token Encryption"
- Section 54.3, "Benefits of Using REST"
- Section 54.4, "Introduction to WebCenter Portal's REST APIs"
- Section 54.5, "Understanding the Link Model"
- Section 54.6, "Understanding Items Hypermedia"
- Section 54.7, "Navigating Hypermedia Using HTTP"
- Section 54.8, "Security Considerations for WebCenter Portal REST APIs"
- Section 54.9, "Security Considerations for CMIS REST APIs"
- Section 54.10, "Understanding Common Types"
- Section 54.11, "Managing Caches"
- Section 54.12, "Configuring a Proxy Server"
- Section 54.13, "WebCenter Portal's REST API Examples"

This chapter includes some examples that demonstrate how to use WebCenter Portal REST APIs. For more examples, see the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

`http://www.oracle.com/technology/products/webcenter/release11_demos.html`

54.1 Introduction to REST

REST (REpresentational State Transfer) is an architectural style for making distributed resources available through a uniform interface that includes uniform resource identifiers (URIs), well-defined operations, hypermedia links, and a constrained set of media types. Typically, these operations include reading, writing, editing, and removing, and media types include JSON and XML/ATOM.

REST commands use standard HTTP methods as requests to point to the resource being used. Every request returns a response, indicating the status of the operation. If the request results in an object being retrieved, created, or updated, the response includes a standard representation of that object.

REST supports multiple clients, both from client machines and other servers, and it can be used from just about any client or development technology, including Java, JavaScript, Ruby on Rails, PHP, .Net, and so on.

> **Tip:** For a good general introduction to REST, see the Wikipedia article Representational State Transfer at `http://en.wikipedia.org/wiki/Representational_State_Transfer`.

REST is typically used with Rich Internet Applications (RIA) that are client-side scripted and require the ability to interact with data from a server-side application. For example, the WebCenter iPhone App uses WebCenter Portal REST APIs to interact with a WebCenter Portal: Spaces application. The native iPhone client is written in Objective-C, and the REST APIs enable the client to send and retrieve application data.

54.2 Understanding the Username-Based Security Token Encryption

To provide additional security, every URI, for both `href` and `template` attributes, includes a security token parameter that is based on the authenticated username (a utoken).

The security generation algorithm uses a randomly generated "salt" along with the username. The salt ensures that if any of the parameters used to perform encryption become compromised, existing tokens can be invalidated and new ones generated. Most importantly, because the username is used as part of the user token generation algorithm, the salt prevents having to change all user names in the event of a compromise.

The salt is stored in the Credential Store Framework (CSF) in the map `o.webcenter.jf.csf.map` against key `user.token.salt`. You can change the value of this key (and other keys used for token encryption) by accessing CSF in Oracle Enterprise Manager.

> **Caution:** If you change the encryption key values, all existing username based security tokens will immediately become invalid. Only change these values under extraordinary circumstances, like an algorithm parameter compromise.

54.3 Benefits of Using REST

Many excellent articles have been published about REST and the benefits of the RESTful style of software architecture. Some of these benefits include:

- Using "Hypermedia As The Engine Of Application State" (HATEOAS) links to access the REST API helps promote API robustness. Since the clients only use URIs returned from the server, if the server changes the URI format, the client will continue to function properly. See also Section 54.5, "Understanding the Link Model."
- Using the standard HTTP protocol allows network infrastructure to cache REST requests where appropriate, reducing load on both the client and server. See also Section 54.11, "Managing Caches."
- Stateless REST requests allow each request to be served by any number of different servers, helping with scalability.

- Using the standard HTTP protocol allows a wide variety of clients to interact with the REST APIs without requiring specialized libraries.

54.4 Introduction to WebCenter Portal's REST APIs

In addition to enabling mobile access, WebCenter Portal REST APIs allow you to take advantage of Web 2.0 technologies like Ajax, JavaScript, and JSON to create rich, interactive browser-based user interfaces and to access and modify Oracle WebCenter Portal: Framework and WebCenter Portal: Spaces data. In general, the WebCenter REST commands provide a more natural and easy-to-use alternative to a SOAP-style web services approach.

Table 54–1 describes the Oracle WebCenter Portal REST APIs provided for WebCenter Portal: Services features.

Table 54–1 Summary WebCenter Portal: Services Features Supported by REST APIs

REST API	Description	Chapter
Discussions	Enable a client to post, read, update, and delete discussion forums, topics, and messages.	Section 34.3.8, "Using the Discussions Service REST APIs."
Lists	Enables a client to browse all the lists associated with a named group space; search list columns given a search term; create new lists; add, update, and remove list rows; and similar sorts of list-related tasks	Section 48.4, "Using the Lists Service REST APIs."
People Connections	Enable a client to view profile data; manage connection lists, feedback, and messages; create new activities and view activities for users, lists, and group spaces.	Chapter 42, "People Connections Service REST APIs."
WebCenter Portal: Spaces	Enable a client to retrieve group space metadata and view, create, update, and delete group space lists and list items. You can also retrieve group space membership information.	Section 57.3, "Using the WebCenter Portal: Spaces REST APIs."
Content Management	Uses the CMIS (Content Management Interoperability Services) RESTful server binding to provide access to the CM VCR (Content Management Virtual Content Repository).	*Oracle Fusion Middleware Content Management REST Service Developer's Guide*.
Activity Graph	Enables you to retrieve recommendations for connections, group spaces, and items using the underlying Activity Graph engine.	Section 46.3.2, "Using the Activity Graph Service REST APIs."
Events	Lets you access calendar events associated with a named group space.	Section 52.3, "Using the Events Service REST APIs."
Feedback	Enables a client to create, read, and delete feedback in a social networking application.	Chapter 42.3, "Feedback REST APIs."
Search	Lets you post, read, update, and delete searches. You can specify keywords and the scope of the search; for example, the iPhone could search for "smith" in all spaces, documents and wiki pages.	Section 45.3.7, "Using the Search Service REST APIs."
Tags	Enables a client to read, post, update, and delete tags and tagged items.	Section 44.3.2, "Using the Tags Service REST APIs."

Table 54–1 (Cont.) Summary WebCenter Portal: Services Features Supported by REST

REST API	Description	Chapter
Navigation	Use the navigation REST APIs to create your own interface for displaying navigations. **Note:** The navigation REST APIs do not share the resource index described in this chapter.	Section 14.3.2, "Using the Navigation REST APIs."
Personalization	Enables you to access the Personalization Conductor.	Section 67.4, "Extending Personalization."
Pagelets	Allows remote web services to retrieve information about resources and pagelets. Inject pagelets into non-proxied pages, allowing the Pagelet Producer to act as a portlet provider for Oracle WebCenter Interaction, Oracle WebLogic Portal, or other third-party portals.	Section 63.2.2.2, "Accessing Pagelets Using REST."

54.5 Understanding the Link Model

Hypermedia is at the core of two of the most successful web-based formats: HTML and ATOM. HTML and ATOM allow consumers to navigate to other hypermedia documents through links–for example, clicking on a link to go to a news article.

Hypermedia drives RESTful application state (known as HATEOAS: Hypermedia As The Engine Of Application State).

Note: HATEOAS analogy to define application state:

Suppose you are completing your taxes in your favorite browser. You finish entering your W-2 data and move on to deductions when the browser crashes. The state you lost—the fact that you were on deductions and still needed to enter data—is the application state; not the W-2 data entered (that is, change states from the current state).

HATEOAS dictates that *this* state—the application state—be captured wholly in hypermedia. Application state is where you are in the application, not what data you've entered into the application. One of the benefits of this approach is that it simplifies the client and server, because they do not need to be aware of the state they are in. The link contains all the state information necessary to process the request, so, when the browser restarts and returns to the link, the user will be at the same place in the tax process.

Given a set of top-level URI entry points to a RESTful service, all interactions beyond those entry points are driven by hypermedia links returned in response representations. This link-centered approach helps keep the client from becoming too tightly coupled to the server URLs. The client is using URLs given to it by the server, therefore the client code does not break if the server URLs change format.

Understanding this link model helps you understand how to use the data the service returns to navigate the REST APIs.

This section describes the hypermedia link model used by WebCenter's RESTful services. It includes the following subsections:

- Section 54.5.1, "The Resource Index"
- Section 54.5.2, "The Anatomy of a Link"

54.5.1 The Resource Index

In WebCenter, the *Resource Index* is your starting point for all authenticated access. The Resource Index provides access to the set of top-level URI entry points. It provides the way in to all the available WebCenter RESTful services. The Resource Index URI is the only URI that you need to know.

The WebCenter Resource Index URI is:

`http://host:port/rest/api/resourceIndex`

> **Note:** Access to the Resource Index always requires authentication; however, you can (optionally) access the CMIS resource entry point anonymously using the following URI:
>
> `http://host:port/rest/api/cmis/repository`
>
> See also Section 54.9, "Security Considerations for CMIS REST APIs."

The first step in using the WebCenter Portal REST APIs is to send a `GET` request to the Resource Index. The response varies depending on the services available and the media type of the request. Example 54–1 shows how the response might look if you made an Ajax request using JavaScript (and possibly a client-side scripting library, such as Dojo) to retrieve the JSON data for the Resource Index. Note that this is an abridged sample response and does not include all of the links actually present in a real response.

Example 54–1 Response to a GET on the Resource Index

```
{
  "resourceType": "urn:oracle:webcenter:resourceindex",
  "links": [
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "resourceType": "urn:oracle:webCenter:cmis",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:discussions:forums",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "resourceType": "urn:oracle:webcenter:resourceindex",
      "rel": "self",
      "href": "http://host:port/rest/api/resourceIndex",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:activities:stream",
```

```
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:people:person",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:feedback",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:spaces",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:people",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    }
  ]
}
```

By interpreting the links returned in the Resource Index data, you can retrieve the URI entry point for an individual service by locating the URI for the resource type you want to use. You can then continue navigating through the hypermedia until you can perform the required operation. Example 54–2 shows a method that locates a URI given the Resource Index JSON data.

Example 54–2 Locating the URI for a Particular Service in the Resource Index

```
/* Parse the resourceIndex to find the specified URL and
 * return it.
 *
 * @Param jsonData the JSON data retrieved from calling
 *        the /rest/api/resourceIndex URL.
 * @Param strResourceType the resource type of the URL
 *        you want to retrieve from the resourceIndex data.
 *        E.g., 'urn:oracle:webcenter:activities:stream'
 */
function getResourceURL(jsonData, strResourceType)
{
  // Using the HATEOAS model, we browse the returned links
  // looking for the one with the correct resource type.
  for (var i = 0; i < data.links.length; i++) {
    if (data.links[i].resourceType == strResourceType) {
      return data.links[i].href;
    }
  }
}
```

54.5.2 The Anatomy of a Link

Example 54–3 and Example 54–4 show the anatomy of a hypermedia link as XML and in JSON document fragments, respectively.

Example 54–3 Link in an XML Document Fragment

```
<links>
  <link href="opaque-URI"
        template="opaque-template-URI (optional)"
        rel="rel-name"
        title="human-readable-title (optional)"
        type="media-type (optional)"
        resourceType="resource-type"
        capabilities="operation"/>
  ...repeat as needed...
</links>
```

Example 54–4 Link in a JSON Document Fragment

```
"links": [
  {
    "href":"opaque-URI",
    "template":"opaque-template-URI (optional)",
    "rel":"rel-name",
    "title":"human-readable-title (optional)",
    "type":"media-type (optional)",
    "resourceType":"resource-type",
    "capabilities":"operation"
  },
  ...repeat as needed...
]
```

The `resourceType`, `rel`, and `capabilities` attributes of the hypermedia link provide metadata that enable clients to determine which URI (`href` or `template`) to use, without having to parse the URIs directly. The URIs are opaque—the metadata determines which link is useful in a given circumstance.

Multiword field, element, and attribute names are formatted in camel case, unless the representation is attempting to conform to a specification not under the service author's direct control. Acronyms are treated as normal words with their case adjusted accordingly (for example, `fooXml` or `xmlFoo`). See Example 54–5 and Example 54–6.

Example 54–5 XML Naming Convention

```
<myElement>text</myElement>
```

Example 54–6 JSON Naming Convention

```
{"myElement": "text"}
```

This section includes the following subsections that describe the different attributes of the hypermedia link:

- Section 54.5.2.1, "Resource Type"
- Section 54.5.2.2, "Relationship"
- Section 54.5.2.3, "Capabilities"
- Section 54.5.2.4, "Media Type"

- Section 54.5.2.5, "Templates"

54.5.2.1 Resource Type

The `resourceType` link attribute indicates the type of resource to which the link points. Clients should use the `resourceType` to determine the expected response bodies for `GET` and `POST` and allowable request bodies for `POST` and `PUT`.

For more information, see Section 54.7, "Navigating Hypermedia Using HTTP."

54.5.2.2 Relationship

The `rel` link attribute indicates the relationship of the linked object to the current object (that is, the object that contains the list of links). The value of this attribute is a space-separated list of the following currently supported values:

- `self`—The linked object is the current object
- `related`—The linked object is related to the current object
- `via`—The linked object is the source of the information for the current object
- `alternate`—The linked object is a substitute for the current object (typically, the same object in another format, such as an HTML page that displays the current object)
- `urn:oracle:webcenter:parent`—The linked object is the parent of the current object. That is, the linked object owns the current object

> **Note:** Some REST APIs for some WebCenter features may contain additional `rel` link attributes. See the REST API documentation for each specific feature for more information.

54.5.2.3 Capabilities

The `capabilities` link attribute indicates which methods are supported by the linked resource.

Links are returned only if a client is allowed to access that resource. User authorization can affect the capabilities a client has with the links returned in a response representation. In general, services only return the capabilities that the current authorized user has permission to execute and that the resource supports.

If there is no link, then the client cannot access the resource. If a link has no capabilities, then it is not returned to the client, meaning that the client does not have permission to do anything with that link (even read it).

Capability-based expression of hypermedia links communicates the range of operations that the client can expect to succeed, which allows the client to dynamically configure any associated UI to provide the best overall user experience.

The value of this attribute is a space-separated list of the following values:

- `urn:oracle:webcenter:create`—This maps to the HTTP verb `POST`
- `urn:oracle:webcenter:read`—This maps to the HTTP verb `GET`
- `urn:oracle:webcenter:update`—This maps to the HTTP verb `PUT`
- `urn:oracle:webcenter:delete`—This maps to the HTTP verb `DELETE`

Note: The top-level `resourceIndex` links only returns the `read` capability, even if the user is authorized with additional capabilities.

Note: Querying a resource for the allowed HTTP verbs using `OPTIONS` returns the verbs that the resource can support in general, and does not take a user's access into account. The capabilities attribute in a link describes exactly what the current user can do with the current resource. `OPTIONS` may return more HTTP verbs than the current user is allowed.

54.5.2.4 Media Type

The `type` link attribute indicates the media types supported by the linked object.

All REST services, except for CMIS, support both XML (`application/xml`) and JSON (`application/json`) media type. CMIS currently supports only ATOM. For more information about CMIS REST APIs, see the *Oracle Fusion Middleware Content Management REST Service Developer's Guide*.

54.5.2.5 Templates

The `template` link attribute indicates that the client can use a URI template, instead of the `href` URI, to provide parameterized values for the linked object. Links must include at least an `href` or a `template` URI, but can include both.

Some hypermedia links support request query parameters that allow the client to configure the link in different ways. Rather than force the client to know the URI format and manually build the URI, URI templates are used. These templates allow client code to easily insert data into a URI without having to understand exactly how the URI works. This maintains the opacity of hypermedia URIs and protects the client from changes to the URI format.

Example 54–7 shows a URI template including several request query parameters.

Example 54–7 URI Template

```
http://host:port/.../lists?startIndex={startIndex}&itemsPerPage={itemsPerPage}&q={
searchTerms}&projection={projection]
```

WebCenter Portal REST APIs use a simple slot replacement syntax that follows many industry URI template schemes.

For example, using the template in Example 54–7, to see 10 list items on the first page, the client would provide a value of `1` for the `startIndex` parameter and a value of `10` for the `itemsPerPage` parameter, as shown in Example 54–8.

Example 54–8 URI Template with Parameter Values

```
http://host:port.../lists?startIndex=1&itemsPerPage=10
```

> **Note:** All unused parameters must be removed from a template before it can be used. Clients may not submit unprocessed templates to the service that produced it; doing so results in undefined behavior, generally returning a status code of 500.
>
> Clients must process templates into valid URI form before submitting to the server. Clients must replace slots with appropriate values, taking care to properly URI encode any value replacing the slot token. If a client does not have a suitable value for one or more of the slots in the template, then it must replace the slot token with an empty string.

You must URL-encode special or reserved character in parameter values. For example, to search lists for a person named Günter, you must URL-encode the ü as shown in Example 54–9.

Example 54–9 Encoding Special Characters in URI Templates

```
http://host:port.../lists?q=G%FCnter
```

Common Request Query Parameters

Many resources support a common set of request query parameters. For example, when retrieving a collection of entities, it is common to change the shape of the results set by limiting the quantity or details of the results. The REST framework uses the following request parameters to scope results and provide security:

- `startIndex`—Specifies the index of the first matching result that should be included in the result set (0-*n* ... zero based). This is used for pagination.
- `itemsPerPage`—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.
- `q`—Specifies implementation-specific searching. Searches may be specified using the following format (square brackets [] denote optional values):

  ```
  [[field1:[operand]][:]value1[;field2:operand:value2]]
  ```

  For example:

  ```
  &q=login:equals:monty
  &q=title:contains:issues
  &q=creator:equals:monty;description:contains:Urgent
  ```

  While each resource uses the same format for the `q` parameter, the way search is implemented is different depending on the resource being searched. For more information about how each resource implements search, see the chapter for the specific service.

- `projection`—Reserved for implementation-specific projection of model representations, such as variable recursion depth, field or attribute filtering. Valid values are `summary` or `details`.

  For example, requesting a projection of `summary` for a collection of lists, returns only the title, description, and hypermedia links. Requesting a projection of `details` results in the server sending back a collection of lists that includes all the column metadata for each list. This may require additional processing time or database queries on the server.

The following example request results in the response entity containing a deeper object graph.

```
http://host:port/...lists&projection=details
```

- `data`—This parameter accepts a comma separated list of data sets and items. This parameter lets clients specify what data they would like to receive. For example, a mobile device application might use this parameter to limit the amount of XML data returned. If both the `projection` and `data` query string parameters are present, the `data` parameter will be used to determine which data to return. If you specify the constant `'data'` as the data parameter, all the standard information will be returned for the resource.

For information about how these parameters are supported by specific resources, see the chapter for the appropriate service.

54.6 Understanding Items Hypermedia

A collection of `items` makes up the actual content of responses. This is at the same level as the `links` section described previously. Each item (including the top-level tag in each response) has one common attribute (`resourceType`) in addition to resource-specific content and format. For details beyond the `resourceType`, see the chapter for the specific service.

See Example 54–13 for an example that describes a collection of entities/items. Example 54–15 describes a single entity/item.

54.7 Navigating Hypermedia Using HTTP

You can navigate REST service hypermedia in a similar way to that used to browse and interact with HTML or an ATOM feed. Interactions are performed on the resources identified by links using HTTP methods. The REST services return response codes and response bodies to the client, and the client uses the hypermedia in the response to drive further interactions.

Table 54–2 describes the general pattern followed when constructing opaque resource URIs. The `resourceType` differentiates whether the HTTP method operates on a collection of resources or an individual resource.

Table 54–2 HTTP Methods

HTTP Method	Response for a Collection of Resources	Response for an Individual Resource
`GET`	Returns resource collection container (200 HTTP response code)	Returns resource (200 HTTP response code)
`PUT`	Cannot update a collection of resources (405 HTTP response code)	Updates and returns resource (200 HTTP response code)
`POST`	Creates and returns a new resource within the collection. **Note:** Can return a 201 or 204 HTTP response code. The returned code depends on whether the newly created object is directly addressable or not. For instance, activities cannot be addressed individually, so they return a 204 no-content response code.	Cannot create a resource within an individual resource (405 HTTP response code)

Table 54–2 (Cont.) HTTP Methods

HTTP Method	Response for a Collection of Resources	Response for an Individual Resource
DELETE	Cannot delete a collection of resources (405 HTTP response code)	Deletes resource (204 HTTP response code)

Collection resources generally support reading a collection (GET) and creating a subordinate to that collection (POST). Individual resources generally support reading a resource (GET), updating a resource (PUT), and deleting a resource (DELETE).

HTTP Response Status Codes

Table 54–3 describes the potential response status codes.

Table 54–3 HTTP Response Status Codes

HTTP Response Status Code	Description
200	OK. Upon successful completion of a GET or PUT. This is accompanied by a resource representation as a response body.
201	Created. Upon successful completion of a POST. This has a location header to the newly-created resource.
204	No content, or any request that does not return content. For example, creating an object that cannot be linked. Upon successful completion of a DELETE.
400	Bad Request. The URI was malformed or could not be processed; for example, the IDs were not formatted correctly, or the ID was supplied in the URI on a POST.
401	Unauthorized. Client may retry by submitting credentials. This may be accompanied with a fault response body to help diagnose the issue.
403	Forbidden. Client does not have permission to perform a particular action, such as creating or deleting a resource. Re-authenticating as the same user does not help. This may be accompanied with a fault response body to help diagnose the issue.
404	Not Found. Referencing a specific resource with an ID, but that resource does not exist.
405	Method Not Allowed. This includes a list of valid methods for the requested resource.
406	Not Acceptable. The Accept header media type(s) sent by the client are not supported for the requested operation.This may be accompanied with a fault response body to help diagnose the issue.
409	Conflict. Possibly the resource ID is in use, or an entity has been modified by another process during an update.This may be accompanied with a fault response body to help diagnose the issue.
422	Bad entity body, the data in the body, although syntactically correct, was not valid, or could not be processed; for example, invalid data when updating a row.
500	Internal server error. The server encountered an unexpected condition that prevented it from fulfilling the request.
501	Not Implemented. The server does not support the functionality required to fulfill the request. This is the appropriate response when the server does not recognize the request method and is not capable of supporting it for any resource.

54.8 Security Considerations for WebCenter Portal REST APIs

All of the WebCenter REST URIs reference protected resources (similar to protected web pages) and require authentication for access.

> **Note:** The one exception to the authenticated access rule is access to the CMIS resources. CMIS resources can be accessed anonymously through the CMIS URI entry point:
>
> `http://host/port/rest/api/cmis/repository`
>
> See also Section 54.9, "Security Considerations for CMIS REST APIs."

You can pass this authentication in with the request using basic authentication, or you can configure the client and the WebCenter REST service to use single sign-on. For more information about single sign-on, see the section "Configuring a WebCenter Portal: Framework Application to Use Single Sign-On" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Basic authentication sends the user's password in plain text. If you use this type of authentication, you should consider securing the connection using SSL. For more information, see the section "Configuring WebCenter Portal: Framework Applications and Components to Use SSL" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To provide additional security, every URI, for both `href` and `template` attributes, includes a security token parameter. The security token is user-scoped. This means that it is based on and scoped to an authenticated user and can be bookmarked or cached across that user's sessions. These security tokens help prevent Cross-Site Request Forgery (CSRF) attacks.

For example:

```
<link
  template="opaque-template-uri/@me?startIndex={startIndex}&itemsPerPage={itemsPerPage}
     &token=generated-token" resourceType="urn:oracle:webcenter:messageBoard"
     href="opaque-uri/@me?token=generated-token" capabilities="urn:oracle:webcenter:read"
/>
```

> **Note:** The security token is not used for authentication or identity propagation.

WebCenter Portal REST APIs operate under the identity of the authenticated user. For example, the group space REST APIs only return information for, and allow changes to, group spaces to which the user has access.

54.9 Security Considerations for CMIS REST APIs

The CMIS REST APIs do not use the same authentication scheme as the other WebCenter Portal REST APIs. Whereas other WebCenter Portal REST APIs do not allow unauthenticated access and prompt the user for authentication before allowing access, the CMIS REST APIs do allow unauthenticated access.

If a document requires authentication information and does not receive that information (because it is being accessed by an unauthenticated user), a 404 error is returned. This does not necessarily mean that the document cannot be found, rather

that the (unauthenticated) user does not have the appropriate permissions to access the document. For the request to succeed, it should include basic authentication headers to identify the current user.

CMIS stands for Content Management Interoperability Services, a standard REST interface for Enterprise Content Management Systems. For more information, see *Oracle Fusion Middleware Content Management REST Service Developer's Guide*.

54.10 Understanding Common Types

This section describes the common types that are shared by multiple WebCenter Portal REST APIs.

- Section 54.10.1, "Common Types"
- Section 54.10.2, "Portable Contact Types"

54.10.1 Common Types

Common types provide a consistent way to reference objects used in the WebCenter Portal REST APIs.

This section includes the following subsections:

- Section 54.10.1.1, "personReference"
- Section 54.10.1.2, "groupSpaceReference"

54.10.1.1 personReference

This is a generic data type that represents a user in the system. It is used by several APIs, for example to identify the author of a message board or feedback message, or a user's manager or direct reports. It is made up of the following elements:

- `guid`—The GUID of the user
- `id`—The login ID of the user
- `displayName`—The display name of the user

The `personReference` also includes a link to the user's profile icon. You can control the size of the icon by providing values: `small`, `medium`, or `large`.

Depending on where the `personReference` type is included, it can also return links to the associated REST APIs of the generating response. For example, if the `personReference` type is included as the author in a message board response, it includes links to message board services.

54.10.1.2 groupSpaceReference

This is a generic data type that represents a group space. It is used by several APIs, for example in the activity stream, to identify a group space in which a particular activity occurred. It is made up on the following elements:

- `guid`—The GUID of the group space
- `name`—The name of the group space
- `displayName`—The display name of the group space

The `groupSpaceReference` also includes an html link, rest link, and icon link.

54.10.2 Portable Contact Types

Portable Contact types provide users with a standard way to access their address books and friends lists over the web. Portable Contact types are used by the Profile component of the People Connections service.

> **Note:** These types are based on the Portal Contact Types in WebCenter. They may include additional data.

This section includes the following subsections:

- Section 54.10.2.1, "name Portable Contact Type"
- Section 54.10.2.2, "address Portable Contact Type"
- Section 54.10.2.3, "organization Portable Contact Type"
- Section 54.10.2.4, "value Portable Contact Type"

54.10.2.1 name Portable Contact Type

This is a portable contact type that provides information about the user's name. It is made up of the following elements:

- `formatted`—The formatted version of the full name of the user, for example, Michael David Jones Ph.D.
- `familyName`—The family name, or last name, of the user, for example Jones
- `givenName`—The given name, or first name, of the user, for example Michael
- `honorificSuffix`—The honorific suffix of the user, for example, Esq. or Ph.D.
- `initials`—The first initials of the user, for example, M. D.
- `maidenName`—The maiden name of the user

Some of the elements may not be present depending on the user repository configuration and data.

54.10.2.2 address Portable Contact Type

This is a portable contact type that provides information about the user's address. It is made up of the following elements:

- `formatted`—The formatted version of the full address
- `type`—The type of the address, for example, Home, Work
- `streetAddress`—The street address
- `poBox`—The post office box number
- `locality`—The city or locality
- `region`—The state or region
- `postalCode`—The zip code or postal code
- `country`—The country

Some of the elements may not be present depending on the user repository configuration and data.

54.10.2.3 organization Portable Contact Type

This is a portable contact type that provides information about the user's organizational affiliation. It is made up of:

- `name`—The name of the organization
- `employeeNumber`—The employee number of the user
- `employeeType`—The employee type of the user.
- `department`—The department within the organization to which the user belongs
- `defaultGroup`—The default group to which the user belongs
- `title`—The job title of the user within the organization
- `description`—A textual description of the user's role within the organization
- `expertise`—The expertise of the user within the organization
- `startDate`—The date when the user joined the organization

Some of the elements may not be present depending on the user repository configuration and data.

54.10.2.4 value Portable Contact Type

This is a generic object that contains data for a wide variety of contact information. It is made up of the following elements:

- `primary`—A boolean value that identifies whether this is the primary piece of information of this type for this person. The primary element may not be present and is only relevant if there are multiple values for the same type of data.
- `value`—The value for this type
- `type`—The type of information. Valid types are:
  - `standard`: with valid values of `work`, `home`, `other`
  - `phoneNumber`: with valid values of `work`, `home`, `fax`, `pager`, `mobile`
  - `photos`: with a valid value of `thumbnail`

54.11 Managing Caches

Client-side developers need to know how to handle HTTP cache headers in both requests and responses. Individual resources that have a "last modified" date are also return entity tags. The entity tags can be used to make retrieval of a specific entity more efficient. To learn more about the use of entity tags in caching, please see the Hypertext Transfer Protocol specification.

54.12 Configuring a Proxy Server

A proxy server is typically employed to avoid cross-domain request problems associated with making XMLHttpRequest (XHR) calls from a browser client. These calls are typically associated with the Ajax development technique for creating rich, interactive client-side interfaces. REST APIs are typically used within this kind of client-side development scenario.

For more information on setting up a proxy server, see "Configuring a Proxy Server" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

54.13 WebCenter Portal's REST API Examples

This section includes some examples illustrating how to use the WebCenter Portal REST APIs. It includes the following subsections:

- Section 54.13.1, "Navigating the Message Board Hypermedia"
- Section 54.13.2, "Displaying Activity Stream Data"
- Section 54.13.3, "Using the WebCenter People Connections Service REST APIs with Ext"
- Section 54.13.4, "Updating User Status"

54.13.1 Navigating the Message Board Hypermedia

This section includes examples to illustrate how to navigate the REST service hypermedia. The examples show how to read messages on a message board, post messages to another user's message board, and delete unwanted messages.

This section includes the following subsections:

- Section 54.13.1.1, "Accessing the Resource Index"
- Section 54.13.1.2, "Reading Messages"
- Section 54.13.1.3, "Creating a New Message"
- Section 54.13.1.4, "Updating a Message"
- Section 54.13.1.5, "Deleting a Message"

54.13.1.1 Accessing the Resource Index

The first step is always to access the Resource Index (Example 54–10).

Example 54–10 Accessing the Resource Index

```
GET /resourceIndex
```

This request returns a list of the top-level URI entry points to the RESTful services, including the entry point for the message board (Example 54–11).

Example 54–11 Response to Accessing the Resource Index

```
200 OK
Accept: application/json;charset=UTF-8

{
  "resourceType": "urn:oracle:webcenter:resourceindex",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:resourceindex",
      "capabilities": "urn:oracle:webcenter:read",
      "rel": "self",
      "href": "http://host:port/rest/api/resourceIndex"
    },
    {
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "capabilities": "urn:oracle:webcenter:read",
      "href": "opaque-messageBoard-URI"
    },
  ...repeating for other services...
}
```

You can examine this list to find the URI that you require to access your message board. You should look for the link with a `resourceType` of `urn:oracle:webcenter:messageBoard`. The `href` for this link is the one that you require to access your message board.

For other resources `rel`, `type`, and `template` also help find the correct link.

54.13.1.2 Reading Messages

Once you have determined the correct URI for your message board, you can send a GET request to that URI to read your messages (Example 54–12).

To read messages on a message board, you must be logged in.

Example 54–12 Retrieving Messages from Your Message Board (GET)

```
GET /opaque-messageBoard-URI
```

The response provides information about all the messages on your message board (Example 54–13).

Example 54–13 Response to Retrieving Messages from Your Message Board

```
200 OK
Accept: application/json;charset=UTF-8

{
  "resourceType": "urn:oracle:webcenter:messageBoard",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:create",
      "rel": "self",
      "href": "opaque-messageBoard-URI"
    }
  ]
  "items": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard:message",
      "links": [
        {
          "resourceType": "urn:oracle:webcenter:messageBoard:message",
          "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:delete",
          "rel": "self",
          "href": "opaque-message-URI"
        }
      ]
      "id": "89add57c-7a35-4d35-b24f-ea9259612eb8",
      "body": "What's up?  It's been a while.  Some of us are going to Conner
O'Neal's after work.  Want to go?",
      "created": "2009-09-10T11:18:46.696-0700",
      "author": {
        "id": "carl",
        "displayName": "carl",
        "guid": "649A27F09D5C11DEBFAA799CBD41D9B8",
        "links": [
          {
            "resourceType": "urn:oracle:webcenter:people:person",
            "capabilities": "urn:oracle:webcenter:read",
            "rel": "via",
```

```
            "href": "opaque-person-URI"
          },
          {
            "resourceType": "urn:oracle:webcenter:messageBoard",
            "capabilities": "urn:oracle:webcenter:read
urn:oracle:webcenter:create",
            "href": "opaque-messageBoard-URI-for-Carl"
          },
          {
            "type": "text/html",
            "resourceType": "urn:oracle:webcenter:spaces:profile",
            "capabilities": "urn:oracle:webcenter:read",
            "rel": "alternate",
            "href": "opaque-profile-URI"
          }
        ]
      },
    }
  ],
  "startIndex": 0,
  "itemsPerPage": 1,
}
```

From the response you can see that you have `read` and `create` capabilities on your message board. So you can read its contents and post new messages.

In addition, the response also includes a collection of items (in this case the collection consists of just a single item). These items, with a `resourceType` of `urn:oracle:webcenter:messageBoard:message`, are the messages on your message board. The `capabilities` attribute for the message indicates that, for this particular message, you can read it or delete it from your message board.

For each message, the response provides the following information:

- `id`—the identifier of the message
- `body`—the text of the message
- `author`—the author of the message. The author element is also made up of several other elements:
  - `id`—the identifier, or user name, of the author of the message
  - `displayName`—the name of the author, formatted for display
  - `guid`—the globally unique identifier of the author

Within the `author` element there is also a collection of three links. The `resourceType` of these links are:

- `urn:oracle:webcenter:people:person`—enables you to view information about the author of the message
- `urn:oracle:webcenter:messageBoard`—enables you to read or create a message on the author's message board
- `urn:oracle:webcenter:spaces:profile`—enables you to read a `text/html` document of the author's profile

54.13.1.3 Creating a New Message

Now that you have read the message on your message board, you probably want to reply to Carl on his message board. To do this you should send a `POST` request to the URI for Carl's message board.

To find the correct URI, use the `href` from the `author` link with `resourceType` of `urn:oracle:webcenter:messageBoard`.

A `POST` request creates a subordinate resource of the resource to which you post it. In this case, we are posting to the `messageBoard`, so we should post its subordinate resource: `message` (Example 54–14).

Example 54–14 Creating a Message on Another User's Message Board (POST)

```
POST opaque-messageBoard-URI-for-Carl
Accept: application/json;charset=UTF-8
Content-Type: application/json;charset=UTF-8

{
    "body": "sure; see you guys at 6."
}
```

The response shows that your message was successfully created on Carl's message board (Example 54–15).

Example 54–15 Response to Creating a Message on Another User's Message Board

```
201 Created
Content-Type: application/json;charset=UTF-8

{
  "id": "36b8464f-afda-44b5-90ad-8ecedcb040a3",
  "body": "sure; see you guys at 6.",
  "created": "2009-09-10T12:21:09.785-0700",
  "resourceType": "urn:oracle:webcenter:messageBoard:message",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard:message",
      "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:update
urn:oracle:webcenter:delete",
      "rel": "self",
      "href": "opaque-message-URI"
    },
  "author": {
    "id": "mike",
    "displayName": "mike",
    "guid": "649657609D5C11DEBFAA799CBD41D9B8",
    "links": [
      {
        "resourceType": "urn:oracle:webcenter:people:person",
        "capabilities": "urn:oracle:webcenter:read",
        "rel": "self",
        "href": "opaque-person-URI"
      },
      {
        "resourceType": "urn:oracle:webcenter:messageBoard",
        "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:create",
        "href": "opaque-messageBoard-URI"
      },
      {
        "type": "text/html",
        "resourceType": "urn:oracle:webcenter:spaces:profile",
        "capabilities": "urn:oracle:webcenter:read",
        "rel": "alternate",
        "href": "opaque:profile:URI"
```

```
      }
    ]
  }
  ]
}
```

54.13.1.4 Updating a Message

A `PUT` request is very similar to a `POST` request, except that it is performed on the resource being edited, instead of on the parent resource.

From the response to your earlier `POST` request, when you created your message on Carl's message board, you can see that you have `read`, `update`, and `delete` capabilities on the message. You can also see that the `href` provides the URI for your message. Something came up at work and you must stay a bit later. Using the URI for your message, you can now send a `PUT` request to update the message and let Carl know that you are going to be late (Example 54–16).

Example 54–16 Updating a Message (PUT)

```
PUT opaque:message:URI
Accept: application/json;charset=UTF-8
Content-Type: application/json;charset=UTF-8

{
    "body": "working late; see you guys at 7."
}
```

The response is nearly identical to that of `POST`, except that the `body` contains your updated message (Example 54–17).

Example 54–17 Updating a Message

```
200 OK
Content-Type: application/json;charset=UTF-8

{
  "id": "36b8464f-afda-44b5-90ad-8ecedcb040a3",
  "body": "working late; see you guys at 7.",

...deleted for brevity...

}
```

54.13.1.5 Deleting a Message

Performing a `DELETE` request on a resource deletes it, if you have the `delete` capability on the resource. The link to your message on Carl's message board supports `delete`.

You decide to delete the message that you left on Carl's message board (Example 54–18).

Example 54–18 Deleting a Message (DELETE)

```
DELETE opaque:message:URI
```

The response is simply a status code of 204 (Example 54–19).

Example 54–19 Response to Deleting a Message

```
204 NO CONTENT
```

> **Note:** `DELETE` is idempotent, meaning that it can be sent multiple times with the same result. Therefore if you try to delete the same object twice, you still receive the same 204 response even though it has previously been deleted.

54.13.2 Displaying Activity Stream Data

To properly display Activity Stream data, you must:

- Retrieve the Activity Stream URI entry point
- Retrieve the Activity Stream data
- Process the Activity Stream data for display

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

`http://www.oracle.com/technology/products/webcenter/release11_demos.html`

In Example 54–20:

- The `getResourceURL` method shows you how to retrieve the URI entry point for the Activity Stream service by retrieving the JSON data for the main Resource Index (`/rest/api/resourceIndex`) and locating the URI for the Activity Stream resource in that data.
- The `formatMessage` method processes the Activity Stream data into a displayable format. This involves locating an individual message and replacing any template parameters in the message with the name of the object or user that corresponds to that parameter. The parameters also include links to display the object or user. They may contain links to REST services for those objects or users, if available.

> **Note:** To get the Resource Index and Activity Stream JSON data, make Ajax requests using Javascript (and possibly a client-side scripting library like Dojo) and pass the resulting data into the appropriate methods.

Example 54–20 Displaying Activity Stream Data

```
/* Parse the resourceIndex to find the specified URL and
 * return it.
 *
 * @Param jsonData the JSON data retrieved from calling
 *        the /rest/api/resourceIndex URL.
 * @Param strResourceType the resource type of the URL
 *        you want to retrieve from the resourceIndex data.
 *        E.g., 'urn:oracle:webcenter:activities:stream'
 */
function getResourceURL(jsonData, strResourceType)
{
  // Using the HATEOAS model, we browse the returned links
  // looking for the one with the correct resource type.
```

```
  for (var i = 0; i < data.links.length; i++) {
    if (data.links[i].resourceType == strResourceType) {
      return data.links[i].href;
    }
  }
}

/* Parse the resourceIndex to find the activity stream URL and
 * then load it.
 *
 * @Param jsonData the JSON data retrieved from calling
 *        the /rest/api/resourceIndex URL.
 */
function getActivitiesURL(jsonData)
{
  // Parse the JSON data to get the activities URI entry point.

  var strHref = getResourceURL(jsonData,
    'urn:oracle:webcenter:activities:stream');

  // INSERT CODE HERE: Implement getting the JSON data from the
  // strHref URL with the Accept header set to "application/json",
  // and use the formatMessage(index, jsonData) function to get
  // the displayable activity message for each activity.

}

/* Replace activity message parameters.
 *
 * @Param index the index of the activity to process
 * @Param jsonData the JSON data retrieved from calling
 *        the /rest/api/resourceIndex URL.
 */
function formatMessage(index, jsonData)
{
  var activity = jsonData.items[index];
  var strMessage = activity.message;

  // Look for activity parameters and replace them in the message.

  if (activity.templateParams && activity.templateParams.items) {
    for (var i = 0; i < activity.templateParams.items.length; i++) {
      var param = activity.templateParams.items[i];

      // Each parameter also has a set of links which at least
      // includes an HTML link and possibly a REST API link.

      strMessage = strMessage.replace(param.key, param.displayName);
    }
  }
  if (activity.detail) {
    strMessage = strMessage + "<br><font size='1'>" +
      activity.detail + "</font>";
  }
  return strMessage;
}
```

54.13.3 Using the WebCenter People Connections Service REST APIs with Ext

Ext is a popular JavaScript library for building tables and forms and linking them to REST web services. The following example illustrates how to display a list of connections from the People Connections service REST APIs using an Ext `JsonStore` and `GridPanel`.

For more information about Ext, see:

`http://www.extjs.com/`

> **Note:** You must run Ext on a web server. If that server is not your WebCenter instance, then you will run into cross-site scripting problems. If you cannot run the example on your WebCenter server, and you want to use Ext, then consider a proxy, such as Apache or WebCenter Ensemble.

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

`http://www.oracle.com/technology/products/webcenter/release11_demos.html`

This section includes the following subsections:

- Section 54.13.3.1, "Creating the HTML Page"
- Section 54.13.3.2, "Creating the JavaScript File"
- Section 54.13.3.3, "The Result"

54.13.3.1 Creating the HTML Page

Example 54–21 shows the simple HTML page. The HTML page must reference the required Ext files and the JavaScript file, `connections.js`. The body of the page contains a destination `div`. The `GridPanel` is rendered in this `div`.

Example 54–21 The HTML Page

```
<head>
    <link rel="stylesheet" type="text/css" href="../../extjs/resources/css/ext-all.css" />
    <script type="text/javascript" src="../../extjs/adapter/ext/ext-base.js"></script>
    <script type="text/javascript" src="../../extjs/ext-all.js"></script>
    <script type="text/javascript" src="connections.js"></script>
</head>

<body>
    <div id="connections"></div>
</body>
```

54.13.3.2 Creating the JavaScript File

The JavaScript file, `connections.js`, enables the population of the list when the page loads. Example 54–22 shows that all of the JavaScript is a parameter to `Ext.onReady()`.

Example 54–22 connections.js as a Parameter to Ext.onReady

```
Ext.onReady(function() {
        //our code goes here
```

```
});
```

The JavaScript does the following:

1. First, it queries the Resource Index (Example 54–23).

   Notice that the example asks for responses in JSON format.

Example 54–23 Querying the Resource Index

```
//Connection Information
var resourceIndexURL = "http://webcenter_server/rest/api/resourceIndex";
var peopleServiceURN = "urn:oracle:webcenter:people";
var connectionsURN = "urn:oracle:webcenter:people:person:list";
var connectionsRel = "urn:oracle:webcenter:people:person:list:connections";

//create a request for the resourceIndex
Ext.Ajax.request({
        url: resourceIndexURL,
        method: 'GET',
        success: function(response, opts) {
                //locate the people connections entry point
                var index = Ext.decode(response.responseText);
                for (x in index.links) {
                        if (index.links[x].resourceType == peopleServiceURN)
                                getMe(index.links[x].href);
                }
        },
        failure: function(response, opts) {
             alert('Could not communicate with the REST server.');
           },
        headers: {
                'Accept': 'application/json'
        },
});
```

2. Next, the JavaScript sends an authenticated request to the People Connections entry point, and gets the Connections list URL from the response (Example 54–24).

   By default, the REST API uses Basic authentication for secure APIs. In the example, credentials for passing to the Connections list URL are Base64 encoded. Ext does not have a Base64 utility object itself, but one has been developed for it at:

   http://extjs.com/forum/showthread.php?p=167166

Example 54–24 Getting the Connections List URL

```
function getMe(requestURL) {
        //Encode a token to identify yourself with secure parts of the REST API.
        var unencodedToken = "username" + ":" + "password";
        var encodedToken = "Basic " + Ext.util.base64.encode(unencodedToken);

        //call the connections entry point
        Ext.Ajax.request({
                url: requestURL,
                method: 'GET',
                success: function(response, opts) {
                        //locate the link for my connections
                        if (index.links[x].resourceType == connectionsURN) {
                                if (index.links[x].rel == connectionsRel)
                                        getMyConnections(index.links[x].href, encodedToken);
                        }
```

```
                },
                failure: function(response, opts) {
                        alert('Could not communicate with the REST server.');
                },
                headers: {
                        'Accept': 'application/json',
                        'Authorization' : encodedToken
                },
        });
}
```

3. The next step is to send an authenticated request to the Connections list URL (Example 54–25).

Example 54–25 Sending an Authenticated Request to the Connections List URL

```
function getMyConnections(requestURL, encodedToken) {
        Ext.Ajax.request({
                url: requestURL,
                method: 'GET',
                success: function(response, opts) {
                                displayData(response, opts);
                   },
                failure: function(response, opts) {
                     alert('Could not communicate with the REST server.');
                   },
                headers: {
                        'Accept': 'application/json',
                        'Authorization' : encodedToken
                },
        });
}
```

4. Then, the JavaScript adds the response to a `JsonStore` (Example 54–26).

   Previously, this example named `displayData()` as the handler for a successful call to the Connections list URL. Now, it creates the function and adds the `JsonStore` code. In the `JsonStore`, the data model for the data is defined and mapped to results expected from the REST call.

Example 54–26 Adding the Response to a JsonStore

```
function displayData(response, opts) {
        //create a datamodel to display the JSON
        var store = new Ext.data.JsonStore({
                // store configs
                autoDestroy: true,
                storeId: 'forumStore',
                // reader configs
                root: 'items',
                idProperty: 'id',
                fields: ['displayName', {name:'email', mapping:'emails.value'},
                         {name:'phone', mapping:'phoneNumbers[0].value'}]
        });
}
```

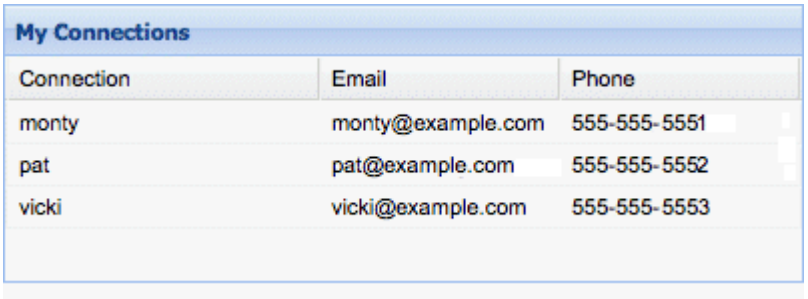
5. The JavaScript creates an Ext `GridPanel` to display the `JsonStore` by including the code in Example 54–27 in `displayData()`.

   The grid defines columns and a title. It also includes other display options, such as the size of the table.

Example 54–27 Creating a GridPanel to Display the JsonStore

```
//create the Grid
var grid = new Ext.grid.GridPanel({
    store: store,
    columns: [
        {id: 'conn', header: 'Connection', width: 80, sortable: true, dataIndex: 'displayName'},
        {header: 'Email', width: 120, sortable: true, dataIndex: 'email'},
        {id: 'phone', header: 'Phone', width: 120, sortable: true, dataIndex: 'phone'}
    ],
    stripeRows: true,
    autoExpandColumn: 'conn',
    height: 200,
    width: 400,
    title: 'My Connections',
    viewConfig: {scrollOffset: 2}
});
```

6. Finally, the code renders the `GridPanel` by including the line in Example 54–28 in `displayData()`.



Example 54–28 Rendering the GridPanel

```
grid.render('connections');
```

54.13.3.3 The Result

Figure 54–1 shows the list of connections from the People Connections service REST APIs.

Figure 54–1 The Connections List

54.13.4 Updating User Status

The following example shows how to use REST APIs to update a user's WebCenter profile status.

Note: You must host the sample on a web server (for example, Apache or Oracle HTTP Server) or an application server. To avoid cross site scripting errors, you should proxy URL access to the REST service. On Apache or OHS, the conf commands would look like (change *myspaceshost* and *port* accordingly):

```
ProxyPass /webcenter/ http://myspaceshost:port/webcenter/
ProxyPassReverse /webcenter/ http://myspaceshost:port/webcenter/
ProxyPass /rest/ http://myspaceshost:port/rest/
ProxyPassReverse /rest/ http://myspaceshost:port/rest/
ProxyPreserveHost on
```

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

http://www.oracle.com/technology/products/webcenter/release11_demos.html

Updating user status involves making a sequence of asynchronous AJAX calls to get the URL for the status object:

```
urn:oracle:webcenter:resourceindex
   urn:oracle:webcenter:people
      urn:oracle:webcenter:people:person:status
```

The HTML page for updating user status (Example 54–29) includes an input field where users can enter the new status message (`statusMessage`). Clicking the **Update Status** button (or pressing Enter) calls the `updateStatus` method to make the initial call to the Resource Index.

Example 54–29 HTML Body

```
<body>
<div>New status message: <input id="statusMessage" type="text"
   onkeyup="{if (event.keyCode==13) updateStatus();}" maxlength="250"
   size="60" /></div>
<div>
<button id="button1" onclick="updateStatus();">Update Status</button>
</div>
<div id="statusResults"></div>
</body>
```

Figure 54–2 shows the HTML page.

Figure 54–2 New Status Message HTML Page

The code in Example 54–30 retrieves the Resource Index (`resourceIndexURL` variable set to `/rest/api/resourceIndex`). The Resource Index is returned as an AJAX request object (`resourceIndexRequest`).

Example 54–30 Retrieving the Resource Index

```
function updateStatus() {
   // Set the UI to busy state. This is cleared in the success and error callbacks
   setUIBusy("Updating status...");
   //get the Resource Index
   resourceIndexRequest.get(
      resourceIndexURL,
      resourceIndexCallback,
      clearUIBusy);
}
```

The `getResourceURL` method shown in Example 54–31 traverses the links in the data returned by a REST call to find a specified string (URN) that identifies the required resource type.

Example 54–31 Traversing the Links

```
function getResourceURL(data, strResourceType) {
   for (var i = 0; i < data.links.length; i++) {
      if (data.links[i].resourceType == strResourceType) {
         return data.links[i].href;
      }
   }
   return null;
}
```

Example 54–32 uses `getResourceURL` to parse the Resource Index to find the user profile URL. The data is returned as an AJAX request object (`profileRequest`).

Example 54–32 Retrieving the User Profile

```
function resourceIndexCallback(data) {
   //get my user profile
   profileRequest.get(
      getResourceURL(data, 'urn:oracle:webcenter:people'),
      profileCallback,
      clearUIBusy);
}
```

Example 54–33 takes the new status message provided by the user in the HTML page (`statusMessage`) and uses `request.put` to update the status object (retrieved by again calling `getResourceURL`).

Example 54–33 Retrieving the Status Object

```
function profileCallback(data) {
   profile = data;
   // get the URL for the status object
   var url = getResourceURL(data, 'urn:oracle:webcenter:people:person:status');
   // get the new status and escape double quotes
   var newStatus = document.getElementById
      ('statusMessage').value.replace(/\"/g. "\\\"");
   //send a JSON string representing the new status object
   var statusMessage = '{"note": "' + newStatus + '"}';
   statusRequest.put(
      getResourceURL(data, 'urn:oracle:webcenter:people:person:status'),
         statusMessage, renderStatusPutResults, clearUIBusy);
}
```

The `renderStatusPutResults` method, shown in Example 54–34, renders the new status object.

Example 54–34 Rendering the New Status Object

```
function renderStatusPutResults(data) {
   var name = profile.displayName;
   // get the URL for my profile HTML page in WebCenter Portal: Spaces
   var profileURL = getResourceURL(profile,
      'urn:oracle:webcenter:spaces:profile');
   var html = 'Status for <a href="' + profileURL + '" target="_blank">'
      + name + '</a> is: ' + data.note;
   // clear the UI busy state and print the new status message
   clearUIBusy(html);
}
```

Example 54–35 shows the code for disabling and reenabling the UI.

Example 54–35 Disabling the UI

```
function setUIBusy(message) {
   document.getElementById('statusResults').innerHTML = message;
   document.getElementById('button1').disabled = true;
   document.getElementById('statusMessage').disabled = true;
}

function clearUIBusy(message) {
   document.getElementById('statusResults').innerHTML = message;
   document.getElementById('button1').disabled = false;
   document.getElementById('statusMessage').disabled = false;
}
```

Example 54–36 shows the library that assists in AJAX calls. Most of this is not WebCenter specific and works for any XHR requests to a service that returns JSON.

The library includes a reusable XHR object. This object supports HTTP GET, POST, PUT, and DELETE. All functions are asynchronous and take a URL and two callback functions, one for success, and one for failure. Success calls are made with a JavaScript object containing the return data. Failure calls are made with an error string. POST and PUT also take a data argument which must be a JSON string.

Example 54–36 AJAX Library

```
function AjaxRequest() {
   // constructor to create an object oriented AJAX request
   var xhr = null;

   // get XHR object. Should work for IE 6+, Safari, and Mozilla based browsers
   if (window.XMLHttpRequest) {
      xhr = new window.XMLHTTPRequest;
   } else {
      try {
         xhr = new ActiveXObject('MSXML2.XMLHTTP.3.0');
      } catch (ex) {
         xhr = null;
      }
   }
   if (xhr == null) {
      alert("Your browser does not support AJAX");
   }

   this.get = function(url, callback, errorCallback) {
      xhr.open('GET', url, true);
      // the REST APIs return XML by default. Please return JSON
      xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
      sendRequest(null, callback, errorCallback);
   };

   this.post = function(url, data, callback, errorCallback) {
      xhr.open('POST', url, true);
      // set headers to send and receive JSON
      xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
      xhr.setRequestHeader('Content-Type', 'application/json; charset=utf-8');
      sendRequest(data, callback, errorCallback);
   };

   this.put = function(url, data, callback, errorCallback) {
      xhr.open('PUT', url, true);
      // set headesr to send and receive JSON
```

```
      xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
      xhr.setRequestHeader('Content-Type', 'application/json; charset=utf-8');
      sendRequest(data, callback, errorCallback);
   };

   this.deleteResource = function(url, callback, errorCallback) {
      xhr.open('DELETE', url, true);
      sendRequest(null, callback, errorCallback);
   };

   // set the callbacks and send the request with data, if any
   function sendRequest(data, callback, errorCallback) {
      xhr.onreadystatechange = function () {
         processResponse(xhr, callback, errorCallback);
      };
      xhr.send(data);
   }

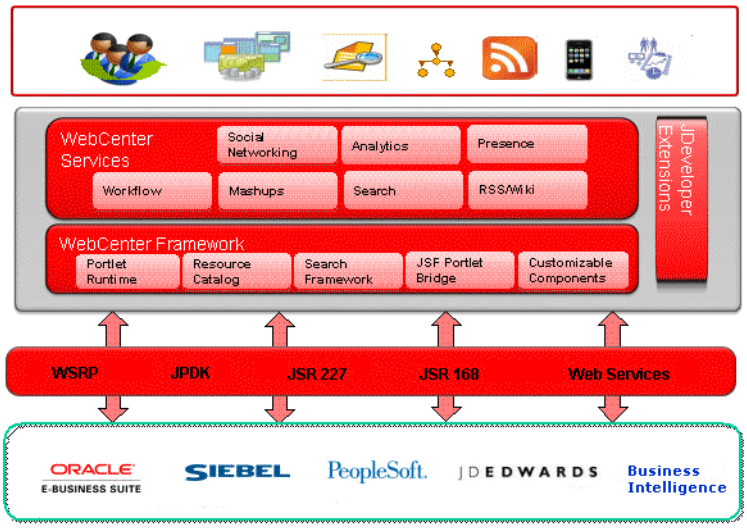
   function processResponse(xhr, callback, errorCallback) {
      var data = null;
      // can get called here many times. 4 means really done
      if (xhr.readyState == 4) {
         // let's call any HTTP codes in the 200s success
         if (xhr.status >= 200 && xhr.status <300) {
            // convert response text into a JSON object. This is insecure.
            // data should not be blindly evaluated from the server return.
            // consider using json2.js http://www.JSON.org/js.html
            data = eval('(' + xhr.responseText + ')');
            callback(data);
         } else {
            // we got an error. Format an error string
            data = 'Error: ' + xhr.status + ' ' + xhr.statusText + '<br />'
               + xhr.responseText;
            errorCallback(data);
         }
      }
   }
}
```

55

Integrating Other Oracle Applications

This chapter describes how you can integrate other Oracle applications with your WebCenter Portal application.

This chapter contains the following sections:



- Section 55.2, "Integrating Siebel Applications"
- Section 55.3, "Integrating E-Business Suite Applications"
- Section 55.4, "Integrating JD Edwards Applications"
- Section 55.5, "Integrating PeopleSoft Applications"
- Section 55.6, "Integrating Oracle Business Intelligence Presentation Services"

55.1 Integrating Oracle and Other Applications in WebCenter Portal

Oracle WebCenter Portal is an integrated suite of technology designed to deliver a unified, context-aware user experience. WebCenter Portal integrates structured and unstructured content, business intelligence, business processes, communication, and collaboration services, and removes the boundaries between enterprise applications. By integrating other applications available within the enterprise with WebCenter Portal, you can create context-centric, composite applications that leverage the capabilities of these applications, extending WebCenter Portal and changing the way people work.

WebCenter Portal uses industry-standard technologies to integrate (primarily as WSRP and JPDK portlets) other application components. Figure 55–1 shows the technologies involved in WebCenter Portal integration with other Oracle applications.

Figure 55–1 WebCenter Portal Integration

Although not all applications support the same integration mechanisms, the integration process is generally quite simple, consisting of exposing the application object to be integrated as a portlet, registering the portlet with WebCenter Portal, adding the portlet to a page, and then running and testing the results.

In Figure 55–1 we show the applications that can be integrated as Siebel, E-Business Suite, JD Edwards, PeopleSoft, and Oracle Business Intelligence. These Oracle applications are fully supported and documented within this chapter. However, you can integrate virtually any application that can expose objects as WSRP or JPDK portlets. The process for integrating them is the same as for the Oracle applications documented here: expose the object as a portlet, register the portlet in WebCenter Portal, and add the portlet to a page. Refer to the documentation for one of the supported Oracle applications for a description of how to consume an exposed portlet in WebCenter Portal.

55.2 Integrating Siebel Applications

This section describes how to integrate a Siebel Web service in a Framework application. It also describes how to integrate Siebel objects using the Siebel Web Engine (SWE). Siebel and WebCenter Portal can work together to include Siebel's CRM capabilities as portlets within your Framework application. You can integrate Siebel applications as Web services, or using the Siebel Web Engine (SWE) as described in the following subsections:

- Section 55.2.1, "Integrating Siebel Applications as Web Services"
- Section 55.2.2, "Integrating Siebel Applications Using the Siebel Web Engine"

55.2.1 Integrating Siebel Applications as Web Services

This section describes how to integrate Siebel applications as Web services in a Framework application.

This section contains the following subsections:

- Section 55.2.1.1, "Preparing the Siebel Application"
- Section 55.2.1.2, "Consuming a Siebel Web Service in a Framework Application"

55.2.1.1 Preparing the Siebel Application

This section describes how to create an inbound Web service, set up operations for the inbound service, and generate a WSDL that you will later use to create a data control to your Framework application.

This section contains the following subsections:

- Section 55.2.1.1.1, "Creating an Inbound Web Service"
- Section 55.2.1.1.2, "Creating Operations for the Inbound Web Service"

55.2.1.1.1 Creating an Inbound Web Service

To create an inbound Web service:

1. Log into the Siebel application.
2. Navigate to the Administration - Web Services page.
3. Click **Inbound Web Services**.

   The Inbound Web Services page shows the out-of-the-box Web services and any other Web services that are currently exposed.
4. Click **Menu** and select `New Record` from the drop-down list.
5. Enter the values for **Namespace**, **Name**, **Status** and **Comment** as appropriate for the Web service you want to set up. For example:

Field Name	Value
Namespace	`http://siebel.com.fmw`
Name	`Siebel Customer Account`
Status	`Active`
Comment	`For Fusion Middleware`

6. Scroll to the Service Ports pane and select **New Record** from the **Menu** drop-down list.
7. Enter `CustAccount` as the **Name** and click **Type**.
8. In the **Inbound Web Service Port Type** pick applet, open the New tab.
9. Select `Business Service` as the **Implementation Type**.
10. From the **Service Name** list, select `Siebel Account`.
11. In the **Inbound Web Service Port Type** pick applet, click **OK** to create the inbound Web service.
12. From the Service Ports dialog's **Transport** drop-down list, select `HTTP`.
13. In the **Address** field, set the URL to your Siebel instance. For example:

```
http://example.com/eai_
enu/start.swe?SWEExtSource=WebService&SWEExtCmd=Execute&UserName=SADMIN&Passwor
d=SADMIN
```

14. From the **Menu** drop-down list, select `Save Record`.

55.2.1.1.2 Creating Operations for the Inbound Web Service

To add operations to the inbound Web service and then create a WSDL file, perform the following steps:

1. Scroll to the Operations section and select `New` from the **Menu** drop-down list.
2. In the **Operation Name** field, enter `AccountInsert`.
3. Click **Method Display Name** to open the Business Service Method dialog.
4. Select `Insert` as the **Method**, and click **OK**.
5. From the **Authentication Type** drop-down list, select an appropriate authentication type:

Authentication Type	Session Type	Description
None	None	A single request is sent with an anonymous user login, and the session is closed after the response is sent out. In order for the anonymous session to be identified by the SWSE Plug-in, UsernameToken and PasswordText must be excluded in the SOAP headers.
Username and password	None	A single request is sent with the username and password used to log in, and the session is closed after the response is sent out.
Username and password	Stateless	The initial request to log in establishes a session that is to remain open and available for subsequent requests. Username/password are used to log in and a session token is returned in a SOAP header included in the outbound response. The session remains open.
Session token (stateless)	Stateless	Request to reconnect to an established session, using the information contained in the session token. If the session has been closed, automatic re-login occurs. The Siebel servers include the session token in the SOAP header of the response. The session remains open.
Session token (stateless)	None	When a SOAP header carries a session token and has the session type set to None, then the Session Manager on the SWSE closes (logs out) of this session, and invalidates the session token. The session token is not used after the session is invalidated.

6. Click **New** to create a new operation.
7. In the **Operation Name** field, enter a name for the new operation (for example, `AccountQueryByExample`).
8. Click **Method Display Name** for the new operation.
9. In the Business Service Method dialog, select the query method (for example, **Query By Example**) and click **OK**.
10. Continue by adding any additional operations you may need as described in steps 6 to 9 above.
11. In the Service Ports pane, select `Save Record` from the **Menu** drop-down list.
12. In the Inbound Web Services pane, select `Save Record` from the **Menu** drop-down list.

13. Select `Clear Cache` from the **Menu** drop-down list.
14. Click the **Generate WSDL**.
15. On the File Download dialog, click **Open**.
16. Select **File --> Save As...**
17. Locate the directory where you want to save the WSDL file, enter a name for the file and click **Save**.

55.2.1.2 Consuming a Siebel Web Service in a Framework Application

This section describes how to consume Siebel applications that have been set up as Web services in a Framework application, including how to set up a WSDL-based data control and, how to use JDeveloper's JSF Navigation Modeler to diagrammatically create your application's pages and the navigation between them.

This section contains the following subsections:

- Section 55.2.1.2.1, "Creating a Data Control Based on a Siebel Web Service"
- Section 55.2.1.2.2, "Creating a Page Flow Diagram"
- Section 55.2.1.2.3, "Adding Pages and Navigation to the Page Flow Diagram"
- Section 55.2.1.2.4, "Creating the Query Page"
- Section 55.2.1.2.5, "Creating the Results Page"
- Section 55.2.1.2.6, "Testing the Application"

55.2.1.2.1 Creating a Data Control Based on a Siebel Web Service

This section describes how to create a WSDL-based data control based on a Web service created from a Siebel application.

To create a WSDL-based data control:

1. Open your Framework application or create a new Framework application in JDeveloper.
2. In the Applications Navigator, right-click the `Model` node and select **New** from the context menu.
3. In the New Gallery, select `All Technologies` from the **Filter By** drop-down list.
4. Select `Business Tier | Web Services` as the category, select the `Web Service Data Control` item, and click **OK**.
5. In the Create Web Service Data Control wizard, click **Next** to leave the Welcome page.
6. In Step 1, enter the Web service name in the **Name** field.
7. Click **Browse** for the **URL** field, locate the directory where you downloaded the WSDL file, select the file and click **Open**.

   In the wizard, note the URL generated in the **Service** field.
8. Click **Next**.

   Step 2 shows all the operations available from the selected Web service.
9. Using the **Add** button, shuttle the operations you want to the Selected pane., and then click **Next**.

When you expand the `Model` node in the Applications Navigator, you should see nodes for the entries that you have created.

10. Click the **Save All** icon to save your changes.

55.2.1.2.2 Creating a Page Flow Diagram -

This section describes how to create the page flow diagram to which you can your add source and query pages.

To create a page flow diagram:

1. In the Applications Navigator, right-click the `ViewController` node and select **New** from the context menu.
2. In the New Gallery, expand the `Web Tier` node and select **JSF**.
3. In the Items pane, select **JSF Page Flow & Configuration (faces-config.xml)** and click **OK**.
4. In the Create JSF Configuration File dialog, click **OK** to accept default values.

   An empty page flow diagram opens with a Component Palette and Data Control Palette to the right of the diagram editor. You use this to create components for the JSF Navigation Model.
5. Click the **Save All** icon to save your changes.

55.2.1.2.3 Adding Pages and Navigation to the Page Flow Diagram

This section describes how to add pages and navigation to the page flow diagram.

To add pages to the page flow diagram:

1. In the JSF Navigation Diagram Component Palette, create a source page by selecting **JSF Page**, clicking the diagram and naming the page appropriately (for example, `QueryByID`). Typically, you will have at least a source and query page.
2. To create the query page, click and drag another JSF Page from the Component Palette and drop it next to the previous one, renaming it appropriately (for example, `ShowResult`).
3. Select **JSF Navigation Case** in the JSF Navigation Diagram Component Palette. Click the icon for the source JSF page, and then click the icon for the destination JSF page for the navigation case.
4. Modify the default label (`success`) by clicking it and entering an appropriate name (for example, `toResult`).
5. Open the Overview tab and click **Navigation Rules**.

   The rule you just created in the diagram should be listed in the table.

   JDeveloper gives you three views of the `faces-config.xml` file: The same information that is presented in the diagram is also accessible through a declarative dialog and directly from the source. If you open the source view (by clicking the Source tab) the `<from-view-id>` tag identifies the source page, and the `<to-view-id>` tag identifies the destination page.
6. From the diagram view, select **JSF Navigation Case** in the Component Palette. Click the icon for the source JSF page, and then click the icon for the destination JSF page for the navigation case.
7. Modify the default label by clicking it and entering an appropriate name (for example, `toQuery`).

8. Click the **Save All** icon to save the diagram.

55.2.1.2.4 Creating the Query Page

This section describes how to create and set up navigation for the query page.

To create the query page:

1. On the Page Flow diagram, double-click the source page icon (`QueryById`) to launch the Create JSF JSP Wizard.
2. Click **Next** to leave the Welcome page.
3. In Step 1 of the wizard, select **JSP Document (*.jspx)** and click **Next**.
4. In Step 2, make sure **Do Not Automatically Expose UI Components in a Managed Bean** is selected and click **Next**.
5. In Step 3, make sure the following libraries are selected:

```
ADF Faces Components 10_1_3_2_0
ADF Faces HTML 10_1_3_2_0
JSF Core 1.0
Cusomizable Components Core 10_1_3_2_0
```

6. Click **Finish** to create the page.

   An empty JSF page opens in the Design tab of the editor.
7. In the Customizable Components Core component palette, click **ShowDetailFrame**.

   The ShowDetailFrame appears in the page.

   Note: Oracle WebCenter Portal provides two customizable components: PanelCustomizable and ShowDetailFrame. These two components make it very easy to organize the content of your Web application, treating different panels as if they are almost stand-alone, portlet-like objects that can be minimized, rearranged, have their own drop-down menus, and so on.
8. With the ShowDetailFrame selected, modify the Text property in the Properties Inspector to Query By ID. Press **[Enter]** to update the page in the Visual Editor.
9. Open the Data Control palette and expand the Siebel Web services node. Drag and drop the `AccountQueryById(String)` node onto the ShowDetailFrame on the page.
10. In the popup menu, select **Create | Parameters | ADF Parameter Form**.
11. In the Edit Form Fields, click **OK**.
12. Select the AccountQueryById button generated in the page and in the Property Inspector pane, change the following properties:

```
Text   Submit
Action toResult
```

13. Select the input field corresponding to the input value, and in the Property Inspector, change the **Label** property to `Account ID:`
14. Click the **Save All** icon to save your work.

55.2.1.2.5 Creating the Results Page

This section describes how to create and add navigation for the results page.

To create the results page:

1. Click the faces-config.xml tab to return to the Page Flow diagram and double-click the **ShowResult** icon to launch the page wizard.
2. Click **Next** to skip the Welcome page.
3. In Step 1 of the wizard, select **JSP Document (*.jspx)** and click **Next**.
4. In Step 2, make sure **Do Not Automatically Expose UI Components in a Managed Bean** is selected and click **Next**.
5. In Step 3, make sure the following libraries are selected:

   ```
   ADF Faces Components 10_1_3_2_0
   ADF Faces HTML 10_1_3_2_0
   JSF Core 1.0
   ```

6. Click **Finish** to create the page.

   An empty JSF page opens in the Design tab of the editor.
7. In the Customizable Components Core component palette, click **ShowDetailFrame**.

   The ShowDetailFrame appears in the page.
8. With the ShowDetailFrame selected, modify the Text property in the Properties Inspector to Query Results. Press **[Enter]** to update the page in the Visual Editor.
9. In the Data Control palette, expand **AccountQueryById | Return | SiebelMessage | ListofAccountInterface**, select the Account node and drop it on the page on the ShowDetailFrame.
10. In the popup menu, select **Create | Forms | ADF Read-only Form**.
11. In the Edit Form Fields, delete all fields except for the following:

    ```
    AccountID
    AccountStatus
    NumberOfEmployees
    CurrencyCode
    Location
    MainPhoneNumber
    Name
    Type
    ```

12. Check the **Include Submit Button** checkbox and click **OK**.
13. In the Action Binding Editor, click **OK**.
14. Click **Submit** and in the Property Inspector change the title to `Back to Query`, and in the **Action** field select `toQuery` from the list.
15. Click the **Save All** icon to save your work.

55.2.1.2.6 Testing the Application

This section describes how to test the application's JSF pages in JDeveloper. Before you can query a Siebel Account using an ID, you need to determine the IDs that are available in your Siebel instance. To perform the following steps you must have access to Siebel Call Center.

To determine the IDS and test your JSF pages:

1. Log into Siebel Call Center, providing the appropriate user ID and password.
2. Navigate to the Accounts List using Site Map.
3. Click **Accounts**, then **Accounts List**.
4. From the returned list, highlight the account you want to query.
5. From the Help menu, select **About Record**.
6. Find the ID value in the **Row #** field and make a note of it.
7. Return to the page flow diagram and right-click the QueryById page icon and select **Run** from the context menu.

   The page is loaded in your default browser.
8. In the ID field, enter the value you previously noted in the the **Row #** field and click **Submit**.

   The Details page displays the detail information for the corresponding account.

55.2.2 Integrating Siebel Applications Using the Siebel Web Engine

As well as integrating Siebel applications using Web Services, you can also integrate Siebel applications in a Framework application using the Siebel Web Engine (SWE).

Siebel Web Engine (SWE) is responsible for rendering the Siebel User Interface. Siebel Web Templates provide this HTML layout information (markup information) to the Siebel Web Engine when rendering Siebel objects in the repository definition of the application. The markup that SWE returns can also be XML for rendering within XML-aware applications or WML (wireless markup language) for rendering on wireless devices. This lets you request the SWE to return a Siebel View as XML, parse the data elements, and display the result in a Framework application.

For instructions on how to use SWE within a Framework application, follow the tutorial *Using the Siebel Web Engine (SWE) to View Data in a WebCenter Application*.

To complete the tutorial, you will need the following:

- Have access to or have installed Oracle JDeveloper Studio Edition
- Have access to or have installed Oracle's Siebel eBusiness Applications.
- Have access to a supported version of Windows Internet Explorer (IE) (see the *System Requirements and Supported Platforms Guide* for Siebel that is available on OTN).

Also refer to the Siebel Bookshelf Guides: *Siebel Portal Framework Guide* (specifically, the section on delivering content to external Web applications), and *Configuring Siebel Business Applications Guide* for details on SWE and Web Templates.

55.3 Integrating E-Business Suite Applications

This section describes how to integrate E-Business Suite applications in WebCenter Portal applications.

This section contains the following subsections:

- Section 55.3.1, "Introduction to Integrating EBS Applications"
- Section 55.3.2, "Integrating EBS Applications in a Framework Application"

- Section 55.3.3, "Integrating EBS Applications in Spaces"

55.3.1 Introduction to Integrating EBS Applications

This section describes the integration points and requirements integrating Oracle E-Business Suite portlets in WebCenter Portal applications.

This section includes the following subsections:

- Section 55.3.1.1, "Understanding EBS Integration"
- Section 55.3.1.2, "Requirements for Integrating EBS Applications"

55.3.1.1 Understanding EBS Integration

Out-of-the-box, Oracle E-Business Suite OA Framework-based portlets, such as Applications Navigator, Favorites, and Worklist are WSRP and JSR 168-compliant. That means that you can access these Oracle E-Business Suite portlets from WSRP-compliant portal servers such as WebCenter Portal: Framework applications or WebCenter Portal: Spaces, by simply adding the portlet onto an application page. Follow the instructions in Section 55.3.2.3, "Creating a JSF Page to Consume the Remote Producer" to add them to a Framework application page, or Section 55.3.3.3, "Adding the EBS Portlet to a Spaces Page" to add them to a Spaces page.

You can also create new E-Business Suite portlets that are WSRP and JSR 168-compliant that can similarly be added to a Framework application. Creating and consuming WSRP and JSR 168 compliant portals in WebCenter Portal is described in Section 55.3.2, "Integrating EBS Applications in a Framework Application" and Section 55.3.3, "Integrating EBS Applications in Spaces."

55.3.1.2 Requirements for Integrating EBS Applications

The following requirements apply for integrating Oracle E-Business Suite portals into WebCenter Portal applications:

- Regions to be exposed as portlets must be created using Oracle E-Business Suite OA Framework Release 12 as previous versions are not WSRP/JSR 168-compliant.
- Oracle E-Business Suite should be configured to use Oracle Internet Directory (OID) and one of following single sign-on solutions:
  - Oracle Single Sign-On (OSSO)
  - Oracle Access Manager (OAM)

  If you are using OSSO, follow the steps in My Oracle Support document 376811.1 to integrate E-Business Suite Release 12 with OID and OSSO.

  If you are using OAM, follow the steps in My Oracle Support document 975182.1 to integrate E-Business Suite Release 12 with OAM.
- You must have granted the WebCenter Portal application access to the E-Business Suite Portlet Producer and added and configured the appropriate users.

> **Note:** To complete some steps, you may need system administrator permissions.

55.3.2 Integrating EBS Applications in a Framework Application

This section includes the following subsections:

- Section 55.3.2.1, "Preparing the EBS Application for Remote Access"
- Section 55.3.2.2, "Registering the EBS WSRP Producer in the Framework Application"
- Section 55.3.2.3, "Creating a JSF Page to Consume the Remote Producer"
- Section 55.3.2.4, "Testing the Framework Application"

55.3.2.1 Preparing the EBS Application for Remote Access

Prepare the standalone regions to be portletized as described in the section on "Basic Implementation" under "Portlets" in Chapter 4: "Implementing Specific UI Features" in the *Oracle Application Framework Developer's Guide*, available from My Oracle Support at:

```
https://support.us.oracle.com/oip/faces/secure/km/DocumentDisplay.jspx?id=1107973.1
```

The Oracle E-Business Suite OA Framework lets you expose any standalone regions (except pageLayout regions) as portlets.

You can also use an Oracle E-Business Suite tool called Portlet Generator to convert existing standalone Oracle Application Framework regions into portlets. For more information, see the section on "Portlet Generator" in Chapter 4: "Developer Tools" in the *Oracle Application Framework Developer's Guide*.

After creating the portlets, grant access to your new UI Function by adding it to a menu and associating the menu with a responsibility. For more information, see the section on "Page Security" under "Portlets" in Chapter 4: "Implementing Specific UI Features" in the *Oracle Application Framework Developer's Guide*.

Before adding the portlets in WebCenter Portal, be sure to bounce the Apache listener as the menu and function definitions are cached. Note that you'll need system administrator permissions to do this.

55.3.2.2 Registering the EBS WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the EBS WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) EBS portlet.
2. Under Application Resources, right-click **Connection** and select **WSRP Producer**.

   Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays.
3. Enter a name for the WSRP producer and click **Next**.

   The Specify Connection Details page displays.
4. Enter the WSDL for the EBS producer in the **WSDL URL** field as shown below:

   ```
   WSDL URL: http://[Release_12_host]:[port]/OA_HTML/portlets/WSRPBaseService?WSDL
   ```

   For example:

   ```
   http://myEBSServer.example.com:8001/OA_HTML/portlets/WSRPBaseService?WSDL
   ```
5. Click **Next** and then **Finish**.

   The WSRP producer should now appear under Connections.

6. Continue by creating a JSF page to consume the WSRP producer as described in Section 55.3.2.3, "Creating a JSF Page to Consume the Remote Producer."

55.3.2.3 Creating a JSF Page to Consume the Remote Producer

Use the following procedure to add or use an existing JSF page to consume the EBS remote producer in your Framework application.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.

   The New Gallery dialog displays.

2. In the Categories field's tree structure, locate and expand the Web Tier.

   A list with the descriptions of the available options display in the Items field.

3. From this list, select **JSF Page** and click **OK**.

   The Create JSF Page dialog displays.

4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.

5. Click **OK**.

   The newly created JSF page displays.

6. Under connections, expand the newly created WSRP producer and drag the portlet for the EBS page onto the JSF page.

7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to `True`.

8. Add any other components that you need onto the page, and save the application.

9. Continue by running the page and testing that modifications made in the Framework application appear in the EBS application as described in Section 55.3.2.4, "Testing the Framework Application."

55.3.2.4 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the EBS application.

1. Run the `.jspx` page that you created.

2. In the running page, modify some information that you can verify the changes for in the EBS application.

3. Save your changes and confirm that the changes also appear in the EBS application.

55.3.3 Integrating EBS Applications in Spaces

This section contains the following subsections:

- Section 55.3.3.1, "Preparing the EBS Portlet for Remote Access"
- Section 55.3.3.2, "Registering the EBS WSRP Producer in Spaces"
- Section 55.3.3.3, "Adding the EBS Portlet to a Spaces Page"

- Section 55.3.3.4, "Testing the Spaces Portlet Connection"

55.3.3.1 Preparing the EBS Portlet for Remote Access

Prepare the standalone regions to be portletized as described the section on "Basic Implementation" under "Portlets" in Chapter 4: "Implementing Specific UI Features" in the *Oracle Application Framework Developer's Guide*, available from My Oracle Support at:

`https://support.us.oracle.com/oip/faces/secure/km/DocumentDisplay.jspx?id=1107973.1`

The Oracle E-Business Suite OA Framework lets you expose any standalone regions (except pageLayout regions) as portlets.

You can also use an Oracle E-Business Suite tool called Portlet Generator to convert existing standalone Oracle Application Framework regions into portlets. For more information, see the section on "Portlet Generator" in Chapter 4: "Developer Tools" in the *Oracle Application Framework Developer's Guide*.

After creating the portlets, grant access to your new UI Function by adding it to a menu and associating the menu with a responsibility. For more information, see the section on "Page Security" under "Portlets" in Chapter 4: "Implementing Specific UI Features" in the *Oracle Application Framework Developer's Guide*.

Before adding the portlets in Spaces, be sure to bounce the Apache listener as the menu and function definitions are cached.

55.3.3.2 Registering the EBS WSRP Producer in Spaces

You can register the EBS WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the EBS WSRP producer using Fusion Middleware Control as described in the steps below.

To register the EBS WSRP producer using Fusion Middleware Control:

1. Prepare the EBS page that you want to consume in Spaces for remote access as described in Section 55.3.3.1, "Preparing the EBS Portlet for Remote Access."
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand `Spaces` in the Navigation bar and from the WebCenter Portal menu, and select **Register Producer**.

   The Add Portlet Producer page displays.
4. Enter a **Connection Name**, set the **Producer Type** to `WSRP Producer`, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. Click **OK** and verify that the producer connection was created successfully.
6. Continue by adding the portlet to a Spaces page as described in Section 55.3.3.3, "Adding the EBS Portlet to a Spaces Page."

55.3.3.3 Adding the EBS Portlet to a Spaces Page

Use the following procedure to consume the EBS remote producer in Spaces.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the EBS portal.
3. Click **Add Content** to open Composer.

4. From the Resource Catalog, select **Portlets**.

   Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the EBS portlet you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.
9. Open the Display Options tab and set the **Render Portlet in IFrame** option to `True` and click **OK**.
10. Continue by checking the portlet connection as described in Section 55.3.3.4, "Testing the Spaces Portlet Connection."

55.3.3.4 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the EBS application.

1. On the Spaces page that you added the EBS portlet to, modify some information that you can verify the changes for in the EBS application.
2. Save your changes and confirm that the changes also appear in the EBS application.

55.4 Integrating JD Edwards Applications

This section describes how to integrate JD Edwards applications into WebCenter Portal applications.

This section contains the following subsections:

- Section 55.4.1, "Integrating JD Edwards Applications in a Framework Application"
- Section 55.4.2, "Integrating JD Edwards Applications in Spaces"

55.4.1 Integrating JD Edwards Applications in a Framework Application

This section includes the following subsections:

- Section 55.4.1.1, "Preparing the JD Edwards Application for Remote Access"
- Section 55.4.1.2, "Registering the JD Edwards WSRP Producer in the Framework Application"
- Section 55.4.1.3, "Creating the JSF Page to Consume the Remote Producer"
- Section 55.4.1.4, "Testing the Framework Application"

55.4.1.1 Preparing the JD Edwards Application for Remote Access

Before you can add JD Edwards standalone regions to Framework applications, you must first prepare them to be portletized within JD Edwards by making them available externally as portlets and locating the pre-configured WSDL in the

`webclient.war/wsdl` directory. The WSDL URL is needed so that you can register the JD Edwards WSRP producer and consume it from a Framework application page.

55.4.1.2 Registering the JD Edwards WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the JD Edwards WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) JD Edwards portlet.
2. Under Application Resources, right-click Connection and select **WSRP Producer**.

   Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays.
3. Enter a name for the WSRP producer and click **Next**.

   The Specify Connection Details page displays.
4. Paste the WSDL URL for the JD Edwards producer into the **WSDL URL** field.
5. Click **Next** and then **Finish**.

   The WSRP producer should now appear under Connections.
6. Continue by creating a JSF page to consume the WSRP producer as described in Section 55.4.1.3, "Creating the JSF Page to Consume the Remote Producer."

55.4.1.3 Creating the JSF Page to Consume the Remote Producer

Use the following procedure to add or use an existing JSF page to consume the JD Edwards remote producer in your Framework application.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.

   The New Gallery dialog displays.
2. In the Categories field's tree structure, locate and expand the Web Tier.

   A list with the descriptions of the available options display in the Items field.
3. From this list, select **JSF Page** and click **OK**.

   The Create JSF Page dialog displays.
4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.
5. Click **OK**.

   The newly created JSF page displays.
6. Under connections, expand the newly created WSRP producer and drag the portlet for the JD Edwards page onto the JSF page.
7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to `True`.
8. Add any other components that you need onto the page, and save the application.
9. Continue by running the page and testing that modifications made in the Framework application appear in the JD Edwards application as described in Section 55.4.1.4, "Testing the Framework Application."

55.4.1.4 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the JD Edwards application.

1. Run the `.jspx` page that you created.
2. In the running page, modify some information that you can verify the changes for in the JD Edwards application.
3. Save your changes and confirm that the changes also appear in the JD Edwards application.

55.4.2 Integrating JD Edwards Applications in Spaces

This section contains the following subsections:

- Section 55.4.2.1, "Registering the Producer"
- Section 55.4.2.2, "Adding the JD Edwards Portlet to a Spaces Page"
- Section 55.4.2.3, "Testing the Spaces Portlet Connection"

55.4.2.1 Registering the Producer

You can register the JD Edwards WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the JD Edwards WSRP producer using Fusion Middleware Control as described in the steps below.

To register the JD Edwards WSRP producer using Fusion Middleware Control:

1. Prepare the JD Edwards page that you want to consume in Spaces for remote access as described in Section 55.4.1.1, "Preparing the JD Edwards Application for Remote Access."
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand `Spaces` in the Navigation bar and from the WebCenter Portal menu, and select **Register Producer**.

   The Add Portlet Producer page displays.
4. Enter a **Connection Name**, set the **Producer Type** to `WSRP Producer`, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. Click **OK** and verify that the producer connection was created successfully.
6. Continue by adding the portlet to a Spaces page as described in Section 55.4.2.2, "Adding the JD Edwards Portlet to a Spaces Page."

55.4.2.2 Adding the JD Edwards Portlet to a Spaces Page

Use the following procedure to consume the JD Edwards remote producer in Spaces.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the JD Edwards portal.
3. Click **Add Content** to open Composer.
4. From the Resource Catalog, select **Portlets**.

Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the JD Edwards portlet you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.
9. Open the Display Options tab and set the **Render Portlet in IFrame** option to `True` and click **OK**.
10. Continue by checking the portlet connection as described in Section 55.4.2.3, "Testing the Spaces Portlet Connection."

55.4.2.3 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the JD Edwards application.

1. On the Spaces page that you added the JD Edwards portlet to, modify some information that you can verify the changes for in the JD Edwards application.
2. Save your changes and confirm that the changes also appear in the JD Edwards application.

55.5 Integrating PeopleSoft Applications

This section describes how to integrate PeopleSoft applications in a WebCenter Portal application.

This section contains the following subsections:

- Section 55.5.1, "Introduction to Integrating PeopleSoft Applications"
- Section 55.5.2, "Integrating PeopleSoft Applications in a Framework Application"
- Section 55.5.3, "Integrating PeopleSoft Applications in Spaces"

55.5.1 Introduction to Integrating PeopleSoft Applications

This section describes the benefits and methods involved in integrating PeopleSoft applications into WebCenter Portal applications.

This section includes the following subsections:

- Section 55.5.1.1, "Understanding PeopleSoft Integration"
- Section 55.5.1.2, "Requirements for Integrating PeopleSoft Applications"

55.5.1.1 Understanding PeopleSoft Integration

PeopleTools 8.48 and later lets you expose PeopleSoft applications as WSRP portlets in remote applications such as WebCenter Portal. This allows people who only need access to a small portion of PeopleSoft's functionality to access it through a WebCenter Portal application without needing to open or learn the entire PeopleSoft application.

55.5.1.2 Requirements for Integrating PeopleSoft Applications

This section the prerequisites for integrating PeopleSoft objects in Framework applications, and Spaces.

- PeopleTools 8.48 or later
- When using WS-Security for automatic sign on to PeopleSoft, in order for the SAML assertion to be valid, the date/time on the PeopleSoft and WebCenter Portal servers must be synchronized. If this is problematic, then the PeopleSoft web server's time may be set to be slightly ahead of WebCenter Portal server.
- For PeopleTools 8.5.1 and earlier, you may need to create and configure a custom OWSM policy in order to fully support WS-Security. For more information, see Section 55.5.2.4, "Setting up WS-Security for PeopleTools."

55.5.2 Integrating PeopleSoft Applications in a Framework Application

This section describes how to create or modify a Framework application that integrates with PeopleSoft Applications.

This section includes the following subsections:

- Section 55.5.2.1, "Preparing the PeopleSoft Application for Remote Access"
- Section 55.5.2.2, "Registering the PeopleSoft WSRP Producer in the Framework Application"
- Section 55.5.2.3, "Creating the JSF Page to Consume the Remote (WSRP) Producer"
- Section 55.5.2.4, "Setting up WS-Security for PeopleTools"
- Section 55.5.2.5, "Testing the Framework Application"

55.5.2.1 Preparing the PeopleSoft Application for Remote Access

This section describes how to prepare the PeopleSoft application so that it can be consumed by Spaces or a Framework application.

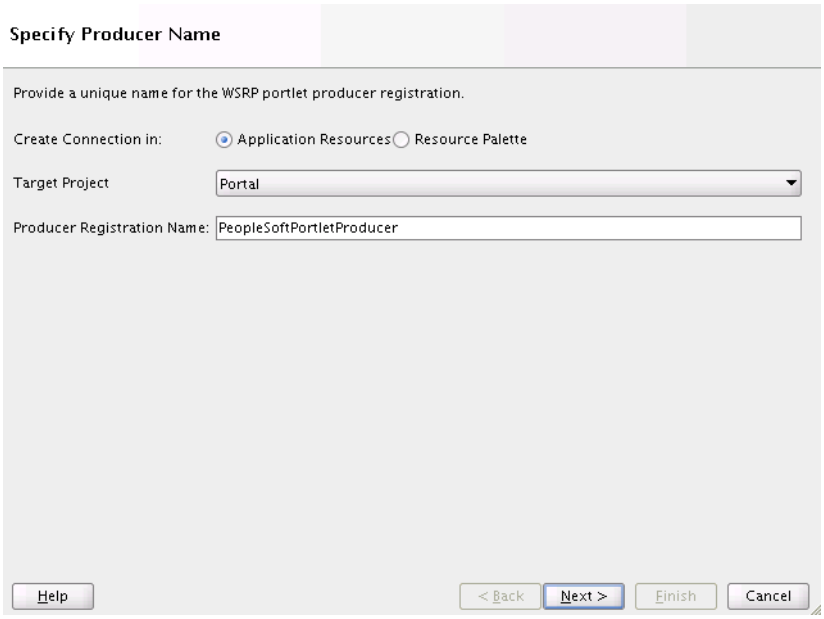
To prepare the PeopleSoft application:

1. Log into PeopleSoft as an administrator.
2. Select PeopleTools from the main menu.
3. From the People Tools main menu, expand **Employee Self-Service**, and then **Portal**.
4. Select **Structure and Content**.
5. Navigate to the folder containing the page that you want to consume in WebCenter Portal and click **Edit** to open it.

   The Content Ref Administration page displays.
6. On the General tab, select the **WSRP Producible** checkbox.
7. Save the page.
8. From the main menu, select **WSRP Production**.

   The Producer Offered Portlets page displays.
9. Verify that the page is exposed, and then expand Web Service Endpoint URL and copy the URL (the WSDL).

10. Open a new tab in your browser, and paste the copied URL into the Navigation Bar to access the WSDL page.
11. Copy the URL to the clipboard.
12. Continue by creating or modifying a Framework application that can access the PeopleSoft remote (WSRP) producer as described in Section 55.5.2.2, "Registering the PeopleSoft WSRP Producer in the Framework Application."



55.5.2.2 Registering the PeopleSoft WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the PeopleSoft WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) PeopleSoft portlet.
2. Under Application Resources, right-click Connection and select **WSRP Producer**.

   Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays (see Figure 55–2).

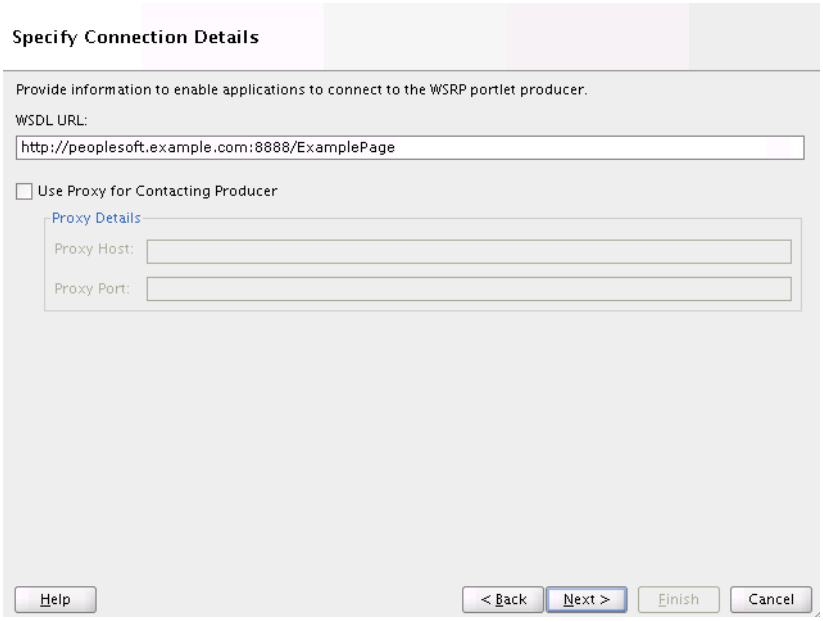


Figure 55–2 Specify Producer Name

3. Enter a name for the WSRP producer and click **Next**.

   The Specify Connection Details page displays (see Figure 55–3).

Figure 55–3 Specify Connection Details

4. Paste the WSDL (the URL you copied earlier) into the **WSDL URL** field.
5. Click **Next** and then **Finish**.

   The WSRP producer should now appear under Connections.
6. Continue by creating a JSF page to consume the WSRP producer as described in Section 55.5.2.3, "Creating the JSF Page to Consume the Remote (WSRP) Producer."

Note: Compression must be turned off in WLS to expose WSRP Portlets. Compression is enabled by default in the Producer Web Server running with Weblogic 10.3.2 and must be disabled in the Server Manager setting for compression available for each instance.

55.5.2.3 Creating the JSF Page to Consume the Remote (WSRP) Producer

Use the following procedure to add a JSF page to consume the PeopleSoft remote producer.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.

   The New Gallery dialog displays.
2. In the Categories field's tree structure, locate and expand the Web Tier.

   A list with the descriptions of the available options display in the Items field.
3. From this list, select **JSF Page** and click **OK**.

   The Create JSF Page dialog displays.
4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.
5. Click **OK**.

The newly created JSF page displays.

6. Under connections, expand the newly created WSRP producer and drag the portlet for the PeopleSoft page onto the JSF page.
7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to `True`.
8. Add any other components that you need onto the page, and save the application.
9. Continue by running the page and testing that modifications made in the Framework application appear in the PeopleSoft application as described in Section 55.5.2.5, "Testing the Framework Application."

55.5.2.4 Setting up WS-Security for PeopleTools

PeopleTools release 8.5.1 (and earlier) does not support outgoing WS-Security headers in its messages. The out-of-the-box WebCenter Portal/OWSM policies require that both outgoing and incoming messages be secured. To bridge this gap you may need to create custom OWSM policies. This section describes the different integration scenarios that require custom WS-Security policies, and the steps required on WebCenter Portal side to configure them.

This section includes the following subsections:

- Section 55.5.2.4.1, "Configuring WS-Security for WSS10 SAML Token with Message Integrity"
- Section 55.5.2.4.2, "Configuring WS-Security for WSS10 SAML Token with Message Protection"
- Section 55.5.2.4.3, "Configuring WS-Security for WSS10 Username Token with Password"

55.5.2.4.1 Configuring WS-Security for WSS10 SAML Token with Message Integrity

This section describes how to configure WS-Security for the WSS10 SAML Token with Message Integrity (`oracle/wss10_saml_token_with_message_integrity_client_policy`) policy.

To configure WS-Security:

1. Configure the WebCenter Portal/OWSM keystore as shown in the chapter "Configuring WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Generate a certificate containing the public key of the WebCenter Portal domain and send it to the PeopleTools administrator so it can be imported in the PeopleTools configuration.
3. When you register the producer, choose `wss10_saml_token_with_message_integrity_client_policy`.
4. Continue by adding the WSRP portlet to a WebCenter Portal page.

55.5.2.4.2 Configuring WS-Security for WSS10 SAML Token with Message Protection

The default WSS10 SAML Token with Message Protection (`oracle/wss10_saml_token_with_message_protection_client_policy`) policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.5.1 and earlier cannot send WS-Security headers in response (only the initial `cookie/get portlet handle` call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the

oracle/wss10_saml_token_with_message_protection_client_policy policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal domain (wc_domain by default).
2. From the WebLogic Domain menu, select **Web Services > Policies**.
3. Select the wss10_saml_token_with_message_protection_client_policy and click **Create Like**.
4. Give the policy a new name (for example, oracle/wss10_saml_token_with_message_protection_plaintext_response_client_policy).
5. Open the Response tab, uncheck the **Include Entire Body** checkboxes under Message Signing Setting and Message Encrypt Setting , and save the policy.
6. Use WLST to register the producer using the newly created policy as shown in the following example:

```
registerWSRPProducer('webcenter', 'wc-pt851-saml_msg-protection',
'http://example.com/pspc/pswsdl/ps/EMPLOYEE', timeout=100,
tokenType='oracle/wss10_saml_token_with_message_protection_plaintext_response_
client_policy',
enforcePolicyURI='false', issuer='www.oracle.com',
sigKeyAlias='webcenter',sigKeyPswd='welcome1', encKeyAlias='webcenter',
encKeyPswd='welcome1', recptAlias='peopleTools_public')
```

Note: You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in enforcePolicyURI='false'.

55.5.2.4.3 Configuring WS-Security for WSS10 Username Token with Password

The default WSS10 Username Token with Password (oracle/wss10_username_token_with_message_protection_client_policy) policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.5.1 and earlier cannot send WS-Security headers in response (only the initial cookie/get portlet handle call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the oracle/wss10_username_token_with_message_protection_client_policy policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal domain (wc_domain by default).
2. From the WebLogic Domain menu, select **Web Services > Policies**.
3. Select the wss10_username_token_with_message_protection_client_policy and click **Create Like**.
4. Give the policy a new name (for example, oracle/wss10_username_token_with_message_protection_plaintext_response_client_policy).
5. Open the Response tab, uncheck the **Include Entire Body** checkboxes under Message Signing Setting and Message Encrypt Setting , and save the policy.
6. Use WLST to register the producer using the newly created policy as shown in the following example:

```
registerWSRPProducer('webcenter', 'wc-pt851-saml_msg-protection',
'http://example.com/pspc/pswsdl/ps/EMPLOYEE', timeout=100,
tokenType='oracle/wss10_username_token_with_message_protection_plaintext_
response_client_policy',
enforcePolicyURI='false', issuer='www.oracle.com',
sigKeyAlias='webcenter',sigKeyPswd='welcome1', encKeyAlias='webcenter',
encKeyPswd='welcome1', recptAlias='peopleTools_public')
```

Note: You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in `enforcePolicyURI='false'`.

55.5.2.5 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the PeopleSoft application.

1. Run the `.jspx` page that you created.
2. In the running page, modify some information that you can verify the changes for in the PeopleSoft application.
3. Save your changes and confirm that the changes also appear in the PeopleSoft application.

55.5.3 Integrating PeopleSoft Applications in Spaces

This section describes how to integrate a PeopleSoft application in Spaces.

This section contains the following subsections:

- Section 55.5.3.1, "Registering the Producer"
- Section 55.5.3.2, "Adding the PeopleSoft Portlet to a Spaces Page"
- Section 55.5.3.3, "Testing the Spaces Portlet Connection"

55.5.3.1 Registering the Producer

You can register the PeopleSoft WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the PeopleSoft WSRP producer using Fusion Middleware Control as described in the steps below.

To register the PeopleSoft WSRP producer using Fusion Middleware Control:

1. Prepare the PeopleSoft page that you want to consume in Spaces for remote access as described in Section 55.5.2.1, "Preparing the PeopleSoft Application for Remote Access."
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand `Spaces` in the Navigation bar and from the WebCenter Portal menu, select **Register Producer**.

   The Add Portlet Producer page displays.
4. Enter a **Connection Name**, set the **Producer Type** to `WSRP Producer`, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. Click **OK** and verify that the producer connection was created successfully.

6. Continue by adding the portlet to a Spaces page as described in Section 55.5.3.2, "Adding the PeopleSoft Portlet to a Spaces Page."

55.5.3.2 Adding the PeopleSoft Portlet to a Spaces Page

Follow the steps below to add the PeopleSoft portlet to a Spaces page.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the PeopleSoft portal.
3. Click **Add Content** to open Composer.
4. From the Resource Catalog, select **Portlets**.

   Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the PeopleSoft page you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.
9. Open the Display Options tab and set the **Render Portlet in IFrame** option to `True` and click **OK**.
10. Continue by checking the portlet connection as described in Section 55.5.3.3, "Testing the Spaces Portlet Connection."

55.5.3.3 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the PeopleSoft application.

1. On the Spaces page that you added the PeopleSoft portlet to, modify some information that you can verify the changes for in the PeopleSoft application.
2. Save your changes and confirm that the changes also appear in the PeopleSoft application.

55.6 Integrating Oracle Business Intelligence Presentation Services

This section explains how to use JDeveloper to create and configure a WebCenter Portal application that integrates with the Oracle Business Intelligence Presentation Services catalog. At runtime, users can add business intelligence objects to their Framework application or Spaces pages.

This section includes the following subsections:

- Section 55.6.1, "Introduction to Integrating Oracle Business Intelligence Presentation Services"
- Section 55.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog"
- Section 55.6.3, "Integrating Oracle Business Intelligence Presentation Services in Framework Applications"
- Section 55.6.4, "Integrating Oracle Business Intelligence Objects in WebCenter Portal: Spaces"

55.6.1 Introduction to Integrating Oracle Business Intelligence Presentation Services

This section explains how you use JDeveloper to create a Framework application, or configure Spaces to integrate with the Oracle Business Intelligence Presentation Services catalog. For more information about adding Oracle Business Intelligence objects to Framework applications, see "Embedding Business Intelligence Objects in ADF Applications" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

This section includes the following subsections:

- Section 55.6.1.1, "Understanding Oracle Business Intelligence Presentation Services Integration"
- Section 55.6.1.2, "Requirements for Integrating Oracle Business Intelligence Presentation Services"

55.6.1.1 Understanding Oracle Business Intelligence Presentation Services Integration

You can use JDeveloper to create Framework applications that integrate with Oracle Business Intelligence Presentation Services. At runtime, these applications include the Presentation Services catalog in the WebCenter Portal - Resource catalog. Users can then browse for and add business intelligence analyses, dashboard pages, dashboards, or scorecard components (strategy maps, strategy trees, KPI watchlists, cause and effect maps, and custom views) to their Framework application pages. Any filters, prompts, and actions links included in the Business Intelligence objects will work within the Framework application or Spaces pages.

At runtime, WebCenter Portal users can expand and browse the Presentation Services catalog's folders to view an analysis' views. The following view types display in the Presentation Services catalog: table, pivot table, chart, funnel chart, gauge, narrative, ticker and title. The following view types do not display in the Presentation Services catalog: view selector, column selector, logical SQL, and no-results view.

Users can also browse the dashboard folder for the pages associated with the dashboard; however, users cannot browse within the dashboard pages to see their components (for example, any analyses embedded in the dashboard). Users cannot include entire Scorecards (only a Scorecard's components) in their Framework application pages.

55.6.1.2 Requirements for Integrating Oracle Business Intelligence Presentation Services

To create a Framework application that integrates with Oracle Business Intelligence Presentation Services, you must have installed Oracle JDeveloper 11g Release 1 (11.1.1.6) or later and the required Oracle BI EE and WebCenter Portal extensions.

To properly create the Framework application, you must configure the library settings, update the `weblogic.xml` and `weblogic-application.xml` files, and have properly configured security.

For both Framework applications and Spaces, you must also set up a connection to the BI application as well as configuring security as described in "Creating an Oracle BI EE Presentation Services Connection" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*. You will also need to specify the credentials for the connection, as described in Section 55.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog."

55.6.2 Configuring Credentials for Connecting to the Oracle BI Presentation Catalog

At design time, you need to specify credentials to connect to the Oracle BI Presentation Catalog. These credentials are used to retrieve the list of business intelligence objects (for example, analyses, dashboards, and scorecard components) from the Oracle BI Presentation Catalog.

This process ensures that the login to the Presentation Server is the same as the current user of the application and any access checks are performed as the current user, and data is fetched as the current user. If the ADF page contains business intelligence objects to which the user does not have access, the ADF page returns a message stating that the user does not have the proper permissions to access these objects.

Note that the **Perform impersonation** parameter should be set to `true` when security is enabled.

This section contains the following subsections:

- Section 55.6.2.1, "Creating the BIImpersonateUser"
- Section 55.6.2.2, "Granting Permissions to BIImpersonateUser"

55.6.2.1 Creating the BIImpersonateUser

Use the following procedures to create a BIImpersonateUser user to secure an application that uses an Oracle BI EE Presentation Services connection and includes Oracle BI EE objects. ADF security must be enabled for your application before you can apply the impersonate user credentials to the Oracle BI EE Presentation Services connection.

The Impersonate User feature secures applications that contain Oracle BI EE objects when Oracle BI EE and ADF are not sharing an Oracle Internet Directory (OID). Before you begin the process of creating and using Impersonate User, you must confirm that this capability is configured in your environment.

Before you perform this procedure, make sure that either you or the Administrator have created users in the WebLogic Server's Oracle BI EE realm and assigned the BIConsumer role to each user in this realm.

Follow the steps below to create the BIImpersonateUser user:

1. Open WebLogic Server for your Oracle BI EE instance.
2. Locate the Domain Structure pane and select Security Realm.

   The Realms pane displays.
3. In the Realms pane, select **<myrealm>**.

   The Settings dialog displays.
4. In the Settings dialog, open the Users and Groups tab.
5. Confirm that the Users tab is displaying and click **New**.
6. Enter `BIImpersonateUser` for the user name and enter a password.
7. Click **OK**.

55.6.2.2 Granting Permissions to BIImpersonateUser

Follow the steps below to use Fusion Middleware Control to grant permissions to BIImpersonateUser:

1. Open Fusion Middleware Control for your Oracle BI EE instance.

2. Locate and select `bifoundation_domain`.

   The bifoundation_domain pane displays.

3. In the `bifoundation_domain` pane, click the **WebLogic Domain** list, highlight `Security`, and select **Application Policies**.

   The Search pane displays.

4. In the **Select Application Name to Search** field's list, select **obi**.

5. Click **Create**.

   The Add Permission dialog displays.

6. In the **Permission Class** field, select `oracle.security.jps.ResourcePermission`. In the Resource Name field, select `oracle.bi.server.impersonateUser`.

7. Click **OK**.

8. In the Grantees pane, click **Add User**.

   The Add User dialog displays.

9. In the Available Users list, select `BIImpersonateUser` and click **Move** to move it to the Selected Users list.

10. Click **OK**.

11. In the `bifoundation_domain` pane, click **OK**.

12. If the changes that you made do not display, stop and restart the following servers:

    - Oracle BI EE Server
    - Oracle BI EE Presentation Server
    - WebLogic Server

55.6.3 Integrating Oracle Business Intelligence Presentation Services in Framework Applications

This section describes how to install the required BI extensions, and create or modify a Framework application that integrates with Oracle Business Intelligence Presentation Services.

This section includes the following subsections:

- Section 55.6.3.1, "Installing the Required Business Intelligence Extensions"
- Section 55.6.3.2, "Creating a Framework Application that Integrates with Oracle BI Presentation Services"
- Section 55.6.3.3, "Testing the Framework Application"
- Section 55.6.3.4, "Post-Deployment Connection Configuration"
- Section 55.6.3.5, "Securing Oracle BI EE Objects Included in a Framework Application"

55.6.3.1 Installing the Required Business Intelligence Extensions

Use this procedure to install the required Business Intelligence extensions:

1. From the JDeveloper Help menu, select **Check for Updates**.

2. Follow the steps in the wizard to locate, download, and install the Oracle BI EE extensions. Be sure to install the bundles in the following order:
   - `bi-soap-cn_bundle`
   - `bi-vo_bundle`
   - `bi-adf_bundle`
   - `bi-adf-taskflow-extension_bundle`
3. Also use the wizard to download and install the Oracle Webcenter Framework Extension bundle (`oracle.webcenter.framework_bundle.zip`).

55.6.3.2 Creating a Framework Application that Integrates with Oracle BI Presentation Services

Use the following procedures to create or modify a Framework application that can access the Oracle Business Intelligence Presentation Services catalog at runtime. Before following these steps you should already have created the BIImpersonateUser, as described in Section 55.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog."

This section includes the following subsections:

- Section 55.6.3.2.1, "Creating the Framework Application and JSF Page"
- Section 55.6.3.2.2, "Configuring the Application to Display the Oracle BI EE Presentation Catalog"
- Section 55.6.3.2.3, "Enabling the BI ADF Task Flow Permission"

55.6.3.2.1 Creating the Framework Application and JSF Page

Use the following procedure to create a Framework application and add a JSF page.

To create a Framework application and JSF page:

1. In Oracle JDeveloper, create a new `WebCenter Portal - Framework application` (be sure to check the checkbox for **Configure the Application with Standard Portal Features**).

   The user name/password in this case should be `BIImpersonateUser/<password>`, where `<password>` is the password that you set when you created the user.
2. Create a connection to the BI application as described in the section "How to Configure SSL and Create an Oracle BI EE Presentation Services Connection" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

   When you create the connection, be sure to set **Perform impersonation when security is enabled** the to `true` and change the username and password to the Impersonate User credentials (`BIImpersonateUser/<password>`) as described above.
3. In the Navigation panel, right-click on the Portal project and select **New**.

   The New Gallery dialog displays.
4. In the **Categories** field's tree structure, locate and expand the Web Tier.

   A list with the descriptions of the available options display in the **Items** field.
5. From this list, select **JSF Page** and click **OK**.

The Create JSF Page dialog displays.

6. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.
7. Click **OK**.

   The newly created JSPX page displays.
8. In the Component Palette pane, select **Composer**.

   The field updates to display the corresponding components, layouts, and operations.
9. From the Common Components category, select **Change Mode Link** and drag and drop it onto your page.
10. From the Common Components category, select **Page Customizable**.
11. Save the application.
12. Right-click the page in Design view and choose **Edit Authorization**.
13. Navigate to **Granted to > Select authenticated-users** and under **Actions** grant authenticated users `Customize`, `Grant`, `Personalize`, and `View` privileges.

55.6.3.2.2 Configuring the Application to Display the Oracle BI EE Presentation Catalog

Use this procedure to add the Presentation Catalog to the Framework application's folder list. At runtime, the catalog displays in the WebCenter Portal - Resource Catalog where the users can browse to business intelligence objects and add them to their Framework application page.

To display the Presentation Catalog in the Framework application's folder list:

1. In the Framework application that you created with Oracle JDeveloper, from the Application menu, right-click **Portal Project** and select **Project Properties**.

   The Project Properties dialog displays.
2. In the available properties pane, select **Technology Scope** and from the Available field, select **Business Intelligence ADF View Components**, and click the **Add** (>) icon to add it to the project's technology scope. Note that you can also add the BI technology libraries when you create a new application.
3. In the available properties pane, select **Libraries and Classpath**, and click **Add Library**.

   The Add Library dialog displays.
4. Add the following libraries to the project, and click **OK**.
   - BI ADF Runtime
   - BI ADF Taskflow
   - BI SOAP Connection Runtime
   - BI View Object Runtime
5. Save the application.
6. In JDeveloper, open the default resource catalog file (`default-catalog.xml`) located in **Portal > Web Content > Oracle > webcenter > portalapp > catalogs**.
7. Add the following `<customFolder>` entry under the `<catalogDefinition> - ><contents>` folder:

```
<customFolder id="oracleBIContent"
    name="Oracle BI"
    description="Oracle BI Presentation Services Content"
    factoryClass="oracle.bi.presentation.rescat.
      BICatalogInitialContextFactory"/>
```

8. Edit `Weblogic.xml` and add references to `oracle.bi.adf.view.slib` and `oracle.bi.adf.webcenter.slib` as shown below:

```
   <library-ref>
      <library-name>oracle.bi.adf.view.slib</library-name>
   </library-ref>
   <library-ref>
      <library-name>oracle.bi.adf.webcenter.slib</library-name>
   </library-ref>
</weblogic-web-app>
```

9. Edit `weblogic-application.xml` and add a reference to `oracle.bi.adf.model.slib` as shown below:

```
   library-ref>
     <library-name>oracle.bi.adf.model.slib</library-name>
   </library-ref>
</weblogic-application>
```

55.6.3.2.3 Enabling the BI ADF Task Flow Permission

Use the following procedure to enable the BI ADF task flow permissions in your application's security settings.

To enable the BI ADF task flow permissions:

1. Open the `jazn-data.xml` file from **Application Resources Pane > META-INF > jazn-data.xml**.
2. Locate the following code in the file:

```
<grantee>
    <principals>
        <principal>
            <class>
              oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl
             </class>
            <name>anonymous-role</name>
        </principal>
    </principals>
</grantee>
```

3. Add the following element:

```
<permission>
    <class>oracle.adf.controller.security.TaskFlowPermission</class>
    <name>/WEB-INF/oracle/bi/presentation/taskflow/
     task-flow-definition.xml#task-flow-definition</name>
    <actions>customize,personalize,view</actions>
</permission>
```

   For example:

```
<grant>
   <grantee>

55.6.3.3 Testing the Framework Application

This section describes how to test the Framework application by performing the following procedures:

- Adding Oracle BI Presentation Services catalog content and modifying a report or dashboard's prompt values
- Confirming and modifying a business intelligence object's initialization parameters.

This section includes the following subsections:

- Section 55.6.3.3.1, "Adding Oracle BI Objects to the Resource Catalog"
- Section 55.6.3.3.2, "Adding Business Intelligence Content at Runtime"
- Section 55.6.3.3.3, "Modifying a Business Intelligence Object's Prompt Values"
- Section 55.6.3.3.4, "Modifying a Business Intelligence Task Flow's Initialization Parameters"

55.6.3.3.1 Adding Oracle BI Objects to the Resource Catalog

Before you can add Oracle BI content to a Framework application page, you must add objects stored in the Oracle BI Presentation Catalog to the WebCenter Portal - Resource Catalog.

1. Run the application in a browser.
2. Log into the Framework application as an administrator.
3. Click **Administration**.

   The WebCenter Portal Administration Console displays.
4. Open the **Resources** tab.
5. Click **Resources Catalogs**.
6. Click **Create a Resource Catalog**.
7. In the **Name** field, enter the name of the catalog you are creating. Complete the other fields on this dialog, as necessary.
8. Click **Edit > Show** for the resource catalog.
9. Click the **Edit** menu and then choose **Edit**.
10. From the **Add** menu, choose **Add From Library...**.
11. Double-click **Connections**.

The BI Presentation Services folder displays in the right frame. Open this folder to display the Oracle BI objects.

12. Browse to and select the objects that you want to add.
13. Click **Add** to add the selected objects to the catalog.
14. Open the Configuration tab and select the resource catalog you just created as the **Default Resource Catalog**.

55.6.3.3.2 Adding Business Intelligence Content at Runtime

Use this procedure to test the Framework application by adding business intelligence content to the Framework application.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Click **Add Content**.

   The WebCenter Portal - Resource Catalog displays.
4. Browse to and open the Oracle BI folder.
5. Click the host machine to which you want to connect.

   The contents of the catalog display.
6. Browse to and click the **Add** link for the object that you want to add to the `.jspx` page.
7. Confirm that the application correctly added the object.

55.6.3.3.3 Modifying a Business Intelligence Object's Prompt Values

Use this procedure to test the Framework application by changing an analysis or dashboard's filter or prompt values.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Add an analysis or dashboard that contains a filter or prompt.

   For more information about adding business intelligence content to the .jspx page, see Section 55.6.3.3.2, "Adding Business Intelligence Content at Runtime."
4. Click **Parameters**.

   The Editing Page dialog displays.
5. Modify the values and click **Save**.
6. Confirm that the application correctly applied the modified prompt values.

55.6.3.3.4 Modifying a Business Intelligence Task Flow's Initialization Parameters

Use the following procedure to test the business intelligence task flow's initialization parameters.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Add a business intelligence object.

   For more information about adding business intelligence content to the .jspx page, see Section 55.6.3.3.2, "Adding Business Intelligence Content at Runtime."

4. Locate the business intelligence object and click the **Edit** (wrench) icon.

   The Component Properties dialog displays.

5. Open the Parameters tab, modify the object's parameters, and click **OK**.

6. Confirm that the application correctly applied the modified prompt values.

55.6.3.4 Post-Deployment Connection Configuration

After an application has been deployed, use Fusion Middleware Control to add a new Oracle BI EE Presentation Services connection to the application, or modify the application's existing Oracle BI EE Presentation Services connection with the user name and password for BIImpersonateUser.

For more information about modifying these connections, see "Adding or Modifying a Presentation Services Connection After Deployment" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

> **Note:** If the Framework application and the Oracle Business Intelligence application do not share the same identity store, you must create the relevant users in both system.

55.6.3.5 Securing Oracle BI EE Objects Included in a Framework Application

Impersonate User lets you secure a Framework application that integrates with Oracle BI EE Presentation Services. For more information about Impersonate User and how to implement it to secure your application, see "How to Create and Use Impersonate User" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

55.6.4 Integrating Oracle Business Intelligence Objects in WebCenter Portal: Spaces

Use the following procedures to test the WebCenter Portal: Spaces integration with the BI objects.

- Section 55.6.4.1, "Adding or Modifying a Presentation Services Connection After Deployment"
- Section 55.6.4.2, "Adding Oracle BI Objects to the Spaces Resource Catalog"
- Section 55.6.4.3, "Adding Oracle BI Content at Runtime"
- Section 55.6.4.4, "Modifying a Business Intelligence Object's Prompt Values"
- Section 55.6.4.5, "Modifying a Business Intelligence Task Flow's Initialization Parameters"

55.6.4.1 Adding or Modifying a Presentation Services Connection After Deployment

Before you can begin integrating BI objects in Spaces, you must first configure a connection from Spaces to the BI server. Oracle BI EE provides an ADF MBean that allows you to add a new connection to a deployed BI ADF or WebCenter Portal: Spaces application. You can also modify a deployed application's existing connection. MBeans are deployed with the application and can be accessed post-deployment using Fusion Middleware Control.

Prior to following the steps below, you should already have followed the steps in Section 55.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog" to specify credentials to connect to the Oracle BI Presentation Catalog.

> **Note:** If the Spaces application and the Oracle Business Intelligence application do not share the same identity store, you must create the relevant users in both system.

Follow the steps below to configure the connection after the application was deployed.

1. Open Fusion Middleware Control and select your WebLogic domain by doing one of the following:
   - If your application is deployed in the BI ADF domain, select the **Application Deployments <your domain>** tree node.
   - If your application is deployed in the Spaces domain, select the **WebCenter** tree node, and then the **Spaces** tree node, and then the **webcenter(11.1.1.4.0)** (**WC_Spaces**) tree node.
2. From the list, select **System MBean Browser**.

   The System MBean Browser pane displays.
3. In the System MBean Browser pane, navigate to the ADF Connections tree node by following the below path:
   a. Select the **Application Defined MBeans** tree node.
   b. Select the **oracle.adf.share.connections** tree node.
   c. Select the **Server: <my server name>** tree node.

      For example, `Server:DefaultServer` or `Server:WC_Spaces`.
   d. Select the **Application:<your application's name>** tree node.

      For example, `Application:Application2` or `Application:webcenter`.
   e. Select the ADF Connections tree node.
   f. Select the ADF Connections tree node.

      The corresponding MBean information displays in the Application Defined MBean pane.
4. In the Application Defined MBean pane, open the Operations tab and then click **createConnection/findOrCreateConnection** to create a Presentation Services connection.

   The Operation:createConnection dialog displays.
5. Specify the required values for the connection.

   In the connection type **Value** field, enter `BISoapConnection`, enter a name in the connection name **Value** field and click **Invoke** to create the connection.
6. In the System MBean Browser pane, click **Refresh** to refresh the tree so that the new connection displays.
7. To modify the connection, locate it in the System MBean Browser pane and click it.

   The connection's information displays in the Application Defined MBean pane.

8. Navigate to ADF Connections from the System MBean Browser pane and open the Attributes tab.
9. Enter the `BISoap` connection information, and then click **Apply** to apply your changes.
10. Open the Operations tab and click **Save** to save the connection.
11. When you click **Invoke**, you should get the following message "Confirmation Operation executed successfully."

55.6.4.2 Adding Oracle BI Objects to the Spaces Resource Catalog

Before you can add Oracle BI content to a Spaces page, you must add objects stored in the Oracle BI Presentation Catalog to the Spaces Resource Catalog.

1. Log into Spaces as an administrator.
2. In Spaces, click **Administration**.

   The Spaces Administration pages displays.
3. Open the **Resources** tab.
4. Click **Resources Catalogs**.
5. Click **Create a Resource Catalog**.
6. In the **Name** field, enter the name of the catalog you are creating. Complete the other fields on this dialog, as necessary.
7. Make the Resource Catalog available by choosing **Edit > Show**.
8. From the **Edit** menu, choose **Edit**.
9. Select the **Add** menu and then choose **Add From Library...**..
10. Double-click **Connections**.

    The BI Presentation Services folder displays.
11. Open this folder to display the Oracle BI objects and browse to and select the objects that you want to add.
12. Click **Add** to add the selected objects to the catalog.

55.6.4.3 Adding Oracle BI Content at Runtime

Use this procedure to create a WebCenter Portal: Spaces page and add Oracle BI objects to it. Before you perform this procedure, you must have added Oracle BI objects to the WebCenter Portal: Spaces resource catalog.

1. Log into Spaces and create a new space or access an existing space.
2. Make the Resource Catalog the default catalog for the space.
   a. Navigate to **Space Settings > General** and select the catalog created in Section 55.6.4.2, "Adding Oracle BI Objects to the Spaces Resource Catalog" as the default catalog for **Resource Catalog for Pages**.
   b. Click **Apply**.
   c. Click **Back to Space**.
3. Create a new page.
4. In the page, click **Add Content**.
5. Browse to the folder containing the Oracle BI objects.

6. Select an analysis or dashboard and click **Add**.

   The object that you selected is added to the page.

7. Click **Close** to exit the Add Content dialog.

55.6.4.4 Modifying a Business Intelligence Object's Prompt Values

Use this procedure to test the WebCenter Portal: Spaces page by changing an analysis or dashboard's filter or prompt values.

1. Open the page that you created.
2. In the running page, click **Page Actions** and then click the **Edit** link to enter edit mode.
3. Add an analysis or dashboard that contains a filter or prompt. For more information about adding Oracle BI objects to the page, see Section 55.6.4.3, "Adding Oracle BI Content at Runtime."
4. Without exiting the edit mode of the page, save the Spaces page.
5. In the Spaces page, modify the prompt values and click **OK**.
6. Exit edit mode, save the page and confirm that the application correctly applied the prompt values.

55.6.4.5 Modifying a Business Intelligence Task Flow's Initialization Parameters

Use the following procedure to test the business intelligence task flow's initialization parameters.

1. Open the page that you created.
2. In the running page, click **Page Actions** and then click the **Edit** link to enter the edit mode.
3. Add an analysis or dashboard that is part of a task flow. For more information about adding business intelligence content to the `.jspx` page, see Section 55.6.4.3, "Adding Oracle BI Content at Runtime."
4. Without exiting the edit mode for the page, save the Spaces page.
5. Locate the business intelligence object and click the **Edit** (wrench) icon.

   The Component Properties dialog displays.

6. On the Spaces page, open the **Parameters** tab and modify the object's parameters and click **OK**.
7. Open the Parameters tab, modify the object's parameters, and click **OK**.
8. Exit edit mode, save the page and confirm that the application correctly applied the modified parameter values.

56

Extending the Spaces Application Using JDeveloper

WebCenter Portal's Spaces application can be customized using browser-based tools and also using JDeveloper. This chapter describes how to customize the Spaces application and Spaces resources in JDeveloper and subsequently utilize them in the Spaces application. For example, you may want to deploy additional shared libraries that include custom code or some additional task flows. Or, you might want to edit Spaces resources, such as skins, page templates, and navigations, in JDeveloper.

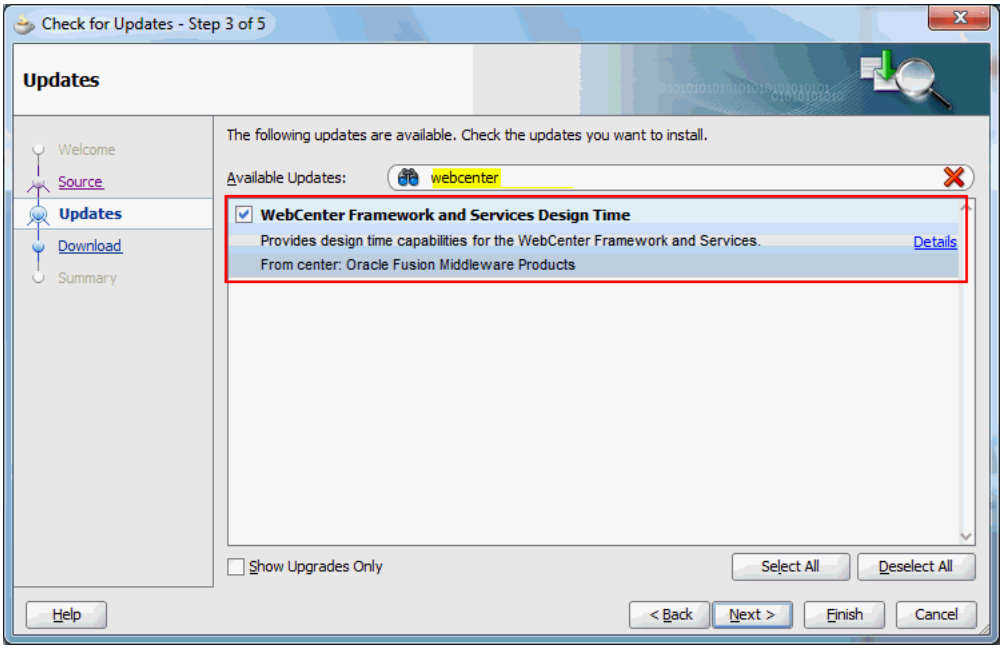
It includes the following sections:

- Section 56.1, "Downloading a Workspace for Spaces Development"
- Section 56.2, "Including Additional Shared Libraries in Spaces"
- Section 56.3, "Developing Resources for the Spaces Application"

Audience

This section is intended for developers who have basic knowledge of JDeveloper with WebCenter Portal: Framework extensions and want to perform advanced customizations for their Spaces deployment.

56.1 Downloading a Workspace for Spaces Development



A JDeveloper workspace for developing Spaces extensions is available as a download from Oracle Technology Network - this workspace is named **DesignWebCenterSpaces.jws**.

To download the Spaces development workspace:

1. Ensure the Spaces application is installed, configured, and working as expected.
2. Download and install Oracle JDeveloper 11g (11.1.1.6.0).

   Oracle JDeveloper 11g (11.1.1.6.0) is available for download from: `http://www.oracle.com/technetwork/developer-tools/jdev/downloads/index.html`
3. Download and install Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions:
   a. In JDeveloper, select **Help** > **Check for Updates**.
   b. Click **Next**, and then **Next** again to display all available updates.
   c. Use the search field to filter the list, for example, enter '`webcenter`'.

Figure 56–1 Download Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions

d. Select **WebCenter Framework and Services Design Time**.

e. Click **Finish**.

See also, Section 3.2, "Installing WebCenter Portal's Extension for Oracle JDeveloper."

4. Download the Spaces development ZIP file (`DesignWebCenterSpaces_PS5.zip`) from Oracle Technology Network:

`http://download.oracle.com/otndocs/tech/webcenter/files/DesignWebCenterSpaces_PS5.zip`

5. Unzip the content locally (Table 56–1).

Table 56–1 DesignWebCenterSpaces_PS5.zip - Unzip Folders

Unzip Folders	Description
\DesignWebCenterSpaces	Includes `DesignWebCenterSpaces.jws`. This workspace enables you to configure your shared library list, that is, you can specify one or more shared libraries containing various customizations (such as custom java code, custom task flows, and so on) that you want to utilize in the Spaces application. The workspace also provides a design environment for editing and uploading Spaces resources.
\copy_to_common	Includes a `common` directory that contains WebCenter Portal WLST commands. WebCenter Portal's WLST commands are required to upload customized resources directly to the Spaces application from `DesignWebCenterSpaces.jws`.

Table 56–1 (Cont.) DesignWebCenterSpaces_PS5.zip - Unzip Folders

Unzip Folders	Description
\copy_to_jdev_ext	Includes `oracle.webcenter.portal.jar`. Required update to Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions.

6. Copy WebCenter Portal's WLST (WebLogic Scripting Tool) commands to the Oracle home directory where JDeveloper is installed:
   a. Navigate to: `<DesignWebCenterSpaces_Unzip_Location>\copy_to_common`
   b. Make a copy of the `common` directory.

      The `common` directory is located under `<DesignWebCenterSpaces_Unzip_Location>\copy_to_common`.
   c. Navigate to: `<JDeveloper_install_directory>\oracle_common`

      Tip: The `JDeveloper_install_directory` is the base directory under which JDeveloper is also installed, that is, the same directory that you configure as the `jdeveloper.install.home.directory` in `config.properties` (see also Table 56–2).
   d. Copy the content of the `common` directory here.

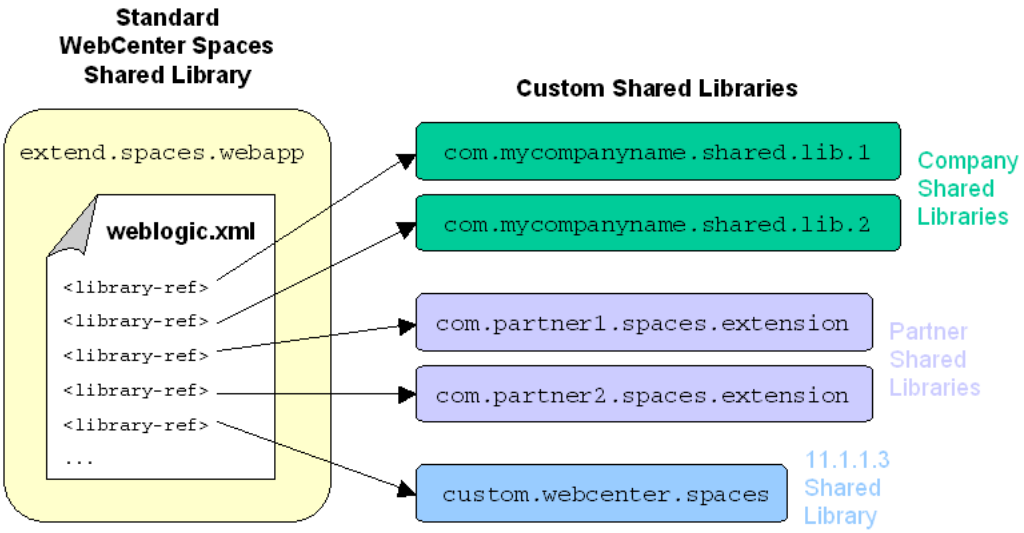
      Tip: On Linux, use the following command: `cp -r <DesignWebCenterSpaces_Unzip_location>/copy_to_common/common/.`
7. Copy new version of `oracle.webcenter.portal.jar` to the Oracle JDeveloper extensions directory:
   a. Navigate to: `<DesignWebCenterSpaces_Unzip_Location>\copy_to_jdev_ext`
   b. Make a copy of `oracle.webcenter.portal.jar`.

      The `oracle.webcenter.portal.jar file` is located under `<DesignWebCenterSpaces_Unzip_Location>\copy_to_jdev_ext`.
   c. Navigate to: `<JDeveloper_install_directory>\jdeveloper\jdev\extensions\`

      Tip: The `JDeveloper_install_directory` is the base directory under which JDeveloper is also installed, that is, the same directory that you configure as the `jdeveloper.install.home.directory` in `config.properties` (see also Table 56–2).
   d. Copy the `oracle.webcenter.portal.jar file` here.
8. Restart JDeveloper if it is open.

56.2 Including Additional Shared Libraries in Spaces

This section includes the following subsections:



- Section 56.2.1, "What You Should Know About Shared Library Deployment for Spaces"
- Section 56.2.2, "Deploying Your Own Custom Code and Task Flows in Shared Libraries"
- Section 56.2.3, "Rebuilding the Spaces Shared Library List"

56.2.1 What You Should Know About Shared Library Deployment for Spaces

The Spaces application includes the standard shared library `extend.spaces.webapp.war`. This .WAR file includes a deployment descriptor (`weblogic.xml`) which can reference other libraries that contain Spaces customizations.

Therefore, if you have custom code or task flows deployed in several shared libraries from multiple sources you can add them to the `extend.spaces.webapp` shared library list, as illustrated in Figure 56–2.

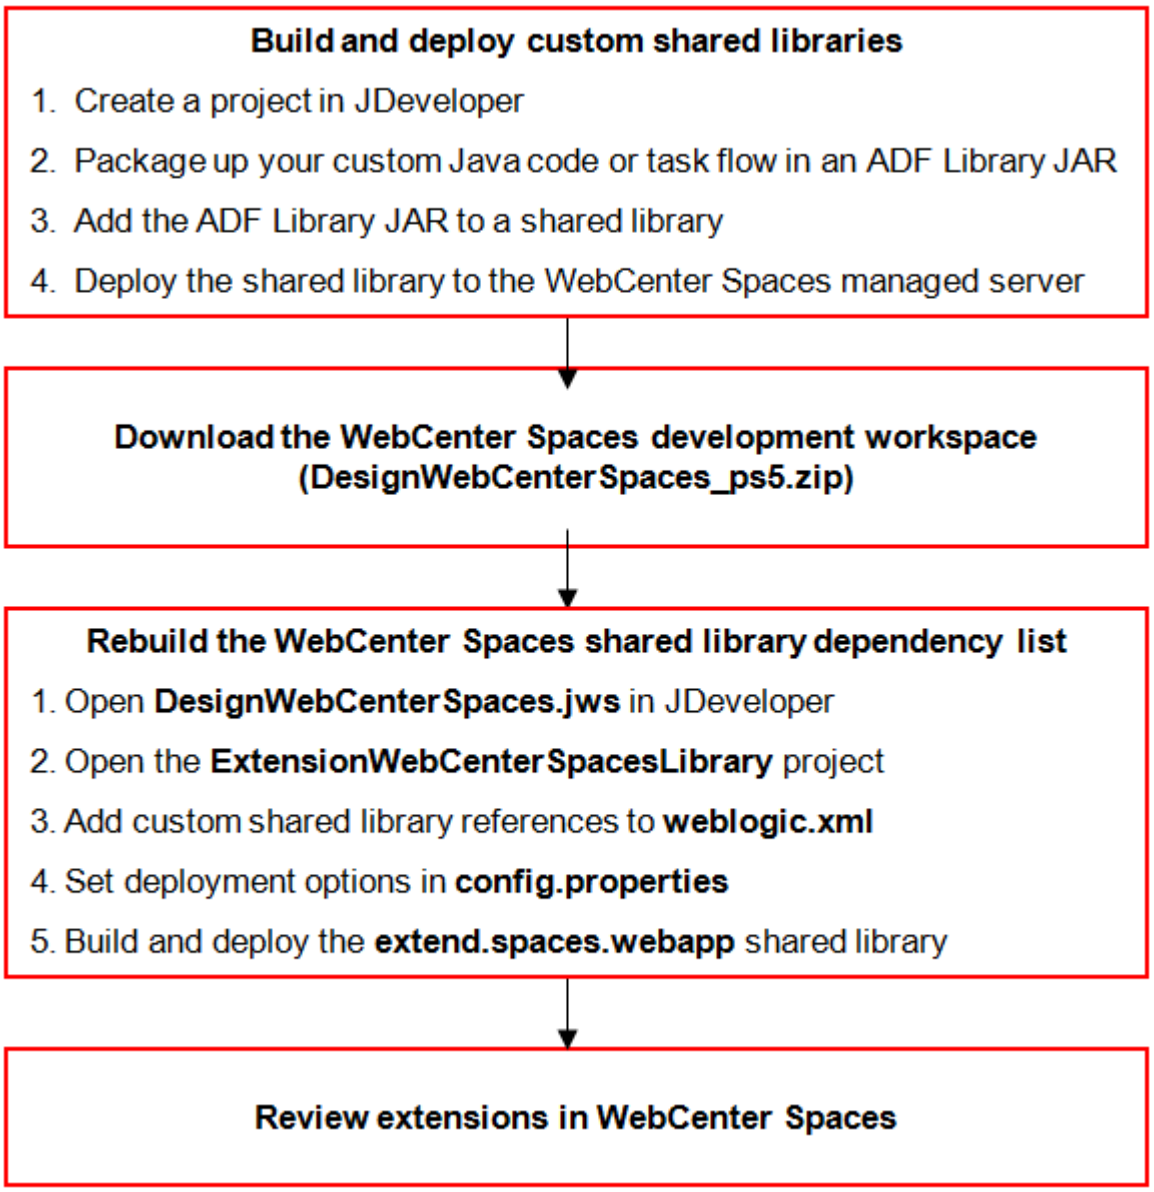


Figure 56–2 Referencing Custom Shared Libraries in extend.spaces.webapp.war

This development model provides an easy way to utilize additional shared libraries in Spaces from multiple contributors, including developers, customers, partners.

Whenever you deploy a new shared library that includes Spaces extensions you must modify the Spaces shared library dependency list and redeploy `extend.spaces.webapp.war`. Figure 56–3 illustrates the process.

Figure 56–3 Overview - Including Additional Shared Libraries in Spaces

For more detail, see Section 56.2.2, "Deploying Your Own Custom Code and Task Flows in Shared Libraries" and Section 56.2.3, "Rebuilding the Spaces Shared Library List".

56.2.2 Deploying Your Own Custom Code and Task Flows in Shared Libraries

Developers can build extensions for the Spaces application, package them in ADF Library JARs, and then deploy them as shared libraries for use in Spaces. For example, you can:

- Develop custom code in JDeveloper and make it available in the Spaces application.
- Develop custom task flows in JDeveloper and make them available to the Spaces application

To help you get started, Oracle provides a sample workspace in which you can develop extensions, and build and deploy Spaces shared libraries that contain your custom code.

The sample workspace, `SampleWebCenterSpacesExtension.jws`, contains sample extensions and scripts that enable you to deploy custom code for Spaces. For more information, download the accompanying whitepaper, *Using Spaces Extension Samples (11.1.1.6.0)*, from Oracle Technology Network at `http://www.oracle.com/technetwork/index.htm`.

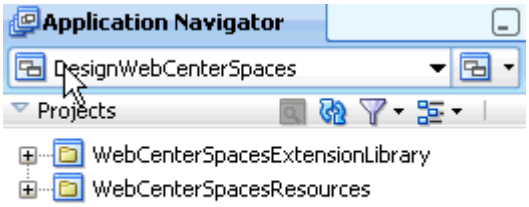
56.2.3 Rebuilding the Spaces Shared Library List

Whenever you deploy a new shared library that includes Spaces extensions you must update the Spaces shared library dependency list and redeploy `extend.spaces.webapp.war`.

This section describes:

- Editing the Shared Library List
- Setting Build and Deployment Options (config.properties)
- Building and Deploying the Shared Library List (extend.spaces.webapp.war)
- Troubleshooting Shared Library Deployment
- Reverting to a Previous Shared Library List

56.2.3.1 Editing the Shared Library List



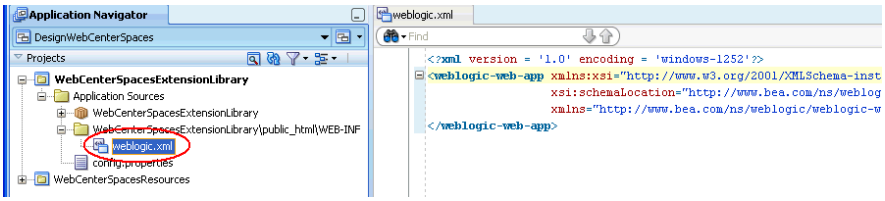
Use the *WebCenterSpacesExtensionLibrary* project to build and deploy `extend.spaces.webapp.war`—a shared library containing `weblogic.xml` in which you configure the Spaces shared library dependency list.

1. Download and unzip the Spaces development workspace.

   See Section 56.1, "Downloading a Workspace for Spaces Development".

2. Navigate to the unzip directory, and open `DesignWebCenterSpaces\DesignWebCenterSpaces.jws` in JDeveloper (Figure 56–4).

Figure 56–4 Projects in the DesignWebCenterSpaces Workspace

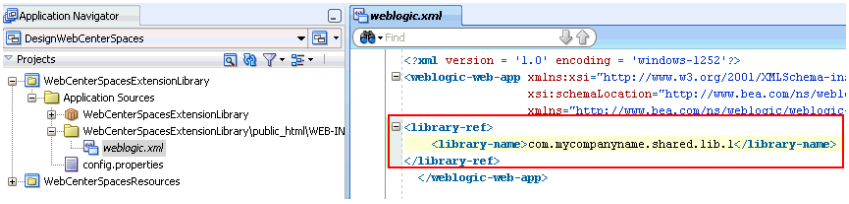


3. Expand the **WebCenterSpacesExtensionLibrary** project.

4. Navigate to **weblogic.xml**, under **Resources\WebCenterSpacesExtensionLibrary\public_html\WEB-INF** (Figure 56–5).

   Out-of-the-box, this file is blank, that is, no additional shared libraries are listed in the file.

Figure 56–5 WebCenterSpacesExtensionLibrary - Out-of-the-box weblogic.xml



5. Add a `<library-ref>` entry for each shared library that you want to use in Spaces.

   For example, you can include a single library entry, as shown in Figure 56–6:

```
<library-ref>
  <library-name>com.mycompanyname.shared.lib.1</library-name>
</library-ref>
```

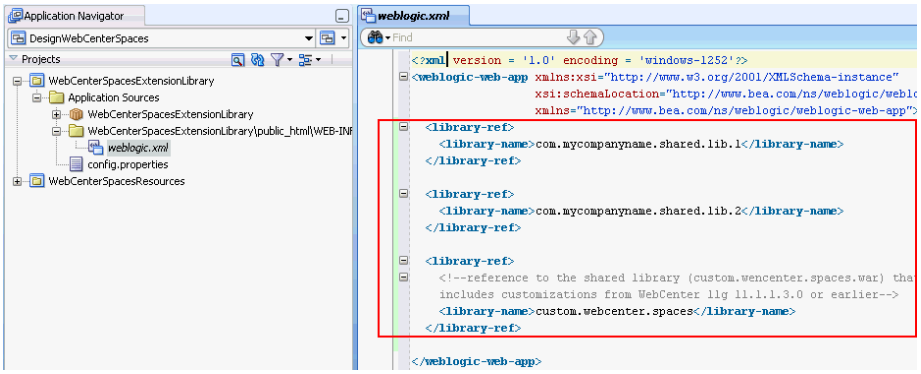


Figure 56–6 weblogic.xml - Single Shared Library Reference

   Or, reference multiple shared libraries, as shown in Figure 56–7:

```
<library-ref>
    <library-name>com.mycompanyname.shared.lib.1</library-name>
</library-ref>
<library-ref>
    <library-name>com.mycompanyname.shared.lib.2</library-name>
</library-ref>
<library-ref>
     <!--reference to the shared library (custom.wencenter.spaces.war) that
      includes customizations from WebCenter 11gR1 11.1.1.3.0 or earlier-->
    <library-name>custom.webcenter.spaces</library-name>
</library-ref>
```

Figure 56–7 weblogic.xml - Multiple Shared Library References

Note: If you want to use custom extensions developed for a previous WebCenter Spaces release (11.1.1.3.0 or earlier), include the name of the old shared library, **`custom.webcenter.spaces`**, in `weblogic.xml`, as shown in Figure 56–7.

6. Ensure each shared library that you reference is deployed on the Spaces managed server.

The next section describes how to set build and deployment options for the shared library list (`extend.spaces.webapp.war`).

56.2.3.2 Setting Build and Deployment Options (config.properties)

Before you can build the shared library list and deploy `extend.spaces.webapp.war` to the Spaces managed server, you must provide some information about your environment and your WebCenter Portal installation in the configuration file `config.properties`.

To set build and deployment properties for the `extend.spaces.webapp` shared library:

1. Open **DesignWebCenterSpaces.jws**.

   See also, Section 56.1, "Downloading a Workspace for Spaces Development"

2. Expand the **WebCenterSpacesExtensionLibrary** project.
3. Open **config.properties**.
4. Enter information about your JDeveloper environment and WebCenter Portal installation, as shown in Table 56–2.

   The `config.properties` file describes each property and offers examples. The defaults provided are only samples and must be replaced with your own, installation-specific values.

Table 56–2 Configuring config.properties to Enable Deployment to the Managed Server

Configuration Property	Description
`jdeveloper.install.home.directory`	Base directory where JDeveloper is installed. The directory you specify contains other folders such as `jdeveloper`, `wlserver_10.3`, `modules`, and so on.
`wlst.executable`	Name of the WLST executable file. Either `wlst.cmd` (on Windows) or `wlst.sh` (on Linux).
`extending.spaces.home.dir`	Path to the Spaces development workspace directory. For example, `C:\DesignWebCenterSpaces`
`oracle.jdeveloper.ojdeploy.path`	Path to `ojdeploy.exe` (Windows) or `ojdeploy` (Linux).
`wls.port`	Port number on which the WLS Administration Console is running
`wls.host`	Host machine on which the Spaces application is running and where the custom shared library is to be deployed
`wls.userkey`	Name and location of the file storing administrator passwords. `config.properties` describes how to generate the file using WLST. The file can be copied to any suitable, accessible location.
`wls.userconfig`	Name and location of the file storing administrator user details. `config.properties` describes how to generate the file using WLST. The file can be copied to any suitable, accessible location.

Table 56–2 (Cont.) Configuring config.properties to Enable Deployment to the Managed

Configuration Property	Description
`wls.target`	Targets on which the Spaces shared library is to be deployed. For example, `WC_Spaces`.
`wls.webcenter.app.target`	Targets on which the `webcenter.ear` file is to be deployed. For example, `WC_Spaces`.
`webcenter.app.name`	Name of the Spaces application. Always `webcenter`.
`restart.implementation.version.suffix`	Controls incremental implementation version numbers.

5. Save your updates to `config.properties`.

Updates to `config.properties` are available immediately so there is no need to restart JDeveloper.

The next section describes how to build and deploy the shared library list `extend.spaces.webapp.war`.

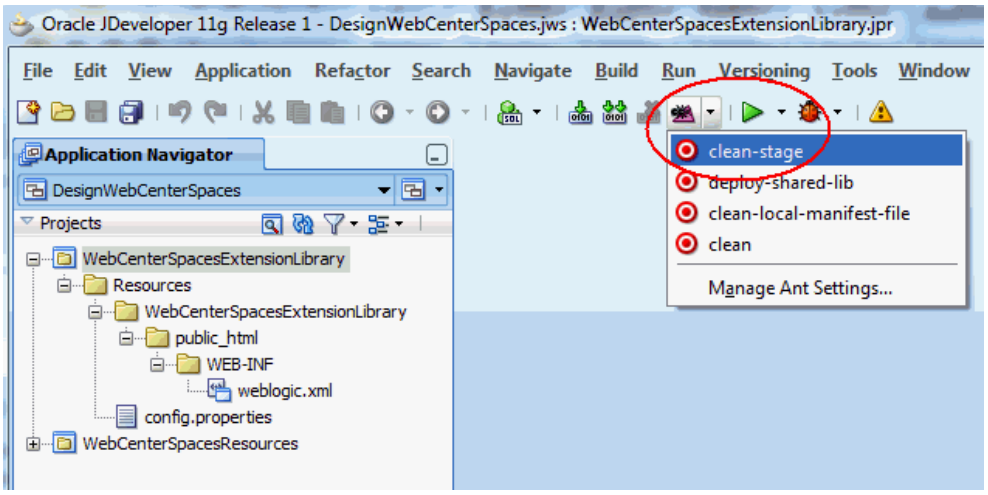
56.2.3.3 Building and Deploying the Shared Library List (extend.spaces.webapp.war)

You must rebuild and redeploy the `extend.spaces.webapp.war` shared library whenever you modify the shared library list (`weblogic.xml`).

To build and deploy the shared library list:

1. Open `DesignWebCenterSpaces.jws` in JDeveloper.

   See also, Section 56.1, "Downloading a Workspace for Spaces Development".



2. Expand the **WebCenterSpacesExtensionLibrary** project.

3. If you have not done so already, specify environment details in `config.properties`.

   See also, Section 56.2.3.2, "Setting Build and Deployment Options (config.properties)".

4. To rebuild `extend.spaces.webapp.war`, open the **Run Ant** dropdown menu, and then select **clean-stage** (Figure 56–8)

Figure 56–8 Building a Customized WebCenter Portal: Spaces Extension Library

This generates a new version of the shared library list `extend.spaces.webapp.war`. The implementation version number associated with the new .WAR is saved to `MANIFEST.MF` as follows:

`<UnzipDir>/DesignWebCenterSpaces/WebCenterSpacesExtensionLibrary/META-INF/MANIFEST.MF`

5. To redeploy the Spaces shared library list, open the **Run Ant** dropdown menu, and then select **deploy-shared-lib**.

A new version of the shared library list is deployed to the Spaces managed server. To verify the new deployment, login to the WLS Administration Console, navigate to the deployment overview page, and check the implementation version, that is, navigate to:

Deployments> extend.spaces.webapp>Overview

If the latest version is not active, refer to the Section 56.2.3.5, "Troubleshooting Shared Library Deployment".

56.2.3.4 Reverting to a Previous Shared Library List

If there is a problem with the latest shared library list or you want to revert to a previous version for some reason, you can undeploy (remove) the current version and revert to the previous version, using the WLS Administration Console.

You can remove unwanted shared library versions too. If you go through several "change-build-deploy-test" iterations, each incremental version is retained by default. As the Spaces application only uses the latest shared library version you can clean up or delete previous versions if you want.

Before undeploying the latest version, you must shut down the managed server on which the Spaces application is running. Once you have removed the latest version, you can restart the managed server.

Note: Oracle recommends that you do not delete the original `extend.spaces.webapp` shared library (version 11.1.1) as this enables you to revert to the out-the-box version if necessary.

1. Run the following script to stop the managed server on which the Spaces application is deployed:
   - UNIX: DOMAIN_HOME/bin/stopManagedWeblogic.sh

- Windows: DOMAIN_HOME\bin\stopManagedWeblogic.cmd

2. Login to the WLS Administration Console, navigate to the deployment overview page (**Deployments> extend.spaces.webapp>Overview**), and remove the latest shared library version.

   To revert to the out-of-the-box Spaces deployment, revert to the original `extend.spaces.webapp.war` shared library, that is, delete all other Spaces shared library versions, except for `extend.spaces.webapp.war` version 11.1.1.

3. Run the following script to start the managed server on which the Spaces application is deployed:

   - UNIX: DOMAIN_HOME/bin/startManagedWeblogic.sh
   - Windows: DOMAIN_HOME\bin\startManagedWeblogic.cmd

56.2.3.5 Troubleshooting Shared Library Deployment

- **Changes are not available after deployment even though deployment successful**.

  The Spaces application always uses the latest shared library version. Check that the implementation version in MANIFEST.MF matches the implementation version displayed in the WLS Administration Console.

  For example, check the value in `<UnzipDir>/DesignWebCenterSpaces/WebCenterSpacesExtensionLibrary/META-INF/MANIFEST.MF` is the same as that displayed in the WLS Admin Console under **Deployments> extend.spaces.webapp>Overview**

- **"Security: 090219" error displays:**

  ```
  weblogic.security.internal.encryption.EncryptionServiceException:
  weblogic.security.internal.encryption.EncryptionServiceException:
  weblogic.security.internal.encryption.EncryptionServiceException:
  [Security:090219]Error decrypting Secret Key com.rsa.jsafe.JSAFE_
  InputException: Invalid input length for decryption. Should be a multiple of
  the block size - 8
  ```

  Check that `wls.userconfig` and `wls.userkey` are both set correctly in the `config.properties` file, and verify that both security files specified are accessible

- **"DeployerException: Task 9 failed" displays:**

  ```
  weblogic.Deployer$DeployerException:
  weblogic.deploy.api.tools.deployer.DeployerException: Task 9 failed:
  [Deployer:149117]deploy library custom.webcenter.spaces
  [LibSpecVersion=11.1.1.2,LibImplVersion=11.1.1.2.5] on AdminServer,WC_Spaces.
  ```

  This error occurs if the implementation version of the new deployment and the existing deployment are the same. Use the WLS Administration Console to verify the current implementation version and then change the restart.implementation.version.suffix property in `config.properties` to this value. When you rebuild and redeploy the shared library, the implementation version should increment by '1'.

- **"java.lang.IllegalArgumentException" displays**:

  Restart the managed server on which the Spaces application is deployed.

- **Deployment hangs:**

If you encounter issues during the deployment phase (**Run Ant Target > deploy-shared-lib**) and the process hangs, end/kill the Ant process from inside JDeveloper, and then restart the Administration Server and the managed server for the Spaces application. If you encounter further issues restarting either the Administration Server or the managed server, end/kill the associated Java processes and restart both servers.

- **Newly deployed Spaces shared library is not active:**

  If a newly deployed shared library is not active, use WLS Administration Console to manually delete the non-active shared library version, and then rebuild (**Run Ant Target>clean-dist**) and redeploy (**Run Ant Target > deploy-shared-lib**) the Spaces shared library.

- **"Error occurred attempting to display the list of pages you can access. Please contact the administrator" displays after logging in:**

  Restart the managed server on which the Spaces application is deployed.

- **"WCS#2009.12.22.00.49.35: Fatal error occurred while getting members" displays:**

  Restart Spaces.

56.3 Developing Resources for the Spaces Application

This section describes the WebCenterSpacesResources project—-a design environment for Spaces resource development. Through this project, you can upload resources, developed or customized through JDeveloper, to the Spaces application.

This section includes the following subsections:

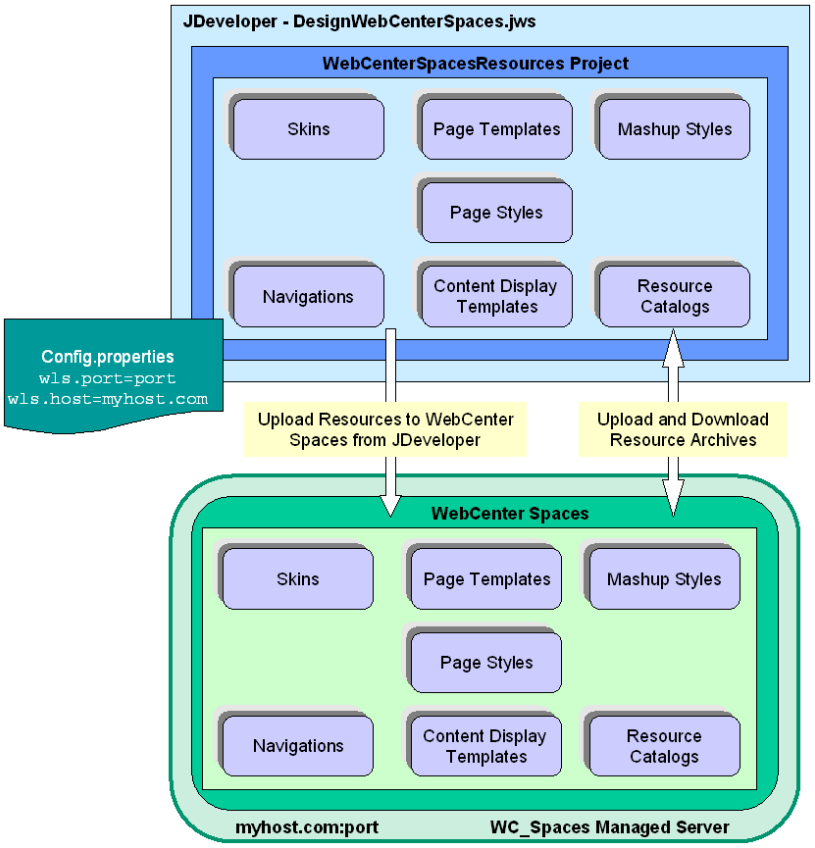
- Section 56.3.1, "Using the WebCenterSpacesResources Project for Round-Trip Development"
- Section 56.3.2, "Opening and Exploring the WebCenterSpacesResources Project"
- Section 56.3.3, "Enabling Direct Uploads to the Spaces Application"
- Section 56.3.4, "Editing Spaces Resources in JDeveloper"
- Section 56.3.5, "Uploading Resources Directly to the Spaces Application"
- Section 56.3.6, "Exporting Spaces Resources to an Archive"
- Section 56.3.7, "Troubleshooting Resource Round-Trip Development"

56.3.1 Using the WebCenterSpacesResources Project for Round-Trip Development

WebCenter Portal's round-trip development features provide a simple, convenient way to modify Spaces resources without redeploying the entire application. Round-trip development refers to features and techniques that allow you to download resources from a deployed application and upload them to JDeveloper for maintenance or enhancement. Once modified, you can upload the resource back to the Spaces application for immediate use or for testing.

Out-of-the-box, Spaces provides some default resources, such as skins and page templates, for people to use or modify. To keep Spaces easy to use, the built-in functionality for creating and editing resources within Spaces is purposely somewhat limited. If your resource requirements extend beyond the editing capabilities of the Spaces application, you can further develop resources using a JDeveloper project that is especially designed for that purpose—*WebCenterSpacesResources*.

Oracle recommends that you use this project to build and manage custom skins, page templates, page styles, navigations, content display templates, mashup styles, and resource catalogs. The project provides some sample resources, as well as other files and folders you might need. You do not have to develop resources from scratch; you can export existing resources from the Spaces application and edit them in JDeveloper, or use one of the samples as your starting point.



Note: This chapter describes how to use the *WebCenterSpacesResources* project to manage resource customizations. If you need more information on how to build/develop resources, see Section 56.3.4.3, "How to Build Spaces Resources".

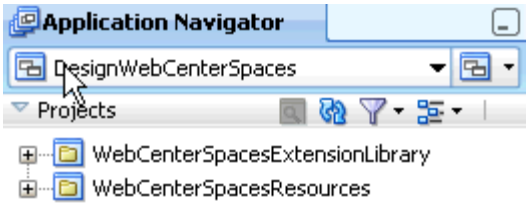
When you are ready to deploy new resources, you can upload them directly from JDeveloper to a live Spaces application simply by providing JDeveloper with the name of the host and port where the Spaces application is running.

Note: You do not need to deploy customized resources to a shared library.

Alternatively, you can login to Spaces and upload new resources through the Resource Manager. If you decide to use this method you must save the resource to an export archive (.ear).

Figure 56–9 Designing Resources Using the WebCenterSpacesResources Project

56.3.2 Opening and Exploring the WebCenterSpacesResources Project



1. Download and unzip the Spaces workspace.

   See Section 56.1, "Downloading a Workspace for Spaces Development".

2. Navigate to the unzip directory, and open `DesignWebCenterSpaces\DesignWebCenterSpaces.jws` in JDeveloper (Figure 56–10).

   This workspace contains a project dedicated to resource development called **WebCenterSpacesResources**.

Figure 56–10 Projects in the DesignWebCenterSpaces Workspace

3. Expand the **WebCenterSpacesResources** project.

   The **WebCenterSpacesResources** project contains several files and folders (Figure 56–11):

Figure 56–11 Exploring the WebCenterSpacesResources Project in JDeveloper

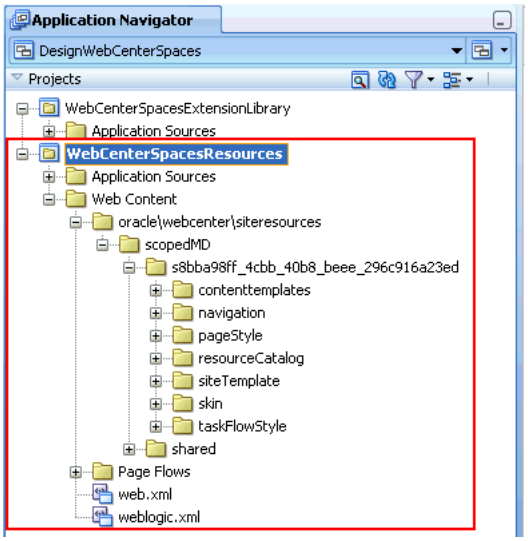


Table 56–3 describes the files and folders in the **WebCenterSpacesResources** project.

Table 56–3 Files and Folders in the WebCenterSpacesResources Project

Configuration Property	Description
\Application Sources	Supporting files and folders.
\Web Content	Contains Spaces resources.

Table 56–3 (Cont.) Files and Folders in the WebCenterSpacesResources Project

Configuration Property	Description
\oracle\webcenter\siteresources	Directory containing Spaces resources. You can develop and manage all your application resources under this folder.
\scopedMD	Contains application-level and Space-level resources. ▪ Application-level resources are stored under the *"default scope"* directory `s8bba98ff_4cbb_40b8_beee_296c916a23ed` Out-of-the box, this directory contains several sample application resources. ▪ Space-level resources are stored under Space-specific directories with the same name as the Space's internal ID. No Space-level resources are provided out-of-the-box.
\<Default Scope ID>	Contains sample application-level resources.
\contenttemplates	Includes a sample Content Presenter display template (`content-default-list-item-view.jsff`) - Sample Content List Item View.
\navigation	includes a sample navigation (`Navigation.xml`) - SampleNavigation.
\pageStyle	Includes a blank page style (`TemplateHome.jspx`) - Sample Home Page Style.
\resourceCatalog	Includes a sample catalog (`ResourceCatalog.xml`) - Sample Home Space Catalog
\siteTemplate	Includes a sample page templates (`Template.jspx`) - Sample Side Navigation **Note:** This directory is the correct directory for developing page templates (even though the directory name is siteTemplate).
\skin	Includes a sample skin (`Skin.css`) - Sample Spaces FX Skin.
\taskFlowStyle	Includes files for a sample mashup style (`pform.jsff` and `pform-definition.xml` - Sample Parameter Form.
\shared	Content directory for images/content used by resources, such as, icons, images, and so on. When you upload a resource to the Spaces application, content in the `\shared` directory is copied to Spaces automatically. Ensure that you copy *all files* that your resources reference to this `\shared` directory and verify that all references to such content point to this location, for example: `<af:image source="/oracle/webcenter/siteresources/scopedMD/shared/mylogo.gif id="pt_12">`
\Page Flows	Supporting files and folders.

56.3.3 Enabling Direct Uploads to the Spaces Application

If you build or modify skins, page templates, and so on, for a Spaces application that is live or running in a test environment you can upload your updates directly to the application from JDeveloper. To enable direct updates from the JDeveloper **WebCenterSpacesResources** project you must:

- Specify the name of the host and port where the Spaces application is running in `config.properties`.
- Check that you have the appropriate roles and permissions to upload the resource to Spaces. You must have the following:
  - **WebLogic Server role** - `monitor` AND
  - **Spaces resource permissions** - For example, to upload a new skin you must have the `Create, Edit, Delete Skins` permission.

Configuring the Spaces hostname and port, enables the *Upload Portal Resource* option in your project. The first time you use this option, within a JDeveloper session, you must enter your Spaces login name and password. For security reasons, your credentials are not saved for future sessions but they are stored in memory for the current JDeveloper session.

Once you are logged in to Spaces you can upload resources, providing, of course, that you have the appropriate permissions to manage Spaces resources.

> **Note:** Out-of-the-box, only the default Fusion Middleware administrator (`weblogic`) has all the required permissions.

To set connection properties in `config.properties` and grant permissions:

1. Open `config.properties`, available at:

   `<Unzip_Directory>\DesignWebCenterSpaces\config.properties`

2. Enter details relating to JDeveloper and your Spaces installation, as shown in Table 56–4:

   The `config.properties` file describes each property and offers examples. The defaults provided are only samples and must be replaced with your own, installation-specific values.

Table 56–4 config.properties Settings to Enable Direct Uploads

Configuration Property	Description
`jdeveloper.install.home.directory`	Base directory where JDeveloper is installed. In addition to `\jdeveloper`, the directory you specify must contain `\wlserver_10.3`, `\modules`, and so on.
`wls.host`	Name of the host machine where the Spaces application is running.
`wls.port`	Port number on which the WLS Administration Console is running.

3. Save your updates to `config.properties`.
4. Verify and, if necessary, request permissions shown in Table 56–5.

Table 56–5 Permissions to Upload and Manage Resources Through JDeveloper

Type	Role or Permissions	Description
WebLogic Server	`monitor`	This role enables you to run the WLST scripts which upload resources from JDeveloper to the Spaces application. See also, "Add users to roles" in *Oracle WebLogic Server Administration Console Help*.
Spaces		
Application-level	`Create, Edit, Delete <resourcetype>`	This permission enables you to create and manage application-level resources for Spaces.
	`Manage Configuration`	This permission gives you access to the Spaces resource administration page. See also, "Managing Application Roles and Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
Space-level Standard	`Create, Edit, Delete Resources`	These permissions enable you to create and manage resources for a particular Space. Either standard or advanced permissions will apply, depending on the Space.
Space-level Advanced	`Create, Edit, Delete <resourcetype>`	
	`Manage Configuration`	This permission gives you access to the Space's resource administration page. See also, "Managing Roles and Permissions for a Space" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Upload a sample resource, to test the connection, and verify that the resource is available in Spaces:

   For details, see Section 56.3.5, "Uploading Resources Directly to the Spaces Application".

   See also, Section 56.3.7, "Troubleshooting Resource Round-Trip Development"

56.3.4 Editing Spaces Resources in JDeveloper

Oracle recommends that you extend Spaces resources in the JDeveloper project, *WebCenterSpacesResources*. This project provides everything you need to create, modify, and upload the following Spaces resources:

- Page Templates
- Navigations
- Page Styles
- Skins
- Content Display Templates
- Resource Catalogs
- Mashup Styles

Where To Start...

You do not have to develop Spaces resources from scratch. Most developers will download an existing resource from the Spaces application and edit it in JDeveloper. There are two techniques for bringing Spaces resources into JDeveloper. The first is downloading the resource into JDeveloper directly from the server. The second is exporting the resource from Spaces and then importing it into JDeveloper.

For more information, see:

- Downloading a Spaces Resource Directly into JDeveloper
- "Downloading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- Importing a Spaces Resource into JDeveloper

See, also How to Build Spaces Resources.

Application-Level vs Space-Level Resources

The difference between application- and Space-level resources is one of scope. In the Spaces application:

- **Application-level resources are available to all Spaces**.

  You must develop all application-level resources under the WebCenterSpacesResources project directory `oracle/webcenter/siteresources/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed`.

  To upload application resources to the Spaces application you must have Spaces permissions: `Application-Manage Configuration` plus `Create, Edit, Delete <Resource_Type>`.

- **Space-level resources are only available within a particular Space**.

  You must develop a resource for a specific Space under the appropriate namespace, so that it can be uploaded to that Space:

  `oracle/webcenter/siteresources/scopedMD/<space_internal_id>`

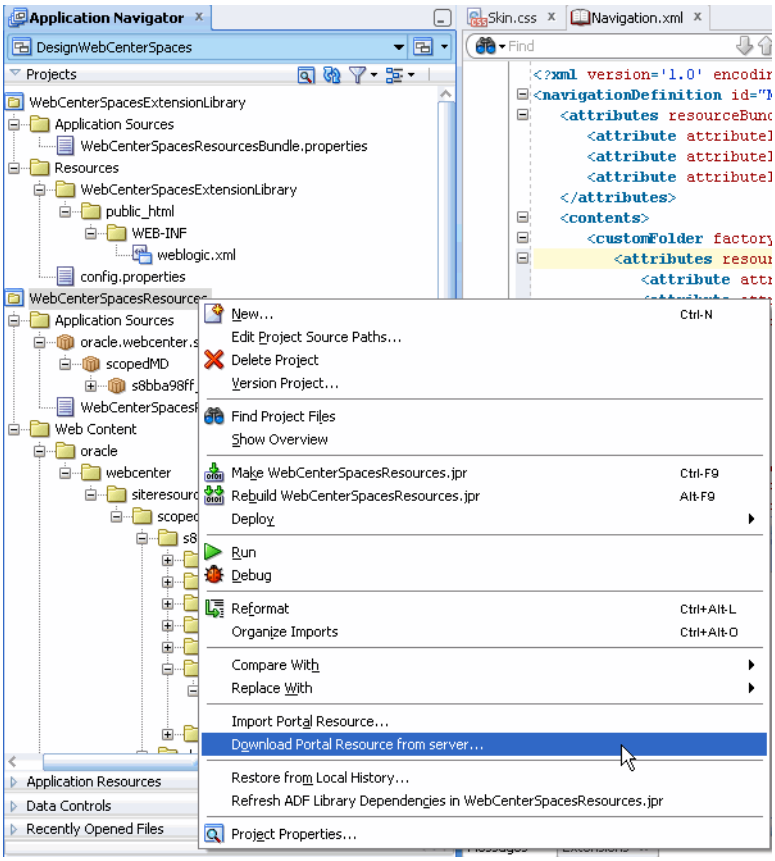
  Similarly, resources downloaded from an existing Space and imported into JDeveloper, can only be uploaded back to the same Space. You cannot upload such resources to a different Space.

  To upload resources to a particular Space you must have the `Space-Manage Configuration` permission, plus one of:

  `Create, Edit, Delete Resources` (standard permission model)
  `Create, Edit, Delete <Resource_Type>` (advanced permission model)

If you want to upload resources directly from JDeveloper, you must also have the WebLogic Server `monitor` role. See Section 56.3.3, "Enabling Direct Uploads to the Spaces Application".

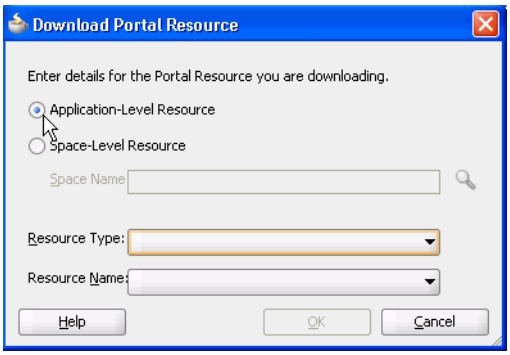
For information on how to create and edit Spaces resources, see:



- Section 56.3.4.1, "Downloading a Spaces Resource Directly into JDeveloper"
- Section 56.3.4.2, "Importing a Spaces Resource into JDeveloper"
- Section 56.3.4.3, "How to Build Spaces Resources"

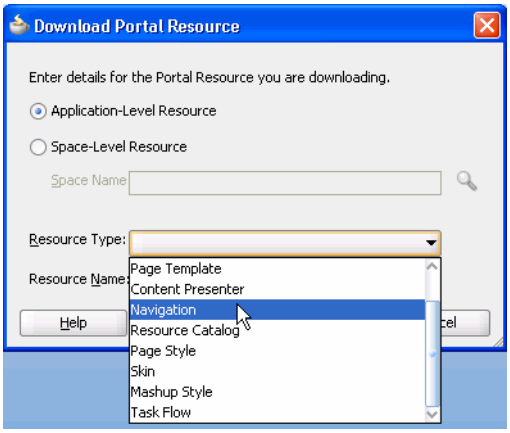
56.3.4.1 Downloading a Spaces Resource Directly into JDeveloper

You can download a Spaces resource directly into JDeveloper from within the WebCenterSpacesResources project.



1. Be sure the configuration properties and permissions are set properly, as described in Section 56.3.3, "Enabling Direct Uploads to the Spaces Application." See also Section 56.2.3.2, "Setting Build and Deployment Options (config.properties)."
2. In the Navigator, right-click the WebCenterSpacesResources project and select **Download Portal Resource from Server**, as shown in Figure 56–12.

Figure 56–12 Download Portal Resource from Server Menu



3. In the Download Portal Resources dialog, choose to download either an Application-Level Resource or a Space-Level Resource, as shown in Figure 56–13 See "Application-Level vs Space-Level Resources" for information on these selections.

Figure 56–13 Download Portal Resources Dialog

4. To filter the list of possible resource names, select the type of resource you wish to download from the Resource Type menu, as shown in Figure 56–14.

Figure 56–14 Selecting a Resource Type to Download

5. Finally, select the name of the resource you wish to download from the Resource Name menu.
6. Click **OK**.

56.3.4.2 Importing a Spaces Resource into JDeveloper

When you import a Spaces resource archive (.ear) into the *WebCenterSpacesResources* project the resource is uploaded to the appropriate project directory.

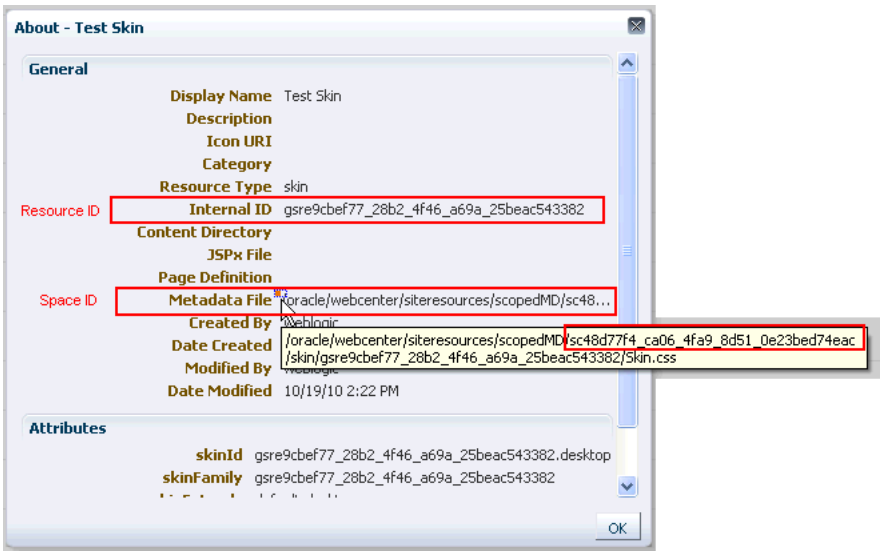
- **Application-level resources are imported to:**

  `WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\`
  `application_ID\resource_type\resource_ID`

  For example, an application-level skin with the resource ID `gsr5a8c2fcc_bc7f_4cba_9254_36df58d66e60` is created under the application directory `s8bba98ff_4cbb_40b8_beee_296c916a23ed`:

  `WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\s8bba98ff_4cbb_40b8_beee_296c916a23ed\skin\gsr5a8c2fcc_bc7f_4cba_9254_36df58d66e60`

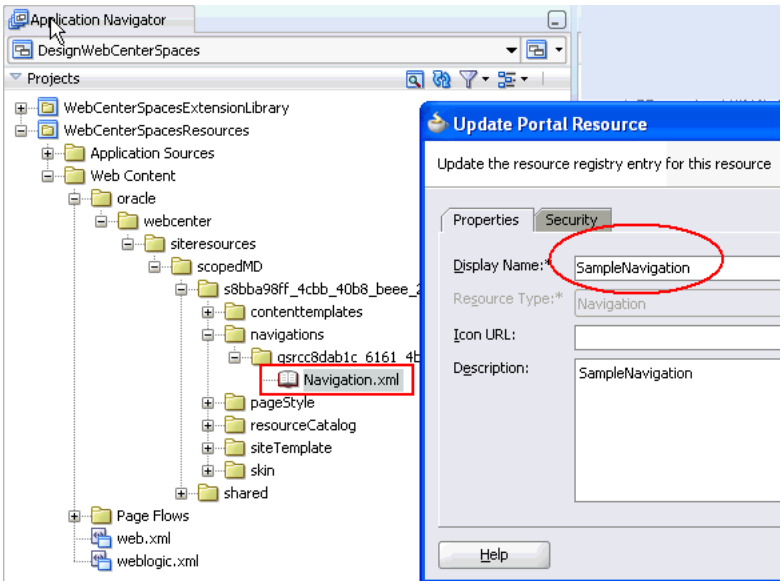
- **Space-level resources are imported to:**



```
WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\
Space_ID\resource_type\resource_ID
```

For example, a Space-level skin with the resource ID `gsre9cbef77_28b2_4f46_a69a_25beac543382` is created under the Space directory `sc48d77f4_ca06_4fa9_8d51_0e23bed74eac`:

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\
sc48d77f4_ca06_4fa9_8d51_0e23bed74eac\skin\gsre9cbef77_28b2_4f46_a69a_25beac543382
```



Its important to know the internal IDs of Spaces resources and the parent Space (Space-level resources only) so that you can locate the appropriate resource folders in JDeveloper. In the Spaces application, internal IDs are published in the resource's About dialog (Figure 56–15). For details, see "Viewing Information About a Resource" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Figure 56–15 Checking Resource IDs in Spaces

Internal IDs are not easy to remember like display names. If you want to identify an imported resource you can check its display name using the **Update Resource** option. Navigate to the resource directory, drill down to the resource file (for example, `mynavigation.xml`, `myskin.css`, `mypagetemplate.jpsx`, `mycatalog.xml`), and then click **Update Resource** from the right mouse menu (Figure 56–16).

Figure 56–16 Checking Resource Display Names in JDeveloper

To import a Spaces resource from an archive:

1. In the Application Navigator, right-click the **WebCenterSpacesResources** project, and choose **Import Portal Resource**.
2. In the Import Portal Resource dialog, enter the name or browse for the archive file (.EAR) that contains the resource that you want to import.

   If the archive does not exist yet, login to Spaces and download the resource to an .EAR file. See "Downloading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
3. Click **OK**.
4. Navigate to the resource:
   - Locate application resources under:

     ```
     WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\
     s8bba98ff_4cbb_40b8_beee_296c916a23ed
     ```
   - Locate space-level resources under:

     ```
     WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\<Space_GUID>
     ```

56.3.4.3 How to Build Spaces Resources

To learn more about building resources, read the appropriate chapter:

- Page Templates - Working with Page Templates
- Page Styles - Working with Page Styles
- Skins - Creating and Managing Skins
- Navigations - Building a Navigation Model for Your Portal
- Content Display Templates - Creating Content Presenter Display Templates
- Resource Catalogs - Creating and Managing Resource Catalogs

- Mashup Styles - Working with Mashup Styles

56.3.5 Uploading Resources Directly to the Spaces Application

If the Spaces application is up and running you can deploy new or updated resources directly to the application from your JDeveloper environment.

You must have appropriate resource management permissions in the Spaces application to upload resources in this way. If you do not have the correct privileges, you are not allowed to upload resources. See also Section 56.3.3, "Enabling Direct Uploads to the Spaces Application".

1. If you have not done so already, configure Spaces connections details in `config.properties` and request the appropriate resource management permissions.

   See also, Section 56.3.3, "Enabling Direct Uploads to the Spaces Application".

2. In JDeveloper, open the **WebCenterSpacesResources** project, and navigate to the resource you want to upload.

   For example, to upload the sample application-level navigation *SampleNavigation*, navigate to (Figure 56–17):

   WebCenterSpacesResources\Web Content\oracle\webcenter\siteresources\scopedMD\s8bba98ff_4cbb_40b8_beee_296c916a23ed\navigation\gsrcc8dab1c_6161_4bb8_8764_127b4ecee01b

Figure 56–17 Navigating to Spaces Resource Folders

3. Verify that the resource is complete.

4. Ensure that all content used by the resource, such as images, icons, and so on, are located under the *content directory* /oracle/webcenter/siteresources/scopedMD/shared and verify that all references to such content point to this location, for example:

```
<af:image
source="/oracle/webcenter/siteresources/scopedMD/shared/mylog
o.gif id="pt_12">
```

5. Right-click the file associated with the resource you want to upload to Spaces, and choose **Upload Portal Resource**.

   There is a single file associated with most resource types. The exception is mashup style which has two files: `definition.xml` and `.jsff`. To upload a mashup style you must right-click the `definition.xml` file.

6. If the selected resource references content under the shared directory, specify whether or not you want to upload the content from JDeveloper.

   – Entire content directories are uploaded rather than individual files. For example, if a skin references two files (`...\shared\skins\logos\mylogo.gif` and `...\shared\skins\icons\myicon.gif`), the entire content of both directories (`\logos` and `\icons`) are uploaded.

   – On upload, all files under the resource's content directories are uploaded to the target application and existing files with the same name are overwritten. While you can opt not to upload content directories, it's an all or nothing approach, that is, you cannot only upload files referenced by this resource.

7. If prompted, enter your Spaces username and password and click **OK**.

   An information message displays to indicate that the upload process is complete and also provides the name and location of the upload log file—`upload_<resource_type_id>.log`.

Figure 56–18 Resource Upload Complete Message

8. Review the upload log file.

   The following message indicates that the upload was successful.

   `Imported <temp_log_directory>\<resource_type_id>.ear`

   If you do not see this message, refer to Section 56.3.7, "Troubleshooting Resource Round-Trip Development"

9. Log in to the Spaces application and verify that the resource is available through Resource Manager as expected.

   a. Log in to Spaces.

   b. Navigate to the Resource Manager as follows:

   To verify an application-level resource, navigate to the following URL:

   `http://host:port/webcenter/spaces/admin/resources`

   To verify a Space-level resources, navigate to the following URL:

   `http://host:port/webcenter/spaces/spaceName/admin/resources`

   c. Select the appropriate resource type from the panel on the left, and verify that the resource you just uploaded is available and working as expected.

Dependent images, and so on, must be located in the Spaces content directory. If an image is missing, check that you copied it to the appropriate content directory in JDeveloper (under `/oracle/webcenter/siteresources/scopedMD/shared`).

56.3.6 Exporting Spaces Resources to an Archive

When your resource is ready for use in the Spaces application you can upload it directly to Spaces or you can export the resource to an .EAR file format which you (or someone else) can upload at any time using Spaces Resource Manager.

To export a Spaces resource:

1. In the Application Navigator, navigate to the resource directory and drill down to the resource file (for example, `myskin.css`, `mypagetemplate.jpsx`, `mycatalog.xml`).

   Note: Ensure that all dependent content such as images, icons, style sheets, and so on, are copied to the /oracle/webcenter/siteresources/scopedMD/shared/ directory and verify that all references to such content point to this location, for example: `<af:image source="/oracle/webcenter/siteresources/scopedMD/shared/mylogo.gif id="pt_12">`

2. Click **Export Portal Resourc**e from the right mouse menu.
3. In the Export Portal Resource dialog, enter or browse for the path and file name for the export archive file. For example: `C:\myskin.ear`
4. If the selected resource references content under the shared directory, specify whether or not you want to **Include Content Directories** in the resource archive.

   Do one of the following:

   - Select **Include Content Directories** to export content referenced by the portal resource, such as images and icons, in the export archive.

     Consider the following before exporting content directories for the resource:

     – Entire content directories are exported rather than individual files. For example, if a skin references two files (`...\shared\skins\logos\mylogo.gif` and `...\shared\skins\icons\myicon.gif`), the entire content of both directories (`\logos` and `\icons`) are exported.

     – On import, all files under the content directories are uploaded to the target Spaces application and existing files with the same name are overwritten. While you can opt not to upload content directories on import, it's an all or nothing approach, that is, you cannot upload individual files for this specific resource.

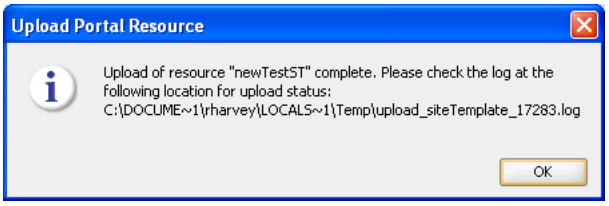
   - Click **No** to exclude content under the `\shared` directory that is referenced by portal resources.

5. Click **OK**.

The steps to upload resource archives to Spaces are available in "Uploading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

56.3.7 Troubleshooting Resource Round-Trip Development

This troubleshooting section includes the following subsections:



- Examining the Resource Upload Log File
- Unable to Upload Resources to Spaces - Access denied
- Unable to Upload a Resource to Spaces - java.lang.Exception

Examining the Resource Upload Log File

When you upload a resource to the Spaces application progress details are recorded in a log file. The name of the log file includes the type of resource you are uploading and a unique ID, in the format—`upload_`*`resource_type_id`*`.log`. For example, `upload_siteTemplate_17283.log`.

The location of the log file depends on your local `temp` directory settings. The exact log file location displays in an information message such as this:

Figure 56–19 Resource Upload Log File Location

The following log entry indicates that the upload process was successful.

```
Imported <temp_log_directory>\<resource_type_id>.ear
```

Insufficient permissions result in "`Access denied`" or "`java.lang.Exception`" errors, as described below.

Unable to Upload Resources to Spaces - Access denied

The following error displays in the *resource upload log file* if you do not have the `monitor` role:

```
Operation: getScopeName(java.lang.String)  Detail: Access denied. Required roles:
Admin, Operator, Monitor, executing subject: principals=[yourusername]
```

The `monitor` role is a Weblogic Server role. This role enables you to run the WLST scripts which upload resources from JDeveloper to the Spaces application. Ask your Spaces administrator to grant you this role through the WebLogic Server Administration Console. See also, "Add users to roles" in *Oracle WebLogic Server Administration Console Help*.

Unable to Upload a Resource to Spaces - java.lang.Exception

The following error displays in the *resource upload log file* if you do not have permission to manage any resources in Spaces or the particular type of resource you are trying to upload:

```
javax.management.MBeanException at
weblogic.rjvm.ResponseImpl.unmarshalReturn(ResponseImpl.java:234) Root Cause:
Caused by: java.lang.Exception at
oracle.webcenter.portalframework.genericsiteresources.model.lifecycle.SiteResource
sHelper.updateResource(SiteResourcesHelper.java)
```

Ask your Spaces administrator to grant you appropriate permissions through Spaces Administration. Or, if the resource you are trying to upload is for a particular Space, contact the Space moderator to request the required permission. See also, Table 56–5, " Permissions to Upload and Manage Resources Through JDeveloper"".

57

Integrating with Oracle WebCenter Portal: Spaces

This chapter describes how to expose WebCenter Portal: Spaces functionality in a WebCenter Portal: Framework application, using Spaces APIs. Through these APIs, you can create new spaces, manage space membership, retrieve space information, and more, from your Framework applications.

The chapter also describes how to expose information from other applications, such as Framework applications in Spaces.

This chapter includes the following sections:

- Introduction to WebCenter Portal: Spaces
- Exposing Spaces in WebCenter Portal Applications Using APIs
- Using the WebCenter Portal: Spaces REST APIs
- Exposing Enterprise Applications in Spaces

> **Note:** Custom-built task flows that implement Spaces APIs (described in this chapter) can be deployed on WebCenter Portal: Framework applications, but you cannot deploy them to WebCenter Portal: Spaces.

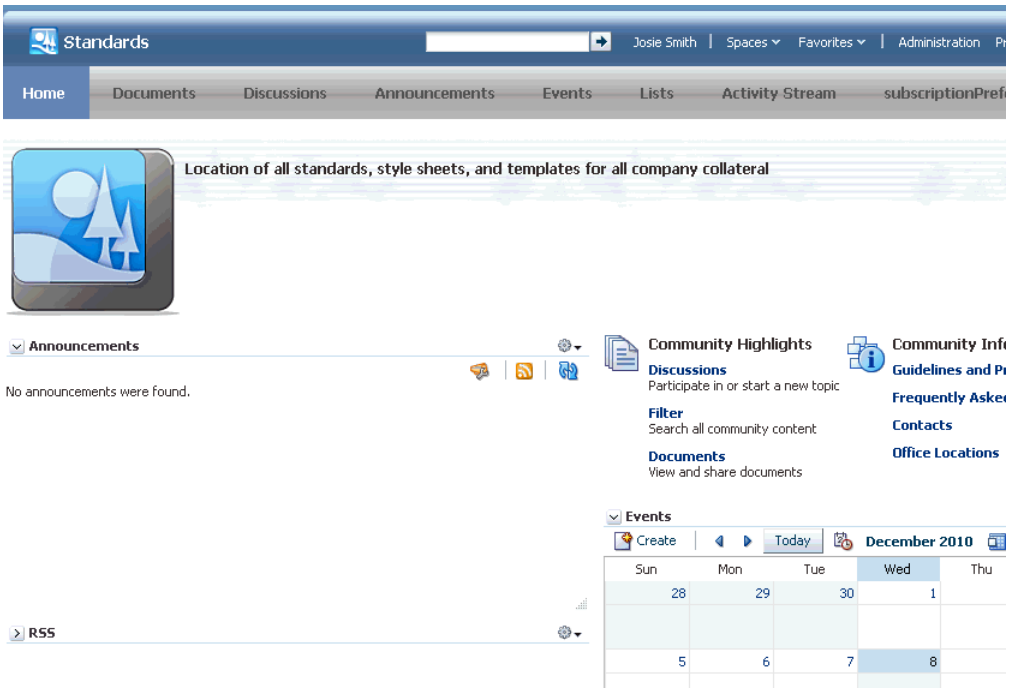
Audience

This section is intended for developers who want to expose Spaces functionality in their WebCenter Portal: Framework applications.

57.1 Introduction to WebCenter Portal: Spaces

WebCenter Portal's Spaces application is a Web-based application, built using the WebCenter Portal: Framework, WebCenter Portal services, and Composer. The Spaces application furnishes all the tools you require to rapidly create portals, communities, and social sites capable of accommodating thousands of users and encompassing diverse populations with differing languages. Figure 57–1 shows a typical Spaces home page.

Figure 57–1 WebCenter Portal: Spaces



Out of the box, Spaces offers a configurable work environment that enables individuals and groups to work and collaborate more effectively. The application is a self-service solution for managing individual and group interactions. It also provides intuitive tools that allow business users to come together and share information by adding pages and resources such as documents, charts, reports, portlets, business applications, services, and other ADF resources or views.

The Spaces application provides two work environments within a single application: the *Home space* and *group spaces*. The Home space provide each user with a private work area for storing personal content, viewing and responding to business process assignments, and performing many other tasks relevant to his or her unique working day. Group spaces (from hereon referred to as *spaces*) support discrete work areas organized around an area of interest or a common goal.

Spaces support the formation and collaboration of project teams and communities of interest. Spaces bring people together in a virtual environment for ongoing interaction and information sharing—in essence, forming a social network. Figure 57–2 shows an example of a space.

Figure 57–2 Standards - Sample Space

Structurally, spaces comprise pages, many of which are dedicated to a particular service. For example, a *Lists page* provides the means to create and publish multicolumn lists. A *Documents page* provides a central library for uploading, organizing, and managing group content. A *Search page* includes features for saving searches and managing search results. In addition to these and other default pages, a space supports custom pages created by authorized users. Page creation is easy with a wide selection of predefined layouts. With little effort, users can provide pages neatly tailored to the unique needs of their team or community. For more information about spaces, see the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

WebCenter Portal provides various *services* that spaces can use to offer a wide variety of functionality in support of group objectives. For example, a Documents service provides features for uploading and managing content; a Discussions service provides features for creating, managing, and participating in discussion forums. Some other examples of these services include Events, Lists, Announcements, and Search. These services are what helps to make Spaces a productive, collaborative working environment. Services expose subsets of their features and functionality through *task flows*. A task flow is a reusable view that may expose all or a subset of the features available from a particular service. For example, a Recent Documents task flow provides a subset of the functionality offered through the Documents service by listing documents that have recently been opened, added, or affected in some way.

To help users get spaces up and running quickly, they can be based on out-of-the-box templates. Additionally, Spaces allows users to turn any space into a template, so they can design spaces to suit specific audiences and offer them up as templates for others to use. For information about creating templates, see "Creating Custom Space Templates" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Spaces can consume portlets from any WSRP, Oracle PDK-Java, or pagelet producer if the producer is registered first. Therefore, any portlets you create for Framework applications can be used in Spaces too. For more information, see the "Managing

Portlet Producers" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

57.2 Exposing Spaces in WebCenter Portal Applications Using APIs

This section includes the following subsections:

- Introduction to Spaces APIs
- Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers
- Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations
- How to Set Up Your WebCenter Portal Application to Use the Spaces APIs
- How to Provide Spaces Functionality in WebCenter Portal Applications
- How to Handle Exceptions Raised by Spaces APIs
- Finding More Information on Spaces APIs
- Troubleshooting Issues with Spaces APIs

57.2.1 Introduction to Spaces APIs

While using your WebCenter Portal: Framework application, users may encounter situations where Spaces would be useful to help them complete a particular task. In such cases, it would be much less disruptive to remain within the context of the current application, rather than having to switch to the Spaces application. To this end, Spaces provides access to a subset of its functionality through several APIs. Using these APIs, you can integrate powerful Spaces functionality into your Framework application.

You can use Spaces APIs to:

- **Create and manage spaces and space templates.** You can create and delete spaces, and add custom attributes. For more information, see Section 57.2.5.1, "Managing Spaces and Space Template."
- **Manage space membership.** You can add and remove space members. For more information, see Section 57.2.5.2, "Managing Space Membership."
- **Retrieve information about apaces and space templates.** For example, you can retrieve the Spaces application URL or the URL of a specific space. You can also retrieve space and space template metadata. For more information, see Section 57.2.5.3, "Retrieving Information for Spaces and Space Templates."

Spaces APIs are contained within several classes. Table 57–1 lists the different classes and describes the purpose of the APIs within each class.

Table 57–1 Spaces API Classes

Class	Contains APIs for	More Information
`GroupSpaceWSClient`	Creating and managing spaces and space templates Managing space membership Retrieving space information	Section 57.2.5, "How to Provide Spaces Functionality in WebCenter Portal Applications"

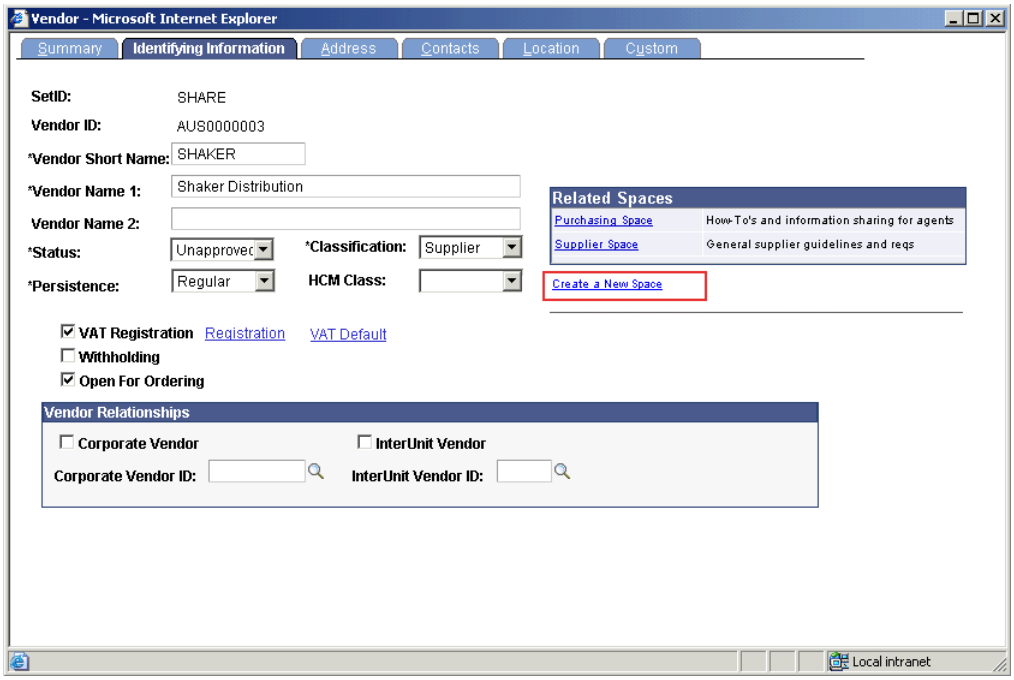
Table 57–1 (Cont.) Spaces API Classes

Class	Contains APIs for	More Information
`GroupSpaceWSContext`	Establishing context before calling the APIs	Section 57.2.4.4, "Setting Up the Spaces Client Context"
`GroupSpaceWSException`	Managing exceptions raised by the APIs	Section 57.2.6, "How to Handle Exceptions Raised by Spaces APIs"
`GroupSpaceWSMembers`	Retrieving information about space members	Section 57.2.5.3, "Retrieving Information for Spaces and Space Templates"
`GroupSpaceWSMetadata`	Retrieving space information	Section 57.2.5.3, "Retrieving Information for Spaces and Space Templates"

Spaces can have many different applications. From your perspective, as a WebCenter Portal: Framework application developer, here are a couple of case studies describing scenarios where building and working with Spaces through the APIs might come in useful:

- In a purchasing application, a purchasing manager may create a space to discuss the suitability of a new supplier. For more information, see Section 57.2.2, "Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers."
- In a Customer Support Center application, a support analyst may create a space to collaborate with other users about a customer escalation. For more information, see Section 57.2.3, "Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations."

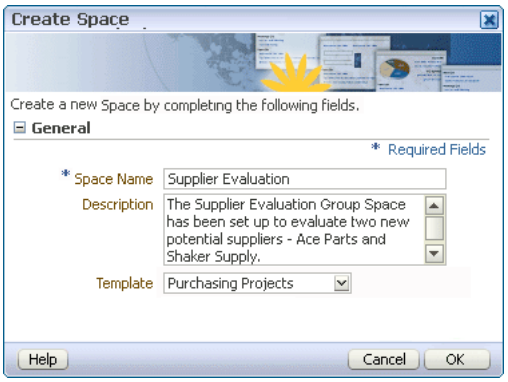
57.2.2 Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers



Consider a purchasing application built using the Oracle WebCenter Portal: Framework. This application tracks suppliers, pricing, lead-time requirements, delivery time estimates, and performance history.

Users of the purchasing application must also be able to select and evaluate supplier candidates. Supplier evaluation is a collaborative process; it requires people from various areas of a company. For example, a design engineer and manufacturing representative must verify that an item being purchased meets the required technical specifications; a purchasing agent can negotiate prices, logistics and contractual issues; and a manager or executive has to approve the deal. How could the purchasing application initiate supplier evaluations?

Typically, the purchasing manager receives a purchase requisition from the manufacturing department. Sometimes the purchase order cannot be completed because the requisition cannot be delivered by the usual supplier in the time frame required by manufacturing. Therefore, a new supplier that can meet delivery and pricing requirements must be determined. The purchasing manager can add a candidate supplier into the system but the purchasing manager needs a way to organize and share information, and collaborate with people in and outside his team so that he can assess the supplier.



A space can provide this collaborative environment. So the purchasing application includes a call to the `createGroupSpace` API, and this enables the purchasing manager to click a link (**Create a New Space**) that displays a "Create Space" dialog, directly from the purchasing application, as shown in Figure 57–3.

Figure 57–3 Purchasing Application Includes a Space Creation Link

When the purchasing manager clicks the link a custom dialog prompts him for some information. The purchasing manager enters a name and description for the space, and also selects a template (Purchasing Projects) as shown in Figure 57–4. The Purchasing Projects template sets up the space quickly so it is ready to use right away. For example, the template defines which services are required (events, a document library, and so on) and any custom pages that may be required. Because the APIs enable you to create your own "Create Space" dialog, you can apply your own look and feel and terminology.

Figure 57–4 Custom Create Space Dialog

In this scenario, the purchasing manager chooses the Purchasing Projects template from the template list. Another approach would be to have the purchasing application pass in a default template value. With this additional default, there would be one less thing (determining which template to use) for the purchasing manager to think about. You could even generate the name of the space from the Supplier ID so that the purchasing manager would not have to enter any details at all. The space could then be created with just the click of a link.

When the purchasing manager clicks **OK**, the new Supplier Evaluation space displays, similar to that shown in Figure 57–5.

Figure 57–5 Supplier Evaluation Space

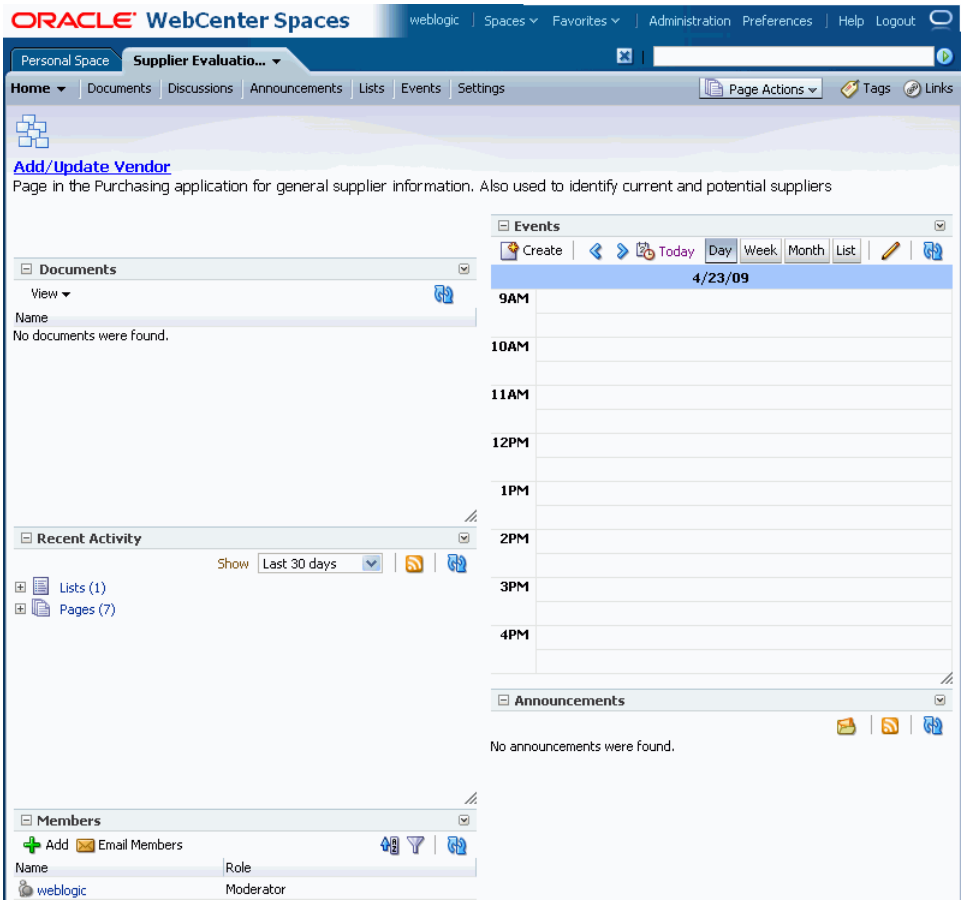


Figure 57–5 shows a Home page for the Supplier Evaluation space, which includes an events calendar, documents the group may find useful, an area for announcements, and so on. Each of these areas was determined by the Purchasing Projects template. In addition a link to the purchasing application transaction instance from which the space was created is also provided. Clicking this link (**Add/Update Vendors**) displays the screen Add/Update Vendor transaction for the supplier Shaker Distribution.

In the Spaces application, the purchasing manager becomes the moderator of the space automatically. The moderator can add content to the space, initiate discussions, invite members, and collaborate with interested parties. Once consensus is reached regarding the supplier, the purchasing manager is can approve or reject the supplier concerned.

57.2.3 Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations

Consider a Customer Support Center application built using the Oracle WebCenter Portal: Framework that tracks customer calls and issues.

A support analyst is notified that a customer has escalated the service request that the analyst has been working on. The analyst knows that she can find a quicker resolution to the issue if she can involve other people from different areas of the company. For example:

- The project manager whose team implemented the project can provide more in depth knowledge of the project.
- An account manager who has been in constant touch with the customer can provide specific information about the implementation of the project at the customer site.
- Another support analyst, who has worked on a similar escalation before, can provide information about how that escalation was resolved.

This problem can be solved collaboratively using a space. The support analyst creates a space from within the Customer Support Center application and adds the required members. These members are then notified and use the space to start discussing the customer situation. The support analyst views their updates to the space inside the support application, navigating to the space whenever necessary to obtain more specific details. Based on the information she gets from the other members of the space, she can diagnose the problem and offer the customer a solution very quickly.

57.2.4 How to Set Up Your WebCenter Portal Application to Use the Spaces APIs

Before you can use the Spaces APIs you must ensure that the Spaces application is up and running and that your project is set up correctly in JDeveloper.

This section includes the following subsections:

- Verifying That the Spaces Application Is Up and Running
- Setting Up the WebCenter Portal Application to Use Spaces APIs
- Securing the Connection Between the Application and Spaces
- Setting Up the Spaces Client Context

57.2.4.1 Verifying That the Spaces Application Is Up and Running

If you want to use the SpacesAPIs, the Spaces application must be up and running.

To verify that Spaces is up and running:

1. Start Spaces. The URL is:

   `http://host:port/webcenter`

   You do not need to log in.

2. Verify that the Spaces Web service is up and running. The URL is:

   `http://host:port/webcenter/SpacesWebService?WSDL`

   You should see a page similar to the one shown in Figure 57–6. If you do not see this page, contact your Fusion Middleware administrator.

Figure 57–6 SpacesWebService WSDL

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```
- <wsdl:definitions name="SpacesWebService"
  targetNamespace="http://oracle.webcenter.spaces.internal.view.ws/">
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Fault_Policy"></wsp:Policy>
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Input_Policy"></wsp:Policy>
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Output_Policy"></wsp:Policy>
  + <wsp:Policy orawsp:provides="{http://schemas.com/ws/2006/01/policy}token.x509, {http://docs.oasis-
    ...
    wsu:Id="wss11_saml_or_username_token_with_message_protection_service_policy"></wsp:Policy>
  - <wsdl:types>
    - <xs:schema version="1.0" targetNamespace="http://oracle.webcenter.spaces.internal.view.ws/types">
      - <xs:complexType name="gsMetadataImpl">
        - <xs:sequence>
            <xs:element name="closed" type="xs:boolean"/>
            <xs:element name="createdBy" type="xs:string" minOccurs="0"/>
            <xs:element name="createdDate" type="xs:dateTime" minOccurs="0"/>
            <xs:element name="customAttributes" type="tns:gsCustomAttribute" nillable="true" minOccurs="0"
            maxOccurs="unbounded"/>
            <xs:element name="description" type="xs:string" minOccurs="0"/>
            <xs:element name="discoverable" type="xs:boolean"/>
            <xs:element name="displayName" type="xs:string" minOccurs="0"/>
            <xs:element name="groupSpaceURI" type="xs:string" minOccurs="0"/>
            <xs:element name="guid" type="xs:string" minOccurs="0"/>
            <xs:element name="iconURI" type="xs:string" minOccurs="0"/>
            <xs:element name="keywords" type="xs:string" minOccurs="0"/>
            <xs:element name="lastUpdatedDate" type="xs:dateTime" minOccurs="0"/>
            <xs:element name="listServiceConfigData" type="tns:gsServiceConfigData" nillable="true"
            minOccurs="0" maxOccurs="unbounded"/>
            <xs:element name="logoURI" type="xs:string" minOccurs="0"/>
            <xs:element name="mailingList" type="xs:string" minOccurs="0"/>
```

For more information about setting up Spaces, see the "Getting the Spaces application Up and Running" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

57.2.4.2 Setting Up the WebCenter Portal Application to Use Spaces APIs

Before you can call the Spaces APIs in your WebCenter Portal: Framework application, you must ensure that your application contains the correct libraries and that there is a connection to the Spaces Web service.

To set up your application to use the Spaces APIs:

1. Start JDeveloper.
2. In the Application Navigator, expand the application for which you want to provide Spaces functionality.

   The application should be based on the WebCenter Portal Application template.
3. Right-click the view-controller project and choose **Project Properties.**
4. Select **Libraries and Classpath.**
5. Check that the following libraries are available in your project, adding any as necessary:
   - ADF DVT Faces Runtime
   - ADF Model Generic Runtime

- ADF Model Runtime
- JAX-RPC Client
- JAX-WS Client
- JAXB
- Oracle JEWT
- Spaces Client
- *JDEV_HOME*/jdeveloper/oracle_common/modules/oracle.adf.model_11.1.1/adfm.jar
- *JDEV_HOME*/jdeveloper/oracle_common/modules/oracle.xdk_11.1.1/xml.jar

6. Click **OK.**
7. In the Application Resources panel of the Application Navigator, right-click **Connections** and choose **New Connection > URL.**
8. In the **Name** field, enter `SpacesWebServiceEndpoint`.
9. In the **URL Endpoint** field, enter the Spaces Web service URL:

   `http://host:port/webcenter/SpacesWebService`

10. Click **OK.**

    The connection information is added to the `connections.xml` file in the application's `META-INF` directory, for example:

    `C:\JDeveloper\mywork\mySpacesApplication\.adf\META-INF`

    If the `connections.xml` file does not exist, it is created.

11. Open the `connections.xml` file and verify that the code shown in Example 57–1 appears:

Example 57–1 Spaces Web Service Endpoint URL Connection

```
<Reference name="SpacesWebServiceEndpoint"
className="oracle.adf.model.connection.url.HttpURLConnection">
<Factory className="oracle.adf.model.connection.url.URLConnectionFactory"/>
<RefAddresses>
  <XmlRefAddr addrType="SpacesWebServiceEndpoint">
    <Contents>
      <urlconnection name="SpacesWebServiceEndpoint"
      url="http://host:port/webcenter/SpacesWebService"/>
    </Contents>
  </XmlRefAddr>
</RefAddresses>
</Reference>
```

If you need to set the SpacesWeb service endpoint at runtime, you can use the `setGroupSpaceWebServiceEndpoint` API (Example 57–2). You can write a wrapper API that takes the endpoint as a parameter and then calls `setGroupSpaceWebServiceEndpoint`, passing the parameter. An exception is reported as INFO in the log file if the endpoint is not set in `connections.xml`.

Example 57–2 Setting the Spaces Web Service Endpoint at Runtime

```
client.setGroupSpacesWebServiceEndpoint("http://myserver.example.com/webcenter/Spa
```

```
cesWebService");
```

57.2.4.3 Securing the Connection Between the Application and Spaces

Before using the Spaces APIs in your WebCenter Portal: Framework application, you must ensure that the communication between the application (the consumer) and Spaces (the producer) is secure. This is so that the identity of the user invoking the APIs is propagated to Spaces in a secure manner where the integrity and confidentiality of the communication is maintained.

To do this, the Spaces APIs use a policy of SAML based token passing with message protection. Your administrator must create a Java keystore and update the credential store so that Spaces can verify the authenticity of the security tokens received from your application. You must then register this keystore and update the credential store using JDeveloper.

For information about the steps that the administrator must perform, see "Securing Spaces for Applications Consuming Spaces Client APIs with WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

57.2.4.4 Setting Up the Spaces Client Context

Before calling any of the Spaces APIs in your application code, a few setup steps are required.

To set up the Spaces client context

1. Domain-wide configuration settings are used when you call Spaces APIs from an application deployed on WebLogic Server (WLS), unless you specifically choose to override them. To override or set security configuration parameters, use the APIs provided by the `GroupSpaceWSContext` class.

   In particular, you must set the SAML issuer name and the public key alias for Spaces, which are required for data encryption. If the Spaces Web service endpoint is not set in the `connections.xml` file, you can set this too.

   For example:

   ```
   GroupSpaceWSContext context = new GroupSpaceWSContext();

   context.setEndPoint("endPointUrl");
   context.setSamlIssuerName("samlIssuer");
   context.setRecipientKeyAlias("producer");

   groupSpaceWSClient = new GroupSpaceWSClient(context);
   ```

   Where:

   - *`endPointUrl`* is the Spaces Web service endpoint, for example, `http://server.example.com:8912/webcenter/SpacesWebService`.
   - *`samlIssuer`* is the issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party, for example, `http://www.oracle.com`. Out-of-the-box, `http://www.oracle.com` is the only trusted SAML issuer.
   - *`producer`* is the public key alias for Spaces, for example, `orakey` if you are using a simple topology.

     For information about the steps that the administrator must perform, see "Securing Spaces for Applications Consuming Spaces Client APIs with

WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

For a full list of the APIs provided by the `GroupSpaceWSContext` class, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

2. Initialize the Spaces client by passing the context. For example:

```
GroupSpaceWSClient client = new GroupSpaceWSClient(context);
```

3. Once you have initialized the client, check everything is set up correctly by calling:

```
getWebCenterSpacesURL();
```

If the correct URL is returned, everything is set up correctly and you can start using the Spaces APIs.

57.2.5 How to Provide Spaces Functionality in WebCenter Portal Applications

The Spaces APIs enable you to perform common space-related operations within a WebCenter Portal: Framework application. Most of these APIs are provided by the `GroupSpaceWSClient` class. The APIs can be grouped into three main categories:

- Managing Spaces and Space Template
- Managing Space Membership
- Retrieving Information for Spaces and Space Templates

Table 57–2 lists the APIs in the `GroupSpaceWSClient` class.

Table 57–2 APIs for Performing Common Spaces Operations

Spaces API	Category	Description
`createGroupSpace`	Managing Spaces and Space Templates	Creates a new space based on a template. See Section 57.2.5.1.1, "Creating a Space."
`setCustomAttribute`	Managing Spaces and Space Templates	Creates one or more custom attributes for a space. See Section 57.2.5.1.2, "Creating a Custom Attribute."
`deleteGroupSpace`	Managing Spaces and Space Templates	Permanently removes a space from Spaces. See Section 57.2.5.1.4, "Deleting a Space."
`createGroupSpaceTemplate`	Managing Spaces and Space Templates	Creates a new space template based on an existing space. See Section 57.2.5.1.3, "Creating a Space Template."
`addMember`	Managing Space Membership	Makes a user (or a group) a space member with a specific role. See Section 57.2.5.2.1, "Adding Members to a Space."
`inviteMember`	Managing Space Membership	Invites a list of users to become members of a space. See Section 57.2.5.2.2, "Inviting Users to Join a Space."
`removeMember`	Managing Space Membership	Revokes space membership. See Section 57.2.5.2.3, "Removing Members from a Space."

Table 57–2 (Cont.) APIs for Performing Common Spaces Operations

Spaces API	Category	Description
`getRoles`	Managing Space Membership	Retrieves all the roles for a given space. See Section 57.2.5.2.4, "Retrieving Role Information."
`getGroupSpaces`	Retrieving Information for Spaces and Space Templates	Retrieves a list of spaces for a given query string. See Section 57.2.5.3.1, "Retrieving a List of Spaces."
`getPublicGroupSpaces`	Retrieving Information for Spaces and Space Templates	Retrieves a list of public spaces for a given query string. See Section 57.2.5.3.2, "Retrieving a List of Public Spaces."
`getDiscoverableGroupSpaces`	Retrieving Information for Spaces and Space Templates	Retrieves a list of discoverable spaces for a given query string. See Section 57.2.5.3.3, "Retrieving a List of Discoverable Spaces."
`getGroupSpaceMetadata`	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space. See Section 57.2.5.3.4, "Retrieving Space Metadata."
`getGroupSpaceMetadataByGuid`	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about a space given the space's GUID. See Section 57.2.5.3.4, "Retrieving Space Metadata."
`getGroupSpaceTemplates`	Retrieving Information for Spaces and Space Templates	Retrieves a list of space templates for a given query string. See Section 57.2.5.3.5, "Retrieving a List of Space Templates."
`getGroupSpaceTemplateMetadata`	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space template. See Section 57.2.5.3.6, "Retrieving Space Template Metadata."
`getGroupSpaceTemplateMetadataByGuid`	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space template given the template's GUID. See Section 57.2.5.3.6, "Retrieving Space Template Metadata."
`getWebCenterSpacesURL`	Retrieving Information for Spaces and Space Templates	Retrieves the Spaces application URL. See Section 57.2.5.3.7, "Retrieving the Spaces URL."
`getGroupSpaceURL`	Retrieving Information for Spaces and Space Templates	Retrieves a space URL. See Section 57.2.5.3.8, "Retrieving a Space URL."
`getServiceRSSFeedURL`	Retrieving Information for Spaces and Space Templates	Retrieves RSS feed URLs for the specified space service.
`getServiceRSSFeedURLbyGuid`	Retrieving Information for Spaces and Space Templates	Retrieves RSS feed URL for a given space by GUID and a given service.

57.2.5.1 Managing Spaces and Space Template

Use the following Spaces APIs to manage your spaces and space templates:

- `createGroupSpace`
- `setCustomAttribute`
- `createGroupSpaceTemplate`

- `deleteGroupSpace`

Before you begin

Before using any of these APIs, you must complete all the steps listed in Section 57.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."

This section includes the following subsections

- Creating a Space
- Creating a Custom Attribute
- Creating a Space Template
- Deleting a Space

57.2.5.1.1 Creating a Space Use the `createGroupSpace` API to create a space that is based on an existing space template.

To use this API, specify:

- The internal name of the new space. This name can contain blank spaces.
- A display name for the new space.
- A description of the space. Although this is not mandatory, we recommend that you provide a description to help users identify the space's purpose.
- The name of the space template you want to use. This should be the internal name of the template, not the display name.

Optionally, you can provide a comma separated list of keywords to help users locate the space in searches.

Example 57–3 creates a space with the name *Databases* that is based on the *CommunityofInterest* template. The example also specifies two search keywords (*databases* and *Oracle*).

Example 57–3 Creating a Space

```
//create the space
GroupSpaceWSMetadata gsMetadata =
client.createGroupSpace("Databases", "Databases" "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
//print the space GUID to provide confirmation of creation
System.out.println("GUID: " + gsMetadata.getGuid());
```

For an example of how to provide custom attributes for a new space, see Section 57.2.5.1.2, "Creating a Custom Attribute."

57.2.5.1.2 Creating a Custom Attribute Every space comes with built-in attributes such as name, description, date created, icon, and so on. In addition, you can define custom attributes that store additional information (metadata) that is unique to the space and its characteristics.

Use the `setCustomAttribute` API to specify a custom attribute for a space. To use this API, specify the name of the space and a name, description, type, and value for the custom attribute.

Example 57–4 creates the Databases space and then creates a custom attribute for that space. The attribute is named *Vendors,* with the description *List of vendors.* It takes string values of *Oracle* and *IBM.*

Example 57–4 Creating a Custom Attribute

```
//create the space
client.createGroupSpace("Databases", "Databases", "A community for people
interested in databases", null, "CommunityofInterest");
//create the custom attribute
client.setCustomAttribute("Databases", "Vendors", "List of vendors",
"java.lang.String", "Oracle, IBM");
```

57.2.5.1.3 Creating a Space Template Use the `createGroupSpaceTemplate` API to create a space template based on an existing space. To use this API specify a name, display name, and description for the template, and the name of the space to use to create the template.

Example 57–5 creates a space template based on the *Databases* space.

Example 57–5 Creating a Space Template

```
GroupSpaceWSMetadata templMetadata =
client.createGroupSpaceTemplate("DatabasesTemplate", "Databases Template",
"A template based on the Databases space", "Databases");
//print the template GUID to provide confirmation of creation
System.out.println("GUID: " + templMetadata.getGuid());
```

57.2.5.1.4 Deleting a Space Use the `deleteGroupSpace` API to permanently delete a space from the Spaces application. To use this API, specify the name of the space to delete. The API returns a boolean value to indicate whether the deletion was successful.

Example 57–6 deletes the space with the name *Databases*. The example uses the boolean value returned by the API to print a message about the success or failure of the operation.

Example 57–6 Deleting a Space

```
//delete the space
Boolean success = client.deleteGroupSpace("Databases");
//print a message depending on the result of the deletion
if(success)
{
  System.out.println("Operation Succeeded");
}
else
{
  System.out.println(Operation Failed");
}
```

57.2.5.2 Managing Space Membership

Use the following Spaces APIs to manage space membership:

- `addMember`
- `inviteMember`
- `removeMember`
- `getRoles`

Before you begin

Before using any of these APIs, you must complete all the steps listed in Section 57.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."

This section includes the following subsections:

- Adding Members to a Space
- Inviting Users to Join a Space
- Removing Members from a Space
- Retrieving Role Information

57.2.5.2.1 Adding Members to a Space

Use the `addMember` API to give users (and groups) space membership and assign the new members to a specific role. To use this API, specify the name of the space, and a list of users/groups. The list must contain objects of type `GroupSpaceWSMembers` that specify the user/group name and the role to give that user/group in the space.

You must specify the name of a valid user or user group that exists in the Spaces identity store. For the role, choose one of the default roles (Moderator, Participant, Viewer) or a custom role (if any). To retrieve a list of the available roles for a space, use the `getRoles` API. For more information, see Section 57.2.5.2.4, "Retrieving Role Information." For more information about roles, see the "Managing Roles and Permissions for a Space" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Example 57–7 makes users (of type `GroupSpaceWSMembers`) named *Pat* and *Vicki* and everyone in the *Sales* and *Marketing* user group, members of the *Databases* space. *Pat* and everyone in *Sales* and *Marketing* are granted the *Viewer* role. *Vicki* is assigned the *Participant* role.

> **Note:** Use `setGroup(true)` to indicate when you are adding a *group of users*.

Example 57–7 Adding Members to a Space

```
//create the list of users
List addMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat", "Viewer");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki", "Participant");
GroupSpaceWSMembers grp1 = new GroupSpaceWSMembers("Sales", "Viewer");
grp1.setGroup(true);
GroupSpaceWSMembers grp2 = new GroupSpaceWSMembers("Marketing", Viewer");
grp2.setGroup(true);
//add the GroupSpaceWSMembers objects to the list of users
addMem.add(mem1);
addMem.add(mem2);
addMem.add(grp1);
addMem.add(grp2);
//add the users to the Space
client.addMember("Databases", addMem);
//print a list of members to confirm the new members were added
GroupSpaceWSMetadata memMetData = client.getGroupSpaceMetadata("Databases");
for (GroupSpaceWSMembers mems: memMetData.getMembers())
{
  System.out.println(mems.getMember());
  System.out.println(mems.getRole());
```

```
}
```

57.2.5.2.2 Inviting Users to Join a Space

Use the `inviteMember` API to invite users to become members of a space. To use this API, specify the name of the space and a list of users to invite. The list must contain objects of type `GroupSpaceWSMembers` that specify the user name and the role to give that user in the space. An invitation to join the space is sent to each user, and each user can then accept or reject that invitation.

You must specify a valid user name that exists in the Spaces identity store. For the role, choose one of the default roles (Moderator, Participant, Viewer) or a custom role (if any). To retrieve a list of the available roles for a space, use the `getRoles` API. For more information, see Section 57.2.5.2.4, "Retrieving Role Information." For more information about roles, see the "Managing Roles and Permissions for a Space" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Example 57–8 invites users (of type `GroupSpaceWSMembers`) named *Pat* and *Vicki* to become members of the *Databases* space with *Viewer* and *Participant* roles respectively.

Example 57–8 Inviting Users to Join a Space

```
//create the list of users
List inviteMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat", "Viewer");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki", "Participant");
//add the GroupSpaceWSMembers objects to the list of users
inviteMem.add(mem1);
inviteMem.add(mem2);
//invite the list of users to join the space
client.inviteMember("Databases", inviteMem);
```

57.2.5.2.3 Removing Members from a Space

Use the `removeMember` API to revoke space membership. To use this API, specify the name of the space, and a list of users. The list must contain objects of type `GroupSpaceWSMembers` that specify the user name. To obtain a list of current space members, use the `getGroupSpaceMetadata` API. For more information, see Section 57.2.5.3.4, "Retrieving Space Metadata."

Example 57–9 removes users (of type `GroupSpaceWSMembers`) *Pat* and *Vicki* from the membership of the *Databases* space.

Example 57–9 Removing Members from a Space

```
//create the list of users
List remMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki");
2 lines
//add the GroupSpaceWSMembers objects to the list of users
remMem.add(mem1);
remMem.add(mem2);

//remove the users from the space
client.removeMember("Databases", remMem);
//print a list of members to confirm the members were removed
GroupSpaceWSMetadata memMetData = client.getGroupSpaceMetadata("Databases");
for (GroupSpaceWSMembers mems: memMetData.getMembers())
{
```

```
  System.out.println(mems.getMember());
  System.out.println(mems.getRole());
}
```

57.2.5.2.4 Retrieving Role Information Use the `getRoles` API to retrieve all the roles for a given space. This is useful for determining which roles are available when adding or inviting members to a space. Roles include out-of-the box roles (Moderator, Participant, Viewer) and also custom roles (if any). To use this API, specify the name of the space.

Example 57–10 retrieves and displays role information for the *Databases* space.

Example 57–10 Retrieving Role Information

```
//retrieve the list of roles
List<String> roles = client.getRoles("Databases");
//print the list of roles
for (String role: roles)
{
  System.out.println(role);
}
```

57.2.5.3 Retrieving Information for Spaces and Space Templates

Use the following Spaces APIs to retrieve space information:

- `getGroupSpaces`
- `getPublicGroupSpaces`
- `getDiscoverableGroupSpaces`
- `getGroupSpaceMetadata`
- `getGroupSpaceMetadataByGuid`
- `getGroupSpaceTemplates`
- `getGroupSpaceTemplateMetadata`
- `getGroupSpaceTemplateMetadataByGuid`
- `getWebCenterSpacesURL`
- `getGroupSpaceURL`

Before you begin

Before using any of these APIs, you must complete all the steps listed in Section 57.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."

This section includes the following subsections

- Retrieving a List of Spaces
- Retrieving a List of Public Spaces
- Retrieving a List of Discoverable Spaces
- Retrieving Space Metadata
- Retrieving a List of Space Templates
- Retrieving Space Template Metadata

- Retrieving the Spaces URL
- Retrieving a Space URL
- Retrieving RSS Feed URLs for Space Services

57.2.5.3.1 Retrieving a List of Spaces Use the `getGroupSpaces` API to obtain a list of spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* spaces that are accessible to the current user.

The API returns spaces that are accessible to the current user, up to a maximum of 500.

Example 57–11 returns a list of spaces containing the string *Database.*

Example 57–11 Retrieving a List of Specific Spaces

```
List<String> allGroupSpaces = client.getGroupSpaces("Database");
```

Example 57–12 returns a list of *all* spaces to which the current user has access. This is achieved by specifying a *null* query string.

Example 57–12 Retrieving a List of All Spaces

```
List<String> allGroupSpaces = client.getGroupSpaces(null)
```

57.2.5.3.2 Retrieving a List of Public Spaces Use the `getPublicGroupSpaces` API to obtain a list of public spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* public spaces.

The API returns spaces that are accessible to all users, even those who are not logged in to the Spaces application, up to a maximum of 500.

Example 57–13 returns a list of public spaces containing the string *Database*.

Example 57–13 Retrieving a List of Specific Public Spaces

```
List<String> allPublicGroupSpaces = client.getPublicGroupSpaces("Database");
```

Example 57–14 returns a list of *all* public spaces. This is achieved by specifying a *null* query string.

Example 57–14 Retrieving a List of All Public Spaces

```
List<String> allPublicGroupSpaces = client.getPublicGroupSpaces(null)
```

57.2.5.3.3 Retrieving a List of Discoverable Spaces Use the `getDiscoverableGroupSpaces` API to obtain a list of discoverable spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* discoverable spaces.

The API returns spaces that are accessible to all users who are logged in to the Spaces application, up to a maximum of 500.

Example 57–13 returns a list of discoverable spaces containing the string *Database*.

Example 57–15 Retrieving a List of Discoverable spaces

```
List<String> allDiscoverableGroupspaces =
client.getDiscoverableGroupspaces("Database");
```

Example 57–14 returns a list of *all* discoverable spaces. This is achieved by specifying a *null* query string.

Example 57–16 Retrieving a List of All Discoverable Spaces

```
List<String> allDiscoverableGroupSpaces = client.getDiscoverableGroupSpaces(null)
```

57.2.5.3.4 Retrieving Space Metadata Use the `getGroupSpaceMetadata` or `getGroupSpaceMetadataByGuid` APIs to obtain information (metadata) about a particular space. This includes information such as the description of the space, the name of the user who created it, the date on which it was last updated, and so on.

To use the `getGroupSpaceMetadata` API, specify the name of the space. To use the `getGroupSpaceMetadataByGuid` API, specify the GUID of the space. Note that while the space name may be changed during the existence of the space, the GUID always remains the same. You can obtain the GUID of a space as follows:

```
getGroupSpaceMetadata("spaceName").getGuid();
```

Both APIs return a bean object that contains more APIs that you can then use for retrieving the space metadata. These APIs are provided by the `GroupSpaceWSMetadata` class. Table 57–3 lists the APIs returned by the bean object:

Table 57–3 APIs for Retrieving Space Metadata

Spaces API	Description
`getCreatedBy`	Returns the name of the person who created the space.
`getSpaceAttributes`	Returns the custom attributes for a space.
`getDescription`	Returns the description of the space.
`getDisplayName`	Returns the display name of the space.
`getGroupSpaceState`	Returns the state of the space: active, offline, deleted.
`getGuid`	Returns the GUID of the space.
`getIconURL`	Returns the location of the space icon.
`getKeywords`	Returns a comma separated list of keywords used to describe the space.
`getLastUpdated`	Returns the date the space was last updated.
`getLogoURL`	Returns the location of the space logo.
`getMailingList`	Returns the mailing list for the space.
`getMembers`	Returns the current list of space members.
`getName`	Returns the internal name of the space.
`isDiscoverable`	Returns if the space is returned in searches made by users who are not members of the space.
`isPublic`	Returns if the space is available to users who are not logged in.

Example 57–17 retrieves the *Description*, *Keywords*, and *Last Updated Date* information for the *Databases* space given the space's name.

Example 57–17 Retrieving Space Metadata Using the Space Name

```
//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
```

```
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
  //retrieve the metadata
  GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
  //get space description
  System.out.println("Description: " + metadata.getDescription());
  //get space keywords
  System.out.println("Keywords: " + metadata.getKeywords());
  //get the date the space was last updated
  System.out.println("Last Updated Date: "+ metadata.getLastUpdated().toString());
}
```

Example 57–18 retrieves the *Display Name, Creator,* and *Last Updated Date* information for the *Databases* space given the space GUID.

Example 57–18 Retrieving Space Metadata Using Space GUID

```
GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadataByGuid("Guid");
//get space display name
System.out.println("Display Name: " + metadata.getDisplayName());
//get the name of the user who created the space
System.out.println("Created By: " + metadata.getCreatedBy());
//get the date the space was last updated
System.out.println("Last Updated Date: " + metadata.getLastUpdated().toString());
```

Example 57–19 retrieves the *Name, Description, Type,* and *Value* for every custom attribute associated with the *Databases* space.

Example 57–19 Retrieving Custom Attribute Metadata

```
//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
  //retrieve the metadata
  GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
  //get list of custom attributes
  List<GSCustomAttribute> attributes = metadata.getCustomAttributes();
  //get name, description, type, and value for each custom attribute
  for(GSCustomAttribute attribute: attributes)
  {
    System.out.println("Name :" + attribute.getName());
    System.out.println("Description :" + attribute.getDescription());
    System.out.println("Type :" + attribute.getType());
    System.out.println("value.toString() :" + attribute.getValue().toString());
  }
}
```

Example 57–20 retrieves a list of members of the *Databases* space.

Example 57–20 Retrieving Membership Information

```
//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
  //retrieve the metadata
```

```
  GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
  //get the list of members
  for(String member: metadata.getMembers())
  {
    System.out.println("Member UID: " + member);
  }
}
```

57.2.5.3.5 Retrieving a List of Space Templates

Use the `getGroupSpaceTemplates` API to obtain a list of space templates that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* templates that are accessible to the current user.

The API returns templates that are accessible to the current user, up to a maximum of 500.

Example 57–21 returns a list of space templates containing the string *Interest*.

Example 57–21 Retrieving a List of Specific Space Templates

```
List<String> allGroupSpaceTemplates = client.getGroupSpaceTemplates("Interest");
```

Example 57–22 returns a list of *all* space templates to which the current user has access. This is achieved by specifying a *null* query string.

Example 57–22 Retrieving a List of All Space Templates

```
List<String> allGroupSpaceTemplates = client.getGroupSpaceTemplates(null);
```

57.2.5.3.6 Retrieving Space Template Metadata

Use the `getGroupSpaceTemplateMetadata` and `getGroupSpaceTemplateMetadataByGuid` APIs to obtain information (metadata) about a particular space template. This includes information such as the description of the template, the name of the user who created it, and so on.

To use the `getGroupSpaceTemplateMetadata` API, specify the name of the template. To use the `getGroupSpaceTemplateMetadataByGuid` API, specify the GUID of the template. Note that while the space template name may be changed during the existence of the template, the GUID always remains the same.

Both APIs return a bean object that contains more APIs that you can then use for retrieving the space template metadata. These APIs are provided by the `GroupSpaceWSMetadata` class. Table 57–4 lists the APIs returned by the bean object:

Table 57–4 APIs for Retrieving Space Template Metadata

Spaces API	Description
`getCreatedBy`	Returns the name of the person who created the template.
`getDescription`	Returns the description of the template.
`getDisplayName`	Returns the display name of the template.
`getGuid`	Returns the GUID of the template.
`getIconURL`	Returns the location of the template icon.
`getKeywords`	Returns a comma separated list of keywords used to describe the template.
`getLogoURL`	Returns the location of the template logo.

Table 57–4 (Cont.) APIs for Retrieving Space Template Metadata

Spaces API	Description
`getName`	Returns the internal name of the template.

Example 57–23 retrieves the *GUID, Description,* and *Created By* information for the *CommunityofInterest* space template given the template name.

Example 57–23 Retrieving Template Metadata Using the Template Name

```
GroupSpaceWSMetadata metadata =
client.getGroupSpaceTemplateMetadata(myGroupSpaceTemplate);
//get the exact name of the space template
List<String> myGroupSpaceTemplate =
client.getGroupSpaceTemplates("CommunityofInterest");
//check that the API returns a single result
if(myGroupSpaceTemplate.size() == 1)
{
  //retrieve the metadata -- get GUID
  System.out.println("GUID: " + metadata.getGuid());
  //get template description
  System.out.println("Description: " + metadata.getDescription());
  //get name of user who created the template
  System.out.println("Keywords: " + metadata.getCreatedBy());
}
```

Example 57–24 retrieves the *name* of a space template given the template GUID.

Example 57–24 Retrieving Template Metadata Given the Template GUID

```
GroupSpaceWSMetadata templGuidMetadata =
client.getGroupSpaceTemplateMetadataByGuid("Guid");
System.out.println("Template Name: " + templGuidMetadata.getName());
```

57.2.5.3.7 Retrieving the Spaces URL Use the `getWebCenterSpacesURL` API to obtain the URL of the Spaces application.

Example 57–25 retrieves the URL of the currently running instance of Spaces.

Example 57–25 Retrieving the WebCenter Portal: Spaces URL

```
String myWebCenterSpacesURL = client.getWebCenterSpacesURL();
```

57.2.5.3.8 Retrieving a Space URL Use the `getGroupSpaceURL` API to obtain the URL of a specific space. This is useful for when you want to construct a hyperlink for a space or you have a relative URL that you need to make into an absolute URL. To use this API, specify the name of the space.

Example 57–26 retrieves the URL of the *Databases* space.

Example 57–26 Retrieving a Space URL

```
String myGroupSpaceURL = client.getGroupSpaceURL("Databases");
```

Example 57–27 prints a list of spaces as hyperlinks.

Example 57–27 Printing a List of Spaces as Hyperlinks

```
//get the list of spaces
List<String> spaces = client.getGroupSpaces("");
//print the list of spaces as hyperlinks
for (String spaceName : spaces)
{
  print("<a href =""" + client.getGroupSpaceURL(spaceName) + "">" + spaceName +
"</a><br>");
}
```

To construct the URL of a particular page in a space, retrieve the space URL and then add the page information. For information about how to create pretty URLs for space pages, see "Spaces Pretty URLs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

57.2.5.3.9 Retrieving RSS Feed URLs for Space Services Space members can find out what is happening in a space through various RSS news feeds. The following space RSS feeds are available:

- Announcements RSS - View space announcements
- Discussions RSS - Track contributions to discussion forums
- Lists RSS - Watch for revisions to lists
- Recent Activity RSS - Monitor recent activities

You can retrieve the RSS feed URLs for these space services, from a WebCenter Portal application, using the following Spaces APIs:

- `getServiceRSSFeedURL`
- `getServiceRSSFeedURLbyGuid`

To obtain an RSS feed URL, you must identify the space (by name or GUID) and specify the service required (using a service ID). Service IDs are available as constants in `GroupSpaceWSClient` as follows:

- Announcements - `GroupSpaceWSClient.ANNOUNCEMENT_SERVICE_ID`
- Discussions - `GroupSpaceWSClient.DISCUSSION_FORUM_SERVICE_ID`
- Lists - `GroupSpaceWSClient.LIST_SERVICE_ID`
- Recent Activities - `GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID`

Retrieving Space RSS News Feed URLs Using `getServiceRSSFeedURL`

Use the `getServiceRSSFeedURL` API to obtain service-related RSS news feed URLs for a particular space by specifying the space name.

To retrieve the RSS news feed URL for a service using `getServiceRSSFeedURL`, use the following:

```
String service_URL = client.getServiceRSSFeedURL("groupspace_name",service_ID);
```

Where:

service_URL refers to the service parameter being retrieved

groupspace_name is the name of the space

service_ID is the ID of the service for which you want to retrieve the RSS news feed URL. Use one of the following: `ANNOUNCEMENT_SERVICE_ID`, `DISCUSSION_FORUM_SERVICE_ID`, `RECENT_ACTIVITY_SERVICE_ID`, or `LIST_SERVICE_ID`.

Therefore, depending on the service required, you can use the following:

- `String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSClient.ANNOUNCEMENT_SERVICE_ID)`
- `String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSClient.DISCUSSION_FORUM_SERVICE_ID)`
- `String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSClient.LIST_SERVICE_ID)`
- `String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID)`

Example 57–28 retrieves the recent activity RSS feed URL for a space named Finance_Project:

Example 57–28 Retrieving the RSS Feed URL for Recent Activity

```
String recentActivityURL = client.getServiceRSSFeedURL("Finance_Project",
GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID);
```

Retrieving RSS News Feed URLs Using `GetServiceRSSFeedURLbyGuid`

Use the `getServiceRSSFeedURLbyGuid` API to obtain service-related RSS news feed URLs for a particular space by specifying the space's GUID.

To retrieve the RSS news feed URL for a service using `getServiceRSSFeedURLbyGuid`, use the following:

```
String service_URL = client.getServiceRSSFeedURLbyGuid("groupspace_GUID",service_
ID);
```

Where:

service_URL refers to the service parameter being retrieved

groupspace_GUID is a space GUID. For information about obtaining a space's GUID, see Section 57.2.5.3.4, "Retrieving Space Metadata."

service_ID is the ID of the service for which you want to retrieve the RSS news feed URL. Use one of the following: `ANNOUNCEMENT_SERVICE_ID`, `DISCUSSION_FORUM_SERVICE_ID`, `RECENT_ACTIVITY_SERVICE_ID`, or `LIST_SERVICE_ID`.

Example 57–29 retrieves the recent activity RSS feed URL for a space with the GUID: s2201fa44_b441_4bdd_950e_47307f6f9800:

Example 57–29 Retrieving the RSS Feed URL for Recent Activity

```
String recentActivityURL = client.getServiceRSSFeedURLbyGuid("s2201fa44_b441_4bdd_
950e_47307f6f9800", GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID);
```

57.2.6 How to Handle Exceptions Raised by Spaces APIs

The `GroupSpaceWSException` class provides APIs for handling exceptions raised by Spaces APIs.

Table 57–5 Spaces APIs in the GroupSpaceWSException Class

API	Class	Description
`getLocalizedMessage`	GroupSpaceWSException	Composes the localized error message.
`printStackTrace`	GroupSpaceWSException	Prints the exception and its back trace to the standard error stream.

This section includes the following subsections:

- Providing Localized Error Messages
- Listing the Error Stack

57.2.6.1 Providing Localized Error Messages

Sometimes you may find that the default error messages provided by the APIs are not specific enough for your particular application. In these cases you can provide your own error messages.

Use the `getLocalizedMessage` API to compose application-specific error messages.

Example 57–30 shows a servlet that includes code to create a space. If any exceptions are raised during the creation process, a localized message is printed.

Example 57–30 Printing a Localized Error Message

```
servlet1.java

doGet()
{
...
  print("<b>Output</b>");
  try
    {
      GroupSpaceWSClient client = new GroupSpaceWSClient(context);
      client.createGroupSpace("Databases", "Databases, "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
      print("Successfully created space");
    }
  catch(GroupSpaceWSException ex)
    {
      if(ex instanceof GroupSpaceNameNullException)
        print(ex.getLocalizedMessage());
      else if (ex instanceof GroupSpaceDescNullException)
        print(ex.getLocalizedMessage());
    }
...
}
```

57.2.6.2 Listing the Error Stack

For debugging purposes, it is often useful to see which errors ultimately led to the failure of a particular operation to discover the underlying cause of the problem. Use the `printStackTrace` API to list all the errors that caused a particular exception.

Example 57–31 prints the exception and all the errors leading up to it.

Example 57–31 Listing the Error Stack

servlet1.java

```
doGet()
{
...
  print("<b>Output</b>");
  try
    {
      GroupSpaceWSClient client = new GroupSpaceWSClient(context);
      client.createGroupSpace("Databases", "Databases", "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
      print("Successfully created space");
    }
  catch(GroupSpaceWSException ex)
    {
      ex.printStackTrace();
    }
...
}
```

57.2.7 Finding More Information on Spaces APIs

API Reference Documentation

For detailed syntax information for each API, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

57.2.8 Troubleshooting Issues with Spaces APIs

If you experience issues with Spaces APIs, check the following:

1. Verify that the credential stores for both WebCenter Portal: Spaces and the client WebCenter Portal application are configured correctly.

   See "Updating the Credential Stores" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

2. Ensure the Spaces client context is set up correctly in the WebCenter Portal application by checking the alias passed in the `context.setRecipientKeyAlias`. The alias should be the public key alias of the producer (Spaces), for example:

   ```
   GroupspaceWSContext context = new GroupspaceWSContext();
   context.setEndPoint(endPointUrl);
   context.setRecipientKeyAlias("orakey");
   groupspaceInternalWSClient = new GroupspaceWSInternalClient(context);
   ```

   In this example, the public key alias of the producer is **orakey**. See also, Setting Up the Spaces Client Context.

3. Check that keystores exist at both ends of the connection. For example:

   - `webcenter.jks` (copied to Spaces end)

   - `clientapi.jks` (copied to WebCenter Portal application end)

   For example, the following commands generate `clientapi.jks` and `webcenter.jks` for a simple topology:

```
keytool -genkeypair -keyalg RSA -dname "cn=spaces,dc=example,dc=com" -alias
orakey -keypass mypassword -keystore webcenter.jks -storepass mypassword
-validity 360
keytool -exportcert -v -alias orakey -keystore webcenter.jks
-storepass mypassword -rfc -file webcenter.cer
keytool -importcert -alias webservice_client_api
-file webcenter.cer -keystore clientapi.jks -storepass mypassword
keytool -genkeypair -keyalg RSA -dname "cn=clientapi,dc=example,dc=com"
-alias clientapi -keypass mypassword -keystore clientapi.jks -storepass
mypassword -validity 360
keytool -exportcert -v -alias clientapi -keystore clientapi.jks -storepass
mypassword -rfc -file clientapi.cer
keytool -importcert -alias clientapi -file clientapi.cer -keystore
webcenter.jks -storepass mypassword
```

See also, Securing the Connection Between the Application and Spaces.

57.3 Using the WebCenter Portal: Spaces REST APIs

Oracle WebCenter Portal: Spaces provides REST APIs to support various space-related operations. You can use REST APIs to perform the following actions in the Spaces application:

- List all spaces in the Spaces application, list public spaces only, list joined spaces, list discoverable spaces.
- View details for a single space.
- List members of a space.
- List role assignments for space members.
- List custom attributes defined for a space.
- View the details of a particular custom attribute.
- View and add lists for a space.
- View and update list items (rows) for a list.
- View, update, and delete list item details (columns).

This section describes the WebCenter Portal: Spaces REST APIs. It contains the following subsections:

- Section 57.3.1, "WebCenter Portal: Spaces Entry Point"
- Section 57.3.2, "WebCenter Portal: Spaces Resource Type Taxonomy"
- Section 57.3.3, "WebCenter Portal: Spaces Security Considerations"
- Section 57.3.4, "WebCenter Portal: Spaces Resource Types"

For an introduction to the REST APIs, see Section 54, "Using Oracle WebCenter Portal REST APIs."

57.3.1 WebCenter Portal: Spaces Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. To find the entry point for WebCenter Portal: Spaces REST APIs, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:spaces
```

The corresponding `href` or `template` element provides the URI entry point which returns a list of spaces accessible to the current user. The client sends HTTP requests to this entry point to work with WebCenter Portal: Spaces.

For more information about the Resource Index, see Section 54.5.1, "The Resource Index".

For more information about resource types, see Section 54.5.2.1, "Resource Type."

57.3.2 WebCenter Portal: Spaces Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in Section 57.3.4, "WebCenter Portal: Spaces Resource Types".

The taxonomy for WebCenter Portal: Spaces is:

```
urn:oracle:webcenter:spaces
urn:oracle:webcenter:spaces:siteresources
urn:oracle:webcenter:spaces:resource:templates
urn:oracle:webcenter:spaces:resource:template
   urn:oracle:webcenter:space:attributes
   urn:oracle:webcenter:space:roles
   urn:oracle:webcenter:space
   urn:oracle:webcenter:space:icon
   urn:oracle:webcenter:space:members
      urn:oracle:webcenter:space:member
   urn:oracle:webcenter:space:attributes
      urn:oracle:webcenter:space:attribute
   urn:oracle:webcenter:space:roles
      urn:oracle:webcenter:space:role
   urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
      urn:oracle:webcenter:space:list
         urn:oracle:webcenter:space:rows
            urn:oracle:webcenter:space:row
         urn:oracle:webcenter:space:columns
            urn:oracle:webcenter:space:column
```

57.3.3 WebCenter Portal: Spaces Security Considerations

There are no specific security considerations for this service. For general security considerations, see Section 54.8, "Security Considerations for WebCenter Portal REST APIs."

57.3.4 WebCenter Portal: Spaces Resource Types

The following sections provide all the information you need to know about each resource type:

- urn:oracle:webcenter:spaces
- urn:oracle:webcenter:siteresources
- urn:oracle:webcenter:spaces:resource:templates
- urn:oracle:webcenter:space
- urn:oracle:webcenter:space:resourceindex
- urn:oracle:webcenter:space:roles

- urn:oracle:webcenter:space:attributes
- urn:oracle:webcenter:space:attribute
- urn:oracle:webcenter:space:members
- urn:oracle:webcenter:space:member
- urn:oracle:webcenter:space:lists
- urn:oracle:webcenter:space:list
- urn:oracle:webcenter:space:list:rows
- urn:oracle:webcenter:space:list:row
- urn:oracle:webcenter:space:list:columns
- urn:oracle:webcenter:space:list:column

57.3.4.1 urn:oracle:webcenter:spaces

Use this resource type to identify the URI to use to view a list of spaces (`GET`) and to create a new space (`POST`). The response from a `GET` operation includes each space, and each space includes links to operate on that space.

Navigation Paths to spaces

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
```

Supported Methods for spaces

The following methods are supported by this resource:

- `GET` – Returns information on all spaces.
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `itemsPerPage`
    - `projection` - Allowed values are `summary` and `details`. The default is `summary`.
    - `visibility` - Determines which spaces are included in the list: all spaces, public spaces only, joined spaces, or discoverable spaces.

      Allowed values are `all`, `public`, `joined` and `discoverable`. The default is `joined`.
  - **response - body:** collection of spaces
- `POST` – Creates a new space.
  - **request - body:** space

```
<space>
   <name>aName</name>
   <description>aDescription</description>
   <templateName>aTemplate</templateName>
</space>
```

Note: The `templateName` parameter must be a valid template name returned from urn:oracle:webcenter:spaces:resource:templates. For example, the default template names are:

```
Basic
CommunityOfInterest
ProjectSpace
```

Resource Types Linked to from spaces

Table 57–6 lists the resource types that the client can link to from this resource.

Table 57–6 Related Resource Types for urn:oracle:webcenter:spaces

rel	resourceType
self	`urn:oracle:webcenter:spaces`
	`urn:oracle:webcenter:space`

57.3.4.2 urn:oracle:webcenter:siteresources

Use this resource type to identify the URI to use to retrieve a list of Site Resources (`GET`). The response from a `GET` operation includes a list of all site resource names. The main purpose of retrieving site resource names is to know what all resources is available in the space.

The returned list includes the resources that are found under the Resources tab of the Spaces application Administration console, and include resources like page templates, navigations, skins, page styles, and others.

Navigation Paths to siteresources

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      siteresources
```

Supported Methods for siteresources

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `itemsPerPage`
    - `projection` - Allowed values are `summary` and `details`. The default is `summary`.
    - `q` - You can search on `siteResourceType` and/or `seeded`.

      If `siteResourceType` is specified, the query returns all site resource names for that site resource type.

The format is: `q = siteResourceType:equals:<value>`

The possible values are `siteTemplate`, `contentPresenter`, `pageStyle`, `navigation`, `resourceCatalog`, or `skin`.

Example:

`q=siteResourceType:equals:siteTemplate`

If `seeded` is specified as `true`, the query returns all site resources names that are seeded.

The format is: `q=seeded:equals:<value>`.

The possible values are `true` or `false`.

Example:

`q=seeded:equals:false` (returns all non-seeded resources)

If a non-seeded site template is required, the query is:

```
siteResourceType:equals:siteTem-
plate;seeded:equals:false
```

– **response - body:** list of all site resource names for all the site resource types for the specified scope. If the `siteResourceType` is specified, returns all the site resource names for that site resource type.

Read-Only Elements for siteresources

Table 57–7 lists the read-only elements for siteresources.

Table 57–7 Read-Only Elements for urn:oracle:webcenter:siteresources

Element	Type	Description
guid	String	Global ID for the site resource.
displayName	String	Name of the site resource as displayed to end users.
name	String	The name of the site resource. A complete list of all of the site resources, by name, is provided in Table 57–8.
description	String	Description of the site resource.
siteResourceType	String	Type of the site resource.
scopeName	String	Either the name of the space or the default scope at the application level.
seeded	Boolean	Set to true if the site resource is pre-populated.
visible	Boolean	Set to true if this site resource is visible in the user interface.
createdBy	String	Username of the user who created the site resource.
createdDate	Date	Date the site resource was created.
modifiedBy	String	Username of the user who updated the site resource.
modifiedDate	Date	Date on which the site resource was modified.
version	String	Version of the site resource.

List of Site Resources by Name

Table 57–8 lists the site resources by name, and gives the type and description of each resource.

Table 57–8 List of Site Resources by Name Provided by WebCenter Portal

Name	Type	Description
Accordion View	contentPresenter	Displays multiple content items in an accordion (stacked) format. When an item is clicked, the other items collapse to reveal the selected items details.
Blank	pageStyle	Blank Page Style
Blank	taskFlowStyle	Blank
Blog	pageStyle	Blog Page Style
Bulleted View	contentPresenter	Displays multiple content items as a bulleted list. Only content items are displayed; sub-folders are omitted.
Bulleted with Folder Label View	contentPresenter	Displays multiple content items as a bulleted list. The name of the parent folder is displayed as a label above the list. Only content items are displayed; sub-folders are omitted.
Carousel View	contentPresenter	Displays multiple content items in a carousel format. Users browse through items using a slider bar from left to right.
Default Document Details View	contentPresenter	Displays detailed information about a single content item, including creation date, modification date, creator, user who last modified the item, and path, as well as any comments.
Default Home Space Catalog	resourceCatalog	Used when editing application-level pages and task flows in your Home space.
Default List Item View	contentPresenter	Used by a single content item view to display a single line with an icon and item name as a link that either displays or downloads the item when clicked.
Default List Item View for Folders	contentPresenter	Used by a single content item view to display a single line with an icon and item name as a link that either displays or downloads the item when clicked.
Default Page Template Catalog	resourceCatalog	Used when editing page templates
Default Space Catalog	resourceCatalog	Used when editing space-level pages and task flows
Default View	contentPresenter	Displays a single content item. Image and HTML content items are displayed directly in the browser. For other item types, details are displayed, along with a link to download the associated file.
Fusion FX	skin	
Fusion Side Navigation	siteTemplate	Stretching Page Layout with Side Navigation. Use Fusion FX Skin.
Fusion Top Navigation	siteTemplate	Stretching Page Layout with Top Navigation. Use Fusion FX Skin.

Table 57–8 (Cont.) List of Site Resources by Name Provided by WebCenter Portal

Name	Type	Description
Home Page	pageStyle	Home Page style
Icon View	contentPresenter	Displays multiple content items in a tiled format, using icons to represent sub-folders and content items.
Left Narrow	pageStyle	Left Narrow Page Style
List View	contentPresenter	Displays multiple content items in a simple list.
List with Details Panel View	contentPresenter	Displays multiple content items in a list on the left. A panel on the right displays the details of a selected item.
Parameter Form	taskFlowStyle	
Right Narrow	pageStyle	
Sortable Table View	contentPresenter	Displays multiple content items in a sortable table that includes the document name, date created, and date modified.
Html Page	pageStyle	HTML page style
Spaces Default Navigation Model	navigation	Navigation model that displays current pages in a space
Spaces Navigation with Blogs/Wikis/Lists Submenus	navigation	Navigation model that displays current pages and submenus for blogs, wikis and lists
Stretch	taskFlowStyle	
Tabbed View	contentPresenter	Displays multiple content items as tabs. Clicking a tab displays the associated item's details.
Three Column	pageStyle	Three Column Page Style
Web Page	pageStyle	Web Page Page Style
Public-Pages Template	siteTemplate	Default Page Template for Public pages.
Collaborative with Top Navigation	siteTemplate	Page Template for Collaborative Spaces, with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Spaces FX	skin	WebCenter Spaces FX Skin
Portal-centric with Top Navigation	siteTemplate	Page Template for Portal-centric Sites, with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Side Navigation	siteTemplate	Flowing Page Layout with Side Navigation. Use WebCenter Spaces FX Skin.
Side Navigation (Stretch)	siteTemplate	Stretching Page Layout with Side Navigation. Use WebCenter Spaces FX Skin.
Top Navigation	siteTemplate	Default Page Template with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Top Navigation (Stretch)	siteTemplate	Stretching Page Layout with Top Navigation. Use WebCenter Spaces FX Skin.
Wiki	pageStyle	Wiki Page Style

Writeable Elements for siteresources

There are no writeable elements for this resource.

57.3.4.3 urn:oracle:webcenter:spaces:resource:templates

Use this resource type to identify the URI to use to retrieve a list of space templates (`GET`). The response from a `GET` operation includes a list of template names. The main purpose of retrieving template names is to provide a value for the `templateName` parameter for the create space command.

Navigation Paths to templates

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resource
         templates
```

Supported Methods for templates

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `projection` - Allowed values are `summary` and `details`. The default is `summary`.
    - `q` - Performs searches.
    - `itemsPerPage`
  - **response - body:** list of template names

For more information about query parameters, see Section 54.5.2.5, "Templates."

Resource Types Linked to from templates

Table 57–9 lists the resource types that the client can link to from this resource.

Table 57–9 Related Resource Types for urn:oracle:webcenter:spaces

rel	resourceType
self	`urn:oracle:webcenter:spaces:resource:templates`

57.3.4.4 urn:oracle:webcenter:space

Use this resource type to identify the URI to use to view details for a single space (`GET`), create a nested space (`POST`), or delete a space (`DELETE`). The response from a `GET` operation includes the specific space identified by the URI, including its creator, description, members, and custom attributes.

> **Note:** The response from this resource also includes a link to the space's message board.

Navigation Paths to space

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
```

Supported Methods for space

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:**
    - `projection` - Allowed values are `summary`, and `details`. The default is `details`. Choose `summary` to exclude member and custom attribute details.
  - **response - body:** Space
- `POST` – Creates a new space that is a child of the named space (a subspace). This feature supports creating hierarchical or nested spaces.
  - **request - body:** Space

```
<space>
   <name>FooSpace</name>
   <description>foobar</description>
   <templateName>CommunityOfInterest</templateName>
</space>
```

> **Note:** The `templateName` parameter must be a valid template name returned from urn:oracle:webcenter:spaces:resource:templates. For example, the default template names are:
>
> ```
> Basic
> CommunityOfInterest
> ProjectSpace
> ```

- `DELETE` – Deletes the named space.
  - **request - body:** None

    On delete, a 204 status code is returned whether or not the space existed.

For more information about query parameters, see Section 54.5.2.5, "Templates."

Writable Elements for space

Table 57–10 lists the writable elements for this resource.

Table 57–10 Writable Elements for urn:oracle:webcenter:space

Element	Type	Description
`description`	String	Description of the space.
`name`	String	Internal name for the space.

Table 57–10 (Cont.) Writable Elements for urn:oracle:webcenter:space

Element	Type	Description

`templateName`	String	Must be a valid template name returned from urn:oracle:webcenter:spaces:resource:templates. For example, the default template names are:
		`Basic`
		`CommunityOfInterest`
		`ProjectSpace`

Read-only Elements for space

Table 57–11 lists the read-only elements for this resource.

Table 57–11 Read-only Elements for urn:oracle:webcenter:space

Element	Type	Description
`guid`	String	Global ID for the space.
`creator`	String	ID of the user who created the space.
`author`	personReference	User information about the user who created the space, including GUID, ID, display name, and a link to the profile icon (same user as `creator`).
`displayName`	String	Name of the space as displayed to members.
`iconUrl`	String	Fully qualified URL for the space's icon image.
`logoUrl`	String	Relative URL for the space's logo image.
`isOffline`	Boolean	Indicates whether the space is offline or online.
`isDiscoverable`	Boolean	Specifies whether the space is discoverable.
`isPublic`	Boolean	Specifies whether the space is public.
`keywords`	String	Lists keywords for the space.
`mailingList`	String	Lists the mailing list email for the space if it has one.
`parentDisplayName`	String	Shows the parent display name if the space is a child space and has a parent. In this case, there will also be an `isInheritFromParent` boolean element that signifies whether the permissions of the parent space are inherited by the child space or not. Specifically, members of the parent space will be inherited.
`serviceDataCopied`	String	List of service ids whose data is to be copied to new spaces/templates when created based off this space.
`defaultLanguage`	String	The default language.
`landingPage`	String	URI to the space landing page if specified.

Table 57–11 (Cont.) Read-only Elements for urn:oracle:webcenter:space

Element	Type	Description
`isTemplate`	Boolean	Specifies whether or not this is a Template.
`isUnsubscriptionApprovalRequired`	Boolean	Specifies whether or not you need approval to unsubscribe.
`isPublishRss`	Boolean	Specifies whether or not the space has an associated RSS feed.
`isClosed`	Boolean	Specifies whether or not the space is closed.
`isBlockAllAccess`	Boolean	Specifies whether or not all access to space is blocked (not sure how this happens).
`members`	String	Returns the members element for the space.
`attributes`	String	Returns the attributes element for the space.

Resource Types Linked to from space

Table 57–12 lists the resource types that the client can link to from this resource.

Table 57–12 Related Resource Types for urn:oracle:webcenter:space

rel	resourceType
self	`urn:oracle:webcenter:space`
	`urn:oracle:webcenter:space:attributes`
	`urn:oracle:webcenter:space:members`
	`urn:oracle:webcenter:space:roles`
	`urn:oracle:webcenter:space:icon`
	`urn:oracle:webcenter:activities:stream`
	`urn:oracle:webcenter:messageBoard`

57.3.4.5 urn:oracle:webcenter:space:resourceindex

Use this resource type to identify the URI to use to view the Spaces resource index.

Navigation Paths to resourceindex

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
```

Supported Methods for resourceindex

The following methods are supported by this resource:

- `GET`
  - **request - body:** None

- **query parameters:** None
- **response - body:** resource index

Resource Types Linked to From resourceindex

Table 57–13 lists the resource types that the client can link to from this resource.

Table 57–13 Related Resource Types for urn:oracle:webcenter:space:resourceindex

rel	resourceType
	urn:oracle:webcenter:space:lists
	urn:oracle:webcenter:discussions:forum

57.3.4.6 urn:oracle:webcenter:space:roles

Use this resource type to get a list of roles for the named space (GET). The results returned from this call can be used to add a new member to a space with urn:oracle:webcenter:space:members.

Navigation Paths to space:roles

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         roles
```

Supported Methods for roles

The following methods are supported by this resource:

- GET – Returns the list of roles assigned to the named space.

Resource Types Linked to from roles

Table 57–14 lists the resource types that the client can link to from this resource.

Table 57–14 Related Resource Types for urn:oracle:webcenter:spaces:roles

rel	resourceType
self	urn:oracle:webcenter:space:roles
	urn:oracle:webcenter:space:role
urn:oracle:webcenter:parent	urn:oracle:webcenter:space

57.3.4.7 urn:oracle:webcenter:space:role

Use this resource type to get a named role (GET).

Use this resource type to get a list of roles for the named space (GET). The results returned from this call can be used to add a new member to a space with urn:oracle:webcenter:space:members.

Navigation Paths to space:role

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         role
```

Supported Methods for role

The following methods are supported by this resource:

- `GET` – Returns the named role.

Resource Types Linked to from role

Table 57–14 lists the resource types that the client can link to from this resource.

Table 57–15 Related Resource Types for urn:oracle:webcenter:spaces:roles

rel	resourceType
self	`urn:oracle:webcenter:space:role`
	urn:oracle:webcenter:space:role
urn:oracle:webcenter:parent	`urn:oracle:webcenter:space`

57.3.4.8 urn:oracle:webcenter:space:icon

Use this resource type to get the icon used for the named space (`GET`).

> **Note:** This resource type is used for space references, not for space responses. This resource can be used anywhere a space is referenced, like in an activity stream or a space event.

Navigation Paths to space:icon

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         icon
```

Supported Methods for icon

The following methods are supported by this resource:

- `GET` – Returns the icon used for the named space.

Resource Types Linked to from icon

Table 57–14 lists the resource types that the client can link to from this resource.

Table 57–16 Related Resource Types for urn:oracle:webcenter:spaces:roles

rel	resourceType
self	`urn:oracle:webcenter:space:icon`
urn:oracle:webcenter:parent	`urn:oracle:webcenter:space`

57.3.4.9 urn:oracle:webcenter:space:attributes

Use this resource type to identify the URI to use to view a list of custom attributes defined for a space (`GET`). The response from a `GET` operation includes each custom attribute for the space, and each attribute includes links to operate on that attribute. Also use this resource type to add custom attributes to a space (`POST`).

Navigation Paths to attributes

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         attributes
```

Supported Methods for attributes

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** collection of attributes
- `POST` – Adds a custom attribute to the named space.
  - **request - body:**

```
<attribute>
   <name>anAttribute</name>
   <value>aValue</value>
</attribute>
```

Writeable Elements for attributes

Table 57–17 lists the writeable elements for this resource.

Table 57–17 Writeable Resources for space:attributes

Element	Type	Description
name	String	Attribute name.
value	String	Attribute value.

Resource Types Linked to From attributes

Table 57–18 lists the resource types that the client can link to from this resource.

Table 57–18 Related Resource Types for urn:oracle:webcenter:space:attributes

rel	resourceType
self	urn:oracle:webcenter:space:attributes
	urn:oracle:webcenter:space:attribute
urn:oracle:webcenter:parent	urn:oracle:webcenter:space

57.3.4.10 urn:oracle:webcenter:space:attribute

Use this resource type to identify the URI to use to view the name and value of single space attribute (`GET`). The response from a `GET` operation includes the specific attribute identified by the URI.

Navigation Paths to attribute

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         attributes
```

Supported Methods for attribute

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** attribute

Read-only Elements for attribute

Table 57–19 lists the read-only elements for this resource.

Table 57–19 Read-only Elements for urn:oracle:webcenter:space:attribute

Element	Type	Description
name	String	Name of the custom attribute.
description	String	Description of the custom attribute.
type	String	Data type of the custom attribute.
value	String	Value of the custom attribute.

Resource Types Linked to From attribute

Table 57–20 lists the resource types that the client can link to from this resource.

Table 57–20 Related Resource Types for urn:oracle:webcenter:space:attribute

rel	resourceType
self	`urn:oracle:webcenter:space:attribute`
urn:oracle:webcenter:parent	`urn:oracle:webcenter:space`

57.3.4.11 urn:oracle:webcenter:space:members

Use this resource type to identify the URI to use to view a list of members for the space (`GET`). The response from a `GET` operation includes each member of the space, each member includes links to operate on that member.

Navigation Paths to members

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
```

Supported Methods for members

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** collection of members
- `POST` – Adds a member to the space.
  - **request - body:** member

```
<member>
    <name>vicki</name>
    <role>Participant</role>
</member>
```

- `DELETE` – Removes the named member from the space. You can obtain the member guid with urn:oracle:webcenter:space:member.
  - **request - body:** None

```
DELETE
http://hostname:portnum/rest/api/spaces/spacename/members/member_guid
```

Writeable Elements of spaces:space:members

Table 57–21 Writeable Elements of spaces:space:members

Element	Type	Description
name	String	The member's name.
role	String	The member's role. Obtain this value from urn:oracle:webcenter:space:roles.

Resource Types Linked to From members

Table 57–22 lists the resource types that the client can link to from this resource.

Table 57–22 Related Resource Types for urn:oracle:webcenter:space:members

rel	resourceType
self	`urn:oracle:webcenter:space:members`
	`urn:oracle:webcenter:space:member`
urn:oracle:webcenter:parent	`urn:oracle:webcenter:space`

57.3.4.12 urn:oracle:webcenter:space:member

Use this resource type to identify the URI to use to view details for a space member and their current role assignments (`GET`). The response from a `GET` operation includes the specific member identified by the URI, including a hyperlink to the member's profile.

Navigation Paths to member

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      space
         members
```

Supported Methods for member

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** member

Read-only Elements for member

Table 57–23 lists the read-only elements for this resource.

Table 57–23 Read-only Elements for urn:oracle:webcenter:space:member

Element	Type	Description
guid	String	Global ID for the space member.
name	String	User ID of the space member.
role	String	Role assigned to the member.
displayName	String	Display name of the member.

Resource Types Linked to From member

Table 57–24 lists the resource types that the client can link to from this resource.

Table 57–24 Related Resource Types for urn:oracle:webcenter:space:member

rel	resourceType
self	`urn:oracle:webcenter:space:member`
	`urn:oracle:webcenter:people:person`
urn:oracle:webcenter:people:icon	`urn:oracle:webcenter:people:person`

57.3.4.13 urn:oracle:webcenter:space:lists

Use this resource type to identify the URI to use to view (`GET`) and add (`POST`) lists for the space. The response from a `GET` operation includes each list in the space, and each list includes links used to operate on that list. The response from a `POST` operation includes the list that was created in this collection of lists and a link to operate on that list.

Navigation Paths to lists

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
      space
         lists
```

Supported Methods for lists

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `itemsPerPage`
    - `q`

      You can search on `name`, `title`, `description`, `creator`, `created`, `modifier`, and `modified`.

      For string type elements (that is, `name`, `title`, `description`, `creator`, and `modifier`), you can use the following supported operands: `equals`, `not.equals`, and `contains`. For example:

      ```
      q=name:contains:issues
      q=creator:equals:monty
      ```

      For date type elements (that is, `created` and `modified`), you can use the following supported operands: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`. For example:

      ```
      q=created:greater.than:10-SEP-2009
      ```

    - `projection` - Allowed values are `summary` and `details`. The default is `summary`.
  - **response - body:** collection of lists
- POST
  - **request - body:** list
  - **response - body:** list

For more information about query parameters, see Section 54.5.2.5, "Templates."

Resource Types Linked to From lists

Table 57–25 lists the resource types that the client can link to from this resource.

Table 57–25 Related Resource Types for urn:oracle:webcenter:space:lists

rel	resourceType
self	`urn:oracle:webcenter:space:lists`

Table 57–25 (Cont.) Related Resource Types for urn:oracle:webcenter:space:lists

rel	resourceType
	urn:oracle:webcenter:space:list

57.3.4.14 urn:oracle:webcenter:space:list

Use this resource type to identify the URI to use to view (GET), update (PUT), and delete (DELETE) a list belonging to a space. The response from a GET operation includes the specific list identified by the URI. The response from a PUT operation includes the modified version of the list identified by the URI. The response to a DELETE operation is a 204 status code.

Navigation Paths to list

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
         lists
             list
```

Supported Methods for list

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** list
- PUT
  - **request - body:** list
  - **response - body:** list
- DELETE
  - **request - body:** None
  - **response - body:** None

Writable Elements for list

Table 57–26 lists the writable elements for this resource.

Table 57–26 Writable Elements for urn:oracle:webcenter:space:list

Element	Type	Required	Constraints	Description
name	String	Yes	1 or more characters	Name of the space list.
description	String	No	0 or more characters	Description of the list.
columns	urn:oracle:webcenter:space:list:columns	Yes	1 or more characters	Columns that make up the list.

Read-only Elements for list

Table 57–27 lists the read-only elements for this resource.

Table 57–27 Read-only Elements for urn:oracle:webcenter:list

Element	Type	Description
id	String	ID of the list.
name	String	Name of the list.
description	String	Description of the list.
scopeguid	String	Global ID of the parent space.
scopename	String	Name of the parent space.
creator	String	ID of the user that created the list.
author	personReference	User information about the user that created the list, including GUID, ID, display name, and a link to the profile icon (same user as `creator`).
created	Date	Date the list was created.
modifier	String	ID of the user that last modified the list.
modifiedByUser	personReference	User information about the user that last modified the list, including GUID, ID, display name, and a link to the profile icon (same user as `modifier`).
modified	Date	Date the list was last modified.
columns	String	Columns that make up the list.

Resource Types Linked to From list

Table 57–28 lists the resource types that the client can link to from this resource.

Table 57–28 Related Resource Types for urn:oracle:webcenter:space:list

rel	resourceType
self	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:rows`
	`urn:oracle:webcenter:space:list:columns`

57.3.4.15 urn:oracle:webcenter:space:list:rows

Use this resource type to identify the URI to use to view (`GET`) and create (`POST`) list rows (list items). The response from a `GET` operation includes each row in this list, each row includes links to operate on that row. The response from a `POST` operation includes the row that was created in this list and a link to operate on that row.

Navigation Paths to rows

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
        lists
           list
```

```
rows
```

Supported Methods for rows

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `itemsPerPage`
    - `q`

      You can search on `name`, `title`, `description`, `creator`, `created`, `modifier`, and `modified`.

      For string type elements (that is, `name`, `title`, `description`, `creator`, and `modifier`), you can use the following supported operands: `equals`, `not.equals`, `contains`, and `starts.with`. For example:

      ```
      q=name:contains:issues
      q=creator:equals:monty
      ```

      For date type elements (that is, `created` and `modified`), you can use the following supported operands: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`. For example:

      ```
      q=created:greater.than:10-SEP-2009
      ```
  - **response - body:** collection of rows
- POST
  - **request - body:** row
  - **response - body:** row

For more information about query parameters, see Section 54.5.2.5, "Templates."

Resource Types Linked to From rows

Table 57–29 lists the resource types that the client can link to from this resource.

Table 57–29 Related Resource Types for urn:oracle:webcenter:space:list:rows

rel	resourceType
self	`urn:oracle:webcenter:space:list:rows`
parent	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:row`

57.3.4.16 urn:oracle:webcenter:space:list:row

Use this resource type to identify the URI to use to view (`GET`), update (`PUT`), and delete (`DELETE`) a list row (list item). The response to a `GET` operation includes the specific row identified by the URI. The response to a `PUT` operation includes the modified version of the row identified by the URI. The response to a `DELETE` operation is a 204 status code.

Navigation Paths to row

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
         lists
            list
              rows
                 row
```

Supported Methods for row

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** row
- `PUT`
  - **request - body:** row
  - **response - body:** row
- `DELETE`
  - **request - body:** None
  - **response - body:** None

For more information about query parameters, see Section 54.5.2.5, "Templates."

Writable Elements for row

Table 57–30 lists the writable elements for this resource.

Table 57–30 Writable Elements for urn:oracle:webcenter:space:list:row

Element	Type	Required	Constraints	Description
columns.column.id	String	Yes	1 or more characters	ID of the column (containing list item detail).
columns.column.name	String	No	1 or more characters	Name of the column.
columns.column.value	String	Yes	1 or more characters	Value of the column.

Read-only Elements for row

Table 57–31 lists the read-only elements for this resource.

Table 57–31 Read-only Elements for urn:oracle:webcenter:space:list:row

Element	Type	Description
id	String	ID of the row (list item).
listId	String	ID of the list.

Table 57–31 (Cont.) Read-only Elements for urn:oracle:webcenter:space:list:row

Element	Type	Description
scope	String	Global ID of the parent space.
creator	String	ID of the user that created the list item.
author	personReference	User information about the user that created the list item, including GUID, ID, display name, and a link to the profile icon (same user as `creator`).
created	Date	Date the list item was created.
modifier	String	ID of the user that last modified the list item.
modifiedByUser	personReference	User information about the user that last modified the list item, including GUID, ID, display name, and a link to the profile icon (same user as `modifier`).
modified	Date	Date the list item was last modified.

Resource Types Linked to From row

Table 57–32 lists the resource types that the client can link to from this resource.

Table 57–32 Related Resource Types for urn:oracle:webcenter:space:list:row

rel	resourceType
self	`urn:oracle:webcenter:space:list:row`

57.3.4.17 urn:oracle:webcenter:space:list:columns

Use this resource type to identify the URI to use to view (`GET`) and create (`POST`) list columns (list item detail). The response from a `GET` operation includes each column in this list, each column includes link to operate on that column. The response from a `POST` operation includes the column created in this list and a link to operate on that column.

Navigation Paths to columns

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
        lists
           list
              columns
```

Supported Methods for columns

The following methods are supported by this resource:

- `GET`
  - **request - body:** None
  - **query parameters:**
    - `startIndex`
    - `itemsPerPage`

        * `q` - Search parameters `STARTS.WITH` and `END.WITH` are not supported.
    - **response - body:** collection of columns
- `POST`
    - **request - body:** column
    - **response - body:** column

For more information about query parameters, see Section 54.5.2.5, "Templates."

Resource Types Linked to From columns

Table 57–33 lists the resource types that the client can link to from this resource.

Table 57–33 Related Resource Types for urn:oracle:webcenter:space:list:columns

rel	resourceType
self	`urn:oracle:webcenter:space:list:columns`
parent	`urn:oracle:webcenter:space:list`
	`urn:oracle:webcenter:space:list:column`

57.3.4.18 urn:oracle:webcenter:space:list:column

Use this resource type to identify the URI to use to view (`GET`), update (`PUT`), and delete (`DELETE`) a list column (list item detail). The response from a `GET` operation includes the specific column identified by the URI. The response from a `PUT` operation includes the modified version of the column identified by the URI. The response from a `DELETE` operation is a 204 status code.

Navigation Paths to column

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
   spaces
      resourceindex
         lists
            list
               columns
                 column
```

Supported Methods for column

The following methods are supported by this resource:

- `GET`
    - **request - body:** None
    - **query parameters:** None
    - **response - body:** column
- `PUT`
    - **request - body:** column
    - **response - body:** column
- `DELETE`

57.4 Exposing Enterprise Applications in Spaces

You can expose various enterprise applications inside the Spaces application, including:

- WebCenter Portal applications—applications developed using the WebCenter Portal: Framework.
- Other portals in the WebCenter Suite—for example, Oracle Portal.
- Oracle Applications Unlimited products—for example, E-Business Suite, Siebel, PeopleSoft, and JDEdwards.
- Other custom applications—applications developed using non-Oracle platforms.

Technologies such as WSRP, Oracle JSF Portlet Bridge, ADF task flows, and WebCenter Portal support for external applications, enable the Spaces application to consume and present application data in a unified way. The following sections tell you how.

This section includes the following subsections:

- Exposing WebCenter Portal Applications in Spaces
- Exposing Oracle Applications in Spaces

- Exposing Non-Oracle Applications in Spaces

57.4.1 Exposing WebCenter Portal Applications in Spaces

You can expose WebCenter Portal: Framework applications, built using the WebCenter Portal: Framework, as portlets and task flows in the Spaces application:

- **Portlets:** Web components that are deployed inside a container and generate dynamic content. For more information, see Chapter 58, "Overview of Portlets."
- **Oracle JSF Portlet Bridge:** A technology that enables you to easily expose existing ADF applications and task flows as JSR 168 portlets. For more information, see Chapter 59, "Creating Portlets with the Oracle JSF Portlet Bridge."
- **Task flows:** ADF navigational components that define the transition between states and activities using call methods on managed beans, evaluating an EL expression, and so on. For more information see, "Getting Started with ADF Task Flows" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

57.4.2 Exposing Oracle Applications in Spaces

You can expose Oracle Applications Unlimited products, for example, E-Business Suite, Siebel, PeopleSoft, and JDEdwards, in the Spaces application, using:

- **Web services and ADF:** Enterprise applications like Siebel expose various web service interfaces. You can leverage these web service interfaces to build data controls, ADF task flows, and portlets that can be consumed in Spaces.
- **Prebuilt portlets:** Enterprise applications such as Oracle E-Business Suite ship portlets out of the box that you can register with Spaces and consume in the same way as any other portlet.

57.4.3 Exposing Non-Oracle Applications in Spaces

You can expose Web applications developed using non-Oracle platforms in the Spaces application, as follows:

- **Support for external applications:** External applications enable credential stores to pass mapped user identities to web applications that require their own authentication. For more information, see "Registering External Applications" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* and "Working with External Applications" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Composer iframe-level integration:** The Composer *Web Page* page style and component displays any Web page content, including pages from applications built using a different Web technology. For more information, see "Adding a View into Another Web Page to a Page" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Raw HTML markup injection in Composer:** The Composer *HTML Markup* layout component injects HTML or JavaScript snippets into pages in Spaces. You can use this component to display content from an external source. For more information see "Adding Markup, Such as HTML, JavaScript, and EL, to a Page" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **OmniPortlet:** A portlet that publishes data from various data sources using a variety of layouts. For more information, see Chapter 65, "Creating Portlets with OmniPortlet."

Part X

Working with Portlets and Portals

Part X contains the following chapters:

- Section 58, "Overview of Portlets"
- Section 59, "Creating Portlets with the Oracle JSF Portlet Bridge"
- Section 60, "Creating Portlets with the Portlet Wizard"
- Section 61, "Coding Portlets"
- Section 62, "Testing and Deploying Your Portlets"
- Chapter 63, "Creating Pagelets with Oracle WebCenter Portal's Pagelet Producer"
- Section 64, "Consuming Portlets"
- Section 65, "Creating Portlets with OmniPortlet"
- Section 66, "Creating Content-Based Portlets with Web Clipping"

58

Overview of Portlets

This chapter provides an overview of portlets, and describes, with the help of examples, the use of portlets. It explains portlet anatomy and the resources to create portlets. This chapter also explains the features, technologies, and tools to help you decide which portlet building technology best suits your needs.

This chapter includes the following sections:

- Section 58.1, "Introduction to Portlets"
- Section 58.2, "Portlet Technologies Matrix"

58.1 Introduction to Portlets

A portlet is a reusable web component that can draw content from many different sources. Figure 58–1 illustrates the Products portlet, a portlet that shows the products available on a shopping web site.

Figure 58–1 The Products Portlet

Portlets provide a means of presenting data from multiple sources in a meaningful and related way. Portlets can display excerpts of other web sites, generate summaries of key information, perform searches, and access assembled collections of information from a variety of data sources. Because different portlets can be placed on a common page, the user receives a single-source experience. In reality, the content may be derived from multiple sources.

A portlet may or may not be rendered in an inline frame (IFRAME). Inline frames enable the placement of a document within a rectangular region that includes scroll bars and borders.

Note: For more information about portlets and inline frames, see Section 64.4.12, "What You May Need to Know About IFRAMEs."

Within this IFRAME, portlets can display many types of content, including HTML, formatted text, images, or elements of an HTML form.

This section includes the following subsections:

- Section 58.1.1, "Portlet Anatomy"
- Section 58.1.2, "Portlet Resources"
- Section 58.1.3, "Portlet Modes"

58.1.1 Portlet Anatomy

Portlet anatomy is the visual representation of the portlet on a page. Figure 58–2 illustrates a typical portlet anatomy on a page in a Framework application. Note that the same portlet displayed in a different application could look different.

Figure 58–2 The Sample Lottery Portlet

What is rendered on the page is controlled not only by the portlet's own logic, but by the attributes of the portlet tag that binds the portlet to the page. Values for these attributes are specified at the design time of the application that consumes the portlet, rather than through the portlet's own logic.

Note: For information about attributes of the `adfp:portlet` tag, see Section 64.4, "Setting Attribute Values for the Portlet Tag."

For example, at application design time you can specify through portlet tag attributes that the runtime portlet should display a header and that its border should be of a specified thickness and color. In the header, you can include a portlet title and an Actions menu icon. The Actions menu icon is displayed on a portlet only when the

portlet header is displayed. If you choose not to display a header, then the Actions menu is displayed on a FadeIn-FadeOut toolbar that renders on a mouse rollover.

These elements are sometimes referred to as *portlet chrome*. The appearance of portlet chrome can be controlled through a style sheet and through style-related attributes of the `adfp:portlet` tag. The values of style-related attributes take precedence over styles specified through a style sheet, or *skin*.

> **Note:** For information about skins and style-related attributes, see Section 22.10, "Applying Styles to Components."

Through portlet tag attributes, you can include or omit display commands on the Actions menu. Actions menu items controlled through portlet tag attributes include *Maximize* and *Restore*. Maximize causes the maximized portlet to displace all other displayed portlets. These are displayed again when a user selects Restore.

> **Note:** The Maximize attribute is meaningful for a portlet only when the portlet is placed inside a `PanelCustomizable` core customizable component.

Other Actions menu items controlled through portlet tag attributes include the display or omission of the mode settings that were specified when the portlet was developed. If the portlet was built without including additional modes, then these commands do not appear on the Actions menu even when you indicate that they should through portlet tag attributes. In other words, portlet tag attributes are sometimes on/off switches that enable or disable the portlet's own built-in functionality.

Mode settings that appear on the Actions menu include such modes as *About*, and *Help*.

Users click the Personalize icon to alter their personal view of the portlet. The Personalize icon is displayed in the portlet header only to authenticated users (that is, users who are logged in). It does not display to Public or unauthenticated users. You must implement some form of application security for users to be able to personalize their portlet views.

> **Note:** If you are a developer creating portlets, and you want to test the Personalize mode without creating a complete security model for your application, see Section 69.12, "Configuring Basic Authentication for Testing Portlet Personalization."

Customization enables application administrators to edit a portlet's default settings at runtime. All users see the results of a customization.

Note: A typical customization setting is Portlet Title. At runtime, the portlet administrator can determine what title should appear in the portlet header. The Portlet Title can also be set at design time through portlet properties, using the `text` attribute of the `adfp:portlet` tag. Consider however that supplying a value to the `text` attribute at design time prevents customization of the Portlet Title at runtime.

For additional information about portlet tag attributes, see Section 64.4, "Setting Attribute Values for the Portlet Tag."

58.1.2 Portlet Resources

Portlet resources include the many prebuilt portlets available out of the box from many sources, including Oracle Portal, Oracle E-Business Suite, and third-party sources. Portlet resources also include programmatic portlets built through WebCenter Portal: Framework's JSR 286 (standards-based) and Oracle PDK-Java wizards, and through other portlet-building tools. Each of these tools offers different product features that are targeted toward different developer roles.

For specific information about each tool and its benefits, see Section 58.2, "Portlet Technologies Matrix."

This section includes the following subsections:

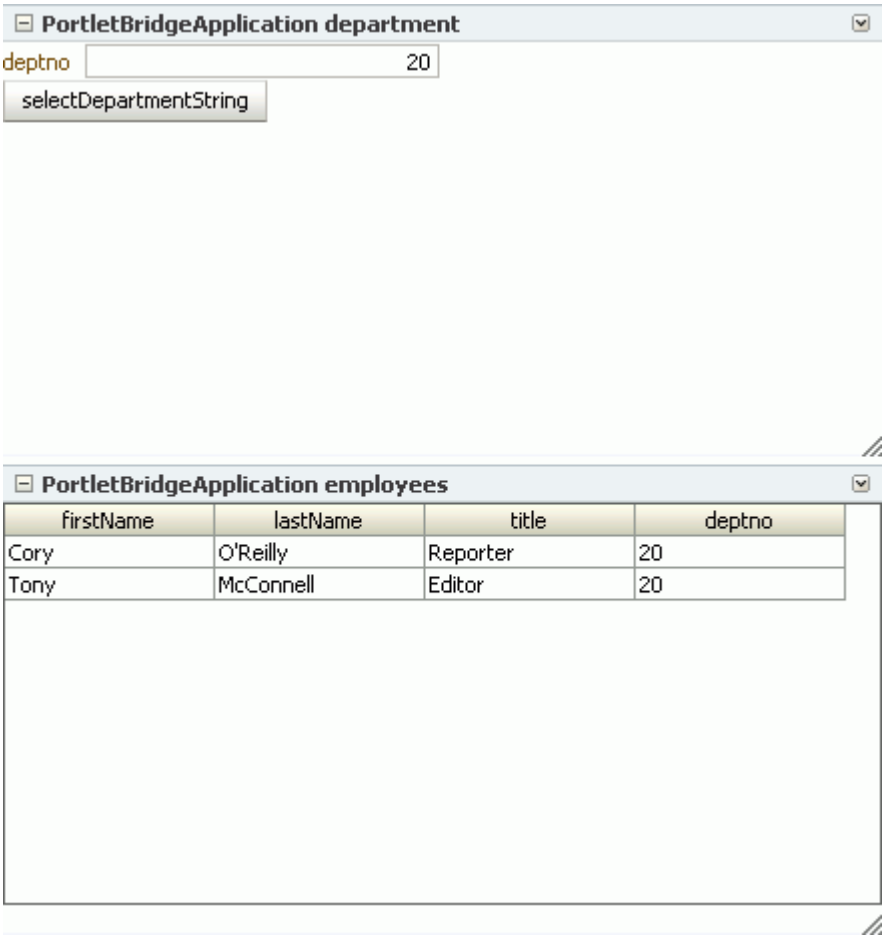
- Section 58.1.2.1, "JSF Portlets"
- Section 58.1.2.2, "Prebuilt Portlets"
- Section 58.1.2.3, "Parameter Form and Parameter Display Portlets"
- Section 58.1.2.4, "Web Clipping"
- Section 58.1.2.5, "OmniPortlet"
- Section 58.1.2.6, "Programmatic Portlets"
- Section 58.1.2.7, "Deciding Which Tool to Use"

58.1.2.1 JSF Portlets

What Are They?

JSF portlets are created using the Oracle JSF Portlet Bridge. The Oracle JSF Portlet Bridge enables application developers to expose their existing JSF applications and task flows as JSR 286 portlets. The Oracle JSF Portlet Bridge simplifies the integration of JSF applications with WSRP portlet consumers, such as Oracle Portal. You can create JSF portlets using the JSR 286 Java Portlet Wizard by invoking it from the New Gallery.

JSF portlets do not require separate source code from that of the JSF application. Since these portlets are created using the Oracle JSF Portlet Bridge, you need only maintain one source for both your application and your portlets. Similarly, when you deploy your JSF application, JSF portlets are also deployed with it. Therefore, using the bridge eliminates the requirement to store, maintain, and deploy your portlets separately from your application.



Who Is the Intended User?

Application developers with the knowledge of Faces and WSRP.

When Should They Be Used?

JSF portlets are best suited when application developers intend to display contents from a JSF application as a portlet without hosting the entire application, or without separately building a portlet for the same. When portletized, the consumption of the portlet is same as registering any WSRP producer using their provider URLs. ADF components that is task flows, can be exposed using the Oracle JSF Portlet Bridge as well.Figure 58–3 shows two portlets, one where users can enter a department number, and one that displays the employee information for the specified department. These portlets were created from ADF task flows using the Oracle JSF Portlet Bridge.

Figure 58–3 JSF Portlets

58.1.2.2 Prebuilt Portlets

What Are They?

Prebuilt portlets are available through Oracle's partnerships with leading system integrators, software vendors, and content providers. You can access these portlets by using the keywords `portal` or `portlet` when searching the Oracle PartnerNetwork Solutions Catalog, available at `http://solutions.oracle.com`. Examples of these include portlets for the following purposes:

- Generating point-to-point driving directions
- Accessing Information Technology (IT) information from a wide variety of sources
- Viewing summary information about news, stocks, and weather

Who Is the Intended User?

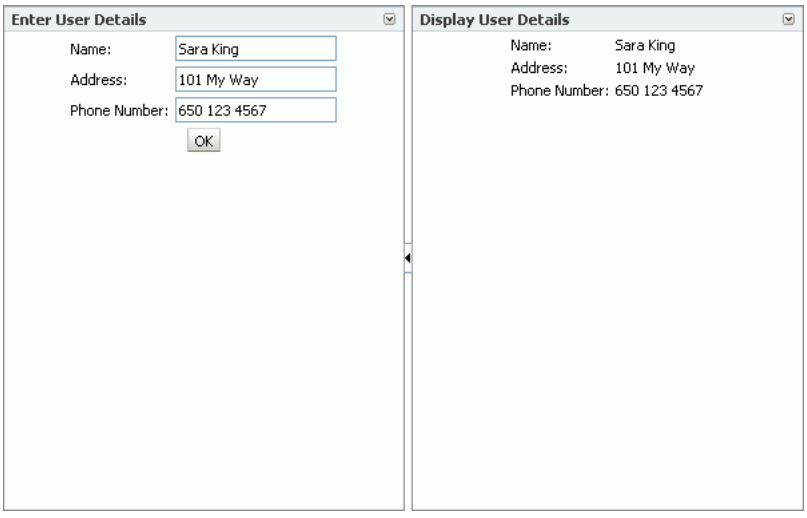
Fully developed, downloadable portlets are best suited for use by application developers who understand how to download, install, and register producers in WebCenter Portal: Framework. They are available for use by all levels of experience.

When Should They Be Used?

Use prebuilt portlets when your needs are satisfied by the functions the portlets offer and the level of personalization readily available is sufficient to complete the desired task.

Consider alternatives when you want to extend or personalize the portlet, for example, when you need a different user interface or when the functionality you require is not available out of the box.

58.1.2.3 Parameter Form and Parameter Display Portlets



What Are They?

The Parameter Form and Parameter Display portlets provide a quick and easy way to pass values between components. They are provided by the WSRP Tools producer.

The Parameter Form portlet has three output parameters that are set when values are submitted in the form inside the portlet. The parameters can then be used to drive the content of other portlets. You can customize the Parameter Form portlet to determine how many of the three fields are displayed on the form, depending on how many parameters you require.

The Parameter Display portlet enables you to quickly test the wiring from the Parameter Form portlet. However, typically you use the values passed from the Parameter Form portlet to drive the content of some other portlet, for example to pass a zip code to a weather portlet, or a stock symbol to a stock ticker portlet.

Figure 58–4 Parameter Form and Display Portlets

Who Is the Intended User?

The Parameter Form and Parameter Display portlets are best suited for use by application developers who want to provide contextual linking between portlets on a page. These portlets can be added to a page by any user with the appropriate privileges.

When Should They Be Used?

Use the Parameter Form and Parameter Display portlets when your needs are satisfied by the functions the portlets offer and the level of personalization readily available is sufficient to complete the desired task.

Consider alternatives when you want to extend or personalize the portlet, for example, when you need a different user interface or when the functionality you require is not available out of the box.

58.1.2.4 Web Clipping

What Is It?

Web Clipping is a browser-based declarative tool that enables the integration of any web application with a Framework application. Web Clipping is designed to provide quick integration by leveraging the web application's existing user interface. Web Clipping has been implemented as a PDK-Java producer.

To create a Web Clipping portlet, the Framework application developer uses a web browser to navigate to a web page that contains desired content. Through the Web Clipping Studio, the application developer can drill down through a visual rendering of the target page to choose the desired content.

Web Clipping supports the following:

- **Navigation through various styles of login mechanisms,** including form- and JavaScript-based submission and HTTP Basic and Digest Authentication with cookie-based session management.
- **Fuzzy matching of clippings,** If a Web clipping gets reordered within the source page or if its character font, size, or style changes, then it is still identified correctly by the Web Clipping engine and delivered as the portlet content.
- **Reuse of a wide range of web content,** including basic support of pages written with HTML 4.0.1, JavaScript, applets, and plug-in enabled content, retrieved through HTTP GET and POST (form submission).
- **Personalization,** allowing an application developer to expose input parameters that users can modify when they personalize the portlet. These parameters can be exposed as public parameters that an application developer can map as page parameters. This feature enables users to obtain personalized clippings.
- **Integrated authenticated web content through Single Sign-On,** including integration with external applications, which enables you to leverage Oracle Single Sign-On and to clip content from authenticated external web sites.
- **Inline rendering,** enabling you to set up Web Clipping portlets to display links within the context of the portlet. As a result, when a user clicks a link in the Web Clipping portlet, the results display within the same portlet. You can use this feature with internal and external web sites.
- **Proxy Authentication,** including support for global proxy authentication and authentication for each user. You can specify the realm of the proxy server and whether all users automatically log in using a user name and password you provide, each user logs in using an individual user name and password, or all users log in using a specified user name and password.
- **Resource Tunneling** of images.
- **Open Transport API** for customizing authentication mechanisms to clipped sites.

Who Is the Intended User?

Web Clipping is best suited for use by application developers and component developers who want to leverage an existing web page for rapid portlet development. This portlet can be added to a page by any user with the appropriate privileges.

When Should It Be Used?

Use Web Clipping when you want to repurpose live content and functionality from an existing web page and expose it in your Framework application as a portlet. Consider alternatives to change the way information is presented in the clipped portlet. That is, you do not want to control the User Interface (UI) or application flow, and you are accessing web-based applications. For a greater level of control, use OmniPortlet's Web Page data source instead of Web Clipping. (For more information, see Section 58.1.2.5, "OmniPortlet.")

The following are some examples of when you can consider using the Web Clipping portlet:

- **Stock chart portlet.** You want to create a portlet that displays the stock market's daily performance chart from your financial advisor's web site. You could clip this information from an external web site, even if your company is using a proxy.
- **Web mail portlet.** Your users want to access their confidential web mail accounts through a portlet and to display their in-boxes in the portlet.

For more information about using Web Clipping, see Chapter 66, "Creating Content-Based Portlets with Web Clipping."

58.1.2.5 OmniPortlet

What Is It?

OmniPortlet is a declarative portlet-building tool that enables you to build portlets against a variety of data sources, including XML files, character-separated value files (CSV, for example, spreadsheets), web services, databases, and web pages. OmniPortlet users can also choose a prebuilt layout for the data. Prebuilt layouts include tabular, news, bullet, form, chart, or HTML. HTML layout enables OmniPortlet users to write their own HTML and inject the data into the HTML. Figure 58–5 shows a portlet created with OmniPortlet.

Figure 58–5 Product Information Portlet

Like Web Clipping, OmniPortlet supports proxy authentication, including support for global proxy authentication and authentication for each user. You can specify whether all users automatically log in using a user name and password you provide, each user logs in using an individual user name and password, or all users log in using a specified user name and password.

Who Is the Intended User?

Business users with a minimum knowledge of the URLs to their targeted data and limited programming skills may find OmniPortlet a valuable tool.

When Should It Be Used?

Use OmniPortlet when you want to build portlets rapidly against a variety of data sources with a variety of layouts. Consider alternatives when you want complete control of the design and functionality of the portlet.

The following are some examples of when you can consider using OmniPortlet:

- **RSS news feed portlet:** You want to create a portlet that displays live, scrolling news information to your users. The data comes from a Really Simple Syndication (RSS) news feed, such as Oracle Technology Network Headlines. You also want the portlet to contain hyperlinks to the news source.
- **Sales chart portlet:** You want to present up-to-date information about your company's sales results. You also want to display data in the form of a pie chart, and your company stores its sales information in a remote relational database.

For more information about OmniPortlet, see Chapter 65, "Creating Portlets with OmniPortlet."

58.1.2.6 Programmatic Portlets

What Are They?

Programmatic portlets are portlets that you write yourself, in Java, using either the standard Java Portlet Specification (JPS) or PDK-Java. WebCenter Portal: Framework provides two declarative wizards for simplifying the creation of standards-based JSR 286 portlets and Oracle PDK-Java portlets. These wizards assist in the construction of the framework within which you create the portlet. Each wizard may include easy steps for the following:

- Configuring general portlet properties
- Specifying names and search terms
- Setting allowable content types and mapping display modes
- Specifying user-customizable preferences
- Adding security roles
- Enabling default caching
- Adding initialization parameters
- Adding public render parameters
- Adding portlet events

Who Is the Intended User?

Use of the wizards is easy, but the creation of portlet logic is best performed by experienced and knowledgeable Java developers who are comfortable with the Java Portlet Specification or PDK-Java and who understand the configuration of producers.

When Should They Be Used?

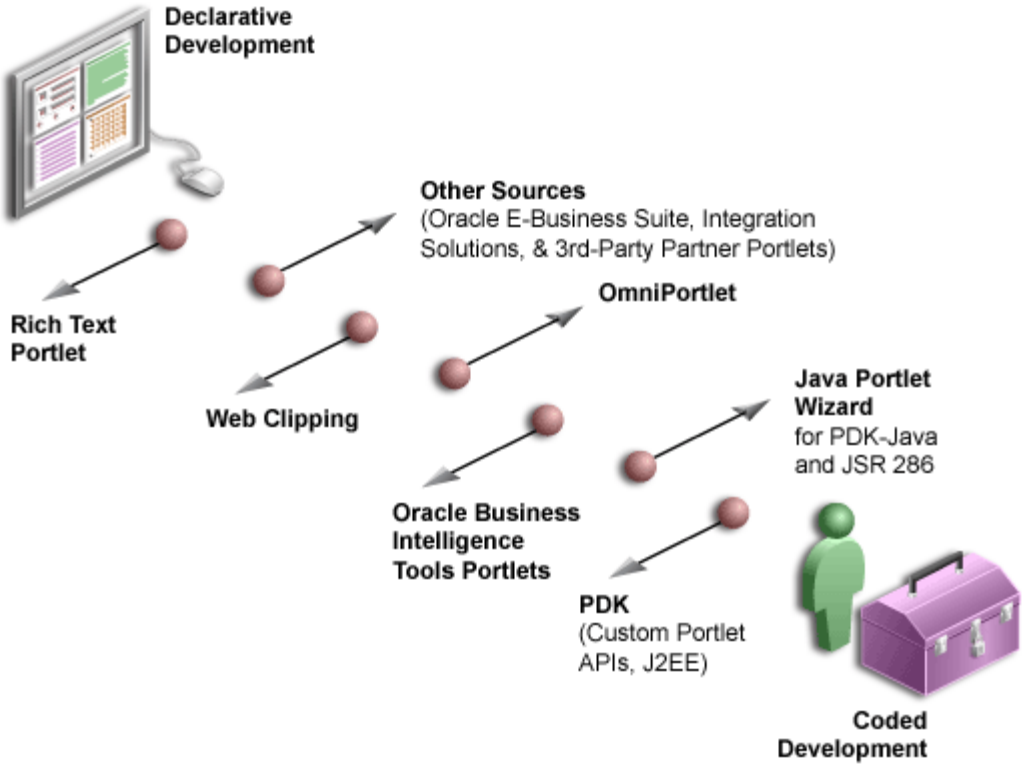
Use programmatic portlets when you have very specialized business rules or logic or when you require personalized authentication, granular processing of dynamic results,

and complete user interface control. Additionally, use programmatic portlets when you want to satisfy any of the following conditions:

Consider using the programmatic approach when the out-of-the-box portlets do not address your needs.

The following list provides a couple of examples of when you can consider using programmatic portlets:

- **Photo Album portlet:** You want to create a a portlet that facilitates uploading, storing, and viewing user photos.
- **Shopping Cart portlet:** You want to create a portlet that facilitates the viewing and purchasing of, for example, company-branded items, such as mouse pads, pens, flash drives, tee shirts, and the like.



For more information about using programmatic portlets, see Chapter 60, "Creating Portlets with the Portlet Wizard" and Chapter 61, "Coding Portlets."

58.1.2.7 Deciding Which Tool to Use

Figure 58–6 illustrates the spectrum of portlet resources described in the previous section. Notice how one end of the spectrum is geared toward a more declarative development environment (that is, develop-through-wizard) while the other end focuses more on hand-coding. You can choose your tool depending on which type of environment is most comfortable and suitable to your skill-base.

For more information about deciding which tool to use, see Section 58.2, "Portlet Technologies Matrix."

Figure 58–6 Portlet Resources from Declarative to Coded Development

58.1.3 Portlet Modes

Portlet modes exhibit the runtime functionality seen by users. The standard modes supported by WebCenter Portal are described in the following subsections:

- Section 58.1.3.1, "View Mode"
- Section 58.1.3.2, "Edit Mode"
- Section 58.1.3.3, "Edit Defaults Mode"
- Section 58.1.3.4, "Help Mode"
- Section 58.1.3.5, "About Mode"

WebCenter Portal defines an extended set of modes that it supports. Different modes are available for both JSR 286 and PDK-Java portlets. For example, the Create JSR 286 Java Portlet wizard includes Print mode, which you can use to provide a printer friendly version of the portlet.

If you are coding portlets to JSR 286, then you can also declare your own custom portlet modes in the `portlet.xml` file. You can use these to map to the extra modes offered by PDK-Java (for example, Full Screen mode), or to accommodate any other functionality you may want to provide.

Defining custom modes is especially useful if the portlet must interoperate with portal implementations from other vendors. You can offer any of these modes to users. In fact, it is recommended that some modes like Edit Defaults are offered.

Note: Third party portal products may have their own set of extended modes (JSR 286 custom modes) that producers can offer. In Framework applications, the chrome UI for portlets only shows the custom modes that are defined in WebCenter Portal: Framework. Arbitrary custom modes that a third party or custom portlet producer offers are ignored and therefore are not supported.

58.1.3.1 View Mode

A portlet uses View mode (known as Shared Screen mode in PDK-Java) to appear on a page with other portlets. This is the mode most people think about when they envision a portlet. A JSR 286 portlet must have a View mode, the rest are optional.

For guidelines about how to implement View mode, see Section 61.1.1.1, "Guidelines for View Mode."

58.1.3.2 Edit Mode

A portlet uses Edit mode to enable users to personalize the behavior of the portlet. Personalization are visible only to the user that performed them; not to other users. Edit mode provides a list of settings that the user can change. These settings may include the title, type of content, formatting, amount of information, defaults for form elements, and anything that affects the appearance or content of the portlet.

Users typically access a portlet's Edit mode by choosing Personalize from the portlet's dropdown list of options. When users choose Personalize, a new page appears in the same browser window. The portlet typically creates a web page representing a dialog to choose the portlet's settings. After applying the settings, users automatically return to the original page.

For guidelines about how to implement Edit mode, see Section 61.1.1.2, "Guidelines for Edit Mode."

58.1.3.3 Edit Defaults Mode

A portlet uses Edit Defaults mode to enable administrators to customize the default behavior of a particular portlet instance. Edit Defaults mode provides a list of settings that the application developer can change. These settings may include the title, type of content, formatting, amount of information, defaults for form elements, and anything that affects the appearance or content of the portlet.

These default personalization settings can change the appearance and content of that individual portlet for all users. Because Edit Defaults mode defines the system-level defaults for what a portlet displays and how it displays it, this mode should not be used as an administrative tool or for managing other portlets.

Administrators access Edit Defaults mode, when editing a page, by choosing Customize from the portlet's dropdown list.

When users click the Customize icon, the portlet displays in the same browser window. The portlet typically creates a web page representing a dialog to personalize the portlet instance settings. After applying the settings, users are automatically returned to the original page.

For guidelines about how to implement Edit Defaults mode, see Section 61.1.1.3, "Guidelines for Edit Defaults Mode."

58.1.3.4 Help Mode

A portlet uses Help mode to display information about the functionality of the portlet and how to use it. The user should be able to find useful information about the portlet, its contents, and its capabilities with this mode.

Users access a portlet's Help mode by choosing the Help action in the portlet.

For guidelines about how to implement Help mode, see Section 61.1.1.4, "Guidelines for Help Mode."

58.1.3.5 About Mode

Users must be able to see what version of the portlet is currently running, its publication and copyright information, and how to contact the author. Portlets that require registration may link to web-based applications or contact information from this mode as well.

User's access a portlet's About mode by choosing About from the dropdown list in the portlet's chrome. A new page appears in the same browser window. The portlet can either generate the content for this new page or take the user to an existing page or application.

For guidelines about how to implement About mode, see Section 61.1.1.5, "Guidelines for About Mode."

58.2 Portlet Technologies Matrix

Table 58–1 summarizes the technologies and tools you can use with Oracle WebCenter Portal: Framework. The matrix describes the tools and technologies that are covered in more detail in this guide: Oracle JSF Portlet Bridge, OmniPortlet, Web Clipping portlet, and programmatic portlets, including standards-based (JSR 286) portlets and PDK-Java portlets.

Note: While these are the primary tools for building portlets, additional tools and technologies exist, such as other Oracle products, including Oracle Reports and Oracle BI Discoverer. These other tools are not covered in this guide.

Use Table 58–1 to quickly scan all the features and characteristics of the different portlet building technologies, then see the subsequent sections for more in-depth information.

Table 58–1 Portlet Building Technologies Comparison Matrix

JSF Portlets	Web Clipping	OmniPortlet	Programmatic Portlets Standards-Based/PDK-Java
General Suitability			
Oracle JSF Portlet Bridge exposes JSF and ADF artifacts as JSR 286 portlets.	A simple wizard-based tool, accessible from a browser, that assists in retrieving and presenting web content that originates from other web sites in a Framework application.	Wizard-based tool, accessible from a browser, that assists in retrieving and presenting data from a wide variety of data sources.	PDK-Java offers Oracle-specific application programming interfaces (APIs) for building portlets for use in Framework applications and Oracle Portal. Standards-based portlets additionally work with portals of other vendors. WebCenter Portal: Framework supports both WSRP and JSR 286 standards.
Expertise Required			
No expertise required.	No expertise required.	Basic understanding of one or more supported data sources and the concepts of portlet and page parameters.	Java, Servlet, JSP knowledge.
Supported Data Sources (for details, see Section 58.2.2, "Expertise Required")			
No limitations.	Any web site accessible on the network over HTTP or HTTPS.	CSV, XML, web service, SQL, web site, JCA.	No limitations.
Deployment Type			
WSRP producers using Oracle JDeveloper or manually.	PDK-Java producers	PDK-Java producers	PDK-Java uses PDK-Java producers. Standards-based portlets use WSRP producers.
Caching Style			
Expiry-based caching, validation-based caching (auto invalidate when personalized).	Expiry-based caching, validation-based caching (auto invalidate when personalized).	Expiry-based caching, validation-based caching (auto invalidate when personalized).	Expiry-based, validation, and invalidation caching, Edge Side Includes. **Note:** JSR 286 does not support validation based caching. WSRP 1.0 does. If you use a pure WSRP portlet, then validation-based caching is also supported. If you host a JSR portlet on WSRP (as is done in WebCenter Portal: Framework) then validation-based caching is not supported.
Development Tool			

Table 58–1 (Cont.) Portlet Building Technologies Comparison Matrix

JSF Portlets	Web Clipping	OmniPortlet	Programmatic Portlets Standards-Based/PDK-Java
Oracle JDeveloper Oracle JSF Portlet Bridge/JSF Portletization dialog.	Browser - wizard.	Browser - wizard.	Oracle JDeveloper Java Portlet wizard (or any other Java development environment).
Portlet Creation Style			
Develop a JSF application first, convert it into a JSF portlet later.	design time at runtime.	design time at runtime.	Develop first, add later.
User Interface Flexibility			
Very Flexible.	N/A	Very flexible, by using the HTML layout.	Very flexible.
Ability to Capture Content from Web Sites			
No. Depends upon the application being portletized.	Yes, by its nature.	Yes, by using the Web Page Data Source.	Yes. For PDK-Java, use the `oracle.portal.provider.v2.*` package. For standards-based portlets, use the `java.net` package.
Ability to Render Content Inline			
Yes.	Yes	No. However, inline rendering can be achieved through public portlet parameters.	Yes. For PDK-Java, use private portlet parameters. Standards-based portlets include servlets and JSPs, using the method `PortletContext.getRequestDispatcher()`.
Charting Capability			
No.	No	Yes, 2D-3D charts.	Yes, using BI Beans.
Public Portlet Parameter Support			
Yes	Yes	Yes	Yes
Private Portlet Parameter Support			
Yes	No	No	Yes
Ability to Hide and Show Portlets Based on User Privileges			
Yes.	No, though it is possible to apply security managers that are not exposed through the user interface (UI).	No, though it is possible to apply security managers that are not exposed through the UI.	Yes. For PDK-Java, by using the Security managers. For standards-based portlets, the Servlet security model is supported by using methods such as `PortletRequest.isUserInRole()` and `PortletRequest.getUserPrincipal()`.
Multilingual Support			
Yes.	N/A	Yes	Yes
Pagination Support			

Table 58–1 (Cont.) Portlet Building Technologies Comparison Matrix

JSF Portlets	Web Clipping	OmniPortlet	Programmatic Portlets Standards-Based/PDK-Java
Yes.	N/A	No	Yes, programmatically
Authenticating to External Applications			
Through custom user attributes.	External application integration supported.	Basic authentication support if the data source requires it.	For PDK-Java portlets, external application integration is supported. LDAP integration is supported when the portlet is running behind the same firewall as the LDAP server. For standards-based portlets, though not specifically supported, external application support is feasible through custom user attributes.) LDAP integration is supported.

The rest of this chapter includes the following sections that provide more in-depth detail about the different portlet building technologies:

- Section 58.2.1, "General Suitability"
- Section 58.2.2, "Expertise Required"
- Section 58.2.3, "Deployment Type"
- Section 58.2.4, "Caching Style"
- Section 58.2.5, "Development Tool"
- Section 58.2.6, "Portlet Creation Style"
- Section 58.2.7, "User Interface Flexibility"
- Section 58.2.8, "Ability to Capture Content from Web Sites"
- Section 58.2.9, "Ability to Render Content Inline"
- Section 58.2.10, "Charting Capability"
- Section 58.2.11, "Public Portlet Parameter Support"
- Section 58.2.12, "Private Portlet Parameter Support"
- Section 58.2.13, "Ability to Hide and Show Portlets Based on User Privileges"
- Section 58.2.14, "Multilingual Support"
- Section 58.2.15, "Pagination Support"
- Section 58.2.16, "Authenticating to External Applications"

58.2.1 General Suitability

This section describes each portlet-building technology in terms of its usage characteristics (for example, wizard-based or programmatic).

JSF Portlets

The Oracle JSF Portlet Bridge is a dialog-based tool that enables page developers to expose their existing JSF applications and task flows as JSR 286 portlets. Using the

Oracle JSF Portlet Bridge to create JSF portlets from JSF applications does not require a technical background.

Web Clipping

Web Clipping is a simple wizard-based tool that assists with retrieving and presenting web content that originates from other web sites in a Framework application. Web Clipping does not require a technical background.

Examples of portlets you can build using Web Clipping

The examples of portlets that you can build by using Web Clipping are as follows:

- Stock chart portlet
- Web mail portlet
- News portlet containing dynamic content from an existing web site

OmniPortlet

OmniPortlet is an easy-to-use, wizard-based tool for presenting information from a wide variety of data sources in a variety of formats. OmniPortlet runs completely in the browser. Drop OmniPortlet on a page, click the Define link, and choose a data source and a presentation format. Select from a wide variety of data sources as follows:

- Spreadsheet
- SQL
- XML
- Web Service
- Web page

OmniPortlet does not require the use of an additional development tool or a strong technical background. Even so, it can be used for building reusable, high-performing portlets.

Examples of portlets you can build using OmniPortlet

The examples of portlets that you can build by using OmniPortlet are as follows:

- RSS news feed portlet
- Sales chart portlet

Programmatic Portlets

If the wizard-based portlet building tools do not satisfy your needs, then you can build your portlets programmatically using Java. The Java Community Process standardized the Java portlet APIs in 2003. Portlets built against the Java Specification Request (JSR) 286 standard are interoperable across different portal platforms. The Java Portlet Wizard, a tool available through WebCenter Portal: Framework, assists with building Java portlets.

> **Note:** When building portlets in Java, you have full control over your portlet's functionality. For example, you can control what it looks like and how it behaves.

Examples of portlets you can build using Java

The examples of portlets that you can build by using Java are as follows:

- Discussion forum portlet
- E-mail portlet

58.2.2 Expertise Required

While some portlet building tools do not require portlet development skills, others assume a strong technical background. This section describes each tool in terms of the level of knowledge required to use it effectively.

JSF Portlets

The Oracle JSF Portlet Bridge does not require a technical background. However, you must have an understanding of Faces and WSRP.

Web Clipping

Web Clipping does not require a technical background. However, to parameterize the web page content that you clipped, you must have an understanding of public portlet parameters and page parameters.

OmniPortlet

OmniPortlet requires a basic knowledge of the data source you want to leverage in your portlet. Table 58–2 lists the types of data sources that can be used with OmniPortlet and describes the type of information required to work with each type.

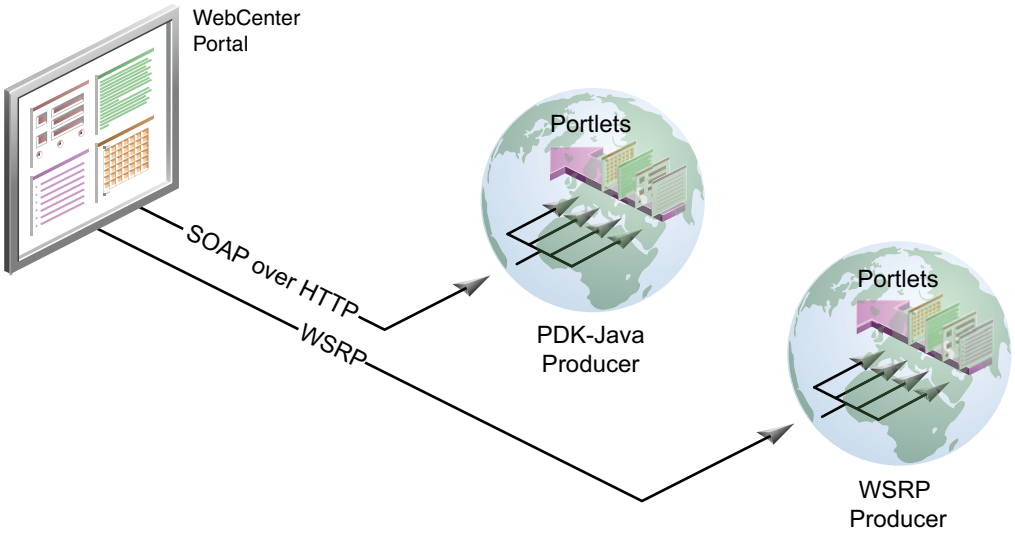
Table 58–2 OmniPortlet Data Sources

Data Source	Required Information
Spreadsheet	The URL that points to the spreadsheet containing the data to display in the portlet.
SQL	The connection information to the data source and the SQL query that retrieves the data from the database.
XML	The location of the XML source and optionally the address of the XSL filter and the XML schema.
Web service	The Web Services Description Language (WSDL) URL, the method of the web service, and optionally the XSL filter URL and the XML schema URL.
Web page	The Web Page data source uses the same environment as Web Clipping. No technical background is required.
J2EE Connector Architecture	Although not displayed on the OmniPortlet Wizard's Type page, a J2EE Connector Architecture (JCA) 1.0 adapter is also available. JCA provides a mechanism to store and retrieve enterprise data such as that held in ERP systems (Oracle Financials, SAP, PeopleSoft, and so on).

Programmatic Portlets

To build Java portlets, you must know at least a subset of Java EE. Knowing HTML, Java servlets, and XML is a must, and JSP experience is recommended. Additional Java knowledge is optional, depending on the task you want to perform. Using Java portlets you can access any data source supported by the Java language.

58.2.3 Deployment Type



Before a portlet can be consumed by an application, you must first deploy it, then register the producer you've deployed the portlet to. As shown in Figure 58–7, portlets can be deployed through the following two producer types:

- PDK-Java producers
- WSRP producers

Within WSRP, both version 1.0 and 2.0 are supported.

PDK-Java portlets are deployed to a Java EE application server, which is often remote and communicates with the consumer through Simple Object Access Protocol (SOAP) over HTTP. JSR 286 portlets are deployed to a WSRP producer, which is also remote and communicates with the consumer through WSRP (Web Services for Remote Portlets). JSF Portlets are deployed as JSR 286 portlets, that is, to a WSRP producer, either from Oracle JDeveloper or manually.

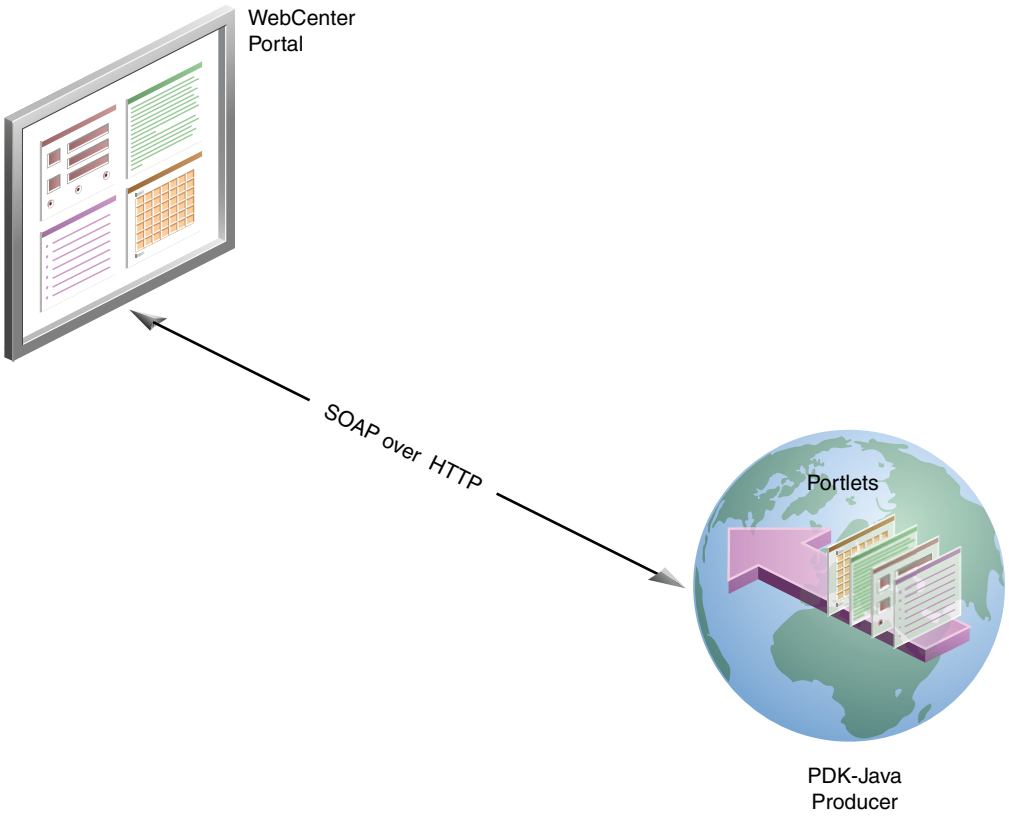


Figure 58–7 Portlet Producer Overview

58.2.3.1 PDK-Java Producers

PDK-Java producers use open standards, such as XML, SOAP, HTTP, or Java EE for deployment, definition, and communication with applications. Figure 58–8 shows how Oracle Portal incorporates portlets from a PDK-Java producer and the PDK-Java producer communicates with Framework application using SOAP over HTTP.

Figure 58–8 PDK-Java Producers

There are several benefits to developing portlets and exposing them through PDK-Java producers as follows:

- Deploy portlets remotely.
- Leverage existing web application code to create portlets.
- Specify producers declaratively.
- Use standard Java technologies (for example, servlets and JSPs) to develop portlets.

To expose your portlets using a PDK-Java producer, you must first create a producer that manages your portlets and communicates with WebCenter Portal: Framework using SOAP. To learn how to expose your portlets using a PDK-Java producer, see Section 60.2, "Creating Java Portlets."

58.2.3.2 WSRP Producers

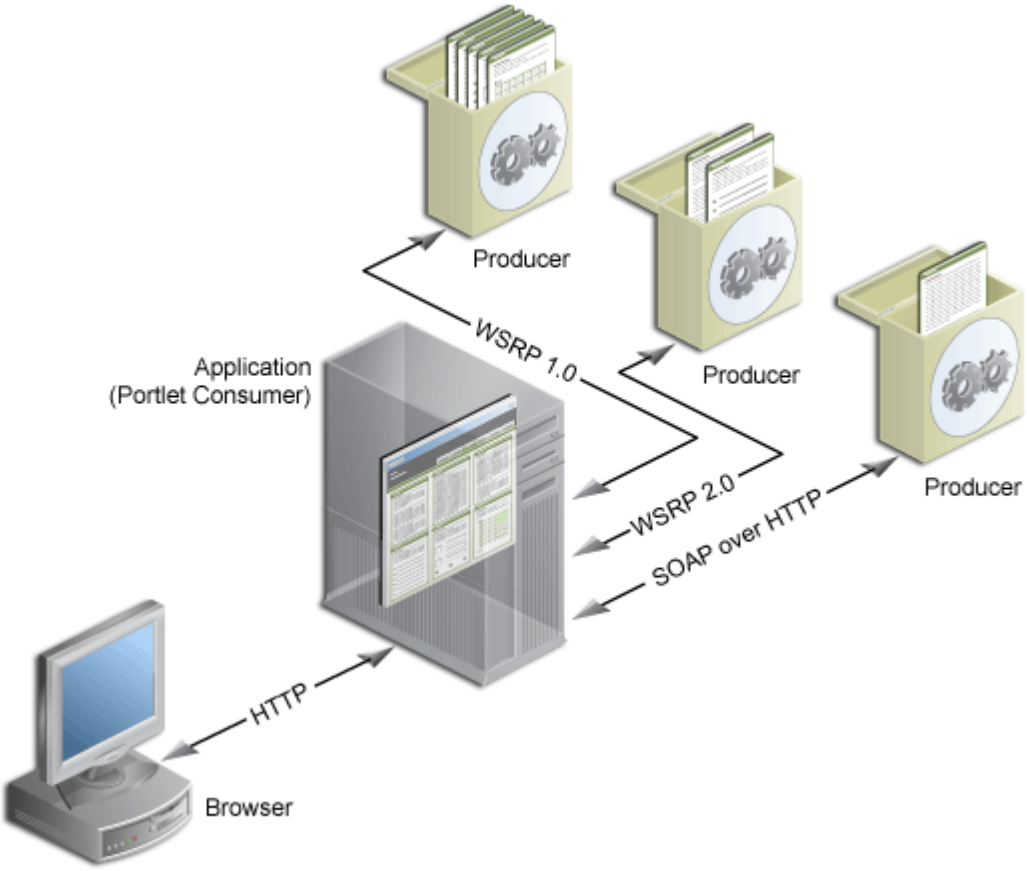
WebCenter Portal supports Web Services for Remote Portlets (WSRP) versions 1.0 and 2.0. This emerging standard provides support for inter-portlet communication and export or import of portlet customizations.

The Producer Registration wizard is the entry point for registering both WSRP 1.0 and 2.0 producers. The wizard automatically recognizes whether WSRP 1.0 or 2.0 is in play.

Architecturally, WSRP producers are very similar to PDK-Java producers. WSRP is a communication protocol between Framework application servers and portlet containers. WSRP is a standard that enables the plug-and-play of visual, user-facing web services with intermediary web applications.

Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as JSR 286, .NET, Perl) and any WSRP portal. So, a portlet (regardless of language) deployed to a WSRP-enabled container can be rendered on any application that supports this standard.

> **Note:** For more information about the WSRP architecture, see "The Relationship Between WSRP and JSR 286" in Chapter 60, "Creating Portlets with the Portlet Wizard."



To make standard portlets (such as JSR 286, .NET, Perl) available to a Framework application, you must package them in a Portlet Producer application and deploy them to a WSRP container.

To learn how to package your portlets in a WSRP container, see Chapter 62, "Testing and Deploying Your Portlets."

58.2.3.3 Producer Architecture

Figure 58–9 illustrates the basic architecture of portlet producers.

Figure 58–9 Producer Architecture

When users display a page in their web browsers, the flow of the request works as follows:

1. The user requests a page from the web browser by entering a URL in the browser's address field.

2. The browser transmits the request to the application over HTTP.
3. The application contacts the portlet producers that provide the portlets that display on the requested page.
4. The producers make the necessary calls to their portlets so that the portlets generate the portlet content in the form of HTML or XML code.
5. The producers return the portlet content back to the application using their relevant protocols:
   - JSR 286 portlets and JSF portlets are initialized by WSRP producers, which communicate using the WSRP 1.0 or 2.0 protocol.
   - PDK-Java portlets are initialized by PDK-Java producers, which communicate using SOAP over HTTP.

JSF portlets, Web Clipping, OmniPortlet, and Java portlets communicate with WebCenter Portal: Framework through either WSRP or PDK-Java producers. You must register these producers with WebCenter Portal: Framework before you can use the portlets they produce in your Framework application.

The latest versions of Web Clipping and OmniPortlet are available through Application Development Runtime Service (ADRS). For more information, see Section 3.4, "Working with the Integrated WebLogic Server."

58.2.4 Caching Style

Portlet caching is key to rapid response to user requests. Portlets implement validation-based and expires-based caching using Java Object Cache. Invalidation-based caching continues to be implemented by a web cache that fronts the PDK-Java producer running the Web Clipping portlet and OmniPortlet.

Caching rules can be specified at a portlet's container level, encoded in the portlet's own logic, or, for JSR 286 portlets, established through the portlet wizard. Provided it is specified, container-level caching takes over when caching is not part of the portlet code.

At the application level, WebCenter Portal: Framework supports use of a Java cache for the establishment of application-level caching rules.

When not using caching, you may find accessing various data sources with Web Clipping and OmniPortlet to be time consuming. When you enable caching at the application level, you instruct the Java cache to maintain a copy of the portlet content. When data that was previously cached is requested, no time is lost in contacting the data source and regenerating its content. Instead, the previously cached portlet content is returned.

A portlet's content weighs heavily in determining the type of caching the portlet should use. For example:

- **Expiry-based caching**: Consider using expiry-based caching when the portlet content is static or when it is not critical that the most up-to-date content be displayed. When using expiry-based caching, you must specify the caching period.
- **Validation-based caching:** Consider using validation-based caching for portlets with dynamic content that changes frequently or unpredictably. The portlet associates its content with a caching key and returns the key value along with the content. When the portlet content is requested, the portlet decides, based on the caching key, if the current content is valid. If the portlet content is valid, then it returns a response indicating that the cached content can be used (that is, the

content is valid) or generates the new portlet content and returns it along with a new caching key for that content.

JSF Portlets

Oracle JSF Portlet Bridge supports expiry- and validation-based caching. JSF portlets can be cached in full, or you can use Edge Side Includes (ESI) to cache fragments of portlets.

Web Clipping and OmniPortlet

In addition to invalidation-based caching, expiry-based caching can be specified for the Web Clipping portlet and OmniPortlet. Additionally, these portlets are refreshed automatically when they are personalized.

Programmatic Portlets

Java portlets support expiry- and validation-based caching. These portlets can be cached in full, or you can use Edge Side Includes (ESI) to cache fragments of portlets.

58.2.5 Development Tool

This section describes the development tools you can use to build different types of portlets.

JSF Portlets

Oracle JSF Portlet Bridge/JSF Portletization dialog is used to create a JSF portlet based upon a page or a task flow.

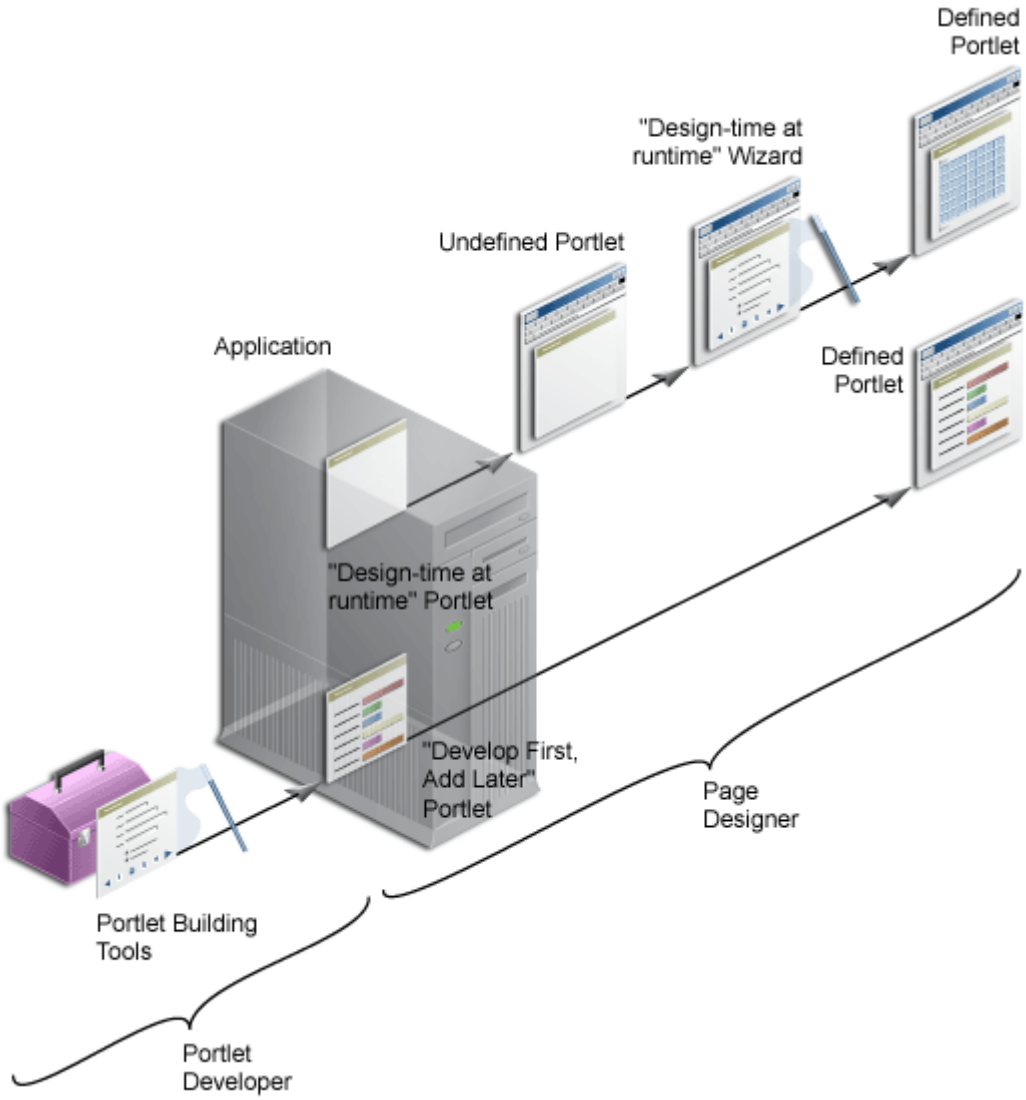
Web Clipping and OmniPortlet

OmniPortlet and Web Clipping use a browser-based wizard as the development tool.

Programmatic Portlets

Although you can use any Java development environment to build Java portlets, it is highly recommended that you use Oracle JDeveloper, a professional IDE. While you can consider other IDEs, Oracle JDeveloper includes the Java Portlet Wizard, to minimize your Java portlet development efforts.

The Java Portlet Wizard generates a starting skeleton and file structure for both JSR 286 and PDK-Java portlets. You need only add your own business logic to the skeleton. Oracle JDeveloper can also package and deploy your applications to your Java EE container. Also, Oracle JDeveloper helps you test your portlet producer. Oracle recommends that you use the Integrated WLS, provided through WebCenter Portal: Framework, as your development Java portlet runtime environment. For more information, see Chapter 3, "Preparing Your Development Environment."



58.2.6 Portlet Creation Style

WebCenter Portal: Framework supports the following types of portlet creation (Figure 58–10):

- Develop first, add later
- Design time at runtime

Develop first, add later portlet creation is usually the task of the *portlet* developer; design time at runtime portlet creation is the *application* developer's responsibility.

Figure 58–10 Portlet Creation Style

JSF Portlets

Develop a JSF application first and then portletize the application using the JSF Portletization dialog at design time.

OmniPortlet and Web Clipping

OmniPortlet and Web Clipping both offer a "design time at runtime" portlet creation style. Register the portlet producers with the application that consumes the portlets, add the portlets to an application page, run the application, and then define the portlets in-place on the page.

Programmatic Portlets

Typically programmatic portlets offer a "develop first, add later" portlet creation style. Two wizards are available through WebCenter Portal: Framework to assist with the creation of Oracle PDK-Java and JSR 286 portlets. The wizards generate the basic files required for portlet creation. The developer hand-codes the portlet logic. The development sequence for programmatic portlets is to create the portlet, deploy it to a

producer, register the producer with the application that consumes the portlet, and then add the portlet to an application page.

Note: With extensive coding, you can create "design time at runtime" Java portlets. For example, Web Clipping and OmniPortlet are both Java portlets.

58.2.7 User Interface Flexibility

This section describes the portlet building tools in terms of the control you have over the user interface.

JSF Portlets

Oracle JSF Portlet Bridge ensures that the portletized JSF application functions as a JSF portlet.

Web Clipping

Because of its nature, Web Clipping always displays the remote web site content, therefore UI flexibility is not a requirement for this portlet.

OmniPortlet

OmniPortlet enables you to use different pre-built layouts, such as scrolling news, tabular, and chart. You can also use the built-in HTML layout to personalize the look and feel of your portlet using HTML and JavaScript.

Note: When using JavaScript in portlets, developers must ensure that the JavaScript identifiers are qualified. That is, identifiers must be unique for each portlet instance and must not clash with the JavaScript on the page.

Programmatic Portlets

In Java portlets, you have full control over your portlet's user interface. Your portlet is free to generate any HTML content that conforms to the rendering rules for pages.

58.2.8 Ability to Capture Content from Web Sites

This section describes the portlet building tools in terms of their ability to include content from other sources.

JSF Portlets

Oracle JSF Portlet Bridge's capability to capture contents from web sites depends upon the JSF application being portletized.

Web Clipping

For portlets that display content from a remote web site as it is presented at the source location, the best tool to use is Web Clipping. Web Clipping can tolerate the changes of the source HTML page to some extent. If a clipped table moves from one place to another in the source page, then the Web Clipping engine can find the table again using the internal "fuzzy match" algorithm. Portlets built with Web Clipping can also maintain sessions to the remote web sites. Web Clipping also supports user personalization of HTML form values.

OmniPortlet

For portlets using the data but not the layout from a remote web site, the best choice is OmniPortlet. Use OmniPortlet to retrieve the data, process the data (format, filter, and so on), and present it in a portlet in a tabular, chart, or news format. OmniPortlet is a powerful tool that extracts data from web pages by using its Web Page data source.

Programmatic Portlets

Java portlets can take advantage of low-level Java networking APIs to retrieve and process content from remote web sites. To avoid unnecessary development efforts, before choosing Java always ensure that Web Clipping or OmniPortlet are not viable options.

58.2.9 Ability to Render Content Inline

Active elements in portlets, such as links or form buttons, enable users to navigate to remote URLs. In a News portlet, for example, a user can click a hyperlink to navigate to a news site with detailed information about news of interest. For example, a user clicks a news-summary link in a News portlet, leaves the application page, and lands on the news site.

You may have a requirement to keep your users within the context of the application page by rendering the requested content within the same portlet container. For example, a user clicks a news-summary link in a News portlet, and the portlet refreshes with the detailed news article.

This maintenance of context is what rendering content inline means .

JSF Portlets

Oracle JSF Portlet Bridge converts a JSF application with multiple pages into JSF portlets. The contents of these pages are rendered inline.

Web Clipping

The Web Clipping portlet supports URL rewriting for achieving inline content rendering. It can process the links originating from the source web site and rewrite them to achieve the desired functionality.

The following options are available:

- Select not to rewrite the URLs within the portlet, in which case clicking the links takes users out of the Framework application to the web site that provides the clipping. Whenever the link brings the user to a place that requires authentication, the user must enter login information before the link target is displayed.
- If the Web Clipping provider is registered with an external application and the clipping requires authentication, then you can instruct Web Clipping to rewrite all URLs within the portlet to point to the Login Server. In this case, navigation causes the user to leave the Framework application, while also using the Login Server to log the browser into the External Application.
- Select to rewrite all URLs within the portlet (inline rendering) to point back to the page so that all browsing within the Web Clipping portlet remains within the Framework application. If the Web Clipping provider is registered with an External Application, then this causes the Web Clipping provider to log itself in to the External Application. In this case, the navigation within the Framework application through the Web Clipping provider is authenticated in the External Application.

OmniPortlet

Rendering content inline is not supported, but you can achieve inline rendering using public portlet parameters.

Programmatic Portlets

As you have full control over the links and buttons in Java portlets, you can easily implement the inline rendering functionality. To achieve inline rendering, you must append the private portlet parameters to the page URL.

If you use Struts in your portlet, then the PDK-Struts integration framework renders your content always in the same portlet container. Oracle recommends, however, that you use ADF Faces navigation for your new WebCenter Portal: Framework portlets.

If your portlet consists of multiple JSPs (for example, several steps in a survey or wizard), then your portlet can make use of a special parameter to specify at runtime the JSP to use to render the content.

58.2.10 Charting Capability

This section describes the portlet building tools in terms of their charting capability.

JSF Portlets

Oracle JSF Portlet Bridge does not have charting capability. However, it supports portletization of a JSF application that contains ADF charts.

Web Clipping

Web Clipping clips pre-existing content. So, while it does not create charts, it can retrieve and present HTML content that contains charts.

OmniPortlet

OmniPortlet supports bar, line, and pie chart types. Charts are dynamically generated images, which can include hyperlinks.

Programmatic Portlets

You can create sophisticated charts programmatically in Java portlets using Oracle's Business Intelligence (BI) Beans.

Note: Oracle Reports and Oracle Discoverer portlets use BI Beans to create professional graphs.

58.2.11 Public Portlet Parameter Support

Typically, a portlet's state is opaque (private); however, in WebCenter Portal: Framework portlets can describe public inputs (parameters) so values can be coordinated by the consuming application with other constituents of that application.

Inputs can include, public portlet parameters and private portlet parameters. These can be described as follows:

- **Public portlet parameters:** Use public portlet parameters to pass values to a portlet. Public parameters can assist with rendering portlet content that is specific to a particular page or user. Portlet parameters are created by the component developer and then exposed to the application developer through the user interface. After adding a portlet to a page, application developers can assign

values to public portlet parameters to make the information displayed in the portlet specific to the page.

Assigned values can be specific (such as a constant), a system variable (for example, the user name), or a page parameter. At runtime, the portlet receives the values from the sources specified.

- **Private portlet parameters:** Use private portlet parameters to implement internal navigation in a portlet. Parameters are passed to the portlet every time the page is requested. Private portlet parameters can be passed exclusively from the portlet instance to the same portlet instance. Private portlet parameters do not require a full page refresh.

  Note: A Refresh action is available for inclusion on the portlet's Actions menu (`isNormalModeAvailable`). It refreshes the portlet without triggering a full page refresh. For details about setting this action programmatically, see Section 64.4, "Setting Attribute Values for the Portlet Tag."

Portlets supporting public portlet parameters enable application developers to tailor data input for each portlet instance. The component developer can focus on the portlet logic, while the application developer can address the interaction between the application page and its portlets.

All portlet building technologies discussed in this chapter (OmniPortlet, Web Clipping, and programmatic portlets) support public portlet parameters. OmniPortlet and Web Clipping provide complete support through their wizard interface. You can add public portlet parameter support to your programmatic portlets programmatically or with the Java Portlet wizard.

58.2.12 Private Portlet Parameter Support

This section describes the portlet building tools in terms of their support for private parameters.

JSF Portlets

In your JSF portlets, you can implement internal navigation using private portlet parameters.

OmniPortlet and Web Clipping

With the OmniPortlet and Web Clipping portlets, component developers do not have access to private portlet parameters.

Programmatic Portlets

In your Java portlets, you can implement internal navigation using private portlet parameters.

58.2.13 Ability to Hide and Show Portlets Based on User Privileges

This section describes the portlet building tools in terms of their support for authorization functionality.

JSF Portlets

Oracle JSF Portlet Bridge supports the standard servlet mechanisms.

Web Clipping and OmniPortlet

Dynamically hide and show portlets built with Web Clipping and OmniPortlet by using security managers. Although Web Clipping and OmniPortlet do not expose security managers through the user interface, they make them available for editing through their XML provider definition files.

Programmatic Portlets

PDK-Java provides security managers for Java portlets. For example:

- **Group security manager:** The group security manager controls access to portlets based on group membership. For example, it shows the portlet to users who are members of a specified group, and hides the portlet from non-members.
- **Authentication level security manager:** The authentication level security manager controls access to the portlets based on authentication level. For example, it shows the portlet to authenticated users, and hides it from public users.

JSR 286 portlets support the standard servlet mechanisms.

58.2.14 Multilingual Support

This section describes the portlet building tools in terms of their support for other languages.

Web Clipping, OmniPortlet, JSF portlets, and Java portlets display textual information in the language selected by the end user.

58.2.15 Pagination Support

Support for pagination is useful when a portlet must display a relatively large set of records.

JSF Portlets

Oracle JSF Portlet Bridge supports pagination, if the application portletized has pagination implemented in it.

Web Clipping

Web Clipping does not support pagination.

OmniPortlet

OmniPortlet does not support pagination.

Programmatic Portlets

With Java, portlet pagination can be implemented programmatically.

58.2.16 Authenticating to External Applications

This section describes the portlet building tools in terms of authentication for external applications.

JSF Portlets

Since any portletized application can function as a WSRP portlet, the external application support is feasible through custom user attributes.

Web Clipping

Web Clipping's integration with the external application framework provides a fully automated mechanism to store passwords to external web sites. All you must do is provide an External Application ID when registering the Web Clipping producer.

OmniPortlet

OmniPortlet enables you to store connection information when the data source is password protected. The credentials to access the data source can either be shared across all users or saved individually for each user. OmniPortlet can storing database credentials and HTTP basic authentication user name-password pairs. Credentials are stored in a secured metadata services repository.

Programmatic Portlets

Java portlets support programmatic integration with the external application framework and any LDAP server, such as Oracle Internet Directory.

59

Creating Portlets with the Oracle JSF Portlet Bridge

This chapter explains how to use the Oracle JSF Portlet Bridge to expose an application as a portlet.

This chapter includes the following sections:

- Section 59.1, "Introduction to the Oracle JSF Portlet Bridge"
- Section 59.2, "Creating a Portlet from a JSF Application"
- Section 59.3, "What You May Need to Know When Creating a JSF Portlet"
- Section 59.4, "Copying a Runtime-Created Skin to a JSF Portlet Producer Application"

59.1 Introduction to the Oracle JSF Portlet Bridge

The Oracle JSF Portlet Bridge enables application developers to quickly and easily expose their existing JSF applications, and Oracle ADF applications and task flows as JSR 286 portlets.

> **Note:** Unless otherwise noted, the term JSF applications encompasses Oracle ADF applications as well.

The Oracle JSF Portlet Bridge:

- Simplifies portlet development by enabling you to provide portlet functionality using JSF rather than relying on the JSR 286 portlet APIs.
- Simplifies exposing your JSF application to JSR 286 portlet consumers, such as Oracle Portal and Oracle WebCenter Portal: Spaces.
- Eliminates the requirement to store, maintain, and deploy your portlets separately from your application by enabling the application to run simultaneously as a regular web application and as a portlet from the same installation.
- Enables you to create portlets at a more granular level by exposing task flows as portlets. Because portletized task flows are WSRP portlets, this also enables you to use distributed task flows.

Note: The Oracle JSF Portlet Bridge is based on and conforms to JSR 329. JSR 329 is the standards effort to define the functionality for the Portlet 2.0 Bridge for JavaServer Faces. Oracle is the specification lead for this standard. More information is available at:

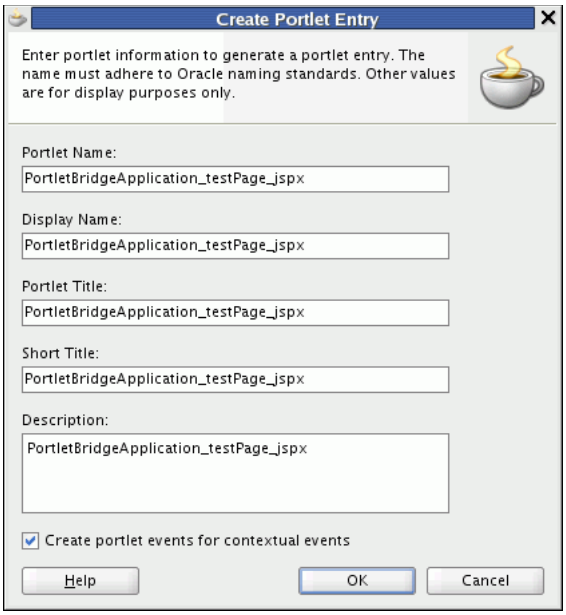
`http://www.jcp.org/en/jsr/detail?id=329`

59.2 Creating a Portlet from a JSF Application

The Oracle JSF Portlet Bridge enables you to expose a JSF application or task flow as a portlet. You do this declaratively, using the Create Portlet Entry dialog; no coding is required. Using the Create Portlet Entry dialog, you can configure Oracle JSF Portlet Bridge on a JSF application to expose the application as a JSR 286 portlet. As part of this configuration, you indicate the initial JSF view (or task flow view) to invoke when the portlet is rendered. From that point on the Oracle JSF Portlet Bridge works with the JSF application to navigate through the additional views that are reachable from this initial view. So in the typical situation when you are exposing the entire JSF application as the portlet, you configure the Oracle JSF Portlet Bridge to render the application's initial view in the portlet and the rest of the navigation works naturally within that same portlet.

This section includes the following subsections:

- Section 59.2.1, "How to Create a JSF Portlet Based on a Page"
- Section 59.2.2, "How to Create a JSF Portlet Based on a Task Flow"
- Section 59.2.3, "How to Test a JSF Portlet Using the Integrated WebLogic Server"
- Section 59.2.4, "What Happens at Runtime"



59.2.1 How to Create a JSF Portlet Based on a Page

The simplest way to create a portlet from a JSF application is to generate a portlet based upon a page.

To create a JSF portlet from an existing application page:

1. In the JDeveloper Application Navigator, open the application that contains the `.jspx` page to portletize.
2. Right-click the page to portletize and choose **Create Portlet Entry.**
3. In the Create Portlet Entry dialog (Figure 59–1), in the **Portlet Name** field, enter a name for the portlet.

Figure 59–1 The Create Portlet Entry Dialog for a Page

4. In the **Display Name** field, enter a descriptive name for your portlet.
5. In the **Portlet Title** field, enter a descriptive title for your portlet.

   The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.
6. In the **Short Title** field, enter a shorter title for your portlet. This short title is displayed on the portlet header when the portlet appears on a page on a mobile device.
7. In the **Description** field, enter a description for your portlet.
8. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the page. This option is selected by default.

   Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.
9. Click **OK.**

   The `portlet.xml` file is created.

   This file contains the portlet entry (Example 59–1) and is opened ready for viewing or editing. By default, the file is opened in Design view. To view or edit the source code, click the **Source** tab.

Example 59–1 Generated Portlet Entry for a Page

```
<portlet id="adf_jsf__testPage_jspx">
  <description>PortletBridgeApplication_testPage_jspx</description>
  <portlet-name>PortletBridgeApplication_testPage_jspx</portlet-name>
  <display-name>PortletBridgeApplication_testPage_jspx</display-name>
  <portlet-class>
    oracle.portlet.bridge.adf.application.ADFBridgePortlet
  </portlet-class>
```

```
  <init-param>
    <name>javax.portlet.faces.defaultViewId.view</name>
    <value>/myPage.jspx</value>
  </init-param>
  <supports>
    <mime-type>text/html</mime-type>
    <portlet-mode>VIEW</portlet-mode>
  </supports>
  <supported-locale>en</supported-locale>
  <portlet-info>
    <title>PortletBridgeApplication_testPage_jspx</title>
    <short-title>PortletBridgeApplication_testPage_jspx</short-title>
  </portlet-info>
  <supported-processing-event id="DepartmentSelectedEvent">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:DepartmentSelectedEvent
    </qname>
  <supported-publishing-event id="DepartmentSelectedEvent">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:DepartmentSelectedEvent
    </qname>
  </supported-publishing-event>
  <supported-public-render-parameter>
    _adf_event_DepartmentSelectedEvent
  </supported-public-render-parameter>
  <container-runtime-option>
    <name>com.oracle.portlet.requireIFrame</name>
    <value>true</value>
  </container-runtime-option>
  <container-runtime-option>
    <name>com.oracle.portlet.minimumWsrpVersion</name>
    <value>2</value>
  </container-runtime-option>
</portlet>
```

The page you selected earlier is used as the entry point for the portlet View mode. This is indicated in the `portlet.xml` file by the `javax.portlet.faces.defaultViewId.view` initialization parameter. You can manually edit the `portlet.xml` file to define the pages for other default and extended portlet modes supported by WebCenter Portal:

- Edit mode: `javax.portlet.faces.defaultViewId.edit`
- Help mode: `javax.portlet.faces.defaultViewId.help`
- About mode: `javax.portlet.faces.defaultViewId.about`
- Config mode: `javax.portlet.faces.defaultViewId.config`
- Edit Defaults mode: `javax.portlet.faces.defaultViewId.edit_defaults`
- Preview mode: `javax.portlet.faces.defaultViewId.preview`
- Print mode: `javax.portlet.faces.defaultViewId.print`

Note: The value for the `defaultViewId` is relative to the application context root and must always start with a `/`. For example, in Example 59–1, the value for `defaultViewId.view` is `/myPage.jspx`.

If you add `defaultViewId` for other portlet modes, then ensure that you also add the mode to the `<supports>` tag. For example, `<portlet-mode>HELP</portlet-mode>`.

59.2.2 How to Create a JSF Portlet Based on a Task Flow

An advantage of using Oracle ADF is task flows that provide a modular approach for defining control flow in an application. Instead of representing an application as a single large JSF page flow, you can break it up into a collection of reusable task flows. In each task flow, you identify application activities, the work units that must be performed in order for the application to complete. An activity represents a piece of work that can be performed when running the task flow.

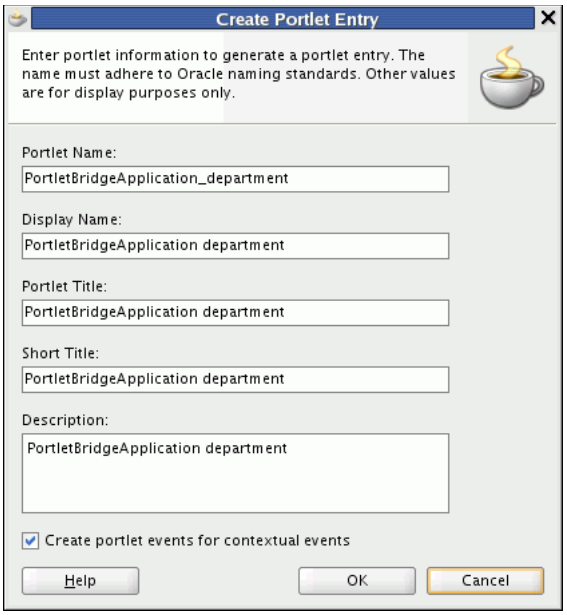
Task flows can be unbounded or bounded:

- An unbounded task flow is a set of activities, control flow rules, and managed beans interacting to allow a user to complete a task. An unbounded task flow consists of all activities and control flows in an application that are not included within any bounded task flow.
- A bounded task flow is a specialized form of task flow, having a single entry point and one or more exit points. It contains its own set of private control flow rules, activities, and managed beans. An Oracle ADF bounded task flow allows reuse, parameters, transaction management, and reentry. It can have zero to many exit points.

A typical application is a combination of an unbounded and one or more bounded task flows. The application can then call bounded task flows from activities within the unbounded task flow. For more detailed information about bounded and unbounded task flows, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

This section includes the following subsections:

- Section 59.2.2.1, "Creating a Portlet From a Task Flow Using the Create Portlet Entry Dialog"
- Section 59.2.2.2, "Creating a Portlet From a Task Flow Using the Manage Portlet Entries of Task Flows Dialog"



59.2.2.1 Creating a Portlet From a Task Flow Using the Create Portlet Entry Dialog

Use the Create Portlet Entry dialog to create a portlet from a single task flow.

To make a portlet from a task flow using the Create Portlet Entry dialog:

1. In the JDeveloper Application Navigator, open the JSF application that contains the task flow from which you want to make a portlet.
2. Right-click the task flow to portletize and choose **Create Portlet Entry.**
3. In the Create Portlet Entry dialog (Figure 59–2), in the **Portlet Name** field, enter a name for the portlet.

Figure 59–2 The Create Portlet Entry Dialog for a Task Flow

4. If the task flow is unbounded, the **Entry Point View** dropdown list displays all the view activities of the task flow. From this dropdown list, choose the view activity to use as the entry point for the portlet. By default, the first view activity in the task flow is chosen.

   If the task flow is bounded, there is only a single possible entry point, so you do not see the **Entry Point View** dropdown list.

5. In the **Display Name** field, enter a descriptive name for your portlet.

6. In the **Portlet Title** field, enter a descriptive title for your portlet.

   The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.

7. In the **Short Title** field, enter a shorter title for your portlet. This short title is displayed on the portlet header when the portlet appears on a page on a mobile device.

8. In the **Description** field, enter a description for your portlet.

9. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the task flow. This option is selected by default.

   Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.

10. Click **OK.**

    When your portlet has been created, you should receive a message that says:

    ```
    New portlet has been successfully created
    ```

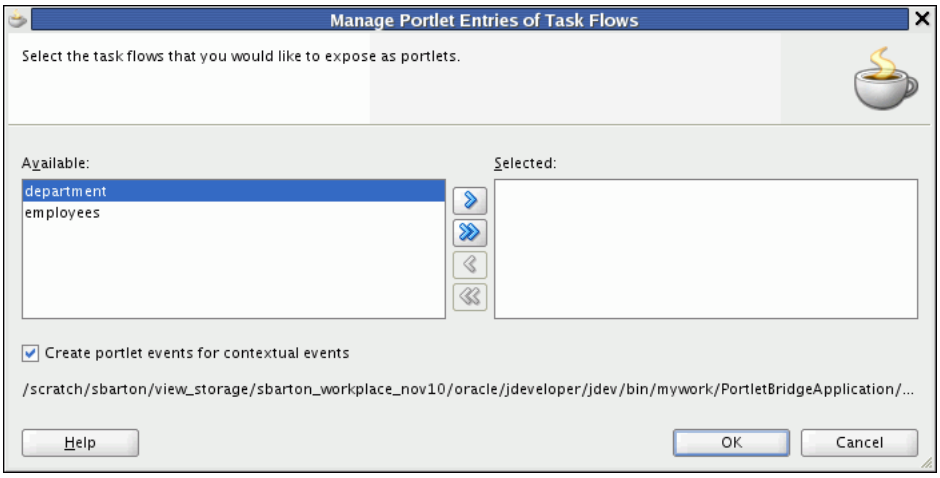
    In addition, the `portlet.xml` file is created. The `portlet.xml` file contains the portlet entry (Example 59–2) and is opened ready for viewing or editing.

Example 59–2 Generated Portlet Entry for a Task Flow

```
<portlet id="adf_taskflow_WEB_INF_department_xml">
    <description>PortletBridgeApplication department</description>
    <portlet-name>PortletBridgeApplication_department</portlet-name>
    <display-name>PortletBridgeApplication department</display-name>
    <portlet-class>oracle.portlet.bridge.adf.application.ADFBridgePortlet</portlet-class>
    <init-param>
      <name>javax.portlet.faces.defaultViewId.view</name>
      <value>
        /adf.task-flow?adf.tfDoc=/WEB-INF/adfp-portlet-bridge-container.xml
        &amp;amp;adf.tfId=adfp-portlet-bridge-container&amp;amp;_fragmentTaskFlowDoc=/WEB-INF/
        department.xml&amp;amp;_fragmentTaskFlowId=department
      </value>
    </init-param>
    <supports>
      <mime-type>text/html</mime-type>
      <portlet-mode>VIEW</portlet-mode>
    </supports>
    <supported-locale>en</supported-locale>
    <portlet-info>
      <title>PortletBridgeApplication department</title>
      <short-title>PortletBridgeApplication department</short-title>
    </portlet-info>
    <supported-publishing-event id="DepartmentSelectedEvent">
      <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
        x:DepartmentSelectedEvent
      </qname>
    </supported-publishing-event>
    <supported-public-render-parameter>
      _adf_event_DepartmentSelectedEvent
    </supported-public-render-parameter>
    <container-runtime-option>
      <name>com.oracle.portlet.requireIFrame</name>
      <value>true</value>
    </container-runtime-option>
    <container-runtime-option>
      <name>com.oracle.portlet.minimumWsrpVersion</name>
      <value>2</value>
    </container-runtime-option>
</portlet>
```

Note: The `portlet.xml` file can include multiple portlets and can have a combination of pages and task flows exposed as portlets.

59.2.2.2 Creating a Portlet From a Task Flow Using the Manage Portlet Entries of Task Flows Dialog



If your project includes a lot of task flows, you may find it easier to select the task flows to create as portlets from a list. You can do this using the Manage Portlet Entries of Task Flows dialog. This dialog also lets you create portlets from multiple task flows at the same time, rather than having to create them individually.

To create a portlet from a task flow using the Manage Portlet Entries of Task Flows dialog:

1. From the main menu, choose **File** and then **New.**
2. In the New Gallery, expand **Web Tier,** select **Portlets** and then **Manage Portlet Entries of Task Flows,** and click **OK.**

3. In the Manage Portlet Entries of Task Flows dialog, use the shuttle buttons to select which task flows you want to create as portlets.

Figure 59–3 The Manage Portlet Entries of Task Flows Dialog

4. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the task flows. This option is selected by default.

   Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.

5. Click **OK** to create portlets for the selected task flows.

59.2.3 How to Test a JSF Portlet Using the Integrated WebLogic Server

When you have created your JSF portlet you can test it using the Integrated WebLogic Server that comes packaged with JDeveloper.

To test a JSF portlet:

1. From the main menu, choose **Run** and then **Start Server Instance.**

   It may take a few moments for the Integrated WLS to start. When the instance has started, you should see a message similar to the following in your Log panel:

   ```
   IntegratedWebLogicServer started.
   ```

   For more information, see Section 3.4, "Working with the Integrated WebLogic Server."

2. You are now ready to run or deploy your Portlet Producer application to the Integrated WLS. Because your web application and Portlet Producer application are one and the same (the Portlet Producer application is your existing web application with additional portlet artifacts), you can run or deploy your web application as you normally would or you can run or deploy your portlet following the instructions in Section 62.2.1, "How to Test JSR 286 Portlets on Integrated WebLogic Server."

   Note the distinction between Run and Deploy in the note in that section. Deploy provides a more persistent testing scenario.

3. When deployed, you can view the Producer Test Page by going to:

   ```
   http://host:port/context-root/info
   ```

Post deployment you must verify that the application works correctly as a web application before it is consumed as a Portlet Producer application. For example, verify that the page you portletized earlier works:

```
http://localhost:7101/myApp-ViewController-context-root/faces/myPage.jspx
```

4. Once you have successfully deployed the application containing the portlet, you can register it as a portlet producer with any other application. For more information see Section 64.2.1, "How to Register a WSRP Portlet Producer."

> **Note:** Because the Oracle JSF Portlet Bridge uses WSRP 2.0 features, you should register the producer using the **WSRP v2 WSDL** URL listed in the WSRP Producer Test Page.

You can continue to access the application as a regular web application or consume it as a portlet producer.

5. Now that your portlet producer is deployed and registered, you can consume your JSF portlet as you would any other portlet. For more information, see Section 64.3, "Adding Portlets to a Page."

59.2.4 What Happens at Runtime

After having created and tested the JSF portlet you can deploy the application to your production environment.

> **Note:** Ensure that you deploy your application to a Java EE container with the Oracle Portlet Container installed. The Integrated WLS has the container installed, which is why it is recommended for testing.

After successful deployment, you can access both the application and the portlet producer test page. For example, the application URL would be similar to:

```
http://host:port/appcontextroot/faces/pagename.jspx
```

And the portlet producer test URL would be similar to:

```
http://host:port/appcontextroot/info
```

For more information, see Section 64.2.1, "How to Register a WSRP Portlet Producer."

59.3 What You May Need to Know When Creating a JSF Portlet

You must code your JSF pages such that they produce markup that conforms with JSR 286 portlet markup fragment rules. If you have chosen to use Oracle ADF, the markup in your page comes mainly from the Oracle ADF Faces components, most of which naturally render markup in a style that is compatible with JSF portlets.

For those components that might cause problems in a portlet environment, the application developer must take special care. Some components generate markup that conflicts with the portlet environment and hence restricts their use. Other components may allow program control (inputs) that enable developers to introduce values that conflict with the portlet environment. In this latter case, you as the developer must be

aware of the potential to publish the page as a portlet and therefore properly encode a value.

This section includes the following subsections:

- Section 59.3.1, "General Guidelines"
- Section 59.3.2, "Portlet Guidelines"
- Section 59.3.3, "Security Guidelines"
- Section 59.3.4, "JSF Guidelines"
- Section 59.3.5, "Oracle ADF Guidelines"

59.3.1 General Guidelines

The guidelines that follow lay out the issues of which you should be aware as you code Oracle ADF pages that you may later choose to publish as portlets.

- Prior to creating a portlet from your JSF application, the application, including all of its pages and task flows, must run properly after you deploy it to Integrated WLS. If it cannot run as a regular web application, it cannot run as a portlet producer either.
- When writing an application that is supposed to run in both servlet and portlet environments, avoid casting to `HttpServlet` objects (or you get a `ClassCastException` when running as a portlet). Instead, use the abstraction provided by the Faces `ExternalContext` object. For example, instead of:

  ```
  HttpServletRequest request =
  (HttpServletRequest)FacesContext().getCurrentInstance().getExternalContext()
  .getRequest();
  ```

  Use the following:

  ```
  String localContextPath=
  FacesContext().getCurrentInstance().getExternalContext().getRequestContextPath(
  );
  ```

  To the extent that `ExternalContext` does not provide that abstraction for you, you can write servlet or portlet specific code. You can use the following method to check if the application runs as portlet:

  ```
  public static boolean isPortletRequest() {
      Map<String, Object> m =
          FacesContext.getCurrentInstance().getExternalContext().getRequestMap();
      Object phase = m.get("javax.portlet.faces.phase");
      if (phase != null) {
          return true;
      }
      else {
          return false;
      }
  }
  ```

- When consuming a JSF Portlet, the consumer application automatically renders the portlet content within an inline frame (IFRAME). The implication is that any inline popup is then confined within the IFRAME. You should take this into consideration when specifying the size of the portlet.

- If your application is secured, ensure that you have secured identity propagation as described in Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."
- Deep links are not directly supported. A by-product of the JSR 286 portlet container implementation on WSRP is that session cookie management is proxied by the consuming application rather than the client. Portlets that deep link to their full service application usually rely on shared session state to allow the transition from the current portlet context. As most applications rely on maintaining session context with a cookie, the current architecture prevents such state sharing. A deep link from the client directly to the producer server to invoke the application does not establish a session cookie between the consumer and the producer, hence a second session is established. Applications that are required to share such state must implement their own schemes for transferring the data between the two contexts. A common implementation is to write this state to a reachable location and pass a reference to this state in the deep link.
- Java EE login is not supported. Java EE applications can be configured with different authentication techniques, such as Basic and Digest. As portlets are fragments incorporated into a consumer's page, it is generally expected that direct authentication occurs between the client and the consumer, not the client and the portlet producer. As a result, these authentication techniques are not supported in JSR 286. In the JSR 286 case, Java EE authentication occurs through WS-Security mechanisms that allow the Web service consumer to be authenticated and verified by the producer, and propagate the user identity for user authentication and authorization. Published Oracle ADF artifacts must not contain login links that trigger Java EE authentication.
- For applications that take a long time to render, consider increasing the time out period when you register a producer that was created by the Oracle JSF Portlet Bridge. Note however that the time out period specified during producer registration is limited by the maximum time out period (`maximumTimeout` element) specified in `adf-config-xml`.

59.3.2 Portlet Guidelines

The portlet guidelines are as follows:

- For resources and links, you must specify the location relative to the `web-app-context-root`. Otherwise, your images and other resources cannot be found by the portlet. Do not use relative (../) path notation. Portlets in Oracle WebCenter Portal: Framework run remotely and are accessed using a SOAP protocol (WSRP). The latter means that the regular web application concept of request path does not apply in a JSR 286 container. The JSR 286 specification reflects this by mandating that all resource URLs either be absolute or context path relative.
- Do not redirect or forward a request within your JSP. JSR 286 only supports `requestDispatcher.include()`. The use of `httpServletResponse.sendRedirect()` or `requestDispatcher.forward()` results in exceptions and errors. To work properly in a portlet environment, you must implement JSF navigation rules in `faces-config.xml` or Oracle ADF task flow control flow rules.
- To minimize overall memory consumption in the application when running as a portlet, you should only store the minimal amount of data in the request scope.
- If you portletize an application that contains downloadable resources, the portlet container may rewrite the file name in such a way that it may be too long for the

browser to open or save. In such a case, you can save the resource to a different name and open the file using the appropriate program directly.

- If the portlet uses JSF view components other than ADF Faces (for example, Trinidad components), then you may want to manually change the portlet's `minimumWsrpVersion` container runtime option to `1` so that it can be registered using the WSRP V1 WSDL. For more information, see Section 61.2.4, "How to Customize the Runtime Environment."

59.3.3 Security Guidelines

The security guidelines are as follows:

- When you use the Create Portlet Entry or Manage Portlet Entries of Task Flows dialog to portletize a task flow in an Oracle ADF secured application (the security scheme being Authentication and Authorization), you must manually grant permission to the following wrapper task flow in the `jazn-data.xml` file of the producer application:

  ```
  /WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
  ```

  If you do not grant the permissions, the portlet does not render.

  For example, if you have an application with two roles: authenticated-role, with view permission; and testrole, with customize, edit, grant, personalize, and view permissions, you must add the following entries inside the `<permissions>` tag of each role:

  - For authenticated-role:

    ```
    <permission>
      <class>oracle.adf.controller.security.TaskFlowPermission</class>
      <name>
      /WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
      </name>
      <actions>view</actions>
    </permission>
    ```

  - For testrole:

    ```
    <permission>
      <class>oracle.adf.controller.security.TaskFlowPermission</class>
      <name>

    /WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
      </name>
      <actions>customize,edit,grant,personalize,view</actions>
    </permission>
    ```

- If you are portletizing a task flow or page that has role based authorization (that is, the task flow or page has been granted certain roles), WS-Security is required to propagate the user correctly. If you set up WS-Security, the JSF portlet does not render the content due to lack of permissions.

  For information about setting up WS-Security on the producer, see Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."

  When registering the producer with the consuming application, you must ensure that you set the appropriate security properties. For more information, see Section 64.2.1, "How to Register a WSRP Portlet Producer."

59.3.4 JSF Guidelines

The JSF guidelines are as follows:

- When using the `h:commandLink` JSF standard HTML component ensure that you set the following `context-param` in `web.xml` so that the JSF Reference Implementation does not generate any external JavaScript resource. This is to work around an issue in the JSF Reference Implementation where the reference to the JavaScript resource is not properly encoded.

```
<context-param>
    <param-name>com.sun.faces.externalizeJavaScript</param-name>
    <param-value>false</param-value>
</context-param>
```

59.3.5 Oracle ADF Guidelines

The Oracle ADF guidelines are as follows:

- If you are portletizing an Oracle ADF task flow, ensure that you are able to consume that task flow by dropping it onto a page as a region and running the page. This ensures that the task flow runs correctly before portletizing it.
- ADF Faces Dialog Framework is not supported. If your application includes any buttons or icons that launch secondary browser windows, then the contents of the new windows are not displayed properly when the application is run as a portlet. As such, you should avoid using these components if you plan to portletize your application. Examples of components that launch secondary windows are:
  - `<tr:inputDate>`
  - `<tr:inputColor>`
  - `<tr:popup>`
  - the `useWindow` attribute of `<af:commandButton>`
- Portletization of pages that contain Composer components is not supported.
- The `<af.fileDownloadActionListener>` component is not supported.
- Oracle ADF components/code that handle `prepareModel` must be idempotent. Any code running during the `prepareModel` phase must be rerunnable without effect to the underlying data/business logic. When running in the portlet environment, `prepareModel` is called twice during the complete JSF life cycle as opposed to being called once when running within a regular web application.

  The reason for this difference is that the Oracle JSF Portlet Bridge runs JSF in two requests not one. It is implemented as if every JSF request redirected before the render phase. The consequence of this approach is that the JSF `restoreView` phase is called both when the request is first submitted and then again when request to render is received.
- Do not access or reference request parameters from model code except in page parameters. Besides being a cleaner MVC2 implementation, following this guideline avoids problems when such artifacts are published as portlets. Where regular JSF artifacts run their entire lifecyle in a single request, the Oracle JSF Portlet Bridge runs these artifacts in two requests, as if every JSF request redirected before the render phase.

  This two phase model enables the clearing of submitted parameters before rendering in a manner that allows such clearing to be communicated all the way back to the client, which makes this request something you could bookmark. As a

result, request parameters do not exist during the render phase. As described previously, `prepareModel` is invoked again in this rendering phase. Therefore, any references to request parameters in this phase handler fail. You should avoid code like either of the following fragments:

```
<invokeAction id="doExecuteWithParams"
              Binds="ExecuteWithParams"
              Refresh="prepareModel"
              RefreshCondition="${param.id != null}"
/>

<invokeAction id="doExecuteWithParams"
              Binds="ExecuteWithParams"
              Refresh="renderModel"
              RefreshCondition="${param.id != null}"
/>
```

- Do not reference page parameters in the `prepareModel` phase. This issue relates to the same problem just described for request parameters. Generally, page parameters depend on request parameters and are evaluated during the `restoreView` phase. As this phase is called a second time during portlet rendering and request parameters are not available, such use fail. Instead, move any dependency on a page parameter value into the model before JSF transitions from its execute phases to its render phase.
- If you are portletizing an application that contains only Trinidad components (`<tr: >` tags only), then you must manually include the following libraries in your project:
  - `jdeveloper\modules\oracle.adf.view_11.1.1\adf-richclient-api-11.jar`
  - `jdeveloper\modules\oracle.adf.view_11.1.1\adf-richclient-impl-11.jar`

  This is so that the URLs to icons in the style sheet generated for the producer are encoded correctly.
- Because a portlet is a naming container, special consideration should be taken when using ADF Faces client-side APIs to find components. An example component ID:
  - When run as a regular web application: `id="demoTemplate:popup"`
  - When run as a Portlet Producer application: `id="__ns12345678:demoTemplate:popup"`

  Things to watch out for specifically are:
  - Avoid using the `AdfPage.PAGE.findComponentByAbsoluteId()` API. Use `getSource()` and `findComponent()` methods instead. For example:

```
<trh:script text="
function showPopup(event) {
    event.cancel();
    // var popup =
    //  AdfPage.PAGE.findComponentByAbsoluteId("demoTemplate:popup");
    var source = event.getSource();
    var popup = source.findComponent("popup");
    popup.show({align:"after_end", alignId:"button"});
}
"/>
```

  - Use a relative path for `clientId` instead of an absolute path (starting with a ':'). For example, use:

    ```
    <af:showPopupBehavior popupId="demoTemplate:iteratorpop"
                triggerType="mouseHover"/>
    ```

    Instead of:

    ```
    <af:showPopupBehavior popupId=":demoTemplate:iteratorpop"
                triggerType="mouseHover"/>
    ```

  - For more information, see "What You May Need to Know About Using Naming Containers" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

- If you are portletizing an Oracle ADF task flow that triggers a contextual event, the Oracle JSF Portlet Bridge creates a JSR 286 event to wrap the contextual event. Part of the JSR 286 event's payload is the wrapped contextual event payload, which is serialized. When this wrapped contextual event is delivered, the contextual event payload must be deserialized on the consumer before the contextual event can be forwarded into the consumer application. To deserialize the event, the payload class must be available on the consumer as well as on the producer. This condition is automatically met when the original payload is a Java Runtime Environment class, such as `java.lang.String`.

- If your Oracle ADF task flow includes ADFm events that do not have corresponding portlet events declared in the `portlet.xml` file, you can enable the Oracle JSF Portlet Bridge to raise these undeclared events.

  To raise undeclared events, set the following container runtime option for the portletized task flow:

  ```
  <portlet id="Application5untitled1jspx1_1">
     ...
     <container-runtime-option>
        <name>oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents</name>
        <value>true</value>
     </container-runtime-option>
     ...
  </portlet>
  ```

  Setting this option to `true` means that any ADFm event raised is forwarded on as a portlet event. If this option is not provided or is set to `false`, then only events with corresponding portlet event declarations are forwarded.

  You can also enable undeclared portlet events to automatically be forwarded on from the portlet binding as ADFm events.

  In the portlet binding, set the `raiseUndeclaredContextualEvent` attribute to `true`, for example:

  ```
  <portlet id="Application5untitled1jspx1_1"
           portletInstance="/oracle/adf/portlet/WsrpPortletProducer4/ap/
                 Application5untitled1jspx_2943bd23_012e_1000_8004_0aa7c0849010"
           class="oracle.adf.model.portlet.binding.PortletBinding"
           retainPortletHeader="false"
           listenForAutoDeliveredPortletEvents="true"
           listenForAutoDeliveredParameterChanges="true"
           raiseUndeclaredContextualEvents="true"
           xmlns="http://xmlns.oracle.com/portlet/bindings"/>
  ```

Setting this option to `true` means that if a portlet event is received, a corresponding ADFm event is raised, even if there is no event declaration in the portlet binding. The name of the ADFm event is directly taken from the QName of the portlet event. This is so that ADFm events raised from the Oracle JSF Portlet Bridge have the same name as that used when the event was raised on the remote application.

- By default, URLs in the portletized page or task flow are encoded such that they are proxied by the consumer application. In some circumstances, you may not want to encode these URLs, for example, when requesting JavaScript libraries from content delivery networks or accessing resources directly from the user's browser to make use of a locally configured HTTP proxy. To bypass the URL encoding, set the `_xEncodeUrl` parameter to `false` on URLs that are passed to the Oracle JSF Portlet Bridge for encoding.

  For example, an inline frame that contains a Google Map would typically need to make use of the user's browser HTTP proxy settings to access the external `maps.google.com` server. The ADF markup to enable the component to work correctly when exposed as a portlet would look like the following:

```
<af:inlineFrame id="if1"
                shortDesc="Location of office"
                source="http://maps.google.com/maps?q=RG6+1RA&amp;
                        output=embed&amp;_xEncodeUrl=false"/>
```

  Note: Do not use this parameter to access resources that reside on the producer server. These resources must be accessed using the portlet client's proxy.

59.4 Copying a Runtime-Created Skin to a JSF Portlet Producer Application

In a WebCenter Portal application, you can create skins at runtime, using the Resource Manager. When you do this, you may encounter rendering issues on pages that include JSF portlets. This is because the skin used by the WebCenter Portal application is not available to the remote application rendering the task flow.

To rectify this issue, you must copy the runtime-created skin to the Portlet Producer application created when the task flow was portletized.

To copy a runtime-created skin to a Portlet Producer application:

1. Export the skin from the Framework application to an EAR file.

   For information about how to do this, see Section 17.4.1, "How to Download a Resource Using the Resource Manager."

2. Repackage the exported skin as a shared library (a JAR file):

   a. Extract the `transport.mar` file:

```
$ jar xvf myskin.ear
inflated: transport.mar
```

   b. Extract the metadata files:

```
$ jar xvf transport.mar
inflated: oracle/webcenter/siteresources/.../Skin.css
inflated: oracle/webcenter/siteresources/.../generic-site-resources.xml
...
```

c. Locate and view the file `generic-site-resources.xml` among the metadata files. Normally, this file is in a directory like:

```
oracle/webcenter/siteresources/scopedMD/scopeGUID/generic-site-resources.xml
```

The file should have a section that describes the exported skin, similar to the following example:

```
<resourceType name="skin" ...>
  <resource displayName="MySkin"
     metadataFile="/oracle/webcenter/siteresources/.../Skin.css" ...>
    <customAttributes>
      <customAttribute name="skinId"
         value="gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a.desktop" .../>
      <customAttribute name="skinFamily"
         value="gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a" ...>
      <customAttribute name="skinExtends"
         Value="webcenter-fusion-internal.desktop" .../>
    </customAttributes>
  </resource>
</resourceType>
```

d. Note the following information from `generic-site-resources.xml`:

- *`skinId`* (for example, `gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a.desktop`)
- *`skinFamily`* (for example, `gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a`)
- *`skinExtends`* (for example, `webcenter-fusion-internal.desktop`)

e. Build the directory structure for the JAR file:

```
$ mkdir META-INF
```

f. Copy the `Skin.css` file into the `META-INF` directory:

```
$ cp oracle/webcenter/siteresources/.../Skin.css META-INF
```

g. Create a new file called `trinidad-skins.xml` under the `META-INF` directory:

```
$ edit META-INF/trinidad-skins.xml
```

h. Add the following XML to the new `trinidad-skins.xml` file:

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<skins xmlns="http://myfaces.apache.org/trinidad/skin">
  <skin>
    <style-sheet-name>Skin.css</style-sheet-name>
    <id>skinId</id>
    <family>skinFamily</family>
    <extends>skinExtends</extends>
    <render-kit-id>org.apache.myfaces.trinidad.desktop</render-kit-id>
  </skin>
</skins>
```

where ***`skinId`***, ***`skinFamily`***, and ***`skinExtends`*** are the values noted earlier.

i. Package the JAR file:

```
$ jar cvf myskin.jar META-INF
adding: META-INF/trinidad-skins.xml(in = 359) (out= 171)(deflated 52%)
adding: META-INF/Skin.css(in = 5560) (out= 1413)(deflated 74%)
```

The JAR file should contain two files: `Skin.css` and `trinidad-skins.xml`.

3. Copy the new `myskin.jar` file to the Portlet Producer application.

   The easiest way to do this is to copy the file to the `WEB-INF/lib` directory of the Portlet Producer web application.

60

Creating Portlets with the Portlet Wizard

This chapter explains how to create Java portlets based on the Java Portlet Specification (JSR 286) or the Oracle Portal Developer Kit-Java (PDK-Java) in a WebCenter Portal Portlet Producer application, using the Create JSR 286 Java Portlet and Create Oracle PDK-Java Portlet wizards.

This chapter includes the following sections:

- Section 60.1, "Introduction to Java Portlets"
- Section 60.2, "Creating Java Portlets"
- Section 60.3, "Troubleshooting Java Portlets"

60.1 Introduction to Java Portlets

This section includes the following sections:

- Section 60.1.1, "Introduction to Standards-Based Java Portlets"
- Section 60.1.2, "Introduction to PDK-Java Portlets"

60.1.1 Introduction to Standards-Based Java Portlets

Historically organizations engaged in portal development projects found application integration to be a major issue. Users developed portlets using proprietary APIs for a single portal platform and often faced a shortage of available portlets from a particular portal vendor. All this changed with the introduction of the following standards:

- Web Services for Remote Portlets (WSRP)
- Java Specification Request (JSR) 286

These two standards enable the development of portlets that interoperate with different portal products, and therefore widen the availability of portlets within an organization. This wider availability, in turn, dramatically increases an organization's productivity when building portals.

WSRP is a web services standard that enables the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container and any WSRP portal. WSRP defines the following:

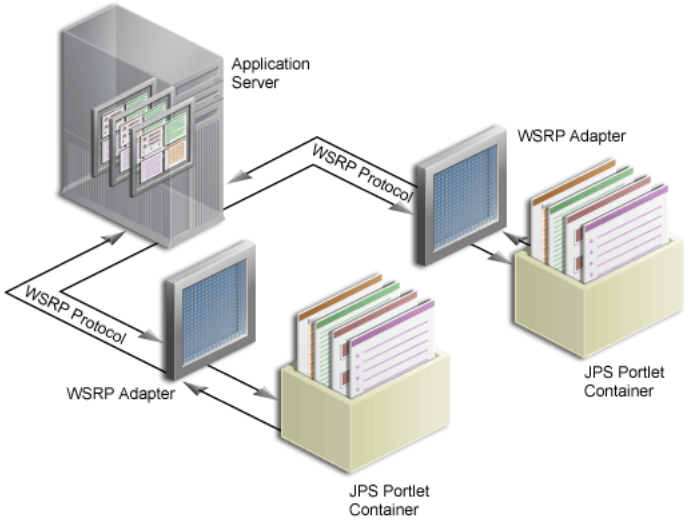
- Web Services Definition Language (WSDL) interface for the invocation of WSRP services
- Markup fragment rules for markup emitted by WSRP services
- The methods to publish, find, and bind WSRP services and metadata

JSR 286 is a specification that defines a set of APIs to enable interoperability between portlets and portals, addressing the areas of aggregation, personalization, presentation, and security. JSR 286 defines container services which provide the following:

- A portlet API for coding portlet functionality
- The URL-rewriting mechanism for creating user interaction within a portlet container
- The security and personalization of portlets
- Inter-portlet communication using portlet events and public render parameters

Oracle actively participates in portlet standards including those produced by the OASIS (WSRP) and JCP (JSR 168, 286, 301, 329, and so on) standards organizations.

> **Note:** HTML forms can be submitted using either the `get` or `post` method, but the WSRP standard only requires the consumer to use the `post` method. Support of the `get` method is optional according to the standard. Since application consumers are not required to support the `get` method, Oracle recommends that you use the `post` method when developing your portlets.



The Relationship Between WSRP and JSR 286

WSRP is a communication protocol between a portlet client, for example, a WebCenter Portal: Framework application, and a portlet container running on a remote server. JSR 286 describes the Java Portlet API for running Portlet Producer applications. Combining these standards enables developers to integrate their applications from any internal or external source as portlets with WSRP portals. Building pages becomes as simple as selecting portlets from the JDeveloper Resource Palette or Application Resources pane of the Application Navigator.

Figure 60–1 shows the architecture of the WSRP specification.

> **Note:** Figure 60–1 illustrates the use of JSR 286 portlets with WSRP.

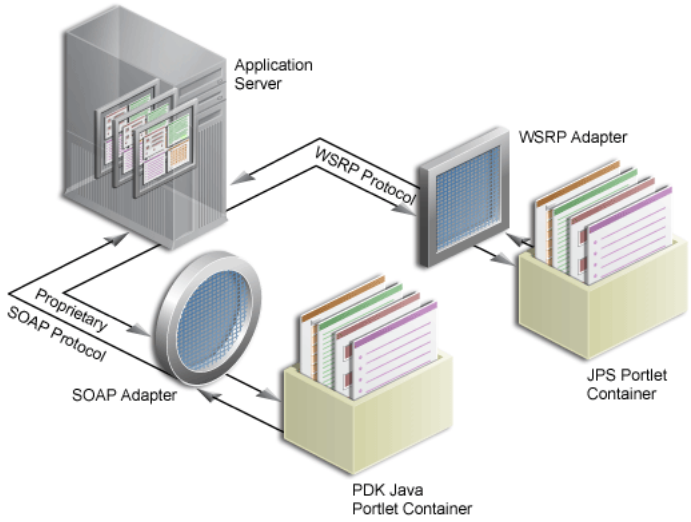


Figure 60–1 WSRP Specification Architecture

WebCenter Portal: Framework can support communication between the Framework application and both the Java Portlet APIs and our existing APIs (PDK-Java).

Figure 60–2 shows the architecture of the WSRP support. Notice that the JSR 286-compliant portlet container uses the WSRP protocol for communication and the PDK-Java portlet container uses Oracle's proprietary SOAP protocol for communication.

Figure 60–2 WebCenter Portal Portlet Architecture

For a description of how JSR 286 security concepts are exposed through WSRP, see Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."

60.1.2 Introduction to PDK-Java Portlets

PDK-Java gives you a framework to simplify the development of Java portlets by providing commonly required utilities and enabling you to leverage existing development skills and application components such as JSPs, servlets, and static HTML pages. PDK-Java also enables you to create portlets without having to deal directly with the complexity of communications between WebCenter Portal: Framework and producers.

The PDK-Java framework is divided into the following areas:

- The **Producer Adapter** insulates the developer from the HTTP syntax defined by WebCenter Portal: Framework for communication with web producers. It translates the information passed between WebCenter Portal: Framework and your Java web producer. Without an adapter, your producer would not only manage portlets, but it would also have to communicate this information directly to WebCenter Portal: Framework in the expected language. The adapter eliminates the need for your web producer to understand the portal language and vice-versa.
- The **Producer Interface** defines the APIs (functions) required by your Java implementation to integrate with the Producer Adapter. The Producer Adapter receives messages from the Framework application, translates them into calls to the Producer Interface, and translates the producer's response into a format that the application can understand. The Producer Interface contains a set of Java classes that define the methods your producer implements and, in often, provides a standard implementation. Some of the primary classes are as follows:

  - `ProviderDefinition` (`oracle.portal.provider.v2.ProviderDefinition`)
  - `ProviderInstance` (`oracle.portal.provider.v2.ProviderInstance`)
  - `PortletDefinition` (`oracle.portal.provider.v2.PortletDefinition`)
  - `PortletInstance` (`oracle.portal.provider.v2.PortletInstance`)
  - `ParameterDefinition` (`oracle.portal.provider.v2.ParameterDefinition`)
  - `EventDefinition` (`oracle.portal.provider.v2.EventDefinition`)
- The **Producer Runtime** provides a base implementation that follows the specification of the Producer Interface. The Producer Runtime includes a set of default classes that implement each of the Producer Interfaces and enables you to leverage the rendering, personalization, and security frameworks provided with PDK-Java. These classes and the associated frameworks simplify the development of a producer by implementing common functions for WebCenter Portal: Framework requests and providing a declarative mechanism for configuring the producer. Using the Producer Runtime, you can focus your development efforts on the portlets themselves rather than the infrastructure needed to communicate with the Framework application. If the standard behavior of the Producer Runtime does not meet your requirements, then you can easily extend or override specific behaviors. Some of the primary classes are as follows:
  - `DefaultProviderDefinition` (`oracle.portal.provider.v2.DefaultProviderDefinition`)
  - `DefaultProviderInstance` (`oracle.portal.provider.v2.DefaultProviderInstance`)
  - `DefaultPortletDefinition` (`oracle.portal.provider.v2.DefaultPortletDefinition`)
  - `DefaultPortletInstance` (`oracle.portal.provider.v2.DefaultPortletInstance`)
  - `PortletRenderer` (`oracle.portal.provider.v2.render.PortletRenderer`)
  - `PortletPersonalizationManager` (`oracle.portal.provider.v2.personalize.PortletPersonalizationManager`)
  - `PortletSecurityManager` (`oracle.portal.provider.v1.http.DefaultSecurityManager`)
- The **Producer Utilities** provide methods for simplifying the rendering of portlets. The utilities include methods for constructing valid links (`hrefs`), rendering the portlet's container (including the header), rendering HTML forms that work within a page, and supporting portlet caching.

For more information about the PDK-Java, see the *Oracle Fusion Middleware Java API Reference for Oracle PDK Java*.

60.2 Creating Java Portlets

Before you begin you should make sure:

- You are familiar with portlet terminology such as portlet modes. For more information, see Chapter 58, "Overview of Portlets."
- You are familiar with Oracle JDeveloper and know how to build and deploy Java components using it.
- The application in which you are going to create your JSR 286 and PDK-Java portlets is either a Portlet Producer application or any application scoped for portlet creation (any application except for one using WebCenter Portal's Framework application template).

> **Note:** The figures in this section were taken with the default Look and Feel (Oracle) and Theme (Fusion Blue) settings in JDeveloper. If you have changed these settings, then what you see on your screen may vary slightly, but the content and functionality remains the same. To change the Look and Feel and Theme settings, select **Preferences** from the **Tools** menu, and then select **Environment.**

This section includes the following subsections:

- Section 60.2.1, "How to Create a JSR 286 Java Portlet"
- Section 60.2.2, "What Happens When You Create a JSR 286 Java Portlet Using the JDeveloper Wizard"
- Section 60.2.4, "How to Create a PDK-Java Portlet"
- Section 60.2.5, "What Happens When You Create a PDK-Java Portlet"
- Section 60.2.6, "After You Create an Oracle PDK-Java Portlet Using the JDeveloper Wizard"

60.2.1 How to Create a JSR 286 Java Portlet

Using the Create JSR 286 Java Portlet wizard in JDeveloper you can expose your portlet over WSRP 2.0 quickly and easily. This wizard supports both WSRP 1.0 and WSRP 2.0.

In the Create JSR 286 Java Portlet wizard, you can choose which portlet modes you want to implement and the implementation method (JSP, HTTP servlet, Java class, or HTML) to use for each mode. The wizard then creates a simple implementation for each of the selected modes.

To create a JSR 286 Java portlet using the JDeveloper wizard:

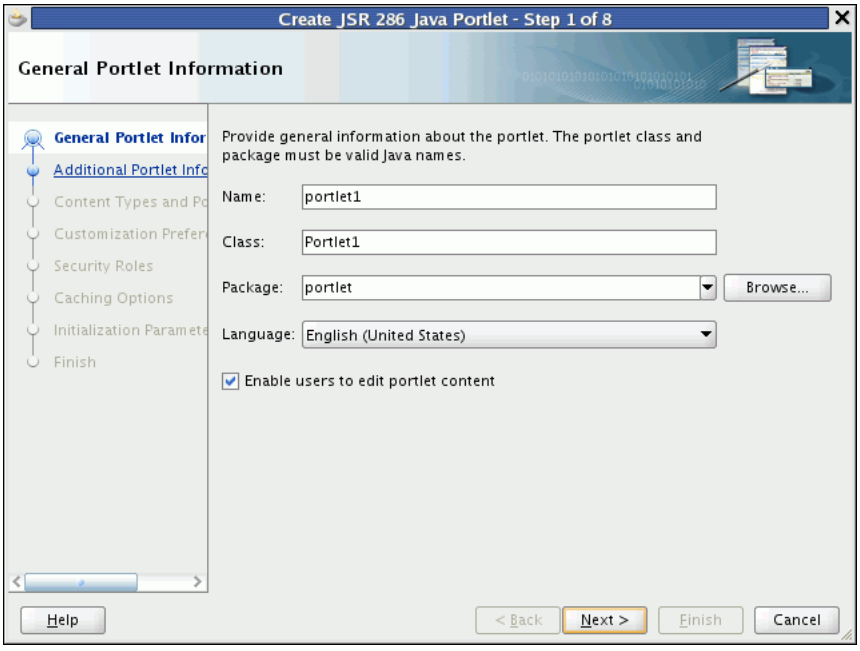
1. In the JDeveloper Application Navigator, open the application under which you want to create your portlet.

   The application must be scoped for portlet creation. An easy way to achieve this is to use the Portlet Producer Application template.

   > **Note:** Application built using WebCenter Portal's Framework application template are *not* scoped for portlet creation.

2. Right-click the project under which you want to create your portlet (for example **Portlets**), and choose **New.**

3. In the New Gallery, expand **Web Tier,** select **Portlets** and then **Standards-based Java Portlet (JSR 286),** and click **OK.**



Note: If the project already contains JSR 286 portlets, you can also create a new portlet by:

- Right-clicking `portlet.xml` and choosing **Add Portlet**.
- Opening `portlet.xml`, clicking the **Design** tab, and clicking the **Add** icon on the **Portlets** tab.

---

4. On the General Portlet Information page of the Create JSR 286 Java Portlet wizard (Figure 60–3), replace the default name provided in the **Name** field with one that better describes the purpose of the portlet.

Figure 60–3 The General Portlet Information Page

5. In the **Class** field, enter a name for the class for the portlet. You can accept the default name provided or supply your own. If you supply your own name, it must be a valid Java name.

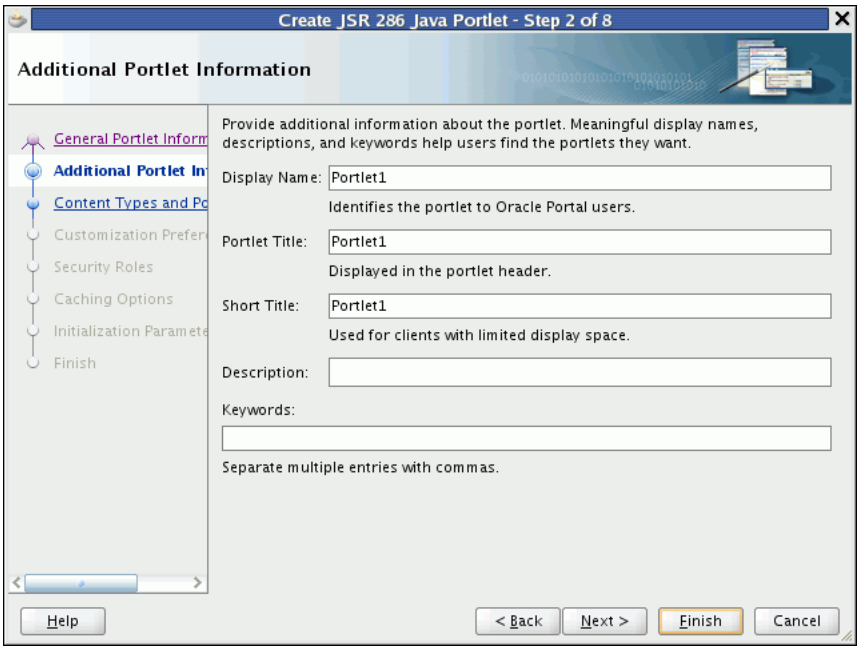
6. From the **Package** enter the name of the package in which to create the class, or select the package from the dropdown list.

   Click the **Browse** button to find packages within the project, if required. If you do not select a specific package, the wizard uses the default package of the project.

7. From the **Default Language** dropdown list, select the default language that your portlet supports. The wizard uses English by default.

8. Select **Enable users to edit portlet content** if you want your portlet to support Edit mode. In the wizard, this option is selected by default.

   Edit mode enables users to personalize the portlet at runtime. For more information, see Section 58.1.3.2, "Edit Mode."



If you select this option, you can specify implementation details for the portlet's Edit mode later on in the wizard.

9. Click **Next**.

10. On the Additional Portlet Information page (Figure 60–4), in the **Portlet Title** field, enter a descriptive title for your portlet.

    The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.

Figure 60–4 The Additional Portlet Information Page

11. The **Display Name**, **Short Title**, **Description**, and **Keyword** attributes are not implemented in Framework applications. You do not need to enter any values for these fields unless your portlet is likely to be consumed by other applications.

    For example, Oracle Portal uses the portlet display name in the Portlet Repository.

12. At this point in the wizard, you can click **Finish** to create the portlet immediately, using the default values for all remaining settings.

    To provide additional details for your portlet, click **Next** and follow the remaining steps.

13. On the Content Types and Portlet Modes page (Figure 60–5), in the **Content Types and Portlet Modes** list, select **view**.

Figure 60–5 The Content Types and Portlet Modes Page

14. In the Implementation Method section, select how you want to implement View mode for your portlet (for more information about View mode, see Section 58.1.3.1, "View Mode"):

    - Select **Generate JSP** to generate a skeleton JSP file for the portlet mode. Enter a name for the JSP in the corresponding field, or accept the default.

      When you complete the wizard, the generated JSP displays in the Application Navigator where you can select it for further development. This is the default selection for all portlet display modes.

    - Select **Generate ADF-Faces JSPX** to generate a page to which you can add ADF-Faces components. Enter a name for the JSPX in the corresponding field, or accept the default.

      Note: If you choose this option, the portlet implementation class is created as a subclass of `oracle.portlet.bridge.adf.application.ADFBridgePortlet`, instead of as a subclass of `javax.portlet.GenericPortlet`. That is, the wizard generates a Portlet Producer application which uses the Oracle JSF Portlet Bridge. For more information about the Oracle JSF Portlet Bridge, see Chapter 59, "Creating Portlets with the Oracle JSF Portlet Bridge."

    - Select **Map to Path** to map the portlet mode to a web resource in the Portlet Producer application, such as a page. The resource is not generated by the wizard. Enter the name and path in the corresponding field. You can create this resource after completing the wizard if necessary.

      With this selection, you must write the targeted resource or file yourself. The target could be, for example, a JSP, a servlet, or an HTML file. This selection enters code in the generated portlet Java class that routes requests for the given mode to the specified target.

- Select **Custom Code** to implement the portlet mode through a custom coded object. You must create this object later. This selection generates a skeleton method to render content (`private void do`*`MODE_NAMECONTENT_TYPE`*) in the generated portlet java class. You must update this code to render useful content.

Note: If you want this portlet mode to support a different content type, for example text/xml, see Step 17.

---

15. If you selected **Enable users to edit portlet content** on the first page of the wizard, select **edit** and then select the implementation method for Edit mode (for information about Edit mode, see Section 58.1.3.2, "Edit Mode").
16. To implement another portlet mode for your portlet:
    a. In the **Content Types and Portlet Modes** list, select an existing mode (for example, **view**) under the appropriate content type (for example, **text/html**).
    b. Click **Add**.
    c. In the Portlet Modes dialog, move the required modes to the **Selected** list and click **OK**.

       The Portlet Modes dialog lists the standard modes supported by JSR 286 and the extended modes supported by WebCenter Portal.

       For more information, see Section 58.1.3, "Portlet Modes."
    d. Select each of the portlet modes and specify the implementation method to use for rendering content, as described in step 14.
17. To add a new content type:
    a. In the **Content Types and Portlet Modes** list, select an existing content type (for example, **text/html**).
    b. Click **Add**.
    c. In the Content Types dialog, move the required content types to the **Selected** list and click **OK**.
18. Click **Next.**

    If you selected **Enable users to edit portlet content** on the General Portlet Information page earlier in the wizard, then you can create customization preferences to enable users of the portlet to specify values for the portlet at runtime. Go to step 19.

    If you did not select this option, go to step 24.
19. On the Customization Preferences page (Figure 60–6), click **Add** to add a new customization preference to the portlet.

    By default, the wizard includes a customization preference to enable users to customize the portlet title.

Figure 60–6 The Customization Preferences Page

20. In the Add New Preference dialog, in the **Name** field, enter a name for the new preference.

    The name must be unique in the portlet. Use only letters, numbers, and the underscore character.

21. In the **Default Values** field, enter one or more default values for the new preference. Separate multiple values with commas.

22. To make the preferences translatable, select the **Translate Preference** checkbox and then click **OK.**

    JDeveloper generates a resource bundle class for translatable preferences, with strings for which you can obtain translations. At runtime, the portlet references the resource bundle entries.

    Note: The preference name is always translated, but there is not always a requirement to translate the default values. For example, if the value is an integer, then no translation is needed.

    ---

23. Repeat the preceding steps to add more preferences. When you are done click **Next.**

24. On the Security Roles page (Figure 60–7), to add an existing security role to your portlet, select the security role and move it to the **Selected** list.

    Security roles enable you to set tiered levels of access to the portlet. For example, a *View* user can view the portlet but cannot edit it; a *Customize* user can customize portlet settings; a *Manage* user can perform all available functions associated with the portlet.

    The **Available** list displays the security roles defined for the application in which you are creating the portlet. Moving a security role to the **Selected** list creates a reference of the security role in the application's portlet deployment file

(`portlet.xml`) that refers to the security role in the application's web deployment file (`web.xml`).

You can create new security roles for the application by editing `web.xml`. For more information, see the JDeveloper online help.

Figure 60–7 The Security Roles Page

25. Click **Next.**

26. On the Caching Options page (Figure 60–8), select **Cache Portlet** to enable expiry-based caching for your portlet.

    Selecting this option indicates that portlet caching is managed by the portlet container. The portlet itself may choose to cache content for any given response. The settings on this page apply only when the portlet itself does not specify a caching condition for a response.

    If you do not want any default caching for this portlet, choose **Do Not Cache By Default.** In this case, the wizard actually sets a cache duration of 0 seconds. As stated earlier, this cache setting only comes into play when the portlet itself does not specify a caching condition for a response.

    If you choose no caching here and you later decide to implement default caching for the portlet, then you can change the cache duration value in the `portlet.xml` file, which is generated by the wizard, to a number greater than zero.

    For more information, see Section 61.2.9.1, "Implementing Expiry-Based Caching."

    For information about how to implement validation-based caching, see Section 61.2.9.2, "Implementing Validation-Based Caching."

Figure 60–8 The Caching Options Page

27. If you chose to cache the portlet, in the Default Expiry Conditions section, select:
    - **Cache Content Expires After [ ] seconds** to expire the cached portlet content after a certain amount of time. Specify the time limit in the corresponding field.
    - **Cache Content Never Expires** to never expire the cached portlet content. You may want to select this option if the portlet contains static content that is unlikely to change.
28. Click **Next.**
29. On the Initialization Parameters page (Figure 60–9), you can add initialization parameters to your portlet.

    Initialization parameters provide the application developer, who decides what goes into the `.war` file, an alternative to JNDI variables for configuring the behavior of all of the different components of the application (for example, servlets and portlets) in a compatible way. These initialization parameters are added to the `portlet.xml` file.

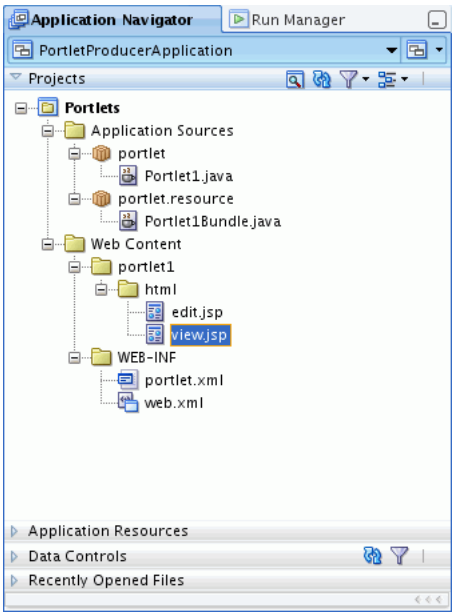
    a. Click **New** to add a new initialization parameter to the portlet.

    b. In the newly added row, double-click each field to provide a **Name**, default **Value**, and **Description** for the parameter.

    c. Repeat these steps to add more initialization parameters.

    d. When you are done, click **Finish**.

Figure 60–9 The Initialization Parameters Page



60.2.2 What Happens When You Create a JSR 286 Java Portlet Using the JDeveloper Wizard

When you use the JDeveloper wizard to create a JSR 286 Java portlet, JDeveloper generates a default implementation of the portlet. Specifically, the following files are created:

- Two Java classes:
  - *portletName*`.java` is invoked by the portlet container and contains all the methods required by the portlet standards.
  - *portletname*`Bundle.java` contains all the translation strings for the portlet.
- `portlet.xml` is the portlet deployment descriptor file for the application.
- `web.xml` is the web deployment descriptor file for the application.
- Files for each portlet mode you selected for the portlet:
  - If you selected **Generate JSP** for the portlet mode, a JSP page is created for the mode, for example, `view.jsp`.
  - If you selected **Generate ADF-Faces JSPX**, a JSPX page is created for the mode, for example, `view.jspx`. You can add Faces components to this page.
  - If you selected **Map to Path,** no additional files are created as the code for the portlet mode resides in an existing resource. Code is added to the portlet's Java class to route requests to the specified target.
  - If you selected **Custom Code**, no additional files are created, but the code for the portlet mode resides in the portlet's Java class.

You can see all these files in the Application Navigator, as shown in Figure 60–10.

Figure 60–10 Files Generated for a JSR 286 Java Portlet

60.2.3 After You Create a JSR 286 Java Portlet Using the JDeveloper Wizard

The next step is to extend the sample code with your own business logic to implement the desired functionality and features for your portlet. For more information, see the JSR 286 specification at:

`http://jcp.org/en/jsr/detail?id=286`

You can change the portlet's settings by editing the `portlet.xml` file. JDeveloper provides an Overview Editor to enable you to easily edit `portlet.xml`. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."

60.2.4 How to Create a PDK-Java Portlet

Using the Create Oracle PDK-Java Portlet wizard in JDeveloper you can quickly and easily create PDK-Java portlets. You can choose which portlet modes you want to implement and the implementation method (JSP, HTTP servlet, Java class, or HTML) to use for each mode. The wizard then creates a simple implementation for each of the selected modes.

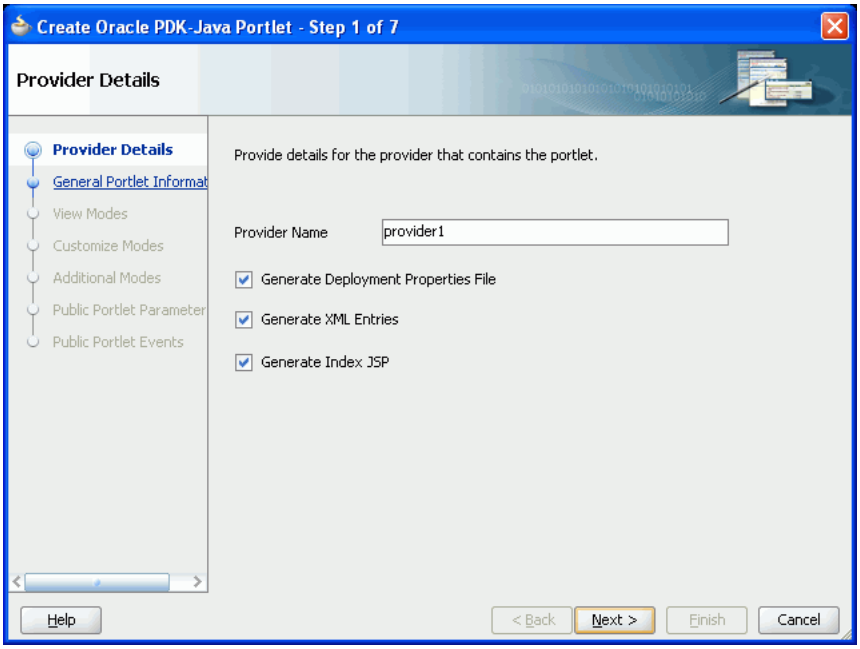
To create a PDK-Java portlet using the JDeveloper wizard:

1. In the JDeveloper Application Navigator, open the application under which you want to create your portlet.

   The application must be scoped for portlet creation. An easy way to achieve this is to use the Portlet Producer application template. Applications build using WebCenter Portal's Framework application template are not scoped for portlet creation.

2. Right-click the project under which you want to create your portlet, and choose **New.**

> **Note:** To create the portlet in an existing producer, right-click the producer's `provider.xml` file and choose **Add Portlet.** This takes you directly to the General Portlet Information page of the Create Oracle PDK-Java Portlet wizard (step 8).



3. In the New Gallery, expand **Web Tier,** select **Portlets** and then **Oracle PDK-Java Portlet,** and click **OK.**

> **Note:** Selecting **Oracle PDK-Java Portlet** opens the wizard for creating PDK-Java portlets. Selecting **Standards-based Java Portlet** opens the wizard for creating JSR 286-compliant portlets.

4. On the Provider Details page of the Create Oracle PDK-Java Portlet wizard (Figure 60–11), enter a name for the new producer to contain your portlet. This name must be unique within the project.

   In the PDK-Java, the term provider is used instead of producer. A provider is the same thing as a producer.

Figure 60–11 The Provider Details Page

5. Select **Generate Deployment Properties File.**

   This automatically generates two `.properties` files:

   - *`serviceID`*`.properties` defines properties for a producer with that service ID. The service ID has the same value as the producer name.
   - `_default.properties` is a default properties file. A producer application may have multiple producers, each with its own service ID. On registration, if no service ID is defined, then the default properties file is used.

6. Select **Generate XML Entries.**

This automatically generates a producer definition file (`provider.xml`) for the producer that contains details of the portlets belonging to the producer, including those generated by the wizard.

7. Select **Generate Index JSP** and then click **Next.**

   This automatically generates an `index.jsp` file that lists all the producers that reside in the application with hyperlinks that enable easy access to producer test pages.

8. On the General Portlet Information page (Figure 60–12), enter a name and display name for your portlet.

   The name is used internally and is not exposed to users. The display name is displayed to users in portlet selection lists, such as the Component Palette.

   The description is not implemented in Framework applications so you do not need to enter a value in this field unless your portlet is likely to be consumed by other applications, such as Oracle Portal.

Figure 60–12 The General Portlet Information Page

9. In the **Timeout Interval (Seconds)** field, enter the number of seconds to allow for rendering the portlet.

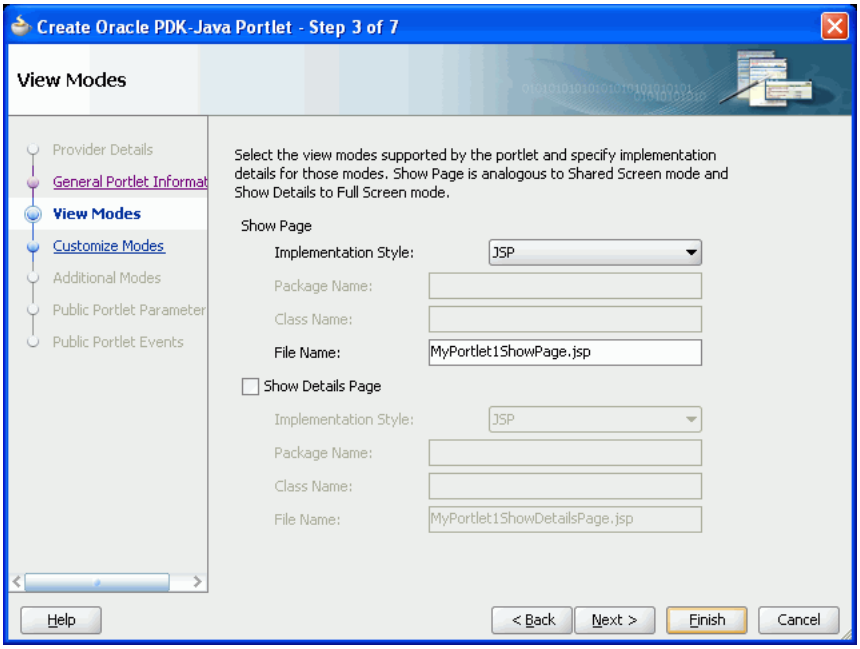
10. In the **Timeout Message** field, enter a message to display if the rendering of the portlet exceeds the timeout interval specified and then click **Next.**

11. On the View Modes page (Figure 60–13), under Show Page, from the **Implementation Style** dropdown list, select the implementation style to use for the portlet's Shared Screen mode.

    - Select **JSP** to implement the portlet's Shared Screen mode as a JavaServer Page. In the **File Name** field, enter the name of the file to be generated by the wizard.
    - Select **HTTP Servlet** to implement the portlet's Shared Screen mode as an HTTP servlet. In the **Package Name** field, enter the name of the package that

contains the HTTP servlet. In the **Class Name** field, enter the Java class to be referenced with the portlet's Shared Screen mode.

- Select **HTML File** to implement the portlet's Shared Screen mode as an HTML file. In the **File Name** field, enter the name of the file to be generated by the wizard. Note that, when you choose **HTML File,** the following code is added inside the `<renderer>` element of your `provider.xml` file:



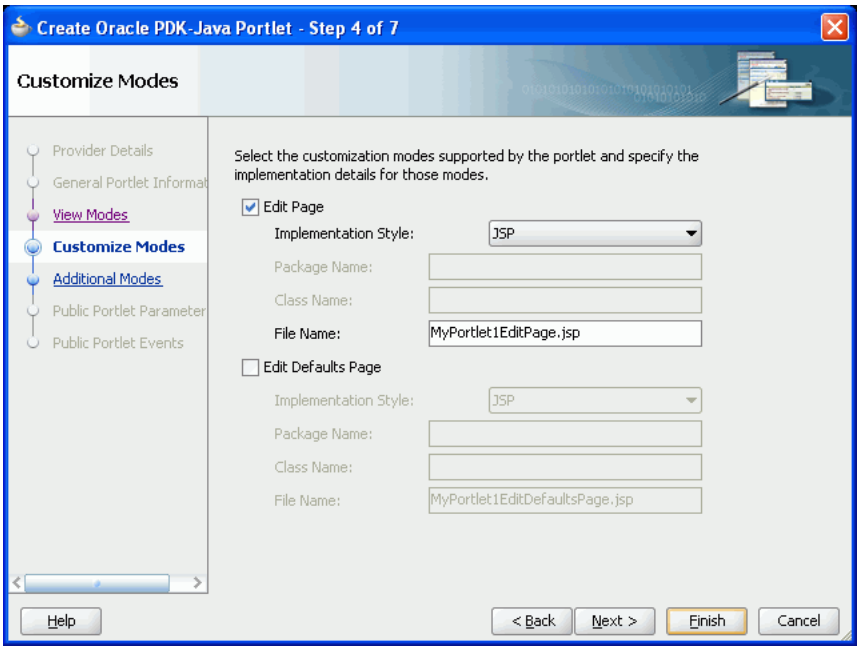
```
<showPage class="oracle.portal.provider.v2.render.http.ResourceRenderer">
    <resourcePath>provider_id/portlet_name/file.html</resourcePath>
    <contentType>content_type</contentType>
    <charSet>char_set</charSet>
 </showPage>
```

  `charSet` indicates the character set that the producer must use to encode the HTML page. The default character set is determined by JDeveloper preferences. If you require a different character set, you must update this element of `provider.xml` accordingly.

- Select **Java Class** to implement the portlet's Shared Screen mode as a Java class. In the **Package Name** field, enter the name of the package that contains the Java class. In the **Class Name** field, enter the name of the Java class.

For more information about Shared Screen mode, see Section 58.1.3.1, "View Mode."

Figure 60–13 The View Modes Page



12. To implement Full Screen mode for your portlet, select **Show Details Page** and then select an implementation style as described for Full Screen mode in step 11.
13. At this point in the wizard, you can click **Finish** to create the portlet immediately, using the default values for all remaining settings.

    To provide additional details for your portlet, click **Next** and follow the remaining steps.

14. On the Customize Modes page (Figure 60–14), **Edit Page** is selected by default. To implement Edit mode for your portlet, select an implementation style as described for Shared Screen mode in step 11. If you do not want to implement Edit mode, then deselect **Edit Page.**

    For more information about Edit mode, see Section 58.1.3.2, "Edit Mode."

Figure 60–14 The Customize Modes Page

15. To implement Edit Defaults mode for your portlet, select **Edit Defaults Page**, and then select an implementation style as described for Shared Screen mode in step 11.

    For more information about Edit Defaults mode, see Section 58.1.3.3, "Edit Defaults Mode."

16. Click **Next.**

17. On the Additional Modes page (Figure 60–15), to implement Help mode for your portlet, select **Help Page**, and then select an implementation style as described for Shared Screen mode in step 11.

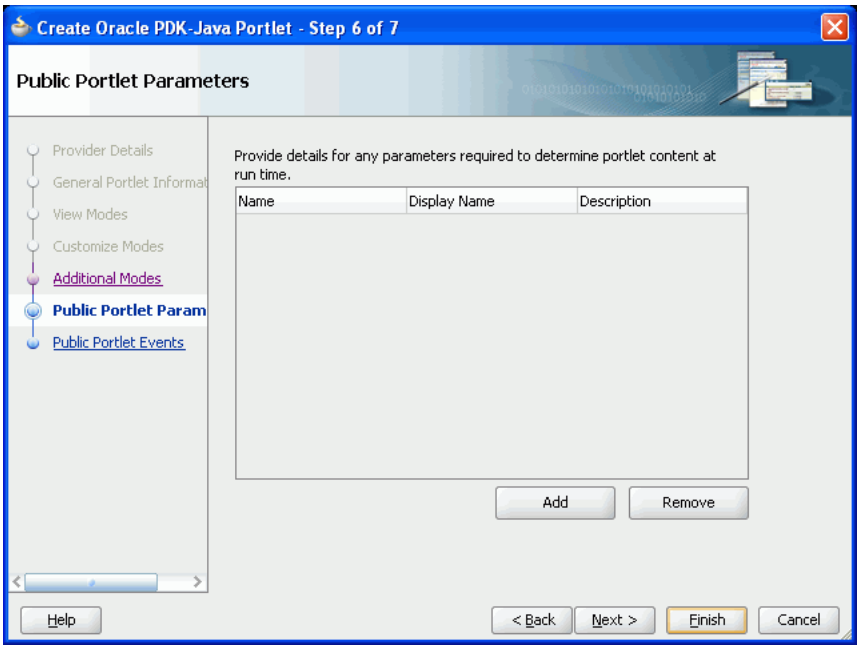
    For more information about Help mode, see Section 58.1.3.4, "Help Mode."

Figure 60–15 The Additional Modes Page

18. To implement About mode for your portlet, select **About Page**, and then select an implementation style as described for Shared Screen mode in step 11.

    For more information about About mode, see Section 58.1.3.5, "About Mode."

19. Click **Next.**



20. On the Public Portlet Parameters page (Figure 60–16), click **Add** to add a public parameter to your portlet.

    This adds a new row to the table of parameters. Double-click each field in the row to provide a name, display name, and description for the parameter.

    Repeat this step to add more public parameters. When you are done, click **Next.**

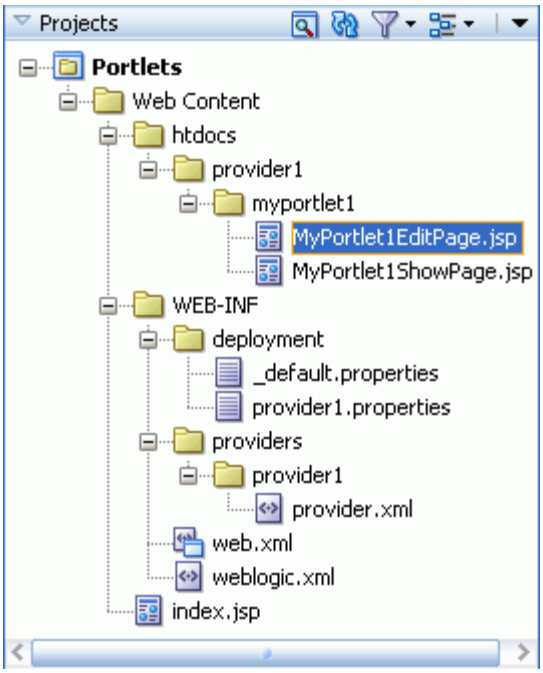
    Public portlet parameters enable a portlet to communicate with the page on which it resides and with other portlets on that page. For more information, see Section 61.3.3, "How to Implement Public Parameters."

Figure 60–16 The Public Portlet Parameters Page

21. Oracle PDK-Java events are not supported in Framework applications, so On the Public Portlets Events page, click **Finish.**

    For more information about events, see the *Oracle Fusion Middleware Developer's Guide for Oracle Portal*.

60.2.5 What Happens When You Create a PDK-Java Portlet



When you use the JDeveloper wizard to create a PDK-Java portlet, JDeveloper generates a default implementation of the portlet. Specifically, the following files are created:

- Files for each portlet mode you selected, for example *portletname*`EditPage.jsp`.
- `provider.xml` is the producer definition file that contains details of the portlets belonging to the producer.
- `web.xml` is the web deployment file for the application.
- `weblogic.xml` includes a shared library definition pointing to the PDK-Java shared library.
- `index.jsp` is used by JDeveloper for testing purposes.
- `_default.properties` is the default properties file.
- *`serviceID`*`.properties` is the properties file for the producer identified by *serviceID*.

All these files are required to deploy and run the portlet successfully, except for `index.jsp`.

You can see all these files in the Application Navigator, as shown in Figure 60–17.

Figure 60–17 Files Generated for a PDK-Java Portlet

60.2.6 After You Create an Oracle PDK-Java Portlet Using the JDeveloper Wizard

The next step is to extend the sample code with your own business logic to implement the desired functionality and features for your portlet.

For more information about the PDK-Java, see the *Oracle Fusion Middleware Java API Reference for Oracle PDK Java*.

60.3 Troubleshooting Java Portlets

This section provides information to assist you in troubleshooting problems you may encounter while creating portlets using the Create Portlet Wizards.

60.3.1 Cannot Access the Create Portlet Wizard

Problem

In the New Gallery, I cannot find the Oracle PDK-Java Portlet or Standards-based Java Portlet (JSR 286) options.

Cause

The application in which you are trying to create the JSR 286 or PDK-Java portlet was created using WebCenter Portal's Framework application template and therefore is not scoped for portlet creation.

Solution

1. Try creating the portlet in a Portlet Producer Application or any application scoped for portlet creation (any application except for those built using WebCenter Portal's Framework application template).
2. In the New Gallery, click the All Technologies tab to list all available options regardless of the technology scope of the application.

60.3.2 Cannot Add the Portlet Functionality that I Want to the Portlet

Problem

I cannot find the option to add certain features, for example portlet events or public render parameters, to the portlet in the Create Portlet Wizard.

Cause

The Create Portlet Wizard does not provide the option to add certain features to portlets.

Solution

After you create the portlet using the Create Portlet Wizard, edit the `portlet.xml` file using the Overview Editor to add advanced functionality. For more information, see Section 61.2, "Enhancing JSR 286 Java Portlets."

61 Coding Portlets

This chapter explains how you can enhance the Java portlets you created with the Oracle JDeveloper Create Java Portlet wizards.

This chapter includes the following sections:

- Section 61.1, "General Guidelines for Coding Java Portlets"
- Section 61.2, "Enhancing JSR 286 Java Portlets"
- Section 61.3, "Enhancing PDK-Java Portlets"
- Section 61.4, "Testing Portlet Personalization"
- Section 61.5, "Creating a Struts Portlet"

Before You Begin

Before you begin looking through this chapter ensure that:

- You are familiar with portlet terminology such as portlet modes. For more information, see Chapter 58, "Overview of Portlets."
- You have access to a WebLogic Server (WLS) managed server that is configured for use as a portlet container, such as the WLS_Portlet server.
- You are familiar with JDeveloper and know how to build and deploy Java components using it. You can download JDeveloper from OTN:

  `http://www.oracle.com/technetwork/developer-tools/jdev/overview/index.html`

61.1 General Guidelines for Coding Java Portlets

When you write your portlets in Java for either JSR 286 or PDK-Java, you should follow the best practices described in this section.

This section includes the following subsections:

- Section 61.1.1, "Guidelines for Portlet Modes"
- Section 61.1.2, "Guidelines for Navigation within a Portlet"
- Section 61.1.3, "Guidelines for JavaScript"

61.1.1 Guidelines for Portlet Modes

Portlet modes exhibit the runtime portlet functionality seen by users. You can provide an extended set of modes in addition to the standard ones provided with WebCenter Portal. Different portal products support extended portlet modes as follows:

- WebCenter Portal has defined an extended set of portlet modes. Different modes are available for both PDK-Java and JSR 286 portlets. For example, the JSR 286 Java Portlet wizard for JSR 286 portlets includes an extended mode called print, which you can use to provide a printer friendly version of the portlet. PDK-Java offers some modes not offered by JSR 286. If you are coding portlets to JSR 286, then you can declare custom portlet modes in the `portlet.xml` file that map to the extended modes offered by PDK-Java, or to accommodate any other functionality you may want to provide.

  Defining custom modes is especially useful if the portlet must interoperate with portal implementations from other vendors. You can offer any of these modes to users. In fact, it is recommended that some modes like Edit Defaults are offered.

- Third party portal products may have their own set of extended modes (JSR 286 custom modes) that producers can offer. In WebCenter Portal: Framework applications, the portlet chrome shows only the custom modes that are defined in WebCenter Portal: Framework. Arbitrary custom modes that a third party or custom portlet producer offers are ignored and therefore not supported.

This section includes the following subsections that discuss each of the standard portlet modes:

- Section 61.1.1.1, "Guidelines for View Mode"
- Section 61.1.1.2, "Guidelines for Edit Mode"
- Section 61.1.1.3, "Guidelines for Edit Defaults Mode"
- Section 61.1.1.4, "Guidelines for Help Mode"
- Section 61.1.1.5, "Guidelines for About Mode"
- Section 61.1.1.6, "Guidelines for Preview Mode"
- Section 61.1.1.7, "Guidelines for Full Screen Mode (PDK-Java Only)"

61.1.1.1 Guidelines for View Mode

View mode is known as Shared Screen mode in PDK-Java. For information about View mode, see Section 58.1.3.1, "View Mode."

When developing portlets, you must consider all of the factors that may influence the portlet's appearance on the page, such as the portlet's containing object and the other portlets with which your portlet shares the page. For example, suppose you choose to place your portlet inside an HTML table cell. The portlet should display only content that can be rendered within a table cell. Furthermore, the actual size of the table cell may vary depending on user settings, the browser width, and the amount and style of content in the portlet.

61.1.1.1.1 HTML Guidelines for Rendering Portlets Plain HTML is the most basic way to render portlets and provides a great deal of flexibility to portlet developers. You can use almost any standard HTML paradigm, such as links, forms, images, tables, if it can display within an HTML table cell. Improperly written HTML may appear inconsistently across different browsers and, in the worst case, could cause parts of your page not to appear at all. Ensure that you adhere to the following rules:

- **Use standard HTML:** The official HTML specification is available from the W3C (more information available at: `http://www.w3.org/`).
- **Avoid unterminated and extraneous tags:** The behavior of pages with improperly terminated tags is unpredictable because it depends on what the browser chooses

to do. Tools like weblint and HTML Tidy can help detect and fix hanging and unnecessary tags.

- **Consider restrictions imposed by container objects:** If your portlet is contained inside of an HTML element, such as a table cell, then you must ensure that your portlet can be rendered within that container. For example, if you place a portlet in a table cell, then you could not use frames in the portlet because they do not appear when inserted in a table.
- **Keep portlet content concise:** Do not try to take full screen content and expose it through a small portlet. You may end up with portlet content too small or cramped for smaller monitors. Full screen content is best viewed in Full Screen mode of PDK-Java.
- **Do not create fixed-width HTML tables in portlets:** You have no way to tell how wide a column your portlet has on a user's page. If your portlet requires more room than given, then it might overlap with another portlet in certain browsers.
- **Avoid long, unbroken lines of text:** The result is similar to what happens with wide fixed-width tables. Your portlet might overlap other portlets in certain browsers.
- **Check behavior when resizing the page:** Test your portlet's behavior when the browser window is resized to ensure that it works in different browser window sizes.
- **Check behavior when the default browser font changes:** People may choose whatever font size they want and they can change it at any time. Your portlet should handle these situations gracefully.

The HTML you use also affects the perceived performance of your site. Users judge performance based on how long it takes for them to see the page they requested, and browsers require time to interpret and display HTML. Given that, you should consider the following:

- **Avoid lengthy, complex HTML:** Portlets share a page with other portlets. Thus, portlet generation times can significantly effect the overall performance of the page. If portlets must render complex HTML or wait for external resources, such as third-party applications, then it can greatly slow the rendering of the page.

61.1.1.1.2 Cascading Style Sheet Guidelines for Rendering Portlets

The fonts and colors of every portlet on a page should match the style settings chosen by the user. To accomplish this goal, these style selections are embedded automatically using a Cascading Style Sheet (CSS) on each page. The portlets access these settings for their fonts and colors, either directly or using the Application Programming Interface (API).

While different browsers have implemented varying levels of the full CSS specification, WebCenter Portal: Framework uses a very basic subset of this specification to allow for consistent fonts and colors. CSS implementation levels should not affect the consistency of your pages across browsers. Follow these guidelines for using CSS:

- **Use CSS instead of hard coding:** Hard coding fonts and colors is extremely dangerous. If you hard code fonts and colors, then your portlet may look out of place when the user changes the page style settings. Since you have no way of knowing the user's font and color preference choices, you might also choose to hard code a font color that turns out to be the same as the user's chosen background color, in which case your portlet appears to be invisible to that user.
- **Use the CSS APIs to format your text:** The style sheet definition is available at the top of pages, but you should not call it directly. Instead, use the APIs provided to

format your text appropriately. This method ensures that your portlets work even if the style sheet changes in the future.

- **Avoid using CSS for absolute positioning:** Since users can personalize their pages, you cannot guarantee that your portlet can appear in a particular spot.
- **Follow Accessibility Standards:** You should ensure that you code your style sheets according to existing accessibility standards (more information available at `http://www.w3.org/TR/WCAG10-CSS-TECHS/`).

61.1.1.2 Guidelines for Edit Mode

For information about Edit mode, see Section 58.1.3.2, "Edit Mode."

61.1.1.2.1 Guidelines for Edit Mode Operations The following guidelines should govern what you expose to users in Edit mode:

- **Enable users to personalize the title of the portlet:** The same portlet may be added to the same page several times. Enabling the user to personalize the title helps alleviate confusion.
- **If using caching, invalidate the content:** If personalizations cause a change in portlet display or content, then you must ensure that the portlet content is regenerated and not returned from the cache. Otherwise, the user may see incorrect content.
- **Do not use Edit mode as an administrative tool:** Edit mode is meant to give users a way of changing the behavior of their portlets. If you want to change producer settings or do other administrative tasks, then you should create secured portlets specifically for those tasks.

61.1.1.2.2 Guidelines for Buttons in Edit Mode For consistency and user convenience, Edit mode should implement the following buttons in the following order:

- **OK** saves the user personalizations and returns the portlet to view mode.
- **Apply** saves the user personalizations and reloads the current page.
- **Cancel** returns the portlet to view mode without saving changes.

61.1.1.2.3 Guidelines for Rendering Personalization Values When you show the forms used to change personalization settings, you should default the values such that the user does not have to constantly reenter settings. When rendering the personalization values, use the following sequence to provide consistent behavior:

1. **User preference:** Query and display this user's personalizations, if available.
2. **Instance defaults:** If no user personalizations are found, then query and display system defaults for the portlet instance. These are set in Edit Defaults mode and apply only to this portlet instance.
3. **Portlet defaults:** If no system default personalizations are found, then display general portlet defaults, which may be blank. General portlet defaults are sometimes hard coded into the portlet but should be overridden if either of the two previous conditions apply.

This logic enables the personalizations to be presented in a predictable way, consistent with the other portlets in the Framework application.

61.1.1.3 Guidelines for Edit Defaults Mode

For information about Edit Defaults mode, see Section 58.1.3.3, "Edit Defaults Mode."

61.1.1.3.1 Guideline for Edit Default Mode Options The following guideline should govern what you expose to page designers in Edit Defaults mode:

- **Do not use Edit Defaults mode as an administrative tool.** Edit Defaults mode gives users a way of changing the behavior of their portlets. If you want to change producer settings or do other administrative tasks, then you should create secured portlets specifically for those tasks.

61.1.1.3.2 Guidelines for Buttons in Edit Defaults Mode For consistency and user convenience, Edit Defaults mode should implement the following buttons in the following order:

- **OK** saves the user personalizations and returns the portlet to view mode.
- **Apply** saves the user personalizations and reloads the current page.
- **Cancel** returns the portlet to view mode without saving changes.

61.1.1.3.3 Guidelines for Rendering Personalization Values When you show the forms used to change personalization settings, you should default the values so that the application developer does not have to constantly reenter settings. When rendering personalization values, use the following sequence to provide consistent behavior:

1. **Instance preferences:** Query and display system defaults for the portlet instance.
2. **Portlet defaults**: If no system default personalizations are found, then display general portlet defaults, which may be blank. General portlet defaults are sometimes hard coded into the portlet but should be overridden by system defaults.

This logic enables the personalizations to be presented in a predictable way, consistent with the other portlets in the Framework application.

61.1.1.4 Guidelines for Help Mode

For information about Help mode, see Section 58.1.3.4, "Help Mode."

The following guideline should govern what you expose to users in Help mode:

- **Describe how to use the portlet.** Users may not know all the features your portlet provides just from its interface. Describe the features and how to get the most out of them.

61.1.1.5 Guidelines for About Mode

For information about About mode, see Section 58.1.3.5, "About Mode."

The following guideline should govern what you expose to users in About mode:

- **Display relevant copyright, version, and author information.** Users want to know what portlet they are using and where they can get more information. The about page may become important when supporting your portlets.

61.1.1.6 Guidelines for Preview Mode

> **Note:** This mode has no particular application in Framework applications, but used in Oracle Portal's Portlet Repository.

The following guidelines should govern what you expose to users in Preview mode:

- **Provide an idea of what the portlet does.** Preview mode should generate enough content for the user to get an idea of the actual content and functionality of the portlet.
- **Keep your portlet previews small.** The amount of data produced in this mode should not exceed a few lines of HTML or a screen shot. Preview mode appears in a small area, and exceeding the window's size looks unprofessional and forces users to scroll.
- **Do not use live hyperlinks.** Links may not work as expected when rendered in Preview mode. Hyperlinks can be simulated using the underline font.
- **Do not use active form buttons.** Forms may not work as you expect them to when rendered in Preview mode. If you decide to render form elements, then do not link them to anything.

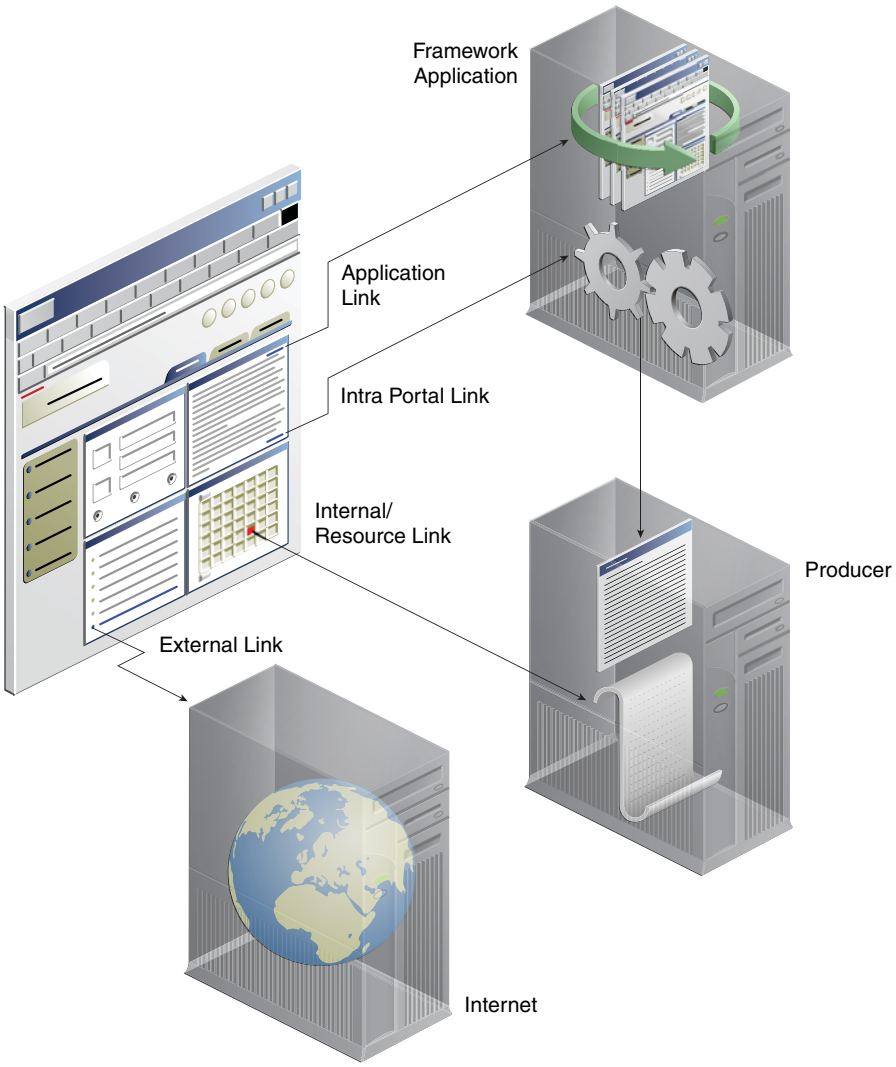
61.1.1.7 Guidelines for Full Screen Mode (PDK-Java Only)

Technically, JSR 286 portlets do not have Full Screen mode. However, you can implement the equivalent of Full Screen mode for a JSR 286 portlet with View mode and a maximized state for the window.

61.1.2 Guidelines for Navigation within a Portlet

In some ways, navigation between different sections or pages of a single portlet is identical to navigation between standard web pages. Users can submit forms and click links. In typical, simple web pages, both of these actions involve sending a message directly to the server responsible for rendering the new content, which is then returned to the client. In portlets, which comprise only part of a page, the form submission or link rendered within the portlet does not directly target the portlet. It passes information to the portlet through the Framework application. If a link or form within a portlet does not refer back to the application, then following that link takes the user away from the application, which is not typically the desired behavior.

The component developer does not need to know the detailed mechanics of how the parameters of a form or link get passed around between the user, application, and portlet. However, they must understand that they cannot write links in a portlet the same way they do for typical, simple web pages.



Types of Links for Portlets

A portlet may render links of four classes, as follows:

- **Intraportlet links** require the portlet to be aware of the address of the Framework application because they actually refer to it in some way.
- **Application links**, like intraportlet links, must be aware of the address of the Framework application for the same reason.
- **External links** make no reference to the Framework application and work in portlets as they would do in a normal web page.
- **Internal/Resource links**, like external links, also make no reference to the Framework application.

Figure 61–1 contains a summary of these link types. The arrows indicate how the links reference the resources to which they logically refer.

Figure 61–1 WebCenter Portal: Framework Application Link Types

This section includes the following subsections:

- Section 61.1.2.1, "Intraportlet Links"
- Section 61.1.2.2, "Application Links"
- Section 61.1.2.3, "External Links"
- Section 61.1.2.4, "Internal/Resource Links"

61.1.2.1 Intraportlet Links

Intraportlet links go to different sections or pages within a given portlet. Strictly speaking, they refer to the page containing the portlet, but they contain parameters that cause the portlet to render a different section or page within that page when it is requested by the user.

As a direct consequence, a portlet cannot expect to render links to different sections or pages of itself using relative links or absolute links based on its own server context. Intraportlet link are useful for intraportlet navigation, either as links or form submission targets.

61.1.2.2 Application Links

Application links refer to significant pages within the Framework application, such as the user's home page.

61.1.2.3 External Links

External links refer neither to the portlet (through a page) nor to any part of the Framework application. If selected, these links take the user away from the application, for example, `www.oracle.com`.

61.1.2.4 Internal/Resource Links

Internal/Resource links refer to internal (to the portlet) resources. Sometimes they are exclusively used internally during portlet rendering, for example as a server side include. On other occasions, they may be used externally to reference portlet resources like images. In this latter case, you can use the PDK-Java `constructResourceURL` method in the `UrlUtils` class to retrieve images from behind a firewall using resource proxy. Note that in order for resource proxying to work, you must first set the JNDI variable, `oracle/portal/provider/sample/resourceUrlKey`, for the producer. For more information about setting JNDI variables, see Section 61.3.5.2, "Setting JNDI Variable Values."

For example, `lottery.jsp` of the lottery sample, which is available with PDK-Java, contains resource proxy requests for images.

```
<%@ page contentType="text/html;charset=UTF-8" %>
<%@ page session="false" import="oracle.portal.provider.v2.render.*" %>
<%@ page import="oracle.portal.provider.v2.render.http.HttpPortletRendererUtil" %>
<%@ page import="oracle.portal.provider.v2.url.UrlUtils" %>
<%@ page import="oracle.portal.sample.v2.devguide.lottery.*" %>
<%
  LottoPicker picker = new LottoPicker();
  picker.setIdentity(request.getRemoteAddr() ); %>
<% PortletRenderRequest portletRequest = (PortletRenderRequest)
request.getAttribute("oracle.portal.PortletRenderRequest"); %>
<% String name = portletRequest.getUser().getName(); %>
<P class="PortletHeading1" ALIGN="CENTER">Hi <%= name %>, Your Specially
  Picked</P>
<P ALIGN="CENTER"><IMG SRC="<%= UrlUtils.constructResourceURL(portletRequest,
  HttpPortletRendererUtil.absoluteLink(request, "images/winningnumbers.gif")) %>"
  WIDTH="450" HEIGHT="69" ALIGN="BOTTOM" BORDER="0"></P>
<P>
<P ALIGN="CENTER">
<TABLE ALIGN="CENTER" BORDER="0" CELLPADDING="0" CELLSPACING="0">
<TR>
<%
     int [] picks = picker.getPicks();
     for (int i = 0; i < picks.length; i++) {
%>
             <TD>
    <IMG SRC="<%= UrlUtils.constructResourceURL(portletRequest,
      HttpPortletRendererUtil.absoluteLink(request, "images/ball" + picks[i])) %>
      .gif" WIDTH="68" HEIGHT="76" ALIGN="BOTTOM" BORDER="0">
     </TD>
<%
     }
```

For session-based producers, any cookies returned from the original `initSession` call to the producer are sent with the request back to the producer to maintain the right session context.

61.1.3 Guidelines for JavaScript

JavaScript can often be useful within a portlet, but bear in mind the following guidelines within your portlets:

- You should never use JavaScript to redirect the page in which the portlet is rendered. If you want to direct users elsewhere, then you should do so in your portlet action handling code or open a new window in the browser.
- Ensure that identifiers in your JavaScript are qualified. By qualifying your identifiers, you ensure that they are unique and do not clash with any JavaScript on the page.

61.2 Enhancing JSR 286 Java Portlets

When you have built your initial portlet in the Create JSR 286 Java Portlet wizard as described in Section 60.2.1, "How to Create a JSR 286 Java Portlet," the next step is to enhance it. Because JSR 286 portlets adhere to the Java standards, you can find substantial information about enhancing them from many different sources, such as third-party books and web pages.

This section includes the following subsections:

- Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File"
- Section 61.2.2, "How to Add Custom Portlet Modes"
- Section 61.2.3, "How to Access User Information"
- Section 61.2.4, "How to Customize the Runtime Environment"
- Section 61.2.5, "How to Use Portlet Events"
- Section 61.2.6, "How to Use Public Render Parameters"
- Section 61.2.7, "How to Add Personalization"
- Section 61.2.8, "How to Use Portlet Filters"
- Section 61.2.9, "How to Implement Portlet Caching"
- Section 61.2.10, "How to Implement Export of Customizations (WSRP 2.0)"
- Section 61.2.11, "How to Implement Rewritten URLs for Resource Proxy"
- Section 61.2.12, "How to Implement Stateless Resource Proxying"
- Section 61.2.13, "How to Enable Java Object Cache for Preference Store Access"
- Section 61.2.14, "How to Implement Security for JSR 286 Portlets"

61.2.1 How to Edit the Portlet Deployment Descriptor File

The portlet deployment descriptor file for the application, `portlet.xml`, specifies the portlet resources in the application. After you have created your JSR 286 portlet using the Portlet Wizard, you can edit the portlet.xml file to edit those resources.

When you open the portlet.xml file in JDeveloper, you can edit the source code or you can use the Overview Editor to edit portlet resources without having to manually modify it in Source mode.

To edit the portlet deployment file:

1. In the JDeveloper Application Navigator, open the portlet producer application.
2. Expand the portlet project.
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click **portlet.xml** and choose **Open**.
5. Click the **Design** tab to open the Overview Editor for `portlet.xml`.
6. The Overview Editor for portlet.xml contains the following tabs:
   - **Application**—Use to specify general information for the portlet producer application. These properties apply to all portlets within the application.
   - **Portlets**—Use to specify information for individual portlets within the application. For example, you can specify the portlet events and public render parameters supported by a portlet.
   - **Events**—Use to create and manage portlet events for use by all portlets in the application. For more information, see Section 61.2.5, "How to Use Portlet Events."
   - **Parameters**—Use to create and manage public render parameters for use by all portlets in the application. For more information, see Section 61.2.6, "How to Use Public Render Parameters."
   - **Filters**—Use to specify filter information for the portlets in the application. For more information, see Section 61.2.8, "How to Use Portlet Filters."
   - **Filter Mappings**—Use to assign portlet filters to individual portlets. For more information, see Section 61.2.8, "How to Use Portlet Filters."

61.2.2 How to Add Custom Portlet Modes

In the Create JSR 286 Java Portlet wizard, you add portlet modes by adding them to a list on the Content Types and Portlet Modes page. For more information about using the wizard, see Section 60.2.1, "How to Create a JSR 286 Java Portlet." The wizard enables you to implement the standard modes supported by JSR 286 and the extended modes provided by WebCenter Portal.

The standard modes supported by JSR 286 are:

- View
- Edit
- Help

WebCenter Portal supports the following additional custom modes:

- about
- config
- edit_defaults
- preview
- print

After the initial creation of the portlet, you can also define your own custom portlet modes. You can add custom modes to map to the extra modes offered by PDK-Java (for example, Full Screen mode), or to accommodate any other unique functionality you may want to provide.

The principles of implementing portlet modes are the same for all modes.

Before You Begin

The steps that follow assume that you have:

- Built a portlet using the Create JSR 286 Java Portlet wizard
- Successfully registered the portlet's producer
- Added the portlet to a page

To add a custom portlet mode:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Application** tab, if necessary.
3. Expand the Custom Modes section, if necessary.

   This section lists all the custom modes available to the portlets within the application. It includes the WebCenter Portal extended portlet modes.
4. Click the **Add Custom Mode** icon to create a new row for the portlet mode.
5. In the **Portlet Mode** field, enter the name of the portlet mode.

   The name must be unique within the application.
6. In the **Description** field, enter a brief description to explain the purpose of the mode.
7. Deselect the **Portal Managed** checkbox if the portlet mode is not managed by the portal
8. Save the `portlet.xml` file.
9. After adding the custom portlet mode to the application, you must then create the code for the mode in the portlet implementation file.

61.2.3 How to Access User Information

You can create user attributes in the Portlet Producer application to access commonly used user information, such as `user.login.id` or `user.name.family`. At runtime, these user attributes are mapped to the actual attributes of the current user. Portlets can use this information to obtain information about the current user.

To access user information:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Application** tab, if necessary.
3. Expand the User Attributes section, if necessary.
4. Click the **Add User Attribute** icon to create a new row for the attribute.
5. In the **Name** field, enter the name of the user attribute, for example `user.login.id`.
6. In the **Description** field, enter a description for the user attribute.

   At runtime, the portlet container maps this attribute to the appropriate value. For example, if the current user is John Doe, then the `user.name.family` user

attribute is mapped to Doe. Portlets can obtain a `Map` object containing the user attributes from the `PortletRequest` interface.

7. Save the `portlet.xml` file.

61.2.4 How to Customize the Runtime Environment

When a portlet is run, the portlet container provides the runtime environment and provides an interface between the Portlet Producer application and the portlet.

Container runtime options provide a way to customize the behavior of the portlet container and therefore customize the runtime environment.

This section includes the following subsections:

- Section 61.2.4.1, "Supported Container Runtime Options"
- Section 61.2.4.2, "Setting Container Runtime Options for All Portlets in an Application"
- Section 61.2.4.3, "Setting Container Runtime Options for Individual Portlets"

61.2.4.1 Supported Container Runtime Options

Table 61–1 lists the container runtime options supported by the WebCenter Portal portlet container.

For more information about the JSR 286 container runtime options, see the JSR 286 specification at:

`http://jcp.org/en/jsr/detail?id=286`

Table 61–1 Supported Container Runtime Options

Container Runtime Option	Supported by	JSR 286 Standard
javax.portlet.actionScopedRequestAttributes	Application Portlet	Yes
javax.portlet.escapeXml	Application Portlet	Yes
java.portlet.renderHeaders	Not supported	Yes
javax.portlet.servletDefaultSessionScope	Application Portlet	Yes
com.oracle.portlet.allowEventPayloadsWithoutJAXBBinding	Application	No
com.oracle.portlet.allowWsrpExport	Application	No
com.oracle.portlet.compatibilityMode	Application Portlet	No
com.oracle.portlet.defaultProxiedResourceRequiresWsrpRewrite	Application Portlet	No
com.oracle.portlet.defaultServedResourceRequiesWsrpRewrite	Application Portlet	No
com.oracle.portlet.disallowResourceServing	Application Portlet	No

Table 61–1 (Cont.) Supported Container Runtime Options

Container Runtime Option	Supported by	JSR 286 Standard
com.oracle.portlet.escapeXmlEncodeUrls	Application Portlet	No
com.oracle.portlet.eventPayloadsXmlType	Application	No
com.oracle.portlet.excludedActionScopeRequestAttributes	Application Portlet	No
com.oracle.portlet.externalScopeRequestAttributes	Application Portlet	No
com.oracle.portlet.importCssToIFrame	Application Portlet	No
com.oracle.portlet.minimumWsrpVersion	Application Portlet	No
com.oracle.portlet.offerPortletOverWsrp	Application Portlet	No
com.oracle.portlet.portalInfoProvider	Application Portlet	No
com.oracle.portlet.redirectAfterAction	Application Portlet	No
com.oracle.portlet.requireIFrame	Application Portlet	No
com.oracle.portlet.streamingOptimized	Application Portlet	No
com.oracle.portlet.suppressWsrpOptimisticRender	Application Portlet	No
com.oracle.portlet.trapWsrpRenderExceptions	Application Portlet	No
com.oracle.portlet.trimEncodeUrls	Application Portlet	No
com.oracle.portlet.useWsrpUserContextForUserAuthentication	Application	No
com.oracle.portlet.wsrpHeaderMode	Application Portlet	No
com.oracle.portlet.wsrpLegacyPortletHandle	Portlet	No
com.oracle.portlet.wsrpPortletHandle	Portlet	No
oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents	Portlet	No

javax.portlet.actionScopedRequestAttributes

Specifies whether to store action-scoped request attributes so that they are available to portlets until a new action occurs.

You can use the WebCenter Portal-specific `excludedActionScopeRequestAttributes` container runtime option to limit which request attributes are stored in the scopes.

Valid values:

- `true`—store request attributes starting at `processAction` until the next `processAction`. You can specify a second value of `numberOfCachedScopes` and a third value indicating the number of scopes to be cached by the portlet container.
- `false`—do not store request attributes.

javax.portlet.escapeXml

Specifies whether to XML encode URLs returned from `actionUrl`, `renderUrl`, and `resourceUrl` JSR 286 tag library tags.

You can override this option on a per-tag basis using the `encodeXml` attribute.

Valid values:

- `true`—(default) the URLs returned by the `actionUrl`, `renderUrl`, and `resourceUrl` tags are XML encoded (using ampersand entities for parameter separation).
- `false`—the URLs returned by the actionUrl, renderUrl, and resourceUrl tabs are not XML encoded (and use just ampersand characters).

Note: This option does not have any effect on the return value of `PortletURL.toString()` or `ResourceURL.toString()`; in both cases, for JSR 286, the output uses only ampersand characters. To use ampersand entities or be able to specify the XML encoding to use when generating URLs not using the tag libraries, see the `BaseURL.write()` methods.

---

javax.portlet.servletDefaultSessionScope

Specifies the scope of the session object provided to servlets or JSPs that are included or forwarded from a Java portlet.

Valid values:

- `APPLICATION_SCOPE`—(default) map the portlet session with application scope.
- `PORTLET_SCOPE`—map the portlet session with portlet scope.

com.oracle.portlet.allowEventPayloadsWithoutJAXBBinding

Allows event payload types declared in `portlet.xml` and event payloads sent from JSR 286 portlets to bypass the JSR 286 spec requirement that these types have a valid JAXB binding.

Valid values:

- `true`—event payloads without valid JAXB bindings are allowed.
- `false`—event payloads without valid JAXB bindings are not allowed, per the JSR 286 specification.

com.oracle.portlet.allowWsrpExport

Specifies whether the WSRP export-portlets operation should be supported for the web application.

This option is used mainly for backward-compatibility; it is preferred to control the export-portlets operation through the `wsrp-producer-config.xml` setting.

Valid values:

- `true`—(default) export-portlets is allowed.
- `false`—export-portlets is not allowed. This overrides the setting in `WEB-INF/wsrp-producer-config.xml`.

com.oracle.portlet.compatibilityMode

Set to `owc168` to invoke the WebCenter Portal JSR 286 container JSR 168 compatibility mode.

This also automatically sets the `disallowResourceServing` runtime option to `true` if no other value for that option is specified.

com.oracle.portlet.defaultProxiedResourceRequiresWsrpRewrite

Specifies the default WSRP `requiresRewrite` flag to use when encoding URLs for resources not served by the portlet. This setting is used for all URLs returned by the `PortletResponse.encodeURL()` method, unless overridden by the presence of the `oracle.portlet.server.resourceRequiresRewriting` request attribute when the `PortletResponse.encodeURL()` method is called.

Valid values:

- `true`—(default) the `requiresRewrite` flag is set to `true`, indicating that the resource should be rewritten by the consumer.
- `false`—the `requiresRewrite` flag is set to `false`, indicating that the resource does not necessarily need to be rewritten by the consumer.

com.oracle.portlet.defaultServedResourceRequiesWsrpRewrite

Specifies the default WSRP `requiresRewrite` flag to use when generating resource URLs for portlet-served resources.

This setting is used for all resource URLs created by the portlet, unless overridden by the presence of the `resourceRequiresRewriting` request attribute when the resource URL methods `write()` or `toString()` are called. This setting is also used to specify the WSRP `requiresRewriting` flag on the served resource response, but can be overridden by the presence of the `resourceRequiresRewriting` request attribute when the portlet's `serveResource()` method returns.

Valid values:

- `true`—the `requiresRewrite` URL flag and `requiresRewriting` response flag are set to `true`, indicating that the resource should be rewritten by the consumer
- `false`—the `requiresRewrite` URL flag and `requiresRewriting` response flag are set to `false`, indicating that the resource does not necessarily need to be written by the consumer, although the consumer may choose to rewrite the URL.

If unspecified, the `requiresRewrite` URL flag is not given a value, and the `requiresRewriting` response flag for a `serveResource` operation is based on the MIME type of the response.

com.oracle.portlet.disallowResourceServing

Specifies whether portlets are allowed to serve resources. This is useful if JSR 168 portlets are run in the 286 container, as any JSR 168 portlet extending `javax.portlet.GenericPortlet` automatically inherits the JSR 286 functionality, which automatically forwards resource requests to a file in the web application named after the resource ID, creating a potential security problem. For the same security reason, JSR 286 portlets that do not serve resources are safest to disallow resource serving.

Valid values:

- `true`—portlets are not allowed to serve resources.
- `false`—portlets are allowed to serve resources.

com.oracle.portlet.escapeXmlEncodeUrls

Specifies whether the JSR 286 container should XML-encode URLs generated from the `PortletResponse.encodeURL()` method.

Valid values:

- `true`—URLs generated by the `PortletResponse.encodeURL()` method are XML-encoded.
- `false`—(default) URLs generated by `PortletResponse.encodeURL()` are not XML-encoded.

com.oracle.portlet.eventPayloadsXmlType

Specifies optional XML schema types for JAXB-bindable Java object event payloads if events are sent over WSRP. This is a multi-valued runtime option; each value consists of a Java class name and QName pair, separated by a colon (`:`). The QName should use the standard Java String representation of a QName (`{`*`namespace`*`}`*`localpart`*). For each value specified, the QName is used as the XML schema type to annotate WSRP event payloads of the specified Java object type after the object has been marshalled to XML. This may be useful when using events to communicate across portlets on multiple producers.

com.oracle.portlet.excludedActionScopeRequestAttributes

This is a multi-valued property with each value being a regular expression. Request attributes which match any of the regular expressions are not stored as action-scoped request attributes if the `javax.portlet.actionScopedRequestAttributes` container runtime option is used, in addition to any request parameters whose values match the regular expressions defined in the `com.oracle.portlet.externalScopeRequestAttributes` container runtime option.

com.oracle.portlet.externalScopeRequestAttributes

This is a multi-valued property with each value being a regular expression. Request attributes which match any of the regular expressions are considered outside of portlet scope, and are shared with the underlying portal request.

If the `javax.portlet.actionScopedRequestAttributes` option is used, any request attributes matching the regular expressions declared in `externalScopeRequestAttributes` are not stored in the action scope request attributes.

com.oracle.portlet.importCssToIFrame

Specifies to a portal consumer whether the CSS file should be imported to an IFRAME portlet.

Valid values:

- `false`—(default) nothing is done.
- `true`—the CSS file from the consumer is applied to an IFRAME portlet.

com.oracle.portlet.minimumWsrpVersion

Specifies minimum required WSRP version for the portlet to work. If the WSRP version being used is less than the value specified, the portlet will not be included in a WSRP `GetServiceDescription`, `GetPortletDescription`, `GetMarkup` and other WSRP responses.

Valid values:

- `1`
- `2`

com.oracle.portlet.offerPortletOverWsrp

Specifies whether the portlet is offered in the WSRP producer's service description.

Any `offerRemote` setting in a `.portlet` file referencing the JSR 168/286 portlet overrides this container runtime option.

Valid values:

- `true`—(default) the portlet is offered in the WSRP producer's service description.
- `false`—the portlet is not included in the service description.

If not specified at all, the default value specified in the `WEB-INF/producer-config.xml` is used.

com.oracle.portlet.portalInfoProvider

Specifies the class name of an optional implementation of `com.bea.portlet.container.IPortalInfo` interface. This implementation defines the value returned by the JSR 286 container's `request.getPortalContext().getPortalInfo()`. The default implementation returns the producer/local server name and version, but a custom implementation could pass both the consumer server information and the producer server information in a WSRP scenario.

com.oracle.portlet.redirectAfterAction

Causes the JSR 286 container to send a redirect to the browser to the portlet's render URL after a `processAction` is run (and after events are handled) so that reloading the resulting page will not result in another `processAction`.

Valid values:

- `true`—a redirect is issued after every portlet action.
- `false`—no redirect is not automatically issued after portlet actions.

com.oracle.portlet.requireIFrame

Specifies whether the portlet must be rendered inside an IFRAME.

Valid values:

- `true`—renders the portlet inside an IFRAME.
- `false`—does not force the portlet to be rendered inside an IFRAME.

com.oracle.portlet.streamingOptimized

Indicates the portlet is optimized to run in streaming mode, which may enhance performance.

Valid values:

- `true`—the portlet is optimized to run in streaming mode.
- `false`—the portlet is not optimized to run in streaming mode.

com.oracle.portlet.suppressWsrpOptimisticRender

Suppresses the optimistic render of a portlet after the action and/or event lifecycles if the portlet is being run over WSRP.

Valid values:

- `true`—optimistic render is always suppressed.
- `false`—optimistic render may be performed.

com.oracle.portlet.trapWsrpRenderExceptions

Specifies whether the JSR 286 container should send exceptions during render as WSRP SOAP faults, or render an exception message for the portlet markup instead.

Valid values:

- `true`—(default) exceptions are not sent as SOAP faults but instead as rendered exception stack traces.
- `false`—exceptions generated by the portlet during render are treated as SOAP faults.

com.oracle.portlet.trimEncodeUrls

Specifies whether the JSR 286 container should trim whitespace from URLs passed to the `PortletResponse.encodeURL()` method.

Valid values:

- `true`—(default) leading and trailing whitespace is trimmed from the URL passed into `PortletResponse.encodeURL()`.
- `false`—whitespace is not trimmed from the URL passed into `PortletResponse.encodeURL()`.

com.oracle.portlet.useWsrpUserContextForUserAuthentication

Specifies whether the PortletRequest methods `getRemoteUser()`, `getUserPrincipal()` and `isUserInRole()` are based on the WSRP user context information or on standard J2EE security.

Valid values:

- `true`—the user information is based on the WSRP user context, if the portlet is run over WSRP. This can be a security problem so use this option with care.
- `false`—(or the portlet is not being run over WSRP) the user information is based on the J2EE authenticated user.

com.oracle.portlet.wsrpHeaderMode

Used only when portlets are being rendered as WSRP remote portlets, to indicate where cookies and headers should be put in the WSRP SOAP response as a hint to the WSRP consumer for the header or cookie's intended final destination.

When portlets are run locally (not over WSRP), headers and cookies set by portlets are always assumed to go to the client. Setting this container runtime option sets a default value for the `PortletRequest` attribute `com.oracle.portlet.wsrpHeaderMode`, which can still be overridden by the portlet at runtime on a per-header basis.

Valid values:

- `client`—headers and cookies set by the portlet are directed to go to the client (for example, the browser).
- `consumer`—headers and cookies set by the portlet are directed to go to the consumer and not passed on to the client.
- `both`—headers and cookies set by the portlet are directed to go to the client and the consumer.

If not set, the portlet container assumes the default value for the producer as specified in the `WEB-INF/wsrp-producer-config.xml` file.

com.oracle.portlet.wsrpLegacyPortletHandle

Allows the specification of a legacy WSRP portlet handle to be used for the portlet, which must be unique within the web application. This is useful for backward-compatibility with WebCenter Portal consumers that use the legacy, portlet-position-based WSRP portlet handles.

If specified, the legacy portlet handle is published in the WSRP serviceDescription as a legacy-handle extension on the portlet, and consumers are able to access the portlet using the legacy portlet handle, although the portlet will not be published in the WSRP serviceDescription under the legacy portlet handle.

com.oracle.portlet.wsrpPortletHandle

Allows the specification of the WSRP portlet handle to be used for the portlet, which must be unique within the web application.

oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents

Allows the Oracle JSF Portlet Bridge to raise ADFm events that do not have corresponding portlet events declared in the `portlet.xml` file.

Valid values:

- `true`—any ADFm event raised is forwarded on as a portlet event.
- `false`—only events with corresponding portlet event declarations are forwarded.

61.2.4.2 Setting Container Runtime Options for All Portlets in an Application

Setting container runtime options at the application level affects all the portlets in the application.

To set application-level container runtime options:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Application** tab, if necessary.

3. Expand the Container Runtime Options section, if necessary.
4. Click the **Add Container Runtime Option** icon to display a list of available options.

   The list includes all container runtime options supported by the WebCenter Portal portlet container, which are listed in Table 61–1.

   If you are using a different portlet container that supports additional container runtime options that are not listed, select **<Customize>** and enter the name of the option in the **Name** field.

   If you specify a container runtime option that is not supported by the portlet container, it is ignored.
5. In the **Value** field, enter a value for the container runtime option.

   The container runtime option is added to the `portlet.xml` code.

```
<container-runtime-option>
   <name>com.oracle.portlet.requireIFrame</name>
   <value>true</value>
</containter-runtime-option>
```

6. Save the `portlet.xml` file.

61.2.4.3 Setting Container Runtime Options for Individual Portlets

You can set container runtime options at the individual portlet level to override the application-wide settings.

To set portlet-level container runtime options:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Portlets** tab, if necessary.
3. Click the **Advanced** tab.
4. Click the **Add Container Runtime Option** icon to display a list of available options.

   The list includes all container runtime options supported by the WebCenter Portal portlet container, which are listed in Table 61–1.

   If you are using a different portlet container that supports additional container runtime options that are not listed, select **<Customize>** and enter the name of the option in the **Name** field.

   If you specify a container runtime option that is not supported by the portlet container, it is ignored.
5. In the **Value** field, enter a value for the container runtime option.

   The container runtime option is added to the `portlet.xml` code.

```
<container-runtime-option>
   <name>com.oracle.portlet.requireIFrame</name>
   <value>false</value>
</containter-runtime-option>
```

6. Save the `portlet.xml` file.

61.2.5 How to Use Portlet Events

Portlet events are a JSR 286 feature that enable inter-portlet communication by providing portlets with the ability to respond to actions that occur outside of the portlet itself, for example an action performed on the page that contains the portlet or on another portlet on the same page. Portlet events can be cascaded so that a portlet may respond to an event by triggering an event of its own, which in turn affects other portlets on the page.

Any portlet events supported by a portlet must be declared in the application section of the portlet deployment descriptor (`portlet.xml`). Portlet events defined at the application level in this way are available to all the portlets in the application.

Individual portlets within the application can then specify which of these portlet events they want to use. Portlets can declare events that they are interested in receiving, called *processing events*, and events that they trigger, called *publishing events*.

This section includes the following subsections:

- Section 61.2.5.1, "Defining a Portlet Event at the Application Level"
- Section 61.2.5.2, "Adding a Processing Event to a Portlet"
- Section 61.2.5.3, "Adding a Publishing Event to a Portlet"

For more information about portlet events and how to implement them, see the JSR 286 specification at:

`http://jcp.org/en/jsr/detail?id=286`

61.2.5.1 Defining a Portlet Event at the Application Level

For a portlet event to be available to a portlet, it must first be declared in the application section of the portlet deployment descriptor (`portlet.xml`).

To define a portlet event at the application level:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Events** tab.
3. Click the **Add** icon to create a new portlet event.
4. From the dropdown list, select whether you are specifying a fully qualified name (QName) for the portlet event, or just the local part of the name.

   A QName uniquely identifies the portlet event across applications by specifying a namespace for the parameter as well as a local name. A page typically contains multiple portlets which may come from different applications. Using QNames ensures that portlet events from one portlet do not unintentionally interfere with the other portlets on a page regardless of where those portlets come from.

   If the namespace for the portlet event is the same as the application default namespace, you can omit the namespace when defining the event by specifying an unqualified name. If the application default namespace has not been defined, a portlet event with an unqualified name uses the XML default namespace.
5. If you selected **Qualified Name**:
   a. In the **Namespace** field, enter the namespace for the portlet event.
   b. In the **Name** field, enter the local part of the portlet event name.
6. If you selected **Unqualified Name**, in the **Name** field, enter the local part of the portlet event name. The event uses the application default namespace as the

namespace for the event (or the XML default namespace if no namespace is defined for the application).

7. In the **Payload** field, enter or browse for the data type of the payload provided by the portlet event.
8. In the **Description** field, enter a description for the portlet event.
9. (Optional) In the Aliases panel, you can provide a list of aliases so that a portlet event can be recognized by the portlet even if it has a different QName from the one defined by the portlet.
   a. Click the **Create** icon to create a new alias for the portlet event.
   b. In the **Namespace** field, enter the namespace of the portlet event to use for the alias.
   c. In the **Name** field, enter the local part of the portlet event to use for the alias.
10. The portlet event is added to the application definition section of the `portlet.xml` file:

```
<event-definition>
   <description>This is my event</description>
   <qname xmlns:x="http://example.com/events">myEvent</qname>
   <value-type>java.lang.String</value-type>
</event-definition>
```

11. Save the `portlet.xml` file.

61.2.5.2 Adding a Processing Event to a Portlet

If your want a portlet to listen for a particular portlet event, define it as a processing event.

To add a processing event to a portlet:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. If the portlet event has not yet been defined within the Portlet Producer application, you must do this first, for more information, see Section 61.2.5.1, "Defining a Portlet Event at the Application Level."
3. Click the **Portlets** tab and select the portlet in which you want to use the portlet event.
4. Click the **Events** tab.

   In the Processing Events panel, the **Available** list shows all the portlet events that have been defined for the application.
5. Select the portlet event that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

   This adds the portlet event as a processing event to the portlet definition in `portlet.xml`:

```
<portlet id="1234567890">
   ...
   <supported-processing-event>
      <name>myParam</name>
   </supported-processing-event>
   ...
</portlet>
```

6. Save the `portlet.xml` file.
7. You can now use this portlet event in the code for your portlet.

61.2.5.3 Adding a Publishing Event to a Portlet

If you want a portlet to trigger a particular portlet event, define it as a publishing event.

To add a publishing event to a portlet:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. If the portlet event has not yet been defined within the Portlet Producer application, you must do this first, for more information, see Section 61.2.5.1, "Defining a Portlet Event at the Application Level."
3. Click the **Portlets** tab and select the portlet in which you want to use the portlet event.
4. Click the **Events** tab.

   In the Publishing Events panel, the **Available** list shows all the portlet events that have been defined for the application.
5. Select the portlet event that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

   This adds the portlet event as a publishing event to the portlet definition in `portlet.xml`:

```
<portlet id="1234567890">
   ...
   <supported-publishing-event>
      <name>myParam</name>
   </supported-publishing-parameter>
   ...
</portlet>
```

6. Save the `portlet.xml` file.
7. You can now use this portlet event in the code for your portlet.

61.2.6 How to Use Public Render Parameters

Public render parameters are a JSR 286 feature that enable portlets to share parameter values, allowing a form of inter-portlet communication.

For example, if a Map portlet and a Weather portlet are both configured to use a Zipcode public render parameter, entering a zip code in the Map portlet updates the same parameter value in the Weather portlet.

Any public render parameters supported by a portlet must be declared in the application section of the portlet deployment descriptor (`portlet.xml`). Public render parameters defined at the application level in this way are available to all the portlets in the application.

Individual portlets within the application can then specify which of these public render parameters they want to use.

This section includes the following subsections:

- Section 61.2.6.1, "Defining a Public Render Parameter at the Application Level"
- Section 61.2.6.2, "Adding a Public Render Parameter to a Portlet"

For more information about public render parameters and how to implement them, see the JSR 286 specification at:

`http://jcp.org/en/jsr/detail?id=286`

61.2.6.1 Defining a Public Render Parameter at the Application Level

For a public render parameter to be available to a portlet, it must first be declared in the application section of the portlet deployment descriptor (`portlet.xml`).

To define a public render parameter at the application level:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Parameters** tab.
3. Click the **Add** icon to create a new public render parameter.
4. From the dropdown list, select whether you are specifying a fully qualified name (QName) for the parameter, or just the local part of the name.

   A QName uniquely identifies the public render parameter across applications by specifying a namespace for the parameter as well as a local name. Within the portlet code, a public render parameter is accessed by its identifier, which identifies the parameter uniquely within the application. However, a page typically contains multiple portlets which may come from different applications. Using QNames ensures that public render parameters from one portlet do not unintentional interfere with the other portlets on a page regardless of where those portlets come from.

   If the namespace for the parameter is the same as the application default namespace, you can omit the namespace when defining the parameter by specifying an unqualified name. If the application default namespace has not been defined, a parameter with an unqualified name uses the XML default namespace.
5. If you selected **Qualified Name**:
   a. In the **Namespace** field, enter the namespace for the parameter.
   b. In the **Name** field, enter the local part of the parameter name.
6. If you selected **Unqualified Name**, in the **Name** field, enter the local part of the parameter name. The parameter uses the application default namespace as the namespace for the parameter (or the XML default namespace if no default namespace is defined for the application).
7. In the **Identifier** field, enter a name to identify the public render parameter within the application.

   The identifier must be unique within the application and is used to identify the parameters used by a portlet and in the portlet code to access the parameter. Using the identifier means that portlet developers do not need to be aware of the parameter's fully qualified name; they simply need to know the simpler application-specific identifier.
8. In the **Description** field, enter a description for the public render parameter. The description should provide enough information so that portlet developers can determine how to use this parameter in their portlets.

9. (Optional) In the Aliases panel, you can provide a list of aliases so that the parameter can accept values from other public render parameters even if they have different QNames.
   a. Click the **Create** icon to create a new alias for the parameter.
   b. In the **Namespace** field, enter the namespace of the parameter to use for the alias.
   c. In the **Name** field, enter the local part of the parameter to use for the alias.

   Note: When creating aliases for public render parameters, it is a good idea to set up reciprocal aliases. So if a parameter in portlet A has an alias to a parameter in portlet B, you should also, if possible, create an alias for the parameter in portlet B to the parameter in portlet A.

10. The public render parameter is added to the application definition section of the `portlet.xml` file:

```
<public-render-parameter>
   <description>This is my parameter</description>
   <identifier>myParam</identifier>
   <qname xmlns:x="http://example.com/params">x:myParam</qname>
   <alias xmlns:x="http://example.com/params">x:yourParam</alias>
</public-render-parameter>
```

11. Save the `portlet.xml` file.

61.2.6.2 Adding a Public Render Parameter to a Portlet

If you want a portlet to support a public render parameter, add it to the portlet.

To add a public render parameter to a portlet:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. If the public render parameter has not yet been defined within the Portlet Producer application, you must do this first, for more information, see Section 61.2.6.1, "Defining a Public Render Parameter at the Application Level."
3. Click the **Portlets** tab and select the portlet in which you want to use the public render parameter.
4. Click the **Parameters** tab.

   In the Publishing Events panel, the **Available** list shows all the portlet events that have been defined for the application.
5. Click the **Parameters** tab.

   In the Public Render Parameters panel, the **Available** list shows all the public render parameters that have been defined for the application.
6. Select the public render parameter that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

   This adds the public render parameter to the portlet definition in `portlet.xml`:

```
<portlet id="1234567890">
 ...
 <supported-public-render-parameter>myParam</supported-public-render-parameter>
```

```
 ...
</portlet>
```

7. Save the `portlet.xml` file.
8. You can now use this public render parameter in the code for your portlet.

61.2.7 How to Add Personalization

Portlet preferences enable end users to personalize the portlet at runtime. These personalizations are visible only to the user that performed them; not to other users. By default, when you create a JSR 286 portlet using the JDeveloper wizard, a portlet preference is created to enable users to personalize the title of the portlet at runtime. You can create additional portlet preferences, either during portlet creation or by editing the `portlet.xml` file after portlet creation, to enable end users to perform other personalizations on the portlet at runtime.

This section includes the following subsections:

- Section 61.2.7.1, "Adding a Portlet Preference to a Portlet"
- Section 61.2.7.2, "Simple Portlet Personalization Example"

61.2.7.1 Adding a Portlet Preference to a Portlet

To add portlet personalization, you must create portlet preferences for those attributes of the portlet that you want users to be able to personalize.

To add a portlet preference to a portlet:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Portlets** tab and select the portlet for which you want to add personalization.
3. Click the **Advanced** tab.

   The Preferences panel lists any existing portlet preferences that exist for the portlet, for example, the `portletTitle` preference.
4. Click the **Add** icon to create a new portlet preference.
5. In the **Name** field, enter a name for the preference.

   The name must be unique within the portlet and use only letters, numbers, and the underscore character.
6. In the **Value** field, enter one or more default values for the preference. Separate multiple entries with commas.
7. Select **Read-only** if you do not want users to be able to update the value of the preference.
8. You can now use this preference in your portlet code using the `getPreference` method.

Note: If you want the preference to be translatable, you must add the appropriate key-value pairs to the resource bundle class.

61.2.7.2 Simple Portlet Personalization Example

The following example provides a simple illustration of how you can enable personalization in portlets.

To add simple personalization to a portlet:

1. In the JDeveloper Application Navigator, open the application that contains the portlet.
2. Expand the project that contains the portlet.
3. Right-click `view.jsp` and choose **Open.**
4. In the visual editor, click the **Source** tab and add the code indicated in bold in Example 61–1 to display the `portletContent` customization preference:

Example 61–1 view.jsp Sample Code

```
<%@ page contentType="text/html"
    import="javax.portlet.*,java.util.*,Portlets.Portlet1,
    Portlets.resource.Portlet1Bundle"%>
<%@ taglib uri="http://java.sun.com/portlet" prefix="portlet"%>

<portlet:defineObjects/>
<%
String[] str = {"Portlet Content"};
PortletPreferences prefs = renderRequest.getPreferences();
str = prefs.getValues("portletContent",str);
for (int i=0; i<str.length; i++)
{
%><%=(i<str.length-1)?str[i]+", ":str[i]%><%}%>
```

5. In the Application Navigator, right-click `edit.jsp` and choose **Open.**

   Notice that the JSP consists of a form field, a form input field, and two form button fields.

6. In the visual editor, click the **Source** tab and add the code indicated in bold in Example 61–2 to implement a form field for users to enter a value for the `portletContent` customization preference:

Example 61–2 edit.jsp Sample Code

```
<%@ page contentType = "text/html; charset=windows-1252"
         pageEncoding = "windows-1252"
         import = "javax.portlet.*, java.util.*,
Portletenhance.Portletenhance,
Portletenhance.resource.PortletenhanceBundle"%>
@ <%@ taglib uri = "http://java.sun.com/portlet" prefix="portlet"%>
<portlet:defineObjects/>
<%
    PortletPreferences prefs = renderRequest.getPreferences();
    ResourceBundle res =
        portletConfig.getResourceBundle(renderRequest.getLocale());
%>
<form action="<portlet:actionURL/>" method="POST">
  <table border="0">
    <tr>
      <td width="20%">
        <p class="portlet-form-field" align="right">
          <%=  res.getString(PortletenhanceBundle.PORTLETCONTENT) %>
        </p>
```

```
      </td>
      <td width="80%">
        <input class="portlet-form-input-field"
               type="TEXT"
               name="<%= Portletenhance.PORTLETCONTENT_KEY %>"
               value="<%= Portletenhance.buildValue(prefs,
Portletenhance.PORTLETCONTENT_KEY) %>"
               size="20">
      </td>
    </tr>    <tr>
      <td width="20%">
        <p class="portlet-form-field" align="right">
          <%=  res.getString(PortletenhanceBundle.PORTLETTITLE) %>
        </p>
      </td>
      <td width="80%">
        <input class="portlet-form-input-field"
               type="TEXT"
               name="<%= Portletenhance.PORTLETTITLE_KEY %>"
               value="<%= prefs.getValue(Portletenhance.PORTLETTITLE_KEY,
res.getString("javax.portlet.title")) %>"
               size="20">
      </td>
    </tr>
    <%
    String[] str = {"Portlet Content"};
    str = prefs.getValues("portletContent",str);
%>
<tr><td width="20%">
<p class="portlet-form-field" align="right">
Content
</p>
</td><td width="80%">
<textarea rows="10" cols="60" class="portlet-form-input-field"
  name="portletContent"><%
for (int i=0; i<str.length; i++)
{%><%= (i<str.length-1) ? str[i]+", " : str[i] %><%}%>
</textarea>
</td></tr>
    <tr>
      <td colspan="2" align="center">
        <input class="portlet-form-button" type="submit"

name="<%=Portletenhance.OK_ACTION%>"

value="<%=res.getString(PortletenhanceBundle.OK_LABEL)%>">
        <input class="portlet-form-button" type="submit"

name="<%=Portletenhance.APPLY_ACTION%>"

value="<%=res.getString(PortletenhanceBundle.APPLY_LABEL)%>">
      </td>
    </tr>
  </table>
</form>
```

7. In the Application Navigator, right-click *portletName*.java and choose **Open.**
8. In the visual editor, click the **Source** tab and add the following two lines of code (indicated in bold) to the `processAction` method:

```
// Save the preferences.
PortletPreferences prefs = request.getPreferences();
String param = request.getParameter(PORTLETTITLE_KEY);
prefs.setValues(PORTLETTITLE_KEY, buildValueArray(param));
String contentParam = request.getParameter("portletContent");
if (contentParam != null)
{
  prefs.setValues("portletContent", buildValueArray(contentParam));
}
prefs.store();
```

9. Redeploy the portlet.

   Notice that JDeveloper automatically saves and compiles the code before deploying the portlet. For a reminder of how to perform this step, see Chapter 62, "Testing and Deploying Your Portlets."

10. Reload the page that contains the portlet and you can see that the portlet now displays the text Portlet Content, which was one of the changes you made.

11. Click the **Personalize** link to see the form field that you added. Enter some text in this field and close the dialog. You can see the new text displayed in the portlet.

61.2.8 How to Use Portlet Filters

Portlet filters are a JSR 286 feature that enable you to alter the content of a portlet at runtime. A portlet filter is a reusable Java component that can transform the content of portlet requests and portlet responses. Filters do not generally create a response or respond to a request as portlets do, rather they modify or adapt the requests and responses.

This section includes the following subsections:

- Section 61.2.8.1, "Adding a Portlet Filter to an Application"
- Section 61.2.8.2, "Applying a Portlet Filter to a Portlet"

For more information about portlet filters and how to implement them, see the JSR 286 specification at:

`http://jcp.org/en/jsr/detail?id=286`

61.2.8.1 Adding a Portlet Filter to an Application

For a portlet to be able to use a portlet filter, the filter must first be defined within the application.

To add a portlet filter to an application:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."

2. Click the **Filters** tab.

3. Click the **Add** icon to create a new portlet filter.

4. In the Create Portlet Filter dialog, select **New Portlet Filter** to create a new filter class to implement the portlet filter. Go to step 5.

   Select **Choose from Existing Class**, and enter or browse for the filter class, if the filter class that implements the portlet filter already exists. Go to step 9.

5. In the **Name** field, enter a name for the portlet filter.

The name must be unique within the application and use only letters, numbers, and the underscore character.

6. In the **Package** field, enter or browse for the package to contain the new filter class.
7. Select one or more of the **Lifecycle Phase** checkboxes to specify which of the `javax.portlet.filter` interfaces the filter class implements:
   - **Action**—The filter class implements the `ActionFilter` interface
   - **Event**—The filter class implements the `EventFilter` interface.
   - **Render**—The filter class implements the `RenderFilter` interface.
   - **Resource**—The filter class implements the `ResourceFilter` interface.

   Note: When you create a new filter class using the Create Portlet Filter dialog, you can specify which of the filter interfaces the filter class implements. After the filter class has been created, you cannot add or remove filter interfaces through the Overview Editor. Instead, you must edit the source of the filter class directly to manually add or remove the interfaces and the `doFilter` methods defined for those interfaces.
8. Click **OK**.
9. In the **Display Name** field, enter a more user-friendly name for the portlet filter.
10. In the **Description** field, enter a description for the portlet filter.
11. In the Initialization Parameters panel, you can specify initialization parameters that pass values to the `init()` method of the filter class.
    a. Click the **Add** icon to specify an initialization parameter for the portlet filter.
    b. In the **Name** field, enter the name of the initialization parameter.
    c. In the **Value** field, enter the value to pass to the initialization parameter.
    d. In the **Description** field, enter a description of the initialization parameter.
12. The portlet filter is added to the application definition section of the `portlet.xml` file:

```
<filter>
    <display-name>Test Filter</display-name>
    <filter-name>filter_1</filter-name>
    <filter-class>javaportlets.MyFilter</filter-class>
    <lifecycle>ACTION_PHASE</lifecycle>
    <lifecycle>RENDER_PHASE</lifecycle>
</filter>
```

13. Save the `portlet.xml` file.

61.2.8.2 Applying a Portlet Filter to a Portlet

After the portlet filter has been defined in the application, you can then apply it to one or more portlets within the application. You can also specify the order in which portlet filters are applied to portlets.

To apply a portlet filter to a portlet:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."

2. Click the **Filter Mappings** tab.
3. Click the **Add** icon to add a row to the filter mappings table.
4. From the **Filter Name** dropdown list, select the portlet filter that you want to apply to the portlet.

   The dropdown list is populated with all the portlet filters that are defined in the `portlet.xml` file.
5. From the **Portlet Name** dropdown list, select the portlet to which you want to apply the portlet filter.

   The dropdown list is populated with all the portlets that are defined in the `portlet.xml` file.

   Alternatively, you can use wildcards to apply the portlet filter to more than one portlet. For example, you can enter `*` to apply the portlet filter to all the portlets in the application.
6. The filter mapping is added to the application definition section of the `portlet.xml` file:

```
<filter-mapping>
    <filter-name>filter_1</filter-name>
    <portlet-name>jsrportlet4</portlet-name>
</filter-mapping>
```

7. Use the **Top**, **Up**, **Down**, and **Bottom** icons to order the portlet filters in the `portlet.xml` file. The order of the portlet filters determines the order in which the filters are applied to the portlets.

   Note: Remember that filters can be mapped to multiple portlets. If you have multiple portlets mapped to (sharing) a filter, arbitrarily changing the filter order can produce undesired side effects. For example, if you change the order in which filters are applied in one portlet, the reordering will apply to all other portlets that share the filter.
8. Save the `portlet.xml` file.

61.2.9 How to Implement Portlet Caching

When you have completed the basic functionality of your portlet, you may want to turn your attention to portlet performance.

Caching is a common technique for enhancing the performance of web sites that include a great deal of dynamic content. The overhead involved in retrieving data and generating the output for dynamic content can be significantly reduced by proxying requests through a local agent backed by a large, low-latency data store known as a cache. The cache agent responds to a request in one of two ways, as follows:

- If a valid version of the requested content exists in the cache, then the agent simply returns the existing cache copy, thus skipping the costly process of content retrieval and generation. This condition is known as a *cache hit*.
- If a valid version of the requested content does not exist in the cache, then the agent forwards the request to its destination and awaits the return of the content. The agent returns the content to the requester and stores a local copy in its cache

for reuse if a subsequent request for the same content arises. This condition is known as a *cache miss*.

Producers generate dynamic content (that is, portlets) and they reside remotely from the Framework application instance on which they are deployed. As such, caching might improve their performance. The architecture lends itself well to caching. You can cache the portlets rendered by your producer and reuse the cached copies to handle subsequent requests, minimizing the overhead your producer imposes on page assembly.

For JSR 286 portlets, there are two different caching methods. The methods differ mainly in how they determine whether content is still valid.

- **Expiry-based caching:** When a producer receives a render request, it stamps its response with an expiry time. The rendered response remains in the cache and fills all subsequent requests for the same content until its expiry time passes. This caching scheme is perhaps the simplest and most performant because the test for cache validity requires very little overhead and does not involve any network round trips. Expiry-based caching suits applications where the content has a well-defined life span. For content with a less certain life span, however, expiry-based caching is less effective. For more information, see Section 61.2.9.1, "Implementing Expiry-Based Caching.".
- **Validation-based caching:** When a producer receives a render request, it stamps a response with a version identifier (or `ETag`). The response goes into the cache, but before the consumer can reuse the cached response, it must determine whether the cached version is still valid. It sends the producer a render request that includes the version identifier of the cached content. The producer determines whether the version identifier remains valid. If the version identifier is still valid, then the producer immediately sends a lightweight response to the consumer without any content, which indicates that the cached version can be used. Otherwise, the producer generates new content with a new version identifier, which replaces the previously cached version. In this form of caching, the consumer must always confirm with the producer whether the content is up to date. The validity of the cached copy is determined by some logic in the producer. The advantage of this approach is that the producer controls the use of the cached content, rather than relying on a fixed period. For more information, see Section 61.2.9.2, "Implementing Validation-Based Caching."

This section includes the following subsections:

- Section 61.2.9.1, "Implementing Expiry-Based Caching"
- Section 61.2.9.2, "Implementing Validation-Based Caching"

61.2.9.1 Implementing Expiry-Based Caching

You can choose to implement expiry-based caching when you first create a portlet using the Create JSR 286 Portlet Wizard. However, during the initial development of a portlet, you may prefer to turn portlet caching off and implement it later in the development cycle when the portlet content becomes more stable. You may also want to edit the expiration period, or change the cache scope.

To implement expiry-based caching:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. Click the **Portlets** tab and select the portlet for which you want to implement expiry-based caching.

3. Click the **Advanced** tab.
4. In the Cache Management panel, select **Cache Portlet**.

> **Note:** To disable portlet caching, deselect **Cache Portlet**. This sets the cache expiration period to `0`, meaning that the cached content is always expired.

5. Select the **Cache Scope**:
   - Select **Public** to share the cached content across users
   - Select **Private** if the cached content should not be shared across users.
6. Specify the cache expiration period:
   - **Select Cache Content Never Expires** to set the cache expiration period to -1. This means that the cached content never expires and the content is always retrieved from the cache. Use this option if you are confident that the portlet contains static content that is unlikely to change. Setting this option results in the following code being added to the `portlet.xml` file:

```
<portlet>
  ...
  <expiration-cache>-1</expiration-cache>
  ...
</portlet>
```

   - Select **Cache Content Expires After** to expire the cached portlet content after a specified number of seconds. Enter the expiration period, in seconds, in the adjacent field. Setting this option results in the following code being added to the `portlet.xml` file:

```
<portlet>
  ...
  <expiration-cache>300</expiration-cache>
  ...
</portlet>
```

7. Save the `portlet.xml` file.

61.2.9.2 Implementing Validation-Based Caching

Implementation of validation-based caching takes place after the initial portlet creation and requires hand coding.

Example 61–3 shows how a `GenericPortlet` would typically implement its `doView()` method such that the consumer caches the markup using validation-based caching. The example also shows how expiry-based caching can be defined programmatically (using the `CacheControl.setExpirationTime()` method) and used in conjunction with validation-based caching to further reduce the load on the producer. This would work equally well for `serveResource()`.

Example 61–3 A JSR 286 Portlet Implementing Validation-Based Caching

```
protected void doView (RenderRequest request, RenderResponse response)
  throws PortletException, IOException
{
  CacheControl cacheControl = response.getCacheControl();
  String eTag = request.getETag();
```

```
  if (isMarkupStillValid(eTag))
  {
    cacheControl.setExpirationTime(30);      // Wait 30 seconds before checking ETag again
    cacheControl.setUseCachedContent(true);  // Tell consumer to use its cached content
    return;
  }

  // ETag not valid so set a new one ...
  cacheControl.setETag(generateETag(...));   // Define a new ETag
  cacheControl.setExpirationTime(60);        // Wait 60 seconds before checking ETag again

  // ... and generate fresh portlet markup
  createMarkup(request, response);
}

private boolean isMarkupStillValid(String eTag)
{
  if (eTag == null)
  {
    return false; // No ETag was supplied
  }

  // Perform portlet specific checks for the consumer's cached
  // copy of the markup still being valid based on the given ETag
  ...
}

private String generateETag(...)
{
  // Portlet specific code to generate an ETag, for example, a hash
  // of the data on which the portlet's markup is based
  ...

  return eTag;
}
```

For more information about validation-based caching in JSR 286 portlets, see the JSR 286 specification at:

http://jcp.org/en/jsr/detail?id=286

61.2.10 How to Implement Export of Customizations (WSRP 2.0)

Another new feature that arrives with WSRP 2.0 is the ability to keep customizations with portlets when moving them from one deployment to another. Customizations are portlet preferences that are set in edit defaults mode. For example, suppose that you create a portlet and then customize its title within your development environment. If you have enabled export for that producer, then the customized title is transported along with the portlet when you deploy it in production environment. If you do not enable export, then all customizations are lost when you transport the portlet from one deployment environment to another.

To implement export of portlet customizations:

1. Open the Overview Editor for the `portlet.xml` file. For more information, see Section 61.2.1, "How to Edit the Portlet Deployment Descriptor File."
2. In the Container Runtime Options section of the Application tab, click the **Add** icon and choose **com.oracle.portlet.allowWsrpExport**.

3. In the row for the newly added container runtime option, double-click the **Value** field to edit it, and enter `true`.
4. Save the `portlet.xml` file.

61.2.11 How to Implement Rewritten URLs for Resource Proxy

Resource proxying is the standard way to retrieve resources with WSRP. To avoid problems with URLs within your portlet, you can set a flag to rewrite all of the URLs within a specified resource. For example, if have an HTML fragment that contains URLs, then you could set this flag to rewrite its URLs taking into account the WSRP resource proxying.

To indicate that URLs should be rewritten, set the `PortletRequest` attribute, `oracle.portlet.server.resourceRequiresRewriting`, to `true`. For example, you might include code similar to the excerpt in Example 61–4 to use resource proxying for a URL that you are encoding. Encapsulate this code within a method to avoid repeating it for every URL individually.

Example 61–4 Resource Proxy for WSRP

```
request.setAttribute("oracle.portlet.server.resourceRequiresRewriting",
     Boolean.TRUE);
String url = response.encodeURL(pathToResourceForRewriting);
request.removeAttribute("oracle.portlet.server.resourceRequiresRewriting");
```

If you do not specifically set `oracle.portlet.server.resourceRequiresRewriting`, then it defaults to `false`, meaning that URLs are not rewritten. You must explicitly activate the feature by setting this attribute to `true`.

61.2.12 How to Implement Stateless Resource Proxying

If you have out of protocol resources that do not require rewriting, you may want to use stateless resource proxying. Stateless resource proxying means that the URLs returned to the browser do not require portlet IDs or any other contextual information. This increases the cache hit ratio for such resources. You might find stateless resource proxying useful for functionality such as static JavaScript files, static images, and so on.

To indicate that stateless proxying is required, set the `PortletRequest` attribute `oracle.portlet.server.useStatelessProxying` to `true`. For example, you might include code similar to the excerpt in Example 61–5 to use stateless proxying for a URL that you are encoding. Encapsulate this code within a method to avoid repeating it for every URL individually.

Example 61–5 Stateless Resource Proxying

```
request.setAttribute("oracle.portlet.server.useStatelessProxying", Boolean.TRUE);
String url = response.encodeURL(pathToResource);
request.removeAttribute("oracle.portlet.server.useStatelessProxying");
```

If you do not specifically set `oracle.portlet.server.useStatelessProxying`, it defaults to `false`. You must explicitly activate the feature by setting this attribute to `true`.

61.2.13 How to Enable Java Object Cache for Preference Store Access

To improve preference store performance, you may choose to use Java Object Cache for preference store access. This avoids the need to access the persistent store on each request. You can configure the use of caching by the WSRP preference store with the following JNDI variable:

```
oracle/portal/wsrp/server/enableJavaObjectCache
```

By default, this variable is set to `false`. You can set the variable yourself in the `web.xml` file for your Portlet Producer application as follows:

```
<env-entry>
 <env-entry-name>oracle/portal/wsrp/server/enableJavaObjectCache</env-entry-name>
 <env-entry-type>java.lang.Boolean</env-entry-type>
 <env-entry-value>true</env-entry-value>
</env-entry>
```

For more information about setting JNDI variables, see Section 61.3.5.2, "Setting JNDI Variable Values."

61.2.14 How to Implement Security for JSR 286 Portlets

You can secure JSR 286 portlets that are deployed to a WSRP producer by configuring security at the WSRP producer end and the client end. For information about securing a JSR 286 portlet through its WSRP producer, see Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."

61.3 Enhancing PDK-Java Portlets

When you have built your initial portlet in the Create Oracle PDK-Java Portlet wizard as described in Section 60.2.4, "How to Create a PDK-Java Portlet," the next step is to enhance it. You can find the JavaDoc reference for the PDK-Java in the *Oracle Fusion Middleware Java API Reference for Oracle PDK Java*:

This section includes the following subsections that describe some enhancements that you might want to perform:

- Section 61.3.1, "Guidelines for PDK-Java Portlets"
- Section 61.3.2, "How to Add Portlet Modes"
- Section 61.3.3, "How to Implement Public Parameters"
- Section 61.3.4, "How to Implement Private Parameters"
- Section 61.3.5, "How to Use JNDI Variables"
- Section 61.3.6, "How to Access Session Information"
- Section 61.3.7, "How to Enhance Portlet Performance with Caching"

The source code for many of the examples referenced in this section is available as part of the Portlet Developer's Kit (PDK).

When you unzip PDK-Java, find the examples in:

```
../pdk/jpdk/v2/src/oracle/portal/sample/v2/devguide
```

61.3.1 Guidelines for PDK-Java Portlets

In WebCenter Portal: Framework, PDK-Java portlets work somewhat differently than they did in Oracle Portal. As a result, you must be aware of the following new design considerations when you build PDK-Java portlets in WebCenter Portal: Framework:

- Your portlet must not contain any code that relies upon the URL format or parameters in the request that were not explicitly added by your portlet.
- You should never assume that your portlet is the only one on a page, regardless of the portlet mode. For example, even if your portlet is in Edit mode, you should not assume that it is the only portlet on the page.
- Never write a portlet mode that simply redirects. A redirect can only be issued while processing a post to your portlet or following a link generated by your portlet.

61.3.2 How to Add Portlet Modes

In the Create Oracle PDK-Java Portlet wizard, you add portlet modes by checking boxes on the wizard pages. For more information about using the wizard, see Section 60.2.4, "How to Create a PDK-Java Portlet." For each portlet mode that you select in the wizard, a basic skeleton is created. If you want to add a portlet mode after creating the portlet, you can do that manually by updating `provider.xml` and HTML or JSPs in JDeveloper.

The principles of implementing portlet modes using `RenderManager` are the same for all modes.

For more detailed information about the PDK runtime classes used in this section, see the JavaDoc in the *Oracle Fusion Middleware Java API Reference for Oracle PDK Java*:

For more information about the syntax of `provider.xml`, see the provider JavaDoc, also available on OTN.

Before You Begin

The steps that follow assume that you have:

- Built a portlet using the Create Oracle PDK-Java Portlet wizard
- Successfully registered the portlet's producer
- Added the portlet to a page

To add a portlet mode:

1. In the JDeveloper Application Navigator, open the application that contains the portlet.
2. Expand the project that contains the portlet.
3. Expand the **Web Content** node and then the **htdocs** node and then the node for the producer.
4. Right-click the node for the portlet and choose **New.**

   The node for the portlet is located under **Web Content > htdocs >** ***provider***.
5. In the New Gallery, expand **Web Tier**, select **HTML** or **JSP**, and click **OK**.

   You must create an HTML file or a JSP for each mode to add to your portlet. For example, to implement Help mode, create an HTML file to provide the help content.

6. In the resulting dialog, enter a file name for the HTML file or JSP and click **OK**.
7. In the visual editor, edit the content of the page to implement the desired functionality.

   For example, for Help mode, you could add the following HTML:

   ```
   <p>This is the <i>Help</i> mode of your portlet!</p>
   ```

8. In the Application Navigator, right-click the `provider.xml` file for the provider that owns the portlet and choose **Open**.

   The `provider.xml` file is located under **Web Content > WEB-INF > providers > *provider***.
9. Change the value of the appropriate tag for the mode you are adding to `true`.

   For example, if you are adding Help mode, change the `hasHelp` tag as follows:

   ```
   <hasHelp>true</hasHelp>
   ```

   This indicates to the PDK Framework that a link or icon to that mode should be rendered.
10. Add the code to point to the HTML page or JSP that you created earlier for the mode.

    For example, for the Help page, add the following code:

    ```
    <helpPage>/htdocs/myprovider/myportlet/myHelpPage.html</helpPage>
    ```

11. Save your changes.
12. Redeploy your portlet. For more information, see Chapter 62, "Testing and Deploying Your Portlets."

    When you redeploy, JDeveloper automatically saves and compiles the code before deploying the portlet.
13. Copy the HTML file or JSP you created and the updated `provider.xml` file to the WLS instance where you plan to deploy the portlet.

    This step is not necessary if you have redeployed the producer application to a server instance.
14. Refresh the producer.
15. Refresh the page containing your portlet.

    You should now be able to access the new mode. For example, if you added Help mode, you should be able to click the Help link.

61.3.3 How to Implement Public Parameters

PDK-Java and WebCenter Portal: Framework provide public and private portlet parameters to enable portlet developers to easily write reusable, complex portlets. The Create Oracle PDK-Java Portlet wizard in JDeveloper creates portlets that are set up to use parameters. This feature enables you to focus solely on adding business logic to your portlets and does not require any changes to `provider.xml`.

For an overview of parameters, see Section 58.2.11, "Public Portlet Parameter Support" and Section 58.2.12, "Private Portlet Parameter Support."

Before You Begin

The steps that follow assume that you have:

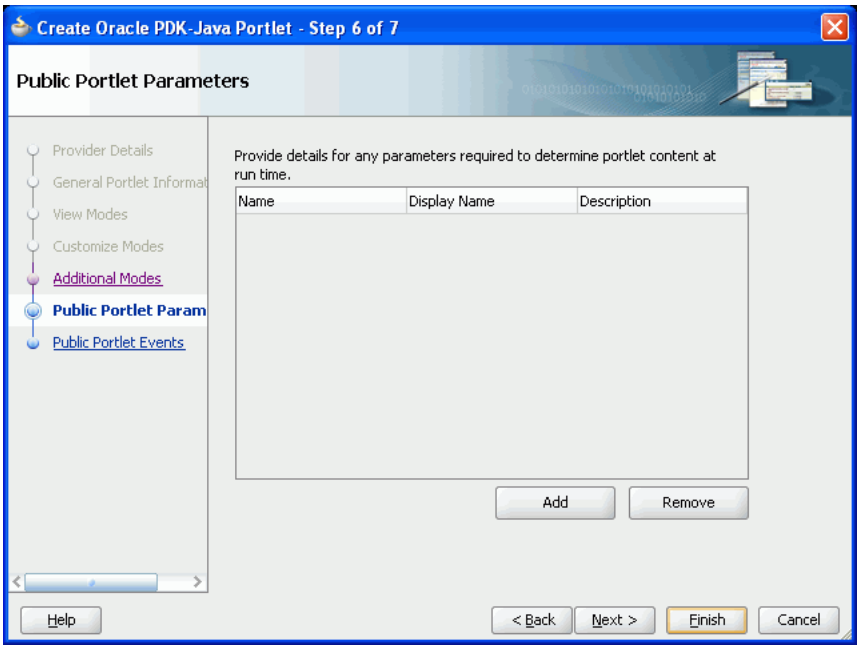
- Followed through and understood Section 60.2.4, "How to Create a PDK-Java Portlet."
- Built a portlet using the wizard and successfully added it to a page.

> **Note:** Each portlet is limited to 4K of data. The lengths of parameter and event names, display names, and descriptions all contribute toward this 4K limit. Hence, you should not use too many parameters and events for each portlet, or give them lengthy names and descriptions.

Using the Create Oracle PDK-Java Portlet wizard, you can easily create a portlet with public parameters. When you register the producer and drop the portlet on a page, the portlet's parameters are automatically linked to page variables.

To create a portlet with public parameters:

1. In the JDeveloper Application Navigator, open the application that contains the portlet.
2. Right-click the project under which you want to create your portlet, and choose **New.**



> **Note:** To create the portlet in an existing producer, right-click the producer's `provider.xml` file and choose **Add Portlet.** This takes you directly to the General Portlet Information page of the Create Oracle PDK-Java Portlet wizard.

3. In the New Gallery, expand **Web Tier,** select **Portlets** and then **Oracle PDK-Java Portlet,** and click **OK.**
4. Proceed through the Create Oracle PDK-Java Portlet wizard until you reach the Public Portlet Parameters page.

   See Section 60.2.4, "How to Create a PDK-Java Portlet" for basic information about going through the wizard.
5. On the Public Portlet Parameters page (Figure 61–2), click **Add.**

   This adds a new row to the table of parameters.

Figure 61–2 Public Portlet Parameters Page of Portlet Wizard

6. Replace the default values in the **Name, Display Name,** and **Description** fields with something more meaningful for your parameter.
7. Add more parameters as required and then click **Finish.**
8. In the Application Navigator, right-click the `provider.xml` file for the provider that owns the portlet and choose **Open.**

   The `provider.xml` file is located under **Web Content > WEB-INF > providers >** ***provider.***

   You should see entries for the parameters that you added on the Public Portlet Parameters page in the wizard, for example, as shown in Example 61–6.

Example 61–6 provider.xml Sample, Public Parameters

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<?providerDefinition version="3.1"?>
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
  <session>false</session>
  <passAllUrlParams>false</passAllUrlParams>
  <preferenceStore class=
     "oracle.portal.provider.v2.preference.FilePreferenceStore">
   <name>prefStore1</name>
   <useHashing>true</useHashing>
  </preferenceStore>
  <portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
      <id>1</id>
      <name>MyPortlet</name>
      <title>My Portlet</title>
      <description>My Portlet Description</description>
      <timeout>40</timeout>
      <showEditToPublic>false</showEditToPublic>
      <hasAbout>false</hasAbout>
      <showEdit>true</showEdit>
      <hasHelp>false</hasHelp>
      <showEditDefault>false</showEditDefault>
```

```
      <showDetails>false</showDetails>
      <inputParameter class=
        "oracle.portal.provider.v2.DefaultParameterDefinition">
       <name>Parameter_01</name>
       <displayName>Parameter_01</displayName>
       <description>My first parameter</description>
      </inputParameter>
      <inputParameter class=
        "oracle.portal.provider.v2.DefaultParameterDefinition">
       <name>Parameter_02</name>
       <displayName>Parameter_02</displayName>
       <description>My second parameter</description>
      </inputParameter>
      <inputParameter class=
        "oracle.portal.provider.v2.DefaultParameterDefinition">
       <name>Parameter_03</name>
       <displayName>Parameter_03</displayName>
      </inputParameter>
      <renderer class="oracle.portal.provider.v2.render.RenderManager">
         <renderContainer>true</renderContainer>
         <renderCustomize>true</renderCustomize>
         <autoRedirect>true</autoRedirect>
         <contentType>text/html</contentType>
         <showPage>/htdocs/myportlet/MyPortletShowPage.jsp</showPage>
         <editPage>/htdocs/myportlet/MyPortletEditPage.jsp</editPage>
      </renderer>
      <personalizationManager class=
        "oracle.portal.provider.v2.personalize.PrefStorePersonalizationManager">
       <dataClass>
        oracle.portal.provider.v2.personalize.NameValuePersonalizationObject
       </dataClass>
      </personalizationManager>
   </portlet>
</provider>
```

9. In the Application Navigator, right-click the *portletname*`ShowPage.jsp` for your portlet and choose **Open.**

   The file is located under **Web Content > htdocs >** ***provider*** **>** ***portlet.***

   The portlet includes logic for retrieving the parameters, for example, as shown in Figure 61–7.

Example 61–7 ShowPage.jsp Sample

```
<%@page contentType="text/html; charset=windows-1252"
        import="oracle.portal.provider.v2.render.PortletRenderRequest"
        import="oracle.portal.provider.v2.http.HttpCommonConstants"
        import="oracle.portal.provider.v2.ParameterDefinition"
%>
<%
   PortletRenderRequest pReq = (PortletRenderRequest)
      request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
%>
<P>Hello <%= pReq.getUser().getName() %>.</P>
<P>This is the <b><i>Show</i></b> render mode!</P>
<%
   ParameterDefinition[] params =
       pReq.getPortletDefinition().getInputParameters();
%>
<p>This portlet's input parameters are...</p>
```

```
<table align="left" width="50%" ><tr><td><span
class="PortletHeading1">Name</span></td><td><span
class="PortletHeading1">Value</span></td></tr>
<%
   String name = null;
   String value = null;
   String[] values = null;
   for (int i = 0; i < params.length; i++)
   {
       name = params[i].getName();
       values = pReq.getParameterValues(name);
       if (values != null)
       {
           StringBuffer temp = new StringBuffer();
           for (int j = 0; j < values.length; j++)
           {
               temp.append(values[j]);
               if (j + 1 != values.length)
               {
                   temp.append(", ");
               }
           }
           value = temp.toString();
       }
       else
       {
           value = "No values have been submitted yet.";
       }
%>
<tr>
  <td><span class="PortletText2"><%= name %></span></td>
  <td><span class="PortletText2"><%= value %></span></td>
</tr>
<%
   }
%>
</table>
```

10. Add logic to your portlet that allows it to submit parameter values entered by users.
11. Create a second portlet using the same steps that simply displays parameter values that it retrieves.
12. Register the producer with a Framework application. For more information, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."
13. Add the two portlets to a page in the application. For more information, see Section 64.3, "Adding Portlets to a Page."
14. In the Structure window of the Application Navigator, right-click an element of the page and choose **Go to Page Definition.**

    The page definition should look similar to Example 61–8. Notice the variables at the page level and the parameters at the portlet level (indicated in bold).

Example 61–8 Page Definition File Sample

```
<?xml version="1.0" encoding="UTF-8"?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
                version="10.1.3.38.90" id="untitled1PageDef"
                Package="view.pageDefs">
```

```
  <executables>
    <variableIterator id="variables">
      <variable Name="portlet1_Parameter_01" Type="java.lang.Object"/>
      <variable Name="portlet1_Parameter_02" Type="java.lang.Object"/>
      <variable Name="portlet1_Parameter_03" Type="java.lang.Object"/>
    </variableIterator>
    <portlet id="portlet1"
       portletInstance="/oracle/adf/portlet/PdkPortletProducer1_1153936627784
          /applicationPortlets/Portlet1_abfc5a10_010c_1000_8003_82235f50d831"
        class="oracle.adf.model.portlet.binding.PortletBinding"
        xmlns="http://xmlns.oracle.com/portlet/bindings">
      <parameters>
        <parameter name="Parameter_01" pageVariable="portlet1_Parameter_01"/>
        <parameter name="Parameter_02" pageVariable="portlet1_Parameter_02"/>
        <parameter name="Parameter_03" pageVariable="portlet1_Parameter_03"/>
      </parameters>
    </portlet>
  </executables>
</pageDefinition>
```

15. Run the application.
16. Enter values in the first portlet and the same values should be displayed in the second portlet.

61.3.4 How to Implement Private Parameters

In some cases, you might need a parameter that is known only to the portlet instance. These parameters are known as private parameters because they have no connection to the page and are known only to the portlet. Private parameters often come in handy when you are building navigation for your portlet. For example, if you have a portlet made up of multiple pages, then you can use these private parameters to jump to another resource of the portlet.

This section includes the following subsections:

- Section 61.3.4.1, "About Private Parameters"
- Section 61.3.4.2, "About Portlet URL Types"
- Section 61.3.4.3, "Building Links with the Portlet URL Types"
- Section 61.3.4.4, "Building Forms with the Portlet URL Types"
- Section 61.3.4.5, "Implementing Navigation within a Portlet"
- Section 61.3.4.6, "Restricting Navigation to Resources"

61.3.4.1 About Private Parameters

Private parameters are used in classic web applications to pass information from links or forms in the browser back to the server. The server in turn takes actions and returns the appropriate content. For example, if the user of a dictionary web site asks for information about hedgehogs, then the URL submitted to the server might append a private parameter as follows:

```
http://dictionary.reference.com/search?q=Hedgehog
```

If the server is responsible for rendering the whole page and the client communicates directly with the server, then this form of URL works well. In a Framework application, the client does not communicate directly with portlets. Instead, WebCenter Portal: Framework mediates between the client and the portlet. Moreover,

because most pages have multiple portlets, WebCenter Portal: Framework communicates with multiple portlets.

For example, suppose a page contains two portlets, a thesaurus portlet and a dictionary portlet. Both portlets use `q` as a parameter to record the search queries made by the user. If the user queries the thesaurus portlet, then the URL used to rerequest the page with the updated thesaurus portlet must contain the thesaurus portlet's parameter, `q`. The thesaurus parameter must also be distinguished from dictionary portlet parameter 1, which performs the same function for that portlet.

You must ensure that the portlet meets the following criteria:

- It properly qualifies its own parameters when they are built into links and forms.
- It leaves unchanged any parameters that do not belong to it.

The following API call transforms an unqualified parameter name into a qualified parameter name:

```
HttpPortletRendererUtil.portletParameter(HttpServletRequest request, String
param);
```

`HttpPortletRendererUtil` is in the package `oracle.portal.provider.v2.render.http`.

For example:

```
qualParamQ = HttpPortletRendererUtil.portletParameter(r, "q");
```

To fetch the value of a portlet parameter from the incoming request, you can use the following API:

> **Note:** The API converts the parameter name into the qualified parameter name before fetching the value from the incoming request. Hence, you need not perform this step.

```
PortletRenderRequest.getQualifiedParameter(String name)
```

`PortletRenderRequest` is in the package `oracle.portal.provider.v2.render`.

For example:

```
valueQ = r.getQualifiedParameter("q");
```

The other aspect of a portlet's responsibilities with private parameters is to not disturb the parameters on the URL that it does not own. The utilities you may use to ensure adherence to this rule are discussed in Section 61.3.4.3, "Building Links with the Portlet URL Types" and Section 61.3.4.4, "Building Forms with the Portlet URL Types."

61.3.4.2 About Portlet URL Types

When a portlet renders itself, WebCenter Portal: Framework passes it various URLs, which the portlet can then use to render links. You can fetch and manipulate these URLs to simplify the task of creating links. The following is a list of the URLs provided to portlets:

- **PAGE_LINK** is a URL to the page upon which the portlet instance resides. You use this URL as the basis for all intraportlet links. If the portlet renders a link that navigates the user to another section of the same portlet, then this navigation must be encoded as a set of parameters using the PAGE_LINK.

- **DESIGN_LINK** is a URL to the portlet's personalization (Edit mode) page. A portlet's Edit and Edit Defaults modes are not rendered on the same page as the portlet. The Edit and Edit Defaults modes take over the entire browser window. The portlet's Edit and Edit Defaults modes are not necessarily accessible to every user. It represents a minimal, static framework in which the portlet is free to render its personalization options. This URL is only of use when rendering Personalize links.
- **BACK_LINK** is a URL to a useful return point from the current page where the portlet renders itself. For example, when the portlet is rendering its personalization page (Edit mode), this link refers to the page on which the portlet resides and from which the user navigated to the personalization page. Consequently, it is the link you encode in the buttons that accept or cancel the pending action. This URL is only useful for the desktop rendering of portlets (usually in Edit or Edit Defaults mode).

61.3.4.3 Building Links with the Portlet URL Types

To build links with Portlet URL types, you must access them and use them when writing portlet rendering code. To fetch the URL for a link, you call the following APIs in PDK-Java:

```
portletRenderRequest.getRenderContext().getPageURL()
portletRenderRequest.getRenderContext().getEventURL()
portletRenderRequest.getRenderContext().getDesignURL()
portletRenderRequest.getRenderContext().getLoginServerURL()
portletRenderRequest.getRenderContext().getBackURL()
```

In portlet navigation, you must add (or update) your portlet's parameters in the page URL. To perform this task, you can use the following API to build a suitable URL:

```
UrlUtils.constructLink(
    PortletRenderRequest pr,
    int linkType, -- UrlUtils.PAGE_LINK in this case
    NameValue[] params,
    boolean encodeParams,
    boolean replaceParams)
```

`UrlUtils` resides in the package called `oracle.portal.provider.v2.url`. Notice that you do not actually fetch the page URL yourself. Rather you use the supplied portlet URL type, `UrlUtils.PAGE_LINK`.

The parameter names in the `params` argument should be fully qualified. Moreover, if you properly qualify the parameters, `UrlUtils.constructLink` with the appropriate `linkType` does not disturb other URL parameters that are not owned by the portlet.

An alternative version of `UrlUtils.contructLink` accepts a URL as the basis for the returned URL. If you require an HTML link, then you can use `UrlUtils.constructHTMLLink` to produce a complete anchor element.

The following example portlet, `ThesaurusLink.jsp`, uses the parameter `q` to identify the word for which to search the thesaurus. It then creates links on the found, related words that the user may follow to get the thesaurus to operate on that new word. To see the initial submission form that sets the value of `q`, see the example in Section 61.3.4.4, "Building Forms with the Portlet URL Types."

```
<%
    String paramNameQ = "q";
    String qualParamNameQ =
    HttpPortletRendererUtil.portletParameter(paramNameQ);
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramValueQ = pRequest.getQualifiedParameter(paramNameQ);
%>
<!-- Output the HTML content -->
<center>
    Words similar to <%= paramValueQ %>
    <br>
    Click the link to search for words related to that word.
    <br>
    <ul>
<%
        String[] relatedWords = Thesaurus.getRelatedWords(paramValueQ);
        NameValue[] linkParams = new NameValue[1];
        for (int i=0; i<=relatedWords.length; i++)
        {
            linkParams[0] = new NameValue(
                qualParamNameQ, relatedWords[i]);
%>
            <li>
            <b> <%= relatedWords[i] %> </b>
            <%= UrlUtils.constructHTMLLink(
                pRequest,
                UrlUtils.PAGE_LINK,
                "(words related to " + relatedWords[i] + ")",
                "",
                linkParams,
                true,
                true)%>
           </li>
<%
        }
%>
   </ul>
</center>
```

61.3.4.4 Building Forms with the Portlet URL Types

The use of portlet parameters in forms is similar to their use in links. The following two fundamental rules continue to apply:

- Qualify the portlet's parameter names.
- Do not manipulate or remove the other parameters on the incoming URL.

In terms of markup and behavior, forms and links differ quite considerably. However, just as with links, PDK-Java contains utilities for complying with these two basic rules.

A parameter name is just a string, whether it is a link on a page or the name of a form element. Therefore, the code for properly qualifying the portlet's parameter name is the same as that described in Section 61.3.4.3, "Building Links with the Portlet URL Types."

Forms differ from links in the way you ensure that the other parameters in the URL remain untouched. Once you open the form in the markup, you can make use of the following APIs:

```
UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName);
UrlUtils.htmlFormHiddenFields(someURL);
```

where `formName = UrlUtils.htmlFormName(pRequest,null).`

> **Note:** Just as parameters in URLs and element names in forms require qualification to avoid clashing with other portlets on the page, form names must be fully qualified because any given page might have several forms on it.

The `htmlFormHiddenFields` utility writes HTML hidden form elements into the form, one form element for each parameter on the specified URL that is not owned by the portlet.

```
<INPUT TYPE="hidden" name="paramName" value="paramValue">
```

Thus, you need only to add their portlet's parameters to the form.

The other item of which you should be aware is how to derive the submission target of your form. In most cases, the submission target is the current page:

```
formTarget = UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK)
```

The value of `formTarget` can be the action attribute in an HTML form or the target attribute in a `SimpleForm`. Even though the method name includes HTML, it actually just returns a URL and thus you can use it in mobile portlets, too.

The following example form renders the thesaurus portlet's submission form. For the portlet that results from the submission of this form, see the example in Section 61.3.4.3, "Building Links with the Portlet URL Types."

```
<%
    String paramNameSubmit = "submit";
    String paramNameQ = "q";
    String qualParamNameQ =
        HttpPortletRendererUtil.portletParameter(paramNameQ);
    String qualParamNameSubmit =
    HttpPortletRendererUtil.portletParameter(paramNameSubmit);
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String formName = UrlUtils.htmlFormName(pRequest,"query_form");
%>
<!-- Output the HTML content -->
<center>
    <b>Thesaurus</b>
    Enter the word you want to search for
    <form name="<%= formName %>" method="POST"
        action="<%= UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK) %>">
        <%= UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName)%>
        <table><tr><td>
            Word of interest:
        </td><td>
            <input
                type="text"
                size="20"
                name="<%= qualParamNameQ %>"
                value="">
        </td></tr></table>
        <input type=submit name="<%= qualParamNameSubmit %>" Value="Search">
```

```
    </form>
</center>
```

61.3.4.5 Implementing Navigation within a Portlet

You can implement navigation within a portlet in one of three ways:

- Pass navigation information in rendered URLs using private portlet parameters. Branching logic within the portlet code then determines which section of the portlet to render based on the URL. This option represents a small extension to the thesaurus example presented in Section 61.3.4.3, "Building Links with the Portlet URL Types" and Section 61.3.4.4, "Building Forms with the Portlet URL Types." Basically, instead of performing thesaurus search operations using the value of parameter `q`, the portlet branches based on the parameter value and renders different content accordingly.
- Pass navigation information as described in the previous item but use PDK-Java to interpret the parameter and thus branch on its value. This option requires some further changes to the thesaurus example and is more fully explained later in this section.
- Use session storage to record the portlet state and private parameters to represent actions rather than explicit navigation. This method provides the only way that you can restore the portlet to its previous state when the user navigates off the page containing the portlet. Once the user leaves the page, all private portlet parameters are lost and you can only restore the state from session storage, assuming you previously stored it there. This option requires that you understand and implement session storage. For more information about implementing session storage, see Section 61.3.6, "How to Access Session Information."

The following portlet code comes from the multipage example in the sample producer of PDK-Java:

```
<portlet>
    <id>11</id>
    <name>Multipage</name>
    <title>MultiPage Sample</title>
    <shortTitle>MultiPage</shortTitle>
    <description>
        This portlet depicts switching between two screens all
        in an application page.
    </description>
    <timeout>40</timeout>
    <timeoutMessage>MultiPage Sample timed out</timeoutMessage>
    <renderer class="oracle.portal.provider.v2.render.RenderManager">
        <contentType>text/html</contentType>
        <showPage>/htdocs/multipage/first.jsp</showPage>
        <pageParameterName>next_page</pageParameterName>
    </renderer>
</portlet>
```

> **Note:** The value of `pageParameterName` is the name of a portlet parameter, `next_page`, that the PDK-Java framework intercepts and interprets as an override to the value of the `showPage` parameter. If the PDK-Java framework encounters the qualified version of the parameter when the multipage portlet is requested, then it renders the resource identified by `next_page` rather than `first.jsp`. PDK-Java does not render the parameter within the portlet, that responsibility falls to the portlet.

You can modify the thesaurus example to operate with the use of this parameter. Specifically, you can use the form submission portlet to be the input for the thesaurus (the first page of the portlet), then navigate the user to the results page, which contains links to drill further into the thesaurus. The following examples illustrate these changes.

> **Note:** The example that follows is most useful for relatively simple cases, such as this thesaurus example. If your requirements are more complex (for example, you want to build a wizard experience), then you should consider using an MVC framework such as Struts. For information about how to build portlets from struts applications, see Section 61.5, "Creating a Struts Portlet."

`ThesaurusForm.jsp`:

```
<%
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramNameSubmit = "submit";
    String paramNameQ = "q";
    String qualParamNameQ =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameQ);
    String qualParamNameSubmit =
    HttpPortletRendererUtil.portletParameter(pRequest, paramNameSubmit);
    String formName = UrlUtils.htmlFormName(pRequest,"query_form");
%>
<!-- Output the HTML content -->
<center>
    <b>Thesaurus</b>
    Enter the word you want to search for
    <form name="<%= formName %>" method="POST"
        action="<%= UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK) %>">
        <%= UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName)
%>
        <%= UrlUtils.emitHiddenField(
                HttpPortletRendererUtil.portletParameter(request, "next_page"),
                "htdocs/path/ThesaurusLink.jsp" ) %>
        <table><tr><td>
            Word of interest:
        </td><td>
            <input
                type="text"
                size="20"
                name="<%= qualParamNameQ %>"
                value="">
        </td></tr></table>
        <input type=submit name="<%= qualParamNameSubmit %>" Value="Search">
```

```
    </form>
</center>
```

Notice how `next_page` must be explicitly set to point to `ThesaurusLink.jsp`. If you do not explicitly set `next_page` in this way, then it defaults to the resource registered in `provider.xml`, which is `ThesaurusForm.jsp`.

`ThesaurusLink.jsp`:

```
<%
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramNameQ = "q";
    String paramNameNextPage = "next_page";
    String qualParamNameQ =
    HttpPortletRendererUtil.portletParameter(pRequest, paramNameQ);
    String qualParamNameNextPage =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameNextPage);
    String paramValueQ = pRequest.getQualifiedParameter(paramNameQ);
%>
<!-- Output the HTML content -->
<center>
    Words similar to <%= paramValueQ %>
    <br>
    Click the link to search for words related to that word.
    <br>
    <ul>
<%
        Thesaurus t = new Thesaurus();
        String[] relatedWords = t.getRelatedWords(paramValueQ);
        NameValue[] linkParams = new NameValue[2];
        linkParams[0] = new NameValue(
            qualParamNameNextPage, "htdocs/path/ThesaurusLink.jsp");
        for (int i=0; i<relatedWords.length; i++)
        {
            linkParams[1] = new NameValue(
                qualParamNameQ, relatedWords[i]);
%>
            <li>
            <b> <%= relatedWords[i] %> </b>
            <%= UrlUtils.constructHTMLLink(
                pRequest,
                UrlUtils.PAGE_LINK,
                "(words related to " + relatedWords[i] + ")",
                "",
                linkParams,
                true,
                true)%>
           </li>
<%
        }
%>
   </ul>
   <a href="<%=XMLUtil.escapeXMLAttribute
               (pRequest.getRenderContext().getPageURL())%>">
      Reset Portlet
   </a>
</center>
```

61.3.4.6 Restricting Navigation to Resources

One limitation of implementing navigation with private parameters is that users could potentially navigate to portlet resources that you prefer to restrict. To control navigation to restricted resources, you can create a *whitelist* of acceptable resources to which a user may navigate. If you do not construct a whitelist to restrict navigation, then your portlet's resources are accessible according to the following default rules:

- Any path immediately beneath the servlet root context is navigable. For example, `/index.jsp` is accessible but `/WEB-INF/web.xml` is not.
- Any path under the `htdocs` directory is navigable. For example, both `/htdocs/multipage/first.jsp` and `/htdocs/lottery/lotto.jsp` are accessible.

To change this default behavior, you can add allowable path values to the provider definition file, `provider.xml`. For example, suppose you have a portlet where a JSP is used as a controller to forward requests to other pages depending on the `pageParameterName` private parameter. The XML excerpt in Example 61–9 allows resources under `/htdocs/multiportlet` to be shown. All other resources are restricted.

Example 61–9 Whitelist Excerpt from the provider.xml File

```
<portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
   <id>1</id>
   <name>Multipage</name>
   <title>A MultiPage Portlet</title>
   ...
   <renderer class="oracle.portal.provider.v2.render.RenderManager">
          <contentType>text/html</contentType>
          <showPage>/htdocs/multiportlet/controller.jsp</showPage>
          <pageParameterName>show_page</pageParameterName>
          <allowedPath>/htdocs/multiportlet/*</allowedPath>
   </renderer>
</portlet>
```

The pattern matching rules for this feature are similar to URL pattern matching in `web.xml` files. The rules are as follows:

- To match the defined patterns, the resource path must exactly match unless wildcards are used.
- The first wildcard is for path matching and consists of a string beginning with `/` and ending with `/*`. Any resource whose path starts with this string is matched. For an `<allowedPath>` value of `/htdocs/sub1/*`, valid values of the private parameter include `/htdocs/sub1/file.jsp` and `/htdocs/sub1/sub2/file2.jsp`.
- The second wildcard is for file type matching and consists of a string starting with `*.` and ending with a file extension. Valid values for the page parameter end with that file extension. For an `<allowedPathvalue>` of `*.jsp`, valid values of the private parameter include `/htdocs/sub1/file.jsp` and `/htdocs/sub1/file2.jsp`.

61.3.5 How to Use JNDI Variables

When writing Java portlets, you may set deployment-specific properties through the JNDI service such that their values may be retrieved from your producer code. In this

way, you can specify any property in a producer deployment and then easily access it anywhere in your producer code.

You can use JNDI variables to change producer property values after the producer has been deployed. The environment entry must be declared in `web.xml`. It can then be updated on deployment using a deployment plan.

PDK-Java provides utilities to enable the retrieval of both producer and non-producer JNDI variables within a Java EE container.

This section includes the following subsections:

- Section 61.3.5.1, "Declaring JNDI Variables"
- Section 61.3.5.2, "Setting JNDI Variable Values"
- Section 61.3.5.3, "Retrieving JNDI Variables"

61.3.5.1 Declaring JNDI Variables

You declare JNDI variables in the `web.xml` file for your producer. The format for declaring a JNDI variable is as follows:

```
<env-entry>
    <env-entry-name>variableName</env-entry-name>
    <env-entry-type>variableType</env-entry-type>
    <env-entry-value>variableValue</env-entry-value>
</env-entry>
```

The `env-entry-name` element contains the name by which you want identify the variable. `env-entry-type` contains the fully qualified Java type of the variable. `env-entry-value` contains the variable's default value.

This section includes the following subsections:

- Section 61.3.5.1.1, "Variable Types"
- Section 61.3.5.1.2, "Variable Naming Conventions"
- Section 61.3.5.1.3, "Examples"

61.3.5.1.1 Variable Types In the `env-entry-type` element, you must supply the fully qualified Java type of the variable, which is expected by your Java code. The Java types you may use in your JNDI variables are as follows:

- `java.lang.Boolean`
- `java.lang.String`
- `java.lang.Integer`
- `java.lang.Double`
- `java.lang.Float`

The Java EE container uses these type declarations to automatically construct an object of the specified type and gives it the specified value when you retrieve that variable in your code.

61.3.5.1.2 Variable Naming Conventions The PDK-Java defines environment variables that can be set at the individual producer service level or at the web application level. To avoid naming conflicts between different producer services or different application components packaged in the same web application, Oracle recommends you devise some naming convention.

> **Note:** If you use the `EnvLookup` method, then you must use `oracle/portal/provider/service/property`. You cannot substitute your own company name or component in this case.

For example:

- Producer service-specific names should be of the form:

  company`/`*component name*`/`*producer name*`/`*variable name*

- Shared names must be of the form:

  company`/`*component name*`/`*producer name*`/global`

where:

- *company* is the name of the company owning the application.
- *component name* is the name of the application or component with which the producer is associated.
- *producer name* is the service name of the producer.
- *variable name* is the name of the variable itself.

As you can see, these naming conventions are similar to those used for Java packages. This approach minimizes the chance of name collisions between applications or application components. PDK-Java provides utilities that enable you to retrieve variables in this form without hard coding the service name of the producer into your servlets or JSPs. The service name need only be defined in the producer's WAR file. For more information about retrieving JNDI variables, see Section 61.3.5.3, "Retrieving JNDI Variables."

61.3.5.1.3 Examples The following examples illustrate producer variable names:

```
oracle/portal/myProvider/myDeploymentProperty
oracle/portal/myprovider/myProperties/myProperty
```

The following example illustrates non-producer variable names:

```
oracle/portal/myOtherProperty
```

61.3.5.2 Setting JNDI Variable Values

In your producer deployment, you may want to set a new value for some or all of your JNDI variables. You can perform this task by setting the values manually within a WLS deployment plan. Deployment plans can be created for the producer deployment through the WLS console.

To set variable values manually within a deployment plan:

1. Go to the producer deployment with the WLS console and create a new deployment plan if one does not exist.
2. Edit the deployment plan XML file. For each deployment property you want to set, add the following variable definition directly under the `<deployment-plan>` tag:

```
<variable-definition>
  <variable>
    <name>jndi_var_def</name>
    <value>false</value>
  </variable>
```

```
</variable-definition>
```

3. To tie this variable definition to the actual JNDI variable, add the following for each property under the `WEB-INF/web.xml` module descriptor (`oracle/portal/sample/rootDirectory` is used as an example):

```
<module-descriptor external="false">
  <root-element>web-app</root-element>
  <uri>WEB-INF/web.xml</uri>
  <variable-assignment>
    <name>jndi_var_def</name>

<xpath>/web-app/env-entry/[env-entry-name="oracle/portal/sample/rootDirectory"]
/env-entry-value</xpath>
   </variable-assignment>
</module-descriptor>
```

4. Save and close the file.
5. Select Update on the producer deployment to apply the deployment plan for the new settings to take effect.

61.3.5.3 Retrieving JNDI Variables

JNDI is a standard Java EE technology. As such, you can access JNDI variables through Java EE APIs. For example:

```
String myVarName = "oracle/portal/myProvider/myVar"
String myVar = null;
try
{
   InitialContext ic = new InitialContext();
   myVar = (String)ic.lookup("java:env/" + myVarName);
}
catch(NamingException ne)
{
   exception handling logic
}
```

In addition to the basic Java EE APIs, PDK-Java includes a simple utility class for retrieving the values of variables defined and used by the PDK itself. These variables conform to the naming convention described in Section 61.3.5.1.2, "Variable Naming Conventions" and are of the form:

```
oracle/portal/provider_service_name/variable_name
oracle/portal/variable_name
```

To use these APIs, you need only provide the *`provider_service_name`* and the *`variable_name`*. The utilities construct the full JNDI variable name, based on the information you provide, and look up the variable using code similar to that shown earlier and return the value of the variable.

The `EnvLookup` class (`oracle.portal.utils.EnvLookup`) provides two `lookup()` methods. One retrieves producer variables and the other retrieves non-producer variables. Both methods return a `java.lang.Object`, which can be cast to the Java type you are expecting.

The following code example illustrates the retrieval of a producer variable:

```
EnvLookup el = new EnvLookup();
String s = (String)el.lookup(myProviderName, myVariableName);
```

myProviderName represents the service name for your producer, which makes up part of the variable name. *myVariableName* represents the portion of the variable name that comes after the producer's service name. The example assumes the variable being retrieved is of type `java.lang.String`.

To retrieve a non-producer variable, you use the same code, you pass only one parameter, the variable name, to the `lookup()`, again excluding the `oracle/portal` prefix.

```
EnvLookup el = new EnvLookup();
Object o = el.lookup(myVariableName);
```

Table 61–2 shows the JNDI variables provided by default with PDK-Java. If you do not declare these variables, then PDK-Java looks for their values in their original locations (`web.xml` and the deployment properties file).

Table 61–2 PDK-Java JNDI Variables

Variable	Description
`oracle/portal/provider/`*provider_name*`/autoReload`	Boolean auto reload flag. Defaults to true.
`oracle/portal/provider/`*provider_name*`/definition`	Location of producer's definition file.
`oracle/portal/provider/global/log/logLevel`	Log setting (0 through 8). 0 being no logging and 8 the most possible logging.
`oracle/portal/provider/`*provider_name*`/maxTimeDifference`	Producer's HMAC time difference.
`oracle/portal/provider/<service_name>/resourceUrlKey`	Authentication key for resource proxying through the Parallel Page Engine. See *Oracle Fusion Middleware Administrator's Guide for Oracle Portal* for more information.
`oracle/portal/provider/`*provider_name*`/rootDirectory`	Location for producer personalizations. No default value.
`oracle/portal/provider/`*provider_name*`/sharedKey`	HMAC shared key. No default value.
`oracle/portal/provider/`*provider_name*`/showTestPage`	(non-producer) A Boolean flag that determines if a producer's test page is accessible. Defaults to true.
`oracle/portal/provider/global/transportEnabled`	A Boolean flag that determines whether Edit Defaults personalizations may be exported and imported.

61.3.6 How to Access Session Information

When a user accesses a page, it initiates a public, unauthenticated session and tracks information about the session across requests. If the user logs in, then this session becomes an authenticated session of the logged-in user. This session terminates when any of the following occur:

- The browser session terminates (that is, the user closes all the browser windows).
- The user explicitly logs out.
- The session times out because the user's idle time exceeds the configured limit.

As part of the metadata generation, all of the producers that contribute portlets to the page are contacted, if they specified during registration that they be called for some special processing. This call allows producers to do processing based on the user session, log the user in the producer's application if needed, and establish producer sessions. For producers, this call is referred to as `initSession`. As most web-enabled applications track sessions using cookies, this API call enables the producer of the application to return cookies.

You can use the session store to save and retrieve information that persists during the portal session. This information is only available, and useful, to you during the life of the session. You should store only temporary information in the session store. Application developers may use the session store to save information related to the current user session. Data in the session store can be shared across portlets.

If the information you want to store must persist across sessions, then you may want to store it in the preference store instead. Some common applications of the session store are as follows:

- To cache data that is expensive to load or calculate (for example, search results).
- To cache the current state of a portlet (for example, the current range, or page, of search results displayed in the portlet, or sequence of events performed by user).

Before you implement session storage, you should carefully consider the performance costs. Because portlets and producers are remote, it can be a relatively expensive operation to create and maintain even a small amount of information in the session store. For this reason, you may want to avoid altogether any session storage for public pages that are accessed frequently by many users.

Furthermore, while using the session store with producers, you create a stateful application that tracks state information in memory. Similarly, you create a stateful application if you use the file-system implementation of preference store.

If scalability is an important concern for you, then a stateful application may cause you problems. Stateful applications can affect the load-balancing and failover mechanism for your configuration. Even though you may deploy multiple middle-tiers, you must implement sticky routing (where the same node handles subsequent requests in the same session) to track state. Sticky routing may result in lopsided load-balancing or loss of session data in case a node crashes, affecting failover. This issue is one reason why many developers prefer to build stateless applications. However, if scalability is not a concern, then a stateful application should present no problems for you.

The PDK Framework represents the session with a `ProviderSession` object, which is established during the call to the Provider Instance's `initSession` method. This object is associated with the `ProviderUser`. To make data persistent between requests, you must write data into the session object using the `setAttribute` method on the `ProviderSession` object. This method maps a `java.lang.Object` to a `java.lang.String` and stores that mapping inside the session object. The `String` can then be used to retrieve the `Object` during a subsequent request, provided the session is still valid.

A producer session may become invalid for the following reasons:

- The session times out.
- The `invalidate` method on `ProviderSession` is called.

- The JVM process running the servlet container is terminated.

All portlets contained by the same `ProviderInstance` share the same session for a particular `ProviderUser`. Therefore, data unique to a particular portlet instance must be mapped to a unique `String` in the session. This is accomplished using the `portletParameter` method in the `PortletRendererUtil` class. This method makes a supplied `String` parameter or attribute name unique to a `PortletInstance`, by prefixing it with a generated identifier for that instance. You can use the returned instance-specific name to write portlet instance data into the session.

For more detailed information about the PDK Framework classes, see the JavaDoc in the *Oracle Fusion Middleware Java API Reference for Oracle PDK Java*.

In the example in this section, session storage is used to count the number of times your portlet has rendered in Shared Screen mode.

Before You Begin

The steps that follow assume that you have:

- Followed through and understood Section 60.2.4, "How to Create a PDK-Java Portlet."
- Built a portlet using the wizard and successfully added it to a page.

To implement session storage:

- Import `ProviderSession`, `PortletRendererUtil`, and `HttpPortletRendererUtil`.
- Retrieve the producer session.
- Read and write the session by accessing it from within your Java portlet.
- Set the session to true in `provider.xml`.
- Register the producer for session storage and set the Login Frequency.

The steps that follow describe how to add a session count to your portlet that displays how many times the portlet has been rendered for the current session.

1. After using the wizard to create a portlet, you can edit the JSP for the Show page in Oracle JDeveloper. You must import the following classes:

```
<%@page contentType="text/html; charset=windows-1252"
import="oracle.portal.provider.v2.render.PortletRenderRequest"
import="oracle.portal.provider.v2.http.HttpCommonConstants"
import="oracle.portal.provider.v2.ProviderSession"
import="oracle.portal.provider.v2.render.PortletRendererUtil"
import="oracle.portal.provider.v2.render.http.HttpPortletRendererUtil"
%>
```

2. Insert code that checks for a valid session first and then increments the count and displays it. If the session is valid and a previously stored value exists, then you display the value, increment the count, and store the new value. If the session is valid but no previously stored value exists, then you initialize a new count starting with 1, and display and store the value. You also want to obtain the unique string key for this portlet and then use an it in an array to count the session. If no session information was received, then you want to provide information to the user indicating they may need to log in again.

```
<%
PortletRenderRequest pReq = (PortletRenderRequest)
```

```
request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
ProviderSession pSession = pReq.getSession();
  if (pSession != null)
  {
    String key = PortletRendererUtil.portletParameter(pReq, "count");
    Integer i = (Integer)pSession.getAttribute(key);
    if (i == null)
    {
      i = new Integer(0);
    }
    i = new Integer(i.intValue()+1);
    pSession.setAttribute(key, i);
%>

<p>Render count in this session: <%=i%> </p>

<%
  }
  else
  {
%>

<p>The session has become invalid</p>
<br>
Please log out and log in again.
<%
  }
%>
```

3. By default, the wizard does not set session to true in `provider.xml`. You must update this flag in order for the producer to receive session information from the portal. You should only set this tag to true if you are using session information in your producer or portlets. By setting this flag to true, extra load is added to the producer calls.

   ```
   <provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
   <session>true</session>
   ```

4. Register your producer with session support. For a reminder on how to register your portlet, see Section 62.4, "Registering and Viewing Your Portlet."

5. If you have not added your Java portlet to a page, then do so now. Ensure that you perform the following tasks:

   - Refresh the producer to accept the new changes.
   - Re-login in case your session is no longer valid.

61.3.7 How to Enhance Portlet Performance with Caching

Once you have completed the basic functionality of your portlet, you may want to turn your attention to portlet performance.

Caching is a common technique for enhancing the performance of web sites that include a great deal of dynamic content. The overhead involved in retrieving data and generating the output for dynamic content can be significantly reduced by proxying requests through a local agent backed by a large, low-latency data store known as a cache. The cache agent responds to a request in one of two ways, as follows:

- If a valid version of the requested content exists in the cache, then the agent simply returns the existing cached copy, thus skipping the costly process of content retrieval and generation. This condition is called a cache hit.
- If a valid version of the requested content does not exist in the cache, then the agent forwards the request to its destination and awaits the return of the content. The agent returns the content to the requester and stores a local copy in its cache for reuse if a subsequent request for the same content arises. This condition is called a cache miss.

Producers generate dynamic content (that is, portlets) and they reside remotely from the Framework application instance on which they are deployed. As such, caching might improve their performance. The architecture lends itself well to caching. You can cache the portlets rendered by your producer and reuse the cached copies to handle subsequent requests, minimizing the overhead your producer imposes on page assembly.

The producer can use any one of three different caching methods, depending upon which one is best suited to the application. The methods differ chiefly in how they determine whether content is still valid. Following are the three caching methods:

- **Expiry-based Caching**: When a producer receives a render request, it stamps its response with an expiry time. The rendered response remains in the cache and fills all subsequent requests for the same content until its expiry time passes. This caching scheme is perhaps the simplest and most performant because the test for cache validity requires very little overhead and does not involve any network round trips. Expiry-based caching suits applications where the content has a well-defined life span. For content with a less certain life span, however, expiry-based caching is less effective. For more information, see Section 61.3.7.1, "Activating Caching" and Section 61.3.7.2, "Adding Expiry-Based Caching."
- **Validation-based Caching**: When a producer receives a render request, it stamps its response with a version identifier (or E Tag). The response goes into the cache, but, before the consumer can reuse the cached response, it must determine whether the cached version is still valid. It sends the producer a render request that includes the version identifier of the cached content. The producer determines whether the version identifier remains valid. If the version identifier is still valid, then the producer immediately sends a lightweight response to the consumer without any content, which indicates the cached version can be used. Otherwise, the producer generates new content with a new version identifier, which replaces the previously cached version. In this form of caching, the consumer must always confirm with the producer whether the content is up to date. The validity of the cached copy is determined by some logic in the producer. The advantage of this approach is that the producer controls the use of the cached content rather than relying on a fixed period. For more information, see Section 61.3.7.1, "Activating Caching" and Section 61.3.7.3, "Adding Validation-Based Caching."

This section includes the following subsections:

- Section 61.3.7.1, "Activating Caching"
- Section 61.3.7.2, "Adding Expiry-Based Caching"
- Section 61.3.7.3, "Adding Validation-Based Caching"

Before You Begin

The steps that follow assume that you have:

- Followed through and understood Section 60.2.4, "How to Create a PDK-Java Portlet."

- Built a portlet using the wizard and successfully added it to a page.

61.3.7.1 Activating Caching

To use the caching features in your producers, you must first activate the middle tier cache. This cache is known as the PL/SQL Cache because it is the same cache used by mod_plsql, the Oracle HTTP Server plug-in that calls database procedures, and hence database producers, over HTTP.

Usually, your administrator is responsible for the configuration details of caching.

61.3.7.2 Adding Expiry-Based Caching

Expiry-based caching is a simple caching scheme to implement, and can be activated declaratively in your XML producer definition. You can set an expiry time for the output of any `ManagedRenderer` you use by setting its `pageExpires` property to the number of minutes you want the output to be cached for. For example, suppose you want portlet output to be cached for one minute.

To add expiry-based caching:

1. After you have used the Create Oracle PDK-Java Portlet wizard to build a portlet as described in Section 60.2.4, "How to Create a PDK-Java Portlet," edit the `provider.xml` file and set the `pageExpires` property tag of showPage to 1. This sets an expiry entry of one minute for the portlet.

   By default the wizard generates a standard and compressed tag for `showPage`. Expand the tag to include a subtag of `pageExpires`:

   ```
   <showPage class="oracle.portal.provider.v2.render.http.ResourceRenderer">
      <resourcePath>/htdocs/mycacheportlet/MyCachePortletShowPage.jsp
         </resourcePath>
      <pageExpires>1</pageExpires>
   </showPage>
   ```

2. Test that the portlet is cached for 1 minute by adding some JSP code to your show page. You can simply add the current time to your JSP.

   ```
   <%@page contentType="text/html; charset=windows-1252"
      import="oracle.portal.provider.v2.render.PortletRenderRequest"
      import="oracle.portal.provider.v2.http.HttpCommonConstants"
      import="java.util.Date"
      import="java.text.DateFormat"
   %>

   <%
    PortletRenderRequest pReq = (PortletRenderRequest)
      request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    DateFormat df = DateFormat.getDateTimeInstance(DateFormat.LONG,
      DateFormat.LONG,pReq.getLocale());
    String time = df.format(new Date());
   %>

   <P>Hello <%=pReq.getUser().getName() %>.</P>
   <P>This is the <b><i>Edit</i></b> render mode!</P>
   <P>This information is correct as of <%=time%>.</P>
   ```

   When viewing the portlet, you see that the time (including seconds) is constant for one minute. After the time has expired, the portlet displays the most current time and a new cache is set.

61.3.7.3 Adding Validation-Based Caching

Adding validation-based caching requires slightly more effort, but gives you explicit control over exactly which requests to your producer are cache hits. As an example, you may want to update the cache only when data within the portlet has changed. To implement this algorithm, you must override the `prepareResponse` method. The signature of the `BaseManagedRenderer.prepareResponse` method is:

```
public boolean prepareResponse(PortletRenderRequest pr)
                        throws PortletException,
                               PortletNotFoundException
```

In your version of `prepareResponse()`, do the following:

- Retrieve the cached version identifier set by the consumer in the render request by calling the `HttpPortletRendererUtil.getCachedVersion()` method:

  ```
  public static java.lang.String getCachedVersion
      (PortletRenderRequest request)
  ```

- If the portlet finds the previously cached version valid, then the appropriate header must be set by calling the `HttpPortletRendererUtil.useCachedVersion()` method. It also instructs the `RenderManager` that it is not necessary to call `renderBody()` to render the portlet body.

  ```
  public static void useCachedVersion(PortletRenderRequest request)
  ```

  Otherwise, use `HttpPortletRendererUtil.setCachedVersion()` to generate a new version of the portlet, which is cached. It also indicates to the consumer that the `renderBody()` method has to be called to regenerate the portlet content.

  ```
  public static void setCachedVersion(PortletRenderRequest request,
                                      java.lang.String version,
                                      int level)
                               throws java.lang.IllegalArgumentException
  ```

For validation-based caching, you need not update `provider.xml`. You can view the portlet by refreshing the page or adding the portlet to a page and updating the content. If the content has changed, then the portlet shows the new content. If the content has not changed, then a cached version of the portlet is displayed.

61.4 Testing Portlet Personalization

If you have implemented personalization for your portlet, then the Personalize link only appears on the portlet for authenticated users. Hence, to test the personalization of a portlet (the Personalize link), you must have some form of security implemented for the application consuming the portlet. For testing purposes, you may prefer to just configure the most basic authentication possible. For more information, see Section 69.12, "Configuring Basic Authentication for Testing Portlet Personalization."

61.5 Creating a Struts Portlet

Oracle PDK contains extensions to integrate Apache Struts applications. This section explains how to build a portlet from an existing struts application. You can also follow these steps to create a portlet that uses the Model View Controller paradigm. The PDK-Java extensions described in this section rely on Apache Struts 1.1.

You can use the Struts framework to enhance portlet behavior. For example, a Struts controller may be used for page flow within a portlet. A portlet renderer is used as a bridge between portlet render requests and Struts servlet requests

The following code shows a portion of the producer definition file (`provider.xml`):

```
...
<renderContainer>true</renderContainer>
    <renderCustomize>true</renderCustomize>
    <autoRedirect>true</autoRedirect>
    <contentType>text/html</contentType>
    <showPage class="oracle.portal.provider.v2.render.http.StrutsRenderer">
        <defaultAction>showCustomer.do</defaultAction>
    </showPage>
</renderer>
...
```

The `showPage` of the Struts portlet contains two important components:

- The renderer class (`oracle.portal.provider.v2.render.http.StrutsRenderer`) receives the render requests and forwards them to the Struts Action Servlet.
- The `defaultAction` tag defines the Struts action that is used by default when the portlet is called for the first time.

The PDK-Java enables you to easily develop a view (portlet view) of your Struts application. This view enforces a consistent look and feel of your Struts portlet using portal styles, and enables the end user to use the application within the portal.

To create a Struts portlet, you must use the PDK-Java Struts tags, which are extensions of the default Struts JSP tags. This development process is similar to that of creating a standalone Struts application. For portlets in a producer application to use the Struts framework, the Struts components must be part of the same web application.

To publish a part of an existing Struts application as a portlet, Oracle recommends that you first create a new view to serve as the portlet view of your application. This view uses existing objects (`Actions`, `ActionForm`, and so on) with a new mapping and new JSPs.

> **Note:** Although Oracle recommends that you create a portlet view of your application, you could alternatively replace your application's struts tags with PDK-Java struts tags. This approach enables your application to run both as a standalone struts application and a portlet.

In this example, you create a portlet that enables you to add a new entry to a blog. Figure 61–3 and Figure 61–4 show how you submit a blog and save a blog entry.

Figure 61–3 Submitting a Blog

Figure 61–4 Saving a Blog Entry

`prepareNewBlog` is a simple empty action that redirects the request to the `enterNewBlog.jsp` page. This page shows a form for submitting a new blog.

The corresponding entry in the `struts-config.xml` is:

```
<action path="/prepareNewBlog" scope="request"
    type="view.PrepareNewBlogAction" >
    <forward name="success" path="/view/enterNewBlog.jsp"/>
</action>
<action path="/saveNewBlog" name="blogForm" scope="request"
    type="view.SaveNewBlogAction" input"/view/enterNewBlog.jsp"  >
    <forward name="success" path="/view/newBlogConfirmation.jsp"/>
</action>
```

This section includes the following subsections:

- Section 61.5.1, "How to Create a New Flow and View to Host the Portlet Actions"
- Section 61.5.2, "How to Create the New JSPs"
- Section 61.5.3, "How to Create a Portlet"
- Section 61.5.4, "How to Extend the Portlet to Add Business Logic"
- Section 61.5.5, "How to Register the Producer"

61.5.1 How to Create a New Flow and View to Host the Portlet Actions

To create a new view, first create a new set of `ActionMappings` (page flow) that redirects the various actions and requests to Portal-specific JSPs.

```
<action path="/portal/prepareNewBlog" scope="request"
    type="view.PrepareNewBlogAction" >
    <forward name="success" path="/view/portal/enterNewBlog.jsp"/>
</action>
<action path="/portal/saveNewBlog" name="blogForm" scope="request"
    type="view.SaveNewBlogAction" input="/view/enterNewBlog.jsp"  >
    <forward name="success" path="/view/portal/newBlogConfirmation.jsp"/>
</action>
```

As you can see, only the path attributes are modified. The `FormBean` Action responsible for the application business logic remains unchanged.

61.5.2 How to Create the New JSPs

As specified in the previous step, the actions forward the request to new JSPs, which are responsible for rendering the portlet content. Your new portlet view JSPs can share the HTML with the standalone view, but ensure the portlet meets the following criteria:

- Uses styles that enforce a consistent look and feel with the rest of the page.
- Contains HTML code that is allowed in HTML table cells (that is, no `<html>`, `<body>`, and `<frame>` tags).
- Uses the PDK-Java version of the Struts HTML tag library. This renders URLs in the correct format to work in a portlet context.

The PDK Struts HTML tag library contains versions of the Struts HTML tags that can be used in portlet markup.

Note: You can register the Oracle PDK with Oracle JDeveloper so that you can drop the tags from the Oracle JDeveloper Components Palette. For more information, see the *Registering a Custom Tag Library in JDeveloper* section in the Oracle JDeveloper online Help.

61.5.3 How to Create a Portlet

You can create your Struts portlet either manually or by using the Create Oracle PDK-Java Portlet wizard. Although the wizard does not explicitly offer Struts support, you can use the wizard to build your Struts portlet.

To create a portlet:

1. In JDeveloper, open the Oracle PDK-Java Portlet wizard.

   For more information, see Section 60.2.4, "How to Create a PDK-Java Portlet."

2. On the View Modes page of the wizard, for the Show Page mode, select an **Implementation Style** of **Java Class**.
3. For the **Package Name**, enter `oracle.portal.provider.v2.render.http`.
4. For the **Class Name**, enter `StrutsRenderer`. This generates the skeleton of the portlet renderer class, `StrutsRenderer`.
5. As the `StrutsRenderer` is part of the PDK, you do not need this generated file. So, when you finish the wizard, you must delete the file generated by the wizard. To do so, click the file in the System Navigator window, then from the **File** menu, select **Erase from Disk** in JDeveloper.
6. Edit the `provider.xml` and change the following properties:

At the producer level, perform the following:

- If the Struts application uses sessions (for example, the form sysnchronizer token mechanism is used or `<actionInSession>` is set to true), then enable session handling:

  ```
  <session>true</session>
  ```

At the portlet level, perform the following:

- If you want users to always return to the same portlet state as when they left the container page, then you can configure the struts renderer to save the struts action in the struts context:

  ```
  <actionInSession>true</actionInSession>
  ```

  If you prefer that users always start from the beginning of the portlet when they return from outside the container page, then you should not save the struts action:

  ```
  <actionInSession>false</actionInSession>
  ```

  Note that this setting is the default behavior.

- Specify the first action to raise when the portlet is called. Use the following code:

  ```
  <showPage class="oracle.portal.provider.v2.render.http.StrutsRenderer">
  <defaultAction>/portal/prepareNewBlog.do</defaultAction>
  </showPage>
  ```

61.5.4 How to Extend the Portlet to Add Business Logic

In your application, you should add code specific to your environment, such as the user's information, personalization, and localization. To do so, you can create a new `Action` class that is only called in context, and handles all business logic.

61.5.5 How to Register the Producer

Now that your portlet is ready to be used by consumers, you must make it accessible by registering it. For information about how to register your PDK-Java portlet, see Section 62.4, "Registering and Viewing Your Portlet."

62

Testing and Deploying Your Portlets

This chapter explains how to test and deploy JSR 286 and Oracle PDK-Java portlets. In a development environment, you can test your portlets on Integrated WebLogic Server (WLS), which comes packaged with Oracle JDeveloper, and also deploy Portlet Producer applications to an Oracle WebLogic Managed Server instance residing outside JDeveloper.

This chapter includes the following sections:

- Section 62.1, "Introduction to Portlet Deployment Testing in a Development Environment"
- Section 62.2, "Testing a Portlet Producer Application on Integrated WebLogic Server"
- Section 62.3, "Deploying a Portlet Producer Application to an Oracle WebLogic Managed Server Instance"
- Section 62.4, "Registering and Viewing Your Portlet"

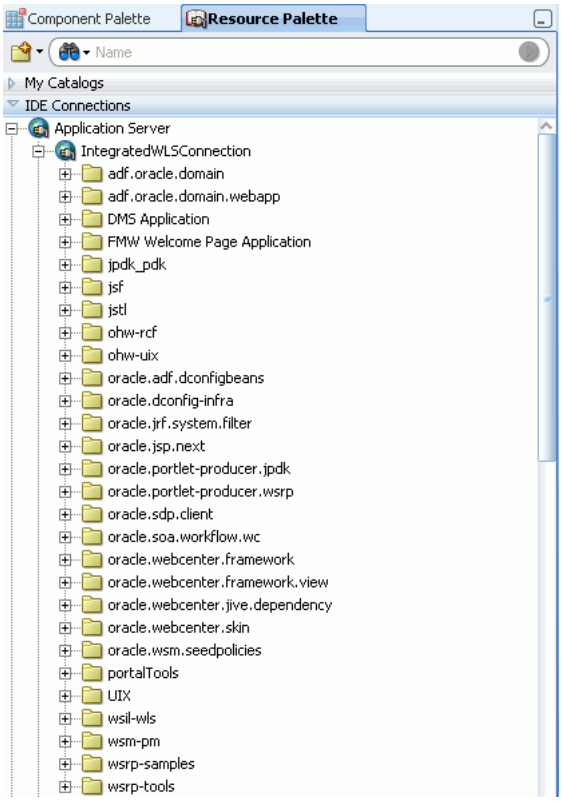
For information about testing and deploying other WebCenter Portal: Framework applications, see Chapter 70, "Deploying and Testing Your WebCenter Portal: Framework Application".

For information about creating portlets, see Chapter 59, "Creating Portlets with the Oracle JSF Portlet Bridge" and Chapter 60, "Creating Portlets with the Portlet Wizard".

62.1 Introduction to Portlet Deployment Testing in a Development Environment

Before you deploy your Portlet Producer application, you are advised to test it in a development environment. Integrated WLS in JDeveloper enables you to test your portlets in a single step, without creating a deployment profile. To learn the benefits of testing applications on Integrated WLS, see Integrated WebLogic Server. An additional benefit is that portlet customizations that you perform at design time are maintained in your application workspace and become an integral part of the application source definition. These changes are packaged with the EAR file when the application is deployed to a WebLogic Managed Server instance (managed servers). This eliminates the requirement to export and import portlet customizations.

If, while testing your application with Integrated WebLogic Server, you make changes at runtime, these customizations are also retained. If you do not want to keep these runtime customizations when you deploy your application to a managed server, you must clear them. You can do this manually by deleting them from the configured directory. Alternatively, during the development of your application, you can clear out these runtime customizations each time the application is run. To do this:



1. In the Application Navigator, click the **Application Menu** icon next to your application's name and choose **Application Properties**.
2. In the Application Properties dialog, expand the **Run** node in the left pane, then select **MDS**.
3. In the right pane, select **Delete customizations before each run**. Doing so clears the MDS of any runtime customizations every time the application is run.
4. Click **OK**.

To test your Portlet Producer application on an Oracle WebLogic Managed Server instance, or to deploy for production, you must configure a connection to the managed server, create deployment plans, and then deploy to the server instance as described in this chapter. For information about deploying Portlet Producer applications using Oracle Enterprise Manager Fusion Middleware Control, WLS Administration Control, or WLST commands, see the chapter, "Managing Portlet Producers" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

62.2 Testing a Portlet Producer Application on Integrated WebLogic Server

The connection to Integrated WLS (Default Server) connection is preconfigured and shows as **IntegratedWLSConnection** under the **Application Server** node in the **IDE Connections** panel of the Resource Palette, as shown in Figure 62–1. You can run multiple applications simultaneously and watch the progress of each application in the Run Manager panel. The Run Manager panel also lets you stop Default Server instances.

Figure 62–1 IntegratedWLSConnection in IDE Connections

For more information about Integrated WLS Server, see Integrated WebLogic Server.

This section includes the following subsections:

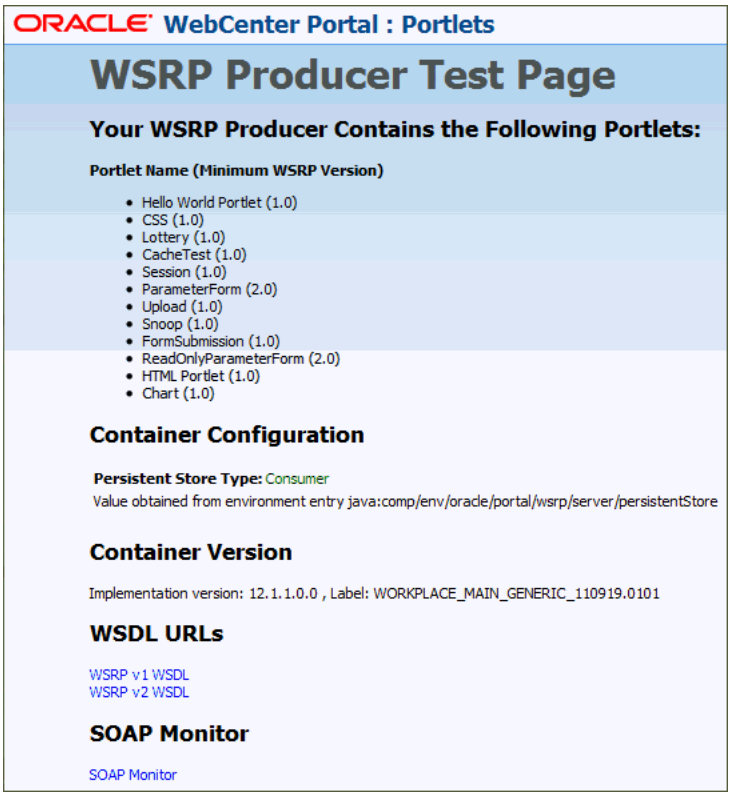
- Section 62.2.1, "How to Test JSR 286 Portlets on Integrated WebLogic Server"
- Section 62.2.2, "What Happens When You Test JSR 286 Portlets on Integrated WebLogic Server"
- Section 62.2.3, "How to Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server"
- Section 62.2.4, "What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server"

62.2.1 How to Test JSR 286 Portlets on Integrated WebLogic Server

To test a JSR 286 Portlet Producer application, right-click the `portlet.xml` page in the project folder and select **Run**. Running `portlet.xml` triggers packaging and deployment of your Portlet Producer application on an instance of Integrated WLS named after the application.

> **Note:** When the Integrated WLS instance stops, the application is undeployed, and therefore, becomes unavailable.
>
> For a more persistent testing scenario, you can deploy your Portlet Producer application to Integrated WLS by right-clicking the application and then selecting **Deploy**. This deploys your application to the Default Server instance so that it is always available when the Default Server is running. Thus, the application remains accessible for multiple consumer applications. If you choose this method, then you must first create deployment profiles, as described in Section 62.3.1, "How to Create Deployment Profiles". If you deploy your application to Integrated WLS, then the Deployment Configuration dialog displays to let you configure and customize deployment settings. The file system MDS repository pre-created by JDeveloper displays in the **Repository Name** field.

See the IntegratedWebLogicServer - Log window to monitor the deployment progress. The log shows the URL of the application page. The WSRP producer URL uses the following syntax:



```
http://host:port/applicationname-Portlets-context-root/info
```

where:

- `host` is the server to which your producer has been deployed.
- `port` is the HTTP Listener port. Typically, it is `7101`. When the server is started, the port is displayed in the console.
- `context-root` is the Web application's context root.

A test page similar to Figure 62–2 displays in a browser window.

Figure 62–2 WSRP Producer Test Page

Note: This procedure is for testing purposes only. After this procedure, you are required to register your producer as described in Section 62.4, "Registering and Viewing Your Portlet".

62.2.2 What Happens When You Test JSR 286 Portlets on Integrated WebLogic Server

When you run JSR 286 portlets on Integrated WLS, the following happens:

- `wsdls` and other configuration files are added to the WEB-INF directory to configure the portlets as a Web service.
- The `web.xml` file is updated with listener and server classes, filters, parameters, and other configurations that are required to run the JSR 286 Portlet Producer application successfully.

  For example, the `oracle.portlet.server.adapter.web.ServerContextListener` class, `WSRP_v2_PortletManagement_Service` and `WSRPBaseService` filters, and so on.
- Libraries required for JSR 286 portlets are added to the `weblogic.xml` file, for example, `oracle.portlet-producer.wsrp`.

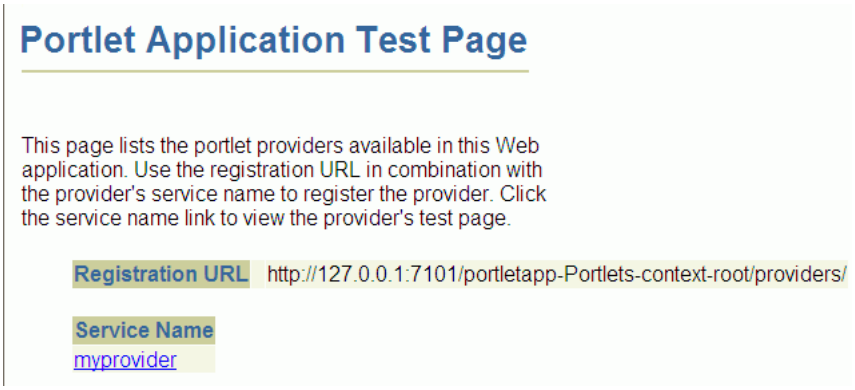
These configurations vary depending upon the portlet requirements.

62.2.3 How to Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server

When you run your Portlet Producer application on Integrated WLS, an instance of Default Server starts.

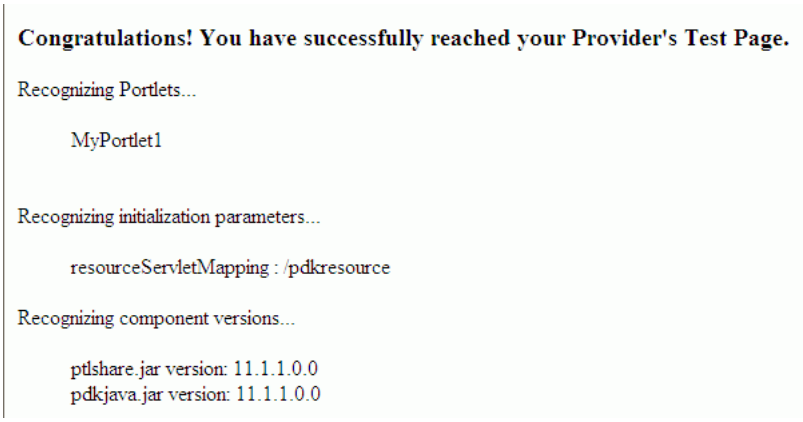
To test a Portlet Producer application, right-click a JSP page, for example, `index.jsp` in the project folder and select **Run**. Running `index.jsp` triggers packaging and deployment of your Portlet Producer application on an instance of Integrated WLS named after the application.

> **Note:** When the Integrated WLS instance stops, the application is undeployed, and therefore, becomes unavailable.
>
> For a more persistent testing scenario, you can deploy your Portlet Producer application to Integrated WLS by right-clicking the application and then selecting **Deploy**. This deploys your application to the Default Server instance so that it is always available when the default server is running. Thus, the application remains accessible for multiple consumer applications. If you choose this method, then you must first create deployment profiles, as described in Section 62.3.1, "How to Create Deployment Profiles". If you deploy your application to Integrated WLS, then the Deployment Configuration dialog displays to let you configure and customize deployment settings. The file system MDS repository pre-created by JDeveloper displays in the **Repository Name** field.



See the DefaultServer Log window to monitor the deployment progress. The DefaultServer - Log shows the URL of the application test page, as shown in Figure 62–3. The format of the URL is `http://`*`host:port/application_name`*`-Portlets-context-root/index.jsp`.

Figure 62–3 DefaultServer - Log



The PDK-Java Application Test page displays in a browser window, as shown in Figure 62–4.

Figure 62–4 Portlet Producer Application Test Page

Click the link underneath **Service Name**. Your browser should open with a page similar to the one shown in Figure 62–5. The URL of this page is the one required to register the producer with another application.

Figure 62–5 Producer Test Page

Alternatively, you can construct the URL yourself as follows:

`http://`*`host`*`:`*`port`*`/`*`context-root`*`/providers/`*`producer_name`*

where:

`host` is the server to which your producer has been deployed.

`port` is the HTTP Listener port. Typically, it is `7101`. When the server is started, the port is displayed in the console.

`context-root` is the Web Application's Context Root, which you specified earlier and can be found in the WAR Deployment Profile Properties under General.

`producer_name` is the name of the portlet's producer. A WAR file may contain multiple producers, hence you should always include the name of the producer for clarity. Otherwise, you get the default producer, which is the first producer created. The default producer is defined by the `_default.properties` file. This is created with the first producer in a project.

If you enter this URL in your browser, you should see a page similar to the one in Figure 62–5.

62.2.4 What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server

When you run PDK-Java portlets on Integrated WLS the following happens:

- Configuration files for PDK-Java portlets are added to the WEB-INF directory.
- The `web.xml` file is updated with listener and server classes, filters, parameters, and other configurations that are required to run the Portlet Producer application successfully.

  For example, the ResourceServlet pdkresource, the `oracle.portlet.server.service.ContextFilter` filter, and so on. These configurations vary depending upon the portlet requirements.
- Libraries required for PDK-Java portlets are added to the `weblogic.xml` file, for example, `oracle.portlet-producer.jpdk`.

62.3 Deploying a Portlet Producer Application to an Oracle WebLogic Managed Server Instance

To test your Portlet Producer application on an Oracle WebLogic Managed Server instance, or to deploy it for production, you must first create an application WAR deployment profile, a deployment descriptor, and a connection to the Oracle WebLogic Managed Server instance. Before you deploy or test your Portlet Producer application to a managed server, ensure that the managed server is created using the correct template and it contains all the required shared libraries as described in the section "Creating a Managed Server" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Note: Before you deploy the application, you must remove the `test-all` application role if you enabled the automatic grants feature in the Configure ADF Security wizard. Because the `test-all` role makes all ADF resources public, its presence increases the risk that your application may leave some resources unprotected. You must therefore remove the role before you migrate the application-level policy store.

For more information, see the section "How to Remove the test-all Role from the Application Policy Store" in *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

For information about deploying Portlet Producer applications using Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Administration Console, or WLST commands, see the chapter, "Managing Portlet Producers" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- Section 62.3.1, "How to Create Deployment Profiles"
- Section 62.3.2, "How to Create and Provision a WebLogic Managed Server Instance"
- Section 62.3.3, "How to Create and Register the Metadata Service Repository"
- Section 62.3.4, "How to Create a WebLogic Managed Server Connection"

- Section 62.3.5, "How to Deploy a Portlet Producer Application to an Oracle WebLogic Managed Server Instance"
- Section 62.3.6, "What Happens When You Deploy a Portlet Producer Application to an Oracle WebLogic-Managed Portlet Server"

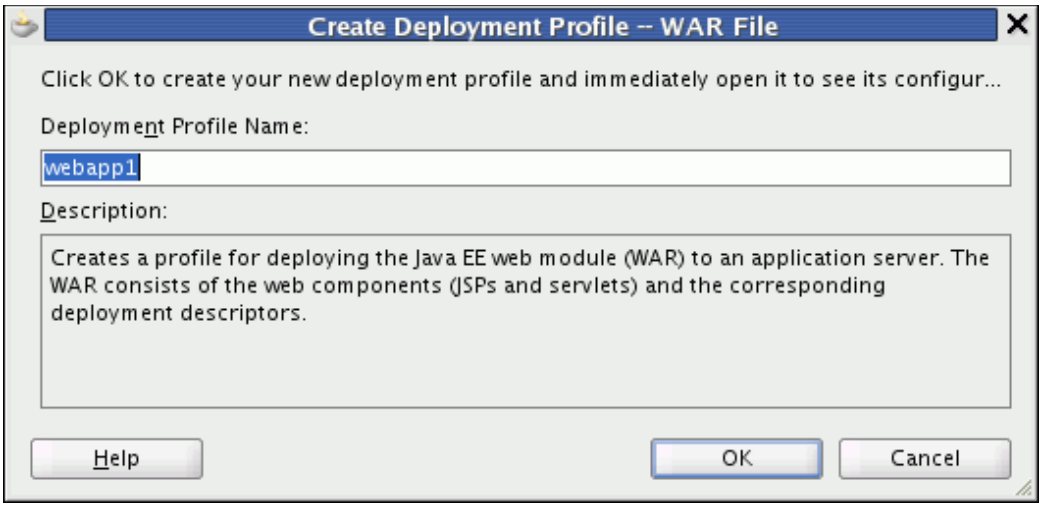
62.3.1 How to Create Deployment Profiles

The project-level deployment profile is packaged as a Web Application Archive (WAR) file. Deployment descriptors are server configuration files that define the configuration of an application for deployment and are deployed with the Portlet Producer application as needed. The deployment descriptors that a project requires depend on the technologies the project uses and on the type of the target application server.

Note: You can deploy PDK-Java portlets only as EAR files. Therefore, while creating deployment profiles, ensure that the WAR file is included in the application's EAR file. For information about how to create an EAR file, see Section 70.3.2.2, "Creating Deployment Profiles" in Chapter 70, "Deploying and Testing Your WebCenter Portal: Framework Application".

This section includes the following subsections:

- Section 62.3.1.1, "Creating a WAR Deployment Profile"
- Section 62.3.1.2, "Creating a Deployment Descriptor"



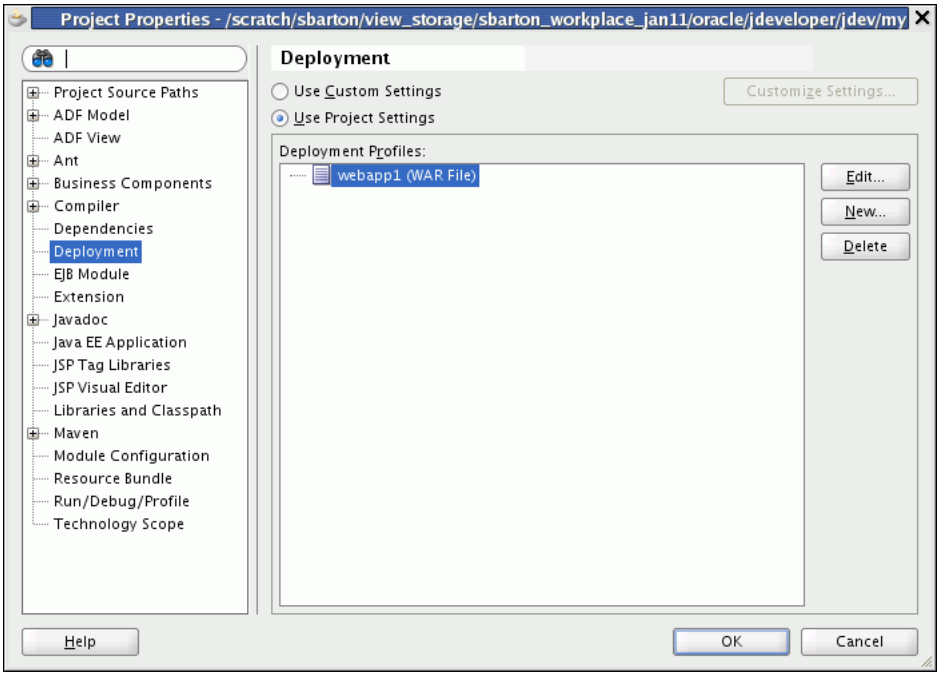
62.3.1.1 Creating a WAR Deployment Profile

To create a WAR deployment profile:

1. In the Application Navigator, expand **Web Content** and **WEB-INF**.
2. Right-click **web.xml** and choose **Create WAR Deployment Profile**.

   Alternatively, from the main menu, choose **File** and then **New**. In the New Gallery, expand **General**, select **Deployment Profiles** and then **WAR File**, and click **OK**.
3. In the Create Deployment Profile -- WAR File dialog (Figure 62–6), enter a name for your deployment profile and click **OK**.

Figure 62–6 The Create Deployment Profile -- WAR File Dialog



4. In the Edit WAR Deployment Profile Properties dialog (Figure 62–7), select the **Specify Java EE Web Context Root** option and enter a context root. Then click **OK**.

Figure 62–7 The Edit WAR Deployment Profile Properties Dialog

5. In the Project Properties dialog (Figure 62–8), under **Deployment Profiles**, select the WAR File you just created and click **OK**.

Figure 62–8 The Project Properties Dialog

62.3.1.2 Creating a Deployment Descriptor

To create a deployment descriptor:

1. From the main menu, choose **File** and then **New**.
2. In the New Gallery, expand **General**, select **Deployment Descriptors** and then **Java EE Deployment Descriptor**, and click **OK**.
3. In the Create Java EE Deployment Descriptor dialog, on steps 1 to 4, accept the default values and click **Finish**.

62.3.2 How to Create and Provision a WebLogic Managed Server Instance

To deploy a portlet producer application to a WebLogic Managed Server instance, you must first create a server instance that contains all the required shared libraries. For more information, see the section "Creating a Managed Server" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

62.3.3 How to Create and Register the Metadata Service Repository

After creating the WebLogic Managed Server instance, you must create and register a Metadata Service Repository (MDS) schema for the application on the WebLogic Domain's Administration Server instance. For more information, see the section "Creating and Registering the Metadata Service Repository" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

62.3.4 How to Create a WebLogic Managed Server Connection

In JDeveloper, you can deploy your Portlet Producer applications to Oracle WebLogic Managed Server instances that reside outside JDeveloper. You must first create a connection to the server instance.

Before You Begin

Before you create a connection to the managed server, ensure that the server instance is up and running.

To create a WebLogic Managed Server connection:

1. From the main menu, select **File** and then **New**.
2. In the New Gallery, expand **General**, select **Connections** and then **Application Server Connection**, and click **OK**.
3. In the Create Application Server Connection wizard, on Step 1, enter a name for the new connection, for example, `PortletServer`. Then click **Next**.
4. On Step 2, specify the user name and password for authentication and click **Next**.
5. On Step 3, enter the host name of the WebLogic Server instance, for example, `webcenter.portletserver.example.com` and the port number, for example, `7001`.
6. In the WLS Domain, specify the name of the domain in which the WebLogic Server instance is created, for example, `wc_domain`. Click **Next**.
7. On Step 4, click **Test Connection**. If the test is successful, the connection is set up.
8. Click **Finish**.

62.3.5 How to Deploy a Portlet Producer Application to an Oracle WebLogic Managed Server Instance

After you have created the deployment profiles and a connection to the managed server for portlet deployment, you can deploy your Portlet Producer application to this server instance.

To deploy a Portlet Producer application:

1. In the Application Navigator, open the application to be deployed.
2. Right-click the project folder, choose **Deploy**, and then the deployment profile.
3. In the Deploy dialog, in the Deployment Action page, select **Deploy to Application Server**, and then click **Next**.
4. In the Select Server page, select the connection to the managed server, and then click **Next**.
5. In the WebLogic Options page, select the managed server, for example, `WLS_Portlet`, and click **Finish**.

> **Note:** If your Portlet Producer application contains JSR 286 portlets, then the Select deployment type dialog displays. Click **Yes** to add the configuration required to expose this application as a WSRP service.

6. In the Deployment Configuration dialog, under the **MDS** tab, in the **Repository Name** dropdown list, select the metadata repository to be used by the application you are deploying.
7. In the **Partition Name** field, specify the application's partition name. Each application is recommended to have its own partition. The application name can be used as the partition name.

8. Under the **Connections** tab, modify the connections packaged with the portlet producer application being deployed.

   Note: Consider the following about producer connections:

   - In the **Connections** tab, you cannot change secure properties of the connections. You can modify these connections post-deployment using Fusion Middleware Control. For information, see the chapter "Managing Services" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
   - To edit a WSRP connection, you must also edit the associated Web service connection, which follows the naming convention *connectionname*`-wsconn`, for example, `myWSRPproducer-wsconn`.
   - To edit PDK-Java producers, you must also edit the underlying URL connection, which follows the naming convention *connectionname*`-urlconn`, for example, `myPDKproducer-urlconn`.
   - WSRP 1.0 standard does not support export and import capabilities. Therefore, customizations made to WSRP 1.0 producers are not migrated during deployment.

9. Click **Deploy**. The Deployment - Log displays the deployment status.

   The message **Deployment started** displays in the Deployment - Log window. If the application is successfully deployed to the targeted server instance, the message **Deployment finished** displays in the log.

62.3.6 What Happens When You Deploy a Portlet Producer Application to an Oracle WebLogic-Managed Portlet Server

If you are deploying JSR 286 portlets, the configuration settings described in Section 62.2.2, "What Happens When You Test JSR 286 Portlets on Integrated WebLogic Server" are added to the EAR file.

If you are deploying PDK-Java portlets, the configuration settings described in Section 62.2.4, "What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server" are added to the application EAR file at design time.

If you are deploying your Portlet Producer application in a cluster environment, you will receive the following warning:

```
WARNING: oracle.webcenter.lifecycle.exception.LifecycleLockedException: A lock
exists that prevents the export set import.
```

This is expected behavior. When you deploy your application, the producer metadata exported into the EAR file (as a MAR file) needs to be imported into an MDS schema for use in the production environment. Importing the metadata occurs automatically during deployment. This import only needs to happen with one node in the cluster, so a lock is created to prevent other nodes in the cluster trying to perform the same operation.

62.4 Registering and Viewing Your Portlet

After you have created and deployed the producer and its portlets, you should register the producer with an application and add one or more portlets to a page to check that it is working correctly. Registering a producer gives applications the information they require to locate and communicate with that producer. After you register a producer, it is exposed as a connection, and the producer and its portlets become available in the Application Resources panel under the Connections node, or in the Resource Palette.

To register producers for your JSR 286 portlets, follow the instructions provided in Section 64.2.1, "How to Register a WSRP Portlet Producer".

To register producers for your PDK-Java portlets, follow the instructions provided in Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer".

To add your portlets to a page, follow the instructions provided in Section 64.3, "Adding Portlets to a Page".

63

Creating Pagelets with Oracle WebCenter Portal's Pagelet Producer

A pagelet is a reusable user interface component. Any HTML fragment can be a pagelet, but pagelet developers can also write pagelets that are parameterized and configurable, to dynamically interact with other pagelets, and respond to user input. Pagelets are similar to portlets, but while portlets were designed specifically for portals, pagelets can be run on any web page, including within a portal or other web application. Pagelets can be used to expose platform-specific portlets in other web environments.

Oracle WebCenter Portal's Pagelet Producer (previously known as Oracle WebCenter Ensemble) provides a collection of useful tools and features that facilitate dynamic pagelet development. This chapter includes detailed information about pagelet development and configuration using the Pagelet Producer.

- Section 63.1, "About Server Communication and the Proxy": This section explains how the Pagelet Producer acts as a proxy server, brokering transactions between client computers and external resources.
- Section 63.2, "Using Pagelets in Web Applications": This section explains how to use pagelets in your WebCenter Portal applications.
  - Section 63.2.1, "Adding a Pagelet to a JSF Page in Oracle JDeveloper": This section explains how to use Oracle JDeveloper to drag and drop pagelets onto a JSF page.
  - Section 63.2.2, "Adding a Pagelet to a Web Page": This section explains how to insert a pagelet into a proxied or non-proxied page using JavaScript or REST.
  - Section 63.2.3, "Adding a Pagelet to a Page in WebCenter Portal: Spaces": This section explains how to add a pagelet to a space using Composer.
- Section 63.3, "Building Pagelets Using the Pagelet Producer": This section provides detailed information about building pagelets using the Pagelet Producer.
  - Section 63.3.1, "Using the Adaptive Pagelet Scripting Framework": This section explains how the adaptive pagelet scripting framework can be used to create a coordinated page with dynamic, interactive functionality.
  - Section 63.3.2, "Using Pagelet Producer Credential Mapping": This section explains how to configure security settings for pagelets and resources to manage authentication for users.
  - Section 63.3.3, "Modifying Pagelet Functionality at Runtime": This section explains how to use custom web injectors and parsers to modify pagelet functionality at runtime.

  - Section 63.3.4, "Debugging Pagelets": This section explains how to access advanced logging traces for debugging pagelets.
- Section 63.4, "Working with WSRP and Oracle JPDK Portlets": This section explains how the Pagelet Producer can be used to present WSRP and Oracle JPDK portlets for use in any web application.
  - Section 63.4.1, "Using Pagelet Chrome": This section explains how to use pagelet chrome to modify markup at runtime in WSRP or Oracle JPDK portlets.
- Section 63.5, "Working with OpenSocial Gadgets": This section summarizes Pagelet Producer support for standard OpenSocial APIs and explains how to use gadgets to store preferences and retrieve user information from WebCenter Portal using OpenSocial APIs.
  - Section 63.5.1, "Configuring Authentication"
  - Section 63.5.2, "Storing User Preferences"
  - Section 63.5.3, "Accessing WebCenter Portal Profile Information"
  - Section 63.5.4, "Accessing a User's Activity Stream"
  - Section 63.5.5, "Using Gadget Eventing"
  - Section 63.5.6, "Example: Consuming an External OpenSocial Gadget"
  - Section 63.5.7, "Example: Consuming a Local OpenSocial Gadget"

63.1 About Server Communication and the Proxy

The Pagelet Producer acts as a proxy server, brokering transactions between client computers and external resources.

Services on external resources communicate with the Pagelet Producer via HTTP. For example, when a browser requests a page, the Pagelet Producer makes simultaneous requests to each external resource to retrieve the pagelet content for the page. The external resource reads the current user's preferences from the HTTP headers sent by the Pagelet Producer and sends back the appropriate HTML. The Pagelet Producer inserts the HTML into the page markup. Any images stored in the Image Service are retrieved and displayed by the browser.

63.1.1 The Pagelet Producer Proxy

A proxy server acts as a middleman, brokering transactions between a client computer and another server. This configuration is typically used to serve content to clients that would otherwise be unable to access the external resource, but it can be used to impose additional security restrictions on the client, including the use of policies. The proxy hides the external resource; to the end user, the content appears to come directly from the proxy server.

This architecture makes the Pagelet Producer the single point of access for content, and allows external resources to reside on a private network or behind a firewall. As long as the Pagelet Producer can connect to the external resource, users can view the content, even if they cannot access it directly. To the browser, the Pagelet Producer appears to be the source of content on the external resource.

When a user interacts with a service, any request made to a URL in the proxy is automatically rerouted through the Pagelet Producer. To the user, the content appears

to come from the Pagelet Producer; the external resource is an unknown back-end system.

There are many benefits to this configuration. The most useful to services are:

- **Dynamic functionality and personalization**: The Pagelet Producer intercepts requests from pagelets, which allows it to include information stored in the MDS in HTTP requests and responses.
- **Security**: Services can allow users to access content that is not publicly available. Files stored on a secure server can be made available by including specific URLs in the configuration of the proxy. Note: The proxy is a powerful feature, and can compromise security if incorrectly configured. Allowing direct access to a external resource that hosts unprotected private content could create a dangerous security hole.
- **Performance**: The Pagelet Producer caches proxied content, decreasing response time for end users and improving performance on the external resource. While proxying works efficiently for content like HTML, it is generally not appropriate for binary data like static images. Images do not need to be transformed, and proxying large images can adversely affect performance. This is one reason the Image Service should be used to prevent routing static images through the proxy.

The collection of URLs that should be proxied for a service is configured in the Resource editor. All URLs that use the Internal URL prefix configured for the resource or point to other proxied CSP or web resources will be proxied unless **Enable URL Rewriting** is deselected.

Keep the following warnings and best practices in mind when implementing services that use the proxy:

- **URL transformation**: The Pagelet Producer must transform code so that proxied URLs open correctly. Before the Pagelet Producer sends a response, it parses the HTML and looks for any URLs that use the Internal URL prefix configured for the associated producer resource. The Pagelet Producer transforms any URLs that should be proxied before returning the response to the client. Relative URLs are transformed to point to the correct location.
- **Scripting limitations**: JavaScript constructs that dynamically create URLs can cause problems, because they are run after content is already transformed. VBScript is not transformed by the proxy; you can continue to use dynamic scripts and VBScript as long as your code is proxy-aware. Parsers and web injectors can be used to implement targeted control over URL rewriting. For details on configuring parsers and web injectors, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- **URL encoding**: It is a best practice to encode all headers that are URLs to prevent unexpected transformation. In JSP, encode all URLs that are written. If the code writes URLs in the body of a page (for example, a link to a preferences page) it should be encoded. The standard Java servlet command response.encodeURL() is the preferred method, but you can also use URLEncoder.encode(url). In the .NET Framework, the HttpUtility.URLEncode class provides the necessary functionality. Note: In .NET, there is no need to encode the redirect URL; this is handled automatically on the back end.

63.1.1.1 About Pagelets and the Proxy

All pagelets are designed to be displayed with other pagelets. As explained in the previous section, the Pagelet Producer acts as a proxy, processing and combining

pagelets from multiple applications to create a single, unified page with a range of functionality.

The code returned by a pagelet is parsed by the Pagelet Producer server and inserted into the HTML markup that makes up the page. Pagelets from the same back-end application can interact with each other within the page.

63.1.2 About HTTP and CSP

HTTP is a protocol used mostly for transferring web page content and XML between a server and a client. CSP is a platform-independent protocol based on the open standard of HTTP 1.1 that defines the syntax of communication between the Pagelet Producer and external CSP resources.

63.1.2.1 HTTP

HTTP communication is made up of Requests and Responses. Requests and Responses are essentially lists of name-value pairs of metadata in headers, along with an optional body. The body is the data that is being transferred (an HTML page or XML file). The metadata in the headers is information about the Request or Response itself (what language the content is in, or how long the browser should cache it). The Request and Response each contain specific information, outlined next. For more detailed information on HTTP, see RFC 2616 (http://www.faqs.org/rfcs/rfc2616.html).

The client sends the server an **HTTP Request**, asking for content. The Request body is used only for requests that transfer data to the server, such as POST and PUT.

HTTP Request Format:

```
[METHOD] [REQUEST-URI] HTTP/[VERSION]
[fieldname1]: [field-value1]
[fieldname2]: [field-value2]
[request body, if any]
```

HTTP Request Example:

```
GET /index.html HTTP/1.1
Host: www.plumtree.com
User-Agent: Mozilla/3.0 (compatible; Opera/3.0; Windows 95/NT4)
Accept: */*
Cookie: username=JoeSmith
```

The server sends back an **HTTP Response** that contains page content and important details, such as the content type, when the document was last modified, and the server type. The Response contains an error message if the requested content is not found.

HTTP Response Format:

```
HTTP/[VERSION] [CODE] [TEXT]
[fieldname1]: [field-value1]
[fieldname2]: [field-value2]
[response body, if any (document content here)]
```

HTTP Response Example:

```
HTTP/1.0 200 Found
Last-modified: Thursday, 20-Nov-97 10:44:53
Content-length: 6372
Content-type: text/html
<!DOCTYPE HTML PUBLIC '-//W3C//DTD HTML 3.2 Final// EN'><HTML>
...followed by document content...
```

Custom HTTP headers can be configured to include specialized information.

> **Note:** Header size limits are controlled by the server that hosts the code. The standard limit for IIS/ASP is 60K. Java Application Servers range from 2K to 10K. These limits are generally configurable; see your server documentation for details.

Services can also access standard HTTP headers, such as the Set-Cookie header or HTTP 1.1 basic authentication header. If you want to investigate HTTP further, you can view all the headers being passed back and forth between your browser and Web server using logging (as described in Section 63.3.4, "Debugging Pagelets"). HTTP is used in conjunction with SSL to serve up secure content. Single Sign-On (SSO) also uses HTTP headers for basic authentication.

63.1.2.2 CSP

CSP extends HTTP and defines proprietary headers to pass settings between Pagelet Producer and external CSP resources (i.e., Oracle WebCenter Interaction portlets). CSP outlines how these services use HTTP to communicate and modify settings. The latest version is 1.4, and is available here: http://download.oracle.com/docs/cd/E13158_01/alui/wci/docs103/devguide/references/CSP1.4.pdf.

The custom CSP headers used to communicate system and user configuration variables can also be used by pagelets.

Table 63–1 Pagelet Producer ***Headers***

Header Name	Description
User ID	The User ID of the currently logged in user. This value can be used to determine if the session has expired. If UserID=2, the default 'Guest' user is logged in; any other user's session has ended.
User Name	The name of the logged in user. The user's name can be used to personalize display or pre-fill form fields.
Image Service URL	The URL to the root virtual directory of the Image Service in the user's implementation of the Pagelet Producer. This location should be used for all static images used in services.
Stylesheet URL	The URL to the current user's style sheet. In each implementation of the Pagelet Producer, the UI is customized. In some portals, users can choose between a selection of stylesheets. Using these styles ensures that pagelets appear in the style of the current user's implementation of the Pagelet Producer.
Pagelet ID	The ID for the current resource (pagelet), and the instance ID for the current pagelet. This value is useful for appending to the names of HTML forms and client-side JavaScript functions to ensure unique form and function names on the page to avoid name conflicts.
Host Page URL	The URL to the page that hosts the pagelet. Preference pages need this URL to return the user to the correct page after settings are configured. This value can also be used to allow a single pagelet to display different content on different pages.

63.2 Using Pagelets in Web Applications

This section describes how to add pagelets to a JSF page in JDeveloper, to any web page, or to a page in WebCenter Portal: Spaces. Before you can add a pagelet to any web application, you must deploy and configure the resource and pagelet in the Pagelet Producer as described in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- Section 63.2.1, "Adding a Pagelet to a JSF Page in Oracle JDeveloper"
- Section 63.2.2, "Adding a Pagelet to a Web Page"
- Section 63.2.3, "Adding a Pagelet to a Page in WebCenter Portal: Spaces"

63.2.1 Adding a Pagelet to a JSF Page in Oracle JDeveloper

Oracle JDeveloper allows you to drag and drop pagelets onto a JSF page. In this section, you will register the Pagelet Producer with your WebCenter Portal: Framework application, add a pagelet to a JSF page, and view the page in a browser to test the pagelet.

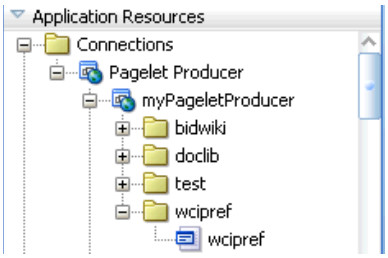
This section includes the following subsections:

- Section 63.2.1.1, "Registering the Pagelet Producer with a WebCenter Portal: Framework Application"
- Section 63.2.1.2, "Adding a Pagelet to a JSF Page"
- Section 63.2.1.3, "Securing a Pagelet"

63.2.1.1 Registering the Pagelet Producer with a WebCenter Portal: Framework Application

Before you can add a pagelet to a JSF page, you must register the Pagelet Producer with your application. You can register a Pagelet Producer in two ways:

- Register a producer with a specific application. By default, the IDE Connection option is selected in the New Pagelet Producer dialog that creates the connection under the Application Resources panel.
- Register a producer using the Resource Palette. This option enables you to use the producer's pagelets in multiple applications. A pagelet that is available in the Resource Palette can be added to any of your Framework applications by dropping it on the page. When you add a pagelet from the Resource Palette, its producer gets registered with the application if that producer is not already registered with the application. You can drag and drop a whole producer connection from the Resource Palette into the Application Resources panel of the Application Navigator. This registers the producer with the application. Alternatively, you can right-click a producer in the Resource Palette and choose **Add to Application** from the context menu to register the producer with the currently open application



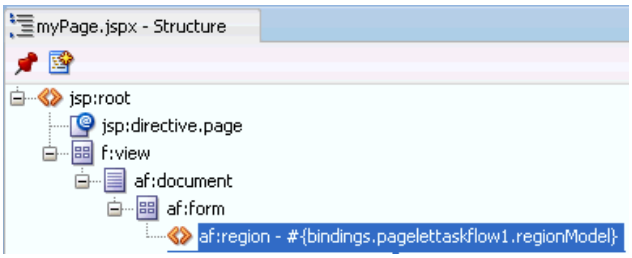
To register a Pagelet Producer through Oracle JDeveloper:

1. In the Application Resources panel of the Application Navigator, right-click **Connections,** choose **New Connection** and then choose **Pagelet Producer.**

   For other methods of invoking the wizard, such as from the Resource Palette, see Section 1.6.2, "How Do I Access the Connection Wizards?"

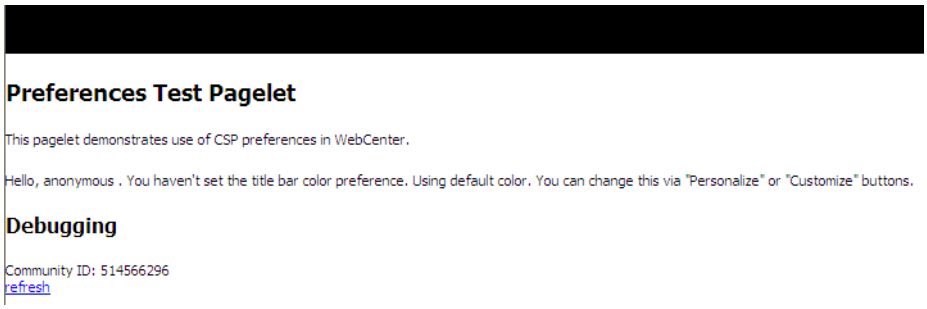
2. In the **Name** field of the New Pagelet Producer dialog, enter a meaningful name for your producer. For example, `myPageletProducer`.
3. In the **URL** field, enter the URL of your Pagelet Producer in the format: `http://hostname:portnumber/pagelets`.
4. Click **OK**. In the Application Resources panel, the Pagelet Producer is created under the Pagelet Producer directory in the Connections directory, as shown in Figure 63–1.

Figure 63–1 Pagelet Producer in the Application Resources Panel



63.2.1.2 Adding a Pagelet to a JSF Page

To add a pagelet to a page:



1. In JDeveloper, open your JSF page in Design View, if it is not open already.
2. Go to the Application Resources panel or the IDE Resources panel in the Resource Palette. Under **Pagelet Producer**, expand your producer to display its contents.
3. From the producer's contents, drop a pagelet onto the JSF page.
4. In the **Add Pagelet to Page** dialog, choose **Yes** in the Use IFrame section if you would like to enable IFRAME for this pagelet.
5. In the **IFrame Height** field, specify the required height in pixels or leave it blank. You can also specify the height as "auto" to use automatic resizing. (To use this option, you must add the IFrame resizing page to the project. For details, see Section 63.2.2.3, "Using Automatic Resizing with IFrames.") Click **OK**.
6. In the **Edit Task Flow Binding** dialog input parameters are specified by default. Change any parameters, if required, and then click **OK**.
7. Save the page. In the Structure window, the page looks like Figure 63–2.

Figure 63–2 Pagelet in the Structure Window

8. In the Application Navigator, right-click your JSF page under Projects, and choose **Run**.
9. If presented with a login page, enter user name and password so you can view the pagelet. Figure 63–3 shows a sample pagelet in a browser window.

Figure 63–3 Sample Pagelet

63.2.1.3 Securing a Pagelet

For information about securing pagelets, see the section "Policy" and the section "Configuring Oracle Single Sign-On (OSSO)" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

63.2.2 Adding a Pagelet to a Web Page

Once you have deployed a pagelet, you can insert it into a proxied or non-proxied page using JavaScript or REST.

This section includes the following subsections:

- Section 63.2.2.1, "Inserting Pagelets Using Javascript": The Pagelet Producer allows you to insert pagelets into non-proxied pages using a simple JavaScript function.
- Section 63.2.2.2, "Accessing Pagelets Using REST": Pagelet Producer REST APIs allow remote web services to retrieve information about resources and pagelets from the Pagelet Producer, and inject pagelets into proxied and non-proxied pages.
- Section 63.2.2.3, "Using Automatic Resizing with IFrames": The pagelet inject function can automatically resize the IFrame that encapsulates pagelet content.

63.2.2.1 Inserting Pagelets Using Javascript

You can insert pagelets into non-proxied pages using a simple JavaScript function.

To activate this feature, add the following HTML snippet in the <HEAD> section of the page.

```
<script type="text/javascript" src="http://proxy:port/pagelets/inject/v2/csapi">
</script>
```

This script injects all CSAPI and pagelet inject functions into the page to display the pagelet. One of the sections injected is the following function:

```
function injectpagelet(library, name, iframe_options, payload, params, context_id,
element_id,  is_in_community, chrome, forward_params)
{
    ...
}
```

This function injects a pagelet as a widget into the parent page. The method interface uses the following parameters:

- **library**: Required. A string representing the library name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.

- **name**: Required. A string representing the name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **iframe_options**: Specifies whether to use IFRAME around the pagelet content. Sample IFRAME options: `iframe width=100% height=auto frameborder=0`. If omitted or left blank, the pagelet content is rendered inline.
- **payload**: The XML payload to send with the pagelet request.
- **params**: The pagelet parameters in query string format. For example, `'param1=value1&param2=value2&param3=value3'`.
- **context_id**: The external identifier of the pagelet instance, used to scope preferences on the Pagelet Producer server. Must be an integer.
- **element_id**: The HTML element ID in which the pagelet content is injected. If omitted or left blank, the pagelet content is injected using `document.write()` when the `injectpagelet` call is evaluated.
- **is_in_community**: Specifies whether this pagelet is on a community or group page. If the value is set to `true`, it sends the `context_id` in the community ID header to the pagelet. Defaults to `false`.
- **chrome**: Specifies the name of the chrome template to use for WSRP/JPDK pagelets. To suppress chrome, use a value of `none`.
- **forward_params**: Specifies whether to forward query string arguments from the consuming page to the back-end server. To suppress this functionality, use a value of `false`.

> **Note:** These arguments are positional; they must be provided in the given order. If you do not want to specify a particular argument, but do want to specify an argument that follows it, you must pass in an empty value ('') for the former. All arguments are optional except for library and name.

The script also creates a new `<div>` with a unique name that includes a reference to the `injectpagelet` function. Several examples are shown below:

```
<div>
    <script type="text/javascript">
        injectpagelet('library', 'name');
    </script>
</div>
<div>
    <script type="text/javascript">
    injectpagelet('library', 'name', 'iframe', 'payload',
'param1=value1&param2=value2&param3=value3');
    </script>
</div>

<div>
    <script type="text/javascript">
    injectpagelet('library', 'name', 'iframe width=100% height=200', 'payload');
    </script>
</div>
```

63.2.2.1.1 Adding a Preference Editor Using Javascript The `injecteditor` function lets you add preference editors that enable users to set personal and shared preferences for

pagelets that support this capability. This functionality is analogous to personalization and customization functionality in Oracle WebCenter Portal.

```
injecteditor(library, name, type, iframe_options, context_id, element_id, is_in_
community, chrome)
```

where:

- **library**: Required. The library name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **name**: Required. The name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **type**: The editor type. This argument supports these values: 'admin', 'pagelet', 'community'. In case of the 'community' argument, `context_id` is sent to pagelet in the community ID CSP header.
- **iframe_options**: Specifies whether to use IFRAME around the pagelet editor content. Sample IFRAME options: `iframe width=100% height=auto frameborder=0`. If omitted or left blank, the editor content is rendered inline.
- **context_id**: The external identifier of the pagelet instance, used to scope preferences on the Pagelet Producer server. Must be an integer.
- **element_id**: The HTML element ID in which the pagelet content is injected. If omitted or left blank, the pagelet content is injected using `document.write()` when the `injecteditor` call is evaluated.
- **is_in_community**: Specifies whether this pagelet is on a community or group page. If the value is set to `true`, it sends the `context_id` in the community ID header to the pagelet. Defaults to `false`.
- **chrome**: Specifies the name of the chrome template to use for WSRP/JPDK pagelets. To suppress chrome, use a value of `none`.

> **Note:** These arguments are positional; they must be provided in the given order. If you do not want to specify a particular argument, but do want to specify an argument that follows it, you must pass in an empty value ('') for the former. All arguments are optional except for library and name.

63.2.2.2 Accessing Pagelets Using REST

REST stands for Representational State Transfer and is a simple way of providing APIs over HTTP. The basic principles of REST are:

- API URLs point to the resource rather than a generic method endpoint.
- Requests use standard HTTP verbs for simplified CRUD methods. This is a read-only API and allows GET requests only.
- Every request returns a full representation of the object retrieved (pagelet or resource).

Pagelet Producer REST APIs provide the following functionality:

- Inject pagelets into non-proxied pages, allowing the Pagelet Producer to act as a portlet provider for Oracle WebCenter Interaction, Oracle WebLogic Portal, or other third-party portals. For details, see Section 63.2.2.2.1, "Pagelet Inject API".

- Allow remote web services to retrieve information about resources and pagelets from the Pagelet Producer. For details, see Section 63.2.2.2.2, "Data Retrieval APIs".

63.2.2.2.1 Pagelet Inject API The pagelet inject URL can be used in portals to specify the location of a remote portlet (this is how a pagelet can be used as a portlet). The inject URL can also be used as the src attribute of an IFrame tag in any HTML page.

The URL must use the following format:

`http://host:port/pagelets/inject/v2/pagelet/libraryname/pageletname?content-type=html`

where `libraryname` and `pageletname` refer to the library and pagelet configured in the Pagelet Producer.

> **Note:** When using the pagelet inject API as the URL for a Portlet Web Service in Oracle WebCenter Interaction, you must switch "pagelet" to "portlet" in the URL. For example, the above URL would become:
>
> `http://host:port/pagelets/inject/v2/`**`portlet`**`/libraryname/pageletname?content-type=html`

The query string arguments to the above call define how the pagelet is to be returned. The following parameters are defined:

- **instanceid:** Optional. The instance ID of the pagelet, used to uniquely identify the pagelet on the page to facilitate inter-pagelet communication. Must be unique to the page.
- **context**: Optional. The external identifier of the pagelet instance, used for scoping preferences on the Pagelet Producer server. Must be an integer.
- **content-type**: The return type. Three types are supported:
  - **javascript**: Returns injectable code.
  - **html**: Returns the pagelet markup with its associated PTPortlet object.
  - **iframe**: Returns an IFrame that points back to the inject api, filling the IFrame with the pagelet content, instead of directly inline with the page. The IFrame can be styled by providing a set of query string parameters.

Parameter	Description	Default
ifwidth	Sets the width of the IFrame; can be specified in percent '%' or pixels 'px', for example: ifwidth=500px. Can be set to 'auto' to automatically resize the IFrame to fit the content within. For details, see Section 63.2.2.3, "Using Automatic Resizing with IFrames".	100%
ifheight	Sets the height of the IFrame; can be specified in percent '%' or pixels 'px', for example: ifheight=500px. Can be set to 'auto' to automatically resize the IFrame to fit the content within. For details, see Section 63.2.2.3, "Using Automatic Resizing with IFrames".	No default
ifborder	Sets the border of the IFrame.	'none'

Parameter	Description	Default
ifalign	Sets the align rule within the IFrame, for example: ifalign=center.	No default
ifdesc	Sets the description of the IFrame.	No default
ifmarginheight	Sets the margin height; can be specified in percent '%' or pixels 'px', for example: ifmarginheight=500px.	No default
ifmarginwidth	Sets the margin width; can be specified in percent '%' or pixels 'px', for example: ifmarginwidth=500px.	No default
ifscrolling	Sets the scrollbars of the IFrame. Accepted values: yes/no/auto.	auto
ifstyle	Sets the CSS style of the IFrame	No default
ifclass	Sets the CSS class of the IFrame.	No default

- **csapi**: Optional. Sets whether the CSAPI will be included with the pagelet response (true or false). Including the CSAPI is optional, but the pagelet included in the response relies on the CSAPI libraries being present on the page where the pagelet is to be rendered. If csapi=false, then the CSAPI libraries must be included with the parent page (usually in the HEAD section).
- **onhtttperror:**: Optional. When a pagelet request results in a 403, 404 or any other error code, the Pagelet Producer can forward the error code and the error page itself to the browser for display to the user. The onhttperror parameter accepts the following values:
  - **comment** (default): The Pagelet Producer will create an HTML comment in place of the failing pagelet (the failing pagelet will simply not be displayed).
  - **inline**: The pagelet error along with the server error page will be displayed inline where the pagelet would normally be shown on the page.
  - **fullpage**: The http error will consume the whole page. This mode is only available if the Pagelet Producer controls the parent page.

For example, the following URL points to the linkspagelet in the samples library:

```
http://host:port/pagelets/inject/v2/pagelet/samples/linkspagelet
?content-type=iframe&csapi=true&ifheight=123px&ifclass=myclass
```

This URL should result in markup similar to the code below.

> **Note:** The IFrame source points back to the inject API, but this time the content-type parameter is set to `html`. This feature adds an additional step in the pagelet retrieval. The `csapi` parameter is set to `true` on the subsequent call to get the IFrame contents so that the required CSAPI content is included in the IFrame (if this was not the case, JavaScript resolve errors would be returned because the pagelet code cannot access any CSAPI script included outside the IFrame).

```
<html>
 <head>
 </head>
 <body>
  <iframe frameborder="none" class="myclass" width="100%" height="123px"
```

```
scrolling="auto"
src="http://proxy:port/inject/v2/pagelet/samples/linkspagelet?asdg=asdfgas&param=t
rue&content-type=html&jswrap=false&csapi=true">
   <html>
    <head>
     <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/
common/private/js/jsutil/LATEST/PTUtil.js" type="text/javascript"> </script>
     <script

     <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/
common/private/js/jsxml/LATEST/PTXML.js" type="text/javascript"></script>
     <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/
common/private/js/jsportlet/LATEST/PTPortletServices.js"
type="text/javascript"></script>
    </head>

    <body>
     <div id="pt-pagelet-content-1" class="pagelet-container" style="display:
inline;">
      <span xmlns:pt="http://www.plumtree.com/xmlschemas/ptui/">
      Pagelet links:
      <br/>
      <a href="http://proxy:port/inject/RP_PID393219_I1/headpagelet1.html">The
first pagelet</a>
      <br/>
      <a href="http://proxy:port/inject/RP_PID393219_I1/headpagelet2.html">The
second pagelet</a>
      <br/>
      <a href="http://proxy:port/inject/RP_PID393219_I1/csapipagelet.html">The
csapi pagelet</a>
      <br/>
      <a href="http://proxy:port/inject/RP_PID393219_I1/linkspagelet.html">This
pagelet</a>
      <br/>
      </span>
     </div>
    </body>
   </html>
  </iframe>
 </body>
</html>
```

63.2.2.2.2 Data Retrieval APIs Two REST APIs are available to retrieve data from the Pagelet Producer:

- **Pagelet API**: Allows remote applications to retrieve pagelet data from the Pagelet Producer. (See Example 63–1, "All Pagelets" and Example 63–2, "Pagelets By Library and Name".)
- **Resource API**: Allows remote applications to retrieve resource data from the Pagelet Producer. (See Example 63–3, "All Resources" and Example 63–4, "Resource By Name".)

The base URL for all requests is `http://`*`host:port`*`/pagelets/restservice/pageletproducer/`.

Example 63–1 All Pagelets

```
http://host:port/pagelets/restservice/pageletproducer/pagelets/
http://host:port/pagelets/restservice/pageletproducer/pagelets/?format=xml
```

Example 63–2 Pagelets By Library and Name

```
http://host:port/pagelets/restservice/pageletproducer/pagelet/libraryname/pageletn
ame/
http://host:port/pagelets/restservice/pageletproducer/pagelet/libraryname/pageletn
ame/?format=xml
```

Example 63–3 All Resources

```
http://host:port/pagelets/restservice/pageletproducer/resources/
http://host:port/pagelets/restservice/pageletproducer/resources/
```

Example 63–4 Resource By Name

```
http://host:port/pagelets/restservice/pageletproducer/resource/name
http://host:port/pagelets/restservice/pageletproducer/resource/name/?format=xml
```

63.2.2.3 Using Automatic Resizing with IFrames

The Pagelet Producer pagelet inject API can automatically resize the IFrame that encapsulates pagelet content. The resizing is done so that the IFrame stretches to fit the content within. To use this feature, the ifwidth and ifheight parameters must be set to 'auto' as shown in the example below:

```
http://proxy:port/inject/v2/pagelet/samples/linkspagelet?content-type=iframe&csapi
=true&ifheight=auto&ifwidth=auto&ifclass=myclass
```

In addition, this feature relies on an external page on the same domain as the consumer page. This page is included into the pagelet IFrame as an internal hidden IFrame. This page collects the sizing information and passes it on to the parent consumer page. This page must be deployed in the same directory as the consumer page.

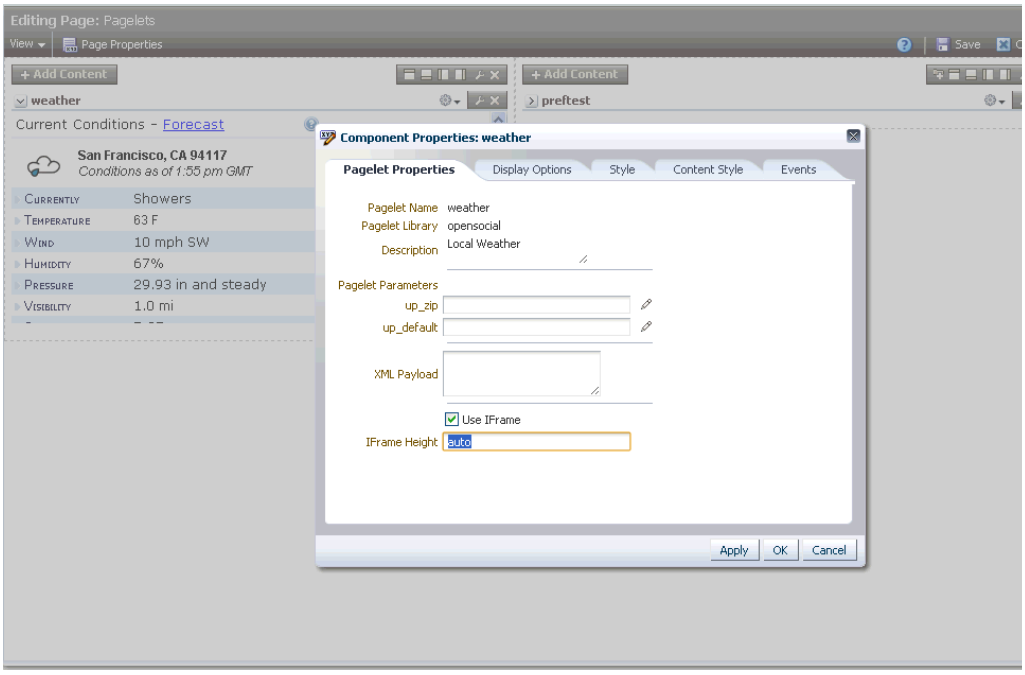
The example below resizes the pagelet IFrame after it finishes loading. To add dynamic auto-resizing capabilities to user interaction activities after the initial load, simply add more event listeners for mouse and keyboard events.

```
<html>
  <head>
    <title>Resizing Page</title>
    <script type="text/javascript">
  function onLoad() {
    var params = window.location.search.substring( 1 ).split( '&' );
    var height;
    var width;
    var iframe;

    for( var i = 0, l = params.length; i < l; ++i ) {
      var parts = params[i].split( '=' );
      switch( parts[0] ) {
        case 'height':
          height = parseInt( parts[1] );
          break;
        case 'width':
          width = parseInt( parts[1] );
          break;
        case 'iframe':
```

```
          iframe = parts[1];
          break;
       }
     }
   window.top.updateIFrame( iframe, height, width );
   }

   if (window.addEventListener) {
     window.addEventListener("load", onLoad, false)
   } else if (window.attachEvent) {
      window.detachEvent("onload", onLoad)
      window.attachEvent("onload", onLoad)
   } else {
     window.onload=onLoad
   }
   </script>
 </head>
<body>
</body>
</html>
```



63.2.3 Adding a Pagelet to a Page in WebCenter Portal: Spaces

In WebCenter Portal: Spaces, you can add a pagelet to a page using Composer. By default, pagelets appear in the Mash-Ups folder in the Resource Catalog. To add a pagelet to a page, navigate to the pagelet in the Resource Catalog and select it.

For detailed information about how to add resources to pages in Spaces, see the section "Adding Resource Catalog Components to Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To configure a pagelet within a page, view the page in Edit mode and click the edit button (wrench icon) for the pagelet. The Pagelet Properties tab in the Component Properties dialog allows you to define pagelet parameters and IFrame options.

Figure 63–4 Component Properties Dialog: Pagelet Properties

63.3 Building Pagelets Using the Pagelet Producer

This section provides information on building pagelets using the Pagelet Producer.

- Section 63.3.1, "Using the Adaptive Pagelet Scripting Framework"
- Section 63.3.2, "Using Pagelet Producer Credential Mapping"
- Section 63.3.4, "Debugging Pagelets"

63.3.1 Using the Adaptive Pagelet Scripting Framework

The **Adaptive Pagelet Scripting Framework** is a client-side JavaScript library that provides services to CSP pagelets and proxied pages. This section explains how to use the scripting framework to implement dynamic functionality in pagelets.

- Section 63.3.1.1, "Handling Structured HTTP Responses": The adaptive pagelet scripting framework can be used as a client-side response handler for structured HTTP, typically encoded as XML.
- Section 63.3.1.2, "Using Event Notification": A pagelet can respond when specific events happen, such as when the page loads or when the browser focus changes.
- Section 63.3.1.3, "Using In-Place Refresh": Pagelets can reload their internal content without refreshing the page.
- Section 63.3.1.4, "Using Session Preferences": Browser-level variables can be stored and shared among pagelets, even if they are not on the same page. For example, a value entered by the user in one pagelet can be retrieved by another. The scripting framework acts as an intermediary, allowing all pagelets access to all values stored in a common session.

For a full list of classes and methods, see the JSPortlet API documentation.

For additional information on adaptive pagelets, see Section 63.3.1.5, "Adaptive Pagelet Development Tips".

63.3.1.1 Handling Structured HTTP Responses

In many cases it can be expensive and inefficient to send large amounts of HTML back in response to some HTTP request, if only a small part of the user interface needs to be changed. This is especially true with more complex user interfaces. In these cases, the response can be encoded in XML. The client-side response handler can then parse the XML, and update the user interface (or perform some other action) based on that response. Use the Structured Response design pattern to redraw a small area of the user interface after making an HTTP request, or to access a simple HTTP/URI type web service from a pagelet. The example code below (structuredresponse_portlet.html) accesses an RSS feed from a selection of news sites.

```
<!-- jsxml includes -->
<a id="imgServerHref" href="/images/plumtree" style="display:none"></a>
<script type="text/javascript"
src="/images/plumtree/common/private/js/PTLoader.js"></script>
<script type="text/javascript">
var oImgServer = new Object();
oImgServer.location = document.getElementById('imgServerHref').href;
var imageServerURL = document.getElementById('imgServerHref').href;
var imageServerConnectionURL = oImgServer.location;
new PTLoader(imageServerURL, imageServerConnectionURL).include('jsxml','en');
</script>

<!-- jscontrols includes -->
<link rel="stylesheet" type="text/css"
href="/portal-remote-server/js/jscontrols/styles/css/PTMenu.css"/>
<link rel="stylesheet" type="text/css"
href="/portal-remote-server/js/jscontrols/styles/css/PTRichTextEditor.css"/>
<script type="text/javascript"
src="/portal-remote-server/js/jscontrols/strings/PTControls-en.js"></script>
<script type="text/javascript"
src="/portal-remote-server/js/jscontrols/PTControls.js"></script>

<!-- Inline JS helper functions -->
-->

<script defer type="text/javascript" id="structured-response-portlet-A-script">
// Function that gets the RSS XML feed found at the specified url
getRSSFeed = function(url)
  {
  // First clear out any existing rows in the table
  channelTable.clearRows();

  // Force the transformer to fix up the url
  var oURL = new Object();
  oURL.location = url;

  // Do the http get
  var get = new PTHTTPGETRequest(oURL.location, handleRSSResponse);
  get.invoke();
  }

// Function that handles the RSS XML response and updates the table based on the
RSS items
handleRSSResponse = function(response)
  {
```

```
  // Get the rss xml
  var xml = response.responseText;
  if (!xml || xml.indexOf('<?xml') == -1) { return; }

  // Parse into a dom, and get the channel node
  var xmlDOM = new PTXMLParser(xml);
  var rssNode = xmlDOM.selectSingleNode('rss');
  var channelNode = rssNode.selectSingleNode('channel');

  // Get the channel title and set the status bar text in the table
  var channelTitle = channelNode.selectSingleNode('title').getNodeValue();
  channelTable.statusBarText = '<b>Loaded Channel</b>: ' + channelTitle;

  // Get channel item nodes
  var itemNodes = channelNode.selectNodes('item');

  // Build table rows
  channelTable.rows = new Array();
  for (var i=0; i<itemNodes.length; i++)
    {
    var itemNode = itemNodes[i];

    // Get channel item properties
    var itemTitle = itemNode.selectSingleNode('title').getNodeValue();
    var itemLink = itemNode.selectSingleNode('link').getNodeValue();
    var itemDescription = itemNode.selectSingleNode('description').getNodeValue();
    if (itemNode.selectSingleNode('author'))
      var itemAuthor = itemNode.selectSingleNode('author').getNodeValue();
    if (itemNode.selectSingleNode('category'))
      var itemCategory = itemNode.selectSingleNode('category').getNodeValue();
    if (itemNode.selectSingleNode('pubDate'))
      var itemPubDate = itemNode.selectSingleNode('pubDate').getNodeValue();

    // Create a row and add it to the table
    var row = new PTRow();
    row.parent = channelTable;
    row.id = i;
    row.uid = i;
    row.previewText = itemDescription;
    row.link = itemLink;
    row.columnValues[0] = new PTTextColumnValue(itemTitle);
    row.columnValues[1] = new PTTextColumnValue(itemCategory);
    row.columnValues[2] = new PTTextColumnValue(itemAuthor);
    row.columnValues[3] = new PTTextColumnValue(itemPubDate);
    channelTable.rows[channelTable.rows.length] = row;
    }

  // Redraw the table
  channelTable.draw();
  }
</script>

```

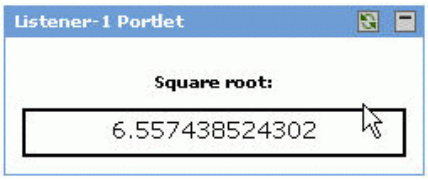
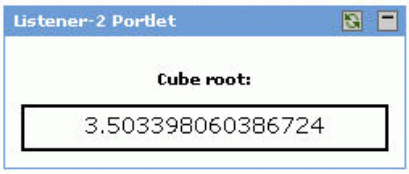
63.3.1.2 Using Event Notification

The adaptive pagelet scripting framework allows pagelets to respond to both page-level events and custom events raised by other pagelets.



The `registerForWindowEvent` and `registerOnceForWindowEvent` methods in the scripting framework provide pagelets with access to page-level events. For a complete list, see Section 63.3.1.2.1, "Page-Level Events for Use with the Scripting Framework". To register for notification of these events, pass in the name of the event and the name of the method that should be called when it occurs. When a page-level event is raised, the JavaScript event object is passed to the event handler as an argument. The scripting framework also allows pagelets to raise and respond to custom events using `raiseEvent` and `registerForEvent`. The Broadcast-Listener design pattern illustrates an important example of using notification services with session preferences. Users can select an item or perform some other action in a "broadcast" pagelet, which causes the content in other related "listener" pagelets to be redrawn. In the following example, the broadcast pagelet displays a form that allows you to enter a number in a text box.

Figure 63–5 Broadcast Portlet



When the user enters a number in the text box, the values in the listener pagelets change. The first listener pagelet displays the square root of the number entered in the broadcast pagelet.

Figure 63–6 Listener -1 Portlet

The second listener pagelet displays the cube root of the number entered in the broadcast pagelet.

Figure 63–7 Listener -2 Portlet

The following steps summarize how the pagelets work:

- On load, each listener pagelet calls its own instance method (`registerForEvent`) to register for events of type 'onBroadcastUpdate'.
- On each onkeyup event that occurs in the "Enter number" text box, the broadcast pagelet sets a session preference to the value entered in the text box, and calls its own instance method (`raiseEvent`) to raise an event of type 'onBroadcastUpdate'.
- When the onBroadcastUpdate event is raised or the page is reloaded, each listener pagelet retrieves the session preference set by the broadcast pagelet and computes a new value to display based on the value of the preference.

Broadcast Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Enter number:</b>
 <input type="text"
style="font-size:22px;font-weight:bold;text-align:center;"
id="broadcast_prefName" value="4" size="7" onkeyup="broadcast_
setPrefs(this.value)"></p>
<br>
</div>
```

```
<script type="text/javascript">
function broadcast_setPrefs(val)
{
    var prefName = 'broadcastNumber';
    var prefValue = val;
    PTPortlet.setSessionPref(prefName,prefValue);
    var broadcastPortlet =
PTPortlet.getPortletByGUID('{D9DFF3F4-EAE7-5478-0F4C-2DBD94444000}');

      if (!broadcastPortlet)
    {
        broadcast_debug('Could not locate PTPortlet object which corresponds to
<b>Broadcast Portlet</b> on page.');
        return;
        }
      broadcast_debug('<b>Broadcast Portlet</b> raising onBroadcastUpdate
event.');
    broadcastPortlet.raiseEvent('onBroadcastUpdate',false);
}
function broadcast_debug(str)
{
    if (window.PTDebugUtil)
    {
        PTDebugUtil.debug(str);
    }
}
</script>
```

{
    if (window.PTDebugUtil)
    {
        PTDebugUtil.debug(str);
    }
```

```
}

function listener2_error(str)
{
    if (window.PTDebugUtil)
    {
        PTDebugUtil.error(str);
    }
}

function listener2_getPortlet()
{
    var portletGUID = '{D9DFF3F4-EAE7-5478-0F4C-2DBDCA1C7000}';
    var listener2Portlet = PTPortlet.getPortletByGUID(portletGUID);
    return listener2Portlet;
}

var listener2Portlet = listener2_getPortlet();
if (listener2Portlet)
{
    listener2Portlet.registerForEvent('onBroadcastUpdate','listener2_update');
    listener2_debug('<b>Listener-2 Portlet</b> registered refreshOnEvent for event
onBroadcastUpdate');
    listener2Portlet.registerForEvent('onload','listener2_update');
}

</script>
```

63.3.1.2.1 Page-Level Events for Use with the Scripting Framework The scripting framework automatically has access to the following page-level events.

Table 63–2 Page-Level Events

Event	Triggered:
onload	immediately after the browser loads the page
onbeforeunload	prior to a page being unloaded (browser window closes or navigates to different location)
onunload	immediately before the page is unloaded (browser window closes or navigates to different location)
onactivate	the page is set as the active element (receives focus)
onbeforeactivate	immediately before the page is set as the active element (receives focus)
ondeactivate	when the active element is changed from the current page to another page in the parent document
onfocus	when the page receives focus
onblur	when the page loses focus
oncontrolselect	when the user is about to make a control selection of the page
onresize	when the size of the page is about to change
onresizestart	when the user begins to change the dimensions of the page in a control selection
onresizeend	when the user finishes changing the dimensions of the page in a control selection
onhelp	when the user presses the F1 key while the browser is the active window

Table 63–2 (Cont.) Page-Level Events

Event	Triggered:
onerror	when an error occurs during page loading
onafterprint	immediately after an associated document prints or previews for printing

63.3.1.3 Using In-Place Refresh

To refresh pagelet content in place, without affecting other content on the page, use the scripting framework to implement in-place refresh.

Many pagelets display data that is time sensitive. In some cases, users should be able to navigate across links within a pagelet without changing or refreshing the rest of the page. You can refresh pagelet content on command, associate the refresh action with an event (`refreshOnEvent`), or program the pagelet to refresh at a set interval (`setRefreshInterval`). The scripting framework also contains methods for expanding and collapsing pagelets. In the simplified example below, the refresh pagelet displays a "Refresh Portlet" button. Clicking the button updates the date and time displayed in the pagelet.

Figure 63–8 Refresh Portlet

The in-place refresh is executed by calling the `refresh()` method on the pagelet object instance. You can also set a new URL to be displayed within the pagelet upon refresh. (The title bar cannot be altered on refresh.)

```
<div style="padding:10px;" align="center">
<p><button onclick="refresh_portlet()">Refresh Portlet</button></p>
<p><b>Current time is:</b><br> <span id="refreshTimeSpan"></span></p>
</div>

<script type="text/javascript">
function refresh_portlet()
{
var refreshPortlet = PTPortlet.getPortletByID($PORTLET_ID$);
if (!refreshPortlet)
  {
  refresh_debug('Could not locate PTPortlet object which corresponds to <b>Refresh
Portlet</b> on page.');
  return;
  }
refresh_debug('<b>Refresh Portlet</b> calling refresh() method.');
refreshPortlet.refresh();
}

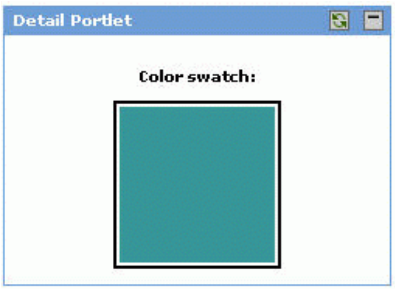
function refresh_debug(str)
{
if (window.PTDebugUtil)
  {
```

```
  PTDebugUtil.debug(str);
  }
}

var t = new Date();
document.getElementById('refreshTimeSpan').innerHTML = t;
</script>
```

63.3.1.4 Using Session Preferences

To store and share settings within the client browser, use session preferences.



Pagelets can use preferences to communicate with each other, but accessing preferences usually requires a round trip to a database. Session preferences provide a way to store and share settings in the user's session within the client browser. The Master-Detail design pattern illustrates the most basic usage of session preferences. This design pattern splits control and display between two pagelets. For example, the "master" pagelet could summarize data in list form, and the "detail" pagelet could display details on each data item in response to user selection. In the example below, the master pagelet displays a form that allows you to enter a color code in a text box.

Figure 63–9 Color Code

When the user enters a color code in the text box, the color in the detail pagelet changes.

Figure 63–10 Color Swatch

For each `onkeyup` event that occurs in the "Enter color" text box in the master pagelet, the following steps are executed:

1. The master pagelet sets the session preference using the current value of the text box.
2. The master pagelet calls an update method on the detail pagelet.
3. The detail pagelet retrieves the session preference to get the color value.
4. The detail pagelet redraws its color swatch area to reflect the new color value.

> **Note:** Shared session preferences must be specified by name on the Preferences page for the pagelet in the Pagelet Producer Console or they will not be sent to the pagelet.

The adaptive pagelet scripting framework provides an easy way to detach the relationship between pagelets and use a common event interface for communication.

> **Note:** The example below is oversimplified; the master pagelet makes a direct call to a JavaScript method of the detail pagelet. Unless the master pagelet takes extra measures to ensure that the detail pagelet is actually present on the same page, calls from master to detail could generate errors.

Master Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Enter color:</b>  
<input type="text" style="font-size:22px;font-weight:bold;text-align:center;"
id="master_prefName"
value="#FFFFFF" size="8" onkeyup="master_setPrefs(this.value)"></p><br>
</div>

<script type="text/javascript">
function master_setPrefs(val)
{
var prefName = 'masterColor';
var prefValue = val;
PTPortlet.setSessionPref(prefName,prefValue);

master_debug('<b>Master Portlet</b> called
PTPortlet.setSessionPref(\'masterColor\',\'' + prefValue + '\').');

if (window.detail_update)
  {
  master_debug('<b>Master Portlet</b> calling detail_update().');
  detail_update();
  }
else
  {
  master_debug('Could not locate portlet <b>Detail Portlet</b> on page.');
  }
}
function master_debug(str)
{
if (window.PTDebugUtil)
  {
  PTDebugUtil.debug(str);
  }
}
</script>
```

Detail Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Color swatch</b>  
<div style="width:100px;height:100px;border:2px solid
black;padding:2px;"id="detail-swatch"></div>
```

```
<script>
function detail_update()
{
var color = PTPortlet.getSessionPref('masterColor');
detail_debug('<b>Detail Portlet</b> received value="' + color + '" for
PTPortlet.getSessionPref(\'masterColor\')');

var swatch = document.getElementById('detail-swatch');
if (swatch)
  {
  swatch.innerHTML = '<div style="background-color:' + color +
';width:100%;height:100%;"></div>';
  }
else
  {
  detail_debug('<b>Detail Portlet</b> cannot find \'detail-swatch\' DIV
element.');
  }
}

function detail_debug(str)
{
if (window.PTDebugUtil)
  {
  PTDebugUtil.debug(str);
  }
}
</script>
```

63.3.1.5 Adaptive Pagelet Development Tips

These tips apply to most pagelets that use the adaptive pagelet scripting framework.

- **Use unique names for all forms and functions.** Use the GUID of a pagelet to form unique names and values to avoid name collisions with other code on the page.
- **Proxy all URLs.** You cannot make a request to a URL with a host/port that is different from that of the calling page. All URLs requested through JavaScript must be proxied. For details, see Section 63.3, "Building Pagelets Using the Pagelet Producer"
- **If you are using the adaptive pagelet scripting framework, check for support.** It is good practice to include code that determines whether or not the component is present. Ideally, your pagelet should be able to handle either situation. The simplest solution is to precede your code with an If statement that alerts the user if the scripting framework is not supported.

  ```
  <script>
  if (PTPortlet == null)
    {
    if (document.PCC == null)
      {
      alert("This pagelet only works in portals that support the JSPortlet API .
  The pagelet will be displayed with severely reduced
      functionality. Contact your Administrator.");
      }
    }
  else
    {
    [scripting code here]
    }
  ```

```
</script>
```

- **Close all popup windows opened by a pagelet when the window closes.** The scripting framework can be used to close popup windows using the `onunload` event.
- **Add all required JavaScript to the page in advance.** Browsers might not process script blocks/includes added to the page through the `innerHTML` property.
  - Microsoft Internet Explorer: Add the defer attribute to the script tag.
  - Netscape: Use RegExp to parse the response and look for the script, then eval it.
- **JavaScript HTTP and proxied HTTP must use the same authentication credentials.** JavaScript brokered HTTP requests send the same authentication token (cookie) as when you make a normal gatewayed HTTP request.

63.3.2 Using Pagelet Producer Credential Mapping

The Pagelet Producer manages authentication with each proxied application based on the settings defined for the associated resource.

The Pagelet Producer provides an API for creating custom mappings to external credential stores, allowing you to authenticate users against a custom credential source.

The `IVendorCredentialMapper` interface defines the Pagelet Producer interface for objects capable of obtaining an appropriate set of credentials needed for secondary authentication for a particular user in an application. To implement this interface, follow the directions below.

1. Create a java class that implements the `com.plumtree.runner.credentialmapper.IVendorCredentialMapper` interface.
2. Map the `getCredential` and `setCredential` methods of this interface to your credential vault. The simplified example below uses an internal class called `VConnector` and calls `VConnector.getInstance().getCredentialsForDomain`. Note: This step is vendor-specific. It will probably include a network hop, since the credential store will most likely reside on another server. You must give the mapper a unique name, and localized ones if necessary. See the IVendorCredentialMapper API documentation for all required names.
3. Compile the class into a jar. The build process must link to `common.jar`, included with the Pagelet Producer distribution.
4. Load the custom vault into the Pagelet Producer. For details, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
5. Restart the Pagelet Producer server (both proxy and adminui if they are on separate servers). The custom credential vault should show up in the list of credential sources on the Credential Mapping page of the Resource editor.

The example below is simplified for illustration purposes.

```
package com.oracle.credentialvault;
import com.oracle.connector.CredentialsSet;
import com.oracle.connector.VConnector;
import com.plumtree.runner.credentialmapper.Credential;
import com.plumtree.runner.credentialmapper.IVendorCredentialMapper;
```

```
public class OracleCredentialVault implements IVendorCredentialMapper {

  /*
  * Pagelet Producer will pass credential types as following:
  * Runner_*, where * is what the credential value type associated with this login
  * form in the adminui. For example, if the credential value type is
  *  'username' then "Runner_username" will be passed to the mapper.
  */
  public Credential getCredential(String initiator, String credType)
  {
     System.out.println("OracleCredentialVault::getCredential, initiator: " +
initiator + ", credType: " + credType);

    /*
     * Since this vault stores credentials per user and domain, we need to devise
     * a scheme to map Pagelet Producer's credential type to a domain.
     * One way to do this is to specify the credential type as something like:
     * "domain_type", which would translate to credTypes like:
     * Runner_domain.com_username and Runner_domain.com_password
     */

    String username = initiator.toLowerCase(); // assume that the vault stores all
usernames in lowercase
    String domain = "oracle.com"; //getDomain(credType);
    String type = credType; //getType(credType);

    CredentialsSet credSet =
VConnector.getInstance().getCrededentialsForDomain(username, domain);
    if( credSet != null ) {
        System.out.println("OracleCredentialVault::getCredential, found vault set:
" + credSet.toString() + ", returning type = " + type);
        return new Credential(credSet.getCredential(type));
    } else {
       System.out.println("OracleCredentialVault::getCredential, found null vault
set");
       return null;
    }
  }

  public String getDescription(String userLocale)   {
    return "Test mapper that mimics a mapper between Pagelet Producer and a
credential vault that associates credentials with a username/domain relationship";
  }

  public String getName() {
     return "OracleCredentialVault";  }

  public String getName(String userLocale) {
     return "OracleCredentialVault"; }

  public String getVendorName(String userLocale) {
     return "Oracle"; }

  public boolean setCredential(String initiator, Credential credential, String
credType)
  {
     System.out.println("OracleCredentialVault::setCredential, initiator: " +
initiator + ", credType: " + credType + ", Credential: " +
credential.getCredentialValue());
```

```
     String username = initiator.toLowerCase(); // assume that the vault stores
all usernames in lowercase
     String domain = "oracle.com"; //getDomain(credType);
     String type = credType; //getType(credType);

     System.out.println("OracleCredentialVault::setCredential setting username: "
+ credential.getCredentialValue());
     CredentialsSet userCredSet =
VConnector.getInstance().getCrededentialsForDomain(username, domain);
     userCredSet.setCrededential(type, credential.getCredentialValue());
     VConnector.getInstance().setCrededentialsForDomain(username, domain,
userCredSet);
     return true;
  }

  public boolean supportsCredentialsEditing()
  {
        // We can set new credentials using this vault
        return true;
    }
  /*
  private String getDomain(String credType)
  {
     int dstart = credType.indexOf("_");
     int dend = credType.indexOf("_", dstart+1);
     String domain = credType.substring(dstart+1, dend);
     System.out.println("TestMapper::getDomain, reading domain as: " + domain);
     return domain;
  }
  */
  /*
  private String getType(String credType)
  {
     int dstart = credType.indexOf("_");
     dstart = credType.indexOf("_", dstart+1);
     String type = credType.substring(dstart+1, credType.length());
     System.out.println("TestMapper::getType, reading type as: " + type);
     return type;
  }
  */
  /*
  private String doGetPropertyValue(String principal, String property)
  {
     return doGetPropertyValue(principal, property, ",", "=");
  }
  */
  /*
  private String doGetPropertyValue(String principal, String property, String
propDelim, String valueDelim)
  {
     int propertyindex = principal.toLowerCase().indexOf(property.toLowerCase());
     String uname = null;
     if( propertyindex != -1)
     {
        // found a property occurence
        int beginIndex = propertyindex;
        int endIndex = principal.toLowerCase().indexOf(propDelim.toLowerCase(),
beginIndex);
        String prop = null;
        if(endIndex != -1)
```

```
        {
           prop = principal.subSequence(beginIndex, endIndex).toString().trim();
         } else {
           prop = principal.subSequence(beginIndex,
principal.length()).toString().trim();
         }
         if( prop != null )
         {
           int valueIndex = prop.toLowerCase().indexOf(valueDelim);
           if(valueIndex != -1)
           {
              uname = prop.subSequence(valueIndex + valueDelim.length(),
prop.length()).toString().trim();
           }
         }
     }
     return uname;
  }
   */
}
```

For details on configuring resources to use credential mappings, see the section "Creating Pagelet Producer Resources and Pagelets" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

63.3.3 Modifying Pagelet Functionality at Runtime

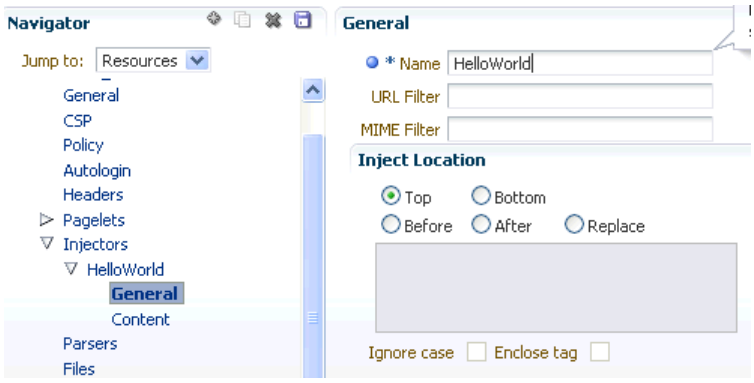
The Pagelet Producer allows you to modify pagelet functionality at runtime using custom injectors and parsers.

63.3.3.1 Creating Web Injectors

A web injector inserts content into a specified location in the proxied resource page. The content may be any text, including HTML, CSS, JavaScript, and pagelet declarations. An empty injector may also be used to remove unwanted content from a page. Injectors cannot be created for OpenSocial resources. While injecting simple HTML content has a limited use case, you can also inject JavaScript that directly modifies the pagelet's HTML markup.

To create a web injector, select the **Injectors** section under the resource you want to use and click the **Create** icon in the toolbar.

The injector can be applied to a subset of the resource by typing a URL pattern into the **URL Filter** field. The injector will be applied only to those URLs within the resource that begin with the text in the URL Filter box. If the box is empty or contains only a '/', the injector will be applied to the entire resource.



To restrict the injector to specific kinds of content, type a comma separated list of MIME types in the **MIME Filter** box. For example, *text/html* restricts the injector to HTML content, while *text/css* only restricts the injector to CSS content.

Define where in the resource's output the injection will be made:

- **Top** puts the content first in the page. Do not use this option to inject pagelet declarations.
- **Bottom** puts the content last in the page.
- The **Before/After/Replace** options put the content into the page relative to the unique string specified in the field provided. You can choose to ignore the case of the string by selecting **Ignore case**.

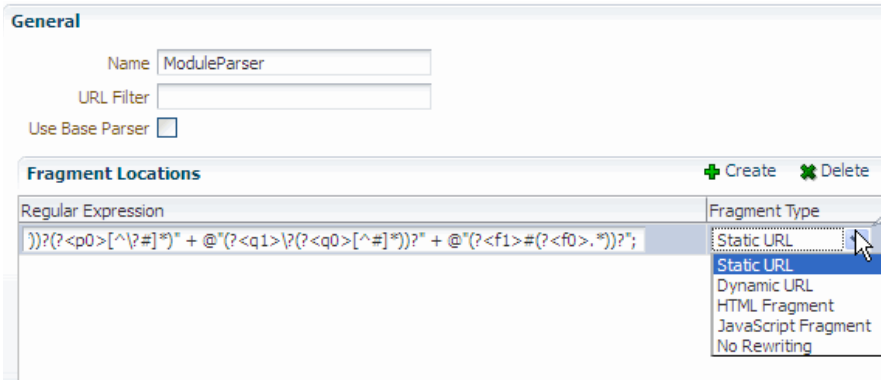
The **Enclose tag** option identifies the unique string and replaces both the text and the enclosing tag with the content specified on the next page.

Figure 63–11 Pagelet Producer Console: Injectors - General Page

Enter the content to be injected on the **Content** page. This content may be any text, including HTML, CSS, JavaScript, and pagelet declarations.

For example, the following code could be injected at the top of a page. This example registers a handler function with the page load event and then uses the handler to modify the page markup (by finding and hiding the header and footer).

```
<script type="text/javascript">
if (window.addEventListener) {
  window.addEventListener('load', hideHeaderFooter, false);
} else if (document.attachEvent) {
  window.attachEvent('onload', hideHeaderFooter);
}
function hideHeaderFooter() {
  var header = null;
  // find the header table by class
  if (document.getElementsByClassName) {
    header = document.getElementsByClassName('page_header')[0];
  } else {
    // for older versions of IE
    var tables = document.getElementsByTagName('table');
    for (var table in tables) {
      if (table.class == 'page_header') {
        header = table;
        break;
      }
    }
  }
  if (header != null) {
    header.style.display = 'none';
  }
  // now find and hide the footer (easier to find, since it has an id)
  var footer = document.getElementById('t23PageFooter');
  if (footer != null) {
    footer.style.display = 'none';
  }
}
</script>
```



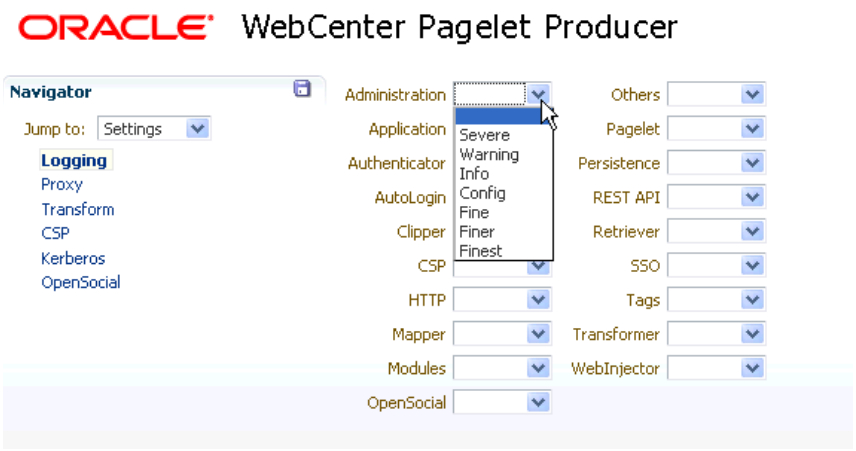
63.3.3.2 Creating Custom Parsers

Custom parsers allow you to supplement or change built-in logic for parsing content and finding URLs. When the built-in parsers fail to identify URLs or identify sections that must not be rewritten as URLs, custom parsers can be used to change the default behavior. Parsers cannot be created for WSRP or Oracle JPDK portlet producers or for OpenSocial gadget producers.

To create a custom parser, select the **Parsers** section under the resource you want to use and click the **Create** icon in the toolbar.

- Enter a **Name** for the parser.
- The parser can be applied to a subset of the resource by typing a URL pattern into the **URL Filter** box. The parser will be applied only to those URLs within the resource that begin with the text in the URL Filter box. If the box is empty or contains only a '/', the parser will be applied to the entire resource.
- To add a new parsing rule, click **Create** to add a new row to the **Fragment Locations** section.
- In the **Regular Expressions** column, enter the regular expression for identifying the URL fragment that should be transformed. The first grouping expression (in parentheses) identifies the fragment, and the rest of the expression provides the context for finding it.
- Choose the **Fragment Type** to define how the selected location should be parsed:
  - **Static URLs** are transformed on the server.
  - **Dynamic URLs** are transformed using JavaScript on the client.
  - **HTML Fragment** and **Javascript Fragment** types are used for content that is embedded in another content type, such as XML.
  - **No Rewriting** specifies a location that should not be searched for URLs. This option is used to prevent rewriting of markup mistakenly identified as URLs.
- Click the **Save** icon in the navigator toolbar.

Figure 63–12 Pagelet Producer Console: Parsers - General Page



For example, the regular expression `XMLFile=(.*?)"` would identify URLs to XML files defined within a tag, as in `<embed src="/i/flashchart/anychart_5/swf/OracleAnyChart.swf?>XMLFile=http://apex.oracle.com/pls/apex/apex_util.flash?p=53557:1:74175370346201:FLOW_FLASH_CHART5_R45192463162785599619_en"`.

63.3.4 Debugging Pagelets

The Pagelet Producer provides advanced logging traces for debugging pagelets. Logging is configured in the Settings section of the Pagelet Producer Console, where you can define different levels of logging for each Pagelet Producer component. (For details on Pagelet Producer configuration settings, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.)

Figure 63–13 Pagelet Producer Console: Settings - Logging

The Pagelet Producer logs messages to the standard Oracle Diagnostic Logging facility. In Oracle WebLogic Server, the logs are stored at `user-projects/domains/<domain>/servers/<server>/logs/<server>-diagnostic.log`.

63.3.4.1 HTTP Tracing

To view the HTTP requests and responses received and sent by the Pagelet Producer, set the **HTTP** component on the Logging Settings page to **Finest**. The example traces below were captured from a test environment.

Example 63–5 HTTP Request Received By Pagelet Producer

```
URL: http://10.148.118.211:7001/pagelets/bidwiki/includes/js/ajax.js

63.4 Working with WSRP and Oracle JPDK Portlets

The Pagelet Producer can be used to present WSRP and Oracle JPDK portlets for use in any web application. For details on configuring the Pagelet Producer to connect to a WSRP or Oracle JPDK portlet producer, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. The Pagelet Producer can also modify portlet markup at runtime as explained in the next section, Section 63.4.1, "Using Pagelet Chrome."

63.4.1 Using Pagelet Chrome

Pagelet chrome allows you to modify markup at runtime in pagelets created from portlets imported from a WSRP or JPDK portlet producer.

A pagelet chrome template is an HTML file that specifies:

- How portlet markup should be rendered stylistically
- How to display the portlet title
- How to render mode switching options

The default chrome template displays the portlet name and a dropdown menu that allows the user to switch into different modes. The dropdown menu is dynamically populated with all the standard modes supported by the underlying portlet. Templates uses the following reserved tokens to identify key portlet elements, which the Pagelet Producer substitutes at runtime.

Table 63–3 Pagelet Chrome Template Tokens

Token	Description
`$$PORTLET TITLE$$`	Portlet title
`$$REPEAT MENU ITEM$$`	Used to indicate the beginning of a repeating section for navigational items
`$$END REPEAT MENU ITEM$$`	Used to indicate the end of a repeating section for navigational items
`$$MENU ITEM URL$$`	Navigation URL (to switch portlet modes or window states)
`$$MENU ITEM$$`	Display name of navigational item (for example, Customize)
`$$TOKEN$$`	Unique identifier for pagelet instance on the page
`$$PORTLET CONTENT$$`	Portlet content
`pt://images`	Tag used to indicate the imageserver URL

The example below is a very simple pagelet chrome template:

```
<script type="text/javascript">
function goto(url)
```

```
{
  document.location = url;
  return false;
}
</script>
<div style="border: 1px solid">
<span><b><!-- $$PORTLET TITLE$$ --></b></span>
<span style="align: right">
  Switch Mode:
  <select size="1" name="mode">
    <!-- $$REPEAT MENU ITEM$$ -->
    <option onclick="goto('$$MENU ITEM URL$$')"><!-- $$MENU ITEM$$ --></option>
    <!-- $$END REPEAT MENU ITEM$$ -->
  </select>

</span>
</div>
<!-- $$PORTLET CONTENT$$ -->
```

Note: The pagelet chrome template file must be hosted on the classpath of the Pagelet Producer web application.

If you configured Pagelet Producer to use an external image server, copy the files from ensemblestatic.war/imageserver/yahoo to your image server to properly render the default chrome template.

To implement the chrome template, add it as a parameter to the pagelet inject URL (REST or JavaScript). For details on pagelet inject URLs, see Section 63.2.2, "Adding a Pagelet to a Web Page." For example:

- REST: `/inject/v2/pagelet/pagelet_lib/pagelet_name?chrome=mychrome.html`
- JavaScript: `injectpagelet(library, name, iframe_options, payload, params, context_id, element_id, is_in_community, chrome)`

The value of the chrome parameter can be the name of the file containing the chrome template or the special reserved value "`none`", which suppresses all chrome and sends back portlet markup only. If the chrome parameter is omitted, the default chrome is returned with the portlet markup. The default chrome template uses YUI menu control to display a gradient title bar and a DHTML dropdown menu for switching modes. (When ADF content is detected, a different chrome template is used by default. This template can be overridden with a custom template or with the standard default template by setting chrome=chrometemplate.html.)

63.5 Working with OpenSocial Gadgets

Any OpenSocial gadget reachable by the Pagelet Producer server can be registered as a pagelet and used in any web application, including a portal. For details on registering OpenSocial pagelets with the Pagelet Producer, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The Pagelet Producer supports most of the standard OpenSocial APIs excluding OAuth. The complete OpenSocial API reference documentation can be found here: `http://shindig.apache.org/shindig-1.1.x/shindig-features/jsdoc/index.html`.

The Pagelet Producer also allows gadgets to store preferences, retrieve WebCenter Portal profile and connection information, and access a user's activity stream using OpenSocial APIs. For more details on using these features, see the sections that follow.

63.5.1 Configuring Authentication

In order for gadgets to request user-level data (preferences or people connections), the end user's identity must be established. If any OpenSocial gadgets need to access user-level data from the server, you must configure a security policy for the parent OpenSocial resource in the Pagelet Producer Console. The first time a user accesses an OpenSocial gadget, a login page will be presented. After the initial login, subsequent requests for OpenSocial gadgets will use the established user identity.

For details on configuring a security policy for a Pagelet Producer resource, see the Managing Pagelets chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*

63.5.2 Storing User Preferences

OpenSocial gadgets may use user preferences to store data at the container. User preferences are scoped to a particular user and may optionally be scoped to an appId (the gadget appId is the pagelet context ID). If you choose to use the OpenSocial gadget.Prefs API, the user preferences will be scoped to the user and pagelet instance. Alternatively, you may use the opensocial.DataRequest API to manage preferences at the user level that can be shared with other pagelets.

When registered as a pagelet, a gadget's user preferences are treated as pagelet preferences. In WebCenter Portal, for example, non-hidden user preferences can be edited by the end user using the Personalize button. Additionally, to simulate preferences shared between users, you may pass in user preferences via pagelet parameters. Note that a pagelet preference, if set, will always override the corresponding pagelet parameter (in other words, personalization takes precedence over customization).

Outside of WebCenter Portal, gadget-backed pagelets are provided with a simple chrome that displays the gadget title and buttons for accessing the preference editor and minimizing/maximizing the gadget. The chrome may be suppressed by passing in the value of 'none' to the chrome parameter in the Pagelet Inject API. The preference editor UI supports all four types of user preferences:

- string: rendered as a text field
- bool: rendered as a checkbox
- enum: rendered as a dropdown list
- list: rendered as a text field (values must be separated with a pipe "|" character)

63.5.3 Accessing WebCenter Portal Profile Information

OpenSocial gadgets can query the current user's profile data and people connections via the standard OpenSocial APIs. To use this feature, you must manually target the WebCenterDS data source to the WC_Portlet server as described in *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Note: The OpenSocial API cannot be used to update profile or connection information.

The supported user profile fields are listed in the table below.

Table 63–4 User Profile Fields

OpenSocial Field	Type	Description
aboutme	string	A general statement about the person.
addresses	Plural-Field <Address>	A physical mailing address for the person.
appData	Plural-Field <AppData>	A collection of AppData keys and values, used for preferences.
birthday	Date	The birthday of the person. The value MUST be a valid Date. The year may be set to 0000 when the age of the person is private or the year is not available.
emails	Plural-Field <string>	E-mail address for the person.
location	string	Physical address for the person.
name	Name	The broken-out components and formatted version of the person's real name.
organizations	Plural-Field <Organization>	Current or past organizational affiliation of the person.
phoneNumbers	Plural-Field <string>	Phone number for the person. In addition to the standard canonical values for type, this field defines the additional values mobile, fax, and pager.
photos	Plural-Field <string>	URL to a photo of the person. The value MUST point to an actual image file (e.g. a GIF, JPEG, or PNG image file) rather than to a web page containing an image. Note that this field SHOULD NOT be used to send down arbitrary photos taken by this user, but specifically profile photos of the contact suitable for display when describing the contact.
preferredUsername	string	The preferred username of this person on sites that ask for a username (e.g. jsmarr or daveman692).
status	string	The person's status, headline or shoutout.
thumbnailUrl	string	The person's photo thumbnail URL, specified as a string. This URL MUST be fully qualified.

63.5.4 Accessing a User's Activity Stream

OpenSocial gadgets can operate on a user's activity stream using OpenSocial APIs. The following operations are supported:

- get activities
- create activity

The following operations are not supported:

- update activity
- delete activity

The supported activity stream fields are listed in the table below.

Table 63–5 Activity Stream Fields

OpenSocial Field	Type	Description
appId	Object-Id	The application with which the activity is associated.
body	string	An optional expanded version of the activity. Bodies may only have the following HTML tags: <b> <i>, <a>, , but this formatting may be ignored.
externalId	Object-Id	An optional ID generated by the posting application.
id	Object-Id	An ID that is permanently associated with the activity.
postedTime	string	The time at which the activity took place in milliseconds since the epoch.

Table 63–5 (Cont.) Activity Stream Fields

OpenSocial Field	Type	Description
priority	number	A number between 0 and 1 representing the relative priority of the activity in relation to other activities from the same source.
title	string	The primary text of the activity. Titles may only have the following HTML tags: <b> <i>, <a>, , but this formatting may be ignored.
userId	Object-Id	ID of the user for whom the activity is defined.

63.5.5 Using Gadget Eventing

The Pagelet Producer supports the OpenSocial pubsub inter-gadget eventing model. A gadget may publish events over any number of arbitrary channels (defined by simple string names) in JavaScript. On the receiving end, a gadget may subscribe to receive events over any number of channels, again in JavaScript, and take appropriate actions based on the events.

```
function connSelected(element) {
  var connId = element.id;
  var connName = element.lastChild.textContent;
  gadgets.pubsub.publish(channel, {id: connId, name: connName});
```

For a complete JavaScript reference to the supported eventing API, see http://shindig.apache.org/shindig-1.1.x/shindig-features/jsdoc/symbols/gadgets.pubsub.html.

63.5.6 Example: Consuming an External OpenSocial Gadget

The example that follows is simplified for illustration. For details on Pagelet Producer Console settings, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

1. Using the Pagelet Producer Console, create a new Resource and choose **OpenSocial** as the type. Define URLs and policies as necessary. Save the new Resource.
2. Using the Pagelet Producer Console, create a new pagelet and enter the location of the gadget XML schema in the **Gadget URL** field.
   - To import the gadget name and any user preferences defined for the gadget, click the **Import Gadget Metadata** button. If any of the preferences are editable, the Pagelet Producer will create a preference editor using the imported preferences.
   - To configure or customize the generated preference editor, go to the **Pagelet Parameters** page.
3. Go to the **Documentation** page to view sample code to access the pagelet and preference editor using either the JavaScript or REST API.
4. Save the new pagelet.

63.5.7 Example: Consuming a Local OpenSocial Gadget

The example that follows is simplified for illustration. For details on Pagelet Producer Console settings, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

1. Using the Pagelet Producer Console, create a new Resource and choose **OpenSocial** as the type. Define URLs and policies as necessary. Save the new Resource.

2. Create or upload the gadget file.

   Note: If you choose to host OpenSocial gadget XML files, the files must be placed under an anonymous resource (with no security policy) or gadget functionality will not work correctly.

   a. Select the **Files** section under the resource and click the **Create** icon in the toolbar.

   b. On the **General** page, enter the relative path to the file in the **Name** field. Do not use a leading forward-slash ("/"). For example, "gadgets/activities.xml". Any path and name can be used; the path is a 'virtual' URL that the Pagelet Producer will use to serve the file. The visual directory structure of the Files collection in the navigator is updated to match the path to the file.

   c. Go to the **Content** page to upload or create the gadget file.

      To upload a gadget file, enter the path to the file or click the Browse button to navigate to the file, then click the **Upload** button to upload the file to the Pagelet Producer server.

      To create a gadget file, use the editor on the **Content** page to enter and edit content.

   d. Click the **Save** icon in the navigator toolbar.

3. Create or upload any other files required by the gadget (JavaScript, images, etc.) in the **Files** section of the resource. Define paths for the files that match the paths in the gadget code. For example, if the gadget uses JavaScript files in a subfolder called "js", include that directory in the Name field when you upload the files, e.g., "gadgets/js/activities.js".)

4. Using the Pagelet Producer Console, create a new pagelet and enter the relative path to the gadget XML schema (created or uploaded in step 2) in the **Gadget URL** field. For local files, this is the same path defined in the Name field for the file object; for example, "gadgets/activities.xml".

   - To import the gadget name and any user preferences defined for the gadget, click the **Import Gadget Metadata** button. If any of the preferences are editable, the Pagelet Producer will create a preference editor using the imported preferences.
   - To configure or customize the generated preference editor, go to the **Pagelet Parameters** page.

5. Go to the **Documentation** page to view sample code to access the pagelet and preference editor using either the JavaScript or REST API.

6. Save the new pagelet.

64

Consuming Portlets

This chapter describes how to add portlets to the pages of your WebCenter Portal: Framework application and the options that accompany this process.

This chapter includes the following sections:

- Section 64.1, "Introduction to Consuming Portlets"
- Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application"
- Section 64.3, "Adding Portlets to a Page"
- Section 64.4, "Setting Attribute Values for the Portlet Tag"
- Section 64.5, "Copying Portlets"
- Section 64.6, "Deleting Portlets from Application Pages"
- Section 64.7, "Consuming WebCenter Services Portlets"
- Section 64.8, "Adding the Portlet Producer Task Flow"
- Section 64.9, "Troubleshooting Portlets"

This chapter does not cover Oracle JDeveloper or Oracle ADF page creation basics. It covers only those aspects of page creation that are specific to Framework application pages. Therefore, you should familiarize yourself with the information covered in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework* before reading this chapter.

For information about creating portlets, which can then be consumed by Framework application pages, see the following chapters:

- Chapter 58, "Overview of Portlets"
- Chapter 59, "Creating Portlets with the Oracle JSF Portlet Bridge"
- Chapter 60, "Creating Portlets with the Portlet Wizard"
- Chapter 65, "Creating Portlets with OmniPortlet"
- Chapter 66, "Creating Content-Based Portlets with Web Clipping"

64.1 Introduction to Consuming Portlets

Oracle WebCenter Portal: Framework enables you to consume a portlet by registering its producer either with an application or with the Resource Palette from where you can add it to any application. After you register the producer, its portlets appear under the registered producer's name under the Connections node in the Application Resources panel or in the Resource Palette.

Your application can consume portlets that you build and portlets that you receive from a third party, such as a packaged-application vendor.

There are many options associated with portlet consumption. For example, you can choose to place portlets straight onto a page or nest them in a Composer component, you can adjust many attributes of the portlet tag, and you can wire portlets to each other.

64.2 Registering Portlet Producers with a WebCenter Portal: Framework Application

Before you can add a portlet to a Framework application page, you must register the portlet's producer with the application. You can register portlet producers in two ways:

- Register the portlet producer with a specific application. Use this option if you are not likely to want to register the producer with other applications.
- Register the portlet producer using the Resource Palette. Use this option to use the producer's portlets in multiple applications.

A portlet that is available in the Resource Palette can be added to any of your Framework applications by dropping it on the page as you would any other component. When you add a portlet from the Resource Palette, its producer gets registered with the application if that producer is not already registered with the application. You can drag and drop a whole producer connection from the Resource Palette into the Application Resources panel of the Application Navigator. This registers the producer with the application. Alternatively, you can right-click a producer in the Resource Palette and choose **Add to Application** from the context menu to register the producer with the currently open application.

JDeveloper provides wizards for registering both WSRP producers and Oracle PDK-Java producers.

Note: If your application is source controlled, you must manually create elements in the source control system for any new files created during producer registration. Any files that are already source controlled are checked out automatically by the producer registration process.

This section includes the following subsections:

- Section 64.2.1, "How to Register a WSRP Portlet Producer"
- Section 64.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles"
- Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer"
- Section 64.2.4, "How to Edit Portlet Producer Registration Settings"
- Section 64.2.5, "How to Test a Portlet Producer Connection"
- Section 64.2.6, "How to Refresh a Portlet Producer"
- Section 64.2.7, "How to Delete a Portlet Producer"

For more information about producers, see Section 58.2.3, "Deployment Type." For information about obtaining prebuilt portlets through Oracle, see Section 3.4, "Working with the Integrated WebLogic Server." For information about using

JDeveloper's portlet creation wizards, see Chapter 60, "Creating Portlets with the Portlet Wizard." For more information about portlets, see Chapter 58, "Overview of Portlets."

64.2.1 How to Register a WSRP Portlet Producer

When you register a WSRP portlet producer, you provide basic information that describes the producer's operational parameters. This information is used by the portlet-consuming application to communicate with the producer and with the portlets through the producer.

WebCenter Portal: Framework supports both WSRP 1.0 and WSRP 2.0 producers. The WSRP 2.0 standard, among others, provides support for inter-portlet communication and export and import of portlet customizations. You can leverage the benefits of WSRP 2.0 while building standards-based JSR 286 portlets.

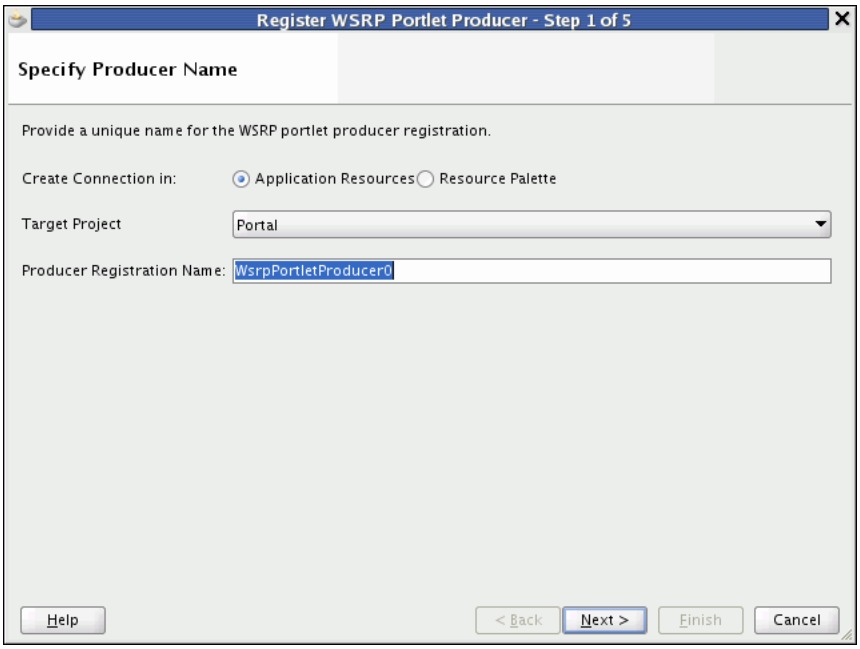
The Register WSRP Portlet Producer wizard is the entry point for registering both WSRP 1.0 and 2.0 producers. When registration is successful, the newly registered producer displays in JDeveloper either in the Application Resources panel of the Application Navigator, or in the Resource Palette, depending on where you created the connection. You can then select portlets from the producer for placement on your application (`.jspx`) pages.

Note: If you are registering a producer provided by Oracle WebLogic Portal, and the portlet uses ADF Rich Components, you should register the WSRP 2.0 WSDL URL to ensure that the portlet functions correctly.

You also use the Register WSRP Portlet Producer wizard to register JSF portlets, which are portletized JSF applications or portletized ADF task flows. Once you create a portlet from a JSF application, you can deploy the portlet to a WLS instance and register the JSF portlet producer as you would register any WSRP portlet producer. The Oracle JSF Portlet Bridge exposes JSF applications and task flows as JSR 286 portlets. For more information, see Chapter 59, "Creating Portlets with the Oracle JSF Portlet Bridge."

To register a WSRP portlet producer:

Note: In the Register WSRP Portlet Producer wizard, if you click **Cancel** after you have clicked **Finish,** the registration is not canceled.



---

1. In the Application Resources panel of the Application Navigator, right-click **Connections,** choose **New Connection** and then choose **WSRP Producer.**

   For other methods of invoking the wizard, such as from the Resource Palette, see Section 1.6.2, "How Do I Access the Connection Wizards?"

2. In the Specify Producer Name page (Figure 64–1) of the Register WSRP Portlet Producer wizard, the **Create Connection in** option is set depending on how you accessed the wizard. The default selection is **Application Resources** if you invoked the wizard from an application, and **Resource Palette** if you invoked the wizard from the Resource Palette. You can change this option at this point.

Figure 64–1 The Specify Producer Name Page (WSRP Producer)

3. From the **Target Project** dropdown list, select the project to be configured for the WSRP producer connection.

   This should be the same project as the one in which you intend to consume the portlets.

   You can change this option only if you invoked the wizard from the Application Navigator.

4. In the **Producer Registration Name** field, enter a name for the producer registration that is unique among all connections and then click **Next.**

5. In the Specify Connection Details page (Figure 64–2), in the **WSDL URL** field, enter the producer's URL.

   The syntax varies according to your WSRP implementation, for example, the sample WSRP producer uses the following syntax:

   - `http://`*`host`*`:`*`port`*`/`*`context-root`*`/portlets/wsrp1?WSDL`
   - `http://`*`host`*`:`*`port`*`/`*`context-root`*`/portlets/wsrp2?WSDL`
   - `http://`*`host`*`:`*`port`*`/`*`context-root`*`/portlets?WSDL` (WSRP 1.0 for backward compatibility)

   Where:

   - *`host`* is the server to which your producer has been deployed.
   - *`port`* is the port to which the server is listening for HTTP requests.
   - *`context-root`* is the Web application's context root.
   - `portlets[/wsrp(1|2)]?WSDL` is static text. The text entered here depends on how the producer is deployed.

   For example:

   ```
   http://myhost.example.com:7101/portletapp/portlets/wsrp2?WSDL
   ```

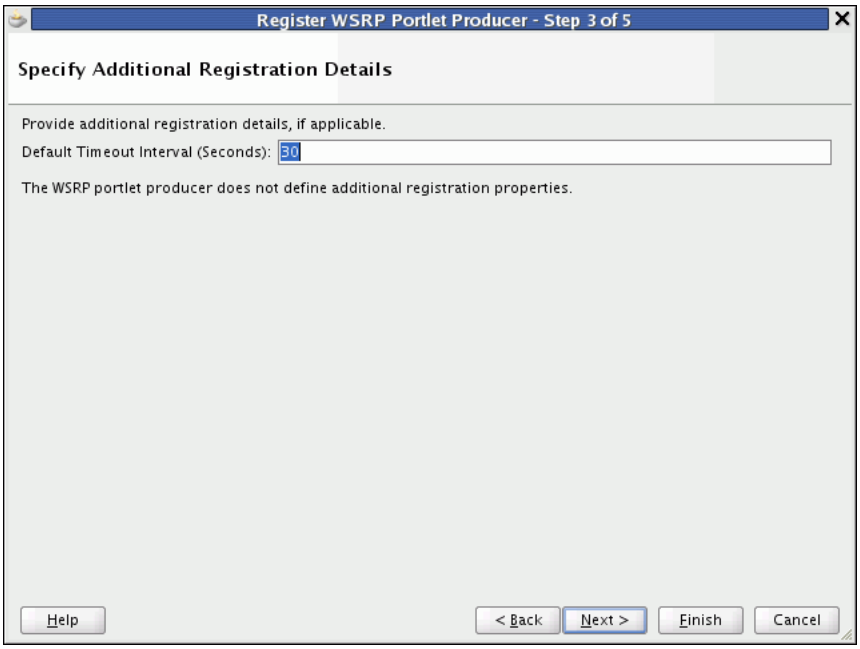
You can access the producer test page through the URL:

`http://host:port/context-root/info`

Figure 64–2 The Specify Connection Details Page (WSRP Producer)

6. If the application and the producer are separated by a firewall, an HTTP proxy is needed for communication between the application and the producer. If this is the case for your application, select **Use Proxy for Contacting Producer** and specify the URL and port number of the proxy.

   Note: The proxy fields in this step default to the proxy preferences set in JDeveloper Preferences (from the main menu, choose **Tools > Preferences,** and then select **Web Browser and Proxy**).



7. Click **Next.**

   The connection to the producer is tested. If there are any problems, an error message displays. You must resolve any problems before you can continue.

8. In the Specify Additional Registration Details page (Figure 64–3), in the **Default Timeout Interval (Seconds)** field, enter the number of seconds to wait for the producer to respond during design time operations.

   Some producers define additional registration properties. In such cases, the properties are displayed in a table on this page of the wizard. You can enter values for these additional properties in the table. These properties are producer-specific and are used only at registration time. That is, they collect information that consumer applications send to producers at registration time; the producers store this information against the consumers and use it subsequently.

Figure 64–3 The Specify Additional Registration Details Page (WSRP Producer)

9. If you are registering the producer in the Resource Palette, click **Finish** to complete the registration.

   If you are registering the producer in the Application Resources panel, and plan to request authentication whenever the producer (and consequently, its portlet) is accessed, click **Next** and follow the remaining steps. If you do not want to configure security, click **Finish.**

   If the producer declares user categories, when you click **Finish,** the Register WSRP Portlet Producer dialog displays. Click **Yes** and see Section 64.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles." Click **No** to decline this opportunity and complete the registration process.

   Note: If you decline to map the user categories to security roles at this point, you can do so later by editing the producer registration.

10. In the Configure Security Attributes page (Figure 64–4), from the **Token Profile** dropdown list, select the type of token profile to use for authentication with the WSRP producer:

    - **None**—No token; no WS-Security header is attached to the SOAP message.

      If you select this option, you do not want to complete the rest of the wizard. Click **Finish.**

    - **WSS 1.0 SAML Token with Message Integrity**—Provides message-level integrity protection and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies and SHA-1 hashing algorithm for message integrity.

- **WSS 1.0 SAML Token with Message Protection**—Provides message-level protection (integrity and confidentiality) and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. The Web service consumer includes a SAML token in the SOAP header and the confirmation type is sender-vouches. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.

  When you select this policy, you must also specify the Recipient Alias.

- **WSS 1.0 User Name Token without Password**—Provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security v1.0 standard. Both plain text and digest mechanisms are supported. This policy uses WS-Security's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanism for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.

  Use this token profile if the WSRP producer has a different identity store. You must define an external application pertaining to the producer and associate the external application with this producer. The external application defined here is used to retrieve and propagate the user credentials to the producer. The producer verifies this against the identity store configured for the external application.

  When you select this policy, you must also specify the Recipient Alias.

- **WSS 1.0 User Name Token with Password**—provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security 1.0 standard. Credentials (username only) are included in outbound SOAP request messages through a WS-Security UsernameToken header. No password is included. Message protection is provided using WS-Security 1.0's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.

  When you select this policy, you must also specify the Recipient Alias.

- **WSS 1.0 SAML Token**—Provides SAML-based authentication for outbound SOAP request messages in accordance with the WS-Security 1.0 standard. The policy propagates user identity and is typically used in intra departmental deployments where message protection and integrity checks are not required.

  This policy does not require any keystore configuration.

- **WSS 1.1 SAML Token with Message Protection**—Provides message-level protection (integrity and confidentiality) and SAML token population for outbound SOAP requests in accordance with the WS-Security 1.1 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses the symmetric key technology for signing and encryption, and WS-Security's Basic128 suite of asymmetric key technologies for endorsing signatures.

Figure 64–4 The Configure Security Attributes Page (WSRP Producer)

11. Select the configuration type:

    - **Default**—If you choose default, then all the default keystore attributes, that is location, password, keystore type, signature key and alias, encryption key and alias are picked up from the JPS (Java Platform Security) configuration. The value for recipient alias is used from the policy being used. The WebLogic Server where the application is deployed must be configured for WS-Security. For more information, see "Securing a WSRP Producer with WS-Security" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
    - **Custom**—If you select this option, then you must enter the appropriate keystore attributes in the next page of the wizard.

12. In the **Default User** field, enter a user name to assert to the remote producer when the user has not authenticated to the Framework application.

    When unauthenticated, the identity *anonymous* is associated with the application user. OWSM does not currently support the propagation of an anonymous identity, so you must specify an alternative identity here. Keep in mind though, that in this case, the Framework application has not authenticated the user so the default user you specify should be a low privileged user in the remote producer that is an appropriate identity to use for showing public content. For example, you may want to create a guest account in the identity store for this purpose. If the user has authenticated to the application, then the user's identity is asserted rather than the default user.

    > **Note:** If you specify a **Default User**, the remote producer must be set up to accept this information.

    The **Default User** field does not appear if you selected **User Name Token with Password.**

13. In the **Issuer Name** field, enter the name of the issuer of the SAML Token, for example `www.oracle.com`.

This field appears only if you selected an **SAML Token** option from the **Token Profile** dropdown list, and **Custom** from the **Configuration** options. The issuer name is the attesting entity that vouches for the verification of the subject.

14. Select **Associate Producer with External Application**, then select the application, if this producer must provide authentication to an external application.

    For more information, see Section 69.13.3, "Managing External Applications."

    This option is available only if you selected **User Name Token with Password.**

15. Click **Next.**

    If you selected **Default** as the configuration option, then the fields on the Specify Key Store page are disabled. Click **Finish** to complete the registration.

    If the producer declares user categories, when you click **Finish,** the Register WSRP Portlet Producer dialog displays. Click **Yes** and see Section 64.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles." Click **No** to decline this opportunity and complete the registration process.

16. In the Specify Key Store page, in the **Store Path** field, provide the full path to the keystore that contains the certificate and the private key that is used for signing some parts (security token and SOAP message body) of the SOAP message.

    If you are not sure of the full path, click **Browse** to navigate to and select the file. The selected file should be a keystore created with the Java keytool.

Figure 64–5 The Specify Key Store Page (WSRP Producer)

17. In the **Store Password** field, provide the password to the keystore that was set when the keystore was created.

    The keystore password must be correct for the **Store Type** field and the **Signature Key Alias** dropdown list to populate.

    If an incorrect keystore path or password is entered, then an error message appears stating that the password is invalid and must be corrected. All fields on

this screen except for **Store Path** and **Store Password** are disabled until you specify the correct values.

18. After you provide the correct keystore path and password, press the Tab key to move to another active field (for example, the **Store Path** field). This ensures that the **Store Type** field and the **Signature Key Alias** dropdown list are properly populated.
19. The **Store Type** value is read from the keystore and is never editable. The store type is always **JKS** (Java Key Store).
20. From the **Signature Key Alias** dropdown list, select the signature key alias.

    This list populates automatically when the correct password is entered in the **Store Password** field. The **Signature Key Alias** is the identifier for the certificate associated with the private key that is used for signing. The key aliases found in the specified keystore are available in the list. Select the one to be used for signing.
21. In the **Signature Key Password** field, specify the password for accessing the key identified by the alias specified in **Signature Key Alias.**
22. Optionally, from the **Encryption Key Alias** dropdown list, select the encryption key alias.

    This list populates automatically when the correct password is entered in the **Store Password** field. The key aliases found in the specified keystore are available in the list. Select the one to be used for encryption.
23. Optionally, in the **Encryption Key Password** field, specify the password for accessing the key identified by the alias specified in **Encryption Key Alias**.
24. From the **Recipient Alias** field, select the keystore alias that is associated with the producer's certificate and then click **Finish.**

    This certificate is used to encrypt the message to the producer.

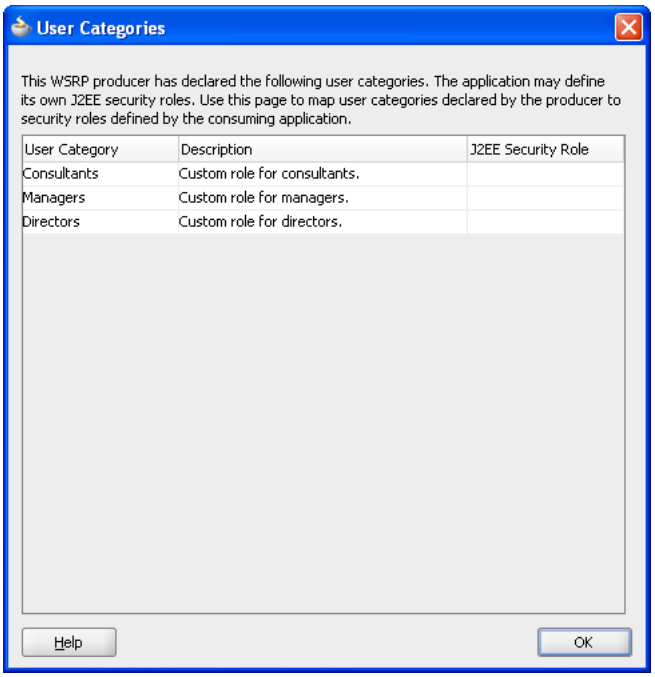
    This field is not displayed if you selected **SAML Token with Message Integrity** as the **Token Profile** in the Configure Security Attributes page of the wizard.

    If the producer declares user categories, when you click **Finish,** a dialog displays asking whether you want to map the user categories to Java EE roles. Click **Yes** and see Section 64.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles." Click **No** to decline this opportunity and complete the registration process.

64.2.2 How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles

The user categories the producer declares come from the portlets it contains. For example, if the producer contains one or more JSR 286 portlets created with the Standards-based Java Portlet (JSR 286) Wizard, then any security roles added during portlet creation are included in the user categories the producer declares. Java EE Security Roles can be specified through the Framework application's `web.xml` file properties.

For more information about security roles in JSR 286 portlets, see Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."



This procedure continues forward from Section 64.2.1, "How to Register a WSRP Portlet Producer."

To map producer-declared user categories with application-defined Java EE security roles:

1. After clicking **Finish** in the Register WSRP Portlet Producer wizard, click **Yes** in the resulting dialog.
2. In the User Categories dialog (Figure 64–6), for each **User Category**, click the corresponding field in the **J2EE Security Role** column.

   The User Categories dialog is also accessible when you edit producer registration settings. For more information see Section 64.2.4, "How to Edit Portlet Producer Registration Settings."

Figure 64–6 The User Categories Dialog

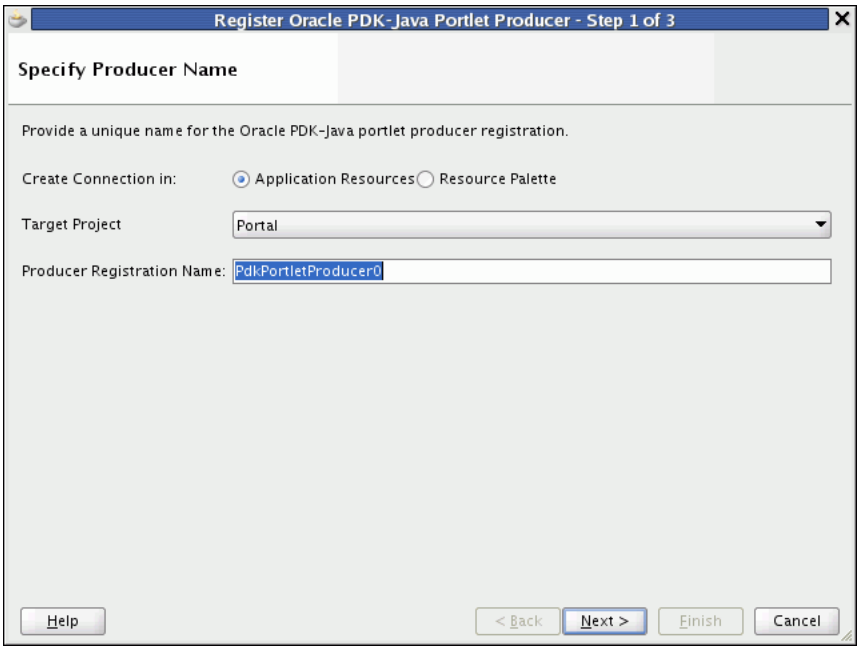
3. From the resulting list, select the security role to map to the producer user category.
4. Click **OK** when all user categories are mapped.

64.2.3 How to Register an Oracle PDK-Java Portlet Producer

When you register a PDK-Java portlet producer, you provide basic information that describes the producer's operational parameters. This information is used by the portlet-consuming application to communicate with the producer and with the portlets through the producer.

When registration is successful, the newly registered producer is displayed in JDeveloper either in the Application Resources panel of the Application Navigator, or in the Resource Palette, depending on where you created the connection. You can then select portlets from the producer for placement on your application (`.jspx`) page.

> **Note:** In the Register Oracle PDK-Java Portlet Producer wizard, if you click **Cancel** after you have clicked **Finish,** the registration is not canceled.



To register a PDK-Java portlet producer:

1. In the Application Resources panel of the Application Navigator, right-click **Connections,** choose **New Connection** and then choose **Oracle PDK-Java Producer.**

   For other methods of invoking the wizard, such as from the Resource Palette, see Section 1.6.2, "How Do I Access the Connection Wizards?."

2. In the Specify Producer Name page (Figure 64–7) of the Register Oracle PDK-Java Portlet Producer wizard, the **Create Connection in** option is set depending on how you accessed the wizard. The default selection is **Application Resources** if you invoked the wizard from an application, and **Resource Palette** if you invoked the wizard from the Resource Palette. You can change this option at this point.

Figure 64–7 The Specify Producer Name Page (PDK-Java Producer)

3. From the **Target Project** dropdown list, select the project to be configured for the PDK-Java producer connection.

   This should be the same project as the one in which you intend to consume the portlets.

   You can change this option only if you invoked the wizard from the Application Navigator.

4. In the **Producer Registration Name** field, enter a name for the producer registration that is unique among all connections and then click **Next.**

5. In the Specify Connection Details page (Figure 64–8), in the **URL Endpoint** field, enter the producer's URL using the following syntax:

   `http://host:port/context-root/providers`

   Where:

   - *host* is the server to which your producer has been deployed.
   - *port* is the port to which the server is listening for HTTP requests.

- *context-root* is the Web application's context root.
- providers is static text. The text entered here depends on how the producer is deployed.

For example:

```
http://myhost.example.com:7101/myEnterprisePortlets/providers
```

Figure 64–8 The Specify Connection Details Page (PDK-Java Producer)

6. In the **Service ID** field, enter the unique identifier for this producer.

   PDK-Java enables you to deploy multiple producers under a single adapter servlet. The producers are identified by their unique service IDs. A service ID is required only when a service ID or producer name is not appended to the URL endpoint. For example the following URL endpoint requires the service ID, sample:

   ```
   http://myhost:7101/myEnterprisePortlets/providers
   ```

   However, the following URL endpoint, does not require a service ID:

   ```
   http://myhost:7101/myEnterprisePortlets/providers/sample
   ```

7. If the application and the producer are separated by a firewall, an HTTP proxy is needed for communication between the application and the producer. If this is the case for your application, select **Use Proxy for Contacting Producer** and specify the URL and port number of the proxy.

   Note: The proxy fields in this step default to the proxy preferences set in JDeveloper Preferences (from the main menu, choose **Tools > Preferences,** and then select **Web Browser and Proxy.**)

8. Select **Associate Producer with External Application**, then select the application, if this producer must provide authentication to an external application.

For more information, see Section 69.13.3, "Managing External Applications."

This option is available only if you invoked the wizard from the Application Navigator, as external applications are scoped to individual applications.

9. Select **Enable Producer Sessions** to enable sessions between the producer and the consuming application.

   When sessions are enabled, the server maintains session-specific information, such as user name. Message authentication uses sessions, so if the shared key is set, then this option should also be selected.

   For sessionless communication between the producer and the server, deselect this option.

10. At this point in the wizard, you can click **Finish** to complete the registration, using the default values for all remaining steps.

    To provide additional details, click **Next** and follow the remaining steps.

11. In the Specify Additional Details page (Figure 64–9), in the **Default Timeout Interval (Seconds)** field, enter the number of seconds to wait for the producer to respond during design time operations.

Figure 64–9 The Specify Additional Registration Details Page (PDK-Java Producer)

12. In the **Subscriber ID** field, enter a string to identify the consumer of the producer being registered.

    When a producer is registered, a call is made to the producer. During the call, the consumer passes the value for Subscriber ID to the producer. This value for Subscriber ID is also passed every time a portlet call is made. If the producer does not see the expected value for Subscriber ID, then it might reject the registration call.

> **Note:** Editing the producer registration to change the Subscriber ID after the initial registration has no effect. To specify a different Subscriber ID, you must reregister the producer.

13. In the **Shared Key** field, enter a shared key to use for producers that are set up to handle encryption and then click **Finish.**

    The shared key is used by the encryption algorithm to generate a message signature for message authentication. Producer registration fails if the producer is set up with a shared key and you enter an incorrect shared key here. The shared key can contain between 10 and 20 alphanumeric characters.

64.2.4 How to Edit Portlet Producer Registration Settings

Both the WSRP and PDK-Java portlet producer registration wizards enable you to access and revise many of the values you entered when you registered the producer.

To edit portlet producer registration settings:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to edit, and choose **Properties.**
3. Edit the producer registration properties as required, clicking **Next** to step through the pages of the wizard.

   You can also go directly to a specific step by clicking the links in the navigation panel on the left side of the wizard.

   - For information about WSRP Producer settings, see Section 64.2.1, "How to Register a WSRP Portlet Producer."
   - For information about Oracle PDK-Java Producer settings, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

   You cannot edit the **Producer Registration Name.**
4. When you have changed all the necessary settings, click **Finish.**
5. Editing some properties, such as the **WSDL URL** or **URL Endpoint,** requires a producer refresh. When you make such a change, a dialog displays allowing you to refresh the producer immediately, save the changes but do not refresh the producer, or return to the edit producer registration wizard. Click **Yes, No,** or **Cancel** as appropriate.

   > **Note:** While you can edit the value of the **WSDL URL** field, you can point to a different producer only if the new producer has access to the preference store of the old producer, or if the preference store of the old producer has been migrated to that of the new producer.

6. Click **OK** when the producer has been successfully refreshed, if necessary.
7. Once you have completed your edits, consider testing the producer connection to be sure the connection information is valid. For more information, see Section 64.2.5, "How to Test a Portlet Producer Connection."

64.2.5 How to Test a Portlet Producer Connection

The connection testing feature provides a means of testing the validity of a portlet producer connection.

To test a portlet producer connection:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to test, and choose **Test Producer Connection.**
3. A progress bar appears while the test is underway. A success or failure dialog displays when the test is complete. Click **OK** to close this dialog.

   If the failure dialog displays, consider editing the producer registration details and retesting the producer connection. Additionally, especially if the failure dialog takes a long time to display, ensure that the producer is available. For example, if the producer is provided through the Integrated WLS, ensure that the Integrated WLS is running, and then retest the connection.

64.2.6 How to Refresh a Portlet Producer

When you refresh a portlet producer, the portlets from that producer are also refreshed. Newly added portlets and any updates to existing portlets become available to any applications that are consuming portlets from this producer.

> **Tip:** When a portlet is removed from a producer, be sure to manually delete the portlet from all application pages on which it has been placed. For more information, see Section 64.6, "Deleting Portlets from Application Pages."

To refresh a portlet producer:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to refresh, and choose **Refresh Producer Registration.**
3. In the Portlet Producer Refresh dialog, click **Yes.**

64.2.7 How to Delete a Portlet Producer

If you no longer want to use a particular producer with your application, you can delete the producer. For information about deleting portlets and relevant page variables, see Section 64.6, "Deleting Portlets from Application Pages."

> **Note:** if you delete a producer, any pages that consume portlets from that producer display an error message that the portlet is unavailable. The portlets continue to be unavailable even if you re-register the producer using the same name.

To delete a portlet producer:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to delete, and choose **Delete.**

3. In the Delete Confirmation dialog, click **Yes.**

64.3 Adding Portlets to a Page

Placing a portlet on a Framework application page is a simple matter of dragging the portlet from the Application Resources panel or Resource Palette and dropping it on the page.

This section includes the following subsections:

- Section 64.3.1, "How to Add a Portlet to a Page"
- Section 64.3.2, "What Happens When You Add a Portlet to a Page"
- Section 64.3.3, "What Happens at Runtime"

Before You Begin

Before you can place a portlet on a page, there are a few preparatory steps you must perform before you can take this simple action. These include:

1. Creating a Framework application. For more information, see Section 5.2.1, "How to Create a Framework Application."
2. Creating an application page. For more information, see Section 5.3, "Adding Pages to a Portal."
3. Registering the portlet's producer with the application. For more information, see Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application."
4. Some of the portlets you plan to consume may come from applications that handle their own authentication. In such cases, you must register the application as an external application and identify it to the portlet producer that provides it. For more information, see Chapter 69, "Securing Your WebCenter Portal: Framework Application."
5. Some of the portlets you plan to consume may come from producers that are Secure Sockets Layer (SSL) enabled. When you try to access an SSL-enabled producer, you may be presented with a Security Alert dialog, prompting you to view the producer's certificate and add it to the list of trusted certificates. The Security Alert dialog displays only if the producer uses a security certificate issued by a certificate authority that is not widely accepted. To consume portlets from such a producer, you must first add the producer's security certificate to the keystore. For more information, see Section 69.14, "Registering Custom Certificates with the Keystore."

64.3.1 How to Add a Portlet to a Page

You can add a portlet to a page by dragging and dropping it from the Application Resources panel of the Application Navigator or from the Resource Palette.

To add a portlet to a page:

1. In the Application Navigator, open the application that contains the page (`.jspx` file) to which you want to add the portlet.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

Tip: You can also double-click the page to open it.

4. Under the **Connections** node in the Application Resources panel of the Application Navigator, or in the Resource Palette:
   - If the producer is a WSRP producer, expand the **WSRP Producer** node.
   - If the producer is a PDK-Java producer, expand the **Oracle PDK-Java Producer** node.
5. Expand the node for the portlet producer that contains the portlet to add to the page.

   Under the selected producer, all portlets contained by that producer are listed.
6. Drag the portlet from the producer node directly onto the page.

   You should drag the portlet onto a form on the page. If you do not, a dialog displays prompting you to create a form to contain the portlet. Select:
   - **ADF Faces - Form** if the page contains rich client components. This adds an `af:form` component to the page.
   - **JSF HTML - Form** if the page contains HTML components (for example, if it is an upgraded 10.1.3.2 page). This adds an `h:form` or `tr:form` component to the page, depending on the surrounding document tag.

   Do not select **HTML - Form** as this is not valid for portlets.

Note: You can include any Oracle ADF Faces component or task flow as a child component of a `Show Detail Frame` component. However, portlets contain headers similar to those provided by the `Show Detail Frame` component and can be added to a `Panel Customizable` component directly. There are no additional benefits to including portlets in `Show Detail Frame` components.

Note: If you are adding a PeopleSoft portlet to a page in a Framework application, you must set the `renderPortletInIFrame` portlet tag attribute to `true`.

For more information, see Section 64.4, "Setting Attribute Values for the Portlet Tag."

64.3.2 What Happens When You Add a Portlet to a Page

When you add a portlet to a page, a portlet tag (`adfp:portlet` or `adfph:portlet`) is added to the page source. This is the tag that represents the portlet component. This tag includes attributes that you can edit using the Property Inspector, or in the page source, to further control the behavior and appearance of the portlet. For information about these attributes, see Section 64.4, "Setting Attribute Values for the Portlet Tag."

The type of portlet tag used is determined by the following:

- If the project is configured for rich client components alone, the `adfp:portlet` tag is used.
- If the project is configured for Trinidad components alone, the `adfph:portlet` tag is used.
- If the project is configured for both rich client and Trinidad components, a dialog displays where you can choose which portlet tag to use.

- If the project is not configured for rich client or Trinidad components, the `adfp:portlet` tag is used and the project is automatically configured for rich client components.

This is so that the look and feel of the portlet matches that of other components on the page. For example, if you created your page as described in Section 5.3, "Adding Pages to a Portal," the page is a rich client page. In this case, the portlet is added using the `adfp:portlet` tag.

Example 64–1 A Rich Client Page Containing a Portlet

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.0"
          xmlns:h="http://java.sun.com/jsf/html"
          xmlns:f="http://java.sun.com/jsf/core"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
          xmlns:adfp="http://xmlns.oracle.com/adf/faces/portlet">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <af:document>
      <af:form>
        <adfp:portlet value="#{bindings.Portlet11_1}"
                      id="portlet1"
                      renderPortletInIFrame="true"/>
      </af:form>
    </af:document>
  </f:view>
</jsp:root>
```

If you are working with an upgraded 10.1.3.2 application or an application that contains Trinidad components, the application uses HTML components, rather than rich client components. In this case, when you drag a portlet onto a page, the `adfph:portlet` tag is used.

Example 64–2 A Trinidad Page Containing a Portlet

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.0"
          xmlns:h="http://java.sun.com/jsf/html"
          xmlns:f="http://java.sun.com/jsf/core"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
          xmlns:tr="http://myfaces.apache.org/trinidad"
          xmlns:adfph="http://xmlns.oracle.com/adf/faces/portlet/html">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <tr:document title="Title 1">
      <tr:form>
        <adfph:portlet value="#{bindings.Portlet12_1}"
                       id="portlet1"/>
      </tr:form>
    </tr:document>
  </f:view>
</jsp:root>
```

If the application page includes one or more Composer components, this may influence where the portlet is placed. For example, in the Structure panel, a portlet placed on a page with a `cust:panelCustomizable` tag, would be placed as illustrated in Example 64–3:

Example 64–3 Hierarchical Placement of the Portlet Tag

```
af:document
  af:form
    cust:panelCustomizable
       adfp:portlet
```

> **Note:** We recommend that you do not mix ADF Faces rich client components with HTML or Trinidad components on the same page. Doing so may produce unexpected results at runtime. Therefore, do not place a rich client portlet inside a Composer HTML component or an HTML portlet inside a Composer rich client component.

For information about Composer tags, see Chapter 20, "Enabling Runtime Editing of Pages Using Composer."

> **Note:** When you drop an instance of OmniPortlet onto your page, open the Property Inspector and ensure that the **AllModesSharedScreen**, under the Display Mode category, is set to `false`, the default value. Setting this property to `true` may prevent you from editing certain sections of your OmniPortlet in the OmniPortlet wizard.

When you add a portlet to a page, a portlet binding is added to the page definition file. This portlet binding includes attributes that specify whether the portlet should automatically listen for parameter changes and events (Example 64–4).

Example 64–4 Portlet Binding

```
<portlet id="LotteryPortlet2_1"
         portletInstance="oracle/adf/portlet/SamplePortlets/ap/Ei7default_03ba18be_012d_1000_8002_
0ae8827e9493"
         class="oracle.adf.model.portlet.binding.PortletBinding"
         retainPortletHeaders="false"
         listenForAutoDeliveredPortletEvents="true"
         listenForAutoDeliveredParameterChanges="true"
         xmlns="http://xmlns.oracle.com/portlet/bindings"/>
```

Setting these attributes to `true` (the default) means that any parameters or events raised that match those supported by the portlet (or that match an alias for one of the supported parameters or events) automatically cause the portlet to be updated accordingly. You can set these attributes to `false` to disable this automatic parameter and event listening off. For example, your page might contain multiple instances of the same portlet that require values to come from different sources. If you disable automatic parameter and event listening, you must manually configure the portlet wiring.

64.3.3 What Happens at Runtime

Once you place a portlet on a page, right-click the page and choose **Run.** This displays the page and runs the portlet in your default browser using JDeveloper's Integrated WLS. Different portlets may require additional runtime configuration. Notably, the content of an OmniPortlet or Web Clipping portlet instance is defined at runtime. For more information about OmniPortlet, see Chapter 65, "Creating Portlets with OmniPortlet." For more information about the Web Clipping portlet, see Chapter 66,

"Creating Content-Based Portlets with Web Clipping." For more information about portlets generally, see Chapter 58, "Overview of Portlets."

When running a portlet that has an Edit mode (in a Framework application, this renders as a Personalize icon (pencil icon) in the portlet header), the Personalize icon displays only to authenticated users (that is, users who have logged in). Anonymous or public users do not see the option to personalize the portlet. Some form of security must be implemented for the portlet-consuming application before users can personalize their view of a portlet. If you are a developer creating portlets and pages, you may want to test your portlet's Edit mode without creating a complete security model for your application. For information about how to add security to enable testing of a portlet's Edit mode, see Section 69.12, "Configuring Basic Authentication for Testing Portlet Personalization."

Note: To be able to add portlets to your page at runtime, you must add at least one portlet to that page at design time. Adding a portlet at design time ensures that the following is added to the `<definitionFactories>` element of the `DataBindings.cpx` file:

```
<factory nameSpace="http://xmlns.oracle.com/portlet/bindings"
className="oracle.adf.model.portlet.binding.PortletBindingDefFactor
yImpl"/>
<dtfactory
className="oracle.adfdtinternal.view.faces.portlet.PortletDefinitio
nDTFactory"/>
```

This entry is required to enable consumption of portlets at runtime.

If a portlet supports parameters or events and the automatic parameter and event listening is enabled, any changes to the supported parameters and events (or to parameters and events that are aliased) automatically update the portlet.

When running a portlet from a producer associated with an external application, a link to update login information is displayed. Clicking the link displays a credential provisioning page for entering external application credentials. After specifying valid credentials the portlet displays content appropriately. For more information about external applications, see Section 69.13, "Working with External Applications."

64.4 Setting Attribute Values for the Portlet Tag

In the source code view of a page, each portlet is represented by an `adfp:portlet` tag (or `adfph:portlet` tag), which includes a set of required and optional attributes. Required attributes, `value` and `portletType`, are provided automatically by the framework, and must not be altered. Optional attribute values are relevant when support for the attribute is built into the portlet. For example, you can set `isAboutModeAvailable` to `true`, but if no About mode has been defined for the portlet, then the attribute setting does not affect the portlet.

Portlets also support a set of style-related attributes, which are discussed more fully in Section 22.10, "Applying Styles to Components."

The portlet tag uses many attributes, which you can set at design time either through the JDeveloper Property Inspector or in the source code as attributes of the tag.

This section includes the following subsections:

- Section 64.4.1, "How to Set Attribute Values for the Portlet Tag Using the Property Inspector"
- Section 64.4.2, "How to Set Attribute Values for the Portlet Tag in Source Code"
- Section 64.4.3, "Common Attributes of the Portlet Tag"
- Section 64.4.4, "Appearance Attributes of the Portlet Tag"
- Section 64.4.5, "Behavior Attributes of the Portlet Tag"
- Section 64.4.6, "Portlet Modes Attributes of the Portlet Tag"
- Section 64.4.7, "Style Attributes of the Portlet Tag"
- Section 64.4.8, "Binding Attributes of the Portlet Tag"
- Section 64.4.9, "Customization Attributes of the Portlet Tag"
- Section 64.4.10, "Other Attributes of the Portlet Tag"
- Section 64.4.11, "What You May Need to Know About Maximize, Minimize, Restore, and Move"
- Section 64.4.12, "What You May Need to Know About IFRAMEs"

64.4.1 How to Set Attribute Values for the Portlet Tag Using the Property Inspector

The Property Inspector provides a quick and easy way to set attribute values for the portlet tag without having to edit the source code yourself.

To set attribute values for the portlet tag using the Property Inspector:

1. In the Application Navigator, open the application that contains the page on which the portlet appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

   Tip: You can also double-click the page to open it.

4. In the design view, select the portlet whose attributes you want to set.
5. In the Property Inspector, click the appropriate tab and set the desired attribute.

   Repeat this step as often as required.
6. Save your changes.
7. To test the changes you have made, right-click the page and choose **Run.**

64.4.2 How to Set Attribute Values for the Portlet Tag in Source Code

If you prefer working in source code, you can set attribute values for the portlet tag directly there.

To set attribute values for the portlet tag in source code:

1. In the Application Navigator, open the application that contains the page on which the portlet appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

   Tip: You can also double-click the page to open it.

4. In the design view, select the portlet whose attributes you want to set.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Make your changes directly to the source code. Example 64–5 shows an edited portlet tag.

Example 64–5 An Edited Portlet Tag

```
<adfp:portlet value="#{bindings.portlet1}"
              portletTypes="/oracle/adf/portlet/WsrpPortletProducer1/applicationPortlets/
                            E0default_b452f828_010a_1000_8002_82235f57eaa8"
              allModesSharedScreen="true"
              isMaximizable="true"
              isMinimizable="true"/>
```

7. Save your changes.
8. To test the changes you have made, right-click the page and choose **Run.**

64.4.3 Common Attributes of the Portlet Tag

Table 64–1 describes the common attributes of the portlet tag.

Table 64–1 Common Attributes of the Portlet Tag

Attribute	Value	Description
`id`	Text string. For example: `id="newsBrief"` The value must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Z a-z) or an underscore (_). ■ Subsequent characters must be ASCII letter or digits (a-Z a-z 0-9), underscores (_), or dashes (-).	The unique identifier of the portlet. This attribute is populated with a unique value by default when you add the portlet to a page.
`title`	Text string. For example: `title="Announcements"`	The portlet title, which is displayed in the portlet header. The value specified here takes precedence over any title specified elsewhere (for example, in the portlet markup). If no value is specified here, the portlet extracts its title from the portlet markup (response). If no value is specified either here or in the portlet markup, the portlet extracts its title from the portlet definition. **Note:** Supplying a value to the `title` attribute at design time means that any change made to the title at runtime in Edit or Edit Defaults mode is ignored.

`width`	Number expressed in pixels or as a percentage of available area:
	■ For pixels, enter *n*px, for example:
	`width = 300px`
	■ For percentage, enter *n*%, for example:
	`width = 50%`
		The width of the area to allow for portlet display.
		If the actual portlet width is larger than the `width` value entered here, a scrollbar appears, provided `displayScrollBar` is set to `auto` or `true`. If `displayScrollBar` is set to `false`, and the actual portlet width exceeds the value expressed for the `width` attribute, the `width` attribute value is considered and the portlet content is truncated.

Table 64–1 (Cont.) Common Attributes of the Portlet Tag

Attribute	Value	Description
`height`	Number expressed in pixels, for example: `height = 300px`	The height of the area to allow for portlet display. If the actual portlet height is larger than the `height` value entered here, a scrollbar appears, provided `displayScrollBar` is set to `auto` or `true`. If `displayScrollBar` is set to `false`, and the actual portlet height exceeds the value expressed for the `height` attribute, the `height` attribute value is considered and the portlet content is truncated.
`icon`	URI to an image. For example: `icon="coffee.png"` In the Property Inspector, click the Property Menu icon next to the field and then choose **Edit** to locate and select the required image. The value must be an absolute URI or a URI that is resolvable relative to the current page or the application context root. The URI provided in the preceding example is stored at the application context root, therefore a full path is not required.	A URI specifying the location of an image to use as an icon, displayed to the left of the portlet title in the portlet header. You can use the icon to indicate the portlet's purpose, to reinforce branding, as a content indicator, or for some other reason.
`partialTriggers`	One or more component IDs. For example: `partialTriggers="_id1 _id2 componentID5"` Separate component IDs with spaces.	The IDs of the components that trigger a partial update. The portlet listens on the specified trigger components. If a trigger component receives a trigger event that causes it to update in some way, this portlet also requests to be updated.

64.4.4 Appearance Attributes of the Portlet Tag

Table 64–2 describes the appearance attributes of the portlet tag.

Table 64–2 Appearance Attributes of the Portlet Tag

Attribute	Value	Description

`expansionMode`	`minimized`
	`normal`
	Default: `normal`
		The default state of the portlet:
		▪ `minimized`—The portlet's default display mode is collapsed (minimized).
		▪ `normal`—The portlet's default display made is neither collapsed nor expanded to the width of the page.

`allModesSharedScreen`	`auto`
	`false`
	`true`
	Default: `auto`
		Whether a change in portlet mode renders the new mode on a new page, rather than the page on which the portlet resides.
		▪ `auto`—All portlet modes are displayed inline if the remote portlet is configured, through the `com.oracle.portlet.requireIFrame` container runtime option in its `portlet.xml` file, to require an inline frame (IFRAME). This ensures that Oracle Bridge portlets are displayed inline.
		▪ `false`—All portlet modes, except View (JSR 286) or Show (PDK-Java), are rendered each on their own page. This is useful for portlets such as OmniPortlet and the Web Clipping portlet, which require that modes other than Show mode display on pages other than the page on which the portlet resides.
		▪ `true`—All portlet modes are displayed inline. One mode is swapped out for another on the same page. In other words, this attribute enables all portlet modes to display without leaving the context of a given page.

`renderPortletInIFrame`	`auto`
	`false`
	`true`
	Default: `auto`
		Whether the portlet is rendered in an IFRAME:
		▪ `auto`—Whenever possible, the portlet consumer attempts to rewrite the portlet markup so that it renders correctly in an ADF page. Otherwise, the portlet is rendered in an IFRAME.
		▪ `false`—The portlet is never rendered in an IFRAME.
		▪ `true`—The portlet is always rendered in an IFRAME.
		For more information, see Section 64.4.12, "What You May Need to Know About IFRAMEs."

`displayScrollBar`	`auto`
	`false`
	`true`
	Default: `auto`
		Whether a scroll bar is displayed:
		▪ `auto`—Render a scroll bar if the portlet content does not fit the `width` and `height` specified.
		▪ `false`—Never render a scroll bar. If the portlet content does not fit the `height` and `width` specified, the portlet renders in its actual size.
		▪ `true`—Always render a scroll bar.

Table 64–2 (Cont.) Appearance Attributes of the Portlet Tag

Attribute	Value	Description
displayHeader	false true Default: true	Whether the portlet header is displayed: ■ false—The portlet header is not displayed. Icons and links normally displayed in the header are hidden. If isSeededInteractionAvailable is set to true, users can access portlet menus and icons by rolling the mouse over the portlet. A fade-in/fade-out toolbar appears, from which users can select Actions menu options. ■ true—The portlet header is displayed. Consequently, header-based icons and links are displayed.
displayShadow	false true Default: true	Whether to display a shadow decoration around the portlet: ■ false—Do not display a shadow decoration. ■ true—Display a shadow decoration.
rendered	false true Default: true	Whether the portlet is rendered. ■ false—Do not render the portlet. No output is rendered. ■ true—Render the portlet. This is the recommended setting. Setting this attribute to false causes problems when you run the page.
background	dark light medium Default: medium	The style selector to apply to the skin used by the portlet: ■ dark—Apply the dark style selector to the skin. ■ light—Apply the light style selector to the skin. ■ medium—Apply the medium style selector to the skin. This provides a way for you to apply a different look and feel to each portlet on an page.
shortDesc	Text string. For example: shortDesc="Portlet for entering display text in place."	A short description of the portlet.
displayActions	always onHover Default: always	Whether seeded interactions for the portlet are shown: ■ always—Always show seeded interactions. ■ onHover—Show seeded interactions when users move the mouse over the portlet.

Table 64–2 (Cont.) Appearance Attributes of the Portlet Tag

Attribute	Value	Description
showMoveAction	menu none Default: menu	Whether to display the **Move** command in the portlet's **Action** menu: ■ menu—Display the **Move** command on the portlet's **Action** menu. ■ none—Do not display the **Move** command. There is a difference in the way that the **Move** command behaves at design time and at runtime. For more information, see Section 64.4.11, "What You May Need to Know About Maximize, Minimize, Restore, and Move."
showRemoveAction	menu none Default: menu	Whether to display the Remove icon on the portlet chrome: ■ menu—Display the **Remove** command on the portlet's **Action** menu. ■ none—Do not display the Remove icon. There is a difference in the way that the Remove icon behaves at design time and at runtime. For more information, see Section 64.4.11, "What You May Need to Know About Maximize, Minimize, Restore, and Move." **Note:** This attribute is available only for the adfp:portlet tag and not for the adfph:portlet tag.
showResizer	always never Default: always	Whether to display the resize handle at the bottom right corner of the portlet. ■ always—Always display the resize handle. ■ never—Never display the resize handle. **Note:** This attribute is available only for the adfp:portlet tag and not for the adfph:portlet tag.
showMinimizeAction	chrome none Default: chrome	Whether to display the Minimize icon on the portlet chrome: ■ chrome—Display the Minimize icon on the portlet chrome. ■ none—Do not display the Minimize icon. There is a difference in the way that the Minimize icon behaves at design time and at runtime. For more information, see Section 64.4.11, "What You May Need to Know About Maximize, Minimize, Restore, and Move."

64.4.5 Behavior Attributes of the Portlet Tag

Table 64–3 describes the behavior attributes of the portlet tag.

Table 64–3 Behavior Attributes of Portlet Tag

Attribute	Value	Description
`partialTriggers`	One or more component IDs. For example: `partialTriggers="_id1 _id2 componentID5"` Separate component IDs with spaces.	The IDs of the components that trigger a partial update. The portlet listens on the specified trigger components. If a trigger component receives a trigger event that causes it to update in some way, this portlet also requests to be updated.

`submitUrlParamters`	`false`
	`true`
	Default: `false`
		Whether parameters in portlet links that point to the page on which the portlet is placed are made available to the page:
		▪ `false`—Parameters are not made available to the page. Rather, they are available only inside the portlet initiating the request.
		▪ `true`—Parameters available on the container page.

64.4.6 Portlet Modes Attributes of the Portlet Tag

Portlet Modes attributes control the rendering of mode-switching UI actions, such as entering edit mode. The ability to render a portlet in a particular mode depends on the modes supported by the portlet and the user authorization. For example, if the `isCustomizeModeAvailable` attribute is set to `true`, but the action is not supported in the portlet, then the attribute setting does not affect the portlet.

Portlet Modes attributes, described in Table 64–4, are value binding expressions that evaluate to `true` or `false`:

- `true` means the portlet is allowed to render in the named mode.
- `false` means the portlet is not allowed to render in the named mode.

Table 64–4 Portlet Modes Attributes of the Portlet Tag

Attribute	Value	Description

`isAboutModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render an **About** command on the portlet's **Actions** menu.
		Users choose **About** to invoke the portlet's About mode.

`isConfigModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Configure** command on a JSR 286 portlet's **Actions** menu.
		Users choose **Configure** to open the portlet's Configuration settings.

`isCustomizeModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Customize** icon in the portlet header.
		Site administrators choose **Customize** to edit a portlet's default personalization data.

`isDetailModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Details** command on a PDK-Java portlet's **Actions** menu.
		Users choose **Details** to open the portlet in Full Screen mode.

Table 64–4 (Cont.) Portlet Modes Attributes of the Portlet Tag

Attribute	Value	Description

`isHelpModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Help** command on the portlet's **Actions** menu.
		Users choose **Help** to open the portlet's Help page.

`isPrintModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Print** command on a JSR 286 portlet's **Actions** menu.
		Users choose **Print** to displays a printer-friendly version of the portlet.

`isNormalModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Refresh** command on the portlet's **Actions** menu.
		Users choose **Refresh** to redraw the portlet independent of any other content on the page (also known as a partial-page refresh).

`isPersonalizeModeAvailable`	`false`
	`true`
	Default: `true`
		Whether to render a **Personalize** icon in the portlet header.
		Users choose **Personalize** to alter their personal view of the portlet. This mode is equivalent to the Edit mode selection in the Standards-based Java Portlet (JSR286) Wizard.
		The **Personalize** icon displays only to authenticated users (that is, users who are logged in). It does not display to public or unauthenticated users. You must implement some form of application security for users to be able to personalize their portlet views.
		If you are a developer creating portlets, and you want to test the Personalize mode without creating a complete security model for your application, then see Section 69.12, "Configuring Basic Authentication for Testing Portlet Personalization."
		Note: A typical personalization setting is Portlet Title. You can set Portlet Title at design time, by providing a value for the `title` attribute. Consider however that supplying a value to the `title` attribute at design time prevents personalization and customization of the portlet title at runtime.

`isPreviewModeAvailable`	`false`
	`true`
	Default: `false`
		Whether to enable previewing of portlet content.
		This mode has no particular application in Framework applications, but it is used in Oracle Portal's Portlet Repository, where it renders as a magnifying glass icon, which users click to preview a portlet.

64.4.7 Style Attributes of the Portlet Tag

Table 64–5 describes the style attributes of the portlet tag.

Table 64–5 Style Attributes of the Portlet Tag

Attribute	Value	Description
`contentStyle`	One or more CSS styles. These should be in compliance with, at least, CSS 2.0 and take the following format: `contentStyle="color:rgb(255,0,255); font-family:Arial Helvetica Geneva sans-serif;font-size:large;"`	The CSS style to apply to the portlet content. Values entered here take precedence over styles specified in the `inlineStyle` attribute and those included in a CSS or skin on the specific portlet instance. For more information, see Understanding contentStyle and inlineStyle Properties.
`inlineStyle`	One or more CSS styles. These should be in compliance with, at least, CSS 2.0 and take the following format: `inlineStyle="color:rgb(255,0,255); font-family:Arial Helvetica Geneva sans-serif;font-size:large;"`	The CSS style to apply to the whole portlet. Values entered here take precedence over styles included in a CSS or skin on the specific portlet instance. For more information, see Understanding contentStyle and inlineStyle Properties.

64.4.8 Binding Attributes of the Portlet Tag

Table 64–6 describes the binding attributes of the portlet tag.

Table 64–6 Binding Attributes of the Portlet Tag

Attribute	Value	Description
`binding`	Name of a managed bean. For example: `binding="#{frameActionsBean.Binding}"` In the Property Inspector, click the Property Menu icon next to the field and then choose **Edit** to select a managed bean and specify the relevant managed bean property.	A binding reference to store the component instance. The binding reference binds an instance of the portlet to a managed bean property. Managed beans are any JavaBeans used by the application that are registered in the JSF `faces-config.xml` file.

64.4.9 Customization Attributes of the Portlet Tag

Table 64–7 describes the customization attributes of the portlet tag.

Table 64–7 Customization Attributes of the Portlet Tag

Attribute	Value	Description

`customizationAllowed`	`false`
	`true`
	Default: `true`
		Whether design time customizations of the portlet tag are allowed on this portlet.

`customizationAllowedBy`	Text string	The roles for which design time customizations are allowed. This attribute enables you to allow customizations, but restrict who can actually perform them.

64.4.10 Other Attributes of the Portlet Tag

Table 64–8 describes the other attributes of the portlet tag.

Table 64–8 Other Attributes of the Portlet Tag

Attribute	Value	Description
iframeDtd	loose none strict Default: loose	Which DTD, if any, is specified in the doctype declaration that is created when portlet content is rendered inside a IFRAME: ■ none—No DTD is specified. This relaxes the restrictions on the HTML content being technically conformant HTML. Browsers usually handle such HTML acceptably, however, because some CSS style sheet from the ADF Faces page consuming the portlet is also imported into the IFRAME document, for that style sheet to work correctly, it may be necessary to declare the content conformant to the loose or strict DTDs. ■ loose—The DTD http://www.w3.org/TR/html/loose.dtd is used. ■ strict—The DTD http://www.w3.org/TR/html/strict.dtd is used

64.4.11 What You May Need to Know About Maximize, Minimize, Restore, and Move

To accommodate the needs of the development environment, the behavior of the actions Minimize, Maximize, Restore, and Move for `Show Detail Frame` and `portlet` components differs between design time and runtime. At design time, these actions persist in a given WLS session, but do not persist over sessions (*session* means the time between starting and stopping WLS). At runtime, these actions persist both during a given WLS session and across sessions.

This difference has been introduced to enable an automatic reset of an application page at design time.

If persisting across sessions is not required at runtime, then a simple modification to the application's `web.xml` file can turn it off. Go to the following parameter setting in the application's `web.xml` file (Example 64–6):

Example 64–6 Persistence Setting in the Application's web.xml File

```
<context-param>
   <param-name>oracle.adf.view.faces.CHANGE_PERSISTENCE</param-name>
   <param-value>oracle.adfinternal.view.faces.change.HybridChangeManager</param-va
lue>
</context-param>
```

Replace it with the following (Example 64–7):

Example 64–7 Turning Runtime Persistence Off in the Application's web.xml File

```
<context-param>
   <param-name>oracle.adf.view.faces.CHANGE_PERSISTENCE</param-name>
   <param-value>oracle.adf.view.faces.change.SessionChangeManager</param-value>
</context-param>
```

If security has been implemented on the application, then the Minimize, Maximize, Restore, and Move actions display only to users with Customize privileges. They do

not display to users with Personalize privileges. Customize users can test the effect of these actions by following these steps at design time:

1. Run the application page using JDeveloper's Integrated WLS.
2. Log in as the administrator.
3. Maximize a portlet. Move portlets around. Make whatever changes you want using the relevant actions commands.
4. Log out, then log in as a user and check the effects of your actions.

64.4.12 What You May Need to Know About IFRAMEs

Rendering a portlet directly on a page provides a better user experience as compared to placing it in an inline frame, or IFRAME. However, at times, it may be required to include the portlet markup inside an IFRAME. You can use the `renderPortletInIFrame` attribute to determine whether or not a portlet should be rendered in an IFRAME.

The default setting of the `renderPortletInIFrame` attribute is `auto`. This causes the portlet consumer to attempt to rewrite the portlet markup whenever possible, so that it renders correctly within the Oracle ADF page without the need for an IFRAME.

However, in the following circumstances, the portlet is rendered within an IFRAME:

- The parser throws an exception as it is not able to parse the markup.
- The portlet code contains a multi-part form post.
- The portlet code contains a file upload element.
- The portlet developer explicitly requested that the portlet be rendered in an IFRAME by setting the `com.oracle.portlet.requireIFrame` container runtime option in the `portlet.xml` file to `true`.

> **Note:** Portlets created using the Oracle JSF Portlet Bridge have the `requireIFrame` container runtime option set to `true` as these portlets are too complex to render directly on Oracle ADF pages due to JavaScript issues.

In some circumstances, the portlet consumer may be unable to rewrite the portlet markup and JavaScript to accommodate the portlet in the Oracle ADF page. If this is the case, you may find that the portlet does not behave as expected, for example, buttons do nothing or you get JavaScript errors in the console. If this happens, you should set the `renderPortletInIFrame` attribute to `true` so that the portlet is always rendered in an IFRAME.

Some examples of when you should set `renderPortletInIFrame` to `true` are when:

- The portlet code builds up element names dynamically in JavaScript.
- The portlet code uses multiple forms and references them in JavaScript by index.
- JavaScript library code references elements within the portlet.

> **Note:** If you render a portlet within an IFRAME, then manipulating `window.location` may give unexpected results. If your portlet uses `window.location`, then you should ensure that your JavaScript is robust enough to handle the case where the portlet renders itself inside an IFRAME.

If you want to ensure that a portlet is never rendered in an IFRAME, for example for accessibility reasons, set the `renderPortletInIFrame` attribute to `false`. Note however, that HTML markup from a portlet that is not rendered in an IFRAME may interfere with other components on the Oracle ADF page.

For more information about the accessibility implications of using IFRAMEs, see Section 2.9, "Overview of WebCenter Accessibility Features."

64.5 Copying Portlets

When you copy portlets, the portlets and their copies must reside within the same application. For example, you can copy a portlet from one page in an application to another page in the same project in that application, or from one place on a page to another place on the same page. You can also copy a portlet from one project to another project in the same application, if the target project is configured for consuming portlets. The copies are references to the same portlet instance, so customizations or personalizations made to any instance of the portlet (original or copy) affect all the other instances.

Copying a portlet is more than a matter of copying and pasting the portlet view tag. It involves copying portlet-related entries from the application page's source. It may also involve copying portlet-related entries from the page definition file and removing duplicate portlet binding information or creating a new method in the copied portlet's binding bean.

When a portlet is copied, the target page must be an Oracle ADF Faces page. Any preexisting code on the target page must reflect that. This is quite easy to accomplish. When JDeveloper creates a new JSF page, it contains pure JSF tags. The first time you drop an Oracle ADF Faces component onto the page, tags are automatically updated to be Oracle ADF Faces tags. For example, an `<html>` tag becomes `<afh:html>`, `<head>` and `<title="title">` tags become `<afh:head title="title">`, and so on. Therefore, a simple way to ensure the conversion of the target page to an Oracle ADF Faces page is to place any Oracle ADF Faces component on the target page. This performs any required code conversion for you automatically.

This section includes the following subsections:

- Section 64.5.1, "How to Copy a Portlet and Place it on the Same Page"
- Section 64.5.2, "How to Copy a Portlet from One Application Page to Another"

64.5.1 How to Copy a Portlet and Place it on the Same Page

Because all of the page's resources are available to both portlet instances when you copy a portlet to the same page, there is no requirement to copy portlet-related information from the page's Page Definition file. It is just a matter of copying and pasting the portlet's view tag, and assigning a unique identifier to the copy.

To copy and place a portlet on the same page:

1. In the Application Navigator, open the application that contains the page on which the portlet to copy appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

   Tip: You can also double-click the page to open it.

4. In the design view, select the portlet to copy.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Copy the portlet tag (Example 64–8).

Example 64–8 Code Fragment to be Copied When Copying a Portlet

```
<f:view>
   <afh:html binding="#{backing_portlet_page.html1}" id="html1">
      <afh:head title="portlet_page" binding="#{backing_portlet_page.head1}"
         id="head1">
         <meta http-equiv="Content-Type"
            content="text/html;charset=windows-1252"/>
      </afh:head>
      <afh:body binding="#{backing_portlet_page.body1}" id="body1">
         <h:form binding="#{backing_portlet_page.form1}" id="form1">
            <adfp:portlet value="#{bindings.portlet1}"
               portletType="/oracle/adf/portlet/
               pdksampleproducer_1153245807295/applicationPortlets/
               Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
               binding="#{backing_portlet_page.portlet1}"
               id="portlet1"
               isCustomModesAvailable="true"/>
         </h:form>
      </afh:body>
   </afh:html>
</f:view>
```

7. Paste the copied code fragment into the desired location of the page source.
8. Provide a unique value for the copy's `id` attribute (Example 64–9).

Example 64–9 Changing the Portlet ID

```
<adfp:portlet value="#{bindings.portlet1}"
   portletType="/oracle/adf/portlet/
   pdksampleproducer_1153245807295/applicationPortlets/
   Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
   binding="#{backing_portlet_page.portlet1}"
   id="portlet2"
   isCustomModesAvailable="true"/>
```

Note: On a given page, each portlet must have a unique ID.

9. In the page source, if the copied portlet's `adfp:portlet` tag has a binding attribute, for example:

   ```
   binding="#{backing_untitled2.portlet1}"
   ```

Then either remove this binding, or create a new method in the binding bean by opening the managed bean class for this managed bean and defining the new method.

For example, if portlet1 is copied, the pasted copy becomes portet2 in the managed bean class, as shown in Example 64–10.

Example 64–10 Creating a New Method for a Managed Bean in the Managed Bean Class

```
.
private PortletBase portlet2;
public void setPortlet2(PortletBase portet2)  {
     this.portlet2 = portlet2;
}
.
public PortletBase getPortlet2()  {
     return portlet2;
}
```

10. From the main menu, choose **File > Save All.**

64.5.2 How to Copy a Portlet from One Application Page to Another

When you copy a portlet from one page to another in an application, portlet-related code must also be copied from the source page's Page Definition file. This section describes the steps related to both copying from one application page to another and from one application project to another.

To copy a portlet from one page to another:

1. In the Application Navigator, open the application that contains the page on which the portlet to copy appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

   Tip: You can also double-click the page to open it.

4. In the design view, select the portlet to copy.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Copy the portlet tag (Example 64–11).

Example 64–11 Source Page Code Fragment to Be Copied When Copying a Portlet

```
<f:view>
   <afh:html binding="#{backing_portlet_page.html1}" id="html1">
      <afh:head title="portlet_page" binding="#{backing_portlet_page.head1}"
         id="head1">
         <meta http-equiv="Content-Type"
            content="text/html;charset=windows-1252"/>
      </afh:head>
      <afh:body binding="#{backing_portlet_page.body1}" id="body1">
         <h:form binding="#{backing_portlet_page.form1}" id="form1">
            <adfp:portlet value="#{bindings.portlet1}"
               portletType="/oracle/adf/portlet/
               pdksampleproducer_1153245807295/applicationPortlets/
               Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
```

```
                binding="#{backing_portlet_page.portlet1}"
                id="portlet1"
                isCustomModesAvailable="true"/>
          </h:form>
       </afh:body>
    </afh:html>
</f:view>
```

7. Go to the application page to which to copy the portlet (the target page).

   Portlets can reside only on Oracle ADF Faces pages. If the target page does not contain Oracle ADF Faces components, then ensure that the container objects—that is, any tags the portlet tag is nested in—use Oracle ADF tags.

   If you are copying the portlet to a page in a different project, the target project must be configured for consuming portlets. To configure the project, you must register a portlet producer with the project. For information, see Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application."

8. Click the **Source** tab and paste the copied code fragment into the desired location of the page source.

9. In the Application Navigator, right-click the source page (the page from which the portlet was copied), and choose **Go to Page Definition.**

10. Click the **Source** tab and copy the portlet binding from the source page's page definition file (Example 64–12).

Example 64–12 Code Fragment to Be Copied From a Page Definition File

```
<portlet id="portlet1"
  portletInstance="/oracle/adf/portlet/pdksampleproducer_
1153245/applicationPortlets/Portlet2_82d49_010c_1000_8006_82235"
  class="oracle.adf.model.portlet.binding.PortletBinding"
  xmlns="http://xmlns.oracle.com/portlet/bindings"/>
```

> **Note:** When the portlet being copied includes parameters, be sure to include the copied portlet's portlet parameters and the page variables linked to the portlet parameters in the copy.

11. In the Application Navigator, right-click the target page and choose **Go to Page Definition.**

    If a page definition does not exist for the page, you are asked if you want to create one. Click **Yes.**

12. Click the **Source** tab and paste the portlet binding you copied from the source (along with relevant portlet parameters and the page variables associated with those parameters).

    Paste the code between the `<executables>` tags. You may need to add a closing `</executables>` tag and ensure that the opening tag does not contain a slash (`/`).

13. From the main menu, choose **File > Save All.**

64.6 Deleting Portlets from Application Pages

When you delete a portlet from an application page, if the portlet had parameters, then you should also delete page variables associated with those parameters from the application page's Page Definition file.

To delete a portlet and its related page variables from a page:

1. In the Application Navigator, open the application that contains the page on which the portlet to delete appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open.**

   Tip: You can also double-click the page to open it.

4. In the design view, right-click the portlet to delete and choose Delete.

   This deletes the portlet from the page and the portlet binding from the Page Definition file.
5. If the portlet included variables, in the Application Navigator, right-click the page and choose **Go to Page Definition.**
6. Click the **Source** tab and locate the page variables associated with the deleted portlet, and delete them from the page definition file.

   For example, if you deleted portlet1, you would also delete the highlighted variables in Example 64–13:

Example 64–13 Deleting Portlet-Related Page Variables from a Page Definition File

```
<?xml version="1.0" encoding="UTF-8" ?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
      version="10.1.3.38.97" id="untitled1PageDef"
      Package="project1.pageDefs">
   <parameters/>
   <executables>
      <variableIterator id="variables">
            <variable Name="portlet1_param1" Type="java.lang.Object"/>
            <variable Name="portlet1_param2" Type="java.lang.Object"/>
            <variable Name="portlet2_param1" Type="java.lang.Object"/>
            <variable Name="portlet2_param2" Type="java.lang.Object"/>
      </variableIterator>
      <portlet id="portlet2" portletInstance="/oracle/adf/portlet/
            PdkPortletProducer2_1154100666247/applicationPortlets/
            Portlet1_b5e49696_010c_1000_8008_8c5707ef9c4f"
            class="oracle.adf.model.portlet.binding.PortletBinding"
            xmlns="http://xmlns.oracle.com/portlet/bindings">
         <parameters>
              <parameter name="param1" pageVariable="portlet2_param1"/>
              <parameter name="param2" pageVariable="portlet2_param2"/>
         </parameters>
      </portlet>
   </executables>
   <bindings/>
</pageDefinition>
```

7. From the main menu, choose, select **File > Save All**.

64.7 Consuming WebCenter Services Portlets

WebCenter Services Portlets is a preconfigured, out-of-the-box producer that enables you to expose WebCenter Portal service task flows in other applications as WSRP portlets or pagelets.

WebCenter Services Portlets provides the following portlets:

- Document Manager—Displays folders, files, and wikis from the WebCenter Content repository
- Blogs—Displays blog posts from a selected location in the WebCenter Content repository
- Discussion Forums—Displays all discussions and their respective replies and enables users to perform various operations based on their privileges
- Announcements—Displays all current announcements and enables users to perform various operations based on their privileges
- Lists—Displays user-created lists and provides controls for creating lists and adding list data
- Polls Manager—Enables users to perform administrative operations on polls
- Take Polls—Displays the most recently published available poll, or a specific poll identified by the pollId parameter
- Worklist—Enables users to view and take action on all tasks and notifications from one or more Oracle BPEL Server
- Mail—Displays a mail inbox
- Activity Stream—Provides an overview of the most recent activities performed by a user's connections
- Tag Cloud—Displays a tag cloud, which is a visual depiction of all the tags used on the page

You can consume WebCenter Services Portlets in the following applications:

- Oracle Portal
- Oracle WebLogic Portal
- Oracle WebCenter Interaction, using Oracle WebCenter Portal's Pagelet Producer

The WebCenter Services Portlets producer is a WSRP producer. As such, you register it with your application in the same way as you would any other WSRP producer.

Note: The WebCenter Services Portlets producer is a secured producer, so when you register the producer, you must use the same token as was used when configuring the producer in WebCenter Portal.

For information about configuring the WebCenter Services Portlets producer, see the "Configuring WebCenter Services Portlets" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- Section 64.7.1, "Consuming WebCenter Services Portlets in Oracle Portal"

- Section 64.7.2, "Consuming WebCenter Services Portlets in Oracle WebLogic Portal"
- Section 64.7.3, "Consuming WebCenter Services Portlets in Oracle WebCenter Interaction"
- Section 64.7.4, "Setting WebCenter Services Portlets Parameters"

64.7.1 Consuming WebCenter Services Portlets in Oracle Portal

To consume WebCenter Services Portlets in Oracle Portal:

1. Register the WebCenter Services Portlets WSRP producer in Oracle Portal.

   For information about how to do this, see the "Securing Access to Web Services Remote Portlets" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.

2. After registering the producer, you can then add any of the portlets provided by the producer to pages in your Oracle Portal application.

   For information about how to do this, see the "Adding a Portlet to a Page" section in the *Oracle Fusion Middleware User's Guide for Oracle Portal*.

64.7.2 Consuming WebCenter Services Portlets in Oracle WebLogic Portal

To consume WebCenter Services Portlets in Oracle WebLogic Portal:

1. Register the WebCenter Services Portlets WSRP producer in Oracle WebLogic Portal.

   For information about how to do this, see the "Adding a Producer" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

2. Add the remote portlets to the Portal Library.

   For information about how to do this, see the "Adding a Remote Portlet to the Portal Library" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

3. The WebCenter Services Portlets producer is a secured WSRP producer, so you must set up the SAML security.

   For information about how to do this, see the "SAML Security Between a WebLogic Portal Consumer and a WebCenter Framework Producer" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

4. After registering the producer and setting up the security, you can then add any of the portlets provided by the producer to pages in your Oracle WebLogic Portal application.

   For information about how to do this, see the "Adding Contents to a Page" section in the *Oracle Fusion Middleware Portal Development Guide for Oracle WebLogic Portal*.

64.7.3 Consuming WebCenter Services Portlets in Oracle WebCenter Interaction

To consume WebCenter Services Portlets in Oracle WebCenter Interaction:

1. To make WebCenter Services Portlets available in Oracle WebCenter Interaction, you must first register the producer as a pagelet producer using Oracle WebCenter Portal's Pagelet Producer.

For information about how to do this, see the "Registering WSRP Portlet Producers" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Note: You must select the same **Token Profile** that was specified when configuring WS-Security for WebCenter Services Portlets.

---

2. After creating the pagelet producer, you must then register it with Oracle WebCenter Interaction.

   For information about how to do this, see the "Creating the Oracle WebCenter Pagelet Producer Remote Server" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

   `http://download.oracle.com/docs/cd/E23010_01/wci.1033/`

3. When the pagelet producer is registered with your Oracle WebCenter Interaction application, you must then create remote pagelet web services for each of the pagelets that you want to use.

   For information about how to do this, see the "Creating or Editing a Remote Pagelet Web Service" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

   `http://download.oracle.com/docs/cd/E23010_01/wci.1033/`

4. Next, create portlets for the pagelets.

   For information about how to do this, see the "Creating or Editing a Portlet" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

   `http://download.oracle.com/docs/cd/E23010_01/wci.1033/`

5. Finally, you can add the portlets to your Oracle WebCenter Interaction community pages.

   For information about how to do this, see the "Creating a Community Page" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

   `http://download.oracle.com/docs/cd/E23010_01/wci.1033/`

64.7.4 Setting WebCenter Services Portlets Parameters

Each portlet provided by WebCenter Services Portlets defines various parameters that enable you to change the appearance or behavior of the portlet when you consume it in your application.

This section includes the following subsections:

- Section 64.7.4.1, "Common WebCenter Services Portlets Parameters"
- Section 64.7.4.2, "Document Manager Portlet Parameters"
- Section 64.7.4.3, "Discussion Forums Portlet Parameters"
- Section 64.7.4.4, "Blogs Portlet Parameters"
- Section 64.7.4.5, "Lists Portlet Parameters"
- Section 64.7.4.6, "Polls Manager Portlet Parameters"
- Section 64.7.4.7, "Take Polls Portlet Parameters"

- Section 64.7.4.8, "Worklist Portlet Parameters"
- Section 64.7.4.9, "Announcements Portlet Parameters"
- Section 64.7.4.10, "Mail Portlet Parameters"
- Section 64.7.4.11, "Activity Stream Portlet Parameters"
- Section 64.7.4.12, "Tag Cloud Portlet Parameters"

64.7.4.1 Common WebCenter Services Portlets Parameters

Table 64–9 lists the parameters that are available for all the portlets provided by WebCenter Services Portlets.

Table 64–9 Common Parameters for WebCenter Services Portlets

Parameter	Description
`width`	Specifies the width of the portlet on the consuming page. If not specified, the portlet takes up as much horizontal space as the page allows.
`height`	Specifies the height of the portlet on the consuming page. If not specified, the portlet height is determined by the portlet consumer.

64.7.4.2 Document Manager Portlet Parameters

Table 64–10 lists the additional parameters available for the Document Manager portlet.

Table 64–10 Document Manager Portlet Parameters

Parameter	Description
`connectionName`	The name of the Oracle Content Server connection used by WebCenter Services Portlets. If no value is selected, the default connection specified by the application developer or administrator is used. For information about configuring content repository connections, see the "Registering Content Repositories" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. Default: The connection selected as default in the Create Content Repository Connection dialog box by the application developer, which can be changed by the administrator.
`featuresOff`	A list of disabled features for the portlet. Use commas or spaces to separate items. Valid values are exposed in the JavaDoc: `checkin, checkout, clipboard, close, delete, download, dnd, editwiki, editoffice, newfolder, newwiki, rename, upload, multifile-upload, profile-upload, search, advancedSearch, workflow, properties, history, comments, likes, links, tags, recommendations, autovue, title, related-items, social, sidebars, ils.`  Example:  `${'search, advancedSearch, clipboard, dnd, rename, newfolder, upload, newwiki, checkin, checkout, editoffice, edithtml, delete, sidebars, history'}`

Table 64–10 (Cont.) Document Manager Portlet Parameters

Parameter	Description
`layout`	A target layout for the task flow. Select from: ■ `${'explorer'}`—(default) Displays folders and files in two panes; the left pane shows folders, and the right pane show the contents of the currently selected folder ■ `${'table'}`—Displays only the contents of the current folder in a single pane, with the capability to click a folder to drill down, refreshing the pane with the folder contents ■ `${'treeTable'}`—Displays the folder hierarchy in a single pane, beginning with the root folder, with the capability to expand and collapse folders
`pageSize`	The maximum number of rows to show in the portlet. If the listing of folders and files in the portlet is larger than the specified number of rows, the portlet displays a scroll bar. Default: `27` **Note:** If you set `pageSize` to a value that is too big for the size of the screen, the end user will experience difficulty coordinating the portlet scroll bar with the application scroll bar.
`readOnly`	Specifies whether to disable and hide all content management operations: ■ `${true}`—Disable content management ■ `${false}`—(Default) Expose content management to users
`resourceId`	The currently focused resource. This value can be a folder ID or a document ID.
`startFolderPath`	The name of the folder to use as the root folder in the current portlet instance. This is a content-scoping parameter that assists with determining the source and range of content to display in the portlet instance. You can specify an EL expression to set this value. Example: `${'/WebCenterB5/Proj_X/Specs'}`

64.7.4.3 Discussion Forums Portlet Parameters

Table 64–11 lists the additional parameters available for the Discussion Forums portlet.

Table 64–11 Discussion Forums Portlet Parameters

Parameter	Description
`categoryId`	An identifier for an existing category in WebCenter Portal's Discussion Server to which the view should be scoped. When no value is supplied, it defaults to the appropriate root category of the discussions server. (This root category ID can be overridden by supplying an additional property named application.root.category.id in the connection.) For testing purposes, you may want to create a category through the discussions server administrator interface and then reference that category identifier here.
`forumId`	An identifier for an existing forum in your discussions server for which popular topics should be fetched. If both categoryId and forumId are given, then only categoryId is honored.

Table 64–11 (Cont.) Discussion Forums Portlet Parameters

Parameter	Description
`showRecursiveForums`	Determines if the portlet shows forums either in a category only or in subcategories. True means all forums under a given category/subcategory are shown; false means only the category's direct child forums are shown. The default value is false. Note: A value of true can impact performance.
`isCategoryView`	Determines if the forums are grouped under the Category ID category or the topics are grouped under the Forum ID forum. True means the portlet displays the forums classified under categoryId; false means the portlet displays the topics associated with the specified forumId. The default value is false. This parameter works in combination with other parameters.

64.7.4.4 Blogs Portlet Parameters

Table 64–12 lists the additional parameters available for the Blogs portlet.

Table 64–12 Blogs Portlet Parameters

Parameter	Description
`hideComments`	Specifies whether or not to display blog post comments: ■ true—Comments are shown for blog posts ■ false—(Default) Comments are hidden for blog posts
`pageSize`	Specifies how many blog posts to show before pagination is displayed and users can select to go to the next page. By default, up to 10 blog posts can be displayed on a blog page.
`resourceId`	Specifies the unique identifier of the selected folder. The value can be specified in the following formats: ■ *`connection_name/path_to_folder`* Where, *`connection_name`* is the name of the Oracle Content Server connection used by WebCenter Services Portlets, and *`path_to_folder`* is the path to the folder on Oracle Content Server that you want to expose as a blog. ■ *`connection_name`*`#dCollectionID:`*`dCollectionId`* Where, *`connection_name`* is the name of the Oracle Content Server connection used b WebCenter Services Portlets, and *`dCollectionId`* is the collection ID of the folder on Oracle Content Server that you want to expose as a blog.

64.7.4.5 Lists Portlet Parameters

The Lists portlet does not include any additional parameters.

64.7.4.6 Polls Manager Portlet Parameters

Table 64–13 lists the additional parameters available for the Polls Manager portlet.

Table 64–13 Polls Manager Portlet Parameters

Parameter	Description
`showUserDataOnly`	Determines whether to display all polls or only those polls created by the user. The default (`No`) is to show all polls. Set to `Yes` to display only those polls created by the user.

64.7.4.7 Take Polls Portlet Parameters

Table 64–14 lists the additional parameters available for the Take Polls portlet.

Table 64–14 Take Polls Portlet Parameters

Parameter	Description
`pollId`	The ID of the poll to display.

64.7.4.8 Worklist Portlet Parameters

The Worklist portlet does not include any additional parameters.

64.7.4.9 Announcements Portlet Parameters

Table 64–15 lists the additional parameters available for the Announcements portlet.

Table 64–15 Announcements Portlet Parameters

Parameter	Description
`parentId`	The forum ID in the discussions server under which announcement objects are maintained. Each application should create a forum on the discussions server. Enter that forum ID here, for example `${2}`. If this parameter is not specified, then amusements default to global announcements.

64.7.4.10 Mail Portlet Parameters

Table 64–16 lists the additional parameters available for the Mail portlet.

Table 64–16 Mail Portlet Parameters

Parameter	Description
`tabularView`	Using the EL value type, enter a value of true to display the information associated with a mail message, such as its subject, sender, and, date sent, in a tabular format. If this parameter is set to false, then mail messages render in a list view.

64.7.4.11 Activity Stream Portlet Parameters

Table 64–17 lists the additional parameters available for the Activity Stream portlet.

Table 64–17 Activity Stream Portlet Parameters

Parameter	Description
`advancedQuery`	A field for specifying a custom query to filter streamed items. For more information, see Section 40.3, "What You Should Know About the Activity Stream Advanced Query Option."

Table 64–17 (Cont.) Activity Stream Portlet Parameters

Parameter	Description
`enableContextInfo`	A means of showing or omitting detailed information about the object in the current context (that is, in a popup or other contextual instrument). ■ Enter `#{true}` to enable Activity Stream to display the `af:contextInfo` component (a small, red dot). Users can click this dot to view object detail information. ■ Enter `#{false}` to omit object detail information. When this parameter is true and the `contextInfoTaskflowId` in the service definition is defined, the activity from the service displays the `af:contextInfo`. Otherwise, no context information is shown.
`hideComments`	A means of showing or hiding the Comments feature on streamed activities. Enter `true` to hide the Comments feature. Enter `false` to show it.
`hideConfigure`	A means of hiding the personalization option on the task flow instance.
`hideInlinePreview`	A means of allowing or omitting an inline preview of files attached to streamed activities. Enter `true` to omit a file preview. Enter `false` to show it.
`hideLike`	A means of showing or hiding the Like link on a streamed activity. Enter `true` to hide the Like link. Enter `false` to show it.
`hideShare`	A means of showing or hiding the Share menu on streamed activities. Enter `true` to hide the Share menu. Enter `false` to show it.
`pageSize`	The number of items to stream in a given task flow instance.
`pagination`	The form of pagination to use on a multipage stream. ■ Enter `#{true}` to show Previous and Next links. ■ Enter `#{false}` hide to omit Previous and Next links. Instead, a more link is rendered, enabling users to navigate to a fuller view of the task flow where all streamed activities are shown.
`profileOnly`	A means of streaming activities only from user profiles. ■ Enter `true` to stream only those activities associated with user profiles ■ Enter `false` to stream other types of activities along with those associated with user profiles
`resourceId`	The current user ID. Enter `#{securityContext.userName}` to return the current user.

Table 64–17 (Cont.) Activity Stream Portlet Parameters

Parameter	Description
`serviceCategories`	A field for entering a comma-separated list of names of services from which to stream activities. Use this parameter to limit the display of streamed activities to only those associated with the specified service or services. Enter one or more service IDs, for example: `oracle.webcenter.collab.announcement, oracle.webcenter.collab.forum` For a list of valid service ID, see Table G–7. Note that all listed service IDs cannot be used because all services do not stream items to the Activity Stream. For example, the RSS service does not stream any activities.

64.7.4.12 Tag Cloud Portlet Parameters

The Tag Cloud portlet does not include any additional parameters.

64.8 Adding the Portlet Producer Task Flow

The portlet producer task flow (Producer) enables users to manage portlet producer connections at runtime.

For applications created using WebCenter Portal's Framework application template, the portlet producer task flow is available out of the box through the WebCenter Portal Administration console (Services tab). For details, see the chapter "Managing Services, Portlet Producers, and External Applications" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

In addition, just like other task flows, you can add the portlet producer task flow to your application pages. This might be especially useful if you are not using WebCenter Portal's Framework application template and the WebCenter Portal Administration console is therefore not part of your project. Special permissions are required to manage or view portlet producer connections through the Producer task flow:

- **`AppConnectionManager`**—Users with this role can register, modify, and delete portlet producer connections at runtime.
- **`AppConnectionViewer`**—Users with this role can view portlet producer connections at runtime. By default, any user who is logged in (that is, has the `authenticated-user` role) is granted this role.

By default, users with the Administrator role can manage portlet producers. If you want other users to manage connections through the portlet producer task flow, you must grant them the `AppConnectionManager` role.

To add the portlet producer task flow:

1. Create or open a JSF page in your application where you want the task flow to be added (see Section 5.3, "Adding Pages to a Portal").
2. In the Resource Palette, expand **My Catalogs**, **WebCenter Portal - Services Catalog**, and **Task Flows**.
3. Drag **Producer** from the Resource Palette and drop it onto the page inside the `af:form` tag.
4. Grant the `AppConnectionManager` role to one or more test users, if required:
   a. Add the test user `TEST_PROD`.

b. Grant the `AppConnectionManager` role.

For information about how to add a user and grant this role, see the section "Creating Test Users" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

5. Save and run your page. Login as an administrator or the `TEST_PROD` user defined in the previous step. The screen shown in Figure 64–10 appears.

Figure 64–10 The Portlet Producer Task Flow

Note: At runtime, application administrators can grant users the `AppConnectionManager` and `AppConnectionViewer` roles through WebCenter Portal Administration (see the section "Adding Members to Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*). Alternatively, system administrators can grant `AppConnectionManager` and `AppConnectionViewer` roles through Fusion Middleware Control (see "Granting Application Roles Using Fusion Middleware Control" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*).

64.9 Troubleshooting Portlets

This section provides information to assist you in troubleshooting problems you may encounter while using portlets. It contains the following subsections:

- Section 64.9.1, "Diagnostic Tools for Troubleshooting Portlets"
- Section 64.9.2, "Configuring the Portlet Logging File"
- Section 64.9.3, "Portlet Displays a Portlet Consumer Error"
- Section 64.9.4, "Portlet Displays a Portlet Timeout"
- Section 64.9.5, "Portlet Displays a Remote Portlet Communication Error"
- Section 64.9.6, "Portlet Displays a Remote Portlet Error"

64.9.1 Diagnostic Tools for Troubleshooting Portlets

There is a set of tools available for both the consumer and producer to help identify and resolve issues with portlets.

If you encounter a portlet error message when a portlet is rendered, or if the portlet displays but you cannot interact correctly with it, there are some general steps using these tools that you should follow to diagnose the issue.

This section includes the following subsections:

- Section 64.9.1.1, "Identify the Portlet Instance"

- Section 64.9.1.2, "Examine the Portlet Consumer Test Page"
- Section 64.9.1.3, "Examine the Producer Test Page"

64.9.1.1 Identify the Portlet Instance

The first step when you encounter a portlet error, is to identify which portlet producer and portlet instance is being invoked. Execute the `portletDebugShow()` JavaScript from your browser to display this information in the main portlet content area.

To identify the portlet instance:

1. Enter the following command in the Location field of your browser:

   ```
   javascript:portletDebugShow()
   ```

   Tip: In Internet Explorer and Google Chrome, you must type this command in the Location field. If you paste the command into the field, the `javascript` piece is removed.

   In Firefox 6 and above, you cannot enter JavaScript in the Location field, you must enter the command in JavaScript console.

2. After running the script, every portlet now displays the following information:
   - Producer name
   - Portlet name
   - Portlet instance ID
   - Execution Context IDs (ECIDs)

     The ECIDs are unique IDs used to identify a portlet request. Use the ECIDs to correlate the messages across different consumer and producer log files using Fusion Middleware Control. The same ECID is propagated from the consumer to the producer. For more information, see the "Correlating Messages Across Log Files and Components" section in the *Oracle Application Server Administrator's Guide*.

     Note: Broken portlets show two ECIDs: one for the request in which the error occurred and one for request in which the error was reported. For inline portlets (that is, portlets that are not displayed in an IFRAME), these two ECIDs are the same.

     For IFRAME portlets, for example Oracle JSF Portlet Bridge portlets, the ECIDs are different. This is because the error is reported in a later request than the one in which the original exception occurred. When checking the logs, you should look for both ECIDs, as either may contain relevant information.

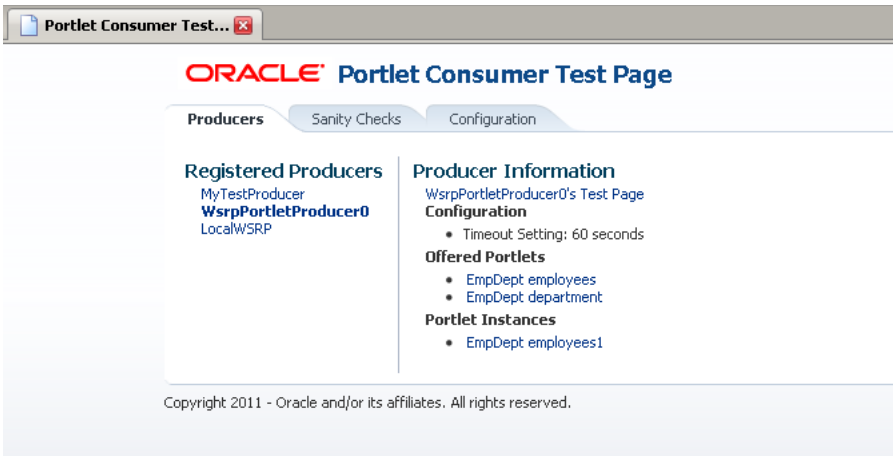
You can use this information in the subsequent diagnostic steps to help locate the issue.

Note: The ECIDs shown in the portlet diagnostic information do not reflect partial page rendering requests that have been made to the portlet producer (using the portlet consumer resource proxy). These requests may update the portlet, but the ECIDs are not recorded in the portlet diagnostic information. Errors that occur during these requests are logged on the producer and by the portlet resource proxy on the consumer but you cannot use the ECID information reported in the portlet diagnostic information to help you determine the ECIDs for the relevant log entries.

---

3. When you have finished debugging the portlets, enter the following command to hide the portlet debugging information:

```
javascript:portletDebugHide()
```



Tip: In Internet Explorer and Google Chrome, you must type this command in the Location field. If you paste the command into the field, the `javascript` piece is removed.

In Firefox 6 and above, you cannot enter JavaScript in the Location field, you must enter the command in JavaScript console.

64.9.1.2 Examine the Portlet Consumer Test Page

The next step in diagnosing a portlet error is to access the Portlet Consumer Test Page (shown in Figure 64–11) to locate the portlet producer and, if necessary, test the portlet in isolation.

Figure 64–11 The Portlet Consumer Test Page

The Portlet Consumer Test Page contains three tabs:

- **Producers:** This tab lists all the producers registered with the consumer application. Selecting a producer provides specific information about that producer.
- **Sanity Checks:** This tab may contain a predefined set of portlet instances and required parameters that can be run in the consumer application, as configured by the consumer application developer. Any failures within these portlets indicate a problem with the corresponding producer and/or portlet.
- **Configuration:** This tab enables you to identify the consumer configuration entries for portlet consumption. You cannot change these values as they are stored within the application; they are displayed for reference information only.

After accessing the Portlet Consumer Test Page, you can perform further diagnostic steps.

This section includes the following subsections for using the Portlet Consumer Test Page to diagnose portlet issues:

- Section 64.9.1.2.1, "Access the Portlet Consumer Test Page"
- Section 64.9.1.2.2, "Locate the Portlet Producer"
- Section 64.9.1.2.3, "Locate and Run the Portlet Instance"
- Section 64.9.1.2.4, "Perform Sanity Checks"
- Section 64.9.1.2.5, "Check Consumer Configuration Entries"

64.9.1.2.1 Access the Portlet Consumer Test Page

The Portlet Consumer Test Page provides diagnostic information about the portlet consumer.

To access the Portlet Consumer Test Page:

1. In your browser, enter the URL for the Portlet Consumer Test Page:

   `http://host:port/context-root/faces/oracle/portlet/client/adf/diagnostic/pages/ConsumerTestPage.jspx`

Note: If the consumer application is secured, the Portlet Consumer Test Page can be accessed only by users granted permission to view those pages.

2. In the Portlet Consumer Test Page, you can perform further diagnostic steps as described in the following sections.

64.9.1.2.2 Locate the Portlet Producer

The Producers tab of the Portlet Consumer Test Page lists all the producers that have been registered with the consumer application. If a portlet instance in your application displays an error message, you can view information about the producer that owns the portlet by selecting it on this tab.

To locate the portlet producer:

1. In the Portlet Consumer Test Page, select the portlet producer that owns the portlet instance that is reporting the error.

   You noted this information in Section 64.9.1.1, "Identify the Portlet Instance."

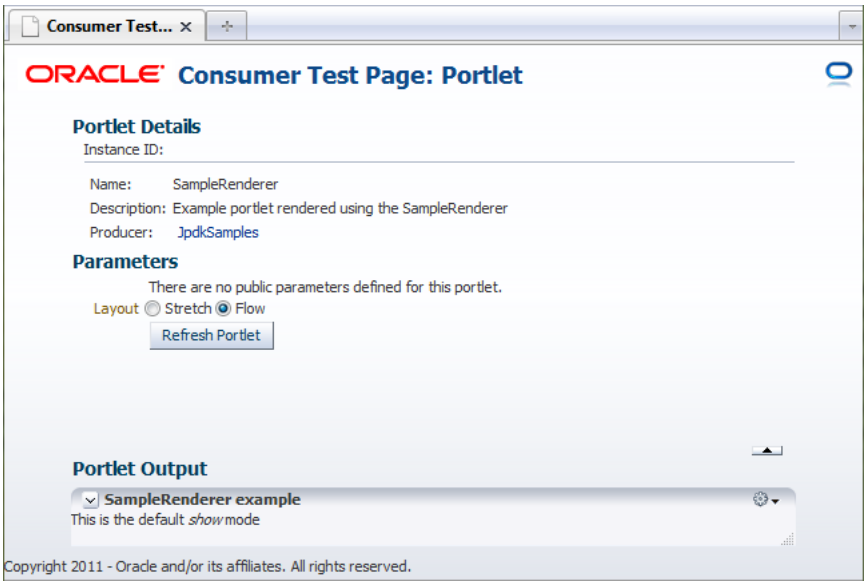
2. The following information is provided for the selected producer:

   - Producer Test Page: A link to the Producer Test Page.
   - Configuration: Details of potential issues surrounding skins, security, and timeouts associated with the using producer.
   - Offered Portlets: A list of all portlets offered by the producer. If there are no offered portlets listed, this indicates that there is a problem with the registration metadata for the producer.
   - Portlet Instances: A list of all portlet instances for the selected producer in the consumer application. This list may be empty.

   You can use this information to identify potential issues with the producer.

64.9.1.2.3 Locate and Run the Portlet Instance

If you have still not been able to identify the cause of the portlet error, the issue may lie with the portlet instance itself.



To locate and run the portlet instance:

1. In the Portlet Consumer Test Page, select the portlet producer that owns the portlet instance that is reporting the error.

   You noted this information in Section 64.9.1.1, "Identify the Portlet Instance."

2. Under Portlet Instances, select the portlet instance to display the Consumer Test Page: Portlet page.

   You noted this information in Section 64.9.1.1, "Identify the Portlet Instance."

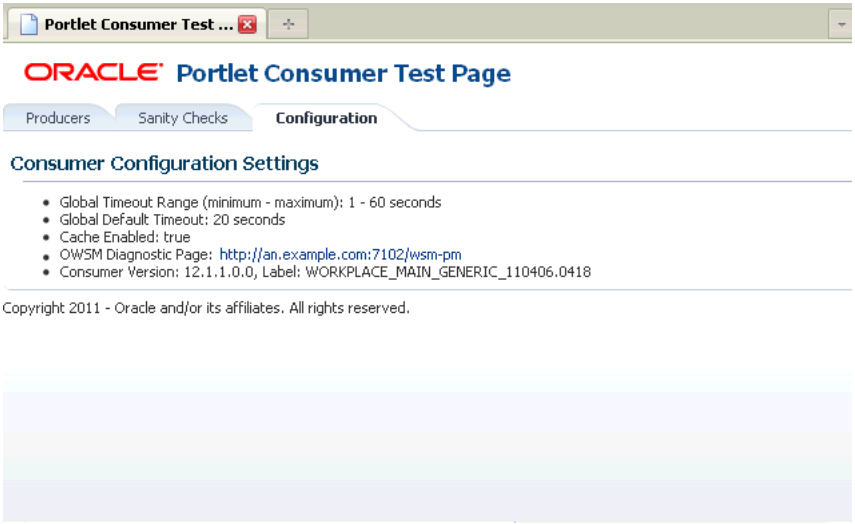
3. The Portlet Consumer Test Page: Portlet page renders the portlet in a standalone page. If the portlet runs correctly on this page, the problem is most likely caused by other components on the page containing the broken portlet.
4. The Parameters section enables you to experiment with how the portlet looks using a stretch or flow layout
5. If the portlet contains parameters, the Parameters section also lists all the public parameters for the portlet. Enter values for any parameters to test that the portlet is receiving parameters correctly.
6. To navigate back to the Portlet Consumer Test Page, click the producer name link at the top of the page.

64.9.1.2.4 Perform Sanity Checks The Sanity Checks tab of the Portlet Consumer Test Page (shown in Figure 64–12) provides a quick overview of the state of portlet communication in your application across all producers.

Figure 64–12 The Sanity Checks Tab

The Sanity Checks tab references portlet instances used within the consumer application. This list is configured by the application developer who chose the portlets to include and the parameters to pass to these portlets.

The checks on this page do not render the output in the UI, but simply create a runnable instance of the portlet under the covers and report any failures if any exception is returned by the portlet.



To perform sanity checks:

1. In the Portlet Consumer Test Page, click the **Sanity Checks** tab.
2. Click the **check** link next to the portlet that you want to test.

   The results of the sanity tests are displayed in the **Status** column.
3. To run sanity checks on all listed portlets, click the **Run all Sanity Checks** link.

64.9.1.2.5 Check Consumer Configuration Entries The Configuration tab of the Portlet Consumer Test Page (shown in Figure 64–13) enables you to identify the consumer configuration entries for portlet consumption. This tab displays settings defined in the `adf-config.xml` file, for example, the minimum and maximum timeout values and the consumer version number. You cannot change these values as they are stored within the application; they are displayed for reference information only.

Figure 64–13 The Configuration Tab

64.9.1.3 Examine the Producer Test Page

If you cannot identify the cause of the error in the consumer application, the next step is to use the Producer Test Page (shown in Figure 64–14) to identify potential issues with the portlet producer application.

Figure 64–14 The Producer Test Page

Access to the main Producer Test Page is public, but links to the test pages for each portlet are accessible only to users granted permission on the underlying pages and task flows.

The Producer Test Page contains five sections:

- Portlets

  A list of all the portlets within the producer. For Oracle JSF Portlet Bridge portlets, each portlet also provides a separate link to run the portlet as a servlet (this is a prerequisite to running them as portlets: if a portlet does not run as a servlet, it cannot run as a portlet).

- Container Configuration

  Information on where the consumer preference information is stored.

- Container Version

  The version number of the Portlet Producer Container.

- WSDL URLs

  Links to the Web Service Definition Language (WSDL) documents to use for registration.

- SOAP Monitor

  A link to the WSRP SOAP monitor where users with the `Monitor` or `Admin` role can track the SOAP messages between the consumer and producer.

After accessing the Producer Test Page, you can perform further diagnostic steps.

This section includes the following subsections:

- Section 64.9.1.3.1, "Access the Producer Test Page"

- Section 64.9.1.3.2, "Run the JSF Portlet as a Servlet"
- Section 64.9.1.3.3, "Examine the SOAP Monitor"

64.9.1.3.1 Access the Producer Test Page The Producer Test Page provides diagnostic information about the portlet producer.

To access the Producer Test Page:

1. In your browser, enter the URL for the Producer Test Page:

   `http://host:port/context-root/info`

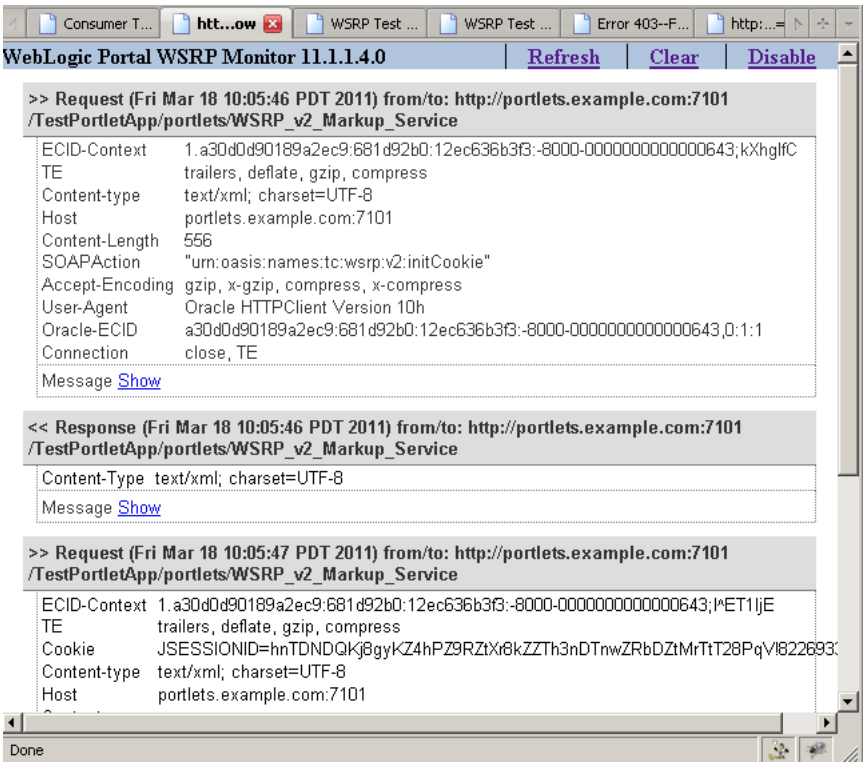
2. In the Producer Test Page, you can perform further diagnostic steps as described in the following sections.

64.9.1.3.2 Run the JSF Portlet as a Servlet To verify that an Oracle JSF Portlet Bridge portlet producer is running correctly, you must first verify that the producer application runs correctly through standard HTTP requests. If the artifacts the producer exposes as portlets do not run as servlets, they will not run as portlets.

To run a JSF portlet as a servlet:

1. In the Producer Test Page, click the **run as servlet** link next to the portlet.
2. The portlet is called using standard HTTP to request the underlying page or task flow. The results of the request are displayed in a new browser window.

   If the resulting page or task flow does not render correctly, then there is a problem with the producer application that must be resolved before you can run the page or task flow as a portlet.
3. If the portlet accepts parameters, click **show parameters** to list them and provide values. When you click **run as servlet**, the portlet call includes the parameter values.



64.9.1.3.3 Examine the SOAP Monitor The SOAP monitor provides access to the SOAP requests between the consumer and producer when rendering a portlet. This is very useful in diagnosing problems at the communication level.

To examine the SOAP monitor:

1. In the Producer Test Page, click the SOAP Monitor link at the bottom of the page.
2. When prompted, enter your user name and password.

   Note: To access the SOAP monitor you must be a member of the `Monitors` or `Administrators` role in the Identity Management System.

3. By default, the SOAP monitor is disabled, so the page is empty. You must first enable the monitor by clicking the **Enable** link at the top of the page.
4. The page does not automatically refresh, so to display SOAP messages, you must click the **Refresh** link.
5. To force a request to the failing portlet, go to the Portlet Consumer Test Page: Portlet page for the portlet and select **Refresh Portlet**.
6. When the portlet has rendered, or failed, click the Refresh link in the SOAP monitor to display the captured request.

7. Now, you can investigate the SOAP messages that were sent and the responses to try to narrow down the cause of the problem.

> **Note:** If, after rerunning the portlet and refreshing the SOAP monitor, you see no messages displayed, this indicates that there may be a security issue between the producer and the consumer. You must verify that the correct WS-Security settings are set up for the producer and consumer to communicate.

64.9.2 Configuring the Portlet Logging File

To troubleshoot portlet issues, it is useful to add portlet log-handlers and loggers to the logging configuration file, `logging.xml`.

Example 64–14 shows how to add the portlet log-handlers and loggers. The example assumes that you are running the consumer and producer applications on the same WebLogic Server instance. If you are running the consumer and producer applications on different instances, you must split them up appropriately.

> **Note:** Add the log entries at the end of the file to ensure that they override any seeded settings.

Example 64–14 Configuring Log Files for Troubleshooting Portlet Issues

```
<!-- NOTE: You need to change the path where the logfile is located -->
<log_handlers>
...
   <!-- Portlet Consumer -->
   <log_handler name="portlet-consumer-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
      <property name="format" value="ODL-Text"/>
```

```
      <property name="path" value="/scratch/logs/portlet-consumer.log"/>
   </log_handler>

   <!-- Portlet Producer -->
   <log_handler name="portlet-producer-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
      <property name="format" value="ODL-Text"/>
      <property name="path" value="/scratch/logs/portlet-producer.log"/>
   </log_handler>

   <!-- Portlet Bridge -->
   <log_handler name="portlet-bridge-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
      <property name="format" value="ODL-Text"/>
      <property name="path" value="/scratch/logs/portlet-bridge.log"/>
   </log_handler>
...
</log_handlers>

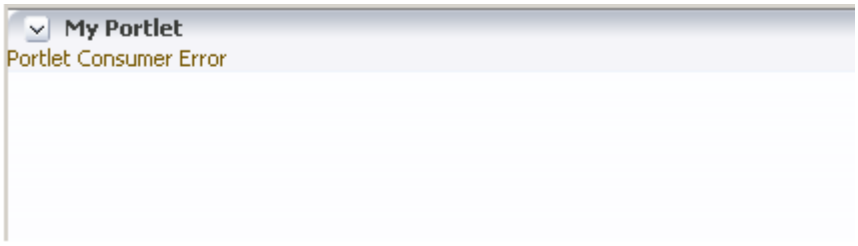
<loggers>
...
   <!-- Portlet Consumer -->
   <logger name="oracle.portlet.client" level="FINEST" useParentHandlers="false">
      <handler name="portlet-consumer-handler"/>
   </logger>

   <!-- Portlet Servers -->
   <logger name="com.bea.portlets" level="FINEST" useParentHandlers="false">
      <handler name="portlet-producer-handler"/>
   </logger>
   <logger name="com.bea.netuix" level="FINEST" useParentHandlers="false">
      <handler name="portlet-producer-handler"/>
   </logger>
   <logger name="com.bea.wsrp" level="FINEST" useParentHandlers="false">
      <handler name="portlet-producer-handler"/>
   </logger>
   <logger name="oracle.portlet.producer" level="FINEST" useParentHandlers="false">
      <handler name="portlet-producer-handler"/>
   </logger>

   <!-- Portlet Bridge -->
   <logger name="oracle.portlet.bridge" level="FINEST" useParentHandlers="false">
      <handler name="portlet-bridge-handler"/>
   </logger>
   <logger name="oracle.portlet.server.bridge" level="FINEST" useParentHandlers="false">
      <handler name="portlet-bridge-handler"/>
   </logger>
...
</loggers>
```

The logging configuration file is located in:

DOMAIN_HOME/config/fmwconfig/servers/*server*/logging.xml



The log file name is also defined in `logging.xml`. By default the log file name is:

DOMAIN_HOME/servers/*server*/logs/*server*-diagnostic.log

64.9.3 Portlet Displays a Portlet Consumer Error

The message **Portlet Consumer Error** (shown in Figure 64–15) typically indicates that an error occurred within the operation of the portlet parts of the portlet consumer application.

Figure 64–15 Portlet Displaying a Portlet Consumer Error

Problem

An error has occurred within the operation of the portlet parts of the portlet consumer application. In other words, the error is unrelated to the remote portlet producer application.

Solution

Consult the diagnostic log file to determine the cause of the exception.

If the `DebugErrorRenderer` is enabled, the cause exception is displayed in the portlet along with links to the log file. If running in production mode, then consult the consumer-side logs.

The exception that caused the error message to be displayed is logged. Wherever possible, a message is included in the log at the start of the exception stack to indicate for which portlet binding the exception occurred. Example 64–15 shows a message logged for a portlet error.

Example 64–15 Example Message Logged for a Portlet Error

```
<PortletRenderer> <setErrorState> An error has occured for Portlet Binding
portlet1.
oracle.portlet.client.container.PortletContentTypeException: Unexpected content
type "null" in WSRPGetMarkup response.
...
```

Pay particular attention to the cause exceptions in the stack as this is likely to indicate what the real underlying problem is.

The cause is likely to be an internal error and the appropriate course of action is to contact Oracle Support.

64.9.4 Portlet Displays a Portlet Timeout

If a **Portlet Timeout** is displayed in the area of the page that you would expect to contain a portlet (as shown in Figure 64–16), this means that the consumer waited for a configured period of time for the producer to respond and did not get a response during that time, or the response did not complete during that time. There are a number of possible causes.

Figure 64–16 Portlet Displaying a Portlet Timeout Error

Problem 1

The producer machine is overloaded.

Solution 1

Check the load on the producer managed server (the tools used to do this vary depending on the operating system that is running on the producer). If the load is high, check whether a particular process is causing this high load, and whether such a process could be run on another machine, or at a less busy time. If no single process is causing the high load, or if the Oracle WebLogic Server is causing the high load, and if the load is consistently high, consider whether the producer hardware is adequate, or whether it is necessary to upgrade it (or add further nodes to the cluster). Also consider adjusting the Oracle WebLogic Server configuration to increase the size of the request thread pool. For more information, see the Oracle WebLogic Server documentation.

Problem 2

The network is overloaded, or there are problems with the network affecting communication between the consumer and producer.

Solution 2

Check that you can ping the producer machine from the consumer machine. Check that you can access the producer's WSRP Producer Test Page in your local browser. If this works, check that you can access this same page from a browser running on the consumer machine. If any of these steps cause problems, and the machine is not overloaded, this could be a network problem, which should be investigated by a system administrator.

Problem 3

There is a deadlock (or a stuck thread) on the producer machine causing the request thread to hang.

Solution 3

This should not happen during normal operation. If it does occur, there will generally be an error in the producer's log files indicating the point at which the deadlock occurred. This may help diagnose the problem. In some cases, it may be possible to alleviate this by modifying the configuration of Oracle WebLogic Server. For more information, see the Oracle WebLogic Server documentation.

Problem 4

The producer application is running slowly (for example, due to processing large quantities of data).

Solution 4

In this case, the producer application may be processing large quantities of data, causing it to spend too long building the response. If the application will regularly deal with large quantities of information, it may be necessary to either add or improve producer hardware, or to increase the portlet timeout duration. The portlet timeout can be configured on the producer connection in the consumer application using Enterprise Manager or the WLST `setWSRPProducerConnection` command. Additionally, minimum and maximum timeouts for all producer connections within the application can be configured within the portlet section of the `adf-config.xml` file.

Problem 5

The producer application is waiting for a response from another resource, such as a database, that is taking too long (for example, if the database is overloaded).

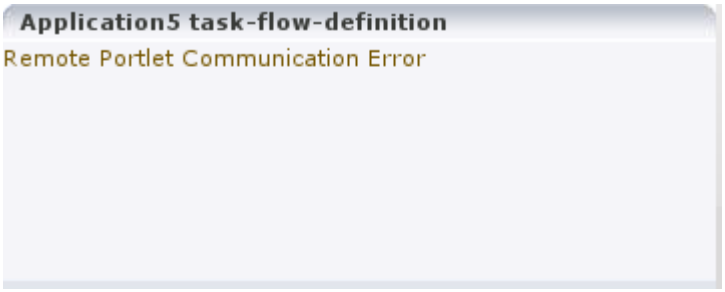
Solution 5

Check that the resource in question is functioning correctly. If it is, the solution is same as Solution 4.

Problem 6

The portlet timeout values have been misconfigured such that the timeout period is too short.

Solution 6



Typically, the timeout for a portlet is set on the registration of the producer. This may have been set to a value that does not give time for the portlet to respond.

Also, the portlet section of the `adf-config.xml` file allows minimum, maximum, and default values for portlet timeouts to be configured across the whole application. The maximum timeout imposes an upper limit on timeouts specified by portlet producers, so if the maximum timeout is too short, this could cause unwanted portlet timeout errors even if the timeout specified on the producer connection is longer.

64.9.5 Portlet Displays a Remote Portlet Communication Error

When a section of the screen shows the **Remote Portlet Communication Error** message (as shown in Figure 64–17), and there is an otherwise blank region surrounding it, this area is expected to be filled with a portlet, which the application is not able to contact.

Figure 64–17 Portlet Displaying a Remote Portlet Communication Error

Problem 1

The producer is down.

Solution 1

It could be that the producer application is not running, or the managed server on which it is deployed is not started. In this case, it will need to be started. Identify the application that needs to be started based on the task being attempted at the time of the portlet failure.

Problem 2

The web services security is incorrectly configured.

Solution 2

Troubleshooting steps for web services security depend on the type of security profile being used, for example AuthN, SSL, or Message Security.

For more information about troubleshooting web service security, see the "Diagnosing Problems" chapter in the *Oracle Application Server Web Services Security Guide*.

Problem 3

The producer managed server cannot be reached.

Solution 3

The producer may be in a location that cannot be reached by the consumer application, due to intervening firewalls or incorrect routing rules. In an environment that is installed by Oracle's provisioning software, this should not be the case, but it is worth checking that you are able to access the WSDL endpoint for the producer from the machine hosting the consumer, by going to:

`http://host:port/context-root/portlets/wsrp2?WSDL`

Where:

- *`host`* is the server to which the portlet producer is deployed
- *`port`* is the port to which the server is listening for HTTP requests
- *`context-root`* is the producer web application's context root

For example:

```
http://portlets.example.com:9999/sample/portlets/wsrp2?WSDL
```

64.9.6 Portlet Displays a Remote Portlet Error

If the portlet displays a **Remote Portlet Error** (as shown in Figure 64–18), this indicates that the producer responded with an error message. The error message is returned in the form of a SOAP fault message inside the response document. There are a number of reasons the producer might return an error. The best strategy to diagnose these errors is to first find the corresponding exception stack trace in the consumer diagnostic logs. This stack trace shows what kind of fault was returned by the producer, plus any further information required in the response. Some faults you may encounter are listed in the following sections.

Figure 64–18 Portlet Displaying a Remote Portlet Error

Problem 1

`OperationFailedException`. This is the most common type of Remote Portlet Error and it is a catch-all for most unhandled exceptions raised in the producer application.

Solution 1

To resolve an `OperationFailedException`, examine the exception in the consumer diagnostic logs. This generally shows any exception that was raised in the producer application to trigger the fault response as the final `Caused by` exception.

If required, you can then examine the diagnostic logs on the producer application for more detail, or for any related exceptions that occurred prior to the fault being triggered. In some cases, the exception in the producer log indicates a problem that can be simply resolved, such as a database connection failure or configuration problem. In other cases, the exception might indicate a product bug.

Problem 2

`InvalidRegistrationException`. This error indicates that the producer has not been properly registered with the consumer before the consumer attempted to communicate with it. This could also occur if the producer's preference store has been moved or deleted since the consumer registered it.

Solution 2

The most likely cause is a problem during provisioning. It is also worth checking the producer application's `web.xml` file setting to ensure that the entry shown in Example 64–16 is present.

Example 64–16 Persistent Store Setting in web.xml

```
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>Consumer</env-entry-value>
</env-entry>
```

Problem 3

`InvalidHandleException`. This indicates that the consumer has asked the producer to render, or otherwise interact with, a portlet instance that the producer does not know about. This could occur if the producer's preference store has been corrupted in some way since the portlet was added to the page.

Solution 3

This error is most likely caused by a problem during provisioning, or a missing `persistentStore` setting in the `web.xml` file, as described in Solution 2.

Problem 4

`AccessDeniedException`. This indicates that the producer application decided that the current user did not have access to the portlet or task flow in question.

Solution 4

This could either be a legitimate error message or an indication of a configuration problem. In most cases, WebCenter Portal should deal with authorization errors gracefully, without a Portlet Remote Error being displayed.

65

Creating Portlets with OmniPortlet

OmniPortlet is a data publishing portlet that you add to your application at design time, and customize at runtime. It provides a runtime, wizard-based experience to allow page designers to publish data from a variety of data sources, including SQL, XML, web services, spreadsheets, and web pages to several different layouts, such as customizable charts and tables.

This chapter covers the information you may find useful if you are planning to use OmniPortlet in your Oracle JDeveloper environment. For information on how to use the OmniPortlet wizard, refer to *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This chapter includes the following sections:

- Section 65.1, "Introduction to OmniPortlet"
- Section 65.2, "Adding OmniPortlet to Your Application"
- Section 65.3, "Customizing OmniPortlet"
- Section 65.4, "Troubleshooting OmniPortlet Problems"

For information about registering and configuring OmniPortlet, see Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application" and Section E.1, "OmniPortlet Configuration Tips."

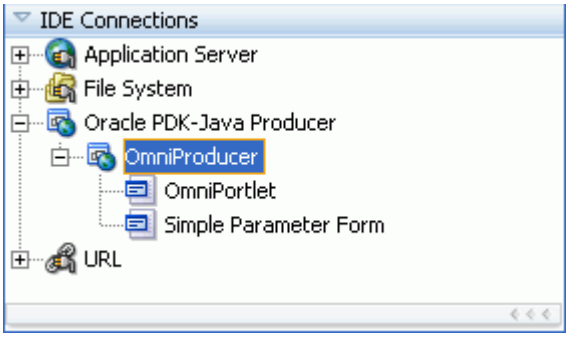
Note: You can find more information about developing different types of portlets and information about producers and other portlet technologies in Chapter 58, "Overview of Portlets."

65.1 Introduction to OmniPortlet

OmniPortlet is a subcomponent of Oracle WebCenter Framework that enables developers to easily publish data from various data sources using a variety of layouts without writing any code. You can base an OmniPortlet on almost any kind of data source, such as a web service, a SQL database, spreadsheet (character-separated values), XML, and even application data from an existing web page. Figure 65–1 shows an example of a portlet created using OmniPortlet.

Figure 65–1 Example of an OmniPortlet

OmniPortlet enables the WebCenter Portal: Framework application developer and component developer to do the following:



- Display data from multiple sources (CSV, XML, web service, SQL, and so on)
- Sort the data to display
- Format data using a variety of layouts (bulleted list, chart, HTML, and so on)
- Use portlet parameters
- Expose personalizable settings to page viewers

To display personalized data, you can refine the retrieved data by filtering the results returned from a data source, and parameterize the credential information used to access secure data. Out of the box, OmniPortlet provides the most common layout for portlets: tabular, chart, HTML, news, bulleted list, and form.

65.2 Adding OmniPortlet to Your Application

As described in Chapter 64, "Consuming Portlets," you can add an OmniPortlet to a page created through Oracle JDeveloper. OmniPortlet is included in the Integrated WebLogic Server (Integrated WLS) that is installed with Oracle JDeveloper. After you start the Integrated WLS, you can register the OmniPortlet producer by using the Register Oracle PDK-Java Producer wizard. When this producer is registered, the portlets become available on the Oracle JDeveloper Resource Palette or in the Application Resources panel. For example, if you register the OmniPortlet producer as "OmniProducer," OmniPortlet displays in your IDE Connections list in the Resource Palette, as shown in Figure 65–2.

Figure 65–2 OmniPortlet in the Resource Palette

Note: For more information about:

- Registering the producer, see Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application."
- Installing, initializing, and stopping the default server and pointing Oracle JDeveloper to it, see Section 3.4, "Working with the Integrated WebLogic Server."
- Adding an instance of OmniPortlet to your page, see Section 64.3, "Adding Portlets to a Page."

After you register the portlet producer, you can simply drag OmniPortlet onto your `*.jspx` page.

Note: When you add an instance of OmniPortlet onto your page in Oracle JDeveloper, open the Property Inspector for the portlet and ensure that the `AllModesSharedScreen` and `RenderPortletInIFrame` properties are set as follows:

- **AllModesSharedScreen** is set to `False` to display the Customize and Personalize in full page size.
- **RenderPortletInIFrame** is set to `True` to display the OmniPortlet in its own inline frame (IFRAME) in the View mode.

For information on configuring OmniPortlet in Oracle JDeveloper, refer to Section E.1, "OmniPortlet Configuration Tips."

65.3 Customizing OmniPortlet

After you add an OmniPortlet to your application at design time, you can customize the content, layout, and other options, by running your application to a browser. This section provides a high-level introduction to the runtime customization experience. For more detailed information on using and customizing this portlet, refer to *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Note: For more information about configuring OmniPortlet, see Appendix E.1, "OmniPortlet Configuration Tips."

The OmniPortlet wizard initially contains five steps. When you first define your OmniPortlet, you set the data source type, data source options, filter options, view options, and layout. When you have completed these steps of the wizard, you can reenter the wizard by clicking the **Customize** link for the portlet. When you reenter the wizard, you can change the definitions on the Source, Filter, View, and Layout tabs.

Note: On the IBM Linux on Power platform, if the action buttons (Next, Previous, Finish, and Cancel) are minimized to dots when defining the OmniPortlet, increase the stack size shell limit to unlimited and restart the `WLS_portlet` instance. Run the following command to set the stack size shell limit to unlimited: `prompt> ulimit -s unlimited`.

You can use several different data sources with OmniPortlet:

- Spreadsheet
- SQL
- XML
- Web Service
- Web Page

For more information on using these data sources with OmniPortlet, refer to the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

65.4 Troubleshooting OmniPortlet Problems

This section provides information to help you troubleshoot problems you may encounter while using OmniPortlet.

Note: As the OmniPortlet producer exists and executes in a tier different from the Framework application and does not have access to the session information, you must expose XML files as PUBLIC in order for OmniPortlet to access them.

Cannot Define OmniPortlet Using the Define Link

You are not able to define the OmniPortlet at runtime.

Problem

OmniPortlet only supports a `RenderPortletInIFrame` value of `true`, meaning that OmniPortlet must be rendered within an IFRAME. Therefore, the OmniPortlet property, `RenderPortletInIFrame`, must be set to `true`. In the Property Inspector, the `RenderPortletInIFrame` property is available under Display Options.

Currently, the `RenderPortletInIFrame` property has a value of `false`. Consequently, when you click the **Define** link at runtime, the **Type** tab may not display and you cannot proceed with defining the OmniPortlet.

Solution

You can choose **Customize** from the Action list to define OmniPortlet, or select the OmniPortlet in the Structure window in Oracle JDeveloper, and in the Property Inspector, set `RenderPortletInIFrame` to `true`.

66

Creating Content-Based Portlets with Web Clipping

Web Clipping is a publishing portlet that enables you to integrate any web application with your WebCenter Portal: Framework application. Web Clipping is designed to give you quick integration by leveraging the existing user interface of a web application. With Web Clipping, you can collect web content into portlets in a single centralized web page. You can use Web Clipping to consolidate content from web sites scattered throughout a large organization.

This chapter includes the information you are required to know to use Web Clipping in your Oracle JDeveloper environment. For information about how to use Web Clipping at runtime, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This chapter includes the following sections:

- Section 66.1, "Introduction to Web Clipping"
- Section 66.2, "Adding Web Clipping to Your Application"
- Section 66.3, "Integrating Authenticated Web Content Using Single Sign-On"
- Section 66.4, "Advanced Features of Web Clipping"
- Section 66.5, "Current Limitations of Web Clipping"
- Section 66.6, "Troubleshooting Web Clipping"

For information about additional Web Clipping portlet producer configuration such as repository and proxy settings and producer security, see Appendix E, "Additional Portlet Configuration."

For information about the different types of portlets, producers, and other portlet technologies, see Chapter 58, "Overview of Portlets."

66.1 Introduction to Web Clipping

With Web Clipping you can clip an entire web page or a portion of it and reuse it as a portlet. You can clip basic and HTML-form-based sites. Use Web Clipping when you want to copy content from an existing web page and expose it in your Framework application as a portlet.

Web Clipping supports the following features:

- **Navigation through various styles of login mechanisms**

Web Clipping supports various login mechanisms including form- and JavaScript-based submission and HTTP Basic and Digest Authentication with cookie-based session management.

- **Fuzzy matching of clippings**

  Fuzzy matching enables the Web Clipping engine to correctly identify a web clipping and deliver it as portlet content even if the web clipping is reordered within the source page or if its character font, size, or style changes.

- **Personalization**

  Personalization enables you to expose input parameters that end users can modify when they personalize the portlet. Parameters can be exposed as public parameters that you can map as page parameters. This feature enables end users to obtain personalized clippings.

- **Integrated authenticated web content through single sign-on**

  You can use external applications and leverage Oracle Single Sign-On to clip content from authenticated external web sites.

- **Inline rendering**

  Inline rendering enables you to set up Web Clipping portlets to display links within the context of the portlet. When a user clicks a link in the Web Clipping portlet, the results display within the same portlet. You can use this feature with internal and external web sites.

- **Proxy authentication**

  Web Clipping supports proxy authentication, including global proxy authentication and authentication for each user. You can use this feature if proxy servers require authentication. You can specify proxy server authentication details, including type (Basic or Digest) and realm in the `provider.xml` file. In addition, you can specify a scheme for entering user credentials:

  – All users automatically log in using a user name and password that you provide.

  – All users are required to log in using a user name and password that they provide.

  – All public users (not authenticated into the Framework application) automatically log in using a user name and password that you provide, while valid users (authenticated into the Framework application) log in using a user name and password that they provide.

  For more information, see Section E.2.2, "HTTP or HTTPS Proxy Configuration."

- **Support for HTTPS**

  Web Clipping enables you to clip content from HTTPS-based external web sites if appropriate server certificates are acquired. For information about server certificates, see Section E.2.3.1, "Adding Certificates for Trusted Sites."

- **Open Transport API**

  By default, the Web Clipping provider supports only HTTP challenge-based authentication methods, such as Basic and Digest and form submission logins. To support custom authentication methods, such as Kerberos proxy authentication, you can use the Web Clipping Transport API. For more information, see Section 66.4.1, "Using the Web Clipping Transport API."

- **Reuse of a wide range of web content**

Web Clipping provides basic support of pages written with JavaScript, applets, and plug-in enabled content, retrieved through HTTP GET and POST methods of form submission.

Web Clipping also supports clipping of content from pages written with HTML 4.01, including:

- Clipping of `<applet>`, `<body>`, `<div>`, `<embed>`, `<img>`, `<object>`, `<ol>`, `<span>`, `<table>`, and `<ul>` tagged content
- Preservation of `<head>` styles and fonts, and CSS
- Support for UTF-8 compliant character sets
- Navigation through hyperlinks (HTTP GET), form submissions (HTTP POST), frames, and URL redirection

- **Globalization support**

  Web Clipping provides globalization support in URLs and URL parameters. For information about how Web Clipping determines the character set of clipped content, see Section 66.5, "Current Limitations of Web Clipping."

- **Persistent storage of Web Clipping definitions**

  Web Clipping definitions are stored persistently in a repository. By default, in JDeveloper, the Web Clipping producer is configured to use the file-based Oracle Metadata Service (MDS) as a repository. If you prefer, you can use a database schema for your Web Clipping repository. For information about configuring a Web Clipping repository, see Section E.2.1, "Web Clipping Repository Configuration."

- **Encryption of secure information**

  Any secure information, such as passwords, is stored in an encrypted form, according to the Data Encryption Standard (DES), using Oracle encryption technology.

66.2 Adding Web Clipping to Your Application

You can add a Web Clipping portlet to a JSP document created through JDeveloper. The Web Clipping portlet producer is included in:

- Integrated WebLogic Server (WLS), the default server installed with JDeveloper
- The `WLS_Portlets` managed server in the default domain in a full Oracle Fusion Middleware installation

To add a Web Clipping portlet to your application:

1. In JDeveloper, start Integrated WLS. For information, see Section 3.4, "Working with the Integrated WebLogic Server."
2. In JDeveloper, register the Web Clipping producer. For more information, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

   During this step, you must provide the endpoint URL, for example:

   ```
   http://localhost:7101/portalTools/webClipping/providers/webClipping
   ```

   You can choose to register the Web Clipping portlet producer from the `WLS_Portlets` managed server or Integrated WLS.

   When the producer is registered, portlets become available either in the Application Resources panel or the Resource Palette.

3. From the Application Resources panel or the Resource Palette, drag the Web Clipping portlet onto your `.jspx` page. For more information, see Section 64.3, "Adding Portlets to a Page."

   If you are using a `PanelCustomizable` or `ShowDetailFrame` component, then drag the portlet on top of that component instead of `af:form`. In the Structure pane, the Web Clipping portlet must display under the `PanelCustomizable` or `ShowDetailFrame` component. In the Page Editor, the portlet must display inside the `PanelCustomizable` or `ShowDetailFrame` component.

   Note: When you add an instance of Web Clipping to your page in JDeveloper, open the Property Inspector for the portlet and ensure that the `AllModesSharedScreen` and `RenderPortletInIFrame` properties are set as follows:

   - **AllModesSharedScreen** is set to `false` to display the Customize and Personalize in full page size. If you do not set this property to `false`, then when you edit the Web Clipping portlet at runtime, the text displayed on the page may be distorted.
   - **RenderPortletInIFrame** is set to `true` to display the Web Clipping in its own inline frame (IFRAME) in the View mode.

4. Right-click the `.jspx` page and choose **Run**.

   The Web Clipping portlet displays in your default browser.

5. Customize the Web Clipping portlet to define its contents. For more information, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

   Note: To clip SSL-enabled web sites, you must add certificates of those sites to the certificate store. You are not required to add certificates of SSL-enabled web sites that use Equifax, VeriSign, or Cybertrust certificates because these certificates are included in the default certificate store.

   For information about adding certificates, see Section E.2.3.1, "Adding Certificates for Trusted Sites."

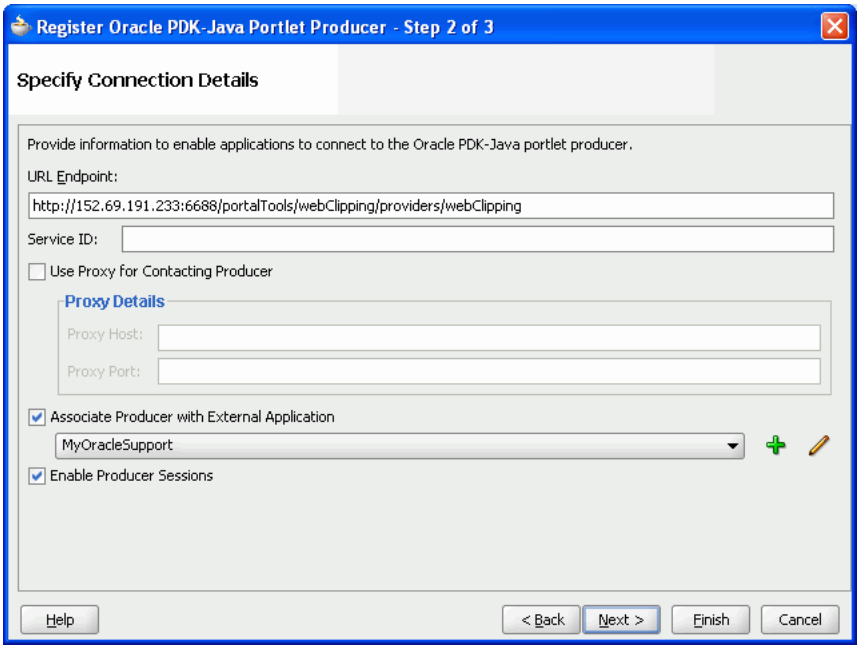
66.3 Integrating Authenticated Web Content Using Single Sign-On

You can leverage Oracle Single Sign-On to integrate content from external web sites that require authentication, into a Web Clipping portlet.

Note: You can associate only one external application with a producer. For each external application, you must register a new producer. Framework application users access the authenticated content by using their user name and password for that system, not your credentials.

To integrate an external application that requires authentication:

1. Open your Framework application in JDeveloper.



2. Register the external application, specifying the authentication information. For more information, see Section 69.13.3.2.1, "Registering an External Application in Oracle JDeveloper."

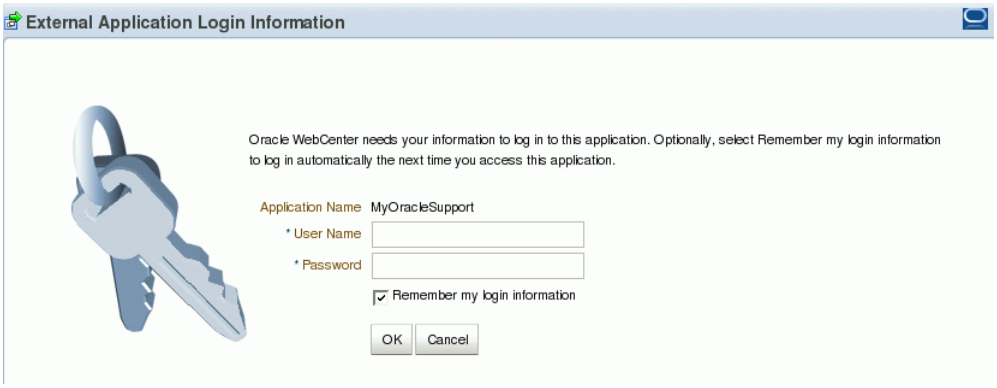
3. Register the Web Clipping producer. For information, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

   While registering the producer by using the Register Oracle PDK-Java Portlet Producer wizard, on the Specify Connection Details page, select the **Associate Producer with External Application** checkbox, and from the list of values, select the external application that you just registered. The **Enable Producer Sessions** checkbox gets selected automatically.

   Figure 66–1 shows the external application named MyOracleSupport associated with a Web Clipping producer.

Figure 66–1 Associating a Web Clipping Producer with an External Application

4. Add the Web Clipping portlet from the producer that you just registered to a `.jspx` page.



5. Right-click the `.jspx` page and choose **Run.**

6. If you did not specify shared or public credentials for the external application, then the portlet contains an **Update login information** link. Click this link.

7. Enter your credentials, and then click **OK** to log in to the external web site.

   Figure 66–2 shows the login screen of an external application named MyOracleSupport.

Figure 66–2 Logging into the Integrated External Application

8. Click the **Actions** icon on the header of the Web Clipping portlet, and select **Customize**.

   The Find a Web Clipping page displays, with the default URL for the external application displayed in the **URL Location** field (Figure 66–3).

Figure 66–3 Finding a Web Clipping

You can now select any section of a web page that you intend to display in your Web Clipping portlet. For information about how to customize a Web Clipping portlet, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

After you clip the required page of the external application, the web clipping, even though it is from a page requiring authentication, is available in your portlet.

66.4 Advanced Features of Web Clipping

Web Clipping supports certain advanced features. You can configure custom authentication methods by using the Web Clipping Transport API and rewrite image links to use a resource proxy.

This section includes the following subsections:

- Section 66.4.1, "Using the Web Clipping Transport API"
- Section 66.4.2, "Rewriting Image Links to Use a Resource Proxy"

66.4.1 Using the Web Clipping Transport API

To support custom authentication methods, you can use the Web Clipping Transport API. To extend the Web Clipping transport layer to support custom authentication methods, you must perform several implementation and deployment procedures.

This section includes the following subsections:

- Section 66.4.1.1, "Implementing the Web Clipping Transport API"
- Section 66.4.1.2, "Deploying the Web Clipping Transport API"

66.4.1.1 Implementing the Web Clipping Transport API

If you want to support a custom authentication method, such as Kerberos, you must first implement your own transport classes.

To implement custom transport classes:

1. Override two use cases of the `oracle.portal.wcs.transport.http.HttpTransportLiaison` interface.

   In Web Clipping, this interface is used to abstract the HTTP transport layer. By default, the two use cases of this interface are manifested by the following implementations:

   - `HttpClientStudioTransportLiaison`, which handles HTTP transport in Web Clipping Studio mode
   - `HttpClientProviderTransportLiaison`, which handles HTTP transport in Web Clipping Producer show mode

   To support more authentication methods, you must override the `addRequestHeaders` methods for both the Studio and Provider `HttpClientTransportLiaison` implementations to add your own authentication-specific headers. For more information, see the *Oracle WebLogic Server Web Clipping Transport API Reference*.

2. Compile the new subclasses and package them into a JAR file.

   For example, to compile the new subclasses, use the following command:

   ```
   javac -classpath path_to_wcejar -d classes/
   ```

   Where, *`path_to_wcejar`* refers to the path to the `wce.jar` file.

   To create the JAR file, for example, run the following command from the `classes` directory:

   ```
   jar cvf ../mytransport.jar
   ```

   Where, *`mytransport.jar`* refers to the JAR file users want to create.

66.4.1.2 Deploying the Web Clipping Transport API

After implementing the new transport classes, you must deploy the JAR file to support the custom authentication method.

To deploy the JAR file:

1. Place the JAR file into the class path or shared library that is used by the Web Clipping producer at runtime.
2. Register the transport class in the `web.xml` file for the Web Clipping producer by making the following modifications to the context parameters defined for

`HttpClientProviderTransportLiaison` and `HttpClientStudioTransportLiaison`:

- Change the parameter value for `oracle.webclipping.provider.TransportLiaisonClass` to the name of the new class extended from the `HttpClientProviderTransportLiaison` class.
- Change the parameter value for `oracle.webclipping.studio.TransportLiaisonClass` to the name of the new class extended from the `HttpClientStudioTransportLiaison` class.

3. Restart the producer server for the changes to take effect.

66.4.2 Rewriting Image Links to Use a Resource Proxy

Web Clipping enables you to rewrite image links to use a resource proxy. To enable this feature, you must add the following entry to the `web.xml` file of the Web Clipping producer:

```
<env-entry>
    <env-entry-name>oracle/webclipping/rewriteImageLink</env-entry-name>
    <env-entry-type>java.lang.Boolean</env-entry-type>
    <env-entry-value>false</env-entry-value>
</env-entry>
```

66.5 Current Limitations of Web Clipping

When you use Web Clipping, you should be aware of the following limitations.

- If the site that you intend to clip uses a large amount of JavaScript to manipulate cookies or uses the `document.write` JavaScript method to modify the HTML document being written, then you may not be able to clip content from the site.
- When you integrate with partner applications (by using `mod_osso`), you cannot clip directly through those partner applications in an authenticated manner. However, you can use partner applications through the external application framework.
- You cannot use the Web Clipping portlet to clip Oracle Portal pages and ADF pages. As a workaround, reregister the same producer in the destination portal and edit the portal manually.
- You cannot use the Web Clipping portlet to clip a web page that contains multiple frames, that is, a frameset.
- Note the following about Web Clipping and the use of a CSS:
  - If a web page contains multiple portlets that use a CSS, then they should not conflict if the CSS uses distinct style names, such as `OraRef`, to specify a style within an HTML tag, rather than using an HTML tag name, such as `<A>`, as the name of the style.
  - If one portlet uses a CSS, and that CSS overwrites the behavior of HTML tags by using the name of the tag, such as `<A>`, as the name of the style, and a second portlet on the same page does not use a CSS, the second portlet is affected by the style instructions of the CSS of the first portlet.
  - If two portlets on the same page use a different CSS and each CSS overwrites the behavior of HTML tags by using the name of an HTML tag, such as `<A>`,

as the name of the style, then the style that is displayed depends on the browser.

- Web Clipping checks for globalization support settings in the following way:
  1. Web Clipping checks the `Content-Type` in the HTTP header for the `charset` attribute. If this is present, then it assumes that this is the character encoding of the HTML page.
  2. If the `charset` attribute is not present, then Web Clipping checks the HTML `META` tag on the page to determine the character encoding.
  3. If the HTML `META` tag is not found, then Web Clipping uses the `charset` in the previous browsed page. If this is the first page, then it defaults to the ISO-8859-1 character encoding.
  4. If the value of the `charset` for `Content-Type` or `META` tag is not supported (for example, if the `charset` was specified as `NONE`), then Web Clipping uses the default character set, ISO-8859-1, not the `charset` in the previously browsed page.
- To use the Web Clipping portlet, you must use Netscape 7.0 or later, Microsoft Internet Explorer 5.5 or later for Windows 2000, or Microsoft Internet Explorer 6.0 or later for Windows XP. If you use browser versions older than these, then you may encounter JavaScript errors.

66.6 Troubleshooting Web Clipping

This section provides information to help you troubleshoot problems you may encounter while using Web Clipping.

Encountered "x" at line n, column n. Was expecting one of: "x", "y" ...

Parser error message written to the log file.

Problem

The web content displayed in the Web Clipping portlet contains invalid HTML or JavaScript.

Solution

This is a site-specific issue, not a Web Clipping error. Contact the site's administrator for assistance.

Part XI

Delivering Personalized Content

Part XI contains the following chapter:

- Chapter 67, "Personalizing WebCenter Portal Applications"
- Chapter 68, "Using Personalization APIs Externally"

67

Personalizing WebCenter Portal Applications

Personalization for WebCenter Portal delivers targeted content based on both user and application context. WebCenter Portal's Personalization also provides a run-time system and associated tools that allow the declarative definition of application flow.

This chapter describes how to integrate Personalization into a WebCenter Portal: Framework application and includes the following sections:

- Section 67.1, "Introduction to Personalization"
- Section 67.2, "Integrating Personalization in Your Application"
- Section 67.3, "Tutorial: Creating, Testing and Deploying a Simple Application"
- Section 67.4, "Extending Personalization"

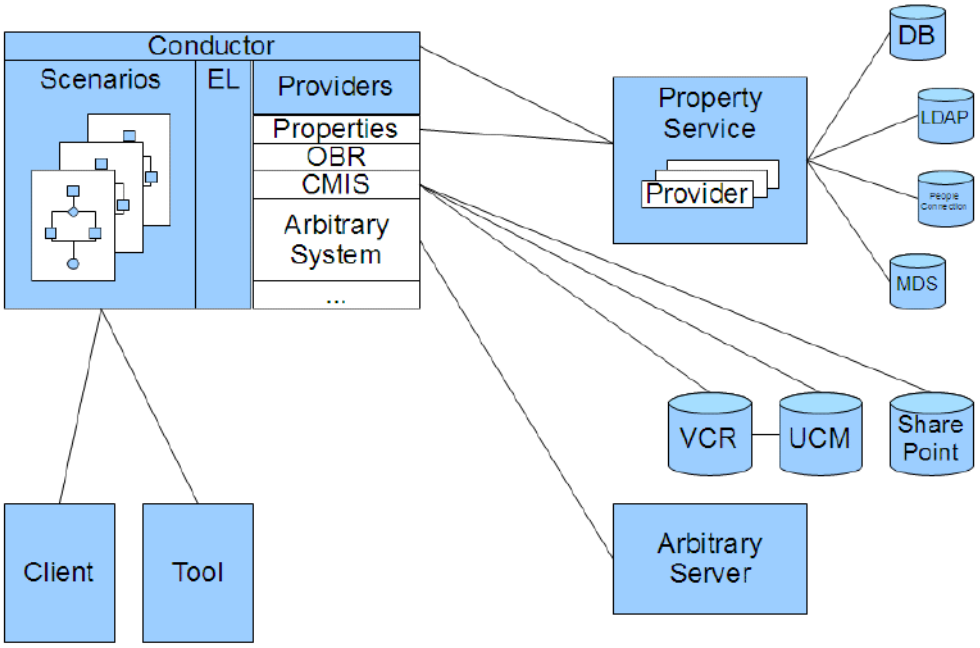
For more information about Personalization, see:

- Appendix G.9, "ELs Related to the Personalization Service"
- "Managing the Personalization Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*

67.1 Introduction to Personalization

Personalization provides a dynamically derived user experience for your WebCenter Portal application. Personalization evaluates defined sources of input data, generates a decision based on that evaluation, and applies this information to a declaratively defined Personalization scenario. Personalization, for example, can return content or change application flow based on information about a user in a Human Resources database, targeting the application experience for that specific user.

This section provides an overview of the features and requirements of Personalization, and contains the following subsections:



- Section 67.1.1, "Personalization Architecture"
- Section 67.1.2, "Personalization Conductor"
- Section 67.1.3, "Personalization Property Service"
- Section 67.1.4, "Personalization Providers"

67.1.1 Personalization Architecture

Figure 67–1 shows the architecture and out-of-the box services and components that comprise Personalization. These and other Personalization components are described in:

- Section 67.1.2, "Personalization Conductor"
- Section 67.1.3, "Personalization Property Service"
- Section 67.1.4, "Personalization Providers"

Figure 67–1 Personalization Services Architecture

67.1.2 Personalization Conductor

This section describes the role of the *Personalization Conductor*. The Conductor is the heart of the Personalization engine, and contains and runs the units of work called *scenarios*. The Conductor runs the prepared scenarios, and provides access to provider extensions that plug into the Conductor. These aspects of the Conductor are described in the following sections:

- Section 67.1.2.1, "Personalized Scenarios"
- Section 67.1.2.2, "Personalized Application Flow"
- Section 67.1.2.3, "Property Set Integration"
- Section 67.1.2.4, "Provider Integration"

67.1.2.1 Personalized Scenarios

A *scenario* is defined by a script you create using the Scenario Editor in JDeveloper (or provide as an XML file) based on a simple syntax that allows conditional statement evaluation resulting in the return (to the client) of some form of content. Based on function provider expressions, a script action may then return filtered content to the client application using a Data Provider and a query. A scenario, rather than returning

targeted content, can also be used to make dynamic changes to application flow, resulting in a personalized user experience within the application.

In JDeveloper, you can use the Scenario Editor to graphically design your scenario. You can also create XML file-based scenarios. See Section 67.2.2.4, "Specifying Scenario Flow Using Node Types" and Section 67.2.3, "Creating File-Based Scenarios" for more information about creating scenarios.

67.1.2.2 Personalized Application Flow

As well as returning content targeted to a specific user, scenarios executing within the Conductor can also control application flow, render user interface components, and execute application-related events. Using the Conductor's public Java and Expression Language (EL) API, you can provide seamless integration with an existing Java or Web-based application. See Chapter 68, "Using Personalization APIs Externally" for more information about using Java and EL APIs.

67.1.2.3 Property Set Integration

The Property Service uses *property sets* to organize sets of user or application data, and *property definitions* to assign a data type to property data. You can extend the Property Service to access additional user profile data in an enterprise LDAP repository, or to access additional repositories such as Oracle MDS. For more information about the Property Service and property sets, see Section 67.1.3, "Personalization Property Service."

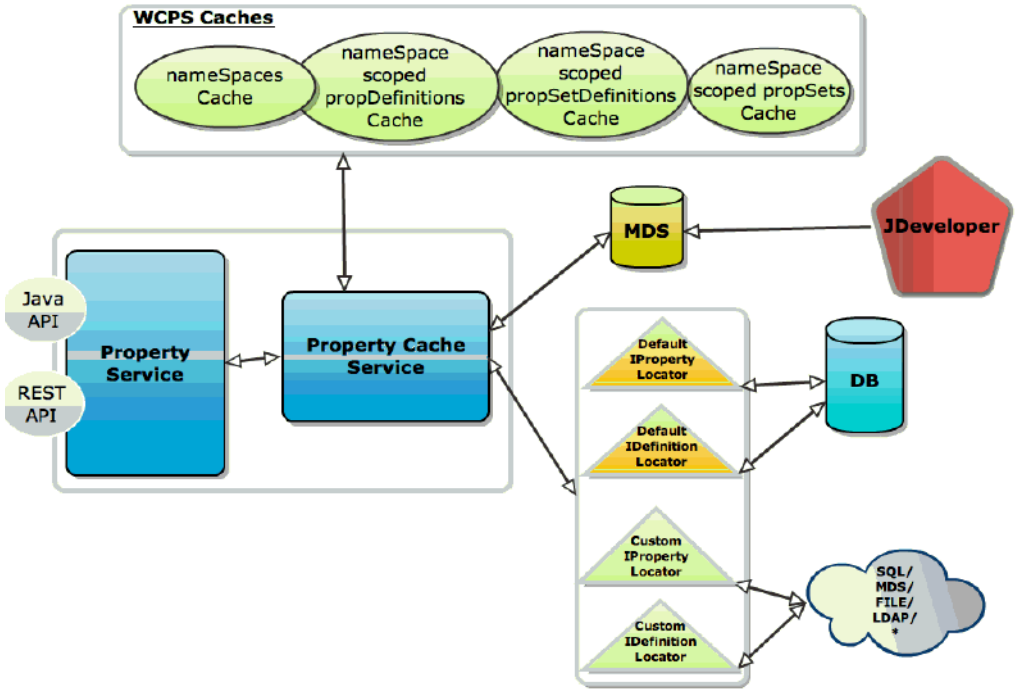
67.1.2.4 Provider Integration

Providers provide a way to access external resources within your scenario. As well as three out-of-the-box providers for the Property Service, Content Server Provider (CMIS), and Activity Graph, the Conductor also supports an extensible architecture that lets you implement and access custom providers from within your Scenarios. For more information about providers, see Section 67.1.4, "Personalization Providers."

67.1.3 Personalization Property Service

This section describes the *Personalization Property Service*. The Property Service provides a simple yet scalable way for developers to access user data.

This section includes the following subsections:



- Section 67.1.3.1, "Property Service Architecture"
- Section 67.1.3.2, "Property Sets"
- Section 67.1.3.3, "Property Locators"

67.1.3.1 Property Service Architecture

The Property Service uses Java and REST APIs to store and retrieve properties about a user, such as their age or gender, or other information such as the current time. These properties are part of a *property set*. A property set can have a schema defined (the schema defines types for properties), or it can be created on demand without a schema. A property set can have properties that are retrieved from different locations such as the Identity Store LDAP server, a file, or using a SQL query. For more information about using Java and REST APIs, see Chapter 68, "Using Personalization APIs Externally"

The Property Service uses the default Personalization cache (or Coherence cache if available) and by default stores property sets in a database. The Property Service is also extensible allowing additional repositories such as Oracle MDS to be configured.

Figure 67–2 Property Service Architecture

67.1.3.2 Property Sets

The Property Service uses *property sets* to organize sets of user or application data, and *property definitions* to assign a data type to property data. The existing user profile data in an enterprise LDAP repository can also be made accessible by extending the Property Service. See Section 67.2.2.5, "Defining Property Sets and Property Locators" for more information about the property sets. In a JDeveloper project for a WebCenter Portal application, the PropertySet Editor creates property namespace files containing `namespace`, `PropertySet`, and `Property` definitions.

67.1.3.3 Property Locators

A property locator is invoked by the Property Service to access external stores of properties. For example, Personalization provides an out-of-the-box People Connections property locator that uses the People Connections REST service to access profile information for users. For more information about property locators, see Section 67.2.2.5, "Defining Property Sets and Property Locators." For more information about the People Connections property locator, see Section 67.1.4.1.4, "People Connections Locator."

67.1.4 Personalization Providers

A provider is an interface point for the Conductor that lets it communicate with external services. Personalization provides out-of-the-box providers for the Property Service, Oracle WebCenter Content: Content Server, and Activity Graph, and a locator used by the Property Service provider to allow integration with People Connections.

There are also two types of custom providers you can implement: *data providers* and *function providers*.

This section describes the out-of-the-box providers and the two types of custom providers in the following subsections:

- Section 67.1.4.1, "Out-of-the-Box Providers"
- Section 67.1.4.2, "Custom Data Providers"
- Section 67.1.4.3, "Function Providers"

67.1.4.1 Out-of-the-Box Providers

This section describes the out-of-the-box providers you can access from within your scenarios, and a locator used by the Property Service provider to allow integration with People Connections.

This section contains the following subsections:

- Section 67.1.4.1.1, "Property Service Provider"
- Section 67.1.4.1.2, "CMIS Provider"
- Section 67.1.4.1.3, "Activity Graph Provider"
- Section 67.1.4.1.4, "People Connections Locator"

67.1.4.1.1 Property Service Provider

The Property Service Provider allows integration with the Property Service. This provider allows you to retrieve property sets for a particular property set definition, retrieve a property set by name, or return a specific property from a property set. For more information about the Property Service Provider, see Section 67.2.2.8.1, "Using the Property Service Provider."

67.1.4.1.2 CMIS Provider

The CMIS Provider provides services to retrieve and search for content from standards-based CMIS (Content Management Interoperability Services) content servers, specifically provided by the Oracle WebCenter Content Server. The CMIS Provider also has utility function providers to convert results to simplified form. For information about integrating the CMIS Provider, see Section 67.2.2.8.2, "Using the CMIS Provider." For information about creating and editing connection configuration for the Content Server provider, see "Configuring the REST Service Identity Asserter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

67.1.4.1.3 Activity Graph Provider

The Activity Graph Provider (ActivityGraphProvider) provides integration with the Activity Graph engine (the basis for the Activity Graph service), which provides recommendations about what a user may be interested in connecting with based on analytics within WebCenter. For example, the Activity Graph Provider method `recommendedUsers`, queries the Activity Graph engine for a list of users that a given user might want to connect with.

The Activity Graph engine provides a central repository for actions that are collected by enterprise applications. For more information about the Activity Graph service and the Activity Graph engine, see Section 46, "Integrating the Activity Graph Service."

The Activity Graph provider is built on two REST services for Activity Graph running on the WebCenter Portal: Spaces server, and consequently requires that WebCenter Portal: Spaces be installed in your environment. For more information about

integrating the Activity Graph provider in your scenario, see Section 67.2.2.8.3, "Using the Activity Graph Provider." For information about creating and editing connection configuration for the Activity Graph provider, see "Configuring the Activity Graph Provider" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

67.1.4.1.4 People Connections Locator

Although The People Connections locator is an ILocator used by the Property Provider to interface with the WebCenter People Connections service. One of the benefits of the People Connections service is that it can access user profile information stored on WebCenter Portal: Spaces. For more information about the People Connections service, see Part VI, "Working with the People Connections Service". For more information about the People Connections locator, see Section 67.2.2.8.1, "Using the Property Service Provider." For information about creating and editing connection configuration for the People Connections locator, see "Configuring the Oracle People Connections Locator" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

67.1.4.2 Custom Data Providers

A *data provider* is a component that plugs into the Conductor architecture and acts as a delegate for some service. Data returned from a data provider can be used as-is (Java classes), or chained to be used as input to other data providers in the same scenario.

The Property Service Provider, Activity Graph Provider, and the CMIS Provider are all examples of data providers that are available out-of-the-box. But data providers (`oracle.wcps.conductor.provider.IDataProvider`) also provide an extension point for the Conductor so that you can write a custom data provider to, for example, integrate with legacy systems or external data stores. You can then call your custom (or out-of-the-box) data provider using the `Invoke Provider` node from within a scenario.

Data providers typically operate on the input context of a given user or an external application data set (or both). Personalization includes a Property Service that can provide typed data storage for user or application data, and is accessible as input to providers. For more information about creating your own data provider, see Section 67.4.1, "Adding Custom Providers."

67.1.4.3 Function Providers

Function providers (`oracle.wcps.conductor.provider.IFunctionProvider`) also provide an extension point for the Conductor to create utility methods (for example, for data manipulation or transformation, or business rule calculation) that can be invoked using Expression Language (EL) expressions. A simple example might be: `${strings:concat('string1','string2')}`). The CMIS and Activity Graph providers each have their own function provider to facilitate data transformations, among other utilities. For more information about Personalization ELs, see Appendix G.9, "ELs Related to the Personalization Service."

67.2 Integrating Personalization in Your Application

This section describes how to integrate Personalization in your Framework application.

This section contains the following subsections:

- Section 67.2.1, "Personalization Requirements"

- Section 67.2.2, "Authoring Personalized Scenarios in JDeveloper"
- Section 67.2.4, "Displaying Targeted Content at Runtime"

67.2.1 Personalization Requirements

This section describes the design-time system requirements and dependencies for developing WebCenter Portal applications with JDeveloper that integrate Personalization services. For a complete list of requirements, dependencies, and options for Personalization, see "Personalization Prerequisites" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

- WebCenter Portal: Spaces must be installed if the CMIS Provider, Activity Graph Provider, or People Connections locator are being used in a scenario. Note that for basic iterative development WebCenter Portal: Spaces is not required to be installed on your domain.
- Before you can use REST APIs, you must take the steps outlined in "Before You Begin: Performing Required Configurations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- Personalization relies on WebCenter Trust Services to provide single sign-on (SSO) between different managed servers within the WebCenter domain, including the Oracle WebCenter Content: Content Server that is accessed through the CMIS Provider. For JDeveloper's integrated domain, the Trust Services must be configured using a WLST script (`configureWCPS.py`) located in the `DefaultDomain/scrpts-wcps` directory. For more information about configuring the WebCenter Trust Services and single sign-on using this script see "Configuring Single Sign-on" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- The REST service must be configured. For information about how to configure the REST service, see the chapter "Managing REST Services" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

Note: Although you can optionally include the out-of-the-box providers for Activity Graph and People Connections in your application, you will not be able to test results in JDeveloper. Note also that these providers are only partially configured, and you must complete their configuration as described in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* in the sections on "Configuring the Oracle People Connections Service" and "Configuring the Activity Graph Service."

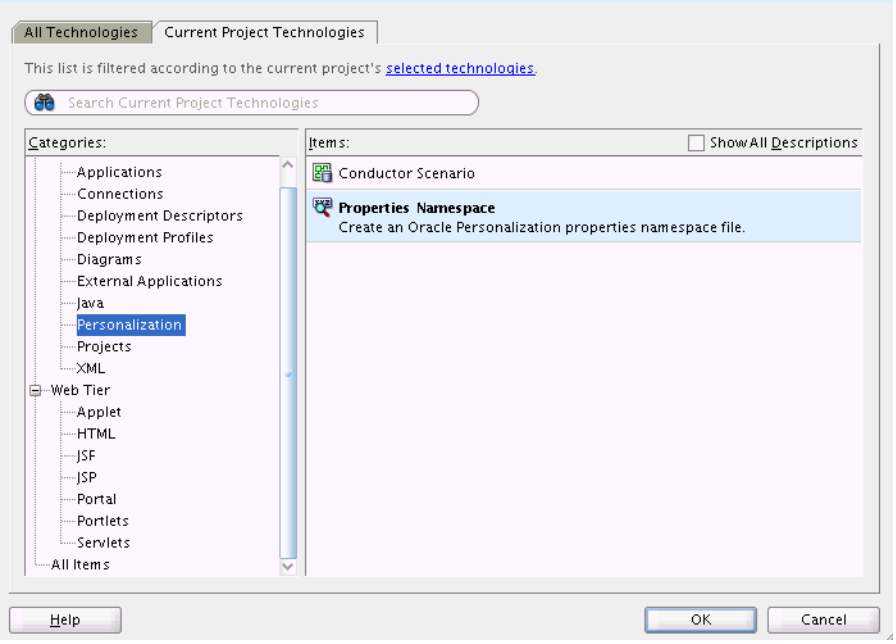
67.2.2 Authoring Personalized Scenarios in JDeveloper

This section describes how to author personalized scenarios using the Personalization tools in JDeveloper, and includes the following subsections:

- Section 67.2.2.1, "Creating a Properties Namespace"
- Section 67.2.2.2, "Creating Property Sets and Property Definitions"
- Section 67.2.2.3, "Creating a New Scenario in the Scenario Editor"
- Section 67.2.2.4, "Specifying Scenario Flow Using Node Types"
- Section 67.2.2.5, "Defining Property Sets and Property Locators"
- Section 67.2.2.6, "Implementing and Calling Function Providers"

- Section 67.2.2.7, "Implementing and Calling Data Providers"
- Section 67.2.2.8, "Using the Out-of-the-Box Providers"

67.2.2.1 Creating a Properties Namespace



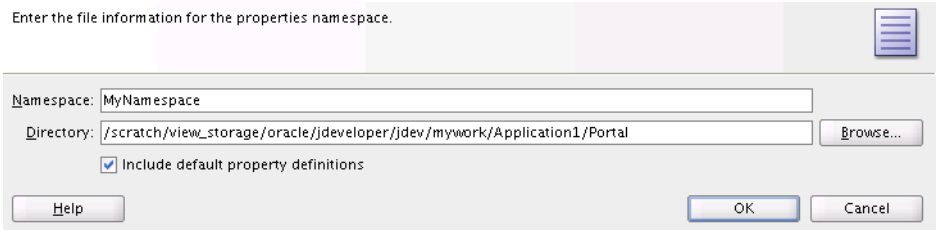
The Properties Namespace file contains the property definitions and property set definitions you define.

To create a Properties Namespace file in JDeveloper:

1. From within your application in JDeveloper, right-click the application in the navigation bar.

   The New Gallery dialog displays (see Figure 67–3).

Figure 67–3 New Gallery Dialog

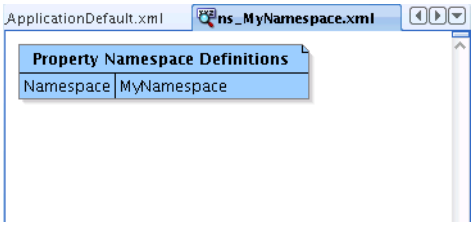


> **Note:** If the Personalization category doesn't display, open the All Technologies tab and select it, or click **selected technologies** and add the Personalization technology to the project.

2. Choose **Properties Namespace** and click **OK**.

   The Create Namespace dialog displays (see Figure 67–4).

Figure 67–4 Create Namespace Dialog



3. Enter a name for the namespace, select the **Include default property definitions** checkbox to add initial default property definitions to the namespace, and click **OK**.

   The **Include default property definitions** checkbox controls whether initial default property definitions are added to the namespace file. These are: `IntDef`, `NumberDef`, `StringDef`, `BooleanDef`, `DateTimeDef`, `ClobDef`, `IntArrayDef`, `NumberArrayDef`, `StringArrayDef`, `BooleanArrayDef`, `DateTimeArrayDef`, `ClobArrayDef`.

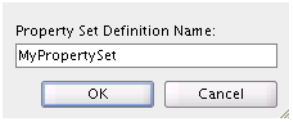
   The property definitions can be removed, if needed afterwards. Or, you can leave the checkbox unselected to start with no initial property definitions and create them as needed in the Scenario Editor.

   A graphic representation of the namespace file displays in the Design pane (see Figure 67–5).

Figure 67–5 Design Pane - Namespace Definition

4. Continue by defining the property sets and properties that you will need in your scenario as described in Section 67.2.2.2, "Creating Property Sets and Property Definitions."

67.2.2.2 Creating Property Sets and Property Definitions



Properties are the bits of data about someone or something on which, for example, you can base evaluations of conditionals in your scenario's flow. A property, for example, could contain a person's age or gender. A property set is simply a collection or container of related properties.

To define a property set and associated properties:

1. From within your application in JDeveloper, right-click the namespace in the Design pane, select **Create New Property Set Definition**, and click **OK**.

   The Create New Property Set dialog displays (see Figure 67–6).

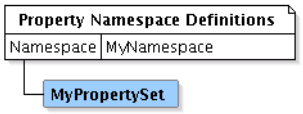


Figure 67–6 Create New Property Set Dialog

2. Enter a name for the property set and click **OK**.

   A node for the new property set displays in the Design pane (see Figure 67–7).

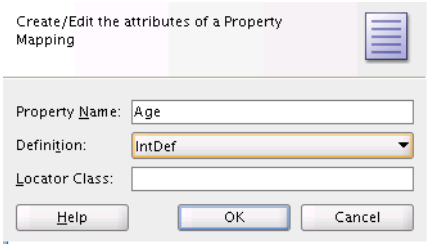

Figure 67–7 Design Pane - New Property Set Definition

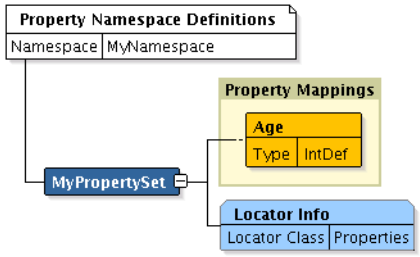
3. To add properties to the new property set, right-click the property set, and select **Create New Property Definition Mapping**.

   The Create Property Definition dialog displays (see Figure 67–8).

Figure 67–8 Create Property Definition



4. Enter a **Property Name** and **Definition** (the value type), and click **OK**.

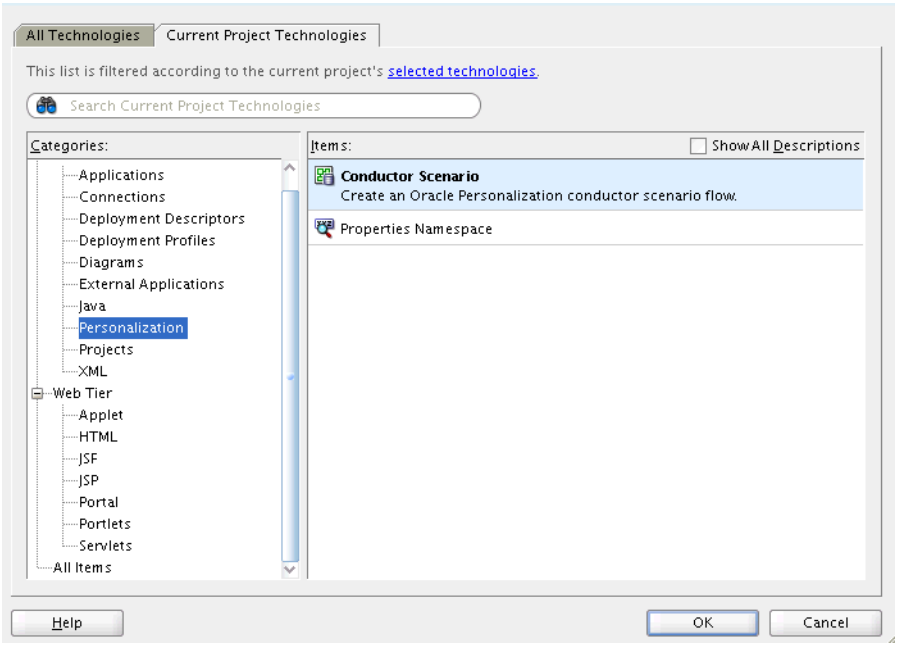
   To create a new property definition, select `New Definition` in the **Definition** drop down list.

   The new property appears as part of the property set's graphic representation (see Figure 67–9).

Figure 67–9 Design Pane - Property Definition

5. Add any additional properties required to the property set (or create new property sets) and then continue by creating the scenario as described in Section 67.2.2.3, "Creating a New Scenario in the Scenario Editor."

67.2.2.3 Creating a New Scenario in the Scenario Editor



The Conductor's Scenario Editor provides a visual tool for viewing and editing scenario definitions managed by the Conductor. The Scenario Editor stores scenarios in both file and visual formats and is available from within JDeveloper. Before creating a scenario, you should have created a namespace and at least some of the property sets and properties you need for the scenario.

To create a new scenario using the Scenario Editor in JDeveloper:

1. From within your application in JDeveloper, right-click the application in the navigation bar.

   The New Gallery dialog displays (see Figure 67–10).

Figure 67–10 New Gallery Dialog

> **Note:** If the Personalization category doesn't display, open the All Technologies tab and select it, or click **selected technologies** and add the Personalization technology to the project.

2. Select **Conductor Scenario** and click **OK**.

   The Scenario Definition dialog displays (see Figure 67–11).

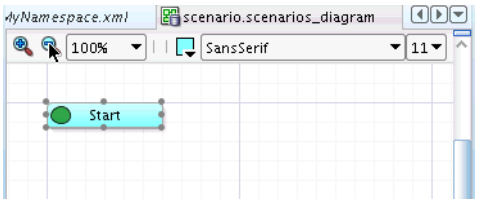


Figure 67–11 Scenario Definition Dialog

3. Select **Create a new conductor scenario file** and modify the file name and where the file is stored if necessary. Note that the scenario name's extension (`.scenarios_diagram`) cannot be changed.

   The Scenario Editor displays with a new Start node (see Figure 67–12).

Figure 67–12 Scenario Editor - Start Node

4. To add nodes to the scenario, right-click the node to which you want to add a new node, select **Add Following Statement**, and chose the node type from the list as shown in Figure 67–13.

Figure 67–13 Adding a Node in the Scenario Editor

Right-click the new node to expose options for setting node properties and extending the flow. For a description of available node types, see Section 67.2.2.4, "Specifying Scenario Flow Using Node Types."

67.2.2.4 Specifying Scenario Flow Using Node Types

The Scenario Editor uses a tree-structured fixed layout where the flow is represented by a combination of subtrees (for decisions) and internal label references to represent flow for loops and complex nested if/else decisions.

Node Types

- **Start:** The Start node is a root level node that defines where a scenario begins.
- **Return:** The Return node halts execution of the scenario, and returns the specified results of evaluation of an EL expression to the caller.
- **Variable Assignment:** The variable assignment node lets you define a variable that is scoped within the context of the currently running scenario and initialize it with an expression.
- **Execute:** The Execute node invokes a specified EL expression with no expected return value. Similar to Variable Assignment, only the results of the expression are not stored within the Scenario context.
- **Condition/Otherwise:** The Condition node evaluates an EL expression and executes the contained statements if the EL expression evaluate to true. Statements within the Otherwise block will only execute if all condition statements evaluate to false.
- **For Each:** For Each nodes are a matched pair of nodes that provide looping/iterating functionality over a collection of things.

- **While:** Provides looping/iterating functionality as long as a specified EL expression evaluates to true.
- **Raise Error:** Raise and throw an error with the specified error message
- **Invoke Provider:** Invokes a named implementation of IDataProvider. Results are stored within the context of the currently running Scenario.
- **Invoke Scenario:** Invokes another named Scenario within the same namespace. Results are stored within the context of the currently running Scenario

67.2.2.5 Defining Property Sets and Property Locators

The Property Editor lets you view and edit the property set definitions and their associated property definitions managed by the Property Service. The Property Editor communicates and persists data through the Property Service.

Property sets and properties within a property set can be stored in many different locations and formats, so a locator facility is needed to retrieve them. A default property set locator is provided that retrieves and stores property set data to a pre-configured database. This default locator is used when no other is specified for the property set.

A custom locator for the People Connections service is also provided out-of-the-box (for more information, see Section 67.1.4.1.4, "People Connections Locator"), but you may want to define additional locators for other data sources. You can define multiple locators for properties and property sets, and they can also be defined in order of precedence. For step-by-step instructions for how to implement a locator see Section 67.4.2, "Adding Custom Locators."

67.2.2.6 Implementing and Calling Function Providers

The `IFunctionProvider` is a marker interface that allows utility code to be accessible from the Expression Language services within the Conductor. Implementations of `IFunctionProvider` contain annotated public and static methods. Example 67–1 shows an example function provider:

Example 67–1 Example Function Provider

```
@FunctionProvider
(
    prefix="interpreter",
    resourceBundle="sample.InterpreterResources",
    nameBundleKey="provider.name",
    descriptionBundleKey="provider.description"
)
public class InterpreterProvider
implements IFunctionProvider
{

    @PublicFunction
    (
        functionName="english",
        descriptionBundleKey="english.description"
    )
    public static String
        interpretEnglish(@PublicParameter(parameterName="phrase",

descriptionBundleKey="phrase.description")String phrase)
    {
        String result = "Not Understood";
```

```
        if ("Bonjour".equals(phrase))
        {
           result = "Hello";
        }

        return result;
    }

    @PublicFunction
    (
        functionName="french",
        descriptionBundleKey="french.description"
    )
    public static String
        interpretFrench(@PublicParameter(parameterName="phrase",

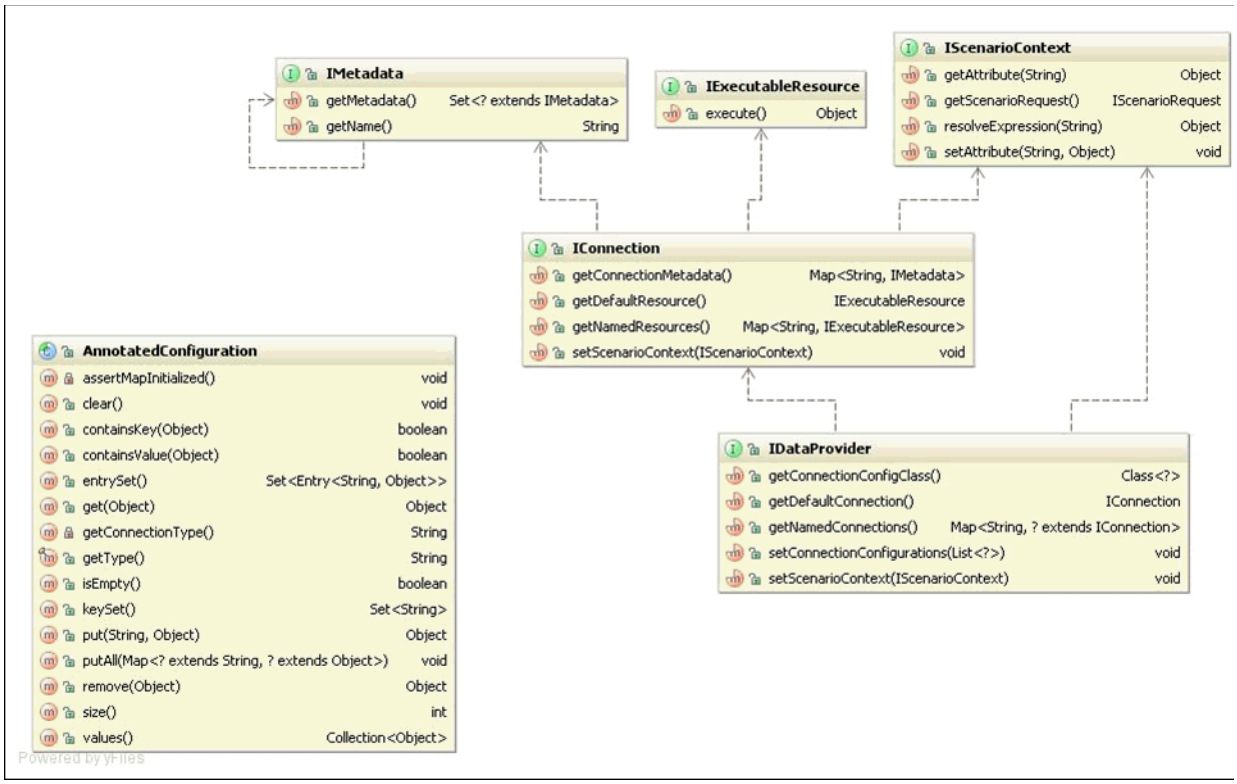
descriptionBundleKey="phrase.description")String phrase)
    {
        String result = "Non compris";

        if ("Hello".equals(phrase))
        {
           result = "Bonjour";
        }

        return result;
    }
}
```

You would call the function provider in Example 67–1 using the following expression syntax:

```
${interpreter:english("Bonjour")}
${interpreter:french("Hello")}
```



Here is an example of how to assign a variable to the results of a function provider based on Example 67–1:

```
<assign-variable>
     <variable>greetings</variable>
    <expression>${interpreter:english("Bonjour")}</expression>
</assign-variable>
```

67.2.2.7 Implementing and Calling Data Providers

Data provider implementations are a more structured way of integrating custom functionality with scenario execution. Unlike function providers, data providers have access to a connection configuration framework built into the Conductor so that environment-specific configuration data can be used. The following diagram illustrates the class interaction for data providers:

Figure 67–14 Class Interaction for Data Providers

IDataProvider

Data providers are responsible for returning abstract named connection implementations of `IConnection`. These named connections are usually backed by environmental configurations provided by the Conductor's connection configuration service, but do not have to be. Should the data provider happen to use the configuration service, the implementation must return a class that extends `oracle.wcps.connection.configuration.AnnotatedConfiguration` from the `getConnectionConfigClass()` method. This class must contain public annotated fields that represent configuration data specific to the data provider.

IConnection

Implementations of `oracle.wcps.conductor.provider.IConnection` are responsible for returning (named and default) Executable Resources. Each instance of `IConnection` can represent a single connection configuration and should be constructed within the instance of `IDataProvider` (not static).

IExecutableResource

Implementations of `oracle.wcps.conductor.provider.IExecutableResource` contain most of the integration code with the external system and the instance should be constructed within the instance of `IConnection` (not static). The default method from within `IExecutableResource` is the `execute` method that takes no arguments, but custom annotated methods can be written within the implementation if `IExecutableResource` and exposed to scenario execution. For example, the following custom method can be invoked from a scenario:

```
@PublicFunction
            (
```

```
                functionName="custom",
                descriptionBundleKey="customFunction.description"
        )
    public String callCustomMethod(@PublicParameter(parameterName="customParam",
        descriptionBundleKey="customParam.description") String param)
    {
        return param + " Results";
    }
```

Here is how the provider with the custom method is invoked from within the scenario:

```
    <call-provider>
        <provider-name>myCustomProvider</provider-name>
        <connection-name>${connectionName}</connection-name>
        <method-name>custom</method-name>
        <variable>searchResults</variable>
        <input>
            <parameter>
                <common:name>customParam</common:name>
                <common:value>${someScenarioVariable}</common:value>
            </parameter>
        </input>
    </call-provider>
```

67.2.2.8 Using the Out-of-the-Box Providers

Personalization provides three providers out-of-the-box providers for use within scenarios: the Property Service Provider, the Content Server Provider (CMIS), and Activity Graph. This section describes how you can integrate these providers in your application in the following subsections:

- Section 67.2.2.8.1, "Using the Property Service Provider"
- Section 67.2.2.8.2, "Using the CMIS Provider"
- Section 67.2.2.8.3, "Using the Activity Graph Provider"

67.2.2.8.1 Using the Property Service Provider

The Property Service Provider (`oracle.PropertiesServiceProvider`) allows integration with the Personalization Server Property Service. This provider lets you to retrieve property sets for a particular property set definition, retrieve a property set by name, or return a specific property from a property set. If you are using the People Connections locator to integrate profile data into your scenario, then you must configure the Property Service before using it. For more information about the People Connections locator, see Section 67.1.4.1.4, "People Connections Locator." For information about configuring the Property Service provider, see "Configuring the Oracle People Connections Locator" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

67.2.2.8.2 Using the CMIS Provider

The CMIS provider (`CMISProvider`) provides services to search for and retrieve content from standards-based CMIS (Content Management Interoperability Services) content servers. For WebCenter, this is specifically provided by the Oracle WebCenter Content: Content Server. The CMIS provider also has a utility function provider (`CMISFunctionProvider`) to convert results to simplified form. Before trying the examples below, be sure to configure your CMIS provider connection as shown in the section on "Configuring the CMIS Provider" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

Example CMIS Provider Scenario

Create a scenario using the following (remember to set the `content-type` of `application/xml`):

Request URI:

```
POST http://localhost:8891/wcps/api/conductor/namespaces/myNameSpace/scenarios
```

Request Body:

```
<scenarioMetadata>
<scenario xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"
xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <body>
    <call-provider>
      <provider-name>CMISProvider</provider-name>
      <connection-name>CmisConfigConnection</connection-name>
      <variable>exprString</variable>
      <input>
        <parameter>
            <common:name>search</common:name>
            <common:value>SELECT * FROM cmis:document WHERE cmis:name LIKE
'flowers'</common:value>
        </parameter>
      </input>
    </call-provider>
    <return>
      <expression>${exprString}</expression>
    </return>
  </body>
  <name>CMIS Scenario</name>
  <comments>CMIS Scenario comments</comments>
  <tags>
    <tag>CMIS Scenario tag</tag>
  </tags>
</scenario>
</scenarioMetadata>
```

Executing the Scenario

Request URI:

```
POST
http://localhost:8891/wcps/api/conductor/namespaces/myNameSpace/scenarios/CMIS%20S
cenario
```

Request Body:

```
<parameters/>
```

Using the CMISFunctionProvider

A function provider is a utility class that can be invoked from within a scenario. The `CMISFunctionProvider` supports several methods (see the JavaDoc for the class for more information). Here are two example methods:

```
/**
     * Convert the array of input IDs to a CMIS query in the form of 'IN'
     * @param ids Array of document IDs, in the form of dDocName only
     * @return CMIS query String
     */
public static String getCMISQueryForDocIDs(
```

```
@PublicParameter(parameterName="repository",descriptionBundleKey="getCMISQueryForD
ocIDs.parameter.description.inputList") String repository,

@PublicParameter(parameterName="ids",descriptionBundleKey="getCMISQueryForDocIDs.p
arameter.description.inputList") List<String> ids))
...

/**
     * Convert the array of input IDs to a CMIS query in the form of 'IN'
     * @param ids, in the form of a WebCenter document ObjectURN.  For example:
stanl18-ucm11g#dDocName:MOUNTAINS
     * @return CMIS query String
     */
 public static String
    getCMISQueryForDocIDsFromFullID(@PublicParameter(parameterName="ids",

descriptionBundleKey="getCMISQueryForDocIDs.parameter.description.inputList")
List<String> ids)
```

Using the CMISFunctionProvider in a Scenario

The following scenario snippet shows how data might be fed into the `CMISFunctionProvider` to create a CMIS query for multiple nodes, where the query is then sent to the CMIS provider. (In a more realistic case, rather than generate the data, we could have passed the results from an Activity Graph provider call, for example.)

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <comments>testFunctionProviderScenario4 comments</comments>
  <body>
   <assign-variable>
      <variable>ids</variable>

```

67.2.2.8.3 Using the Activity Graph Provider

The Activity Graph Provider (`ActivityGraphProvider`) provides integration with the Activity Graph service, which provides recommendations based on analytics within WebCenter. Before attempting the examples below, be sure to configure the connection for the Activity Graph service as shown in the section on "Configuring the Activity Graph Provider" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

Example Activity Graph Provider Scenario

Create a scenario using the following (remember to set the `content-type` of `application/xml`):

Request URI:

```
POST http://localhost:8891/wcps/api/conductor/namespaces/default/scenarios
```

Request Body:

```
<scenarioMetadata>
<scenario xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0">
    <body>
        <call-provider>
            <provider-name>ActivityGraphProvider</provider-name>
            <connection-name>ActivityGraphConfigConnection</connection-name>
            <resource-name>QueryCommonItems</resource-name>
            <method-name>queryCommonItems</method-name>
            <variable>providerResults</variable>
            <input>
                <parameter>
                    <common:name>sourceClassURN</common:name>
                    <common:value>WC.user</common:value>
                </parameter>
                <parameter>
                    <common:name>sourceObjectURN</common:name>
                    <common:value>carl</common:value>
                </parameter>
                <parameter>
                    <common:name>targetClassURN</common:name>
                    <common:value>WC.user</common:value>
```

```
                </parameter>
                <parameter>
                    <common:name>targetObjectURN</common:name>
                    <common:value>monty</common:value>
                </parameter>
                <parameter>
                    <common:name>similarityURN</common:name>
                    <common:value>user-edit</common:value>
                </parameter>
            </input>
        </call-provider>
        <return>
            <expression>${providerResults}</expression>
        </return>
    </body>
    <name>QueryCommonItemsScenario</name>
    <comments>QueryCommonItemsScenario comments</comments>
    <tags>
        <tag>invoke</tag>
        <tag>sample</tag>
        <tag>provider</tag>
        <tag>resource</tag>
        <tag>input</tag>
        <tag>parameters</tag>
        <tag>overloaded</tag>
    </tags>
</scenario>
</scenarioMetadata>
```

Executing the Scenario

Before continuing, you must set the header values: `Accept=application/xml` and `content-type=application/xml`.

Request URI:

```
POST
http://localhost:8891/wcps/api/conductor/namespaces/default/scenarios/QueryCommonI
temsScenario
```

Request Body:

```
<parameters/>
```

Using the AGFunctionProvider

A function provider is a utility class that can be invoked from within a scenario. The `AGFunctionProvider` supports these methods:

```
/**
     * Return the value of 'ObjectURN', only for WC.document, from the input
Object.
     * @param agResults From call to 'QueryRecommendations' or QueryItems.  Can be
one of the following Classes:
     *
     * From AG REST 'recommendations'
     * <ul>
     *   <li> Recommendations
     *   <li> RecommendedItems
     *   <li> List<Recommendation>
     * </ul>
     *
```

```
     * From AG REST 'items'   (common items)
     * <ul>
     *   <li> Results
     *   <li> Items
     *   <li> List<Item>
     * </ul>
     *
     * @param dDocNameOnly  If true, just the last part of the ObjectURN for
     * document will be returned; otherwise, the entire ObjectURN will be.
     * For example, if ObjectURN is example-ucm11g#dDocName:EXAMPLEACL000116,
     * if this value is 'true', then only EXAMPLEACL000116 will be returned.
     * Otherwise, all of stanl18-ucm11g#dDocName:EXAMPLEACL000116 is returned.
     *
     * @return a List of ObjectURN representing the document ID
     */
    @PublicFunction

    public static List<String> getDocumentIDs(
@PublicParameter(parameterName="agResults",descriptionBundleKey="getContentIDs.par
ameter.description.inputList")Object agResults,
 @PublicParameter(parameterName="dDocNameOnly",
descriptionBundleKey="getContentIDs.parameter.description.inputList")boolean
dDocNameOnly)
    {
...

/**
     * Return the value of 'ObjectURN' for the 'ClassURN' from the input Object.
     * @param agResults From call to 'QueryRecommendations' or QueryItems.  Can be
one of the following Classes:
     *
     * From AG REST 'recommendations'
     * <ul>
     *   <li> Recommendations
     *   <li> RecommendedItems
     *   <li> List<Recommendation>
     * </ul>
     *
     * From AG REST 'items'   (common items)
     * <ul>
     *   <li> Results
     *   <li> Items
     *   <li> List<Item>
     * </ul>
     *
     * param filterClassURN return content only of this type.  Examples are:
WC.wiki-page, WC.group-space, WC.user, WC.blog,
     * WC.topic, WC.document.  If this is null, return all types.
     *
     * @return a List of ObjectURN representing the item identifier.
     */
    @PublicFunction
            (
                    functionName="getContentIDs",
                    descriptionBundleKey="getContentIDs.method.description"
            )
    public static List<String>
getContentIDs(@PublicParameter(parameterName="agResults",

descriptionBundleKey="getContentIDs.parameter.description.inputList")Object
```

```
agResults,

@PublicParameter(parameterName="filterClassURN",

descriptionBundleKey="getContentIDs.parameter.description.filterClassURN") String
filterClassURN)
    ...

/**
     * Filter recommendations by score.  Only those recommendations with a score
>= the cutoff will be preserved.
     */
    @PublicFunction
            (
                    functionName="filterRecsByScore",
                    descriptionBundleKey="filterRecsByScore.method.description"
            )
    public static Recommendations filterRecsByScore(
            @PublicParameter(parameterName="recommendations",
            descriptionBundleKey="filterRecsByScore.parameter.description.agRecs")
Recommendations recs,
            @PublicParameter(parameterName="cutoffScore",

descriptionBundleKey="filterRecsByScore.parameter.description.cutoffScore") float
cutoffScore
            )
    {
```

Using the AGFunctionProvider in a Scenario

In the following scenario, a call is first made to the Activity Graph REST service. The results of that call are in the `agRecommendations` variable. The next call in the scenario is to the `AGFunctionProvider.getContentIDs()` method, passing in the results of the `agRecommendations` (an Activity Graph object), and returning a `List<String>` of document IDs, held in the evaluation of the `expressions` call.

```
<expression>${agfunction:getContentIDs(agRecommendations,'WC.user')}</expression>

 <scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
    <comments>CallProviderScenario comments</comments>
    <body>
        <call-provider>
            <provider-name>ActivityGraphProvider</provider-name>
            <connection-name>AgTestServerConnection</connection-name>
            <resource-name>QueryRecommendations</resource-name>
            <method-name>getRecommendationsUsingDefaultRecipe</method-name>
            <variable>agRecommendations</variable>
            <input>
                <parameter>
                    <common:name>classURN</common:name>
                    <common:value>WC.user</common:value>
                </parameter>
                <parameter>
                    <common:name>objectURN</common:name>
                    <common:value>carl</common:value>
                </parameter>
            </input>
        </call-provider>
```

```
          <!-- Now call function provider to translate into user IDs.  A more
specific call is available for WC.document; this just tests
         the ability of the function provider to handle different types of content
-->
        <return>

<expression>${agfunction:getContentIDs(agRecommendations,'WC.user')}</expression>
        </return>
    </body>
    <name>CallProviderScenario</name>
</scenario:scenario>
```

67.2.3 Creating File-Based Scenarios

As well as using the Scenario Editor, you can also create file-based scenarios in XML format. Note that file-based scenarios are only supported through the Conductor's import/export function and JDeveloper MDS integration. To import a file-based scenario into the Scenario Editor, select the **Create from file** option when you create the scenario.

Table 67–1 shows the statements that make up the contents of a scenario file. For more detailed information about the statements, refer to the node descriptions in Section 67.2.2.4, "Specifying Scenario Flow Using Node Types."

Table 67–1 Scenario Statements

Statement	Description	Example

Variable Assignment	Creates a variable that is scoped within the context of the currently running scenario.	`<assign-variable>`
		`<variable>index</variable>`
		`<expression>3</expression>`
		`</assign-variable>`

Execute	Invokes a specified EL Expression with no expected return value. Similar to Variable Assignment, only results of the expression are not stored within the Scenario Context.	`<execute>`
		`<comments>Adds to an existing collection.</comments>`
		
		`<expression>${collections:append(responses,'The outlook is not so good.')}</expression>`
		`</execute>`

Table 67–1 (Cont.) Scenario Statements

Statement	Description	Example

Condition/Otherwise	Evaluates an EL expression and executes the contained statements should the EL expression evaluate to true. Statements within the otherwise block will only execute if all condition statements evaluate to false.	`<conditions>`
		`<body>`
		`<condition>`
		`<body>`
		`<assign-variable>`
		
		`<variable>customerType</variable>`
		`<expression>Great Customer</expression>`
		`</assign-variable>`
		`</body>`
		
		`<expression>${customer.totalMoneySpent >= 100000}</expression>`
		`</condition>`
		`<otherwise>`
		`<body>`
		`<assign-variable>`
		
		`<variable>customerType</variable>`
		`<expression>Good Customer</expression>`
		`</assign-variable>`
		`</body>`
		`</otherwise>`
		`</body>`
		`</conditions>`

ForEach	Provides looping/iterating functionality over a collection of things.	`<for-each>`
		`<body>`
		`<execute>`
		`<comments>`
		`Let's send each great customer an email, thanking them for their loyalty.`
		`</comments>`
		`<expression>`
		
		`${emailService:sendMail(customer,'Subject:Thanks for being a great customer')}`
		`</expression>`
		`</execute>`
		`</body>`
		`<variable>customer</variable>`
		
		`<max-iterations>10</max-iterations>`
		`<items>${greatCustomers}</items>`
		`</for-each>`

Table 67–1 (Cont.) Scenario Statements

Statement	Description	Example

While	Provides looping/iterating functionality as long as the specified EL expression evaluates to true.	`<while>`
		`<body>`
		`<assign-variable>`
		`<comments>Sum up customer invoices to arrive at customer total expenditure.</comments>`
		`<variable>customerTotalSpent</variable>`
		`<expression>${customerTotalSpent+order.invoiceTotal}</expression>`
		`</assign-variable>`
		`</body>`
		`<expression>${customer.id = currentCustomerId }</expression>`
		`<max-iterations>-1</max-iterations>`
		`</while>`

Invoke Scenario	Invokes another named scenario within the same namespace. Results are stored within the context of the currently running scenario.	`<call-scenario >`
		`<variable>greeting</variable>`
		`<scenario>randomGreetingGenerator</scenario>`
		`<input>`
		`<parameter>`
		`<ns2:name>greetingsList</ns2:name>`
		`<ns2:value>hello, Bonjour, Buenos días</ns2:value>`
		`</parameter>`
		`</input>`
		`</call-scenario>`

Invoke Provider	Invokes a named implementation of IDataProvider. Results are stored within the context of the currently running scenario	`<call-provider>`
		`<provider-name>CRM_Provider</provider-name>`
		`<connection-name>crm_db</connection-name>`
		`<resource-name>getGreatCustomers</resource-name>`
		`<variable>greatCustomers</variable>`
		`<input>`
		`<parameter>`
		`<ns2:name>minMoneySpent</ns2:name>`
		`<ns2:value>100000</ns2:value>`
		`</parameter>`
		`</input>`
		`</call-provider>`

Table 67–1 (Cont.) Scenario Statements

Statement	Description	Example

Return	Returns the specified results of evaluation of an EL Expression.	`<return>`
		`  <comments>Return the sales rep who sold the most widgets this month.</comments>`
		
		`<expression>${bestSalesRep.id}</expression>`
		`</return>`

Raise Error	Raise and throw an error with the specified error message	`<raise-error>`
		`  <comments>User is unathorized, so let's return a 401.</comments>`
		`  <statusCode>401</statusCode>`
		`  <message>User ${ScenarioContext.scenarioRequest.userPrincipal.name} is unauthorized to execute this scenario.</message>`
		`</raise-error>`

Example 67–2 Example File-based Scenario

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <comments>sampleScenarioWithIf comments</comments>
  <body>
    <assign-variable>
      <variable>index</variable>
      <expression>3</expression>
    </assign-variable>
    <conditions>
      <body>
        <condition>
          <body>
            <assign-variable>
              <variable>ResultVar</variable>
              <expression>conditionSatisfied</expression>
            </assign-variable>
          </body>
          <expression>${index == 3}</expression>
        </condition>
        <otherwise>
          <body>
            <assign-variable>
              <variable>ResultVar</variable>
              <expression>otherwiseInvoked</expression>
            </assign-variable>
          </body>
        </otherwise>
      </body>
    </conditions>
    <return>
      <expression>${ResultVar}</expression>
    </return>
  </body>
  <name>sampleScenarioWithIf</name>
  <tags>
```

```
    <tag>if</tag>
    <tag>condition</tag>
    <tag>otherwise</tag>
  </tags>
</scenario:scenario>
```

67.2.4 Displaying Targeted Content at Runtime

This section describes how targeted content is displayed using the Content Presenter to the user at runtime for WebCenter Portal: Spaces and WebCenter Portal: Framework applications. It also describes how you can use REST APIs to create your own user interface for presenting content.

This section contains the following subsections:

- Section 67.2.4.1, "Presenting Content with Content Presenter"
- Section 67.2.4.2, "Presenting Content with a Custom User Interface"

67.2.4.1 Presenting Content with Content Presenter

Content Presenter is tightly integrated with the Conductor's dynamic content query generation and enables simple surfacing of dynamic content. For more information about using Content Presenter in your application, see Chapter 29, "Creating Content Presenter Display Templates."

For information about using Expression Language expressions in WebCenter Portal: Spaces to access a Personalization server scenario, see "Personalizing Pages" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

67.2.4.2 Presenting Content with a Custom User Interface

Using REST APIs, you can create your own user interface for presenting content rather than using Content Presenter. For more information about REST APIs, see Chapter 54, "Using Oracle WebCenter Portal REST APIs."

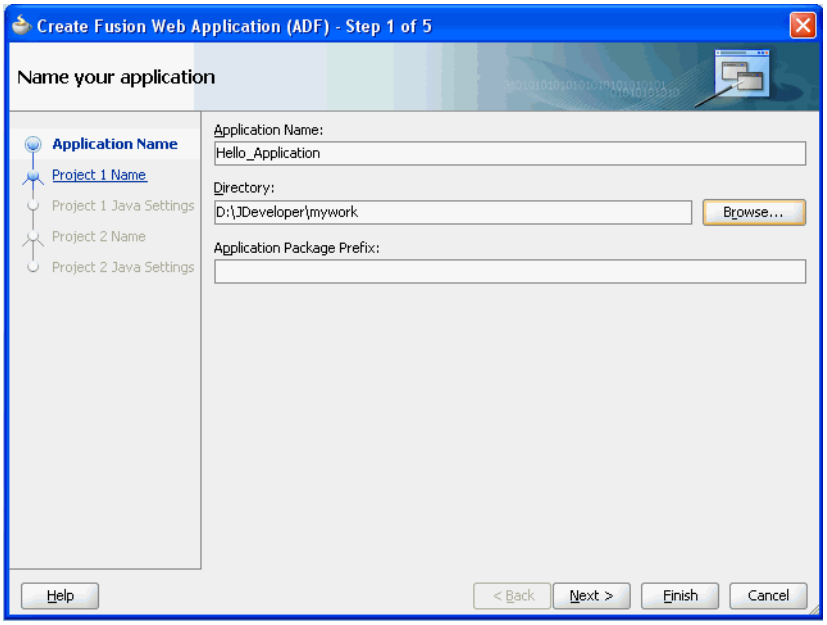
67.3 Tutorial: Creating, Testing and Deploying a Simple Application

This section describes how to create a simple application in JDeveloper containing a scenario that returns a simple string (`"Hello World"`). You'll then test the results of that scenario by adding it to a JSP page, and run the application in the integrated WebLogic server to display the results in a browser.

This section also covers the steps to configure and start the integrated WebLogic server, define a connection to the Personalization Server Conductor, and how to deploy the scenario and JSP artifacts to the server domain for testing.

> **Note:** as a prerequisite to to this tutorial, you should already have installed WebCenter Portal's extension for Oracle JDeveloper (`oracle.webcenter.framework_bundle.zip`). If you have not already added this extension, use the Update Wizard in JDeveloper to check for updates by clicking **Check for Updates** from the **Help** menu.

1. Create a simple WebCenter Portal application (`Hello_Applicaton`) using the default options and technologies.
   a. From the File menu select New...



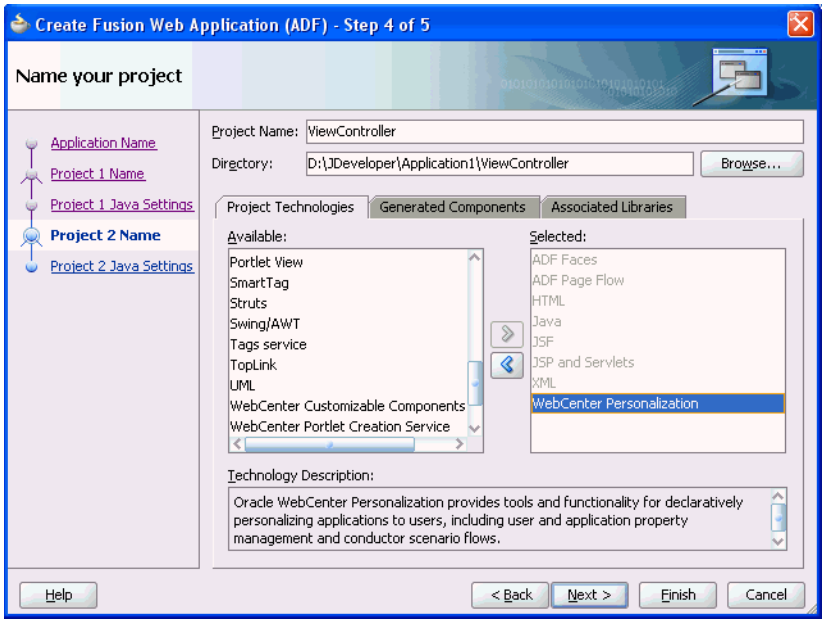
The New Gallery appears.

b. From the All Technologies tab, select Applications.

c. Select `Fusion Web Application (ADF)` from the list and click OK.

The Create Fusion Web Application (ADF) wizard appears (see Figure 67–15).

Figure 67–15 Creating the Hello_Application - Step 1



d. Enter the Application Name as `Hello_Application`.

e. Click Next until you arrive at `Step 4 of 5`, the wizard page for the `Portal` project.

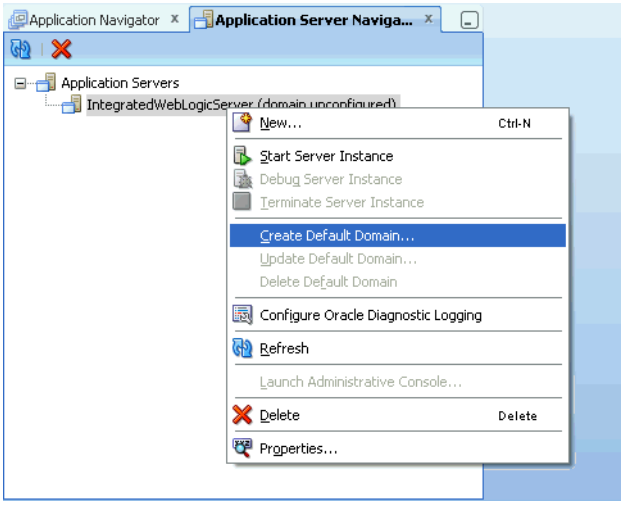
The Project Technologies tab displays a list of available technologies to install for the application.

Figure 67–16 Creating the Hello_Application - Step 4

f. Add `Webcenter Personalization` to the list of selected technologies for the `Portal` project, and click Finish to create the configured `Hello_Application` application.

2. Configure JDeveloper's integrated server's (integrated WLS) default domain.

The domain will automatically be extended to include necessary server artifacts required for running the Personalization components (i.e., the Personalization Conductor and the Property Service).



a. From the View menu, select `Application Server Navigator` and expand the `Application Servers` tree node to display the `IntegratedWeblogicServer`.

The current status should be `(domain unconfigured)`.

b. Right-click `IntegratedWeblogicServer` to display the context menu and select `Create Default Domain...`

The status displays `(domain building)` and the Message Log window displays the output as the domain is being built. Wait for the domain to finish building. This may take some time to complete. When complete, the message log should display `"Integrated Weblogic domain processing completed successfully."`

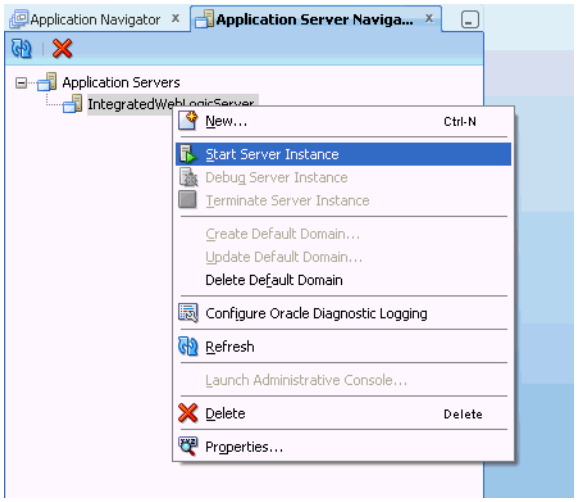


Figure 67–17 Application Server Navigator - Creating the Default Domain

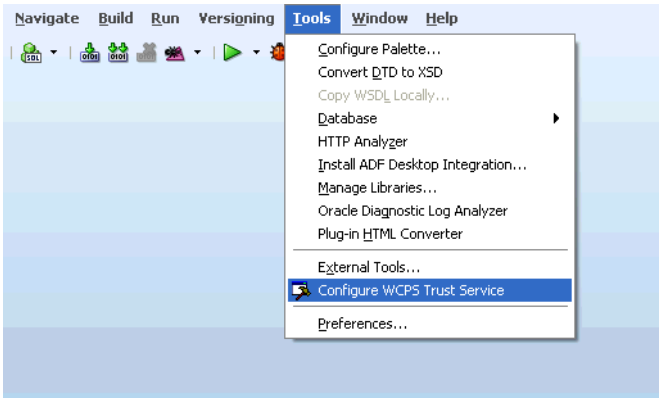
c. Start the server by right-clicking `IntegratedWeblogicServer` to display the context menu, and selecting Start Server Instance.

The `Running: IntegratedWeblogicServer - Log` view should appear and display output as the server is starting. Wait for the server to finish starting. This may take some time to complete. When complete, the IntegratedWeblogicServer Message Log should display `IntegratedWebLogicServer started`.

Figure 67–18 Application Server Navigator - Starting the Server



3. Configure the Personalization (WCPS) Trust service on the running server to enable single sign-on (SSO) for JDeveloper's IntegratedWebLogicServer domain.

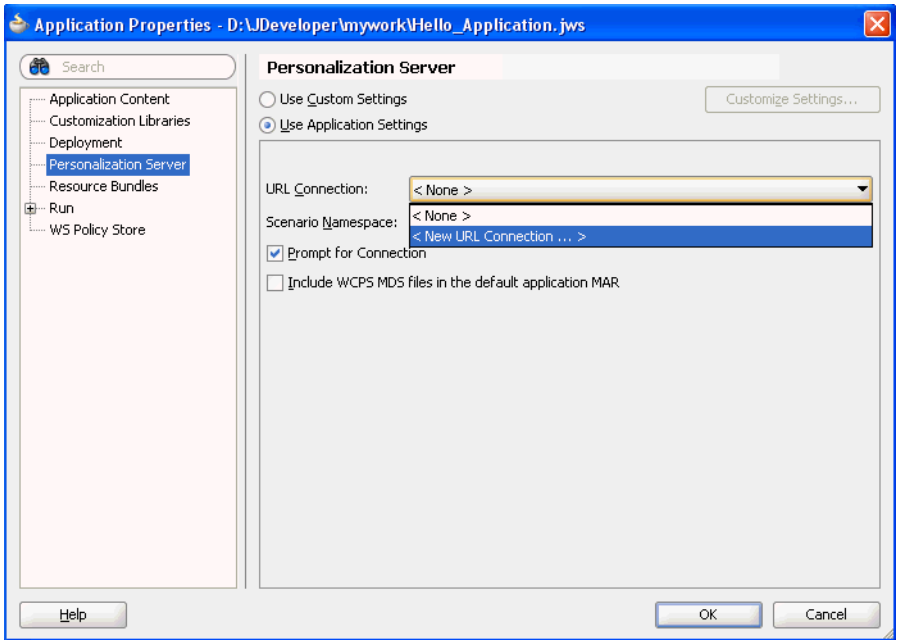
a. From the Tools menu, select Configure WCPS Trust Service.

The external tool to perform this task will begin running and its output will be directed to the `Configure WCPS Trust Service - Log` view. Wait for the configuration to complete. This may take a while. When complete, the log will display the message `"YOU HAVE MADE CHANGES THAT REQUIRE THE`

```
DOMAIN TO BE RESTARTED. PLEASE RESTART ALL DOMAIN
SERVERS."
```

Figure 67–19 Configuring the WCPS Trust Service

b. Stop the application server by clicking Terminate on the `Running: IntegratedWeblogicServer - Log` view.



When shutdown is complete you will see the message `"Process Exited"`. You can then proceed to restart the server as shown in step 2c.

4. Configure an application URL connection to the Personalization Conductor component of the application server.

a. From the Application menu select `Application Properties...`

The Application Properties dialog displays.

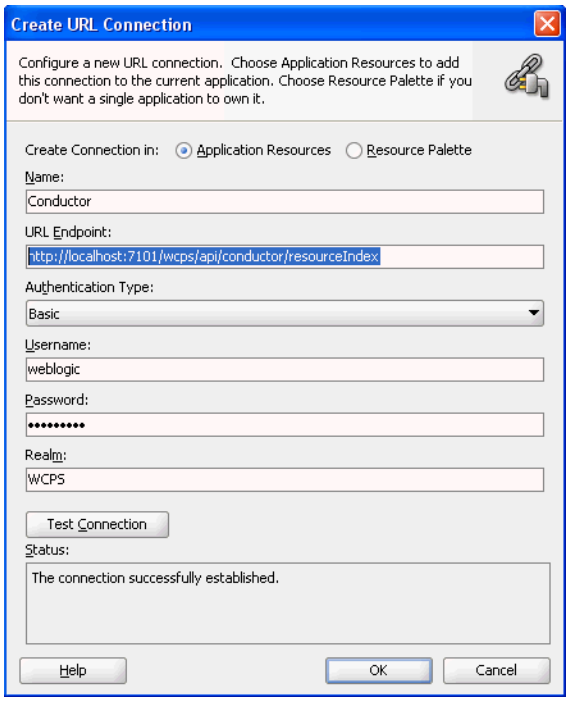


Figure 67–20 Application Properties Dialog - Configuring the Personalization Server Connection

b. Select the `Personalization Server` category, and from the URL Connection: drop-down list and select `< New URL Connection... >`.

The Create URL Connection dialog displays (see Figure 67–21).

Figure 67–21 Create URL Connection Dialog - Conductor URL Connection

c. Enter the (default) data entry fields as shown below to create the connection.

Field Name	Value
Name	Conductor
URL Endpoint	http://localhost:7101/wcps/api/conductor/resourceIndex
Authentication Type	Basic
Username	weblogic
Password	weblogic1
Realm	WCPS

d. Click Test Connection.

The Status should display as `"The connections successfully established."`

e. Click OK to create the Conductor URL connection.

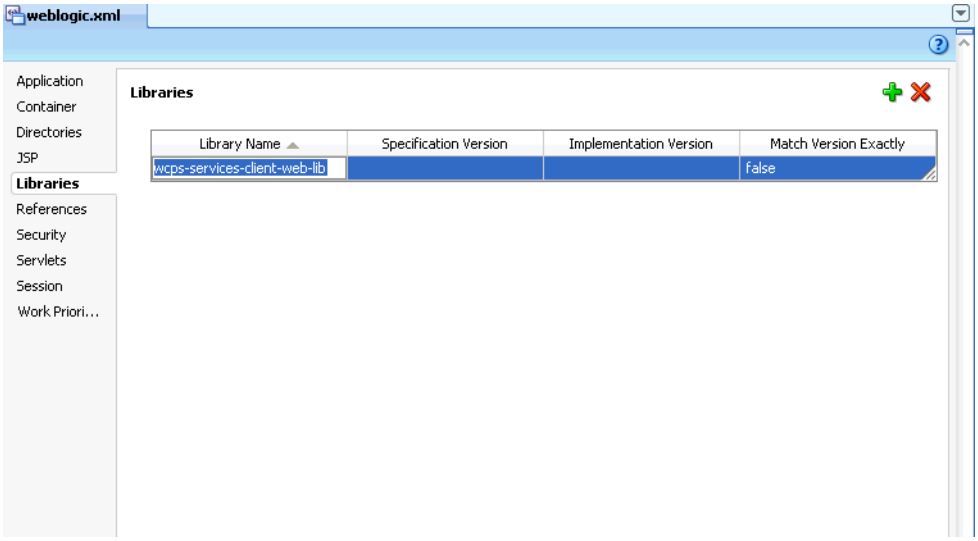
f. On the Personalization Server page, leave the default Scenario Namespace set to the application name (`Hello_Application`), and click OK in the Application Properties dialog to accept the settings.

5. Configure the server deployment descriptor for the `Hello_Application` such that the Personalization Services (WCPS) libraries are available to the application.

a. In the Application Navigator, expand the folder `Portal/Web Content/WEB-INF`.

b. Double-click the `weblogic.xml` deployment descriptor to open it.

   The WebLogic Descriptor Editor displays.



c. Select the `Libraries` category.

d. Click the Plus (+) icon to create a new library entry.

e. In the Library Name column of the table enter the following library name:

   `wcps-services-client-web-lib`

Figure 67–22 WebLogic Descriptor Editor - Adding the WCPS Library

f. When finished, select `Save` from the File menu to save the `weblogic.xml` descriptor.

6. Create a simple `hello_world` scenario that returns the string `"Hello World"` when invoked by the Personalization Conductor.

   a. Right-click the `Portal` project in the Application Navigator and select New...

      The New Gallery appears.

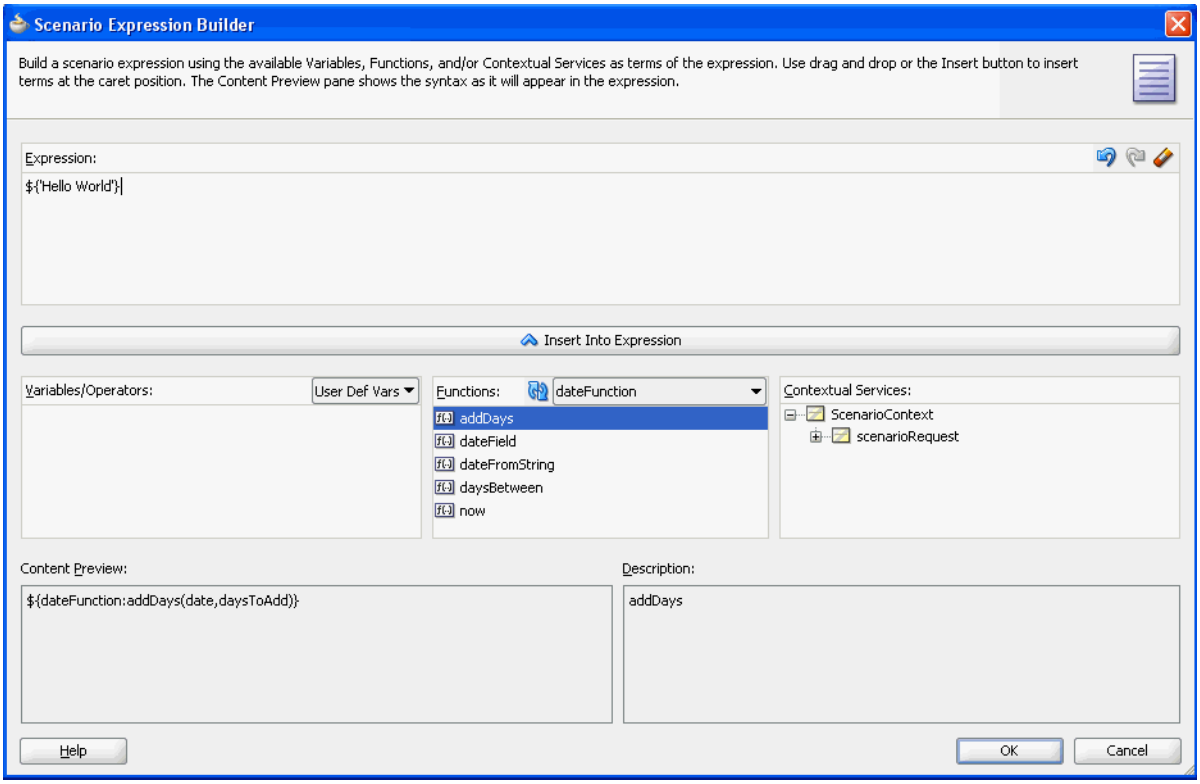
   b. From the Current Project Technologies tab, select the `Personalization` category.

   c. Select `Conductor Scenario` and click OK.

      The New Conductor Scenario dialog displays.

Figure 67–23 New Conductor Scenario Dialog

d. Leave the option `Create a new conductor scenario file` selected, enter a New scenario filename called `hello_world.scenarios_diagram`, and click OK to create the scenario.



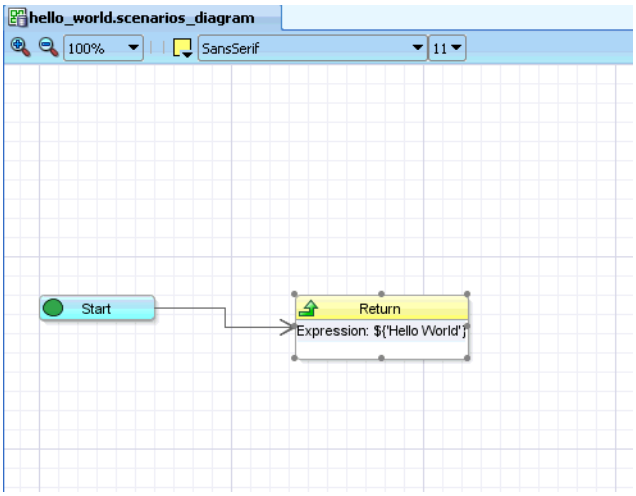
e. In the Scenario Editor's Diagram view, right-click the Start node and select `Add Following Statement->Return`.

A Return node is added and connected.

f. Right-click the Return node and select `Set Expression...`

The Scenario Expression builder displays (see Figure 67–24).

Figure 67–24 Scenario Expression Builder



g. In the Expression text area, enter the following EL expression and click OK.

```
${'Hello World'}
```

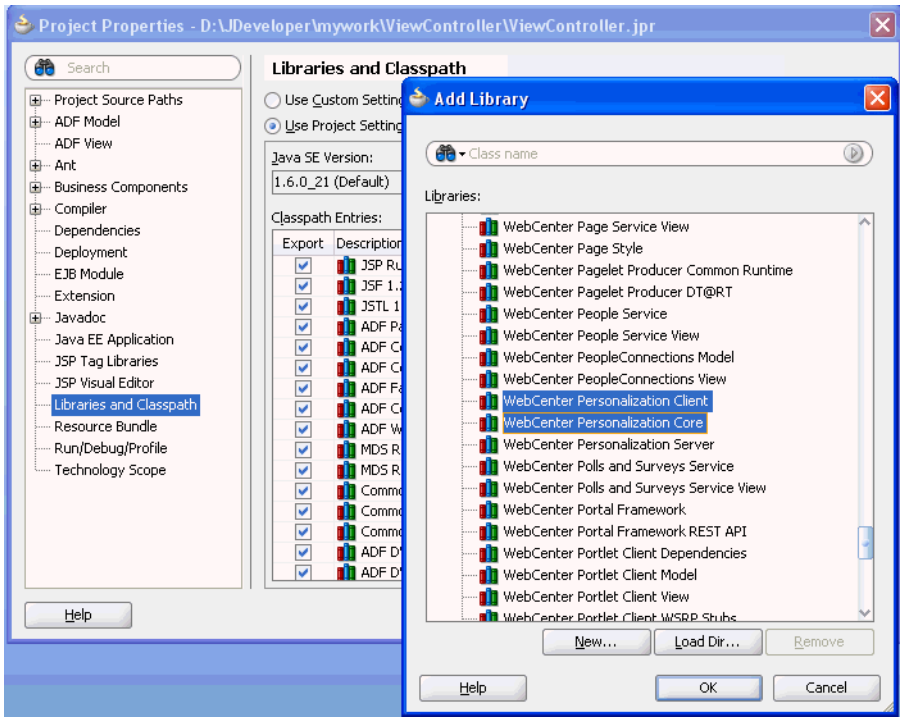
Your scenario diagram should look like the one shown in Figure 67–25.

Figure 67–25 Scenario Editor - hello_world Scenario

h. From the File menu, select `Save` to save the `hello_world.scenarios_diagram`.

7. Create a JSP page that invokes the `hello_world` scenario and displays the results.

Before creating the JSP page we need to add some libraries to the `Portal` project that contain resources required by the JSP page.



a. Right-click `Portal` project in the Application Naviagtor and select Project Properties...

The Project Properties dialog displays.

b. Select the `Libraries and Classpath` category, and click Add Library...

The Add Library dialog displays (see Figure 67–26).

Figure 67–26 Project Properties Dialog - Adding the Extension Libraries

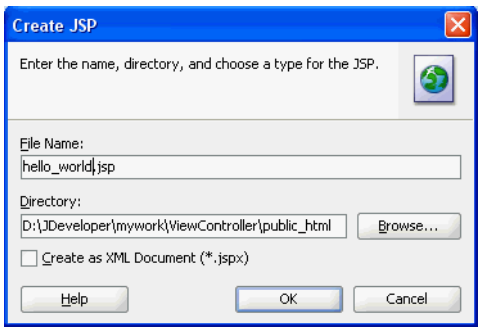
c. Select the following Extension library from the list and click OK to add it.

```
Webcenter Personalization Client
```

d. Click OK on the Project Properties dialog when finished.

Now we can create the JSP page that executes the `hello_world` scenario on the Personalization Conductor and displays the result.

e. Right-click the `Portal` project in the Application Naviagtor and select New...



The New Gallery appears.

f. From the Current Project Technologies tab, select the JSP category.

g. From the item list select JSP and click OK.

The Create JSP dialog displays (see Figure 67–27).

Figure 67–27 Create JSP Dialog

h. Enter the File Name as `hello_world.jsp` and click **OK** to create the JSP page.

i. When the JSP Editor launches, select the Source view and replace the template text with the following JSP code:

Notice in the `c:out` command how the Personalization Context Bean `p13nContext` is being used to invoke the Conductor connection (`Conductor`) you created earlier using the scenario namespace `Hello_Application` specified earlier in the Application Properties dialog, invoking the scenario called `hello_world`, and finally displaying the results.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
<%@ page contentType="text/html;charset=UTF-8"%>
<%@ taglib uri="http://java.sun.com/jsp/jstl/core" prefix="c"%>
<html>
  <head>
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8"/>
    <title>hello_world</title>
  </head>
  <body>
    <jsp:useBean id="p13nContext"
class="oracle.wcps.client.PersonalizationContext" scope="session"/>

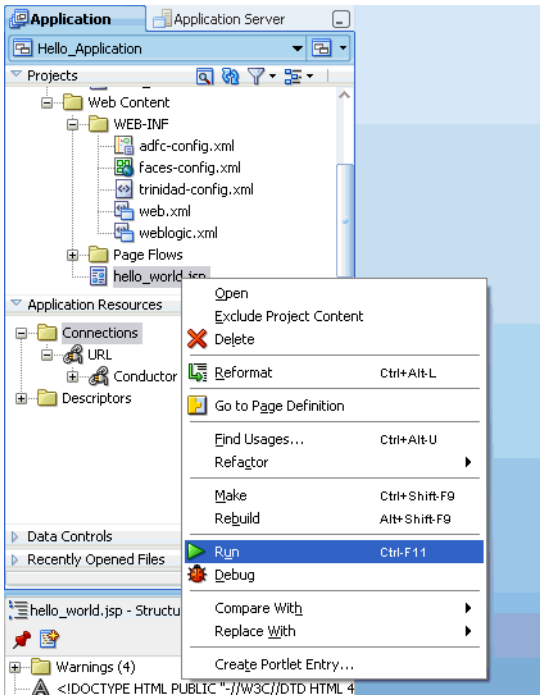
<%((oracle.wcps.client.PersonalizationContext)session.getAttribute("p13nCon
text")).reset(); %>
    <c:out value="${p13nContext.conductor['Conductor'].namespaces['Hello_
application'].scenario['hello_world'].results}"/>
  </body>
</html>
```

Note: If you haven't configured single sign-on and the trust service as outlined in step 3, then the `Conductor` URL connection specified here will generate a 401 "Unauthorized" return code when the page is run. As a shortcut (for testing purposes only) you can substitute an inline connection:

```
http://weblogic:weblogic1@localhost:7101/wcps/api/co
nductor/resourceIndex
```

in place of the `Conductor` URL to get around the single sign-on constraint.

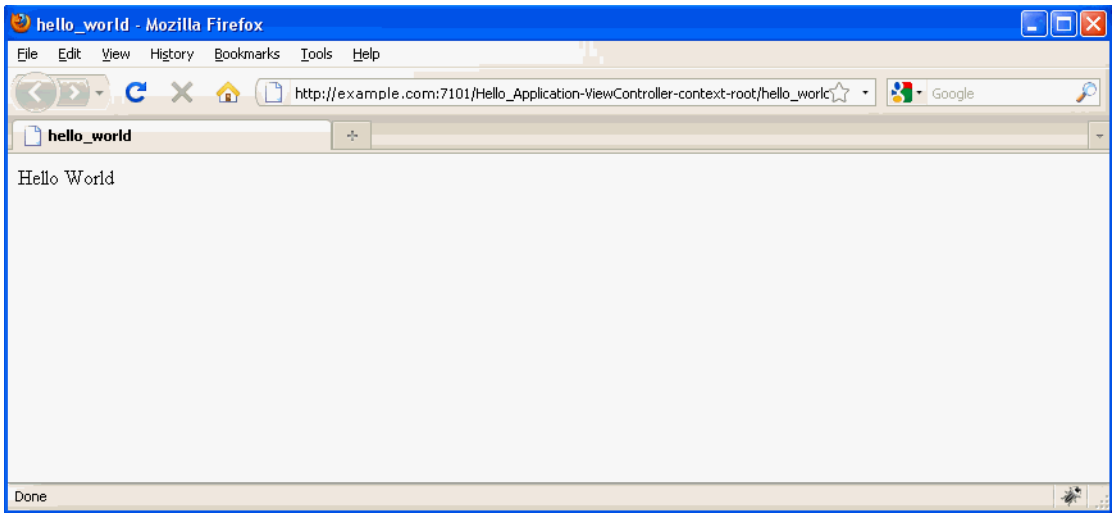
---



j. From the File menu, select Save to save the `hello_world.jsp`.

8. Finally, to build and deploy the `Hello_Application`, right-click the runnable artifact the `hello_world.jsp` page in the Application Navigator and select Run.

JDeveloper starts several background processes in sequence, including:



- Building the application,
- Starting the intergated server (if not already started),
- Deploying the application artifacts (including any Personalization artifacts) to the default domain, and
- Launching an external web browser to display the artifact `hello_world.jsp`.

Figure 67–28 Application Navigator - Building and Deploying the Application

The resulting `hello_world.jsp` JSP page appears in the browser.

Figure 67–29 Hello_Application's hello_world.jsp Page Displayed in Browser

67.4 Extending Personalization

This section describes how you can create new ways to personalize application flow or content by adding custom providers and locators.

This section includes the following sub-sections:

- Section 67.4.1, "Adding Custom Providers"

- Section 67.4.2, "Adding Custom Locators"

67.4.1 Adding Custom Providers

Providers provide an extension point to Personalization, with which you can add custom function providers and custom data providers. Table 67–2 shows the available extension points for Function and Data Providers.

Table 67–2 Extension Points

Extension	Description
oracle.wcps.provider.IFunctionProvider	A Function Provider extension point for the Conductor to create utility methods for data manipulation/transformation, business rule calculation, and so forth that can be invoked using EL. A simple example might be: ${strings:concat('string1','string2')}
oracle.wcps.provider.IDataProvider	A Data Provider extension point for the Conductor. Custom data providers can be written to integrate with legacy systems or external data stores.

67.4.1.1 Extending the AnnotatedConfiguration Class

The `AnnotatedConfiguration` class describes the connection parameters required for a data provider, and can be found in:

Location:
`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\connections-service-1.0.jar`

You will need to extend this class and add any other properties your custom provider may require. Create this class first, as the other components will build upon it (see Example 67–3).

Example 67–3 HelloWorldConnectionConfig

```
import oracle.wcps.connection.annotation.ConnectionProperty;
import oracle.wcps.connection.configuration.AnnotatedConfiguration;

@ConnectionConfiguration
(connectionType="hello.world.provider.connection")
@L10n
(bundle="demo.provider.resources.HelloWorldProviderResources")
public class HelloWorldConnectionConfig extends AnnotatedConfiguration
{
  @ConnectionProperty(propertyName="sampleProperty", required=true)
  String sampleProperty;
}
```

67.4.1.2 Implementing the Required Interfaces

IMetadata

Location:
`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\conductor-server-1.0.0.0.jar`

```
public interface IMetadata
{
    public String getName();
    public Set<? extends IMetadata> getMetadata();
}
```

Next, implement the IMetadata interface. This provides information to the tools to surface the connection parameters, essentially representing the information in your `HelloWorldConnectionConfig` class as metadata (see Example 67–4). Each of the properties in the `HelloWorldConnectionConfig` class becomes a child metadata object. This is not so intuitive for simple structures, but is useful when the connection configuration may contain nested classes that relate to other components in the 'model'.

Example 67–4 HelloWorldConfigMetadata

```
public class HelloWorldConfigMetadata implements IMetadata
{
    private String name;
    private Object value ;
    private Map<String, IMetadata> childMDataMap = new HashMap<String,
IMetadata>();

    public HelloWorldConfigMetadata(HelloWorldConnectionConfig config)
    {
        name = config.name;
    }

    public HelloWorldConfigMetadata(String name, Object value)
    {
        this.name = name;
        this.value = value;
    }

    public void addMetadata(IMetadata childMetadata)
    {
        childMDataMap.put(childMetadata.getName(), childMetadata);
    }

    public String getName()
    {
        return name;
    }

    public Object getValue()
    {
        return value;
    }

    public Object getProperty(String propName)
    {
        IMetadata md = childMDataMap.get(propName);
        if (md != null)
        {
            return ((HelloWorldConfigMetadata)md).getValue();
        }
        return null;
    }

    public Set<IMetadata> getMetadata()
    {
        Set<IMetadata> rv = new HashSet<IMetadata>();
        Set<String> childKeySet = childMDataMap.keySet();
        for (String key : childKeySet)
        {
```

```
            rv.add(childMDataMap.get(key));
        }

        return rv;
    }

    public Properties getProperties()
    {
        Properties props = new Properties();
        Set<String> childKeySet = childMDataMap.keySet();
        for (String key : childKeySet)
        {
            HelloWorldConfigMetadata cmd =
                (HelloWorldConfigMetadata)childMDataMap.get(key);
            props.put(key, cmd.getValue());
        }
        return props;
    }

    @Override
    public String toString()
    {
        return (name + ", properties: " + getProperties());
    }
}
```

IExecutableResource

An executable resource is a class having public methods annotated to designate them as executable by the Conductor. These methods could execute code directly, or delegate the call to an external REST service.

Location:

`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\conductor-server-1.0.0.0.jar`

```
public interface IExecutableResource
{
    public Object execute();
}
```

Your `ExecutableResources` can specify additional methods for execution by virtue of this annotation. Note the use of resource bundles (see section on Resource Bundles for more info). You can create any number of `ExecutableResources` and add them to your connection (see Example 67–5).

Example 67–5 SayHelloExecutableResource

```
package demo.provider;

import oracle.wcps.annotation.PublicFunction;
import oracle.wcps.annotation.PublicParameter;
import oracle.wcps.provider.IExecutableResource;

public class SayHelloExecutableResource implements IExecutableResource
{
    // This method will execute if no specific method is given

    public Object execute()
    {
```

```
        return "Hello from my custom provider";
    }

   // This method can be named explicitly in a Scenario to be invoked

    @PublicFunction(functionName = "sayHello",
                    descriptionBundleKey = "provider.method.sayHello.description")
    public String sayHello(@PublicParameter(parameterName = "user",
                                            descriptionBundleKey =

"provider.parameter.sayHello.user.description")
        String user)
    {
        return "Hello, " + user + ".  Enjoy using the new Personalization
feature!";
    }
}
```

IConnection

Once you have implemented your `IExecutableResources` and `IMetadata`, you can construct your actual connection object. Each connection has a specific set of configuration parameters, so your provider could possibly have multiple connection objects (see Example 67–6).

Location:

`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\conductor-server-1.0.0.0.jar`

```
 public interface IConnection
{
    public void setScenarioContext(IScenarioContext context);

    public Map<String, IExecutableResource> getNamedResources();

    public IExecutableResource getDefaultResource();

    public Map<String, IMetadata> getConnectionMetadata();

}
```

Example 67–6 HelloWorldConnection

```
package demo.provider;

import java.util.Collections;
import java.util.HashMap;
import java.util.Iterator;
import java.util.Map;

import java.util.concurrent.ConcurrentHashMap;

import oracle.wcps.provider.IConnection;
import oracle.wcps.provider.IExecutableResource;
import oracle.wcps.provider.IMetadata;
import oracle.wcps.scenario.IScenarioContext;

public class HelloWorldConnection implements IConnection
{
    private IScenarioContext scenarioContext;
```

```
private Map<String, IExecutableResource> executableResources =
    new ConcurrentHashMap<String, IExecutableResource>();

private IExecutableResource defaultResource;
private HelloWorldConfigMetadata configMetadata;
private Map<String, IMetadata> metadataMap = new HashMap<String, IMetadata>();

/**
 * Create metadata about this connection from the incoming config
 * @param config
 */
public HelloWorldConnection(HelloWorldConnectionConfig config)
{
    configMetadata = new HelloWorldConfigMetadata(config);

    // Loop over config properties and add as child metadata
    Iterator<Map.Entry<String, Object>> iter =
        config.entrySet().iterator();
    while (iter.hasNext())
    {
        Map.Entry<String, Object> entry = iter.next();
        String key = entry.getKey();
        Object value = entry.getValue();
        if (value != null)
        {
            configMetadata.addMetadata(new HelloWorldConfigMetadata(key,
                                                                    value));
        }
    }
    metadataMap.put(config.name, configMetadata);

    // Now create the executable resources for this connection
    createExecutableResources(config);
}

public void setScenarioContext(IScenarioContext scenarioContext)
{
    this.scenarioContext = scenarioContext;
}

public Map<String, IExecutableResource> getNamedResources()
{
    return executableResources;
}

public IExecutableResource getDefaultResource()
{
    return defaultResource;
}

public Map<String, IMetadata> getConnectionMetadata()
{
    return metadataMap;
}

/**
 * Create the IExecutableResources for this connection. An executable resource
 * is a class having one or more public methods.
 * @param config
 */
```

```
    private void createExecutableResources(HelloWorldConnectionConfig config)
    {
        // NOTE: you may or may not need to use the config information with your
executable resources

        IExecutableResource helloResource = new SayHelloExecutableResource();
        IExecutableResource addingResource = new AddingExecutableResource();

        executableResources.put("HelloResource", helloResource);
        executableResources.put("AddingResource", addingResource);

        // Make one of them the default
        defaultResource = helloResource;

    }
}
```

An instance of your `HelloWorldConnection` will be instantiated for each entry in your `provider-connections.xml` file that corresponds to the connection type specified in `HelloWorldConnectionConfig` (`connectionType="hello.world.provider.connection"`).

IDataProvider

Finally, we are ready to roll all this into our top-level provider class `HelloWorldProvider`. This is the access point for the Conductor to configure our connections and invoke our `IExecutableResource`(s).

Location:

`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\conductor-server-1.0.0.0.jar`

Project Properties -> Libraries and Classpath -> add Jar/Directory -> (point to above conductor-server-1.0.0.0.jar)

Example 67–7 IDataProvider

```
 public interface IDataProvider
{
    /**
     * Returns a map of connections keyed by connection name
     */
    public Map<String, ? extends IConnection> getNamedConnections();

    /**
     * Returns the "default" connection to use
     */
    public IConnection getDefaultConnection();

    /**
     * Called by the framework to set the current scenario context.
     */
    public void setScenarioContext(IScenarioContext scenarioContext);

    /**
     * Return the annotated class used to house connection configuration.
     *
     * <p>
     * Returning null disables this feature.
     */
    public Class<?> getConnectionConfigClass();
```

```
    /**
     * If getConnectionConfigClass returns a valid configuration class,
     * configurations are provided through this method, if any exist.
     * @param configurations The collection of configurations.
     */
    public void setConnectionConfigurations(List<?> configurations);
}
```

Required annotations:

```
@ContextualProvider
        (
                contextName="HelloWorldProvider",

resourceBundle="demo.provider.resources.HelloWorldProviderResources",
                nameBundleKey="provider.name",
                descriptionBundleKey="provider.description"
        )
```

See Example 67–8 on resource bundles below for more information.

Example 67–8 Resource Bundles

```
package demo.provider;

import java.util.Collections;
import java.util.List;
import java.util.Map;

import java.util.concurrent.ConcurrentHashMap;

import oracle.wcps.annotation.ContextualProvider;
import oracle.wcps.provider.IConnection;
import oracle.wcps.provider.IDataProvider;
import oracle.wcps.scenario.IScenarioContext;
@ContextualProvider
        (
                contextName="HelloWorldProvider",

resourceBundle="demo.provider.resources.HelloWorldProviderResources",
                nameBundleKey="provider.name",
                descriptionBundleKey="provider.description"
        )
public class HelloWorldProvider implements IDataProvider
{
  // Never used, but there is a required public method to set this.
  private IScenarioContext scenarioContext;

  // ConnectionConfigurations may come in via
classes/META-INF/connection-providers.xml
   private List<HelloWorldConnectionConfig> connectionConfigurations;

  // Each IConnection is uniquely identified via the AGConnectionConfig
  private static Map<String, HelloWorldConnection> connections =
              new ConcurrentHashMap<String, HelloWorldConnection>();

  // One of the connections will become the default
  private IConnection defaultConnection;

    public HelloWorldProvider() {
```

```
        super();
    }

    /**
     * Return a map of all our Connections, keyed by config.name.
     * @return
     */
    public Map<String, HelloWorldConnection> getNamedConnections()
    {
        return connections;
    }

    /**
     * One of the connections will be designated the default
     * @return
     */
    public IConnection getDefaultConnection()
    {
        return defaultConnection;
    }

    /**
     * Used to hold parameters specific to a given scenario
     * @param scenarioContext
     */
    public void setScenarioContext(IScenarioContext scenarioContext)
    {
        this.scenarioContext = scenarioContext;
    }

    /**
     * The config class is specific to each data provider
     * @return
     */
    public Class<HelloWorldConnectionConfig> getConnectionConfigClass()
    {
        return HelloWorldConnectionConfig.class;
    }

    /**
     * Create a HelloWorldConnection instance from each of the incoming configs.
     * These configs are created when the provider-connections.xml file is loaded.
     * @param configs
     */
    public void setConnectionConfigurations(List<?> configurations)
    {
        List<HelloWorldConnectionConfig> configs =
(List<HelloWorldConnectionConfig>)configurations;
        for (HelloWorldConnectionConfig config : configs)
        {
            // Create a HelloWorldConnection from the config
            HelloWorldConnection connection = new HelloWorldConnection(config);
            if (config.isDefault)
            {
                defaultConnection = connection;
            }
            connections.put(config.name, connection);
        }
    }
}
```

67.4.1.3 Creating the Resource Files

These files also go in the same directory as your classes, so they will be added to your final JAR file. The location of the files must correspond to the package name given in `HelloWorldProvider:bundle="demo.provider.resources.HelloWorldProviderResources"`

```
File name: HelloWorldProviderResources.properties

File contents: provider.name=Hello World
provider.description=Data provider for Hello World

provider.parameter.sayHello.user.description=Method to say hello to a named user
provider.parameter.addTwoIntegers.int1.description=First number to add
provider.parameter.addTwoIntegers.int2.description=Second number to add
```

67.4.1.4 Wiring the Data Provider to the Conductor

Configure your connection in as described in

Name your provider for the Conductor by creating this file in the `META-INF/services` directory (in the same directory structure as your classes, so they will be added to your final jar file):

```
file name: oracle.wcps.provider.IDataProvider
file contents: demo.provider.HelloWorldProvider (fully-qualified name of your
provider)
```

67.4.1.5 Invoking your Data Provider in a Scenario

Note the resource name is the same as in your `HelloWorldConnections` source code.

Example 67–9 Scenario Calling the Provider

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
    <body>
        <call-provider>
            <provider-name>HelloWorldProvider</provider-name>
            <connection-name>HelloWorldConnection</connection-name>
            <resource-name>HelloResource</resource-name>
            <method-name>sayHello</method-name>
            <variable>providerResults</variable>
            <input>
                <parameter>
                    <common:name>user</common:name>
                    <common:value>cindymc</common:value>
                </parameter>
            </input>
        </call-provider>
        <return>
            <expression>${providerResults}</expression>
        </return>
    </body>
    <name>TestMyProviderScenario</name>
</scenario:scenario>
```

67.4.2 Adding Custom Locators

This section describes how you can extend your personalized WebCenter Portal application by adding custom locators.

This section contains the following subsections:

- Section 67.4.2.1, "Understanding Property Locators"
- Section 67.4.2.2, "Implementing the Required Interfaces"
- Section 67.4.2.3, "Implementing Security"
- Section 67.4.2.4, "Creating a Property Set Definition"
- Section 67.4.2.5, "Putting It All Together"
- Section 67.4.2.6, "Invoking the Property Locator"

67.4.2.1 Understanding Property Locators

A property locator is invoked by the Property Service to access external stores of properties. For example, Personalization provides an out-of-the-box `PeoplePropertyLocator` that uses the People Connections REST service to access profile information for users. The locator is not invoked directly by the Conductor/Scenario, but is instantiated by the Property Set service, which then delegates calls for retrieving properties and property sets to the underlying locator implementation.

The example in the following sections will walk you through creating your own `BookPropertyLocator` to find a book by title in a library, and load its attributes into a property set you have created to represent a Book object.

There are two major steps to implementing this example:

1. Define the PropertySet for Book, and let the Property Set service know about it
2. Implement the `IPropertyLocator` to load properties from a Book object.

67.4.2.2 Implementing the Required Interfaces

Location:

`\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\properties-common-1.0.0.0.jar`

```
public interface IPropertyLocator
{
    public void loadProperties(IContext context, IPropertySet propertySet,
                               IPropertySetDefinition propertySetDefinition,
                               List<IPropertyName> propertyNames);

    public void storeProperties(IContext context,  propertySet,
                                IPropertySetDefinition propertySetDefinition,
                                List<IPropertyName> propertyNames);

    public void removeProperties(IContext context,  propertySet,
List<IPropertyName> propertyNames);

    public void removeProperties(IContext context,  nameSpaceName,
IPropertySetDefinitionName name);

    public IPagedList<IPropertySet> filter(IContext context,  nameSpaceName,
                                           IPropertySetDefinitionName
setDefinitionName, PropertySetFilterContext filterContext);
```

```
    public int count(IContext context,  nameSpaceName, PropertySetExpression
expression);
}
```

67.4.2.3 Implementing Security

The `IContext` object is the vehicle for authentication, passed in from the Property Service. There are two ways you can access the credentials:

- Using the request: `HttpServletRequest request = context.getProperty(IContext.HTTP_REQUEST_KEY)`
- Using the user/password: `String user = context.getProperty(IContext.USERNAME_KEY); String pw = context.getProperty(IContext.PASSWORD_KEY);`

67.4.2.4 Creating a Property Set Definition

This section describes how to create a `PropertySetDefinition` that will be used with your locator.

Follow the steps below to create the `PropertySetDefinition`:

1. Create a new JDeveloper project for your source files.
2. Add the required Personalization classes to the project classpath.
   a. Right-click on the project name and select **Project Properties**.
   b. Select **Libraries and Classpath**, then select **Add Library**.
   c. Enter the name of the library to search for (for example, IPropertyLocator) and select it when it appears.
   d. Repeat these steps for other classes your source code will need to reference.
3. Compile the project and deploy it to a JAR file.
4. Copy the JAR file to the Personalization extensions directory in `/DefaultDomain/locator-extensions-library/WEB-INF/lib`.

67.4.2.5 Putting It All Together

This section describes how to implement the property locator, data object, and data layer.

Implement the IPropertyLocator

(read-only for demo simplicity)

```
/**
 * Our locator will be read-only
 */
public class BookPropertyLocator implements IPropertyLocator
{
    // Let's delegate all the hard work to a BookPropertyDAO
    private BookPropertyDAO dao;

    // Must have a public default constructor, since the Property Service
instantiates
    // this

    public BookPropertyLocator()
    {
```

```
        // todo: show how connection properties could be initialized and passed in
        dao = new BookPropertyDAO();
    }

    /**
     * Load property values, optionally returning only a subset of those.
     * @param iPropertySet The PropertySet into which the retrieved values will be
loaded
     * @param iPropertySetDefinition The PropertySetDefinition defining the
'shape' of the properties
     * @param list List of PropertyNames to load.  If null, all will be loaded.
     */
    public void loadProperties(IContext context, IPropertySet iPropertySet,
                               IPropertySetDefinition iPropertySetDefinition,
                               List<IPropertyName> list)
    {
        try
        {
            // Delegate to BookProperDAO
            dao.loadProperties(iPropertySet, list);
        } catch (Exception e)
        {
            throw new RuntimeException("Cannot load properties ", e);
        }
    }

    /**
     * Filter properties; load/return those properties that only match the filter
criteria.
     * @param iNameSpaceName
     * @param iPropertySetDefinitionName
     * @param propertySetFilterContext
     * @return
     */
    public IPagedList<IPropertySet> filter(IContext context, INameSpaceName
iNameSpaceName,
                                           IPropertySetDefinitionName
iPropertySetDefinitionName,
                                           PropertySetFilterContext
propertySetFilterContext)
    {
        return null;   // todo: possibly implement for demo
    }

    public int count(IContext context, INameSpaceName iNameSpaceName,
                     PropertySetExpression propertySetExpression)
    {
        return 0;
    }

    // As a read-only implementation, we don't support this
    public void storeProperties(IContext context, IPropertySet iPropertySet,
                                IPropertySetDefinition iPropertySetDefinition,
                                List<IPropertyName> list)
    {
        throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
    }
```

```
    // As a read-only implementation, we don't support this
    public void removeProperties(IContext context, IPropertySet iPropertySet,
                                 List<IPropertyName> list)
    {
        throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
    }

    // As a read-only implementation, we don't support this
    public void removeProperties(IContext context, INameSpaceName iNameSpaceName,
                                 IPropertySetDefinitionName
iPropertySetDefinitionName)
    {
        throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
    }
}
```

Implement the Data Access Object for retrieving property values

```
/**
 * Data access class, to load books from a backing store (perhaps a database or
 * some REST service)
 */
class BookPropertyDAO
{
    // Generate the library that will provide our backing store.
    static
    {
        Library.generateLibrary();
    }

    /**
     * Assume the name of the PropertySet is the title of the book.
     * @param propertySet
     * @param list
     */
    void loadProperties(IContext context, IPropertySet propertySet,
                        List<IPropertyName> list) throws Exception
    {
        String title = propertySet.getPropertySetName().getName();
        Book book = Library.getBook(title);
        loadProperties(book, propertySet, list);
    }

    private void loadProperties(IContext context, Book book, IPropertySet
propertySet,
                                List<IPropertyName> propertyNames) throws
Exception
    {
        // Loop over all property names, create a Property value, and add it to
the Property set
        for (IPropertyName pname : propertyNames)
        {
            // System.err.println("Getting property: " + pname + ", with name: " +
pname.getName());
            String value = book.getProperty(pname.getName());
            if (value != null)
            {
                addProperty(value, pname, propertySet);
```

```
            }
        }
    }

    private void addProperty(IContext context, String value, IPropertyName pname,
                             IPropertySet propertySet)
    {

        IProperty<String> ps =
            Property.<String>builder().withProperty(pname,
value).buildWithOutValidation();
        propertySet.putProperty(pname, ps);
    }
}
```

Implement the data layer (Books within a Library)

```
 /**
 * Simple class to demonstrate loading properties.  It could be improved by adding
 * support for non-String attributes (Date, arrays, etc) and using Java Bean
 * Introspection/Reflection to get the property values.
 */
public class Book
{
    String title;
    String author;
    String ISBN;

    public Book(String title, String author, String ISBN)
    {
      setTitle(title);
      setAuthor(author);
      setISBN(ISBN);
    }

    public void setTitle(String title)
    {
        this.title = title;
    }

    public String getTitle()
    {
        return title;
    }

    public void setAuthor(String author)
    {
        this.author = author;
    }

    public String getAuthor()
    {
        return author;
    }

    public void setISBN(String ISBN)
    {
        this.ISBN = ISBN;
    }

    public String getISBN()
```

```
    {
        return ISBN;
    }

    String getProperty(String propName)
    {
         // Here, we could use introspection on the Book class, but since there
are only
         // three properties, we can code it simpler
         if (propName.equals("ISBN"))
         {
           return getISBN();
         }
         if (propName.equals("title"))
         {
           return getTitle();
         }
         if (propName.equals("author"))
         {
           return getAuthor();
         }
         return null;  // todo: perhaps throw Exception here
    }
}

/**
 * Class to generate a library of Books
 */
class Library
{
    static String [] titles = {"Into Thin Air", "Climbing Everest", "Rocky
Mountains"};
    static String [] ISBNs = {"0-201-69581-2", "0-423-78123-1", "0-321-23425-2"};
    static String [] authors = {"Jon Krakauer", "Fooey Handley", "Rick Bicknell"};

    // Keyed by title
    private static Map<String, Book> library = new HashMap<String,Book>();

    static void generateLibrary()
    {
        for (int i=0; i<titles.length; i++)
        {
            Book book = new Book(titles[i], authors[i], ISBNs[i]);
            library.put(book.getTitle(), book);
        }
    }

   static Book getBook(String title)
   {
     return library.get(title);
   }
}
```

67.4.2.6 Invoking the Property Locator

The `PropertyLocator` is invoked by the Property Service, which is itself part of the `PropertiesServiceProvider`. We can invoke the `GetProperties` method on that provider in a scenario, as shown below:

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"
```

```
xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <body>
  <call-provider>
      <provider-name>oracle.PropertiesServiceProvider</provider-name>
      <method-name>GetProperty</method-name>
      <variable>property</variable>
      <input>
        <parameter>
            <common:name>namespace</common:name>
            <common:value>book.property.locator</common:value>
        </parameter>
        <parameter>
            <common:name>definition</common:name>
            <common:value>BookPropertySetDefinition</common:value>
        </parameter>
        <parameter>
            <common:name>set</common:name>
            <common:value>Into Thin Air</common:value>
        </parameter>
        <parameter>
            <common:name>property</common:name>
            <common:value>ISBN</common:value>
        </parameter>
      </input>
    </call-provider>
    <return>
      <expression>${property}</expression>
    </return>
  </body>
  <name>BookPropertyScenario</name>
</scenario:scenario>
```

68

Using Personalization APIs Externally

A client can access the WebCenter Personalization public APIs using Java APIs or public Rest APIs as described in the following sections:

- Section 68.1, "Using Java APIs"
- Section 68.2, "Using the Property Service REST APIs"
- Section 68.3, "Property Service REST APIs"
- Section 68.4, "Using the Conductor REST APIs"
- Section 68.5, "Calling Personalization Client Services Using ELs"

68.1 Using Java APIs

The service interfaces shown in Table 68–1 define the remote Conductor API.

Table 68–1 Remote Conductor APIs

Interface/Service	Description
oracle.wcps.conductor.services.IScenariosService	General management, retrieval, and execution of stored Scenarios.
oracle.wcps.conductor.services.INamespaceService	General management of stored namespaces known to the Conductor.
oracle.wcps.conductor.services.IProviderService	Retrieval of provider metadata known to the Conductor server.

For more information about Personalization Java APIs, see the JavaDoc for WebCenter in the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

68.2 Using the Property Service REST APIs

This section provides examples of how you can use the Property Service's REST APIs to programatically carry out basic Personalization tasks, such as:

- Creating a namespace
- Viewing and creating property set definitions
- Viewing and creating property definitions
- Viewing, creating, and executing scenarios
- Viewing data provider details

This section contains the following subsections:

- Section 68.2.1, "Accessing the Property Service's Resource Index"
- Section 68.2.2, "Creating a Namespace Using the Property Service"
- Section 68.2.3, "Viewing Property Set Definitions Within a Namespace Using the Property Service"
- Section 68.2.4, "Creating a Property Definition Within a Namespace Using the Property Service"
- Section 68.2.5, "Viewing Property Definitions Within a Namespace Using the Property Service"
- Section 68.2.6, "Creating a Property Set Definition Within a Namespace Using the Property Service"
- Section 68.2.7, "Creating a Property Set Within a Namespace Using the Property Service"
- Section 68.2.8, "Viewing a Property Set Within a Namespace Using the Property Service"
- Section 68.2.9, "Accessing the Conductor ResourceIndex"
- Section 68.2.10, "Accessing Namespaces Using the Conductor"
- Section 68.2.11, "Creating a Scenario Within a Namespace Using the Conductor"
- Section 68.2.12, "Viewing Scenarios Within a Namespace Using the Conductor"
- Section 68.2.13, "Executing a Scenario Using the Conductor"
- Section 68.2.14, "Viewing Data Providers Within a Namespace Using the Conductor"
- Section 68.2.15, "Viewing Detailed Data Provider Properties Within a Namespace Using the Conductor"
- Section 68.2.16, "Viewing Data Provider Connections Within a Namespace Using the Conductor"
- Section 68.2.17, "Viewing Data Provider Connection Resources Within a Namespace Using the Conductor"
- Section 68.2.18, "Viewing Data Provider Connection Resources Method Within a Namespace Using the Conductor"
- Section 68.2.19, "Viewing Function Providers Within a Namespace Using the Conductor"

68.2.1 Accessing the Property Service's Resource Index

The Property Service resource index's response contains links and templates to access other resources of the Property Service. For the request and response for accessing the Property Service's resource index, see Section 68.3.1.1, "ResourceIndex."

68.2.2 Creating a Namespace Using the Property Service

Creating an object using the REST HTTP interface requires setting the request method to `POST` and adding a header `content-type` with the value `application/xml`. For the request and response for creating a namespace using the Property Service, see Section 68.3.2.1, "Create Namespace."

68.2.3 Viewing Property Set Definitions Within a Namespace Using the Property Service

For the request and response for viewing property set definitions within a namespace using the Property Service, see Section 68.3.4.3, "Retrieve All Property Set Definitions."

68.2.4 Creating a Property Definition Within a Namespace Using the Property Service

For the request and response for creating a property definitions within a namespace using the Property Service, see Section 68.3.3.1, "Create Property Definition - Create Integer Property Definition."

68.2.5 Viewing Property Definitions Within a Namespace Using the Property Service

For the request and response for viewing property definitions within a namespace using the Property Service, see Section 68.3.3.6, "Retrieve all Property Definitions."

68.2.6 Creating a Property Set Definition Within a Namespace Using the Property Service

For the request and response for creating a property set definition within a namespace using the Property Service, see Section 68.3.4.1, "Create Property Set Definition."

68.2.7 Creating a Property Set Within a Namespace Using the Property Service

For the request and response for creating a property set within a namespace using the Property Service, see Section 68.3.5.1, "Create Property Set."

68.2.8 Viewing a Property Set Within a Namespace Using the Property Service

For the request and response for viewing a property set within a namespace using the Property Service, see Section 68.3.5.5, "Retrieve all Property Sets."

68.2.9 Accessing the Conductor ResourceIndex

Note that in the example below the link templates and ResourceIndex will be modified to comply with best practice guidelines.

Request URI:

```
GET http://localhost:8891/wcps/api/conductor/resourceIndex
```

Response:

```
<resourceIndex resourceType="urn:oracle:wcps:conductor:resourceIndex">
  <links>
    <link resourceType="urn:oracle:wcps:conductor:namespaces"

68.3.3 Property Definition CRUD

This section contains the following subsections:

- Section 68.3.3.1, "Create Property Definition - Create Integer Property Definition"
- Section 68.3.3.2, "Create Property Definition - Create Integer Array Property Definition"
- Section 68.3.3.3, "Retrieve Property Definition"
- Section 68.3.3.4, "Update Property Definition"
- Section 68.3.3.5, "Delete Property Definition"
- Section 68.3.3.6, "Retrieve all Property Definitions"
- Section 68.3.3.7, "Delete all Property Definitions"

68.3.3.1 Create Property Definition - Create Integer Property Definition

`CreateIntPD`

68.3.5 Property Set CRUD

This section contains the following subsections:

- Section 68.3.5.1, "Create Property Set"
- Section 68.3.5.2, "Retrieve Property Set"
- Section 68.3.5.3, "Update Property Set"
- Section 68.3.5.4, "Delete Property Set"
- Section 68.3.5.5, "Retrieve all Property Sets"
- Section 68.3.5.6, "Delete all Property Sets"

68.3.5.1 Create Property Set

`CreatePS`

68.3.7 JSON Payload

The property value in JSON format indicates the value type using `concreteType` field names. The following table maps the property definition type and Java data type to the values of `concreteType`.

Table 68–2 concreteType Values

Property Definition Type	Java Data Type	concreteType Value
INT	java.lang.Integer	urn:oracle:wcps:property:internal:jaxrs:model:integer-value
NUMBER	java.lang.Double	urn:oracle:wcps:property:internal:jaxrs:model:double-value
STRING	java.lang.String	urn:oracle:wcps:property:internal:jaxrs:model:string-value
BOOLEAN	java.lang.Boolean	urn:oracle:wcps:property:internal:jaxrs:model:boolean-value
BLOB	oracle.wcps.property.BlobData	urn:oracle:wcps:property:blob-data
CLOB	oracle.wcps.property.ClobData	urn:oracle:wcps:property:clob-data
DATETIME	oracle.wcps.property.DateTime	urn:oracle:wcps:property:date-time

68.3.8 Exceptions

- If optimistic concurrency is disabled on the property server, the "If-Match" request header is not required. If enabled, the value of the "If-Match" header should be the value sent for the response header "ETag".
- Not sending the request header X-Oracle-RF-Token results in a 403 response status. The value of the token should be the one sent in response of the `/resouceIndex` request.
- Attempting to delete an "in use" Namespace, Property Definition, or Property Set Definition results in a 412 response status.

68.3.9 Query Parameters

Table 68–3 shows the supported query parameters and their default values.

Table 68–3 Query Parameters

Query Parameter Name	Description	Default Value	Other Special Values
q	the value for it is a search expression	none	none
startIndex	Represents the index of the first element in a page	0	none
itemsPerPage	Represents the number of items to be included in a page	10	none
dataFields	Represents a list of attributes of a property service entities for which data is returned	empty list = (Return zero attributes)	* = (all attributes)

68.3.10 Search Expressions

This section contains the following subsections:

- Section 68.3.10.1, "Format"
- Section 68.3.10.2, "Supported Operators"
- Section 68.3.10.3, "Supported Attribute Names"

68.3.10.1 Format

The value for the 'q' query parameter is a search expression. The search expression format is:

```
single_expression = attribute_name:operator_name:value
expression = single_expression[;single_expression]
```

68.3.10.2 Supported Operators

- Relational Operator
  - `:equals:` ==> Equals
  - `:contains:` ==> Contains
  - `:like:` ==> SQL Like, applies only to string type property values
  - `:gt:` ==> Greater than
  - `:gte:` ==> Greater than or equals to
  - `:lt:` ==> Less than
  - `:lte:` ==> Less than or equals to
- Logical Opertion
  - `;` ==> and

68.3.10.3 Supported Attribute Names

Table 68–4, Table 68–5, Table 68–6, and Table 68–7 show the supported attribute names that can be used in a search expressions to search for property service entities.

Namespace Attributes

Table 68–4 Namespace Attributes

Attribute Name	Description
ns-name	A namespace's name
ns-property-locator-class-name	A namespace's property locator class name
ns-definition-locator-class-name	A namespace's definition locator class name
ns-created-on	A namespace's created on date time
ns-updated-on	A namespace's updated on date time

Examples:

```
/wcps/api/property/namespaces?q=ns-name:like:Oracle_%25
```

```
/wcps/api/property/namespaces?q=ns-definition-locator-class-name:like:%25Locator%2
5;ns-name:like:Oracle_%25
```

Property Definition Attributes

Table 68–5 Property Definition Attributes

Attribute Name	Description
pd-name	A property definition's name
pd-description	A property definition's description
pd-type	A property definition's type
pd-restricted	A property definition's restricted attribute
pd-validator-class-name	A property definition's validator class name
pd-created-on	A property definition's created on date time
pd-updated-on	A property definition's updated on date time

Example:

```
/wcps/api/property/namespaces/Oracle/propertydefinitions?q=pd-name:like:%25D%25;pd
-description:contains:4th;pd-restricted:contains:true
```

Property Set Definition Attributes

Table 68–6 Property Set Definition Attributes

Attribute Name	Description
psd-name	A property set definition's name
psd-description	A property set definition's description
psd-pd-name	A property definition name referred by a property set definition
psd-property-locator-class-name	A property locator class name associated with a property set definition
psd-created-on	A property set definition's created on date time
psd-updated-on	A property set definition's updated on date time

Example:

```
wcps/api/property/namespaces/Oracle/propertysetdefinitions?q=psd-created-on:gt:198
0-01-01T00:00:00.000-0700;psd-name:like:%255%25
```

Property Set Attributes

Table 68–7 Property Set Attributes

Attribute Name	Description
ps-name	A property set's name
ps-description	A property set's description
psd-created-on	A property set's created on date time
psd-updated-on	A property set's updated on date time
a property's name	A property's name attribute (for example, firstName, zipCode, etc.)

Example:

```
/wcps/api/property/namespaces/Oracle/propertysetdefinitions/partners_
info/propertysets?q=ps-created-on:gt:1980-01-01T00:00:00.000-0700
```

68.4 Using the Conductor REST APIs

This section provides examples of how you can use the Conductor's REST APIs to programatically carry out basic Personalization tasks, such as:

- Get information about data providers
- Get information about function providers
- Create, retrieve, or delete a namespace
- Create, retrieve, execute, or delete a scenario

You can use the Conductor REST APIs from within application code, or using Personalization ELs to call them from within your WebCenter Portal: Framework application or WebCenter Portal: Spaces.

This section contains the following subsections:

- Section 68.4.1, "Using the Data Provider Management APIs"
- Section 68.4.2, "Using the Function Provider Management APIs"
- Section 68.4.3, "Using the Namespace Management APIs"
- Section 68.4.4, "Using the Scenario Management APIs"

68.4.1 Using the Data Provider Management APIs

This section provides examples of using the Conductor's data provider management APIs, and contains the following subsections:

- Section 68.4.1.1, "Getting a Collection of Data Providers (GET)"
- Section 68.4.1.2, "Getting a Single Data Provider's Metadata (GET)"
- Section 68.4.1.3, "Getting Information About a Data Provider Connection (GET)"

- Section 68.4.1.4, "Getting Information about an Executable Resource for a Data Provider and Connection (GET)"
- Section 68.4.1.5, "Getting Method Information for an Executable Resource for a Data Provider and Connection (GET)"
- Section 68.4.1.6, "Getting Entire Data Provider Information with Details Projection (GET)"

68.4.1.1 Getting a Collection of Data Providers (GET)

68.4.2 Using the Function Provider Management APIs

This section provides examples of using the Conductor's function provider APIs, and contains the following subsections:

- Section 68.4.2.1, "Getting a Collection of Function Providers (GET)"
- Section 68.4.2.2, "Getting Metadata for a Single Function Provider (GET)"

68.4.2.1 Getting a Collection of Function Providers (GET)

XML

Request:

```
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/functionProviders?proje
ction=summary
accept-language: en
content-type: application/xml
accept: application/xml
```

Response:

```

68.4.3 Using the Namespace Management APIs

This section provides examples of using the Conductor's namespace management APIs, and contains the following subsections:

- Section 68.4.3.1, "Getting a Collection of Namespaces (GET)"
- Section 68.4.3.2, "Retrieving a Single Namespace (GET)"
- Section 68.4.3.3, "Creating a Namespace (POST)"
- Section 68.4.3.4, "Deleting a Namespace (DELETE)"

68.4.3.1 Getting a Collection of Namespaces (GET)

XML

Request:

```
GET
http://localhost:7001/wcps/api/conductor/namespaces?startIndex=0&itemsPerPage=10
accept-language: en
content-type: application/xml
accept: application/xml
```

Response:

68.4.4 Using the Scenario Management APIs

This section provides examples of using the Conductor's scenario management APIs, and contains the following susbsections:

- Section 68.4.4.1, "Getting a Collection of Scenarios (GET)"
- Section 68.4.4.2, "Retrieving a Single Scenario (GET)"
- Section 68.4.4.3, "Creating a Scenario (POST)"
- Section 68.4.4.4, "Updating a Scenario (PUT)"
- Section 68.4.4.5, "Deleting a Scenario (DELETE)"
- Section 68.4.4.6, "Execute a Scenario (POST)"

68.4.4.1 Getting a Collection of Scenarios (GET)

XML

```
Request:

68.5 Calling Personalization Client Services Using ELs

Using Expression Language (EL) expressions, you can call Personalization services from remote clients such as web pages and Java Server Faces environments. You can, for example, use ELs to apply Personalization scenarios to pages in WebCenter Portal: Spaces. For more information about Personalization ELs, see also Section G.9, "ELs Related to the Personalization Service."

This section contains the following subsections:

- Section 68.5.1, "Calling Personalization Client Services from JSF Pages"
- Section 68.5.2, "Calling Personalization Client Services from JSP Pages"
- Section 68.5.3, "Personalization Context Object Method Reference"
- Section 68.5.4, "Enabling Single Sign-on"

68.5.1 Calling Personalization Client Services from JSF Pages

The Personalization Context is a session-scoped managed bean that is automatically declared and instantiated by the Java Server Faces context, and there for use with the following EL:

```
#{p13nContext}
```

Accessing the Conductor context

Access to remote Conductor services can be accessed in the following way:

```
#{p13nContext.conductor["<UrlOrConnectionName>"]}
```

where ***UrlOrConnectionName*** is a URL to the conductor resource index (for example, `http://localhost:7001/wcps/api/conductor/resourceIndex`), or a connection name specified in `connections.xml` (available only within JDeveloper or WebCenter environments).

If the connection name "`default`" is specified, the first connection name that starts with "`Conductor`" is retrieved. For example:

```
#{p13nContext.conductor['default'].namespaces['myNamespace'].scenario['myScenario'
].results}
```

Accessing the Properties service context

Access to remote Properties Service services can be accessed in the following way:

```
#{p13nContext.properties["<UrlOrConnectionName>"]}
```

where ***UrlOrConnectionName*** is a URL to the Properties Service resource index (for example `http://localhost:7001/wcps/api/property/resourceIndex`), or a connection name specified in `connections.xml` (available only within JDeveloper or WebCenter environments).

If the connection name "`default`" is specified, the first connection name that starts with "`Properties`" is retrieved. For example:

```
#{p13nContext.properties['default'].namespaces['myNamespace'].setDefinitions['MyPr
opertySetDefinition'].sets['MyPropertySet'].results['MyPropertyName']}
```

Configuring the client services for request scope

You may sometimes need to have the Personalization services client use request scope rather than session scope. To do this, configure a custom managed bean in your application's `faces-config` as shown in the example below:

```
<managed-bean>
    <managed-bean-name>myP13nContext</managed-bean-name>
    <managed-bean-class>oracle.wcps.client.PersonalizationContext
 </managed-bean-class>
    <managed-bean-scope>request</managed-bean-scope>
</managed-bean>
```

68.5.2 Calling Personalization Client Services from JSP Pages

The Personalization client can be used with

JSP pages similarly to the way it is used in Java Server Faces pages (see Section 68.5.1, "Calling Personalization Client Services from JSF Pages"). You must, however, register the bean using `<jsp:useBean>` as shown in the following example:

```
<jsp:useBean id="p13nContext" class="oracle.wcps.client.PersonalizationContext"
scope="session"/>
<c:out
value="${p13nContext.conductor['http://weblogic:webl0gic@localhost:7001/wcps/api/c
onductor'].namespaces['default'].scenario['my_scenario_
name'].withInput['question=Does JSP work?'].results}"/>
```

If you want to clear the bean's state, you can invoke it using scriptlet code by placing it after the `<jsp:useBean>` statement:

```
<jsp:scriptlet>((oracle.wcps.client.PersonalizationContext)session.getAttribute("p
13nContext")).reset();</jsp:scriptlet>
```

68.5.3 Personalization Context Object Method Reference

Table 68–8 shows the Personalization context object methods.

Table 68–8 Personalization Context Object Method Reference

Method Name	Description	Example
reset	Clears the state of the context object in which it is invoked.	`#{p13nContext.reset}` `#{p13nContext.conductor['ConductorConnection'].reset}` `#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset}` `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}`
update	Updates the property set with new values if bound to a form. This method only applies to the PropertySetContext. **Note:** This method can only called as part of a form-based action.	`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}`
results	Retrieves the results of the context object. For PropertySetContext, it retrieves the property set by name and property set definitions, if they exist. For ScenarioExecutionContext and ParameterizedScenarioExecutionContext, the scenario results are retrieved.	`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results}` `#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}` `#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`
withInput	Executes a scenario by name with input parameters. Input parameters must be in the format: `<paramOne>=<valueOne>;<paramTwo>=<valueTwo>;<paramThree>=<valueThree>` where each parameter name and value is separated by semicolon. This method only applies to ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`
isError	Determines if an error has occurred in the current context object. Only applies to PropertySetContext and ~ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError}` `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}`
errorMessage	Returns the error message if an error has occurred in the current context object. Only applies to PropertySetContext and ~ScenarioExecutionContext.	`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].errorMessage}` `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}`

68.5.4 Enabling Single Sign-on

To enable single sign-on, access to the `HttpServletRequest` must be available for both JSF and JSP environments. An implementation of `javax.servlet.Filter` (`PersonalizationFilter`) puts the `HttpServletRequest` on `ThreadLocal` for access within the client as shown in the example below:

```
<filter>
     <description>Personalization Filter for staging client-side
objects.</description>
     <filter-name>PersonalizationFilter</filter-name>
     <filter-class>oracle.wcps.client.PersonalizationFilter</filter-class>
</filter>

<filter-mapping>
     <filter-name>PersonalizationFilter</filter-name>
     <url-pattern>/*</url-pattern>
     <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

This filter is automatically configured in the `wcps-services-client-web-lib`.

Part XII

Completing Your WebCenter Portal Application

Part XII contains the following chapters:

- Chapter 69, "Securing Your WebCenter Portal: Framework Application"
- Chapter 70, "Deploying and Testing Your WebCenter Portal: Framework Application"
- Chapter 71, "Building Multilanguage Portals"

69

Securing Your WebCenter Portal: Framework Application

This chapter describes the security mechanisms and features provided in a WebCenter Portal: Framework application, and how you can use Oracle ADF Security to handle authentication and authorization.

This chapter includes the following sections:

- Section 69.1, "Introduction to WebCenter Portal: Framework Application Security"
- Section 69.2, "Creating an Application Role"
- Section 69.3, "Configuring ADF Security"
- Section 69.4, "Using the Role Manager Task Flow"
- Section 69.5, "Using the Enterprise Role Member Task Flows"
- Section 69.6, "Using the Page Hierarchy Security Editor"
- Section 69.7, "Creating Login Pages and a Login Component"
- Section 69.8, "Creating a Login Portlet"
- Section 69.9, "Adding Portlets to a Login Page"
- Section 69.10, "Creating a Self-Registration Page"
- Section 69.11, "Creating a Reset Password Page"
- Section 69.12, "Configuring Basic Authentication for Testing Portlet Personalization"
- Section 69.13, "Working with External Applications"
- Section 69.14, "Registering Custom Certificates with the Keystore"
- Section 69.15, "Overriding Inherited Security on Portlets and Customizable Components"
- Section 69.16, "Identity Propagation Mechanisms"
- Section 69.17, "Securing Identity Propagation Through WSRP Producers with WS-Security"
- Section 69.18, "Implementing PDK-Java Portlet Security"
- Section 69.19, "Troubleshooting Security Issues"

69.1 Introduction to WebCenter Portal: Framework Application Security

WebCenter Portal: Framework applications are dynamic and often involve input from users in the form of customizations and preferences, and consequently require a flexible security model. The WebCenter security model is based on the ADF security model rather than the more traditional J2EE security model. For more information on ADF security, the section on "Enabling ADF Security in a Fusion Web Application" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

By default, a Framework application is configured with ADF security. A default username and password (weblogic/weblogic1) are created automatically for you, and you can use this username/password combination for testing purposes immediately. For more information about configuring ADF security, see Section 69.3, "Configuring ADF Security."

Default login and logout pages are also provided with the Framework application template.

Framework applications can also use two out-of-the-box security tools: the *Role Manager* task flow, and *Page Hierarchy* security editor. The Role Manager task flow provides pre-defined runtime security administration functionality to define roles and permissions for users. Using the Page Hierarchy security editor provides a quick way to apply inherited and/or delegated security to application pages. These two security tools are described in Section 69.4, "Using the Role Manager Task Flow," and Section 69.6, "Using the Page Hierarchy Security Editor."

69.2 Creating an Application Role

There are three roles available out-of-the box:

- **Administrator** - the default member for the application Administrator role is the enterprise Administrator role, whose default member is `weblogic`
- **AppConnectionManager** - the default member for the AppConnectionManager role is the application Administrator role
- **AppConnectionViewer** - the default member for the AppConnectionViewer role is the authenticated-role

The Administrator role is provided so that you can set up navigation and security for your application, and delegate permissions to other users.

The AppConnectionManager and AppConnectionViewer are roles that are defined for managing and viewing application connections respectively. Typically, application connections are configured and managed using Fusion Middleware Control or WLST commands. However, connections for portlet producers and external applications can be configured through the application's runtime Administration page (or the Role Manager task flow if implemented separately). To manage or view these connections, you must be part of one of these roles. For more information about the default roles, see "Default Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

You can add members at runtime for these roles using the Administrator page (or the Role Manager task flow if implemented separately), and in JDeveloper using the JAZN Editor. Out-of-the-box, an administrator will be able to configure external application and portlet producer connections, and any other authenticated user will only be able to view these connections. Similarly, you can add users to the application by selecting the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

To create an application role:

1. Access the ADF Security Policy editor using any of the following methods:
   - Navigate to the **jazn-data.xml** file in the Application Resources Panel, under the META-INF folder. Right-click **jazn-data.xml** and select **Open** from the context menu. Open the Application Roles tab.
   - Right-click the application name, select **Secure** and then **Application Roles**.
   - From the Application menu, select **Secure** and then **Application Roles**.
2. In the Application Roles editor, click the Add (+) icon and select **New Role**.
3. Enter a name, a display name, and description for the new role.
4. Save the file.

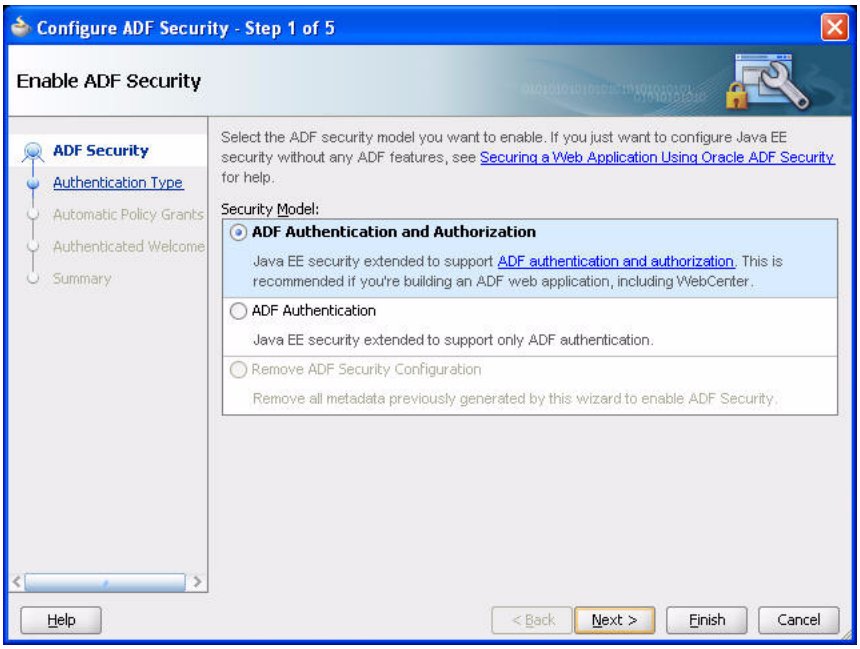
Similarly, you can add users to the application by opening the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

69.3 Configuring ADF Security

ADF security is configured by default if you created your application using the Framework application template. This section describes the Configure ADF security wizard, which you can use to override the default settings for a Framework application, or if your application does not use the Framework application template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application). This section also describes the grants that are generated when you create a Framework application, and when services are consumed.

This section contains the following subsections:

- Section 69.3.1, "Configuring ADF Security Settings"
- Section 69.3.2, "Automated Security Grants for WebCenter Portal Services"



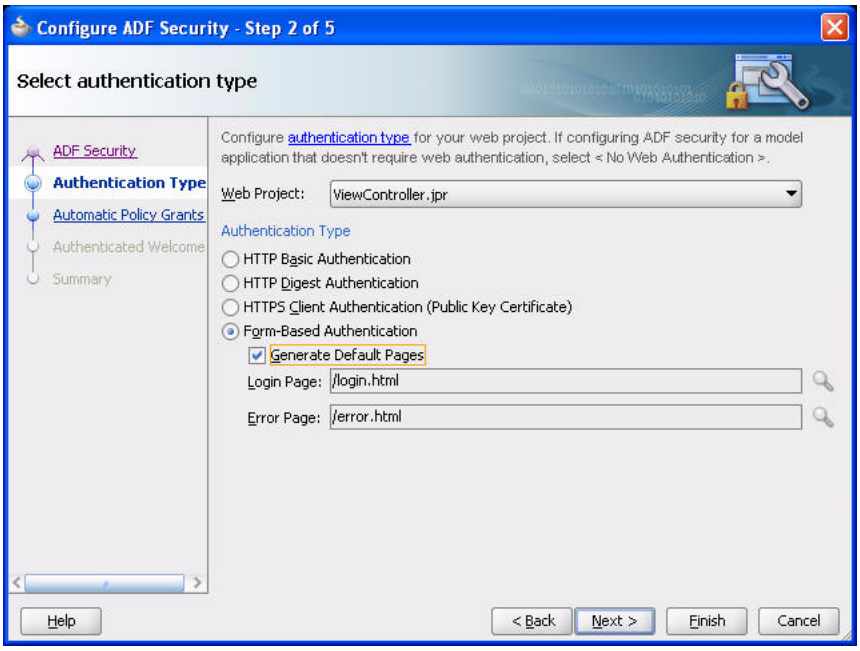
69.3.1 Configuring ADF Security Settings

This section describes the Configure ADF security wizard, which you can use to override the default settings for a Framework application, or if your application does not use the Framework application template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application).

To configure the ADF security settings:

1. Open your portal application.
2. Access the Configure ADF Security Wizard using one of the following methods:
   - From the **Application** menu, select **Secure** and then **Configure ADF Security**.
   - Right-click the application name, select **Secure** and then **Configure ADF Security**.
3. On the Enable ADF Security page, select **ADF Authentication and Authorization**, which is the typical choice for Framework applications.

Figure 69–1 ADF Security Page of the ADF Security Wizard



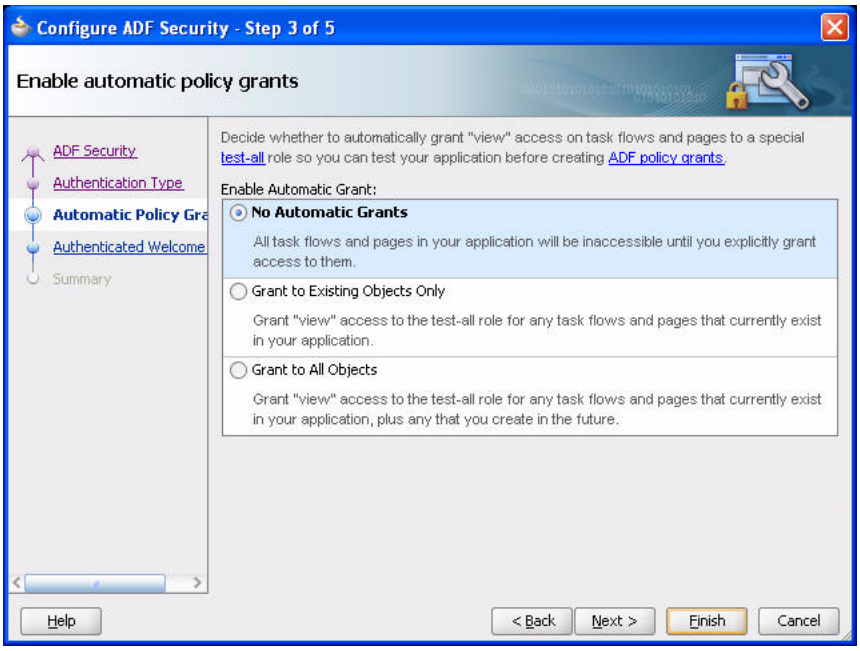
4. Click **Next**.
5. Notice that form-based authentication is selected by default.

   To make the process of securing your application easy, select **Form-Based Authentication** and then the **Generate Default Pages** option, as shown in Figure 69–2.

   Note: Framework applications provide default login and error pages. You should only select the **Generate Default Pages** option for applications not built using the Framework application template.

   Alternatively, if you do not select Generate Default Pages, you can create custom login and error pages. For information about creating custom login pages, see Section 69.7, "Creating Login Pages and a Login Component."

Figure 69–2 Authentication Page of ADF Security Wizard



6. Click **Next**.

7. On the Enable automatic policy grants page, shown in Figure 69–3, select whether to make ADF resources public without requiring application developers to first define ADF policy grants. For a standard security implementation, you can select the **No Automatic Grant** option.

   However, in this case, you must individually grant permissions on each page in the application.

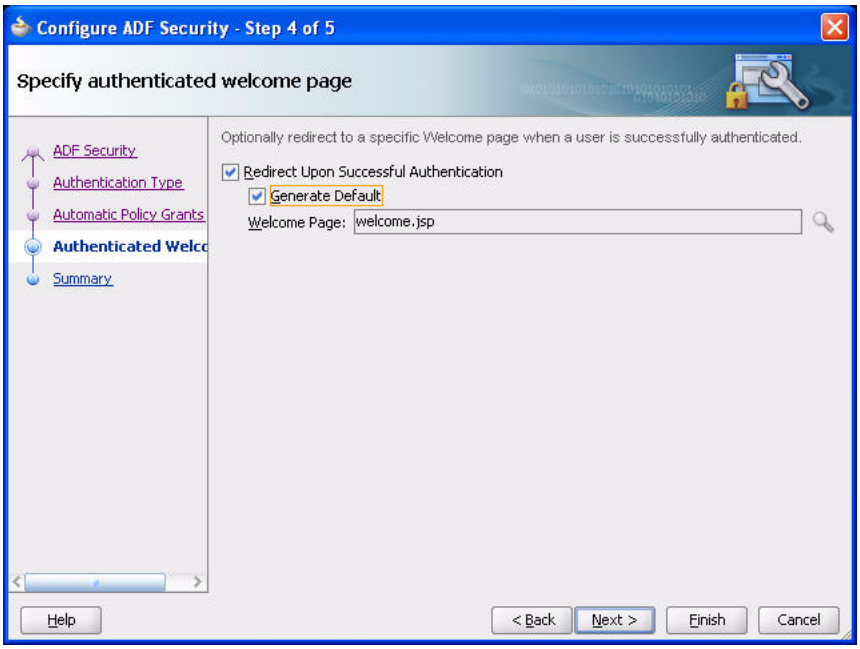
Figure 69–3 Automatic Policy Grants Page

When you enable automatic policy grants, a *View* grant for all ADF resources is made to the `test-all` application role, whose default member is the `public` role. This option provides a convenient way to run and test application resources without the restricted access that ADF authorization enforces. You can also disable automatic policy grants to secure all ADF resources by default.

Select **No Automatic Grant** when you want to explicitly configure a policy store to grant access to ADF resources. No automatic grants to the `test-all` application role are granted. However when WebCenter Portal services task flows are consumed in an application, the WebCenter extension automatically adds appropriate grants for these task flows, giving View access to the role `authenticated-role`. For more information about the specific grants provided through task flows, see Section 69.3.2, "Automated Security Grants for WebCenter Portal Services."

Note: By default, `anonymous-user` is granted permission to access services task flows. Anonymous access is also provided to the `resourceViewer` task flow that allows resources to be visible when looking at data through Activity Stream or Search. If you have no public or anonymous access to your functionality, all the grants that are currently given to `anonymous-role`, should be moved to `authenticated-role`. Also, grants made to `authenticated-role` are visible in the source view of the `jazn-data.xml` file.

If the default grants to `anonymous-role` or `authenticated-role` are not appropriate to the application, you can change them by opening the source view of the application's the `jazn-data.xml` file and cutting and pasting the permissions to the appropriate role.



Select **Grant to Existing Objects Only** when you want JDeveloper to grant View privileges to the `test-all` (public) application role and you want this policy to apply to all your application's existing ADF task flows and web pages in the user interface project.

Select **Grant to All Objects** when you want JDeveloper to grant View privileges to the `test-all` application role and you want this policy to apply to all ADF task flows and web pages that developers create in the user interface project. Note that the **Grant to All Objects** option appears when you run the wizard for the first time. Subsequently, the **Grant to New Objects** option appears each time you run the wizard.

8. Click **Next**.
9. Optionally, if you want to display a specific welcome page upon authentication, then select the **Redirect Upon Successful Authentication** option as shown in Figure 69–4.

   You can either create a custom welcome page or let the wizard create a default one. To keep the process simple, select **Generate Default**.

Figure 69–4 Specify an Authenticated Welcome Page

10. The Summary page opens, as shown in Figure 69–5.

Figure 69–5 Summary Page

11. Click **Finish**.

It may take several moments for the wizard to complete.

12. On the Security Infrastructure Created dialog, click **OK**.

69.3.2 Automated Security Grants for WebCenter Portal Services

Table 69–1 lists the security grants that are given automatically in a Framework application, configured with standard Portal features.

Note: If you have do not have public or anonymous access to your application, grants that are currently given to `anonymous-role` can be removed using the following WLST command:

```
revokePermission(appStripe="papp1#V2.0",principalClass="oracle.secu
rity.jps.internal.core.principals.JpsAnonymousRoleImpl",
principalName="anonymous-role",
permClass="oracle.adf.controller.security.TaskFlowPermission",
permActions="view", permTarget="/oracle/webcenter/.*")
```

			oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_taskflowstyle_.*

Table 69–2 lists the grants that are given when a service is consumed. A service is consumed whenever a component (from the Component Palette) or a task flow (from the Resource Palette) belonging to that service is added to a page.

Grants are added automatically to the `jazn-data.xml` file. They can be viewed and edited through the ADF Security Policy Editor. For more information, see Section 69.3.1, "Configuring ADF Security Settings."

Note: When a WebCenter Portal: Framework application is created, the following element:

```
<name>resource=MyApplicationName</name>
```

(where *`MyApplicationName`* is the name of the application you created) is added to the `jazn-data.xml` file. If you modify the `jazn-data.xml` file, be sure that the application name matches the application name under the `jazn-data.xml` file's <policy-store> element. If these two application names do not match, any functionality that relies on WS-security identity propagation will not work.

If ADF security has not been configured for the application, then these grants are not added; however, if security is later configured, grants are added for all services that have been consumed in the application. Common grants are granted whenever any Oracle WebCenter Portal service is consumed.

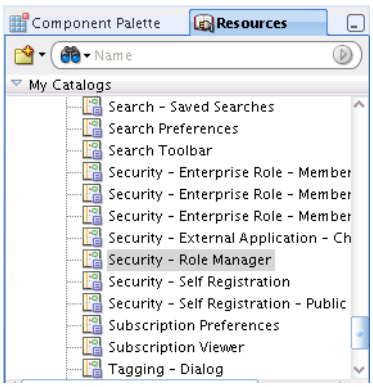
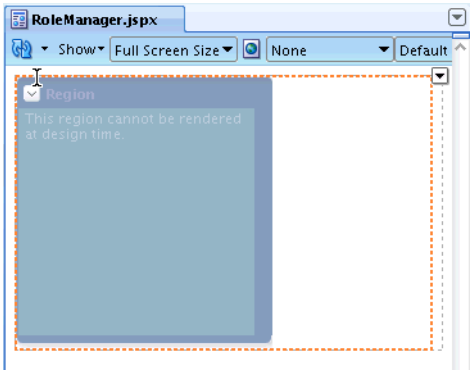
69.4 Using the Role Manager Task Flow



The Role Manager task flow lets administrators manage application roles, its memberships, and associate service permissions for the role. The Role Manager task flow is available out-of-the-box from the runtime Administration page's Security tab for applications built using the Framework application template. For information on how to use the Role Manager runtime to manage and configure users and application roles, see "Managing Users and Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To prevent customizations from being overwritten during updates, the source for the Administration page should not be customized. You can, however, choose to write your own administration page if the default administration page is not sufficient, in which case you can use the Role Manager task flow as part of your application's runtime security administration. Follow the steps below to add it a JSF or JSP page and include it in your application.

To add the Role Manager task flow to your Framework application:



1. Create a new application choosing **Framework application** as the application type.
2. Create the application adding any project technology libraries that the application may require. Do not uncheck the **Configure the application with standard Portal features** check box.
3. Create a new JSF or JSP page.
4. From the Resource Palette, expand WebCenter Portal - Services Catalog, and from the list of Task Flows, select the `Security - Role Manager` task flow.

Figure 69–6 Resource Palette - WebCenter Portal - Services Catalog

5. Drag the Role Manager task flow onto the page you created as a region.

Figure 69–7 Role Manager Task Flow

6. Build the application, log in as an administrator, and navigate to the page containing the role Manager task flow.

69.5 Using the Enterprise Role Member Task Flows

The Enterprise Role Member task flows provide additional task flows to the Role Manager task flow that you can add to a page to monitor enterprise users and roles. The members shown are both roles and users, with the result shown in a tree structure. Roles can be further expanded to see their members.

To add the task flows, follow the same steps as for the Role Manager task flow (see Section 69.4, "Using the Role Manager Task Flow"), substituting one of the task flows described below. Note that all of the Enterprise Role Members task flows take a single mandatory parameter which is the enterprise role name.

- **Security - Enterprise Role Members**

  This task flow shows a list of the members for a specified role.

- **Security - Enterprise Role - Members Search**

  This task flow does a nested search of members using a pattern for the specified role and shows the list of members.

- **Security - Enterprise Role - Members Viewer**

  This task flow shows the Members and Search tabs that are shown for the Enterprise Role Members and Members Search task flows in a single page.

69.6 Using the Page Hierarchy Security Editor

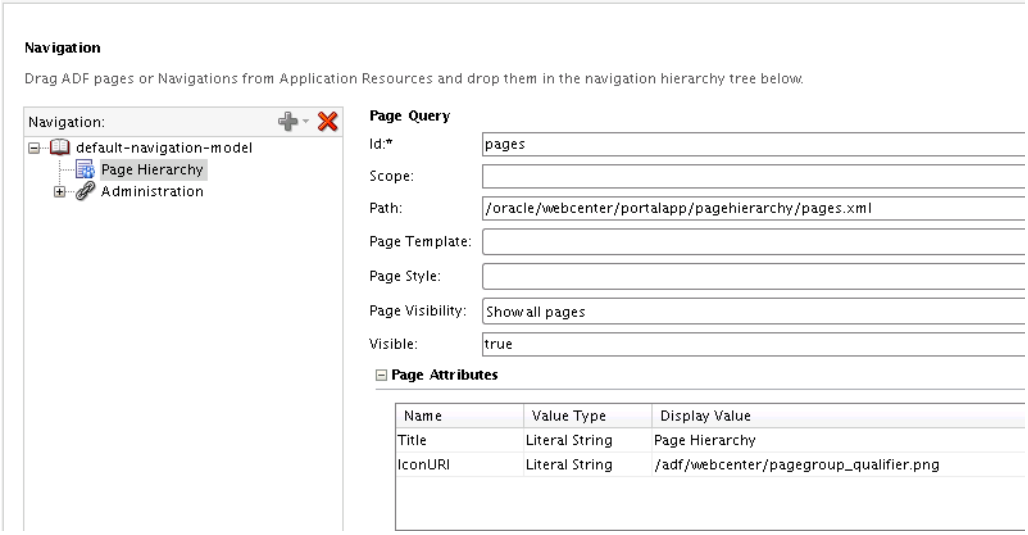
This section describes how to use page hierarchy security to provide inherited and delegated security for WebCenter Portal: Framework application pages. It includes the following sections:

- Section 69.6.1, "Introduction to Page Hierarchy Security"
- Section 69.6.2, "Building a Page Hierarchy"

69.6.1 Introduction to Page Hierarchy Security

This section describes the page hierarchy model and how page hierarchy security works within a WebCenter Portal: Framework application.

This section includes the following subsections:



- Section 69.6.1.1, "Page Hierarchy Model"
- Section 69.6.1.2, "Page-level and Page Hierarchy Security"
- Section 69.6.1.3, "Inherited and Delegated Security"

69.6.1.1 Page Hierarchy Model

A page hierarchy has a default security policy that is set at the root of the hierarchy. Unless explicitly overridden, this policy applies to all pages underneath. At any page in the hierarchy, it is possible to override the inherited policy with a new overriding policy, allowing for delegated administration and modifying the policy at the subordinate pages. Once the policy is overridden for a particular page, the children of that page, by default, will inherit the new policy. The policy established at any node is a list of grants indicating what permissions each of the grantees has on that page and its children, if any.

When you create a WebCenter Portal: Framework Application, a default navigation model is created for you that also contains the root node of a page hierarchy. These two structures work independently and collectively to provide the navigation flow and secured access to pages for your application. Figure 69–8 shows the default navigation model (`default-navigation-model.xml`), which includes a node for the default page hierarchy (`pages.xml`).

Figure 69–8 Default Navigation Model

You can add additional navigation models to, for example, provide different navigation views for specific user groups. For each navigation you can also add one or more page hierarchy nodes to provide a more granular navigation and security model. For more information about creating new navigation models, see Section 11.2, "Creating a Navigation Model." For more information about adding page hierarchies to a navigation, see Section 11.3.5, "How to Add a Page Hierarchy to a Navigation Model."

Although there is only a single page hierarchy within your application, any node within that hierarchy can be used as the root node in a navigation model. For example, you might have a page hierarchy that contains top level nodes for Human Resources, Support, Sales, Administration, and so forth. Each of these nodes can be added to the navigation model separately to create navigation only to that section of the page hierarchy.

Figure 69–9 Page Hierarchy Root Node Permissions

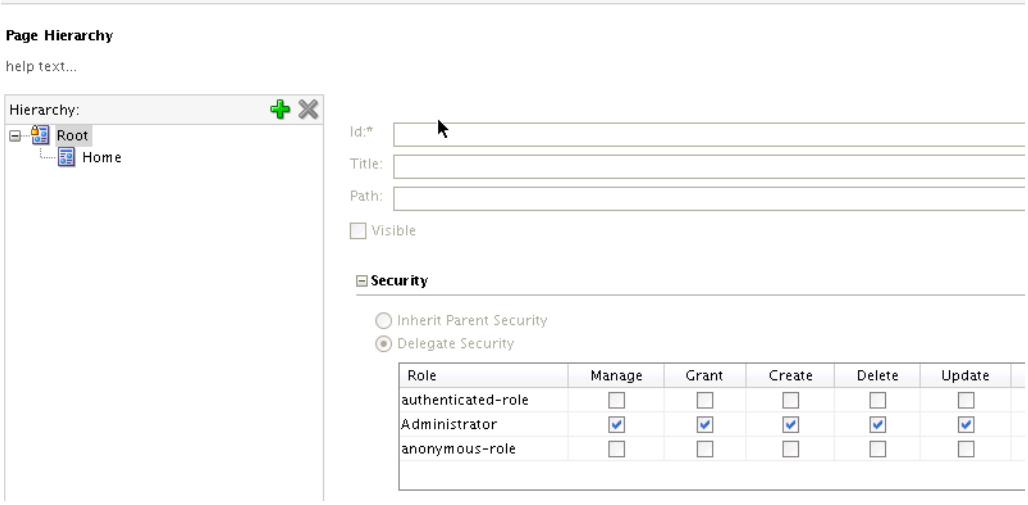


Figure 69–9 shows the page hierarchy root node and the associated permissions. From the root node you can start building your page hierarchy by adding or dragging pages into it. Note that the "Manage" permission appears only on the root node, and only for the administrator. This allows the administrator to delegate security and have full access to all pages within the hierarchy regardless of any security overrides downstream. In short, a user with "manage" permission on the root node is a "super admin" and has all access to all pages in the entire hierarchy.

69.6.1.2 Page-level and Page Hierarchy Security

A page hierarchy provides an alternative security mechanism to page-level security for your Framework application. Although you can add pages to your application and provide security for them without making them a part of a page hierarchy, a page hierarchy provides a convenient and more manageable way to secure the content for large sites. By simply adding a hierarchy node to the hierarchy root or home node and dragging and dropping pages into it, you can very quickly provide basic security for them.

> **Note:** Although page-level security can co-exist with page hierarchy security, you cannot apply both page-level and page hierarchy security to the same page. Note also that if you add a page to a hierarchy node, all previous page-level permissions are purged.

69.6.1.3 Inherited and Delegated Security

The page hierarchy model uses a node structure that provides cascaded, role-based security where each child node inherits its parent's security permissions. By adding pages to a node you can quickly configure security for your application pages.

To be able to perform any action at a particular node, you need to have the required permission at the node or its immediate parent that delegates (overrides) security. However in order to view a page, you need to have view access for all pages up the hierarchy right till the root page.

As well as providing basic security inherited from a node's parent, you can also apply delegated security to child nodes to limit or override the security that would otherwise

have been inherited. These aspects of page hierarchy security are described in Section 69.6.2, "Building a Page Hierarchy."

> **Note:** Inherited security is cascaded through a root node that can initially only be populated by an administrator. For other users to be able to create and delegate permissions the administrator must first delegate those permissions. In all cases, permissions are only cascaded down in the tree (that is, a user cannot change settings for a parent node). A user can also only delegate the rights they have themselves or a subset of those rights to another user.

69.6.2 Building a Page Hierarchy

This section explains how to use page hierarchy security to automatically cascade a parent page's role-based security settings to its child pages, and how to "delegate" security for individual page nodes.

This section contains the following subsections:

- Section 69.6.2.1, "Adding a Page Hierarchy to a Navigation"
- Section 69.6.2.2, "Adding Pages to a Page Hierarchy"
- Section 69.6.2.3, "Delegating Security"

69.6.2.1 Adding a Page Hierarchy to a Navigation

In addition to the default page hierarchy in the default navigation model, you can add page hierarchy nodes from the default page hierarchy to the navigations within your application as root nodes. For more information about adding a page hierarchy to a navigation, see Section 11.3.5, "How to Add a Page Hierarchy to a Navigation Model."

69.6.2.2 Adding Pages to a Page Hierarchy

This section describes how to add JSF or JSP pages to a page hierarchy.

> **Note:** To avoid issues with conflicting inherited security models, a page can only appear once in the page hierarchy.

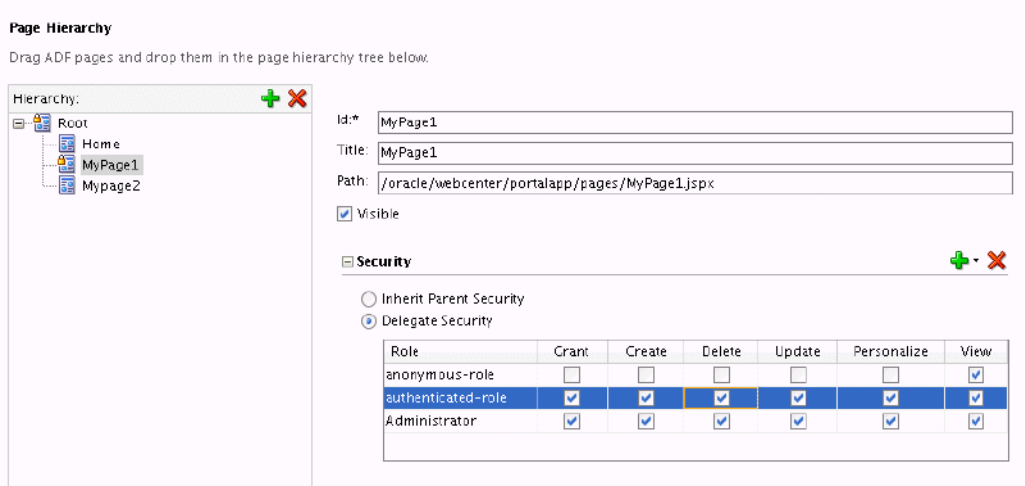
To add a JSF or JSP page to a page hierarchy:

1. Open the page hierarchy editor in JDeveloper:
   - Right-click the `/oracle/webcenter/portalapp/pagehierarchy` folder

     or
   - Right-click any `.jspx` page under `/oracle/webcenter/portalapp` and select **Edit Page Hierarchy** from the context menu
2. Select the node to which you want to add pages, and either:
   - Click the **Add page** icon and use the browser to locate and add the page

     or
   - Drag and drop the page from the Navigator under the appropriate node
3. Continue by adding additional pages as required, or use the **Remove Page** icon to delete any unwanted pages.

69.6.2.3 Delegating Security



This section describes how to override inherited security by delegating permissions for a node and its child pages. You can also delegate security for pages using the runtime Administration page. For more information about delegating security using the runtime Administration page, see "Managing Application Roles and Permissions" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To override inherited security with delegated security:

1. Open the page hierarchy (`pages.xml`) in JDeveloper.
2. Select the node at which to begin overriding inherited security.
3. Check or uncheck the **Visible** checkbox to specify whether the page or resource is displayed. Check the checkbox if you want the resource to be displayed to all users at all times. Uncheck the checkbox to hide the resource from all users at all times.
4. Select **Delegate Security**.

   The Security options for delegating security displays (see Figure 69–10).

Figure 69–10 Page Hierarchy - Delegate Security

5. Check or uncheck permissions for the roles for this page and its child pages.
6. To specify permissions for another available user role, click the **Add** icon (**+**) and select the desired role. A new row will be created in the table for this role. To remove the permissions for an existing role, select the corresponding row in the table and click the **Delete** (**X**) icon.

> **Note:** The role names in the Add list correspond to the application roles that have been defined in the policy store for the application. Delegating security is limited to only application roles at design time. You can, however, add user and enterprise roles at runtime using the runtime Administration page, as described in "Managing Application Roles and Permissions" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

69.7 Creating Login Pages and a Login Component

You can add login and logout links to your public welcome page or other page using a login backing bean (`LoginBackingBean`) so that users can explicitly log in and out while they are in the application. The bean provides methods that can be used by the user to log in and log out.

To use the bean, create a simple page and bind it to the bean to do the login and logout as described in the following steps:

1. Create a JSF page.
2. Add the `LoginBackingBean` to the `faces-config.xml` or `taskflow.xml` file.
3. Create a page with user name, password, login and logout links.
4. Bind the user name and password to the bean's user name and password.
5. Map the login and logout links to the `doLogin` and `doLogout` method respectively as shown in the example below:

```
          <af:subform id="pt_sf1" defaultCommand="pt_logincb"
                      rendered="#{attrs.showLogin and
!securityContext.authenticated}">
               <af:panelFormLayout id="pt_pfl1">
                 <af:panelLabelAndMessage id="pt_plam1" label="User Name"
                                          styleClass="NoLabelWrap"

labelStyle="font-size:small;color:white;">
                   <af:inputText id="pt_it1" simple="true"
                                 value="#{o_w_s_l_LoginBackingBean.userName}"
                                 columns="15"/>
                 </af:panelLabelAndMessage>
                 <af:panelLabelAndMessage id="pt_plam2" label="Password"
                                          styleClass="NoLabelWrap"

labelStyle="font-size:small;color:white;">
                   <af:inputText id="pt_it2" simple="true"
                                 value="#{o_w_s_l_LoginBackingBean.password}"
                                 columns="15" secret="true"/>
                 </af:panelLabelAndMessage>
               </af:panelFormLayout>
               <af:spacer width="3" height="3" id="pt_s2"/>
               <af:panelGroupLayout id="pt_pgl14" layout="horizontal"
                                    halign="end">
                 <af:commandLink id="pt_logincb" text="Login"
                                 action="#{o_w_s_l_LoginBackingBean.doLogin}"
                                 inlineStyle="font-size:small;color:white;"/>
                 <af:spacer id="pt_s3" width="5px"/>
               </af:panelGroupLayout>
             </af:subform>
```

The login and logout methods return values that can be mapped to actions and used in the navigation rules of `faces-config.xml` after a successful login and logout. The following entry in `faces-config.xml` is seeded by default in a Framework application:

```
<navigation-rule>
  <from-view-id>*</from-view-id>
  <navigation-case>
    <from-outcome>login_success</from-outcome>
```

```
    <to-view-id>/pages_home</to-view-id>
    <redirect/>
  </navigation-case>
  <navigation-case>
    <from-outcome>logout_success</from-outcome>
    <to-view-id>/pages_home</to-view-id>
    <redirect/>
  </navigation-case>
</navigation-rule>
```

This defines where to go to after a successful login and logout (in this case, for both login and logout the user is returned to the home page). If you want to alter that behavior, you can edit these rules in `faces-config.xml` to, for example, redirect the user to a different page.

For reference information about other configuration elements you can use in the `faces-config.xml` file, see "ADF Faces Configuration" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework.*

69.8 Creating a Login Portlet

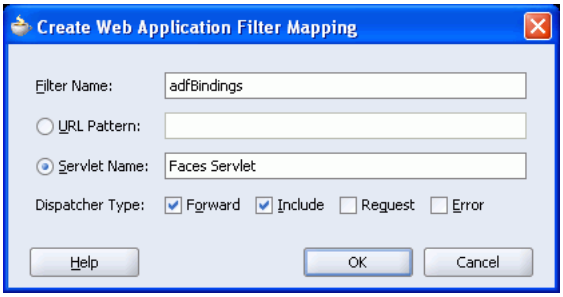
Refer to the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for information about creating a login portlet for your application.

69.9 Adding Portlets to a Login Page

The *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* describes how you can create an ADF Faces-based login page for your application. In this section, you will add some portlets to such a login page so that the login page becomes indistinguishable from the other pages in your WebCenter Portal: Framework application.

Make sure your portlet producers have been registered before proceeding. See Section 64.2, "Registering Portlet Producers with a WebCenter Portal: Framework Application" for details.

To add portlets to the login page, perform the following steps:



1. Drag a **PanelCustomizable** onto the `h:form` tag that is inside the first `cust:panelCustomizable` tag you added to the login page.
2. From the Component Palette, select **RichTextPortlet Producer**, then select the Rich Text portlet from the list and drag it onto the `PanelCustomizable` component.
3. From the Component Palette, select **ADF Faces Core** and drag an **ObjectSeparator** below the Rich Text portlet on the `PanelCustomizable` component.
4. From the Component Palette, select **OmniPortlet Producer**, then select the OmniPortlet from the list and drag it onto the `PanelCustomizable` component.
5. Save the page.

Because the login page is called from the container as part of the login process, the request must be forwarded to the ADF binding filter to establish the appropriate portlet and security context. To do this, you must configure a mapping for the ADF Binding filter in the `web.xml` file. To do this, perform the following steps:

1. In the Applications Navigator, expand the WEB-INF node, right-click **web.xml** and select **properties** to open the property palette.

2. Select **Filter Mappings** in the left panel and click **add** to define a new mapping for the `adfBindings` Filter. This displays the Create Web Application Filter Mapping dialog box.
3. Specify **adfBindings** for the filter name and click the Servlet Name option and specify **Faces Servlet** as the servlet name. Ensure that the Forward and Include dispatcher types are selected as shown in Figure 69–11.

Figure 69–11 Create Web Application Filter Mapping Dialog Box

4. Click **OK**.

Follow the steps in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* to complete the creation of the login page.

69.10 Creating a Self-Registration Page

You can create a self-registration page using the WebCenter Portal: Spaces self-registration task flow, or build a custom self-registration page based on a provided sample that shows how to use the user and role APIs provided in `CreateUserHelper`. This type of self-registration provides a way for public users to create their own login and password for your application.

You can also invite users who may, for example, be outside your organization to self-register using the Spaces public invitation task flow. For more information about these two types of self-registration pages and their runtime behavior, see the chapter on "Enabling Self-Registration" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This section contains the following subsections:

- Section 69.10.1, "Integrating the Spaces Self-Registration Task Flow"
- Section 69.10.2, "Building a Custom Self-Registration Page"

69.10.1 Integrating the Spaces Self-Registration Task Flow

You can integrate the self-registration page provided in Spaces in a Framework application as described below. For information about the runtime behavior of the task flow, see "Enabling Anyone to Self-Register" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To consume the Spaces self-registration task flow:

1. Open or create a Framework application in JDeveloper.
2. Create a JSPX page.
3. From the Resource Palette, expand the task flows and drag and drop the self-registration task flow onto the page.

4. Create a mail connection and an external application with public credentials and connect the external application to the mail connection. Make this the mail default connection.
5. Run the page with the self-registration task flow to see the runtime self-registration page.

69.10.2 Building a Custom Self-Registration Page

The example self-registration page described below provides a simple page that accepts the user's `firstname`, `lastname`, `mailid`, `login name` and `password`. Use the sample files as a starting point for use within your local environment, or build your own self-registration page and logic using the user and role APIs provided in `CreateUserHelper`. You can use the property set of the user profile attributes provided in the sample and add more attributes to the user as required.

To create the sample self-registration page:

1. Unzip the security samples files in `security-samples.zip` found in the `webcenter/customportal` directory in the WebCenter extension bundle.
2. Copy the `CreateUserBean.java` and `CreateUserHelper.java` files into the application sources folder for your Framework application.
3. Copy the `TestCreateUserPage.jspx` file into the public-html folder.
4. Edit the `TestCreateUserPage.jspx` file to suit the local environment and local requirements.
5. Run the `TestCreateUserPage.jspx` page to view the self-registration page.

69.10.3 Creating a Self-Registration Invitation Page

You can create a public invitation to self-register page in your Framework application using the Spaces public invitation task flow. For information about the runtime behavior of the task flow, see "Enabling Self-Registration by Invitation Only" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To consume the self-registration invitation task flow:

1. Open or create a Framework application in JDeveloper.
2. Create a JSPX page.
3. From the Resource Palette, expand the task flows and drag and drop the self-registration invitation task flow onto the page.
4. Grant the following `CredentialAccessPermission` in `jazn-data.xml` to `oracle.webcenter.framework.view/-`

   The `jazn-data.xml` file should like like the following:

   ```
   <permission>
   <class>oracle.security.jps.service.credstore.CredentialAccessPermission</class>
   <name>context=SYSTEM,mapName=o.webcenter.security.selfreg,keyName=o.webcenter.s
   ecurity.selfreg.hmackey</name>
   <actions>read,write</actions>
   </permission>
   ```

5. Run the page with the self-registration task flow to see the runtime self-registration invitation page.

69.11 Creating a Reset Password Page

The following example provides a simple reset password page that accepts a username and new password. Use the sample files as a starting point for use within your local environment, or build your own reset password page and logic using the user and role APIs provided in `ResetPasswordHelper` to change the password.

To create the sample reset password page:

1. Unzip the security samples files in `security-samples.zip` found in the `webcenter/customportal` directory in the WebCenter extension bundle.
2. Copy the `ResetPasswordBean.java` and `ResetPasswordHelper.java` files into the application sources folder for your Framework application.
3. Copy the `TestResetPasswordPage.jspx` file into the public-html folder.
4. Edit the `TestResetPasswordPage.jspx` file to suit the local environment and local requirements.
5. Run the `TestResetPasswordPage.jspx` page to view the reset password page.

69.12 Configuring Basic Authentication for Testing Portlet Personalization

Portlet personalizations are tied to particular, authenticated users. Hence, when running a portlet that has an Edit mode, the Personalize option in the portlet's dropdown menu only appears to authenticated users of the application. Anonymous or public users will not have the option to personalize the portlet. If you are a developer creating portlets and pages, then you may want to quickly test the Edit mode of your portlet without creating a complete security model for your application. To perform this sort of testing, you can easily configure some very basic authentication for your application and then remove it when you have finished testing:

Note: This procedure is useful for any portlet that has an Edit mode (Omniportlet, Web Clipping, JPS, and PDK-Java).

---

1. Create a user `sking` and the role `manager`. See the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for information about creating users and roles.
2. Secure your application using the ADF Security Wizard. See the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for the steps to be performed. On the Login page of the wizard, select **HTTP Basic Authentication (RFC 2617)**. This specifies that the application will use basic authentication.
3. Run the page in the integrated WLS and log in as a valid user and test your portlet's edit mode.

When you are done testing your portlet's Edit mode, you can quickly remove this test security by do the following:

1. In the Applications Navigator, click the project that contains a page with the portlet you want to test.
2. From the **Tools** menu, choose **ADF Security Wizard**.
3. If the Welcome page appears, then click **Next**.

4. Choose **Remove All ADF Security Settings**.
5. Click **Next** until you come to the Finish page of the wizard. Click **Finish**. The security is removed. If you want to ensure that the security has been removed, then exit your browser and rerun the application. When you access the page, you are not prompted to login and the personalize option no longer available from the portlet's dropdown menu.

69.13 Working with External Applications

Oracle WebCenter Framework defines an external application as any application that implements its own authentication process. That is, an application that does not take part in the WebCenter Framework application's single sign-on process. In some cases, the identity management solution may be the same, but the authentication process can be different.

When WebCenter Framework Service interacts with an application that handles its own authentication, you can associate that service with an external application to allow for credential provisioning. Therefore, the use of an external application definition provides a means of accessing content from these independently authenticated applications.

To replicate a single sign-on experience from the end user's perspective, the external application service captures the username and password, and any other credentials for the external application, and supplies it to the WebCenter service requiring it. The WebCenter service then uses this and logs in on behalf of the end user. This username and password combination is securely stored in a credential store configured for the WebLogic domain where the application is deployed.

The user provides login credentials when prompted, and these credentials are mapped to the Framework application user and stored in the credential store configured for the domain. The credential store subsequently supplies that information during authentication to the external application. Unless the external application's credentials change, the user supplies the credentials only once as the mapped information is read from the credential store for future requests.

> **Note:** When logging in to an external application, if you clear the **Remember My Login Information** checkbox, then the credentials provisioned for that user session are lost if there is a failover in a high availability (HA) environment. You are prompted to specify the credentials again if you try to access the external application content in the same user session.

The external applications that are to be used by the WebCenter Portal: Framework application can be specified before deployment through a wizard in Oracle JDeveloper, or post-deployment through the application server management interfaces (WebLogic Scripting Tool and Oracle Enterprise Manager). See *Oracle Application Server Administrator's Guide* for more information.

This section contains the following:

- Section 69.13.1, "Using External Applications"
- Section 69.13.2, "Supplying User Credentials"
- Section 69.13.3, "Managing External Applications"

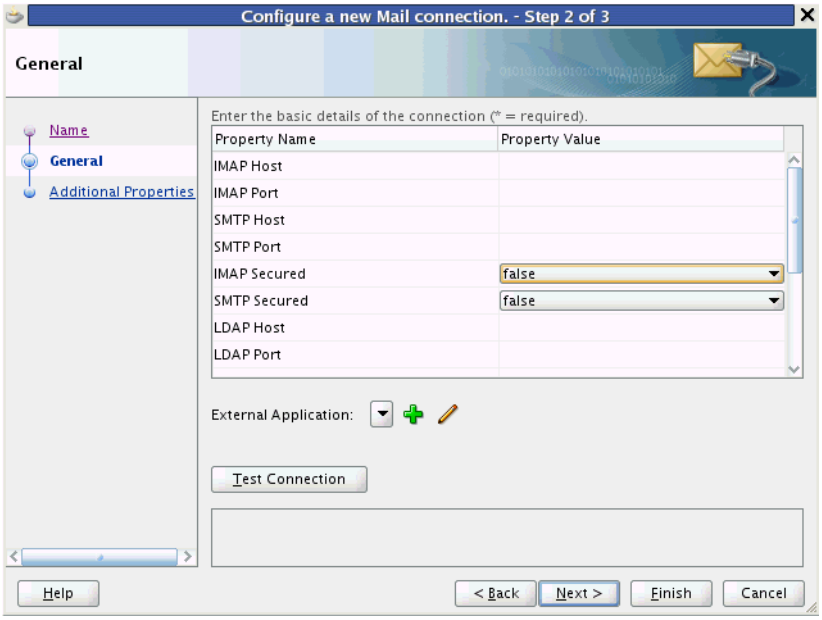
69.13.1 Using External Applications

The WebCenter External Application Service provides a way for mapped user identities to be passed to a web application that requires its own authentication. The support for external applications and credential mapping provided by the WebCenter External Application Service can be used to set up a secured service connection and to provide a seamless automated single sign-on experience for the user.

This is described in the following sections:

- Section 69.13.1.1, "Secured Service Connections"
- Section 69.13.1.2, "Automated Single Sign-On"

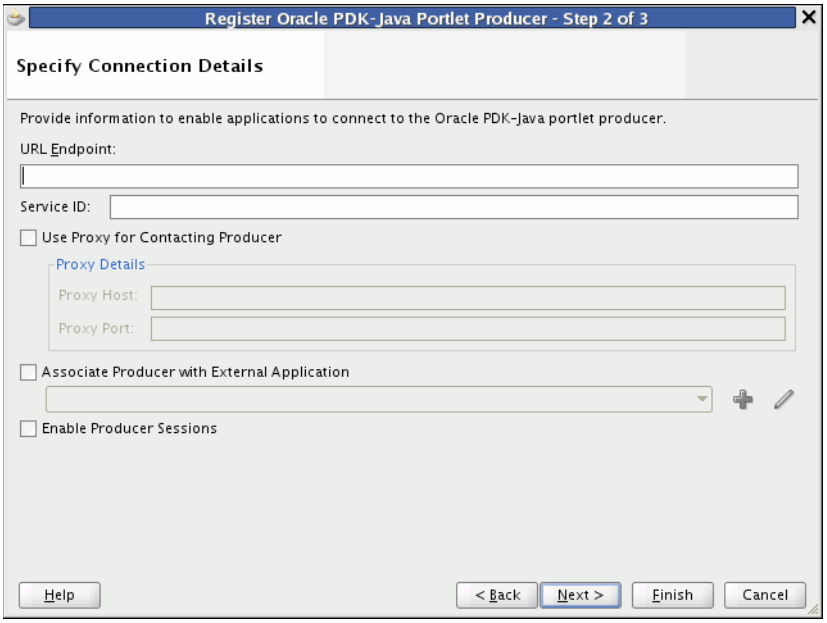
69.13.1.1 Secured Service Connections



To use an external application definition with a secured service (such as a mail server or portlet producer) you associate the named external application with the connection configuration to the required service. For example, the connection to a mail server requires the user to supply a valid username and password to see their mail. Therefore, by associating an external application to the IMAP server connection definition, the user's credentials are automatically passed as part of the mail request as shown in Figure 69–12.

Note: The following WebCenter Portal services must be configured with external applications for credential mapping support to be available:

- Instant Messaging and Presence (IMP)
- Mail
- Documents
- RSS



For more information about the identity propagation mechanisms used by WebCenter Portal services, see Section 69.16, "Identity Propagation Mechanisms".

Figure 69–12 Configure a New Mail Connection Page

When a portlet producer depends on an application that handles its own authentication, you can associate the producer with an external application so that when you register the producer it is a simple task to select the appropriate external definition that maps to the application that is exposed within the portlet, as shown in Figure 69–13.

Figure 69–13 External Application URL

At run time, the producer uses the information associated with the external application to authenticate the user to the application, and consequently consume its portlets. The producer code is responsible for actually performing the authentication interaction with the external application. The external application support provided

with WebCenter Framework simply provides the information needed for authentication to the portlet producer. The use of external applications is supported for both Oracle PDK-Java as well as WSRP producers.

For example, a producer provides a stock portfolio portlet from a portlet-producing application that has its own authentication mechanism. In this case the developer:

- Defines the external application. This can be done through the Oracle JDeveloper wizard or through Oracle Enterprise Manager.
- Associates the external application with the portlet producer.

69.13.1.2 Automated Single Sign-On

With automated single sign-on, the user directly links to the application and is automatically authenticated to the secured web application, as their credentials are retrieved from the credential store. This provides the end user with a seamless single sign-on experience.

Note: Automated login is not supported for:

- External applications using BASIC authentication.
- External applications configured for SSO.
- External applications with a customized login form (built using ADF Faces) that does not implement the J2EE security container login method `j_security_check` for authentication.
- External sites that do not support UTF8 encoding

Rather than using a URL directly to the web application, links to the application are proxied through the external application's automated login servlet (`adfextapplogin`). If the user is not authenticated to the external application and they have not previously stored their credentials in the credential store, they will be challenged for their password through the credential provisioning page discussed below. If, however, the user has previously defined credentials, they will be returned from the credential store and the user will automatically be logged on to the application.

The proxy URL references the external application in question and redirects to the URL that is specified in the external application definition.

```
/adfextapplogin?extappid=<extappid>
```

For example, if you had a WebCenter Portal: Framework application in which you defined an external application that represented the myoracle.com Web site (external application identifier is "myoracle"), the proxy URL would look like this:

```
/adfextapplogin?extappid=myoracle
```

The link's `target` attribute should also be set appropriately. For example, if you use `<a href=>`, then set the `target` attribute appropriately in addition to specifying the target in the `href`. The target attribute specified for the servlet will determine how the Cancel button functions as described below.

```
/adfextapplogin?extappid=<extappid> [target= _self | _blank]
```

If you specify `target=_blank` the link opens in new window. If you specify `target=_self` the link opens in current window. If the `target` parameter is not specified the link opens in current window.

This parameter also affects how the **Cancel** button on the credential provisioning page works. If `_blank` is specified, the new window is closed when **Cancel** is clicked; if `_self` is specified (or the `target` parameter is not used), the user is returned to the calling page.

Note: Automated login for external sites is not supported for sites that do not support UTF8 encoding.

69.13.2 Supplying User Credentials

How you allow an end user to define their credentials for an external application depends on the use of the external application. For most services, the credential provisioning screen is incorporated into the task flow that the service exposes and for these no further configuration steps are required. You can, however, add the `External Application - Change Password` task flow component to applications using these services thereby allowing the end user to preemptively set the appropriate user name and password for each of the external applications that is registered with your WebCenter Portal: Framework application.

The `External Application - Change Password` task flow displays all external applications defined in the application that do not specify shared credentials (for more information about shared credentials, see Section 69.13.3, "Managing External Applications"). Note that the user must to be authenticated to view this task flow.

For the Instant Messaging and Presence service, however, you must explicitly add the `External Application - Change Password` task flow component to your application from the Resource Palette or Component Palette. For step-by-step instructions on how to configure security for the Instant Messaging and Presence service using the `External Application - Change Password` task flow component, see Section 35.2.2, "Adding the IMP Service at Design Time".

At run time, the credential provisioning screen displays login data fields composed of the data fields specified through external application registration. Users fill in the data fields with their login information for the specified external application and that login information is passed to the external application or service. Entering the credentials in the provisioning screen also results in the credentials being persisted in the credential store configured for the WebLogic domain.

By default, the login information the user entered is preserved in a credential store, which handles logins for future sessions. The user does not have to enter login information again (unless the user's credentials change). However, the end user can choose to use the information for the current session by deselecting the **Remember my Login Information** checkbox on the credential provisioning page.

69.13.3 Managing External Applications

This section provides information about registering external applications. Additionally, it describes the process of editing and deleting registration details. It contains the following subsections:

- Section 69.13.3.1, "Adding External Application Task Flows"
- Section 69.13.3.2, "Working with External Applications in Oracle JDeveloper"
- Section 69.13.3.3, "Working with External Applications in Enterprise Manager"
- Section 69.13.3.4, "Working with External Applications Using WLST"

69.13.3.1 Adding External Application Task Flows

The External Application task flow enables users to manage external application connections at runtime. This task flow provides an interface for users to update their credentials for all external applications as and when these credentials are changed at the back end. That is, users do not need to update credentials through the runtime Administration Console's Services tab if they use this task flow.

The external application task flows that you can add using Oracle JDeveloper are:

- **External Application**: This task flow enables users to register, modify, and delete connections at runtime.
- **External Application - Change Password**: This task flow enables users to change external application passwords at runtime.

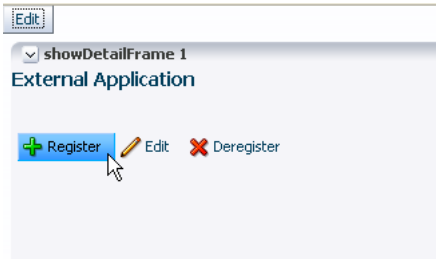
For applications created using the Framework application template, both these task flows are available out-of-the-box through Framework application Administration page (Services tab). For details, see the section "Managing Services, Portlet Producers, and External Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

In addition, just like other task flows, you can add external application task flows to your application pages. This may be especially useful if you are not using the Framework application template and the Administration pages are therefore not part of your project.

Special permissions are required to manage or view external application connections through these task flows:

- **AppConnectionManager** - Users with this role can register, modify, and delete external application connections at runtime.
- **AppConnectionViewer** - Users with this role can view external application connections at runtime. By default, any user who is logged in (that is, has the authenticated-role) is granted this role.

By default, users with the Administrator role can manage external applications. If you want other users to manage connection through these task flows you must grant them the AppConnectionManager role.



To add the external application task flows:

1. Create or open a JSF page in your application where you want the task flow to be added (see Section 5.3, "Adding Pages to a Portal").
2. In the Resource Palette, expand **My Catalogs**, **WebCenter Portal - Services Catalog**, and **Task Flows**.
3. Drag **External Application** from the Resource Palette and drop it onto the page inside of the `af:form` `begin` and `end` tags.
4. Drag **External Application - Change Password** from the Resource Palette and drop it onto the page inside of the `af:form` `begin` and `end` tags after the **External Application** task flow (`af:region - #{bingings.extapp1.regionModel}`).
5. Grant the AppConnectionManager role to one or more test users, if required:
   - Add the test user `TEST_EXTAPP`.
   - Grant the AppConnectionManager role.

For information about how to add a user and grant this role, see the section "Creating Test Users" in *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

6. Save and run your page. Login as an administrator or the `TEST_EXTAPP` user defined in the previous step. The screen shown in Figure 69–14 appears.

Figure 69–14 External Application Task Flow in a Browser

Note: At runtime, application administrators can grant users the AppConnectionManager and AppConnectionViewer roles through WebCenter Portal administration (see the section "Adding Members to Application Roles" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.). Alternatively, system administrators can grant AppConnectionManager and AppConnectionViewer roles through Fusion Middleware Control (see, "Granting Application Roles Using Fusion Middleware Control" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.)

69.13.3.2 Working with External Applications in Oracle JDeveloper

This section provides information about registering external applications and editing and deleting registration details in Oracle JDeveloper. It contains the following subsections:

- Section 69.13.3.2.1, "Registering an External Application in Oracle JDeveloper"
- Section 69.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper"
- Section 69.13.3.2.3, "Deleting External Application Registration Details in Oracle JDeveloper"

69.13.3.2.1 Registering an External Application in Oracle JDeveloper

Use the Register External Application Wizard to identify and store information about the type of data required to authenticate to an external application, such as the names of login fields.

To register an external application in Oracle JDeveloper:

1. In the Applications Navigator, right-click a WebCenter Portal: Framework application or project and select **New** from the context menu.
2. In the New Gallery, select **External Applications** under the **General** node.
3. In the right pane, select **External Application**, and click **OK**.

   This displays the Register External Application Wizard.

4. On the Name page, use the **Create external application in** option to specify whether the external application can be reused in other Framework applications. Select **Application Resources** to make the external application available only in the Framework application in which it is registered, or select **Resource Palette** to make the external application available from the Resource Palette to any new Framework applications you create in Oracle JDeveloper.

   If you choose **Resource Palette**, then the external application connection will be visible under IDE connections in the Resource Palette. If you want to use it in an application, you can right click the external application from resource palette and click **Add to Application**.

5. In the **Name** field enter a unique name to identify the application.

   This name must be unique within the WebCenter Portal: Framework application, and among other connections as well. Note that you cannot edit this field afterward.

6. In the **Display Name** field enter a name for the application that end users will see in the credential provisioning screens.

   You can modify the Display Name at any time as described in Section 69.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper". If you leave the field blank the display name is set to the value of the Name field by default.

7. Click **Next**.

8. On the General page, in the **Login URL** field enter the URL to which the HTML login page is submitted.

   View the HTML source of the application's login form to retrieve this URL.

   > **Note:** The fields on the General pane are only required if the external application being defined participates in click-through login as described in Section 69.13.2, "Supplying User Credentials".

9. In the **User Name/ID FieldName** field, enter the label that the application uses for the user name field, for example, `User Name`.

10. In the **Password FieldName** field, enter the label that the application uses for the password field, for example `Password`.

11. From the **Authentication Method** list, select the application's login method.

    Choose from the following:

    - **GET**

      Presents a page request to a server. Submits the login credentials as part of the login URL.

    - **POST**

      Submits login credentials within the body of a form.

12. Click **Next**.

13. On the Additional Fields page, enter the names and values of any additional fields that are submitted with the external application's login form:

    Click the **Add Field** button to create an input field:

- **Field Name**

  Enter a unique name for any additional field that requires user input on the external application HTML login form.

- **Field Value**

  Enter a default value for the corresponding field name.

- **Display to User**

  Select to display the field on the external application login screen. If the field is not displayed (unchecked), then a default value must be specified, which will be used to login into the external application for all users. If the value is user-specific, then the field must be displayed to the user provisioning page.

  Note: The Delete Field option can be used to delete selected rows.

14. Click **Next**.
15. On the Shared Credentials page, select the **Specify Shared Credentials** check box and specify a **Username** and **Password** if you want all authenticated users to access the external application using this credential. Authenticated users will not be challenged to provide their credentials when they access the external application.
16. Click **Next**.
17. On the Public Credentials page, select the **Specify Public Credentials** check box and specify a **Username** and **Password** to be used for all unauthenticated (public) users accessing the external application. This is required when the external application content is accessed through one of the WebCenter Portal services (such as Document Library, or Instant Messaging and Presence), and the task flow is placed on a public page.
18. Click **Finish** to register the external application.

After registering your external application, you must configure the application to allow the end user to define the username and password. You can do this by dropping an `External Application - Change Password` task flow component into your application. This allows the end user to preemptively set the appropriate username and password for each of the external applications that is registered with your WebCenter Portal: Framework application.

To configure the application to allow the end user to define the username and password, perform the following steps:

1. Open a JSF Page in your ViewController project.
2. From the Resource Palette, under My Catalogs, WebCenter Portal - Services Catalog, expand **Task Flows**.
3. Drag an `External Application - Change Password` task flow component onto your page.
4. When prompted, choose **Region** as the way to create the task flow.
5. Secure the page as this task flow is accessible only to authenticated users

69.13.3.2.2 Editing External Application Registration Details in Oracle JDeveloper

Use the Edit External Application Registration Information Wizard to revise the registration details provided for an external application.

To edit external application registration details:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Properties** from the context menu.
2. In the Edit External Application Wizard, click a link to show a page and revise its values.

   Choose from the following:

   - **Name**
   - **General**
   - **Additional Fields**
   - **Shared Credentials**
   - **Public Credentials**

   For more information, see Section 69.13.3.2.1, "Registering an External Application in Oracle JDeveloper".
3. Click **OK** to save your changes and exit the wizard, or click **Cancel** to exit the wizard without saving.

69.13.3.2.3 Deleting External Application Registration Details in Oracle JDeveloper To delete external application registration information, perform the following steps:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Delete** from the context menu.

   Alternatively, you can select an external application in the Applications Navigator and from the Edit menu, select **Delete**.
2. In the External Application Delete dialog box, select **Yes**.

Oracle recommends that you remove any references to services, such as a portlet producer, with which the external application is associated. Failing to do so will likely result in runtime errors, because the components will attempt to communicate with the external application.

69.13.3.3 Working with External Applications in Enterprise Manager

Just as you can create, edit, and delete external application registration details in Oracle JDeveloper, you can also do this in Enterprise Manager. See the section "Working with External Applications" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

69.13.3.4 Working with External Applications Using WLST

As well as Oracle JDeveloper and Enterprise Manager, you can also use WebLogic Scripting Tool (WLST) commands to create, edit, and delete external application registration details. See the section "Working with External Applications" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

69.14 Registering Custom Certificates with the Keystore

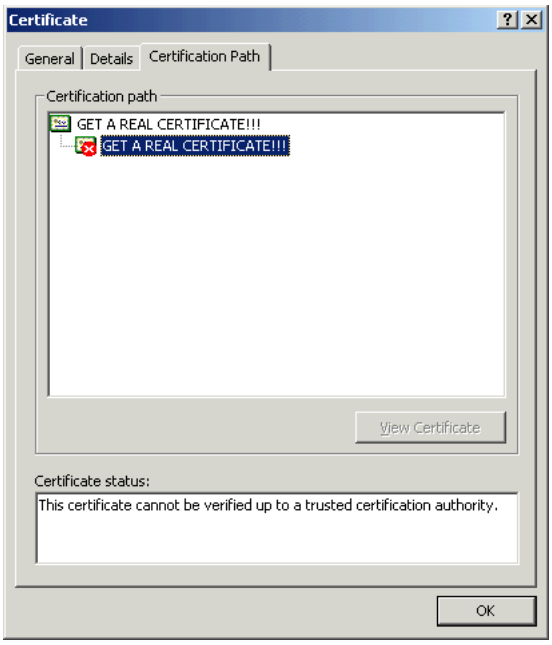
Secure Sockets Layer (SSL) Communication requires the use of trusted certificates issued by a certificate authority, which vouches for the authenticity of the certificates that it issues or signs. Widely accepted certificate authorities are listed in the keystore,

the `cacerts` file, available in the `<JDEV_HOME>\jdk\jre\lib\security` directory. If a portlet producer uses a security certificate issued by a non-widely accepted certificate authority and you try to access portlets from this producer, a security alert is displayed informing you that the security certificate was issued from a certificate authority you do not trust. This means the certificate is not available in the keystore. To avoid being prompted each time you access such portlets, you must register this certificate with the keystore.

To register a certificate with the keystore, perform the following steps:

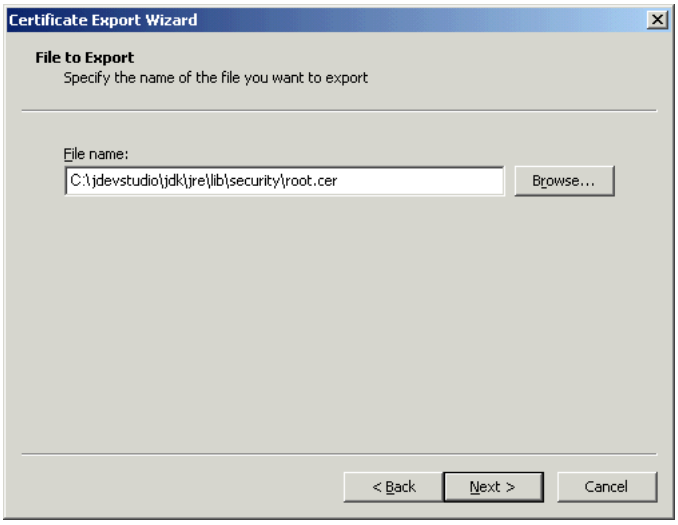
1. Navigate to *JDEV_HOME*`\jdk\jre\lib\security`.
2. Back up the `cacerts` file.
3. Access the producer URL in Internet Explorer to get the certificate.

> **Note:** Recent versions of FireFox do not provide a means to export certificates.



4. In the Security Alert dialog box, shown in Figure 69–15, click **View Certificate**.

Figure 69–15 Security Alert Dialog Box



5. In the Certificate dialog box, click the **Certification Path** tab.
6. The dummy child certificate is selected by default as shown in Figure 69–16. Select the root certificate and click **View Certificate**.

Figure 69–16 Certificate Dialog Box

7. Click the **Details** tab, and click **Copy to File**.
8. In the Certificate Export Wizard, accept the default settings and click **Next** until you reach the File to Export screen, shown in Figure 69–17.

Figure 69–17 File to Export Screen of the Certificate Export Wizard

9. In the File Name field, enter `<JDEV_HOME>\jdk\jre\lib\security\root.cer` and click **Next**.
10. Click **Finish**.
11. In the command prompt, set your default directory to `<JDEV_HOME>\jdk\jre\lib\security` and run the following command:

    ```
    keytool -import -file root.cer -keystore cacerts -storepass changeit
    ```

    By running this command, the `root.cer` certificate is imported into the keystore.

12. Enter `y` at the prompt to confirm that you trust this certificate.
13. Verify that the `cacerts` file is updated with the certificate.

69.15 Overriding Inherited Security on Portlets and Customizable Components

Individual actions on portlets and customizable components are not secured by default. Rather, the ability to customize a portlet or customizable component as a whole is inherited from the page permissions. If you want to grant more granular activities within a portlet or customizable component, then you can override the page-level security inheritance and define security directly on the required actions.

The ability of a user to perform actions on portlets and customizable components is inherited from the page security based on the value of the application-wide switch, `enableSecurity`, in the `adf-config.xml` file. If you selected the WebCenter Portal: Framework application template while creating your application, then the `adf-config.xml` file is located in the `<APPLICATION_NAME>/.adf/META-INF` directory. The `enableSecurity` element is not available by default in `adf-config.xml`. To override or extend the page-level security inheritance for portlets and customizable components, you must add the portlets security and customizable components security sections in the `adf-config.xml` file, as shown in Example 69–1 and Example 69–2 and set the `enableSecurity` element in those sections to `true`.

Example 69–1 enableSecurity Element in the Portlet Security Section in adf-config.xml

```
<!--
================================================================================
PORTLETS ACTIONS SECURITY
================================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
       ......................................
</adfp:adf-config-child>
```

Example 69–2 enableSecurity Element in the Customizable Components Security Section in adf-config.xml

```
<!--
================================================================================
CUSTOMIZABLE COMPONENTS ACTIONS SECURITY
================================================================================
-->
<cust:customizableComponentsSecurity
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>
    <cust:actionsCategory>
       ......................................
</cust:customizableComponentsSecurity>
```

Security for actions on portlets and customizable components can be implemented at the following levels:

- Page level: You can define security for portlets and customizable components such that page-level privileges are inherited by these components. This is the default behavior.

By default, portlets and customizable components inherit allowable actions from the defined page-level permissions such as personalize or customize. That is, a user who has *customize* privileges on the page has permission on the customize action for the components on that page. The `enableSecurity` element enables you to override the security inheritance behavior and can take either of the following values:

- `true`: If set to `true` (the default), then the ability for a user to modify a component will first be determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If a user has customize permission, then the actions that constitute the customize category (move, customize, and so on) are available to the user, but they will be overridden by the actions that are defined in the `adf-config.xml` file. For example, a page designer wants to allow the end user to be able to customize portlets, but not customize the page layout. By setting `enableSecurity` to `true`, the page designer enforces that users must first have customize permission on the page. Setting `customizeActionsCategory` to `false` for customizable components will prevent the customization of the page layout, yet still allowing portlet customization. (As the default for `customizeActionsCategory` is `true`, it does not need to be set explicitly for portlets.).
- `false`: If set to `false`, then all the actions are available to users. The user's page permissions and actions configured in `adf-config.xml` are ignored.

- Actions category level: You can define security on all actions for portlets or customizable components that belong to a named category.

  You can add an `actionsCategory` element in the `adf-config.xml` file to define security on multiple actions simultaneously. Depending on the `actionCategory` attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

- Actions level: You can define security on individual actions for portlets or customizable components.

  You can use the `actions` element in the `adf-config.xml` file to enable or disable individual actions. Depending on the `actions` attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

Notes:

- Privileges can be inherited from the parent only. Inheritance from a component in any other position in the hierarchy is not supported
- Although the security override implementation for portlets and customizable components is similar, they are independent from each other. Therefore, if you place a portlet inside a customizable component (for example, in a `PanelCustomizable` component), the portlet will not inherit override settings from the customizable component. Instead it will use the security override settings that are defined for portlets.
- Settings made at the actions category level or actions level are applicable for all component instances in the application. These settings cannot be made for a single instance of a portlet or customizable component.

Section 69.15.1, "Portlets Security" describes how you can implement security on portlets at the actions category level and actions level. For information on how to define security for actions on customizable components at the application level, see Section 24.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."

69.15.1 Portlets Security

You can define portlet security if actions on portlets are inherited from the page at the application level by setting `enableSecurity` to `true` in the portlets security section of the `adf-config.xml` file. A value of `true` implies that the user's permissions are determined from the page permission and then augmented according to the `actionsCategory` and `actions` elements specified. By defining actions categories and individual actions, you can control the exposure of the individual actions available within the given page permissions.

To implement security for actions on portlets at various levels as described earlier, you must define security settings at the following sections:

- Defining Security at the Actions Category Level
- Defining Security at the Actions Level

69.15.1.1 Defining Security at the Actions Category Level

You can add an `actionsCategory` element in the portlets security section in the `adf-config.xml` file to define the group of actions that are exposed on the portlets within the application. Depending on the `actionsCategory` attributes that you enable, appropriate privileges are provided on the portlets. Table 69–3 describes the different `actionsCategory` attributes and the portlet actions they support by default.

Table 69–3 actionsCategory Attributes and Portlets Actions Mapping

Attribute Value	Actions Supported
viewActionsCategory	Render isHelpModeAvailable isNormalModeAvailable isAboutModeAvailable isPreviewModeAvailable isDetailModeAvailable isLinkModeAvailable isPrintModeAvailable
customizeActionsCategory	showMoveAction showRemoveAction isCustomizeModeAvailable showMinimizeAction showMaximizeAction isConfigModeAvailable
personalizeActionsCategory	isPersonalizeModeAvailable

Example 69–3 shows the `actionsCategory` entry that you can add to the portlets security section in the `adf-config.xml` file. In this example, `customizeActionsCategory` is set to `false` to prevent customization. You can use Expression Language (EL) for the values of these elements.

Example 69–3 actionsCategory Element in the Portlets Security Section

```
<!--
================================================================================
PORTLETS ACTIONS SECURITY
================================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
      <adfp:actionCategory name="viewActionsCategory" value="true"/>
      <adfp:actionCategory name="customizeActionsCategory" value="false"/>
      <adfp:actionCategory name="personalizeActionsCategory" value="true"/>
    </adfp:actionsCategory>

    <adfp:actions>
    ......................................
    </adfp:actions>

</adfp:adf-config-child>
```

69.15.1.2 Defining Security at the Actions Level

You can use the `actions` element in the portlets security section of the `adf-config.xml` file to enable or disable individual portlet actions. Depending on the `action` attributes that you enable, appropriate privileges are provided on the portlets.

Example 69–4 shows an example of an `actions` entry that you can add to the portlets security section in the `adf-config.xml` file. You can use EL for the values of these elements. In this case you prevent customization by setting `isCustomizeModeAvailable` to `false`.

Example 69–4 actions Element in the Portlets Security Section

```
<!--
================================================================================
PORTLETS ACTIONS SECURITY
================================================================================
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
    <adfp:actionsCategory>
    ......................................
    </adfp:actionsCategory>

    <adfp:actions>
      <adfp:action name="Render" value="true"/>
      <adfp:action name="showMoveAction" value="true"/>
      <adfp:action name="isCustomizeModeAvailable" value="false"/>
      <adfp:action name="isPersonalizeModeAvailable" value="true"/>
    </adfp:actions>

</adfp:adf-config-child>
```

Using EL to Prevent Customization of Portlets Outside of Business Hours

An example to show when you may need to override inherited portlet security is an application that is configured to disable portlet customization outside of standard business hours. For this, you must first create a managed bean (for example, a managed bean called `appBusinessRules`), containing the method shown in Example 69–5.

Example 69–5 InsideBizHours Method Defined in appBusinessRules Managed Bean

```
public boolean isInsideBizHours()
  {
    Calendar rightNow = Calendar.getInstance();
    int      currentHr = rightNow.get(rightNow.HOUR_OF_DAY);

    // Do not allow customize operation outside of standard business hours

    if ((currentHr > 9) && (currentHr < 17))
       return true;
    else
       return false;
  }
```

You can then reference this managed bean from the `actionsCategory` element in the portlet security section of the `adf-config.xml` file, as shown in Example 69–6.

Example 69–6 InsideBizHours Method Referenced in the adf-config.xml File

```
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

    <adfp:actionsCategory>
      <adfp:actionCategory name="customizeActionsCategory"
      value="#{appBusinessRules.InsideBizHours?"true":"false"}"/>
    </adfp:actionsCategory>

</adfp:adf-config-child>
```

In this example, the `customizeActionsCategory` will be set to `true` only if the application is run within business hours. Outside of these hours, the portlet cannot be customized even if the user had that permission granted on the page. All other categories that are not explicitly defined, will be inherited from the page.

Using EL to Prevent Personalization and Customization of Portlets Outside the Corporate Network

In this example the managed bean checks the IP address of the request to determine whether the user has accessed the application through the corporate proxy server or from within the corporate network. In this simple example, assume that if the request has the proxy server's IP address, then it is coming from outside the corporate network. In general it is not advised to base security strictly on IP addresses, because these can be compromised. For this, you must add the method shown in Example 69–7 to the managed bean:

Example 69–7 InsideCorpNetwork Method Defined in appBusinessRules Managed Bean

```
public boolean isInsideCorpNetwork()
  {
    // Do not allow personalize and customize operations
    // for requests that go through the corporate proxy
```

```
    FacesContext       ctx = FacesContext.getCurrentInstance();
    ExternalContext    ectx = ctx.getExternalContext();
    HttpServletRequest myrequest = (HttpServletRequest) ectx.getRequest();
    String             currentIP = myrequest.getRemoteAddr();

    if (currentIP.equals(getProxyServerIP()))
        return false;
    else
        return true;
  }
```

You can then reference this managed bean from the `actionsCategory` element in the portlet security section of the `adf-config.xml` file, as shown in Example 69–8.

Example 69–8 InsideCorpNetwork Method Referenced in the adf-config.xml File

```
<adfp:adf-config-child xmlns="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

    <adfp:actionsCategory>
      <adfp:actionCategory name="customizeActionsCategory"
                    value="#{appBusinessRules.InsideCorpNetwork?"true":"false"}"/>
      <adfp:actionCategory name="personalizeActionsCategory"
                    value="#{appBusinessRules.InsideCorpNetwork?"true":"false"}"/>
    </adfp:actionsCategory>
</adfp:adf-config-child>
```

In this example, the `customizeActionsCategory` and the `personalizeActionsCategory` will be set to `true` only if the IP address of the request for the application does not match that of the corporate proxy. The assumption is that the internal requests would have a valid client IP address. All other categories that are not explicitly defined, will be inherited from the page.

69.16 Identity Propagation Mechanisms

The following table lists the identity propagation mechanisms employed by WebCenter Services for propagating the end-user's identity to the various information sources from which content is being integrated into the Framework application.

Whenever possible, WS-Security is the preferred means of identity propagation. Where WS-Security cannot be used due to legacy restrictions or pre-defined store-specific standards or specifications, the primary mechanism used is the credential mapping capability provided by the External Applications service to obtain the user's credentials for a remote application using a distinct security provider. For more information about WS-Security, see the *Oracle Application Server Web Services Security Guide*. For more information about External Applications, see Section 69.13, "Working with External Applications".

Table 69–4 Identity Propagation Mechanisms

Service	Connection Type	Identity Propagation Mechanism
Discussions	Jive	Oracle WS-Security
Announcements	see Discussion Forum	

Table 69–4 (Cont.) Identity Propagation Mechanisms

Service	Connection Type	Identity Propagation Mechanism
Documents	Content Server	Proprietary ID propagation mechanism through socket connection. Can use SSL with mutual authentication, or clear socket with IP authorization (or use External Application option)
	File System	N/A
	Portal 10g/11g	JSR-170 (External Application)
	Day Adapters	JSR-170 (External Application)
EMail	EMail Connection	External Application
	LDAP Connection	External Application
Events - Personal	Exchange Server Connection	External Application
External Application	HTTP Request from Browser	External Application
IMP	Microsoft Live Communication Server (LCS)	SOAP, Web Services calls. External Application
Portlet Producers	WSRP Producer	Oracle WS-Security
	(Secure)	(Recommended by WSRP Specification)
	WSRP Producer	WSRP userContext in SOAP message
	(Non-Secure)	(WSRP Specification)
	JPDK Producer	External Application
	(External App)	JPDK payload includes the user information and is conveyed to the producer in the ProviderUser. The information also includes a mapped username and password. (Proprietary, Legacy)
	JPDK Producer	Username in render request
	(Non-Secure)	(Proprietary, Legacy)
Search	Secure Enterprise Search (SES)	Web Service Call
Wiki	Browser Connection	SSO mechanisms - OSSO/OAM or other WLS supported SSO mechanism
Worklist Service	BPEL Connection	Web Service call Oracle WS-Security

69.17 Securing Identity Propagation Through WSRP Producers with WS-Security

The Web Services for Remote Portlets (WSRP) specification indicates that Web Services Security (WS-Security) can be leveraged for providing secure identity propagation between the consumer and the portlet producer. However, WSRP in and of itself does not provide secure identity propagation of the end user's identity to the portlet producer. The WSRP specification explicitly defers to other security standards for secure identity propagation and does not go into the specific WS-Security profiles or

options that may be employed. In the absence of a secure mechanism, WSRP defines the concept of *user categories*, which can be mapped to security roles like the ones used by the JSR168 portlets. By using a combination of WSRP and WS-Security, you can ensure end-to-end security.

This section covers the following:

- Identity Propagation Without WS-Security
- Identity Propagation with WS-Security
- Configuring Security for WSRP Portlets

69.17.1 Identity Propagation Without WS-Security

When using WSRP without WS-Security, the `userContext` structure within the SOAP message contains user profile information and user category information. This information is not considered secure and should only be used for personalization and customization functionality. It should not be used for authorization of sensitive resources. This information is also exposed in the JSR168 APIs, `isUserInRole(`*`role`*`)` and `getUserPrincipal`. The code in Example 69–9 shows how a sample portlet's markup rendering code uses the `isUserInRole` API to decide what content to display.

Example 69–9 isUserInRole(role) API

```
private void doViewHtml(RenderRequest
request, RenderResponse response)
throws PortletException, IOException
{
// To do: markup the required content.
PrintWriter out = response.getWriter();
out.print("<p>Welcome");
out.println("</p>");
if (request.isUserInRole("moderator"))
   {out.println("<p>MODERATOR</p>" );}
else
   {out.println("<p>not moderator</p>" );}
if (request.isUserInRole("participant"))
   {out.println("<p>PARTICIPANT</p>" );}
else
   {out.println("<p>not participant</p>" );}
if (request.isUserInRole("viewer"))
   {out.println("<p>VIEWER</p>" );}
else
   {out.println("<p>not viewer</p>" );}
    }
```

69.17.2 Identity Propagation with WS-Security

When WS-Security is leveraged with WSRP, the user's identity is propagated outside of the SOAP message body in the WS-Security header. This is a user assertion, using the Username Token format, and is digitally signed to authenticate the consumer and to ensure the integrity of the assertion.

When this mechanism is used, the JSR 168 APIs `isUserInRole` and `getUserPrincipal` are established based on the security context resulting from the WS-Security authentication, rather than the information in the SOAP message's `userContext`.

Also, when an Anonymous (i.e., PUBLIC) client is mapped to a default user using the producer's Default User connection parameter, the WSRP producer must be configured with `strict-authentication` and a grant must be added to the Policy store. For more information, see "Adding a Grant to the Policy Store for a Mapped User Identity" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The use of WS-Security adds some complexity to the configuration and management of the WebCenter Portal: Framework application and the set of producers it consumes. However, when the situation warrants its use, it becomes an important ingredient of the SOA architecture that ensures the security of the information being published by the WebCenter Portal: Framework application.

Oracle WebCenter Framework supports the following token profiles (to digitally sign the security token and message body to ensure authenticity and integrity):

- Username token without password
- Username token with password
- SAML token (uses the *sender vouches* method that the producer uses to confirm the subject assertion)

Digitally signing the security token and the SOAP message body accomplishes the following objectives:

- Consumer Authentication
- Assertion and Message Integrity
- Supported Producers
- Security Domain Implication

Consumer Authentication

When a portlet producer is generating sensitive information, for example paystub information, it is imperative that it only responds to requests to show the information from a legitimate consumer.

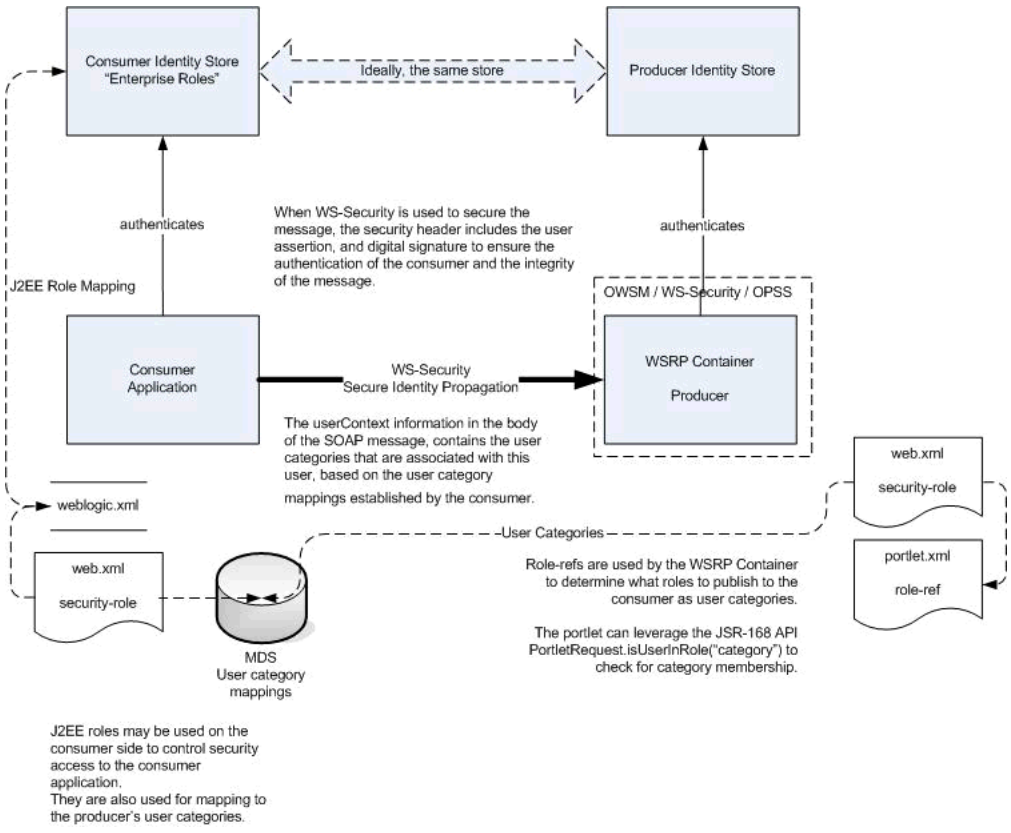
By using WS-Security, and having the consumer digitally sign the security token and the message body, the producer can verify the signature using the public key of the legitimate consumer. If the signature cannot be verified, then it means that the request may have come from a fraudulent consumer. By requiring the verification of the digital signature, the sensitive information will only be sent to the legitimate consumer.

Assertion and Message Integrity

In addition to verifying the identity of the consumer making the Web Service requests, digitally signing the security token and the message body also ensures that the token and the message have not been tampered with. This prevents such problems as man-in-the-middle attacks where a legitimate request might be intercepted and the user name in the security token replaced with another user name to see the paystub information coming back for the other user. By digitally signing the token, it cannot be tampered with. Any modification to the token would result in the inability to verify the signature on the producer end, and would result in a SOAP fault to be returned instead of the requested paystub information.

Supported Producers

WS-Security implementation is supported by the Oracle WebCenter Suite WSRP container. Other WSRP vendors may also be able to support the WS-Security



configuration of Username Token without password, with XML digital signature on the Username Token and the SOAP Message body.

Security Domain Implication

When using secure identity propagation as described in this section, the user name of the user authenticated to the consumer (WebCenter Portal: Framework application) is propagated to the producer without any remapping or providing any credentials. There is an inherent assumption that the producer understands this user name and can locate this user in its associated security domain. Consequently, it is highly desirable to ensure that the consumer and producer share the same security provider (identity store) to simplify the management of this configuration.

Figure 69–18 summarizes the overall WSRP portlet security architecture.

Figure 69–18 WSRP Portlet Security Architecture

69.17.3 Configuring Security for WSRP Portlets

Before you configure the producer for WS-Security, you must first deploy your standards-compliant portlet producer to the Oracle WebCenter Suite WSRP Container by performing the steps described in Chapter 62, "Testing and Deploying Your Portlets".

After you have deployed the producer, configure the producer for WS-Security by performing the following steps:

- Attaching a policy to the producer endpoint
- Creating the keystores
- Configuring the producer

- Configuring the consumer

These steps are described in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* .

69.18 Implementing PDK-Java Portlet Security

This section describes the available security services for your PDK-Java portlet.

For more detailed information about the PDK classes referred to in this section, see the JavaDoc on OTN by clicking **Java Doc API** on the Portlet Development page available at

http://www.oracle.com/technology/products/ias/portal/portlet_development_10g1014.html

69.18.1 Assumptions

The following assumptions are made to perform the tasks in this section:

1. You have followed through and understood Section 60.2, "Creating Java Portlets".
2. You built a portlet using the wizard and successfully added it to a page.

69.18.2 Introduction to PDK-Java Portlet Security Features

This section introduces the major features that are available to secure your PDK-Java portlet producers.

69.18.2.1 Identity Propagation

When a user first logs in, they must enter their password to verify their identity and obtain access.

Once the user is authenticated, the producer code has access to the authenticated user's identity from the `PortletRenderRequest` that is available from the `HttpServletRequest` object as follows:

```
PortletRenderRequest pr = (PortletRenderRequest)request.getAttribute
   (HttpCommonConstants.PORTLET_RENDER_REQUEST);
   String userName = pr.getUser().getName();
```

When using this user identity for sensitive operations, it is important to ensure that you have configured this producer to use basic message authentication to secure the integrity of the identity assertion.

69.18.2.2 Authorization

Authorization determines if a particular user may view or interact with a portlet. For information about how to restrict access to portlets, see Section 69.18.4, "Portlet Security Managers."

69.18.2.3 Message-level Security

To this point, user authentication and authorization are covered, which do not check the authenticity of messages received by a producer. To completely secure your producers, you should also secure the communication with a producer. If the communication is not secured, then it is possible for someone to imitate an application instance and fool the producer into returning sensitive information. There are three types of communication security:

- **Server Authentication** restricts access to a producer to a small number of recognized computers. This method compares the IP address or the host name of an incoming HTTP message with a list of trusted hosts. If the IP address or host name is in the list, then the message is passed to the producer. If not, it is rejected before reaching the producer.
- **Message Authentication** provides consumer authentication and message integrity. It uses a shared key known to the client (Framework application) and the producer to digitally sign messages. See Section 69.18.5, "Message Authentication" for more information.
- **Message Encryption** relies on the use of the HTTPS protocol for communication between applications and producers. Messages are strongly encrypted to protect the data therein. Encryption provides a high level of security, but it incurs a performance penalty due to the additional processing required for each message.
- **User Input Escape** causes the application to escape any user input strings and treat them as text only to protect against XSS attacks, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title parameter entry. For this reason, the default behavior is to escape user input and thus disable any incoming scripts. See Section 69.18.6, "User Input Escape" for more information.

69.18.3 Single Sign-On

Portlets may act as windows into an application. They display summary information and provide a way to access the full functionality of the application. Portlets display some portions of the application in the WebCenter Portal: Framework application and typically enable the user to perform some application tasks.

An application may need to authenticate the user accessing the application through the portlet. The following are the possible application authentication methods:

- External Application. In this case, the Oracle Portal (Oracle Portal) user is different from the application user, but the application user name and password are managed by the Oracle Portal user.
- No Application Authentication. In this case, the communication between producer and consumer is not protected at all.

69.18.3.1 External Application

An external application uses a different authentication server than the WebCenter Portal: Framework application. This means that when a user is logged into the WebCenter Portal: Framework application, you want to also log them into the external application without having to type in their user name or password.

Applications that manage the authentication of users can be loosely integrated with the WebCenter Framework if the administrator registers them as external applications. When a user who was previously authenticated by the WebCenter Framework accesses an external application for the first time, WebCenter Framework attempts to authenticate the user with the external application. The authentication process submits an HTTP request that combines the registration information and the user's user name and password for the application. If the user has not yet registered their user name and password for the external application, then the user is prompted for the required information before making the authentication request. When a user supplies a user name and password for an external application, WebCenter Framework maps the new user name and password to the WebCenter Portal: Framework application user name

and stores them. They will be used the next time the user needs authentication with the external application.

The advantages of an external application implementation are as follows:

- Provides a single sign-on experience for users. However, users still must maintain different user names and passwords. In addition, the external application user name mapping must be maintained.
- Allows integration with multiple portals independent of their user repositories and Oracle Single Sign-On.
- Avoids the requirement of having access to the application source code.

The disadvantages of an external application implementation are as follows:

- Does not share the same user repository as the portal, which requires additional maintenance of user information by the end user.
- Transmits the user name and password to the producer in plain text, unless you implement Secure Sockets Layer (SSL).

69.18.3.2 No Application Authentication

The producer trusts the WebCenter Portal: Framework application instance sending the request completely. The producer can determine if the user is logged in and the portal user name, but the application has not authenticated the user.

The advantages of no application authentication are as follows:

- Provides the easiest form of integration and the fastest to implement.

The disadvantages of no application authentication are as follows:

- Provides the least security.
- Provides the weakest integration with the WebCenter Portal: Framework application.

69.18.4 Portlet Security Managers

Portlet security managers may be implemented within a producer to restrict access to portlets depending on the user details. When a user views a page with a portlet instance on it, security managers determine whether the user has the appropriate privileges to see the portlet. Implementing access control methods in the producer restricts the retrieval of content from a portlet (that is, hides the portlet) from users without the appropriate privileges. Only if the specified characteristics, such as user details and preferences, pass the authorization logic will the content be retrieved for the user. If no portlet security methods are implemented in the producer, then any user name may be passed in, even fictitious, unauthenticated ones.

`AuthLevelSecurityManager` has access to the following information about authorization level:

- Strongly authenticated.

  The user has signed into the Framework application, and requested the portlet in the context of that session.

- Public or not authenticated.

  The user has not logged in within the context of the current session, and does not have a persistent cookie to indicate that such a state previously existed.

To incorporate these security services into your Java portlet, you must update `provider.xml` and set the security level to strong, weak, or public. Place the following XML right before the `</portlet>` tag in `provider.xml`:

```
<securityManager class="oracle.portal.provider.v2.security.AuthLevelSecurityManager">
   <securityLevel>strong</securityLevel>
</securityManager>
```

After you make this change to `provider.xml`, refresh the producer.

For more information about the syntax of `provider.xml`, see the producer JavaDoc on OTN:

http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml_tag_reference_v2.html

69.18.4.1 Implementing Your Own Security Manager

If your portlet requires special security arrangements which are not provided by the implementations shipped with the PDK, then you must supply your own custom `PortletSecurityManager` controller class. To do this, extend the `oracle.portal.provider.v2.security.PortletSecurityManager` class and supply implementations for the two methods specified by the interface. Then replace the class attribute of the `securityManager` controller element in the XML producer definition with you new class name and configure child elements appropriately.

69.18.5 Message Authentication

Message authentication uses a digital signature. The signature is generated using a Hashed Message Authentication Code (HMAC) algorithm and is based on user information, the shared key, and a UTC (Universal Time, Coordinated) timestamp. The producer authenticates the message using its own copy of the shared key. This technique can be used in Secure Sockets Layer (SSL) communication with a producer instead of client certificates.

For caching purposes, show request signatures are calculated each time a session is set up so producers using message authentication must always have Producer Sessions enabled. This also means that there is a trade-off between performance and security. Shorter session timeouts mean less chance of a message being re-sent illegally, but there is a performance overhead associated with reestablishing a provider session.

A single producer instance cannot support multiple shared keys because it could cause security and administration problems. For instance, if one copy of the shared key is compromised in some way, then the producer administrator has to create a key and distribute it to all of the application clients, who then must update their producer definitions. The way around this problem is to deploy different producer services, specifying a unique shared key for each service. Each producer service has its own deployment properties file so that each service is configured independently of the others. The overhead of deploying multiple producer services within the same producer adapter is relatively small.

While the signature element provides protection against interception and resending of messages, it does nothing to prevent interception and reading of message contents. Messages are still transmitted in plain text. If you are concerned about the content of messages being read by unauthorized people, then this must used in conjunction with SSL to encrypt the message.

The advantage of message authentication is as follows:

- Ensures that the message received by a producer comes from a legitimate WebCenter Portal: Framework application instance.

The disadvantages of message authentication are as follows:

- Causes administration problems if a producer serves multiple portals.
- Entails performance implications if made very secure by having a short session timeout.

69.18.6 User Input Escape

By accepting user input without escaping it to text, you run the risk of an XSS attack, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title string. PDK-Java provides the following features to ensure that you can protect your portlets from such attacks:

- Default Container Encoding
- Escape Methods

69.18.6.1 Default Container Encoding

To prevent any script inside a portlet title from being executed, the framework default container renderer class encodes any script characters. This default behavior is controlled through a JNDI variable, `escapeStrings`. When set to `true`, the markup tags in portlet titles are rendered as visible tag characters. For example, a title customization of `<i>title</i>` will be rendered as `<i>title</i>` not *title*. This mode is secure, but, if it is not the desired behavior, then you can set `escapeStrings` to `false` for that producer.

`escapeStrings` applies to all logical producers within a producer. You can set the value of `escapeStrings` from the Fusion Middleware Control Console as you would any other JNDI variable. See Section 61.3.5.2, "Setting JNDI Variable Values" for more information.

69.18.6.2 Escape Methods

If you have code that renders customized values, then you must ensure that you escape those input values appropriately to avoid XSS attacks. This requirement applies to code for rendering pages in any mode. PDK-Java supplies two new static methods for this purpose. They are in the Java class `oracle.portal.provider.v2.url.UrlUtils`, and can be described as follows:

- `public static escapeString(`*`string_text`*`)` escapes any script characters in a given string. For example, less than < becomes `&lt`. This method is unaffected by the `escapeStrings` JNDI variable and is the secure, recommended method to use.
- `public static escapeStringByFlag(`*`string_text`*`)` escapes any script characters in a given string. This method is controlled by the `escapeStrings` JNDI variable and is therefore less secure and not the recommended method to use.

For example:

```
title = UrlUtils.escapeString(data.getPortletTitle());
```

69.19 Troubleshooting Security Issues

This section provides troubleshooting information to help diagnose security related issues for Framework applications.

This section includes the following troubleshooting notes:

- Section 69.19.1, "Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed"

69.19.1 Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed

Problem

When you run a page containing a content repository data control method, the following error message appears:

```
"Unable to locate the credential for key extapp in JPS credential store."
```

Cause

Credentials need to be provisioned explicitly using the change password task flow before you access the page that uses the data control method.

Solution

Since the data control is only a model and cannot do anything at the user interface level to allow credential provisioning, you must write an error handler that takes care of the redirection in the user interface. For information about writing an error handler, see the "Customizing Error Handling" section in the Oracle Application Development Framework Developer's Guide.

The following is a sample error handler:

```
public class ErrorHandler
  extends DCErrorHandlerImpl
{
  public ErrorHandler(boolean b)
  {
    super(b);
  }

  public ErrorHandler()
  {
    super(true);
  }

@Override
  public void reportException(DCBindingContainer formBnd, Exception ex)
  {
   if (ex instanceof AdapterException)
    {
      AdapterException ae = (AdapterException) ex;
      if (ae.getCause() != null &&
          ae.getCause() instanceof ExtAppLoginException)
      {
        ExtAppLoginException eale = (ExtAppLoginException) ae.getCause();
        Throwable t = eale.getCause();
         if (t != null &&
            (t instanceof ExtAppCredentialNotFoundException) ||
```

```
            (t instanceof ExtAppInvalidUserCredential))
        {
          String extAppId = eale.getExternalAppId();
          showCredentialsProvisioningDialog(extAppId);
          return;
        }
      }
    }
    super.reportException(formBnd, ex);
  }

  private void showCredentialsProvisioningDialog(String extAppId)
  {
    FacesContext context = FacesContext.getCurrentInstance();
    // Create the dialog UIViewRoot
    ViewHandler viewHandler = context.getApplication().getViewHandler();
    UIViewRoot dialog =
      viewHandler.createView(context,
      "/oracle/adfinternal/extapp/view/pages/CredentialProvisionerDialog.jspx");

     HashMap<String, Object> properties = new HashMap<String, Object>();
     properties.put("width", new Integer(500));
     properties.put("height", new Integer(350));

     HashMap<String, Object> parameters = new HashMap<String, Object>();
     parameters.put("oracle.extapp.id", extAppId);

     RequestContext reqContext = RequestContext.getCurrentInstance();
     //launched from the button, need to specify this for the return listener
     //to be called.
     reqContext.launchDialog(dialog, parameters, null, true, properties);
  }
}
```

70

Deploying and Testing Your WebCenter Portal: Framework Application

This chapter describes how to deploy and test WebCenter Portal: Framework applications using the Integrated WebLogic Server (Integrated WLS) that comes packaged with Oracle JDeveloper and is configured as the default server (DefaultServer). This chapter also describes how to use JDeveloper to deploy applications to an Oracle WebLogic Managed Server configured to test application deployment or host applications for production.

For information about deploying WebCenter Portal: Framework applications through other mechanisms, such as Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Administration Console, and WebLogic Scripting Tool (WLST) commands, see the chapter, "Deploying WebCenter Portal: Framework Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This chapter includes the following sections:

- Section 70.1, "Introduction to Oracle WebLogic Servers"
- Section 70.2, "Deploying a Framework Application to the Integrated WebLogic Server"
- Section 70.3, "Deploying a Framework Application to a WebLogic Managed Server"
- Section 70.4, "Transporting Customizations Between Environments"

70.1 Introduction to Oracle WebLogic Servers

This section provides an overview of the Integrated WebLogic Server (or Integrated WLS) and Oracle WebLogic Managed Servers. Using Oracle JDeveloper, you can test your applications on the Integrated WLS and deploy applications to an Oracle WebLogic Managed Server that resides outside Oracle JDeveloper for staging and further testing or, if you have the required permissions, to an actual production environment.

Integrated WebLogic Server

The Integrated WebLogic Server (IntegratedWebLogicServer) comes packaged with Oracle JDeveloper. The Integrated WebLogic Server connection appears as IntegratedWebLogicServer in the Resource Palette under **IDE Connections > Application Server**. With the Integrated WLS, you can quickly and easily test your application at design time without needing to package the application and create and configure a WebLogic Managed Server.

When you run an application, an Integrated WLS instance for that application automatically starts. You can also start the Integrated WLS manually by choosing the **Run > Start Server Instance** menu option in JDeveloper. Doing so creates a single server instance for all applications; any applications you run will then use this server instance.

Testing WebCenter Portal: Framework applications on the Integrated WLS helps to improve design-time tasks by:

- Optimizing deployment: the requirement to archive and copy files to a separate server for design time testing is eliminated.
- Instantly refreshing changes to the application: you can directly run most files from project directories, which enables you to make selected changes and refresh these changes while the application is running. For example, you can modify a task flow on a JSPX page, then refresh the page in the browser to view your changes without redeploying the application.
- Removing the requirement to undeploy applications after testing and debugging. If you stop the Integrated WLS, however, applications running on it are automatically undeployed.

To learn more about testing a WebCenter Portal: Framework application on the Integrated WLS, refer to Section 70.2, "Deploying a Framework Application to the Integrated WebLogic Server."

WebLogic Managed Server

An Oracle WebLogic Managed Server resides outside of Oracle JDeveloper as part of a domain, and is managed by an Administration server within that domain. A WebLogic Managed Server hosts applications, along with the libraries and other resources needed by those applications. A domain, which is a logically related group of Oracle WebLogic Server resources, can have any number of Managed Servers. Managed Servers can be configured to run applications in a test environment, a production environment, or both.

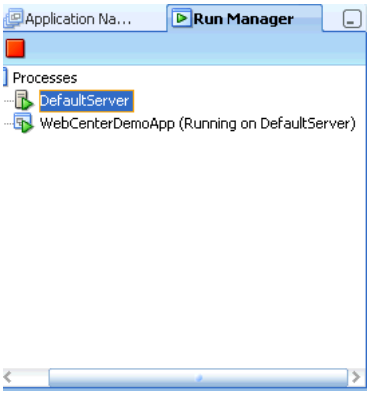
To learn more about deploying a WebCenter Portal: Framework application to an Oracle WebLogic Managed Server, see Section 70.3, "Deploying a Framework Application to a WebLogic Managed Server."

70.2 Deploying a Framework Application to the Integrated WebLogic Server

The Integrated WLS is preconfigured so that you can run applications within Oracle JDeveloper without needing to create deployment profiles.

However, when the Integrated WLS instance stops, the application is undeployed and therefore becomes unavailable. For a more persistent testing scenario, you can also deploy your application to the Integrated WLS. These two options are described in the following subsections:

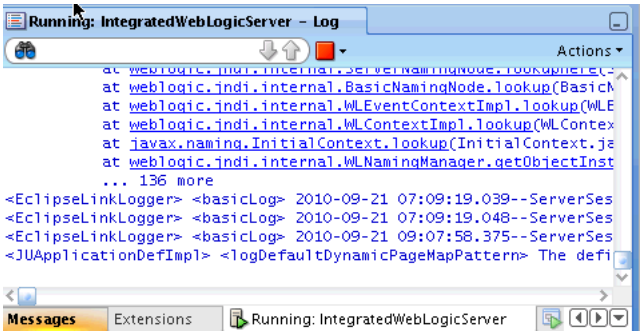
- Section 70.2.1, "Running a Framework Application in the Integrated WebLogic Server"
- Section 70.2.2, "Deploying a Framework Application to the Integrated WebLogic Server"



70.2.1 Running a Framework Application in the Integrated WebLogic Server

To run a WebCenter Portal: Framework application, you can right-click the `.jspx` page in the project folder in the Application Navigator and choose **Run**, or select **Run** from the Run menu or click the **Run** icon from the toolbar to run the current project.

When you run an application in JDeveloper, a server instance named after the application is automatically created. While the application is running, you can switch back and forth between JDeveloper and your browser to make changes at design time in your application, save the changes and then refresh your JSPX page in your browser to view those changes. While in JDeveloper, you can also watch the progress of your applications, as well as stop the server instance (and thus stop the application).



When you run the application page or project, it triggers the packaging and deployment of your WebCenter Portal: Framework application on an Integrated WLS instance named after the application. You can stop instances of the Integrated WLS by using the Run Manager panel (shown in Figure 70–1).To stop an instance, just select **DefaultServer** and click the red Stop icon on the Run Manager tab.

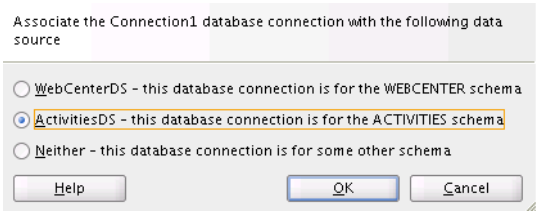
Figure 70–1 Run Manager

Use the DefaultServer Log window (shown in Figure 70–2) to view how the activity is progressing.

Figure 70–2 DefaultServer Log Window

Note: Secure attributes and credentials are migrated by default when running a WebCenter Portal: Framework application on the Integrated WLS.

70.2.2 Deploying a Framework Application to the Integrated WebLogic Server



When the Integrated WLS instance stops, the application is undeployed, and therefore, becomes unavailable. For a more persistent testing scenario, you can deploy your application to the Integrated WLS by right-clicking the application and then selecting **Deploy**. This deploys the application to the Default Server instance and it will always be available while the Default Server is running. If you choose this method, then you must first create deployment profiles, as described in Section 70.3.2.2, "Creating Deployment Profiles." If you deploy your application to the Integrated WLS, then the Deployment Configuration dialog displays to let you configure and customize deployment settings. The file system MDS repository pre-created by JDeveloper displays in the **Repository Name** field.

To deploy and run an application in the Integrated WLS:

1. Open your application in JDeveloper.
2. Create the local data source for WebCenter Portal.

   For more information about how to create a local data source, see Section 7.2.2, "Setting Up a Database Connection."
3. If you're using Analytics task flows, create a local data source for Activities.
   a. From the File menu, select **New**.
   b. From the Connections category, select **Database Connection** and click **OK**.
   c. Enter the connection details for the connection to the Activities schema and click **OK**.
   d. Associate the connection with the ActivitiesDS data source as shown in Figure 70–3 and click **OK** .

Figure 70–3 Associate to Data Source Dialog - Activities Schema

4. From the Run menu, select **Run xxxx.jpr** (where **xxxx** is the name of your project) to deploy and run your application.

70.3 Deploying a Framework Application to a WebLogic Managed Server

When you're ready to test your Framework application using an external test or staging site, you can deploy your applications directly from JDeveloper to an Oracle WebLogic Managed Server.

For information about deploying Framework applications using Fusion Middleware Control, Oracle WebLogic Administration Console, and WLST commands, see the chapter, "Deploying WebCenter Portal: Framework Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following:

- Section 70.3.1, "Deployment Roadmap"

- Section 70.3.2, "Packaging a Framework Application"
- Section 70.3.3, "Preparing the Target Environment for Deployment"
- Section 70.3.4, "Deploying a Framework application to a Managed Server"

70.3.1 Deployment Roadmap

The flow chart and table in this section provide an overview of the prerequisites and tasks required to deploy a Framework application to an Oracle WebLogic Managed Server. Figure 70–4 shows the steps to deploy a Framework application, and the roles that will carry them out.

Figure 70–4 Deploying a Framework Application to a Managed Server

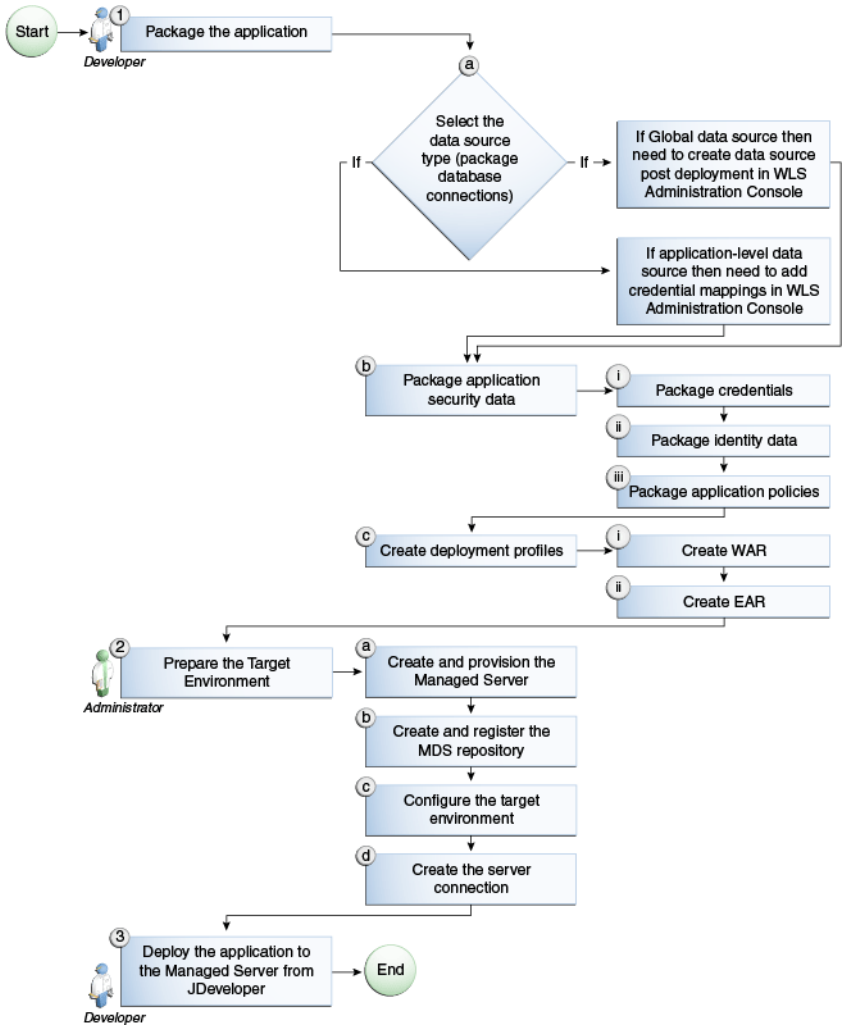


Table 70–1 shows the tasks, sub-tasks and who will need to carry them out to deploy a Framework application from JDeveloper.

Table 70–1 Deploying a Framework Application to a Managed Server

Actor	Task	Sub-task	Notes
Developer	**1.** Package the Application	**1.a** Select the data source type (package database connections)	You can use either a global data source or an application-level data source. If using a global data source, then you need to create the data source in the WLS Administration Console before deploying. If using an application-level data source, then you may need to add credential mappings using the WLS Administration Console after deploying (see the note below). **Note:** There are two options for deploying from JDeveloper. You can deploy directly to the Managed Server, or you can deploy to an EAR file and then deploy the EAR file using either Fusion Middleware Control, WLST or the WLS Admin Console. If you deploy directly from JDeveloper the credential mapping step is not required as JDeveloper automatically handles the credential mapping. However, if you deploy the EAR file outside of JDeveloper, then this step is required.
		1.b Package application security data	This sub-task consists of packaging the credentials, identity data, and application policies.
		1.c Create deployment profiles	This sub-task consists of creating the WAR and EAR files.
Administrator	**2.** Prepare the Target Environment	**2.a** Create and provision the Managed Server	
		2.b Create and register the MDS repository	
		2.c Configure the target environment	
		2.d Create the server connection	
Developer	**3.** Deploy the Application to a Managed Server from JDeveloper		The final step is to deploy the application to the Managed Server from JDeveloper.

70.3.2 Packaging a Framework Application

When you deploy WebCenter Portal: Framework applications, you may also need to migrate your database connections and the related security for connecting to the databases. You will also need to create a set of project-level and application-level deployment profiles that indicate how a WebCenter Portal: Framework application and its associated files should be packaged so that the application can be deployed to an Oracle WebLogic Managed Server.

This section includes the following:

- Section 70.3.2.1, "Packaging Database Connections and Application Security"
- Section 70.3.2.2, "Creating Deployment Profiles"

70.3.2.1 Packaging Database Connections and Application Security

When you deploy WebCenter Portal: Framework applications, you'll also need to package your database connections and the related security for connecting to the databases. This section describes how to package a WebCenter Portal: Framework application that uses one of the two database connection types: JDBC data source and JDBC URL. This section also describes security migration for applications that use database connections that specify passwords, or external applications that specify shared or public credentials.

Based on the policy defined by your administrator (if, for example, your administrator does not allow any application-level data sources), you may need to migrate the database connections and respective credentials to the target server. The packaging options described below allow you to choose how the database connections should be treated.

This section includes the following sub-sections:

- Section 70.3.2.1.1, "Packaging the Database Connections"
- Section 70.3.2.1.2, "Packaging Application Security Data"

70.3.2.1.1 Packaging the Database Connections

If your WebCenter Portal: Framework application contains JDBC database connections, you'll need to choose how JDeveloper will migrate those database connections to the Oracle WebLogic Managed Server. You can choose from:

- *Global data source*:

  Oracle recommends that you choose this type of data source if you plan to deploy an application EAR file to a Managed Server running in production mode using Fusion Middleware Control, the Oracle WebLogic Administration Console, or using a WLST (`wldeployer`) command.

  To choose a global data source, deselect the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** checkbox when you create the EAR file so that JDeveloper does not create an application-level data source with password indirection. Instead, create the global data source using Oracle WebLogic Administration Console prior to or after deploying the application to a Managed Server in production mode using the default WebCenter Portal and Activities schemas. For more information on creating global data sources, see the section "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and Managing JDBC Data Sources for Oracle WebLogic Server*.

- *Application-level data source with password indirection*:

  JDeveloper generates an application-level data source with password indirection by default when you run an application on the Integrated WLS. That is, when the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** checkbox is selected in the Application Properties dialog, as shown in Figure 70–5.

Figure 70–5 Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment Checkbox

To generate an application-level indirection data source, JDeveloper does the following:

- Generates a `<connection>-jdbc.xml` file (such as `WC-jdbc.xml`) for each connection in the Application Resource.
- Sets the indirect password attribute in the `<connection>-jdbc.xml` file:

```
<jdbc-driver-params>
<use-password-indirection>true</use-password-indirection>
</jdbc-driver-params>
```

- Updates `weblogic-application.xml` to add each `<connection>-jdbc.xml` file as a module. For example:

```
<module>
<name>WC</name>
<type>JDBC</type>
<path>META-INF/WC-jdbc.xml</path>
</module>
```

- Adds a resource reference to each JDBC JNDI name in the `web.xml` file, if this file exists. For example:

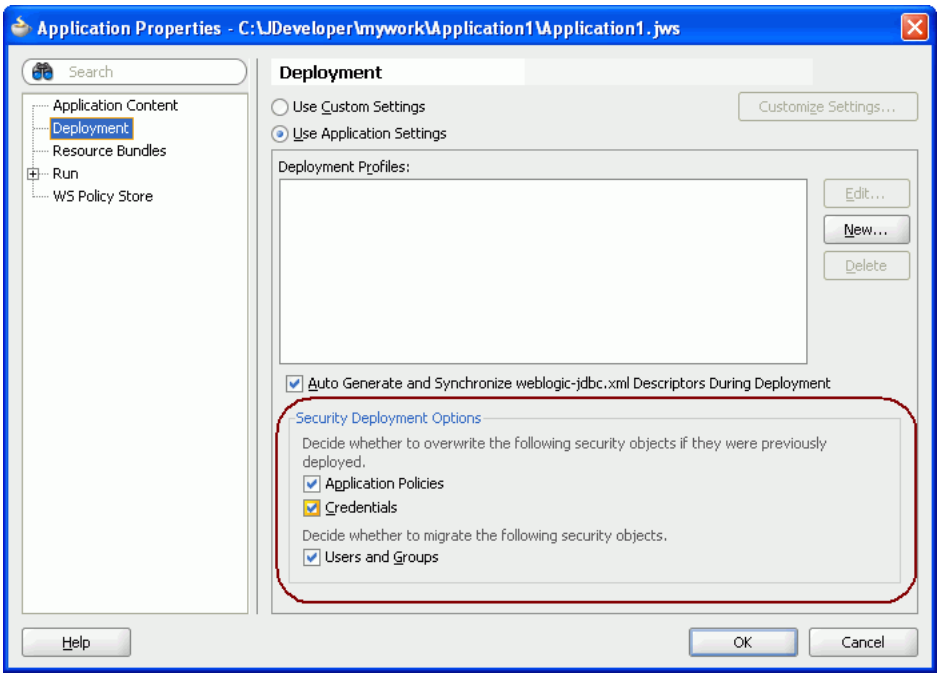
```
<resource-ref>
<description>WC-Connection</description>
<res-ref-name>jdbc/WCDS</res-ref-name>
<res-type>javax.sql.DataSource</res-type>
<res-auth>Container</res-auth>
</resource-ref>
```

If you choose to generate an application data source with password indirection, then you must add credential mappings using the Oracle WebLogic Administration Console to be able to activate the application. For more information on adding credential mappings, see the section "Creating a JDBC Data

Source" in *Oracle Fusion Middleware Configuring and Managing JDBC Data Sources for Oracle WebLogic Server*.

Note: Do not use WLST commands to deploy applications that use application-level data sources with password indirection, as WLST cannot set password indirection credential mappings on the server.

70.3.2.1.2 Packaging Application Security Data



The following is applicable only if you have configured security in your application using the Configure ADF Security wizard, or the application contains connections with secure attributes such as a database connection password or external applications with shared or public credentials:

- Packaging Credentials
- Packaging Identity Data
- Packaging Application Policies

Packaging Credentials

If you do not intend to migrate credentials, then deselect the **Credentials** checkbox in the **Security Deployment Options** section in the Application Properties dialog (see Figure 70–6).

Figure 70–6 Security Deployment Options

If you retain the default selection in the Security Deployment Options section, then the credential migration will behave as follows, depending on whether the WebLogic domain is in development or production mode:

- When you deploy a WebCenter Portal: Framework application to a Managed Server running in production mode, secure attributes of the connections packaged within your application and any shared or public credentials specified for external

applications are not migrated to the domain-level credential store. This is because secure properties are likely to be different between development and production environments. Therefore, you must reconfigure secure attributes of connections and shared or public credentials for external applications using WLST commands or Fusion Middleware Control, as described in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

For more information on credential migration behavior, see the section "Configuring the Credential Store" in *Oracle Containers for J2EE Security Guide*.

- When you deploy a Framework application in development mode, you must first enable credential migration. To enable credential migration for an application to be deployed in development mode, start the Managed Server with `-Djps.app.credential.overwrite.allowed=true`, by adding the following option to the `setDomainEnv.cmd` or `setDomainEnv.sh` file located in *`domain`*`\bin`:

```
set EXTRA_JAVA_PROPERTIES=-Djps.app.credential.overwrite.allowed=true %EXTRA_
JAVA_PROPERTIES%
```

Packaging Identity Data

In Figure 70–6, in the Security Deployment Options section, the Users and Groups checkbox is selected by default. This indicates that the users and groups defined in the application's `jazn-data.xml` file will be migrated to the identity store configured for the WebLogic Managed Server, if the authenticator configured in the domain allows creation of users and groups. When migrating the identify store, you should deselect this option as users and groups defined in the identity store configured for the Managed Server should be used to access the application.

Packaging Application Policies

When the **Application Policies** checkbox is selected, then the `jps.policystore.migration` parameter in the `weblogic-application.xml` file is set to `OVERWRITE`. This means that during application deployment and redeployment, the application policies packaged with the application will be overwritten on the domain-level policy store for the domain to which the application is being deployed.

If the **Application Policies** checkbox is not selected, then the `jps.policystore.migration` parameter is set to `MERGE`. This means that the application policies will be migrated during application deployment but not during redeployment, and the existing application policies will not be overwritten.

70.3.2.2 Creating Deployment Profiles

Deploying your application to a Managed Server that resides outside JDeveloper using Fusion Middleware Control or the WLS Administration Console can only be done using a deployment profile, or Enterprise Archive (EAR) file. The EAR file packages (or archives) a WebCenter Portal: Framework application and its associated files so that the application can be deployed to an Oracle WebLogic Managed Server (this is typically done by a system administrator when the target is a production server).

> **Note:** You can deploy Oracle ADF applications, such as WebCenter Portal: Framework applications, only as EAR files.

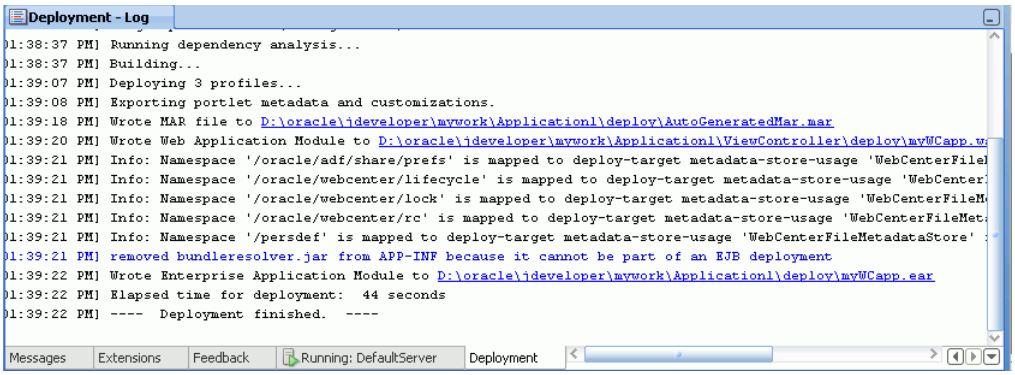
The EAR file contains application artifacts such as, `adf-config.xml`, `connections.xml`, `weblogic-application.xml`, `jazn-data.xml`, metadata

archive (MAR) files, and all project-related WAR files. For WebCenter Portal: Framework applications containing MDS metadata or portlets, a metadata archive file (with the extension .MAR) is automatically generated and included in the EAR file. This file contains all MDS metadata and portlet customization data.

For Framework applications, both the WAR (project-level) and EAR-level deployment profiles are created for you as you build your application. These are named:

```
<application name>_webapp1
<application name>_application1
```

respectively, where *<application name>* is the name given to the application at creation time. Note that this only applies to Framework applications created based on the WebCenter Portal template.



If your application, however, was not created using the WebCenter Portal template, then you will need to create a deployment profile file for your application. You may also want to create your own EAR file if you want to give it a specific name or change what's included in the EAR file through the Application Assembly section.

To create an EAR file:

1. In JDeveloper, in the Application Navigator, right-click the application and select **New**.
2. In the New Gallery, expand **General**, select **Deployment Profile**, then **EAR File**, and click **OK**.
3. In the Create Deployment Profile – EAR File dialog, enter a name for your deployment profile and click **OK**.
4. In the Edit EAR Deployment Profile Properties dialog, select **Application Assembly**, then select the project WAR you want to make available in the project file and and click **OK**.
5. In the Application Properties dialog, select the deployment options to use and click **OK**.

   For a description of the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** option, see Section 70.3.2.1.1, "Packaging the Database Connections." For a description of the Deployment Security Options, see Section 70.3.2.1.2, "Packaging Application Security Data."
6. In the Application Navigator, right-click the application name, choose **Deploy**, *deployment profile name*, **to**, and then choose **to EAR file**. This creates the EAR file in the **deploy** folder located in *JDEV_HOME*\mywork*application_name*\deploy\, as shown in Figure 70–7.

Figure 70–7 EAR Status in Deployment - Log

70.3.3 Preparing the Target Environment for Deployment

This section describes how to create and provision a WebLogic Managed Server instance prior to deploying your Framework application.

This section includes the following sub-sections:

- Section 70.3.3.1, "Creating and Provisioning an Oracle WebLogic Managed Server Instance"
- Section 70.3.3.2, "Creating and Registering the Metadata Service Repository"
- Section 70.3.3.3, "Configuring the Target Environment"
- Section 70.3.3.4, "Creating a WebLogic Managed Server Connection"

70.3.3.1 Creating and Provisioning an Oracle WebLogic Managed Server Instance

Before deploying a WebCenter Portal: Framework application, you must create a WebLogic Managed Server based on the "Oracle WebCenter Custom Portal" template that contains all the required shared libraries and a MDS Repository. For instructions on how to create a new managed server, see "Extending an Existing Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*. For instructions on how to create a new domain, see "Creating a New Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

> **Note:** Oracle does not recommend deploying Framework applications to any of the three pre-configured Managed Servers created during the installation, or to a domain Administration Server.

70.3.3.2 Creating and Registering the Metadata Service Repository

After creating and provisioning the WebLogic Managed Server instance, you must create and register a Metadata Service Repository (MDS) schema for the application on the WebLogic Domain's Administration Server instance, as described in the section "Creating and Registering the Metadata Service (MDS) Repository" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

70.3.3.3 Configuring the Target Environment

After creating the Managed Server and creating and registering the MDS repository, continue by configuring the data sources, and the connections to the Identity Store, and the Policy and Credential Store. For information on configuring data sources, see the section "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and*

Managing JDBC Data Sources for Oracle WebLogic Server, or How to Create a JDBC Data Source for Oracle WebLogic Server. Note that when setting up the data source, you must provide a password or the connection may not be created when the application is deployed.

70.3.3.4 Creating a WebLogic Managed Server Connection

Before you can deploy your applications using JDeveloper to an Oracle WebLogic Managed Server instance that reside outside JDeveloper, you must create a connection to the Managed Server instance where you will deploy the application. Before you create a connection to an Oracle WebLogic Managed Server instance, ensure that the target Managed Server instance is up and running, and has the required libraries.

To create a connection to an Oracle WebLogic Managed Server:

1. In JDeveloper, from the File menu, select **New**.
2. In the New Gallery, expand General, select **Connections**, and then **Application Server Connection**.
3. Click **OK**.
4. In the Create Application Server Connection wizard, for Step 1, enter a name for the new connection (for example, `WC_CustomPortal`), and then click **Next**.
5. At Step 2, specify the user name and password for authentication, and then click **Next**.
6. At Step 3, enter the host name of the WebLogic Managed Server (for example, `webcenter.myserver.example.com`) and the port number (for example, 7888).
7. In the WLS Domain field, specify the name of the domain in which the WebLogic Managed Server instance is created (for example, `wc_server`), and then click **Next**.
8. At Step 4, click **Test Connection**.

   If the test is successful, you now have a connection to the target WebLogic Managed Server.

70.3.4 Deploying a Framework application to a Managed Server

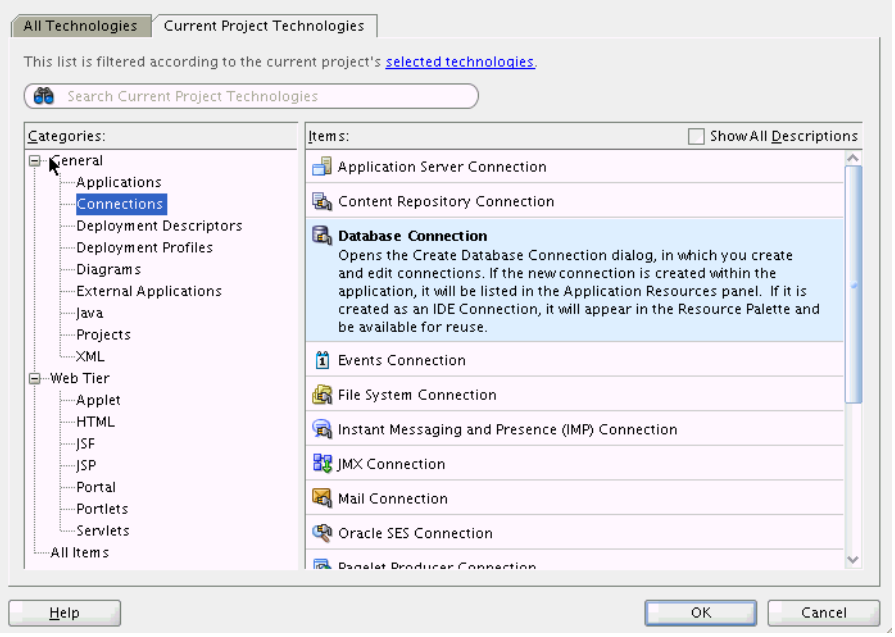
You can deploy a Framework application to a Managed Server using either local application or global data sources. Local application data sources can only be accessed by the deployed application. However, it's an easy way to deploy in that it needs no other data source configuration in order to work if deployed directly from JDeveloper.

Global data sources benefit from being able to be shared by other applications on the server where database connection config updates can be more easily maintained and picked up by all users of the global data source. For more information about data sources, see the section "Choosing the Data Source" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section contains the following subsections:

- Section 70.3.4.1, "Deploying to a Managed Server Using Local Data Sources"
- Section 70.3.4.2, "Deploying to a Managed Server Using Global Data Sources"

70.3.4.1 Deploying to a Managed Server Using Local Data Sources



When you deploy to a Managed Server, the application EAR file is generated. The EAR file packages the metadata archive (MAR file), which includes the metadata content to be deployed to an MDS repository. Additionally, the `adf-config.xml` file is reconfigured with a modified `mds-config` for the target deployment environment. Application-wide features, security, caching, and change persistence remain unchanged. Properties for other Oracle components, if any, are also configured in this file. Similarly, JSF and JSTL shared libraries are added in the `weblogic.xml` file during packaging.

To deploy a WebCenter Portal: Framework application to a Managed Server using local data sources:

1. In JDeveloper, in the Application Navigator, open the application to be deployed.
2. Create the local data source for WebCenter Portal (if required).
   a. From the File menu, select **New**.

      The New Gallery appears (see Figure 70–8).

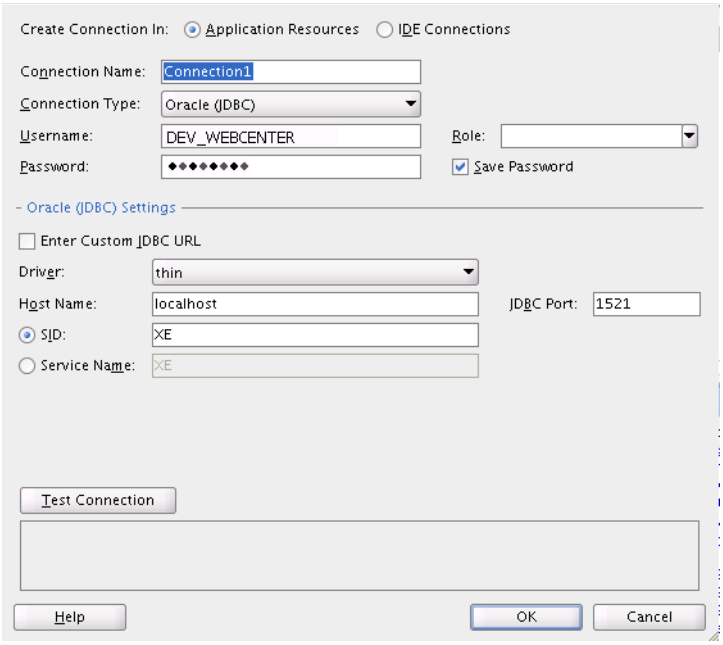


Figure 70–8 New Gallery

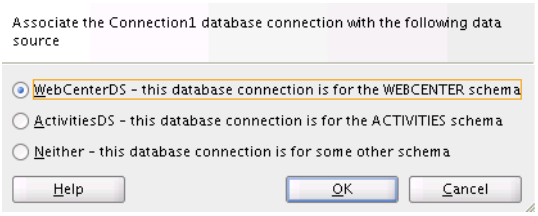
   b. From the Connections category, select **Database Connection** and click **OK**.

      The Create Database Connection Dialog displays (see Figure 70–9).

Figure 70–9 Create Database Connection



c. Enter the connection details for the connection to the WebCenter Portal schema and click **OK**.

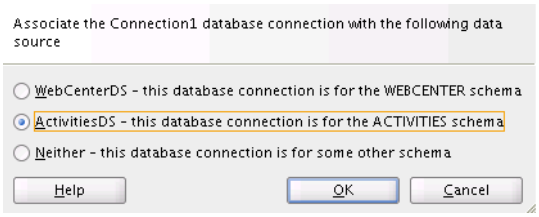
Note: When deploying directly from JDeveloper to a WLS Managed Server the local data source will only be created if the password is saved in the connection (that is, the **Save Password** option is checked), and the database is accessible at deployment time. If there is no saved password, or if the credentials are not able to access a database, the data source will not be created, the application will fail to deploy, and an error will be generated.

When deploying indirectly using Fusion Middleware Control or WLS Administration Console, however, the data sources are created and can be configured subsequent to deployment.

The Associate to Data Source dialog displays (see Figure 70–10).

Figure 70–10 Associate to Data Source Dialog

d. If there are multiple projects select the project, associate the connection with the WebCenterDS data source and click **OK**.



Note that the Associate to Data Source dialog can also be invoked from the context menu for a database connection (right-click on a database connection and select **Associate to Data Source**). This is useful if you change your mind

and want to associate the database connection to a different data source, or disassociate it (by selecting **Neither**).

3. If you're using Analytics task flows, create a local data source for Activities.
   a. From the File menu, select **New**.
   b. From the Connections category, select **Database Connection** and click **OK**.
   c. Enter the connection details for the connection to the Activities schema and click **OK**.
   d. Associate the connection with the ActivitiesDS data source as shown in Figure 70–11 and click **OK** .

      Note that the Associate to Data Source dialog can also be invoked from the context menu for a database connection (right-click on a database connection and select **Associate to Data Source**). This is useful if you change your mind and want to associate the database connection to a different data source, or disassociate it (by selecting **Neither**).

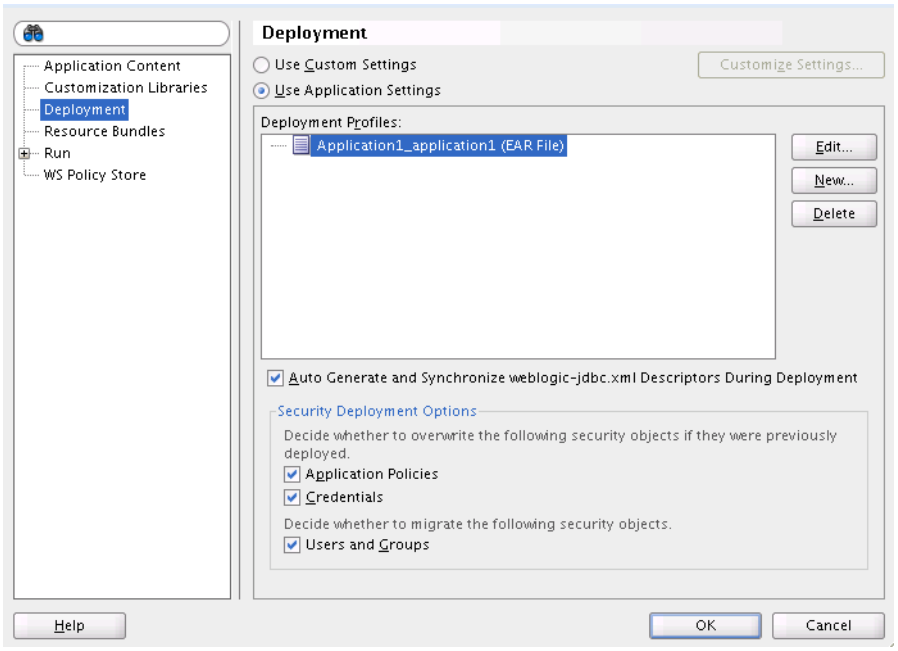


Figure 70–11 Associate to Data Source Dialog - Activities Schema

4. Right-click the Application menu and select **Application Properties...**

   The Application Properties dialog displays (see Figure 70–12).

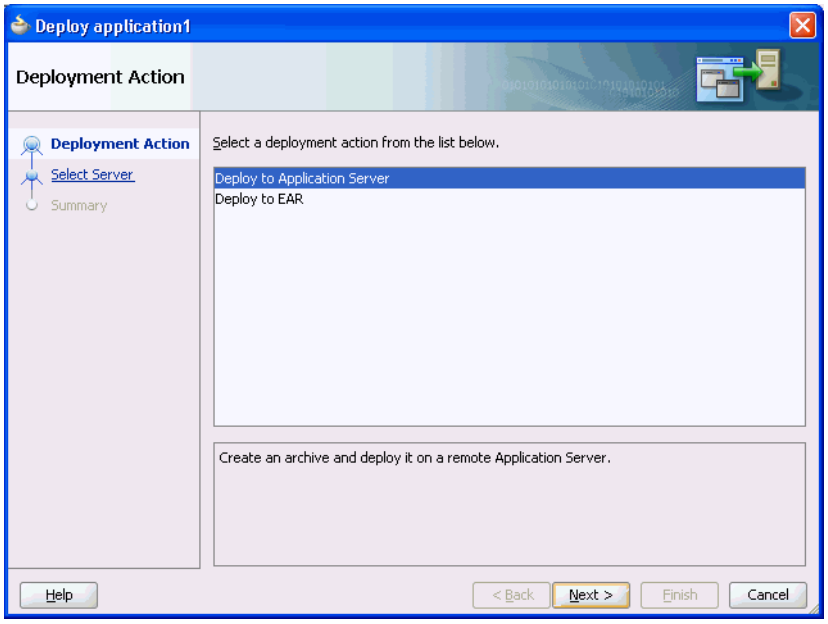

Figure 70–12 Application Properties Dialog

5. Choose **Deployment** from the navigation panel to display the Deployment options.
6. Make sure that the `Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment` option is selected and click **OK**.
7. Right-click on the Application menu, select **Deploy** and then the application name.

   The Deployment Action dialog displays (see Figure 70–13).

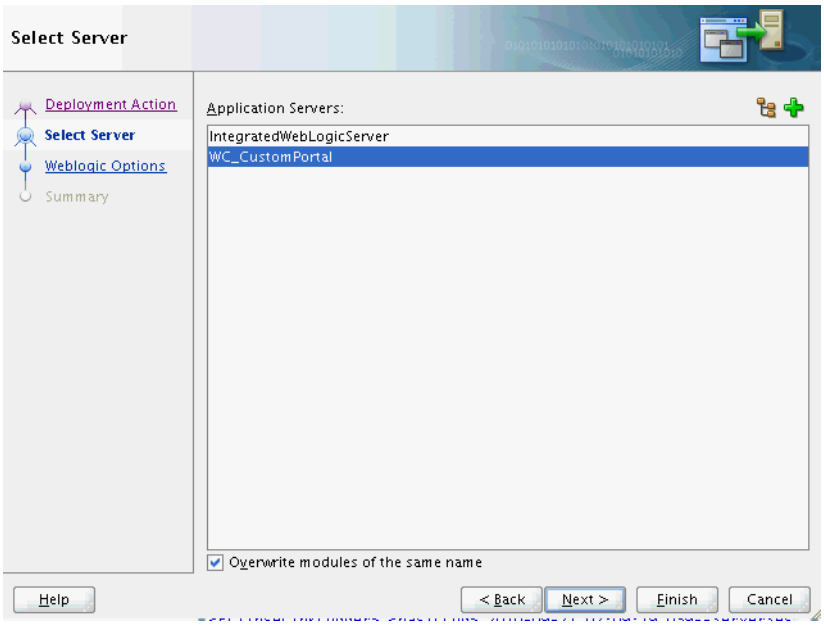

Figure 70–13 Deployment Action Dialog

8. Select **Deploy to Application Server** and click **Next**.

   The Select Server dialog displays (see Figure 70–14).

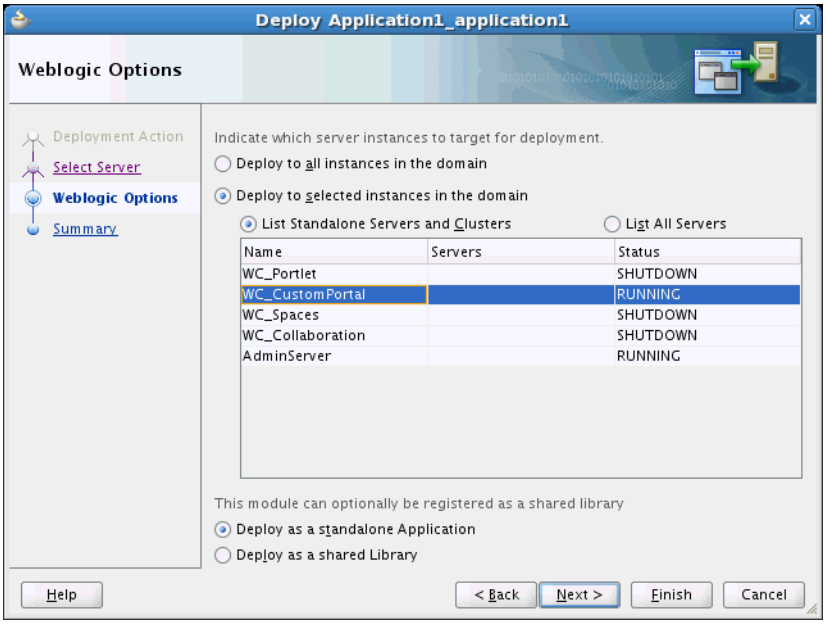

Figure 70–14 Select Server Dialog

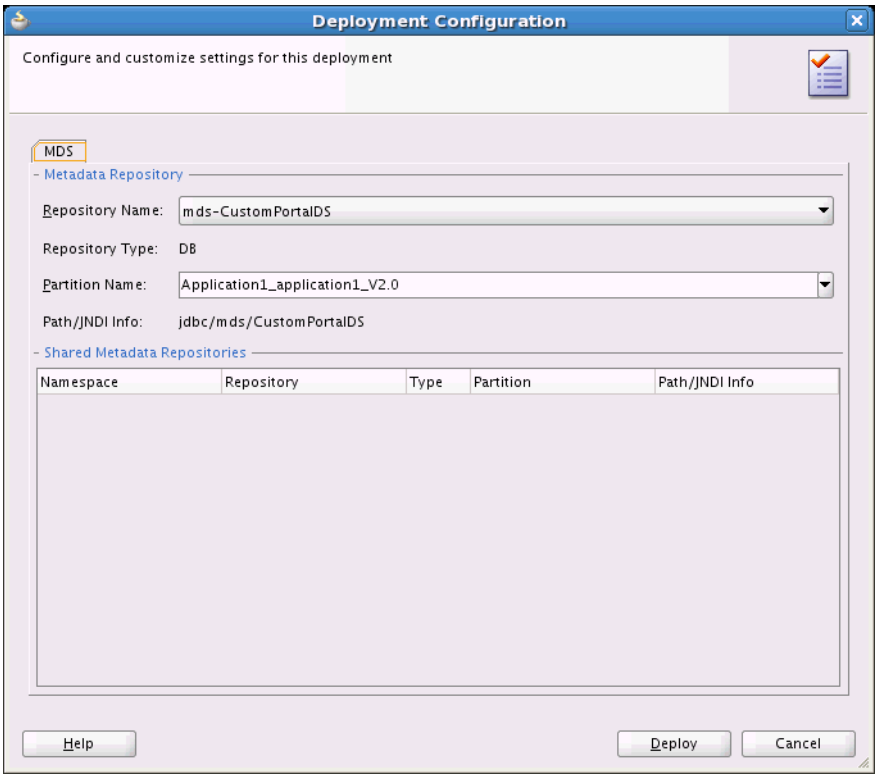
9. Select the connection name of the Managed Server (for example, `WC_CustomPortal`), and click **Next**. If the server to which you want to deploy is not listed, click the Add icon (+) and complete the connection details to add the application server to the list.

   The Deployment WebLogic Options dialog displays (see Figure 70–15).

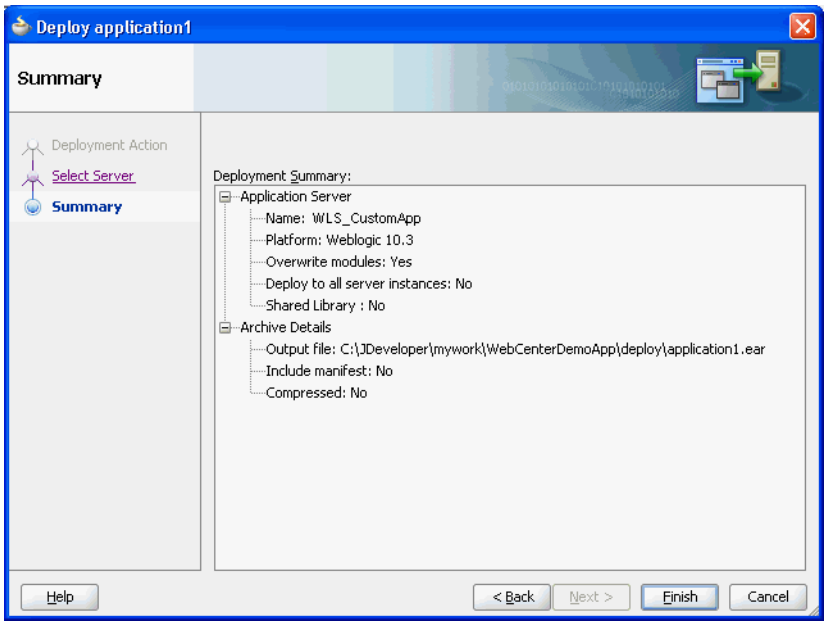
Figure 70–15 Deployment WebLogic Options dialog



10. Select `Deploy to selected instance in the domain`, select the managed server from the list (for example, `WC_CustomPortal`), and click **Next**.

    In most cases you will want to deselect **Deploy to all server instances in the domain** and select the specific servers and clusters to deploy to using the Server

Instances dialog. Refer to the online help for more information about using the Select Server dialog options.



The Deployment Configuration dialog displays (see Figure 70–16).

Figure 70–16 Deployment Configuration Dialog

11. Select the Repository Name (for example, `mds-CustomPortalDS`), enter a Partition Name (if the partition doesn't already exist then it will be created during the deployment), and click **Deploy**.
12. On the Deployment Summary dialog (see Figure 70–17), check that all of the deployment options are correct and click **Finish** to start the deployment.

Figure 70–17 Deployment Summary Dialog

13. Continue by doing any post-deployment security or data source connection configurations that may be required as described in the section on "Post-Deployment Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

70.3.4.2 Deploying to a Managed Server Using Global Data Sources

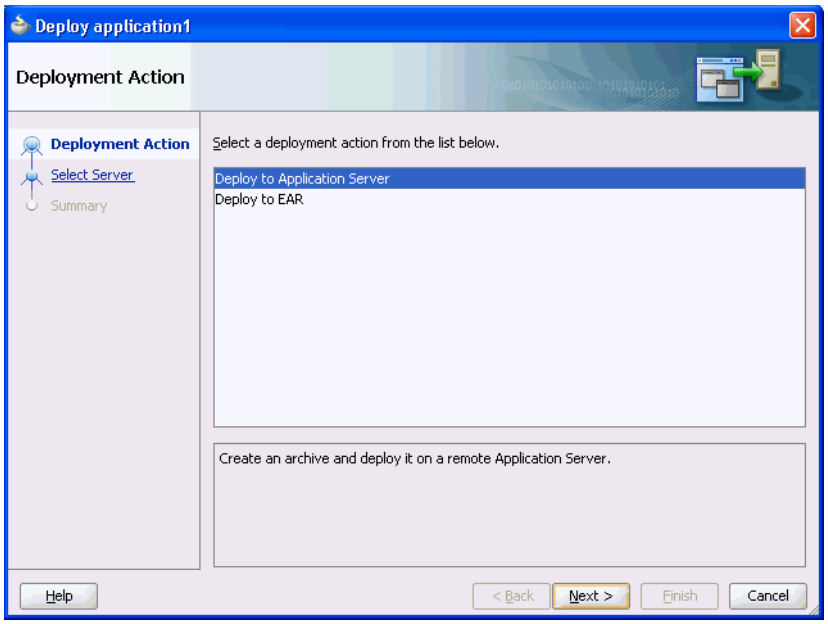
Deploying to a Managed Server using global data sources is recommended when the application is not intended to run on a Managed Server created with the WebCenter Custom Portal template, or is intended to run against custom data sources not named `WebCenterDS` or `ActivitiesDS`.

Oracle recommends using the default data source names, but if you use non-default pre-seeded data sources, then you must name your data sources accordingly and follow the pre- or post-deployment global data source creation steps to create data sources that map to the names you have chosen. For more information, see the section "Choosing the Data Source" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To deploy to a Managed Server using global data sources:

1. Open the application to be deployed in JDeveloper.
2. Determine the JNDI names your application will be using for the data-sources.

   The JNDI names will depend on whether you've created a database connection for your application in JDeveloper or are using the defaults. The following table shows the default JNDI names:



Data Source	JDeveloper JNDI Name	Default JNDI Name
WebCenterDS	`jdbc/`*`WebCenterConnectionNameDS`* (where *`WebCenterConnectionName`* is the name of the WebCenter Portal database connection)	`jdbc/webcenter/CustomPortalDS`

Data Source	JDeveloper JNDI Name	Default JNDI Name
ActivitiesDS	`jdbc/ActivitiesConnectionNameDS` (where `ActivitiesConnectionName` is the name of the Activities database connection)	`jdbc/activities/CustomPortalDS`

3. Choose **Deployment** from the navigation panel to display the Deployment options.
4. Deselect the `Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment` option if selected and click **OK**.
5. Right-click on the Application menu, select **Deploy** and then the application name.

   The Deployment Action dialog displays (see Figure 70–13).

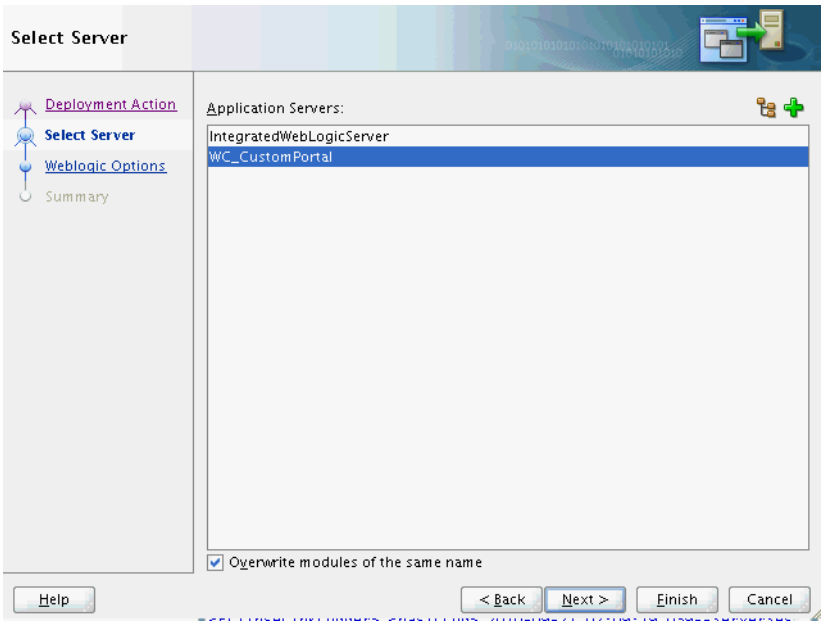


Figure 70–18 Deployment Action Dialog

6. Select **Deploy to Application Server** and click **Next**.

   The Select Server dialog displays (see Figure 70–14).

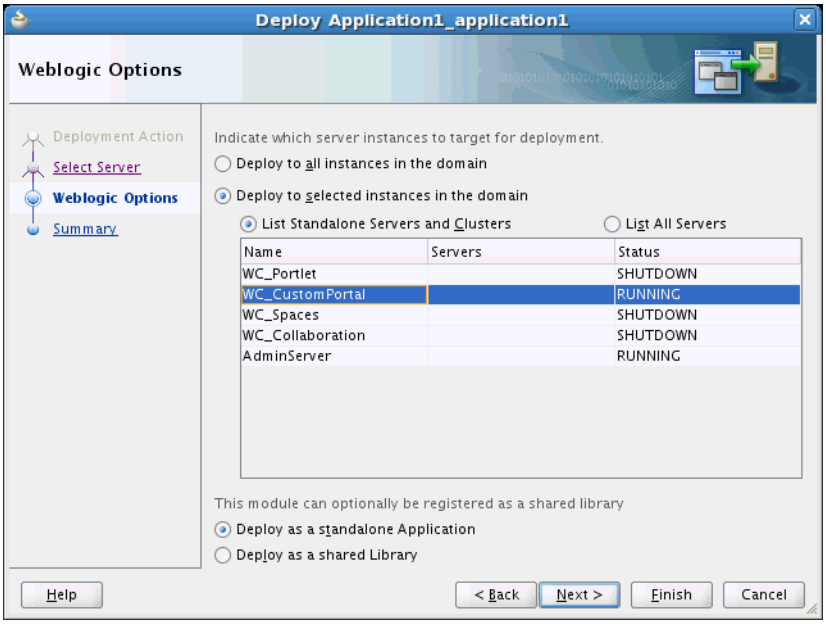

Figure 70–19 Select Server Dialog

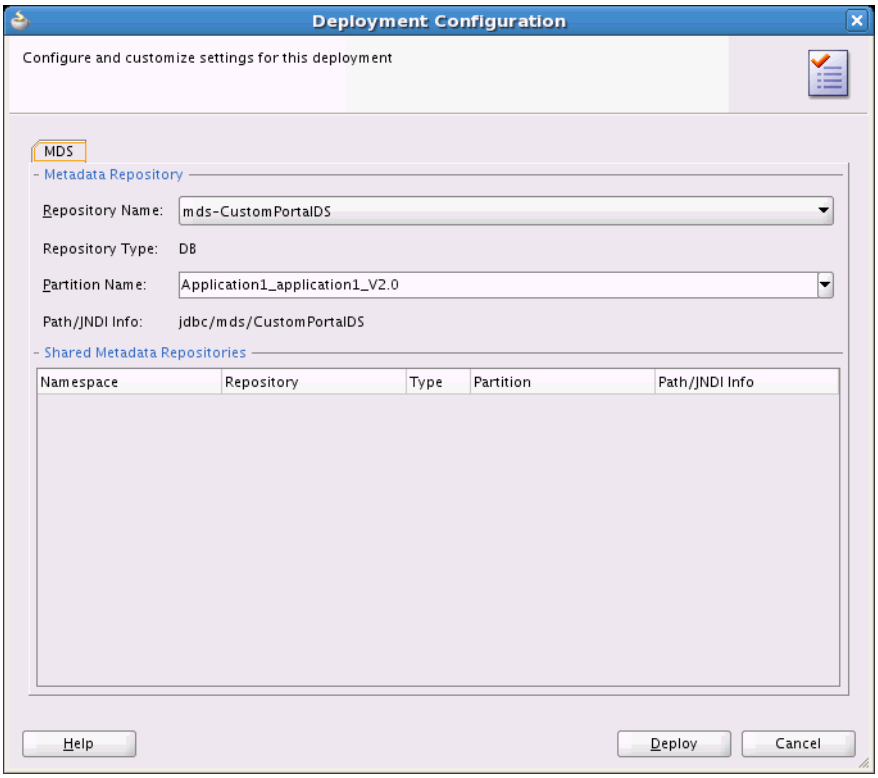
7. Select the connection name of the Managed Server (for example, `WC_CustomPortal`), and click **Next**. If the server to which you want to deploy is not listed, click the Add icon (+) and complete the connection details to add the application server to the list.

   The Deployment WebLogic Options dialog displays (see Figure 70–15).

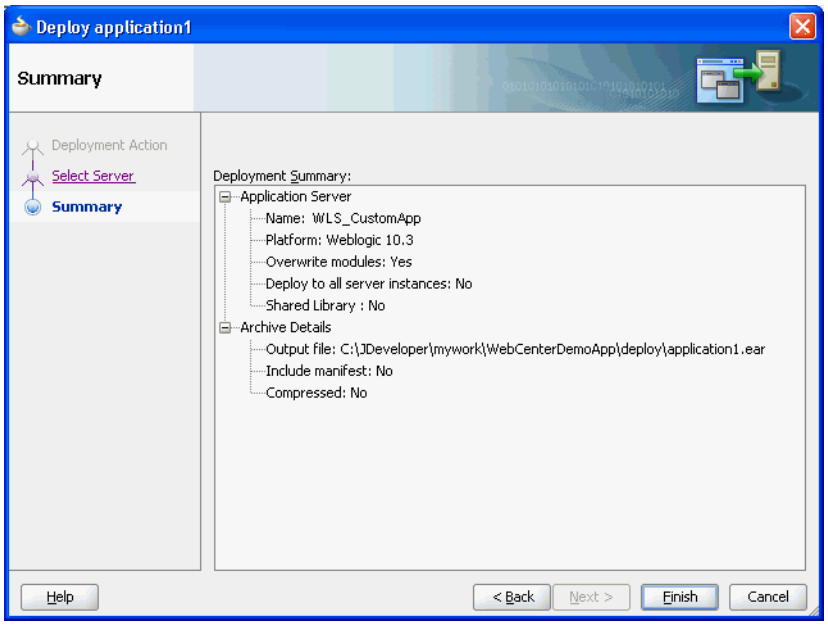
Figure 70–20 Deployment WebLogic Options dialog



8. Select `Deploy to selected instance in the domain`, select the managed server from the list (for example, `WC_CustomPortal`), and click **Next**.

   In most cases you will want to deselect **Deploy to all server instances in the domain** and select the specific servers and clusters to deploy to using the Server

Instances dialog. Refer to the online help for more information about using the Select Server dialog options.



The Deployment Configuration dialog displays (see Figure 70–16).

Figure 70–21 Deployment Configuration Dialog

9. Select the Repository Name (for example, `mds-CustomPortalDS`), enter a Partition Name (if the partition doesn't already exist then it will be created during the deployment), and click **Deploy**.
10. On the Deployment Summary dialog (see Figure 70–17), check that all of the deployment options are correct and click **Finish** to start the deployment.

Figure 70–22 Deployment Summary Dialog

11. Continue by doing any post-deployment security or data source connection configurations that may be required as described in the section on "Post-Deployment Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

70.4 Transporting Customizations Between Environments

When migrating a deployed application to a new environment, post-deployment customizations made to pages, WebCenter Portal service, and portlets (PDK-Java and WSRP version 2 producers) must be migrated too. Export and import utilities are available to assist with this process. For more information, see the chapter, "Managing Backup, Recovery, Export, and Import of WebCenter Portal" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

71

Building Multilanguage Portals

When your application will be viewed by users in multiple countries, you can configure your JSF page or application to use different locales so that it displays the correct language for the language setting of a user's browser. For example, if you know your page will be viewed in Italy, you can localize your page so that when a user's browser is set to use the Italian language, text strings in the browser page appear in Italian.

Additionally, locale selection applies special formatting considerations applicable to the selected locale. For example, whether information is typically viewed from left to right or right to left, how numbers are depicted (such as monetary information), and the like.

When you develop a multi-language portal:

- Make use of the inherent multi-language support in Oracle WebCenter Portal: Services. For more information, see Section 71.1, "Language Support in ADF Faces Components."
- Put all resources in resource bundles, provide alternate-language resource bundles, and code your application to respond to users' language selection. For more information, see Section 71.2, "Using Resource Bundles to Support Multiple Languages."
- Make sure your database character set supports all required languages.

  For more information, see "Choosing a Character Set" in the *Oracle Database Globalization Support Guide*.
- Use number, date, and time formatting that supports all required locales.

  For more information, see "Setting Up a Globalization Support Environment" in the *Oracle Database Globalization Support Guide*.
- Use linguistic sort parameters to get the correct sort ordering for locale.

  For example, the same characters have different sort ordering in French and Canadian-French.

  For more information, see "Linguistic Sorting and String Searching" in the *Oracle Database Globalization Support Guide*.
- Write web pages that correctly render left to right or right to left (for example, if Arabic languages must be supported).

For more guidelines on globalization, see "Internationalizing and Localizing Pages" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework* or the *Oracle Database Globalization Support Guide*.

71.1 Language Support in ADF Faces Components

Some ADF Faces components include text that is part of the component, for example the `af:table` component uses the resource string `af_table.LABEL_FETCHING` for the message text that is displayed in the browser while the table is fetching data during the initial load of data or while the table is being scrolled. Oracle JDeveloper provides translations of these text resources into 28 languages. Therefore, when using the supplied components, you do not need to perform additional steps to translate the text in the components.

71.2 Using Resource Bundles to Support Multiple Languages

For any text you add to a component, for example if you define the label of an `af:commandButton` component by setting the text attribute, you must provide a resource bundle that holds the actual text, create a version of the resource bundle for each locale, and add a `<locale-config>` element to define default and support locales in the application's faces-config.xml file. You must also add a `<resource-bundle>` element to your application's faces-config.xml file to make the resource bundles available to all the pages in your application. Once you have configured and registered a resource bundle, the Expression Language (EL) editor displays the key from the bundle, making it easier to reference the bundle in application pages.

To simplify the process of creating text resources for text you add to ADF components, JDeveloper supports automatic resource bundle synchronization for any translatable string in the visual editor. When you edit components directly in the visual editor or in the Property Inspector, text resources are automatically created in the base resource bundle.

For more information on automatic resource bundles, see "Using Automatic Resource Bundle Integration in JDeveloper" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

For more information on manually defining resource bundles, see "Manually Defining Resource Bundles and Locales" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

Part XIII

Appendixes

Part XIII contains the following appendixes:

- Appendix A, "Files for WebCenter Portal: Framework Applications"
- Appendix B, "Composer Component Properties and Files"
- Appendix C, "Resource Catalog Properties and Files"
- Appendix D, "Guidelines for Creating Task Flows to Be Used in Composer-Enabled Pages"
- Appendix E, "Additional Portlet Configuration"
- Appendix F, "Reuse of Oracle Portal Components"
- Appendix G, "Expression Language Expressions"
- Appendix H, "Manually Migrating a Framework Application"
- Appendix I, "WebCenter Portal Analytics Database Schema,"

A

Files for WebCenter Portal: Framework Applications

This appendix provides reference information about the files that are created and modified as you build up your WebCenter Portal: Framework application. This appendix includes the following sections:

- Section A.1, "About Files"
- Section A.2, "Files Overview"
- Section A.3, "Files Related to WebCenter Portal: Framework Applications"
- Section A.4, "Files Related to JSR 286 Portlets"
- Section A.5, "Files Related to PDK-Java Portlets"
- Section A.6, "System Files"
- Section A.7, "Files Related to Security"
- Section A.8, "Oracle JDeveloper Files"
- Section A.9, "Files Related to Oracle WebCenter Portal Services"

For a complete reference for the Oracle Application Development Framework (Oracle ADF) metadata files that you create in your data model and user interface projects, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

To learn more how files are affected by major actions, see Section 4.2.2, "Developer Actions Affecting Metadata Files."

A.1 About Files

When you use Oracle WebCenter Framework to build applications and components, several files are created as you perform such actions as building and consuming portlets. As you work with your application, you may find it useful to know a little bit about each of these files and how they relate to your application. You can group the files affected by the Oracle WebCenter Framework into two broad categories as follows:

- Files that are common to any Oracle ADF application, such as `web.xml`. For these files, it is useful to know what specific additions and changes are made for Framework applications. Those modifications are described in this appendix, but for more complete descriptions of these common files, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

- Files that are unique to Framework applications, such as `portlet.xml`. For these files, it is useful to know what the file is for and what it contains. These files are described completely in this appendix.

A.2 Files Overview

The files that are created and modified are closely associated with the objects that you create as part of your Framework application. Hence, the easiest way to discuss these files is by object as follows:

- Files Related to JSR 286 Portlets
- Files Related to PDK-Java Portlets
- System Files
- Files Related to Security
- Oracle JDeveloper Files
- Files Related to Oracle WebCenter Portal Services

A.3 Files Related to WebCenter Portal: Framework Applications

This section includes the following subsections that describe the files that are created for you when you create an application using WebCenter Portal's Framework application template:

- Section A.3.1, "catalog-registry.xml"
- Section A.3.2, "default-catalog.xml"
- Section A.3.3, "default-navigation-model.xml"
- Section A.3.4, "index.html"
- Section A.3.5, "navigation-registry.xml"
- Section A.3.6, "pages.xml"
- Section A.3.7, "error.jspx"
- Section A.3.8, "home.jspx"
- Section A.3.9, "login.jspx"
- Section A.3.11, "pageTemplate_globe.jspx"
- Section A.3.12, "pageTemplate_swooshy.jspx"

There are also image files created that are used in the application.

A.3.1 catalog-registry.xml

`catalog-registry.xml` is a catalog registry file. It is used by the Resource Manager when a user creates or edits a resource catalog. The registry defines the superset of all items that are available to be included in a catalog that you create or edit. You can create multiple catalogs for an application, but an application can only have one catalog registry file.

A.3.2 default-catalog.xml

`default-catalog.xml` is a default resource catalog. When a user edits pages at runtime using Composer, the default catalog file specifies all of the items that are available to be added to a page.

A.3.3 default-navigation-model.xml

`default-navigation-model.xml` is the navigation model file, which incorporates navigation structures in portal site. For more information, see Chapter 11, "Building a Navigation Model for Your Portal" and Section 9.5.3, "Understanding the Navigation Model and the Navigation Registry."

A.3.4 index.html

`index.html` contains a redirect statement that refers to the portal navigation model, including an URL element, `pages_home`, which refers to the "home" page specified in the page hierarchy. For more information, see Section 9.13, "Changing the Default Home Page and Login/Logout Target Pages"

A.3.5 navigation-registry.xml

`navigation-registry.xml` is used by the Resource Manager when a user creates or edits a navigation model. The registry defines the superset of all items that are available to be included in a model that you create or edit. You can create multiple navigation models for an application, but an application can only have one navigation registry file. For more information, see Chapter 11, "Building a Navigation Model for Your Portal."

A.3.6 pages.xml

`pages.xml`, or the "page hierarchy" file, organizes pages into a tree structure, with a parent-child relationship between pages. This hierarchical structure allows the convenient propagation or inheritance of security settings from pages to sub pages. For more information, see Section 9.5.1, "Understanding Pages, Page Templates, and the Portal Page Hierarchy."

A.3.7 error.jspx

`error.jspx` is the default error page displayed to users when WebCenter Portal encounters an error.

A.3.8 home.jspx

`home.jspx` is the default Home page, providing users access to features such as the Documents service, Links service, Tags service, and Discussion service.

A.3.9 login.jspx

`login.jspx` is the default login page that provides login/logout functionality to users. For information on customizing the login page, see Section 69.9, "Adding Portlets to a Login Page."

A.3.10 navigation-renderer.jspx

`navigation-renderer.jspx` is responsible for rendering non-page resources that appear in a navigation, such as portlets, content, and task flows. For more information, see Section 11.5, "Editing the Navigation Renderer."

A.3.11 pageTemplate_globe.jspx

`pageTemplate_globe.jspx` is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as `pageTemplate_swooshy.jxpx` but with different graphics. For more information, see Section 12.2, "Working with Page Templates."

A.3.12 pageTemplate_swooshy.jspx

`pageTemplate_swooshy.jspx` is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as `pageTemplate_globe.jxpx` but with different graphics. For more information, see Section 12.2, "Working with Page Templates."

A.4 Files Related to JSR 286 Portlets

This section includes the following subsections that describe the files that are created for you when you build a JSR 286 portlet:

- Section A.4.1, "portlet.xml"
- Section A.4.2, "oracle-portlet-tags.jar"
- Section A.4.3, "portlet_mode.jsp"
- Section A.4.4, "portlet_name.java"
- Section A.4.5, "portlet_nameBundle.jar"
- Section A.4.6, "web.xml"

A.4.1 portlet.xml

`portlet.xml` defines the characteristics of your JSR 286 portlet. For complete details on `portlet.xml`, you should see the Java Portlet Specification available at:

`http://jcp.org/en/jsr/detail?id=168`

Example A–1 provides a sample fragment from a `portlet.xml` file. Note that this example does not include all of the available elements of `portlet.xml`.

Example A–1 portlet.xml Sample

```
<portlet>
   <description xml:lang="en">JSR 286 map portlet </description>
   <portlet-name>portlet1</portlet-name>
   <display-name xml:lang="en">Map Portlet</display-name>
   <portlet-class>jsrportlet.MapPortlet</portlet-class>
   <expiration-cache>0</expiration-cache>
   <supports>
      <mime-type>text/html</mime-type>
      <portlet-mode>edit</portlet-mode>
      <portlet-mode>help</portlet-mode>
```

```
      <portlet-mode>about</portlet-mode>
   </supports>
   <supported-locale>en</supported-locale>
   <resource-bundle>jsrportlet.resource.MapPortletBundle</resource-bundle>
   <portlet-info>
      <title>Map Portlet</title>
      <short-title>Map</short-title>
      <keywords/>
   <portlet-preferences>
      <preference>
         <name>portletTitle</name>
      </preference>
   </portlet-preferences>
   <security-role-ref>
      <role-name>viewer</role-name>
   </security-role-ref>
</portlet>
```

For JSR 286 portlets, the `portlet.xml` file contains all information related to portlets and their settings. Note that not all of these settings are used in the previous sample.

- `<description>` describes the portlet, providing details to the end user.
- `<portlet-name>` uniquely identifies the portlet within the Portlet Producer application.
- `<display-name>` is used when presenting a list of available portlets to the user.
- `<portlet-class>` contains the fully qualified class name of the class implementing the `javax.portlet.Portlet` interface or extending the `GenericPortlet` abstract class that becomes the entry point for the portlet logic. The portlet container uses this class when it invokes the portlet life cycle methods. For JSF portlets created using the Oracle JSF Portlet Bridge, this is `oracle.portlet.bridge.adf.application.ADFBridgePortlet`.
- `<expiration-cache>` the default duration (in seconds) of the expiration cache.
- `<init-param>` defines initialization parameters for configuring the behavior of the portlet. The Oracle JSF Portlet Bridge uses initialization parameters to identify the entry points for the different portlet modes supported by the portlet, for example, for View mode:

  ```
  <init-param>
    <name>javax.portlet.faces.defaultViewId.view</name>
    <value>/myPage.jspx</value>
  </init-param>
  ```

  Initialization parameters for other WebCenter Portal-supported modes are:

  - Edit mode: `javax.portlet.faces.defaultViewId.edit`
  - Help mode: `javax.portlet.faces.defaultViewId.help`
  - About mode: `javax.portlet.faces.defaultViewId.about`
  - Config mode: `javax.portlet.faces.defaultViewId.config`
  - Edit Defaults mode: `javax.portlet.faces.defaultViewId.edit_defaults`
  - Preview mode: `javax.portlet.faces.defaultViewId.preview`
  - Print mode: `javax.portlet.faces.defaultViewId.print`

Note: The value for the `defaultViewId` is relative to the application context root and must always start with a `/`. In the example provided, the value for `defaultViewId.view` is `/myPage.jspx`.

If you add a `defaultViewId` for other portlet modes, then you must also add the mode to the `<supports>` tag. For example, `<portlet-mode>HELP</portlet-mode>`.

- `<supports>` provides information about the portlet modes supported for each content type. Portlet modes supported by WebCenter Portal include: `edit`, `help`, `about`, `config`, `edit_defaults`, `preview`, and `print`.
- `<supported-locale>` lists the locales supported by the portlet at runtime.
- `<resource-bundle>` is the fully qualified class name of the resource bundle used to provide language specific portlet information, such as title and keywords.
- `<title>` is the static title of the portlet, usually displayed in the portlet decoration on the portlet window.
- `<short-title>` is the title that is used on devices (such as mobile phones) that have limited display capabilities.
- `<keywords>` are used by applications that offer search capabilities for their users.
- `<portlet-preferences>` are preference attribute definitions.
- `<supported-processing-event>` are events that the portlet can receive.
- `<supported-publishing-event>` are events that the portlet raises.
- `<supported-public-render-parameter>` is a public render parameter supported by the portlet.
- `<container-runtime-option>` an option for defining additional runtime behavior.
- `<security-role-ref>` maps a role name to a security role in `web.xml`. The list of roles in `web.xml` that the `<security-role-ref>` maps to is published to the consumer as the producer's user categories. In `web.xml`, `<security-role>` appears similar to the following:

```
<security-role>
   <description>Viewer role</description>
   <role-name>viewer</role-name>
</security-role>
```

A.4.2 oracle-portlet-tags.jar

`oracle-portlet-tags.jar` is the Oracle implementation of the JSP tag library defined by the Java Portlet Specification.

A.4.3 portlet_mode.jsp

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your *`portlet_name`*`\html` directory to define that mode. For example, if you choose to have View and Edit modes for your portlet, then you need `view.jsp` and `edit.jsp` in your *`portlet_name`*`\html` directory. For JSR 286 portlets, you can have the following JSP files for your portlet modes:

- about.jsp
- config.jsp
- edit_defaults.jsp
- edit.jsp
- help.jsp
- preview.jsp
- print.jsp
- view.jsp

For further explanation of portlet modes, see Section 61.1.1, "Guidelines for Portlet Modes."

A.4.4 portlet_name.java

portlet_name.java is the class that acts as the entry point for the portlet logic. This class must implement the javax.portlet.Portlet interface or extend the GenericPortlet abstract class. The portlet container uses this class when it invokes the portlet lifecycle methods.

A.4.5 portlet_nameBundle.jar

*portlet_name*Bundle.jar is a resource bundle class, containing translation of the strings used by the portlet.

A.4.6 web.xml

web.xml is a Java EE standard descriptor that contains details about Web applications. For more information about web.xml, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

A.5 Files Related to PDK-Java Portlets

This section includes the following subsections that describe the files that are created for you when you build a PDK-Java portlet:

- Section A.5.2, "_default.properties"
- Section A.5.3, "index.jsp"
- Section A.5.4, "portlet_name_modePage.jsp"
- Section A.5.1, "producer_name.properties"
- Section A.5.5, "provider.xml"
- Section A.5.6, "web.xml"

A.5.1 producer_name.properties

producer_name.properties specifies deployment details about the producer, such as the location of the provider.xml file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

http://*host*:*port*/jpdk/provider/samples

or:

`http://host:port/jpdk/provider`

where the service ID field contains `samples`. See also Section A.5.2, "_default.properties".

A.5.2 _default.properties

`_default.properties` specifies deployment details about the producer, such as the location of the `provider.xml` file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

`http://host:port/jpdk/provider`

Note that the producer name is not supplied here so it has to default. See also Section A.5.1, "producer_name.properties".

A.5.3 index.jsp

`index.jsp` serves as a convenient starting point when testing PDK-Java producers from Oracle JDeveloper. This file lists all of the producers available in the application.

A.5.4 portlet_name_modePage.jsp

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your `\htdocs\portlet_name` directory to define that mode. For example, if you choose to have View and Edit modes for a portlet named `portletOne`, then you need `portletOneShowPage.jsp` and `PortletOneEditPage.jsp` in your `\htdocs\portletOne` directory. For PDK-Java portlets, you can have the following JSP files for your portlet modes:

- `portlet_nameAboutPage.jsp`
- `portlet_nameEditDefaultsPage.jsp`
- `portlet_nameEditPage.jsp`
- `portlet_nameHelpPage.jsp`
- `portlet_nameShowDetailsPage.jsp`
- `portlet_nameShowPage.jsp`

For further explanation of portlet modes, see Section 61.1.1, "Guidelines for Portlet Modes".

A.5.5 provider.xml

`provider.xml` is the definition file for your PDK-Java producer.

> **Note:** PDK-Java producers were formerly referred to as providers.

This section includes the following subsections:

- Section A.5.5.1, "provider.xml Syntax"
- Section A.5.5.2, "provider.xml Sample"

A.5.5.1 provider.xml Syntax

For more information about the elements and syntax of `provider.xml`, see the Provider Definition Extensible Markup Language (XML) Tag Reference v2 on the Oracle Technology Network.

http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml_tag_reference_v2.html

A.5.5.2 provider.xml Sample

Example A–2 provides a sample `provider.xml` file.

Example A–2 provider.xml Sample

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<?providerDefinition version="3.1"?>
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
 <localePersonalizationLevel>none</localePersonalizationLevel>
 <session>true</session>
 <defaultLocale>en</defaultLocale>
 <preferenceStore
  class="oracle.portal.provider.v2.preference.FilePreferenceStore">
  <name>prefStore1</name>
  <useHashing>true</useHashing>
 </preferenceStore>
 <portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
  <id>1</id>
  <name>SampleRenderer</name>
  <title>SampleRenderer example</title>
  <shortTitle>SampleRenderer</shortTitle>
  <description>Example portlet rendered using the SampleRenderer</description>
  <timeout>40</timeout>
  <timeoutMessage>SampleRenderer example timed out</timeoutMessage>
  <acceptContentType>text/html</acceptContentType>
  <showEdit>true</showEdit>
  <showEditToPublic>false</showEditToPublic>
  <showEditDefault>true</showEditDefault>
  <showPreview>true</showPreview>
  <showDetails>true</showDetails>
  <hasHelp>true</hasHelp>
  <hasAbout>true</hasAbout>
  <renderer
   class="oracle.portal.sample.v2.devguide.samplerenderer.SampleRenderer"/>
   <personalizationManager
   class="oracle.portal.provider.v2.personalize.PrefStorePersonalizationManager">
   <dataClass>oracle.portal.provider.v2.personalize.
     NameValuePersonalizationObject
   </dataClass>
   </personalizationManager>
 </portlet>
</provider>
```

A.5.6 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

A.6 System Files

This section includes the following subsections that describe the files that are created or modified when you create or modify pages, deploy your application, or consume JSR 268 portlets:

- Created at page design time:
  - Section A.6.1, "adf-config.xml"
  - Section A.6.2, "DataBindings.cpx"
  - Section A.6.3, "faces-config.xml"
  - Section A.6.4, "page_name.jspx"
  - Section A.6.5, "PageDef.xml"
  - Section A.6.6, "trinidad-config.xml"
  - Section A.6.7, "web.xml"
  - Section A.6.8, "weblogic-application.xml"
- Created at application deployment time:
  - Section A.6.9, "mds Subdirectory"
- Created upon consumption of JSR 286 portlets
  - Section A.6.10, "wsdl Subdirectory"

A.6.1 adf-config.xml

The `adf-config.xml` file is an extensible configuration file used by any ADF component. This file is used by the various WebCenter Portal services, including pages, portlets, and all the services such as search, worklist, forums, and so on, to set configuration information. This file, with `connections.xml`, contains the configuration information required for most of the services to function.

For more information, see:

- Section 15.10.1, "adf-config.xml" (for information on Skins settings)
- Section 21.2.1.3, "Registering Add-Ons in adf-config.xml"
- Section 22.11.2.2, "Adding Relevant Entries to the adf-config.xml File" (for information on configuring change persistence)
- Section 23.2.1.1, "Updating Your Application's adf-config.xml File" (for information on configuring sandbox creation)
- Section 24.5.1, "How to Add an enableSecurity Section to adf-config.xml"
- Section B.2.2, "adf-config.xml" (for information on Composer-specific settings)
- Section H.5.6, "Updating adf-config.xml" (for information on migration)

Table A–1 describes the child elements of `<adf-portlet-config>`. The `init-param` names in the first column correspond to the names of the servlet `init-params` used when the portlet client is accessed through the Web adapter.

Table A–1 Child Elements of adf-portlet-config

Element (init-param)	Description	Default Value
`parallelPoolSize (parallel.pool.size)`	The number of threads to use for parallel execution of tasks.	10

Table A–1 (Cont.) Child Elements of adf-portlet-config

Element (init-param)	Description	Default Value
`parallelQueueSize` (`parallel.queue.size`)	The size of the queue of tasks waiting for parallel execution. Tasks are rejected when the queue size is exceeded.	20
`defaultTimeout` (`default.timeout`)	The default timeout period in seconds for requests made to producers. This value is used when a timeout is not defined at the portlet or producer level.	10
`minimumTimeout` (`minimum.timeout`)	The minimum timeout period in seconds for requests made to producers. This value is used to impose a lower limit on timeout periods specified by portlets or producers.	0.1
`maximumTimeout` (`maximum.timeout`)	The maximum timeout period in seconds for requests made to producers. This value is used to impose an upper limit on timeout periods specified by portlets or producers.	300
`resourceProxyPath` (`resource.proxy.path`)	The base path of the resource proxy servlet, relative to the context root of the application. Used to construct links to the resource servlet within portlet markup.	/resourceproxy
`supportedLocales` (`supported.locales`)	The set of supported locales defined using strings of the form: `language[_country[_variant]]`	Commented out by default. You should uncomment it if you have multiple locales. See Example A–3.
`portletTechnologies` (`portlet.technologies`)	The set of portlet technologies supported by the client defined by the fully qualified names of classes that implement the PortletTechnologyConfig interface.	{o.p.c.ci.web.WebPortletTechnologyConfig, o.p.c.ci.wsrp.WSRPPortletTechnologyConfig}
`cacheSettings` (`cache.*`)	Cache configuration information. Used to enable or disable the cache, define its maximum size and impose limits on the amount of space available for different users and subscribers.	The cache is enabled and no size restrictions are imposed.

Table A–1 (Cont.) Child Elements of adf-portlet-config

Element (init-param)	Description	Default Value
`maximumResourceUrlLength` (`maximum.resource.url.length`)	The maximum length allowed for resource URLs. This prevents the URL from becoming to long if the portlet passes a lot of contextual information in a resource request. Resource URLs longer than 2048 characters may cause problems in some browsers. If the information encoded in a resource URL exceeds this value, the portlet client stores the information in the session and encodes a key to the session attribute in the URL instead. The key is calculated in a deterministic way to avoid adversely affecting browser caching.	2048

<adf-portlet-config> element Sample

Example A–3 illustrates the usage of the `<adf-portlet-config>` element.

Example A–3 <adf-portlet-config> element Sample

```
<adf-portlet-config xmlns="http://xmlns.oracle.com/adf/portlet/config">
  <supportedLocales>
    <value>en</value>
    <value>fr</value>
    <value>de</value>
    <value>es</value>
  </supportedLocales>
  <portletTechnologies>
   <value>oracle.portlet.client.containerimpl.web.
     WebPortletTechnologyConfig</value>
   <value>oracle.portlet.client.containerimpl.wsrp.
     WSRPPortletTechnologyConfig</value>
  </portletTechnologies>
  <defaultTimeout>20</defaultTimeout>
  <minimumTimeout>1</minimumTimeout>
  <maximumTimeout>300</maximumTimeout>
  <resourceProxyPath>/portletresource</resourceProxyPath>
  <cacheSettings>
    <maxSize>10000000</maxSize>
    <subscriber default="true">
      <systemLevel>
        <maxSize>5000000</maxSize>
      </systemLevel>
      <userLevel>
        <maxSize>8000000</maxSize>
      </userLevel>
    </subscriber>
  </cacheSettings>
</adf-portlet-config>
```

A.6.2 DataBindings.cpx

`DataBindings.cpx` is a file common to Web applications. For more information about `DataBindings.cpx`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.3 faces-config.xml

`faces-config.xml` is a file common to JSF applications. It describes the page flow of your application. For more information about `faces-config.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.4 page_name.jspx

`page_name``.jspx` is the JSP file for your page. Whenever you add or remove components, such as portlets or data controls from the page, this file is updated.

A.6.5 PageDef.xml

`PageDef.xml` is a file common to Oracle ADF applications. This file holds information about portlet bindings. Also, portlet parameters can be tied to page variables in this file.

For more information about `PageDef.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

PageDef.xml Sample

Example A–4 provides a sample `PageDef.xml` file.

Example A–4 PageDef.xml Sample

```
<?xml version="1.0" encoding="UTF-8" ?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
   version="10.1.3.37.97" id="app_SRFeedbackPageDef"
   Package="oracle.srdemo.view.pageDefs">
  <parameters/>
  <executables>
    <methodIterator id="findAllServiceRequestIter"
                    Binds="findAllServiceRequest.result"
                    DataControl="SRPublicFacade" RangeSize="4"
                    BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
    <variableIterator id="variables">
      <variable Name="portlet1_Param1" Type="java.lang.Object"
      DefaultValue="
      ${bindings.findAllServiceRequestIter.currentRow.dataProvider['svrId']}"/>
      <variable Name="portlet1_Param2" Type="java.lang.Object"/>
      <variable Name="portlet1_Param3" Type="java.lang.Object"/>
      <variable Name="portlet1_Param4" Type="java.lang.Object"/>
      <variable Name="portlet1_Param5" Type="java.lang.Object"/>
    </variableIterator>
    <methodIterator id="findServiceRequestByIdIter"
                    Binds="findServiceRequestById.result"
                    DataControl="SRPublicFacade" RangeSize="10"
                    BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
    <portlet id="portlet1"
      portletInstance="/oracle/adf/portlet/OmniProducer_1150310748178/
      applicationPortlets/Portlet100_eebc7f18_010b_1000_8001_82235f640cea"
      class="oracle.adf.model.portlet.binding.PortletBinding"
```

```
      xmlns="http://xmlns.oracle.com/portlet/bindings">
    <parameters>
      <parameter name="Param1" pageVariable="portlet1_Param1"/>
      <parameter name="Param2" pageVariable="portlet1_Param2"/>
      <parameter name="Param3" pageVariable="portlet1_Param3"/>
      <parameter name="Param4" pageVariable="portlet1_Param4"/>
      <parameter name="Param5" pageVariable="portlet1_Param5"/>
    </parameters>
  </portlet>
</executables>

      <Item Value="custComment"/>
    </AttrNames>
  </attributeValues>
  <attributeValues id="mgrNotes" IterBinding="findServiceRequestByIdIter">
    <AttrNames>
      <Item Value="mgrNotes"/>
    </AttrNames>
  </attributeValues>
  <list id="ServiceRequestcustCommentContactBy"
```

```
            IterBinding="findServiceRequestByIdIter" ListOperMode="0"
            StaticList="true" NullValueFlag="1">
          <AttrNames>
            <Item Value="custCommentContactBy"/>
          </AttrNames>
          <ValueList>
            <Item Value=" "/>
            <Item Value="Phone"/>
            <Item Value="Email"/>
            <Item Value="SMS"/>
          </ValueList>
        </list>
        <methodAction id="mergeEntity" InstanceName="SRPublicFacade.dataProvider"
                      DataControl="SRPublicFacade" MethodName="mergeEntity"
                      RequiresUpdateModel="true" Action="999"
                      IsViewObjectMethod="false"
                      ReturnName="SRPublicFacade.methodResults.
                                  SRPublicFacade_dataProvider_mergeEntity_result">
          <NamedData NDName="entity"
             NDValue=
             "${bindings.findServiceRequestByIdIter.currentRow.dataProvider}"
             NDType="java.lang.Object"/>
        </methodAction>
      </bindings>
    </pageDefinition>
```

A.6.6 trinidad-config.xml

`trinidad-config.xml` contains information about the application skin family. Additionally, it can contain information about the level of page accessibility support, page animation, time zone, enhanced debugging output, and the URL for Oracle Help for the Web (OHW). For more information, see Section 1.10.3, "The Framework Application Template Default trinidad-config.xml File"

A.6.7 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

A.6.8 weblogic-application.xml

`weblogic-application.xml` is a deployment descriptor (a server configuration file that defines the application configuration) for Oracle WebLogic Server deployment.

A.6.9 mds Subdirectory

When you deploy a WebCenter Portal: Framework application, an `mds` subdirectory is created in your project directory. This subdirectory contains other subdirectories and metadata files, such as portlet customizations and personalizations.

A.6.10 wsdl Subdirectory

When you consume JSR 286 portlets in an application, a `wsdl` subdirectory is created in the `WEB-INF` directory. The files in this subdirectory are internal files created for portlets from a WSRP producer.

A.7 Files Related to Security

This section includes the following subsections that describe the files that are created or modified when you implement or modify security:

- Section A.7.1, "connections.xml"
- Section A.7.2, "jazn-data.xml"

A.7.1 connections.xml

`connections.xml` contains portlet producer connection information. Example A–5 shows a sample `connections.xml` file.

Example A–5 connections.xml

```
<?xml version = '1.0' encoding = 'UTF-8'?>

A.7.2 jazn-data.xml

When you implement or modify security for your application, the `jazn-data.xml` file is created or modified.

The `jazn-data.xml` file is used to facilitate the deployment of realm and policy information for your application. In your development environment (JDeveloper), `jazn-data.xml` is located in your application's *`workspacedir`*`/src/META-INF` directory. After deployment, the contents of this file are merged in domain-level identity or policy stores. This file contains the policies that are created at design time, and is merged at deployment by `JpsApplicationLifecycleListener` into the `system-jazn-data.xml` file (or appropriately configured policy store) for the deployment target.

When you migrate security information with `JpsApplicationLifecycleListener`, the `jazn-data.xml` file can be used as the source file for the migration. For more information about migrating roles, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

jazn-data.xml Sample

Example A–6 provides a sample `jazn-data.xml` file.

Example A–6 jazn-data.xml Sample

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<jazn-data>
   <jazn-realm>
      <realm>
         <name>jazn.com</name>
      </realm>
   </jazn-realm>
   <policy-store>
      <applications>
         <application>
```

```
            <name>mdsapp-secure</name>
            <app-roles>
               <app-role>

</jazn-data>
```

A.7.3 cwallet.sso

`cwallet.sso` contains external application credentials, if any, and the connection's secure data such as database password. The `cwallet.sso` file is located in the *`workspaceroot`*`/src/META-INF` directory.

A.7.4 jps-config.xml

`jps-config.xml` is located at *`workspaceroot`*`/src/META-INF`. The `jps-config.xml` file packaged with the application is used only at design time. At runtime, the configurations stored in the domain-level `jps-config.xml` file become functional.

`jps-config.xml` configures OPSS services. For more information on the element hierarchy and attributes of `jps-config.xml`, see the appendix "OPSS Configuration File Reference" in the *Oracle Containers for J2EE Security Guide*.

The recommendation for migration is to create a new `jps-config.xml` file with the source and destination contexts defined as required by the migration commands. For details on migrating identities, see the section "Migrating Identities Manually" in the *Oracle Containers for J2EE Security Guide*.

The policy store is migrated in the following ways: entire policy store, application-specific policies, and global polices. For details, see the section "Migrating Policies Manually" in the *Oracle Containers for J2EE Security Guide*.

The credential store is migrated in the following ways: entire credential store or application-specific credentials. When migrating application-specific credentials, ensure that `srcFolder` and `targetFolder` are the same. `srcFolder` and `targetFolder` can be determined from `appUID` in the `adf-config.xml` file, see Example A–7. For details, see the section "Migrating Credentials Manually" in the *Oracle Containers for J2EE Security Guide*.

Example A–7 appUID in the adf-config.xml file

```
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
  <adf-property name="adfAppUID" value="Application1-1167"/>
</adf:adf-properties-child>
```

A.7.5 adf-config.xml

Security configurations are stored in `adf-config.xml`. This file is located at *`workspaceroot`*`/.adf/META-INF/adf-config.xml`. See Example A–8.

Example A–8 adf-config.xml

```
<adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
        <JaasSecurityContext
initialContextFactoryClass="oracle.adf.share.security.JAASInitialContextFactory"
jaasProviderClass="oracle.adf.share.security.providers.jps.JpsSecurityContext"
             authorizationEnforce="true"
             authenticationRequire="true"/>
    <CredentialStoreContext
credentialStoreClass="oracle.adf.share.security.providers.jps.CSFCredentialStore"
             credentialStoreLocation="../../src/META-INF/jps-config.xml"/>
</adf-security-child>
```

Note: The `credentialStoreLocation` entry in the sample is valid at design time only.

A.8 Oracle JDeveloper Files

This section includes the following subsection that describes the file that is created or modified when you create a page template:

- Section A.8.1, "pagetemplate-metadata.xml"

A.8.1 pagetemplate-metadata.xml

`pagetemplate-metadata.xml` keeps track of all the page templates you create in a project.

A.9 Files Related to Oracle WebCenter Portal Services

This section includes sample `connections.xml` and `adf-config.xml` files for some WebCenter Portal services.

Example A–9 shows the minimum required configuration for the SES Web service connection.

Example A–9 SES Web Service Sample Connection

```
<Reference name="GenericSesConnection"
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionReferen
ceable"
credentialStoreKey="GenericSesConnection" xmlns="">
      <Factory
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionFactory
"/>
      <RefAddresses>
         <XmlRefAddr addrType="SesConfig">
            <Contents>
               <SesConfig>
                  <AttributeMap>
                     <Attribute name="date">
                        <SesAttribute>LastModifiedDate</SesAttribute>
                     </Attribute>
                     <Attribute name="person">
                        <SesAttribute>Author</SesAttribute>
                     </Attribute>
                  </AttributeMap>
                  <SoapUrl>http://host:port/search/query/OracleSearch</SoapUrl>
```

```
            </SesConfig>
         </Contents>
      </XmlRefAddr>
      <StringRefAddr addrType="appUsername">
         <Contents>wpadmin</Contents>
      </StringRefAddr>
      <SecureRefAddr addrType="appPassword"/>
   </RefAddresses>
</Reference>
```

Example A–10 shows a sample `adf-config.xml` for the Documents service.

Example A–10 ADF Configuration for the Documents Service

```
<doclibC:adf-doclib-config xmlns="http://xmlns.oracle.com/webcenter/doclib/config"
   primaryConnectionName="Oracle_Content_Server">
    <doclibC:spaces-repository
      spacesRoot="/repositoryPath"
      adminUserName="sysadmin"
      applicationName="application_name" />
  </doclibC:adf-doclib-config>
```

Example A–11 shows a sample `adf-config.xml` for the Worklist service.

Example A–11 ADF Configuration for the Worklist Service

```
  <worklistC:adf-worklist-config>
    <worklistC:ConnectionName>WebCenter-Worklist</worklistC:ConnectionName>
  </worklistC:adf-worklist-config>
```

B

Composer Component Properties and Files

This appendix provides reference information about Composer-specific tags, configuration files, and style properties. This information is useful while performing the tasks described in Chapter 20, "Enabling Runtime Editing of Pages Using Composer" and Chapter 21, "Extending Runtime Editing Capabilities Using Composer."

This appendix contains the following sections:

- Section B.1, "Composer Component Properties"
- Section B.2, "Composer-Specific Files and Configurations"
- Section B.3, "Composer Default Add-Ons and Property Panels"
- Section B.4, "Composer Help Topic IDs"
- Section B.5, "Composer Components Style-Specific Properties"
- Section B.6, "Customizable Components (HTML) Properties"

B.1 Composer Component Properties

This section is a quick reference for all Composer tags. When you add Composer components to a page, default values are assigned to certain attributes. You can change these default values and define values for the remaining attributes in JDeveloper.

For information about adding these components to the page, see Section 20.1, "Designing Editable Pages Using Composer Components."

> **Note:** The Property Inspector in JDeveloper displays certain extended metadata attributes under the Customization Attributes category. You can use these properties to provide additional metadata information. For more information, see the section "Extended Metadata Properties" in *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

This section contains the following subsections:

- Section B.1.1, "Page Customizable"
- Section B.1.2, "Change Mode Link and Change Mode Button"
- Section B.1.3, "Layout Customizable Component"
- Section B.1.4, "Panel Customizable Component"
- Section B.1.5, "Show Detail Frame Component"

- Section B.1.6, "Custom Action"
- Section B.1.7, "Show Property"

B.1.1 Page Customizable

Use the `Page Customizable` component to enable page editing at runtime. The `Page Customizable` component denotes the customizable part of a page and shows the Composer toolbar in Edit mode at runtime. When you enclose components within a `Page Customizable` component, Composer is enabled in the application page at run time, allowing the user to customize and edit the components.

In large applications, where you want to enable runtime page editing on multiple pages, you can include the `Page Customizable` component in the page template, somewhere in the top of the hierarchy. This way, all pages created using the template are editable at runtime.

Geometry Management

View mode: The `Page Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. If the `Page Customizable` component is stretched, it in turn stretches its child component to fill the space available to it. However, if the `Page Customizable` component is not stretched, its size is determined by the child component.

Edit mode: The `Page Customizable` component stretches its child component to fill the space available to it.

Attributes

Table B–1 describes the attributes of a `Page Customizable` component.

Table B–1 Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
Appearance Attributes			
sourceViewPosition	String	Yes	The position of the Source view pane displaying components in a tree structure. Valid values are `bottom`, `end`, `start`, and `top`. Default value is `top`. Alternatively, the Source Position submenu on the View menu on the Composer toolbar provides options to set this attribute at runtime. For more information, see the section, Section 18.5, "Editing Capabilities in Source View in Page Edit Mode.".
sourceViewSize	String	Yes	The height or width of the Source view pane in pixels. Use this to specify height if the `sourceViewPosition` is set to `top` or `bottom`, or to specify width if `sourceViewPosition` is set to `start` or `end`. Since the default for `sourceViewPosition` is `top`, the pane has a default height of `200` pixels. Alternatively, the resize handler on the edge of the Source view pane enables users to alter the height or width of the pane at runtime.
toolbarLayout	String	Yes	The elements to be displayed on the Composer toolbar. This attribute can take a space-separated list of elements. The built in strings the component recognizes are `message`, `stretch`, `statusindicator`, `newline`, `menu`, `addonpanels`, `stretch`, `help`, and `button`. For more information about using this attribute, see Section 21.10, "Customizing the Composer Toolbar."
view	String	Yes	The default view in which to open a page in Composer. Available options are `design` and `source`. Default value is `design`. For more information, see Section 22.7, "Configuring an Application Page to Display in Source View by Default."
designViews	String	No	The views available to the user in Composer Design view. This attribute can take a space-separated list of elements. Available options are `select`, `add-content` and `all`. Default value is `add-content`. This setting overrides the global setting `<pe:enable-design-views>` in adf-config.xml. For more information see Section 21.11, "Enabling Direct Select in Design View."

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
Style Attributes			
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.PageCustomizable`	Supports only EL	An EL reference that stores the component instance on a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
sourceViewNodeAction	String	Yes	The name of the JPSX file to be called if you want to display custom actions against task flows in the component navigator in Composer Source view. The `sourceViewNodeAction` attribute can take the name of a JSPX file or an EL value that evaluates to a JSPX file name. For information about using this attribute, see Section 22.4, "Enabling Custom Actions that Display on Task Flows in the Component Navigator."
allowLabel	Boolean	Yes	Specifies whether label creation must be enabled in the Customization Manager. When `allowLabel` is set to `true`, a Save and Label button is displayed on the Composer toolbar. For more information, see Section 18.4.14, "Manage Application Customizations." This attribute is relevant only if you have configured sandbox support in your application.
catalog	String	Yes	The Resource Catalog to be used as the default one for the application page. Provide the catalog definition file name. For more information about using multiple Resource Catalogs, see Chapter 16, "Creating and Managing Resource Catalogs."

Table B–1 (Cont.) Attributes of a Page Customizable Component

Attribute	Type	Supports EL	Description
allowEL	Boolean	No	Specifies whether or not EL can be run in application pages. Default is true. This setting overrides the `<pe:allow-el>` setting in adf-config.xml. For more information, see Section 21.4.2, "How to Protect Expression Language."
protectEL	Boolean	No	Specifies whether or not EL in form elements is read-only. Default is false. This setting overrides the `<pe:protect-el>` setting in adf-config.xml. For more information, see Section 21.4.2, "How to Protect Expression Language."

Supported Facets

The `Page Customizable` component provides an `editor` facet, which is prepopulated with a `Page Editor Panel` component. To ensure that Composer works properly, the `editor` facet must contain the `Page Editor Panel` component.

B.1.2 Change Mode Link and Change Mode Button

Use the `Change Mode Button` or `Change Mode Link` to enable switching to Edit mode of the page at runtime.

The `Change Mode Link` and `Change Mode Button` components share a common set of attributes. Table B–2 describes the attributes of a `Change Mode Link` or `Change Mode Button` component.

Table B–2 Attributes of a Change Mode Link or Change Mode Button Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	Yes	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_ '). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. In a secured application, to enable the Edit link or button only for selected users based on specific criteria, you can specify an EL value for the `rendered` attribute. **Note**: In a secured application, it is recommended that you check all users' privileges and enable the Edit link or button only for privileged users. Unauthenticated users who stumble into page Edit mode can change component properties.
Behavior Attributes			

Table B–2 (Cont.) Attributes of a Change Mode Link or Change Mode Button Component

Attribute	Type	Supports EL?	Description
immediate	Boolean	Yes	Specifies whether data validation - client-side or server-side - must be skipped when events are generated by this component. When `immediate` is `true`, the command's action and ActionListeners, including the default ActionListener provided by the JavaServer Faces implementation, is executed during the Apply Request Values phase of the request processing lifecycle, rather than waiting until the Invoke Application phase. Because validation runs during Process Validators (after Apply Request Values, but before Invoke Application), setting `immediate` to `true` skips validation.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.ChangeModeLink` or `oracle.adf.view.page.editor.component.ChangeModeButton`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

If you do not want to use the `Change Mode Link` or `Change Mode Button` component, you can add your own button or link component and use the `ChangeModeLink` or `ChangeModeButton` API to enable the switching of the page mode.

Disabling Runtime Editing in Your Application Pages

To disable runtime editing of pages, you can revoke Edit privileges for users, or delete the `Change Mode Link` or `Change Mode Button` component from the page so that the user cannot navigate to the Edit mode of the page.

B.1.3 Layout Customizable Component

The `Layout Customizable` component applies a predefined layout to its child components. It is a container component that enables end users to lay out its child components in several predefined ways. Use the `Layout Customizable` component only to enable changing of the page layout at runtime. If you just want container components in which to layout components, but do not want to enable runtime layout changes, then it is recommended that you use ADF Faces layout components like `Panel Stretch Layout` and `Panel Group Layout`. It is recommended that you have just one `Layout Customizable` on the page.

A `Layout Customizable` component contains a direct child `Panel Customizable` component and two facets with `Panel Customizable` components by default to enable users to add content inside them at runtime. However, you can add any components inside the `Layout Customizable` component and its facets. The content in the three `Panel Customizable` components can be placed in different ways using predefined layouts. For more information, see the section, "Predefined Layout Types".

Table B–3 describes the attributes of a `Layout Customizable` component.

Table B–3 Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
type	String	Yes	Specifies the layout to be used for the page. You can choose from a list of eight predefined layouts. For more information, see Table B–5. Default value is `threeColumn`. You can define customization restrictions on a `Layout Customizable` component. Specifically, if you place a restriction on the `type` attribute, then layout changer options are shown as disabled and users cannot use them to change the page layout. For more information, see Chapter 24, "Modifying Default Security Behavior of Composer Components."
Appearance Attributes			
text	String	Yes	Specifies the text to be displayed for the Change Layout menu. Use the `text` attribute to provide a descriptive label for the `Layout Customizable` component so that the component is clearly visible on the page at runtime. For example: `text="Change Layout"`

Table B–3 (Cont.) Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
accessKey	Char	Yes	A character used to gain quick access to this button. For accessibility reasons, this functionality is not supported in screen reader mode. If the same access key appears in multiple input fields in the same page of output, the rendering user agent cycles among the elements accessed by the similar keys. Note that user agents are inconsistent about dealing with two links having same access key, and so the cycling behavior is dependent on what the user agent provides. This attribute is sometimes referred to as the "mnemonic". The character specified by this attribute must exist in the `Text` attribute of this button instance. If it does not, the user receives no visual indication of the existence of the `accessKey`. The easiest, and most convenient way to specify both the text and the mnemonic together is to use `textAndAccessKey`. Note that the `accessKey` is triggered by browser-specific and platform-specific modifier keys. It even has browser-specific meaning. For example, Internet Explorer 7.0 sets focus when you press Alt+<accessKey>. Firefox 2.0 on some operating systems sets focus when you press Alt+Shift+<accessKey>. Firefox 2.0 on other operating systems set focus when you press Control+<accessKey>. Refer to your browser's documentation for how it treats accessKey.
showIcon	Boolean	Yes	Specifies whether the default **Change Layout** icon is visible or not. The default value is `true`.
showLayoutChanger	Boolean	Yes	Specifies whether the **Change Layout** icon or text must be displayed. The default value is `true`. When set to `true`, the runtime behavior of the layout changer is as follows: ■ Displayed in View mode. ■ Displayed in Edit mode. It is always displayed in Edit mode, even if the value of the `showLayoutChanger` attribute is `false`. ■ If there is a security or MDS restriction on the Layout Customizable component, then the layout changer is not displayed in View or Edit modes.

Table B–3 (Cont.) Attributes of the Layout Customizable Component

Attribute	Type	Supports EL?	Description
showTypes	String	Yes	Specifies the names of predefined layouts that must be displayed in the layout changer. Use this attribute to control the layout options displayed to users. You can provide a space-separated list of layout types. By default, all eight layouts are displayed when a user clicks the Change Layout icon or link.
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Behavior Attributes			
binding	`oracle.adf.view.page.editor.component.LayoutCustomizable`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`

Supported Facets

Table B–4 describes the facets provided for a `Layout Customizable` component.

Table B–4 Facets of the Layout Customizable Component

Name	Description
contentA	Prepopulated with a `Panel Customizable` component. This `Panel Customizable` contains content to be rendered in area A in the layouts shown in Table B–5.
contentB	Prepopulated with a `Panel Customizable` component. This `Panel Customizable` contains content to be rendered in area B in the layouts shown in Table B–5.
facetSeparator	Content to be rendered once between each facet.
separator	Content to be rendered once between each of the other children.

Predefined Layout Types

When you add a `Layout Customizable` component to the page, three child `Panel Cutsomizable` components are added by default; one direct child and two `Panel Customizables` in the two facets. However, you can replace the child `Panel Customizable` components with any container components of your choice. When you select the layout type, the components in these `Panel Customizables` are arranged according to the layout type chosen.

Table B–5 describes the eight layouts that you can apply to your page or an area of the page at design time. To easily describe how components are laid out, let us assume the following:

- The child `Panel Customizable` of `contentA` facet is called **A**.
- The child `Panel Customizable` of `contentB` facet is called **B**.
- The primary `Panel Customizable`, which is a direct child of the `Layout Customizable`, is called **C**.

Table B–5 Values for Type Attribute of Layout Customizable

Layout Type	Image Showing Content Arrangement
oneColumn	 **Note**: In a `oneColumn` layout, `A` and `B` are rendered only if they contain child components.
threeColumn	
threeColumnNarrow	
twoColumn	
twoColumnBottom	
twoColumnNarrowLeft	
twoColumnNarrowRight	
twoColumnTop	

B.1.4 Panel Customizable Component

Use the `Panel Customizable` component as a container for page content that can be customized at runtime. You can add content inside a `Panel Customizable` component at runtime using the Resource Catalog. When you add child `Show Detail Frame` components inside a `Panel Customizable`, the `Show Detail`

`Frame` components provide runtime customization options for arranging or deleting components on the page.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

Geometry Management

The `Panel Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. By setting the `layout` attribute on the `Panel Customizable` component to `stretch`, the child component can be stretched to the size of the `Panel Customizable`.

Table B–6 describes the attributes of a `Panel Customizable` component.

Table B–6 Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
halign	String	Yes	Specifies the horizontal alignment of child components. You can set horizontal alignment on child components only if the `Panel Customizable` component has a horizontal or vertical layout. Available values are `center`, `end`, `left`, `right`, and `start`. Default value is `start`.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
valign	String	Yes	Specifies the vertical alignment of child components. You can set vertical alignment on child components only if the `Panel Customizable` component has a horizontal layout. Available values are `baseline`, `bottom`, `middle`, and `top`. Default value is `top`.
shortDesc	String	Yes	Specifies a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent. For example, Firefox 2 truncates long tooltips.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
layout	String	Yes	Specifies how the children of the `Panel Customizable` must be laid out. Available options are `horizontal`, `vertical`, `scroll`, `stretch`, and `auto`. The default value is `vertical`. Depending on the value of the `layout` attribute, child components are laid out as follows: ■ If you select `vertical`, then the child components are displayed one below the other and can be moved either up or down within the layout. ■ If you select `horizontal`, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout. ■ If you select `scroll`, then the child components are displayed one below the other, with scroll bars displayed if content overflows. ■ If you select `stretch`, then the first child component is stretched to fill up available space in the `Panel Customizable` component. Subsequent child components are ignored. However, they are not removed from the page. The Add icons for adding new `Panel Customizable` components adjacent to the selected one are not enabled if you set `layout` to `stretch`. ■ If you select `auto`, the child component is stretched only if the `Panel Customizable` is stretched by its parent. If not, the content scrolls.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle` attribute's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Behavior Attributes			
allowAction	Boolean	Yes	Determines whether this component allows addition of child components, dragging and dropping `Show Detail Frame` components inside and from it, and rearranging child components at runtime. It also determines whether the Add Box icons (that enable users to add Box components adjacent to the component) must be rendered on the component. Available values are `none` and `all`. The default value is `all`. **Note:** You can also set this attribute while defining component security in the application's `adf-config.xml` file. For more information, see Section 24.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."
showEditAction	Boolean	Yes	While in Edit mode, in Design view, renders an **Edit** icon on the `Panel Customizable` header that enables users to edit component properties at runtime. Available values are `true` and `false`. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component.

Table B–6 (Cont.) Attributes of a Panel Customizable Component

Attribute	Type	Supports EL?	Description
showSplitAction	Boolean	Yes	In Design view of a page in Edit mode, renders the Add Box icons on the `Panel Customizable` header that enable users to add Box components above, below, to the left, or right of the selected component. Available values are `true` and `false`. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component. However, the Add Box icons are not displayed on the root `Panel Customizable` component. Although the default value for this attribute is `true`, the Add Box icons are not displayed on a component that is stretched.
showTabAction	Boolean	Yes	In Design view of a page in Edit mode, renders the Add a Tab Set or a Tab icon on the `Panel Customizable` header that enables users to add a tabs to the page. Available values are `true` and `false`. Default value is `false`. This is relevant only in a Composer-enabled page, that is, if the `Panel Customizable` component is nested within a `Page Customizable` component.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.PanelCustomizable`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

Supported Facets

The `Panel Customizable` component supports a `separator` facet, which can be used to render content once between each of its child components.

Disabling the Edit Option on a Panel Customizable Component

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all `Panel Customizable` or `Box` components that can be edited. To disable property editing on a specific `Panel Customizable` or `Box` component in Design view, you must set the `showEditAction` attribute on the component to `false` at design time. The **Edit** icon is no longer displayed on the

component in Design view. However, users can still select such a component in Source view and edit its properties.

B.1.5 Show Detail Frame Component

Add `Show Detail Frame` components inside `Panel Customizable` components to enable runtime customizations like move, minimize, restore, and delete of child components. You can move `Show Detail Frame` components only if they are added inside a `Panel Customizable` component.

Geometry Management

A `Show Detail Frame` component can be stretched by a parent layout component that stretches its children, for example, `Panel Customizable`.

A `Show Detail Frame` component stretches its child component to fill the height and width available to it. It is recommended that you add only one child component inside a `Show Detail Frame` component. However, if you have more than one child component, the first child component is stretched to the height and width of the `Show Detail Frame`'s content area and subsequent child components are ignored.

The resize handler at the lower right corner of a `Show Detail Frame` enables you to resize the component vertically. From then on, the `Show Detail Frame` cannot be stretched by its parent.

Table B–7 describes the attributes of a `Show Detail Frame` component.

Table B–7 Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
text	String	Yes	A title for the `Show Detail Frame` component. You can change the style of this text using the `headerStyle` attribute.

icon	String	Yes	If you decide to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

Appearance Attributes			
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.
background	String	Yes	Working with the skin CSS, provides a means of applying a different look and feel for this `Show Detail Frame` instance. Available values are `light`, `medium`, `dark`, and `coreDefault`. The default value is `medium`. The `coreDefault` value is similar to `medium`, but additionally it provides a rounded border for the container and renders a shadow. The background in this case would be similar to that of an ADF Faces `panelBox` component.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
displayHeader	Boolean	Yes	Indicates whether the header of the `Show Detail Frame` is displayed. The default value is `true`. If you choose to set `displayHeader` to `false` and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar displays only in Edit mode, if there are actions available on the component.
displayShadow	Boolean	Yes	Specifies whether a shadow is cast by the `Show Detail Frame` component. The default value is `false`.
expansionMode	String	Yes	The default state of the `Show Detail Frame`. Available values are `minimized` and `normal`. The default display mode is `normal`.
Actions Attributes			
displayActions	String	Yes	Specifies when seeded interactions are displayed. Available options are `onHover` and `always`. The default is `always`.
inheritGlobalActions	Boolean	Yes	This attribute is of significance if you add child custom action components, and the attribute specifies whether the global `action` value of a `custom action` must override the local value. The default value is `false`. For information about global custom actions, see Section 22.3.2.2, "Defining Custom Actions at the Global Level."
showMoveAction	String	Yes	Specifies whether the Move action is displayed in the Actions menu. Available values are `menu` and `none`. The default value is `menu`.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
showRemoveAction	String	Yes	Renders a **Remove** icon on the `Show Detail Frame` header. Clicking this icon removes the component from the page. Available values are `chrome` and `none`. The default value is `none`. Note: In page Edit mode, the Remove icon appears regardless of this setting, provided other restrictions have not been applied.
showResizer	String	Yes	Specifies whether a resize handle is displayed on the lower right corner of the `Show Detail Frame`. You can alter only the height of a `Show Detail Frame` while resizing it. Available values are `never` and `always`. The default value is `always`.
showMinimizeAction	String	Yes	Specifies whether the minimize action is displayed on the header. Available values are `chrome` and `none`. The default is `chrome`.
showEditAction	Boolean	Yes	While in Edit mode, in Design view, renders an **Edit** icon on the `Show Detail Frame` header that enables you to edit component properties at runtime. Default value is `true`. This is relevant only in a Composer-enabled page, that is, if the `Show Detail Frame` component is nested within a `Page Customizable` component.
Style Attributes			
contentStyle	String	Yes	The CSS style to apply to the `Show Detail Frame` content area. Manually enter any style in compliance with CSS version 2.0 or later. Th CSS styles in this attribute are commonly used to define the height and background color of the `Show Detail Frame`. For example, `height:200px; background-color:green;` **Note**: If the `Show Detail Frame` component is nested inside a `Panel Customizable` component with a horizontal layout, you must specify a width for the `Show Detail Frame` component to ensure that it is rendered in page View mode.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
headerStyle	String	Yes	The CSS style to apply to the `Show Detail Frame` title that is displayed on the header. Manually enter any style in compliance with CSS version 2.0 or later. Th CSS styles in this attribute are commonly used to define the font, size, and color of the title text.
Behavior Attributes			
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - "`::`" pop out of the component's naming container (or itself if the component is a naming container) and begin the search from there, "`:::`" pop out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	`javax.el.MethodExpression`	Yes	A method reference to a disclosure listener. A disclosure event is fired when the user expands or collapses the `Show Detail Frame` component.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
stretchContent	String	Yes	Specifies whether the `Show Detail Frame` stretches its child component. Available options are `true`, `false`, and `auto`. The default value is `true`. You can use the `stretchContent` attribute to stretch a child component that supports being stretched.For example, container components like `Panel Form Layout`, `Panel Customizable`, and `Show Detail Item` provide the capability to be stretched. If you select `true`, then the child component is stretched to the height and width of the `Show Detail Frame`'s content area. The default height of the `Show Detail Frame` is 200px. The height of the `Show Detail Frame` is defined using the `ContentStyle` attribute. If you select `auto`, the child component is stretched only if the `Show Detail Frame` is wrapped inside a component that stretches it. If not, `stretchContent` is set to `false`.
Advanced Attributes			
binding	`oracle.adf.view.page.editor.component.ShowDetailFrame`	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
attributeChangeListener	`javax.el.MethodExpression`	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change event might include the width of a column that supported client-side resizing.

Table B–7 (Cont.) Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
selectChild	String	Yes	Specifies whether runtime selection and customization are enabled on child components. This is relevant only in a Composer-enabled page, that is, if the `Show Detail Frame` component is nested within a `Page Customizable` component. Default value is `yes`. However, when you add a task flow as a child of the `Show Detail Frame` component, this attribute defaults to `no`. If you select `yes`, then child components can be selected and customized at runtime.
Other Attributes			
helpTopicID	String	Yes	Specifies a Help topic ID that is used to link to a custom Help topic from the component. To link to a Help topic from your `Show Detail Frame` component instance, you can either link to an HTML file that is stored directly in your application directory, or to a Help topic that is part of a JAR file.

Supported Facets

Table B–8 describes the facets available on a `Show Detail Frame` component.

Table B–8 Show Detail Frame Facets

Name	Description
titleBarAction	Used if an action is to be associated with title of the `Show Detail Frame` component. The component specified by the facet is rendered in place of the `Show Detail Frame`'s `text` attribute.
additionalActions	Used if some additional actions are to be added to the Actions menu available on the `Show Detail Frame` header. To ensure that the additional actions appear similar to other actions on the menu, use `Command Menu Item` components or a `Group` component with nested `Command Menu Item` components inside this facet.

Displaying Child Component Properties Along with Show Detail Frame Properties

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all `Show Detail Frame` components that can be edited. Clicking this icon invokes the Component Properties dialog in which users can edit the `Show Detail Frame`'s properties. If you want the Component Properties dialog to display the `Show Detail Frame`'s properties and its child component's properties, then you can use the custom attribute, `sdf_selection_rule`.

In JDeveloper, right-click the `Show Detail Frame` component and select **Insert inside cust:showDetailFrame**, **JSF core**, and then **Attribute**. In the Insert Attribute

dialog, specify `sdf_selection_rule` as the name and `sdf_for_edit_mode_only` as the value. In Source mode, this attribute appears as shown in the following example:

```
<cust:showDetailFrame text="showDetailFrame 1" id="sdf1">
  <f:attribute name="sdf_selection_rule" value="sdf_for_edit_mode_only"/>
</cust:showDetailFrame>
```

Disabling the Edit Option on a Show Detail Frame Component

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all `Show Detail Frame` components that can be edited. To disable property editing on a specific `Show Detail Frame` or `Movable Box` component in Design view, then you can do this by setting the `showEditAction` attribute on the component to `false` at design time. The **Edit** icon is no longer displayed on the component when you enter the Edit mode of the page at runtime. However, users can still select such a component in Source view and edit its properties.

B.1.6 Custom Action

Use `Custom Action` components to trigger navigational flow in a task flow when a region is included inside a `Show Detail Frame` component. You can define custom actions corresponding to the ADFc outcomes of the task flows. At runtime, these custom actions are displayed on the `Show Detail Frame` header as icons, menu options, or both. A `Custom Action` must always be defined as a child component of a `Show Detail Frame` and is useful only when the `Show Detail Frame` also contains a task flow as its child component.

You can add as many `Custom Action` components as there are ADFc outcomes in the task flow. If you add a `Custom Action` attribute without a corresponding ADFc outcome, or if the `action` attribute value does not match an ADFc outcome defined on the view that is currently being displayed by the task flow, then that action is not displayed at runtime.

Note: You can also define custom actions for `Show Detail Frame` components at the global level. For more information, see Section 22.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."

Table B–9 describes the attributes of a `Custom Action` component.

Table B–9 Attributes of a Custom Action Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ■ Must not be a zero-length String. ■ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
action	String	Yes	Specifies the action outcome defined for the task flow. The value of this attribute must match the relevant ADFc outcome in the task flow definition file.
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
text	String	Yes	Represents the text of the menu item link. This is applicable for a custom action rendered as a menu item link.
Appearance Attributes			

Table B–9 (Cont.) Attributes of a Custom Action Component

Attribute	Type	Supports EL?	Description
icon	String	Yes	For a custom action rendered as a toolbar link, specifies the icon to be rendered on the chrome. For a custom action rendered as a menu item link, this represents the icon to be displayed against the menu item text. This attribute supports these various types of URIs: ■ absolute - an absolute path to the image, like `"http://oracleimg.com/admin/images/ocom/hp/oralogo_small.gif"` ■ relative - a path located relatively to the source page, like `"bullet.jpg"` ■ context relative - a path relatively based on the web application's context root, like `"/images/error.png"` ■ server relative - a path relatively based on the web server by application name, like `"//adf-richclient-demo-context-root/images/error.png"` As icon does not allow alternative text to be provided for the image, in order to create an accessible product an icon must only be used when its use is purely decorative.
shortDesc	String	Yes	Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window. This is applicable only for a custom action rendered as a toolbar icon.
location	String	Yes	Determines whether the custom action is rendered as a toolbar icon or a menu item link. Available values are `chrome`, `menu`, or `both`. Default value is `chrome`.
Other Attributes			
actionComponent	String	Yes	Specifies the ID of the command component that must be queued for the action event. When the `actionComponent` attribute is specified, the `Show Detail Frame` component queues the action event on this component. For more information, see Section 22.3.2.3, "Configuring Custom Actions that Display Task Flow Views in a Separate Browser Window."

B.1.7 Show Property

Use the `Show Property` component to display an attribute or parameter in a custom property panel at runtime. Use one `Show Property` component for each attribute or parameter that you want to display to users at runtime.

For more information about the `Show Property` component, see Section 21.3.6, "How to Display Properties and Parameters in a Custom Property Panel."

Table B–10 describes the new attributes of a `Show Property` component.

Table B–10 Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
Common Attributes:			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`. The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.
attributeType	String	Yes	Specifies the property type. Supported values are `text`, `cbox`, `date`, `lov`.
value	String	Yes	Specifies the current value of the property. If the EL binding for the "value" points to a bean property with a getter but no setter, and this is an editable component, the component will be rendered in read-only mode.
label	String	Yes	Specifies the label of the component. If you want the label to appear above the control, use a `panelFormLayout`.
Data Attributes:			
selectItem			Specifies the list of values to be displayed if `attributeType` was set to `lov`. This attribute takes an EL value that returns the list of values dynamically.
Appearance Attributes:			

Table B–10 (Cont.) Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
columns	Int	Yes	Specifies the size of the text control specified by the number of characters shown. The number of columns is estimated based on the default font size of the browser.
rows	Int	Yes	Specifies the height of the text control specified by the number of characters shown. The default value is 1, which generates a one-row input field. The number of rows is estimated based on the default font size of the browser.
shortDesc	String	Yes	Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window. This is applicable only for a custom action rendered as a toolbar icon.
simple	Boolean	Yes	A boolean value that controls whether the component provides label support; when set to "true", the component will not display the label (these may be ignored: label, labelAndAccessKey, accessKey, showRequired, help facet) and may use simpler layout primitives. One of the usecases can be when the component is used in repeatable elements like in table, for-each etc., where label is not required.
unselectedLabel			Specifies the label for the option that represents a value of null, meaning nothing is selected. If `unselectedLabel` is not set and if the component does not have a selected value, then an option with an empty string as the label and value is rendered as the first option in the choice box (if there isn't an empty option already defined). Once an option has been successfully selected, and if `unselectedLabel` is not set, then the empty option will not be rendered.
Behavior Attributes:			
required	Boolean	Yes	Specifies whether a non-null, non-empty value must be entered. If `false`, validators will not be executed when the value is null or empty.
autoSubmit	Boolean	Yes	Specifies an attribute which if set to TRUE on a form element, the component will automatically submit when an appropriate action takes place (a click, text change, etc.). Since `autoSubmit` is a partial submit, also submitted and re-rendered are any other components with `partialTriggers` pointing to this component.

Table B–10 (Cont.) Attributes of a Show Property Component

Attribute	Type	Supports EL?	Description
disabled	Boolean	Yes	Specifies whether the property should be shown as disabled. This is useful if the `Show Property` component is inside an iterator whose model specifies that the property must be shown as disabled, for example, if an MDS restriction has been applied on the property.
valueChangeListener	javax.faces.el.MethodBinding	EL only	Specifies a method reference to a value change listener.
Advanced Attributes:			
binding	`oracle.adf.view.rich.component.fragment.UIXDeclarativeComponent`	Supports only EL	Specifies an EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
clientComponent	Boolean	Yes	Specifies whether a client-side component will be generated. A component may be generated whether or not this flag is set, but if client Javascript requires the component object, this must be set to true to guarantee the component's presence. Client component objects that are generated today by default may not be present in the future; setting this flag is the only way to guarantee a component's presence, and clients cannot rely on implicit behavior. However, there is a performance cost to setting this flag, so clients should avoid turning on client components unless absolutely necessary.
componentId			If you use the `Show Property` tag in Composer's property panel, `componentId` specifies the ID of the component for which the property must be rendered.
showELBuilder	Boolean	Yes	Specifies whether to display the EL builder for the property.
showResourceEditor	Boolean	Yes	Specifies whether to display the resource string editor for the property. However, this option is enabled only if you have configured resource string editing in the application and the property is of type String. For more information, see Section 22.12, "Configuring Runtime Resource String Editing."
taskFlowId	String	Yes	If `Show Property` is used to display task flow parameters, `taskFlowId` specifies the ID of the task flow.
taskFlowParam	String	Yes	If `Show Property` is used to display task flow parameters, `taskflowParam` specifies the task flow parameter that the input field must display.
validator	String	Yes	Specifies a method reference to a validator method.

Supported Facets

The `Show Property` component supports a `customLink` facet, which can be used to include a `Commamd Menu Item`. The `Command Menu Item` specified in this facet appears as a custom link in the dropdown next to the property field, along with Resource String editor and EL Builder.

B.2 Composer-Specific Files and Configurations

This section describes the various files that you can modify to extend Composer capabilities. While some files, for example the Composer extension file, `pe_ext.xml`, are entirely relevant to Composer only, others are ADF configuration files that can take entries for Composer-specific configurations.

This section includes the following topics:

- Section B.2.1, "pe_ext.xml"
- Section B.2.2, "adf-config.xml"
- Section B.2.3, "adf-settings.xml"
- Section B.2.4, "web.xml"

B.2.1 pe_ext.xml

You can create a `pe_ext.xml` file and add elements in it to register new Composer add-ons and custom property panels, selectively render panels, register event handlers, and define property filters. This file is not available by default when you add Oracle Components to a page. You can create this file in the `META-INF` directory in your `Portal` project; for example, in the *`APPLICATION_HOME`*`\Portal\src\META-INF` directory. This section describes the different elements of the Composer extension file schema and explain when you may want to use the schema elements.

> **Note:** In applications that use shared libraries with their own pe_ext.xml file, use the **`sequence`** element within the `pe-extension` tag to define the order of execution. Use `sequence="first"` to lay down default settings, and `sequence="last"` to load the file last and override settings defined by files loaded previously.

This section contains the following subsections:

- Section B.2.1.1, "addon-config"
- Section B.2.1.2, "property-panels"
- Section B.2.1.3, "lov-config"
- Section B.2.1.4, "event-handlers"
- Section B.2.1.5, "drop-handlers"
- Section B.2.1.6, "filter-config"
- Section B.2.1.7, "elbuilder-config"
- Section B.2.1.8, "selection-config"
- Section B.2.1.9, "Sample pe_ext.xml File"

B.2.1.1 addon-config

Use the `addon-config` element to include entries for new Composer add-ons and custom property panels. For example, to add a new **About** button to your page that invokes a panel displaying information about your application, you must first create a task flow containing the information and then register this task flow in the `pe_ext.xml` file. Composer add-ons declared inside the `addon-config` element are configured in the `adf-config.xml` file, whereas custom property panels declared within the `addon-config` element are configured within the `property-panels` element in the extension file itself.

For information about configuring add-ons in `adf-config.xml`, see Section B.2.2.2, "addon-panels." For information about configuring custom property panels using the `property-panels` element, see Section B.2.1.2, "property-panels."

Insert the `addon-config` element within the `pe-extension` tag. You can add only one `addon-config` element in the XML file. Within the `addon-config` element you can have a `panels` element to define add-ons.

panels

Use the `panels` element to register new add-ons or property panels in Composer. Add the `panels` element within the `addon-config` element. You can have only one `panels` element in an extension file, and all custom panels must be defined inside this element.

panel

Use `panel` elements to define individual add-ons and property panels to display to users. Within the `panels` element you can insert any number of individual `panel` elements that define the add-ons or property panels to be displayed in Composer. You must have one `panel` element for every add-on or property panel you want to display.

Table B–11 describes the attributes of the `panel` element.

Table B–11 panel Element Attributes

Attribute	Description
`name`	An identifier that is used while referencing the new add-on in `adf-config.xml`, or a property panel in the `property-panels` section. This must be unique in the application.
`title`	The title to display on the button used to invoke the task flow in Composer. You can use EL for this property to show a localized title. For custom property panels, the title to display on the new tab for that panel.
`icon`	The icon that appears next to the title on the button. This is optional.
`taskflow-id`	The ID of the task flow that defines the add-on or property panel.
`help-topic-id`	A help topic ID that links to a custom help topic from the add-on or property panel. This is optional.

When a `panel` element is deleted from the file, that add-on or property panel is not displayed on the page.

The following example shows how to use the `addon-config`, `panels`, and `panel` elements:

```
<addon-config>
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
           icon="adf/webcenter/images/about.gif"
           taskflow-id="/WEB-INF/about-fod.xml#about-fod"
    />
  </panels>
</addon-config>
```

For more information about add-ons, see Section 21.2, "Creating Composer Add-Ons."

Optionally, to register an event handler for a specific add-on panel, you can also add an `event-handlers` element inside a `panel` element, as shown in the following example:

```
<event-handlers>
  <event-handler event="close">
    oracle.fod.custom.TaskFlowEventHandler
  </event-handler>
</event-handlers>
```

The XML code is the same as for any generic event handler. For more information, see Section B.2.1.4, "event-handlers."

B.2.1.2 property-panels

Use the `property-panels` element to register custom property panels. Add the `property-panels` element within the `addon-config` element. For information about custom property panels, see Section 21.3, "Creating Custom Property Panels." You can have only one `property-panels` element in an extension file.

property-panel

Use the `property-panel` element to define a custom property panel to display for a particular component in Composer. Within the `property-panels` element you can insert any number of individual `property-panel` elements to define custom property panels to display as tabs in the Component Properties dialog. To specify the component or task flow for which you want to register a custom property panel, you must add a `component` or `taskflow-id` element respectively within the `property-panel`.

Table B–12 describes the `property-panel` element attributes.

Table B–12 property-panel Element Attributes

Attribute	Description
`name`	An identifier for the custom property panel you want to display in the Component Properties dialog.
`rendered`	Whether this panel is displayed to users in the Component Properties dialog. This can take an EL value.

component

Use the `component` element to specify the fully qualified class name of the component for which you are registering the custom property panel. You can have only one `component` inside a `property-panel` element.

taskflow-id

Use the `taskflow-id` element to specify the name of the task flow for which you are registering the custom property panel. You can have only one `taskflow-id` inside a `property-panel` element.

panel

Use the `panel` element to specify a custom property panel to display as a tab in the Component Properties or Page Properties dialog for the component. Within a `property-panel` element, you can have any number of `panel` elements. Table B–13 describes the attributes of a `panel` element.

Table B–13 panel Element Attributes

Attribute	Description
`name`	Name with which you declared the panel in the `addon-config` section.
`rendered`	Whether the custom property panel must be rendered or not.
`parameter`	Parameters to be passed to the implementing task flow. Takes an EL only and must return a `Map<String, String>`.

When a `panel` element is deleted from the file, that property panel is no longer displayed in the Component Properties dialog.

The following example shows how to register a custom property panel for a `Command Button` component:

```
<property-panels>
  <property-panel name="cmdbtn">
    <component>oracle.rich.CommandButton</component>
    <panel name="prop.panel.cmdbtn"/>
  </property-panel>
</property-panels>
```

The following example shows how to register a custom property panel for a task flow:

```
<property-panels>
  <property-panel name="dashboard">
    <taskflow-id>/WEB-INF/dashboard-taskflow#prop-panel</taskflow-id>
    <panel name="dashboard.prop-panel" />
  </property-panel>
</property-panels>
```

B.2.1.3 lov-config

Use the lov-config element to register a custom List of Values or picker for a task flow parameter. Add the `lov-config` element directly under the `pe-extension` tag. You can have only one `lov-config` element in an extension file. Within this element, you can add a `task-flow-definition` element for each task flow that you want to register for LOV usage. Add an `input-parameter-definition` for each parameter that provides an LOV. Use `enumeration` elements to list the LOV options for a parameter, as shown in the following example:

```
<lov-config>
  <task-flow-definition
taskflow-id="/WEB-INF/employee-details.xml#employee-details">
    <input-parameter-definition>
      <name>Designation</name>
        <enumeration>
```

```
            <item>
              <name>Accounts Manager</name>
              <value>Accounts Manager</value>
              <description>Accounts Manager</description>
            </item>
            <item>
              <name>Accounts Assistant</name>
              <value>Accounts Assistant</value>
              <description>Accounts Assistant</description>
            </item>
            <item>
              <name>Payroll Executive</name>
              <value>Payroll Executive</value>
              <description>Payroll Executive</description>
            </item>
            <item>
              <name>Senior Manager</name>
              <value>Senior Manager</value>
              <description>Senior Manager</description>
            </item>
          </enumeration>
      </input-parameter-definition>
    </task-flow-definition>
</lov-config>
```

For more information, see Section 21.5, "Configuring Custom LOVs or Pickers for Task Flow Parameters."

B.2.1.4 event-handlers

Use the `event-handlers` element to register handlers for events generated by Composer. Add the `event-handlers` element directly under the `pe-extension` tag. You can have only one `event-handlers` element under `pe-extension`.

Alternatively, to register an event handler for a specific Composer add-on panel, you can also add an `event-handlers` element inside a `panel` element under the `addon-config` section. For more information, see Section B.2.1.1, "addon-config."

event-handler

Use the `event-handler` element to register an event handler in Composer. Within `event-handlers` you can have any number of `event-handler` elements to register handlers for save, close, deletion, addition, and selection events. For example, if you have implemented the `processSave` method in a Java class called `SaveHandler` to perform a specific action when a Save event is invoked, then you can register that implementation in Composer by adding an `event-handler` entry in the `pe_ext.xml` file as follows:

```
<event-handlers>
  <event-handler event="save">view.SaveHandler</event-handler>
</event-handlers>
```

For information about configuring event handlers, see Section 21.6, "Configuring Event Handlers for Composer UI Events."

B.2.1.5 drop-handlers

Use the `drop-handlers` element to register drop handlers to handle addition of components to the page from the Resource Catalog. Add the `drop-handlers`

element directly under the pe-extension tag. You can have only one drop-handlers element in an extension file.

drop-handler

Use the drop-handler element to register a drop handler in Composer. Within drop-handlers you can have any number of drop-handler elements to register drop handlers that you created in the application. For example, if you created a drop handler called TestDropHandler to handle addition of XML components on the page, then you can register that implementation in Composer by adding a drop-handler entry in the pe_ext.xml file as follows:

```
<drop-handlers>
  <drop-handler>test.TestDropHandler</drop-handler>
</drop-handlers>
```

For more information, see Section 21.7, "Configuring Drop Handlers in the Resource Catalog."

B.2.1.6 filter-config

Use the filter-config element to define property filters for components that can be edited at runtime. For a selected component, the Component Properties dialog displays properties that can be edited. If you do not want to expose all properties for editing, you can filter specific properties so that they are not displayed in the Component Properties dialog. You can specify global-level filters to filter common attributes across all components, or you can define tag-level filters to filter properties for a particular component only.

Add the filter-config element directly under the pe-extension tag. You can have only one filter-config element in an extension file.

For information about property filters, see Section 21.8, "Defining Property Filters."

global-attribute-filter

Use the global-attribute-filter element to filter specific properties across all components. You can have only one global-attribute-filter element in the extension file. Within this element you can include any number of attribute elements to define property filters for components from different libraries.

taglib-filter

Use the taglib-filter element to define property filters for components within a particular library. You can include multiple taglib-filter elements to filter properties for components in different libraries. Within this element you can include tag elements for every component belonging to the library.

Table B–14 describes the attribute the taglib-filter element can take.

Table B–14 tag Element Attribute

Attribute	Description
namespace	Namespace of the tag library containing the component whose properties you want to filter.

tag

Use the tag element to specify a component whose properties you want to filter. You can include multiple tag elements within a taglib-filter element. Within this element you can include attribute elements for all properties you want to filter.

Table B–15 describes the attribute the `tag` element can take.

Table B–15 tag Element Attribute

Attribute	Description
`name`	Name of the component whose properties you want to filter, for example, `commandButton`, `portlet`.

attribute

Use the `attribute` element to specify a property to filter either across all components or for the specified component only. To define global-level filters, you must include `attribute` elements inside the `global-attribute-filter`. To define property filters for a particular component, you must include `attribute` elements inside the `taglib-filter` element.

Table B–16 describes the attributes the `attribute` element can take.

Table B–16 attribute Element Attributes

Attribute	Description
`name`	Name of the property you want to filter.
`filtered`	Whether the property must be filtered or not. Takes a value of `true` or `false`. To filter the property in a specific view, use the `view` attribute.
`label`	The label for the property in the UI. To retrieve localized strings or show a different label depending on the view, use EL.
`view`	(Optional) The view in which to show/hide this property. Takes a value of `design` or `source`.

The following example shows how you can define global and component-level property filters:

```
<filter-config>
   <global-attribute-filter>
    <attribute name="readOnly" filtered="false" label="Read Only"/>
    <attribute name="required" filtered="false" label="Mandatory"/>
    <attribute name="shortDesc" filtered="false" label="#{composerBundle.PNL_TB_
SHORTDESC}"/>
  </global-attribute-filter>

  <taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
    <tag name="goLink">
      <attribute name="accessKey" view="design"/>
      <attribute name="targetFrame" filtered="false" view="source"/>
      <attribute name="destination" filtered="false"
label="#{pageEditorPanelBean.layoutView ?  'Where do you want to surf?' :
'Destination'}"/>
    </tag>
    <tag name="inputText">
      <attribute name="all" view="design"/>
      <attribute name="label" label="Field Name" filtered="false" />
      <attribute name="readOnly" filtered="false" />
      <attribute name="required" filtered="false" />
      <attribute name="rendered" filtered="false" />
      <attribute name="wrap" filtered="false" />
    </tag>
  </taglib-filter>
```

```
</filter-config>
```

B.2.1.7 elbuilder-config

Use the `elbuilder-config` element to configure custom values for the expression builder. The expression builder invoked from Composer's Component Properties dialog enables users to specify EL values for component properties. Users can either select for a set of predefined values or enter an EL value in the text box. You can customize the expression builder to provide more options to users. For more information, see Section 21.4, "Extending the Expression Builder."

Add the `elbuilder-config` element directly under the `pe-extension` tag. You can have only one `elbuilder-config` element in an extension file.

selector

Use `selector` elements to define and include custom options, as shown in the following example:

```
<elbuilder-config>
  <!-- define selector -->
  <selector id="CustomELParameter">
    view.CustomELParameter
  </selector>

  <!-- include selector -->
  <selectors>
    <selector id="CustomELParameter"/>
  </selectors>
</elbuilder-config>
```

You can include many `selector` elements inside a `selectors` element.

B.2.1.8 selection-config

Use the `selection-config` element to to enable or disable direct select for specific components and define associated operations. To make a component selectable, you must define operations within this tag. For more information, see Section 21.11, "Enabling Direct Select in Design View."

Within the `<selection-config>` tag, you can configure selection globally using `<global-filter>` and by namespace and tag using `<selection-taglib-filter>`.

selection

The selection tag is used to enable or disable the associated direct select operations for a specific view. In the current release, direct select options can only be enabled/disabled for the Design view.

operation

Available operations are defined within `<operation>` tags under each specific component. The following elements are used to define operations:

- `name`: Defines the operation to be executed. (Use standard or custom operations.)
- `label` (optional): Overrides the operation name as the tab label in the popup window.
- `filtered`: Set to `false` to include the operation in the popup window.

```
<selection-config>
```

```
  <global-filter>
    <selection view="design" enabled="false"/>
  </global-filter>

  <selection-taglib-filter
   namespace="http://xmlns.oracle.com/adf/faces/customizable">
    <tag name="showDetailFrame">
      <selection view="design" enabled="true"/>
      <operation name="oracle.adf.pageeditor.pane.sdfprop"
                 label="SDF Change Property"
                 filtered="false"/>
    </tag>
  </selection-taglib-filter>
</selection-config>
```

B.2.1.9 Sample pe_ext.xml File

Example B–1 shows a sample `pe_ext.xml` file with different elements used to extend Composer capabilities.

Example B–1 Sample pe_ext.xml File

```
<pe-extension xmlns="http://xmlns.oracle.com/adf/pageeditor/extension">

<addon-config>
<!-- Composer add-on panels configuration -->
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
           icon="adf/webcenter/images/about.gif"
           taskflow-id="/WEB-INF/about-fod.xml#about-fod"/>
  </panels>

<!-- Composer property panels configuration -->
  <property-panels>
    <property-panel name="cmdbtn">
      <component>oracle.rich.CommandButton</component>
      <panel name="prop.panel.cmdbtn" />
    </property-panel>
  </property-panels>
</addon-config>

<Save event handler configuration -->
  <event-handlers>
    <event-handler event="save">view.SaveHandler</event-handler>
  </event-handlers>

<!-- Test drop handler configuration -->
  <drop-handlers>
    <drop-handler>test.TestDropHandler</drop-handler>
  </drop-handlers>

<!-- Property filter configuration. Properties defined here are not displayed in
Composer. -->
  <filter-config>
    <global-attribute-filter>
      <attribute name="accessKey" />
      <attribute name="attributeChangeListener" />
      <attribute name="autoSubmit" />
      <attribute name="binding" />
    </global-attribute-filter>
```

```
    <taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
      <tag name="commandButton">
        <attribute name="text" />
        <attribute name="icon" />
      </tag>
  </filter-config>
</pe-extension>
```

B.2.2 adf-config.xml

The `adf-config.xml` file specifies application-level settings that are usually determined at deployment and are often changed at runtime. This file is created when you create your application and is located in the `ADF META-INF` folder under `Descriptors` in the Application Resources panel. The following example shows the minimal `adf-config.xml` file created when you create a Framework application:

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="Application4-2138"/>
  </adf:adf-properties-child>
</adf-config>
```

When you add the `Page Customizable` component to a page, certain required configurations are added to the `adf-config.xml` file.

You must update the `adf-config.xml` file when you perform tasks such as registering new add-ons and custom property panels, selectively rendering add-ons, creating customization layers, enabling and disabling the Composer sandbox, creating custom Resource Catalogs, and disabling Source view. The following sections describe the various `adf-config.xml` elements used for Composer-specific configurations.

This section contains the following subsections:

- Section B.2.2.1, "page-editor-config"
- Section B.2.2.2, "addon-panels"
- Section B.2.2.3, "sandbox-namespaces"
- Section B.2.2.4, "session-options-factory"
- Section B.2.2.5, "enable-design-views"
- Section B.2.2.6, "allow-el and protect-el"
- Section B.2.2.7, "rcv-config"
- Section B.2.2.8, "customizableComponentsSecurity"
- Section B.2.2.9, "mds-config"
- Section B.2.2.10, "resource-string-editor"
- Section B.2.2.11, "enable-source-view"
- Section B.2.2.12, "enable-zoom"
- Section B.2.2.13, "persistent-change-manager"
- Section B.2.2.14, "taglib-config"
- Section B.2.2.15, "security-config"
- Section B.2.2.16, "Sample adf-config.xml File"

B.2.2.1 page-editor-config

Use the <pe:page-editor-config> element to include Composer-specific configurations such as add-on panel registration, sandbox configuration, resource string editor configuration, and so on. Add the <pe:page-editor-config> element within the adf-config tag as shown in the following example:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
. . .
  <pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
  </pe:page-editor-config>
</adf-config>
```

B.2.2.2 addon-panels

Use the <pe:addon-panels> element to register custom add-ons and property panels in Composer. Insert the <pe:addon-panels> element within <pe:page-editor-config>. You can have only one <pe:addon-panels> element in the file, however, within <pe:addon-panels> you can have any number of <pe:addon-panel> elements to register custom panels. For more information about Composer add-ons and property panels, see Section 21.2, "Creating Composer Add-Ons" and Section 21.3, "Creating Custom Property Panels."

addon-panel

Use a <pe:addon-panel> element to register an add-on in the adf-config.xml file. A <pe:addon-panel> element must only be included inside the <pe:addon-panels> element. You can have any number of <pe:addon-panel> elements to register custom panels. The following example shows how you can register a new add-on using these elements:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  <pe:addon-panels>
    <!-- Page Properties add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-settings" />

    <!-- Page Reset add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-reset" />

    <pe:addon-panel name="oracle.fod.custom.panel" />

  </pe:addon-panels>
  . . .
</pe:page-editor-config>
```

The <pe:addon-panel> element also supports the rendered attribute. This attribute can take an EL value and specifies whether the panel must be rendered in Composer or not.

When registering custom add-ons, you must also include entries for the default add-ons. If the default add-ons are not registered, then only your custom add-on is available in Composer.

The <pe:addon-panel> element supports the following parameters:

- **rendered**: Use to specify whether the add-on must be rendered or not. The rendered attribute can take true, false, or an EL value. Use this attribute to display an add-on conditionally based on specific criteria.

- **parameters**: Use to declaratively pass parameters to the add-on task flow. The `parameters` attribute takes an EL value as shown in the following example:

```
<pe:addon-panels>
  <pe:addon-panel
name="oracle.adf.pageeditor.addonpanels.customization-manager"
parameters="#{AppUtilBean.customizationManagerParams}"/>
    . . .
</pe:addon-panels>
```

  where `AppUtilBean` provides the logic to pass parameters to the add-on task flow.

B.2.2.3 sandbox-namespaces

Use the `<pe:sandbox-namespaces>` element to register namespaces for all metadata for which you want to enable sandbox creation at runtime. For more information about enabling sandbox creation, see Section 23.2.1, "How to Enable Composer Sandbox Creation."

Insert the `<pe:sandbox-namespaces>` element within the `<pe:page-editor-config>` element. The following example shows how to use the `sandbox-namespaces` element:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:sandbox-namespaces>
    <pe:namespace path="/pages"/>
    <pe:namespace path="/pageDefs"/>
  </pe:sandbox-namespaces>
</pe:page-editor-config>
```

B.2.2.4 session-options-factory

When creating customization layers in your application, use the `<pe:session-options-factory>` element to register the `ComposerSessionOptionsFactory` implementation with Composer. This class contains the logic to save customizations in different layers based on the specified criteria. For more information, see Section 23.3, "Adding Customization Layers to View and Edit Modes: Example."

The following example shows how to register a class named `AppsSessionOptionsFactoryImpl`:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .

<pe:session-options-factory>view.AppsSessionOptionsFactoryImpl</pe:session-options
-factory>
</pe:page-editor-config>
```

B.2.2.5 enable-design-views

To enable Composer direct select, you must first enable the select view. For more information on direct select functionality, see Section 21.11, "Enabling Direct Select in Design View." Add the `<pe:enable-design-views>` tag inside the `<pe:page-editor-config>` tag to define the available views. The possible values are:

- `select`: Makes the direct select view the only view.
- `add-content` (default): Makes the legacy view the only view.

- `all`: Displays a toggle button to switch between views.

By default the hot key to switch between views is Ctrl-Shift-S. To change or disable the hot key, add a `<pe:component-view-switch-key>` tag inside the `<pe:page-editor-config>` tag. For example:

```
<pe:component-view-switch-key>
  <pe:enabled>true</pe:enabled>
  <pe:key-sequence>ctrl shift l</pe:key-sequence>
</pe:component-view-switch-key>
```

B.2.2.6 allow-el and protect-el

You can configure Composer to disable EL or protect existing EL from overwrite. Use `<pe:allow-el>` to define whether or not EL can be run in application pages. The default is true. Use `<pe:protect-el>` to define whether or not EL in form elements can be edited. The default is false. For more information, see Section 21.4.2, "How to Protect Expression Language."

The following example disables EL:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:allow-el>false</pe:allow-el>
</pe:page-editor-config>
```

B.2.2.7 rcv-config

Use the `<rcv-config>` element to register custom Resource Catalogs with Composer and to register the `ResourceCatalogSelector` implementation when using multiple Resource Catalogs.

If you want to display a custom Resource Catalog to users in place of the default one, you must first create a catalog definition file with the required content and then register this catalog definition in the Composer extension file and `adf-config.xml` file. The custom Resource Catalog is then displayed when a user clicks an Add Content button on the page. For more information, see Section 16.2, "Creating a Custom Resource Catalog."

Insert the `<rcv-config>` element within the `adf-config` tag. The following example shows how you can use the `<rcv-config>` element to register a custom catalog called `users-catalog`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <default-catalog catalog-name="users-catalog"/>
  </rcv-config>
</adf-config>
```

You can also configure multiple Resource Catalogs with Composer so that different catalogs are displayed to different users depending on the specified criteria. When configuring multiple Resource Catalogs, use the `<rcv-config>` element with a `<catalog-selector>` element to register the `ResourceCatalogSelector` implementation, which contains the logic for selecting a Resource Catalog.

The following example shows how you can use the `<rcv-config>` element to register a `ResourceCatalogSelector` implementation called `CatalogSelector`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
```

```
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <catalog-selector class-name="webcenter.CatalogSelector"/>
    <default-catalog catalog-name="default-catalog"/>
  </rcv-config>
</adf-config>
```

B.2.2.8 customizableComponentsSecurity

Use the `<customizableComponentsSecurity>` element to apply restrictions on `Show Detail Frame` actions. Insert the `<customizableComponentsSecurity>` element within the `adf-config` tag.

Within the `<customizableComponentsSecurity>` element, you can specify the `<enableSecurity>`, `<actionsCategory>`, `<actions>`, and `<custom-actions>` elements.

enableSecurity

Use the `<enableSecurity>` element to override the security inheritance behavior on `Show Detail Frame` actions. This element can take a value of `true` or `false`. If set to `true`, then the ability for a user to modify a component is first determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If set to `false`, then all actions are available to users. A user's page permissions and actions configured in `adf-config.xml` are ignored.

actionsCategory

Use the `<actionsCategory>` element to apply restrictions on a group of `Show Detail Frame` actions simultaneously. Within the `<actionsCategory>` element, you can have `<actionCategory>` elements for the supported categories. For more information about action categories, see Section 24.5.2, "Defining Security at the Actions Category Level."

The following example shows how `actionsCategory` can be used:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <cust:enableSecurity value="true"/>

    <cust:actionsCategory>
      <cust:actionCategory name="personalizeActionsCategory" value="false"/>
      <cust:actionCategory name="editActionsCategory" value="true"/>
    </cust:actionsCategory>

    <cust:actions>
      . . .
    </cust:actions>

  </cust:customizableComponentsSecurity>
</adf-config>
```

actions

Use the <actions> element to apply restrictions on individual actions. Within each actions element, you can have <action> elements for all supported actions.

The following example shows how <actions> can be used:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <cust:enableSecurity value="true"/>

    <cust:actionsCategory>
      . . .
    </cust:actionsCategory>

    <cust:actions>
      <cust:action name="showMinimizeAction" value="true"/>
      <cust:action name="showMoveAction" value="false"/>
    </cust:actions>

  </cust:customizableComponentsSecurity>
<adf-config>
```

For more information about applying action-level restrictions, see Section 24.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."

custom-actions

Use the <custom-actions> element to define custom actions to display along with the other Show Detail Frame actions. You must add only one <custom-actions> element inside the customizableComponentsSecurity section. Within this you can add any number of <custom-action> elements to define individual custom actions.

> **Note:** Alternatively, you can add a <custom-actions> element inside an <adf-config-child> element instead of inside the <customizableComponentsSecurity> section.

For more information about custom actions, see Section 22.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."

B.2.2.9 mds-config

When defining type-level application customization restrictions on components, use the <mds-config> element to register a standalone XML file describing the restrictions to be applied on specific components. For information about applying type-level restrictions, see Section 24.1.1, "How to Define Type-Level Customization Policies."

Insert the <mds-config> element within the <adf-config> tag. You can add the <mds-config> element as follows:

```
<mds-config xmlns="http://xmlns.oracle.com/mds/config">
  <type-config>
    <standalone-definitions>
```

```
      <file>Directory_Name/standalone.xml</file>
    </standalone-definitions>
  </type-config>
</mds-config>
```

B.2.2.10 resource-string-editor

Use a <pe:resource-string-editor> element to enable resource string editing in your application. Insert the <pe:resource-string-editor> element within the <pe:page-editor-config> section, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:resource-string-editor>
    <pe:enabled>true</pe:enabled>
  </pe:resource-string-editor>
</pe:page-editor-config>
```

For more information, see Section 22.12, "Configuring Runtime Resource String Editing."

B.2.2.11 enable-source-view

Use the <pe:enable-source-view> element to enable or disable Source view in Composer. Insert the <pe:enable-source-view> element within the <pe:page-editor-config> section. Source view is enabled by default in Composer. You can disable it by setting <pe:enable-source-view> to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:enable-source-view>false</pe:enable-source-view>
</pe:page-editor-config>
```

For more information, see Section 22.8, "Disabling the Source View Menu for an Application."

B.2.2.12 enable-zoom

Use the <pe:enable-zoom> element to enable or disable the capability to zoom into task flows in Composer. Insert the <pe:enable-zoom> element within a <pe:source-view> tag in the <pe:page-editor-config> section. Task flow zoom is enabled by default in Composer. You can disable it by setting <pe:enable-zoom> to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:source-view>
    <pe:enable-zoom>false</pe:enable-zoom>
  </pe:source-view>
</pe:page-editor-config>
```

For more information, see Section 22.9, "Disabling Task Flow Zoom Capability."

B.2.2.13 persistent-change-manager

Use this to configure the change manager to be used for persisting changes made in Composer. Insert the <persistent-change-manager> element within the <adf-faces-config> section. You must set <persistent-change-manager> to

MDSDocumentChangeManager as follows if you want to persist application customizations to MDS:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
  <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMana
ger</persistent-change-manager-class>
  </persistent-change-manager>
. . .
</adf-faces-config>
```

For more information about change persistence in Composer, see Section 22.11, "Configuring the Persistence Change Manager."

For more information about the <persistent-change-manager> element, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

B.2.2.14 taglib-config

Use the <taglib-config> element to specify the component tags that must be persisted by default. This element is relevant only when you define change persistence using <persistent-change-manager> in your adf-config.xml file.

When you add Composer components to the page, the adf-config.xml file is populated with the <taglib-config> element containing a list of tags and attributes that must be persisted. You can add more elements and attributes to the default list.

For more information about this element, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

Insert the <taglib-config> element within the <adf-faces-config> section. The <taglib-config> element appears as shown in the following example:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
  . . .
  <taglib-config>
    <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
      <tag name="showDetailFrame">
        <persist-operations>all</persist-operations>
        <attribute name="expansionMode">
          <persist-changes>true</persist-changes>
        </attribute>
        <attribute name="contentStyle">
          <persist-changes>true</persist-changes>
        </attribute>
      </tag>
      <tag name="panelCustomizable">
        <persist-operations>all</persist-operations>
      </tag>
    </taglib>
  </taglib-config>
</adf-faces-config>
```

For more information, see Section 22.11, "Configuring the Persistence Change Manager."

B.2.2.15 security-config

Use this to override Composer-specific security configurations, specifically if you want to override the default security policies with application-level checks. Insert the

<pe:security-config> element inside the <pe:page-editor-config> section. Within the security-config element, you can define <pe:security-policies>, <pe:security-policy>, <pe:policy-class>, and <pe:task-flow-security> elements.

security-policies

Use this to encompass all the security policies and policy overrides for Composer. You can have only one <pe:security-policies> element under the <pe:page-editor-config> section.

security-policy

Use this to override an existing policy. Add one <pe:security-policy> element for each policy that you want to override.

The <pe:security-policy> element supports the name and override attributes, where name is used to specify a name with which to register the custom policy and override is used to specify the name of the default policy that you want to override.

policy-class

Use this to specify the name of the custom security policy.

task-flow-security

Use this element, along with the check-permission attribute, to enable Composer to check for a task flow's permissions so that only users with appropriate privileges are allowed to edit or customize the task flow at runtime.

For more information, see Section 24.6, "Implementing Task Flow Security."

B.2.2.16 Sample adf-config.xml File

Example B–2 shows a sample adf-config.xml file with Composer-specific configurations.

Example B–2 Sample adf-config.xml File with Composer-Specific Configurations

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="configfilesapp-7198"/>
  </adf:adf-properties-child>

  <mdsC:adf-mds-config version="11.1.1.000">
    <mds-config xmlns="http://xmlns.oracle.com/mds/config">
      <persistence-config>
        <metadata-namespaces>
          <namespace path="/oracle/adf/rc/metadata"
                     metadata-store-usage="WebCenterFileMetadataStore"/>
          <namespace path="/persdef/"
                     metadata-store-usage="WebCenterFileMetadataStore"/>

          <!-- Namespace definitions for Composer sandbox -->
          <!-- Your jspx customizations alone go here -->
          <namespace path="/pages"
metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
          </namespace>
```

```
          <!-- Your pagedef customizations alone go here -->
          <namespace path="/pageDefs"
metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
          </namespace>
        </metadata-namespaces>
        <metadata-store-usages>
          <metadata-store-usage id="WebCenterFileMetadataStore"
                                default-cust-store="true">
            <metadata-store
class-name="oracle.mds.dt.persistence.stores.file.SrcControlFileMetadataStore">
              <property name="metadata-path" value="../../mds"/>
            </metadata-store>
          </metadata-store-usage>
        </metadata-store-usages>
      </persistence-config>
      <cust-config>
        <match>

      <cust:actionCategory name="personalizeActionsCategory" value="false"/>
      <cust:actionCategory name="editActionsCategory" value="true"/>
    </cust:actionsCategory>
    <cust:actions>
      <cust:action name="showMinimizeAction" value="true"/>
      <cust:action name="showMoveAction" value="false"/>
    </cust:actions>
  </cust:customizableComponentsSecurity>

  <adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">

    <!-- Composer persistence change manager configuration -->
      <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMana
ger</persistent-change-manager-class>
      </persistent-change-manager>

    <!-- Composer default persistence configuration -->
    <taglib-config>
      <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
        <tag name="showDetailFrame">
          <persist-operations>all</persist-operations>
          <attribute name="expansionMode">
            <persist-changes>true</persist-changes>
          </attribute>
          <attribute name="contentStyle">
            <persist-changes>true</persist-changes>
          </attribute>
        </tag>
        <tag name="panelCustomizable">
          <persist-operations>all</persist-operations>
        </tag>
      </taglib>
    </taglib-config>
  </adf-faces-config>
</adf-config>
```

B.2.3 adf-settings.xml

The `adf-settings.xml` file, in addition to holding generic project- and library-level settings, can also be used to define custom actions on task flows. This section describes the `adf-settings.xml` configurations specific to Composer.

B.2.3.1 custComps-config

Use the `custComps-config` element to define custom actions on task flows consumed in the application. At runtime, the custom actions configurations in the application's `adf-config.xml` and `adf-settings.xml` files are picked up and appropriate actions are displayed on the `Show Detail Frame` component surrounding a task flow. For more information, see Section 22.3, "Enabling Custom Actions on a Task Flow."

Insert the `custComps-config` element within the `adf-settings` tag. Within the `custComps-config` element, you can specify the `customActions` element.

customActions

Use the `customActions` element in the `adf-settings.xml` file to define actions that you want to display on task flows. The custom actions defined here will be displayed along with the other actions on the surrounding `Show Detail Frame` component. You must add only one `customActions` element inside the `custComps-config` section. Within the `customActions` element you can add any number of `customAction` elements to define individual custom actions, as shown in the following example:

```
  <customActions>
   <customAction action="next" location="chrome"
                 rendered="true"
                 icon="/adf/webcenter/editheader_ena.png"
                 text="Next"

taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
                 shortDesc="next"/>
    <customAction action="prev" location="chrome"
                 rendered="true"
                 icon="/adf/webcenter/editheader_ena.png"
                 text="Previous"
 taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
                 shortDesc="prev"/>
  </customActions>
```

B.2.4 web.xml

The `web.xml` file is a Java EE standard descriptor that contains details about web applications. When you add a `Page Customizable` component to your page, the `web.xml` file available in the *`Application_Root`*`\`*`Project_Name`*`\public_html\WEB-INF` directory is updated to enable change persistence among other settings.

You must update `web.xml` further when creating an application that uses multiple customization layers and when enabling Composer sandbox. The following sections describe the `web.xml` configurations specific to Composer.

B.2.4.1 CHANGE_PERSISTENCE Context Parameter

The `CHANGE_PERSISTENCE` context parameter in the application's `web.xml` file specifies how application customizations are persisted. To enable changes in a

Composer-enabled page to be persisted in MDS, you must ensure that the `CHANGE_PERSISTENCE` context parameter is set to `ComposerChangeManager`, as shown in the following example:

```
<context-param>
  <param-name>org.apache.myfaces.trinidad.CHANGE_PERSISTENCE</param-name>

<param-value>oracle.adf.view.page.editor.change.ComposerChangeManager</param-value
>
</context-param>
```

This context parameter registers the `ChangeManager` class to be used to ensure persistence to MDS. This configuration happens automatically when you add a `Page Customizable` component to a page in a new Framework application. However, in an existing ADF application, this context parameter may be set to some other value, for example `session` or `oracle.adf.view.rich.change.FilteredPersistenceChangeManager`. Therefore, when you add Composer components to such an application, you must ensure that the `CHANGE_PERSISTENCE` parameter is set to `ComposerChangeManager`.

For more information, see Section 22.11, "Configuring the Persistence Change Manager."

B.2.4.2 WebCenterComposerFilter

Use `WebCenterComposerFilter` in the `web.xml` file to register Composer's `ComposerSessionOptionsFactory` with Oracle ADF for every HTTP request. The request is then handled depending on your implementation of `ComposerSessionOptionsFactory`. This filter can be defined as shown in the following example:

```
<filter-mapping>
<filter-name>WebCenterComposerFilter</filter-name>
  <url-pattern>/faces/*</url-pattern>
  <dispatcher>FORWARD</dispatcher>
  <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

You must use `WebCenterComposerFilter` if you are performing the following tasks:

- Creating customization layers. For information, see Section 23.3, "Adding Customization Layers to View and Edit Modes: Example."
- Enabling sandbox creation in Composer. For more information, see Section 23.2.1, "How to Enable Composer Sandbox Creation."

B.3 Composer Default Add-Ons and Property Panels

This section lists the add-ons and property panels available by default in Composer.

B.3.1 Default Add-Ons

This section lists the add-ons available in Composer and provides the names with which these add-ons are registered in the `adf-config.xml` file. It is useful to know these names as you will need them to enable or disable the display of the add-ons in your application.

- **Page Properties**

Used to edit page properties and create page parameters.

This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.page-settings` in the `adf-config.xml` file.

- **Reset Page**

  Used to reset page customizations.

  This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.page-reset` in the `adf-config.xml` file.

- **Customization Manager**

  Used to manage customizations made to pages and task flows.

  This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.customization-manager` in the `adf-config.xml` file.

The Page Properties and Reset Page add-ons are rendered by default. If you create custom add-ons in your application, while registering those add-ons in `adf-config.xml`, you must also include the entries for the default add-ons. Without these, the default add-ons are not displayed in Composer. For information about add-ons, see Section 21.2, "Creating Composer Add-Ons."

B.3.2 Default Property Panels

This section lists the property panels available by default in the Component Properties and Page Properties dialogs and provides the names with which these panels are registered in the `pe_ext.xml` file. These names are useful if you choose to override the default panels with custom property panels, or hide some or all of the default panels. You can also enable specific panels for display in Composer Design view; for details, see Section 21.11, "Enabling Direct Select in Design View."

For information about creating property panels, see Section 21.3, "Creating Custom Property Panels."

- **Display Options**

  Used to define display-related behavior of a component. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.generic-property-inspector`.

- **Display Options (Show Detail Frame)**

  Used to define display-related behavior of a `Show Detail Frame` component. This panel is displayed in the Component Properties dialog for a `Show Detail Frame` component only.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.sdfprop`.

- **Tabs**

  Used to define the display properties and order of tabs on a `Panel Customizable` or `Box` component. This panel is displayed in the Component Properties dialog for a `Panel Tabbed` or `Panel Customizable` component. The panel is displayed for a `Panel Customizable` component only if the component has tabs on it.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.panel-tabbed`.

- **Style**

  Used to define the appearance of the component instance. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.inline-style-editor`.

- **Content Style**

  Used to define the appearance of content inside a component instance. This panel is displayed in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.content-style-editor`.

- **Events**

  Used to wire a contextual event to an action handler to enable the passing of values from a producer component to a consumer component when the event is triggered on the producer. This panel displays in the Component Properties dialog for all components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.events`.

- **Region Parameters**

  Used to define parameters for the task flow region. This panel displays in the Component Properties dialog only for task flow regions.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.region-param`.

- **Portlet Paramters**

  Used to define portlet parameters. This panel displays in the Component Properties dialog only for portlets.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.portlet-param`.

- **Layout Customizable**

  Used to define the layout for page components by selecting from a set of predefined layouts. This panel displays in the Component Properties dialog only for `Layout Customizable` components.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.layout-cust-prop`.

- **Child Components**

  Used to rearrange and show or hide child components inside a `Panel Customizable` component. This panel displays only for `Panel Customizable` components

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.child-navigator`.

- **Page Parameters**

  Used to define the page parameters that can be wired to components on the page. This panel displays in the Page Properties dialog.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-param`.

- **Page Security**

  Used to define page permissions. This panel displays in the Page Properties dialog for secured application pages.

  In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-sec`.

B.4 Composer Help Topic IDs

By default, context-sensitive help is not available for Composer panels and dialogs, and therefore Help icons are not displayed. These icons are displayed when you install a help provider and hook up help topics for the different panels and dialogs. Composer help topics are available in the `pages_cs.jar` file on the Oracle WebCenter Portal 11g Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

`http://webcenter.oracle.com`

To integrate this help with the Composer UI in your Framework application, a help provider must be available to the application. After creating a help provider, use the topic IDs in Table B–17 to hook up individual help topics.

Table B–17 Composer Runtime Help Topics

Topic ID to be Used	Corresponding Composer UI
pages_cs_ pgeditmodesv	Source view of a page in Edit mode
pages_cs_ pgeditmodedv	Design view of a page in Edit mode
pages_cs_cpparams	Parameters tab in the Component Properties dialog
pages_cs_ cpdisplayopts	Display Options tab in the Component Properties dialog
pages_cs_ cptabs.html	Tabs tab in the Component Properties dialog
pages_cs_cpstyle	Style tab in the Component Properties dialog
pages_cs_cpcontstyle	Content Style tab in the Component Properties dialog
pages_cs_othercss	Other CSS option on the Style tab in the Component Properties dialog
pages_cs_cpevents	Events tab in the Component Properties dialog
pages_cs_compcat	Resource Catalog
pages_cs_ppgen	Display Options tab in the Page Properties dialog
pages_cs_ppsecurity	Security tab in the Component Properties dialog
pages_cs_ pppgparams	Parameters tab in the Component Properties dialog
pages_cs_ cplayoutprops	Layout Customizable tab in the Component Properties dialog for a `Layout Customizable` component
pages_cs_ resourceeditor	Select text resource dialog invoked on selecting the Select Text Resource option on the menu next to a field in the Component Properties dialog

Creating and Registering a Help Provider

This section describes an example where the help topics are extracted to a folder in the application Web context root and then hooked up to the UI elements.

> **Note:** For detailed information about creating a help provider and displaying help for components, see the section, "Displaying Help for Components" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

To create and register a help provider:

1. Download the help JAR from OTN and extract the help files to a folder in your application, for example, `Web Content/help`.
2. Create a provider class, for example, `WebCenterHelpProvider`, with the following code:

```
package portal;

import javax.faces.component.UIComponent;
import javax.faces.context.FacesContext;

import oracle.adf.view.rich.help.ResourceBundleHelpProvider;

public class WebCenterHelpProvider extends ResourceBundleHelpProvider {
    public WebCenterHelpProvider() {
        super();
    }

    public String getExternalUrl(FacesContext context,
                                       UIComponent component,
                                       String topicId) {
      return "http://localhost:7101/help_test-Portal-context-root/help/" +
topicId+".html";
    }
}
```

3. Register the new help provider in the `adf-settings.xml` file as follows:

```
<adf-settings xmlns="http://xmlns.oracle.com/adf/settings">
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/settings">
  <help-provider prefix="pages_cs">
    <help-provider-class>
      portal.WebCenterHelpProvider
    </help-provider-class>
    <property>
      <property-name>baseName</property-name>

<value>oracle.adfinternal.view.page.editor.resource.ComposerBundle</value>
    </property>
  </help-provider>
</adf-faces-config>
</adf-settings>
```

4. Run a page in your application and verify that the help shows up correctly.

B.5 Composer Components Style-Specific Properties

This section includes a series of tables that describe the style selectors associated with Composer components. Additionally, it describes how to use the `background` property to choose one of three skin-defined looks for these components.

This section contains the following subsections:

- Section B.5.1, "Style Selectors for Composer Components"
- Section B.5.2, "Style Attributes"

B.5.1 Style Selectors for Composer Components

Use a style selector to describe an element's appearance by identifying the element and defining styles for it.

This section contains the following subsections:

- Global Style Selectors
- Composer Status Indicator Style Selectors
- Page Customizable Style Selectors
- Layout Customizable Style Selectors
- Panel Customizable Style Selectors
- Show Detail Frame Style Selectors

B.5.1.1 Global Style Selectors

Use global style selectors to define styles for multiple components within the application. Table B–18 lists and describes the global style selectors relevant to Composer components.

Table B–18 Global Style Selectors

Style Selector	Description
`.ComposerDark:alias`	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of *dark*.
`.ComposerLight:alias`	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of *light*.
`.ComposerBackground`	Specifies the color scheme for Composer dialogs, such as the Component Properties and Page Properties dialogs.

Table B–18 (Cont.) Global Style Selectors

Style Selector	Description
`.ComposerBorder`	Specifies the border, width, and so on for Composer dialogs, such as the Component Properties and Page Properties dialogs.
`.PEClickableImageAnchor:alias`	An alias for rendering a clickable icon in a table cell. Specifies the CSS properties needed to display an image which is clickable and which has inline-mode display. For example, you can specify this as a common property for all action icons on a `Show Detail Frame` header. By default, this alias is included in style selectors that use 16x16 images and have to display inline background-images for both IE and Firefox. To customize, you can include this alias in your selector and override its properties. For example, you can change font-size and padding-right for an image with different height and width, or you can set "display: block" with height, width attributes to display in block mode.
`.ChildPanelFacetWarning`	Specifies the style for the warning message displayed in the child navigator in the Component Properties dialog.

B.5.1.2 Composer Status Indicator Style Selectors

Use the style selectors in Table B–19 to skin the status indicator component in the Composer toolbar.

Table B–19 Status Indicator Style Selectors

Style Selector	Description
`af|statusIndicator.ComposerStatus`	Specifies the style for the status indicator component. You can use this to specify a fixed height for the status indicator.
`af|statusIndicator.ComposerStatus::idle-icon`	Specifies the icon that represents the idle state. This icon is generally a non-animated icon that indicates communication is NOT occurring with the server.
`af|statusIndicator.ComposerStatus::processing-icon`	Specifies the icon that represents the processing state. This icon is generally an animated icon that indicates communication IS occurring with the server.
`af|statusIndicator.ComposerStatus::connecting-icon`	Specifies the icon that displays when the Active Data Service is in the process of connecting. This icon is generally an animated icon.
`af|statusIndicator.ComposerStatus::connected-icon`	Specifies the icon that displays when the Active Data Service is in the connected state. This icon is generally a non-animated icon and may be the same as the idle state icon.
`af|statusIndicator.ComposerStatus::reconnecting-icon`	Specifies the icon that displays when the Active Data Service has lost connection and is attempting to reconnect. This icon is generally an animated icon.
`af|statusIndicator.ComposerStatus::disconnected-icon`	Specifies the icon that displays when the Active Data Service is in the disconnected state. This icon is generally a non-animated icon used to indicate that no further reconnection attempts will be made without use interaction.

B.5.1.3 Page Customizable Style Selectors

Use the style selectors in Table B–20 to skin `Page Customizable` components.

Table B–20 Page Customizable Style Selectors

Style Selector	Description
af|pageCustomizable	Specifies the default size of a `Page Customizable` component when not being stretched by its parent container.
af|pageCustomizable af|toolbox.ComposerToolbox	Specifies the style for the main dark gray toolbar displayed in Edit mode. This toolbar contains a message about the page being edited and the various buttons.
af|pageCustomizable af|toolbox.ComposerToolbox af|panelGroupLayout.ComposerConcurrency	Specifies the style for the concurrency toolbar that appears below the main Composer toolbar when two or more users are editing a page at the same time in the same customization layer.
af|pageCustomizable af|toolbox.ComposerToolbox af|toolbar af|pageCustomizable af|toolbox.ComposerToolbox af|toolbar::separator af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::row af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::last-row af|pageCustomizable af|toolbox.ComposerToolbox af|toolbox::body af|toolbox::row af|toolbox::leading-cell	Specifies the styles for the different areas in the toolbar.
af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton::text af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton:hover af|pageCustomizable af|toolbox.ComposerToolbox af|commandToolbarButton:depressed	Specify the styles for the Composer toolbar buttons such as Page Properties and Reset Page.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar::body af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar::body:rtl	Specifies the style for the body of the View menu on the toolbar.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item-text	Specifies the style for the text on the View menu.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item:highlighted	Specifies the style for the View menu when the mouse hovers over it.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item:depressed	Specifies the style for the View menu when it is clicked.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu::bar-item-open-icon-style	Specifies the style for the dropdown icon appearing on the View menu.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu:depressed af|menu::bar-item-open-icon-style	Specifies the style for the dropdown icon when it is clicked on the View menu.
af|pageCustomizable af|toolbox.ComposerToolbox af|menuBar af|menu:highlighted af|menu::bar-item-open-icon-style	Specifies the style for the dropdown icon when the mouse hovers over it.
af|pageCustomizable af|toolbar.SourceView	Specifies the style for the toolbar in Composer Source view.

Table B–20 (Cont.) Page Customizable Style Selectors

Style Selector	Description
af|pageCustomizable af|toolbar.SourceView af|menuBar	Specifies the style for the menubar in Source view.
af|dialog.ComposerDialog::content-start af|dialog.ComposerDialog::content-start:rtl af|dialog.ComposerDialog::content af|dialog.ComposerDialog::content:rtl af|dialog.ComposerDialog::content-end	Specify the styles for the dialogs invoked using Composer toolbar buttons. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|pageCustomizable af|breadCrumbs.ComposerBreadcrumbs af|pageCustomizable af|breadCrumbs.ComposerBreadcrumbsHidden:step	Specify the styles for Composer breadcrumbs.
af|pageCustomizable:edit af|panelGroupLayout.ComposerSplitHorz af|pageCustomizable:edit af|panelGroupLayout.ComposerSplitVert	Specifies the style for `Panel Customizable` components that are split horizontally or vertically. Typically, these selectors are used to specify the height in case of a horizontal split, or width in case of a vertical split.
af|pageCustomizable:edit, af|pageCustomizable:stretched	Specifies the style for the `Page Customizable` component in Edit mode. This selector ensures that in Edit mode, a `Page Customizable` always stretches. In View mode, it will flow if being flowed, or stretch if being stretched.
af|pageCustomizable:printable	Specifies the style for the `Page Customizable` in printable mode. It suppresses the height and width of the `Page Customizable`.
af|pageCustomizable af|panelGroupLayout.ComposerCutComp af|tree::node-stamp-text	Specifies the style for the dotted line border around components that are cut.

B.5.1.4 Layout Customizable Style Selectors

Use the style selectors in Table B–21 to skin `Layout Customizable` components.

Table B–21 Layout Customizable Style Selectors

Style Selector	Description
af|layoutCustomizable::menu:edit	Specifies the style for the **Change Layout** button in Edit mode.
af|layoutCustomizable::menu:edit af|commandImageLink::text af|layoutCustomizable::menu:edit af|commandImageLink::text:hover	Specify the styles for the text on the **Change Layout** button in Edit mode.
af|layoutCustomizable.AFStretchWidth	Specifies the width to which the component can stretch horizontally.

B.5.1.5 Panel Customizable Style Selectors

Use the style selectors listed in Table B–22 to skin `Panel Customizable` components.

Note: Some style selectors in Table B–22 have three color-scheme selections: *light*, *medium*, and *dark*. Using these you can define three distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

Table B–22 Panel Customizable Style Selectors

Style Selector	Description
`af|panelCustomizable`	Specifies the style for the root element of the component.
`af|panelCustomizable.PEStretched`	Specifies the style for the component, when it is stretched.
`af|panelCustomizable:edit`	Specifies the style for the container in Edit mode.
`af|panelCustomizable:edit:drop-target`	Specifies the style for this component when you drag another component on the page and hover over this component to drop it in.
`af|panelCustomizable::edit-mode-content-style`	Specifies the style for the area containing the Edit and Delete icons.

`af|panelCustomizable::add-icon-style`
`af|panelCustomizable::add-icon-style:active`
`af|panelCustomizable::add-icon-style:hover`
`af|panelCustomizable::add-icon-style:rtl`
	Specify the styles for the Add Content button on the component.

`af|panelCustomizable::edit-icon-style`
`af|panelCustomizable::edit-icon-style:active`
`af|panelCustomizable::edit-icon-style:hover`
	Specify the styles for the Edit icon on the component.

`af|panelCustomizable::delete-icon-style`
`af|panelCustomizable::delete-icon-style:active`
`af|panelCustomizable::delete-icon-style:hover`
	Specify the styles for the Delete icon on the component.

`.PanelCustomizableDropProxy`	Specifies the style for the placeholder area inside this component when you drag another component on the page and hover over this component to drop it in.

`af|panelCustomizable:edit:inline-selected`
`.p_AFActiveInlineEditableContainer`
`af|panelCustomizable:edit:hover-target`
	Specifies the styles for the components in the inline editable subtree in the `Panel Customizable` component.

`af|panelCustomizable::add-icon-link`
`af|panelCustomizable::add-icon-link:active`
`af|panelCustomizable::add-icon-link:hover`
	Specify the styles for the Add icon in the `Panel Customizable` component.

Table B–22 (Cont.) Panel Customizable Style Selectors

Style Selector	Description
af|panelCustomizable::addtab-icon-style af|panelCustomizable::addtab-icon-style:active af|panelCustomizable::addtab-icon-style:hover	Specify the styles for the Add Tab icon in the Panel Customizable component.
af|panelCustomizable::split-up-icon-style af|panelCustomizable::split-up-icon-style:active af|panelCustomizable::split-up-icon-style:hover af|panelCustomizable::split-down-icon-style af|panelCustomizable::split-down-icon-style:active af|panelCustomizable::split-down-icon-style:hover af|panelCustomizable::split-left-icon-style af|panelCustomizable::split-left-icon-style:active af|panelCustomizable::split-left-icon-style:hover af|panelCustomizable::split-right-icon-style af|panelCustomizable::split-right-icon-style:active af|panelCustomizable::split-right-icon-style:hover	Specify styles for the icons available on a Panel Customizable component to split it horizontally and vertically.
.PanelCustomizableDropProxy	Specifies the style for a component being dragged and dropped inside a Panel Customizable component.

B.5.1.6 Show Detail Frame Style Selectors

Use the style selectors listed in Table B–23 to skin portlets and Show Detail Frame components.

In Framework applications, each portlet is rendered with portlet *chrome* (for more information, see Section 58.1.1, "Portlet Anatomy"). The portlet chrome shares the same chrome rendering mechanism as a Show Detail Frame component. Thus, the style and icon selectors that apply to Show Detail Frame also apply to the portlet chrome. In other words, in addition to defining styles for Show Detail Frame components, use Show Detail Frame style and icon selectors to define styles for portlets.

Note: Some Show Detail Frame style selectors in Table B–23 have *light*, *medium*, *dark*, and *core:default* color scheme options. Using these you can define four distinct looks in your CSS and specify which one to use through the background property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's background property, the skin applies the relevant style.

Table B–23 Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame	Specifies the style for the root element of the component.
af|showDetailFrame::container:light af|showDetailFrame::container:medium af|showDetailFrame::container:dark af|showDetailFrame::container:core:default	Specify the styles for the element containing the contents within the component.
af|showDetailFrame.p_AFStretched	Specifies the style for the root element when the component is stretched.
af|showDetailFrame::content af|showDetailFrame::content:light af|showDetailFrame::content:medium af|showDetailFrame::content:dark af|showDetailFrame::content:core:default	Specify the styles to render for the content region of the component.
af|showDetailFrame::header af|showDetailFrame::header:light af|showDetailFrame::header:medium af|showDetailFrame::header:dark af|showDetailFrame::header:core:default	Specify the styles for the header element. This element surrounds the header text, icon, and actions regions.
af|showDetailFrame::header-center af|showDetailFrame::header-center:light af|showDetailFrame::header-center:medium af|showDetailFrame::header-center:dark af|showDetailFrame::header-center:core:default	Specify the styles for the region on the component header containing the icons, title, and actions menu.
af|showDetailFrame::header-start af|showDetailFrame::header-start:rtl af|showDetailFrame::header-start:light af|showDetailFrame::header-start:light:rtl af|showDetailFrame::header-start:medium af|showDetailFrame::header-start:medium:rtl af|showDetailFrame::header-start:dark af|showDetailFrame::header-start:dark:rtl af|showDetailFrame::header-start:core:default af|showDetailFrame::header-start:core:default:rtl	Specify the styles for the small cap-like area at the start of the header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::header-end af|showDetailFrame::header-end:rtl af|showDetailFrame::header-end:light af|showDetailFrame::header-end:light:rtl af|showDetailFrame::header-end:medium af|showDetailFrame::header-end:medium:rtl af|showDetailFrame::header-end:dark af|showDetailFrame::header-end:dark:rtl af|showDetailFrame::header-end:core:default af|showDetailFrame::header-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.

Table B–23 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::footer-start af|showDetailFrame::footer-start:rtl af|showDetailFrame::footer-start:light af|showDetailFrame::footer-start:light:rtl af|showDetailFrame::footer-start:medium af|showDetailFrame::footer-start:medium:rtl af|showDetailFrame::footer-start:dark af|showDetailFrame::footer-start:dark:rtl af|showDetailFrame::footer-start:core:default af|showDetailFrame::footer-start:core:default:rtl	Specify the styles for the small cap-like area at the start of the footer. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::footer-center af|showDetailFrame::footer-center:light af|showDetailFrame::footer-center:medium af|showDetailFrame::footer-center:dark af|showDetailFrame::footer-center:core:default	Specify the styles for the central region of the `Show Detail Frame` component's footer element.
af|showDetailFrame::footer-end af|showDetailFrame::footer-end:rtl af|showDetailFrame::footer-end:light af|showDetailFrame::footer-end:light:rtl af|showDetailFrame::footer-end:medium af|showDetailFrame::footer-end:medium:rtl af|showDetailFrame::footer-end:dark af|showDetailFrame::footer-end:dark:rtl af|showDetailFrame::footer-end:core:default af|showDetailFrame::footer-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the footer. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::shadowbox af|showDetailFrame::shadowbox:rtl af|showDetailFrame::shadowbox_div1 af|showDetailFrame::shadowbox_div1:rtl af|showDetailFrame::shadowbox_div2 af|showDetailFrame::shadowbox_div2:rtl	Specify styles for the shadow cast by the `Show Detail Frame` component.
af|showDetailFrame::toolbar af|showDetailFrame::toolbar:rtl	Specifies the styles for a floating toolbar on the `Show Detail Frame` component.
af|showDetailFrame::icon-style	Specifies the style for the icon on the `Show Detail Frame` header, if the `icon` attribute is set on the component.
af|showDetailFrame::header-text af|showDetailFrame::header-text:rtl	Specifies the style for the title available on the component header. Available alias is `:rtl`, which can be used when the component must be rendered right-to-left.
af|showDetailFrame::header-actions	Specifies the style for icons such as delete and the actions menu on the component header.
af|showDetailFrame::toolbar-container af|showDetailFrame::toolbar-container:light af|showDetailFrame::toolbar-container:medium af|showDetailFrame::toolbar-container:dark af|showDetailFrame::toolbar-container:core:default	Specify styles for the container element of the floating toolbar. Available aliases are `:light`, `:medium`, and `:dark`.

Table B–23 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::collapse-icon-style af|showDetailFrame::collapse-icon-style:active af|showDetailFrame::collapse-icon-style:hover af|showDetailFrame::collapse-icon-style.PEDisplayNone	Specify styles for the Collapse icon on the component header. Available aliases are `:active` and `:hover` that you can use to specify styles for the Collapse icon when clicked or when the mouse hovers over it. You can use `PEDisplayNone` to hide the Collapse icon.
af|showDetailFrame::disclose-icon-style af|showDetailFrame::disclose-icon-style:active af|showDetailFrame::disclose-icon-style:hover af|showDetailFrame::disclose-icon-style.PEDisplayNone	Specify the styles for the Disclose icon on the component header. You can use `PEDisplayNone` to hide the Disclose icon.
af|showDetailFrame::actionmenu-icon-style af|showDetailFrame::actionmenu-icon-style:active af|showDetailFrame::actionmenu-icon-style:hover	Specify the styles for the action menu icon. This style has a background-image that you can override.
af|showDetailFrame::remove-icon-style af|showDetailFrame::remove-icon-style:active af|showDetailFrame::remove-icon-style:hover	Specify the styles for the Delete icon.
af|showDetailFrame::edit-icon-style af|showDetailFrame::edit-icon-style:active af|showDetailFrame::edit-icon-style:hover	Specify the styles for the Edit icon.
af|showDetailFrame::preview-icon-style af|showDetailFrame::preview-icon-style:active af|showDetailFrame::preview-icon-style:hover	Specify styles for the Preview icon.
af|showDetailFrame::edit-mode-content-style af|showDetailFrame::edit-mode-content-style:light	Specify the styles for the area that contains the edit and remove icons.
af|showDetailFrame::edit-mode-edit-icon-style af|showDetailFrame::edit-mode-edit-icon-style:active af|showDetailFrame::edit-mode-edit-icon-style:hover	Specify the styles for the Edit icon on the component header in Edit mode.
af|showDetailFrame::edit-mode-remove-icon-style af|showDetailFrame::edit-mode-remove-icon-style:active af|showDetailFrame::edit-mode-remove-icon-style:hover	Specify the styles for the Delete icon on the component header in Edit mode.
af|showDetailFrame::edit-text-link af|showDetailFrame::edit-text-link:rtl af|showDetailFrame::edit-text-link:hover	Specify the styles for the Edit Text link in Edit mode when the component includes a Rich Text Editor component as a child.
af|showDetailFrame::resize af|showDetailFrame::resize:rtl	Specifies the style for the resize handler on the component. Available alias is `:rtl`, which can be used when component must be rendered right-to-left.

Table B–23 (Cont.) Show Detail Frame Style Selectors

Style Selector	Description
af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body > af|toolbox::row, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox > af|toolbox::body > af|toolbox::last-row, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input-container af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input, af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|richTextEditor::content-input-container af|showDetailFrame::content:medium.PEWrapsRTE af|showDetailFrame::content:light.PEWrapsRTE af|showDetailFrame::content.PEWrapsRTE > af|richTextEditor af|toolbox	Specify styles for the areas surrounding and inside a nested Rich Text Editor component. For example, to ensure that the background color of the Rich Text Editor component is transparent in Edit mode, or to provide borders around the component.
af|showDetailFrame::content.PEStretched	Specifies the height when the `Show Detail Frame` component stretches its content.
af|showDetailFrame::content.PEStretched:printable	Ensures that the `Show Detail Frame` does not restrict the height of its content in printable mode.
af|showDetailFrame::dynamic-help-icon-container af|showDetailFrame::dynamic-help-icon-container:rtl	Specifies the styles for the help icon container on the component header.
af|showDetailFrame::dynamic-help-icon-style af|showDetailFrame::dynamic-help-icon-style:active af|showDetailFrame::dynamic-help-icon-style:hover	Specify the styles for the help icon on the component header.
.PEShowDetailFrameAnimIcon	Specifies the animation icon to be used to show busy status on the component, for example, when you expand it.
.PEIconAndTextInHeading:alias .PEIconAndTextInHeading:alias:rtl	Specify the styles for rendering an icon with text in the component header.

B.5.2 Style Attributes

Table B–24 provides a quick reference for the style attributes available for WebCenter Portal Customizable Components and Composer components through the JDeveloper Property Inspector. Note that portlets also use these style attributes.

For detailed information about style properties, see the CSS Specifications page at:

http://www.w3.org/TR/CSS21/

Table B–24 Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`background-color`	The background color of the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
`background-image`	The image that is displayed in the component background. Select to inherit from a parent component or to display no image, or click the Edit icon to select an image.
`background-repeat`	Specify whether and how the background image should repeat. Choose from: ■ `<none>`: Forgo repeating the image. ■ `no-repeat`: Forgo repeating the image. ■ `repeat`: Repeat the image to fill the container. ■ `repeat-x`: Repeat the image horizontally but not vertically. ■ `repeat-y`: Repeat the image vertically but not horizontally. ■ `inherit`: Inherit this setting from a parent component.
`border-color`	The color of the border that surrounds the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
`border-style`	The style of border to draw around the component. Choose from: ■ `<none>`: Apply no style to the border. ■ `none`: Do not display a border (use `border-style:none` on the `ContentStyle` property to turn off portlet borders. Using this attribute with `InlineStyle` does not turn off portlet borders.) ■ `hidden`: Hide the border. ■ `dotted`: Display the border as a line of dots. ■ `double`: Display the border as a double line. ■ `groove`: Display the border as a grooved line. ■ `ridge`: Display the border as a ridged line. ■ `inset`: Display the border as a concave line. ■ `outset`: Display the border as a convex line. ■ `dashed`: Display the border as a line of dashes. ■ `solid`: Display the border as a solid line. ■ `inherit`: Inherit the border style from a parent component.
`border-width`	The thickness of the component border. Select `thick`, `medium`, `thin`, or `inherit` to determine the thickness of the border or inherit border width from a parent component. Alternatively, click the Edit icon and define a thickness in your preferred unit of measurement.
`color`	The color of the component text. Select from a list, or click the Edit icon to select from a color palette.
`font-family`	The font family (such as Arial, Helvetica, or sans-serif) for the component text. Enter this value manually.

Table B–24 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
font-size	The size of component text. Choose from: ■ Choose Length: Specify an absolute value for the font-size in your preferred unit of measurement. ■ Choose Percentage: Specify font size as a percentage of the normal text size defined for the browser. ■ inherit: Inherit font size from a parent component. ■ large: Select the next size larger than the font associated with the parent component. ■ larger: Increase the font size to larger than the font associated with the parent component (larger is larger than large). ■ medium: Set the font size to the default font size of the parent component. ■ small: Set the font size to smaller than the default font size of the parent component. ■ smaller: Set the font size to smaller than the default font size of the parent component (smaller is smaller than small).
font-style	The font style of the component text. Choose from: ■ <none>: Apply no style to the font. ■ normal: The font is not italic. ■ italic: The font is italic. ■ oblique: The font is slanted to look italic, though the font family may not have a formal italic member. ■ inherit: Inherit font style from a parent component.
font-weight	The thickness of the component text. Choose from: ■ <none>: Specify no weight for the component text. ■ normal: Apply same weight as the parent component's default font weight. ■ bold: Set component text in bold. ■ bolder: Set component text darker than bold. ■ light: Set component text lighter than normal. ■ lighter: Set component text lighter than light. ■ 100–900: Specify a value for text darkness—100 is lightest and 900 is darkest—400 is normal weight; 700 is bold. ■ inherit: Inherit font weight from a parent component.
height	The spacing to apply between lines of continuous text (also known as *leading*). Specify a height by choosing from: ■ Choose Length: Specify an absolute value in your preferred unit of measurement. ■ Choose Percentage: Specify a value as a percentage of the value set for a parent component. ■ auto: Set line height automatically, usually about 2 points larger than font size. ■ inherit: Inherit line height from the parent component.
list-style-image	An image to use as an indicator of a list item. Specify an image instead of defining a list-style-type. Choose from: ■ inherit: Inherit a list style image from a parent component. ■ none: Use no image as an indicator of a list item. Or click the Edit icon and select an image.

Table B–24 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`list-style-type`	The type of indicator to use for items on a list. Use this instead of specifying a image through `list-style-image`. Select from among many styles offered on the list, including `<none>`, which means the browser's default style is used, and `inherit`, which means the `list-style-type` is inherited from a parent component.
`margin`	The border of space surrounding the component content. Choose from: ■ `Choose Length`: Specify an absolute value for all margins. ■ `Choose Percentage`: Set a value as a percentage of the margin of a parent component. ■ `inherit`: Inherit margin value from a parent component. ■ `auto`: Set the value automatically according to browser defaults.
`padding`	The amount of space between the component and its margin or, if there is a border, between the component and its border. Choose from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify the value as a percentage of the padding set for a parent component. ■ `inherit`: Inherit the value from a parent component.
`text-align`	The horizontal alignment of the component text. Choose from: ■ `<none>`: Use browser default. ■ `left` ■ `right` ■ `center` ■ `justify`: Align text so that all lines start and end at the same point left and right. ■ `auto`: Apply a value automatically, either left or right. ■ `inherit`: Inherit alignment from a parent component.

Table B–24 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components

Attribute	Description
`text-decoration`	The decorative value to apply to component text. Choose from: ■ `<none>`: Use the browser default for hyperlinks; otherwise, no text decoration. ■ `none`: No text decoration, including no underscore for hyperlinks. ■ `underline`: Draw a line under all component text. ■ `overline`: Draw a line over all component text. ■ `line-through`: Draw a line through the middle of all component text. ■ `blink`: Make component text blink. ■ `inherit`: Inherit text decoration from a parent component.
`vertical-align`	The vertical alignment of component text. Choose from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify a value as a percentage of the value set for a parent component. ■ `inherit`: Inherit the value from a parent component. ■ `baseline`: Set the text on the baseline of the text row. ■ `middle`: Set the text in the middle of the text row. ■ `text-bottom`: Set the text on the bottom of the text row, lower than the baseline. ■ `text-top`: Set the text at the top of the text row, above the baseline. ■ `sub`: Set the text as subscript. ■ `super`: Set the text as superscript.
`width`	The spacing between text. Specify a width by choosing from: ■ `Choose Length`: Specify an absolute value in your preferred unit of measurement. ■ `Choose Percentage`: Specify a value as a percentage of the value set for a parent component. ■ `auto`: Set line height automatically, usually about 2 points larger than font size. ■ `inherit`: Inherit line height from the parent component.

B.6 Customizable Components (HTML) Properties

Customizable Components (HTML) are similar in function to customizable components from the 10.1.3.2.0 release and can be used to add more customizable components to your migrated 10.1.3.2.0 application page. These customizable components are available from the Customizable Components (HTML) tag library in JDeveloper. When you add customizable components to the page, default values are assigned to certain attributes and you can define values for the remaining attributes as required.

Customizable components enable users to minimize or maximize, hide or show, or move any component on the page at runtime.

Note: The Customizable Components (HTML) library is available only to support applications created in release 10.1.3.2.0. Adding these components to new applications is not supported.

It is recommended that you replace Customizable Components (HTML) in existing applications with their rich counterparts (from the Composer tag library) whenever possible.

B.6.1 Panel Customizable (HTML) Component

Use the `Panel Customizable (HTML)` component as a container for page content that can be customized at runtime. Components added inside a `Panel Customizable (HTML)` can be maximized, minimized, or rearranged.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components at design time, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

Table B–25 describes the attributes of a `Panel Customizable (HTML)` component.

Table B–25 Attributes of a Panel Customizable (HTML) Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.

Table B–25 (Cont.) Attributes of a Panel Customizable (HTML) Component

Attribute	Type	Supports EL?	Description
layout	List of values `horizontal/vertical`	Yes	Specifies how the children of the `Panel Customizable` (HTML) are laid out. The default value is `vertical`. Depending on the value of the layout attribute, child components are laid out as follows: If you select `vertical`, then the child components are displayed one below the other and can be moved either up or down within the layout. If you select `horizontal`, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout.
Style Attributes			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Advanced Attributes			
binding	String	Yes	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`

B.6.2 Show Detail Frame (HTML) Component

Add `Show Detail Frame (HTML)` components inside `Panel Customizable (HTML)` components to enable user customizations like maximizing, moving, minimizing, restoring, and deleting child components. You can perform these customizations only if you add `Show Detail Frame (HTML)` components inside `Panel Customizable (HTML)` components.

Table B–26 describes the attributes of a `Show Detail Frame (HTML)` component.

Table B–26 Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
Common Attributes			
id	String	No	The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML: ▪ Must not be a zero-length String. ▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_'). ▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').
rendered	Boolean	Yes	Specifies whether the component is rendered. When set to `false`, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client). The default value is `true`.
text	String	Yes	A title for the `Show Detail Frame` (HTML) component.

icon	String	Yes	If you want to add an icon on the header of the `Show Detail Frame` component, then this specifies the URI for the image to be used.
			For example:
			`icon="http://source-pc/images/accessability.gif"`
			Note: An image that is stored at the document root does not require a full path. For example:
			`icon="detail.gif"`

Appearance Attributes			

Table B–26 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the `shortDesc` is displayed in a note window.
background	List of values `light/medium/dark`	Yes	Working with the skin CSS, provides a means of applying a different look and feel for this `Show Detail Frame (HTML)` instance. The default value is `medium`.
displayHeader	Boolean	Yes	Indicates whether the header of the `Show Detail Frame` (HTML) is displayed. The default value is `true`. If you set `displayHeader` to `false` and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar is rendered only if there are actions available on the component. The toolbar display is also affected by the `isSeededInteractionAvailable` attribute. As the default value for `isSeededInteractionAvailable` is `false`, the toolbar is not displayed. It can be displayed by setting `isSeededInteractionAvailable` to `true`.
expansionMode	List of values `maximized/minimized/normal`	Yes	The default state of the `Show Detail Frame (HTML)`. The default display mode is `normal`.
Actions Attributes			
showMoveAction	List of values `menu/none`	Yes	Specifies whether the Move action is displayed in the Actions menu. The default value is `menu`.
showMinimizeAction	List of values `chrome/none`	Yes	Specifies whether the minimize action is displayed on the header. The default is `chrome`.

Table B–26 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
showMaximizeAction	List of values `menu/none`	Yes	Specifies whether the minimize action is displayed on the header. The default value is `menu`.
Style Attributes			
contentStyle	String	Yes	The CSS style to apply to the `Show Detail Frame (HTML)` content area. Manually enter any style in compliance with CSS version 2.0 or later.
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The `inlineStyle` is a set of CSS styles that are applied to the root DOM element of the component. If the `inlineStyle`'s CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like `::label` or `::icon-style`.
Behavior Attributes			
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - "`:`" pops out of the component's naming container (or itself if the component is a naming container) and begin the search from there, "`:::`" pops out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	`javax.el.MethodExpression`	Yes	A method reference to a disclosure listener. A disclosure event is fired when the disclosure state changes.

Table B–26 (Cont.) Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
Advanced Attributes			
binding	String	Yes	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean. For example: `binding="#{yourManagedBean.Binding}"`
attributeChangeListener	`javax.el.MethodExpression`	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change events might include the width of a column that supported client-side resizing.

The **Expression Builder** option available when setting these attributes enables you to bind the component instance to a managed bean property.

Show Detail Frame Facets

You can use the `Show Detail Frame (HTML)` facets to define and display custom actions on `Show Detail Frame (HTML)` components. Table B–27 describes the facets that enable you to display custom actions supported by the `Show Detail Frame (HTML)` component.

Table B–27 Show Detail Frame (HTML) Facets

Facet	Description
titleBarAction	Used if an action is to be associated with title of the `Show Detail Frame` (HTML) component.
additionalActions	Used if some additional actions are to be added to the list of actions available on the `Show Detail Frame (HTML)` header.

JDeveloper displays all facets available to the `Show Detail Frame (HTML)` component in the Structure window. However, only those that contain UI components appear activated.

B.6.3 Customizable Components (HTML) Style Selectors

The tables in this section describe the style selectors that you can use to skin WebCenter Portal Customizable Components.

This section contains the following subsections:

- Panel Customizable (HTML) Style Selectors

- Show Detail Frame (HTML) Style Selectors
- Property Keys
- Icon Selectors

B.6.3.1 Panel Customizable (HTML) Style Selectors

Use the style selectors listed in Table B–28 to skin `Panel Customizable (HTML)` components. For icon selectors relevant to the `Panel Customizable` component, see Section B.6.3.4, "Icon Selectors."

Table B–28 Panel Customizable (HTML) Style Selectors

Style Selector	Description
`afh|panelCustomizable::no-header-content`	Specifies the style to render for all four component borders when the component header is turned off.

B.6.3.2 Show Detail Frame (HTML) Style Selectors

Use the style selectors listed in Table B–29 to skin the `Show Detail Frame (HTML)` components.

> **Note:** In addition to defining styles for `Show Detail Frame` components, the `Show Detail Frame` style and icon selectors define styles for portlets.

Table B–29 Show Detail Frame (HTML) Style Selectors

Style Selector	Description

`afh|showDetailFrame::header-top-border-light`
`afh|showDetailFrame::header-top-border-medium`
`afh|showDetailFrame::header-top-border-dark`
	Specifies the style for the top and bottom border of a component header and, also the header background color.

`afh|showDetailFrame::container`	Specifies the style for the component's container.

`afh|showDetailFrame::header-light`
`afh|showDetailFrame::header-medium`
`afh|showDetailFrame::header-dark`
	Specifies the style for text in the component's header. The header is usually a banner of color that contains a title and links to menus and other types of actions.
	Define the header background color with the `af|showDetailFrame::header-top-border-[light,medium,dark]` style element. Use icon selectors to specify the icons to use in the component header and, also the shape of the header's left and right sides.

`afh|showDetailFrame::content-light`
`afh|showDetailFrame::content-medium`
`afh|showDetailFrame::content-dar`
	Specifies the style for the component's left, right, and bottom borders.

`afh|showDetailFrame::main-menu-container`	Specifies the style for the component's main menu container.
`afh|showDetailFrame::sub-menu-container`	Specifies the style for the component's submenu container.
`afh|showDetailFrame::menu-item`	Specifies the style for an individual item on the component's main menu.
`afh|showDetailFrame::menu-item:hover`	Specifies the style to render when the mouse hovers over a component main menu item.
`afh|showDetailFrame::sub-menu-item`	Specifies the style for an individual item on the component's submenu.

Table B–29 (Cont.) Show Detail Frame (HTML) Style Selectors

Style Selector	Description
`afh|showDetailFrame::sub-menu-item:hover`	Specifies the style to render when the mouse hovers over a component submenu item.
`afh|showDetailFrame::actions-image-separator`	Specifies the amount of padding to provide around the component's Actions, Minimize, and Restore icons. For more information, see also Section B.6.3.4, "Icon Selectors".
`afh|showDetailFrame::menu-item-separator`	Specifies the style for the line that separates a command or groups of commands on the component's Actions menu. In the default case, a separator appears to be a single thick line. This is achieved using `border-top` and `border-bottom` elements to style the separator. A user who creates a custom skin can style the separator differently. For example, a user can create a separator that displays as a rectangular bar with a colorful background.
`A.afh|showDetailFrame::title-clickable`	Specifies the style to render for the component's title when the title is a link.

`afh|showDetailFrame::no-header-content`
`afh|showDetailFrame::no-header-content-light`
`afh|showDetailFrame::no-header-content-medium`
`afh|showDetailFrame::no-header-content-dark`
	Specifies the style to render for all four component borders when the component header is turned off.

B.6.3.3 Property Keys

Use property keys to control the display of custom menu items and component action icons. Though you include property keys in your custom skin, they are not represented in the generated CSS that results from the skin.

To explain, skins go through a process that results in a generated CSS. In turn, the generated CSS is consumed by the application. Most style selectors for `Panel Customizable` and `Show Detail Frame` components are represented in the generated CSS. Property keys are the exception. Although they affect the application as much as any other component style selector, they are not represented in the final generated CSS.

Table B–30 lists and describes property keys relevant to `Panel Customizable` and `Show Detail Frame` components.

Table B–30 Property Keys of Panel Customizable and Show Detail Frame Components

Property Key	Description
`showDetailFrame {-ora-additional-actions-position-last:true}`	Positions additional actions relative to seeded actions on the component's Actions menu. Set to `false` to position additional actions before seeded actions. By default, additional actions are positioned after seeded actions. The default value is `true`.
`showDetailFrame {-ora-menu-icon-display:false}`	Controls the display of icons next to their related commands on a `Show Detail Frame` Actions menu. Set to `true` to display icons to the left of each action on the Actions menu. By default, no icons are displayed to the left of individual actions. The default value is `false`. For information about specifying the icons to use when this property key is set to `true`, see Section B.6.3.4, "Icon Selectors."

B.6.3.4 Icon Selectors

Icons are either displayed or not displayed depending on whether the component's `ora-menu-icon-display` property key is set to `true` or `false`. Property keys are described in Section B.6.3.3, "Property Keys."

Each icon selector has a *light*, *medium*, and *dark* scheme. Using these you can define three distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

For easy, error-free portability, store all application icons under the Framework application's root folder.

The selectors described in Table B–31 apply to the icons used with `Panel Customizable (HTML)` and `Show Detail Frame (HTML)` components.

Table B–31 Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ActionsIcon:alias showDetailFrame::medium-ActionsIcon:alias showDetailFrame::dark-ActionsIcon:alias **panelCustomizable** panelCustomizable::light-ActionsIcon:alias panelCustomizable::medium-ActionsIcon:alias panelCustomizable::dark-ActionsIcon:alias	This icon represents the Actions menu. The Actions menu lists the actions a user can perform on the component. In a Framework application, the Actions icon is rendered on the right corner of the component header.
showDetailFrame showDetailFrame::light-MinimizeIcon:alias showDetailFrame::medium-MinimizeIcon:alias showDetailFrame::dark-MinimizeIcon:alias **panelCustomizable** panelCustomizable::light-MinimizeIcon:alias panelCustomizable::medium-MinimizeIcon:alias panelCustomizable::dark-MinimizeIcon:alias	This icon represents the Minimize option. Minimize collapses the view of the component like a window shade. In a Framework application, the Minimize icon is rendered on the left side of the component header. See also, showDetailFrame::light-ExpandIcon:alias.
showDetailFrame showDetailFrame::light-MaximizeIcon:alias showDetailFrame::medium-MaximizeIcon:alias showDetailFrame::dark-MaximizeIcon:alias	This is applicable only for the Show Detail Frame (HTML) component. The rich variant of this component does not support the maximize action. This icon represents the Maximize option, which expands the Show Detail Frame (HTML) component to the dimensions of the Panel Customizable (HTML) component that contains it. Where multiple Show Detail Frame (HTML) components display in the same container, these are displaced while the maximized Show Detail Frame (HTML) remains maximized. In a Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.
panelCustomizable panelCustomizable::light-MaximizeIcon:alias panelCustomizable::medium-MaximizeIcon:alias panelCustomizable::dark-MaximizeIcon:alias	This is applicable only for the Panel Customizable (HTML) component. The rich variant of this component does not provide any actions. This icon represents the Maximize option, which expands component display to the dimensions of the container. Where multiple components display in the same container, these are displaced by the maximized component. In a Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.
showDetailFrame showDetailFrame::light-RestoreIcon:alias showDetailFrame::medium-RestoreIcon:alias showDetailFrame::dark-RestoreIcon:alias **panelCustomizable** panelCustomizable::light-RestoreIcon:alias panelCustomizable::medium-RestoreIcon:alias panelCustomizable::dark-RestoreIcon:alias	This icon represents the Restore option, which restores maximized views to their default display modes. In a Framework application, the Restore icon is rendered to the left of the Restore command on the component's Actions menu.

Table B–31 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ExpandIcon:alias showDetailFrame::medium-ExpandIcon:alias showDetailFrame::dark-ExpandIcon:alias **panelCustomizable** panelCustomizable::light-ExpandIcon:alias panelCustomizable::medium-ExpandIcon:alias panelCustomizable::dark-ExpandIcon:alias	The Expand icon represents the action that expands a component that has been minimized. The Expand icon toggles with the Minimize icon. That is, when the component is minimized, the Expand icon is displayed; when the component is expanded, the Minimize icon is displayed. In a Framework application, the Expand icon is displayed on the left side of the component header.
showDetailFrame showDetailFrame::light-MoveIcon:alias showDetailFrame::medium-MoveIcon:alias showDetailFrame::dark-MoveIcon:alias **panelCustomizable** panelCustomizable::light-MoveIcon:alias panelCustomizable::medium-MoveIcon:alias panelCustomizable::dark-MoveIcon:alias	This icon represents the Move option, which enables rearrangement of a component's location in relation to the other components on the page. In a Framework application, the Move icon is displayed to the left of the Move command on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveLeftIcon:alias showDetailFrame::medium-MoveLeftIcon:alias showDetailFrame::dark-MoveLeftIcon:alias **panelCustomizable** panelCustomizable::light-MoveLeftIcon:alias panelCustomizable::medium-MoveLeftIcon:alias panelCustomizable::dark-MoveLeftIcon:alias	This icon represents the Move Left option on the component submenu. Move Left rearranges the component horizontally, one position closer to the left boundary of the page. For example, imagine three horizontally arranged components. You select Move Left on the right-most component. It becomes the middle component. In a Framework application, the Move Left icon is displayed to the left of the Move Left submenu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveRightIcon:alias showDetailFrame::medium-MoveRightIcon:alias showDetailFrame::dark-MoveRightIcon:alias **panelCustomizable** panelCustomizable::light-MoveRightIcon:alias panelCustomizable::medium-MoveRightIcon:alias panelCustomizable::dark-MoveRightIcon:alias	This icon represents the Move Right option on the component submenu. Move Right rearranges the component horizontally, one position closer to the right boundary of the page. For example, imagine three horizontally arranged components. You select Move Right on the left-most component. It becomes the middle component. In a Framework application, the Move Right icon is displayed to the left of the Move Right submenu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-MoveUpIcon:alias showDetailFrame::medium-MoveUpIcon:alias showDetailFrame::dark-MoveUpIcon:alias **panelCustomizable** panelCustomizable::light-MoveUpIcon:alias panelCustomizable::medium-MoveUpIcon:alias panelCustomizable::dark-MoveUpIcon:alias	This icon represents the Move Up option on the component submenu. Move Up rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Up on the middle component. It becomes the topmost component. In a Framework application, the Move Up icon is displayed to the left of the Move Up submenu item on the component's Actions menu.

Table B–31 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-MoveDownIcon:alias showDetailFrame::medium-MoveDownIcon:alias showDetailFrame::dark-MoveDownIcon:alias **panelCustomizable** panelCustomizable::light-MoveDownIcon:alias panelCustomizable::medium-MoveDownIcon:alias panelCustomizable::dark-MoveDownIcon:alias	This icon represents the Move Down option on the component submenu. Move Down rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Down on the middle component. It becomes the bottommost component. In a Framework application, the Move Down icon is displayed to the left of the Move Down submenu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-HeaderLeftIcon:alias showDetailFrame::medium-HeaderLeftIcon:alias showDetailFrame::dark-HeaderLeftIcon:alias **panelCustomizable** panelCustomizable::light-HeaderLeftIcon:alias panelCustomizable::medium-HeaderLeftIcon:alias panelCustomizable::dark-HeaderLeftIcon:alias	This icon provides an image for the top-left corner of the component header.
showDetailFrame showDetailFrame::light-HeaderRightIcon:alias showDetailFrame::medium-HeaderRightIcon:alias showDetailFrame::dark-HeaderRightIcon:alias **panelCustomizable** panelCustomizable::light-HeaderRightIcon:alias panelCustomizable::medium-HeaderRightIcon:alias panelCustomizable::dark-HeaderRightIcon:alias	This icon provides the image for the top-right corner of the component header.
showDetailFrame showDetailFrame::light-ToolbarLeftIcon:alias showDetailFrame::medium-ToolbarLeftIcon:alias showDetailFrame::dark-ToolbarLeftIcon:alias **panelCustomizable** panelCustomizable::light-ToolbarLeftIcon:alias panelCustomizable::medium-ToolbarLeftIcon:alias panelCustomizable::dark-ToolbarLeftIcon:alias	This icon provides the left portion of the component's FadeIn-FadeOut toolbar. The FadeIn-FadeOut toolbar comes into play when the `adfp:portlet` tag attribute `isSeededInteractionAvailable` is set to `true` and `displayHeader` is set to `false`. The toolbar contains the Actions menu that would otherwise be displayed on the header. To invoke the toolbar, users move their mouse over the component content area. If the page design is very simple, then the FadeIn-FadeOut toolbar may not display, even when `displayHeader` is set to `false` and `isSeededInteractionAvailable` is set to `true`.
showDetailFrame showDetailFrame::light-ToolbarRightIcon:alias showDetailFrame::medium-ToolbarRightIcon:alias showDetailFrame::dark-ToolbarRightIcon:alias **panelCustomizable** panelCustomizable::light-ToolbarRightIcon:alias panelCustomizable::medium-ToolbarRightIcon:alias panelCustomizable::dark-ToolbarRightIcon:alias	This icon provides the right portion of the component's FadeIn-FadeOut toolbar. See the description for `showDetailFrame::light-ToolbarLeftIcon:alias` for an explanation of the FadeIn-FadeOut toolbar.

Table B–31 (Cont.) Icon Selectors for WebCenter Portal Customizable Components

Selector	Description
showDetailFrame showDetailFrame::light-ToolbarCenterIcon:alias showDetailFrame::medium-ToolbarCenterIcon:alias showDetailFrame::dark-ToolbarCenterIcon:alias **panelCustomizable** panelCustomizable::light-ToolbarCenterIcon:alias panelCustomizable::medium-ToolbarCenterIcon:alias panelCustomizable::dark-ToolbarCenterIcon:alias	This icon provides the center portion of the component's FadeIn-FadeOut toolbar. See the description for `showDetailFrame::light-ToolbarLeftIcon:alias` for an explanation of the FadeIn-FadeOut toolbar.
showDetailFrame showDetailFrame::light-EditIcon:alias showDetailFrame::medium-EditIcon:alias showDetailFrame::dark-EditIcon:alias **panelCustomizable** panelCustomizable::light-EditIcon:alias panelCustomizable::medium-EditIcon:alias panelCustomizable::dark-EditIcon:alias	This icon represents the Edit option on the component menu. In a Framework application, the Edit icon is displayed to the left of the Edit menu item on the component's Actions menu.
showDetailFrame showDetailFrame::light-HelpIcon:alias showDetailFrame::medium-HelpIcon:alias showDetailFrame::dark-HelpIcon:alias **panelCustomizable** panelCustomizable::light-HelpIcon:alias panelCustomizable::medium-HelpIcon:alias panelCustomizable::dark-HelpIcon:alias	This icon represents the Help option on the component menu. In a Framework application, the Help icon is displayed to the left of the Help menu item on the component's Actions menu.

C

Resource Catalog Properties and Files

This appendix provides reference information about the configuration, location, and attributes of the default catalog definition file. This information is useful while performing the tasks described in Part III, "Customizing Your Application and Extending Customization Options".

For detailed information about Resource Catalogs, see Chapter 16, "Creating and Managing Resource Catalogs."

This appendix includes the following sections:

- Section C.1, "Configuration and Location of Catalog Definitions"
- Section C.2, "XML Schema"
- Section C.3, "Catalog Definition Attributes"
- Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog"

C.1 Configuration and Location of Catalog Definitions

The `rcv-config` section of your `adf-config.xml` file defines the name of the default catalog. The `rcv-config` element is not available by default in your application's `adf-config.xml` file. You must add it if you want to change the name of the default catalog or, if you have chosen to implement multiple catalogs, specify a catalog selector class.

```
<rcv:rcv-config>
  <rcv:catalog-selector class-name=""/>
  <rcv:default-catalog
catalog-name="/oracle/webcenter/portalapp/catalogs/default-catalog.xml"/>
</rcv:rcv-config>
```

The Resource Catalog service stores catalog definition files in MDS at the *`resource-catalog-root`* directory. The *`resource-catalog-root`* is defined as an MDS namespace, hence the exact location depends on your MDS configuration. The default *`resource-catalog-root`* is defined by the `default-scope` attribute in the `adf-rcs-config` element in your `adf-config.xml`. This attribute is set to "**`/`**" implying that a catalog ID is expressed as fully the qualified MDS path:

```
<rcs:adf-rcs-config>
  <rcs:rcs-config>
    <rcs:catalog-config default-scope="/"

default-registry="/oracle/webcenter/portalapp/catalogs/catalog-registry.xml"/>
    . . .
```

```
    <rcs:security-manager
class-name="oracle.webcenter.portalframework.genericsiteresources.internal.securit
y.CatalogSecurityManager"/>
  </rcs:rcs-config>
```

The `security-manager` element defines the security manager implementation.

C.2 XML Schema

Example C–1 provides the catalog definition XML schema for your reference.

Example C–1 XML Schema for Catalog Definition

```
<xsd:schema elementFormDefault="qualified"
            targetNamespace="http://xmlns.oracle.com/adf/rcs/catalog"
            xmlns:rcs="http://xmlns.oracle.com/adf/rcs/catalog"
            xmlns:md="http://xmlns.oracle.com/bali/xml/metadata"
            xmlns:mds="http://xmlns.oracle.com/mds"
            xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            xmlns:jaxb="http://java.sun.com/xml/ns/jaxb" jaxb:version="1.0">

  <xsd:annotation>
    <xsd:appinfo>
      <jaxb:schemaBindings>
        <jaxb:package name="oracle.adfinternal.rc.catalog.xml"/>
      </jaxb:schemaBindings>
    </xsd:appinfo>
  </xsd:annotation>

  <!-- declare all elements as top-level elements so they appear in the
       component palette pages generated by XMLEF -->

  <!-- IMPORTANT: catalogDefinition & navigationModel CANNOT share a common type
-->
  <!--            MDS cannot handle it. -->
  <xsd:element name="catalogDefinition" type="rcs:catalogDefinitionType">

  </xsd:complexType>

</xsd:schema>
```

C.3 Catalog Definition Attributes

The catalog definition schema provides a rich set of elements through which you can specify the structure and content of your Resource Catalogs.

This section contains the following subsections:

- Section C.3.1, "catalogDefinition"
- Section C.3.2, "folder"
- Section C.3.3, "url"
- Section C.3.4, "includeCatalog"
- Section C.3.5, "component"
- Section C.3.6, "customFolder"
- Section C.3.7, "customContent"
- Section C.3.8, "attributes"
- Section C.3.9, "attribute"
- Section C.3.10, "parameters"
- Section C.3.11, "schema"
- Section C.3.12, "resource"

For an example of creating a custom catalog definition file, see Section 16.2, "Creating a Custom Resource Catalog."

C.3.1 catalogDefinition

The `catalogDefinition` element defines the overall characteristics of the catalog, such as the location of translated strings.

Example C–2 illustrates the use of `catalogDefinition`.

Example C–2 Example of catalogDefinition

```
<catalogDefinition id="DefaultCatalog" visible="#{true}"
                   resourceBundle="portal.catalog.DefaultCatalogBundle"
                   definitionFilter="portal.catalog.DefaultCatalogFilter"
                   xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
```

Table C–1 describes the keywords of the `catalogDefinition` element. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Table C–1 catalogDefinition Keywords

Keyword	Description
`xmlns`	`http://xmlns.oracle.com/adf/rcs/catalog`
`id`	The identifier used when referring to this catalog definition.
visible	Whether the Resource Catalog must be available for selection at runtime. This attribute takes an EL value and can be used to conditionally display the catalog to specific users or groups. The default value is #{true}, which means that the catalog is displayed at all times.
`resourceBundle`	The name of the resource bundle to be used for obtaining translated attribute values, where `<attribute.... isKey="true"/>`. The `resourceBundle` attribute can also be used at lower levels in the document, such as on individual `attributes` elements. Refer to the XSD for further details.
`definitionFilter`	The fully qualified name of a Java class that implements the `oracle.adf.rc.spi.plugin.catalog.CatalogDefinitionFilter`. You can use a definition filter to dynamically exclude entries from a catalog at runtime. One common use of a definition filter is to provide different views of the same catalog to users with different roles. For example, WebCenter Portal: Spaces uses a definition filter to hide entries for services that the administrator has disabled.

A catalog can have `attributes`, such as title, subject, and description. For information about including `attributes`, see Section C.3.8, "attributes."

C.3.2 folder

The `folder` element defines a catalog folder, used to organize content in the catalog. Folders can contain any number of entries including other folders. You can mix different types of catalog elements in the same folder.

Folders can have `attributes` just like any other entry. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Example C–3 illustrates the use of the `folder` element.

Example C–3 Example of folder

```
<folder visible="#{true}" id="webDevFolder">
  <attributes>
    <attribute value="WEB_DEV_FOLDER.TITLE" attributeId="Title"
               isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.DESCRIPTION" attributeId="Description"
               isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.KEYWORDS" attributeId="Subject"
               isKey="true"/>
    <attribute value="/adf/webcenter/folderlayout_qualifier.png"
```

```
                isKey="false" attributeId="IconURI"/>
  </attributes>
  <contents/>
<folder>
```

Table C–2 describes the keywords of the `folder` element.

Table C–2 folder Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
`visible`	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.

Rather than adding the code to the catalog definition source, you may find it easier to add a folder in Design view of the catalog definition file. For more information, see Section 16.2.3.1, "Adding a Folder."

C.3.3 url

The `url` element is used to define the following types of links in a catalog:

- **Task Flow**: Link to a WebCenter Portal service task flow or a custom task flow created in Oracle JDeveloper.
- **Portlet**: Link to any registered portlet producer.
- **Content**: Link to a file or directory from an existing Content Repository connection.
- **Other**: Link to a custom component that you create by providing the XML code for that component.

Example C–4 illustrates the use of the `url` element.

Example C–4 Example of a url Resource

```
<url visible="#{true}"

factoryClass="oracle.webcenter.portalframework.sitestructure.rc.TaskFlowResourceFa
ctory"
     id="tagCloud"

url="taskflow://oracle/webcenter/tagging/controller/taskflows/tag-selection.xml#ta
g-selection">
  <attributes>
    <attribute value="TAG_CLOUD.TITLE" attributeId="Title" isKey="true"/>
    <attribute value="TAG_CLOUD.DESCRIPTION" attributeId="Description"
               isKey="true"/>
    <attribute value="TAG_CLOUD.KEYWORDS" attributeId="Subject"
               isKey="true"/>
    <attribute value="oracle.webcenter.tagging"
               attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
    <attribute value="/adf/webcenter/label_qualifier.png"
               attributeId="IconURI"/>
    <attribute value="height:211px" attributeId="attr.contentStyle"
               isKey="false"/>
```

```
  </attributes>
  <contents/>
</url>
```

Table C–3 describes the keywords for the `url` element.

Table C–3 url Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.
`factoryClass`	If you are adding a custom component, then specify the factory class of the component. For all other resource types, the `Factory Class` value is populated as soon as you select the type in Design mode. The factory classes for the available resource types are as follows: ■ Task flow: `oracle.webcenter.portalframework.sitestructure.rc.TaskFlowResourceFactory` ■ Portlet: `oracle.webcenter.portalframework.sitestructure.rc.PortletResourceFactory` ■ Content: `oracle.webcenter.content.model.rc.ContentUrlResourceFactory` ■ Data control: `oracle.webcenter.datacomposer.internal.adapter.datacontrol.DataControlContextFactory`
`URL`	The URL to access the resource. Different link types support different URL formats. For more information, see Table 16–1, " URL Format for the Different Resource Types".

Resource links can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a link in Design view of the catalog definition file. For more information, see Section 16.2.3.2, "Adding a Link."

C.3.4 includeCatalog

The `includeCatalog` element is used to include a reference to another catalog definition file.

Example C–5 illustrates the use of the `includeCatalog` element.

Example C–5 Example of a Nested Resource Catalog

```
<includeCatalog visible="#{true}" scope="/" id="users-catalog"

catalogId="/oracle/webcenter/portalapp/catalogs/users-catalog.xml">
 <attributes>
```

```
   <attribute value="catalog" isKey="false" attributeId="Title"/>
 </attributes>
</includeCatalog>
```

The `includeCatalog` element supports the same keywords as the `catalogDefinition` element. See Table C–1 for the keywords on the `includeCatalog` element.

A catalog can have `attributes`, such as title, subject, and description. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Rather than adding the code to the catalog definition source, you may find it easier to add a catalog in Design view of the catalog definition file. For more information, see Section 16.2.3.3, "Adding a Resource Catalog."

C.3.5 component

The `component` element is used to include a custom XML resource, such as a simple ADF Faces component or raw HTML, in the catalog. The `component` element must be located within the `contents` section. You can add multiple `component` in a catalog definition file.

The `component` element must contain a `parameters` element with a nested `parameter` element. Set the `id` for the `parameter` element to `xml`. Include the XML fragment inside this `parameter` element. To generate an ADF Faces ID for the component at runtime, set the ID on the component to `#` (hash symbol).

Example C–6 shows the code to add a `Box` component to the Resource Catalog.

Example C–6 Panel Customizable Component in the Catalog Definition File

```
<component id="pc" visible="#{true}"
           factoryClass="oracle.adf.rc.component.XmlComponentFactory">
  <attributes>
    <attribute attributeId="Title" value="BOX" isKey="true"/>
    <attribute attributeId="Description" value="BOX.DESCRIPTION"
               isKey="true"/>
    <attribute attributeId="Subject" value="BOX.KEYWORDS" isKey="true"/>
    <attribute attributeId="IconURI"
               value="/adf/webcenter/panelcustomizable_qualifier.png"/>
  </attributes>
<parameters>
  <parameter id="xml">&lt;cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
  </parameter>
</parameters>
  </parameters>
</component>
```

Table C–4 describes the keywords of the `component` element. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Table C–4 component Keywords

Keyword	Description
`id`	The unique identifier for the component in the catalog definition.

Table C–4 (Cont.) component Keywords

Keyword	Description
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is `#{true}`, which means that the resource is displayed in the catalog at all times
`factoryClass`	The name of a Java class that implements the `oracle.adf.rc.component.ComponentFactory` interface and generates a Resource Catalog item based on a set of parameters. Each `ComponentFactory` implementation defines the set of parameters it requires. For example, `XmlComponentFactory` requires a single parameter named `xml` and the value of the parameter is a block of XML representing a component or components that can be inserted into a page.

A custom component can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

You may find it easier to add a custom component in Design view of the catalog definition file. For more information, see Section 16.2.3.4, "Adding a Component."

C.3.6 customFolder

The `customFolder` element defines content generated using Resource Catalog adapters. This element renders a folder that is populated with content dynamically at runtime. The catalog displays the folder even if there are no resources inside it.

Example C–7 illustrates the use of the `customFolder` element to render task flows from the Analytics service.

Example C–7 Example of a customFolder Resource

```
<customFolder
factoryClass="oracle.webcenter.analytics.view.rc.ASServiceContextFactory"
id="analyticsServiceFolder" visible="#{true}">
         <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle">
            <attribute attributeId="Description" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.DESCRIPTION"/>
            <attribute attributeId="IconURI" isKey="false"
value="/adf/webcenter/folderanalytics_qualifier.png"/>
            <attribute attributeId="Subject" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.KEYWORDS"/>
            <attribute attributeId="WEBCENTER_SERVICE_ID" isKey="false"
value="oracle.webcenter.analytics"/>
            <attribute attributeId="attr.text" isKey="false" value="#{uib_o_w_s_r_
DefaultGroupSpaceCatalog['ANALYTICS_FOLDER.TITLE']}"/>
            <attribute attributeId="Title" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.TITLE"/>
         </attributes>
         <parameters/>
      </customFolder>
```

Table C–5 describes the keywords for the `customFolder` element.

Table C–5 customFolder Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.
factoryClass	The factory class of the service. See Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog" for information about the supported factory classes.

A custom folder can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a custom folder in Design view of the catalog definition file. For more information, see Section 16.2.3.5, "Adding a Custom Folder."

C.3.7 customContent

The `customContent` element defines content generated using Resource Catalog adapters. This element renders a folder that contains resources that are generated dynamically at runtime. Unlike the `customFolder` element, the `customContent` element renders a folder in the catalog only if the folder contains resources.

Example C–8 illustrates the use of the `customContent` element.

Example C–8 Example of a customContent Resource

```
<customContent
contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
               id="ensembleContentProvider" visible="true">
  <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

Table C–3 describes the keywords for the `customContent` element.

Table C–6 customContent Keywords

Keyword	Description
`id`	The unique identifier used when referring to this folder.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is #{true}, which means that the resource is displayed in the catalog at all times.
contentProviderClass	The fully qualified name of a class that implements the interface `oracle.adf.rc.spi.plugin.catalog.CustomContentProviderV2`.

A custom content provider can have attributes, such as title, subject, and description, and parameters. For more information, see Section C.3.8, "attributes" and Section C.3.10, "parameters."

Rather than adding the code to the catalog definition source, you may find it easier to add a custom content folder in Design view of the catalog definition file. For more information, see Section 16.2.3.6, "Adding a Custom Content Provider."

C.3.8 attributes

Entries in a Resource Catalog have associated attributes that describe the entry. Values for some attributes can be obtained directly from the resources or from the `name` and `description` attributes on each XML element in the catalog definition. However, these values may not always be appropriate for displaying to end users, and often they are not available in different languages. Attributes defined using the `attributes` element in the catalog definition let you override those available from other sources. In addition, these attributes can be defined in terms of a key to a resource bundle so the actual values displayed reflect the current user's locale.

Within the `attributes` element you can insert any number of individual `attribute` elements that define the attributes you want to apply to a Resource Catalog entry.

Example C–9 illustrates the use of the `attributes` element.

Example C–9 Example of attributes and attribute Elements

```
<attributes>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESCRIPTION" attributeId="Description"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
  isKey="true"/>
 <attribute value="oracle.webcenter.collab.announcement"
  attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

Table C–7 describes the keywords of the `attributes` element.

Table C–7 attributes Keywords

Keyword	Description
`resourceBundle`	The name of the resource bundle to be used for obtaining translated attribute values.

C.3.9 attribute

The `attribute` element defines an attribute for a Resource Catalog entry that corresponds to a descriptor in the `schema` element. For information about attributes, see Section C.3.8, "attributes." Composer uses the following attributes:

- Title
- Description
- Subject
- IconURI
- ToolTip

You should include at least a `Title` and `Description` attribute for each catalog entry. A `Subject` attribute is also highly recommended to facilitate keyword searching of the Resource Catalog. The `Title` attribute overrides the `name` attribute on the parent element and is used to declare a display name that is translated through a resource bundle. Similarly, the `Description` attribute overrides the `description` attribute on the parent element and is used to declare a description that is translated through a resource bundle.

You can declare your own attributes by including them in the `schema` element. For more information, see Section C.3.11, "schema."

Example C–10 illustrates the use of the `attribute` element.

Example C–10 Example of attributes and attribute Elements

```
<attributes>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESCRIPTION" attributeId="Description"
  isKey="true"/>
 <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
  isKey="true"/>
 <attribute value="oracle.webcenter.collab.announcement"
  attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

Table C–8 describes the keywords of the `attribute` element.

Table C–8 attribute Keywords

Keyword	Description
`attributeId`	The identifier of the attribute as declared in the `schema` element.
`value`	The value of the attribute.
`isKey`	A flag indicating whether the value is a literal value (`false`) or a key to a resource bundle (`true`). In most cases, attributes should be resource bundle keys and the values translated through a resource bundle. The resource bundle can be declared at the catalog level or on various lower level elements such as `attributes`.
`resourceBundle`	The name of the resource bundle to be used for obtaining translated attribute values.

For task flows included in your Resource Catalog, you can use the `attribute` element to pass task flow parameters and attributes of the enclosing `Show Detail Frame` component. You can do this by prefixing the `attributeId` values for the task flow parameters and `Show Detail Frame` attributes with **`parameter.`** and **`attr.`** respectively as shown in the following example:

```
<attributes>
  <attribute value="dark" attributeId="attr.background"
   isKey="false"/>
  <attribute value="#{myBean.myParam1}" attributeId="parameter.myParam1"
   isKey="false"/>
</attributes>
```

For more information, see Section 16.2.9, "How to Define Task Flow Parameters and Attributes of the Enclosing Show Detail Frames for Task Flows."

C.3.10 parameters

A few of the Resource Catalog components, such as links, custom components, and custom folders, support parameters. Parameters are used to provide the XML code for a custom component or bind the resource to other artifacts in the application. You can use the `parameters` element to define parameters on a resource. The `parameters` element must be included inside the tag for the resource. Each `parameters` element can have multiple `parameter` tags. You must provide an ID and a value for each parameter that you define.

When you define a parameter for a custom XML component, you must specify the parameter ID to be `xml` and the value is the code for the custom component. In the code, the component's ID must be `#` so that it is generated at runtime. In addition, you must specify the namespace for the component.

Example C–11 illustrates the use of the `parameters` element in a custom XML component definition.

Example C–11 Example of parameters and parameter Elements

```
<parameters>
  <parameter id="xml">&lt;cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
  </parameter>
</parameters>
```

C.3.11 schema

The `schema` element contains one or more `descriptor` elements. The `descriptor` elements provide the Resource Catalog service with information about the attributes used within the catalog, such as whether they are searchable. Out-of-the-box, the attributes Title, Description, Subject, ToolTip, and IconURI are supported for a resource. You can add other custom attributes that you want to expose on the resource.

Example C–12 illustrates the use of the `schema` element.

Example C–12 Example of schema

```
<schema resourceBundle="oracle.adf.rc.attribute.nls.AttributeBundle"
          xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
    <descriptor labelKey="TITLE.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Title"
                shortLabelKey="TITLE.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="DESCRIPTION.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Description"
                shortLabelKey="DESCRIPTION.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="SUBJECT.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="true" attributeId="Subject"
                shortLabelKey="SUBJECT.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="TOOL_TIP.PROMPT_KEY" endUserVisible="true"
                multivalue="false" searchable="false" attributeId="ToolTip"
                shortLabelKey="TOOL_TIP.SHORT_PROMPT_KEY"
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
    <descriptor labelKey="ICON_URI.PROMPT_KEY" endUserVisible="false"
                multivalue="false" searchable="false" attributeId="IconURI"
                shortLabelKey="ICON_URI.SHORT_PROMPT_KEY"
```

```
                xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
  </schema>
```

Table C–9 describes the keywords of the `descriptor` element.

Table C–9 descriptor Keywords

Keyword	Description
`attributeId`	The identifier of the attribute being described.
`searchable`	Indicates whether the attribute is included in Resource Catalog searches (`true`) or not (`false`).
`multivalue`	Indicates whether the attribute can have multiple values (`true`) or not (`false`).
`endUserVisible`	Indicates whether the attribute should be exposed to end users (`true`) or not (`false`).
`resourceBundle`	The name of the resource bundle used to translate the label keys.
`labelKey`	The resource bundle key for the attribute's label.
`shortLabelKey`	The resource bundle key for the attribute's short label.

C.3.12 resource

The `resource` element is used to declare an individual resource, such as a task flow, in the catalog. You would need to use this element if you are using a standalone version of Composer (that is, Composer without WebCenter Portal: Framework).

> **Note:** The `url` element, discussed in Section C.3.3, "url," also enables you to declare a resource in the catalog. However, `url` is available only if you have installed WebCenter Portal: Framework and have the associated shared libraries.

Example C–13 illustrates the use of the `resource` element.

Example C–13 Example of resource

```
<resource id="weatherTF"
      repository="application.classpath"
      path="TaskFlow.jar/ADF_
TaskFlow/oracle+composer+internal+test+weather-tfdefn.xml#weather_tf_defn"
      visible="#{true}">
  <attributes>
    <attribute value="/images/bulbgauge_ena.png" attributeId="IconURI"/>
    <attribute value="never" attributeId="attr.showResizer"/>
    <attribute value="Weather in Bangalore is rainy"
               attributeId="parameter.message"/>
    <attribute value="WeatherBee" isKey="false" attributeId="Title"/>
    <attribute value="Displays the weather of your city" isKey="false"
               attributeId="Description"/>
    <attribute value="Weather widget" isKey="false" attributeId="ToolTip"/>
  </attributes>
  <parameters/>
</resource>
```

Table C–10 describes the keywords of the `resource` element. For information about including `attributes` for elements, see Section C.3.8, "attributes."

Table C–10 resource Kaywords

Keyword	Description
`id`	The identifier for the element in the catalog. Identifiers are required and must be unique at the folder level.
`repository`	The path to access ADF libraries included in your classpath.

`path`	The path to the resource. For a task flow in an ADF Library, the path is of the following form:
	`path_to_jar/ADF_TaskFlow/task_flow_path`
	To obtain the `task_flow_path`, create a file system connection in Application Connections and navigate to the task flow in your ADF Library. The tooltip for the task flow shows the fully qualified ID of the task flow. Take this value and replace all occurrences of "/" with "+".
	For example:
	If the tooltip is:
	`oracle/webcenter/collab/announcement/view/taskflows/main-view-definition.xml#announcement-main-view`
	then `task_flow_path` would be:
	`oracle+webcenter+collab+announcement+view+taskflows+main-view-definition.xml#announcement-main-view`

C.4 Factory Classes Available for Adding Dynamic Resources to the Catalog

Resource Catalog adapters are used to add resources to a catalog dynamically, for example, a folder to display all available content repository connections to users. As the content of such a folder cannot be determined when you create the catalog, the adapter ensures that the folder is populated dynamically.

To use an adapter, you must specify the factory class as part of the resource definition while adding the resource. This section describes the supported factory classes. It includes the following sections:

- Section C.4.1, "XMLComponentFactory"
- Section C.4.2, "ContentUrlResourceFactory"
- Section C.4.3, "CustomFolderContextFactory"
- Section C.4.4, "DefaultFolderContextFactory"
- Section C.4.5, "ContentListFactory"
- Section C.4.6, "EnsembleContentProvider"

C.4.1 XMLComponentFactory

Use the `oracle.adf.rc.component.XmlComponentFactory` class inside a `<component>` construct to include an XML component in the catalog. The `XmlComponentFactory` class requires a single parameter named `xml` and the value of the parameter is a block of XML representing one or more components that can be added to a page. The following example shows the code to add a `Panel Customizable` component to the Resource Catalog:

```
<component id="pc" factoryClass="oracle.adf.rc.component.XmlComponentFactory">
```

```
  <attributes>
    <attribute attributeId="Title" value="Box"/>
    <attribute attributeId="Description" value="Container for other objects"/>
    <attribute attributeId="IconURI" value="/adf/webcenter/panelcustomizable_
qualifier.png"/>
  </attributes>
  <parameters>
    <parameter id="xml">
      <cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/>
    </parameter>
  </parameters>
</component>
```

For the detailed steps, see Section 16.2.3.4, "Adding a Component."

C.4.2 ContentUrlResourceFactory

The `ContentUrlResourceFactory` class is used to include portal framework content from UCM connections. It is used when you add a URL resource of type Content to the catalog. The following example shows how the `ContentUrlResourceFactory` class can be used:

```
<url id="contentItem"
     factoryClass="oracle.webcenter.content.model.rc.ContentUrlResourceFactory"
     url="content://UCM/PersonalSpaces/weblogic/content.xml">
<attributes>
  <attribute value="Personal Document" isKey="false" attributeId="Title"/>
</attributes>
<parameters>
  <parameter id="templateView">SpaceTemplate</parameter>
  </parameters>
</url>
```

where `id` is the unique identifier for the resource, and `url` is the URL to access the resource. The URL must begin with `content:` if you use `ContentUrlResourceFactory`. In addition, you can add a `templateView` parameter to specify the Content Presenter display template to be used.

For more information, see Section 16.2.3.2, "Adding a Link."

C.4.3 CustomFolderContextFactory

The `ContentFolderContextFactory` class is used to list all the Content Repository connections available to the application. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="AllConnections"

factoryClass="oracle.webcenter.content.model.rc.CustomFolderContextFactory" />
```

For more information about custom folders, see Section 16.2.3.5, "Adding a Custom Folder."

C.4.4 DefaultFolderContextFactory

In the WebCenter Portal: Spaces context, the `DefaultFolderContextFactory` class is used to render the folder for the current space. If the user is in the Home space, then

the user's personal folder is rendered. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="GroupDocuments"

factoryClass="oracle.webcenter.doclib.model.rc.DefaultFolderContextFactory" />
```

For more information about custom folders, see Section 16.2.3.5, "Adding a Custom Folder."

C.4.5 ContentListFactory

The `ContentListFactory` class is used to add a dynamic list of folders to the catalog. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="customFolder-folder" visible="#{true}" path=""
              factoryClass="oracle.webcenter.content.model.rc.ContentListFactory">
  <attributes>
    <attribute attributeId="Title" value="Folders List" isKey="false"/>
  </attributes>
  <parameters>
    <parameter id="datasource">UCM#dCollectionID:60</parameter>
    <parameter id="datasourceType">dsTypeFolderContents</parameter>
  </parameters>
 </customFolder>
```

The `ContentListFactory` class supports the following parameters:

- `datasource`: The data source of the content. The value depends on the value of `datasourceType`.
- `datasourceType`: The data source type of the content. Valid values are `dsTypeSingleNode`, `dsTypeFolderContents`, `dsTypeQueryExpression`, `dsTypeMultiNode`, and `dsTypeScenarioResults`.
- `templateView`: To specify the Content Presenter display template to be used.

For more information about using Content Presenter, see Chapter 31, "Adding Content Task Flows and Document Components to a Portal Page."

C.4.6 EnsembleContentProvider

The `EnsembleContentProvider` class is used to display a dynamic list of all registered pagelet producers. You can add a `customContent` resource to the catalog and specify this factory class, as shown in the following example:

```
<customContent
contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
               id="ensembleContentProvider" visible="true">
  <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

For more information about custom content providers, see Section 16.2.3.6, "Adding a Custom Content Provider."

D

Guidelines for Creating Task Flows to Be Used in Composer-Enabled Pages

Task flows are reusable building blocks in Oracle ADF. Oracle WebCenter Portal provides task flows for you, or you can build your own task flows and add them to your Framework application pages. When you add task flows to customizable pages (that is, Composer-enabled pages), users can personalize, customize, and edit these task flows at runtime. It is imperative that you design your task flows according to the rules set forth in Oracle WebCenter Portal publications. Failure to do so can result in problems when the task flows are consumed in portal pages, such as too much white space, too many scroll bars, or slow, jerky, and unpredictable responses when displaying large data sets.

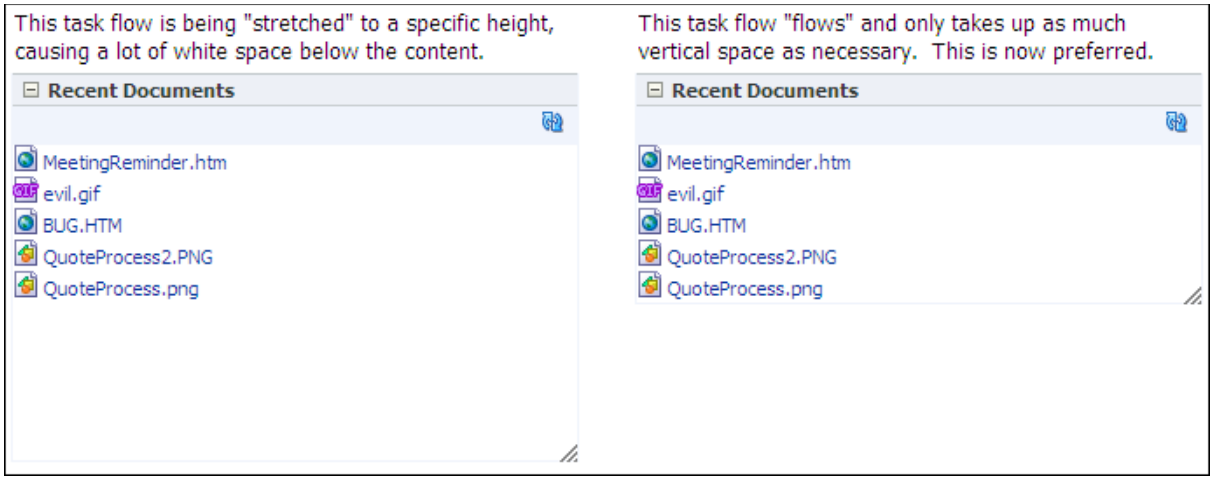
To prevent these issues and provide a consistent user experience in terms of look and feel, layout design, and interaction, follow the instructions in this document for:

- Creating highly performant, cost-effective task flows
- Consuming these task flows effectively in your application by implementing task flow parameters and customization and personalization options

This appendix contains the following topics:

- Section D.1, "Guidelines for Effective Geometry Management and Pagination"
- Section D.2, "Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options"
- Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines"
- Section D.4, "Conclusion"

D.1 Guidelines for Effective Geometry Management and Pagination



Effective geometry management results in efficient sizing and placement of task flows on the page. If the task flows are not designed properly, you end up with pages that have a slow response time or lots of unnecessary scroll bars or white spaces between components. For example, if you include a task flow containing very little data inside a container that stretches it (for example, a `Show Detail Frame` component), there is a lot of white space below the data in the task flow. Poor design can also cause scrolling to be slow and unpredictable in a task flow with a table displaying a large amount of data. To avoid such issues, be sure to design your task flows so that they flow and use a conventional pagination model when displaying large data sets.

Follow the guidelines in this section when designing new task flows for Framework applications. Also, be sure to adhere to these guidelines when you edit existing Framework application task flows.

D.1.1 Guideline 1: Create Task Flows that Flow

To avoid unnecessary white spaces in your task flows, you must ensure that the task flow content flows and is not stretched by the task flow container. A *stretching* task flow is one that is stretched to the height of the container, whereas a *flowing* task flow is one whose height is determined by its content, rather than by a stretching container or by itself having a fixed height. A flowing task flow with a small amount of data is shorter than one with large amounts of data, as shown in Figure D–1.

Figure D–1 Difference Between a Task Flow that Stretches and One that Flows

To design a flowing task flow, you must ensure that:

- The child component of the task flow does not have a fixed height.
- The `Show Detail Frame` component surrounding the task flow region does not have a fixed height (specified using its `contentStyle` attribute).

The following two examples illustrate how you might include flowing components inside task flows.

D.1.1.1 Example 1: Oracle ADF Faces Table Component with Its autoHeightRows Attribute Set to a Specific Value

Add an Oracle ADF Faces `Table` component within the task flow and set the `autoHeightRows` attribute on the `Table` to a specific value. By defining this attribute, the table height is adjusted according to the content (flow behavior), rather than the table having a fixed height or being stretched into a container (stretch behavior). The `autoHeightRows` attribute setting results in table data being displayed as follows:

- If you provide a value `H` for `autoHeightRows`, the table grows to a maximum of `H` rows.
- If the number of records returned from the data source is less than `H`, the table height wraps to that number.
- If the number of records is more than `H`, the table displays `H` rows and provides a scrollbar to view the remaining rows.

- If the `autoHeightRows` attribute is not used, the table displays at a fixed default height irrespective of the amount of data displayed.

Instead of specifying a fixed value for the `autoHeightRows` attribute, you can also provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

Example D–1 shows the attributes of a sample ADF Faces `table` component that is included inside a task flow called `recent-pages-task-flow-definition`. The `autoHeightRows` attribute is set to an EL expression that references a Java bean, `recentPagesBean`. This bean contains the logic to populate this attribute with a value provided by the end user (either as a personalization or a customization).

Example D–1 The autoHeightRows Attribute on a Sample ADF Faces Table

```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
          var="row" rowBandingInterval="0" id="t1"
          rowSelection="none" columnBandingInterval="0"
          width="100%" inlineStyle="border:none;width:100%;"
          columnStretching="last" horizontalGridVisible="true"
          verticalGridVisible="false"
          autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_show_
at_a_time}"
            contentDelivery="immediate"
           fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">
      .
      .
      .
</af:table>
```

For a detailed description of the sample task flow displaying personalization and customization options for specifying the `autoHeightRows` value, see Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."

To learn more about the `autoHeightRows` attribute, including requirements such as setting the `contentDelivery` attribute to `immediate`, see the tag documentation for `<af:table>` in the *Oracle Fusion Middleware Tag Reference for Oracle ADF Faces*.

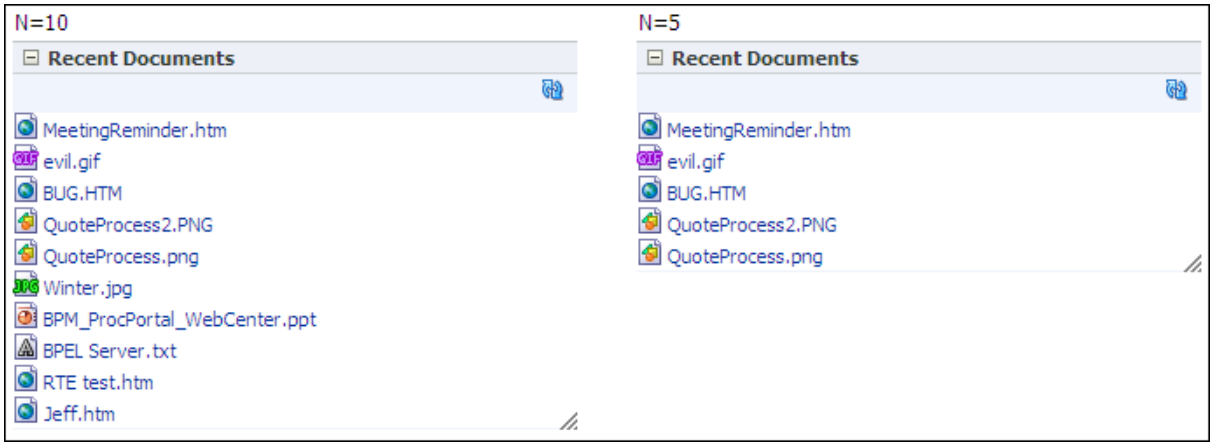
D.1.1.2 Example 2: Oracle ADF Faces Iterator Component Inside a Panel Group Layout with a Scrolling Layout

Add a `Panel Group Layout` component within the task flow and set its `layout` attribute to `scroll`. Then add an `Iterator` inside the `Panel Group Layout`. Add your content inside the `Iterator`. The content from the `Iterator` flows inside the `Panel Group Layout`.

Since the height of the `Panel Group Layout` depends on the content from the `Iterator`, specify a minimum and maximum height for the component by using `min-height` and `max-height` in the `Panel Group Layout`'s `inlineStyle` attribute.

D.1.2 Guideline 2: Limit the Number of Records Displayed in a Task Flow

To avoid a slow and jerky response when scrolling large data sets in your task flow, you must limit the number of records to be fetched from the data source at a time. For example, if you have included an ADF faces `Table` component inside your task flow,



limit the number of records to be displayed in the table. Use the `fetchSize` attribute on the `Table` to specify the number of records to be fetched from the data source in a single query. If you specify a fetch size of `N`, only `N` records are sent to the client from the data source.

The `fetchSize` and `autoHeightRows` attributes together control the number of rows displayed in the table. The relationship between these attributes is as follows:

- If `fetchSize` equals `autoHeightRows`, all records are displayed in the table.
- If `fetchSize` is less than `autoHeightRows`, the table is cropped at the `fetchSize` value.
- If `fetchSize` is greater than `autoHeightRows`, you can decide whether to display only as many records as the `autoHeightRows` value or provide pagination controls to display the remaining records. For example, you might include a More link at the bottom of the task flow or include pagination using Previous and Next links. For more information, see Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."

Figure D–2 shows the difference between two task flows containing tables with equal `autoHeightRows` and `fetchSize` values of 10 and 5. The task flows wrap to the number of records displayed.

Figure D–2 Difference Between Task Flows with Different Fetch Size Values

Instead of specifying a fixed value for `fetchSize`, you can provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

The following example shows the attributes of a sample ADF Faces `Table` component that is included inside a task flow called `recent-pages-task-flow-definition`. The `fetchSize` attribute is set to an EL expression that references a Java bean, `recentPagesBean`. This bean contains the logic to populate this attribute with a customization value provided by the end user.

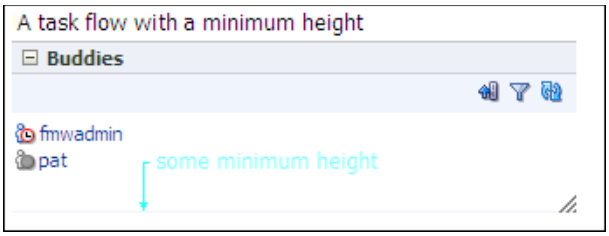
```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
          var="row" rowBandingInterval="0" id="t1"
          rowSelection="none" columnBandingInterval="0"
          width="100%" inlineStyle="border:none;width:100%;"
          columnStretching="last" horizontalGridVisible="true"
          verticalGridVisible="false"
```

```
          autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_
show_at_a_time}"
          contentDelivery="immediate"
          fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">
      .
      .
      .
</af:table>
```

For a detailed description of the sample task flow displaying a customization option for specifying the `fetchSize` value, see Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."

To learn more about the `fetchSize` attribute, see the tag documentation for `<af:table>` in the *Oracle Fusion Middleware Tag Reference for Oracle ADF Faces*.

D.1.3 Guideline 3: Specify a Minimum Height for the Task Flow



You can ensure that the task flow wraps to the height of the content by adhering to the first guideline, described in Section D.1.1, "Guideline 1: Create Task Flows that Flow."

To prevent the task flow from collapsing completely when there are no records, or seeming too short when there are only one or two records, specify a minimum height for the content.

For example, if your task flow contains a table with an `autoHeightRows` value specified, you can specify a `min-height` value using the table's `inlineStyle` attribute.

Figure D–3 shows a task flow displayed with a reasonable height even though it has only two rows.

Figure D–3 Task Flow with a Minimum Height Specified

D.1.4 Guideline 4: Include UI for Accessing Data Beyond the Display Limit

If a task flow is showing ten records, but the data source contains 100 records, you can design the task flow to do one of the following depending on the nature of data in the task flow:

- Display only ten records.

  For example, a Popular Discussion Topics task flow may use this first option if it is considered sufficient to show the ten most popular topics and not necessary to let users see even the eleventh most popular topic.

- Show a More link at the bottom of the task flow that opens a view with the ability to show more records.

  For example, the People Connections task flow on a Spaces page displays a More link at the bottom.

- Show a pagination control with Previous and Next links.

  For example, a Watched Discussion Topics task flow may display pagination controls, as users typically want to see all of their watched topics. Pagination is a common choice for task flows in which the data is not inherently ranked in order of importance or can be sorted in different ways, and where it is important to be able to access any record in the data set. The pagination control can be placed either above or below the content, depending on the nature of the content.

Figure D–4 shows the Watched Topics and Popular Topics task flows containing tables having a `fetchSize` of 5 but both having more than five records in the data source. The Watched Topics task flow displays five records with pagination at the bottom, but the Popular Topics task flow displays only five records with no UI option to view other records.

Figure D–4 Task Flows With and Without Pagination Controls

Pagination Specifics

Here are a few simple recommendations for creating a pagination control:

- Add a pagination message in the format `1 to N of M [prev][next].`
- Align the pagination elements to the right so that the Previous and Next links do not move as you navigate pages.
- Ensure that the Next or Previous option is grayed out when it is not required.

For an example of how to use pagination controls, see Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."

You can customize pagination controls using the following parameters:

- Position of Previous and Next links
- Labels for Previous and Next links, for example, Newer and Older
- Icons used with Previous and Next links
- The words or symbols used to represent to and of, for example, `1-5 of 100`
- Options for permitting random access, for example, `Prev 1 2 3 ... Next Last`

D.2 Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options

While creating a task flow, you can create parameters and provide options for users to customize and personalize the task flow. You can enable privileged users to customize the task flow for all users (customization) and edit the task flow's properties and parameters in Composer. You can enable all users viewing the page to customize their view of the page (personalization). This section provides guidelines for implementing task flow parameters and the customization and personalization options.

Table D–1 provides an overview of the various task flow editing options available to users.

Table D–1 Options Used to Define Task Flow Appearance and Behavior

Option	Description	When to Use	Who can See It
Parameters	A small set of ideally scalar values, used to program a task flow or set its context.Each parameter must have a good display name and description (which must include possible values and examples).	Use for a context like the city or pin code so that you can add multiple instances of the task flow, each showing different information or programmed to show information based on receiving a value from the page, programmatically or using the URL. In Spaces, you can use a parameter for a context like space name. Precedence: 3 This value overrides built-in values in the task flow.	Power users (or users with Edit or Customize permission) can see parameters in Composer's Component Properties dialog while editing a page. In Spaces, moderators can see and edit task flow parameters. When a WebCenter Portal service task flow is exposed as a portlet in Oracle Portal, page designers can see these parameters while setting up the portlet.

Table D–1 (Cont.) Options Used to Define Task Flow Appearance and Behavior

Option	Description	When to Use	Who can See It
Customization/Preferences	These two are synonymous.Customizations are typically considered changes a business user makes to the task flow. These changes are available to all viewers of the page and are used to specify values for options defined in the task flow. For example, users can decide whether to display the author name or revision date for a document. Preferences are referred to as a definition of the content in the task. For example, a query definition in the Document Viewer task flow, or a query in OmniPortlet.	Use these when the task flow must provide a user interface that assists the user in defining the task flow behavior. That is, when Lists of Values or specific UI components such as images or radio buttons guide the user better, or when the task flow setup is a multiple step wizard-style interface. Such assistance cannot be provided through parameters because they are strictly scalar values, with no assistance other than a description. Precedence: 2 If there is an identical parameter value (for example, space name), customization overrides that value.	Business users (or users with Edit or Customize permission) editing a page in Composer can see the customization or preferences options. Typically, customization or preferences options are available on the chrome surrounding the task flow in Edit mode. However, users with Edit or Customize permission can also see these options on the chrome in View mode of the page. When a WebCenter Portal task flow is exposed as a portlet in Oracle Portal, the page designer sees these as Edit Defaults options while setting up the portlet.
Personalization	A subset of the customization and preferences options. You cannot have personalization options that are not also customization options.	Use these to allow all viewers of the page to tweak and tune the visual aspects of the task flow or the amount of data shown to them. For example, to set the number of items to display. Precedence: 1 If there is an identical customization value (for example, number of items), personalization overrides that value.	All end users with View permission can see these options. Personalization options are available on the chrome surrounding the task flow. When WebCenter Portal task flows are exposed as portlets in Oracle Portal, the Personalization options allow end users to tweak the same visual aspects.
Implicit Personalization	Options that are persisted for end users from session to session. Implicit personalization options are not available on the chrome surrounding the task flow, but are actions that can be performed directly in the body of the task flow. For example, sorting and column resizing are implicit personalization options.	Use these options sparingly and only for options that are frequently changing. Options like column resizing and sorting are available for free from Oracle ADF.	All end users with View permission on the page can perform personalizations.

To improve application performance, follow the guidelines in this section while implementing parameters and customization and personalization options in task flows.

D.2.1 Guidelines for Implementing Task Flow Parameters

At design time (in JDeveloper), you can create parameters by defining them in the task flow definition XML file. At runtime, users with Edit or Customize permission can edit task flow parameters in the Component Properties dialog in Composer. To provide a good user experience, you must adhere to the following guidelines when creating parameters:

- Provide a display name that is meaningful.
- Provide a description for each parameter, along with examples and the possible values it can take.

The following example shows the code to define a parameter called `layoutStyle` in the task flow definition file:

```
<input-parameter-definition>
  <name>layoutStyle</name>
  <description> Used to control whether the documents must display as a list, with
icons, or with document details.
Allowed values are list, icon, and detail.</description>
  <display-name>Layout Style</display-name>
</input-parameter-definition>
```

D.2.2 Guidelines for Implementing Customization

Users with Edit or Customize permission can access customization options from the chrome surrounding the task flow.

You must adhere to the following guidelines while implementing customization in your task flow:

- Customization options must be a subset of the task flow's parameters.
- Implement a view fragment within the task flow and expose an outcome to open this view in a separate dialog. For example, the control flow rule to invoke a view called `advancedEditPopupView` in a dialog is as follows:

  ```
  <control-flow-case>
    <from-outcome>dialog:advancedEditPopup</from-outcome>
    <to-activity-id>advancedEditPopupView</to-activity-id>
  </control-flow-case>
  ```

  Adhering to this guideline is mandatory for new task flows.

- Implement a view fragment within the task flow and expose an outcome to transition inline to this view. For example, the control flow rule to invoke a view called `advancedEditView` within the same screen is as follows:

  ```
  <control-flow-case>
    <from-outcome>advancedEdit</from-outcome>
    <to-activity-id>advancedEditView</to-activity-id>
  </control-flow-case>
  ```

  Although you can implement a task flow in this way, it is recommended that you expose an outcome to open the view in a dialog.

- Ensure that customizations are saved in the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, customizations are saved in the Metadata Storage (MDS). If you do not explicitly specify the MDS layer to be used to save task flow customizations, customization metadata and the consuming application metadata may get stored in different layers.

To ensure that customizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring customization. For an example of how this is implemented, see Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."

D.2.3 Guidelines for Implementing Personalization

All users viewing the page can access personalization options from the chrome surrounding the task flow in View mode of the page.

You must adhere to the following guidelines while implementing personalization in your task flow:

- Ensure that personalization options are a subset of the customization options you define on the task flow.
- If a key aspect of the task flow is to show objects—for example, documents, users, or requests—then you must include a personalization option for users to set the maximum number of objects to display.
- Implement a view fragment within the task flow, and expose an outcome to open this view in a dialog. For example, the control flow rule to invoke a view called `simpleEditPopupView` in a dialog is as follows:

  ```
  <control-flow-case>
    <from-outcome>dialog:simpleEditPopup</from-outcome>
    <to-activity-id>simpleEditPopupView</to-activity-id>
  </control-flow-case>
  ```

  Adhering to this guideline is mandatory for new task flows.
- Implement a view fragment within the task flow and expose an outcome to transition inline to the view. For example, the control flow rule to invoke a view called `simpleEditView` within the same screen is as follows:

  ```
  <control-flow-case>
    <from-outcome>simpleEdit</from-outcome>
    <to-activity-id>simpleEditView</to-activity-id>
  </control-flow-case>
  ```

  Although you can implement a task flow in this way, it is recommended that you make a transition to bring this view up as a dialog.
- Ensure that personalizations are written to the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, personalizations are saved in MDS. If you do not explicitly specify the MDS layer to be used to save personalizations, personalization metadata and application metadata may get stored in different layers.

  To ensure that personalizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring personalization. For an example of how this is implemented, see "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines"

D.2.4 Guidelines for Implementing Implicit Personalization

Users perform implicit personalizations while using the task flow itself, by way of resizing, sorting table columns, and so on. Personalization options in this case are not

invoked using dialogs and users may not even be aware that they are actually personalizing a page.

Adhere to the following guidelines while implementing implicit personalization:

- Do not overload the task flow with implicit personalization attributes. Select a few key, frequently used attributes to expose as implicit. Infrequently used or complex attributes can be handled with explicit personalization.
- Do not implement implicit personalization such that a dialog is invoked. Implicit personalization must be performed in the body of the task flow itself.

D.3 Example of a Framework Application Containing a Task Flow Created By Following the Guidelines

As a companion to this document, a sample application was developed using Oracle WebCenter Portal: Framework. This sample application, called `RecentPages`, is used as an example to illustrate how you can build a near-perfect task flow by adhering to the guidelines in this document. The `RecentPages` application contains a customizable page, `Welcome.jspx`, which contains a task flow named `recent-pages-taskflow-definition` created by following all the required guidelines.

This section only provides a high-level description of how the task flow was implemented. For detailed information about using task flows and Composer, see the following guides:

- *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*, for information about creating task flows.
- *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*, for information about editing, customizing, and personalizing task flows in Composer.

The `RecentPages` sample application is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

`http://webcenter.oracle.com`

The `RecentPages` application contains the following projects:

- A Model project
- A Portal project named `RecentPagesTaskFlow` that contains the `recent-pages-task-flow-definition` task flow
- Another Portal project named `WebPages` that contains the JSPX page in which the task flow is consumed

D.3.1 The RecentPagesTaskFlow Project

This project contains the task flow created by following the guidelines. The files of significance in this project are as follows:

- The `recent-pages-task-flow-definition.xml` file
- The `mainView.jsff` fragment
- The `simpleEditPopupView.jspx` page
- The `advancedEditPopupView.jspx` page
- The `recentPagesBean` Java bean

- The `Preference` Java bean

D.3.1.1 The recent-pages-task-flow-definition.xml File

This is an Oracle ADF task flow definition containing three views: `mainView`, `simpleEditPopupView`, and `advancedEditPopupView`. The task flow is designed such that `mainView` displays a list of recently created pages in the application, `simpleEditPopupView` displays a personalization option to all users, and `advancedEditPopupView` displays customization options to users with Edit or Customize permission.

The following table breaks down the code in `recent-pages-task-flow-definition.xml` and explains each snippet.

The outcomes from `mainView` to `simpleEditPopupView` and `advancedEditPopupView` are called `dialog:simpleEditPopupview` and `dialog:advancedEditPopupView` respectively. This is to ensure that the views open in separate dialogs, not inline. In addition, this task flow provides Refresh, Previous, and Next outcomes on `mainView`. The `simpleEditPopupView` and `advancedEditPopupView` views provide Save and Cancel outcomes.

The following table describes significant sections of code in the `recent-pages-task-flow-definition.xml` file.

Table D–2 Sections Of Code in the Task Flow Definition File

Code	Description
`<default-activity>mainView</default-activity>`	Defining the default view for the task flow: `mainView`

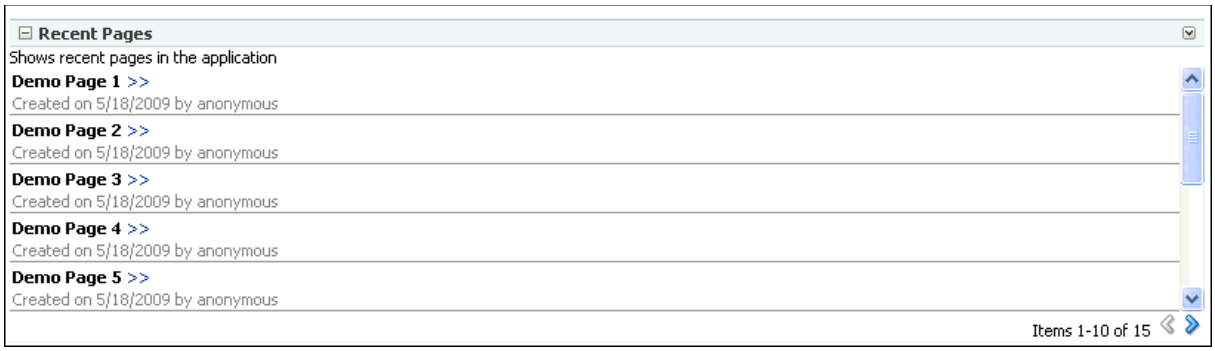
`<managed-bean>`
`  <managed-bean-name>recentPagesBean</managed-bean-name>`
`  <managed-bean-class>view.RecentPangesBean</managed-bean-class>`
`  <managed-bean-scope>pageFlow</managed-bean-scope>`
`</managed-bean>`
	Referencing the `recentPagesBean` Java bean that is associated with the task flow definition. This bean was created as part of the `view` package.

`<view id="mainView">`
`  <page>/mainView.jsff</page>`
`</view>`
`  <view id="simpleEditPopupView">`
`  <page>/simpleEditPopupView.jspx</page>`
`</view>`
`  <view id="advancedEditPopupView">`
`  <page>/advancedEditPopupView.jspx</page>`
`</view>`
	Mapping task flow views to pages or page fragments. For example, `mainView` is associated with `mainView.jsff`.

Table D–2 (Cont.) Sections Of Code in the Task Flow Definition File

Code	Description

`<control-flow-rule>`
`  <from-activity-id>mainView</from-activity-id>`
`  <control-flow-case>`
`  <from-outcome>refresh</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>dialog:simpleEditPoup</from-outcome>`
`  <to-activity-id>simpleEditPopupView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>next</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>previous</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>dialog:advancedEditPopup</from-outcome>`
`  <to-activity-id>advancedEditPopupView</to-activity-id>`
`  </control-flow-case>`
`</control-flow-rule>`
	Control flow rules from `mainView`. Each control flow case defines an outcome and a corresponding target view.



`<control-flow-rule>`
`  <from-activity-id>simpleEditPopupView</from-activity-id>`
`  <control-flow-case>`
`  <from-outcome>save</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>cancel</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`</control-flow-rule>`
	Control flow rules from `simpleEditPopupView`. Each control flow case defines an outcome and a corresponding target view.

`<control-flow-rule>`
`  <from-activity-id>advancedEditPopupView</from-activity-id>`
`  <control-flow-case>`
`  <from-outcome>save</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`  <control-flow-case>`
`  <from-outcome>cancel</from-outcome>`
`  <to-activity-id>mainView</to-activity-id>`
`  </control-flow-case>`
`</control-flow-rule>`
	Control flow rules from `advancedEditPopupView`. Each control flow case defines an outcome and a corresponding target view.

D.3.1.2 The mainView.jsff Fragment

Figure D–5 displays a list of recently created pages in the application. At runtime, the list looks like this:

Figure D–5 The mainView Fragment in the Task Flow

The design features of this view fragment are as follows:

- The `autoHeightRows` attribute is defined on the table to control the number of items displayed in the table. The task flow then wraps to the height of the items displayed.
- The `fetchSize` attribute is defined to control the number of items to be fetched from the data source and displayed in the table.
- Pagination controls are included to display a message in the format "`Items 1-4 of 25`" along with previous and next icons.

Table D–3 describes significant sections of code in the `mainView.jsff` fragment.

Table D–3 The mainView Fragment Code

Code	Description
`<af:panelGroupLayout id="pgl1" layout="vertical">` `  <af:outputText value="Shows recent pages in the application" id="ot1"/>`	A single top-level component-`Panel Group Layout`.This component is designed to ensure that the task flow content flows vertically and always stretches horizontally. This allows geometry management.

Table D–3 (Cont.) The mainView Fragment Code

Code	Description
<af:table value="#{pageFlowScope.recentPagesBean.pages}" var="row" rowBandingInterval="0" id="t1" rowSelection="none" columnBandingInterval="0" width="100%" inlineStyle="border:none;width:100%;" columnStretching="last" horizontalGridVisible="true" verticalGridVisible="false" **autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_show_at_a_time}"** contentDelivery="immediate" **fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">**	A table component that is a child of the `Panel Group Layout`. Table attributes: ▪ `autoHeightRows` (`N`): The number of items to display in the table at one time. An EL value is specified here such that a Java bean, `recentPagesBean`, populates this attribute with a value specified by the user at runtime. If there are more than `N` items to display, a scrollbar appears on the task flow. ▪ `fetchSize` (`M`): The maximum number of items to be fetched from the data source. An EL value is specified here such that a Java bean, `recentPagesBean`, populates this attribute with a value specified by the user at runtime. If `M` is greater than `N`, pagination controls appear on the task flow to enable users to view the remaining items.
<af:column sortable="false" headerText="#{null}" align="start" id="c1"> <af:panelGroupLayout id="pgl11" styleClass="nowrap" inlineStyle="padding-top:2px; font-weight:bold;"> <af:outputText value="#{row.title}" id="ot4"/> <af:goLink destination="/faces#{row.contentMRef}" text=">>" targetFrame="_blank" id="gl1"/> </af:panelGroupLayout> <af:panelGroupLayout id="pgl10" styleClass="AFFieldTextDisabled nowrap" inlineStyle="padding-top:2px"> <af:outputText value="Created on " id="ot7"/> <af:outputText value="#{row.createDate}" id="ot8"/> <af:outputText value=" by #{row.createdBy}" id="ot9"/> </af:panelGroupLayout> </af:column>	The table contains a single column that displays a list of pages in the application along with the creation date and author for each page. Implicit personalization capability to sort the table column is turned off.

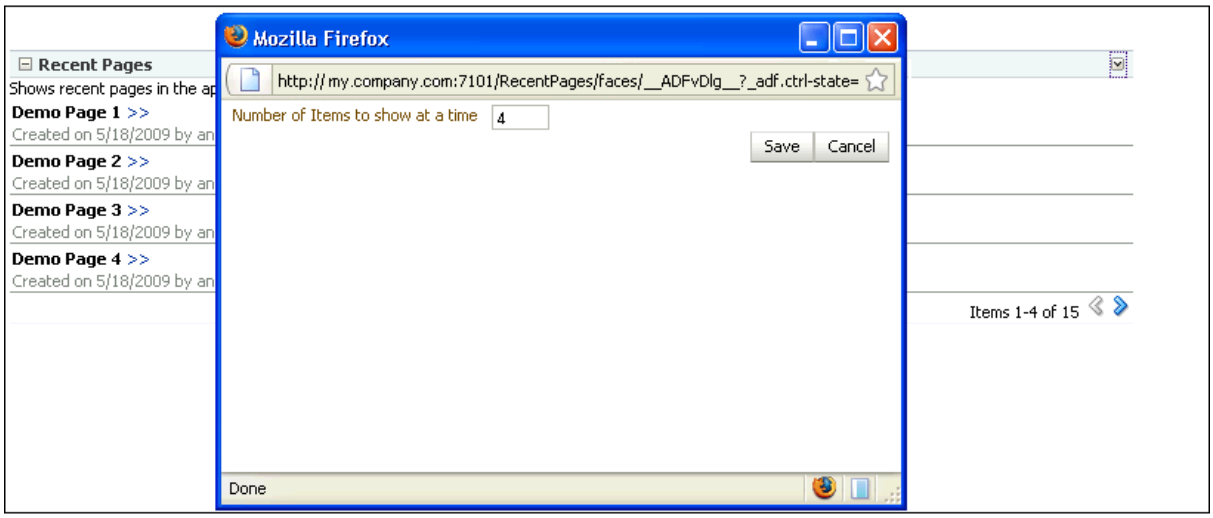


Table D–3 (Cont.) The mainView Fragment Code

Code	Description
<af:panelGroupLayout id="pgl2" halign="end" layout="vertical" inlineStyle="margin:1px" rendered="#{pageFlowScope.recentPagesBean.showPageControl}"> <af:panelGroupLayout id="pgl3"> <af:outputText value="#{pageFlowScope.recentPagesBean.footerText}" id="ot2"/> <af:commandLink id="cl1" actionListener="#{pageFlowScope.recentPagesBean.previous}" disabled="#{not pageFlowScope.recentPagesBean.showPrevious}" action="previous"> <af:image source="#{pageFlowScope.recentPagesBean.showPrevious ? '/adf/webcenter/shuttleleft_ena.png' : '/adf/webcenter/shuttleleft_dis.png'}" id="i1" shortDesc="previous"/> </af:commandLink> <af:commandLink id="cl2" actionListener="#{pageFlowScope.recentPagesBean.next}" disabled="#{not pageFlowScope.recentPagesBean.showNext}" action="next"> <af:image source="#{pageFlowScope.recentPagesBean.showNext ? '/adf/webcenter/shuttleright_ena.png' : '/adf/webcenter/shuttleright_dis.png'}" id="i2" shortDesc="next"/> </af:commandLink> </af:panelGroupLayout> </af:panelGroupLayout>	Pagination controls to display records beyond those that are displayed in the table. The `recentPagesBean` code defines what is displayed to users at runtime.

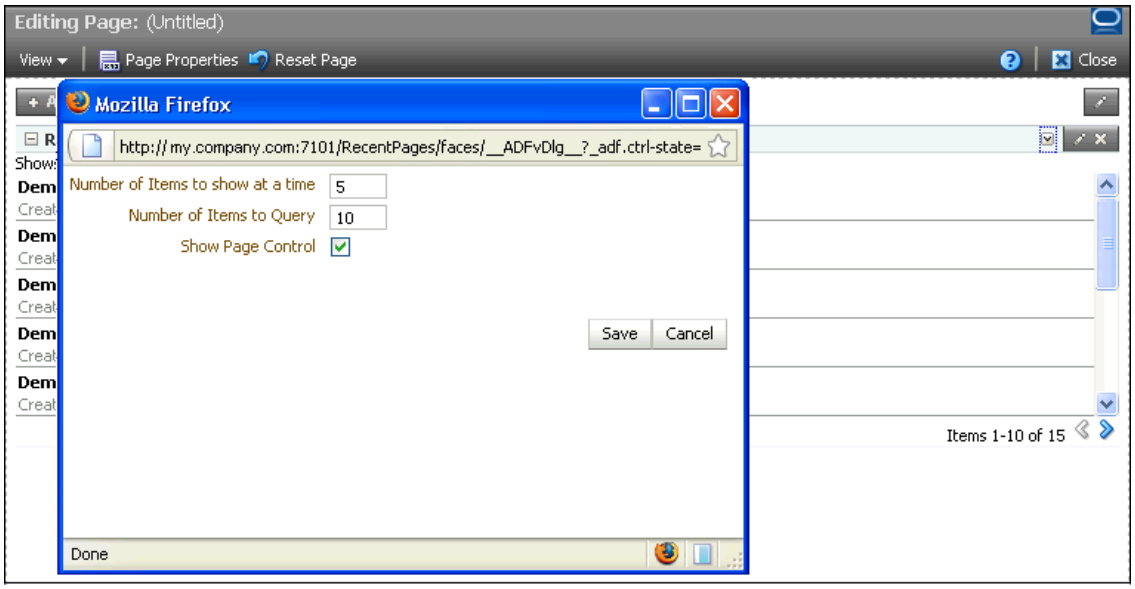
D.3.1.3 The simpleEditPopupView.jspx Page

Figure D–6 displays an option to select the number of items to be displayed in the task flow. All users viewing the page can personalize the task flow using this option. The value specified by a user is applicable only for that user's view of the page.

Figure D–6 The simpleEditPopupView Page

The following table describes significant sections of code in the `simpleEditPopupView.jspx` page.

Table D–4 Code in the Personalization Page



Code	Description

`<af:panelStretchLayout id="psl1">`
`  <f:facet name="center">`
`  <af:group id="group1">`
`  <af:panelFormLayout id="pfl1">`
`  <af:inputText label="Number of Items to show at a time"`
`  id="it1"`
`  value="#{pageFlowScope.recentPagesBean.number_of_items_to_show_at_a_time}"`
`  columns="3"/>`
`  </af:panelFormLayout>`
`  <af:panelGroupLayout id="pgl2"`
`  layout="horizontal"`
`  halign="right"`
`  inlineStyle="width:500px;">`
`  <af:commandButton text="Save" id="cb1"`
`  action="#{pageFlowScope.recentPagesBean.saveSettings}"/>`
`  <af:commandButton text="Cancel" id="cb2"`
`  action="cancel"`
`  actionListener="#{pageFlowScope.recentPagesBean.cancel}"/>`
`  </af:panelGroupLayout>`
`  </af:group>`
`  </f:facet>`
`</af:panelStretchLayout>`
	A single top-level `Panel Stretch Layout` component with a `Group` component in its center facet. Within this group are a `Panel Form Layout` and a `Panel Group Layout`.
	The `Panel Form Layout` contains an `Input Text` component, which is populated with a value returned by `recentPagesBean`.
	The `Panel Group Layout` contains two `Command Button` components called Save and Close, which are wired to events defined in `recentPagesBean`.

D.3.1.4 The advancedEditPopupView.jspx Page

This page displays customization options to users with Edit or Customize permission. At runtime, this page opens in a separate dialog and displays options to select the

number of items to be displayed and number of items to be queried, and a check box to show or hide pagination controls.

The following table describes significant sections of code in the `advancedPopupView.jspx` page.

Table D–5 Code in the Customization Page

Code	Description
<af:panelStretchLayout id="psl1"> <f:facet name="center"> <af:group id="group1"> <af:panelFormLayout id="pfl1"> <af:inputText label="Number of Items to show at a time" id="it1" value="#{pageFlowScope.recentPagesBean.number_of_items_to_show_at_a_time}" columns="3"/> <af:inputText label="Number of Items to Query" id="it2" value="#{pageFlowScope.recentPagesBean.number_of_items_to_query}" columns="3"/> <af:selectBooleanCheckbox label="Show Page Control" id="sbc1" value="#{pageFlowScope.recentPagesBean.showPageControl}"/> </af:panelFormLayout> <af:panelGroupLayout id="pgl2" layout="horizontal" halign="right" inlineStyle="width:500px;"> <af:commandButton text="Save" id="cb1" action="#{pageFlowScope.recentPagesBean.saveSettings}"/> <af:commandButton text="Cancel" id="cb2" action="cancel" actionListener="#{pageFlowScope.recentPagesBean.cancel}"/> </af:panelGroupLayout> </af:group> </f:facet> </af:panelStretchLayout>	A single top-level `Panel Stretch Layout` component with a group component in its center facet. Within this group are a `Panel Form Layout` and a `Panel Group Layout`. The `Panel Form Layout` contains two `Input Text` components and a `Select Boolean Checkbox`. These components are populated with values returned by `recentPagesBean`. The `Panel Group Layout` contains two `Command Button` components called Save and Close, which are wired to events defined in `recentPagesBean`.

D.3.1.5 The recentPagesBean Java Bean

This Java bean contains the logic for the following:

- Displaying a specific number of items in the table based on user input.
- Handling the Save and Cancel events triggered from the `simpleEditPopupView` and `advancedEditPopupView` pages.
- Rendering Previous and Next icons while implementing pagination.
- Displaying the pagination message after retrieving the total number of pages.
- Referencing the `Preference` bean that defines where customizations and personalizations must be saved.

You can find the code for this bean in the `RecentPages` application that is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

http://webcenter.oracle.com

The following table describes significant sections of code in the `recentPagesBean.java` file.

Table D–6 The recentPagesBean Java Bean Code

Code	Description

`private String _getPreferenceFileName()`
`  {`
`  String taskflowId =`
 	
`ControllerContextFwk.getInstanceFwk().getCurrentVi`
`ewPortFwk().getClientId();`
`  if (taskflowId == null)`
`  {`
`  taskflowId =`
 	
`ControllerContextFwk.getInstanceFwk().getCurrentVi`
`ewPortFwk().getParentViewPort().getClientId();`
`  }`
`  String preferenceFileName =`
`  PREFERENCE_BASE + taskflowId.replace(".", "_`
`") + ".xml";`
`  return preferenceFileName;`
`  }`
`  private static PageServiceBean`
`getPageServiceBean()`
`  {`
`  String beanName = "pageServiceBean";`
`  Object bean = null;`
`  FacesContext ftx =`
`FacesContext.getCurrentInstance();`
`  bean =`
`ftx.getExternalContext().getRequestMap().get(beanN`
`ame);`
`  if (bean == null)`
`  {`
`  ELContext elContext = ftx.getELContext();`
`  ExpressionFactory exFactory =`
 	
`ftx.getApplication().getExpressionFactory();`
`  ValueExpression expr =`
`  exFactory.createValueExpression(elContext,`
`"#{" + beanName + "}",PageServiceBean.class);`
`  bean = expr.getValue(elContext);`
`  }`
`  return (PageServiceBean) bean;`
` }
	Logic for identifying the task flow and retrieving the instance-level preference file for the currently running task flow.

Table D–6 (Cont.) The recentPagesBean Java Bean Code

Code	Description

`public String saveSettings()  throws Exception`
`  {`
`    if (number_of_items_to_query != null &&`
`        !number_of_items_to_query.isEmpty())`
`    {`
`      Preference.setNumberOfItemsToQuery(_`
`getPreferenceFileName(),`
 	
`Integer.parseInt(number_of_items_to_query));`
`    }`
`    if (this.number_of_items_to_show_at_a_time !=`
`null &&`
`        !this.number_of_items_to_show_at_a_`
`time.isEmpty())`
`    {`
`      Preference.setNumberOfItemsToShow(_`
`getPreferenceFileName(),`
 	
`Integer.parseInt(number_of_items_to_show_at_a_`

`    }`
`    if (_showPageControl != null)`
`    {`
`      Preference.setShowPageControl(_`
`getPreferenceFileName(),_showPageControl);`
`    }`
 	
`AdfFacesContext.getCurrentInstance().returnFromDia`
`log(null, null);`
`    return "save";`
`  }`
	Logic to define behavior of Save button in the personalization or customization dialog. Settings are saved in the task flow preference file.

`public void setNumber_of_items_to_show_at_a_`
`time(String number_of_items_to_show_at_a_time)`
` {`
`    this.number_of_items_to_show_at_a_time =`
`       number_of_items_to_show_at_a_time;`
`  }`
`  public String getNumber_of_items_to_show_at_a_`
`time()`
`  {`
`    String query =`
 	
`Integer.toString(Preference.getNumberOfItemsToShow`
`(_getPreferenceFileName()));`
`    return query;`
`  }`
	Logic to populate the `Number of Items to show at a time` field in the personalization or customization dialog.

Table D–6 (Cont.) The recentPagesBean Java Bean Code

Code	Description

`public void setNumber_of_items_to_query(String number_of_items_to_query)`
`  {`
`  this.number_of_items_to_query = number_of_items_to_query;`
`  }`
`  public String getNumber_of_items_to_query()`
`  {`
`  String query =`
 	
`Integer.toString(Preference.getNumberOfItemsToQuery(_getPreferenceFileName()));`
`  return query;`
`  }`
	Logic to populate the `Number of Items to Query` field in the customization dialog.

`public boolean getShowPageControl()`
`  {`
`  boolean showPageControl = Preference.getShowPageControl(_getPreferenceFileName());`
`  return showPageControl;`
`  }`
`  public void setShowPageControl(boolean showPageControl)`
`  {`
`  _showPageControl = showPageControl;`
`  }`
	Logic to set the `Show Page Control` check box in the customization dialog.

`public List<PageDef> getPages()`
`{`
`  PageServiceBean psb = getPageServiceBean();`
`  List<PageDef> pages = psb.getPages();`
`  int start = getStart();`
`  int end = getEnd();`

`  }`
`  return local_page_num;`
`  }`	

`public void cancel(ActionEvent actionEvent)`
`  {`
 	
`AdfFacesContext.getCurrentInstance().returnFromDia`
`log(null, null);`
`  }`
	Logic to define behavior of Cancel button in the personalization or customization dialog.

Table D–6 (Cont.) The recentPagesBean Java Bean Code

Code	Description

`public void previous(ActionEvent actionEvent)`
`  {`
`  int page_num = getPageNumber();`
`  page_num--;`
`  if (page_num <= 0)`
`  {`
`  page_num = 1;`
`  }`
 	
`RequestContext.getCurrentInstance().getPageFlowSco`
`pe().put("page_num", page_num);`
`  }`
	Logic to define behavior of Previous action in the task flow's pagination control.

`public void next(ActionEvent actionEvent)`
`{`
`  int page_num = getPageNumber();`
`  page_num++;`
`  String items_to_query =`
`this.getNumber_of_items_to_query();`
`  int offset = Integer.parseInt(items_to_query);`
`  int total_page_num = getTotalPageNumber();`
`  if (page_num > total_page_num)`
`  {`
`  page_num = this.getTableSize()`
`/ offset;`
`  }`
 	
`RequestContext.getCurrentInstance().getPageFlowSco`
`pe().put("page_num",  page_num);`
`  }`
	Logic to define behavior of Next action in the task flow's pagination control.

`public boolean isShowPrevious()`
`  {`
`  int page_num = getPageNumber();`
`  if (page_num <= 1)`
`  {`
`  return false;`
`  }`
`  else`
`  {`
`  return true;`
`  }`
`  }`
	Logic to render Previous icon

`public boolean isShowNext()`
`  {`
`  int page_num = getPageNumber();`
`  if (page_num >= getTotalPageNumber())`
`  {`
`  return false;`
`  }`
`  else`
`  {`
`  return true;`
`  }`
`  }`
	Logic to render Next icon.

Table D–6 (Cont.) The recentPagesBean Java Bean Code

Code	Description

`public int getTotalPageNumber()`
`  {`
`  String items_to_query =`
`  this.getNumber_of_items_to_query();`
`  int offset = Integer.parseInt(items_to_query);`
`  int total_page_num = this.getTableSize()`
`  / offset;`
`  if (getTableSize() % offset > 0)`
`  {`
`  total_page_num++;`
`  }`
`  return total_page_num;`
`  }`
	Logic to return the total number of pages.

`public String getFooterText()`
`  {`
`  return "Items " + (this.getStart() + 1) + "-"`
`+ this.getEnd() +`
`" of " + " " + this.getTableSize() + " ";`
`  }`
	Logic for returning pagination text in the format `Items 1-4 of 25`.

D.3.1.6 The Preference Bean

This Java bean is a wrapper that provides APIs to get and set attributes in the task flow preference file. It contains the logic for saving personalizations and customizations on this task flow instance in the same MDS layer as that used by the application. In this sample application, site-level customizations are stored in the `mds/mdssys/cust/site/site` directory. Therefore, the code in the `Preference` bean ensures that the application's MDS session is cloned and the task flow personalizations and customizations are stored in the same directory.

You can find the code for this bean in the `RecentPages` application that is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

`http://webcenter.oracle.com`

The following table describes significant sections of code in the `Preference.java` file.

Table D–7 The Preference Java Bean Code

Code	Description

`private static MDSSession _getClonedMDSSession()`
`  {`
`  MDSInstance instance = (MDSInstance)`
`ADFContext.getCurrent().getMDSInstanceAsObject();`
`  MDSSession mdsSession = (MDSSession)`
`ADFContext.getCurrent().getMDSSessionAsObject();`
`  mdsSession =`
` instance.createSession(mdsSession.getSessionOptions(),`
`mdsSession.getUserStateHandler());`
`  return mdsSession;`
`  }`
	Logic to clone the application's MDS session.

Table D–7 (Cont.) The Preference Java Bean Code

Code	Description
`private static MetadataObject _ readPreference(MDSSession mdsSession, String preferenceFileName) { MetadataObject mo = null; try { mo = mdsSession.getMutableMO(MOReference.create(preferenceFileName)); } catch (MetadataNotFoundException mnfe) { _LOG.warning("Creating a new preference file " + preferenceFileName); } catch (ReferenceException re) { _LOG.warning("Creating a new preference file " + preferenceFileName); } catch (Exception e) { throw new RuntimeException(e); } // preference file is not available create a new one if (mo == null) { try { DocumentBuilderFactory builderFactory = DocumentBuilderFactory.newInstance(); builderFactory.setNamespaceAware(true); builderFactory.setValidating(false); DocumentBuilder builder = builderFactory.newDocumentBuilder(); Document document = builder.parse(new ByteArrayInputStream(CONTENTS.getBytes())); mo = mdsSession.createMetadataObject(preferenceFileName, document); mdsSession.flushChanges(); mo = mdsSession.getMutableMO(MOReference.create(preferenceFileName)); } catch (Exception e) { throw new RuntimeException(e); } } return mo; }`	Logic to read the preference file in the MDS session or create one, if required.

Table D–7 (Cont.) The Preference Java Bean Code

Code	Description
`public static void setNumberOfItemsToShow(String preferenceFileName, int numberOfItemsToShow) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); mo.getDocument().getDocumentElement().setAttribute("numberOfItemsToShow", Integer.toString(numberOfItemsToShow)); _flushChanges(session); } public static int getNumberOfItemsToShow(String preferenceFileName) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); String show = mo.getDocument().getDocumentElement().getAttribute("numberOfItemsToShow"); return Integer.parseInt(show); }`	Logic to get and set the number of items to show in the table at a time.
`public static void setNumberOfItemsToQuery(String preferenceFileName, int _numberOfItemsToQuery) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); mo.getDocument().getDocumentElement().setAttribute("numberOfItemsToQuery", Integer.toString(_numberOfItemsToQuery)); _flushChanges(session); } public static int getNumberOfItemsToQuery(String preferenceFileName) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); String query = mo.getDocument().getDocumentElement().getAttribute("numberOfItemsToQuery"); return Integer.parseInt(query); }`	Logic to get and set the number of items to query from the data source.

Table D–7 (Cont.) The Preference Java Bean Code

Code	Description
`public static void setShowPageControl(String preferenceFileName, boolean showPageControl) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); mo.getDocument().getDocumentElement().setAttribute("showPageControl", Boolean.toString(showPageControl)); _flushChanges(session); } public static boolean getShowPageControl(String preferenceFileName) { MDSSession session = _getClonedMDSSession(); MetadataObject mo = _readPreference(session, preferenceFileName); String pageControl = mo.getDocument().getDocumentElement().getAttribute("showPageControl"); return Boolean.parseBoolean(pageControl); }`	Logic to get and set whether to show page control on the task flow.
`private static void _flushChanges(MDSSession session) { try { session.flushChanges(); } catch (Exception e) { throw new RuntimeException(e); } }`	Logic to save changes made to the task flow into the MDS session.If a sand box is set up in the MDS session, the changes are saved to the sand box. Else, they are permanently written to MDS.
`private static final String CONTENTS = "<preference numberOfItemsToShow='5' numberOfItemsToQuery='10' showPageControl='true' xmlns='http://xmlns.oracle.com/apps/preference'/>"; }`	Logic to display defaults in the Number of Items to show at a time and `Number of Items to query fields` and the `Show Page Control` check box. When a user first accesses an instance of the `RecentPages` task flow, a new preference file is created with this content.

The `RecentPages` project containing all these files is deployed to Oracle ADF and the task flow is then consumed in the customizable `Welcome.jspx` page in the `WebPages` project.

D.3.2 The WebPages Project

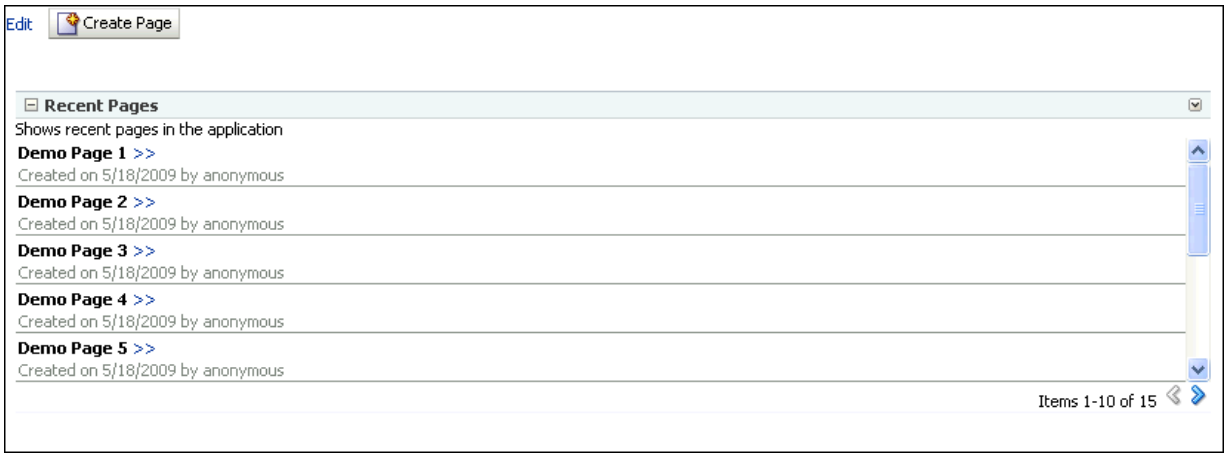
This project contains the `Welcome.jspx` page in which the `recent-pages-task-flow-definition` task flow is consumed.

D.3.2.1 The Welcome.jspx File

`Welcome.jspx` is a customizable page containing a `Panel Stretch Layout` component. The top facet of the `Panel Stretch Layout` contains a `Change Mode Link` and a Page Create task flow. The center facet contains a `Page Customizable` with a child `Panel Customizable`, which in turn contains a `Show Detail Frame` component with the `recent-pages-task-flow-definition` task flow.

The `stretchContent` and `showResizer` attributes on the `Show Detail Frame` are set to `false` and `never` respectively to ensure that this component does not stretch its child task flow.

Also, the `refresh` attribute is set to `ifNeeded` in the task flow binding. This is to ensure that customizations made to the page at runtime are reflected when users perform a refresh.



The `Welcome.jspx` page contains the following code:

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
          xmlns:f="http://java.sun.com/jsf/core"
          xmlns:h="http://java.sun.com/jsf/html"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
          xmlns:pe="http://xmlns.oracle.com/adf/pageeditor"
          xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <af:document id="d1">
      <af:form id="f1">
        <af:panelStretchLayout id="psl1">
          <f:facet name="top">
            <af:panelGroupLayout layout="horizontal"
      xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
                                 id="pgl2">
              <pe:changeModeLink id="cml1"/>
              <af:spacer width="10" height="10" id="s2"/>
              <af:region value="#{bindings.pagecreatepage1.regionModel}"
                         id="r1"/>
              <af:panelGroupLayout id="pgl1"/>
            </af:panelGroupLayout>
          </f:facet>
          <f:facet name="center">
            <pe:pageCustomizable id="pageCustomizable1">
              <cust:panelCustomizable id="panelCustomizable1" layout="scroll">
                <cust:showDetailFrame text="Recent Pages" id="sdf1"
                 stretchContent= "never" showResizer="never">
                  <af:region
value="#{bindings.recentpagestaskflowdefinition1.regionModel}"
                            id="r2"/>
                </cust:showDetailFrame>
              </cust:panelCustomizable>
              <f:facet name="editor">
                <pe:pageEditorPanel id="pep1"/>
              </f:facet>
            </pe:pageCustomizable>
          </f:facet>
          <f:facet name="start"/>
          <f:facet name="end"/>
        </af:panelStretchLayout>
      </af:form>
    </af:document>
  </f:view>
```

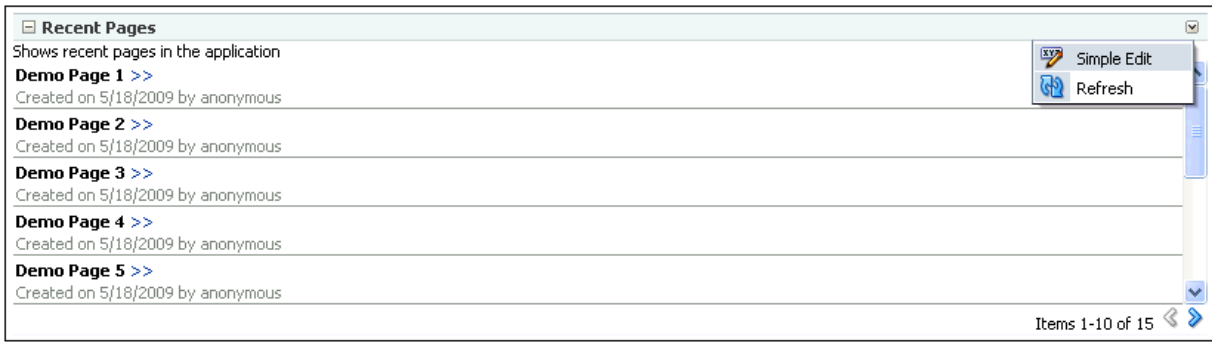
```
</jsp:root>
```

At runtime, the page appears as shown in Figure D–7.

Figure D–7 The Welcome.jspx Page

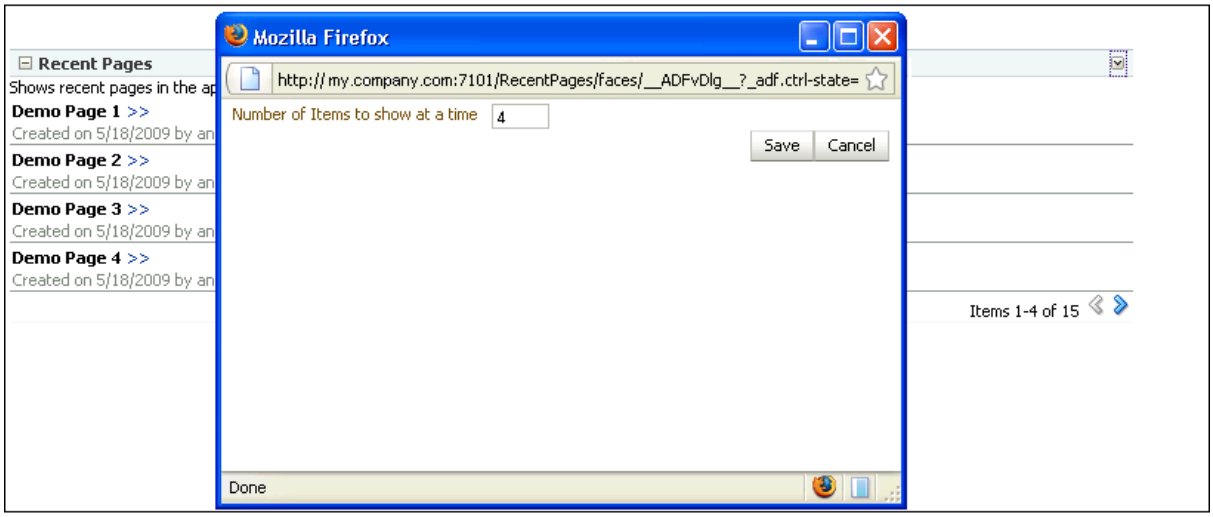
D.3.2.2 The adf-config.xml File

You can add a task flow inside a `Show Detail Frame` component and display the task flow's outcomes as actions on the chrome of the parent `Show Detail Frame` component. This is possible by defining custom actions on the parent `Show Detail Frame` component. You can define custom actions at the instance level where `Custom Action` components are added as child components of the `Show Detail Frame`, or at the global level where `Custom Action` elements are defined in the application's `adf-config.xml` file. Global custom actions are enabled on all `Show Detail Frame` instances in the application, but are displayed only when a `Show Detail Frame` instance contains the task flow as its child.



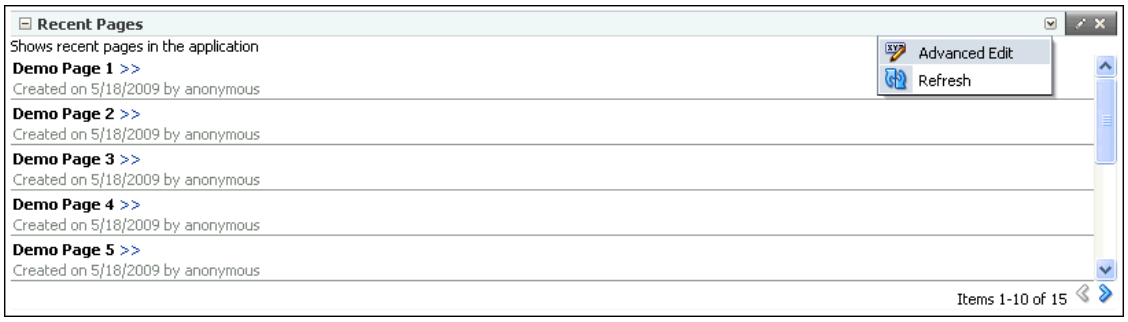
In this application, custom actions corresponding to the task flow's outcomes, `dialog:simpleEditPopupView` and `dialog:advancedEditPopupView`, are defined globally in the `adf-config.xml` file as follows:

```
<customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
    <enableSecurity value="true"/>
    <customActions>
      <customAction action="refresh" text="Refresh"
                    shortDesc="Refresh"
                    location="menu" rendered="true"
                    icon="/adf/pe/images/refresh_ena.png"/>
      <customAction action="dialog:simpleEditPoup"
                    text="Simple Edit"
                    shortDesc="Simple Edit"
                    location="menu"
                    rendered="#{!changeModeBean.inEditMode}"
                icon="/adf/pe/images/editproperties_ena.png"/>
      <customAction action="dialog:advancedEditPopup"
                    text="Advanced Edit"
                    shortDesc="Advanced Edit" location="menu"
                    rendered="#{changeModeBean.inEditMode}"
                icon="/adf/pe/images/editproperties_ena.png"/>
    </customActions>
  </customizableComponentsSecurity>
```

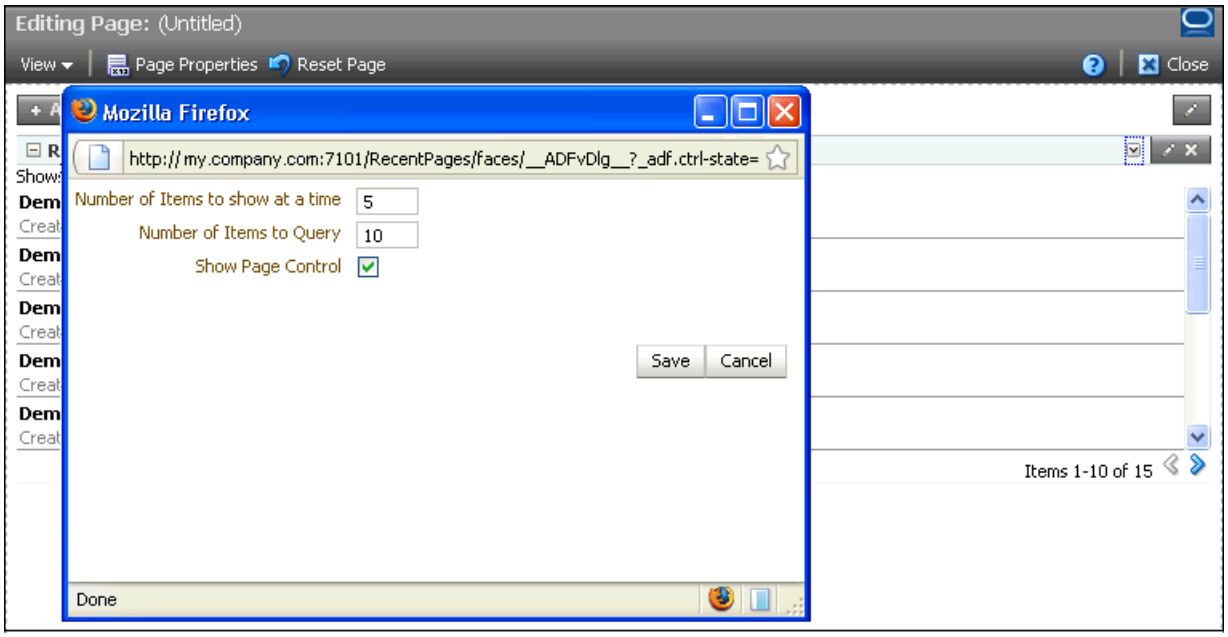


D.3.3 Runtime Behavior

This configuration results in the following behavior at runtime:



- All users see a Simple Edit action on the chrome surrounding the task flow while viewing the page.



Clicking this action displays the personalization option in a separate dialog.

- Users with Edit or Customize permission see an Advanced Edit action on the chrome surrounding the task flow while editing the page.

Clicking this action displays customization options in a separate dialog.

D.4 Conclusion

In Framework application pages containing task flows, task flow design can have a significant impact on application performance. Also, slow response time and inconsistent UI can lead to an unpleasant experience for application users. To ensure better performance and a good user experience for Framework application users, follow the guidelines in this document while implementing task flows to be consumed in the application.

E

Additional Portlet Configuration

This appendix discusses configuration information for the portlet technologies available with Oracle WebCenter Portal.

This chapter includes the following sections:

- Section E.1, "OmniPortlet Configuration Tips"
- Section E.2, "Web Clipping Portlet Configuration Tips"
- Section E.3, "Hiding or Removing the WSRP Test Page"
- Section E.4, "Setting Up a Preference Store"
- Section E.5, "Portlet Preference Store Migration Utilities"
- Section E.6, "Exporting and Importing Portlet Producers at Design Time"
- Section E.7, "Migrating WebLogic Portal Portlets to WebCenter Portal"

For more information about using the portlet technologies at design time, see their respective chapters throughout this guide:

- Chapter 60, "Creating Portlets with the Portlet Wizard"
- Chapter 61, "Coding Portlets"
- Chapter 65, "Creating Portlets with OmniPortlet"
- Chapter 66, "Creating Content-Based Portlets with Web Clipping"

For more information about using these technologies at runtime, see their respective chapters in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

E.1 OmniPortlet Configuration Tips

This section contains configuration information for OmniPortlet. To learn more about the OmniPortlet wizard, see Chapter 65, "Creating Portlets with OmniPortlet." This section contains configuration information for the following areas:

- Section E.1.1, "Configuring the OmniPortlet Producer to Access Data Outside a Firewall"
- Section E.1.2, "Configuring the OmniPortlet Producer to Access Other Relational Databases"
- Section E.1.3, "Configuring Portal Tools and Web Producers (Optional)"

Note: In this section, *OmniPortlet_WAR_DIR* indicates the directory where `omniPortlet.war` is deployed in the WebLogic Server. The exact path can vary depending on your installation. To determine this path, search for `omniPortlet/provider.xml` in the file system. For example, run the following command in UNIX:

```
> find DOMAIN_DIR -name "provider.xml" | grep -i omniportlet
```

In the Integrated WebLogic Server (Integrated WLS or Default Server), the path of OmniPortlet's `provider.xml` is located here:

JDEV_SYSTEM_DIRECTORY/DefaultDomain/servers/DefaultServer/tmp/_WL_user/portalTools_11.1.1.2.0/*RANDOMLY_GENERATED_DIRECTORY*/war/WEB-INF/providers/omniPortlet/provider.xml

Note that, on a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the *JDEV_SYSTEM_DIRECTORY* path does not contain spaces.

In the Fusion Middleware 11*g* installation, the path of OmniPortlet's `provider.xml` is located here:

FMW_HOME/user_projects/domains/wc_domain/servers/WLS_Portlet/tmp/_WL_user/portalTools_*version_number*/*RANDOMLY_GENERATED_DIRECTORY*/war/WEB-INF/providers/omniPortlet/provider.xml

E.1.1 Configuring the OmniPortlet Producer to Access Data Outside a Firewall

If the OmniPortlet producer is inside your firewall, then you must configure the proxy information so that OmniPortlet can access URLs of data (such as CSV, XML, or web services) located outside the firewall. To do so, you can either set the proxy information in the command line when you start your WebLogic server. Or, you can set up the proxy information in OmniPortlet's `provider.xml` file, located here: *OmniPortlet_WAR_DIR*`/WEB-INF/providers/omniPortlet/provider.xml`.

Note: For the Web Service data source, you must set the proxy information in both the `provider.xml` file and using the command line parameters.

- To set the proxy information in the command line when starting the WebLogic server, set the parameters as described in Table E–1, if you are using an HTTP Proxy Host, or Table E–2, if you are using an HTTPS Proxy Host.

Table E–1 HTTP Proxy Information Command Line Parameters

Parameter	Description
`http.proxyHost`	The host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
`http.proxyPort`	The port number for the HTTP Proxy Host.
`http.nonProxyHosts`	The name of any domain or hosts to which you can directly connect, bypassing a proxy server, such as your local machine: `localhost|localhost.localdomain` Hosts can be fully qualified host names or can be IP addresses.

Table E–1 (Cont.) HTTP Proxy Information Command Line Parameters

Parameter	Description
`http.proxyUser`	The user to log in to the proxy server if the proxy server requires authentication.
`http.proxyPassword`	The password to log in to the proxy server if the proxy server requires authentication.
`http.proxyAuthType`	The authentication type of the proxy server. Acceptable values: `Basic | Digest`.
`http.proxyAuthRealm`	The name of the realm of the proxy server. If you do not know the name of the realm, contact the proxy server administrator.

Table E–2 HTTPS Proxy Information Command Line Parameters

Parameter	Description
`https.proxyHost`	The host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
`https.proxyPort`	The port number for the HTTPS Proxy Host.
`https.nonProxyHosts`	The name of any domain or hosts to which you can directly connect, bypassing a proxy server, such as your local machine: `localhost|localhost.localdomain` Hosts can be fully qualified host names or can be IP addresses.
`https.proxyUser`	The user to log in to the proxy server if the proxy server requires authentication.
`https.proxyPassword`	The password to log in to the proxy server if the proxy server requires authentication.
`https.proxyAuthType`	The authentication type of the proxy server. Acceptable values: `Basic | Digest`.
`https.proxyAuthRealm`	The name of the realm of the proxy server. If you do not know the name of the realm, contact the proxy server administrator.

The following are examples of three parameters and their values:

```
-Dhttps.proxyHost=myProxyServer.mycompany.com
-Dhttps.proxyPort=80
-Dhttps.nonProxyHosts=localhost|localhost.localdomain|127.0.0.1|
```

- To configure the proxy information in the `provider.xml` file, see Table E–3 for a list of parameters and their descriptions.

Table E–3 Provider.xml Tags

Parameter	Description
`httpProxyHost`	Enter the host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
`httpProxyPort`	Enter the port number for the HTTP Proxy Host.

Table E–3 (Cont.) Provider.xml Tags

Parameter	Description
dontProxyFor	Enter the name of any domain or hosts to which you can directly connect, bypassing a proxy server. Domain names are the part of a URL that contain the names of a business, or organization, or government agency, for example: *.company.com, *.us.company.com Hosts can be fully qualified host names or can be IP addresses.
proxyUseAuth	Acceptable values: true | false Enter true if your proxy server requires authentication. The authentication parameters are specified by the following tags: proxyType, proxyRealm, proxyUseGlobal, proxyUserName, and proxyPassword.
proxyType	Acceptable values: Basic | Digest Choose the type of proxy server this provider. For more information about basic or digest authentication, see http://www.faqs.org/rfcs/rfc2617.html.
proxyRealm	Enter the name of the realm of the proxy server that is accessed by the user according to the login information described later in the table. If you do not know the name of the realm, then contact the administrator of the proxy server.
proxyUseGlobal	Acceptable values: true | false If true, then the <proxyUser> and <proxyPassword> values are used for all users. Users do not see the Proxy Authentication section on the Source tab and Personalize page. If false, then page designer must log in using the Proxy Authentication section on the Source tab when they define the portlet. The end user must log in using the Proxy Authentication section on the Personalize screen. If <proxyUsername> and <proxyPassword> are given, then they are only used for public users.
proxyUserName	Enter the user name to log in to the proxy server.
ProxyPassword	Enter the password for the specified user name. You must prefix ! before your plain password text. It is then encrypted in the provider.xml file for protection when the producer starts.

The following is a basic example of using a proxy to access data outside a firewall:

```
<proxyInfo class="oracle.portal.provider.v2.ProxyInformation">
<httpProxyHost>www-proxy.example.com</httpProxyHost>
<httpProxyPort>80</httpProxyPort>
<proxyUseAuth>false</proxyUseAuth>
</proxyInfo>
```

The following example requires a login and basic authentication for all users for the proxy server:

```
<proxyInfo class="mycompany.portal.provider.v2.ProxyInformation">
<httpProxyHost>myport.example.com</httpProxyHost>
<httpProxyPort>8080</httpProxyPort>
<proxyUseAuth>true</proxyUseAuth>
<proxyType>Basic</proxyType>
<proxyRealm>myport</proxyRealm>
<proxyUseGlobal>false</proxyUseGlobal>
</proxyInfo>
```

E.1.2 Configuring the OmniPortlet Producer to Access Other Relational Databases

The OmniPortlet SQL data source is preconfigured to access Oracle databases using the Oracle JDBC drivers, and ODBC data sources using Sun Microsystem's JDBC-ODBC driver. Oracle allows developers to access other relational databases using DataDirect JDBC drivers.

> **See Also:** For a list of supported databases, Certification Matrix for Oracle Application Server and DataDirect JDBC available on the Oracle Technology Network (http://www.oracle.com/technetwork/index.html).

This section contains the following steps:

- Section E.1.2.1, "Installing DataDirect JDBC Drivers"
- Section E.1.2.2, "Registering DataDirect Drivers in OmniPortlet"

E.1.2.1 Installing DataDirect JDBC Drivers

The following DataDirect JDBC drivers are included with the WebLogic Server installation:

- `wlinformix.jar`
- `wlsqlserver.jar`
- `wlutil.jar`
- `wldb2.jar`
- `wlresource.jar`
- `wlspy.jar`
- `wlbase.jar`

If you do not plan to use these DataDirect drivers, you can instead download DataDirect JDBC drivers to access the desired database. These drivers are packaged in a single ZIP, which you can download from the following location:

http://www.oracle.com/technetwork/topics/datadirect-index-091847.html

To install DataDirect JDBC drivers:

1. Unzip the contents of the ZIP file into a temporary directory, for example `/temp/datadirect`.
2. Copy the DataDirect JDBC drivers from the temporary directory to your WebLogic Server directory: `WLS_DOMAIN_DIRECTORY/lib`.

E.1.2.2 Registering DataDirect Drivers in OmniPortlet

OmniPortlet is implemented as a Web producer and all the configuration properties are stored in the `provider.xml` file. To use DataDirect JDBC drivers with OmniPortlet, you must register these drivers in the `provider.xml` file.

To register the new DataDirect JDBC drivers:

1. Back up the file, *`OmniPortlet_WAR_DIRECTORY`*`/WEB-INF/providers/omniPortlet/provider.xml`, and then open the file.
2. Add the drivers to use for the SQL data source configuration entry:

a. Search for the XML tag, `driverInfo`.

b. Add a new entry after the last `driverInfo` tag.

The following are examples of the driverInfo for WebLogic DataDirect drivers:

- Microsoft SQL Server:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCDriverInfo">
  <name>Microsoft SQL Server</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:sqlserver</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.sqlserver.SQLServerDriver
  </driverClassName>
  <dataSourceClassName>weblogic.jdbcx.sqlserver.SQLServerDataSource
  </dataSourceClassName>
  <connHandlerClass>oracle.webdb.reformlet.data.jdbc.JDBCConnectionHandler
  </connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeOut>30</loginTimeOut>
</driverInfo>
```

- Sybase:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCDriverInfo">
  <name>Sybase</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:sybase</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.sybase.SybaseDriver
  </driverClassName>
  <connHandlerClass>
  oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler
  </connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeOut>30</loginTimeOut>
</driverInfo>
```

- DB2:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCDriverInfo">
  <name>DB2</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:db2</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.db2.DB2Driver
  </driverClassName>
  <connHandlerClass>
  oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler
  </connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeOut>30</loginTimeOut>
</driverInfo>
```

- Informix:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCDriverInfo">
  <name>Informix</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:informix</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.informix.InformixDriver
```

```
  </driverClassName>
  <connHandlerClass>
  oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler
  </connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeOut>30</loginTimeOut>
</driverInfo>
```

Table E–4 describes the parameters in the `driverInfo` property.

Table E–4 Parameters in the driverInfo Property

Parameter	Description
`name`	Name of the database you want to use. This name is used on the Source tab of the OmniPortlet wizard.
`sourceDataBase`	Internal value. Set the value to `other`.
`subProtocol`	JDBC subprotocol name used by OmniPortlet to create the connection string, for example `sqlserver`, `sybase`, or `db2`. To get the list of subprotocol names, see the DataDirect JDBC driver documentation using the links provided at the end of this section.
`connectString`	Description of the connect string format. For DataDirect drivers, the format is: `mainProtocol:subProtocol://databaseName`
`driverClassName`	Name of the driver class. To get the different values, see the DataDirect JDBC driver documentation using the links provided at the end of this section.
`dataSourceClassName`	Name of the data source class that implements connection pooling. This parameter is only available in OmniPortlet version 9.0.4.1 or later. See Table E–5 for the right data source class name for your driver.

`connHandlerClass`	Class used by OmniPortlet to manage the driver and connection pooling. The value is either of the following:
	▪ For OmniPortlet version 9.0.4.1 or later:
	`oracle.webdb.reformlet.data.jdbc.JDBCConnectionHandler`
	▪ For OmniPortlet versions before 9.0.4.1:
	`oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler`

`connPoolSize`	Minimum number of connections that are opened by the connection pool.
`loginTimeOut`	Maximum time, in seconds, that this data source waits while attempting to connect to a database.

Table E–5 lists the values for the `driverClassName` and `dataSourceClassName` properties for specific DataDirect JDBC drivers.

Table E–5 Parameters and Values for driverClassName and dataSourceClassName

DataDirect Drivers Supported	Properties
Microsoft SQL Server	Parameter: `driverClassName` Value: `weblogic.jdbc.sqlserver.SQLServerDriver`

Table E–5 (Cont.) Parameters and Values for driverClassName and

DataDirect Drivers Supported	Properties
Sybase	Parameter: `driverClassName` Value: `weblogic.jdbc.sybase.SybaseDriver`
DB2	Parameter: `driverClassName` Value: `weblogic.jdbc.db2.DB2Driver`
Informix	Parameter: `driverClassName` Value: `weblogic.jdbc.informix.InformixDriver`

3. Save the `provider.xml` file.
4. Stop and start the Oracle WebLogic Managed Server instance where your portlet producer was deployed. To do so, navigate to your `WL_HOME`, then to the subdirectory `opmn/bin`.

Note: If you are using OmniPortlet in a multiple nodes configuration, for example, in a clustering or load-balancing environment, then you must manually copy the `provider.xml` file on each node.

See Also: For more information about how to use DataDirect JDBC drivers, see Chapter 65, "Creating Portlets with OmniPortlet."

E.1.3 Configuring Portal Tools and Web Producers (Optional)

To ensure that the OmniPortlet and Web Clipping producers, locally built, and custom built Web producers work properly in the middle-tier environment, some additional configuration may be needed. If OmniPortlet or any other Web producers have customizations in the file system, then PDK-Java provides a Preference Store Migration/Upgrade Utility that you can use to migrate the existing customizations to the database and upgrade customizations from earlier releases. See Section E.5, "Portlet Preference Store Migration Utilities" for more information about the PDK Preference Store Migration Utility.

Configuring Portal Tools Producers in the Multiple Middle-Tier Environment

By default, the OmniPortlet producer uses the Database Preference Store. It can work in a multiple middle-tier environment without additional configuration.

You can find more information about configuring the database Preference Store in Section E.5, "Portlet Preference Store Migration Utilities."

1. If you have created an OmniPortlet instance with customizations in the file system, then you must migrate these customizations to the database using the Preference Store Migration Utility.

   To run the migration utility:

   1. Navigate to the WebCenter Portal Oracle home directory using the following command:

      ```
      cd WC_ORACLE_HOME
      ```

2. Run the following command to migrate OmniPortlet data from a file-based Preference Store (`FilePreferenceStore`) to the database Preference Store (`DBPreferenceStore`):

```
java -classpath
lib/dms.jar:jdbc/lib/ojdbc14dms.jar:portal/jlib/pdkjava.jar:portal/jlib/
ptlshare.jar oracle.portal.provider.v2.preference.MigrationTool -mode
filetodb -pref1UseHashing true -pref1RootDirectory
portal/portletdata/tools/omniPortlet
-pref2User User_Name -pref2Password User_Password -pref2URL
jdbc:oracle:thin:@infra.host.com:1521:orcl
```

See Section E.5, "Portlet Preference Store Migration Utilities" for more information about the PDK Preference Store Migration Utility.

2. Typically, you perform the HTTP Proxy configuration for OmniPortlet and Web Clipping before you configure the Load Balancing Router (LBR). To do it after the LBR is configured, perform the following steps:

   a. The Portal Tools configuration information is stored in the `provider.xml` file on the middle-tier server. You must update the configuration directly on one middle tier (for example, **M1**) and then propagate it across all middle tiers front-ended by the LBR. You must first shut down all middle tiers except **M1**.

   b. You can change the HTTP Proxy settings in the `provider.xml` file. For more information, see Section E.1.1, "Configuring the OmniPortlet Producer to Access Data Outside a Firewall."

   c. Propagate the changes made to the `provider.xml` file to middle tier **M2**:

      – Copy *OmniPortlet_WAR_DIR*`/WEB-INF/providers/omniPortlet/provider.xml` from **M1** to **M2**.

      – Copy *WebClipping_WAR_DIR*`/WEB-INF/providers/webClipping/provider.xml` from **M1** to **M2**.

3. Restart middle tier **M2**.

4. Update portlet producer registration in your Framework application. Change the first part of the producer registration URL from `http://m1.abc.com:7777/` to `http://lbr.abc.com/`.

5. Verify that OmniPortlet and the Web Clipping producers work properly through the LBR, by going to the test pages at the following URLs.

   - OmniPortlet Producer:
     `http://lbr.abc.com/portalTools/omniPortlet/producers/omniPortlet`

     If you see the "No Portlets Available" message under the Portlet Information section in the OmniPortlet Producer test page, then you may not have configured OmniPortlet correctly in Step 1. If OmniPortlet is configured correctly, then the OmniPortlet and Simple Parameter Form portlets are available on the test page.

   - Web Clipping Producer:
     `http://lbr.abc.com/portalTools/webClipping/producers/webClipping`

Note: To use the Web Clipping portlet, or the Web Page Data Source for OmniPortlet, then you must also enable session binding in Oracle Web Cache.

E.2 Web Clipping Portlet Configuration Tips

Before you use Web Clipping, you must perform some administrative tasks, including the following:

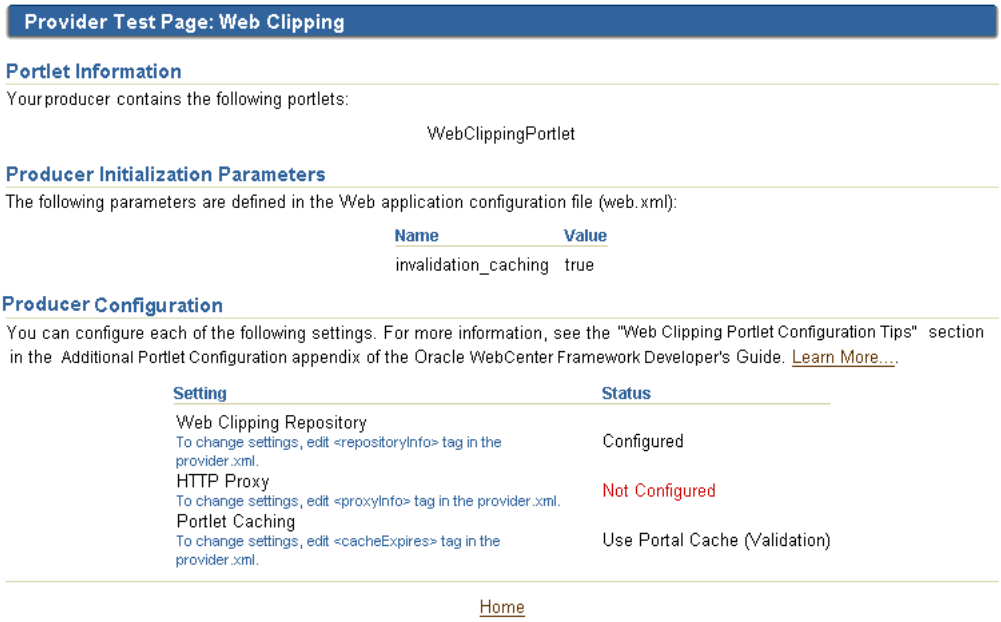
- Section E.2.1, "Web Clipping Repository Configuration"
- Section E.2.2, "HTTP or HTTPS Proxy Configuration"
- Section E.2.3, "Web Clipping Producer Security"

E.2.1 Web Clipping Repository Configuration

Web clippings have definitions that must be stored persistently in an Oracle Metadata Services (MDS) store or an Oracle database.

Note: You cannot use a Microsoft SQL Server or IBM DB2 database as the Web Clipping repository.

You can view the Web Clipping repository configuration by accessing the Web Clipping Producer Test Page at:



`http://host:port/portalTools/webClipping/providers/webClipping`

Where, *`host`* is the server to which your Web Clipping producer has been deployed and *`port`* is the port to which the server is listening for HTTP requests.

Note: Integrated WLS and the `WLS_Portlet` managed server are deployed to different ports even if they may be available on the same system. By default, Integrated WLS is deployed to port 7101 and `WLS_Portlet` is deployed to port 8889.

The Provider Test Page automatically detects whether the Web Clipping producer is configured with a valid repository. If it is not, then the **Status** column for the Web Clipping Repository displays **Not Configured**. Figure E–1 shows the Provider Test Page of Web Clipping.

Figure E–1 Web Clipping - Provider Test Page

You cannot change the Web Clipping configuration information by using the Provider Test Page. You can configure the Web Clipping repository by setting appropriate values in the `provider.xml` file. In this file, you use the `repositoryInfo` tag to specify the Web Clipping repository settings.

Note: To determine the path of `provider.xml`, search for `webClipping/provider.xml` in the file system. For example, run the following command in UNIX:

```
> find DOMAIN_DIR -name "provider.xml" | grep -i webClipping
```

In Oracle JDeveloper's Integrated WLS, Web Clipping's `provider.xml` is located here:

JDEV_SYSTEM_DIRECTORY`/DefaultDomain/servers/DefaultServer/tmp/_WL_user/portalTools_11.1.1.2.0/`*RANDOMLY_GENERATED_DIRECTORY*`/war/WEB-INF/providers/webClipping/provider.xml`

Note that, on a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the *JDEV_SYSTEM_DIRECTORY* path does not contain spaces.

In the Fusion Middleware 11*g* installation, Web Clipping's `provider.xml` is located here:

FMW_HOME`/user_projects/domains/wc_domain/servers/WLS_Portlet/tmp/_WL_user/portalTools_11.1.1.2.0/`*RANDOMLY_GENERATED_DIRECTORY*`/war/WEB-INF/providers/webClipping/provider.xml`

This section includes the following subsections:

- Section E.2.1.1, "Using Oracle Metadata Services (MDS) as the Web Clipping Repository"
- Section E.2.1.2, "Using an Oracle Database as the Web Clipping Repository"

- Section E.2.1.3, "Configuring Web Clipping Repository in provider.xml"
- Section E.2.1.4, "Attributes and Child Tags of the repositoryInfo Tag"

E.2.1.1 Using Oracle Metadata Services (MDS) as the Web Clipping Repository

By default, in Oracle JDeveloper, the Web Clipping producer hosted on Integrated WLS, the default server, is configured to use MDS, which is file-based, as the Web Clipping repository.

> **Note:** In a full Oracle Fusion Middleware installation, the Web Clipping portlet producer is also included within the `WLS_Portlets` managed server in the default domain. By default, this Web Clipping portlet producer is configured to use the Oracle database, which is installed as part of Oracle WebLogic Server, as the Web Clipping repository.

Example E–1 shows MDS as the default repository in `provider.xml`.

Example E–1 MDS as the Default Web Clipping Repository in provider.xml

```
<repositoryInfo class="oracle.portal.wcs.provider.info.MdsInformation">
  <mdsConfigLocation>mds-config.xml</mdsConfigLocation>
</repositoryInfo>
```

For an MDS repository, the `repositoryInfo` tag is set to the `MdsInformation` class. The `mdsConfigLocation` entry specifies the path to the `mds-config.xml` file, which contains the metadata store configuration information, including the path to the actual metadata store. In Oracle JDeveloper, the `mds-config.xml` file is located at the following path:

JDEV_SYSTEM_DIRECTORY/DefaultDomain/servers/DefaultServer/tmp/_WL_user/portalTools_11.1.1.2.0/*RANDOMLY_GENERATED_DIRECTORY*/war/WEB-INF

> **Note:** On a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the *JDEV_SYSTEM_DIRECTORY* path does not contain spaces.

The `mds-config.xml` file specifies the location of the repository in a property tag:

```
<property name="metadata-path" value="portletdata/tools/webClipping"/>
```

The location specified for `value` is relative to *JDEV_HOME*`/portal`. Any relative path specified is interpreted to be relative to *JDEV_HOME*`/portal`. To use another location, for example, a location outside the Oracle JDeveloper home, then specify an absolute path, such as `c:\mds`.

> **Note:** For a multiple middle tier deployment, change the metadata path to a shared file system.

E.2.1.2 Using an Oracle Database as the Web Clipping Repository

Although MDS is the default repository in Oracle JDeveloper, you can alternatively select to use a database schema for your Web Clipping repository.

> **Note:** If you use a database as your Web Clipping repository, any customizations are retained even if the Web Clipping producer or the consuming application is redeployed.

You can use either of the following database schemas for Web Clipping:

- The default `PORTLET` database schema created by RCU for Oracle WebLogic Server
- A user-defined database schema for Oracle 9*i* or later

> **Note:** You cannot use a Microsoft SQL Server or IBM DB2 database as the Web Clipping repository.

This section includes the following subsections:

- Section E.2.1.2.1, "Using the Database Schema Created by RCU"
- Section E.2.1.2.2, "Creating a Database Schema"

E.2.1.2.1 Using the Database Schema Created by RCU For Web Clipping repository, you can use the Oracle database installed as part of Oracle WebLogic Server, through a JNDI data source named `jdbc/portletPrefs`. To access the database, the schema named `PORTLET` is used.

> **Note:** The `PORTLET` schema must be created in the Oracle database configured for WebCenter Portal. For more information, see the "Installing WebCenter Portal" chapter in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

E.2.1.2.2 Creating a Database Schema You can use any user-defined schema for an Oracle 9*i* or later database as the Web Clipping repository. To create a database schema for Web Clipping definitions and clippings, run the Java command described in Example E–2.

Example E–2 Java Command for Creating a Schema for Web Clipping Portlet Definitions and Clippings

```
java -classpath WC_ORACLE_HOME/lib/xmlparserv2.jar:
WC_ORACLE_HOME/jdbc/lib/ojdbc14.jar:WC_ORACLE_HOME/portal/jlib/wce.jar
oracle.portal.wcs.Installer -installSchema -username dbuser -password
dbpassword -dburl jdbc:oracle:thin:@//host:port/dbid
```

Where:

- *WC_ORACLE_HOME* is the path to your WebCenter Portal Oracle home directory
- *dbuser* is the database user for the schema

  Consider using the same database user you use to create the WSRP and PDK-Java preference store database schema. If you do not use the same user, then you must create a new user and grant it connect and resource privileges.

- *dbpassword* is the specified user's password
- *dburl* is the URL for the database

  This is the database that contains the schema that you create for Web Clipping portlet definitions and clippings by using the following syntax:

  ```
  jdbc:oracle:thin:@//dbhost:dbport/service_name
  ```

  For example:

  ```
  jdbc:oracle:thin:@//shobeen:1521/sales_us
  ```

Note: The classpath in Example E–2 uses different separators for UNIX and Windows. On UNIX systems, the `classpath` uses a colon (:) separator. On Windows systems, the `classpath` uses a semicolon (;) separator.

E.2.1.3 Configuring Web Clipping Repository in provider.xml

To change the repository configuration for the Web Clipping producer deployed to Integrated WLS:

1. Open the `provider.xml` file in a text editor.
2. Specify the setting for your Web Clipping repository:
   - Use the `PORTLET` schema referred by the JNDI data source created by RCU. Specify the entries shown in Example E–3.

Example E–3 Oracle Database as the Web Clipping Repository

```
<repositoryInfo class="oracle.portal.wcs.provider.info.JdbcDbInformation">
   <connectionName>jdbc/portletPrefs</connectionName>
   <useRAA>false</useRAA>
   <useASO>false</useASO>
</repositoryInfo>
```

For information about tag parameters, see Section E.2.1.4, "Attributes and Child Tags of the repositoryInfo Tag."

   - Use the database schema, created for an Oracle database 9*i* or later, where you can manually specify connection information.

     To specify Oracle 9*i* or later database as the Web Clipping repository, specify database connection parameters in the entry shown in Example E–4.

Example E–4 Setting Oracle Database 9i or Later as Web Clipping Repository

```
<repositoryInfo class="oracle.portal.wcs.provider.info.DatabaseInformation">
   <useRAA>false</useRAA>
   <databaseHost>dbhost.mycompany.com</databaseHost>
   <databasePort>1521</databasePort>
   <databaseSid>iasdb</databaseSid>
   <databaseUsername>scott</databaseUsername>
   <databasePassword>!tiger</databasePassword>
   <useASO>false</useASO>
</repositoryInfo>
```

For information about tag parameters, see Section E.2.1.4, "Attributes and Child Tags of the repositoryInfo Tag."

If you require a secure database connection, then enable the Advanced Security Option (ASO) by setting the `useASO` entry to `true`. For more information about configuring ASO, see Section E.2.3, "Web Clipping Producer Security."

Note: Only one entry of `<repositoryInfo>` can exist in `provider.xml`. Depending on the Web Clipping repository you choose, you must uncomment only that entry.

---

3. Save the `provider.xml` file.
4. Restart Integrated WLS.

E.2.1.4 Attributes and Child Tags of the repositoryInfo Tag

Table E–6 lists and describes the attributes and child tags of the `repositoryInfo` tag.

Note: The attributes and child tags of the `repositoryInfo` tag are also described in the comments in the Web Clipping `provider.xml` file.

In the comments in the `provider.xml` file, the example provided for *Oracle9i Database or later using Oracle infrastructure database* is specific to Oracle Portal and its infrastructure database and application programming interfaces. That example must not be used for Framework application implementations.

Table E–6 Attributes and Child Tags of the repositoryInfo Tag

Attributes/Parameter	MDS/Database	Description
`class`	Both	The `class` attribute specifies the type of repository used to store Web Clipping definitions. The possible values for this attribute are: ■ `oracle.portal.wcs.provider.info.MdsInformation` This value signifies that MDS is used to store Web Clipping definitions and that MDS configuration is pushed to the `mds-config.xml` file. ■ `oracle.portal.wcs.provider.info.DatabaseInformation` This value signifies that an Oracle9*i* Database or later is used to store Web Clipping definitions and that the database connection details are included as children in the `repositoryInfo` tag. ■ `oracle.portal.wcs.provider.info.JdbcDbInformation` This value signifies that Oracle database installed as part of Oracle WebLogic Server is used to store Web Clipping definitions.
`mdsConfigLocation`	MDS	Use the `mdsConfigLocation` tag when the value for the `class` attribute indicates an MDS repository. It points to the MDS configuration file `mds-config.xml`, which specifies the actual MDS location. The `mds-config.xml` file is located at: *MW_HOME*`/wlserver_10.3/wc_domain/servers/WLS_Portlet/tmp/_WL_user/portalTools_11.1.1.2.0/yyggl7/war/WEB-INF`
`connectionName`	Database	Specifies the JNDI name of the data source where the Web Clipping repository has been installed using the RCU. By default, the connection name is `jdbc/portletPrefs`, which points to the `PORTLET` schema in Oracle WebLogic Server. In an interoperability scenario where an Oracle WebLogic Server 11*g* Middle Tier is paired with an Oracle Application Server 10*g* repository, the connection points to the `PORTAL` schema in the Oracle Application Server 10*g* repository.
`useASO`	Database	Set to `true` or `false`: ■ Specify `true` to use Oracle Advanced Security Option (ASO) to encrypt the communication channel between the Web Clipping producer and the database. This is provided for introducing added security if case-sensitive data is contained in the clipped content. ■ Specify `false` to omit this option.
`useRAA`	Database	Set to `true` or `false`: ■ Specify `true` if Repository Access APIs are used to access the database connection parameters. Specifying `true` is equivalent to making the Web Clipping producer use the default Oracle infrastructure database as the repository. Specifying `true` removes the need for other `repositoryInfo` child tags. ■ Specify `false` to omit this option.
`databaseHost`	Database	Specify the host name of the Oracle database. Use only version 9*i* or later. For example: `mycompany.dbhost.com`
`databasePort`	Database	Specify the port number of the Oracle database listener. This is usually `1521`.

Table E–6 (Cont.) Attributes and Child Tags of the repositoryInfo Tag

Attributes/Parameter	MDS/Database	Description
`databaseSid`	Database	Specify the Oracle SID of the database that hosts the Web Clipping repository.
`databaseUsername`	Database	Enter the user name used to log in to the database.
`databasePassword`	Database	Enter a plain text password for the specified database user name. Prefix the password with an exclamation point (!) to allow the Web Clipping producer to encrypt the password when the producer starts. For example: `!AX3tR`

E.2.2 HTTP or HTTPS Proxy Configuration

Your HTTP or HTTPS proxy settings must be set to allow the Web Clipping Studio to connect to web sites outside of your firewall. You can specify the settings by manually editing the `provider.xml` file.

Framework application administrators can set proxy settings manually according to the HTTP or HTTPS configuration. Edit the appropriate entries in the `provider.xml` file.

Example E–5 shows the relevant portion of `provider.xml`.

Example E–5 Proxy Settings

```
- <!--
 proxy information: Fill the following up if you have a proxy
 server between the provider and external sites.
   <proxyInfo class="oracle.portal.provider.v2.ProxyInformation">
      <httpProxyHost>proxy.mycompany.com</httpProxyHost>
      <httpProxyPort>80</httpProxyPort>
      <dontProxyFor>*.mycompany.com</dontProxyFor>
      <proxyUseAuth>true</proxyUseAuth>
      <proxyType>Basic</proxyType>
      <proxyRealm>realm1</proxyRealm>
      <proxyUseGlobal>false</proxyUseGlobal>
      <proxyUser>scott</proxyUser>
      <proxyPassword>!tiger</proxyPassword>
   </proxyInfo>

  -->
```

It is optional to specify values for the following tags: `<proxyUseAuth>`, `<proxyType>`, `<proxyRealm>`, `<proxyUseGlobal>`, `<proxyUser>`, and `<proxyPassword>`.

Table E–3, available earlier in this appendix, describes the proxy settings you specify in the `provider.xml` file. The descriptions in the table are applicable for Web Clipping producers also.

Note: For environments that use a proxy server to reach external web sites, you can use the `dontProxyFor` entry to specify the proxy exception list. Web Clipping uses the proxy exception list to restrict users from clipping content from unauthorized external web sites. Users attempting to reach a web site in a listed domain, from the Web Clipping Studio, receive an HTTP timeout error.

E.2.3 Web Clipping Producer Security

The preceding sections described the administrative tasks that must be performed before you are able to use the Web Clipping producer. The following sections describe some security configuration options that you must implement to enable the Web Clipping producer to access Secure Sockets Layer (SSL)-enabled web sites and encrypt the channel between itself and the database:

- Section E.2.3.1, "Adding Certificates for Trusted Sites"
- Section E.2.3.2, "Configuring Oracle Advanced Security for the Web Clipping Producer"

E.2.3.1 Adding Certificates for Trusted Sites

When a user navigates to a secure site, the web site typically returns a certificate, identifying itself to the user when asking for secure information. If the user accepts the certificate, then the certificate is placed into the list of trusted certificates of the browser so that a secure channel can be opened between the browser and that server. Like a web browser, the Web Clipping producer acts as an HTTP client to external web sites. To keep track of trusted sites, the Web Clipping producer uses the `cacerts` file, which is the Java keystore to store trusted certificates.

By default, the `cacerts` file stores various certificates including the Equifax, VeriSign, and Cybertrust certificates. However, it does not include all possible server certificates that exist on the web. For this reason, when a user navigates to a secure server using HTTPS, the user can get an SSL handshake failed exception in the Web Clipping Studio. To solve this problem, you must add the certificate of that site to the `cacerts` file.

To add a certificate to the `cacerts` file:

1. Download the certificate of the HTTPS web site and save the certificate in the PEM format.

   Tip: Mozilla Firefox 3.0 or later enable you to save a certificate file in the PEM format.

2. Locate the path to the `cacerts` file:
   a. Log in to the Oracle WebLogic Server Administration Console by using the following URL format:

      `http://host:port/console`

   b. Open the **Keystore** tab for the **WLS_Portlets** managed server.
   c. Note down the location of the `cacerts` file given in the **Java Standard Trust Keystore** field.

Figure E–2 Locating the cacerts file

3. At the command prompt, navigate to the location of the `cacerts` file and run the following command to add the certificate:

   `keytool -importcert -alias` *`certi_alias`* `-file` *`certifi_name`* `-keystore cacerts -storepass` *`password`*

   Where, *`certi_alias`* refers to the alias used for the certificate, *`certifi_name`* refers to the certificate file name, and *`password`* refers to the password of the `cacerts` file. The default password is `changeit`.

   For example,

   ```
   keytool -importcert -alias stamf05 -file stamf05.crt
   -keystore cacerts -storepass changeit
   ```

   Tip: It is advisable to import trusted certificate into the `cacerts` file by using an alias. It makes it easier for you to delete or list the entries in the keystore.

E.2.3.2 Configuring Oracle Advanced Security for the Web Clipping Producer

The Web Clipping producer can use Oracle Advanced Security Option (ASO) to secure and encrypt the channel between itself and the database that hosts the Web Clipping repository. This feature is available only if you have selected any Oracle database as the Web Clipping repository. This feature is disabled by default as Oracle Metadata Services is the default Web Clipping repository in Oracle JDeveloper.

To enable ASO:

1. Open `provider.xml` in a text editor.
2. Under the repository settings section in the file (shown in Example E–3), set the `useASO` entry to `true`.
3. Save the `provider.xml` file.

In addition, you must set the following ASO configuration parameters in the `sqlnet.ora` file to ensure that the database connections created between the Web Clipping producer and the database hosting the Web Clipping repository are using ASO.

- `SQLNET.AUTHENTICATION_SERVICES` -- This parameter is used to select a supported authentication method in making database connections with ASO. For more information about setting this parameter, see the *Oracle Database Advanced Security Administrator's Guide*.
- `SQLNET.CRYPTO_SEED` -- This parameter denotes the cryptographic seed value (FIPS 140-1 setting), used in making database connections with ASO.

  For more information about setting parameters and about the values to use for various possible combinations of parameters, see the *Oracle Database Advanced Security Administrator's Guide*.

> **Note:** When setting these parameters after the initial configuration (where the database parameters are already set up), database connections are assumed to be open. Because enabling the ASO affects all connections made to the database, it is advisable to restart Integrated WLS containing the Web Clipping producer to reset all the current connections to use ASO. You must also do this when disabling ASO.

E.3 Hiding or Removing the WSRP Test Page

If you do not want all users to be able to see the WSRP test page, you can protect it so that only administrators can see it. To do this, add the code shown in Example E–6 to the `web.xml` file.

Example E–6 Hiding the WSRP Test Page

```
<security-role>
  <description>AdministratorRole</description>
  <role-name>Admin</role-name>
</security-role>
<security-constraint>
  <display-name>TestPageInfo</display-name>
  <web-resource-collection>
    <web-resource-name>TestPageInfo</web-resource-name>
    <description>Protect the test page servlet.</description>
    <url-pattern>/info/*</url-pattern>
  </web-resource-collection>
  <auth-constraint>
    <description>Administrators</description>
    <role-name>Admin</role-name>
  </auth-constraint>
  <user-data-constraint>
    <transport-guarantee>NONE</transport-guarantee>
  </user-data-constraint>
</security-constraint>
```

If you want to remove the WSRP test page completely, you must modify the `web.xml` file to comment out the element shown in Example E–7.

Note: This element is injected into `web.xml` at packaging time, so you must edit the `web.ml` file in the resulting EAR file.

Example E–7 Removing the WSRP Test Page

```
<servlet-mapping>
   <servlet-name>WSRPTestPage</servlet-name>
   <url-pattern>/info</url-pattern>
</servlet-mapping>
```

E.4 Setting Up a Preference Store

The portlet preference store is used for persisting consumer registration handles and portlet preference data. Portlet producers can use one of three types of preference store: *File*, *Database* and *Consumer*.

Using a consumer preference store ensures that the preference store data is always stored with the consumer application. Whatever happens to the producer over time, the consumer application's registrations and portlets continue to be valid while the producer connections point to functionally compatible producers (that is, the producer should be able to decode the portlet name from the portlet handle and be able to resolve this to the portlet that the consumer application developer expects). When this mechanism is used, the producer itself stores no persistent state whatsoever, meaning that a producer can be switched for another compatible one at any time, with no requirement to perform a preference store migration or export/import cycle.

In a clustered environment, Oracle recommends the use of a database or consumer preference store. If you prefer to use a file-based preference store, then you must also use a shared file system.

If you configure the WebLogic Server to run Portlet Producer applications, then the database preference store is configured for you. For more information, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

This section contains configuration information for the following areas:

- Section E.4.1, "WSRP Producers"
- Section E.4.2, "PDK-Java Producers"

E.4.1 WSRP Producers

WSRP producers have a JNDI preference value that determines which preference store is used, and is set in the `web.xml` file of the Portlet Producer application. Table E–7 lists and describes the JNDI variables used to specify the preference store for WSRP producers.

Table E–7 WSRP Producer Database Preference Store-Related JNDI Variable

Variable Name	Variable Value	Description

`oracle/portal/wsrp/server/persistentStore`	`Database`
	`File`
	`Consumer`
		Determines which data store (File, Database, or Consumer) is used for persisting a Portlet Producer application's consumer registration handles and portlet preferences.

`oracle/portal/wsrp/server/fileStoreRoot`	`portletdata`	Defines the path to the root directory to be used by the file preference store. Absolute paths are interpreted relative to the file system root. Relative paths are interpreted relative to the *`WC_ORACLE_HOME`*`/portal` directory. Note that all producers running within the same WebLogic Server must use the same path for this variable. Otherwise, you get a `Portlet unavailable` error for some portlets.

The following examples show the entries in a producer's `web.xml` file.

Example E–8 Configuring web.xml to Use a Database Preference Store

```
<env-entry>
   <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
   <env-entry-type>java.lang.String</env-entry-type>
   <env-entry-value>Database</env-entry-value>
</env-entry>
```

Example E–9 Configuring web.xml to Use a File-Based Preference Store

```
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>File</env-entry-value>
</env-entry>
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/fileStoreRoot</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>myPrefStore</env-entry-value>
</env-entry>
```

Example E–10 Configuring web.xml to Use a Consumer Preference Store

```
<env-entry>
   <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
   <env-entry-type>java.lang.String</env-entry-type>
   <env-entry-value>Consumer</env-entry-value>
</env-entry>
```

When you have updated the relevant `web.xml` files, restart your WebLogic Server.

E.4.2 PDK-Java Producers

The type of preference store used for PDK-Java producers is determined by the `preferenceStore` tag in the `provider.xml` file. Table E–8 lists and describes the attributes and parameters used with the `preferenceStore` tag when a database preference store is specified.

Table E–8 Attributes and Parameters of the preferenceStore Tag

Attribute/Parameter	Description

`class`	This required attribute specifies the Java class that defines the location and other details of portlet preferences. For example, a file-based preference store might use:
	`<preferenceStore class="oracle.portal.provider.v2.preference.FilePreferenceStore ">`
	A database preference store might use:
	`<preferenceStore class="oracle.portal.provider.v2.preference.DBPreferenceStore">`
	OmniPortlet uses its own class, for example:
	`<preferenceStore class="oracle.webdb.reformlet.ReformletFilePreferenceStore">`

`name`	This required parameter provides a name for the preference store. Use any value you choose. For example:
	`<preferenceStore class="oracle.portal.provider.v2.preference.DBPreferenceStore">`
	`<name>MyPDKProducerPreferenceStore</name>`
	`</preferenceStore>`

`connection`	This required parameter for a database preference store points to a JNDI connection that connects with a schema containing the portlet preference store. For example:
	`<preferenceStore class="oracle.portal.provider.v2.preference.FCFDBPreferenceStore">`
	`<name>MyPDKProducerPreferenceStore</name>`
	`<connection>java:comp/env/jdbc/portletPrefs</connection>`
	`</preferenceStore>`

`rootDirectory`	This optional parameter specifies the location where the file-based preference store preferences are stored. When this parameter is not included with the `preferenceStore` tag, the default file-based preference store location is used. This is the same folder where the producer's provider definition file is stored.

`useHashing`	This optional parameter is used when specifying a file based preference store, and accepts the value `true` or `false`. When it is set to `true`, each preference data file is stored in an extra subdirectory with a name determined by hashing the data file name. Using this parameter can improve file system performance by limiting the number of preference data files stored in a single directory.
	For example:
	`<preferenceStore class="oracle.portal.provider.v2.preference.FilePreferenceStore">`
	`<name>PDKProducerPreferenceStore</name>`
	`<useHashing>true</useHashing>`
	`</preferenceStore>`

E.5 Portlet Preference Store Migration Utilities

A preference store is a mechanism for storing information like user preference data, portlet and producer settings, or even portlet data. Preferences can be stored in a database, which is recommended for high availability configurations, a file system, or with the consuming application. You can migrate the following stores for your Framework applications:

- Section E.5.1, "JPS Portlet Preference Store - PersistenceMigrationTool"
- Section E.5.2, "PDK-Java Portlet Preference Store - Migration and Upgrade Utilities"
- Section E.5.3, "Web Clipping Repository"
- Section E.5.4, "Moving a Producer"

E.5.1 JPS Portlet Preference Store - PersistenceMigrationTool

A WSRP container preference store is a mechanism used for persisting consumer registration and portlet preference data. Currently, there are three preference store implementations, *database preference store*, *file-based preference store*, and *consumer preference store*. A database preference store persists data using a relational database. A file-based preference store persists data using the file system. A consumer preference store ties the producer metadata to the consumer application. A file-based or consumer preference store may be used for testing, since it removes the dependency on a database. But, for highly available configurations, Oracle recommends that you use a database or consumer preference store.

The WSRP container preference store migration utility, `PersistenceMigrationTool`, enables you to migrate existing data between database and file-based preference stores (for example, from a database preference store to a file preference store). This utility also enables upgrading users to ensure that their existing locale-specific portlet preference data uses a naming format compatible with the latest JPS release. You can also use this utility to migrate between source and destination stores of the same type, enabling data to be moved from one database store to another.

Note: You cannot use the preference store migration utility to migrate to or from a consumer preference store. To migrate to or from a consumer preference store, you must export the data from one producer from the consumer and import into another.

1. Export the producer metadata from your consumer application to an EAR file, using JDeveloper or WLST. This contacts the remote producer to get customization data, and so on.
2. Either remap the producer connection to another producer, which can be using any preference store type, or change the preference store configuration of the current producer, and restart it.
3. Import from the exported EAR file back to your consumer application. This pushes the relevant metadata back to the producers, which then store it in their configured preference store.

For information about exporting and importing producers using JDeveloper, see Section E.6, "Exporting and Importing Portlet Producers at Design Time." For information about exporting and importing producers using WLST, see the section "Exporting and Importing Custom WebCenter Applications for Data Migration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The syntax of the `PersistenceMigrationTool` is:

```
java oracle.portlet.server.containerimpl.PersistenceMigrationTool
-sourceType [file | db]
-destType [file | db]
{-sourcePath [dir |
 -sourceUsername username -sourcePassword password -sourceDatabase db]}
{-destPath [dir | destUsername username -destPassword password -destDatabase db]}
[-debug]
```

where:

`sourceType` indicates whether the source store is in a file or database. You can have source and destination stores of the same type. Hence, you can migrate from one database to another or one file system to another.

`destType` indicates whether the destination store is in a file or database. You can have source and destination stores of the same type. Hence, you can migrate from one database to another or one file system to another.

`sourcePath` is the location of a file-based preference store. This argument is required when `sourceType` is `file`.

`sourceUsername` is the database user name for a preference store database. This argument is required when `sourceType` is `db`.

`sourcePassword` is the database password for a preference store database. This argument is required when `sourceType` is `db`.

`sourceDatabase` is the name of a preference store database. This argument is required when `sourceType` is `db`.

`destPath` is the location of a file-based preference store. This argument is required when `destType` is `file`.

`destUsername` is the database user name for a preference store database. This argument is required when `destType` is `db`.

`destPassword` is the database password for a preference store database. This argument is required when `destType` is `db`.

`destDatabase` is the name of a preference store database. This argument is required when `destType` is `db`.

`debug` turns on full logging through standard output to enable users to diagnose issues that arise when the tool runs.

Note: There are several libraries that must be referenced in the classpath when running the `PersistenceMigrationTool` utility:

- `wcs-producer-spi.jar`
- `portlet-utils.jar`
- `portlet-producer-container-common.jar`
- `portlet-producer-container-persistence.jar`
- `oracle-portlet-api.jar`
- `wsrp-container.jar`
- `oracle-portlet-tags.jar`
- `ojdbc6.jar`

The `ojdbc6.jar` library referenced in the classpath must be the same as the one used by your database.

Example E–11 demonstrates running the `PersistenceMigrationTool` utility. In this example, preferences from a database store are copied to a file store.

Example E–11 Running the PersistenceMigrationTool Utility

```
./java  -classpath
ORACLE_COMMON_HOME/webcenter/modules/com.bea.wsrp_10.3.2.0/system/wcs-producer-spi.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.portlet.server_11.1.1/portlet-utils.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-common.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-persistence.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/oracle-portlet-api.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/wsrp-container.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/oracle-portlet-tags.jar:
DB_ORACLE_HOME/jdbc/lib/ojdbc6.jar
oracle.portlet.server.containerimpl.PersistenceMigrationTool
-sourceType db \
-sourceUsername scott \
-sourcePassword tiger \
-sourceDatabase abc.mycompany.com:1521:yourdatabase \
-destType file \
-destRoot /data/prefs
```

where:

- *ORACLE_COMMON_HOME* is your Oracle Common home
- *WC_ORACLE_HOME* is your WebCenter Portal Oracle home
- *DB_ORACLE_HOME* is your database Oracle home if it is on the same machine as the WebCenter Portal Oracle home. If the database Oracle home is on a separate

machine, then you must copy the *DB_ORACLE_HOME/jdbc/lib* directory into a temporary directory on the WebCenter Portal Oracle home and reference the `ojdbc6.jar` library from this temporary directory in the classpath.

E.5.2 PDK-Java Portlet Preference Store - Migration and Upgrade Utilities

PDK-Java has two `PreferenceStore` implementations, `DBPreferenceStore` and `FilePreferenceStore`. `DBPreferenceStore` persists data using a JDBC-compatible relational database and `FilePreferenceStore` persists data using the file system.

If you have installed Oracle PDK, then you can manage the information stored in the preference store by using the Preference Store Migration and Upgrade Utility, which is included in the `pdkjava.jar` file. Note that you must run this tool from `WC_ORACLE_HOME`. The syntax of the migration utility is:

Note: You must set the classpath when running this tool to include `pdkjava.jar`, `ptlshare.jar`, and `ojdbc6.jar`. For example:

```
java -classpath WC_ORACLE_HOME\jdeveloper\modules\oracle.dms_
11.1.1\dms.jar;
WC_ORACLE_HOME\wlserver_10.3\server\lib\ojdbc6.jar;WC_ORACLE_
HOME\jdeveloper\webcenter\modules\oracle.portlet.server_
11.1.1\pdkjava.jar;
WC_ORACLE_HOME\jdeveloper\webcenter\modules\oracle.portlet.server_
11.1.1\ptlshare.jar
oracle.portal.provider.v2.preference.MigrationTool
```

```
java oracle.portal.provider.v2.preference.MigrationTool
  -mode [file | db | filetodb | filetofile | dbtofile | dbtodb]
  [-remap language | locale]
  [-countries iso_country_code]
  [-pref1UseHashing true | false]
  [-pref1Driver driver]
  {-pref1RootDirectory directory |
   -pref1User username -pref1Password password -pref1URL url}
  [-pref2UseHashing true | false]
  [-pref2Driver driver]
  {-pref2RootDirectory directory |
   -pref2User username -pref2Password password -pref2URL url}
  [-upfixwpi filename]
```

where

- `-mode` is the mode in which you want to run the Preference Store Migration and Upgrade Utility

  `filetodb`, `filetofile`, `dbtofile`, or `dbtodb` indicates to run in migration mode. See Section E.5.2.1, "Migration Mode" for more information about this mode.

  `file` or `db` indicates to run in upgrade mode. See Section E.5.2.2, "Upgrade Mode" for more information about this mode.

- `-remap` is the `localePersonalizationLevel` (language or locale). Note that you only must use this option to change `localePersonalizationLevel` as part of your upgrade or migration.

- `-countries` specifies a prioritized list of ISO country codes, indicating your order of preference in a collision between remapped preferences for different countries. `-countries` is only meaningful if you also specified the `-remap` option.
- `-pref1UseHashing` specifies whether you want to employ hashing on the source for this operation.
- `-pref1Driver` is the driver for the source database. If you do not specify this parameter, the nearest matched driver is used.
- `-pref1RootDirectory` is the path of a source file system, for example, `j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample`.
- `-pref1User` is the user name for a source database.
- `-pref1Password` is the password for a source database.
- `-pref1URL` is the URL to a source database, for example, `jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid`.
- `-pref2UseHashing` specifies whether you want to employ hashing on the destination for this operation.
- `-pref2Driver` is the driver for the destination database. If you do not specify this parameter, the nearest matched driver is used.
- `-pref2RootDirectory` is the path of a destination file system, for example, `j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample`.
- `-pref2User` is the user name for a destination database.
- `-pref2Password` is the password for a destination database.
- `-pref2URL` is the URL to a destination database, for example, `jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid`.
- `-upfixwpi` indicates a log file for the operation.

This section includes the following subsections:

- Section E.5.2.1, "Migration Mode"
- Section E.5.2.2, "Upgrade Mode"

E.5.2.1 Migration Mode

Use a migration mode to copy data from a source preference store to a target preference store. When the utility is run in this mode, the preference stores for all the portlet definitions are updated.

Table E–9 describes the migration modes in which you can run the utility.

Table E–9 Migration Modes in Which to Run the Utility

Mode	Description
`filetodb`	Use when data must be copied from a `FilePreferenceStore` to a `DBPreferenceStore`.
`filetofile`	Use when data must be copied from one `FilePreferenceStore` to another `FilePreferenceStore` that is in a different location.
`dbtofile`	Use when data must be copied from a `DBPreferenceStore` to a `FilePreferenceStore`.

Table E–9 (Cont.) Migration Modes in Which to Run the Utility

Mode	Description
dbtodb	Use when data must be copied from one DBPreferenceStore to another DBPreferenceStore that is based on a different database table.

If the destination for the operation is a database, you must ensure that the destination WebLogic Server is created using the WebCenter Portal portlet template and the appropriate schemas have been created using the RCU. For more information, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

When using a migration mode, you can also use the -remap and -countries options to specify that the data must be upgraded while being migrated. Specifically, you use these options to ensure that the locale-specific preferences are appropriately remapped.

You can use the other options accepted by the utility to specify the properties of the preference stores involved in the upgrade or migration process. These options must correspond to the tags you specify in provider.xml to describe the preference stores.

Properties beginning with the prefix -pref1 correspond to properties of the source preference store (in an upgrade mode, this is the only preference store). For example, specifying -pref1UseHashing true -pref1RootDirectory j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample sets the useHashing and rootDirectory properties of a source FilePreferenceStore.

When a migration basic mode is selected, properties beginning with the prefix -pref2 correspond to properties of the target preference store. For example, specifying -pref2User portlet_prefs -pref2Password portlet_prefs -pref2URL jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid sets the database connection details on a target DBPreferenceStore.

Example E–12 PDK-Java Migration Utility Command Line, Migration

```
java -classpath WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_
11.1.1/pdkjava.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/ptlshare.jar:WC_
ORACLE_HOME/ucm/shared/classes/ojdbc14.jar \
oracle.portal.provider.v2.preference.MigrationTool \
-mode dbtofile \
-pref1User portlet_prefs \
-pref1Password portlet_prefs \
-pref1URL jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid \
-pref2RootDirectory /mydirectory/preferences
```

E.5.2.2 Upgrade Mode

Use an upgrade mode to upgrade data in place, and to modify existing locale-specific preferences in the preference store so that the naming format used is compatible with the current version of Oracle Portal and a given localePersonalizationLevel setting.

Table E–10 describes the upgrade modes in which you can run the utility.

Table E–10 Upgrade Modes in Which to Run the Utility

Mode	Description
`file`	Use when data in a `FilePreferenceStore` must be upgraded.
`db`	Use when data in a `DBPreferenceStore` must be upgraded.

An upgrade mode can be used in the following scenarios:

- You have upgraded from Oracle PDK 9.0.4.0.0 or earlier and want to use existing portlets with the default `localePersonalizationLevel` setting of language (In earlier releases, the default setting was `locale`).
- You have upgraded from Oracle Portal 9.0.2.0.0 or earlier and want to use existing portlets with a `localePersonalizationLevel` setting of `locale` (Oracle Portal now uses different names for some locales and therefore some existing data must be remapped).
- You want to change the `localePersonalizationLevel` for an existing portlet from `locale` to `language` or vice-versa.

When using an upgrade mode, you must use the `-remap` option to specify the `localePersonalizationLevel` (`language` or `locale`) that you are upgrading to. You can also use the `-countries` option to specify a prioritized list of ISO country codes, indicating your order of preference in a collision between remapped preferences for different countries. For example, if you specify `-remap language -countries GB,US` in the command, then it means that if the utility comes across both US English and British English preferences (`en_US` and `en_GB`) in a given preference store, it remaps the British English preference to become the English-wide preference (`en`).

Example E–13 PDK-Java Migration Utility Command Line, Upgrade

```
java -classpath WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_
11.1.1/pdkjava.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/ptlshare.jar:WC_
ORACLE_HOME/ucm/shared/classes/ojdbc14.jar \
  oracle.portal.provider.v2.preference.MigrationTool \
 -mode file -remap language
 -countries GB,US -pref1UseHashing true
 -pref1RootDirectory j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample
```

E.5.3 Web Clipping Repository

Web Clipping does not have a preference store as such, but it stores Web Clipping definitions and associated metadata. By default, it uses MDS, which is file-based, for this purpose. But you can configure Web Clipping to use a database. To migrate this repository for Framework applications, you can use the Predeployment tool in export and import mode to go from MDS to a database, or vice versa. This procedure must be done for each application as follows:

1. Run the Predeployment tool in `export` mode on all Framework applications that use the Web Clipping producer. For more information, see Section 61.2.10, "How to Implement Export of Customizations (WSRP 2.0)."
2. Update the producer to use a different repository. For information, see Section E.2.1.3, "Configuring Web Clipping Repository in provider.xml."

3. Run the Predeployment tool in `import` mode on all Framework applications that use the Web Clipping producer. For more information, see Section 61.2.10, "How to Implement Export of Customizations (WSRP 2.0)."

E.5.4 Moving a Producer

In some situations, you may want to move a portlet producer. To do so, you must:

1. Install the new producer.
2. Make the preference store of the original producer available to the new producer by performing one of the following tasks:
   - Migrate the preference store using the Preference Store Migration and Upgrade Utilities (see Section E.5.2, "PDK-Java Portlet Preference Store - Migration and Upgrade Utilities" for more information), or
   - Configure the new producer to use the same preference store as the original producer. If the database preference store is being used, then you must point the WebLogic Server data source to the same database as the original producer.
3. Update the URL of the producer registration by using Enterprise Manager Fusion Middleware Control or the WLST commands: `setWSRPProducerRegistration` or `setPDKJavaProducerRegistration`.

E.6 Exporting and Importing Portlet Producers at Design Time

You can export and import portlet producers at design time.

This section includes the following subsections:

- Section E.6.1, "Exporting Portlet Producers at Design Time"
- Section E.6.2, "Importing Portlet Producers at Design Time"

E.6.1 Exporting Portlet Producers at Design Time

When you package an application for deployment, any portlet producers referenced by the application are contacted so that the producer data can be included in the MAR file. If any of the producers are not running, they cannot be contacted and the data cannot be included.

By creating an export archive of the producer data at design time instead, you can ensure that the producers are running, therefore all the producer data, including remote customizations and client-side metadata, can be retrieved. WebCenter Portal: Framework can then use the export archive at deployment, instead of having to contact the remote producers.

To export portlet producers at design time:

1. Edit the *`WC_ORACLE_HOME`*`/jdeveloper/jdev/bin/jdev.conf` file and set the following JVM flag:

   ```
   AddVMOption  -Doracle.webcenter.portlet.dt.disableRemoteExport=true
   ```

   Setting this flag ensures that, when the application is packaged for deployment, the export archive you create in the following steps is included in the MAR file, rather than the remote producers being contacted to retrieve producer data.
2. Restart JDeveloper to apply the new setting.

3. Open the application that consumes the producers to export.
4. From the menu, choose **Application** and then **Export Portlet Producers**.

   This menu option appears only if the current application contains producers.
5. In the Export Portlet Producers dialog, in the **Export Archive File Name (.ear)** field, enter the absolute path and file name to use for the export set.
6. Click **OK**.

   When the application is packaged for deployment, because you set the `disableRemoteExport` flag to `true`, WebCenter Portal: Framework checks for the presence of the export archive at the location specified in the dialog. If the export archive exists, the contents of the archive are included in the MAR file instead of contacting the remote producers to retrieve producer data.

   Note: If the `disableRemoteExport` flag is set and there is no export archive, a default export archive, without the remote producer data, is created and included in the MAR file.

E.6.2 Importing Portlet Producers at Design Time

You can import producer data, including customizations made at runtime, from a deployed application into your application at design time.

Note: The producers in the export archive (EAR file) must be the same as those in the application into which they are being imported.

For information about how to create an export archive of producer metadata from a deployed application, see the section "Exporting Portlet Client Metadata (WebCenter Portal: Framework Application)" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To import portlet producers at design time:

1. Edit the *`WC_ORACLE_HOME`*`/jdeveloper/jdev/bin/jdev.conf` file and set the following JVM flag:

   ```
   AddVMOption  -Doracle.webcenter.portlet.dt.enableImport=true
   ```
2. Restart JDeveloper to apply the new setting. This ensures that the **Import Portlet Producers** menu option is available.
3. Open the application into which you want to import the producers.
4. From the menu, choose **Application** and then **Import Portlet Producers**.
5. In the Import Portlet Producers dialog, in the **Import Archive File Name (.ear)** field, enter the absolute path and file name of the export archive to import.
6. Click **OK**.

   Note: If the application into which you import producers is currently running in Integrated WLS, you must re-run the application to see the updated producers. Simply refreshing the page may result in errors caused by the different MDS instances used at design time and runtime.

E.7 Migrating WebLogic Portal Portlets to WebCenter Portal

This section discusses migrating WebLogic Portal portlets developed with the WebLogic Portal's Eclipse IDE to WebCenter Portal's JDeveloper environment.

Note: There is no direct support or tooling available for migrating WLP portlets to a WebCenter Portal project. In many cases, significant refactoring and recoding is required. This section highlights some of the migration issues and offers recommendations as appropriate.

E.7.1 Migrating Java Portlets from WebLogic Portal to WebCenter Portal

In general, JSR 286 standard portlets (Java portlets) that were developed in WebLogic Portal can be moved directly to a WebCenter Portal/JDeveloper environment. Simply copy all of the portlet artifacts (`portlet.xml`, `.java` files, `.jsp` files, and so on) into a JDeveloper Portlet Producer application project.

Note: Any WebLogic Portal specific APIs used by the portlet must be rewritten to use WebCenter Portal APIs. WebLogic Portal specific APIs will not work in a WebCenter environment.

Tip: You can use the WebLogic Portal Export feature to export your Java portlets to an archive file and then import the archive file into your JDeveloper project. This technique may be simpler than manually copying all the portlet artifacts from one environment to another. See "Exporting Java Portlets for Use on Other Systems" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*.

E.7.2 Problems With Migrating WLP Portlets to a WebCenter Portal Application

Moving portlets from a WLP development environment to a WebCenter Portal development environment is not directly supported. In general, this process can involve substantial rewriting or refactoring of the migrated portlet code and related files.

Note: If a portlet (regardless of type) was capable of running over WSRP in WebLogic Portal, the portlet can be consumed directly from the WebLogic Portal's portlet producer in a WebCenter Portal consumer. See "WSRP Interoperability with WebCenter Framework" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

Problems inherent in moving WebLogic Portal portlets directly to a WebCenter Portal project in JDeveloper can include the following:

- **URL Generation** – Some URL types supported by WebLogic Portal do not work in WebCenter Portal, including DesktopURL, CustomEventURL, PageURL, WindowURL, StandalonePortletURL, and possibly others.
- **Events** – The WebCenter Portal consumer does not generate all of the events that the WebLogic Portal framework generates. These unsupported events include Init,

LookAndFeelReinit, Notification, Refresh, WindowActivation, WindowDeactivation, and possibly others.

- **Render Dependencies** – WLP render dependencies do not work in WebCenter.
- **WLP Framework APIs** – Many WLP APIs are not supported in WebCenter Portal.

E.7.3 General Tips for Migrating WLP Portlets to a WebCenter Portal Portlet Producer Application

This section provides general guidance on moving WLP portlets into WebCenter Portal's portlet producer environment. Although portlet migration is not directly supported, this section lists tips that might help you with the manual migration process of the various WLP portlet types.

> **Caution:** This section provides general guidance only. As discussed in Section E.7, "Migrating WebLogic Portal Portlets to WebCenter Portal," direct migration of WLP portlet types to WebCenter Portal application or portlet producer application is not directly supported. In almost all cases, rewriting and refactoring of existing portlet code is required when moving portlets from WLP to WebCenter Portal.
>
> As noted previously, any WebLogic Portal specific APIs used by the portlet must be rewritten to use WebCenter Portal APIs. WebLogic Portal specific APIs will not work in a WebCenter environment.

- **JSP portlets** – Moving JSP portlets directly into a WebCenter Portal project is not supported. You can consider refactoring the JSP portlet into a JSR286 portlet and then migrate it as explained in Section E.7.1, "Migrating Java Portlets from WebLogic Portal to WebCenter Portal."
- **JSR 168/286 portlets** – Most Java (JSR 168 / 286) portlets can be directly imported to a WebCenter Portal portlet producer and run as JSR286 portlets. Some JSR168 portlets that take advantage of specific error conditions guaranteed by the JSR168 specification may need to be run in a JSR168 compatibility mode. See "JSR-286/JSR-168 Portlet Compatibility" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*. JSR168 portlets using WLP's proprietary eventing (event subscriptions declared in a `.portlet` file) must be re-written to use JSR286 events.
- **Java Page Flow portlets** – JPF portlets are not supported by WebCenter Portal's portlet producer and must be either consumed from a WebLogic Portal WSRP producer or refactored to become JSR286 or JSF portlets.
- **JSF portlets** – If the portlet is written to the JSR329 JSF Portlet bridge in WLP, it should run on a WebCenter producer with no changes. For portlets using the WLP "native" JSF portlet bridge, the portlet must be consumed from a WebLogic Portal producer or upgraded to a JSF 1.2 portlet using the JSR329 bridge. See also "Working With JSF-Java Portlets" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*.
- **Clipper portlets** – Clipper portlets are not supported in WebCenter portal, but the web clipping features in WebCenter Portal's pagelet producer provide equivalent functionality.
- **Struts portlets** – Moving Struts portlets directly into a WebCenter Portal project is not supported. You can consider refactoring the JSP portlet into a JSR286 portlet

and then migrate it as explained in Section E.7.1, "Migrating Java Portlets from WebLogic Portal to WebCenter Portal."

- **Content Presenter portlets** – WLP Content Presenter portlets will not work over WSRP and will not work with WebCenter. Portal However, equivalent functionality is available in WebCenter Portal's content presenter. See "Publishing Content Using Content Presenter" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Remote (WSRP) portlets** – Remote (WSRP) portlets consumed in WLP can be consumed in a WebCenter Portal's consumer instead. Remote portlets taking advantage of WLP-specific WSRP features may need modification. For example the custom data transfer feature must be replaced by using events or shared parameters to convey data. See "WSRP Interoperability With WebCenter Framework" and "Configuring WSRP Security Between WLP and WebCenter Framework" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

F

Reuse of Oracle Portal Components

This appendix describes how to reuse components from your existing Oracle Portal application in an application built with Oracle WebCenter Portal: Framework.

This appendix includes the following sections:

- Section F.1, "Introduction to Oracle Portal Components"
- Section F.2, "Reusing Portlets"
- Section F.3, "Reusing Items"

F.1 Introduction to Oracle Portal Components

The two most basic building blocks of Oracle Portal are as follows:

- Portlets are the fundamental building blocks of a portal page. Portlets can be deployed to Oracle Portal through three producer (known in Oracle Portal as provider) types:
  - **Web (or Oracle PDK-Java) producers** use open standards, such as XML, SOAP, HTTP, or J2EE for deployment, definition, and communication with applications. The Oracle PDK-Java provides a framework that simplifies the task of building Web producers. For more information, see Section 58.2.3.1, "PDK-Java Producers."
  - **WSRP producers** serve as the containers for standards-based portlets. For more information, see Section 58.2.3.2, "WSRP Producers."
  - **Database producers** own one or more database portlets. Examples of database portlets include, portlets built using the Oracle PDK-PL/SQL, Portlet Builder portlets (charts, forms, reports, and so on), and Oracle Portal page portlets).

  In WebCenter Portal: Framework, you can make Web and WSRP portlets available by registering their producers with the application. For more information, see Section F.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets."

  You can also make database portlets available to Framework applications by using the Federated Portal Adapter. For more information, see Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."
- Items are individual pieces of content (text, hyperlink, image, and so on) that reside on a page in an item region. Users with an appropriate privilege level can add items to a page. Item content and metadata are stored in the Oracle Portal schema of the Metadata Repository. Items are rendered on the page according to the layout, style, and attribute display defined for the item region.

Because items are stored in a content repository, you can retrieve them with Java Content Repository (JCR) data controls. A default adapter for the Oracle Portal content repository is provided with WebCenter Portal: Framework. For more information, see Section F.3, "Reusing Items."

Given the technical differences between Oracle Portal and WebCenter Portal, there is no direct upgrade available across the platform. However, key components of your portal can be exposed within WebCenter Portal.

F.2 Reusing Portlets

You can make the portlets used in your portal available to your Framework applications.

This section includes the following subsections:

- Section F.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets"
- Section F.2.2, "What You May Need to Know About Events"
- Section F.2.3, "What You May Need to Know About Mobile Portlets"
- Section F.2.4, "What You May Need to Know About the Portlet Chrome"
- Section F.2.5, "What You May Need to Know About Personalizations and Customizations"
- Section F.2.6, "What You May Need to Know About Oracle Portal System Resources"
- Section F.2.7, "What You May Need to Know About Partner and External Applications"
- Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets"
- Section F.2.9, "What You May Need to Know About Troubleshooting the Federated Portal Adapter"
- Section F.2.10, "What You May Need to Know About Limitations of the Federated Portal Adapter"
- Section F.2.11, "How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions"

F.2.1 How to Reuse JSR 286 and Oracle PDK-Java Portlets

To reuse JSR 286 and Oracle PDK-Java portlets in your Framework application, simply register the producers in the same way as any other producer.

To reuse JSR 286 and Oracle PDK-Java portlets:

1. In Oracle JDeveloper, access the WSRP or Oracle PDK-Java Producer Registration wizard.
2. Step through the wizard providing information about the producer, including the URL endpoint.
3. Open the page to which you to add the portlet.
4. Drag the portlet from the registered producer to the appropriate part of the page.

For more detailed information about consuming portlets in a Framework application, see Chapter 64, "Consuming Portlets."

F.2.2 What You May Need to Know About Events

Oracle PDK-Java events are not supported in WebCenter Portal: Framework. If you have Oracle PDK-Java portlets that use events and you deploy them in an WebCenter Portal: Framework environment, then the events are ignored.

F.2.3 What You May Need to Know About Mobile Portlets

Mobile portlets are not supported in WebCenter Portal: Framework. If you have Oracle PDK-Java mobile portlets, then they do not work in a WebCenter Portal: Framework environment.

F.2.4 What You May Need to Know About the Portlet Chrome

In WebCenter Portal: Framework, the portlet does not provide the chrome. The consuming application provides the chrome. This behavior conforms to the WSRP convention, but it is a change from Oracle Portal, where Oracle PDK-Java provided the chrome for portlets. Hence, the Oracle PDK-Java portlet header is filtered out in the WebCenter Portal: Framework environment.

As part of this filtering process, WebCenter Portal: Framework parses the title area of PDK-Java portlets to preserve the title and add the necessary portlet mode links. The filtering algorithm is as follows:

- If the portlet has multiple tables, then the title area is considered to be the first table. If the portlet has only one table, then the title area is considered to be the first row in that table.
- The first text in the title area is considered to be the title. If the portlet has no tables or a discernible title, then the title is taken from the `adfp:portlet` component.
- Any link that contains the fragment `_mode=` *`parameter`* is considered to be a portlet mode link. These links are moved into the portlet menu by WebCenter Portal: Framework.

If you want to bypass the rendition of the header section of your portlet chrome and reuse its original, Oracle PDK-Java header, then you can set the `displayHeader` attribute of the `adfp:portlet` tag to `false` and `retainPortletHeader` as `true` in the associated portlet bindings of the page definition XML. Setting `retainPortletHeader=true` in the page definition portlet binding retains the portlet header in the portlet response. Setting `displayHeader=false` in the `adf:portlet` tag suppresses the application's header for the portlet chrome, and hides the icons and links normally displayed in the header.

F.2.5 What You May Need to Know About Personalizations and Customizations

Portlet customizations and personalizations that you or your users applied to your portlets in Oracle Portal are not carried over to your Framework application. In a Framework application, your Oracle Portal portlets are treated as new instances. Hence, previous personalizations and customizations are not available.

F.2.6 What You May Need to Know About Oracle Portal System Resources

Portlets built with a target consumer of Oracle Portal in mind tend to make invalid assumptions about the runtime environment. For example, the portlet might assume the presence of Oracle Portal resources, such as images or JavaScript functions. In WebCenter Portal: Framework, these resources are not available. Hence, you must bundle the resources the portlet needs with the producer to ensure that the portlet runs properly in the WebCenter Portal: Framework environment.

Another common issue with portlets designed for Oracle Portal consumption is the portlet assuming the Oracle Portal URL format and the presence of Oracle Portal parameters. The page URL of an Oracle ADF application is different from that of Oracle Portal. Therefore, portlet developers cannot make assumptions about the page URL and must prepare their Oracle PDK-Java portlets for execution in the WebCenter Portal: Framework environment by using the proper portlet APIs.

F.2.7 What You May Need to Know About Partner and External Applications

Partner applications are not supported. External applications are supported. Automatic login is supported through an external application automated login servlet, which is automatically configured in your application when you register a producer.

F.2.8 How to Use the Federated Portal Adapter to Reuse Database Portlets

The Federated Portal Adapter is a component of Oracle Portal that enables Oracle Portal instances to share their database portlets through the Web portlet interface. The Federated Portal Adapter receives the SOAP messages for a Web producer, parses the SOAP and then dispatches the messages to a database producer as PL/SQL procedure calls. In effect, the Federated Portal Adapter makes a database producer behave in the same way as a Web producer. You can make Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets, available for use in your Framework applications.

> **Note:** You can also expose Oracle Portal pages in WebCenter Portal through the Federated Portal Adapter by publishing them as portlets in Oracle Portal.

Implementing the Federated Portal Adapter for your portal exposes the Oracle Portal portlets through the Oracle PDK-Java Web producer protocol making it possible to register them as PDK-Java producers. Registering the producer with a Framework application causes the portlets to appear in the Component Palette, and you can then drag and drop them onto pages in the same way as any other portlet. Without the Federated Portal Adapter, you cannot access these producers from a Framework application.

For more information about the Federated Portal Adapter, see the chapter "Using the Federated Portal Adapter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.

To register a Federated Portal Adapter producer with WebCenter Portal:

1. Set up the Oracle Portal environment for the Federated Portal Adapter. For more information, see the section "Setting Up the Environment to Use the Federated Portal Adapter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.
2. To register an instance of Oracle Portal through the Federated Portal Adapter, the portal must have a user named "PORTAL" in Oracle Internet Directory. To create this user:
   a. Log in to the Oracle Portal instance as the portal administrator user.
   b. In the **User** portlet, click **Create New Users.**

      By default, the **User** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.

c. In the **Last Name** field, enter `PORTAL`.

d. In the **User ID** field, enter `PORTAL`.

e. In the **Password** and **Confirm Password** fields, enter an appropriate password.

f. In the **Email Address** field, enter an appropriate email address.

g. Click **Submit,** then **Done.**

h. In the **Portal User Profile** portlet, enter `PORTAL` in the **Name** field, and click **Edit.**

By default, the **Portal User Profile** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.

i. In the **Default Group** field, enter `PORTLET_PUBLISHERS`.

j. Click **OK.**

3. If you want to display Oracle Portal pages in your Framework applications, you must first publish each of those pages as portlets. To display Oracle Portal pages, edit the page properties and select **Publish As Portlet** on the **Optional** tab. For more information, see the section "Placing One Page Onto Another" in the *Oracle Fusion Middleware User's Guide for Oracle Portal*.

4. Confirm that the users of the Framework application have appropriate privileges on the portlets and pages exposed through the Federated Portal Adapter, and that they map to the users of the Oracle Portal instance. The user name for a person on the Framework application should map to the user name of the same person in Oracle Portal. For example, JSMITH should represent the same person in both the Framework application and Oracle Portal.

5. In Oracle JDeveloper, register the producer as an Oracle PDK-Java producer using the Federated Portal Adapter URL and Service ID:

```
http://host:port/adapter/dad/schema
```

To verify the URL, enter it in a browser. If the URL is correct you should see the following message:

```
Congratulations - you got to the adapter test page
```

If you are logged in you should see a list of producers, their service IDs, and the portlets each provides. If you are logged in as an Oracle Portal administrator, you should also see additional details about page portlets and Oracle Portal HMAC registrations.

When you register the producer, ensure that you select the **Establish Producer Sessions** checkbox on the Specify Connection Details page of the wizard. This is so that the WebCenter Portal user information is correctly propagated to Oracle Portal.

For more information, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

6. You can drag and drop the producer's portlets onto a page.

7. To secure communication between the Oracle Portal instance and WebCenter Portal, provide a shared key using Hash Message Authentication Code (HMAC):

a. Go to SQL*Plus and log in as the portal schema owner.

b. Run:

```
@wwc/proadssr.sql http://www.oracle.com/adapter/portal
```

Note that, for Framework applications, the adapter URL is always the same:

```
http://www.oracle.com/adapter/portal
```

c. Enter a shared key code.

d. In Oracle JDeveloper, enter this shared key code into the **Shared Key** field on the Specify Additional Registration Details step of the Create/Edit Oracle PDK-Java Portlet Producer wizard or dialog.

Note: To remove the shared key from the Oracle Portal instance use:

```
@wwc/proadsdr.sql
```

---

8. Certain portlets built in Oracle Portal, such as page portlets and several sample database portlets, assume that the set of images shipped in the portal middle tier are available in the path `/images` in the Web server of the portal page. These images are not available by default for your Framework applications. For these images to display correctly:

   a. Download the following zip file:

   http://download.oracle.com/otndocs/tech/portal/files/portal-images.zip

   b. Extract the contents of the zip file and mount the contents under the URL `/images`.

9. You can now run the page that contains the portlet.

F.2.9 What You May Need to Know About Troubleshooting the Federated Portal Adapter

The following information may help when trying to resolve issues with the Federated Portal Adapter in WebCenter Portal.

This section includes the following subsections:

- Section F.2.9.1, "On Registration"
- Section F.2.9.2, "During Runtime"

F.2.9.1 On Registration

Error occurred trying to register producer

The shared key has not been set up in the Oracle Portal instance or it does not match that given in Oracle JDeveloper, or the service ID has not been entered.

Could not Contact Producer

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal instance could not be contacted (for example, it is behind a firewall or is not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.

- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

F.2.9.2 During Runtime

Could not Contact Producer

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal could not be contacted (for example, if it is behind a firewall or not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.
- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

Portlet does not render properly

- If images are missing or appear as links, see the instructions for downloading the images zip file provided in Section F.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."
- If navigation does not work properly, try editing the page and setting `RenderPortletInIframe` to `true`. Some portlets work better in their own inline frame (IFRAME).
- If the portlet responds with the following message, try putting the portlet in an IFRAME, by setting `RenderPortletInIframe` to `true`:

  ```
  The portlet attempted to issue a redirect in response to a render request.
  ```

- If popups, lists of values, and so on do not work in the portlet, it may be because JavaScript exceptions are raised in an attempt to avoid XSS attacks. The popup must have the same server URL as the Framework application.
- If a portlet renders a blank screen for Customize or Personalize, it may be that the user does not have permission to edit the portlet. Check the Portal log files.

F.2.10 What You May Need to Know About Limitations of the Federated Portal Adapter

The following limitations apply when using the Federated Portal Adapter with WebCenter Portal:

- Deep linking may not work. In some cases, putting the portlet in an IFRAME helps (setting `RenderPortletInIframe` to `true`).
- Links rendered by the portlet must be absolute URLs.
- If a page portlet displays a page with tabs it should be placed into an IFRAME.

- Refresh, Collapse, and Remove portlet links do not work in portlets displayed in page portlets.
- Not all objects are returned by the Federated Portal Adapter, and thus are not visible in WebCenter Portal. For a full list, see "Oracle Portal - Limitations" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

F.2.11 How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions

If you have a producer that you designed and deployed on Oracle Application Server Release 2 (10.1.2) or earlier, then you can reuse it in either one of two ways:

- You can consume a portlet from a producer running on an Oracle Application Server Release 2 (10.1.2.0.2) middle tier. In this case, the producer's code is running on Release 2 (10.1.2.0.2) while the application consuming the producer is running on Release 11.
- You can redeploy the producer application as an EAR file on Oracle WebLogic Server and consume its portlets in other Framework applications. In this case, both the producer's code and the consuming application run on Release 11.

In either of these cases, you must take some additional steps to get the producer's portlets to operate correctly. Portlets built for Oracle Portal expect certain boilerplate images to be present on the page assembly servlet and they break if those images are not available. These images were included in the middle-tier servlet by default in Oracle Application Server Release 2 (10.1.2.0.2), but for WebCenter Portal: Framework you must manually ensure that the images can be found by portlets.

This section includes the following subsections:

- Section F.2.11.1, "Consuming a Portlet from Oracle Portal"
- Section F.2.11.2, "Redeploying PDK-Java Producers from Oracle Portal"

F.2.11.1 Consuming a Portlet from Oracle Portal

In WebCenter Portal, to consume a portlet running on a page in an Oracle Portal instance, you can do either of the following:

- Obtain the Oracle Portal images zip file from the Oracle Technology Network and unzip it inside the ADFP servlet.
- Properly configure the resource servlet as follows:

1. Add an initialization parameter to the Web servlet as shown is Example F–1.

Example F–1 Web Servlet Initialization Parameters

```
<servlet>
 <servlet-name>SOAPServlet</servlet-name>
 <display-name>SOAPServlet</display-name>
 <description>Extended Portal SOAP Server</description>
 <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
 ...
 <init-param>
   <param-name>resourceServletMapping</param-name>
   <param-value>/pdkresource</param-value>
 </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in Example F–2.

Example F–2 Servlet Definition for Resource Servlet

```
<servlet>
 <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as shown in Example F–3.

Example F–3 Servlet Mapping for Resource Servlet

```
<servlet-mapping>
 <servlet-name>ResourceServlet</servlet-name>
 <url-pattern>/pdkresource/*</url-pattern>
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

F.2.11.2 Redeploying PDK-Java Producers from Oracle Portal

If you choose to take a PDK-Java producer built for Oracle Portal and redeployed on Oracle WebLogic Server, then you must enable the resource servlet as follows:

1. Add an initialization parameter to the Web servlet as shown in Example F–4.

Example F–4 Web Servlet Initialization Parameter

```
<servlet>
 <servlet-name>SOAPServlet</servlet-name>
 <display-name>SOAPServlet</display-name>
 <description>Extended Portal SOAP Server</description>
 <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
 ...
 <init-param>
   <param-name>resourceServletMapping</param-name>
   <param-value>/pdkresource</param-value>
 </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in Example F–5.

Example F–5 Servlet Definition for Resource Servlet

```
<servlet>
 <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as Example F–6.

Example F–6 Servlet Mapping for Resource Servlet

```
<servlet-mapping>
 <servlet-name>ResourceServlet</servlet-name>
 <url-pattern>/pdkresource/*</url-pattern>
```

```
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see Section 64.2.3, "How to Register an Oracle PDK-Java Portlet Producer."

F.3 Reusing Items

Items from Oracle Portal have no equivalent in WebCenter Portal: Framework. As such, creating, maintaining, and publishing items is not supported in WebCenter Portal: Framework. To replicate the behavior of items with WebCenter Portal: Framework, you can use JCR data controls to include content from Oracle Portal. Oracle Portal is a content repository that WebCenter Portal: Framework supports out of the box in the Create a Content Repository Data Control dialog in JDeveloper. For more information about integrating content from Oracle Portal, see Chapter 27, "Managing Content Repository Connections."

G

Expression Language Expressions

This appendix catalogs the Expression Language expressions (ELs) available for use with the custom portals and applications you create using Oracle WebCenter Portal: Framework. Some of these expressions can be used in both Framework applications and the Spaces application.

This appendix includes the following sections:

- Section G.1, "ELs Related to Applications"
- Section G.2, "ELs Related to Security"
- Section G.3, "ELs Related to General Settings"
- Section G.4, "ELs Related to Application Resources"
- Section G.5, "ELs Related to Navigation"
- Section G.6, "ELs Related to WebCenter Portal Services"
- Section G.7, "ELs Related to the Documents Service"
- Section G.8, "ELs Related to the People Connections Service"
- Section G.9, "ELs Related to the Personalization Service"

> **See Also:** For additional information about EL APIs, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

G.1 ELs Related to Applications

Table G–1 lists an EL expression relevant to an application and describes the type of functionality it provides. The listed EL applies to both Framework applications and the Spaces application.

Table G–1 EL Expression Relevant to an Application

Expression	Function
`#{requestContext.skinFamily}`	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on. Returns the same value as `#{adfFacesContext.skinFamily}`.

G.2 ELs Related to Security

Table G.2 lists EL expressions relevant to application security and describes the types of functionality they provide. Some of these expressions can be used in both Framework applications and the Spaces application. The **Context** column indicates whether the EL is exclusive to WebCenter Portal: Framework (WCF) or can be used with both (Both).

Table G–2 EL Expressions Relevant to Security

Expression	Function	Context
`#{security.authenticated}`	Returns `true` when the current user is authenticated in the context in which the EL is being invoked, otherwise `false`.	Both
`#{securityContext.userName}`	Returns the user name of the currently logged in user. If the current user is not logged in, this expression returns no value.	Both
`#{WCSecurityContext.currentUser['userName']}`	Returns the value `true` if the current user is the specified user, otherwise `false`.	Both
`#{WCSecurityContext.userInAppRole['role']}`	Returns the value `true` if the current user is assigned the specified OPSS application role. This expression is useful in Framework applications that are scope unaware (that is, that do not support spaces). Example: `#{WCSecurityContext.userInAppRole['AppConnectionManager']}`	WCF
`#{WCSecurityContext.userInGroup['group']}`	Returns the value *true* if the current user is assigned the specified group, for example: `#{WCSecurityContext.userInGroup['Administrators']}`	Both

G.3 ELs Related to General Settings

Table G.3 lists EL expressions relevant to general application settings and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

Table G–3 EL Expressions Relevant to General Settings

Expression	Function
`#{generalSettings.userTimeZone}`	Returns the time zone the current user has selected in application preferences.
`#{generalSettings.preferredDateStyle}`	Returns the date format the current user has selected in application preferences.
`#{generalSettings.preferredDatePattern}`	Returns the current user's preferred date format pattern if it has been set, else, returns `null`. Note that date + pattern is applicable only to Framework applications, where they take precedence over date + style if they are set.
`#{generalSettings.preferredTimeStyle}`	Returns the time format the current user has selected in application preferences.

Table G–3 (Cont.) EL Expressions Relevant to General Settings

Expression	Function
`#{generalSettings.preferredTimePattern}`	Returns the current user's preferred time format pattern if it has been set, else, returns `null`.
`#{generalSettings.preferredDateTimePattern}`	Returns the current user's preferred date and time format pattern if it has been set, else, returns `null`.
`#{generalSettings.preferredAccessibilityMode}`	Returns the current user's preferred accessibility mode (either `default`, `inaccessible`, or `screenReader`)
`#{generalSettings.preferredSkinName}`	The current user's preferred skin name if one is specified, otherwise the default value.
`#{generalSettings.formattedCurrentDate}`	Returns the current date in the current user's selected locale.
`#{generalSettings.formattedCurrentTime}`	Returns the current time in the current user's selected locale.
`#{generalSettings.formattedCurrentDateTime}`	Returns the current date and time in the current user's selected locale.
`#{requestContext.skinFamily}`	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on.

G.4 ELs Related to Application Resources

Use the expressions in this section to query for resources. Querying for a resource through an EL expression is similar to querying for it through an API call. That is, you must set query parameters in the format `.`*`property`*`['`*`value`*`']`, where *`property`* is the name of the property, for example, `id`, `resourceScope`, and the like, and *`value`* is the search value for the attribute.

A query can result in single or multiple results. The query designer must decide what is wanted. The query designer determines whether to return one or multiple results by encountering one of the following values in the expression:

- `singleResult`—Returns a single resource. When no matching resource is found, null is returned.
- `resultList`—Returns a list of resources. When no matching resources are found, an empty list is returned.

> **Note:** Occurrences of `singleResult` or `resultList` in the expression are used internally as the query end point, and, after this, the query is executed immediately. Anything set after the end point can result in unexpected behavior.

The following example returns the first template resource found with a display name that contains `myPage`:

```
#{srmContext.resourceType['siteTemplate'].displayName['myPage'].singleResult}
```

The following example returns a list of template resources residing in the directory `resourceDir`, with a description that contains `sampleDesc`:

```
#{srmContext.resourceType['siteTemplate'].description['sampleDesc'].contentDirecto
```

```
ry['resourceDir'].resultList}
```

A property of this class includes any attribute of this class. Example properties include: `Id`, `DisplayName`, `iconURI`, `contentDirectory`, and the like.

The property value can be an explicit value or an EL expression that returns that type of value. For example, the following two queries return the same result:

```
#{srmContext.id['resourceId'].singleResult}

#{srmContext.id['spacesContext.currentSpace.uiMetadata.siteTemplateId'].singleResu
lt}
```

You can use any property of this class in an EL-based query in the format *`property`*`['`*`value`*`']` and in any order. For example, the following two queries return the same result:

```
#{srmContext.resourceScope['scopeName'].id['resourceId'].singleResult}

#{srmContext.id['resourceId'].resourceScope['scopeName'].singleResult}
```

Table G–4 lists EL expressions relevant to portal resources and describes the types of functionality each provides. You can use all resource EL expressions in both Spaces and Framework applications built with Oracle JDeveloper.

Many of the expressions in Table G–4 are building blocks for narrowing down the resource or resources you want returned. That is, they are not necessarily meant to be used by themselves, but rather in an assembly of ELs to form the desired query.

For example, the following expression uses three resource-related ELs to form a single query that returns a particular space template. It retrieves the template `storesMasterTemplate` from the parent space `stores`:

```
#{srmContext.resourceScope['stores'].resourceType['siteTemplate'].displayName['sto
resMasterTemplate'].singleResult}
```

Table G–4 ELs Relevant to Portal Resources

EL	Function
`#{srmContext.id['`*`resourceGUID`*`']}`	Returns the resource with the specified ID
`#{srmContext.displayName['`*`resourceDisplayName`*`' ]}`	Returns any resources with the specified display name
`#{srmContext.displayNameKey['`*`displayNameKey`*`']}`	Returns any resources with the specified display name key
`#{srmContext.description['`*`resourceDescription`*`' ].singleResult}`	Returns one result of a resource that contains the specified value in its description To get multiple results, use `resultList` in lieu of `singleResult`.
`#{srmContext.descriptionKey[`*`descriptionKey`*`].si ngleResult}`	Returns one result of a resource with the specified description key The description key is the key in the `xsrt` file for the resource description. To get multiple results, use `resultList` in lieu of `singleResult`.
`#{srmContext.createdDate['`*`resourceCreationDate`*` ']}`	Returns any resource with the specified creation date

Table G–4 (Cont.) ELs Relevant to Portal Resources

EL	Function
`#{srmContext.modifiedBy['resourceLastModifiedBy']}`	Returns any resource that was last modified by the user with the specified user name
`#{srmContext.modifiedDate['resourceLastModifiedDate']}`	Returns any resource that was last modified by the specified date
`#{srmContext.resourceScope['resourceScope']}`	Returns any resource that falls within the specified scope
`#{srmContext.category['categoryName']}`	Returns any resource that falls within the specified category For example: `#{srmContext.category['siteTemplates']}`
`#{srmContext.contentDirectory['contentDirectory']}`	Returns any resource that is stored within the specified directory
`#{srmContext.metadataFile['metadataFileLocation']}`	Returns resource metadata from the specified metadata file For example, the following expression returns resource metadata from the following file `/home/metadata/data.xml`: `#{srmContext.metadataFile['/home/metadat/data.xml']}`
`#{srmContext.jspx['jspxFileLocation']}`	Returns any `jspx` file in the specified location For example, the following expression returns the `page.jspx` file: `#{srmContext.jspx['/home/web/page.jspx']}`
`#{srmContext.pageDef['pageDefinition']}`	Returns any `jspx` file with the specified page definition
`#{srmContext.iconURI['iconURI']}`	Returns the icon at the specified icon URI
`#{srmContext.excludeFrom['excludeFromScopes']}`	In a larger expression, returns all specified resources except those available in the excluded scopes
`#{srmContext.usesCustomSecurity['usesCustomSecurity']}`	In a larger expression, returns any resource the either does or does not use custom security Set *usesCustomSecurity* to `TRUE` or `FALSE`. For example: `#{srmContext.usesCustomSecurity['TRUE']}`
`#{srmContext.seeded['seeded']}`	In a larger expression, returns any resource that is or is not seeded, depending on the provided value Set *seeded* to `TRUE` or `FALSE`. For example: `#{srmContext.seeded['TRUE']}`

Table G–4 (Cont.) ELs Relevant to Portal Resources

EL	Function
`#{srmContext.visibleType['visibleType']}`	In a larger expression, returns any resource that is of the specified type of visibility Set *visibleType* to `TRUE`, `FALSE`, or `NEVER` to indicate that the resource is never shown. For example, the following expression returns resources that are visible, that is, resources that are set to **Show**: `#{srmContext.visibleType['TRUE']}`
`#{srmContext.visible['visible']}`	In a larger expression, returns one or multiple resources with visibility set to either `TRUE` or `FALSE`
`#{srmContext.createdBy['resourceCreator']}`	In a larger expression, returns any resource created by the specified user
`#{srmContext.resourceType['resourceType']}`	In a larger expression, returns one or multiple resources of the specified type For example, the following expression searches for a resource of the type `SITE_TEMPLATE`: `#{srmContext.resourceType['SITE_TEMPLATE']}` Note that all resource types are listed in *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*, in the `GenericSiteResourceTypes` class.
`#{srmContext.version['version']}`	In a larger expression, returns one or multiple resources available in the application of the specified version
`#{srmContext.resourceScope['scopeName']}`	In a larger expression, returns one or multiple resources available in the specified scope For example, the following expression searches for resources in the scope (in this instance, the space) `MySpace`: `#{srmContext.resourceScope['MySpace']}` To search in the default scope, that is, the application scope, use `defaultScope`.
`#{srmContext.searchType['searchType']}`	In a larger expression, returns one or multiple resources that contain or equal the values set by other included expressions Set *searchType* to `CONTAINS` or `EQUALS`.

G.5 ELs Related to Navigation

Table G.5 lists EL expressions relevant to application navigation and describes the types of functionality they provide. All listed navigation ELs apply to both Framework applications and the Spaces application.

Table G–5 EL Expressions Relevant to Navigation

Expression	Function
Navigation Context Expressions	
`#{navigationContext.defaultNavigationModel}`	Returns default navigation model. It gets the value from the preference bean. The preference bean gets the value based on the preference setting in `adf-config.xml`, `static value`. The following example returns the specified default tree model: `#{navigationContext.defaultNavigationModel.defaultTreeModel}` You can also use `defaultMenuModel` and `defaultListModel` (see next listing).
`#{navigationContext.currentNavigationModel}`	Returns the navigation model used to navigate to the current view (that is, the current page) There may be a number of navigation models on the page. Only the one used to navigate to the page is the current navigation model. The current navigation model is set only when the `processAction` is called. The following example returns the default tree model for the current navigation model: `#{navigationContext.currentNavigationModel.defaultTreeModel}` You can also use `defaultMenuModel` and `defaultListModel`. **See Also:** `#{navigationContext.processAction}`.

`#{navigationContext.navigationModel['model_path']}`	Returns the navigation model specified by path.
	Example:
	`#{navigationContext.navigationModel['/oracle/webcenter/portalapp/navigations/default-navigation-model']}`
	User can simply enter the path in the square bracket without having to remember the parameter name. For backward compatibility, comma-separated parameters are also supported. Available parameters (with examples) are:
	■ `modelPath=/oracle/webcenter/portalapp/navigations/default-navigation-model`
	■ `modelScope=/oracle/webcenter/portalapp/navigation`
	■ `modelId=default-navigation-model`
	Note: `modelScope` and `modelId` are used together, for example:
	`#{navigationContext.navigationModel['modelScope=/oracle/webcenter/portalapp/navigations,modelId=default-navigation-model']}`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.processAction}`	Returns the default navigation method for binding to UI component's `actionListener` attribute. This assumes that the target resource to navigate to is passed in through the action UI component's `node` or `path` attribute.
	
	The `node` attribute is typically used for the iterative case; while the `path` attribute is typically used to create a static link. If both are specified, the `node` attribute is used. Note that when using the `path` attribute, you must also specify the `model` attribute to pass in the navigation model object. If the `model` attribute is not specified, the current navigation model is used.
	
	Example using the `node` attribute:
	
	`<af:forEach var="node" varStatus="vs"`
	`  items="#{navigationContext.defaultNavigationModel.rootNode.children}">`
	`  <af:subform id="pt_sfm1">`
	`  <af:commandLink id="pt_cl1"`
	`  text="#{node.title}"`
	`  inlineStyle="font-size:small;color:White;"`
	`  actionListener="#{navigationContext.processAction}"`
	`  action="pprnav">`
	`<f:attribute name="node" value="#{node}"/>`
	`  <af:showPopupBehavior popupId="menuPopup"`
	`  align="afterStart"`
	`  triggerType="mouseOver"/>`
	`  </af:commandLink>`
	
	Example using the `path` attribute:
	
	`<af:commandLink id="pt_cl1" text="Prescriptions"`
	`  inlineStyle="font-size:small; color:White;"`
	`  actionListener="#{navigationContext.processAction}"`
	`  action="pprnav">`
	`<f:attribute name="path" value="/prescriptions"/>`
	`<f:attribute name="model"`
	`  value="#{navigationContext.defaultNavigationModel}"`
	`/>`
	`</af:commandLink>`

Navigation Model Expressions	

`#{navigationContext.defaultNavigationModel.defaultTreeModel}`
 	
`#{navigationContext.defaultNavigationModel.defaultMenuModel}`
 	
`#{navigationContext.defaultNavigationModel.defaultListModel}`
 	
`#{navigationContext.defaultNavigationModel.defaultSiteMap}`
	Returns a tree/menu/list model based on the default settings
	
	The default values for the settings are specified in the next row. For example, the default value for `depth` is `0`.
	
	For `defaultSiteMap`, it returns the XML for the site map of the navigation based on the default settings.
	
	This expression returns a model of type:
	
	■ `ChildPropertyTreeModel`—used in `<af:tree>` component
	
	■ `ChildPropertyMenuModel`—used in `<af:breadcrumbs>` or <af:menu> component
	
	■ `List`*`NavigationResource`*—used in `<af:foreach>`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.defaultNavigationModel.treeModel['parameters']}`
`#{navigationContext.defaultNavigationModel.menuModel['parameters']}`
`#{navigationContext.defaultNavigationModel.listModel['parameters']}`
`#{navigationContext.defaultNavigationModel.siteMap['parameters']}`
	Returns tree/menu/list model based on the specified comma-separated parameters. Available parameters (with default values as examples) are:
	■ `startNode=/`—specify the starting node of the model (do not need "/" prefix unless requesting the root node, for example, `home`).
	■ `includeStartNode=true`—specify `true` if you want to include the starting node (for example, the root node above) or `false` to start from its children.
	■ `depth=0`—defines the initial depth of fetching. "0" means fetch the entire tree, which may take a long time. In which case, use "1" to fetch on demand (when users click the **Expand** icon).
	■ `prefetchOnly=false`—by default (`true`), it returns nodes up to the depth level requested initially; deeper level nodes are returned on demand. Use `false` if you want only the initial sets of nodes. In which case, it does not return deeper nodes later on when requested, even when there are deeper nodes.
	For `siteMap`, the available parameters are `startNode` and `includeStartNode`.
	Example:
	`#{navigationContext.defaultNavigationModel.treeModel['startNode=home,includeStartNode=false,depth=2']}`

`#{navigationContext.defaultNavigationModel.rootNode}`	Returns a root node (of type `NavigationResource`) of the navigation model. Example: `<af:commandLink id="pt_cl1" text="Prescriptions" inlineStyle="font-size:small; color:White;" actionListener="#{navigationContext.processAction}" action="pprnav"> <f:attribute name="node" value="#{navigationContext. defaultNavigationModel. rootNode.children[2]"/> </af:commandLink>`
`#{navigationContext.defaultNavigationModel.node['path']}`	Returns a node (of type `NavigationResource`) based on the path specified (you do not need "/" prefix unless you are requesting the root node, for example, `'/'`) Example: `#{navigationContext.defaultNavigationModel.node['home/page1']}`
`#{navigationContext.defaultNavigationModel.currentSelection}`	Returns currently selected navigation resource.

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

`#{navigationContext.defaultNavigationModel.newCurrentSelection['path']}`	Sets the current selection to a node specified by the given path (you do not need "/" prefix unless you are requesting the root node, for example, `'/'`). If successful, returns the newly selected node of type `NavigationResource`.
	The user must have the ability to explicitly set the current selection without having to actually navigate to a node.
	This can be used where the user enters a page directly, and no selection is set. It provides a mechanism for the user to control what is the default when there is no current selection.
	Example:
	`<c:set value="${navigationContext.defaultNavigationModel.newCurrentSelection['home/page1']}" var="currSel" scope="session"/>`
	`<c:if test="${currSel!=null}">`
	`<af:forEach items="#{currSel.children}" var="cnode" varStatus="cnodestatus">`
	`...`
	`</c:if>`

`#{navigationContext.defaultNavigationModel.attributes.Description}` `#{navigationContext.defaultNavigationModel.attributes['Description']}`	Returns the value of the specified attribute of the navigation model.
`#{navigationContext.defaultNavigationModel.properties['propertyName']}`	Returns the value of the specified property of the navigation model, where propertyName is either `rootNode` or `currentSelection`.
Navigation Resource Expressions	
`#{node.attributes.Description}` `#{node.attributes['Description']}`	Returns the value of the specified attribute of the navigation resource.
`#{node.parameters.StockSymbol}` `#{node.parameters['StockSymbol']}`	Returns the value of the specified parameter of the navigation resource.
`#{node.parametersRaw.StockSymbol}` `#{node.parametersRaw['StockSymbol']}`	Returns the raw value of the specified parameter of the navigation resource (before it is evaluated).
`#{node.title}`	Returns the title of the navigation resource.
`#{node.path}`	Returns the path to the navigation resource.
`#{node.externalURL}`	Returns the URL for the navigation resource of type `External Link`.
`#{node.prettyUrl}`	Returns the identifying path for this navigation resource.
`#{node.prettyUrlPath}` `#{node.prettyUrlPath[N]}`	Returns a collection of identifying paths by depth to enable its use as a starting path to drive another navigation view. For example, assuming the `currentSelection` is `home/company/products/applications`, the following EL returns `home/company/products`: `#{node.prettyUrlPath[3]}`

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function
#{*node*.goLinkPretty Url}	Returns the identifying path for this navigation resource suitable for `goLink` destination `<af:goLink id="pt_gl2" text="#{node.title}" destination="#{node.goLinkPrettyUrl}" targetFrame="#{node.attributes['Target']}" inlineStyle="font-size:small;#{node.selected ? 'font-weight:bold;' : ''}"/>`
#{*node*.separator ? ... : ...}	Returns whether this resource is a separator item.
#{*node*.navigable ? ... : ...}	Returns whether it is possible to navigate to this resource.
#{*node*.selected ? ... : ...}	Returns whether this resource is currently selected.
#{*node*.currentlySelected ? ... : ...}	Returns whether the resource is the currently selected resource and the model is the currently selected model.
#{*node*.onSelectedPath ? ... : ...}	Returns whether this node lies on the selected path. This is useful for highlighting the selected tab, for example. For example, assuming the currently selected node is `home/company/products/applications`, the following EL highlights the `home` tab. `<c:set value="${navigationContext.defaultNavigationModel.node['home']}" var="home" scope="session"/> <af:commandImageLink id="cil1" icon="#{(home.onSelectedPath) ? '/images/caremark/nav/HomeSelected.png' : '/images/caremark/nav/HomeIcon.png'}" actionListener="#{navigationContext.processAction}" action="pprnav"> <f:attribute name="node" value="#{home}"/> </af:commandImageLink>`
#{*node*.leaf ? ... : ...}	Returns whether this resource is a leaf node.
#{*node*.parent}	Returns the parent node (of type `NavigationResource`) of this node. For the root node, `null` is returned.
#{*node*.ancestors}	Returns the hierarchy list of ancestors of this node (of type NavigationResource) starting with the root node. For example, assuming the current node is `home/company/products/applications`, the following ELs return the following values: ■ `#{node.ancestors[1]}` returns the node for `home` ■ `#{node.ancestors[3]}` returns the node for home/company/products
#{*node*.depth}	Returns the depth of this node from the root node. Root node has a depth of zero.
#{*node*.siblings}	Returns the list of siblings (of type `NavigationResource`) of this node (inclusive).

Table G–5 (Cont.) EL Expressions Relevant to Navigation

Expression	Function

#{*node*.nextSibling}	Returns the next sibling in the list (of type NavigationResource) of this node.
	For example, the following code ensures that you do not output two separators in a row:
	`<c:if test="${(node.separator) && (!node.nextSibling.separator}">`
	`  <af:separator id="s166"/>`
	`</c:if>`

#{*node*.previousSibling}	Returns the previous sibling in the list (of type `NavigationResource`) of this node.
#{*node*.index}	Returns the zero-relative index of this node relative to its siblings.
#{*node*.children}	Returns a collection of child resources.
#{*node*.children[*N*].title}	
#{*node*.children[*N*].children[*N*].title}	
#{*node*.childCount}	Returns the number of children of this node.
#{*node*.childByIndex['index']}	Returns the child node (of type `NavigationResource`) specified by the zero-relative index. If not found, this returns `null`.
#{*node*.childByPath['admin']}	Returns the child node (of type `NavigationResource`) specified by the path relative to this node. The path can be deeper than one level and does not need the `'/'` prefix. If not found, this returns `null`.
#{*node*.properties['propertyName']}	Returns the value of the specified property of the navigation resource, where propertyName is one of the following: `separator`, `title`, `prettyUrl`, `prettyUrlPath`, `depth`, `leaf`, `childCount`, `navigable`, `selected`, or `currentlySelected`.

G.6 ELs Related to WebCenter Portal Services

Table G.6 lists EL expressions relevant to WebCenter Portal services and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

Table G–6 EL Expressions Relevant to WebCenter Portal Services

Expression	Function
`#{webcenterService['serviceId']}`	An `oracle.webcenter.framework.service.Service` object representing the WebCenter Portal service with the service ID `serviceId`. For example, the following EL returns *Documents Service*: `#{webcenterService['oracle.webcenter.doclib']}` For service IDs, see Table G–7.
`#{webcenterService['serviceId'].configured}`	Returns a Boolean value that indicates whether the WebCenter Portal service with the service ID *serviceId* is configured for use in the current Framework application. For example, the following EL returns `true` if Discussions service can be used in the application, `false` otherwise: `#{webcenterService['oracle.webcenter.collab.forum'].configured}` For service IDs, see Table G–7.
`#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['spaceName'].forumId}`	Returns the forum ID of the specified space discussion forum. Enter the space name in lieu of *spaceName*.
`#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['spaceName'].categoryId}`	Returns the category ID of the specified space discussion forums. Enter the space name in lieu of *spaceName*.

Table G–7 lists service IDs associated with WebCenter Portal services.

Table G–7 Service IDs

Service	ID
Announcements	oracle.webcenter.collab.announcement
Discussions	oracle.webcenter.collab.forum
Documents and Wikis	oracle.webcenter.doclib
Events	oracle.webcenter.collab.calendar.community
Instant Messaging and Presence (IMP)	oracle.webcenter.collab.rtc
Links	oracle.webcenter.relationship
Lists	oracle.webcenter.list
Mail	oracle.webcenter.collab.mail
Notifications	oracle.webcenter.notification
Page	oracle.webcenter.page
People Connections: Activity Stream	oracle.webcenter.activitystreaming
People Connections: Connections	oracle.webcenter.peopleconnections.connections
People Connections: Feedback	oracle.webcenter.peopleconnections.kudos
People Connections: Message Board	oracle.webcenter.peopleconnections.wall
People Connections: Profile	oracle.webcenter.peopleconnections.profile
Polls	oracle.webcenter.collab.survey

Table G–7 (Cont.) Service IDs

Service	ID
Recent Activities	oracle.webcenter.recentactivity
Activity Graph	oracle.webcenter.activitygraph
RSS	oracle.webcenter.rss
Search	oracle.webcenter.search
Tags	oracle.webcenter.tagging
Blogs	oracle.webcenter.blog
Worklist	oracle.webcenter.worklist

G.7 ELs Related to the Documents Service

Table G–8 lists EL expressions relevant to the Documents service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

Table G–8 EL Expressions Relevant to the Documents Service

Expression	Function
`#{documentsService.defaultConnectionName}`	Gets the default content repository connection name. Returns `null` if no connection name is defined.
`#{documentsService.configured}`	Checks whether the Documents service is configured. Returns `true` if the Documents service is configured, otherwise `false`.

G.8 ELs Related to the People Connections Service

Table G–9 lists EL expressions relevant to the Profile feature of the People Connections service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application..

Note: The entry `securityContext.userName`, included in every Profile expression, returns the name of the current user. Note also that information is returned only if it is present in the user's profile. If the information is not included in the profile, a null value is returned.

Table G–9 EL Expressions Relevant to the People Connections Service (Profile)

Expression	Function
`#{WebCenterProfile[userName].ManagerDisplayName}` `#{WebCenterProfile[securityContext.userName].ManagerDisplayName}`	The display name of the specified user's manager if the current user is allowed to know it.
`#{WebCenterProfile[userName].employeeNumber}` `#{WebCenterProfile[securityContext.userName].employeeNumber}`	The specified user's employee number if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessPOBox}` `#{WebCenterProfile[securityContext.userName].businessPOBox}`	The post office box number associated with the specified user if the current user is allowed to know it.
`#{WebCenterProfile[userName].timeZone}` `#{WebCenterProfile[securityContext.userName].timeZone}`	The time zone in which the specified user's home office is located if the current user is allowed to know it.
`#{WebCenterProfile[userName].description}` `#{WebCenterProfile[securityContext.userName].description}`	A description of the specified user (from Profile "About Me") if the current user is allowed to know it.
`#{WebCenterProfile[userName].department}` `#{WebCenterProfile[securityContext.userName].department}`	The department to which the specified user belongs if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessPager}` `#{WebCenterProfile[securityContext.userName].businessPager}`	The specified user's business pager number if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessCity}` `#{WebCenterProfile[securityContext.userName].businessCity}`	The city in which the specified user is located if the current user is allowed to know it.
`#{WebCenterProfile[userName].maidenName}` `#{WebCenterProfile[securityContext.userName].maidenName}`	The specified user's surname or last name before marriage if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessFax}` `#{WebCenterProfile[securityContext.userName].businessFax}`	The specified user's business fax number if the current user is allowed to know it.
`#{WebCenterProfile[userName].dateofHire}` `#{WebCenterProfile[securityContext.userName].dateofHire}`	The specified user's date of hire if the current user is allowed to know it.
`#{WebCenterProfile[userName].nameSuffix}` `#{WebCenterProfile[securityContext.userName].nameSuffix}`	Additional information appended to the user's name, such as `Esq.`, `Jr.`, and so on if the current user is allowed to know it.
`#{WebCenterProfile[userName].middleName}` `#{WebCenterProfile[securityContext.userName].middleName}`	The specified user's middle name if the current user is allowed to know it.

Table G–9 (Cont.) EL Expressions Relevant to the People Connections Service (Profile)

Expression	Function
`#{WebCenterProfile[userName].homePhone}` `#{WebCenterProfile[securityContext.userName].homePhone}`	The specified user's home phone number if the current user is allowed to know it.
`#{WebCenterProfile[userName].employeeType}` `#{WebCenterProfile[securityContext.userName].employeeType}`	The specified user's employee type classification, for example, `IC4` if the current user is allowed to know it.
`#{WebCenterProfile[userName].lastName}` `#{WebCenterProfile[securityContext.userName].lastName}`	The specified user's surname or last name if the current user is allowed to know it.
`#{WebCenterProfile[userName].dateofBirth}` `#{WebCenterProfile[securityContext.userName].dateofBirth}`	The specified user's birthday if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessState}` `#{WebCenterProfile[securityContext.userName].businessState}`	The state in which the specified user's home office is located if the current user is allowed to know it.
`#{WebCenterProfile[userName].homeAddress}` `#{WebCenterProfile[securityContext.userName].homeAddress}`	The specified user's home street address if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessStreet}` `#{WebCenterProfile[securityContext.userName].businessStreet}`	The street on which the specified user's home office is located if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessPostalCode}` `#{WebCenterProfile[securityContext.userName].businessPostalCode}`	The specified user's postal or ZIP code if the current user is allowed to know it.
`#{WebCenterProfile[userName].initials}` `#{WebCenterProfile[securityContext.userName].initials}`	The specified user's initials if the current user is allowed to know it.
`#{WebCenterProfile[userName].firstName}` `#{WebCenterProfile[securityContext.userName].firstName}`	The specified user's first name if the current user is allowed to know it.
`#{WebCenterProfile[userName].organizationalUnit}` `#{WebCenterProfile[securityContext.userName].organizationalUnit}`	The organizational unit to which the specified user belongs, for example, `D10`, if the current user is allowed to know it.
`#{WebCenterProfile[userName].wirelessAcctNumber}` `#{WebCenterProfile[securityContext.userName].wirelessAcctNumber}`	The specified user's wireless account number if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessPhone}` `#{WebCenterProfile[securityContext.userName].businessPhone}`	The specified user's business telephone number if the current user is allowed to know it.

Table G–9 (Cont.) EL Expressions Relevant to the People Connections Service (Profile)

Expression	Function
`#{WebCenterProfile[userName].businessCountry}` `#{WebCenterProfile[securityContext.userName].businessCountry}`	The country in to which the specified user is assigned if the current user is allowed to know it.
`#{WebCenterProfile[userName].preferredLanguage}` `#{WebCenterProfile[securityContext.userName].preferredLanguage}`	The specified user's preferred language if the current user is allowed to know it.
`#{WebCenterProfile[userName].displayName}` `#{WebCenterProfile[securityContext.userName].displayName}`	The specified user's display name if the current user is allowed to know it.
`#{WebCenterProfile[userName].userName}` `#{WebCenterProfile[securityContext.userName].userName}`	The specified user's actual name if the current user is allowed to know it.
`#{WebCenterProfile[userName].title}` `#{WebCenterProfile[securityContext.userName].title}`	The specified user's job title if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessEmail}` `#{WebCenterProfile[securityContext.userName].businessEmail}`	The specified user's business email address if the current user is allowed to know it.
`#{WebCenterProfile[userName].organization}` `#{WebCenterProfile[securityContext.userName].organization}`	The organzation to which the specified user belongs, for example, `Sales`, if the current user is allowed to know it.
`#{WebCenterProfile[userName].businessMobile}` `#{WebCenterProfile[securityContext.userName].businessMobile}`	The specified user's cell or mobile phone number if the current user is allowed to know it.
`#{WebCenterProfile[userName].expertise}` `#{WebCenterProfile[securityContext.userName].expertise}`	The specified user's business expertise if the current user is allowed to know it.

G.9 ELs Related to the Personalization Service

Table G–10 lists EL expressions relevant to the Personalization+ service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

Table G–10 EL Expressions Relevant to the Personalization Service

Expression	Function

`#{p13nContext.reset}`	Clears the state of the context object in which it is invoked.
	Other examples:
	`#{p13nContext.conductor['ConductorConnection'].reset}`
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset}`
	`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}`

`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}`	Updates the property set with new values if bound to a form. The `update` method applies only to the context `PropertySetContext`, and can be called only as part of a form-based action.

`#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results}`	Retrieves the results of the context object. In the case of `PropertySetContext`, it retrieves the property set by name and property set definition, if they exist.
	In the case of `ScenarioExecutionContext` and `ParameterizedScenarioExecutionContext`, the scenario results are retrieved.
	Other examples:
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}`
	`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`

`#{p13nContext.conductor['PropertiesConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}`	Executes a scenario by name.

Table G–10 (Cont.) EL Expressions Relevant to the Personalization Service

Expression	Function
`#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}`	Executes a scenario by name with input parameters. Input parameters must be in the following format: *<paramOne>=<valueOne>;<paramTwo>=<valueTwo>;<paramThree>=<valueThree>* Where each parameter name and value is separated by semicolon. The `withInput` method applies only to the context `ScenarioExecutionContext`.
`#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError}`	Determines if an error has occurred in the current context object. The `isError` method applies only to `PropertySetContext` and `~ScenarioExecutionContext`. Other examples: `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}`
`#{p13nContext.conductor['ConductorConnection'].namespaces['myManagedBean.namespace'].scenario['myManagedBean.scenario'].errorMessage}`	Returns the error message if an error has occurred in the current context object. The errorMessage method applies only to `PropertySetContext` and `~ScenarioExecutionContext`. Other examples: `#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}`

H

Manually Migrating a Framework Application

This appendix explains how to manually migrate a PS2 WebCenter custom application to a PS5 WebCenter Portal: Framework application.

This appendix includes the following sections:

- Section H.1, "When is Migration Required?"
- Section H.2, "Anatomy of a Framework Application"
- Section H.3, "Overview of the Migration Procedure"
- Section H.4, "Preparing for the Migration"
- Section H.5, "Editing Configuration Files"
- Section H.6, "Modifying the Project Configurations"
- Section H.7, "Creating Portal-Specific Files"
- Section H.8, "Applying Security Configurations"

H.1 When is Migration Required?

Oracle strongly recommends that you perform the procedures in this appendix only after careful consideration and then only if absolutely necessary. The recommended best practice for migration is to create a new (PS5) Framework application using the WebCenter Portal – Framework Application template and then manually migrate the content, configurations, and logic from your old PS2 application to the new Framework application. If it is not possible to follow this recommended practice, then follow the procedures described in this appendix to migrate your application.

It is important to understand that this appendix is about manually adding WebCenter Portal: Framework file structures, components, and configurations to an existing WebCenter PS2 application that has been migrated to PS5 using the automatic migration feature in JDeveloper. Oracle WebCenter Portal: Framework features include page navigations, page hierarchies, and other features, as discussed in Chapter 9, "Understanding Framework Applications."

As explained in detail in this appendix, you first need to perform an automatic migration to PS5 (by opening your PS2 application in a PS5 version of JDeveloper). Then, you can follow the directions in this appendix to manually add portal features.

The procedure described in this appendix is optional. Even if you perform the automatic migration by opening your PS2 application in PS5 JDeveloper, your existing, you only need to perform the migration steps described in this appendix if you want to use the Oracle WebCenter Portal: Framework features.

For detailed information on the WebCenter Portal: Framework Application template and creating a WebCenter Portal: Framework application, see Chapter 5, "Creating Framework and Portlet Producer Applications."

H.2 Anatomy of a Framework Application

Besides explaining how to manually migrate an application, this appendix outlines in technical detail the configuration elements that distinguish a PS2 custom application from a PS5 Framework application. One way to read this appendix is as a detailed roadmap or "anatomy" of the structure of a Framework application versus a PS2 custom application.

For more information on the portal-specific features, see Chapter 9, "Understanding Framework Applications." For more information on the structure of a portal, see Section 9.12, "How are WebCenter Portal Files Organized?."

H.3 Overview of the Migration Procedure

The manual migration of a PS2 WebCenter custom application to a PS5 Framework application can be broken down into these basic steps:

1. Preparing for the migration.

   Preparation includes properly installing the WebCenter and JDeveloper PS5 software and opening the PS2 application in the PS5 version of JDeveloper (with PS5 WebCenter installed). See Section H.4, "Preparing for the Migration."

2. Editing configuration files.

   You must manually open and edit several configuration files to add PS5 features. See Section H.5, "Editing Configuration Files."

3. Adding project configurations.

   Project configurations include adding appropriate JAR files and technology scopes to your application. See Section H.6, "Modifying the Project Configurations."

4. Creating portal-specific files.

   You must manually create the directory structure of a Framework application and populate it with portal-specific files, like navigation, registry, page hierarchy, and catalog files. See Section H.7, "Creating Portal-Specific Files."

5. Applying security configurations.

   Finally, you need to configure ADF security and populate the `jazn-data.xml` file with appropriate policy information. See Section H.8, "Applying Security Configurations."

H.4 Preparing for the Migration

Before performing the rest of the migration steps described in this appendix:

1. Install the PS5 version of Oracle JDeveloper and WebCenter Portal's extension for Oracle JDeveloper. For details, see Section 3.2, "Installing WebCenter Portal's Extension for Oracle JDeveloper."

2. Back up your PS2 application.

3. In JDev (with the PS5 version of the WebCenter Portal extension installed), open the application:

1. From the File menu select **Open**.
2. In the Open dialog, navigate to the application `.jws` file and click **OK**.
3. If prompted to migrate the application, click **Yes**. This step migrates the application from PS2 technology to PS5 technology without changing the structure of the application. Your PS2 application will continue to function as it did in PS2.

4. Follow the migration steps described in the rest of this chapter.

H.5 Editing Configuration Files

This section lists the set of configuration files that you must manually update.

- Section H.5.1, "Updating DataBindings.cpx"
- Section H.5.2, "Updating weblogic.xml"
- Section H.5.3, "Updating faces-config.xml"
- Section H.5.4, "Updating trinidad-config.xml"
- Section H.5.5, "Updating web.xml"
- Section H.5.6, "Updating adf-config.xml"

H.5.1 Updating DataBindings.cpx

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Application Sources > DEFAULT_PACKAGE > DataBindings.cpx

Location on the filesystem:

- *PROJECT_ROOT*/adfmsrc/*DEFAULT_PACKAGE*/DataBindings.cpx

Detailed Instructions:

The following two attributes must exist in the root `<Application>` element of `DataBindings.cpx`. These attributes enable dynamic page mapping, so that any pages created at runtime (for example, through the Page Hierarchy editor) do not need to have page definition mappings in `DataBindings.cpx`.

```
<Application PageMapClass="oracle.jbo.uicli.mom.DynamicPageMapImpl"
     BasePageDefPackageName="pageDefs" ... >
```

H.5.2 Updating weblogic.xml

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > WEB-INF > weblogic.xml

Location on the filesystem:

- *PROJECT_ROOT*/public_html/WEB-INF/weblogic.xml

Detailed Instructions:

Add the following entry as a child of the root `<weblogic-web-app>` element. This element adds a reference to the REST shared library, which is necessary for the application to be able to use REST features.

```
<library-ref>
```

```
    <library-name>jaxrs-framework-web-lib</library-name>
</library-ref>
```

H.5.3 Updating faces-config.xml

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > WEB-INF > faces-config.xml

Location on the filesystem:

- *PROJECT_ROOT*/public_html/WEB-INF/faces-config.xml

Detailed Instructions:

Add the following entries as children of the root `<faces-config>` element or merge them in with any existing elements, as appropriate.

- The `CustomViewHandler` interprets the URL syntax used by the navigation model. The handler takes a URL that points to a node in a navigation and finds the corresponding JSPX page to render.
- The `SkinPhaseListener` enables any skins that are created and registered as portal resources at design time to be used at runtime.
- The `preferenceBean` provides the set of "default values" for the application, such as default navigation, catalog, page template, and skin. These values are defined in `adf-config.xml` and can be changed at runtime in the Preferences tab of the Portal Administration page.

```
<application>
    <default-render-kit-id>oracle.adf.rich</default-render-kit-id>
    <view-handler>
      oracle.webcenter.portalframework.sitestructure.handler.CustomViewHandler
    </view-handler>
</application>
<lifecycle>
    <phase-listener>oracle.webcenter.skin.view.SkinPhaseListener</phase-listener>
</lifecycle>
<managed-bean>
    <managed-bean-name>preferenceBean</managed-bean-name>
    <managed-bean-class>
      oracle.webcenter.portalframework.sitestructure.preference.PortalPreferences
    </managed-bean-class>
    <managed-bean-scope>application</managed-bean-scope>
</managed-bean>
```

H.5.4 Updating trinidad-config.xml

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > WEB-INF > trinidad-config.xml

Location on the filesystem:

- *PROJECT_ROOT*/public_html/WEB-INF/trinidad-config.xml

Detailed Instructions:

Add the following entry as a child of the root `<trinidad-config>` element, replacing any existing `<skin-family>` value. This EL expression allows the default skin to be changed at runtime; the value for the skin is provided by the

preferenceBean. The preferenceBean provides the set of "default values" for the application, such as default navigation, catalog, page template, and skin.

```
<skin-family>#{preferenceBean.defaultTrinidadSkin}</skin-family>
```

H.5.5 Updating web.xml

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > WEB-INF > web.xml

Location on the filesystem:

- *PROJECT_ROOT*/public_html/WEB-INF/web.xml

Detailed Instructions:

Add the following entries as children of the root <web-app> element. The <context-param> values should replace any existing values, as appropriate.

- The PortalAdminServlet redirects to the built in Portal Administration page. The link to this administration page is accessible at http://<server:port>/<context-root>/admin.
- The PortalFrameworkContextListener ensures that the application's memory references are properly cleaned up when it is deployed/undeployed.
- The JerseyWebApplicaton and restFacesContext entries configure the application to be able to use REST functionality.
- The parameter org.apache.myfaces.trinidad.DISABLE_CONTENT_COMPRESSION is set to false by default for Framework applications for performance reasons, enabling compression for style class names.
- The parameter oracle.adf.view.rich.pprNavigation.OPTIONS is set to onWithForcePPR by default for Framework applications for performance reasons. This setting enables partial page navigation.

```
<context-param>
    <param-name>org.apache.myfaces.trinidad.DISABLE_CONTENT_COMPRESSION</param-name>
    <param-value>false</param-value>
  </context-param>
  <context-param>
    <param-name>oracle.adf.view.rich.pprNavigation.OPTIONS</param-name>
    <param-value>onWithForcePPR</param-value>
  </context-param>
  <listener>
    <description>Portal Framework Context Listener</description>
    <display-name>PortalFrameworkContextListener</display-name>

```

H.5.6 Updating adf-config.xml

Location in JDeveloper's Application Navigator:

- Application Resources > Descriptors > ADF META-INF > adf-config.xml

Location on the filesystem:

- *APPLICATION_ROOT*/.adf/META-INF/adf-config.xml

Detailed Instructions:

Add these entries as children of the root `<adf-config>` element. The highlighted (**bold faced**) `<namespace>` elements must be merged in with the existing `<mds-config>` entry, because this top-level entry should already exist.

- The `<mds-config>` element is the top-level element.
- The `<page-editor-config>` element sets up the default security policies for customization and personalization of pages and task flows within the Resource Manager. See also Chapter 17, "Adding and Using the Resource Manager."
- The `<adf-portal-config>` entry specifies the values of the default resources for the application. These values are the default values for the PreferenceBean and for the preferences that will appear in the Preferences tab of the WebCenter Portal: Spaces Administration console. Replace the highlighted paths with actual values (these default resources will be created in subsequent steps).
- The `<adf-rcs-config>` element defines the default resource catalog registry and navigation registry, which are used when editing catalogs and navigations in the Resource Manager. Replace the highlighted paths with actual values (these resources will be created in subsequent steps).
- The `<rcv-config>` element defines the default resource catalog, which is used when editing a page with Composer. This element includes the default resource catalog and the catalog selector. The catalog selector determines which catalog is used when editing a page. The `PortalCatalogSelector` attribute receives its values from the portal preference settings. The defaults for these settings are defined under `<adf-portal-config>`. The default catalog defined in `<rcv-config>` is only used if the catalog selector does not return a value. The preference setting takes precedence over the `<rcv-config>` setting. The highlighted path should be replaced with the path to the desired catalog. Any existing resource catalogs in the migrated application should be moved to the `/oracle/webcenter/portalapp` directory (created in subsequent steps), if they are to continue to be used in the Framework application. See also Chapter 16, "Creating and Managing Resource Catalogs."

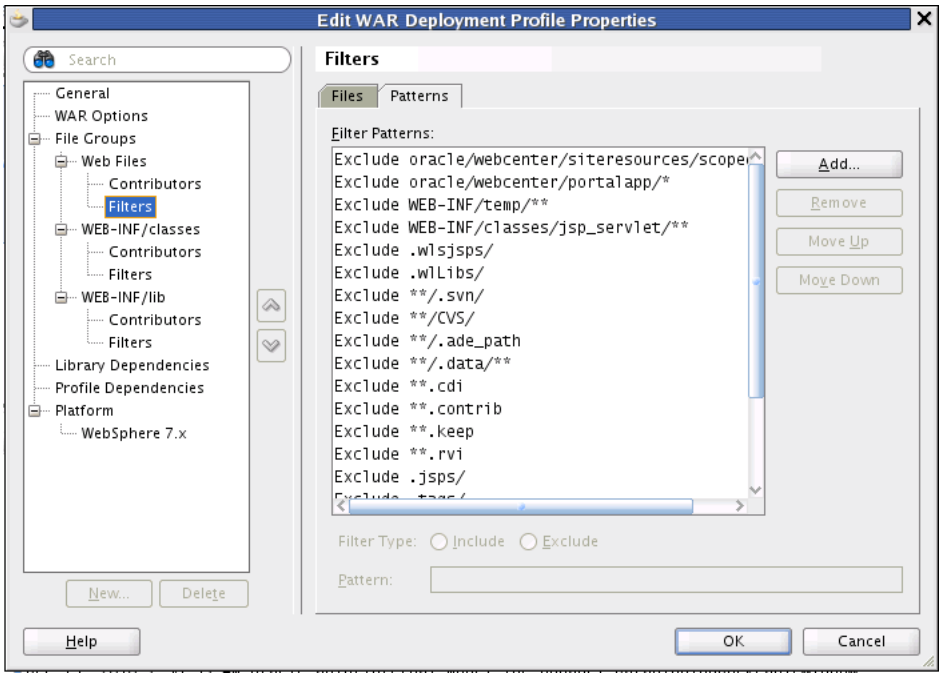
                        desc="Default Navigation Renderer"
                        value="/oracle/webcenter/portalapp/pages/navigation-renderer.jspx"
                        display="false"/>
      <preference id="oracle.webcenter.portalapp.skin"
                        desc="Default Portal Skin" value="portal"
                        resourceType="Skin" display="true"/>
    </preferences>
  </adf-portal-config>
  <adf-rcs-config xmlns="http://xmlns.oracle.com/adf/rcs/adf-config">
    <rcs-config>
      <catalog-config default-scope="/"
                      default-registry="/path/to/your/default/catalog/registry.xml"/>
      <navigation-config default-scope="/"
                        default-registry="/path/to/your/default/navigation/registry.xml"/>
      <security-manager class-name=
"oracle.webcenter.portalframework.genericsiteresources.internal.security.CatalogSecurityManager"/>
    </rcs-config>
  </adf-rcs-config>
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <default-catalog catalog-name="/path/to/your/default/catalog.xml"/>
    <catalog-selector
class-name="oracle.webcenter.portalframework.sitestructure.rc.PortalCatalogSelector"/>
```

```
</rcv-config>
```

H.6 Modifying the Project Configurations



This section lists the project configuration files – JAR files, technology scopes, and WAR files – that must be added to the application.

- Add the following Oracle WebCenter Portal: Framework libraries to the project classpath. These libraries add the necessary Framework-specific JARs to the design time classpath. (To do this, right-click the project and chose **Project Properties** and then **Libraries and Classpaths**. Simply add the libraries from the list of available libraries.)
  - WebCenter Portal Framework
  - WebCenter Portal Framework REST API
- Add the following technology scope to the application. This technology scope identifies the application as a PS5 framework application. See also Section 6.1, "Manually Configuring a Framework Application With Technology Scopes."
  - WebCenter Portal – Framework
- Create a WAR deployment profile for project (or modify an existing one) and add pattern filters as described below. The deployment profile and filters ensure that the framework application's resources are properly packaged when it is deployed.
  - Web files
    - Exclude `oracle/webcenter/portalapp/*`
    - Exclude `oracle/webcenter/siteresources/scopedMD/*`
  - WEB-INF/classes
    - Exclude `oracle/webcenter/portalapp/*/*.dcx`
    - Exclude `oracle/webcenter/portalapp/*/*.cpx`
    - Exclude `oracle/webcenter/portalapp/*/*.xml`

  The basic procedure for adding the filters is:

  1. Right-click the project and select **Project Properties**.
  2. In the Project Properties dialog, select the **Deployment** node.
  3. In the Deployment Profiles list, select the WAR file deployment profile for your framework application and click **Edit**.
  4. In the Edit WAR Deployment Profile Properties dialog, open the **File Groups** node and select **Filters** under the **Web Files** node.
  5. Select the **Patterns** tab, as shown in Figure H–1.

Figure H–1 Edit WAR Deployment Profile Properties Dialog

6. Select the file patterns to exclude.

The steps for excluding `WEB-INF/classes` is similar the above procedure. Instead of selecting **Web Files** and then **Filters**, select **WEB-INF/classes** and then **Filters**.

H.7 Creating Portal-Specific Files

A Framework application requires a specific file structure. This section explains how to create and configure this file structure. See also Section 9.12, "How are WebCenter Portal Files Organized?."

- Section H.7.1, "Create the Framework Application Folder Structure"
- Section H.7.2, "Create a Resource Registry File"
- Section H.7.3, "Create Default Resources"

H.7.1 Create the Framework Application Folder Structure

Create the portal folder structure in the specified location.

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content

Location on the filesystem:

- *PROJECT_ROOT*/public_html

Detailed Instructions:

Create the following folder structure in the location specified above (that is, in the Web Content folder in JDev). To add a folder, right-click the `portalapp` folder and select **General** in the New Gallery dialog. Then, select **Folder** from the list of Items.

- `oracle/webcenter/portalapp/`

- `catalogs/`
- `navigations/`
- `pages/`
- `pagetemplates/`
- `shared/`

The `/oracle/webcenter/portalapp` folder structure is required, and all portal resources must be created under this namespace. For more information on the file structure, see Section 9.12.1.2, "Why Is a WebCenter Portal: Framework Application Organized the Way It Is?."

The additional subfolders (except for the shared folder) are not strictly required, but are useful for organizational purposes. However, the `shared` folder must exist. This folder provides the path under which any resources associated with a portal resource (such as images) must be located.

H.7.2 Create a Resource Registry File

The `generic-site-resources.xml` file is required for resources to be registered with the runtime Resource Manager. For more information on the Resource Manager, see Chapter 17, "Adding and Using the Resource Manager."

Create a resource registry file under `APPLICATION_ROOT/mds/oracle/webcenter/siteresources/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/generic-site-resources.xml` with the following content. Note that you must create this folder structure manually; it does not exist by default.

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<resources xmlns="http://xmlns.oracle.com/webcenter/portalframework/genericSiteResources"
           xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <resourceType name="siteTemplate" resourceBundle=""/>
  <resourceType name="pageStyle" resourceBundle=""/>
  <resourceType name="dataPresenter" resourceBundle=""/>
  <resourceType name="contentPresenter" resourceBundle=""/>
  <resourceType name="resourceCatalog" resourceBundle=""/>
  <resourceType name="navigation" resourceBundle=""/>
  <resourceType name="skin" resourceBundle=""/>
  <resourceType name="taskFlowStyle" resourceBundle=""/>
  <resourceType name="taskFlow" resourceBundle=""/>
  <resourceType name="dataControl" resourceBundle=""/>
</resources>
```

H.7.3 Create Default Resources

This section explains how to create and register several portal resource files.

H.7.3.1 Default Navigation Model File

The navigation model file, `default-navigation-model.xml`, allows you to incorporate navigation structures in portal site. For more information, see Chapter 11, "Building a Navigation Model for Your Portal" and Section 9.5.3, "Understanding the Navigation Model and the Navigation Registry."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/navigations

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/navigations

Procedure:

1. Right-click `/oracle/webcenter/portalapp/navigations` folder in Application Navigator and select **New**.
2. In the New Gallery dialog, open the **Portal** node under **Web Tier** and select **Navigation**.
3. Enter a name (for example, `default-navigation-model.xml`), ensure directory is PROJECT_ROOT`/public_html/oracle/webcenter/portalapp/navigations`, and check the box labeled **Create as a Portal Resource**.

H.7.3.2 Navigation Registry File

The navigation registry file, `navigation-registry.xml`, is used for editing navigations in the Resource Manager. See also Chapter 11, "Building a Navigation Model for Your Portal" and Section 9.5.3, "Understanding the Navigation Model and the Navigation Registry."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/navigations

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/navigations

Procedure:

1. Create a new Framework application. You will copy some files from this new application into the application you are migrating.
2. From the new application, copy this file:

   ```
   <PROJECT_ROOT>/public_
   html/oracle/webcenter/portalapp/navigations/navigation-registry.xml
   ```

   to this location in the application you are migrating:

   ```
   <PROJECT_ROOT>/oracle/webcenter/portalapp/navigations/navigation-registry.xml
   ```

3. Add two top-level folders, called `new` and `links`.
4. Under the `new` folder, add the set of resources that should allowed to be added to a navigation when editing at runtime.
5. Under the `links` folder, add the set of resources that should appear in the links picker, which is displayed when adding an item of type "Link" to a navigation at runtime. For more information, see Chapter 11, "Building a Navigation Model for Your Portal."

H.7.3.3 Resource Catalog File

A catalog specifies a collection of an otherwise unrelated group of elements, like layout components, task flows, portlets, documents, and others, that an authorized user can add to a portal at runtime. Oracle WebCenter Portal's Composer uses catalogs at runtime to determine which elements an authorized user can add to a portal page. See also Chapter 17, "Adding and Using the Resource Manager" and Section 9.5.4, "Understanding Resource Catalogs and the Catalog Registry."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/catalogs

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/catalogs

Follow one of the following two procedures. The first explains how to create a new resource catalog, and the second explains how to reuse resource catalogs from your current application.

Procedure:

1. Right-click `/oracle/webcenter/portalapp/catalogs` folder in Application Navigator and select **New**.
2. In the New Gallery dialog, open the **Portal** node under **Web Tier** and select **Application Resource Catalog**.
3. Enter a name (for example, `default-catalog.xml`), ensure directory is PROJECT_ROOT`/public_html/oracle/webcenter/portalapp/catalogs`, and check the box labeled **Create as a Portal Resource**.
4. Add the set of resources that should allowed to be added to a page when editing at runtime. For more information, see Section 17.2, "Working with Portal Resources in JDeveloper."

Alternate Procedure:

Consider following this procedure if you have existing resource catalogs that you would like to reuse:

1. Copy any existing resource catalogs your application may have (normally found in `APPLICATION_ROOT/mds/oracle/adf/rc/metadata`) to `PROJECT_ROOT/public_html/oracle/webcenter/portalapp/catalogs`.
2. Right-click on each catalog under `PROJECT_ROOT/public_html/oracle/webcenter/portalapp/catalogs` and choose **Create Portal Resource**.

   This alternate procedure registers each catalog as a portal resource so it appears in the Resources tab of the WebCenter Portal Administration Console.

H.7.3.4 Resource Catalog Registry File

The resource catalog registry file defines the set of items that are available for inclusion in your resource catalog at runtime. See Chapter 16, "Creating and Managing Resource Catalogs."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/catalogs

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/catalogs

Procedure:

1. Create a new Framework application. You will copy some files from this new application into the application you are migrating.
2. From the new application, copy this file:

   `<PROJECT_ROOT>/public_`

```
html/oracle/webcenter/portalapp/catalogs/catalog-registry.xml
```

to this location in the application you are migrating:

```
<PROJECT_ROOT>/oracle/webcenter/portalapp/catalogs/catalog-registry.xml
```

H.7.3.5 Page Template File

Page templates allow you to define entire page layouts and apply them to pages to create a consistent layout across the portal. For more information, see Chapter 12, "Designing the Look and Feel of Your Portal."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/pagetemplates

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/pagetemplates

Procedure:

1. Right-click the `/oracle/webcenter/portalapp/pagetemplates` folder in Application Navigator and select **New**.
2. In the New Gallery dialog, open the **JSF** node under **Web Tier** and select **JSF Page Template**.
3. Check the box labeled **Create Associated ADFm Page Definition** and add a facet definition named `content`.
4. Add a reference to the `content` facet within the page template once it has been created. For example:

```
<?xml version='1.0' encoding='UTF-8'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich">
  <jsp:directive.page contentType="text/html;charset=UTF-8"/>
  <af:pageTemplateDef var="attrs">
    <af:xmlContent>
      <component xmlns="http://xmlns.oracle.com/adf/faces/rich/component">
        <display-name>Default Page Template</display-name>
        <facet>
          <facet-name>content</facet-name>
        </facet>
      </component>
    </af:xmlContent>
    <af:facetRef facetName="content"/>
  </af:pageTemplateDef>
</jsp:root>
```

5. Right-click the page template in the Application Navigator and select **Create Portal Resource**, then click **OK**.

H.7.3.6 Navigation Renderer File

The navigation renderer file is responsible for rendering non-page resources that appear in a navigation, such as portlets, content, and task flows. For more information, see Section 11.5, "Editing the Navigation Renderer."

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/pages/

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/pages/

Procedure:

1. In the folder specified by the location listed above, create a new JSF page. From the New menu, select **Web Tier**, then **JSF**, then **JSF Page**. Name the file `navigation-renderer.jspx`.
2. Replace the file content with the following:

```
<?xml version='1.0' encoding='UTF-8'?>
 <jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
           xmlns:f="http://java.sun.com/jsf/core"
           xmlns:af="http://xmlns.oracle.com/adf/faces/rich">
   <jsp:directive.page contentType="text/html;charset=UTF-8"/>
   <f:view>
     <af:document id="d1"

title="#{SiteStructureContext.currentNavigationModel.currentSelection.title}">
       <af:form id="f1">
         <af:pageTemplate
value="#{bindings.pageTemplateBinding.templateModel}"
                          id="pt1">
           <f:facet name="content">
             <af:region value="#{bindings.sitestructurerenderer1.regionModel}"
                        id="r1"/>
           </f:facet>
         </af:pageTemplate>
       </af:form>
     </af:document>
   </f:view>
 </jsp:root>
```

H.7.3.7 Page Hierarchy File

The `pages.xml`, or "page hierarchy" file, organizes pages into a tree structure, with a parent-child relationship between pages. This hierarchical structure allows the convenient propagation or inheritance of security settings from pages to sub pages. See Section 9.5.1, "Understanding Pages, Page Templates, and the Portal Page Hierarchy."

> **Note:** After creating the `pages.xml` file in JDeveloper, JDeveloper must be restarted in order for the `pages.xml` to be recognized as a page hierarchy file and for the hierarchy editor to be displayed when it is opened.

Location in JDeveloper's Application Navigator:

- *PROJECT_NAME* > Web Content > oracle/webcenter/portalapp/pagehierarchy

Location on the filesystem:

- *PROJECT_ROOT*/public_html/oracle/webcenter/portalapp/pagehierarchy

Procedure:

1. In the folder specified by the location listed above, create a new file called `pages.xml`.

2. Add the following content to the file:

```
<?xml version="1.0" encoding="US-ASCII" ?>
   <pagesDef xmlns="http://xmlns.oracle.com/webcenter/page"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation=
          "http://xmlns.oracle.com/webcenter/page/pagesDef.xsd"
  />
```

H.8 Applying Security Configurations

This section explains how to configure security in the Framework application.

- Section H.8.1, "Configure ADF Security"
- Section H.8.2, "Configure the jazn-data.xml File"

H.8.1 Configure ADF Security

Ensure ADF Security is configured for ADF Authentication and Authorization. For more information, see Section 69.3.1, "Configuring ADF Security Settings." If security was not already configured for the application, you can configure it as follows:

1. From the Application menu, select **Secure** and then **Configure ADF Security**.
2. Select the **ADF Authentication and Authorization** option.
3. Click **Finish**.

H.8.2 Configure the jazn-data.xml File

These permissions are required for the proper functioning of the Portal Administration page and the Resource Manager at runtime.

> **Note:** Do not replace the contents of `jazn-data.xml` with the following contents; rather, merge the highlighted (**bold faced**) elements with the existing `<grant>` and `<permissions>` entries.

1. In the Application Navigator, open the **Application Resources** folder, then open **Descriptors**, and then the **META-INF** folder.
2. In the **META-INF** folder, open the `jazn-data.xml` file.
3. Add an Application Role called **Administrator**, if one doesn't exist. See Section 69.2, "Creating an Application Role."
4. Manually insert permission entries into the source file as follows. Again, be careful to *merge the highlighted elements* rather than replace the entire contents of the file with the following code.

```
<grant>
    <grantee>
      <principals>
        <principal>
          <class>oracle.security.jps.internal.core.principals.JpsAuthenticatedRoleImpl</class>
          <name>authenticated-role</name>
        </principal>
      </principals>
    </grantee>
```

```
    <permissions>
      ...
      <permission>
         <class>oracle.adf.share.security.authorization.RegionPermission</class>
         <name>oracle.webcenter.portalwebapp.pages.adminPageDef</name>
         <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.taskflow.view.ContainerPageDef</name>
        <actions>grant</actions>
      </permission>
      <permission>
        <class>oracle.webcenter.security.auth.HierarchicalResourcePermission</class>
        <name>serviceID=oracle.webcenter.page,scopeID=s8bba98ff_4cbb_40b8_beee_
296c916a23ed,resourceID=s8bba98ff_4cbb_40b8_beee_296c916a23ed</name>
        <actions>personalize,view</actions>
      </permission>
      <permission>
        <class>oracle.adf.rc.security.CatalogPermission</class>
        <name>/oracle/webcenter/quicklinks/scopedMD/.*</name>
        <actions>create,edit</actions>
      </permission>
      ...
    </permissions>
  </grant>
  <grant>
    <grantee>
      <principals>
        <principal>
          <class>oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl</class>
          <name>anonymous-role</name>
        </principal>
      </principals>
    </grantee>
    <permissions>
      ...
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.siteresources.scopedMD.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.controller.security.TaskFlowPermission</class>
        <name>/oracle/webcenter/siteresources/scopedMD/.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.controller.security.TaskFlowPermission</class>
        <name>/oracle/webcenter/portalapp/.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.taskflow.view.ContainerPageDef</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.taskflow.view.ViewerPageDef</name>
```

```
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.taskflowstyle.view.PreviewPageDef</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.page.pstemplates.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.share.security.authorization.RegionPermission</class>
        <name>oracle.webcenter.portalapp.pagetemplates.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.webcenter.security.auth.HierarchicalResourcePermission</class>
        <name>serviceID=oracle.webcenter.page,scopeID=s8bba98ff_4cbb_40b8_beee_
296c916a23ed,resourceID=s8bba98ff_4cbb_40b8_beee_296c916a23ed</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.controller.security.TaskFlowPermission</class>
        <name>/oracle/webcenter/navigationtaskflows/view/.*</name>
        <actions>view</actions>
      </permission>
      <permission>
        <class>oracle.adf.controller.security.TaskFlowPermission</class>
        <name>/oracle/webcenter/.*</name>
        <actions>view</actions>
      </permission>
      ...
    </permissions>
  </grant>
  <grant>
    <grantee>
      <principals>
        <principal>
          <class>oracle.security.jps.service.policystore.ApplicationRole</class>
          <name>Administrator</name>
          <guid>843A31B1C1B211DFBFA9CF5E373CA556</guid>
        </principal>
      </principals>
    </grantee>
    <permissions>
      ...
       <permission>
           <class>oracle.webcenter.security.auth.HierarchicalResourcePermission</class>
           <name>serviceID=oracle.webcenter.page,scopeID=s8bba98ff_4cbb_40b8_beee_

WebCenter Portal Analytics Database Schema

This appendix describes the underlying database design for Oracle WebCenter Portal's Analytics. This information is useful to developers building *custom* analytics data queries, as described in Section 47.3, "Building Analytics Reports.".

This appendix contains the following topics:

- Section I.1, "Analytics Database Schema Overview"
- Section I.2, "Analytics Fact Table Descriptions"
- Section I.3, "Analytics Dimension Table Descriptions"
- Section I.4, "Analytics System Table Descriptions"
- Section I.5, "Analytics User Properties"
- Section I.6, "Analytics Event and Dimension Data Types"

I.1 Analytics Database Schema Overview

This section contains the following topics:

- Section I.1.1, "Analytics Database Model Overview"
- Section I.1.2, "Analytics Database Table Overview"

I.1.1 Analytics Database Model Overview

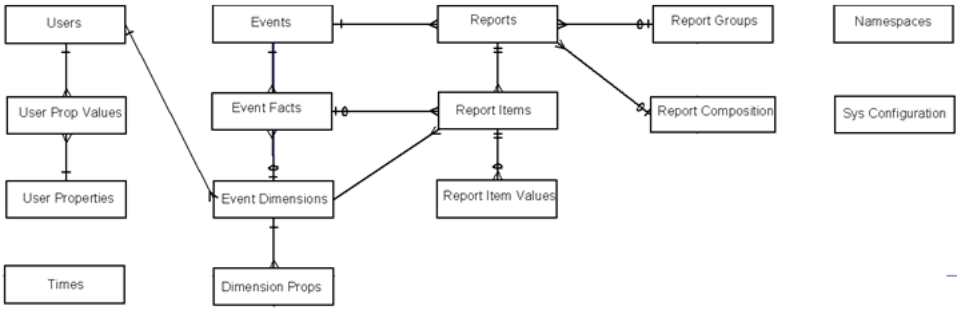
Oracle WebCenter Portal's Analytics database schema is modeled as a star-schema to optimize performance and provide fast response times.

Analytics data is stored in fact and dimension fact tables:

- **Analytics Fact Tables** are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, space views, document uploads, blog views, wiki edits, and so on. Columns in these fact tables mostly contain integer IDs that reference descriptive data stored in dimension tables.

  Table I–1, " Analytics Facts Tables (Prefixed ASFACT_WC)" lists types of analytics events that can be collected and stored, and the associated tables.

- **Analytics Dimension Tables** are also created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is



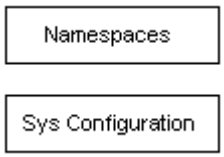
added. Typical analytics dimension data includes: page name, browser name, document name, space name, and so on.

Table I–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)" lists the different types of analytics dimensions that can be collected and stored, and the associated table names.

The Analytics database schema also contains a few application tables that store information such as system configuration parameters. Application tables are created during installation.

Figure I–1 shows the relationship between predefined fact, dimension, and application tables in the analytics database schema.

Figure I–1 Analytics Database Model



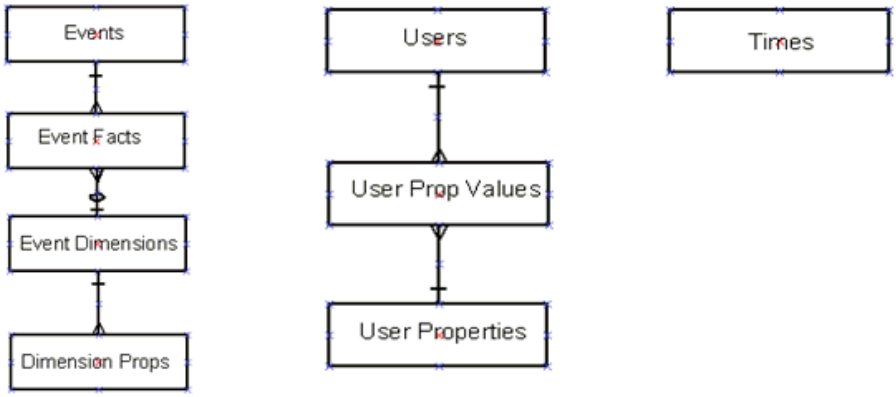
Tables shown in Figure I–1 store the following analytics data:

- Application configuration
- Event metadata
- Report metadata

Application Configuration

Figure I–2 shows which entities are used to store system parameters for the Analytics service.

Figure I–2 Application Configuration Entities

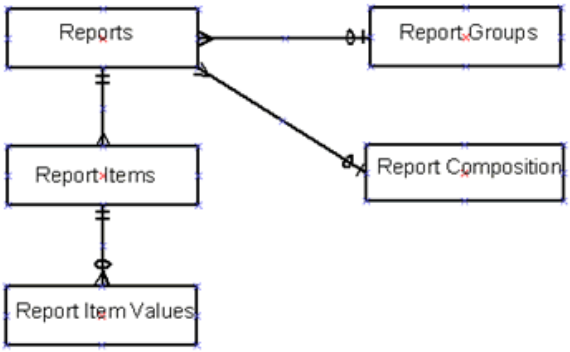


Event Metadata

Figure I–3 shows which entities are used to store event data. The Users and Times entities are mainly dimensions that provide user/time oriented views of the event data.

Event metadata records which events are collected, the tables where events are stored, as well as dimensions that are saved each time an event occurs.

Figure I–3 Event Metadata Entities



Report Metadata

Figure I–4 shows which entities represent out-of-the-box analytics reports. Metadata in these tables are the primary source for information such as report metrics, report structure, and columns listed.

Report metadata stores out-of-the-box report configurations for WebCenter Portal's Analytics. Each report contains many columns to display in the report and which filters to apply. Some reports are composed from other reports.

Figure I–4 Report Metadata Entities

I.1.2 Analytics Database Table Overview

This section lists and describes database tables in the analytics schema:

- Table I–1, " Analytics Facts Tables (Prefixed ASFACT_WC)"
- Table I–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)"
- Table I–3, " Analytics System Tables (Prefixed ASSYS)"

Note: Table names for analytics event and dimension tables are automatically generated based on analytics event and dimension names. The mapping between analytics event and dimension names and their corresponding table names is defined in the ASSYS_EVENTS and ASSYS_EVENTDIMENSIONS tables.

For an example of how to use a query to return the table names associated with a specific event, see Section I.1.2.1, "Sample SQL Query: Finding Table Names Associated with Specific Events".

Table I–1 Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
Pages	ASFACT_WC_PAGECRE_0	Stores event information captured by the Analytics service when a page is created.
	ASFACT_WC_PAGEDEL_0	Stores event information captured by the Analytics service when a page is deleted.
	ASFACT_WC_PAGEEDI_0	Stores event information captured by the Analytics service when a page is edited.
	ASFACT_WC_PAGETAG_0	Stores event information captured by the Analytics service when a page is tagged.
	ASFACT_WC_PAGEVIE_0	Stores event information captured by the Analytics service when a page is viewed.
Discussions	ASFACT_WC_DISCUSS_0	Stores event information captured by the Analytics service when a discussion topic is viewed.
	ASFACT_WC_DISCUSS_1	Stores event information captured by the Analytics service when an announcement is viewed.
	ASFACT_WC_DISCUSS_2	Stores event information captured by the Analytics service when a discussion forum is created.
	ASFACT_WC_DISCUSS_3	Stores event information captured by the Analytics service when a discussion forum is deleted.
	ASFACT_WC_DISCUSS_4	Stores event information captured by the Analytics service when a discussion topic is created.
	ASFACT_WC_DISCUSS_5	Stores event information captured by the Analytics service when a discussion topic is edited.
	ASFACT_WC_DISCUSS_6	Stores event information captured by the Analytics service when a discussion topic is deleted.
	ASFACT_WC_DISCUSS_7	Stores event information captured by the Analytics service when a discussion topic is tagged.
	ASFACT_WC_DISCUSS_8	Stores event information captured by the Analytics service when someone replies to a discussion topic message.
	ASFACT_WC_DISCUSS_9	Stores event information captured by the Analytics service when a discussion topic message is liked.
	ASFACT_WC_DISCUSS_A	Stores event information captured by the Analytics service when an announcement is created.
	ASFACT_WC_DISCUSS_B	Stores event information captured by the Analytics service when an announcement is edited.
	ASFACT_WC_DISCUSS_C	Stores event information captured by the Analytics service when an announcement is deleted.

Table I–1 (Cont.) Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
Documents - Blog - Wikis	ASFACT_WC_DOCLIB__0	Stores event information captured by the Analytics service when a document is viewed.
	ASFACT_WC_DOCLIB__1	Stores event information captured by the Analytics service when a document is downloaded.
	ASFACT_WC_DOCLIB__2	Stores event information captured by the Analytics service when a document is created.
	ASFACT_WC_DOCLIB__3	Stores event information captured by the Analytics service when a document is edited.
	ASFACT_WC_DOCLIB__4	Stores event information captured by the Analytics service when a document is tagged.
	ASFACT_WC_DOCLIB__5	Stores event information captured by the Analytics service when a document is liked.
	ASFACT_WC_DOCLIB__6	Stores event information captured by the Analytics service when a document is commented.
	ASFACT_WC_DOCLIB__7	Stores event information captured by the Analytics service when a document is deleted.
Space Events	ASFACT_WC_EVENT_C_0	Stores event information captured by the Analytics service when a space event is created.
	ASFACT_WC_EVENT_D_0	Stores event information captured by the Analytics service when a space event is edited.
	ASFACT_WC_EVENT_E_0	Stores event information captured by the Analytics service when a space event is deleted.
Spaces	ASFACT_WC_GROUPSP_0	Stores event information captured by the Analytics service when a space is viewed.
	ASFACT_WC_GROUPSP_1	Stores event information captured by the Analytics service when a space is created.
	ASFACT_WC_GROUPSP_2	Stores event information captured by the Analytics service when someone joins a space.
	ASFACT_WC_GROUPSP_3	Stores event information captured by the Analytics service when a space is deleted.
Lists	ASFACT_WC_LIST_CR_0	Stores event information captured by the Analytics service when a list is created.
	ASFACT_WC_LIST_DE_0	Stores event information captured by the Analytics service when a list is deleted.
	ASFACT_WC_LIST_ED_0	Stores event information captured by the Analytics service when a list is edited.
Logins	ASFACT_WC_LOGINS_0	Stores event information captured by the Analytics service when a user logs in to the site.
People	ASFACT_WC_PEOPLEC_0	Stores event information captured by the Analytics service when someone adds a connection.
	ASFACT_WC_PEOPLEC_1	Stores event information captured by the Analytics service when someone posts on a wall.
	ASFACT_WC_PEOPLEC_2	Stores event information captured by the Analytics service when someone edits a profile.
	ASFACT_WC_PEOPLEC_3	Stores event information captured by the Analytics service when someone edits status information.

Table I–1 (Cont.) Analytics Facts Tables (Prefixed ASFACT_WC)

Event Object	Table Name	Event Table Description
Portlets	ASFACT_WC_PORTLET_0	Stores event information captured by the Analytics service when a portlet is viewed.
Searches	ASFACT_WC_SEARCHE_0	Stores event information captured by the Analytics service when a search is performed.

Table I–2 Analytics Dimension Tables (Prefixed ASDIM_WC)

Dimension Name	Table Name	Dimension Table Description
Applications	ASDIM_WC_APPLICA_0	Stores names of WebCenter Portal applications accessing analytics data.
IP Clients	ASDIM_WC_CLIENT__0	Stores client IP addresses received in analytics events.
Discussion Topics	ASDIM_WC_DISCUSS_0	Stores discussion topic details received in analytics events.
Discussion Forums	ASDIM_WC_DISCUSS_1	Stores discussion forum details received in analytics events.
Discussion Messages	ASDIM_WC_DISCUSS_2	Stores discussion message details received in analytics events.
Announcements	ASDIM_WC_DISCUSS_3	Stores announcement details received in analytics events.
Documents	ASDIM_WC_ DOCUMENT_0	Stores document details received in analytics events.
Lists	ASDIM_WC_LISTS_0	Stores list details received in analytics events.
Pages	ASDIM_WC_PAGES_0	Stores WebCenter Portal page details received in analytics events.
Portlets	ASDIM_WC_PORTLET_0	Stores portlet information received in analytics events.
Portlet Instances	ASDIM_WC_PORTLET_1	Stores portlet instance information received in analytics events.
Portlet Producers	ASDIM_WC_PRODUCE_0	Stores producers associated with portlet.
Referrers	ASDIM_WC_REFERRE_0	Stores referred URLs where analytics events come from.
Searches	ASDIM_WC_SEARCHE_0	Stores search phrases received in analytics events.
Space Events	ASDIM_WC_EVENTS_0	Stores space event details, received in analytics events.
Spaces	ASDIM_WC_GROUPSP_0	Stores space information received in analytics events.
Tags	ASDIM_WC_TAGS_0	Stores tags received in analytics events.
Browsers	ASDIM_WC_USER_AG_0	Stores information about which browsers are used to access analytics.
Times	ASDIM_TIME	Stores times used to group analytics reports.
Users	ASDIM_USERS	Stores user details received in analytics events.
User Properties	ASDIM_ USERPROPERTIES	Stores user properties.

Table I–2 (Cont.) Analytics Dimension Tables (Prefixed ASDIM_WC)

Dimension Name	Table Name	Dimension Table Description
User Property Values	ASDIM_ USERPROPERTYVALUES	Stores user property values.

Table I–3 Analytics System Tables (Prefixed ASSYS)

Entity Name	Table Name	Table Description
Configuration	ASSYS_CONFIG	Stores system configuration details.
Dimension Properties	ASSYS_ DIMENSIONPROPS	Stores configuration details for each dimension.
Event Dimensions	ASSYS_ EVENTDIMENSIONS	Stores dimensions associated with each event.
Event Facts	ASSYS_EVENTFACTS	Stores facts associated with each event.
Events	ASSYS_EVENTS	Stores the different types of analytics events that are collected by the Analytics service. An analytics event represents a single user action, such as document view, user login, and so on.
Namespaces	ASSYS_NAMESPACES	Stores the namespace in which analytics events are registered.
Report Composition	ASSYS_ REPORTCOMPOSITION	Stores out-of-the-box composite analytics reports.
Report Group	ASSYS_REPORTGROUP	Stores out-of-the-box analytics report groups, such as portlets, services, and so on.
Report Items	ASSYS_REPORTITEMS	Stores items included in each analytics report.
Report Item Values	ASSYS_ REPORTITEMVALUES	Stores values associated with each item in an analytics report.
Reports	ASSYS_REPORTS	Stores out-of-the-box analytics reports.

I.1.2.1 Sample SQL Query: Finding Table Names Associated with Specific Events

This section provides a sample SQL query to return the names of tables associated with a specific event. This query uses a filter to return tables associated with the Documents service.

```
SELECT tablename "Table Name",
       displayname "Event Display Name"
FROM   assys_events
WHERE tablename like 'ASFACT_WC_DOCLIB%'
ORDER BY 1;
```

Sample Report Output

```
Table Name            Event Display Name
----------------------------------------
ASFACT_WC_DOCLIB__0   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTVIEWS
ASFACT_WC_DOCLIB__1   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTDOWNLOADS
ASFACT_WC_DOCLIB__2   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTCREATE
ASFACT_WC_DOCLIB__3   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTEDIT
ASFACT_WC_DOCLIB__4   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTTAG
ASFACT_WC_DOCLIB__5   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTLIKE
ASFACT_WC_DOCLIB__6   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTCOMMENT
ASFACT_WC_DOCLIB__7   {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTDELETES
```

I.2 Analytics Fact Table Descriptions

Analytics fact tables are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, space views, document uploads, blog views, wiki edits, and so on. Columns in these fact table mostly contain integer IDs that reference descriptive data stored in dimension tables.

This section describes each of the tables listed in Table I–1, " Analytics Facts Tables (Prefixed ASFACT_WC)".

I.2.1 ASFACT_WC_PAGECRE_0

Fact table that stores event information captured by the Analytics service when someone creates a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID.	ASDIM_WC_ APPLICA_0.ID

I.2.2 ASFACT_WC_PAGEDEL_0

Fact table that stores event information captured by the Analytics service when someone deletes a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.3 ASFACT_WC_PAGEEDI_0

Fact table that stores event information captured by the Analytics service when someone edits a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID

I.2.4 ASFACT_WC_PAGETAG_0

Fact table that stores event information captured by the Analytics service when someone tags a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
TAG_	NULL	NUMBER(38)	Tag ID dimension.	ASDIM_WC_USER_ AG_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.5 ASFACT_WC_PAGEVIE_0

Fact table that stores event information captured by the Analytics service when someone views a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
RESPONSE_ TIME_	NULL	NUMBER(16)	Response time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_ AG_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.6 ASFACT_WC_DISCUSS_0

Fact table that stores event information captured by the Analytics service when someone views a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_ AG_0.ID
FORUM_	NULL	NUMBER(38)	Discussion forum associated with the event.	ASDIM_WC_ DISCUSS_1.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
TOPIC_	NULL	NUMBER(38)	Discussion topic associated with the event.	ASDIM_WC_DISCUSS_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID

I.2.7 ASFACT_WC_DISCUSS_1

Fact table that stores event information captured by the Analytics service when someone views an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement associated with the event.	ASDIM_WC_DISCUSS_3.ID

I.2.8 ASFACT_WC_DISCUSS_2

Fact table that stores event information captured by the Analytics service when someone creates a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
DISCUSSION_ FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_ DISCUSS_0.ID

I.2.9 ASFACT_WC_DISCUSS_3

Fact table that stores event information captured by the Analytics service when someone deletes a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
DISCUSSION_ FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_ DISCUSS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.10 ASFACT_WC_DISCUSS_4

Fact table that stores event information captured by the Analytics service when someone creates a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_ DISCUSS_0.ID
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_ DISCUSS_2.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID

I.2.11 ASFACT_WC_DISCUSS_5

Fact table that stores event information captured by the Analytics service when someone edits a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID

I.2.12 ASFACT_WC_DISCUSS_6

Fact table that stores event information captured by the Analytics service when someone deletes a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_DISCUSS_0.ID

I.2.13 ASFACT_WC_DISCUSS_7

Fact table that stores event information captured by the Analytics service when someone tags a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
TAG_	NULL	NUMBER(38)	Tag ID dimension.	ASDIM_WC_ TAGS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_ DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.14 ASFACT_WC_DISCUSS_8

Fact table that stores event information captured by the Analytics service when someone replies to a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_ DISCUSS_2.ID
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_ DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.15 ASFACT_WC_DISCUSS_9

Fact table that stores event information captured by the Analytics service when someone likes a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	ASDIM_WC_ DISCUSS_2.ID
APPLICATION _	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	ASDIM_WC_ DISCUSS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.16 ASFACT_WC_DISCUSS_A

Fact table that stores event information captured by the Analytics service when someone creates an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
DISCUSSION_ ANNOUNCEM ENT_	NULL	NUMBER(38)	Announcement ID dimension.	ASDIM_WC_ DISCUSS_3.ID

I.2.17 ASFACT_WC_DISCUSS_B

Fact table that stores event information captured by the Analytics service when someone edits an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DISCUSSION_ ANNOUNCEM ENT_	NULL	NUMBER(38)	Announcement ID dimension.	ASDIM_WC_ DISCUSS_3.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.18 ASFACT_WC_DISCUSS_C

Fact table that stores event information captured by the Analytics service when someone deletes an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
DISCUSSION_ FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	ASDIM_WC_ DISCUSS_1.ID

I.2.19 ASFACT_WC_DOCLIB__0

Fact table that stores event information captured by the Analytics service when someone views a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
RESPONSE_ TIME_	NULL	NUMBER(16)	Response Time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
GROUPSPACE	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
REFERRER	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_ DOCUMENT_ 0.ID
USER_AGENT	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID
APPLICATION	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.20 ASFACT_WC_DOCLIB__1

Fact table that stores event information captured by the Analytics service when someone downloads a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_ DOCUMENT_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.21 ASFACT_WC_DOCLIB__2

Fact table that stores event information captured by the Analytics service when someone creates document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.22 ASFACT_WC_DOCLIB__3

Fact table that stores event information captured by the Analytics service when someone edits a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.23 ASFACT_WC_DOCLIB__4

Fact table that stores event information captured by the Analytics service when someone tags a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
TAGS	NULL	NUMBER(38)	Tag added to the document.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.24 ASFACT_WC_DOCLIB__5

Fact table that stores event information captured by the Analytics service when someone "likes" a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

I.2.25 ASFACT_WC_DOCLIB__6

Fact table that stores event information captured by the Analytics service when someone comments on a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.26 ASFACT_WC_DOCLIB__7

Fact table that stores event information captured by the Analytics service when someone deletes a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
WEBCENTER_ RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

I.2.27 ASFACT_WC_EVENT_C_0

Fact table that stores event information captured by the Analytics service when someone creates an event in a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_ EVENTS_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.28 ASFACT_WC_EVENT_D_0

Fact table that stores event information captured by the Analytics service when someone edits an event in a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_ EVENTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.29 ASFACT_WC_EVENT_E_0

Fact table that stores event information captured by the Analytics service when an event is deleted.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
EVENT_	NULL	NUMBER(38)	Event Identifier.	ASDIM_WC_ EVENTS_0.ID

I.2.30 ASFACT_WC_GROUPSP_0

Fact table that stores event information captured by the Analytics service when someone views a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
RESPONSE_ TIME_	NULL	NUMBER(16)	Response time (ms).	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.31 ASFACT_WC_GROUPSP_1

Fact table that stores event information captured by the Analytics service when someone creates a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.32 ASFACT_WC_GROUPSP_2

Fact table that stores event information captured by the Analytics service when someone joins a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.33 ASFACT_WC_GROUPSP_3

Fact table that stores event information captured by the Analytics service when someone deletes a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.34 ASFACT_WC_LIST_CR_0

Fact table that stores event information captured by the Analytics service when someone creates a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_ LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

I.2.35 ASFACT_WC_LIST_DE_0

Fact table that stores event information captured by the Analytics service when someone deletes a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_ LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID

I.2.36 ASFACT_WC_LIST_ED_0

Fact table that stores event information captured by the Analytics service when someone edits a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.I D
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LIST_	NULL	NUMBER(38)	List ID.	ASDIM_WC_LISTS_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID

I.2.37 ASFACT_WC_LOGINS_0

Fact table that stores login event information captured by the Analytics service with related data for each event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID	
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID

I.2.38 ASFACT_WC_PEOPLEC_0

Fact table that stores event information captured by the Analytics service when someone adds a people connection.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
TARGET_USER	NULL	NUMBER(38)	User ID	

I.2.39 ASFACT_WC_PEOPLEC_1

Fact table that stores event information captured by the Analytics service when someone posts on a wall.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
TARGET_ USER	NULL	NUMBER(38)	User ID.	

I.2.40 ASFACT_WC_PEOPLEC_2

Fact table that stores event information captured by the Analytics service when someone edits a profile.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID

I.2.41 ASFACT_WC_PEOPLEC_3

Fact table that stores event information captured by the Analytics service when someone edits status information.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.I D

I.2.42 ASFACT_WC_PORTLET_0

Fact table that stores information captured by the Analytics service when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
CACHED_	NULL	NUMBER(5)	Indicates whether the portlet was displayed from the cache.	
PORTLET_	NULL	NUMBER(38)	Portlet.	ASDIM_WC_ PORTLET_1.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
PRODUCER_	NULL	NUMBER(38)	Portlet producer.	ASDIM_WC_ PRODUCE_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_ PAGES_0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
CLIENT_IP	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT__0.ID
PORTLET_ INSTANCE_	NULL	NUMBER(38)	Portlet instance.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
RESPONSE_ TIME_	NULL	NUMBER(16)	Response time (ms).	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID

I.2.43 ASFACT_WC_SEARCHE_0

Fact table that stores event information captured by the Analytics service when someone performs a search.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_ USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT__0.ID
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICA_0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERRE_0.ID
SEARCHED_PHRASE	NULL	NUMBER(38)	Search phrase.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID

I.3 Analytics Dimension Table Descriptions

Analytics dimension tables are created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is added. Typical analytics dimension data includes: page name, browser name, document name, space name, and so on.

This section describes each of the tables listed in Table I–2, " Analytics Dimension Tables (Prefixed ASDIM_WC)".

I.3.1 ASDIM_WC_APPLICA_0

Dimension table that stores the names of WebCenter Portal applications accessing analytics data, for example `webenter` (Spaces application).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NOT NULL	NVARCHAR2(254)	Application name.	

I.3.2 ASDIM_WC_CLIENT__0

Dimension table that stores client IP address details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
IP	NOT NULL	NVARCHAR2(15)	Client IP address	

I.3.3 ASDIM_WC_DISCUSS_0

Dimension table that stores discussion topic details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
NAME_	NULL	NVARCHAR2(254)	Discussion topic name.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion topic description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

I.3.4 ASDIM_WC_DISCUSS_1

Dimension table that stores discussion forum details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion forum description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion forum.	

I.3.5 ASDIM_WC_DISCUSS_2

Dimension table that stores discussion message details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date records last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion message.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion message description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	

I.3.6 ASDIM_WC_DISCUSS_3

Dimension table that stores announcement details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Announcement description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, name of the announcement.	

I.3.7 ASDIM_WC_DOCUMENT_0

Dimension table that stores information captured by the Analytics service when documents are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
CONTENTTYPE_	NULL	NVARCHAR2(254)	Document content type.	
CONTEXT	NULL	NVARCHAR2(512)	Document prefix (for identification purposes): ■ Document prefix - Folder URL for parent space ■ Blog prefix - Blog title name ■ Wiki prefix - Wiki title name	
NAME_	NULL	NVARCHAR2(254)	Document name.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Document description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
PATH_	NULL	NVARCHAR2(512)	Document path.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OBJECTTYPE_	NULL	NVARCHAR2(254)	Object type.	

I.3.8 ASDIM_WC_EVENTS_0

Dimension table that stores information about space events captured by the Analytics service when a user creates an event in his or her calendar.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the space event.	

I.3.9 ASDIM_WC_GROUPSP_0

Dimension table that stores information captured by the Analytics service when a space is accessed by an end user (Spaces application only).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
DESCRIPTION_	NULL	NVARCHAR2(254)	Description.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the space is the Home space (0) or a group space (1).	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Name of the space.	

I.3.10 ASDIM_WC_LISTS_0

Dimension table that stores list details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the list.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

I.3.11 ASDIM_WC_PAGES_0

Dimension table that stores information captured by the Analytics service when pages are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the page is a personal page (in the Home space) or belongs to a group space.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID. The full page path, for example, `/oracle/webcenter/page/sda254765_f950/Home.jspx`	
NAME_	NULL	NVARCHAR2(254)	Name of the page.	

I.3.12 ASDIM_WC_PORTLET_0

Dimension table that stores information captured by the Analytics service when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
DEFAULT_TITLE_	NULL	NVARCHAR2(254)	Default portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

I.3.13 ASDIM_WC_PORTLET_1

Dimension table that stores portlet instance information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
TITLE_	NULL	NVARCHAR2(254)	Portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

I.3.14 ASDIM_WC_PRODUCE_0

Dimension table that stores portlet producer information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Producer name.	

I.3.15 ASDIM_WC_REFERRE_0

Dimension table that stores information captured by the Analytics service related to the location (URL) to which the user was navigating when the analytics event was captured.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
URL	NOT NULL	NVARCHAR2(2000)	Referred URL	

I.3.16 ASDIM_WC_SEARCHE_0

Dimension table that stores search phrases captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PHRASE	NOT NULL	NVARCHAR2(254)	Search phrase.	

I.3.17 ASDIM_WC_TAGS_0

Dimension table that stores tag information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
VALUE	NOT NULL	NVARCHAR2(254)	Tag value.	

I.3.18 ASDIM_WC_USER_AG_0

Dimension table that stores information about whichbrowsers are used to access analytics data.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
OS	NULL	NVARCHAR2(100)	Operating system.	
AGENT	NOT NULL	NVARCHAR2(512)	User agent ID.	
BROWSER	NULL	NVARCHAR2(255)	Name of the browser.	
BROWSER_ VERSION	NULL	NVARCHAR2(30)	Browser version.	

I.3.19 ASDIM_TIME

Dimension table that stores times used to group analytics reports. An entry is created every hour. analytics reports use this table to group data within a specific time frame.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERIODSTART	NULL	DATE	Current period start.	
PERIODEND	NULL	DATE	Current period end.	
HOUROFDAY	NULL	NUMBER(5)	Hour corresponding to this time period.	
DAYOFMONTH	NOT NULL	NUMBER(5)	Current day of the month.	
DAYOFYEAR	NULL	NUMBER(5)	Current day of the year.	
WEEKOFYEARSU NDAY	NULL	NUMBER(5)	Week number of Sunday year.	
WEEKOFYEARMO NDAY	NULL	NUMBER(5)	Week number of Monday year.	
WEEKOFYEARSA TURDAY	NULL	NUMBER(5)	Week number of Saturday year.	
MONTHOFYEAR	NOT NULL	NUMBER(5)	Month corresponding to the period's year.	
YEAR	NOT NULL	NUMBER(5)	Current year.	

I.3.20 ASDIM_USERS

Dimension table that stores user details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
USERID	NOT NULL	NVARCHAR2(255)	User ID. For example: `weblogic`	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

I.3.21 ASDIM_USERPROPERTIES

Dimension table that stores user properties, such as Title, Department, and so on.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(255)	Property name.	

I.3.22 ASDIM_USERPROPERTYVALUES

Dimension table that stores values for user properties.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
USERID	NOT NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	ASDIM_USERPROPERTIES.ID
VALUE	NULL	NVARCHAR2(255)	Property ID value.	
TYPE	NULL	NUMBER(38)	Property type.	

I.4 Analytics System Table Descriptions

System tables are created during installation to store application information such as system configuration parameters. Each table is described in this section.

I.4.1 ASSYS_CONFIG

System table that stores system configuration information. Each row contains value pairs—configuration type/value.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NULL	NVARCHAR2(510)	Name of configuration parameter, for example, collector_port.	
CONFIGTYPEID	NOT NULL	NUMBER(38)	Configuration type ID.	
INTVAL	NULL	NUMBER(38)	Integer value associated with the configuration.	
STRVAL	NULL	NVARCHAR2(2000)	String value associated with the configuration.	

I.4.2 ASSYS_DIMENSIONPROPS

System table that stores dimension configuration information. Each row represents property values for a dimension.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DIMENSIONID	NOT NULL	NUMBER(38)	Dimension ID.	ASSYS_EVENTDIMENSIONS.ID
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension property display name.	
COLUMNNAME	NOT NULL	NVARCHAR2(510)	Column name.	
COLUMNTYPE	NULL	NUMBER(38)	Column type.	
COLUMNLENGTH	NULL	NUMBER(38)	Column length.	
ISKEY	NULL	NUMBER(38)	Indicates whether this is a key dimension property.	

I.4.3 ASSYS_EVENTDIMENSIONS

System table that stores dimensions associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension event display name.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name associated with the dimension.	
ISUNIQUE	NULL	NUMBER(38)	Deprecated.	
IDENTIFYINGUSER	NOT NULL	NUMBER(38)	User ID.	ASDIM_USERS.ID

I.4.4 ASSYS_EVENTFACTS

System table that stores facts associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASDIM_WC_EVENTS_0.ID
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
COLUMNAME	NOT NULL	NVARCHAR2(510)	Event fact column name.	
COLUMNTYPEID	NULL	NUMBER(38)	Indicates the data type of the event fact: INTEGER (1), STRING (2), DATE (3), FLOAT (4), BOOLEAN (5) If the event fact is a dimension, COLUMNTYPEID is -1.	
COLUMNLENGTH	NULL	NUMBER(38)	User ID.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	ASSYS_EVENTDIMENSIONS.ID

I.4.5 ASSYS_EVENTS

System table that stores the different analytics events representing *one* user action that is captured. Both out-of-the-box analytics events and custom (user-defined) analytics events are stored. Each row represents the event captured with its associated data such as active status, and table name where data is stored.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Event description.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ISCUSTOM	NOT NULL	NUMBER(38)	Indicates whether or not the event is a custom event. (0/1)	
ISACTIVE	NOT NULL	NUMBER(38)	Deprecated.	
ISPERSISTENT	NOT NULL	NUMBER(38)	Indicates whether or not to create a fact table for the event. (0/1)	
ISACTION	NOT NULL	NUMBER(38)	Not used.	

I.4.6 ASSYS_NAMESPACES

System table that stores the different namespaces in which analytics events are registered.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PREFIX	NOT NULL	NVARCHAR2(510)	Namespace prefix.	
URI	NOT NULL	NVARCHAR2(510)	Universal resource identifier for the namespace.	

I.4.7 ASSYS_REPORTCOMPOSITION

System table that stores the composition for reports provided by the Analytics service.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PARENTREPORTID	NOT NULL	NUMBER(38)	Reference to parent report ID.	ASSYS_REPORTS.ID
CHILDREPORTID	NOT NULL	NUMBER(38)	Reference to child report ID.	ASSYS_REPORTS.ID
SEQUENCE	NULL	NUMBER(10)	Sequence of report composition.	
NAME	NOT NULL	NVARCHAR2(510)	Name of report composition.	
DESCRIPTION	NULL	NVARCHAR2(510)	Description of report composition.	

I.4.8 ASSYS_REPORTGROUP

System table that stores the report groups included for the Analytics service. Report groups enable end users to display analytics data in a specific way.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record was last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report group name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Report group description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	

I.4.9 ASSYS_REPORTITEMS

System table that stores item information in each report. Each row represents a specific item belonging to one report.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTID	NOT NULL	NUMBER(38)	Report ID.	ASSYS_REPORTS.ID
ITEMTYPE	NOT NULL	VARCHAR2(30)	Item type.	
ITEMDESCRIPTION	NULL	NVARCHAR2(510)	Item description.	
ITEMVALUE	NULL	NUMBER(5)	Item value.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	ASSYS_EVENTDIMENSIONS.ID
EVENTDIMENSIONNAME	NULL	NVARCHAR2(510)	Dimension name.	
EVENTFACTID	NULL	NUMBER(38)	Event fact ID.	ASSYS_EVENTFACTS.ID
EVENTFACTNAME	NULL	NVARCHAR2(510)	Event fact name.	
PROPERTYNAME	NULL	NVARCHAR2(510)	The name of the column in the dimension table to be selected in the query performed, for example, name or ID.	
AGGREGATEFUNCTION	NULL	VARCHAR2(60)	SQL function for grouping purposes (AVG, MIN, MAX, COUNT, COUNT DISTINCT).	
DISPLAYFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to display the item in the report. (0/1)	
IDENTIFIERFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to use this item as an identifier (SQL: whether or not to group by this column). (0/1)	

I.4.10 ASSYS_REPORTITEMVALUES

System table that stores the values associated to each item in a report. Each row represents a specific value (char, float or date) for one report item instance.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTITEMID	NOT NULL	NUMBER	Report item ID.	ASSYS_REPORTITEMS.ID
VALUETYPE	NOT NULL	VARCHAR2(30)	Value type: CVALUE, NVALUE or DVALUE.	
CVALUE	NULL	NVARCHAR2(510)	Char value.*	
NVALUE	NULL	NUMBER	Numeric value.*	
DVALUE	NULL	DATE	Date value.*	

*Only one of CVALUE, NVALUE or DVALUE has a value.

I.4.11 ASSYS_REPORTS

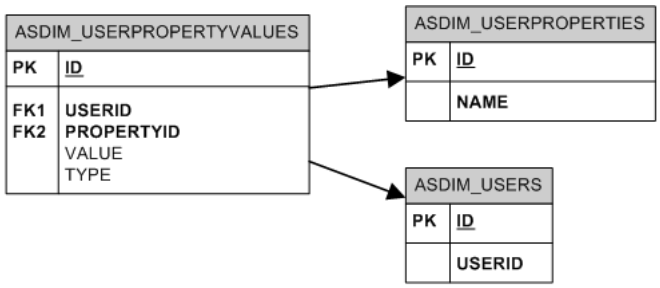
System table that stores the different out-of-the-box reports to be provided by the Analytics service. Each row represents a single report and the report's configuration.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report item ID.	
DESCRIPTION	NULL	NVARCHAR2(255)	Report description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	
GROUPID	NULL	NUMBER (38)	Group ID for the report.	ASSYS_REPORTGROUP.ID
EVENTTYPEID	NULL	NUMBER(38)	Associated event ID.	ASSYS_EVENTS.ID
EVENTDISPLAYNAME	NULL	NVARCHAR2(510)	Denormalized. Display name of associated event.	
GROUPSPACEFILTERENABLED	NOT NULL	VARCHAR2(1)	Indicates whether users can filter the report 'by space'. If set to true (1), the report displays the space selector UI.	
DEFAULTCHARTSTYLE	NULL	NVARCHAR2(255)	Default chart style for the report.	
DEFAULTCHARTTYPE	NULL	NUMBER(2)	Default chart type.	
DEFAULTDISPLAYCOUNT	NULL	NUMBER(2)	Default display count.	
DEFAULTTIMEFRAME	NULL	NUMBER(2)	Default time frame.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DEFAULTGROUPBYTIMEINTERVAL	NULL	NUMBER(2)	Default group time interval.	
DEFAULTGROUPBYUSERPROPERTY	NULL	NUMBER(38)	Default "group by user" property.	
SHOWMETRICSELECTOR	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display selector UI for this metric. (Y/N)	
SHOWCHARTTYPEOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display chart type options in the UI. (Y/N)	
SHOWDISPLAYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not the field to select display options will be shown in the UI. (Y/N) (The field is a drop-down list to select between: Top n, Bottom n, All records, or List of specific records.)	
SHOWDISPLAYTOPOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Top n" option. (Y/N) If N, the "Top n" option will not be available in the combo box.	
SHOWDISPLAYBOTTOMOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Bottom n" option. (Y/N) If N, the "Bottom n" option will not be available in the combo box.	
SHOWDISPLAYALLOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "All records" option. (Y/N) If N, the "All records" option will not be available in the combo box, and users will only be able to select from Top n, Bottom n or a list of specific records.	
SHOWOBJECTPICKER	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select a list of specific records option. (Y/N) If N, the "Select ..." option will not be available in the combo box. If Y the "Select ..." option will be available and a picker dialog will be displayed to select the list of objects to be included in the report.	
SHOWTIMEFRAMEFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display time frame filter. (Y/N)	
SHOWUSERPROPERTYFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display user property filter (Y/N).	
SHOWGROUPBYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display "group by" options. (Y/N)	
COMPOSEDREPORT	NOT NULL	NVARCHAR2(1)	Indicates whether this is a composed report.	
PORTLETTYPEID	NULL	NUMBER(38)	Portlet type ID.	

I.5 Analytics User Properties

The Analytics service uses several tables to store information about users who are triggering analytics events in WebCenter Portal applications. This section contains the following topics:



- Section I.5.1, "User Property Tables - Overview"
- Section I.5.2, "User Property Dimension Tables"
- Section I.5.3, "Out-of-the-Box User Properties for WebCenter Portal"

For sample queries related to user properties, see Section 47.3.3, "Sample Queries for User Metrics" in Chapter 47, "Integrating the Analytics Service."

I.5.1 User Property Tables - Overview

Figure I–5 shows the database model used by the Analytics service to store information about users. The user dimension table has a single property column (USERID). In addition, there are two other tables (ASDIM_USERPROPERTIES and ASDIM_USERPROPERTYVALUES) that store user properties as key-value data. This model enables additional user properties to be added without changing the user dimension definition.

Figure I–5 User Property Dimensions for Analytics

The ASDIM_USERPROPERTIES table stores the names of user properties received by the Analytics service. User properties (attributes of the user including name, position, email, address, etc) are captured by the Analytics service as an event when a user logs in to Spaces, not when the properties are modified. If a user changes a property, the value of the property will be updated in analytics the next time the user logs in.

The ASDIM_PROPERTYVALUES table stores one row per property, per user, where each row corresponds to a value for a property associated with a specific user.

I.5.2 User Property Dimension Tables

User property dimension tables are described in the following topics:

- Section I.5.2.1, "ASDIM_USERPROPERTIES"
- Section I.5.2.2, "ASDIM_USERPROPERTYVALUES"

I.5.2.1 ASDIM_USERPROPERTIES

Dimension table that stores the names of user properties received by the Analytics service.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
NAME	VARCHAR(255)	Name of the user property. Names are converted to uppercase and whitespace characters are removed.

I.5.2.2 ASDIM_USERPROPERTYVALUES

Dimension table that stores one row per property per user, where each row corresponds to a value for a property associated with a specific user.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
USERID	NUMBER(38,0)	Foreign key to the ASDIM_USERS table.
PROPERTYID	NUMBER(38,0)	Foreign key to the ASDIM_USERPROPERTIES table.
VALUE	VARCHAR(255)	The value of a particular property (identified by the PROPERTYID column) for a particular user (identified by the USERID column). For example, if the property is "CITY" and the user "weblofig", this column will be storing the city name where that user works (for example "San Francisco").
TYPE	NUMBER(38,0)	User property value type. (Property values are always stored as strings.)

I.5.3 Out-of-the-Box User Properties for WebCenter Portal

WebCenter Portal applications send a specific set of user properties to the Analytics service, as shown in Table I–4.

Note: WebCenter Portal applications can only send properties that are set by the user or available in the user directory. If a property value is blank, no row is created for it in the ASDIM_USERPROPERTYVALUES table for that user.

Table I–4 Out-of-the-Box User Properties for WebCenter Portal

Property Name	Property Label (displayed in reports)	Example Value
IMUSER	IM User	dfrabott
DISPLAYNAME	Display	Diego Frabotta
PHONE	Phone	+5411-2222-1234
TITLE	Title	Software Engineer
DEPARTMENT	Department	Analytics
MANAGER	Manager	uid=dsabaris,cn=users,dc=us,dc=myco,dc=com
COMPANY	Company	MyCo
STREET*	Street	Parque Austral, Edificio Insignia M3
ZIPCODE	ZIP Code	12345

Table I–4 (Cont.) Out-of-the-Box User Properties for WebCenter Portal

Property Name	Property Label (displayed in reports)	Example Value
STATEORPROVINCE	State or Province	Buenos Aires
COUNTRY	Country	Argentina
EMPLOYEEID	Employee Id	55555
CITY	City	Pilar

* STREET stores the user's home address street.

I.6 Analytics Event and Dimension Data Types

Table I–5 shows how analytics event and dimension data types map to data types in Oracle, Microsoft SQL Server, and IBM DB2 databases.

Table I–5 Analytics Event and Dimension Data Types

Analytics Event and Dimension Type	Oracle	Microsoft SQL Server	IBM DB2
INTEGER	NUMBER	BIGINT	INTEGER
STRING	NVARCHAR	NVARCHAR	VARGRAPHIC
DATE	DATE	DATETIME	TIMESTAMP
FLOAT	FLOAT	FLOAT	DECFLOAT
BOOLEAN	NUMBER(5)	TINYINT	SMALLINT

Glossary

About mode

A **portlet mode** that typically displays information such as copyright, version, and author of the portlet.

Activity Stream

In the **People Connections service**, a feature for viewing the application activities tracked for you and other users.

Activity Graph

A WebCenter Portal service that provides suggestions of people, items, and spaces that users may be interested in interacting with.

The engine used by the Activity Graph service to provide a central repository for actions that are collected by enterprise applications. The data stored in the activity graph is analyzed to calculate ranks for nodes, predict new actions, and make recommendations.

Activity Rank

Determines the relevance of a search result.

administrator

In the Spaces application there are two types of administrator:

- Fusion Middleware administrator: Also referred to as systems administrator. A user with complete administrative capabilities. This administrator can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks.
- Spaces administrator: A user responsible for customizing Spaces out of the box, managing and granting application roles, and maintaining the application when it is in use.

Ajax

A combination of asynchronous JavaScript, dynamic HTML (DHTML), XML, and XmlHttpRequest communication channel that enables requests to be made to the server without fully re-rendering the page. Ajax enables rich client-like applications to use standard internet technologies.

Analytics service

A WebCenter Portal service offers real-time usage and activity reporting for your portal. In the Spaces application, users can track and analyze Spaces traffic and usage.

Announcements service

A WebCenter Portal service that offers a quick, convenient way to create and widely distribute messages instantly or at a specific time.

API

Application Programming Interface. A set of exposed data structures and functions that an application can use to invoke services on an application object, such as a **portlet**.

application customization

Performed by an administrator, all users see the change. These are static changes to an application that affect a site or sites that do not involve changes to the application's code or schema.

See also **user customization** and **personalization**

Application Development Framework

See **Oracle ADF**.

Application Programming Interface

See **API**.

application role

Roles that are specific to a particular application and are stored in an application-specific stripe of the policy store.

application skin

Specifies the application background color, screen fonts, and, with some skins, the shapes and images used for application buttons and icons. In the Spaces application, the administrator chooses the default application skin and Spaces users may change the application skin on the General tab of the Preferences dialog.

application templates

WebCenter Portal provides templates for creating two kinds of applications: Framework applications and Portlet Producer applications. Templates ensure that the right technology scopes are set, tag libraries added, and required Java classes are added to the class path. Once you do this, relevant components are included to the Component Palette and relevant context menus become available in JDeveloper.

See also **Framework application template** and **Portlet Producer Application template**.

authenticated user

A user who is logged into a WebCenter Portal application. Credentials of this user are verified against the identity store. By default, an authenticated user can access public information. To access secured information, such as pages and **portlet**s, this user must be authorized through the policy and credential store.

Contrast with **public user**s, who are not logged in, and can access public content only.

authentication

Identification of a user through an identity management system. You can require ADF authentication to enforce credentials for users to access the Framework application only (all ADF resources in the application remain accessible), or authentication *and*

authorization to enforce credentials for users to access the Framework application and any ADF resources that have been secured in the application.

authorization

The policies that define the access rights of an individual or group to a secured resource. This resource may be a page or component within a page.

authorized user

An individual who has access to a secured resource. For non-public resources, this individual is also an **authenticated user**.

AviTrust Portal Demonstration for WebCenter Portal

An enterprise banking application built using Oracle Fusion Middleware, including Oracle WebCenter Portal: Framework and WebCenter Portal: Spaces, used to provide examples of WebCenter Portal functionality.

blog page

A page that provides a personal record of an individual user's experience and opinions. There are two kinds of blog: personal blogs are written by an individual; group blogs are written by several users.

Box layout component

A layout component available through **Composer**. A container that enables the placement of content on a page created in the Spaces application. In Composer, a Box is rendered as a rectangle comprised of dashed lines. In a Framework application, this is the runtime equivalent of a Panel Customizable component.

BPEL

Business Process Execution Language. An XML-based markup language for composing a set of discrete web services into an end-to-end process flow.

business role page

A page, created by the administrators in the Spaces application, specifically provided for a given role in an organization. Business role pages provide a targeted environment for users of a particular role by delivering information that is timely and relevant to individual roles without the noise of irrelevant information from other lines of business. Business role pages appear in the Home space of users classified under the specified role.

caching

The act of storing frequently accessed information, typically web pages, in a location where it can be accessed quickly to avoid frequent content generation.

See also **expiry-based caching** and **validation-based caching**.

calendar overlay

The ability to display multiple calendars in a single Events task flow.

Change Mode Button component

In the **Composer** tag library that enables users to change from page View mode to page Edit mode.

Change Mode Link component

A component provided in the **Composer** tag library that enables users to change from page View mode to page Edit mode.

check out/check in

A mechanism that enables a user to lock information, by checking it out, so that other users cannot modify that same piece of information. This prevents users from overwriting each other's changes. After making modifications, the user releases it by checking it back in, making it available again for other users to modify.

Child Components

The components contained within a parent component. For example, the task flows contained within a Box layout component are the child components of the Box.

See also **Box layout component** and **parent component**.

chrome

Visual elements surrounding a portlet or task flow that provide an access point for actions, such as those on the Actions menu and those embedded in the chrome itself, such as the minimize icon or resize handles.

CMIS

Content Management Interoperability Services (CMIS) standard defines a domain model and Web services and Restful AtomPub bindings that can be used by applications to work with one or more Content Management repositories or systems.

component

An individual piece of an application, for example, a task flow, portlet, page, or layout element such as a box or image.

Component Catalog

A dialog, accessed from **Composer**, that provides access to all the content you can add to a WebCenter Portal application page.

component developer

The developer who builds components (such as portlets, **JavaServer Faces** components, and web services).

Component Properties

A dialog, accessed from **Composer**, that provides access to a component's parameters, display options, child components, style settings, and associated events.

Composer

A seamlessly integrated environment for populating, revising, and configuring portal pages. Composer enables users to easily build or revise page layout and content. It also provides the means of adding different components, such as task flows, portlets, content, and other objects, onto a page and then linking those components for a more relevant or personalized view of the information.

Connections

In the **People Connections service**, a feature for establishing a social network with other application users.

container

An application program or subsystem in which the program building block, known as a **component**, is run.

container runtime option

A JSR 286 feature that provides a way to customize the behavior of the portlet container and therefore customize the runtime environment.

content integration services

Services provided by **Oracle WebCenter Portal** to enable developers to display content from a **content repository**, such as by creating **data control**s.

Content Presenter

A feature of the **Documents service** that enables end users to select and search content items and then display those items using available display templates. Oracle WebCenter Portal provides out-of-the-box templates for displaying single and multiple content items on your pages. You can also define custom templates for the content that you want to display in your **Framework application**, or for selection by end users at runtime.

content repository

A specialized storage and management mechanism that provides such features as author-based versioning, full text searching, and content categorization and attribution. A content repository is optimized for storing unstructured information, which differentiates it from a data repository.

content repository data control

A **data control** sourced though a content repository. In a **Framework application**, you can create content repository data controls for the following content repositories: **Oracle Portal**, **Oracle WebCenter Content**, third-party repositories that support the Java Content Repository (JCR) standard, and your local file system.

credential provisioning page

A **JSF** (`*.jspx`) page used for authenticating to an **external application**. At runtime, the Credential Provisioning page displays login data fields consisting of the data fields specified through external application registration. Login information is passed to the producer, which in turn passes the login values to the external application. The application provides the producer with the requested portlets.

After authentication, the user's login credentials are preserved in a **credential store**, which subsequently supplies that information at future sessions. Unless his information changes, the user supplies his credentials only one time.

credential store

Provides storage for login credentials for its associated domain. It also preserves the login credentials that a user provides for authentication to an **external application**. Credential store is usually combined with the policy store as a single logical store.

Although the credentials stored in the credential store are used during subsequent logins for authentication, the main function of this store is to provide authorization for those accounts.

CSS

Cascading Style Sheet. A simple mechanism for ensuring a consistent look and feel or adding style, such as fonts, colors, and spacing, to web documents.

custom action

Icons or menu items rendered on the header or the Actions menu of a Show Detail Frame component surrounding a task flow. Custom actions can represent actions that were defined in the task flow when it was created. For example, at design time a developer can build a task flow with custom personalization settings. At runtime, users can access these settings through icons or Actions menu items provided in the task flow's surrounding chrome (or Show Detail Frame).

custom attribute

In the Spaces application, custom attributes specify information in addition to that provided by the built-in attributes. Custom attributes can be used to determine the content of the components in a space based on the parameter passed in. For example, a component can display data for a specific customer by passing in the customer ID. A custom attribute is simply a name value pair, for example customerId=400, orderId=11, userName=Smith, and so on. Custom attributes are stored within the space template.

custom page

Any page created by a user rather than one provided out of the box.

custom display template

A Content Presenter display template is a JSFF file (JSF page fragment) that defines how Content Presenter renders content items on a Framework application page. WebCenter Portal provides several out-of-the-box display templates to get you started, or, you can create your own templates.

custom resource catalog

A resource catalog that has been customized to control the components that are visible to specific users.

Contrast with **default resource catalog**.

custom role

A user role created by an administrator or a space moderator to meet a specific Home space or space requirement.

Customize mode

A **portlet mode** that enables users to set the default values for portlet preferences for all users.

customizable component

A WebCenter Portal component that can be added to a page at runtime to enable end users to perform personalizations such as move, minimize, restore, or remove on content within those components. Customizable components are the **Panel Customizable component** and the **Show Detail Frame component**.

data control

A mechanism that provides an abstraction of the business service's data model. The ADF data controls provide a consistent mechanism for clients and web application controllers to access data objects, collections, methods, and operations.

default language (application-level)

A display language specified by the Spaces administrator that is used when users log in to the Spaces application. The Spaces administrator sets the application-level default

language on the **General** tab of the **Administration** page. Individual users can set their own user-level default language on the General tab of the Preferences dialog.

default language (user preference)

A user-specified display language that is rendered when the user logs in to the Spaces application. This language selection lasts until the user specifies a different default language. It can be overridden by a session language, but returns as the default when the session cookie is purged or expires. This value is set on the **General** tab of the Preferences dialog.

default resource catalog

The resource catalog that is provided by default for an application. It contains all of the Oracle ADF components and portlets available to the application.

Contrast with **custom resource catalog**.

Default Server

See **Integrated WLS**.

delegated administration

Provides a mechanism for securing portal resources based on user roles. You apply delegated administration to a page hierarchy, and the specific security assignments are automatically propagated down through the hierarchy through pages and sub pages.

deployment profile

A file used in application deployment that specifies the following types of information:

- The source files, deployment descriptors, and other auxiliary files that are packages
- The type and name of the archive file to be created
- Dependency information
- Platform-specific instructions
- Other information

Oracle WebCenter Portal: Services provides a special deployment profile, the **Framework application** WAR deployment profile, that includes an option to export project metadata.

Design view (JDeveloper)

A view, in **Oracle JDeveloper**, that provides a WYSIWYG representation of a file.

See also **Source view (JDeveloper)**.

Design view (Spaces)

A view, in **Composer**, that provides a WYSIWYG representation of a page and its components.

See also **Source view (Spaces)**.

discoverable space

A space that can be found by anyone logged into the Spaces application, for example through a search. Any **Public** or **Private** space is discoverable. Discoverable spaces are listed on the **Spaces** page when **All Spaces** is selected from the **Show** list. Users

wishing to join the space can request membership through self-service (if enabled) or by contacting the space moderator.

Discussions service

A WebCenter Portal service that provides a means of creating and participating in discussion forums.

display language

Controls the language in which application user interface elements, such as buttons, field labels, and screen text, are rendered in the browser. The order of precedence for Framework application display language settings from weakest to strongest is: browser setting, application setting, user preference setting, session setting, space setting.

Documents page

A predefined page provided in every Spaces group and Home space that includes the Document Manager task flow for managing content.

Documents service

A WebCenter Portal service that provides several task flows that offer a variety of formats to display folders and files on a page. You can choose the task flows appropriate for your application to provide features for accessing, adding, and managing folders and files; configuring and viewing file and folder properties; and searching file and folder content in the connected content repositories.

domain

Any tree or subtree within the Domain Name System (DNS) namespace. Domain most commonly refers to a group of computers whose host names share a common suffix: the domain name.

dynamically-generated page

A page that displays as the result of a user action, such as a search or a click on a tag. As the name suggests, dynamically-generated pages are not stored, but rather are created as and when needed.

EAR

Enterprise Archive file. A **Java EE** archive file that is used in deploying applications on a **Java EE** application server. **Framework application**s are deployed using both a generic EAR file, which contains the application and the respective runtime customization, and a targeted EAR file, which contains only the application for deployment to the application server. EAR files simplify application deployment by reducing the possibility of errors when moving an application from development to test, and test to production.

See also **WAR**.

ECMA-262 specification

A standardization of scripting programming languages, such as **ECMAScript** and JavaScript.

ECMAScript

A scripting programming language, standardized by Ecma International according to the **ECMA-262 specification**. Frequently referred to as JavaScript or JScript, which are both extensions of the ECMA-262 specification.

Edit Defaults mode

(**JSR 286** portlets only.) A **portlet mode** that enables personalization of a JSR 286 portlet. Edit Defaults mode is a display mode for the JSR 286 portlet's properties. In a **Framework application**, the Edit Defaults mode displays on the portlet's Actions menu as the Customize command.

See also **Edit mode**.

Edit mode

A **portlet mode** that enables personalization of the portlet for each user, for each instance.

See also **Edit Defaults mode**.

edit mode

A view mode that enables users to modify the content, style, and layout of a page. Access edit mode by choosing Edit Page from the Page Actions menu.

EL

Expression Language. Provides a shorthand way of working with web application data by providing operators for retrieving and manipulating application data residing in a **Java EE** web container. In a **Framework application**, EL expressions are encapsulated in the characters "#{" and "}" and typically come in the form #{object.data} where *object* represents any Java object or **Oracle ADF** component placed in the **Java EE** web container's page, request, session, or application's scope.

Enterprise Archive file

See **EAR**.

enterprise mashup

An application that enables users to bring all sorts of content and services together in a single place.

Events service

A WebCenter Portal service that provides calendars for scheduling meetings, appointments, and so on. In the Spaces application, it provides calendars to record events relevant to the specific space. You can also integrate the Events service with Microsoft Exchange Server to enable individual users to access their personal calendars in their Home space. Personal calendars are also available in Framework application.

expiry-based caching

A **caching** method that uses a retention period to specify how long the item is valid in the cache before a refresh is required. When there is a request for the item beyond the retention period, it is refreshed in the cache.

See also **validation-based caching**.

Expression Language

See **EL**.

external application

Applications that do not delegate authentication to the single sign-on server. Instead, they display HTML login forms that ask for application user names and passwords. At

the first login, users can choose to have the single sign-on server retrieve these credentials for them. Thereafter, they are logged in to these applications transparently.

farm

A collection of components managed by Fusion Middleware Control. A farm can contain a Managed Server domain and other Oracle Fusion Middleware system components that are installed, configured, and running on the domain.

favorites

A personal list of links to favorite pages in the Spaces application and external web sites.

Federated Portal Adapter

See **FPA**.

Feedback

In the **People Connections service**, a feature for posting informal appraisals for and receiving informal appraisals from other application users.

FPA

Federated Portal Adapter. A component of **Oracle Portal** that enables Oracle Portal instances to share their database portlets through the web portlet interface. Using the FPA, Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets can be made available for use in Framework applications.

Framework application

A Framework application is built on top of the ADF using the **WebCenter Portal's Extension for Oracle JDeveloper**. This application combines web content, portlets, content integration, and collaborative services for the end user. Developers and administrators can create a Framework application based on their roles and skill levels in the organization.

A portal also includes page hierarchies, navigation models, and delegated administration.

Framework application administrator

The administrator responsible for maintaining the **Framework application**. For example, in Spaces, the administrator performs tasks such as implementing the branding for the Framework application, making new content available, modifying pages, and granting and revoking privileges.

Contrast with systems administrator who has administrative rights for entire Fusion Middleware functions. The Fusion Middleware administrator is also responsible for deploying, setting up, and configuring the Framework application, and performing on-going administrative tasks for the Framework application and other WebCenter Portal components through Fusion Middleware Control.

Framework application developer

The developer who plans, builds, and maintains a **Framework application** using the Oracle Application Development Framework, **Oracle JDeveloper**, and **Oracle WebCenter Portal**.

Framework application end user

The runtime user of the **Framework application**, who accesses pages, portlets, and content, and personalizes portlets (assuming the appropriate privileges).

Framework application life cycle

The process of creating and testing a Framework application in a design time environment, deploying it to a production system, and then performing routine maintenance, such as monitoring performance and migrating customization data. The life cycle of an application also includes performing further enhancements, restaging, and then redeploying the application to the production system.

Framework application template

A JDeveloper template which includes WebCenter Portal: Framework features like site navigation, page hierarchies, delegated administration, and page templates.

See also **application templates** and **Portlet Producer Application template**.

Full Screen Mode (Spaces)

A view mode that opens the space to occupy the entire screen, thus maximizing the display space. The Sidebar is not displayed in Full Screen Mode.

Full Screen mode (Portlets)

(**PDK-Java** portlets only.) A **portlet mode** that provides more content than can be shown in the portlet when it is sharing a page with other portlets.

Fusion Middleware Control

A browser-based management application that is deployed when you install Oracle WebCenter Portal. From Fusion Middleware Control, you can monitor and administer a **farm** (such as Oracle WebCenter Portal).

Fusion Order Demo (FOD)

See **AviTrust Portal Demonstration for WebCenter Portal**.

HA

High Availability. A collection of solutions to ensure that your applications meet the required availability to achieve your business goals, eliminating single points of failure with no or minimal outage in service.

Help mode

A **portlet mode** that displays usage information about the functionality of the portlet.

High Availability

See **HA**.

Home space

A work area within Spaces that provides individual users with a private space for storing personal content, keeping notes, viewing and responding to assignments, maintaining a list of online buddies, and performing many other tasks relevant to their unique working day. Users can also extend this environment by creating additional personal pages and custom content.

HTML Markup layout component

A layout component available through **Composer**. A simple HTML component that renders raw HTML and JavaScript mark-up inline on the page.

Hyperlink layout component

A layout component available through **Composer**. A link to an internal or external web page. For designers of Framework applications, this is the runtime equivalent of a Go Link component.

IDE

Integrated Development Environment. A visual application development tool containing editors, debuggers, screen painters, object browsers, and the like. **Oracle JDeveloper** is an example of an IDE.

Identity Propagation

For a Framework application and associated content repositories, selecting this option allows propagation of current user's identity across the application and processes. The propagated identity is verified on the receiver's side, and then it is used to make decisions such as assigning role based access control.

Image layout component

A layout component available through **Composer**. An illustration that can include a hyper link. For designers of Framework applications, this is the runtime equivalent of an Image Link component.

IMP service

See **Instant Messaging and Presence service**.

initialization parameters

The parameters initialized upon the start-up of a standard JSR 286 portlet. Initialization parameters provide an alternative to JNDI (Java Naming and Directory Interface) variables. Use initialization parameters instead of JNDI to configure the behavior of all of the different components of the portlet—for example, servlets and other portlets—in a compatible way. In **Oracle WebCenter Portal**, initialization parameters are entered into the `portlet.xml` file.

Instant Messaging and Presence service

A WebCenter Portal service that enables users to observe the presence status of other authenticated users and provides instant access to interaction options, such as instant messages and emails.

Integrated Development Environment

See **IDE**.

Integrated WLS

Integrated WebLogic Server. A WLS instance used as a platform for pretesting Framework application deployments on a local computer. Integrated WLS also contains preconfigured portlet producers and several useful prebuilt portlets.

Iterative development

Iterative development lets you make changes to your Framework application while it is running on the Integrated WebLogic Server and immediately see the effect of those changes simply by refreshing the current page in your browser. The iterative development feature works by disabling certain optimization features. Iterative development allows developers to work more quickly and efficiently when building a Framework application.

JAAS

Java Authentication and Authorization Service (JAAS) is a Java package that enables applications to authenticate and enforce access controls upon users. JAAS is designed to complement Java 2 security and implements a Java version of the standard Pluggable Authentication Module (PAM) framework. This enables an application to remain independent from the authentication service, and supports the use of custom authentication modules.

JAAS extends the access control architecture of the Java 2 Security Model to support subject-based authorization. It also supports declarative security settings in deployment descriptors instead of being limited to code-based security settings.

Java Authentication and Authorization Service

See **JAAS**.

Java Content Repository

See **JCR 1.0**.

Java EE

Also known as Java EE 5. Java Enterprise Edition 5 Platform. A platform that enables application developers to develop, deploy, and manage multitier, server-centric, enterprise-level applications. The Java EE platform offers a multitiered distributed application model, integrated XML-based data interchange, a unified security model, and flexible transaction control. You can build your own Java EE portlets and expose them through web producers.

Java Enterprise Edition 5 Platform

See **Java EE**.

Java Portlet Specification

Standardizes how components for portal servers are to be developed. This specification defines a common portlet **API** and infrastructure that provides facilities for personalization, presentation, and security. Portlets using this **API** and adhering to the specification are product-agnostic, and can be deployed to any portal product that conforms to the specification. See also **JSR 286**.

Java Specification Request

See **JSR 286**.

JavaServer Faces

See **JSF**.

JavaServer Page

See **JSP**.

JCR 1.0

Java Content Repository 1.0. Also known as JSR 170. It proposes a standard access and interaction **API** for content repositories, much like JDBC does for databases.

JDeveloper

See **Oracle JDeveloper**.

JSF

JavaServer Faces. A standard Java framework for building web applications. It simplifies development by providing a component-centric approach to developing Java web user interfaces. JSF offers rich and robust **API**s that provide programming flexibility and ensures that applications are well designed with greater maintainability by integrating the Model-View-Controller (**MVC**) design pattern into its architecture. As JSF is a Java standard developed through Java Community Process, development tools like **Oracle JDeveloper** are fully empowered to provide easy to use, visual, and productive development environments for JSF.

JSF JSP

JavaServer Faces JavaServer Page. JSF JSPs differ from plain JSPs through their support of **Oracle ADF Faces** components for the user interface and JSF technology for page navigation. JSF JSP pages leverage the advantages of the Oracle **Application Development Framework** (Oracle ADF) by using the ADF Model binding capabilities for the components in the pages.

JSP

JavaServer Page. An extension to servlet functionality that provides a simple programmatic interface to web pages. JSPs are HTML pages with special tags and embedded Java code that is executed on the web or application server. JSPs provide dynamic functionality to HTML pages. They are actually compiled into servlets when first requested and run in the servlet container.

See also **JSP tags**.

JSP tags

Tags that can be embedded in **JSP**s to enclose Java code. These tags use the `<jsp:` syntax and enclose action elements in the JSP with `begin` and `end` tags similar to XML elements.

JSR 286

Java Specification Request (JSR) 286. Defines a set of **API**s for building standards-based portlets using Java. Portlets built to this specification can be rendered to a portal locally or deployed to a WSRP container for rendering portlets remotely. For more information, see `http://jcp.org/en/jsr/detail?id=286`.

JSR 170

See **JCR 1.0**

JSR 329

See **Oracle JSF Portlet Bridge**.

keystore

A file that provides information about available public and private keys that are used for authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the keystore.

layout box

A container that enables placement of content on a page created in the Spaces application.

layout component

An object for enhancing the usefulness and appearance of a given page. Layout components include layout boxes, a rich text editor, images, hyperlinks, and so on.

Layout Customizable component

A component provided in the **Composer** tag library that enables users to select from a set of predefined layouts (for example, two column, three column, two row, and so on) and apply it to the page. Users can apply these layouts to a particular area of the page or to the entire page.

LDAP

Lightweight Directory Access Protocol. A standard, extensible directory access protocol. It is a common language that LDAP clients and servers use to communicate. The framework of design conventions supporting industry-standard directory products, such as the Oracle Internet Directory.

life cycle

See **Framework application life cycle**.

Lightweight Directory Access Protocol (LDAP)

See **LDAP**.

Links service

A WebCenter Portal service that provides a means of creating a bidirectional association between two objects, thus setting up easy access between those objects.

Lists service

A WebCenter Portal service that provides a means of creating lists and exposing them for placement on application pages at runtime. At design time, you can make the Lists task flow available in your runtime Resource Catalog. At runtime, users can add the task flow from the Catalog to a page and use the task flow to create lists.

Lists page

A predefined page that displays the space's current lists.

Look and feel

A look and feel file determines the appearance of your application, from the placement and behavior of elements on a portal page to the colors used in the portlet title bars. The look and feel is determined by skins, navigations, page templates, layouts, content display templates, and other similar components.

Mail service

A WebCenter Portal service for exposing familiar email functionality in applications.

Managed Server

In a production environment, a Managed Server hosts applications and the resources needed by those applications. A domain, which is a logically related group of Oracle WebLogic Server resources, can have any number of Managed Servers. An Administration Server manages these servers.

mashup

A web application that enables end users to pull information from different sources to create a personalized application that exactly meets their individual requirements.

See also **enterprise mashup**.

MBean Browser

In Fusion Middleware Control, MBean browsers enable the administrator to perform specific monitoring and configuration tasks and browse MBeans for an Oracle WebLogic Server or a selected application.

MDS

Oracle Metadata Services. A core technology of the **Application Development Framework**. MDS provides a unified architecture for defining and using metadata in an extensible and customizable manner.

MDS repository

An application server and Oracle relational database that keep metadata in these areas: a file-based repository, dictionary tables accessed by build-in functions, and a metadata registry. One of the primary uses of MDS is to store customizations and persisted personalization for Oracle applications.

Message Board

In the **People Connections service**, a feature for posting messages to and receiving messages from other application users.

metadata

Information about a content item, such as title, author, or security group. Metadata is used to describe, find, and group content items. Also referred to as content information.

Model-View-Controller

See **MVC**.

moderator

A Spaces user who is responsible for managing a particular space. A space moderator can add and remove members, invite new members, enable self registration, provide and update space metadata, and manage the services available to the space.

Movable Box layout component

A layout component available through **Composer**. A container that enables the placement of content on a page created in the Spaces application. Movable Boxes, along with their content, can be moved around on the page. For designers of Framework applications, this is the runtime equivalent of Show Detail Frame component.

MVC

Model-View-Controller. A classic design pattern often used by applications that need the ability to maintain multiple views of the same data. The MVC pattern hinges on a clean separation of objects into one of three categories: models for maintaining data, views for displaying all or a portion of the data, and controllers for handling events that affect the model or views. Because of this separation, multiple views and controllers can interface with the same model. Even new types of views and controllers that never existed before, such as portlets, can interface with a model without forcing a change in the model design.

My Spaces page

A predefined page that displays a list of all the spaces available to the currently logged in user. The user can select from the **Show** menu to display **All Spaces**, only spaces of which the user is a member (**Joined by Me**), or only spaces of which the user is the moderator (**Moderated by Me**).

navigation

WebCenter Portal provides three navigation components to create portal navigation. These components are: Breadcrumb navigation, menu navigation, and tree navigation.

navigation model

Navigation models provide data to the navigation user interface and enable navigation to resources in your application, such as pages, page hierarchies, task flows, external sites, portlets, and other entities. You can configure navigation models at both design time and runtime.

Notes service

A WebCenter Portal service that provides useful features for writing personal notes and reminders. This service is available only in Spaces, and not in Framework applications.

Notifications service

A WebCenter Portal service that provides an automated means of triggering notices across different messaging channels, such as phone, mail, Worklist, and so on. Messages are triggered when the spaces and application objects to which you have subscribed change.

Oracle ADF

Oracle Application Development Framework. A range of technologies aimed at making **Java EE** application development faster and simpler for developers while at the same time taking advantage of proven software patterns to ensure that the developed application is scalable, performant, and the like.

OAM

See **Oracle Access Manager (OAM)**.

OHS

See **Oracle HTTP Server (OHS)**.

OmniPortlet

A component of **Oracle WebCenter Portal** that enables you to inject portal-like capabilities, such as portlets, content integration, and customization, into your **Oracle ADF Faces** applications.

Oracle Access Manager (OAM)

Part of Oracle's enterprise class suite of products for identity management and security, Oracle Access Manager provides a wide range of identity administration and security functions, including several single sign-on options for Spaces and Framework applications. OAM is the recommended single sign-on solution for Oracle WebCenter Portal 11g installations.

Oracle ADF Faces

Oracle **Oracle ADF** Faces is a rich set of user interface components based on the new **JavaServer Faces** JSR (JSR 127). Oracle ADF Faces provide various user interface components with built-in functionality, such as data tables, hierarchical tables, and color and date pickers, that can be customized and reused in an application.

Oracle WebCenter Content: Content Server

A content repository for building secure business libraries with check in and check out, revision control, and automated publishing in web-ready formats. Current information is available to authorized users anytime, anywhere.

Oracle WebCenter: Content Server is a component of Oracle WebCenter Content.

Oracle WebCenter Portal's Discussions Server

Backend discussions server for the Discussions and Announcements services.

Oracle Enterprise Manager

A component that enables administrators to manage Oracle Fusion Middleware services through a single environment. The Fusion Middleware administrator uses Enterprise Manager to configure, manage, and monitor Framework applications.

Oracle HTTP Server (OHS)

Software that processes web transactions that use the Hypertext Transfer Protocol (HTTP). Oracle uses HTTP software developed by the Apache Group.

Oracle Internet Directory

Oracle's LDAP V3 compliant LDAP server. It is used as a repository for provisioning users and groups. By default, the **Oracle Single Sign-On (OSSO)** authenticates user credentials against Oracle Internet Directory information about dispersed users and network resources. Oracle Internet Directory combines LDAP version 3 with the high performance, scalability, robustness, and availability of the Oracle database.

Oracle JDeveloper

Oracle JDeveloper is an integrated development environment (**IDE**) for building applications and web services using the latest industry standards for Java, XML, and SQL. Developers can use Oracle JDeveloper to create Java portlets.

Oracle JSF Portlet Bridge

Based on and conforming to JSR 329, the Oracle JSF Portlet Bridge enables application developers to expose a JSF application or task flow as a JSR 286 portlet for consumption in another application.

Oracle Metadata Services

See **MDS**.

Oracle Portal

A component used for the development, deployment, administration, and configuration of enterprise class **portal**s. Oracle Portal incorporates a portal building framework with self-service publishing features to enable you to create and manage information accessed within your portal.

See also **Oracle WebLogic Portal**.

Oracle Secure Enterprise Search (SES)

Provides easy-to-use search for public and secure data, with unified ranking results. With Framework applications, Oracle SES is set as the default and preferred search platform.

With Spaces applications, WebCenter Portal's internal live search adapters are set as the default search platform; however, large-scale implementations should be configured to use Oracle SES for best performance.

Oracle Single Sign-On (OSSO)

A component that enables users to log in to all features of the Oracle Fusion Middleware product suite, and to other web applications, using a single user name and password.

Oracle WebCenter Content's Site Studio

A powerful, flexible web development application suite that offers a comprehensive approach to designing, building, and maintaining enterprise-scale web sites. Site Studio uses Oracle WebCenter Content: Content Server as the main repository for a web site.

In WebCenter, Content Presenter integrates with Site Studio to allow you to create, access, edit, and display Site Studio contributor data files in either a Site Studio region template or a custom Content Presenter display template.

Oracle SOA Suite

A middleware component of Oracle Fusion Middleware. Oracle SOA Suite enables services to be created, managed, and orchestrated into SOA composite applications. Composites enable you to easily assemble multiple technology components into one SOA composite application. Oracle SOA Suite plugs into heterogeneous infrastructures and enables enterprises to incrementally adopt SOA.

Oracle Technology Network

See **OTN**.

Oracle WebCenter Content

Provides a flexible, secure, centralized, web-based repository that manages all phases of the content life cycle: from creation and approval to publishing, searching, expiration, and archival or disposition. It enables contributors to easily contribute content from native desktop applications, efficiently manage business content through rich library services, and securely access that content anywhere using a web browser. All content, regardless of content type, is stored in the web repository or database for management, reuse and access.

Oracle WebCenter Portal

A suite of services that enables you to build Oracle WebCenter Portal applications. Oracle WebCenter Portal reduces the front-end labor historically required to bring necessary business components to the user by capitalizing on the notion of Service Oriented Architecture (SOA). The suite includes a wide range of plug-and-play products, tools, and services that make it easy to build the applications your users need.

Oracle WebCenter Portal: Framework

A set of features provided by **Oracle WebCenter Portal** that augments the Java Server Faces (JSF) environment by providing additional integration and runtime customization options. It integrates capabilities historically included in portal

products, such as site navigation, page hierarchies, portlets, customization, personalization, and integration, directly into the fabric of the JSF environment. This eliminates artificial barriers for the user and provides the foundation for developing context-rich applications. You can selectively add only desired Oracle WebCenter Portal components or services to your framework application.

Oracle WebCenter Portal's Pagelet Producer

Provides a collection of useful tools and features that facilitate dynamic pagelet development.

Oracle WebCenter Portal: Services

A collection of Web 2.0 services that expose social networking and personal productivity features through various services.

- Activity Graph
- Announcements service
- Analytics service
- Discussions service
- Documents service
- Events service
- Instant Messaging and Presence service
- Links service
- Lists service
- Mail service
- Notes service
- Notifications service
- People Connections service
- Personalization for WebCenter Portal
- Polls service
- Recent Activities service
- RSS service
- Search service
- Tags service
- Worklist service

Oracle WebCenter Portal: Spaces

A WebCenter Portal application built using JSF, Oracle ADF, WebCenter Portal: Framework, WebCenter Portal: Services, and Composer. In the production documentation, it is commonly referred as **Spaces application (Spaces)**.

Oracle WebLogic Server Administration Console

A browser-based, graphical user interface to manage a WebLogic Server domain. Use to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters

- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy your applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

OTN

Oracle Technology Network. The online Oracle technical community that provides a variety of technical resources for building Oracle-based applications. You can access OTN at `http://www.oracle.com/technetwork`.

Oracle WebLogic Portal

WebLogic Portal enables you to provide a user interface to integrate your applications. WebLogic Portal lets you surface application data and functionality from heterogeneous environments into an integrated, dynamic, and customizable web-based portal user interface that can simultaneously support multiple devices. In addition to a powerful portal framework and its J2EE security foundation, WebLogic Portal provides many business services, such as content management, communities, personalization, search, and user management. WebLogic Portal provides a virtual content repository that lets you federate external content management systems into a single management interface. You can then build portals using content in those external resource. WebLogic Portal also provides a WLP content repository for creating and managing content.

Page Composer

See **Composer**.

Page Customizable component

A component provided in the **Composer** tag library that defines the editable area of a page at runtime. Within this area, users can edit properties for a component, add content to the page, arrange content, and so on.

page hierarchy

A model that associates pages in a parent-child relationship, where any page can have one or more sub pages. This parent-child model not only helps define the overall structure of the portal, but also allows child pages to inherit the security policies from their parent.

page parameter

A parameter associated with a page that can be used to store values that can then be passed to the components on the page. It also enables your page to take values through its URL. Page parameters are defined using the `<parameter>` tag at the top of your `PageDef.xml`. You can bind page parameters to your **page variable**s.

Page Properties

A dialog, accessed from **Composer**, that provides access to a page's display options, security settings, and parameters.

page scheme

Determines the background image used in the page. The Spaces application provides several default page schemes and an option for specifying a custom page scheme.

page style

Determines the initial page structure, for example one column or two column. Some default page styles also include the task flows, components, and page properties useful for a particular purpose. For example, a page created using the Text page style includes a Text layout component.

page template

Lets you specify view elements that you intend to be common to all of your pages. A page template file is a JSPX file that includes ADF layout components and other elements. Typically, page templates define a page layout, with headers, footers, and content areas. In addition, the page template usually specifies the positioning and style of the navigation UI for your pages.

page variable

A variable that binds your public portlet parameter to the page. Page variables are defined within the `<variableIterator>` of your `PageDef.xml`. One page variable can be bound to multiple public portlet parameters.

pagelet

A **portlet** that can be used in any web page (not just within a portal).

Panel Customizable component

A component provided in the **Composer** tag library that provides a container region for a group of Oracle ADF components and portlets that are customizable at runtime. Any Show Detail Frame components and portlets added as child components to a Panel Customizable component can be moved or maximized with the Panel Customizable component.

parameter

A variable that controls the default behavior of task flow content and facilitates the wiring of a task flow to page parameters and page definition variables.

parent component

A component that contains other components, such as a Box layout component that contains task flows. The Box is the parent component of the task flows. In contrast, the task flows are the Box's child components.

See also **Child Components**.

participant

A Spaces user who can manipulate the content of a space. A participant can upload and share documents, initiate and take part in chats with other members, create discussion topics, create new or view existing lists.

PDK-Java

Java Portlet Developer Kit. The development framework used to build and integrate web content and applications with **Oracle WebCenter Portal**. It includes toolkits, samples, and technical articles that help make portal development simple. You can take existing Java **servlet**s, **JSP**s, URL-accessible content and web services and turn

them into **portlet**s. It is typically used by external developers and vendors to create portlets and services.

People Connections service

A WebCenter Portal service that provides social networking tools for creating, interacting with, and tracking the activities of one's enterprise connections.

See also, **Activity Stream**, **Connections**, **Feedback**, **Message Board**, and **Profile**.

personalization

Dynamic changes to an application's behavior based on user context, facilitated by Personalization for WebCenter Portal.

See also **application customization** and **user customization**

Personalization for WebCenter Portal

A WebCenter Portal service that enables you to deliver content within your application to targeted application users based on selected criteria. Personalization for WebCenter Portal also provides a declarative means for specifying dynamic application flow.

personal page

A page created by a user in his or her Home space. Personal pages are viewable by other users only if specifically granted access by the user who created the page.

personal profile

A page that displays a user's personal information such as email address, phone number, office location, department, manager, direct reports, and so on.

See also, **Profile**.

Polls service

A WebCenter Portal service that enables you to create, edit, and take online polls on your application pages. Polls let you survey your audience (such as their opinions and their experience level) and check whether they can recall important information, and gather feedback on the efficacy of presentations.

portal

A common interface (that is, a web page) that provides a personalized, single point of interaction with web-based applications and information relevant to individual users or class of users.

portal application template

See **application templates**.

Portal Developer Kit

See **PDK-Java**.

portlet

A reusable web component that can draw content from many different sources. Portlets can display excerpts of other web sites, generate summaries of key information, perform searches, and access assembled collections of information from a variety of data sources. Because different portlets can be placed on a common page, the user receives a single-source experience, even though the content may be derived from multiple sources. Portlet resources include the many prebuilt portlets available

out of the box and programmatic portlets built through WebCenter's JSR 286, PDK-Java Portlet wizards, and other portlet building tools.

portlet event

A JSR 286 feature that allows portlets to react to actions or state changes not directly related to an interaction of the user with the portlet.

portlet filter

A JSR 286 feature that allows on-the-fly transformations of information in both the request to and the responses from a portlet. A portlet filter is a reusable piece of code that can transform the content of portlet requests and portlet responses.

portlet mode

The ways by which a **portlet** can be called to display information. These methods include:

- **Shared Screen mode** or **View mode**
- **Edit mode** or **Edit Defaults mode**
- **Customize mode**
- **Help mode**
- **About mode**
- **Full Screen mode (Portlets)** or **Show Details Page mode**

Portlet Producer Application template

An application template, provided by JDeveloper, for creating an application with the recommended projects and technology scopes required for developing portlets. The Portlet Producer Application template consists of a single project scoped for portlet creation (Portlets).

See also **Framework application template** and **producer**.

predefined page

A page created by the Spaces application to perform a specific function. Examples of predefined pages include, Welcome pages, Search pages, and Documents pages.

Predeployment Tool

A utility for **Framework application**s that assists you in configuring your target system with the new producer registrations you have added to your application in Oracle JDeveloper. You must run this utility before deploying your application. You can also use this utility after deployment to migrate metadata from stage to production, for example, to export and import your customizations. This tool also enables you to define the **MDS** repository location to allow run-time customizations to be migrated.

pretty URL

A shortened version of a page's URL that hides the complexity of the real web address.

private parameter

A portlet parameter that is known only to the portlet itself and has no connection to the page on which the portlet resides.

Contrast with **public parameter**.

producer

A communication link between portlet consumers (such as a **Framework application** or a **portal**). When a consumer application renders a portlet, it calls the producer of that portlet, which in turn executes the portlet and returns the results in the form of portlet content. A producer can contain one or more portlets. A portlet can be contained by only one producer.

Oracle WebCenter Portal supports two types of producers:

- Oracle **PDK-Java** producers: Deployed to a **Java EE** application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP.
- **Web Services for Remote Portlets** (WSRP): A web services standard that enables the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as **JSR 286**, .NET, Perl) and any WSRP portal. A portlet (regardless of language) deployed to a WSRP-enabled container can be rendered in any application that supports this standard.

Profile

In the **People Connections service**, a feature for viewing and managing information about yourself, such as your contact information, manager, and direct reports, and for viewing this information about other application users.

programmatic portlets

Portlets constructed in a non-declarative manner using **API**s. Also referred to as *hand-* or *manually-coded* portlets.

public render parameters

A JSR 286 feature that enables portlets to share parameter values, allowing a form of interportlet communication.

public space

A space that is available to all users, even those who are not logged in to the Spaces application.

public page

A page within the Spaces application that is available to all users, even those who are not logged in to the application.

public parameter

A portlet parameter that is known to the page and bound to it by way of a page variable.

Contrast with **private parameter**.

public user

A user who can access, but is not logged into, a WebCenter Portal application. A public user can view any page that has been marked as public, but cannot personalize or edit any content, or view pages that have any form of access control.

Contrast with **authenticated user**.

Recent Activities service

A WebCenter Portal service that provides a means of tracking recent activities in a Framework application.

recipe

A weighted list of similarity calculations. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

resize handle

A user interface element in a task flow chrome increasing or decreasing the height of the task flow.

resource

Items users can manage through the Resource Manager, like page templates, skins, task flows, navigations, and so on. Spaces categorizes resources under the following categories: Structure, Look and Layout, and Mashups.

Resource Action Handling framework

Enables services that expose custom resources to be viewed, searched, and tagged.

Resource Catalog

A catalog that provides a federated view of one or more otherwise unrelated repositories in a unified search and browse user interface. Resources are created and published in their source repository and are then exposed to the developer in JDeveloper's Resource Palette and to the end user in the Resource Catalog Viewer. Resource catalogs can contain layout components, Oracle ADF components, portlets, service task flows, and documents.

Resource Index

The starting point for accessing WebCenter Portal REST APIs. Sending a GET request to the Resource Index URI returns a list of links to entry points for all available services.

Resource Manager

Enables users with the appropriate privileges to continue developing the portal after the application has been deployed. Using the Resource Manager users can also download runtime portal resources (from Framework applications and Spaces) and import them into Oracle JDeveloper for further development. These resources can then be exported from JDeveloper and uploaded back into the deployed application.

resource type

Defines the type of resource that a WebCenter Portal REST API link identifies. Use resource types to determine the response bodies for GET requests and allowable request bodies for POST and PUT. Also use `resourceType` attributes on entities to uniquely identify their type.

REST APIs

Oracle WebCenter Portal provides a set of web-based REST (REpresentational State Transfer) APIs for retrieving and modifying server data dynamically from the client. REST APIs are available for **Discussions service**, **People Connections service**, and **Spaces application (Spaces)**.

Reverse Proxy Server

A server process that hides the physical location of internal servers by exposing the servers as a single public site. Requests to the public site are routed to the appropriate internal server.

Round-trip development

Round-trip development refers to features and techniques that allow you to retrieve resources from a deployed, runtime portal back to JDeveloper for maintenance or enhancement. After modifying a resource in JDeveloper, you can use the Resource Manager to upload the resource back to the deployed portal. WebCenter Portal's round-trip development features provide a simple, convenient way to modify portal resources without redeploying the entire application.

RSS reader

An RSS reader provided with the Spaces application that incorporates public news feeds from external sources onto application pages. This RSS reader is available only in Spaces, and not in Framework applications.

RSS service

A WebCenter Portal service that provides a means of publishing content from other services as news feeds. The RSS service supports both RSS 2.0 and Atom 1.0 formats.

Search service

A WebCenter Portal service that enables the discovery of information and people in an application, returning only the results users are authorized to see

Secure Enterprise Search

See **Oracle Secure Enterprise Search (SES)**.

secured application page

A page created by a user that has not been made available to public users.

Self-Registration page

A predefined page where users can register with the Spaces application, thus creating themselves an identity store login account. Administrators can customize certain aspects of this page.

Self-Subscription page

A predefined page where users can register to become members of a space. Moderators can customize certain aspects of this page.

service ID

In Expression Language, the string that identifies a particular service. For example, the string `oracle.webcenter.collab.announcement` is the service ID for the Announcements service.

A PDK-Java producer's unique identifier. PDK-Java enables you to deploy multiple producers under a single adapter servlet. Different producers are identified by their unique service IDs. A service ID is required only when a service ID/producer name is not appended to the URL endpoint.

Service Oriented Architecture

See **SOA**.

servlet

A Java program that usually runs on a **Web server**, extending the web server's functionality. HTTP servlets take client HTTP requests, generate dynamic content (such as through querying a database), and provide an HTTP response.

session language

A display language specified by the user that remains in effect for the life of the session cookie (from log on to log off). If the user clears browser cookies, the display language reverts to the user-level default language, if specified, then to the application-level default language set by the Spaces administrator. Set the session language in the Change Language pop-up, accessible from the Welcome page.

Shared Screen mode

A **portlet mode** that renders the body of the portlet and enables you to display a portlet on a page that can contain other portlets. Every portlet must have at least a Shared Screen mode.

See also **View mode**.

Show Detail Frame component

A component provided in the **Composer** tag library that renders a border or chrome around the child component. It provides a header with an Actions menu and thereby providers user interface (UI) controls to customize the display of the child component. However, to customize the display of the child component, the Show Detail Frame component must be included inside a Panel Customizable component.

Show Details Page mode

A **portlet mode** that provides full-browser display of the portlet. For example, a portlet in **Show Page mode** could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with **Show Page mode**.

show modes

Types of **portlet mode**s encompassing **Show Page mode** and **Show Details Page mode**.

Show Page mode

A **portlet mode** that provides a smaller portlet display to allow space for additional portlets and other objects in the browser window. For example, a portlet in Show Page mode could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with **Show Details Page mode**.

similarity calculation

Used by the Activity Graph service to provide a similarity score (a number between zero and one) that designates how similar two objects are to each other given a specific criterion. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

skin

A style sheet based on the CSS 3.0 syntax specified in one place for an entire application. Instead of providing a style sheet for each component, or inserting a style sheet on each page, you can create one skin for the entire application.

SOA

Service Oriented Architecture. A design methodology aimed at maximizing the reuse of application services.

Source view (JDeveloper)

A view, in **Oracle JDeveloper**, that provides a way to directly edit the source code of a file.

Source view (Spaces)

A view, in **Composer**, that provides a selectable structural representation of a page and its components.

See also Design view (Spaces).

space

A work area within Spaces that supports a group of people of any size that is organized around an area of interest or a common goal.

Spaces application (Spaces)

A web-based application that offers the very latest technology for social networking, communication, collaboration, and personal productivity. Spaces uses services and applications to bring everything together that users require to exchange ideas with others, keep track of personal and work-related tasks, interact with critical applications, and zero in on projects and interests; all within a single integrated environment.

space icon

An image displayed alongside space names on the Spaces page in My Spaces to help other users with identification and location.

space logo

An image displayed on the Home space page to provide a visual identity for the space. The Home space logos also display alongside the space name at the top of the page in Full Screen Mode.

space member

A user who is participating in a space. Members can be added or invited to a space, or they can subscribe to a space themselves if self-registration is enabled.

space owner

A user who initially created a space. The space owner is automatically also a moderator of the space.

space template

A starting point for creating a new space. Spaces includes several out-of-the-box templates to get you started, and you can create custom space templates using existing spaces as the basis.

space Unavailable page

A predefined page that displays when a space member tries to open a space that is temporarily offline. Moderators can customize this page.

Spaces application administrator

See administrator.

Spaces Switcher

A menu showing three areas: **Recent Spaces** lists up to ten recently accessed spaces, followed by spaces to which current user most recently gained access. **My Spaces** lists all spaces to which the current user has access, in alphabetical order. A list of links provides direct access from the menu to the Home space, the Spaces browser page, and the Create a Space dialog.

struts

A development framework for Java servlet applications based upon the **MVC** design paradigm.

style properties

Used to override the style information from the skin CSS to set specific instances of component display.

Tags service

A WebCenter Portal service that enables users to apply their own terms to application objects, making it possible to search for those objects using personally meaningful terms.

task flow

A set of ADF Controller activities, control flow rules, and managed beans that interact to allow a user to complete a task. Task flows provide a modular approach for defining control flow in an application. Instead of representing an application as a single JSF page flow, developers can break it up into a collection of reusable task flows.

task flow header

An area at the top of a task flow that displays the task flow name and various tools for interacting with the task flow.

template

See **space template**, **application templates**, and **custom display template**.

Text layout component

A layout component available through **Composer**. A rich text editor for providing static page text. For designers of Framework applications, this is the runtime equivalent of a Rich Text Editor component.

Unauthorized Access page

A predefined page that is shown when someone without access permission tries to open a page.

URL parameter

See **private parameter**.

user customization

Changes that affects only a user's own work space.

See also **application customization** and **personalization**

validation-based caching

A **caching** method that uses a validation check to determine if the cached item is still valid.

Contrast with **expiry-based caching**.

Virtual Content Repository

Virtual Content Repository (VCR) enables you to plug in multiple, heterogeneous content repositories.

viewer

Spaces users who can look at the information in a space but cannot contribute any of their own.

View mode

(**JSR 286** portlets only.) A **portlet mode** that enables you to display a JSR 286 portlet on a page that can contain other portlets. It is the only required mode for JSR 286 portlets.

See also **Shared Screen mode**.

WAR

Web application archive file. This file is used in deploying applications on a **Java EE** application server. WAR files encapsulate in a single module all of the components necessary to run an application. WAR files typically contain an application's **servlet**, **JSP**, and **JSF JSP** components.

See also **EAR**.

Web 2.0

Technologies, such as wiki, RSS, and blogs, that enable the construction of highly interactive web applications.

See also **Oracle WebCenter Portal: Services**.

Web Application Archive file

See **WAR**.

Web Clipping portlet

A browser-based declarative tool that enables you to integrate any web application with your **Framework application**. It is designed to give you quick integration by leveraging the web application's existing user interface. You can drag and drop Web Clipping portlets onto a `*.jspx` page.

Web Page layout component

A layout component available through **Composer**. A means of embedding another web site, wiki, or blog within the context of a page which is created in the Spaces application. For designers of Framework applications, this is the equivalent of an Inline Frame component.

Web server

A program that delivers web pages.

Web Services for Remote Portlets

See **WSRP**.

WebCenter Portal Application

A WebCenter Portal application based on **Oracle WebCenter Portal: Framework** or **Oracle WebCenter Portal: Spaces**.

WebCenter Portal's Extension for Oracle JDeveloper

An extension available through the Oracle JDeveloper Update Wizard that installs the necessary libraries, templates, wizards, and dialogs needed to build and deploy **Framework application**s in **Oracle JDeveloper**.

WebCenter Portal: Framework

See **Oracle WebCenter Portal: Framework**.

WebCenter Portal systems administrator

See administrator.

WebLogic Server

See **WLS**.

Welcome page

There are two types of Welcome page:

- Public Welcome page: A predefined page that users encounter before logging in to the Spaces application.
- Personal Welcome page: A predefined page that introduces users to their Home space.

wiki page

A page that provides in-place editing using HTML or a simple mark-up language. Any user with sufficient privileges can add, revise, and remove wiki content.

WLS

WebLogic Server. A scalable, enterprise-ready Java Platform, Enterprise Edition (Java EE) application server. The WebLogic Server infrastructure supports the deployment of many types of distributed applications and is an ideal foundation for building applications based on Service Oriented Architectures (SOA).

See also **Integrated WLS**

WLST

WebLogic Scripting Tool. A command line tool for managing Oracle Fusion Middleware components, such as Oracle WebCenter Portal.

Worklist service

A WebCenter Portal service that provides access to notifications, alerts, and BPEL tasks assigned to the current user.

WSRP

Web Services for Remote Portlets (WSRP) is a web services standard that allows the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as JSR 286, .NET,

Perl) and any WSRP portal. A portlet (regardless of language) deployed to a WSRP-enabled container can be rendered on any portal that supports this standard.

XSL

Extensible Stylesheet Language (XSL) is the language used within style sheets to transform or render XML documents.
