1 Oracle Fusion Middleware Patching and Upgrade Overview
  1.1 Installation, Patching, and Upgrade Terminology .............................................................................. 1-1
    1.1.1 Patching ......................................................................................................................................... 1-1
    1.1.2 Migration ...................................................................................................................................... 1-1
    1.1.3 Upgrade ....................................................................................................................................... 1-1
    1.1.4 Installation ................................................................................................................................... 1-2
  1.2 Patching and Upgrade Tools .................................................................................................................. 1-2
  1.3 About Database Patches for Oracle Fusion Middleware ...................................................................... 1-2

2 Patching Oracle Fusion Middleware with Oracle OPatch
  2.1 About Patching with Oracle OPatch ..................................................................................................... 2-1
    2.1.1 Types of Patches That Are Applied Using OPatch ...................................................................... 2-1
    2.1.2 Types of Patches that Cannot be Applied with OPatch ............................................................. 2-3
  2.2 About OPatch ......................................................................................................................................... 2-3
    2.2.1 Getting OPatch .............................................................................................................................. 2-3
    2.2.2 Getting Patches that Can be Applied with OPatch ...................................................................... 2-4
    2.2.3 OPatch Environment Variables .................................................................................................... 2-4
    2.2.4 OPatch System Requirements ........................................................................................................ 2-4
    2.2.5 Backup and Recovery Considerations for Patching ...................................................................... 2-4
  2.3 OPatch in a Fusion Middleware Environment ...................................................................................... 2-5
    2.3.1 A Typical Patching Scenario ......................................................................................................... 2-5
    2.3.2 Patching a Fusion Middleware Product ......................................................................................... 2-8
    2.3.3 Patching in a Distributed Environment ......................................................................................... 2-8
      2.3.3.1 Patching with a Local Middleware Home ............................................................................... 2-9
      2.3.3.2 Patching with a Shared Middleware Home ............................................................................ 2-11
    2.3.4 Patching Artifacts Deployed Outside the Oracle Home ............................................................... 2-12
  2.4 Running OPatch ..................................................................................................................................... 2-12
    2.4.1 Applying Patches and Deploying Patched Artifacts to WebLogic Servers ................................ 2-13
      2.4.1.1 Using the OPatch Property File ............................................................................................ 2-13
# 3 Applying the Latest Oracle Fusion Middleware Patch Set

## 3.1 Oracle Fusion Middleware Patching Process Overview

## 3.2 Oracle Fusion Middleware Patching Process Roadmap

## 3.3 Before You Begin

### 3.3.1 Special Instructions for Patching Oracle WebCenter

### 3.3.2 Special Instructions for Patching Oracle Portal, Forms, Reports and Discoverer

### 3.3.3 Special Instructions for Patching Oracle Identity and Access Management

### 3.3.4 Special Instructions for Patching a Distributed Environment

### 3.3.5 Special Instructions for Patching Oracle SOA Suite

### 3.3.6 Special Instructions for Patching Oracle WebLogic Server 10.3.6 with SOA Suite

## 3.4 General Pre-Patching Tasks

### 3.4.1 Reviewing System Requirement and Certification

#### 3.4.1.1 System Requirements and Specifications

#### 3.4.1.2 Certification and Supported Platforms

#### 3.4.1.3 Upgrading the Embedded JDK in 11g Release 1 (11.1.1.7.0)

### 3.4.2 Reviewing the Oracle Fusion Middleware Interoperability and Compatibility Guide

## 3.5 Stopping the Servers and Processes

## 3.6 Backing Up Your Middleware Home, Domain Home and Oracle Instances

## 3.7 Backing Up Your Database and Database Schemas

## 3.8 Backing Up Additional Configuration Information

## 3.9 Updating Oracle WebLogic Server

## 3.10 Renaming the emCCR File for Silent Patching

## 3.11 Downloading the Installer

### 3.11.1 About the Installers Used for Patching

### 3.11.2 Downloading the Required Installer

## 3.12 Patching Oracle Fusion Middleware

### 3.12.1 Starting the Installer

### 3.12.2 Applying the Patch Set

## 3.13 Updating Your Schemas with Patch Set Assistant

## 3.14 Starting the Servers and Processes

## 3.15 Verifying Your Patch Set Installation

### 3.15.1 Verifying the Upgrade Log
### 3.9.2 Verifying the Domain Server Logs

3-15

### 3.9.3 Verifying OPMN Status

3-15

### 3.9.4 Checking Browser URLs

3-15

## 4 Updating Your Schemas with Patch Set Assistant

4.1 Which Schemas Need to be Updated with Patch Set Assistant? 4-2

4.2 Special Instructions for Standalone Oracle Portal Repository Schemas 4-5

4.3 Before You Begin Using the Patch Set Assistant 4-5

4.3.1 Back Up Your Database and Database Schemas 4-5

4.3.2 Check Your Database and Schemas 4-5

4.3.3 Create an Edition on the Database Server for Editions-Based Redefinition 4-6

4.3.4 Shut Down All Components Using the Schemas You Want to Update 4-6

4.3.5 Check the aq_tm_processes Value for Oracle Portal 4-7

4.3.6 Setting ORACLE_HOME and JAVA_HOME Environment Variables 4-7

4.4 Running the Patch Set Assistant 4-7

4.4.1 Using the Patch Set Assistant Graphical Interface 4-7

4.4.2 Using the Patch Set Installer from the Command Line 4-8

4.4.3 Verifying the Schema Version Number After Update 4-9

4.4.4 Checking for Invalid Database Objects 4-9

4.5 Patch Set Assistant Log Files 4-9

## 5 Post-Patching Procedures

5.1 Post-Patching Tasks If Your Starting Point is Release 11.1.1.2.0 5-1

5.2 Post-Patching Tasks If Your Starting Point is Release 11.1.1.3.0 5-3

5.3 Post-Patching Tasks If Your Starting Point is Release 11.1.1.4.0 5-4

5.4 Post-Patching Tasks If Your Starting Point is Release 11.1.1.5.0 5-6

5.5 Post-Patching Tasks If Your Starting Point is Release 11.1.1.6.0 5-7

5.6 Post-Patching Tasks for System Components 5-8

5.6.1 Upgrading System Components 5-9

5.6.2 Updating Oracle Configuration Manager 5-11

5.6.3 Resolving JDBC Errors in Oracle Reports and Oracle Portal 5-12

5.6.4 Adding Datafiles to the OLTS_CT_STORE and OLTS_ATTRSTORE Tablespaces for Oracle Internet Directory 5-13

5.6.5 Generating the BASE64 Encoded Encryption Key for OPSS 5-13

5.6.6 Enabling Dynamic Audit Metadata Model for OPSS Running in JavaSE Mode 5-13

5.6.7 Configuring Diagnostic Framework Dump Sampling 5-14

5.6.8 Adding Batik Library Jar Files to the JRF Template for IBM WebSphere 5-14

5.7 Post-Patching Tasks for Oracle Identity Management Components 5-14

5.7.1 Enabling the Evaluate Policies Scheduled Job Run 5-14

5.7.2 Updating Oracle Identity Management in an Existing ORACLE_IDM_HOME Directory 5-15

5.7.3 Updating Configuration Properties in Oracle Identity Federation 5-15

5.7.4 Configuring Oracle Identity Management to Listen on Dual Network Addresses 5-16

5.8 Post-Patching Tasks for Your WebLogic Server Domain 5-16

5.8.1 Updating the JDK 5-16

5.8.2 Updating Fusion Middleware Shared Libraries 5-17
5.10.3 Updating Configurations and Stores ................................................................. 5-17
5.10.4 Enabling WS-AtomicTransaction .................................................................... 5-18
5.10.5 Optimizing Performance for WebLogic Server Domains on 64-Bit Platforms 5-19
5.10.6 Updating the Plug-In Configuration When Using a Proxy with WebLogic Server 5-20
5.9 Post-Patching Tasks for Oracle SOA Suite .......................................................... 5-20
5.9.1 Loading the Oracle SOA Suite Purge Scripts for Database Management ....... 5-20
5.9.2 Removing the tmp Folder for SOA Composer, BPM Workspace and B2B ....... 5-21
5.9.3 Updating the "BPEL Message Recovery Required" Warning Message Duration... 5-22
5.9.4 Updating MAXRECOVERATTEMPT Attribute to 2........................................... 5-22
5.9.5 Updating the soa-infra Application in Warning State ....................................... 5-22
5.9.6 Running soa-upgrade.py to Update the Policy Store ....................................... 5-23
5.9.7 Running soa-upgrade.py to Update the Policy Store and Deploy a Shared Library ....... 5-24
5.9.8 Updating the Oracle Data Integrator Clients if BAM-ODI Integration is Enabled 5-24
5.9.9 Saving and Restoring XEngine Customizations for Oracle B2B....................... 5-26
5.9.10 Configuring Oracle JMS Adapter with IBM WebSphere MQ JMS ................. 5-27
5.9.11 Extending the SOA Domain with UMS Adapter Features ............................. 5-27
5.9.12 Extending the SOA Domain with Business Process Management Features ... 5-28
5.10 Post-Patching Tasks for Oracle WebCenter Content ......................................... 5-28
5.10.1 Updating Oracle WebCenter Content: Imaging .............................................. 5-28
5.10.2 Updating Oracle Application Adapters for Oracle WebCenter Content ......... 5-30
5.10.3 Configuring the Report Library for Records Management in Content Server .... 5-30
5.10.4 Extending the IPM Domain to Include Viewer Cache .................................... 5-31
5.11 Post-Patching Tasks for Oracle Service Bus ...................................................... 5-31
5.11.1 Updating an Oracle Service Bus Domain After Applying the Latest Patch Set ... 5-32
5.11.2 Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.5 .... 5-32
5.11.3 Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.6 .... 5-32
5.11.4 Performing Additional Post-Update Tasks for Oracle Service Bus IDE ......... 5-32
5.11.4.1 Deleting Oracle WebLogic Server 11g Release 1 (10.3.3) ........................... 5-32
5.11.4.2 Creating Servers ....................................................................................... 5-33
5.12 Post-Patching Tasks for Oracle Business Intelligence ....................................... 5-34
5.12.1 Updating Oracle Business Intelligence Code Grants ..................................... 5-34
5.12.2 Updating Oracle BI Presentation Catalogs ..................................................... 5-34
5.12.3 Enabling bicontentserver Features ............................................................... 5-35
5.12.4 Enabling Oracle Business Intelligence Composer Features ....................... 5-36
5.12.5 Enabling JBIPS Features ............................................................................... 5-37
5.12.6 Updating Oracle Real-Time Decisions ............................................................ 5-38
5.12.6.1 Updating the rtd_ils Resource Type Using WLST .................................... 5-38
5.12.6.2 Adding Permissions to the BIAdministrator Principle Using EM .............. 5-39
5.12.6.3 Removing JMS ......................................................................................... 5-40
5.13 Post-Patching Tasks for Oracle Data Integrator ............................................... 5-40
5.13.1 Finalizing Repository Patching ....................................................................... 5-40
5.13.2 Reconfiguring the Java EE Agent ................................................................... 5-41
5.13.3 Reconfiguring the ODI Standalone Agent ...................................................... 5-42
5.13.4 Reconfiguring Oracle Enterprise Manager Properties .................................. 5-43
5.13.5 Reconfiguring the ODI Console ..................................................................... 5-43
5.13.6 Adding the Version Number for the odi-sdk-ws Application in config.xml ....... 5-43
6 Patching Oracle WebCenter Portal

6.1 New Product Names for Oracle WebCenter and Oracle Enterprise Content Management Suite .......................................................... 6-1

6.2 Patching an Oracle WebCenter Portal 11.1.1.6.0 Installation .......................................................... 6-2

6.3 Patching an Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0 Installation .......................................................... 6-7

6.4 Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation .......................................................... 6-13

6.4.1 Managed Server Changes .......................................................................................................................... 6-14

6.4.2 Migration Roadmap for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0................................................. 6-14

6.4.3 Patching to Oracle WebCenter 11.1.1.7.0.......................................................................................... 6-21

6.4.3.1 Updating Oracle WebCenter Using Node Manager and Automated Script........................................ 6-21

6.4.3.2 Updating Oracle WebCenter Using WLST Commands ..................................................................... 6-26

6.5 Patching an Oracle WebCenter 11.1.1.1.0 Installation ........................................................................... 6-29

6.6 Troubleshooting Issues ............................................................................................................................. 6-31

6.6.1 Troubleshooting Issues with Patching Oracle WebCenter ................................................................. 6-31

6.6.2 Troubleshooting Post-Patching Issues .................................................................................................... 6-31

6.6.2.1 Related Items Tab Not in Focus ............................................................................................................. 6-31

6.6.2.2 Content Getting Clipped and Inner Scrollbars Appearing ................................................................. 6-32

6.6.2.3 Pretty URLs Not Working for Page Navigation ..................................................................................... 6-32

6.6.2.4 Content Queries Not Rendered in Navigation Model ............................................................................. 6-33

6.6.2.5 Blog Posts Not Displayed in Spaces ................................................................................................. 6-33

6.6.2.6 Comments and Likes Not Displayed in Activity Stream ....................................................................... 6-33

6.6.3 Pre-Patching Tasks for WebCenter Portal ......................................................................................... 6-34

6.7.1 Determining OWSM Policy URIs for Spaces, Discussions, and Portlet Web Service End Points .................................................................................................................................................. 6-34

6.7.1.1 Determining OWSM Policy URI for the Spaces Web Service End Point ........................................... 6-34

6.7.1.2 Determining OWSM Policy URI for the Discussions Web Service End Point ................................ 6-35

6.7.1.3 Determining OWSM Policy URIs for Portlet Producer Web Service End Points ........................................... 6-35

6.7.2 Saving Your OmniPortlet and WebClipping Customizations ................................................................................. 6-36

6.7.3 Running purgeMetadata() for WebCenter Spaces ................................................................................ 6-37

6.7.4 Considerations for Upgrading Oracle WebCenter Content or Oracle ECM ......................................................... 6-38

6.7.4.1 Upgrading Oracle ECM .......................................................................................................................... 6-39

6.8 Post Patching Tasks for WebCenter Portal ............................................................................................... 6-39

6.8.2 Extending the Domain Using the Pagelet Producer Upgrade Template ....................................................... 6-41

6.8.3 Updating SSO and OHS Configuration ........................................................................................................ 6-42

6.8.3.1 Updating OHS Configuration for Pagelet Producer .................................................................................. 6-43

6.8.3.2 Updating SSO Configuration for Pagelet Producer .................................................................................. 6-43

6.8.3.3 Updating SSO Configuration for Portlet Producer Applications .................................................................. 6-46

6.8.3.4 Updating SSO Configuration for Oracle SES .......................................................................................... 6-46

6.8.3.5 Verifying SSOFilter Grant ....................................................................................................................... 6-46

6.8.4 Performing Post-Patching Tasks for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installations .................................................................................................................................................. 6-47

6.8.4.1 Migrating Oracle Wiki Pages and Blogs ..................................................................................................... 6-48

6.8.4.2 Migrating Content Presenter Custom Templates ........................................................................................ 6-53

6.8.4.3 Updating the Configuration for WebCenter REST APIs ........................................................................ 6-54
6.8.4.4 Updating Multi-Calendar Layouts ................................................................. 6-54
6.8.4.5 Restoring Your OmniPortlet and WebClipping Customizations .................. 6-55
6.8.4.6 Extending a Domain to Install Oracle WSM Policy Manager ..................... 6-56
6.8.4.7 Remove openusage Properties in setDomainEnv ...................................... 6-56
6.8.4.8 Redeploying your Custom Applications to Upgraded Custom Managed Servers .... 6-57
6.8.4.9 Remove the LD_LIBRARY_PATH Entry from the setDomainEnv Script ........... 6-57
6.8.4.10 Migrating WSRP Portlet Preferences ....................................................... 6-58

6.8.5 Performing Post-Patching Tasks for Oracle WebCenter Spaces ...................... 6-58
6.8.5.1 Setting the Web Server Context Root on the Content Server Connection .......... 6-58
6.8.5.2 Configuring Group Space Workflows ....................................................... 6-59
6.8.5.3 Updating the Timezone Attribute in WebCenter Spaces ............................. 6-59
6.8.5.4 Updating the Group Spaces Display Mode ................................................. 6-59
6.8.5.5 Choosing a Default Start (or Landing) Page .............................................. 6-60
6.8.5.6 Migrating WebCenter Spaces Custom Library ........................................... 6-60
6.8.5.7 Upgrading Process Spaces ......................................................................... 6-61
6.8.6 Adding Oracle Single Sign-On Authentication Provider to the List of Authentication Providers 6-65
6.8.7 Adding New Features to WebCenter Portal ................................................... 6-66
6.8.7.1 Installing Activity Graph, Analytics, Pagelet Producer, Personalization Server, and WebCenter Services Portlets 6-66
6.8.7.2 Adding Portal Framework Features to WebCenter Custom Applications ...... 6-67

7 Patching Oracle Identity and Access Management
7.1 Before You Begin .................................................................................................. 7-1
7.2 Patching Oracle Identity and Access Management 11.1.1.3.0 Components .......... 7-2
7.3 Upgrading Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0 .............................. 7-2
7.3.1 Upgrading Oracle Identity Manager Remote Manager .................................. 7-5
7.3.2 Upgrading Oracle Identity Manager Design Console .................................. 7-6

8 Patching an Oracle Identity Management High Availability Environment
8.1 Task 1: Stopping Servers and System Components .......................................... 8-2
8.1.1 Stopping Managed Servers ........................................................................... 8-2
8.1.2 Stopping the Administration Server ............................................................. 8-2
8.1.3 Stopping the Node Manager ......................................................................... 8-2
8.1.4 Stopping the Oracle Management Agent .................................................... 8-2
8.1.5 Stopping the System Components ................................................................ 8-2
8.1.6 Special Consideration for Patching OID Replication Environments ............. 8-2
8.2 Task 2: Updating Oracle WebLogic Server to Version 10.3.5 ............................. 8-3
8.3 Task 3: Updating the Oracle Identity Management Oracle Home using the Oracle Identity Management Patch Set Installer 8-3
8.4 Task 4: Updating the Oracle HTTP Server Oracle Home Using the Oracle Web Tier Patch Set Installer 8-3
8.5 Task 5: Updating the Oracle Identity Management Repository using Patch Set Assistant .... 8-3
8.6 Task 6: Performing Manual Post-Patching Procedures .................................. 8-4
8.7 Task 7: Restarting System Components and Servers .................................... 8-4

D Sample Patch Master Properties File
Preface

The Oracle Fusion Middleware Patching Guide describes the tools and procedures required for you to patch your existing Oracle Fusion Middleware environment or upgrade your existing Oracle Application Server environment.

Intended Audience

This guide is intended for existing Oracle Fusion Middleware users who are upgrading their Oracle Fusion Middleware products to a more recent version or to the latest version. To follow the instructions provided in this document, the reader should be comfortable running system administration operations, such as creating users and groups, adding users to groups, and installing operating system patches on the computer where the products are going to be installed. Users on UNIX systems who are updating their Oracle Fusion Middleware software may need root access to run some scripts.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For additional information, see the following manuals:

- Oracle Fusion Middleware Concepts. This book introduces the common terms and concepts in an Oracle Fusion Middleware environment.
- Oracle Fusion Middleware Administrator’s Guide. This book contains information for managing your Oracle Fusion Middleware environment after installation and configuration is complete.
## Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><code>monospace</code></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
This book describes the tools available for you to patch your existing Oracle Fusion Middleware or upgrade your existing Oracle Application Server environment.

The following topics are covered:

- Section 1.1, "Installation, Patching, and Upgrade Terminology"
- Section 1.2, "Patching and Upgrade Tools"
- Section 1.3, "About Database Patches for Oracle Fusion Middleware"

### 1.1 Installation, Patching, and Upgrade Terminology

This section describes various terms that you should be familiar with before you continue.

#### 1.1.1 Patching

Patching involves copying a small collection of files over an existing installation. A **patch** is normally associated with a particular version of an Oracle product and involves updating from one minor version of the product to a newer minor version of the same product (for example, from version 11.1.1.2.0 to version 11.1.1.3.0).

A **patch set** is a single patch that contains a collection of patches designed to be applied together.

#### 1.1.2 Migration

Migration typically involves moving from a third-party (non-Oracle) product to an Oracle product.

It can also be used to refer to moving an existing set of software parameters (for example, an existing configuration or existing domain) from one release to another. For example, instructions for migrating your configuration from Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) to 11g Release 1 (11.1.1.2.0) are provided in Appendix C, "Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.1.2.0)".

#### 1.1.3 Upgrade

Upgrade involves moving from a previous major version to a new major version. For example, an upgrade would be required to move from Oracle Application Server 10g to Oracle Fusion Middleware 11g.
Patching and Upgrade Tools

1.1.4 Installation

Installation is when new software is copied onto your system for use. After the new software is installed, you can patch it or upgrade it as necessary.

1.2 Patching and Upgrade Tools

Table 1–1 provides a brief summary of the patching and upgrade tools, and provides pointers to more detailed information.

<table>
<thead>
<tr>
<th>Tool</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPatch</td>
<td>OPatch is typically used to patch the software on your system by copying a small collection of files over your existing installation. In Oracle Fusion Middleware, OPatch is used to patch an existing Oracle Fusion Middleware 11g installation.</td>
<td>Chapter 2, &quot;Patching Oracle Fusion Middleware with Oracle OPatch&quot;</td>
</tr>
<tr>
<td>WebLogic Server Upgrade Installer</td>
<td>WebLogic Server Upgrade Installer is used to update your existing Oracle WebLogic Server installation to the latest available version. Oracle Fusion Middleware products require the presence of Oracle WebLogic Server and its directory structure on your system. When you update your Oracle Fusion Middleware software, you must also update the version of Oracle WebLogic Server on your system using the WebLogic Server Upgrade Installer. The WebLogic Server Upgrade Installer is only available from My Oracle Support.</td>
<td>Oracle Fusion Middleware Upgrade Guide for Oracle WebLogic Server</td>
</tr>
<tr>
<td>Product Installer and Patch Set Installer</td>
<td>The Patch Set Installer is used to update your existing Fusion Middleware product to the latest version. At the time of publication, the latest version is 11g Release 1 (11.1.1.7.0) and in this release, only Oracle Portal, Forms, Reports and Discoverer require updating with the Patch Set Installer. All other Oracle Fusion Middleware products in this release can be updated with their usual product installer. NOTE: If you are upgrading from 11g Release 1 (11.1.1.1.0) you must first follow the steps in Appendix C, &quot;Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.2.0)&quot;.</td>
<td>See Chapter 3, &quot;Applying the Latest Oracle Fusion Middleware Patch Set&quot; for instructions on how to use the Patch Set Installer for Oracle Portal, Forms, Reports and Discoverer. See Section 3.5.1, &quot;About the Installers Used for Patching&quot; for more information about the types of installers available for patching.</td>
</tr>
<tr>
<td>Patch Set Assistant</td>
<td>Patch Set Assistant is used to update your database schemas to prepare them for use with the latest version of Oracle Fusion Middleware software. This tool is used with Patch Set updates only and cannot be used for upgrades. If you need to add or drop schemas, you should use the Repository Creation Utility (RCU).</td>
<td>Chapter 4, &quot;Updating Your Schemas with Patch Set Assistant&quot;</td>

1.3 About Database Patches for Oracle Fusion Middleware

This guide provides instructions for applying Oracle Fusion Middleware patches to your existing Oracle Fusion Middleware installations.
However, there are specific cases where you might be instructed to apply an Oracle
Database patch to an existing Oracle Fusion Middleware Oracle home. This is because
some Oracle Fusion Middleware products include specialized components, such as
application programming interfaces (APIs), software libraries, and other software code
developed for Oracle Database products.

In these specific cases, you might be referred to Oracle Database patching and
installation documentation for more information.

Note that in most cases Oracle Fusion Middleware patches include all necessary
software updates. You should apply Database patches only when specifically
instructed or if you are experiencing a specific issue that can be resolved by the
database patch.
This document describes patching in an Oracle Fusion Middleware environment. The following topics are covered:

- Section 2.1, "About Patching with Oracle OPatch"
- Section 2.2, "About OPatch"
- Section 2.3, "OPatch in a Fusion Middleware Environment"
- Section 2.4, "Running OPatch"
- Section 2.5, "Troubleshooting OPatch in a Fusion Middleware Environment"

## 2.1 About Patching with Oracle OPatch

Patches are a small collection of files copied over to an existing installation. They are associated with particular versions of Oracle products.

**Note:** Oracle recommends that all customers upgrade to the latest version of OPatch. Review the following My Oracle Support note and follow the instructions to update to the latest version if needed:

**Note 224346.1 - Opatch - Where Can I Find the Latest Version of Opatch?**

## 2.1.1 Types of Patches That Are Applied Using OPatch

**Note:** As of 11g Release 1 (11.1.1.7.0) Oracle is implementing a new patch nomenclature for Oracle products. The new patch names and the previous names are listed below for reference.

OPatch can be used for the following types of patches:
### Table 2–1  Patches that can be used with OPatch

<table>
<thead>
<tr>
<th>New Name</th>
<th>Old Name(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interim Patch</td>
<td>PSE</td>
<td>A patch containing one or more fixes made available to customers who cannot wait until the next patch set or new product release to get a fix.</td>

</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> The program name which delivers SPUs will still be called Critical Patch Update, as defined below:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Critical Patch Update: Oracle’s program for quarterly release of security fixes. Patches released as part of this program may be Patch Set Updates, Security Patch Updates, and Bundle Patches. Regardless of the patch type, the patches are cumulative.</td>
</tr>
<tr>
<td>Patch Set Updates (PSUs)</td>
<td></td>
<td>Patch Set Updates are used to patch Oracle WebLogic Server only. Patch Set Updates are released on a quarterly basis, following the same schedule as the Critical Patch Updates (CPUs). These come out the closest Tuesday to the 15th of the months of January, April, July and October. Patch Set Update content is intended to address the top fifty critical bugs affecting the broad customer base.</td>
</tr>
</tbody>
</table>
2.1.2 Types of Patches that Cannot be Applied with OPatch

The only type of patch that is not applied with OPatch is a patch set. A patch set contains a large number of merged patches, is thoroughly tested, changes the version of the product it is applied to, and can sometimes introduce new functionality. Patch sets are cumulative bug fixes that fix all bugs and consume most patches since the last base release.

Patch sets and the Patch Set Assistant are usually applied through OUI-based product specific installers. For more information, see Chapter 3, "Applying the Latest Oracle Fusion Middleware Patch Set".

2.2 About OPatch

OPatch is a Java-based utility that runs on all supported operating systems and requires installation of the Oracle Universal Installer. This document contains information pertaining to OPatch commands that are most commonly used in an Oracle Fusion Middleware environment. You can use all supported OPatch commands if you choose; for a full list of OPatch commands and for more information about the OPatch utility, refer to the Oracle Universal Installer and OPatch User’s Guide at the following URL:

http://docs.oracle.com/cd/B28359_01/em.111/b31207/toc.htm

This section contains the following:

- Section 2.2.1, "Getting OPatch"
- Section 2.2.2, "Getting Patches that Can be Applied with OPatch"
- Section 2.2.3, "OPatch Environment Variables"
- Section 2.2.4, "OPatch System Requirements"
- Section 2.2.5, "Backup and Recovery Considerations for Patching"

2.2.1 Getting OPatch

OPatch can be found in your Fusion Middleware product’s ORACLE_HOME/OPatch (on UNIX operating systems) or ORACLE_HOME\OPatch (on Windows operating systems) directory.

Oracle recommends that you always check for and obtain the latest version of OPatch from My Oracle Support (formerly Oracle MetaLink).

1. Access and log into My Oracle Support at the following location:

   http://support.oracle.com/

2. In the Search Knowledge Base field, enter 224346.1. This is the ID of the document that describes how to obtain the latest version of OPatch.

3. In the search results, click on the link corresponding to document ID 224346.1.

4. In the document, click on the Patch 6880880 link which will take you to the screen where you can obtain the latest version of OPatch based on release versions and platforms.

   Make sure you verify that the OPatch release number in the "Release" column is "11.1.0.0.0" as this is the correct version of OPatch for Oracle Fusion Middleware 11g products.
2.2.2 Getting Patches that Can be Applied with OPatch

You can obtain the latest patches by specifying the patch ID in My Oracle Support (formerly MetaLink):

1. Access and log into My Oracle Support at the following location:
   http://support.oracle.com/

2. Click the **Patches & Updates** link.

3. Enter the **Patch ID or Number**, then click **Search**. A Patch Search Results table appears.

4. Using the Release and Platform columns, find the desired patch, then click the associated Patch ID.

5. In the page that now appears, click the **Download** button in the right-hand column.

2.2.3 OPatch Environment Variables

OPatch uses the environment variables listed in Table 2–2:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME</td>
<td>Points to the location of the Oracle home directory.</td>
</tr>
<tr>
<td>MW_HOME</td>
<td>Points to the location of the Middleware home directory.</td>
</tr>
<tr>
<td>PATH</td>
<td>Points to the location(s) from which various commands should be run.</td>
</tr>
</tbody>
</table>

2.2.4 OPatch System Requirements

The OPatch utility has the following requirements:

- The **ORACLE_HOME** environment variable must point to a valid Oracle home directory and match the value used during installation of the Oracle home directory.

- If the `-invPtrLoc` command-line argument was used during installation, then it must be used when using the OPatch utility. Oracle recommends the use of the default central inventory for a platform.

- The `java`, `ar`, `cp`, and `make` commands must be available in one of the directories listed in the **PATH** environment variable. The commands are not available for all platforms.

2.2.5 Backup and Recovery Considerations for Patching

It is highly recommended that you back up the **ORACLE_HOME** before any patch operation. You can back up the **ORACLE_HOME** using your preferred method. You can use any method such as `zip`, `cp -r`, `tar`, and `cpio` to compress the **ORACLE_HOME**.

If the **ORACLE_HOME** does not appear when you execute the `opatch lsinventory -detail` command, the **ORACLE_HOME** might be missing from the Central Inventory, or the Central Inventory itself could be missing or corrupted.

If the **ORACLE_HOME** is listed when you execute the `opatch lsinventory -detail` command, but the products and components within the **ORACLE_HOME** are
not listed, the inventory within the ORACLE_HOME (local inventory) might be missing or corrupted.

If the local inventory is corrupted or lost for some reason, you can simply restore the ORACLE_HOME/inventory (on UNIX operating systems) or ORACLE_HOME\inventory (on Windows operating systems) if it was backed up. If a backup does not exist, you may have to reinstall the software.

2.3 OPatch in a Fusion Middleware Environment

This section describes the Oracle OPatch utility as it pertains to an Oracle Fusion Middleware environment. You should be familiar with the Oracle Fusion Middleware concepts introduced in the Oracle Fusion Middleware Installation Planning Guide, which is available at the following URL:

http://download.oracle.com/docs/cd/E15523_01/install.1111/b32474/toc.htm

This section contains the following:

- Section 2.3.1, "A Typical Patching Scenario"
- Section 2.3.2, "Patching a Fusion Middleware Product"
- Section 2.3.3, "Patching in a Distributed Environment"
- Section 2.3.4, "Patching Artifacts Deployed Outside the Oracle Home"

2.3.1 A Typical Patching Scenario

Consider a common, non-distributed Fusion Middleware topology for Oracle SOA Suite and Oracle WebCenter, as shown in Figure 2–1:

---

**Note:** OPatch can be used to patch any Fusion Middleware product, even though only a few are shown in this example. OPatch can not be used to patch Oracle WebLogic Server.

---
Suppose you have a problem in the SOA Domain. Below is a typical patching process:

**Step 1. Contact Oracle Support**
You can contact your Oracle support representative, or you can go to My Oracle Support (formerly OracleMetaLink):

http://support.oracle.com/

**Step 2. Check for Existing Patches**
If Oracle Support is not able to resolve the issue, they may ask to see if you have any patches already installed on your system. To determine this information, you should run the `opatch lsinventory` command.

To check if a particular patch is installed in the Oracle home (or the set of Oracle homes within a Middleware home) you use the `opatch checkInstalledOneOffs` command. See Section 2.4.7, "Listing Patches Applied to an Oracle Home or WebLogic Domain" for more information about this command.
Step 3. Obtain OPatch and the Necessary Patch

Upon determining that you are in need of a new patch and it has not already been installed on your system, you should do the following:

1. Make certain that you have the latest version of OPatch, as described in Section 2.2.1, "Getting OPatch".
2. Obtain the patch as described in Section 2.2.2, "Getting Patches that Can be Applied with OPatch".

Step 4. Determine the Oracle Home

Once you obtain the patch, determine the Oracle home directory to which you are going to apply the patch.

The most common type of patch available in a Fusion Middleware environment involves patching a specific Oracle home directory. Some patches (for example, a patch pertaining to JRF) may apply to multiple Oracle home directories within a specific Middleware home. A third type of patch could involve client components in one Oracle home and server components in a different Oracle home (for example, Oracle WebCenter in the WebCenter Oracle home depends on BPEL Process Manager in the Oracle SOA Suite Oracle home).

If you do not know the name of your Oracle home, you should run the `opatch lshomes` command as described in Section 2.4.6, "Listing the Applicable Oracle Homes for a Patch" to obtain a list of Oracle homes that pertain to the domain. In this example, the Oracle home to which the patch should be applied is the SOA Oracle home.

After you determine your Oracle home, you should run the `opatch checkApplicable` command as described in Section 2.4.6, "Listing the Applicable Oracle Homes for a Patch" to make sure that the patch can actually be applied to the Oracle home.

As the Middleware home is the top-level entity in a Fusion Middleware topology, the location of your Middleware home will be required for many of the OPatch commands in a Fusion Middleware environment.

Step 5. Read the README File

Read the README file that accompanies the patch. This file contains important information and instructions that must be followed prior to applying your patch.

For example, the README file may instruct you to apply the patch using the `-auto` option (described in Section 2.4.1.2, "Using the -auto Option"). The more common scenario is that the README will instruct you to use a series of OPatch commands, including `opatch stop` and `opatch start` (see Section 2.4.8, "Starting or Stopping a Runtime Instance").

Step 6. Apply the Patch

After you determine the Oracle home to which you need to apply the patch, you should apply the patch with the `opatch apply` command as described in Section 2.4.1, "Applying Patches and Deploying Patched Artifacts to WebLogic Servers".

After Applying the Patch...

In most cases, after you apply the patch the instructions in the README file will tell you to run the `opatch start` command to re-start your servers.
After the patching is complete and your servers are restarted, you should check your product software to verify that the issue has been resolved.

If for some reason the result is not satisfactory, you can use the `opatch rollback` command to remove the patch from the Oracle home. See Section 2.4.2, "Rolling Back Patches and Deploying Patched Artifacts to WebLogic Servers" for more information, and consult the README file for specific instructions.

### 2.3.2 Patching a Fusion Middleware Product

Many Fusion Middleware artifacts are deployed to a runtime environment, where applications pick up these binaries for execution. A common example of this are J2EE artifacts (for example, `.ear`, `.war`, or `.rar` files) or J2EE shared libraries deployed to a Managed Server or cluster running within a domain. Patching in a Fusion Middleware environment involves updating and replacing these artifacts in the Oracle home. The servers to which the artifacts are deployed need to be restarted for the changes to take effect.

After the artifacts are deployed, there are various staging modes that affect how WebLogic Server treats these artifacts, which in turn determine how the applications are patched. All artifacts in Oracle Fusion Middleware 11g Release 1 (11.1.1.7.0) are deployed in NoStage Mode, which means that each Managed Server must access the archive files from a single source directory for deployment. If a J2EE application is deployed to three Managed Servers within a cluster, each Managed Server must be able to access the same application archive files from a shared or network-mounted directory in order to deploy the new J2EE application.

Take note of the following:

- If multiple Managed Servers on multiple machines are used, the path to the application bits must be the same on all machines because there is a single point of entry for the application in the domain configuration.
- Since the source location for the application bits is fixed and points back to its own `ORACLE_HOME` location, all domains that were created using a given `ORACLE_HOME` will pick up the patched bits once the `ORACLE_HOME` is patched.
- If you are using multiple Managed Servers on multiple machines and the product `ORACLE_HOME` is not shared or network-mounted on the target Managed Servers, then each machine must have the product installed on an `ORACLE_HOME` on the local file system from which the Managed Servers can access the application binaries. Therefore, the `ORACLE_HOME` on each local file system of each machine must be patched separately.

The steps that need to be performed for this scenario are as follows:

1. Stop all Managed Servers in the WebLogic Domain to which the application is deployed.
2. Use the `opatch apply` command to apply the bits to an Oracle home.
3. Restart all the Managed Servers in the same WebLogic Domain.

Steps 1 and 3 are performed by the Fusion Middleware capabilities in OPatch.

### 2.3.3 Patching in a Distributed Environment

The process to patch in a distributed environment depends on whether or not your Middleware home directory is shared or not shared.
2.3.3.1 Patching with a Local Middleware Home
Consider the environment shown in Figure 2–2. This is a distributed environment, where you have identical topologies on separate machines, each with its own local Middleware home and Fusion Middleware products inside the Middleware home:
If you encountered a problem in the SOA domain, you would have to patch the corresponding Oracle home on each machine separately, according to the instructions.
in the README file. After you patch the SOA Oracle home on "Middleware Host 1," for example, you must then repeat the same procedure on "Middleware Host 2."

### 2.3.3.2 Patching with a Shared Middleware Home

Consider the environment shown in Figure 2–3. This is also a distributed environment, where you have identical topologies on separate machines, but the Middleware home on "Middleware Host 2" is shared or NFS mounted:

*Figure 2–3  Distributed Fusion Middleware Topology for Oracle SOA Suite and Oracle WebCenter*

In this topology, if you encountered a problem in the SOA Domain, you would only need to patch the SOA Oracle home on either "Middleware Host 1" or "Middleware Host 2" in accordance with the instructions in the README file, and OPatch would automatically patch all of the matching Oracle homes that share the same Middleware home.
2.3.4 Patching Artifacts Deployed Outside the Oracle Home

Some applications, such as Oracle Enterprise Manager Fusion Middleware Control and Oracle Web Services Manager Policy Manager (WSM-PM), are deployed outside of the product Oracle home (in the Oracle Common Home or oracle_common directory). OPatch can also apply patches to files that reference the oracle_common directory.

2.4 Running OPatch

The OPatch utility is located in the ORACLE_HOME/OPatch (on UNIX operating systems) or ORACLE_HOME\OPatch (on Windows operating systems) directory. Below is the syntax for the OPatch utility:

```
path_to_opatch/opatch command -options
```

Acceptable values for `command` are described in Table 2–3.

Valid `options` for each `command` are described in the sections that describe each `command`.

### Table 2–3 Commands for the OPatch Utility in a Fusion Middleware Environment

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply</td>
<td>Apply the patch to an Oracle home and deploy the patch to a WebLogic domain. For details, see Section 2.4.1, &quot;Applying Patches and Deploying Patched Artifacts to WebLogic Servers&quot;.</td>

<tr>
<td>lshomes</td>
<td>List the Oracle homes that have been used to create WebLogic Domains. For details, see Section 2.4.4, &quot;Listing the Source Oracle Homes&quot;.</td>
</tr>
<tr>
<td>lsdomains</td>
<td>List all WebLogic domains created from the Middleware home or specific Oracle home. For details, see Section 2.4.5, &quot;Listing the Domains Created from the Middleware Home or Oracle Home&quot;.</td>
</tr>
<tr>
<td>checkInstalledOneOffs</td>
<td>Check if certain patches are installed on any Oracle homes. For details, see Section 2.4.7, &quot;Listing Patches Applied to an Oracle Home or WebLogic Domain&quot;.</td>
</tr>
<tr>
<td>start</td>
<td>stop</td>
</tr>
</tbody>
</table>
To view additional information for these Fusion Middleware options, use the following command:

```
path_to_OPatch/opatch -help -fmw
```

## 2.4.1 Applying Patches and Deploying Patched Artifacts to WebLogic Servers

The `apply` command in a Fusion Middleware environment applies the patch to the Oracle home on the local machine.

---

**Note:** The option to apply a patch to a Middleware home (including all Oracle homes inside that Middleware home) is not yet available.

---

### 2.4.1.1 Using the OPatch Property File

Sensitive information such as Administration Server credentials, and other important information such as the Administration Server URL, domain location and applications directory location, are obtained by prompts from the console. In some cases, default values may be found and specified by OPatch; in these cases, press Enter to use these default values.

Automation applications such as Grid Control may invoke OPatch with the `-silent` option, which does not prompt for any input from the console. To supply the necessary Administration Server credentials and other information, a response file can be created and passed to OPatch as an argument with the `-property_file` option.

For Fusion Middleware components, `userConfigFile` and `userKeyFile` can be specified in the property file as keys with corresponding file names. The `userConfigFile` file contains an encrypted user name and password, while the `userKeyFile` contains a secret key that is used to encrypt and decrypt the user name and password. Similarly, the `AdminServerURL` (URL of the Administration Server), `DomainHome` (full path to the `domains` directory) and `ApplicationsDir` (full path to the `applications` directory) can also be specified in the `properties` file.

### 2.4.1.2 Using the `-auto` Option

Some patches are certified by Oracle Product Support as capable of being used with the `-auto` option, which can automate certain portions of your patching procedure. The `-auto` option applies the patch to the Oracle home; verifies that the patch is actually applied, then performs any necessary redeploy operations against the specified WebLogic Domain, including stopping and starting all the servers that are affected by the patch. If your patch is certified for use with the `-auto` option, you will be informed of such in the patch's README file.

#### 2.4.1.2.1 Configuring Node Manager

Beginning with OPatch release 11.1.0.8.2, the `-auto` option requires the Node Manager user name and password. In order for OPatch to be used properly:

- The Administration Server must be up and running.
- If the Managed Servers are up and running, OPatch will stop the servers, apply the patch, then restart the servers.
  - If the Managed Servers are not running, OPatch will apply the patch but then you must manually start the servers in order to see the effects of the patch.

To configure Node Manager, refer to “General Node Manager Configuration” in *Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server.*
2.4.1.2 Using the -auto Option with the -domain Option

The -auto option should be used in conjunction with the -domain option; the only exception is if only one WebLogic Domain was configured from the Oracle home. In such cases, OPatch will use that domain as the default domain. If multiple domains have been created and the -domain option is not used, then it is the user’s responsibility to run opatch deploy to redeploy the patched artifacts to their respective domains, and also stop and start the affected servers in each of the domains.

2.4.1.3 Using the apply Command

The apply command (with the -auto option specified) performs the following:

1. Stops all affected target servers.
   - This might involve stopping server instances on other nodes for:
     a. Staged mode applications.
     b. NoStage mode applications sharing the Oracle home.

2. Applies the patch to the Oracle home on the local machine.
3. Performs any required deploy operations for patched artifacts.
4. Restarts all affected servers.

The syntax for the apply command is shown below:

```
opatch apply
   [-auto [-domain domain_name]]
   [-mw_home MW_HOME]
   [-oh ORACLE_HOME]
   [-property_file path_to_property_file]
   [-report]
```

A summary of the options for the apply command are described in Table 2-4.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-auto [-domain domain_name]</td>
<td>Optional - causes OPatch to automate the rollout of the patch to Oracle Fusion Middleware entities. If -auto is used then -domain must also be used to indicate the name of the domain in which the rollout should occur; the exception is when there is only one domain configured out of the Oracle home, in which case the -domain flag is optional. See Section 2.4.1.2, &quot;Using the -auto Option&quot; for more information.</td>
</tr>
<tr>
<td>-mw_home MW_HOME</td>
<td>Optional - The Middleware home to which the patch will be applied. The Middleware home specified here supersedes the MW_HOME environment variable. If neither is specified, then the Middleware home from where the command is run will be used.</td>
</tr>
<tr>
<td>-oh ORACLE_HOME</td>
<td>Optional - This option is used to specify the Oracle home to which the patch should be applied. This value supersedes the ORACLE_HOME environment variable. If neither is specified, OPatch will apply the updates to the Oracle home from which it was launched.</td>
</tr>
<tr>
<td>-property_file name</td>
<td>Optional - absolute path and name of the property file. See Section 2.4.1.1, &quot;Using the OPatch Property File&quot; for more information.</td>
</tr>
</tbody>
</table>
Running OPatch

2.4.1.4 Sample Output for the apply Command

Below is a sample output from the `opatch apply` command on a UNIX operating system:

```
[aime@stadn41 Oracle_SOA1]$ ./OPatch/opatch apply
-auto /OracleFMW/Middleware_PS1_RC2/FMWPatches/9991008/
-oh /OracleFMW/Middleware_PS1_RC2/oracle_common/
-domain MySOAWebCenterDist
Invoking OPatch 11.1.0.6.9

OPatch Session completed with warnings.

OPatch completed with warnings.

2.4.2 Rolling Back Patches and Deploying Patched Artifacts to WebLogic Servers

The rollback command allows you to remove an existing one-off patch by specifying the unique patch ID.

The rollback command (with the -auto option specified) performs the following:
1. Stops all affected target servers.
   This might involve stopping server instances on other nodes for:
   a. Staged mode applications.
   b. NoStage mode applications sharing the Oracle home.
2. Rolls back the patch on the Oracle home on the local machine.
3. Performs any required deploy operations for patched artifacts.
4. Restarts all affected servers.

The syntax for the `rollback` option is shown below:

```
opatch rollback -id patch_id
    [-auto [-domain domain_name]]
    [-mw_home MW_HOME]
    [-oh ORACLE_HOME]
    [-property_file path_to_property_file]
    [-report]
```

A summary of the options for the `rollback` command are described in Table 2–5.

### Table 2–5 Options for the OPatch rollback Command

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-id patch_id</code></td>
<td>Use the <code>-lsinventory</code> option to display all applied patch IDs. Each one-off patch is uniquely identified by an ID. To rollback to a previous patch version, that patch version's ID must be supplied.</td>
</tr>
<tr>
<td><code>-auto [-domain domain_name]</code></td>
<td>Optional - causes OPatch to automate the rollout of the patch to Oracle Fusion Middleware entities. If <code>-auto</code> is used then <code>-domain</code> must also be used to indicate the name of the domain in which the rollout should occur; the exception is when there is only one domain configured out of the Oracle home, in which case the <code>-domain</code> flag is optional. Refer to Section 2.4.1, ”Applying Patches and Deploying Patched Artifacts to WebLogic Servers” for more information.</td>
</tr>
<tr>
<td><code>-mw_home MW_HOME</code></td>
<td>Optional - The Middleware home to which the patch will be applied. The Middleware home specified here supersedes the <code>MW_HOME</code> environment variable. If neither is specified, then the Middleware home from where the command is run will be used.</td>
</tr>
<tr>
<td><code>-oh ORACLE_HOME</code></td>
<td>Optional - This option is used to specify the Oracle home to which the patch should be applied. This value supersedes the <code>ORACLE_HOME</code> environment variable. If neither is specified, OPatch will apply the updates to the Oracle home from which it was launched.</td>
</tr>
<tr>
<td><code>-property_file path_to_property_file</code></td>
<td>Optional - absolute path and name of the property file. Refer to Section 2.4.1, ”Applying Patches and Deploying Patched Artifacts to WebLogic Servers” for more information.</td>
</tr>
<tr>
<td><code>-report</code></td>
<td>Optional - print out the actions that will be taken by executing the command, but does not actually execute the command.</td>
</tr>
</tbody>
</table>

### 2.4.3 Deploying Patched Artifacts to WebLogic Servers

This operation deploys modified artifacts from the Fusion Middleware `ORACLE_HOME` to the Fusion Middleware domain.

The location of the patch binaries must be specified using the `-ph` option. If the patch is installed in the current Oracle home (the Oracle home from which you are running this command) then the `-ph` option is not required.

If the patch is already applied to the Oracle home, the `-id` option can be used to specify the patch you want to use for deployment.
The syntax for the `deploy` command is shown below:

```
opatch deploy -id patch_id -ph patch_location
    [-auto [-domain domain_name]]
    [-mw_home MW_HOME]
    [-oh ORACLE_HOME]
    [-property_file path_to_property_file
    [-report]]
```

A summary of the options for the `deploy` command are described in Table 2–6.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-id patch_id</code></td>
<td>The unique ID of the patch that is installed in the Oracle home.</td>
</tr>
<tr>
<td><code>-ph patch_location</code></td>
<td>The absolute path to the location of the patch. If none is specified, then the current directory is used.</td>
</tr>
<tr>
<td><code>-auto [-domain domain_name]</code></td>
<td>Optional - causes OPatch to automate the rollout of the patch to Oracle Fusion Middleware entities. If <code>-auto</code> is used then <code>-domain</code> must also be used to indicate the name of the domain in which the rollout should occur; the exception is when there is only one domain configured out of the Oracle home, in which case the <code>-domain</code> flag is optional. Refer to Section 2.4.1, &quot;Applying Patches and Deploying Patched Artifacts to WebLogic Servers&quot; for more information.</td>
</tr>
<tr>
<td><code>-mw_home MW_HOME</code></td>
<td>Optional - The Middleware home to which the patch will be applied. The Middleware home specified here supersedes the <code>MW_HOME</code> environment variable. If neither is specified, then the Middleware home from where the command is run will be used.</td>
</tr>
<tr>
<td><code>-oh ORACLE_HOME</code></td>
<td>Optional - This option is used to specify the Oracle home to which the patch should be applied. This value supersedes the <code>ORACLE_HOME</code> environment variable. If neither is specified, OPatch will apply the updates to the Oracle home from which it was launched.</td>
</tr>
<tr>
<td><code>-property_file name</code></td>
<td>Optional - absolute path and name of the property file. Refer to Section 2.4.1, &quot;Applying Patches and Deploying Patched Artifacts to WebLogic Servers&quot; for more information.</td>
</tr>
<tr>
<td><code>-report</code></td>
<td>Optional - print out the actions that will be taken by executing the command, but does not actually execute the command.</td>
</tr>
</tbody>
</table>

### 2.4.4 Listing the Source Oracle Homes

The `lshomes` command lists all the Oracle homes pertaining to logical entities such as Host or Domain. For a Host, the list of Oracle homes is obtained from the machine’s central inventory. For a WebLogic domain, the list of homes is limited to products Oracle homes that are installed within a top-level Middleware home.

If the `-domain` or `-domaindir` option is used, the command lists the Oracle homes that have been used to create or extend the WebLogic domain. If not, all the homes registered with the machine’s central inventory or the inventory location specified using `-invPtrLoc` are listed.

The Middleware home can be specified by using the `-mw_home` option or by setting the `MW_HOME` environment variable. When the Middleware home is specified and the `-domain` or `-domaindir` option is not specified, this command will list all the
Running OPatch

Patching Oracle Fusion Middleware with Oracle OPatch

Oracle homes within the Middleware home that are registered with the machine's central inventory or the specified inventory location.

The syntax for the lshomes option is shown below:

```bash
opatch lshomes
   [-domain domain_name | -domain_dir domain_location]
   [-mw_home MW_HOME ]
   [-invPtrLoc path_to_oraInst.loc]
```

A summary of the options for the lshomes command are described in Table 2–7.

**Table 2–7 Options for the OPatch lshomes Command**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-domain domain_name</td>
<td>Optional - list the Oracle homes that have been used to create or extend this WebLogic Domain.</td>
</tr>
<tr>
<td>-domain_dir domain_location</td>
<td>Optional - list the Oracle homes that have been used to create or extend the WebLogic Domain at this location. You must specify the absolute path to the WebLogic Domain.</td>
</tr>
<tr>
<td>-mw_home MW_HOME</td>
<td>Optional - list only the Oracle homes registered with the machine's central inventory that are located in this Middleware home. You must specify the absolute path to the Middleware home directory; this value supersedes the MW_HOME environment variable. If neither is available, the Middleware home from which the command is executed will be used.</td>
</tr>
<tr>
<td>-invPtrLoc path_to_oraInst.loc</td>
<td>Optional - absolute path to the location of your oraInst.loc file; this option is needed if the installation was performed using the -invPtrLoc option.</td>
</tr>
</tbody>
</table>

Below is an example of the opatch lshomes command on a UNIX operating system:

```
[aime@stadm41 Oracle_SOAl]$ ./OPatch/opatch lshomes
-domain MySOAWebCenterDist
Invoking OPatch 11.1.0.6.9
Oracle Interim Patch Installer version 11.1.0.6.9

Home path = "*/OracleFMW/Middleware_PS1_RC2/oracle_common"
```
2.4.5 Listing the Domains Created from the Middleware Home or Oracle Home

The `lsdomains` command lists all the WebLogic Domains that have been created from a certain Oracle home:

- If the Oracle home is specified, then only those domains created from the specified Oracle home are listed. If no Oracle home is specified, OPatch will list the domains created from the Oracle home as defined by the `ORACLE_HOME` environment variable. If neither is available, then OPatch will use the Oracle home directory from which the command is run.
- If a Middleware home is specified, all domains created from all Oracle homes within the specified Middleware home are listed.
- If neither is specified, and neither the `MW_HOME` or `ORACLE_HOME` environment variable is defined, then OPatch will run the command for the Middleware home from where the command was run.

The syntax for the `lsdomains` command is shown below:

```bash
opatch lsdomains
    [-oh ORACLE_HOME]
    [-mw_home MW_HOME]
    [-invPtrLoc path_to_oraInst.loc]
```

A summary of the options for the `lsdomains` command are described in Table 2–8.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-oh ORACLE_HOME</td>
<td>Optional - absolute path to the Oracle home directory.</td>

OPatch command 'lsdomains' done.
OPatch succeeded.

2.4.6 Listing the Applicable Oracle Homes for a Patch

This checkApplicable command produces a list of Oracle homes to which the patch can be applied. For Fusion Middleware, this command is limited in scope to the top-level Middleware home:

- If only the Middleware home is specified, OPatch will check to see whether or not this patch can be applied to all Oracle homes within the specified Middleware home.
- If an Oracle home is specified in addition to the Middleware home, OPatch will check to see if the patch can be applied to the specified Oracle home in the specified Middleware home.
- If neither is specified, and neither the MW_HOME or ORACLE_HOME environment variable is defined, then OPatch will run the command for the Middleware home from where the command was run.

The syntax for the checkApplicable command is shown below:

```
opatch checkApplicable
[ -ph patch_location ]
[ -mw_home MW_HOME ]
[ -oh ORACLE_HOME ]
[ -invPtrLoc path_to_oraInst.loc ]
```

A summary of the options for the checkApplicable command are described in Table 2–9.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ph patch_location</td>
<td>Optional - location of the patch for which you want to run the checkApplicable command. If not specified, then the patch in the current directory is used.</td>
</tr>
<tr>
<td>-mw_home MW_HOME</td>
<td>Optional - absolute path to the Middleware home directory.</td>
</tr>
<tr>
<td>-oh ORACLE_HOME</td>
<td>Optional - absolute path to the Oracle home directory.</td>
</tr>
<tr>
<td>-invPtrLoc path_to_oraInst.loc</td>
<td>Optional - absolute path to the location of your oraInst.loc file; this option is needed if the installation was performed using the -invPtrLoc option.</td>
</tr>
</tbody>
</table>
Below is an example of the `opatch checkApplicable` command on a UNIX operating system:

```
[aime@stadn41 Oracle_SOAI]$ ./OPatch/opatch checkapplicable -ph /OracleFMW/Middleware_PS1_RC2/FMWPatches/9991008/
Invoking OPatch 11.1.0.6.9

Patch 9991008: Required component(s) missing : [ oracle.jrf.j2ee, 11.1.1.2.0 ] , [ oracle.jrf.dms, 11.1.1.2.0 ]
Some of the Oracle Homes under the Middleware Home "/OracleFMW/Middleware_PS1_RC2" have failed this check.

OPatch command 'checkApplicable' done.
```

The following warnings have occurred during OPatch execution:
1) OUI-67124:Some of the Oracle Homes under the Middleware Home
"/OracleFMW/Middleware_PS1_RC2" have failed this check.

OPatch Session completed with warnings.

OPatch completed with warnings.

### 2.4.7 Listing Patches Applied to an Oracle Home or WebLogic Domain

The `checkInstalledOneOffs` command checks to see if the specified patch or patches have been applied to certain Oracle homes or WebLogic Domains:
If a Middleware home is specified, OPatch checks all the Oracle homes within the specified Middleware home that are registered with the machine's central inventory. If not specified, then the MW_HOME environment variable is used.

- If an Oracle home is specified, OPatch checks the patch against the specified Oracle home only.
- If neither is specified, and neither the MW_HOME or ORACLE_HOME environment variable is defined, then OPatch will run the command for the Middleware home from where the command was run.
- If a WebLogic Domain is specified, OPatch checks against all the Oracle homes within the specified WebLogic Domain.

The syntax for the checkInstalledOneOffs command is shown below:

```bash
opatch checkInstalledOneOffs -id patch_IDs
    [-mw_home MW_HOME]
    [-oh ORACLE_HOME]
    [-domain domain_name]
    [-invPtrLoc path_to_oraInst.loc]
```

A summary of the options for the checkInstalledOneOffs command are described in Table 2–10.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-id patch_IDs</code></td>
<td>ID of the patch or patches that you want to check. Separate multiple patch IDs with a comma (,) character.</td>

OPatch completed with warnings.

2.4.8 Starting or Stopping a Runtime Instance

The start and stop commands allow Fusion Middleware runtime entities to be started or stopped, respectively. Only entities of the same type can be started or stopped; if you need to start or stop entities of multiple types, you must run this command separately for each entity type.

In order to run this command:

- Node Manager must be configured and running on the target server machine.
- The WebLogic_Home/common/nodemanager/nodemanager.domains (on UNIX operating systems) or WebLogic_Home\common\nodemanager\nodemanager.domains (on Windows operating systems) must be populated.
- You must be able to connect to the Administration Server, which must be up and running.

The syntax for the start and stop commands is shown below:

```bash
opatch start|stop
-domain domain_name
-targets product_entity_name
-target_type product_entity_type
[-oh ORACLE_HOME]
```

A summary of the options for the start and stop commands are described in Table 2–11.
Below is an example of the `opatch start` command on a UNIX operating system:

```
[aime@stadn41 Oracle_SOA1]$ ./OPatch/opatch start
-targets soa_server1
-target_type fmwserver
-domain MySOAWebCenterDist
```

2.5 Troubleshooting OPatch in a Fusion Middleware Environment

This section describes common issues you may encounter when running the OPatch utility in a Fusion Middleware environment.

2.5.1 Notes About Patching the MDS Repository

For special information about patching the MDS repository, refer to "Understanding the MDS Repository" in the Oracle Fusion Middleware Administrator's Guide.

2.5.2 Setting the Machine Name and Listen Address

The machine name of the Administration Server and Managed Servers must be set to a valid value. It cannot be set to blank or None.

The listen address of the Administration and Managed Servers must be set to the real physical host's address (hostname, FQDN, or IP address). It cannot be set to blank or localhost.
These values need to be properly set only once; you will not need to reset them should you ever need to patch your software.

To set the machine name and listed address of the Managed Servers:

1. Open the Administration Console.
2. In the Domain Structure, navigate to domain_name > Environments > Machines.
3. If your WebLogic Server is running in Production Mode, click the Lock & Edit button on the left hand side. If your WebLogic Server is running in Development Mode, this step is not needed.
4. Click the New button to create a new machine. Specify a name and select the operating system.
5. Select the machine you just created, go to Configuration > Node Manager and change the Listen Address to the host on which the Node Manager is listening, then click the Save button.
6. In the Domain Structure, navigate to domain_name > Environments > Servers.
7. For each Managed Server, assign the machine you just created. In the Listen Address field, specify the name of the host on which the Node Manager is listening. Click Save when you are finished.
8. If your WebLogic Server is running in Production Mode, click the Activate Changes button on the left hand side. If your WebLogic Server is running in Development Mode, this step is not needed.

To set the machine name and listen address of the Administration Server:

1. Stop the Administration Server and all Managed Servers.
2. Back up the config.xml file in the domain.
   The default location of this file is the config directory inside your Domain home.
3. Modify the existing config.xml file as follows:
   a. Find the following line:
      
      <name>AdminServer</name>

   b. Add the following lines:
      
      <machine>host_name</machine>
      <listen-address>host_name</listen-address>

c. Save the file.
4. Restart the Administration Server and all the Managed Servers.
   If you encounter any problems, revert back to the saved version of the config.xml file and contact Oracle Support.
Applying the Latest Oracle Fusion Middleware Patch Set

This chapter describes how to patch your existing Oracle Fusion Middleware software to the latest version. The specific patching instructions you follow depend on the version of your current software. Instructions in this chapter are provided for software versions 11.1.2.0 and later.

Note: The following pre-patching procedures must be completed before you can update your software to Release 11.1.1.7.0:

- If you have Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0), you must update to Release 1 (11.1.1.2.0) before you can update your software to Release 11.1.1.7.0. See Appendix C, "Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.1.2.0)" for instructions.
- If you have Oracle Identity and Access Management 11g Release 1 (11.1.1.3.0) components, you must update to Release 1 (11.1.1.5.0) before you can update your software to Release 11.1.1.7.0. See Section 7.2, "Patching Oracle Identity and Access Management 11.1.1.3.0 Components"

- Section 3.1, "Oracle Fusion Middleware Patching Process Overview"
- Section 3.2, "Oracle Fusion Middleware Patching Process Roadmap"
- Section 3.3, "Before You Begin"
- Section 3.4, "General Pre-Patching Tasks"
- Section 3.5, "Downloading the Installer"
- Section 3.6, "Patching Oracle Fusion Middleware"
- Section 3.7, "Updating Your Schemas with Patch Set Assistant"
- Section 3.8, "Starting the Servers and Processes"
- Section 3.9, "Verifying Your Patch Set Installation"

3.1 Oracle Fusion Middleware Patching Process Overview

Figure 3–1 shows the general patching procedures for Oracle Fusion Middleware. Review the overview before you begin your patching procedures to ensure you understand the process.
3.2 Oracle Fusion Middleware Patching Process Roadmap

Table 3–1 provides links to additional information for each of the patching steps.
### Table 3–1 Summary of Patching Procedures and Links to Documentation

3.3 Before You Begin

Before you begin the patching procedures discussed in this chapter, complete any applicable pre-patching tasks outlined in this section. The "Special Instructions" sections in this chapter will help you determine if there are any special pre-patching tasks required for your environment.

- Special Instructions for Patching Oracle WebCenter
- Special Instructions for Patching Oracle Portal, Forms, Reports and Discoverer
- Special Instructions for Patching Oracle Identity and Access Management
- Special Instructions for Patching a Distributed Environment
- Special Instructions for Patching Oracle SOA Suite
- Special Instructions for Patching Oracle WebLogic Server 10.3.6 with SOA Suite

3.3.1 Special Instructions for Patching Oracle WebCenter

The procedures you need to follow for patching your existing Oracle WebCenter software depend on your current software version. Chapter 6, "Patching Oracle WebCenter Portal" describes the procedures for patching the various versions of Oracle WebCenter. For patching Oracle WebCenter, you can directly navigate to
Chapter 6 and follow the instructions there. Many of the steps listed in refer back to this and other chapters of this guide.

3.3.2 Special Instructions for Patching Oracle Portal, Forms, Reports and Discoverer

- To prevent compatibility issues with other Fusion Middleware products, Oracle recommends that Oracle Portal, Forms, Reports, and Discoverer be installed in its own Middleware home directory that it does not share with any other Oracle Fusion Middleware products. For more information on the compatibility and interoperability of Fusion Middleware products, see the Oracle Fusion Middleware Interoperability and Compatibility Guide.

- This Oracle Fusion Middleware patch set provides Oracle Portal 11.1.1.6.0 which is the latest version of Oracle Portal. The Patch Set Assistant for this release upgrades the PORTAL schema to this version. As a result, a schema update is not required if Oracle Portal 11.1.1.6.0 has already been installed.

3.3.3 Special Instructions for Patching Oracle Identity and Access Management

- If you are currently using the 11.1.1.3.0 versions of Oracle Identity Manager, Oracle Access Manager or Oracle Adaptive Access Manager, you will need to upgrade to 11.1.1.5.0 before applying the latest patch set (11.1.1.7.0). For more information, see Section 7.2, "Patching Oracle Identity and Access Management 11.1.1.3.0 Components".

- Before applying the latest patch set for Oracle Identity and Access Management 11g Release 1 (11.1.1.7.0), see "Patch Set Interoperability Between Oracle Identity Management and Oracle Identity and Access Management" in Oracle Fusion Middleware Interoperability and Compatibility Guide for interoperability issues between these products.

3.3.4 Special Instructions for Patching a Distributed Environment

If you are running your products in a distributed environment (for example, you have Managed Servers running in multiple domains on multiple systems) and you have set up a shared Middleware home on a shared network drive mounted to each machine that is part of your domain, then this patching procedure only needs to be done once (see Section 2.3.3, "Patching in a Distributed Environment").

If your distributed environment has a separate Middleware home on each system, then this patching procedure must be repeated for each domain on each system.

More information about distributed topologies can be found in the Enterprise Deployment Guide for your specific product.

3.3.5 Special Instructions for Patching Oracle SOA Suite

Before upgrading from a previous release to 11.1.1.7.0, make sure all Edit sessions in SOA Composer are committed or reverted.

SOA Composer provides DT@RT functionality to edit rules dictionaries after deployment. After upgrading to the latest version, all uncommitted sessions in SOA Composer will be lost or there can be issues accessing the edit sessions. This is because the MDS sandboxes (used for handling sessions) are not updated by the patch set.

To commit or revert the sessions:

1. Log in to the SOA Composer (/soa/composer) as any user with active sessions.
2. Go to **Open > My Edits** to view all of your active sessions.

3. Open each document listed in "My Edits" and do one of the following:
   a. Click **Commit** to commit the session changes.
   b. Select **Revert > Clear all session edits and saved changes** to abort the changes.

   Either step will result in the session being closed.

### 3.3.6 Special Instructions for Patching Oracle WebLogic Server 10.3.6 with SOA Suite

After installing the latest version of Oracle WebLogic Server (version 10.3.6), you must install the required patches as described on the "Known Issues for Oracle SOA Products and Oracle AIA Foundation Pack" page on Oracle Technology Network at:

http://www.oracle.com/technetwork/middleware/docs/aia-soarelnotes-ps6-1866030.html

### 3.4 General Pre-Patching Tasks

This section describes tasks that should be completed before you patch your software:

- Reviewing System Requirement and Certification
- Reviewing the Oracle Fusion Middleware Interoperability and Compatibility Guide
- Stopping the Servers and Processes
- Backing Up Your Middleware Home, Domain Home and Oracle Instances
- Backing Up Your Database and Database Schemas
- Backing Up Additional Configuration Information
- Updating Oracle WebLogic Server
- Renaming the emCCR File for Silent Patching

### 3.4.1 Reviewing System Requirement and Certification

Before you begin to update your software, you should make sure that your system environment and configuration meet the minimum requirements for the software you want to install in order to perform the update. This section contains links to several key pieces of documentation you should review:

- System Requirements and Specifications
- Certification and Supported Platforms
- Upgrading the Embedded JDK in 11g Release 1 (11.1.1.7.0)

#### 3.4.1.1 System Requirements and Specifications

For certification information, refer to the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document on the Oracle Fusion Middleware Supported System Configurations page at the following URL:

This page contains information related to hardware and software requirements, minimum disk space and memory requirements, database schema requirements, and required system libraries, packages, or patches.

3.4.1.2 Certification and Supported Platforms
Read the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document. This document contains certification information related to supported 32-bit and 64-bit operating systems, databases, web servers, LDAP servers, adapters, IPv6, JDKs, and third-party products. It is located on the Oracle Fusion Middleware Supported System Configurations page.

---

Note: You will need to have the latest supported JDK version installed in your patched environment. Consult the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document at http://www.oracle.com/technetwork/middleware/downloads/fmw-11gr1certmatrix.xls for the latest certified JDK versions for your patch set.

You can access the latest JDK from the Oracle Software Downloads page on the Oracle Technology Network at http://www.oracle.com/technetwork/indexes/downloads/index.html. Follow the installation instructions provided with each download.

---

3.4.1.3 Upgrading the Embedded JDK in 11g Release 1 (11.1.1.7.0)
Oracle Fusion Middleware 11g Release 1 (11.1.1.7.0) does not include an updated version of Oracle WebLogic Server; this release is supported for use with Oracle WebLogic Server 10.3.6, which was released with Oracle Fusion Middleware 11g Release 1 (11.1.1.6.0).

As a result, some Oracle Fusion Middleware products may require a JDK version higher than the one that is embedded with Oracle WebLogic Server 10.3.6. In such cases, you must manually upgrade your JDK to the supported version.

Apply the FMW Patch Set before updating the JDK used with Oracle WebLogic Server 10.3.6, in order to ensure a certified and latest WLS/JDK/FMW combination.

Oracle Java SE (JDK/JRE) may be installed as part of the Oracle Fusion Middleware (FMW) 11g product or installed on your system beforehand. In either case, it is supported to update this Java SE (or JDK/JRE if separate) to the latest release, as long as it remains on a certified version.

See the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document on the Oracle Fusion Middleware Supported System Configurations page for supported JDK versions.

3.4.2 Reviewing the Oracle Fusion Middleware Interoperability and Compatibility Guide
Read "Patch Set Interoperability" in the Oracle Fusion Middleware Interoperability and Compatibility Guide before you begin your patching process. This document contains important information regarding the ability of Oracle Fusion Middleware products to function with previous versions of other Oracle Fusion Middleware, Oracle, or third-party products. This information is applicable to both new Oracle Fusion Middleware users and existing users who are upgrading their existing environment.
General Pre-Patching Tasks

3.4.3 Stopping the Servers and Processes

Before you run the installer to update your software, you should stop all servers and processes (including OPMN) on all machines which are part of any domain used from the Middleware home.

Instructions for stopping an Oracle Fusion Middleware environment are provided in "Stopping an Oracle Fusion Middleware Environment" in Oracle Fusion Middleware Administrator's Guide.

If your environment is running Oracle Process Manager and Notification Server (OPMN), you should also stop OPMN with the `opmnctl stopall` command.

If you are running Node Manager, you should also stop Node Manager. You can do this by closing the console window in which Node Manager is running, or by using the `stopNodeManager` WLST command.

Note: In order for the `stopNodeManager` command to work, Node Manager must be configured with `QuitEnabled=true`.

See "stopNodeManager" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference for more information.

3.4.4 Backing Up Your Middleware Home, Domain Home and Oracle Instances

After stopping the servers and processes, back up your Middleware home directory (including the Oracle home directories inside the Middleware home), your local Domain home directory, your local Oracle instances, and also the Domain home and Oracle instances on any remote systems that use the Middleware home.

Backing up your environment before applying your patch is an important step in the patching process. If your patch set installation is unexpectedly interrupted, or if you choose to cancel out of the installation before it is complete, you may not be able to install the patch unless you restore your environment to the previous configuration before running the Installer again.

For more information on backing up your environment, see "Backing Up Your Environment" in the Oracle Fusion Middleware Administrator's Guide.

3.4.5 Backing Up Your Database and Database Schemas

If your database schemas require updating, you should also back up your database before you begin the patching procedure. Make sure this back up includes the schema version registry table, as each Fusion Middleware schema has a row in this table. The name of the schema version registry table is `SYSTEM.SCHEMA_VERSION_REGISTRY$`. Refer to your database documentation for instructions on how to do this.

If you run the Patch Set Assistant to update an existing schema and it does not succeed, you must restore the original schema before you can try again. Make sure you back up your existing database schemas before you run the Patch Set Assistant.

To see if your schemas require updating, refer to Table 4–1, "Schemas That Require Updating for the Latest Release" in "Updating Your Schemas with Patch Set Assistant".

---

Caution: Some versions of Oracle Identity Management products are not compatible with previous versions. For detailed information, see the Oracle Fusion Middleware Interoperability and Compatibility Guide.
3.4.6 Backing Up Additional Configuration Information

Depending on your specific environment, you might also need to back up the following before performing any patching procedures:

- **Back Up Configurations and Stores**
  
  Each WebLogic Server domain must be updated using the `upgradeOpss()` WLST command. Before running the `upgradeOpss()` command, make sure that you backup the store to be updated. In case of a LDAP store, backup all data under the root node of the store (which is specified as a property of the store in the configuration file). For example, to backup OID as LDAP store, do the following:

  1. For more information about how to backup the OID DB, see "Backing Up and Restoring Oracle Internet Directory" in *Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory*.

     All the Oracle Internet Directory data you need to backup and restore is in the underlying Oracle Database. For more information about how to backup and restore the Oracle database, see *Oracle Database Backup and Recovery User’s Guide*.

     For more information on how to backup and restore your FMW Oracle home and Oracle instance, see Oracle Fusion Middleware Administrator’s Guide.

  2. Do an `ldapsearch` backup from the root (-b "") to get an ldif backup without operational attributes (which could be imported with ldap tools later if required). For example, `ldapsearch -h <oid host> -p <oid port> -D cn=orcladmin -w <password> -L -s sub -b "* objectclass=*" > /tmp/ldapsearchOfAllEntries.ldif`

  3. Do an `ldifwrite` from the root (basedn="") to get an ldif backup with operational attributes (which could be imported with bulkload restore option later if required). For example, `ldifwrite connect=oiddb basedn="" ldifile="/tmp/ldifwriteOfAllEntries.ldif"`

     In case of an update failure, restore that node entirely.

     For more information, see "Upgrading Policies with upgradeOpss" in *Oracle Fusion Middleware Security Guide*.

- **Save OmniPortlet and WebClipping Customizations for Oracle WebCenter or Oracle Portal**

  If you are using OmniPortlet and WebClipping customizations, and they are being used with a file-based preferences store, you must save your customizations.

- **Save XEngine Customizations for Oracle B2B**

  This procedure is needed only if you use custom XEngine configurations in cases where B2B server is integrated with B2B EDI endpoints. In such cases, all B2B domains created from the same installation share the a single XEngine configuration stored within a single directory. This directory must be backed up prior to patching, and then restored after patching is complete.

  For more information, see Section 5.9.9, "Saving and Restoring XEngine Customizations for Oracle B2B".

- **Back Up Existing Oracle BI Presentation Catalogs**

  When updating your Oracle Business Intelligence (BI) software from Release 11.1.1.3.0 to 11.1.1.7.0, you must manually update your Oracle BI Presentation Catalogs. See Section 5.12.2, "Updating Oracle BI Presentation Catalogs" for more information.
General Pre-Patching Tasks

- Back Up Files for Oracle Data Integrator Java EE Standalone Agent

  Make sure the following files and directories are backed up (they should be if you backed up your Oracle home directory, as specified in Section 3.4.4, “Backing Up Your Middleware Home, Domain Home and Oracle Instances”):

  1. Backup the `ODI_HOME/oracledi/agent/bin/odiparams.sh` (on UNIX operating systems) or `ODI_HOME/oracledi\agent\bin\odiparams.bat` (on Windows operating systems) file.

  2. Backup the `ODI_HOME/oracledi/agent/drivers` (on UNIX operating systems) or `ODI_HOME/oracledi\agent\drivers` (on Windows operating systems) directory.

  After Oracle Data Integrator is patched, follow the instructions in Section 5.13.3, “Reconfiguring the ODI Standalone Agent”.

- Back up custom JSPs for Oracle Identity Federation

  If you are updating your Oracle Identity Federation to the latest release, you should back up any custom JSPs before patching to the latest version. The patching process will overwrite the JSPs included in the `oif.ear` file.

  After the patching process is complete, you should restore your custom JSPs.

3.4.7 Updating Oracle WebLogic Server

If Oracle WebLogic Server is already installed on your system, make sure you have updated Oracle WebLogic Server to either version 10.3.6 or 10.3.5 (both are supported in Release 11.1.1.7.0) using the Upgrade installer.

To update the WebLogic Server:

1. Download the Upgrade installer from My Oracle Support.

   For instructions, see "Downloading an Upgrade Installer From My Oracle Support" in Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server.

2. Run the Upgrade installer in graphical mode to patch your WebLogic Server.

   For instructions, see "Running the Upgrade Installer in Graphical Mode" in Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server.

If you want to run the Upgrade installer in silent mode (for example, you have an environment where you need to patch multiple instances of Oracle WebLogic Server), see the instructions in "Running the Installation Program in Silent Mode" in Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server.

---

**Note:** If you have Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0), and you are installing Oracle WebLogic Server for the first time to upgrade to Release 1 (11.1.1.2.0) or later, see the "Installation Overview" in the Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server.

---

3.4.8 Renaming the emCCR File for Silent Patching

If you are patching your software in silent mode, you may encounter the following error messages:

```
*SEVERE*: Values for the following variables could not be obtained from the command line or response file(s):
MYORACLESUPPORT_USERNAME [MyOracleSupportUsername]
```
To work around this issue, rename the `ORACLE_HOME/ccr/bin/emCCR` (on UNIX operating systems) or `ORACLE_HOME\ccr\bin\emCCR` (on Windows operating systems) file.

For example, on a UNIX operating system:

```bash
cd ORACLE_HOME/ccr/bin
mv emCCR emCCR_LAST
```

On a Windows operating system:

```bash
cd ORACLE_HOME\ccr\bin
mv emCCR emCCR_LAST
```

### 3.5 Downloading the Installer

The following sections contain instructions on how to obtain the proper installer required to patch your product:

- About the Installers Used for Patching
- Downloading the Required Installer

#### 3.5.1 About the Installers Used for Patching

The installers you use to apply the latest Oracle Fusion Middleware patch sets vary in their behavior and capabilities, depending upon the product you are using. Before you begin the patching process, review Table 3–2 for information about the types of installers and what to expect when you run the installer to apply the latest patch set.

Note that this table is not a complete list of Oracle Fusion Middleware products. For a complete list of the products available with each patch set release, see the Oracle Fusion Middleware Download, Installation, and Configuration ReadMe Files.

<table>
<thead>
<tr>
<th>Products</th>
<th>Type and Behavior of the Installer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Application Developer Runtime</td>
<td>These installers are full installers that can also function as update installers. You can use them to update an existing 11g Release 1 Oracle home, or you can use them to install a new, complete Oracle home.</td>
</tr>
<tr>
<td>Oracle SOA Suite</td>
<td></td>
</tr>
<tr>
<td>Oracle Service Bus</td>
<td></td>
</tr>
<tr>
<td>Oracle WebCenter Portal</td>
<td></td>
</tr>
<tr>
<td>Oracle WebCenter Content</td>
<td></td>
</tr>
<tr>
<td>Oracle Identity Management</td>
<td></td>
</tr>
<tr>
<td>Oracle Web Tier</td>
<td></td>
</tr>
<tr>
<td>Oracle Business Intelligence</td>
<td>These installers are full installers that can also function as update installers. They can be used to update an existing 11g Release 1 Oracle home, or they can be used to install a new, complete Oracle home. These installers also offer a configuration option. When using them to apply a patch set, you must select the option to install the software only. Do not select the option to configure the software. The domain you are patching is already configured and does not require any reconfiguration.</td>
</tr>
</tbody>
</table>
3.5.2 Downloading the Required Installer

To download and unpack the Installer files for your product:

1. Download the installer from the Oracle Technology Network, My Oracle Support, or Oracle Software Delivery Cloud (formerly E-Delivery).
   
   For more information, see "Select an Oracle Fusion Middleware Software Download Site" and "Download the Software Required for Your Starting Point" in Oracle Fusion Middleware Download, Installation, and Configuration ReadMe Files.

2. Unpack the downloaded archive that contains the installer and software that you want to install into a directory on the target computer.

3.6 Patching Oracle Fusion Middleware

The following sections contain instructions on how to start the installer and apply the patch set for your product:

- Starting the Installer
- Applying the Patch Set

3.6.1 Starting the Installer

To start the installer you just downloaded and unpacked:

1. Change directory to the Disk1 folder inside the unpacked archive folder.

2. Start the Installer:
   
   On UNIX operating systems:
   
   ./runInstaller

   On Windows operating systems:
   
   setup.exe

   Depending on your system environment and product you are updating, you may be prompted to provide the location of a JRE/JDK on your system when you start the installer. When you installed Oracle WebLogic Server, a JRE was installed in the jdk160_version directory inside the Middleware home; you can use this location to start the installer.

   If you do not have Oracle WebLogic Server installed on your system, you can use the JDK in the jdk directory inside the Oracle home.

   Make sure you specify the absolute path to your JRE/JDK location; relative paths are not supported.
The Installer can also be run in silent mode. See “Silent Oracle Fusion Middleware Installation and Deinstallation” in Oracle Fusion Middleware Installation Planning Guide for more details.

### 3.6.2 Applying the Patch Set

After you have started the Installer, follow the instructions on the screen to apply the patch set to your existing Middleware home.

---

**Note:** If your domain includes multiple host computers, you must run the Installer separately on each host to update the software on that host.

---

As you review each screen of the installer, note that there are two significant differences between applying a patch set and installing software for the first time:

- When you are applying a patch set, you must identify an existing Middleware home on the Specify Installation Location screen.
- If you are installing Oracle Identity Management, Oracle Business Intelligence, or Oracle Web Tier, then you must perform a software only install and select the existing Middleware home and Oracle home you want to patch. There is no need to configure or re-configure your existing software.

Table 3–3 provides a summary of the typical installation screens you will see when you are applying a patch set to an existing Middleware home.

---

**Note:** Oracle Fusion Middleware products in this release can be updated with their usual product installer.

---

If you need additional help with any of the installation screens, refer to Appendix A, “Installer Screens” or click Help to access the online help.

**Table 3–3 Typical Installation Flow For Installing a Patch Set**

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>This page introduces you to the Oracle Fusion Middleware installer.</td>
</tr>
</tbody>
</table>
| Install Software Updates   | Select the method you want to use for obtaining software updates, or select **Skip Software Updates** if you do not want to get updates.  
If updates are found, the installer will automatically attempt to apply them at this point; make sure that the server you are using to perform the installation is connected to the Internet.  
Some updates will require that the installer be restarted; if this happens, the Install Software Updates screen will not be seen the next time. |
| Prerequisite Checks        | Verify that your system meets all necessary prerequisites.                                       |
| Specify Installation Location | Specify Oracle Middleware home and Oracle home locations.                    
The Oracle Common home (oracle_common) directory will automatically be created inside the Middleware home; do not use oracle_common as the name of your Oracle home directory. |
| Application Server         | Select the application server and specify its location.                                       |
3.7 Updating Your Schemas with Patch Set Assistant

To see if your schema requires updating with the Patch Set Assistant, refer to Table 4–1, “Schemas That Require Updating for the Latest Release” in “Which Schemas Need to be Updated with Patch Set Assistant?”. If the product you are patching uses one of the schemas listed in the table, follow the instructions in Chapter 4, "Updating Your Schemas with Patch Set Assistant" to update your schemas.

If the product you are patching does not use one of these schemas, you can skip this section and proceed to Chapter 5, "Post-Patching Procedures".

3.8 Starting the Servers and Processes

After you have finished patching your software and performing any necessary post-patching tasks, you are ready to start the servers and processes.

Procedures for starting and stopping Oracle Fusion Middleware, including the Administration Server, Managed Servers, and components are provided in "Starting and Stopping Oracle Fusion Middleware" in Oracle Fusion Middleware Administrator’s Guide.

Note: Once the servers are restarted, you may need to clear your browser cache. See your internet browser documentation for information on clearing cache.

3.9 Verifying Your Patch Set Installation

After you have successfully patched your environment, you can verify the status of your installation by performing any combination of the following:

- Verifying the Upgrade Log
- Verifying the Domain Server Logs
- Verifying OPMN Status
- Checking Browser URLs

3.9.1 Verifying the Upgrade Log

View the log file located in the MW_HOME/oracle_common/upgrade/logs (on UNIX operating systems) or MW_HOME\oracle_common\upgrade\logs (on Windows operating systems) directory for details about the upgrade.
3.9.2 Verifying the Domain Server Logs

Check the domain server logs, which are located in the servers directory inside the domain home directory. For example, on UNIX systems:

```
MW_HOME/user_projects/domains/domain_name/servers/server_name
```

On Windows systems:

```
MW_HOME\user_projects\domains\domain_name\servers\server_name
```

3.9.3 Verifying OPMN Status

Run the `opmnctl status` command from the `INSTANCE_HOME/bin` (on UNIX operating systems) or `INSTANCE_HOME\bin` (on Windows operating systems) directory in your instance home location. The example below shows the output on a UNIX system:

```
> ./opmnctl status

Processes in Instance: asinst_1
+---------------------------------+--------------------+---------+---------+
| ias-component                    | process-type       |     pid | status  |
+---------------------------------+--------------------+---------+---------+
| emagent_asinst_1                 | EMAGENT            |   11849 | Alive   |
| wcl                             | WebCache-admin     |   11333 | Alive   |
| wcl                             | WebCache           |   11332 | Alive   |
| ohs1                            | OHS                |   11207 | Alive   |
+---------------------------------+--------------------+---------+---------+

This information shows the components configured for this installation. The status "Alive" means the component is up and running.

You can also run the `opmnctl status -l` command to obtain a list of ports used by the components. The example below shows the output on a UNIX system:

```
> ./opmnctl status -l

Processes in Instance: asinst_1
+---------------------------------+--------------------+---------+----------+------+
| ias-component                    | process-type       |     pid | status   | ports |
+---------------------------------+--------------------+---------+----------+------+
| uid | memused | uptime   |          |
+---------------------------------+--------------------+---------+----------+------+
| emagent_asinst_1                 | EMAGENT            |   11849 | Alive    | N/A   |
| 1133259606 | 4204 | 0:09:38 |          |
| wcl                             | WebCache-admin     |   11333 | Alive    | http_admin:8091 |
| 1133259605 | 43736 | 0:15:35 |          |
| 1133259604 | 63940 | 0:15:35 |          |
| ohs1                            | OHS                |   11207 | Alive    |          |
| 1133259603 | 50744 | 0:15:43 |          |
```

3.9.4 Checking Browser URLs

Verify that you can access your installed and configured products, as shown in Table 3–4:
### Table 3–4 Installed Product URLs

<table>
<thead>
<tr>

</tbody>
</table>
Updating Your Schemas with Patch Set Assistant

The Patch Set Assistant is used in patch set releases only to update the database schemas of Oracle Fusion Middleware components. The schemas that are valid for updating with the Patch Set Assistant must meet one of the following criteria:

- The schema was created in an 11g release using the Repository Creation Utility (RCU).
- The schema was upgraded from 10g to 11g using the Upgrade Assistant.

**Note:** The Patch Set Assistant does not upgrade schemas that are in customer databases, which includes any database that has not been updated using the Upgrade Assistant (UA), Repository Creation Utility (RCU), or Patch Set Assistant (PSA).

If you are an Oracle Portal user, note that the Oracle Portal schema can in certain circumstances be installed in a customer database. For more information, refer to Section 4.2, "Special Instructions for Standalone Oracle Portal Repository Schemas".

The Patch Set Assistant updates 11g Release 1 schema versions starting at 11.1.1.2.0 to version 11.1.1.7.0. See Table 4–1 for specific information.

If your existing schema version is 11.1.1.1.0, you must migrate to version 11.1.1.2.0 before you can run the Patch Set Assistant. See Appendix C, "Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.1.2.0)" for more information.

If you are interested in creating new schemas or dropping existing schemas, you must use the Repository Creation Utility (RCU). Information is provided in Oracle Fusion Middleware Repository Creation Utility User’s Guide.

This chapter contains the following topics:

- Section 4.1, "Which Schemas Need to be Updated with Patch Set Assistant?"
- Section 4.2, "Special Instructions for Standalone Oracle Portal Repository Schemas"
- Section 4.3, "Before You Begin Using the Patch Set Assistant"
- Section 4.4, "Running the Patch Set Assistant"
- Section 4.5, "Patch Set Assistant Log Files"
4.1 Which Schemas Need to be Updated with Patch Set Assistant?

The component schemas in Table 4–1 (default names shown) must be updated with the Patch Set Assistant in order to update them to 11g Release 1 (11.1.1.7.0).

---

**Note:** The Schema(s) column in Table 4–1 shows the default schema name format of prefix and schema name separated by an underscore (_) character. The default prefix is `DEV`, but you may have created new prefixes for your schemas while using the RCU.

---

**Notes About the Schemas That Need to Be Updated:**

- Schemas that are not listed in Table 4–1 do not need to be upgraded to 11g Release 1 (11.1.1.7.0).

- Table 4–1 lists only the schemas for products that are available in the latest Oracle Fusion Middleware 11g Release 1 patch set.

  To apply the latest patch set and upgrade the schemas for those products, see the Oracle Fusion Middleware Patching Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.5.0) documentation library.

- This Oracle Fusion Middleware patch set provides Oracle Portal 11.1.1.6.0. The Patch Set Assistant for this release upgrades the PORTAL schema to this version. As a result, a schema update is not required if Oracle Portal 11.1.1.6.0 has already been installed.

- The component names shown in Table 4–1 are the component names used in previous Oracle Fusion Middleware releases. Some of these product and component names were changed in Oracle Fusion Middleware 11g Release 1 (11.1.1.6.0).

  For more information, see Section 6.1, "New Product Names for Oracle WebCenter and Oracle Enterprise Content Management Suite".

- When upgrading _OPSS schemas to 11.1.1.7.0 from a previous release, it is important to note that OPSS audit data will now be stored in IAU common tables instead of the JPS table. Any existing data in the JPS table can remain unchanged for reporting or auditing purposes, and there is no need to upgrade JPS table with extra columns.

</tbody>
</table>

1 A schema update is not required if Oracle Portal 11.1.1.6.0 has already been installed. 11.1.1.6.0 is the latest version of Oracle Portal.

2 Oracle Identity Manager 11.1.1.3.0 users must first patch to 11.1.1.5.0 before applying the 11.1.1.7.0 patch. For more information, see Chapter 7, "Patching Oracle Identity and Access Management".

3 Oracle Adaptive Access Manager 11.1.1.3.0 users must first patch to 11.1.1.5.0 before applying the 11.1.1.7.0 patch. For more information, see Chapter 7, "Patching Oracle Identity and Access Management".

4 If the Discussions Crawler schema has not previously been installed using RCU, then migrating Discussions will automatically install the Discussions Crawler schema, assigning the same password as the Discussions schema. If you then attempt to update the Discussions Crawler schema individually, the Patch Set Assistant will warn that the schema has already been updated.
4.2 Special Instructions for Standalone Oracle Portal Repository Schemas

If you are using an Oracle Portal repository stored outside of the OracleAS Metadata Repository (any database that has not used the Upgrade Assistant, Repository Creation Utility, or Patch Set Assistant), then do not use the Patch Set Assistant to update the Portal schemas in the repository. Instead, refer to "Upgrading an Oracle Portal Repository in a Customer Database" in *Oracle Fusion Middleware Upgrade Guide for Oracle Portal, Forms, Reports, and Discoverer*.

4.3 Before You Begin Using the Patch Set Assistant

This section contains information about things you should check before you run the Patch Set Assistant:

- Section 4.3.1, "Back Up Your Database and Database Schemas"
- Section 4.3.2, "Check Your Database and Schemas"
- Section 4.3.3, "Create an Edition on the Database Server for Editions-Based Redefinition"
- Section 4.3.4, "Shut Down All Components Using the Schemas You Want to Update"
- Section 4.3.5, "Check the aq_tm_processes Value for Oracle Portal"
- Section 4.3.6, "Setting ORACLE_HOME and JAVA_HOME Environment Variables"

4.3.1 Back Up Your Database and Database Schemas

Make sure you have backed up your existing database and database schemas before you run the Patch Set Assistant, as instructed in Section 3.4.5, "Backing Up Your Database and Database Schemas".

4.3.2 Check Your Database and Schemas

Before running Patch Set Assistant, you should check to make sure that your database and database listener is up and running and that the schemas you want to upgrade are at versions that are supported for upgrade. If you are using an Oracle database, connect to the database as SYS and run the following from SQL*Plus:

```
SELECT owner, version, status, upgraded FROM schema_version_registry;
```

If the number in the "VERSION" column is 11.1.1.2.0 or greater, then the schema is supported for upgrade.

If you are using an Oracle database, you should recompile database objects before running the Patch Set Assistant to check for invalid objects before the upgrade. Connect to the database as SYS and run the following from SQL*Plus:

```
/rdbms/admin/utlrp.sql
```

After running `utlrp.sql`, and before you upgrade your schema, issue the following query to ensure there are no longer any invalid database objects:

```
SELECT owner, object_name FROM all_objects WHERE status='INVALID';
```

Take note of any invalid objects. The existence of invalid database objects may prevent the upgrade from completing successfully.
To recompile just the objects that belong to a single Oracle Fusion Middleware schema, you can use the Oracle Database stored procedure `dbms_utility.compile_schema` as shown in the example below:

```
SQL> execute
dbms_utility.compile_schema('PS7_SOAINFRA');
PL/SQL procedure successfully completed
```

### 4.3.3 Create an Edition on the Database Server for Editions-Based Redefinition

Edition-based redefinition (EBR) enables you to support multiple versions of a database schema on the same database and at the same time.

**Note:** When using the Patch Set Assistant, the database type **Oracle Database enabled for editions-based redefinition** should only be selected when editions created in the EBR database require an upgrade. If this is not the intent, select **Oracle Database**. EBR is not available for all Oracle Fusion Middleware components, therefore the EBR database option may not be available.

Before upgrading an EBR-enabled schema from FMW 11.1.1.6.0 release to 11.1.1.7.0, you must connect to the database server and create an edition on the database server for the 11.1.1.7.0 release. The new edition for 11.1.1.7.0 must be a child of your 11.1.1.6.0 edition.

To create an edition on the database server, log in as SYS (or another Oracle user that has DBA privileges) and use the following command:

```
SQL> create edition Oracle_FMW_11_1_1_7_0 as child of Oracle_FMW_11_1_1_6_0;
Edition created.
```

Note that in the code example above, `Oracle_FMW_11_1_1_6_0` is used as an example of the edition name you specified in RCU 11.1.1.6.0 when the 11.1.1.6.0 schemas were created. Be sure to provide the actual name used when creating the edition.

For more information on enabling editions-based redefinitions, see “Edition-Based Redefinition” in the *Oracle Database Advanced Application Developer’s Guide*.

### 4.3.4 Shut Down All Components Using the Schemas You Want to Update

Before running Patch Set Assistant, shut down all Oracle Fusion Middleware components (including the Managed Server and Oracle instances) that may be using the schemas you want to update.

**Exception:** If you will be updating Oracle Identity Manager, make sure that both the database and listener are running prior to running Patch Set Assistant. If they are not running the `ds_attrstore` table will have a prior version listed in the attrname field where `attrname = 'orcldirectoryversion'`, and `opmnctl startall` will time out when starting the Oracle Identity Manager component, even though it seems that the install was successful.
4.3.5 Check the aq_tm_processes Value for Oracle Portal

If you are running the Patch Set Assistant for the Oracle Portal schema on an Oracle database, make sure that the aq_tm_processes value in your database is greater than 0. To check, use the following command after connecting to the database:

```sql
show parameter aq_tm_processes;
```

If the value returned is 0, use the following command to change the value to 1:

```sql
alter system set aq_tm_processes=1 scope=both;
```

4.3.6 Setting ORACLE_HOME and JAVA_HOME Environment Variables

You may need to set or modify your environment variables in the following scenarios:

- If you are running the Patch Set Assistant with an Oracle WebLogic Server, and the environment variables ORACLE_HOME or JAVA_HOME have been set on either UNIX or Windows operating systems, then you must remove these variables prior to running Patch Set Assistant. In some cases if you run the Patch Set Assistant with these variables already set, then the PSA may not run properly.

- If you are running the Patch Set Assistant and your install does not contain an Oracle WebLogic Server (standalone) or Java files, you must set the JAVA_HOME environment variable. PSA may not be able to detect the location of the required Java files without setting this variable.

4.4 Running the Patch Set Assistant

The following sections describe how to run the Patch Set Assistant when you are installing the Oracle Fusion Middleware 11g Release 1 (11.1.1.7.0) patch set:

- Section 4.4.1, "Using the Patch Set Assistant Graphical Interface"
- Section 4.4.2, "Using the Patch Set Installer from the Command Line"
- Section 4.4.3, "Verifying the Schema Version Number After Update"
- Section 4.4.4, "Checking for Invalid Database Objects"

4.4.1 Using the Patch Set Assistant Graphical Interface

The Patch Set Assistant is installed into the `bin` directory in the Oracle Common home by the Product or Patch Set Installer.

You can use the Patch Set Assistant to patch any component schema in the Middleware home from where the Patch Set Assistant started.

To start Patch Set Assistant, go to the `bin` directory in the Oracle Common home, then run the following command:

On UNIX operating systems:

```bash
cd Oracle_Home/bin
./psa
```

On Windows operating systems:

```bash
CD Oracle_Home\bin
psa.bat
```

Follow the instructions in Table 4–2 to use the Patch Set Assistant to update your schemas.
If you need additional help with any of the screens, refer to Appendix B, "Patch Set Assistant Screens" or click Help on the screen to access the online help.

### Table 4–2  Patch Set Assistant Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>This page introduces you to the Patch Set Assistant.</td>
</tr>
</tbody>
</table>
| Select Component| Select the single top-level component you want to upgrade. You may only upgrade one component at a time.  
NOTE: If you are upgrading from Release 11.1.1.2.0 or 11.1.1.3.0, the prefix_ACTIVITIES schema will not be available in your environment as this schema was not introduced until Release 11.1.1.4.0. Make sure you de-select this schema from the WebCenter Portal component; otherwise the Patch Set Assistant will ask for credentials for this schema. |
| Prerequisites    | Verify that you have satisfied the database prerequisites.                  |
| Schema          | Specify your database credentials to connect to your database, then select the schema you want to update.  
This screen appears once for each schema that must be updated as a result of the component you selected on the Select Component screen. |
| Examine         | This page displays the status of the Patch Set Assistant as it examines each component schema. Verify that your schemas have a "succeeded" or "already upgraded" indicator in the Status column. |
| Upgrade Summary  | Verify that the schemas listed to be upgraded are the ones you expect.      |
| Upgrade Progress | This screen shows the progress of the schema update.                        |
| Upgrade Success  | This screen shows the final status of the update and the location of the log file. |

### 4.4.2 Using the Patch Set Installer from the Command Line

Use the following syntax to perform upgrades using the command line interface (CLI):

```
psa -response <response_file> [-logLevel <log_level>] [-logDir <log_directory>]
```

See Table 4–3 for descriptions of these parameters.

### Table 4–3  Patch Set Assistant Command Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional Parameter?</th>
<th>Description</th>
</tr>
</thead>
</table>
| -response    | Required.                       | The full path and name of the file containing inputs required to perform an upgrade.  
To generate the response file used with the -response parameter, you should run the Patch Set Assistant GUI (Section 4.4.1, "Using the Patch Set Assistant Graphical Interface"). On the Upgrade Summary screen, click Save Response File to save your information to a response file.  
NOTE: When Patch Set Assistant is run in -response file mode it will not upgrade any schemas that return "already upgraded" during the Examine phase. These schemas will skip the upgrade phase entirely. This applies only when Patch Set Assistant is run in -response file mode. |
4.4.3 Verifying the Schema Version Number After Update

You can use the SQL command below to verify that the schema version in `schema_version_registry` has been properly updated:

```sql
SELECT OWNER, VERSION, STATUS, UPGRADED FROM SCHEMA_VERSION_REGISTRY;
```

Check that the number in the "VERSION" column matches the latest version number for that schema. See Table 4–1 to verify that the updated version number is correct for your schema.

If the status appears as "INVALID" then the schema update failed. You should examine the logs files to determine the reason for the failure. For more information, see Section 4.5, "Patch Set Assistant Log Files".

4.4.4 Checking for Invalid Database Objects

If you are using an Oracle database, you should recompile database objects after running the Patch Set Assistant by connecting to the database as SYS and running the following from SQL*Plus:

```sql
SQL> /rdbms/admin/utlrp.sql
```

This will compile the database objects that were updated by Patch Set Assistant.

Then issue the following query to ensure there are no longer any invalid database objects:

```sql
SELECT owner, object_name FROM all_objects WHERE status='INVALID';
```

None of the database objects for the updated schema should be invalid at this point. If there are any, run the `utlrp.sql` command again and check again. If the problem persists, you should file a service request.

4.5 Patch Set Assistant Log Files

The Patch Set Assistant writes log files to the following locations:

On UNIX operating systems:
Patch Set Assistant Log Files

On Windows operating systems:

\texttt{MW_HOME/oracle_common/upgrade/logs/psa\_timestamp.log}

Some components will create a second log file called \texttt{psa\_timestamp.out}, also in the same location.

The \textit{timestamp} will reflect the actual date and time that Patch Set Assistant was run.

Should any failures occur when running Patch Set Assistant, these log files will be needed to help diagnose and correct the problem; do not delete them. You can alter the contents of your log files by specifying a different \texttt{-logLevel} from the command line.

Some of the operations performed by the Patch Set Assistant may take longer to complete than others. If you want to see the progress of these long operations, you can see this information in the log file, or you can use the following query:

\begin{verbatim}
SELECT VERSION, STATUS, UPGRADED FROM SCHEMA_VERSION_REGISTRY WHERE OWNER='\textit{schema\_name}';
\end{verbatim}

In the query results, the \texttt{STATUS} field will be either "UPGRADING" or "UPGRADED" during the schema patching operation, and will become "VALID" when the operating is finished.
This section contains information about manual tasks performed after the Release 11.1.1.7.0 patch installation is complete. Some of the tasks may not apply to your environment as you may not be using the products in question.

**NOTE:** The post-patching tasks described in this chapter are not required for all environments or upgrade paths. Consult the Release Starting Point table for your existing environment to determine which tasks apply.

The following topics are covered:

- Section 5.1, "Post-Patching Tasks If Your Starting Point is Release 11.1.1.2.0"
- Section 5.2, "Post-Patching Tasks If Your Starting Point is Release 11.1.1.3.0"
- Section 5.3, "Post-Patching Tasks If Your Starting Point is Release 11.1.1.4.0"
- Section 5.4, "Post-Patching Tasks If Your Starting Point is Release 11.1.1.5.0"
- Section 5.5, "Post-Patching Tasks If Your Starting Point is Release 11.1.1.6.0"
- Section 5.6, "Post-Patching Tasks for System Components"
- Section 5.7, "Post-Patching Tasks for Oracle Identity Management Components"
- Section 5.8, "Post-Patching Tasks for Your WebLogic Server Domain"
- Section 5.9, "Post-Patching Tasks for Oracle SOA Suite"
- Section 5.10, "Post-Patching Tasks for Oracle WebCenter Content"
- Section 5.11, "Post-Patching Tasks for Oracle Service Bus"
- Section 5.12, "Post-Patching Tasks for Oracle Business Intelligence"
- Section 5.13, "Post-Patching Tasks for Oracle Data Integrator"

### 5.1 Post-Patching Tasks If Your Starting Point is Release 11.1.1.2.0

Table 5–1 summarizes the post-patching tasks that may be required depending on your existing Release 11.1.1.2.0 environment. Locate the applicable product area in the table, then refer to the documentation link for instructions.
## Table 5-1  Post-Patching Tasks If Your Starting Point is Release 11.1.1.2.0

<table>
<thead>
<tr>
<th>Product Area</th>

5.5 Post-Patching Tasks If Your Starting Point is Release 11.1.1.6.0

Table 5–5 summarizes the post-patching tasks that may be required depending on your existing Release 11.1.1.6.0 environment. Locate the applicable product area in the table, then refer to the documentation link for instructions.

<table>

</tbody>
</table>
### Post-Patching Tasks for System Components

A system component is a manageable process that is not deployed as a Java application. Instead, a system component is managed by Oracle Process Manager and Notification (OPMN). For more information, see "Understanding Key Oracle Fusion Middleware Concepts" in Oracle Fusion Middleware Administrator’s Guide.

Post-patching procedures for the Oracle Identity Management components are described in Section 5.7, "Post-Patching Tasks for Oracle Identity Management Components”.

Oracle Fusion Middleware system components include the following:

---

Post-Patching Tasks for System Components

- Products included with Oracle Web Tier, including Oracle HTTP Server and Oracle Web Cache.
- Products included with Oracle Identity Management, including Oracle Virtual Directory and Oracle Internet Directory.
- Products included with Oracle Portal, Forms, Reports and Discoverer.
- Products included with Oracle Business Intelligence, including BI Server, BI Scheduler and BI Presentation Services.
- Products included with Oracle Data Integrator.

If you have patched one or more of these components, the tasks in this section should be performed. For more information about system components, refer to "Understanding Key Oracle Fusion Middleware Concepts" in Oracle Fusion Middleware Administrator's Guide.

The following tasks should be performed:

- Section 5.6.1, "Upgrading System Components"
- Section 5.6.2, "Updating Oracle Configuration Manager"
- Section 5.6.3, "Resolving JDBC Errors in Oracle Reports and Oracle Portal"
- Section 5.8.6, "Updating the Plug-In Configuration When Using a Proxy with WebLogic Server"
- Section 5.6.5, "Generating the BASE64 Encoded Encryption Key for OPSS"
- Section 5.6.6, "Enabling Dynamic Audit Metadata Model for OPSS Running in JavaSE Mode"
- Section 5.6.7, "Configuring Diagnostic Framework Dump Sampling"
- Section 5.6.8, "Adding Batik Library Jar Files to the JRF Template for IBM WebSphere"

5.6.1 Upgrading System Components

This step is required for any system component that is associated with a WebLogic domain. In some cases (for example, Oracle Web Tier and Oracle Internet Directory), you can choose to create system components that are not associated with any domain; in these cases, you do not have to perform this procedure.

After you have patched your system component software that is associated with a WebLogic domain, you must run the `ORACLE_HOME/opmn/bin/upgradenonj2eapp.sh` (on UNIX operating systems) or `ORACLE_HOME\opmn\bin\upgradenonj2eapp.bat` (on Windows operating systems) script to update your system components.

Before running this script, make sure:

1. The Administration Server is up and running.
2. The `ORACLE_HOME` environment variable has been set to your product's Oracle home directory.
3. The OPMN instance in the `bin` directory in the Instance home is up and running.

On UNIX operating systems:

```
cd INSTANCE_HOME/bin
./opmnctl start
```

On Windows operating systems:
Post-Patching Tasks for System Components

```
cd INSTANCE_HOME\bin
opmnctl start
```

**NOTE:** Be sure to select the procedure that applies to your environment.

To run the script on UNIX operating systems:

```
cd ORACLE_HOME/opmn/bin
./upgradenonj2eeapp.sh
  -oracleInstance Instance_Home_Location
  -adminHost WebLogic_Server_Host_Name
  -adminPort administration_server_port_number
  -adminUsername administration_server_user
  -adminProtocol t3
```

**On Windows operating systems:**

```
cd ORACLE_HOME\opmn\bin
upgradenonj2eeapp.bat
  -oracleInstance Instance_Home_Location
  -adminHost WebLogic_Server_Host_Name
  -adminPort administration_server_port_number
  -adminUsername administration_server_user
  -adminProtocol t3
```

If the Administration Server has been configured for SSL Only:

```
cd ORACLE_HOME\opmn\bin
upgradenonj2eeapp.bat
  -oracleInstance Instance_Home_Location
  -adminHost WebLogic_Server_Host_Name
  -adminPort administration_server_port_number
  -adminUsername administration_server_user
  -adminProtocol t3
```

If the Administration Server allows access over HTTP:

```
cd ORACLE_HOME\opmn\bin
upgradenonj2eeapp.bat
  -oracleInstance Instance_Home_Location
  -adminHost WebLogic_Server_Host_Name
  -adminPort administration_server_port_number
  -adminUsername administration_server_user
```

**NOTE:** If the Administration Server allows access over HTTP, then you should NOT specify the `adminProtocol`. It will default to `t3` which is the non-secure protocol.

**Troubleshooting**

If you encounter the `Command failed: NonJ2EEManagement Application deployment failed` error while running the `upgradenonj2eeapp` script, perform the following steps to diagnose and correct the problem:

1. Review the provisioning.log to determine the root cause of the failure. The log file is located in the following directory:
   ```
   MW_HOME/instances/myinstance/diagnostics/logs/OPMN/opmn
   ```
2. If the root cause of the failure is a locking issue, continue with the remaining steps.
   If the error was not caused by a locking failure, you may need to simply redeploy and register your instance as described in Step 5.
3. Login to the Oracle WebLogic Server Administration console:
Navigate to the Change Center and click **Release Configuration**.
The lock on the configuration will be removed, but you may also need to deploy re-register your instance.

4. Restart the `upgradenonj2eeapp` script as described above and review the `provisioning.log`.
   If you see: "Failed to unregister instance instance1. It does not exist on the adminserver." continue on to the next step.

5. Redeploy and register the instance as shown in the following examples. Be sure to use the directory path and instance name for your environment.

   ```
   ./opmnctl redeploy -oracleInstance /Middleware/instances/instance1 -adminHost localhost -adminPort 7001 -adminUsername weblogic
   
   Command requires login to weblogic admin server (localhost):
   Username: weblogic
   Password:
   
   ./opmnctl registerinstance
   Command requires login to weblogic admin server (localhost):
   Username: weblogic
   Password:
   ```

6. Restart the `upgradenonj2eeapp` script as described above. You should see "Successfully upgraded NonJ2EEManagement.ear and the registration."

### 5.6.2 Updating Oracle Configuration Manager

If you are patching Oracle Identity Manager or Oracle Portal, Forms, Reports and Discoverer, you must run some `emCCR` commands after applying the latest patch set in order for the correct version to appear. `emCCR` is used by Oracle Configuration Manager, which is used to collect client configuration information and upload it to the Oracle repository:

1. Go to the `ORACLE_HOME\ccr\bin` directory.

2. Set the `ORACLE_CONFIG_HOME` environment variable to the Instance home that contains Oracle Configuration Manager.
   For example, on a Windows operating system:
   ```
   set ORACLE_CONFIG_HOME=C:\Oracle\Middleware\Instances\asinst_ocmoc
   
   Below is an example on a UNIX operating system:
   ```
   ```
   setenv ORACLE_CONFIG_HOME /home/Oracle/Middleware/asinst_ocmoc
   ```

3. Run the following `emCCR` commands:
   ```
   emccr collect
   emccr status
   ```
5.6.3 Resolving JDBC Errors in Oracle Reports and Oracle Portal

If you have Oracle Reports or Oracle Portal configured in a domain and you apply the latest patch set, you will see the following error if you try to change the invalidation password:

Error. Check logs for details. [OK].

The following errors are seen in the portal_wls.log and wls_portal.out log files:

---

You must perform the following in order to avoid these JDBC error messages:

1. Go to the bin directory inside your DOMAIN_HOME.
2. Edit the setDomainEnv.sh (on UNIX operating systems) or setDomainEnv.cmd (on Windows operating systems) file and search for EXT_PRE_CLASSPATH.
3. Change the definition to match the following:

   On UNIX operating systems:

```bash
EXT_PRE_CLASSPATH=$ORACLE_HOME/jdbc/lib/ojdbc6.jar
export EXT_PRE_CLASSPATH
```

   For example:

```bash
if [ "${EXT_PRE_CLASSPATH}" != "" ]; then
  if [ "${PRE_CLASSPATH}" != "" ]; then
    EXT_PRE_CLASSPATH=$ORACLE_HOME/jdbc/lib/ojdbc6.jar // add this line
    export EXT_PRE_CLASSPATH
  fi
  PRE_CLASSPATH="${EXT_PRE_CLASSPATH}$(CLASSPATHSEP)${PRE_CLASSPATH}" // add this line
else
  export PRE_CLASSPATH
```

---
EXT_PRE_CLASSPATH=$ORACLE_HOME/jdbc/lib/ojdbc6.jar  // add this line
export EXT_PRE_CLASSPATH
PRE_CLASSPATH="$(EXT_PRE_CLASSPATH)"
export PRE_CLASSPATH
fi
fi

On Windows operating systems:
if NOT "%EXT_PRE_CLASSPATH%"=="" {
    if NOT "%PRE_CLASSPATH%"=="" {
        set EXT_PRE_CLASSPATH=%ORACLE_HOME%\jdbc\lib\ojdbc6.jar  // add this line
        set PRE_CLASSPATH=%EXT_PRE_CLASSPATH%;%PRE_CLASSPATH%
    } else {
        set EXT_PRE_CLASSPATH=%ORACLE_HOME%\jdbc\lib\ojdbc6.jar  // add this line
        set PRE_CLASSPATH=%EXT_PRE_CLASSPATH%
    }
}

4. Restart the Portal Managed Server.

5.6.4 Adding Datafiles to the OLTS_CT_STORE and OLTS_ATTRSTORE Tablespaces for Oracle Internet Directory

If your Oracle Internet Directory schema was created during installation of a version prior to 11g Release 1 (11.1.1.6.0), you must add datafiles to the OLTS_CT_STORE and OLTS_ATTRSTORE tablespaces if you intend to add more than a million entries to Oracle Internet Directory. Perform this step prior to the bulkload or ldapadd operation.

For details, see "Creating Datafiles and Adding Datafiles to a Tablespace" in Oracle Database Administrator’s Guide.

5.6.5 Generating the BASE64 Encoded Encryption Key for OPSS

The upgradeOpss() command is used to add a new BASE64 encoded key for each encryption key already in the bootstrap wallet. This key is required when OBI C based code accesses DB credential store. This optional command can be used when starting from version 11.1.1.4.0, 11.1.1.5.0, or 11.1.1.6.0. If this step is not followed, OBI will be unable to access DB-based credential stores in 11.1.1.7.0.

For more information on running OPSS in JSE mode, see "Configuring DB-Based OPSS Security Stores" in Oracle Fusion Middleware Security Guide.

5.6.6 Enabling Dynamic Audit Metadata Model for OPSS Running in JavaSE Mode

To enable the dynamic audit metadata model in audit service for OPSS running in JavaSE mode, the upgradeOpss() command is used to modify jps-config-jse.xml with the additional audit service properties. This optional command can be used when starting from version 11.1.1.4.0, 11.1.1.5.0, or 11.1.1.6.0. If this step is not followed, 11.1.1.7.0 components registered to audit service with the new metadata model will not have audit service in JSE mode.

For more information on running OPSS in JSE mode, see "Configuring Policy and Credential Stores in Java SE Applications" in Oracle Fusion Middleware Security Guide.
5.6.7 Configuring Diagnostic Framework Dump Sampling

In Release 11.1.1.7.0 a new dump sampling feature was added to Diagnostic Framework. To enable this optional feature, the following WLST command should be run while connected to the AdminServer:

```
wlst.sh <ORACLE_HOME>/common/scripts/wlst/upgradeDFWConfig.py --adminuser <admin user name> --password <admin password> --adminurl <admin url>
```

5.6.8 Adding Batik Library Jar Files to the JRF Template for IBM WebSphere

This optional post-patching step enables you to provide printer-friendly renderings of certain DVT components such as treemap and sunburst by adding the Batik SVG libraries to the ADF View JRF classpath and the Apache JARs to the application classpath.

For more information, see “updateADFLibrary” in the Oracle Fusion Middleware Administrator’s Guide for Oracle Application Development Framework.

5.7 Post-Patching Tasks for Oracle Identity Management Components

This section describes post-patching tasks for products included in Oracle Identity Management: Oracle Internet Directory, Oracle Directory Integration Platform, Oracle Virtual Directory, Oracle Directory Services Manager and Oracle Identity Federation.

- Section 5.7.1, ”Enabling the Evaluate Policies Scheduled Job Run”
- Section 5.7.2, ”Updating Oracle Identity Management in an Existing ORACLE_IDM_HOME Directory”
- Section 5.7.3, ”Updating Configuration Properties in Oracle Identity Federation”
- Section 5.7.4, ”Configuring Oracle Identity Management to Listen on Dual Network Addresses”

5.7.1 Enabling the Evaluate Policies Scheduled Job Run

If you are upgrading Oracle Identity Manager to 11.1.1.7.0 from a previous release, and you use the Evaluate Policies scheduled job, you must enable this job to run after you have patched your existing environment. In Oracle Identity Manager 11.1.1.7.0, the Evaluate Policies scheduled job defaults to disabled, therefore your jobs will not run successfully. In addition, consider setting the frequency to 10 minutes.

To enable the Evaluate Policies Scheduled Job:

1. Log in to Oracle Identity Administration with the appropriate credentials.
2. Click the System Management tab and then click Scheduler. Alternatively, you can click the “Search Scheduled Jobs” link on Welcome Screen.
3. On the left pane, in the search results table, right click on Evaluate Policies and select Enable. You should see a message indicating that the job has been successfully enabled.
4. Click OK to close the dialog box.

To change the frequency of a scheduled job:

1. Log in to Oracle Identity Administration with the appropriate credentials.
2. Click the System Management tab and then click Scheduler. Alternatively, you can click the “Search Scheduled Jobs” link on Welcome Screen.
3. Click **Evaluate Policies** in the Job Name column of the search results table.

4. Navigate to the **Job Details** page and enter 10 in the **-mins** field. This will trigger the job to run every 10 minutes.

---

**Note:** For all the schedule types, if you want the job to be saved and then immediately run, then click **Save and Run Now.**

A message confirming that the job has been successfully created and triggered is displayed.

---

### 5.7.2 Updating Oracle Identity Management in an Existing ORACLE_IDM_HOME Directory

If you are updating Oracle Identity Management in an already patched ORACLE_IDM_HOME, you will be prompted twice to run `oidRoot.sh`. Answer 'Yes' twice and the `oidRoot.sh` will execute as normal. If the root privileges need to be changed then they will be changed.

### 5.7.3 Updating Configuration Properties in Oracle Identity Federation

Oracle Identity Federation has new features and bug fixes that require new properties to be defined in the Oracle Identity Federation configuration file. If you want to take advantage of the functionality provided by these new properties, you must run one of the following WLST scripts:

- Run the `oif-upgrade-11.1.1.2.0-11.1.1.7.0.py` script if:
  - You are updating your software from 11.1.1.2.0 or 11.1.1.3.0 to 11.1.1.7.0
  - You did not previously run the `oif-upgrade-11.1.1.2.0-11.1.1.4.0.py` script on an existing 11.1.1.4.0 or 11.1.1.5.0 installation.

- Run the `oif-upgrade-11.1.1.4.0-11.1.1.7.0.py` script if you are updating your software from 11.1.1.4.0 or 11.1.1.5.0 to 11.1.1.7.0.

- Run the `oif-upgrade-11.1.1.6.0-11.1.1.7.0.py` script if you are updating your software from 11.1.1.6.0 to 11.1.1.7.0.

The instructions to run the scripts are shown below:

1. On Linux operating systems, enter the `bash` command:

   ```bash
   bash
   ```

2. Set the `DOMAIN_HOME` variable to your Oracle Identity Federation Domain home location.

3. Set the `ORACLE_HOME` variable to your Oracle Identity Federation Oracle home location.

4. Run the `setOIFEnv.sh` script.

   On UNIX operating systems:

   ```bash
   export DOMAIN_HOME=full_path_to_domain_home_directory
   source ORACLE_HOME/fed/scripts/setOIFEnv.sh
   ```

   On Microsoft Windows operating systems:

   ```cmd
   cd ORACLE_HOME/fed/scripts
   ```
5. Run the oif-upgrade-11.1.1.2.0-11.1.1.7.0.py, oif-upgrade-11.1.1.4.0-11.1.1.7.0.py, or oif-upgrade-11.1.1.6.0-11.1.1.7.0.py script.

For example, on UNIX operating systems:

cd ORACLE_HOME/fed/scripts
java weblogic.WLST oif-upgrade-11.1.1.2.0-11.1.1.7.0.py

On Microsoft Windows operating systems:

cd ORACLE_HOME\fed\scripts
java weblogic.WLST oif-upgrade-11.1.1.4.0-11.1.1.7.0.py

You will be prompted for the WebLogic Server Administrator credentials (user name and password) and the location of the Managed Server where Oracle Identity Federation is running. You only need to do this for one Managed Server even if you have multiple Managed Servers in your domain.

5.7.4 Configuring Oracle Identity Management to Listen on Dual Network Addresses

If you are patching Oracle Identity Management to 11g Release 1 (11.1.1.7.0) from a version prior to 11.1.1.6.0, and you are changing your configuration from a machine listening on one network address to a machine listening on dual network addresses, you must do the following after applying the patch:

1. Stop all servers and instances in your domain.
2. Reset the value of IPv6 to false in the DOMAIN_HOME/bin/setDomainEnv.sh (on UNIX operating systems) or DOMAIN_HOME\bin\setDomainEnv.bat script (on Windows operating systems).
3. Restart the servers and instances in your domain.

5.8 Post-Patching Tasks for Your WebLogic Server Domain

Your existing WebLogic Server Domain must be updated by performing the following tasks:

- Section 5.8.1, "Updating the JDK"
- Section 5.8.2, "Updating Fusion Middleware Shared Libraries"
- Section 5.8.3, "Updating Configurations and Stores"
- Section 5.8.4, "Enabling WS-AtomicTransaction"
- Section 5.8.5, "Optimizing Performance for WebLogic Server Domains on 64-Bit Platforms"
- Section 5.8.6, "Updating the Plug-In Configuration When Using a Proxy with WebLogic Server"

5.8.1 Updating the JDK

You will need to have the latest supported JDK version installed in your patched environment. Consult the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document at http://www.oracle.com/technetwork/middleware/downloads/fmw-11gr1_certmatrix.xls for the latest certified JDK versions for your patch set.
You can access the latest JDK from the Oracle Software Downloads page on the Oracle Technology Network at http://www.oracle.com/technetwork/indexes/downloads/index.html. Follow the installation instructions provided with each download.

### 5.8.2 Updating Fusion Middleware Shared Libraries

For each WebLogic Server domain, you must run the `upgradeJRF()` WLST command to update the shared libraries in your domain:

---

**Note:** If you are patching Oracle WebCenter Portal, you do not need to run this command if you follow the directions in Chapter 6, "Patching Oracle WebCenter Portal".

---

2. Start WLST.

   On UNIX operating systems:
   ```
   cd oracle_common/common/bin
   ./wlst.sh
   ```

   On Windows operating systems:
   ```
   cd oracle_common\common\bin
   wlst.cmd
   ```

3. Run the `upgradeJRF()` command on the node or system where the Administration Server is located for each domain you want to update. Your domain location is passed as a parameter:

   ```
   wlst> upgradeJRF('/DOMAIN_HOME')
   ```

---

**Note:** After you run this command, any custom changes that you have made to your `setDomainEnv` script will be lost. Oracle recommends that you keep your custom modifications in a separate script that is called by `setDomainEnv` in order to minimize the disruption that is caused when other domain templates are applied and the `setDomainEnv` script is regenerated.

If you have set IPv6 to `false` in your `setDomainEnv` script, this change will be overwritten when you run the `upgradeJRF()` command. Make sure you reset IPv6 to `false` in the `setDomainEnv` script after you run the `upgradeJRF()` command.

---

### 5.8.3 Updating Configurations and Stores

For each WebLogic Server domain, you must run the `upgradeOpss()` WLST command to update your configurations and stores from previous releases to Release 11.1.1.7.0 configurations and stores using a `system-jazn-data` file.
5.8.4 Enabling WS-AtomicTransaction

WS-AtomicTransaction is a web services feature which was introduced in Oracle Fusion Middleware Release 11.1.1.3.0 release. If you are upgrading a domain which is at the 11.1.1.2.0 release, then you need to perform the following steps to ensure that WS-AtomicTransactions are enabled:

1. Edit the following file.
   
   On UNIX operating systems:
   
   `DOMAIN_HOME/config/fmwconfig/policy-accessor-config.xml`
   
   On Windows operating systems:
   
   `DOMAIN_HOME\config\fmwconfig\policy-accessor-config.xml`

2. In the Interceptors section, add the following XML code:
   
   ```xml
   <interceptor name="ClientWSATInterceptor"
   class="oracle.j2ee.ws.client.transaction.ClientWSATInterceptor"
   category="transaction" />
   <interceptor name="ServerWSATInterceptor"
   class="oracle.j2ee.ws.server.transaction.ServerWSATInterceptor"
   category="transaction" />
   ```

3. In the Interceptor Chains section:
   
   ```xml
   <interceptor-ref name="ServerWSATInterceptor"/>
   ```
   should be added in the existing entry of SOAPServiceBindingInterceptorChain between the Context and RM interceptors. For example:
   
   ```xml
   <interceptor-chain name="SOAPServiceBindingInterceptorChain"
   @ class="oracle.integration.platform.common.SOAPBindingInterceptorChain">
   <interceptor-ref name="MTOMInterceptor"/>
   <interceptor-ref name="BindingSecurityInterceptor"/>
   <interceptor-ref name="ServerAddressingInterceptor"/>
   <interceptor-ref name="MEXInterceptor"/>
   <interceptor-ref name="WSRMServerInterceptor"/>
   <interceptor-ref name="ServerWSATInterceptor"/>
   <interceptor-ref name="ContextInterceptor"/>
   <interceptor-ref name="BindingManagementInterceptor"/>
   </interceptor-chain>
   ```

**Note:** When running `upgradeOpss` for 11.1.1.7.0, you may receive a “File Not Found” error message for the audit-store.xml file. This error message can be ignored. The audit-store.xml file is provided after running the `upgradeOpss` script.

For more information on updating configurations and stores, see “Configuring File-Based Policy and Credential Stores” in the Oracle Fusion Middleware Security Guide.

**Note:** If you are patching Oracle WebCenter Portal, you do not need to run this script if you follow the directions in Chapter 6, “Patching Oracle WebCenter Portal.”
If you are upgrading any existing 11g Oracle WebLogic Domain to Release 11.1.1.7.0, it is recommended to make the changes in the setDomainEnv file as described below to optimize performance:

```bash
if [ "${JAVA_USE_64BIT}" = "true" ] ; then
  if [ "${JAVA_VENDOR}" = "Oracle" ] ; then
    EXTRA_JAVA_PROPERTIES="-XXcompressedRefs:enable=TRUE
  fi
fi
if [ "${JAVA_VENDOR}" = "Oracle" ] ; then
  EXTRA_JAVA_PROPERTIES="-XX:+UseLargePagesForHeap
fi
EXTRA_JAVA_PROPERTIES="-Djps.auth.debug=false ${EXTRA_JAVA_PROPERTIES}"
export EXTRA_JAVA_PROPERTIES
```

The applicable `EXTRA_JAVA_PROPERTIES` are described in

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-XXcompressedRefs</code></td>
<td>This option governs the use of compressed references, limiting all pointers stored on the heap to 32 bits. Compressed references use fewer Java heap resources and transport less data on the memory bus, thereby improving the performance. This option also frees space on the heap. <code>-XXcompressedRefs:enable=TRUE</code> is applicable for the JRockit JVM running on a 64-bit operating system.</td>
</tr>
<tr>
<td><code>-XX:+UseLargePagesForHeap</code></td>
<td>This option enables the use of large pages (if they are available) for the Java heap and code in the JVM. Large pages allow your application to more effectively use the translation look-aside buffer (TLB) in the processor. This option is applicable for the JRockit JVM.</td>
</tr>
</tbody>
</table>
5.8.6 Updating the Plug-In Configuration When Using a Proxy with WebLogic Server

Due to security changes in WebLogic Server, if you are running a proxy module in front of your WebLogic Server, such as mod_wl_ohs for example, you will need to perform the steps mentioned in the Oracle Fusion Middleware Using Web Server 1.1 Plug-Ins with Oracle WebLogic Server.

In addition, if a load balancer or other software deployed in front of the web server and plug-in is the SSL termination point, and that product sets the WL-Proxy-SSL request header to true or false based on whether or not the client connected to it over SSL, you may need to configure the WLProxySSL and WLProxySSLPassThrough parameters as described in "Parameters for Web Server Plug-Ins" in Oracle Fusion Middleware Using Web Server 1.1 Plug-Ins with Oracle WebLogic Server.

5.9 Post-Patching Tasks for Oracle SOA Suite

This section contains the following topics for completing your Oracle SOA Suite patch:

- Section 5.9.1, "Loading the Oracle SOA Suite Purge Scripts for Database Management"
- Section 5.9.2, "Removing the tmp Folder for SOA Composer, BPM Workspace and B2B"
- Section 5.9.5, "Updating the soa-infra Application in Warning State"
- Section 5.9.6, "Running bpm-ps6-upgrade.py to Update the Policy Store"
- Section 5.9.7, "Running soa-upgrade.py to Update the Policy Store and Deploy a Shared Library"
- Section 5.9.8, "Updating the Oracle Data Integrator Clients if BAM-ODI Integration is Enabled"
- Section 5.9.9, "Saving and Restoring XEngine Customizations for Oracle B2B"
- Section 5.9.10, "Configuring Oracle JMS Adapter with IBM WebSphere MQ JMS"
- Section 5.9.11, "Extending the SOA Domain with UMS Adapter Features"
- Section 5.9.12, "Extending the SOA Domain with Business Process Management Features"

5.9.1 Loading the Oracle SOA Suite Purge Scripts for Database Management

When the amount of data in Oracle Fusion Middleware databases grows very large, maintaining the databases can become difficult and can affect performance. Oracle
Fusion Middleware 11g Release 1 (11.1.1.4.0) and later provide a set of tools that can help you purge the Oracle Fusion Middleware of unneeded data.

When a new Oracle Fusion Middleware user installs the latest Oracle SOA Suite schemas using the Repository Creation Utility (RCU), stored procedures required by the Oracle SOA Suite purge scripts are automatically installed in the database.

However, if you are running Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or Release 1 (11.1.1.3.0), these stored procedures are not installed automatically. As a result, after you run the Patch Set Assistant to update your Oracle SOA Suite schemas to the latest version, you must manually install the necessary database objects using the following procedure. This procedure is necessary if you want to use the purging capabilities provided by Oracle SOA Suite 11g Release 1 (11.1.1.4.0) or later:

1. Locate, download, and unpack the latest Oracle Fusion Middleware 11g Repository Creation Utility (RCU) software archive.
   
   For more information, see "Obtaining RCU" in the Oracle Fusion Middleware Repository Creation Utility User’s Guide.

   The directory where you unpack the RCU software is referred to as the RCU_HOME directory.

2. Using SQLPlus, connect to the database where the Oracle SOA Suite schemas are installed using the database user that owns the SOAINFRA schema.

3. Run the following script to load the database objects required for purging Oracle SOA Suite data:

   RCU_HOME/rcu/integration/soainfra/sql/soa_purge/soa_purge_scripts.sql

4. Run the following script to load the database objects required for verifying the Oracle SOA Suite data in the database:

   RCU_HOME/rcu/integration/soainfra/sql/verify/soa_verify_scripts.sql

After you load the database objects using the provided SQL scripts, refer to "Managing Database Growth" in the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite for more information.

5.9.2 Removing the tmp Folder for SOA Composer, BPM Workspace and B2B

This manual step must be performed if:

- You are upgrading from any previous SOA release, the Admin tabs within B2B may not appear after you patch to the latest version.
- You are upgrading Oracle SOA Composer from Release 11.1.1.2.0 or 11.1.1.3.0; the SOA Composer login screen may appear blank after you patch to the latest version.
- You are upgrading Oracle BPM Workspace from Release 11.1.1.3.0; the Oracle BPM Workspace application will not start after you patch to the latest version.

To resolve these issues, do the following:

1. Stop all servers (Administration Server and all Managed Servers).

2. Remove the tmp directory in DOMAIN_HOME/servers/AdminServer (on UNIX operating systems) or DOMAIN_HOME\servers\AdminServer (on Windows operating systems).
3. Remove the tmp directory in `DOMAIN_HOME/servers/soa_server1` (on UNIX operating systems) or `DOMAIN_HOME\servers\soa_server1` (on Windows operating systems).

   If the name of your SOA Managed Server is not `soa_server1`, replace `soa_server1` with the name of your SOA Managed Server.

4. Start all the servers.

5.9.3 Updating the “BPEL Message Recovery Required” Warning Message Duration

The `bpelRecoveryAlertDurationInDays` key limits the BPEL Message Recovery Required inline warning message to be displayed only when recoverable BPEL messages have been created in the last seven days. The default setting of seven days can be changed. You cannot set this property to negative values such as -1 or to 0. In such cases, the key uses its default value (seven days).

To disable the alert message, use the `bpelRecoveryStatus` key. The duration value is not applicable to the flow trace alert message.

5.9.4 Updating MAXRECOVERATTEMPT Attribute to 2

When upgrading from Oracle SOA Release 11.1.1.4.0, 5.0 or 6.0 to the latest version, you must manually reset the `MAXRECOVERATTEMPT` attribute (default 0) to a non-zero value to correctly display activity recoverable messages.

Use Oracle Enterprise Manager Fusion Middleware Control to reset this System MBean Browser property:

1. Access this page through one of the following options:

   a. From the SOA Infrastructure Menu...

   b. From the SOA Folder in the Navigator...

   1. Select SOA Administration > BPEL Properties.

   2. Right-click soa-infra.

   3. Select SOA Administration > BPEL Properties.

The BPEL Service Engine Properties page is displayed.

2. Click More BPEL Configuration Properties.

3. In the Attributes tab, click MAXRECOVERATTEMPT.

4. In the Value field, enter 2.

5. Click Apply.

5.9.5 Updating the soa-infra Application in Warning State

If you have a Release 11.1.1.3.0 Oracle SOA Suite domain with only Oracle SOA configured (no Oracle BAM and no Oracle BPM), or only Oracle SOA and Oracle BAM configured (no Oracle BPM), the soa-infra application (the WebLogic server EAR file which contains the underlying logic for the SOA Suite infrastructure) will have a deployment status of Warning which will be visible within the WebLogic Server Administration Console. This state will not cause any loss or degradation in service.
If you want to fix this issue, you must create JMS connection factories and topics as follows:

1. From the WebLogic Server Administration Console, navigate to Domain Structure>JMS Modules>SOAJMSModule and add the following objects:
   - jms/bpm/PeopleQueryConnectionFactory
   - jms/bpm/CubeCommandXAConnectionFactory
   - jms/bpm/PeopleQueryConnectionFactory
   - jms/bpm/MeasurementTopic
   - jms/bpm/PeopleQueryTopic

2. Perform any other post-patching procedures required for your starting point and applicable components.
   
   NOTE: If you want to use the UMS adapter features, then follow the procedures as described in Section 5.9.11, "Extending the SOA Domain with UMS Adapter Features".

3. Restart the WebLogic Server and Administration Console.

5.9.6 Running bpm-ps6-upgrade.py to Update the Policy Store

To update your policy store to add the new Code Source Permissions, run the bpm-ps6-upgrade.py script from the bin directory inside your SOA Oracle home. You do not need to run this script if you are starting from version 11.1.1.5.0 or 11.1.1.6.0.

Note: This script must be run as a WLST online script. Make sure the Administration Server and Managed Servers are up and running before running this script.

On a UNIX operating systems:

```bash
cd $SOA_ORACLE_HOME/bin
../common/bin/wlst.sh bpm-ps6-upgrade.py
```

On a Windows operating system:

```bash
cd $SOA_ORACLE_HOME\bin
..\common\bin\wlst.cmd bpm-ps6-upgrade.py
```

The command will prompt you for the following items of information:

- Administrator username for your Oracle BPM domain.
- Administrator password for your Oracle BPM domain.
- Host name and Administration Server listen port number where your WebLogic Server/Oracle BPM domain are installed. This should be specified in the following format:
5.9.7 Running soa-upgrade.py to Update the Policy Store and Deploy a Shared Library

To update your policy store and deploy shared libraries, run the soa-upgrade.py WLST script, which does the following:

- Adds a new Role Grant and Policy grant within the soa-infra application stripe in the Policy Store.
- Deploys the oracle.soa.worklist.webapp shared library to the SOA domain.

The soa-upgrade.py script must be run from the bin directory inside your SOA Oracle home. The syntax for the soa-upgrade.py script is shown below.

```
On a UNIX operating system:

cd SOA_ORACLE_HOME/bin
../common/bin/wlst.sh soa-upgrade.py --targetList list_of_SOA_servers_or_migratable_targets
```

```
On a Windows operating system, run wlst.cmd from the same directory.

cd SOA_ORACLE_HOME\bin
..\common\bin\wlst.cmd soa-upgrade.py --targetList list_of_SOA_servers_or_migratable_targets
```

The command will prompt you for the following items of information:

- Administrator username for your Oracle SOA domain.
- Administrator password for your Oracle SOA domain.
- Host name and Administration Server listen port number where your WebLogic Server/Oracle SOA domain are installed. This should be specified in the following format:

```
t3://host:port
```

After running this command, stop and restart all the servers.

5.9.8 Updating the Oracle Data Integrator Clients if BAM-ODI Integration is Enabled

If you are currently using Oracle BAM and Oracle Data Integrator (ODI) integration, you must re-run an installation script to update your ODI clients after patching your software.
The Oracle BAM interface used by ODI has undergone some changes between releases which require an update by all ODI client endpoints. This manual step is only required for domains where a BAM-ODI integration has been configured.

For each such domain, you must run the `SOA_ORACLE_HOME/bam/bin/bam_odi_configuration.sh` (on UNIX operating systems) or `SOA_ORACLE_HOME\bam\bin\bam_odi_configuration.bat` (on Microsoft Windows operating systems) script. Use the PATCH command line parameter to copy the Oracle BAM artifacts. For details, see "Using Oracle Data Integrator With Oracle BAM" in Oracle Fusion Middleware Developer’s Guide for Oracle SOA Suite.

If ODI and Oracle BAM Server are installed on hosts in different networks, or for any reason you cannot use the script in your environment, you must manually do the following to update your ODI clients:

1. Using the Middleware home directory under which Oracle BAM is installed, generate a `wlfullclient.jar` file by using the instructions in "Using the WebLogic JarBuilder Tool" in Oracle Fusion Middleware Programming Stand-alone Clients for Oracle WebLogic Server.

2. Copy `wlfullclient.jar` to the `ODI_ORACLE_HOME/lib/weblogic` (on UNIX operating systems) or `ODI_ORACLE_HOME\lib\weblogic` (on Windows operating systems) directory.

3. Copy the following Oracle BAM .jar files to the `lib` directory in the ODI Oracle home:
   - On UNIX operating systems:
     ```
     SOA_ORACLE_HOME/bam/modules/oracle.bam_11.1.1/oracle-bam-common.jar
     SOA_ORACLE_HOME/bam/modules/oracle.bam_11.1.1/oracle-bam-etl.jar
     SOA_ORACLE_HOME/bam/modules/oracle.bam_11.1.1/oracle-bam-adc-ejb.jar
     SOA_ORACLE_HOME/bam/modules/oracle.bam.thirdparty_11.1.1/commons-codec-1.3.jar
     SOA_ORACLE_HOME/bam/modules/oracle.bam.thirdparty_11.1.1/xstream-1.3.1.jar
     oracle_common/modules/oracle.odl_11.1.1/ojdl.jar
     oracle_common/modules/oracle.jps_11.1.1/jps-api.jar
     oracle_common/modules/oracle.dms_11.1.1/dms.jar
     oracle_common/modules/org.jaxen_1.1.1.jar
     ```
   - On Windows operating systems:
     ```
     SOA_ORACLE_HOME\bam\modules\oracle.bam_11.1.1\oracle-bam-common.jar
     SOA_ORACLE_HOME\bam\modules\oracle.bam_11.1.1\oracle-bam-etl.jar
     SOA_ORACLE_HOME\bam\modules\oracle.bam_11.1.1\oracle-bam-adc-ejb.jar
     SOA_ORACLE_HOME\bam\modules\oracle.bam.thirdparty_11.1.1\commons-codec-1.3.jar
     SOA_ORACLE_HOME\bam\modules\oracle.bam.thirdparty_11.1.1\xstream-1.3.1.jar
     oracle_common\modules\oracle.odl_11.1.1\ojdl.jar
     oracle_common\modules\oracle.jps_11.1.1\jps-api.jar
     oracle_common\modules\oracle.dms_11.1.1\dms.jar
     oracle_common\modules\org.jaxen_1.1.1.jar
     ```

4. Copy the following Oracle BAM Knowledge Modules from the `SOA_ORACLE_HOME/bam/ODI/knowledge_modules` (on UNIX operating systems) or `SOA_ORACLE_HOME\bam\ODI\knowledge_modules` (on Windows operating systems) directory to the `ODI_HOME/lib` (on UNIX operating systems) or `ODI_HOME\lib` (on Windows operating systems) directory:
   ```
   KM_CRM Get Oracle BAM Metadata.xml
   KM_IRM SQL to Oracle BAM (delete).xml
   KM_IRM SQL to Oracle BAM (insert).xml
   KM_IRM SQL to Oracle BAM (looksert natural).xml
   KM_IRM SQL to Oracle BAM (looksert surrogate).xml
   ```
5. Backup the following ODI_HOME configuration files.

On UNIX operating systems:

ODI_HOME/lib/bam_odi.logging.properties
ODI_HOME/lib/config/BAMODIConfig.xml

On Windows operating systems:

ODI_HOME\lib\bam_odi.logging.properties
ODI_HOME\lib\config\BAMODIConfig.xml

6. Copy the new version of the ODI configuration files from the SOA_ORACLE_HOME.bam/ODI (on UNIX operating systems) or SOA_ORACLE_HOME\bam\ODI (on Windows operating systems) directory to the ODI_ORACLE_HOME directory as follows.

   **Note:** If you made any changes to the ODI configuration files before you installed the patch set, then you must make those changes again after you copy the new configuration files from the SOA Oracle home.

On UNIX operating systems:

SOA_ORACLE_HOME/bam/ODI/config/bam_odi.logging.properties to ODI_HOME/lib/bam_odi.logging.properties
SOA_ORACLE_HOME/bam/ODI/config/BAMODIConfig.xml to ODI_HOME/lib/config/BAMODIConfig.xml

On Windows operating systems:

SOA_ORACLE_HOME\bam\ODI\config\bam_odi.logging.properties to ODI_HOME\lib\bam_odi.logging.properties
SOA_ORACLE_HOME\bam\ODI\config\BAMODIConfig.xml to ODI_HOME\lib\config\BAMODIConfig.xml

5.9.9 Saving and Restoring XEngine Customizations for Oracle B2B

The procedure in this section is needed only if you use custom XEngine configurations in cases where B2B server is integrated with B2B EDI endpoints.

In such cases, all B2B domains created from the same installation share the a single XEngine configuration stored within the following directory:

- On UNIX operating systems:
  
  MW_HOME/SOA_ORACLE_HOME/soa/thirdparty/edifecs/XEngine

- On Windows operating systems:
  
  MW_HOME\SOA_ORACLE_HOME\soa\thirdparty\edifecs\XEngine

To preserve your XEngine customizations:

1. Prior to patching Oracle SOA Suite, back up all contents in the following directory:
Post-Patching Tasks for Oracle SOA Suite

Post-Patching Procedures

2. Run the Installer to update the software.

3. Unzip the XEngine ZIP file in the following directory:

   MW_HOME/SOA_ORACLE_HOME/soa/thirdparty/edifecs/XEngine

   For example, on a UNIX operating system:
   
   cd SOA_ORACLE_HOME/soa/thirdparty/edifecs
   gunzip XEngine.tar.gz
   tar -xvf XEngine.tar

4. Restore only the customized configuration files from your backup location.

   For example, if you made changes to the XERegistry.xml file on a UNIX operating system:

   cp backup_location/config/XERegistry.xml
   SOA_ORACLE_HOME/soa/thirdparty/edifecs/XEngine/config

5.9.10 Configuring Oracle JMS Adapter with IBM WebSphere MQ JMS

   This step is needed if you are upgrading Oracle SOA Suite from release 11.1.1.2.0 or earlier to the latest release, and you have developed and deployed composites that leverage the Oracle JMS Adapter to access JMS messages that are utilizing IBM WebSphere MQ for message transport/persistence services.

   If the Outbound Connection Pool entry created for the JMS Adapter is to be used with Topics, you must use the following additional connection property, which must be added to the end of the connection factory properties for Outbound Connection Pool entry:

   ThirdPartyJMSProvider=true

   For more information, see “Configuring Oracle JMS Adapter with IBM WebSphere MQ JMS” in Oracle Fusion Middleware User’s Guide for Technology Adapters.

5.9.11 Extending the SOA Domain with UMS Adapter Features

   This manual step is needed if you are upgrading your Oracle SOA Suite from release 11.1.1.6.0 or earlier to the latest release, and you want to enable the new User Messaging Service (UMS) Adapter features.

   1. Stop all Admin and Managed Servers as described in "Starting and Stopping Oracle WebLogic Server Instances" in the Oracle Fusion Middleware Administrator’s Guide.

   2. Launch the Oracle WebLogic Configuration Wizard as described in "Starting the Configuration Wizard in Graphical Mode" in Oracle Fusion Middleware Creating Domains Using the Configuration Wizard.

   3. On the Select Extension Source screen of the Configuration Wizard, select Extend my domain using an existing extension template and specify the following path to the SOA upgrade extension template in the Template location field:

   SOA_HOME/common/templates/applications/oracle.soa_template_111160_111170.jar
4. Continue through the remaining screens to complete the extension.

5. Restart the Admin and Managed Servers as described in "Starting and Stopping Oracle WebLogic Server Instances" in the Oracle Fusion Middleware Administrator's Guide.

5.9.12 Extending the SOA Domain with Business Process Management Features

This manual step is needed if you are upgrading your Oracle SOA Suite from release 11.1.1.6.0 or earlier to the latest release, and you want to enable the new BPM features such as Case Management and Frevvo Webforms.

1. Apply the SOA upgrade template as described in Section 5.9.11, "Extending the SOA Domain with UMS Adapter Features". This is a mandatory prerequisite.

2. Stop all Admin and Managed Servers as described in "Starting and Stopping Oracle WebLogic Server Instances" in the Oracle Fusion Middleware Administrator's Guide.

3. Launch the Oracle WebLogic Configuration Wizard as described in "Starting the Configuration Wizard in Graphical Mode" in Oracle Fusion Middleware Creating Domains Using the Configuration Wizard.

4. On the Select Extension Source screen of the Configuration Wizard, select **Extend my domain using an existing extension template** and specify the following path to the BPM upgrade extension template in the Template location field:

   \[SOA_HOME\]/common/templates/applications/oracle.bpm_template_111160_111170.jar

5. Continue through the remaining screens to complete the extension.

6. Restart the Admin and Managed Servers as described in "Starting and Stopping Oracle WebLogic Server Instances" in the Oracle Fusion Middleware Administrator's Guide.

5.10 Post-Patching Tasks for Oracle WebCenter Content

This section contains the following topics:

- Section 5.10.1, "Updating Oracle WebCenter Content: Imaging"
- Section 5.10.2, "Updating Oracle Application Adapters for Oracle WebCenter Content"
- Section 5.10.3, "Configuring the Report Library for Records Management in Content Server"

5.10.1 Updating Oracle WebCenter Content: Imaging

After updating your Oracle WebCenter Content software to Release 11.1.1.7.0 from any previous version, the manual steps in this section must be performed to target a newly distributed library to the Oracle WebCenter Content: Imaging deployment. If these steps are not performed, the Oracle WebCenter Content: Imaging Managed Server (default of IPM_server1) will not start.

1. Make sure Oracle WebLogic Server is started, then open the Oracle WebLogic Server Administration Console:

   http://administration_server_host:administration_server_port/console
2. For production systems, go to the "Change Center" portion of the navigation panel on the left and click **Lock & Edit**.

3. Targeting the Oracle Application Core Stub file:
   a. In the "Domain Structure" portion of the navigation panel on the left, click **Deployments**.
   b. Above the "Deployments" table, click the **Install** button.
   c. In the "Path" field, browse to the directory containing the Oracle Application Core Stub file.
      The default location is \MW_HOME\oracle_common\atgpf\modules\oracle.applcore.model_11.1.1 (on UNIX operating systems) or \MW_HOME\oracle_common\atgpf\modules\oracle.applcore.model_11.1.1 (on Windows operating systems).
   d. Select the oracle.applcore.model.stub.ear file and click **Next**.
   e. Select **Install this deployment as a library** and click **Next**.
   f. Select **IPM_server1** as the deployment target and click **Next**.
   g. Click **Finish**.

4. Targeting the Oracle SOA Libraries file for BPM:
   
   **Note:** If oracle.soa.workflow.wc.jar is already installed due to Oracle SOA Suite being a part of the domain, you should skip the following Steps a-f. Instead, navigate to oracle.soa.workflow.wc in deployments, then go into its "Targets" tab and target **IPM_server1**.
   
   a. In the "Domain Structure" portion of the navigation panel on the left, click **Deployments**.
   b. Above the "Deployments" table, click the **Install** button.
   c. In the "Path" field, browse to the directory containing the Oracle SOA Libraries file.
      The default location is \ECM_ORACLE_HOME\soa\modules\oracle.soa.workflow_11.1.1 (on UNIX operating systems) or \ECM_ORACLE_HOME\soa\modules\oracle.soa.workflow_11.1.1 (on Windows operating systems).
   d. Select the oracle.soa.workflow.wc.jar file and click **Next**.
      A message indicating errors while parsing the deployment will appear in the "Messages" box at the top of the screen. The configuration will treat this as a library deployment. This is expected.
   e. Select **IPM_server1** as the deployment target and click **Next**.
   f. Click **Finish**.

5. For production systems, go to the "Change Center" portion of the navigation panel on the left and click **Activate Changes**.

6. Any instances of the IPM Managed Server must be restarted for this change to take effect.

7. Redeploy the imaging.ear file that is installed by the patch set.
The `imaging.ear` file is saved by the installer to the following directory:

```
ECM_ORACLE_HOME/ipm/lib/imaging.ear
ECM_ORACLE_HOME\ipm\lib\imaging.ear
```

To redeploy the EAR file, you can use the command-line, or you can use the Oracle WebLogic Server Administration Console:

- For information about redeploying an EAR file in from the Administration Console, see "Update (redeploy) an Enterprise application" in the Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help.
- From the command-line, you can use the Oracle WebLogic Server deployer command; for example:
  ```
  java weblogic.Deployer -redeploy -name appName
  ```
  Where `appName` is the name of the EAR file as defined in the `config.xml` file.
- You can also redeploy using the WLST `redeploy()` command:
  ```
  redeploy('appName')
  ```
  For more information about the `redeploy()` WLST command, see "redeploy" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.

### 5.10.2 Updating Oracle Application Adapters for Oracle WebCenter Content

The Oracle WebCenter Content application adapters as described in Oracle WebCenter Administrator’s Guide for Application Adapters contain manual steps for installing the adapters to their respective ERP system (EBS and PeopleSoft). In order to update to from any previous release to Release 11.1.1.7.0, these adapters must be reinstalled.

To reinstall the EBS adapter:

2. If you are configured for SSL, follow the instructions in "Configuring the Integration for SSL" in Oracle WebCenter Administrator’s Guide for Application Adapters.

To re-import the PeopleSoft project, follow the instructions (steps 1-6) in "Importing the Oracle PeopleSoft Project" in Oracle WebCenter Administrator’s Guide for Application Adapters.

### 5.10.3 Configuring the Report Library for Records Management in Content Server

If you plan to configure the Records Management feature in Content Server, you need configure the report library for Records Management after creating the domain that includes the WebCenter Content Managed Server, before starting it for the first time. Without this library, you cannot check in any templates to Content Server.

For more information on configuring the report library for Records Management, see "Configuring the Report Library for Records Management in Content Server" in the Oracle WebCenter Content Installation Guide.
### 5.10.4 Extending the IPM Domain to Include Viewer Cache

If you plan to take advantage of the Viewer Cache feature, or if you were already using it in a previous version of IPM (11.1.1.4.0 or 11.1.1.5.0) that was delivered in a previous patch, then you will need to extend the IPM domain with a new separately packaged Viewer Cache component.

1. Run the Configuration Wizard:
   ```
   cd $ORACLE_HOME/common/bin
   ./config.sh
   ```

2. On the Welcome screen, select "Extend an existing WebLogic domain".

3. On the Select a WebLogic Domain Directory screen, select the domain in which IPM is currently configured. The folder icon of domains in the tree presentation will be designated differently with a small ball on the folder image. By default the domain name provided by the ECM install is `base_domain`.

4. On the Select Extension Source screen, select the "Oracle WebCenter Content: Imaging Viewer Cache - 11.1.1.0 [...]".

   **Note:** If you are applying the patch to a system that was upgraded from a previous IPM version (11.1.1.4.0 or 11.1.1.5.0) in which the Viewer Cache was present, you will encounter a dialog titled "Conflict Detected". This message indicates that Component Named "Viewer JMS ConnectionFactory" is already defined. Choose the "Replace existing component" option.

5. Click **Next** to move through the remaining configuration screens without making changes. No further changes are required to extend the domain.

6. On the Configuration Summary screen, click **Extend** to complete the domain extension.

7. Restart the Administration Server.

8. The Viewer Cache remains inactive until it is configured. You must perform the steps described in "Configuring the Imaging Viewer Cache" in *Oracle WebCenter Content Installation Guide* to fully enable Viewer Cache.

### 5.11 Post-Patching Tasks for Oracle Service Bus

Follow the instructions in this section to update your Oracle Service Bus Release 11.1.1.2.0 or 11.1.1.3.0 domain configuration information to the latest release, after you have patched your Oracle Service Bus software:

- **Section 5.11.1**, "Updating an Oracle Service Bus Domain After Applying the Latest Patch Set"

- **Section 5.11.2**, "Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.5"

- **Section 5.11.3**, "Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.6"

- **Section 5.11.4**, "Performing Additional Post-Update Tasks for Oracle Service Bus IDE"
5.11.1 Updating an Oracle Service Bus Domain After Applying the Latest Patch Set

To update your Oracle Service Bus domain configuration information:

1. Make sure you have backed up and shut down all domains to be updated.
2. Under each Oracle Service Bus domain to be updated, open a command window and run the `DOMAIN_HOME/bin/setDomainEnv.sh` (on UNIX operating systems) or `DOMAIN_HOME\bin\setDomainEnv.cmd` (on Windows operating systems) command.
3. In the command window, switch to the directory in which the update scripts resides:
   
   `OSB_ORACLE_HOME/common/lib/upgrade`

4. On the command line, run the appropriate script for your operating system:
   
   (UNIX) `java weblogic.WLST ./domainUpgrade.py`
   
   (Windows) `java weblogic.WLST domainUpgrade.py`

5.11.2 Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.5

Oracle Fusion Middleware 11g Release 1 (11.1.1.7.0) supports both Oracle WebLogic Server release 10.3.5 and 10.3.6. However, if you have already configured Oracle Service Bus with Oracle WebLogic Server 10.3.5 and you want to update Oracle Service Bus with Oracle Service Bus IDE to 11g Release 1 (11.1.1.7.0), then you must also update Oracle WebLogic Server to release 10.3.6. Oracle WebLogic Server 10.3.5 is not supported in an Oracle Service Bus IDE 11g Release 1 (11.1.1.7.0) environment.

If you must update Oracle Service Bus to 11g Release 1 (11.1.1.7.0), and you want to keep your Oracle WebLogic Server release at 10.3.5, then you must disable Oracle Service Bus IDE by manually deleting the following file:

(UNIX) `MW_HOME/oepe_11.1.1.8.0/dropins/oracle.osb.ide.lnk`

(Windows) `MW_HOME\oepe_11.1.1.8.0\dropins\oracle.osb.ide.lnk`

5.11.3 Using Oracle Service Bus Release 11.1.1.7.0 with WebLogic Server 10.3.6

If you installed the latest version of Oracle WebLogic Server (version 10.3.6), and you updated Oracle Service Bus to 11g Release 1 (11.1.1.7.0), then you must install the required patches as described on the "Known Issues for Oracle SOA Products and Oracle AIA Foundation Pack" page on Oracle Technology Network at:

http://www.oracle.com/technetwork/middleware/docs/aiasoarelnotesps6-1866030.html

5.11.4 Performing Additional Post-Update Tasks for Oracle Service Bus IDE

If you are using Oracle Service Bus IDE in your environment, this section describes the required tasks after updating your Oracle Service Bus software to the latest version.

5.11.4.1 Deleting Oracle WebLogic Server 11g Release 1 (10.3.3)

You need to create a new Server pointing to Weblogic Server 11g Release 1 (10.3.6) to successfully publish the Oracle Service Bus configuration to the server. In order to do this, you need to delete Oracle WebLogic Server 11g Release 1 (10.3.3).

To delete Oracle WebLogic Server 11g Release 1 (10.3.3), use the following steps:

1. Select Oracle WebLogic Server 11g Release 1 (10.3.3), right click and select **Delete** option.

2. Uncheck **Stop server(s) before deleting** and click **OK**.
5.11.4.2 Creating Servers

You can deploy (publish) and test your Oracle Service Bus configuration on a running
server in Eclipse. When connected to a running server in development, you can also
connect to resources in the run-time environment such as JNDI resources and remote
EJBs.

If you have an existing Oracle WebLogic Server you want to connect to, the server
creation process simply involves you pointing at the existing server domain. If you
want to create a new server, the new server wizard lets you create one using the Oracle
Fusion Middleware Configuration Wizard.

To create a server in Eclipse, use the following steps:

1. In the Oracle Service Bus perspective, select **File > New > Server**. The New Server
   wizard appears.

2. Select the server type/version you want to create or connect to.

3. For **Server's host name**, enter **localhost** for a local server or enter the name or IP
   address of the remote system hosting an existing server.

4. The **Server name** is for display purposes in Eclipse.

5. Click **Next**.

6. For **WebLogic home**, click **Browse** and select the **WebLogic_Server_HOME** in the
   Oracle Fusion Middleware installation where the server domain is to reside (or
   already resides). The default WebLogic home directory is called **wlserver_10.3**.

   For example, if you are creating a new server in **MW_HOME_1**, select the **MW_HOME_1/wlserver_10.3**;
or if you are connecting to an existing server domain in **MW_HOME_2**, select the **MW_HOME_2/wlserver_10.3**.

   **Note:** You cannot reference a **WebLogic_Server_HOME** that is outside
   of the server’s installation **MW_HOME**, even if the external **MW_HOME** is the
   same product version.

7. The **Java home** should be populated automatically. If you want to use a different
   JRE, such as the default Oracle JRockit JRE, click **Browse** and select the JRE under
   the same **MW_HOME** as the server.

8. Click **Next**.

9. Select whether the server is **Local** or **Remote**. Remote implies an existing remote
   server.

   - If **Local**, either select an existing server in the Domain Directory field or click
     the link to create a new domain. After creating a new domain, select it in the
     Domain Directory field.
     
     Set other options as desired, such as automatic publishing and debug mode.
     
     For information on creating a new Oracle Service Bus domain, see
     "Configuring Oracle Service Bus” in the Oracle Fusion Middleware Installation
     Guide for Oracle Service Bus.

   - If **Remote**, enter the connection settings to an existing remote server.

10. Click **Next**.
11. Move any Oracle Service Bus configuration(s) you want to publish on the server to the Configured pane. You can modify this targeting after you create the server by right-clicking the server and selecting Add and Remove.

12. Click Finish. The new server appears in the Servers view in Eclipse, where you can start, stop, and publish to the server.

5.12 Post-Patching Tasks for Oracle Business Intelligence

This section contains instructions for post-patching tasks for Oracle Business Intelligence. It contains the following topics:

- Section 5.12.1, "Updating Oracle Business Intelligence Code Grants"
- Section 5.12.2, "Updating Oracle BI Presentation Catalogs"
- Section 5.12.3, "Enabling bicontentserver Features"
- Section 5.12.4, "Enabling Oracle Business Intelligence Composer Features"
- Section 5.12.5, "Enabling JBIPS Features"
- Section 5.12.6, "Updating Oracle Real-Time Decisions"

**Note:** Before you continue, make sure you have performed the tasks in Section 5.6, "Post-Patching Tasks for System Components" to update your Oracle Business Intelligence system components.

5.12.1 Updating Oracle Business Intelligence Code Grants

If you are updating to the latest version of Oracle Business Intelligence (BI) from Release 11.1.1.3.0, you must run the bi-upgrade.py script in each Oracle BI domain. This script configures the code grants necessary to ensure that SSL works correctly for Oracle BI, and must be run even if SSL is not used.

To run the script on UNIX operating systems:

```
cd MW_HOME/oracle_common/common/bin
./wlst.sh BI_ORACLE_HOME/bin/bi-upgrade.py --bioraclehome BI_ORACLE_HOME
--domainhome bi_domain_home
```

To run the script on Windows operating systems:

```
cd MW_HOME\oracle_common\common\bin
wlst.cmd BI_ORACLE_HOME\bin\bi-upgrade.py --bioraclehome BI_ORACLE_HOME
--domainhome bi_domain_home
```

Replace BI_ORACLE_HOME with the full path to your Business Intelligence Oracle home location, and replace bi_domain_home with the full path to your Business Intelligence domain home location.

5.12.2 Updating Oracle BI Presentation Catalogs

When updating your Oracle Business Intelligence (BI) software from Release 11.1.1.3.0, 11.1.1.5.0 or 11.1.1.6.x, you must manually update your Oracle BI Presentation Catalogs. Instructions are provided below:

1. Stop Oracle BI Presentation Services using Oracle Enterprise Manager.

   For details, see "Using Fusion Middleware Control to Start and Stop Oracle Business Intelligence System Components and Java Components" in Oracle Fusion
Post-Patching Tasks for Oracle Business Intelligence

2. Back up your Release 11.1.1.3.0, 11.1.1.5.0 or 11.1.1.6.x catalogs by using the 7-Zip utility to create a compressed file for it.

3. Create a backup copy of the instanceconfig.xml file.

   The instanceconfig.xml file is located in the ORACLE_INSTANCE/config/OracleBIPresentationServicesComponent/coreapplication_obipsn (on UNIX operating systems) or ORACLE_INSTANCE\config\OracleBIPresentationServicesComponent\coreapplication_obipsn (on Windows operating systems) directory.

4. Change the upgradeAndExit option to true in the instanceconfig.xml file.

   Find the following code:

   ```
   <Catalog>
     <UpgradeAndExit>false</UpgradeAndExit>
   </Catalog>
   ```

   Change it to the following:

   ```
   <Catalog>
     <UpgradeAndExit>true</UpgradeAndExit>
   </Catalog>
   ```

5. Start Oracle BI Presentation Services using the following OPMN command to update the catalogs:

   opmnctl startproc ias-component=coreapplication_obipsn

   For example, on a UNIX operating system:

   ```
   cd ORACLE_INSTANCE/bin
   ./opmnctl startproc ias-component=coreapplication_obipsn
   ```

   On a Windows operating system:

   ```
   cd ORACLE_INSTANCE\bin
   opmnctl startproc ias-component=coreapplication_obipsn
   ```

6. After the catalogs are updated, edit the instanceconfig.xml file again and change the upgradeAndExit option back to false.

7. Restart Oracle BI Presentation Services using Fusion Middleware Control.

5.12.3 Enabling bicontentserver Features

If you are upgrading Oracle Business Intelligence from 11g Release 1 (11.1.1.5.0), you must perform the following if you want to enable the bicontentserver configuration template features:

1. Make sure all processes in the domain are stopped, including all Oracle instances, the Administration Server, all Managed Servers, and Node Manager.

2. Start the Configuration Wizard.

   On UNIX operating systems:

   ```
   cd WLHOME/common/bin
   ```

   where WLHOME is the directory in which WebLogic Server is installed.
5.12.4 Enabling Oracle Business Intelligence Composer Features

If you are upgrading Oracle Business Intelligence from 11g Release 1 (11.1.1.x), you must perform the following if you want to enable the Oracle BI Composer or Oracle BI Composer Runtime configuration template features:

1. Make sure all processes in the domain are stopped, including all Oracle instances, the Administration Server, all Managed Servers, and Node Manager.

2. Start the Configuration Wizard.
   
   On UNIX operating systems:
   
   ```
   cd WLHOME/common/bin
   ./
   ```
   
   On Windows operating systems:
   
   ```
   cd WLHOME\common\bin
   config.bat
   ```

3. On the Welcome screen, select **Extend an existing WebLogic domain**.

4. On the Select a WebLogic Domain Directory screen, select the location of your existing Oracle BI domain.

5. On the Select Extension Source screen, select **Extend my domain using an existing extension template** and enter the location of the oracle.bicomposer_template_11.1.1.jar file.

   On Unix operating systems enter a command such as the following:
ORACLE_HOME/common/templates/applications/oracle.bicomposer_template_11.1.1.jar

6. Continue with the remainder of the Configuration Wizard screens to apply this template.

7. After the template is applied, restart all Oracle Instances, the Administration Server, Managed Servers, and Node Manager.

---

**Note:** After you perform the steps in this section, you must edit an MBean to enable Oracle BI Composer. For information, see "Manually Enabling BI Composer" in *Oracle Fusion Middleware Upgrade Guide for Oracle Business Intelligence*.

---

### 5.12.5 Enabling JBIPS Features

If you are upgrading Oracle Business Intelligence from 11g Release 1 (11.1.1.x), and you want to enable the Oracle BI JBIPS configuration template features, you must perform the following:

1. Make sure all processes in the domain are stopped, including all Oracle instances, the Administration Server, all Managed Servers, and Node Manager.

2. Start the Configuration Wizard.

   On UNIX operating systems:
   
   ```
   cd WLHOME/common/bin
   ./config.sh
   ```
   
   where `WLHOME` is the directory in which WebLogic Server is installed.

   On Windows operating systems:

   From the Start Menu launch the Configuration Wizard for WebLogic from the `Programs > Oracle WebLogic > WebLogic Server > Tools > Configuration Wizard` menu option.

3. On the Welcome screen, select **Extend an existing WebLogic domain**.

4. On the Select a WebLogic Domain Directory screen, select the location of your existing Oracle BI domain.

5. On the Select Extension Source screen, select **Extend my domain automatically to support the following added products** and select Oracle JBIPS 11.1.1.7.0.

6. Continue with the remainder of the Configuration Wizard screens to apply this template.

7. Review the Configuration Summary screen and verify that the JBIPS Enterprise Web application and the following JBIPS shared libraries are listed:
   - `oracle.bi.jbips`
   - `oracle.bi.jbips.commons`
   - `oracle.bi.jbips.soap`

   **NOTE:** The JBIPS Web application and JBIPS shared libraries must be deployed to the same target as Analytics web application. The default target is "bi_cluster".

8. After the template is applied, restart all Oracle Instances, the Administration Server, Managed Servers, and Node Manager.
You should see "jbips (11.1.1)" Enterprise Application and the JBIPS shared libraries in the list of deployed modules in the Weblogic Administration Console.

5.12.6 Updating Oracle Real-Time Decisions

This section describes how to update Oracle Real-Time Decisions (RTD) to the latest patch set. The following steps are required only if you are patching from 11g Release 1 (11.1.1.3.0); you do not need to perform these steps if you are patching from 11g Release 1 (11.1.1.5.0).

- Section 5.12.6.1, "Updating the rtd_ils Resource Type Using WLST"
- Section 5.12.6.2, "Adding Permissions to the BIAdministrator Principle Using EM"
- Section 5.12.6.3, "Removing JMS"

5.12.6.1 Updating the rtd_ils Resource Type Using WLST

Perform the following to add actions to the rtd_ils resource type:

1. Navigate to the MW_HOME/oracle_common/common/bin (on UNIX operating systems) or MW_HOME\oracle_common\common\bin (on Windows operating systems) directory.
2. Launch the WebLogic Scripting Tool (WLST).
   On UNIX operating systems:
   ./wlst.sh
   On Windows operating systems:
   wlst.cmd
3. Connect to the WebLogic Server using the connect() command:
   
   ```
   connect('adminuser', 'adminuser_password', 't3://admin_server_host:admin_server_port')
   ```
   Replace `adminuser` and `adminuser_password` with the name and password of the Administrator you provided during the Oracle BI installation. Replace `admin_server_host` and `admin_server_port` with the host name and port number of the system where Oracle WebLogic Server is running. Below is a sample command:
   ```
   connect('exampleuser', 'examplepassword', 't3://examplehost:7001')
   ```
4. List all resources of the resource type "rtd_ils" using the following command:
   ```
   listResources(appStripe="obi", type="rtd_ils")
   ```
   This will list all ILS's deployed to the RTD server. For example, if the sample ILS CrossSell was deployed to your RTD server, you would see the following:
   ```
   [Name: CrossSell Type: rtd_ils DisplayName: CrossSell Description: CrossSell ]
   ```
5. Delete all resources of resource type "rtd_ils" using the following command:
   ```
   deleteResource(appStripe="obi", name=resource_name, type="rtd_ils")
   ```
   For example, the following command would delete the CrossSell resource:
   ```
   deleteResource(appStripe="obi", name="CrossSell", type="rtd_ils")
   ```
6. Run the `listResources()` command again to ensure all the resources have been deleted:

   `listResources(appStripe='obi', type='rtd_ils')`

   There should be no resources listed.

7. Delete the resource type "rtd_ils":

   `deleteResourceType(appStripe='obi', resourceTypeName='rtd_ils')`

8. Create a resource type "rtd_ils" using the following `createResourceType()` command:

   ```
   createResourceType(appStripe='obi',
                      resourceTypeName='rtd_ils',
                      displayName='ILS',
                      description='Inline Service name',
                      matcher='oracle.security.jps.ResourcePermission',
                      allowedActions='choice_editor,decision_service:stress,open_service:write,decision_service:normal,open_service:read,deploy_service,download_service,clear_choice_history,clear_statistics,clear_study,clear_all_operational_data,delete_service,unlock_service,clear_model',
                      delimiter=',')
   ```

9. Disconnect from Oracle WebLogic Server:

   `disconnect()`

10. Exit from the WebLogic Scripting Tool:

    `exit()`

5.12.6.2 Adding Permissions to the BIAdministrator Principle Using EM

The steps in this section need to be performed if you are using the BIAdministrator principle included with the product, or if you have replaced the BIAdministrator principle included with the product with your own principle:

1. Start Fusion Middleware Control using the following syntax:

   `http://admin_server_host:admin_server_port/em`

2. In the left tree view, select Weblogic Domain / bifoundation_domain.

3. In the content pane, select Security/Application Policies from the drop down "WebLogic Domain".

4. Check Select Application Stripe to Search, and select "obi" from its drop down list.

5. Leave the Principal and Permissions blank.

6. Click the Search button next to the Permission field.

7. From the search result, click on the Principal "BIAdministrator" (or the name of your own principle if you are not using "BIAdministrator").

8. Click the Edit button.

9. In the Edit Application Grant pane, go to the Permissions section and click the Add button.

10. In the Add Permission dialog, under the Customize section, add the following entries:
Permission Class: oracle.security.jps.ResourcePermission
Resource Name: resourceType=rtd_ils,resourceName=_all_
Permission Actions: clear_choice_history,clear_statistics,clear_study,clear_all_operational_data,delete_service,unlock_service,clear_model

11. Click OK in the Add Permission dialog.
12. Click OK in the Edit Application Grant pane.

5.12.6.3 Removing JMS
In earlier releases, Oracle RTD relied on JMS for its intra-member cluster communication. In the latest release, JMS is replaced with JRF web services. This is an optional step and no functionality will be affected if you choose not to perform this step.

To remove JMS for Oracle RTD:
1. Using a browser, connect to the Administration Server Console:
   http://admin_server_host:admin_server_port/console
2. Click Lock & Edit.
4. Click JMS Modules.
5. On JMS Modules table in the right pane, select RTDJMSMODULE.
6. Click the Delete button, then click the Yes button to confirm.
7. On the left pane, click JMS Servers (under Services > Messaging).
8. On the JMS Servers table on the right pane, select RTDJmsServer.
9. Click the Delete button, then click the Yes button to confirm.
10. Click the Activate Changes button.

5.13 Post-Patching Tasks for Oracle Data Integrator
This section contains instructions for post-patching tasks for Oracle Data Integrator. It contains the following topics:
- Section 5.13.1, "Finalizing Repository Patching"
- Section 5.13.2, "Reconfiguring the Java EE Agent"
- Section 5.13.3, "Reconfiguring the ODI Standalone Agent"
- Section 5.13.4, "Reconfiguring Oracle Enterprise Manager Properties"
- Section 5.13.5, "Reconfiguring the ODI Console"
- Section 5.13.6, "Adding the Version Number for the odi-sdk-ws Application in config.xml"

5.13.1 Finalizing Repository Patching
After you have patched the Oracle Data Integrator schemas in your database (Chapter 4, "Updating Your Schemas with Patch Set Assistant"), you must update the following repository objects (technologies, profiles, knowledge modules), which are not updated with Patch Set Assistant:
Technology Changes
- Added: ComplexFile and Groovy
- Changed: Oracle
  * Natural keyword join was added
  * Join capability was extended to BOTH
  * Default table name prefixes were added
- Changed: Teradata
- Changed: PostgreSQL
- Changed: Netezza
- Changed: OracleBI
- Changed: Hypersonic In-Memory Engine
- Changed: PostgreSQL supports SQL for retrieving sequences

Language Changes: Groovy was added

Profile Changes
Changes were made to LoadPlan support in the following profiles:
- [NG] DESIGNER
- [NG] REPOSITORY EXPLORER
- [NG] VERSION ADMIN
- OPERATOR
- SECURITY_ADMIN

Knowledge Modules
LKM File to Oracle (SQLLDR) works after removing 'import javaos' from KM step 'call sqlldr'. The old LKM no longer works with an upgraded Jython version.

For more information about how to update these repository objects, see "Oracle Data Integrator Post-Upgrade Tasks" in Oracle Fusion Middleware Upgrade Guide for Oracle Data Integrator.

5.13.2 Reconfiguring the Java EE Agent
By default, ODI ships a static Java EE Agent deployment template. To reconfigure the Java EE agent:

1. Run the Configuration Wizard. On the Select Domain Source screen, select the Oracle Data Integrator – Agent – 11.1.1.0 template.
   For more information, see "Configure a WebLogic Domain" in Oracle Fusion Middleware Installation Guide for Oracle Data Integrator.

2. On UNIX operating systems, check $DOMAIN_HOME/bin/setDomainEnv.sh for the following line:
   
   ```bash
   -Dodi.oracle.home=${ODI_ORACLE_HOME}
   ```

   On Windows operating systems, check $DOMAIN_HOME\bin\setDomainEnv.cmd for the following line:

   ```cmd
   -Dodi.oracle.home=%ODI_ORACLE_HOME%
   ```
On either operating system, if this line is not present, add it to the EXTRA_JAVA_PROPERTIES parameter.

3. Make sure the Administrator Server and ODI Managed Servers are up and running.

4. Add the WebLogic Server classes to the CLASSPATH environment variable and the WebLogic_Home/server/bin (on UNIX operating systems) or WebLogic_Home\server\bin (on Windows operating systems) directory to the PATH environment variable.

This can be accomplished by sourcing the setWLSEnv script located in the WebLogic_Home/server/bin (on UNIX operating systems) or WebLogic_Home\server\bin (on Windows operating systems) directory. For example:

```bash
source setWLSEnv.sh
```

5. Redeploy the version 11.1.1.3.0 Java EE agent from your domain using the following command:

```bash
java weblogic.Deployer -url admin_server_url -username admin_server_username -password admin_server_password -targets odi_server_name -name odi_agent_name -redeploy
```

For example:

```bash
java weblogic.Deployer -url t3://examplehost.com:7001 -username exampleuser -password examplepassword -targets odi_server1 -name oraclediagent -redeploy
```

For more information, see "Managing Deployed Applications" in Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server.

ODI also enables you to generate a Java EE agent deployment template from ODI Studio. You can customize the Java EE agent with additional data sources and libraries. To do so:

1. Undeploy the version 11.1.1.3.0 Java EE agent from your domain.

   For more information, see "Managing Deployed Applications" in Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server.

2. Using ODI Studio version 11.1.1.7.0 or the command line script to generate equivalent Java EE agent template with required data sources and additional libraries.

   For more information on data source declaration, deployment and template generation in ODI Studio, see "Java EE Agent" in the Oracle Fusion Middleware Developer’s Guide for Oracle Data Integrator.

4. Run the Configuration Wizard a second time, and on the Select Domain Source screen, deploy the generated version 11.1.1.7.0 ODI Java EE agent template to the domain.

### 5.13.3 Reconfiguring the ODI Standalone Agent

To reconfigure the ODI standalone agent:

1. Make sure you have backed up the necessary files and directories as described in "Section 3.4.6, "Backing Up Additional Configuration Information"."
2. Run the Oracle Data Integrator installer.
   On the Configure Repositories Install screen, choose **Skip Repository Creation**.

3. After the installation is complete:
   - Restore the `ODI_HOME/oracleedi/agent/bin/odiparams.sh` (on UNIX operating systems) or `ODI_HOME/oracleedi/agent/bin/odiparams.bat` (on Windows operating systems) file.
   - Restore the `ODI_HOME/oracleedi/agent/drivers` (on UNIX operating systems) or `ODI_HOME/oracleedi/agent/drivers` (on Windows operating systems) directory.

For more information, see "Stopping a Standalone Agent" and "Manually Configure the Standalone Agent" in *Oracle Fusion Middleware Installation Guide for Oracle Data Integrator*.

### 5.13.4 Reconfiguring Oracle Enterprise Manager Properties

After you have patched Oracle Data Integrator, some of the properties in Oracle Enterprise Manager are lost. To restore these properties, set the following property before starting the Managed Server on which the Oracle Data Integrator Console is deployed:

```
set JAVA_OPTIONS=-Doracle.odi.repex.view.main.init.skipem=false
```

### 5.13.5 Reconfiguring the ODI Console

If the domain created in Release 11.1.1.3.0 contains odiconsole components, reconfigure the odiconsole application as follows:

1. Extend the domain with Oracle Shared SDK Library 11.1.1.0 and target the deployment to `odi_server1`.
2. Set the CLASSPATH by running the `Weblogic_Home/server/bin/setWLSEnv.sh` (on UNIX operating systems) or `Weblogic_Home/server/bin/setWLSEnv.cmd` (on Windows operating systems) script.
3. Start the Administration Server and the `odi_server1` Managed Server.
4. Redeploy the `odiconsole` application using the following command:

```
java weblogic.Deployer -url administration_server_url -username administration_server_username -password administration_server_password -targets odi_server_name -name odi_console_name -redeploy
```

For example:

```
java weblogic.Deployer -url t3://examplehost.com:7001 -username exampleuser -password examplepassword -targets odi_server1 -name odiconsole -redeploy
```

### 5.13.6 Adding the Version Number for the odi-sdk-ws Application in config.xml

As of 11g Release 1 (11.1.1.6.0), the `odi-sdk-ws` application was updated to introduce a version number. This version number must be added to the `config.xml` file prior to starting the Administration Server or Managed Servers in the domain for Releases 11.1.1.3.0, 11.1.1.4.0 or 11.1.1.5.0 to Release 11.1.1.7.0.

To do this:

1. Edit the `DOMAIN_HOME/config/config.xml` (on UNIX operating systems) or `DOMAIN_HOME\config\config.xml` (on Windows operating systems) file.
2. Change the following line:

   <name>odi-sdk-ws</name>

   to add a version number, as shown below:

   <name>odi-sdk-ws#11.1.1.7.0.0</name>

3. Start or restart the Administration Server and Managed Servers in the domain.
Patching Oracle WebCenter Portal

This chapter provides instructions for Oracle WebCenter Portal users who want to apply the 11.1.1.7.0 patch set to their existing WebCenter Portal installations. The chapter includes the following sections:

- Section 6.1, "New Product Names for Oracle WebCenter and Oracle Enterprise Content Management Suite"
- Section 6.2, "Patching an Oracle WebCenter Portal 11.1.1.6.0 Installation"
- Section 6.3, "Patching an Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0 Installation"
- Section 6.4, "Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation"
- Section 6.5, "Patching an Oracle WebCenter 11.1.1.1.0 Installation"
- Section 6.6, "Troubleshooting Issues"

For additional information about the various starting points available for installing and patching Oracle WebCenter Portal, refer to Oracle WebCenter Portal Installation and Configuration Roadmap.

---

**Note:** Oracle recommends that all products must be patched to their latest released versions. There is no particular order in which the products must be patched unless specified in the procedures documented in this chapter.

---

### 6.1 New Product Names for Oracle WebCenter and Oracle Enterprise Content Management Suite

Oracle WebCenter and Oracle Enterprise Content Management Suite have been rebranded (renamed) from Release 11.1.1.6.0 onward. Table 6–1 provides a mapping of the old product names and terminology with the new ones.

---

**Note:** This chapter uses the old terminology unless a product name is accompanied by the release number (11.1.1.6.0, 11.1.1.7.0 or 11g) or a Release 11.1.1.6.0 or 11.1.1.7.0-specific feature is discussed.

6.2 Patching an Oracle WebCenter Portal 11.1.1.6.0 Installation

Figure 6–1 illustrates the steps required to update an Oracle WebCenter Portal installation from Release 11.1.1.6.0 to Release 11.1.1.7.0. Table 6–2 describes each of these steps in detail. Click the required steps in the table to navigate to the information for each step. Many of these steps refer back to chapter 3 or other chapters of this guide.
Figure 6–1 Applying the Latest Patch to Oracle WebCenter Portal 11.1.1.6.0
### Table 6–2 Applying the Latest Patch to Oracle WebCenter Portal 11.1.1.6.0

<table>
<thead>
<tr>
<th>Task</th>
<th>Mandatory or Optional?</th>
<th>Description</th>
<th>Links</th>
</tr>
</thead>
</table>
| Determine OWSM policy URIs for the Web service end points of Spaces and Discussions, and if required portlet producers | Mandatory | Before you begin, note down the OWSM policy URIs so that you can restore the policies in your patched instance. If WebCenter Services Portlets producer or any custom portlet producers are deployed and OWSM security policies are configured for their Web service end points, determine the security policy URIs. | ■ Section 6.7.1.1, "Determining OWSM Policy URI for the Spaces Web Service End Point"  
■ Section 6.7.1.2, "Determining OWSM Policy URI for the Discussions Web Service End Point"  
■ Section 6.7.1.3, "Determining OWSM Policy URIs for Portlet Producer Web Service End Points" |
| Perform the general pre-patching tasks: | Mandatory | Before patching Oracle WebCenter Portal, make sure your system environment and configuration meet the minimum requirements and the backups are in place. Also, you must patch Oracle WebLogic Server to either version 10.3.6 or 10.3.5. If you are patching your software in silent mode, you need to rename the emCCR file. | Section 3.4, "General Pre-Patching Tasks" |
| ■ Review system requirement, certification and interoperability information | | | |
| ■ Stop the servers and processes | | | |
| ■ Back up your Middleware Home, Domain Home, and Oracle instances | | | |
| ■ Back up your database and database schemas | | | |
| ■ Back up additional configuration information | | | |
| ■ Patch Oracle WebLogic Server | | | |
| ■ Rename the emCCR file for silent patching | | | |
| Download the installer for WebCenter Portal and other required products | Mandatory | Download the WebCenter Portal installer, which is a full installer that also functions as an update installer. At this stage, if required, you can also download installers for other FMW products that you plan to patch, such as Oracle WebCenter Content and Oracle SOA Suite. | Section 3.5, "Downloading the Installer"  
**Note:** If you have already downloaded the product installers as per instructions in Chapter 3, you may skip this step. |

| Run Patch Set Installer to patch the following Fusion Middleware products to 11.1.1.7.0:  
- Oracle Identity Management  
- Oracle Web Tier (Oracle HTTP Server)  
- Oracle Forms, Reports and Discoverer | Mandatory only if these products are installed in your environment | Patch these products before you patch WebCenter Portal. This Oracle Fusion Middleware patch set provides Oracle Portal 11.1.1.6.0, which is the latest version of Oracle Portal. If Oracle Portal 11.1.1.6.0 is already installed, you do not need to patch it.  
**Note:** If you have already patched these Fusion Middleware products as per instructions in Chapter 3, you may skip this step.  
**Note:** Oracle recommends that Oracle Portal, Forms, Reports and Discoverer should be installed in a separate Middleware home directory that is not shared with other Oracle Fusion Middleware products. | Section 3.3.2, "Special Instructions for Patching Oracle Portal, Forms, Reports and Discoverer"  
Section 3.3.3, "Special Instructions for Patching Oracle Identity and Access Management"  
Section 3.6, "Patching Oracle Fusion Middleware" |
| Run the WebCenter Portal installer to patch to Release 11.1.1.7.0 | Mandatory | Run the WebCenter Portal 11.1.1.7.0 installer. While applying the patch set, specify your existing Oracle Middleware home and WebCenter Portal Oracle home locations. | Section 3.6, "Patching Oracle Fusion Middleware" |
| Patch the other required Fusion Middleware products | Mandatory only for the products installed in the Middleware home | At this stage, you can patch other Fusion Middleware products, such as Oracle WebCenter Content and Oracle SOA Suite, by running their product installers.  
**Note:** If you have already patched the other Fusion Middleware products and updated the schemas as per instructions in Chapter 3, you may skip this step. | Section 3.6, "Patching Oracle Fusion Middleware"  
Section 6.7.4, "Considerations for Upgrading Oracle WebCenter Content or Oracle ECM" |
Update the MDS and WEBCENTER schemas

Mandatory

Use the Patch Set Assistant to update the MDS and WEBCENTER schemas.

Before running Patch Set Assistant, you should check to make sure that your database is up and running and that the schema you want to upgrade is at the version supported for upgrade.

Note: Check whether schemas of other patched products need to be updated. You can update all the required schemas at this stage. You may skip this step if you have already patched schemas listed in Table 4–1, "Schemas That Require Updating for the Latest Release”.

Perform the following post-patching tasks for WebCenter Portal:

- Restore the OWSM Web service policy settings for Spaces and Discussions, and if applicable, portlet producers
- Configure Spaces workflows
- Upgrade Process Spaces

Mandatory

You must restore your previous OWSM security policy configuration. If WebCenter Services Portlets producer or any custom portlet producers are deployed, attach the security policies to their Web services end points.

If Spaces workflows are configured, upgrade the related configuration.

It is optional, but recommended, to upgrade Process Spaces.

Perform post-patching tasks for the other patched Fusion Middleware products.

Mandatory

For all the Fusion Middleware products that you patched to Release 11.1.1.7.0, perform the required post-patching tasks.

Start the servers and processes

Mandatory

Start your Oracle Fusion Middleware environment. This involves starting your Oracle WebLogic Server Administration Server, managed servers, node manager, OPMN and all system components.

Verify Oracle WebCenter Portal 11.1.1.7.0 installation

Mandatory

Verify your patched WebCenter Portal instance by trying to access various URLs like for Administration Server and Oracle WebCenter Portal: Spaces.
6.3 Patching an Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0 Installation

Figure 6–2 illustrates the steps required to update an Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0 installation to 11.1.1.7.0. Follow the instructions in Table 6–2 to navigate to the information for each step. Many of these steps refer back to chapter 3 or other chapters of this guide.

Figure 6–2  Applying the Latest Patch to Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0
### Table 6–3 Applying the Latest Patch to Oracle WebCenter 11.1.1.0 or 11.1.1.5.0

</table>
| Determine the OWSM policy URIs for Spaces and Discussions Web service end points, and if required, for portlet producers | Mandatory | Before you begin, note down the policy names so that you can restore the policies in your patched instance. If any custom portlet producers are deployed and OWSM security policies are configured for their Web service end points, determine the security policy URIs. | ■ Section 6.7.1.1, Determining OWSM Policy URI for the Spaces Web Service End Point  
■ Section 6.7.1.2, Determining OWSM Policy URI for the Discussions Web Service End Point  
■ Section 6.7.1.3, Determining OWSM Policy URIs for Portlet Producer Web Service End Points |

Perform the general pre-patching tasks:  
- Review system requirement, certification and interoperability information  
- Stop the servers and processes  
- Back up your Middleware Home, Domain Home, and Oracle instances  
- Back up your database and database schemas  
- Back up additional configuration information  
- Patch Oracle WebLogic Server  
- Rename the emCCR file for silent patching  
  
  Before patching Oracle WebCenter Portal, make sure your system environment and configuration meet the minimum requirements and the backups are in place. Also, you must patch Oracle WebLogic Server to either version 10.3.6 or 10.3.5. If you are patching your software in silent mode, you need to rename the emCCR file. | Mandatory | | Section 3.4, "General Pre-Patching Tasks" |

6.4 Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation

This section describes the procedures involved in migrating Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 installation to 11.1.1.7.0. It contains the following subsections:

- Section 6.4.1, "Managed Server Changes"

### Table 6–3 (Cont.) Applying the Latest Patch to Oracle WebCenter 11.1.1.4.0 or 11.1.1.5.0

<td>Section 3.8, &quot;Starting the Servers and Processes&quot;</td>
</tr>
</tbody>
</table>

**Note:** Beginning with Release 11.1.1.6.0, a new WebCenter Services Portlets producer is available for exposing task flows from WebCenter services as portlets. You can consume portlets from WebCenter Services Portlets in Oracle Portal, Oracle WebLogic Portal, and Oracle WebCenter Interaction applications. For information, see Section 6.8.7.1, "Installing Activity Graph, Analytics, Pagelet Producer, Personalization Server, and WebCenter Services Portlets."

**Note:** After patching to Release 11.1.1.7.0, you can optionally disable the Analytics Collector TRACE log level and enable the NOTIFICATION log level for a stable server performance. On the WC_Utilities managed server, the level attribute of the com.plumtree.analytics logger is set to value TRACE:32. Change this value to NOTIFICATION:16. For more information, see "Setting the Level of Information Written to Log Files" in Oracle Fusion Middleware Administrator’s Guide.

Perform post-patching tasks for the required Fusion Middleware products.

Mandatory

For all the Fusion Middleware products that you patched to Release 11.1.1.7.0, perform the required post-patching tasks.

Chapter 5, "Post-Patching Procedures"

Start the servers and processes

Mandatory

Start your Oracle Fusion Middleware environment. This involves starting your Oracle WebLogic Server Administration Server, managed servers, node manager, OPMN and all system components.

Section 3.8, "Starting the Servers and Processes"

Verify Oracle WebCenter Portal 11.1.1.7.0 installation

Mandatory

Verify your patched WebCenter Portal instance by trying to access various URLs like for Administration Server and Oracle WebCenter Portal: Spaces.

"Verifying the Installation" section in Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal
6.4.1 Managed Server Changes

From Release 11.1.1.4.0 onward, managed servers have been renamed from WLS_name to WC_name, where name refers to the name of the managed server. For more information, see the "WebCenter Portal Managed Servers" section in Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal.

In Release 11.1.1.2.0 and 11.1.1.3.0, the WLS_Services managed server hosts Oracle WebCenter Discussions and Oracle WebCenter Wiki and Blog Server. From Release 11.1.1.4.0 onward, WLS_Services is no longer supported. Oracle WebCenter Discussions is deployed to WC_Collaboration, and wikis and blogs reside on Content Server.

From Release 11.1.1.4.0 onward, a new managed server, WC_Utilities, is supported that hosts the following WebCenter components: Oracle WebCenter Analytics Collector, Oracle WebCenter Activity Graph Engines, and Oracle WebCenter Personalization.

6.4.2 Migration Roadmap for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0

Figure 6–3 illustrates the steps required to update an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 installation to 11.1.1.7.0. Follow the instructions in Table 6–4 to navigate to the information for each step. Many of these steps refer back to chapter 3 or other chapters of this guide.

<table>
<thead>
<tr>
<th>Task</th>
<th>Mandatory or Optional?</th>
<th>Description</th>
<th>Link</th>
</tr>
</thead>
</table>
| Update the Spaces application using either of the following:  
- Node Manager and Automated Script  
- WLST commands | Mandatory | If Oracle WebCenter is installed on multiple machines, you can update your software only by using WLST commands, and not through the automated script. | Section 6.4.3.1, "Updating Oracle WebCenter Using Node Manager and Automated Script"  
Section 6.4.3.2, "Updating Oracle WebCenter Using WLST Commands" |
| Perform post-patch tasks for the required Fusion Middleware products. | Mandatory | For all the Fusion Middleware products that you patched to Release 11.1.1.7.0, perform the required post-patching tasks. | Chapter 5, "Post-Patching Procedures" |
| Perform post-patching tasks for WebCenter Portal:  
- Migrate Oracle Wiki pages and blogs  
- Migrate Content Presenter custom templates  
- Update REST API configuration  
- Update multi-calendar layouts  
- Restore your OmniPortlet and WebClipping customizations  
- Extend a domain to install Oracle WSM Policy Manager  
- Remove OpenUsage properties in setDomainEnv  
- Redeploy applications to upgraded custom portal managed servers  
- Remove LD_LIBRARY_PATH from setDomainEnv script  
- Migrate WSRP portlet preferences | Mandatory | Perform post-patching tasks for WebCenter Portal. | Section 6.8.4, "Performing Post-Patching Tasks for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installations" |
| Perform post-patch tasks for WebCenter Spaces:  
- Set the Web Context Root on the Content Server connection  
- Configure group space workflows  
- Update the timezone attribute  
- Update the group spaces display mode  
- Choose a default start (or landing) page  
- Migrate Spaces custom library  
- Upgrade Process Spaces | Mandatory | Perform post-patch tasks for WebCenter Spaces. | Section 6.8.5, "Performing Post-Patching Tasks for Oracle WebCenter Spaces" |
Perform post-patch tasks for WebCenter security:

- Configure OWSM policies for Spaces and Discussions Web service end points, and if required, for portlet producers
- Update the list of authentication providers to add the Oracle Single Sign-On authentication provider

You must configure the security policy for Spaces and Discussions Web service end points. It is mandatory to configure security policies for portlet producers only if policies were configured in your pre-patched instance.

If an external authentication provider or identity assenter was configured in your pre-patched instance, you must configure it again after patching the instance.

**Note:** If you want to set additional WS-Security for WebCenter Portal, refer to the chapter "Configuring WS-Security" in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

Add new Oracle WebCenter Portal features:

- Extend the domain to add Activity Graph, Analytics, Pagelet Producer, Personalization, and WebCenter Services Portlets
- Upgrade custom WebCenter applications to add WebCenter Portal: Framework features

Compared to Release 11.1.2.0 or 11.1.3.0, Oracle WebCenter Portal 11.1.7.0 includes several new features. You can extend the WebCenter Portal domain to add new features and can update your applications, if required.

Start the servers and processes

Start your Oracle Fusion Middleware environment. This involves starting your Oracle WebLogic Server Administration Server, managed servers, node manager, OPMN and all system components.

Verify Oracle WebCenter Portal 11.1.7.0 installation

Verify your patched WebCenter Portal instance by trying to access various URLs like for Administration Server and Oracle WebCenter Portal: Spaces.
6.4.3 Patching to Oracle WebCenter 11.1.1.7.0

You can update Oracle WebCenter 11.1.1.7.0 using either Node Manager and automated script, or WebLogic Scripting Tool (WLST).

This section includes the following subsections:

- Section 6.4.3.1, "Updating Oracle WebCenter Using Node Manager and Automated Script"
- Section 6.4.3.2, "Updating Oracle WebCenter Using WLST Commands"

---

**Note:** If Oracle WebCenter is installed on multiple machines, you can update your software only by using WLST commands, and not through the automated script. Make sure that the product installer is run on each WebCenter Oracle home directory on each machine, and all the domains are updated using pack/unpack.

---

6.4.3.1 Updating Oracle WebCenter Using Node Manager and Automated Script

The Oracle WebCenter patch includes a script called `upgrade.py` that you can use to upgrade to the latest release. This script shuts down all the Managed Servers and the Administration Server at the beginning of the update process, and then starts all the servers during the update process.

You can use this script to update Oracle WebCenter only if you have set up Node Manager, have Oracle WebCenter installed on a single machine, and have verified that it is configured correctly. If your Node Manager is not configured correctly, you must use the WLST commands instead of this script to patch Oracle WebCenter.

This section includes the following subsections:

- Section 6.4.3.1.1, "Configure Node Manager"
- Section 6.4.3.1.2, "Verify Your Node Manager Configuration"
- Section 6.4.3.1.3, "Update Oracle WebCenter"
- Section 6.4.3.1.4, "How to Run the Oracle WebCenter Automated Script"

6.4.3.1.1 Configure Node Manager

To use the `upgrade.py` script, you must configure Node Manager as follows:

1. Make sure that all the servers in the domain (including the Administration Server) are associated with a machine that is configured to use your Node Manager. See "Configure a Machine to Use Node Manager" in Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server.

2. If you are using demo certificates (the certificates that ship with Oracle WebLogic Server), disable host name verification for all the servers. For more information, see "Disable host name verification" at the following URL:

   [http://download.oracle.com/docs/cd/E12839_01/apirefs.1111/e13952/taskhelp/security/DisableHostNameVerification.html](http://download.oracle.com/docs/cd/E12839_01/apirefs.1111/e13952/taskhelp/security/DisableHostNameVerification.html)

3. Ensure the following properties are set to true in the `nodemanager.properties` file:
   - `StartScriptEnabled` for the Node Manager, so that Managed Servers can receive proper classpath and command arguments.
- DomainRegistrationEnabled, so that domain can be registered.

Refer to Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server for more information.

4. Make sure the nmConnect command can be used to connect to the Node Manager in WLST. If you are in a production environment, follow the instructions in “Using nmConnect in a Production Environment” in Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server.

5. Make sure the nmStart command can be used to start the Administration Server in WLST. If you are in a production environment, a user name and password may be required to start the Administration Server, so ensure that Node Manager has the required credentials.

For more information, refer to "nmstart" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference, and also "How Node Manager Starts an Administration Server" in Oracle Fusion Middleware Node Manager Administrator’s Guide for Oracle WebLogic Server.

6.4.3.1.2 Verify Your Node Manager Configuration To verify that Node Manager has been configured correctly:

1. Stop all the servers in your domain.

2. Start WLST and connect to the Node Manager using nmConnect. For example, on a UNIX operating system:

   ```sh
cd WebCenter_ORACLE_HOME/common/bin
./wlst.sh
nmConnect(username = 'weblogic', password = 'examplepassword', host = 'localhost', port = '5556', domainDir = 'DOMAIN_HOME', nmType = 'ssl')
```

3. Start the Administration Server using nmStart. For example:

   ```sh
   nmStart('AdminServer')
   ```

4. Connect to the Administration Server in WLST and start a Managed Server. For example:

   ```sh
   connect()
   start('WLS_Spaces')
   ```

5. Check that the Managed Server you started is running. For example, try to access the following URL and log in:

   ```sh
   http://localhost:8888/webcenter
   ```

---

**Note:** If you are not able to verify your Note Manager configuration, then you must use WLST commands instead of the automated script to update Oracle WebCenter.

---

6.4.3.1.3 Update Oracle WebCenter To update Oracle WebCenter using the Node Manager and the automated script:

1. Ensure that you have run the Oracle WebCenter installer to update your software. For information, see Section 3.5.2, "Downloading the Required Installer" and Section 3.6.1, "Starting the Installer."
2. Ensure that you have updated your database schemas using the Patch Set Assistant. For information, see Section 3.7, "Updating Your Schemas with Patch Set Assistant".

3. Run the `upgrade.py` script as described in Section 6.4.3.1.4, "How to Run the Oracle WebCenter Automated Script".

4. Copy the Trust Store file from the Oracle home directory to the Oracle WebLogic Server domain directory.
   
   For example:
   ```
   cp $MW_HOME/oracle_common/modules/oracle.jps_11.1.1/jps-wls-trustprovider.jar $DOMAIN_HOME/lib/mbeantypes/jps-wls-trustprovider.jar
   ```

5. Restart the Node Manager, Administration Server, and the Managed Servers in the domain.

6.4.3.1.4 How to Run the Oracle WebCenter Automated Script  The `upgrade.py` script must be run on the same machine as the Administration Server. The script is located in the `WebCenter ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4` (on UNIX operating systems) or `WebCenter ORACLE_HOME/webcenter\scripts\upgrade_11.1.1.4` (on Windows operating systems) directory.

The following is the command line syntax for running the `upgrade.py` script:

```
upgrade.py path_to_upgrade_properties_file administrator_password node_manager_password
```

The `upgrade.py` script takes optional command line parameters, where:

- `path_to_upgrade_properties_file` is the path to the upgrade properties file
- `administrator_password` is the password for the Administration Server.
- `node_manager_password` is the password for the Node Manager.

Refer to the following sections for examples of how to run the `upgrade.py` script.

6.4.3.1.5 Example 1: No Optional Parameters Specified  If no optional parameters are specified, the script uses the default values for all the properties with the exception of the `domain.directory` and the passwords; you are prompted for these values. Here is an example:

```
cd WebCenter ORACLE_HOME/common/bin
./wlst.sh WebCenter ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4/upgrade.py
```

6.4.3.1.6 Example 2: Specifying a Properties File and Setting the Value of user.config.file  If you specify a properties file that sets the value of the `user.config.file` property, then the script overrides the default values of the properties with the values specified in the properties file and connects to the Administration Server and Node Manager with the credentials stored in the user configuration file. Here is an example:

```
cd WebCenter ORACLE_HOME/common/bin
./wlst.sh WebCenter ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4/upgrade.py
~/.upgrade.properties
```
If you specify a properties file and that properties file does not set the value of the `user.config.file` property and you do not pass the Administration Server and Node Manager passwords as a command line argument, then the script overrides the default values of the properties with the values specified in the properties file and prompt for passwords.

### 6.4.3.1.7 Example 3: Specifying a Properties File and Administrator Password
If you specify a properties file and `administrator_password`, then the script overrides the default values of the properties with the values specified in the properties file and uses the specified password to connect to the Administration Server. You will be prompted for the Node Manager password even if the Node Manager user name is same as the Administrator user name. Here is an example:

```bash
cd WebCenter_ORACLE_HOME/common/bin
./wlst.sh WebCenter_ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4/upgrade.py ~/upgrade.properties example_admin_password
```

### 6.4.3.1.8 Example 4: Specifying a Properties File, Administrator Password, and Node Manager Password
If you specify a properties file, `administrator_password` and `node_manager_password`, then it overrides the default values of the properties with the values specified in the properties file and uses the passwords specified to connect to the Administration Server and Node Manager. Here is an example:

```bash
cd WebCenter_ORACLE_HOME/common/bin
./wlst.sh WebCenter_ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4/upgrade.py ~/upgrade.properties example_admin_password example_nm_password
```

### 6.4.3.1.9 Properties That can be Set in the Upgrade Properties File
Table 6–5 lists the properties that can be set in the upgrade properties file.

**Tip:** A sample upgrade properties (upgrade.properties) file is available in the `WebCenter_ORACLE_HOME/webcenter/scripts/upgrade_11.1.1.4` directory.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain.directory</td>
<td>Path to the domain directory (Domain Home).</td>
</tr>
<tr>
<td>oracle.home</td>
<td>Path to the WebCenter Oracle home directory.</td>
</tr>
</tbody>
</table>
| admin.user      | Name of a user that is part of the LDAP wired to WebCenter Spaces and has Administrator privileges in the WLS embedded LDAP. To give a user Administrator privileged in WLS embedded LDAP:  
  1. Log in to the WebLogic Server console.  
  2. Click **Security Realms** and select the security realm.  
  3. Click the **Roles/Policies** tab.  
  4. Expand **Global Roles** and **Roles**, then click "View Role Conditions" for the **Admin** role.  
  5. Select the **User** role from the drop-down list, enter the user ID, then click **Add**.  
  6. Save your changes and exit. |
| admin.url       | URL used to connect to the Administration Server.                           |
| admin.server    | Name of the Administration Server.                                         |
6.4.3.10 Formatting Your Properties File  You must make sure you escape values correctly in your properties file. This is particularly important when entering Windows paths because all backslashes must be escaped with backslashes (in other words, a single backslash is represented by two backslashes in a Java properties file).

Refer to the following URL for details:

http://download.oracle.com/javase/6/docs/api/java/util/Properties.html#load%28java.io.Reader%29

The following is a sample properties file on a Windows operating system:

domain.directory=C:\Middleware\domains\domain_name
oracle.home=C:\Middleware\Oracle_WC1
admin.user=weblogic
admin.url=t3://examplehost:7001
admin.server=AdminServer
nodemanager.user=node_manager_user
nodemanager.host=localhost
nodemanager.port=5556
nodemanager.type=ssl
upgrade.custom.spaces=false
The following is a sample properties file on a UNIX operating system:

domain.directory=/home/Middleware/domains/domain_name
oracle.home=/home/Middleware/Oracle_WC1
admin.user=weblogic
admin.url=t3://examplehost:7001
admin.server=AdminServer
nodemanager.user=node_manager_user
nodemanager.host=localhost
nodemanager.port=5556
nodemanager.type=ssl
upgrade.custom.spaces=false

6.4.3.2 Updating Oracle WebCenter Using WLST Commands

If you choose not to configure the Node Manager, you can update your middle tier by using WLST commands. You must run the WLST commands from the same machine on which the Administration Server is running.

Before you upgrade Oracle WebCenter using WLST:

- Ensure that you have updated your Oracle WebCenter software by using Oracle WebCenter installer.
  
  For more information, see Section 3.5.2, "Downloading the Required Installer" and Section 3.6.1, "Starting the Installer".

- Ensure that you have updated your database schemas.
  
  For more information, see Section 3.7, "Updating Your Schemas with Patch Set Assistant".

To update Oracle WebCenter using WLST commands:

1. Stop the Administration Server and all Managed Servers.
2. Start WLST from the WebCenter Oracle home.
   
   On UNIX operating systems:
   
   cd WebCenter_ORACLE_HOME/common/bin
   
   ./wlst.sh
   
   On Windows operating systems:
   
   cd WebCenter_ORACLE_HOME\common\bin
   
   wlst.cmd

3. Ensure the external LDAP server is up and running, then run the upgradeOpss command in offline mode (without connecting to any server):

   On UNIX operating systems:
   
   upgradeOpss(jpsConfig='DOMAIN_HOME/config/fmwconfig/jps-config.xml',
   jaznData='MW_HOME/oracle_common/modules/oracle.jps_11.1.1/domain_config/system-jazn-data.xml')

   On Windows operating systems:
   
   upgradeOpss(jpsConfig='DOMAIN_HOME\config\fmwconfig\jps-config.xml',
   jaznData='MW_HOME\oracle_common\modules\oracle.jps_11.1.1\domain_config\system-jazn-data.xml')
Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation

4. Run the `upgradeWebCenterDomain` command in offline mode:

   `upgradeWebCenterDomain(domainDirName='DOMAIN_HOME', oracleHome='WebCenter_ORACLE_HOME', upgradeCustomSpaces=1)

Where:

- `domainDirName` - Replace `DOMAIN_HOME` with the full path to your Domain home directory.
- `oracleHome` - Replace `WebCenter_ORACLE_HOME` with the full path to your WebCenter Oracle home directory.
- `upgradeCustomSpaces` - Set to 1 if you used the custom.webcenter.spaces shared library to customize WebCenter Spaces and you want to migrate your customizations to the upgraded instance. For information about how to use your extensions in WebCenter Spaces, refer to:

**WARNING:** If you upgrade your WebCenter domain with `upgradeCustomSpaces` set to 0, none of your previous customizations and resources that you developed, like page templates and skins, will be available in the upgraded WebCenter Spaces instance; there is no facility to migrate WebCenter Spaces customizations after the upgrade process.

For example:

   `upgradeWebCenterDomain(domainDirName='/home/Oracle/Domains/wc_domain', oracleHome='/home/Oracle/Middleware/Oracle_WC1', upgradeCustomSpaces=1)`

**Note:** You may see error messages when you run the `upgradeWebCenterDomain` command. These errors can be safely ignored so long as there is some text indicating that your operation was completed successfully. For more information about error messages, refer to *Oracle Fusion Middleware Release Notes*.

5. Start the Administration Server.

6. Connect to the Administration Server.

   `connect()`

7. In the domain running the WebCenter Spaces Managed Server, run the `upgradeWebCenterPermissions` command to add the required permission to the LDAP store.

   `upgradeWebCenterPermissions()`
8. All of the instructions to this point have been for a single node. If your domain has servers running on more than one machine, you need to pack and unpack your domain to replicate the changes to other nodes in your cluster.

To pack and unpack your updated domain:

a. Pack the Administration Server:
   
   ```
   cd WebCenter_ORACLE_HOME/common/bin
   ./pack.sh -managed=true -domain=DOMAIN_HOME -template=wcdomaintemplate.jar
   -template_name=wc_domain_template
   ```

b. Copy `wcdomaintemplate.jar` to the `WebCenter_ORACLE_HOME/common/bin` on the other machines.

c. Remove or move the old domain directories (`DOMAIN_HOME` and `APPLICATION_HOME`) on the other machines.

d. Unpack the domain on each of the other machines:
   
   ```
   cd WebCenter_ORACLE_HOME/common/bin
   ./unpack.sh -domain=DOMAIN_HOME -template=wcdomaintemplate.jar
   ```

9. Start the WebCenter Managed Servers:
   
   - **WC_Spaces** (WebCenter Spaces)
   - **WC_Portal** (Oracle Portlet Producers)
   - **WC_Collaboration** (Oracle WebCenter Discussion Server)

   Make sure the **WC_Spaces** server is up and running before moving on to the next step.

10. Disconnect from the Administration Server, and connect to the **WC_Spaces** server as an Oracle WebCenter administrator that is defined in the external LDAP server and is defined as an administration user in the embedded Oracle WebLogic Server.

   **Note:** It is important to note that the administration user must be defined both as a user in the external LDAP directory and as a user with administration privileges in the embedded Oracle WebLogic Server LDAP directory.

   If necessary, you can add a user to the Administration Group of the embedded Oracle WebLogic Server LDAP server as follows:

   1. Log in to the WebLogic Server console.
   2. Click **Security Realms** and select the "myrealm" link.
   3. Click the **Roles/Policies** tab.
4. Expand **Global Roles**, then expand **Roles**, then click "View Role Conditions" for the **Admin** role.

5. Click **Add Condition**, then select **User** from the "Predicate List" field, then click **Next**.

6. Enter the user name in the "User Argument Name" field, then click **Add**.

7. Click **Finish**. The user you just entered should now be listed along with the administrators.

8. Save your changes and exit.

11. In the domain running the WebCenter Spaces managed server, run the `upgradeWebCenterApplication` command.

   ```
   upgradeWebCenterApplication(appName='webcenter')
   ```

   If you have a cluster environment where there are multiple servers with WebCenter Spaces deployed, you must specify the server name. For example:

   ```
   upgradeWebCenterApplication(appName='webcenter', server="server_name")
   ```

12. Copy the Trust Store file from the Oracle home directory to the Oracle WebLogic Server domain directory.

    For example:

    ```
    cp $MW_HOME/oracle_common/modules/oracle.jps_11.1.1/jps-wls-trustprovider.jar
    $DOMAIN_HOME/lib/mbeantypes/jps-wls-trustprovider.jar
    ```

13. Restart the Administration Server and the Managed Servers in the domain.

### 6.5 Patching an Oracle WebCenter 11.1.1.1.0 Installation

If you are running Oracle WebCenter 11g (11.1.1.1.0), you must first update your Oracle Fusion Middleware environment to 11g Release 11.1.1.2.0, and then apply the Oracle WebCenter Portal 11.1.1.7.0 patch.

Figure 6–4 illustrates the steps required to update an Oracle WebCenter 11.1.1.1.0 installation to Release 11.1.1.7.0. Table 6–6 describes these steps in detail. Click the required steps in the table to navigate to the information about each step. Alternatively, follow the instructions in Appendix C, "Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.0) to Release 1 (11.1.2.0)".

6.6 Troubleshooting Issues

This section provides information to help you troubleshoot problems you may encounter while patching or after patching Oracle WebCenter.

6.6.1 Troubleshooting Issues with Patching Oracle WebCenter

This section provides information to help you troubleshoot problems you may encounter while patching Oracle WebCenter.

Problem

While running the upgrade.py script, you may encounter the following error:

WLSTException: Error occurred while performing nmConnect : Cannot connect to Node Manager. : Connection refused. Could not connect to NodeManager.

Solution

If you encounter this error, check that the Node Manager is running and that the user and server details provided to the script are correct. Then, re-run the upgrade.py script to complete patching your Oracle WebCenter instance.

6.6.2 Troubleshooting Post-Patching Issues

This section provides information to help you troubleshoot issues you may encounter after patching to WebCenter Portal 11.1.1.7.0. It contains the following subsections:

- Section 6.6.2.1, "Related Items Tab Not in Focus"
- Section 6.6.2.2, "Content Getting Clipped and Inner Scrollbars Appearing"
- Section 6.6.2.3, "Pretty URLs Not Working for Page Navigation"
- Section 6.6.2.4, "Content Queries Not Rendered in Navigation Model"
- Section 6.6.2.5, "Blog Posts Not Displayed in Spaces"
- Section 6.6.2.6, "Comments and Likes Not Displayed in Activity Stream"

6.6.2.1 Related Items Tab Not in Focus

Problem

In Oracle WebCenter 11.1.1.4.0, your WebCenter Portal application contained a Document Viewer task flow, and the Initial Sidebar property was set to relatedItems. However in the patched instance, the Related Items tab is not in focus when you navigate to the task flow though the related items are visible.

Solution

Perform post-patching configuration for other Fusion Middleware products

<table>
<thead>
<tr>
<th>Task and Link to More Information</th>
<th>Mandatory or Optional?</th>
<th>Links</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform post-patching configuration for other Fusion Middleware products</td>
<td>Mandatory</td>
<td>Appendix C.4.3, &quot;Post-Migration Configuration for Oracle Fusion Middleware Components&quot;</td>
</tr>
<tr>
<td>Decommission the 11.1.1.1.0 installation</td>
<td>Mandatory</td>
<td>Appendix C.4.2.11, &quot;Decommissioning the 11.1.1.1.0 Installation&quot;</td>
</tr>
<tr>
<td>Patch from Release 11.1.1.2.0 to 11.1.1.7.0</td>
<td>Mandatory</td>
<td>Section 6.4, &quot;Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation&quot;</td>
</tr>
</tbody>
</table>

Table 6–6 (Cont.) Applying the Latest Patch to Oracle WebCenter 11.1.1.1.0

Mandatory Appendix C.4.3, "Post-Migration Configuration for Oracle Fusion Middleware Components"

Mandatory Appendix C.4.2.11, "Decommissioning the 11.1.1.1.0 Installation"

Mandatory Section 6.4, "Patching an Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installation"
Beginning with Release 11.1.1.6.0, Related Items no longer exists as a tab. You can change the value of the Initial Sidebar property to target one of the new tabs: tags, links or recommendations.

6.6.2.2 Content Getting Clipped and Inner Scrollbars Appearing

**Problem**

In the spaces upgraded from Release 11.1.1.2.0 and 11.1.1.3.0, content is getting clipped and inner scrollbars appear on the components.

**Solution**

Beginning with Release 11.1.1.6.0, the default page template for Spaces is Top Navigation, which implements a flowing layout. All the page templates that implement a flowing layout have a fixed width. Most of the pages created before Release 11.1.1.4.0 were based on page templates that implemented a stretching layout that allows components to be stretched to maximize the usage of the viewable area. When you upgrade your Spaces instance, Top Navigation is set as the default template, and therefore space pages might not be rendered properly if they are based on a stretching layout page template.

After patching from Release 11.1.1.2.0 or 11.1.1.3.0, configure your spaces, if required, to use a page template that allows the content to be stretched. Beginning with Release 11.1.1.6.0, the following out-of-the-box page templates support a stretching layout: Top Navigation (Stretch), Side Navigation (Stretch), Fusion Top Navigation, and Fusion Side Navigation.

6.6.2.3 Pretty URLs Not Working for Page Navigation

**Problem**

In your patched Spaces application, you are unable to navigate to a specific page using the pretty URL.

**Solution**

Beginning with Release 11.1.1.6.0, the pretty URLs to navigate to a specific page in a space have changed.

To go to a specific page in the Home Space, use:

http://host:port/webcenter/spaces/profile/userName/page/escapedPageDisplayName

The variable `userName` is your user name or the name of the user who owns the page in the Home Space. The variable `escapedPageDisplayName` indicates the use of an escaped version of the page display name. For example, when you create a page with the name My Page, the URL to this page ends with My+Page. For example:

http://host:port/webcenter/spaces/profile/weblogic/page/My+Page

Use the following syntax for UI URLs that target business role pages and system pages:

http://host:port/webcenter/spaces/system/page/pageName

For example:

http://host:port/webcenter/spaces/system/page/Documents
6.6.2.4 Content Queries Not Rendered in Navigation Model

Problem
After patching to Release 11.1.1.7.0, content queries do not get rendered in a navigation model.

Solution
After patching WebCenter Portal, if previous content queries are no longer listed in your navigation model, you must re-build the index collection on Content Server. For information, see "Rebuilding the Collection" in *Oracle WebCenter Content System Administrator’s Guide for Content Server*.

6.6.2.5 Blog Posts Not Displayed in Spaces

Problem
After you patched your Oracle WebCenter 11.1.1.2.0 instance, blog posts are not getting displayed in spaces.

Solution
The Wiki Migrator utility wiki-upgrade.jar migrates only the wiki pages and blogs that are created using the Wiki and Blog page styles. In a space, you can configure a page to point to a different wiki or blog by using the wcURL parameter. However, this type of customization is not supported in wiki migration. Therefore, in Release 11.1.1.2.0, if your page was custom wired to point to a different wiki or blog, the page will not display the wiki or blog in the patched instance.

The wiki-upgrade.jar utility migrates your Release 11.1.1.2.0 wiki and blog data to a temporary folder with the same name as the domain. You must move this folder to the required space folder. Then, you can either:

- Rename the domain folder to have the same name as the wiki page or blog.
- Create a new page with the same name as the newly moved folder, in the required space. This will create a new page that exposes the wiki or blog. You can then delete the old broken page.

6.6.2.6 Comments and Likes Not Displayed in Activity Stream

Problem
In your patched WebCenter Portal instance, Activity Stream lists the various messages that were posted and documents that were added in your pre-patched instance. However, it does not show the comments and likes associated with these messages and documents.

Explanation
In WebCenter Portal 11.1.1.7.0, comments and likes are associated with an activity, and not with the object (a message or a document), whereas in previous releases, comments and likes were associated with the object itself.

For example, suppose you upload version 1 of a document, and later update the document to version 2. Activity Stream will display any comments or likes associated with the activity of uploading version 1 or updating the document to version 2. Any comments or likes associated with the document itself are not displayed.
6.7 Pre-Patching Tasks for WebCenter Portal

Preparing to patch your WebCenter Portal environment involves performing generic tasks such as stopping the servers, backing up your environment, and upgrading to the latest version of WebLogic server. It also involves preparing WebCenter Portal. This section describes all the WebCenter Portal-specific pre-patching tasks that you may need to perform before patching WebCenter Portal to release 11.1.1.7.0.

Note: The pre-patching tasks described in this section are not required for all upgrade paths. To determine whether a task is applicable, refer to the diagram and the table given in this chapter for your existing environment. For example, if you are patching WebCenter Portal 11.1.1.6.0, refer to the diagram and the table given in Section 6.2, "Patching an Oracle WebCenter Portal 11.1.1.6.0 Installation."

This section contains the following subsections:

- Section 6.7.1, "Determining OWSM Policy URIs for Spaces, Discussions, and Portlet Web Service End Points"
- Section 6.7.2, "Saving Your OmniPortlet and WebClipping Customizations"
- Section 6.7.3, "Running purgeMetadata() for WebCenter Spaces"
- Section 6.7.4, "Considerations for Upgrading Oracle WebCenter Content or Oracle ECM"

6.7.1 Determining OWSM Policy URIs for Spaces, Discussions, and Portlet Web Service End Points

In an out-of-the-box installation, the Web service end points for Spaces and Discussions are seeded with Oracle Web Services Manager (OWSM) security policies. In certain configurations, WSRP portlet producer endpoints (WSRP_v2_Markup_Service) could also be configured with OWSM security policies. When you patch your WebCenter Portal instance, the assigned security policy configuration is changed to no security policy, causing functional loss. To be able to restore OWSM security policies in your patched instance, you must note down the policy URIs before you patch the instance.

This section contains the following sections:

- Chapter 6.7.1.1, "Determining OWSM Policy URI for the Spaces Web Service End Point"
- Chapter 6.7.1.2, "Determining OWSM Policy URI for the Discussions Web Service End Point"
- Chapter 6.7.1.3, "Determining OWSM Policy URIs for Portlet Producer Web Service End Points"

6.7.1.1 Determining OWSM Policy URI for the Spaces Web Service End Point

To list the OWSM security policy URI for the Spaces Web service end point:

1. Ensure the WC_Spaces managed server is up and running.
2. Invoke the WLST script from your WebCenter Portal Oracle home directory, and connect to the Administration Server for WebCenter Portal.
For information, see the section "Running Oracle WebLogic Scripting Tool (WLST) Commands" in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

3. Run the following command:

```
listWebServicePolicies('/wc_domain/WC_Spaces/webcenter#11.1.1.4.0', 'webcenter', 'web', 'SpacesWebService', 'SpacesWebServiceSoapHttpPort')
```

Where, `wc_domain` refers to the WebCenter Portal domain, and `WC_Spaces` is the name of the managed server on which the Spaces application is deployed. The other parameters are all fixed. To get details about parameters, you can use the WLST command `help('listWebServicePolicies')`.

If you are using the out-of-the-box OWSM security policy, the command result is displayed in the following format:

```
SpacesWebServiceSoapHttpPort :
  security : oracle/wss11_saml_or_username_token_with_message_protection_service_policy, enabled=true
  Attached policy or policies are valid; endpoint is secure.
```

Note down the security policy name displayed in bold. You will need to specify this security policy URI to restore the security configuration post patching.

### 6.7.1.2 Determining OWSM Policy URI for the Discussions Web Service End Point

To list the OWSM policy URI for the Discussions Web service end point:

1. Ensure the `WC_Collaboration` managed server is up and running.
3. Run the following command:

```
listWebServicePolicies('/wc_domain/WC_Collaboration/owc_discussions', 'owc_discussions', 'web', 'OWCDiscussionsServiceAuthenticated', 'OWCDiscussionsServiceAuthenticated')
```

Where, `wc_domain` refers to the WebCenter Portal domain, and `WC_Collaboration` is the name of the managed server on which Discussion Server is deployed. The other parameters are all fixed.

If you are using the out-of-the-box OWSM security policy, the command’s result is of the following format:

```
OWCDiscussionsServiceAuthenticated :
  security : oracle/wss10_saml_token_service_policy, enabled=true
  Attached policy or policies are valid; endpoint is secure.
```

Note down the security policy name highlighted in bold. You will need to specify this security policy URI while restoring the security settings post patching.

### 6.7.1.3 Determining OWSM Policy URIs for Portlet Producer Web Service End Points

All out-of-the-box portlet producers get redeployed during the patching process. If you have OWSM security policies attached to portlet producers’ Web service end points, you must note down the policy URIs.
For this, invoke the WLST script from your WebCenter Portal Oracle home directory and connect to the Administration Server for WebCenter Portal. For information, see the section "Running Oracle WebLogic Scripting Tool (WLST) Commands" in Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal. Also, ensure the WC_Portlet managed server and any custom managed servers on which custom portlet producers are deployed are up and running. Then, run WLST commands to determine OWSM policy URIs for your portlet producers.

- WebCenter Services Portlets producer
  This producer is available out-of-the-box from WebCenter Portal release 11.1.1.6.0 onward. If this producer is deployed in your instance, run the following command to list the security policy attached to the Web service end point, services-producer:

  ```
  listWebServicePolicies('/wc_domain/WC_Portlet/services-producer#11.1.1.6.0','services-producer','web','WSRP_v2_Service','WSRP_v2_Markup_Service')
  ```

- Custom portlet producers
  You may have various custom portlet producers deployed in your WebCenter Portal instance, and have OWSM security policies attached to custom portlet producers' Web service end points (WSRP_v2_Markup_Service). After patching your WebCenter Portal instance, if you intend to redeploy the custom portlet producers, you must note down the OWSM policy URI for each custom portlet producer before your patch your instance.

  For example, if your custom portlet producer is named TestJSR286 and deployed to WC_PORTLET managed server with version 1.0, run the following command to determine the security policy URI:

  ```
  listWebServicePolicies('/wc_domain/WC_Portlet/TestJSR286#1.0','TestJSR286','web','WSRP_v2_Service','WSRP_v2_Markup_Service')
  ```

  The following is a sample output for the command:

  ```
  WSRP_v2_Markup_Service :
  security : oracle/wss10_saml_token_service_policy, enabled=true
  Attached policy or policies are valid; endpoint is secure.
  ```

  Note down the security policy URI highlighted in bold. You will need to specify the security policy URI while restoring the security settings in your patched instance.

### 6.7.2 Saving Your OmniPortlet and WebClipping Customizations

**Note:** Perform the procedure listed in this section only if you are using OmniPortlet and WebClipping customizations, and they are stored in a file-based preferences store. By default, in Oracle WebCenter and Oracle Portal, a file-based preferences store is not used. Such stores are used by default only for 11g Release 1 (11.1.1) Portal environments that are upgraded from their 10g versions.

When you apply the latest patch set for Oracle WebCenter or Oracle Portal, both the OmniPortlet and WebClipping applications are re-deployed, and all configuration data stored within file-based preference stores is lost. You must save the OmniPortlet and WebClipping configuration and customizations to ensure that customizations are not lost when you apply the patch set.
To save and back up your customizations:

1. Locate the following directories:
   - On UNIX operating systems:
     - path_to_war_directory/WEB-INF/providers/omniPortlet
     - path_to_war_directory/WEB-INF/providers/webclipping
   - On Windows operating systems:
     - path_to_war_directory\WEB-INF\providers\omniPortlet
     - path_to_war_directory\WEB-INF\providers\webclipping
   Where path_to_war_directory refers to the following path:
     - On a UNIX operating system: DOMAIN_HOME/servers/WLS_Portlet/tmp/_WL_user/portalTools_version/randomly_generated_directory/war
     - On a Windows operating system: DOMAIN_HOME\servers\WLS_Portlet\tmp\_WL_user\portalTools_version\randomly_generated_directory\war
   Where, DOMAIN_HOME is the domain home locations for your Oracle Portal or Oracle WebCenter domain, as specified on the "Specify Domain Name and Location" screen in the Configuration Wizard.

2. Run the following command to back up the directory:
   - On UNIX operating systems:
     - cp -fr path_to_war_directory/WEB-INF/providers/omniPortlet backup_location
     - cp -fr path_to_war_directory/WEB-INF/providers/webclipping backup_location
   - On Windows operating systems:
     - xcopy /y/e path_to_war_directory\WEB-INF\providers\omniPortlet backup_location
     - xcopy /y/e path_to_war_directory\WEB-INF\providers\webclipping backup_location

6.7.3 Running purgeMetadata() for WebCenter Spaces

If you are using WebCenter Spaces, you must run the purgeMetadata() WLST command to remove older versions of documents in MDS. This enables the patching process to run on a smaller set of data and thus decrease the time required to upgrade.

To purge metadata for WebCenter Spaces:

1. Start your Administration Server and Spaces Managed Server (WLS_Spaces) as the purgeMetadata() command is an online command.
2. Start WLST from your WebCenter Oracle home.
   - On UNIX operating systems:
     - cd WebCenter_ORACLE_HOME/common/bin
     - ./wlst.sh
   - On Windows operating systems:
Pre-Patching Tasks for WebCenter Portal

3. Connect to the Administration Server using the WLST `connect()` command.

4. Run the `purgeMetadata()` WLST command. For example, run the following command to purge metadata older than 3060 seconds:
   
   ```
   purgeMetadata('webcenter', 'WLS_Spaces', 3060)
   ```
   
   See "purgeMetadata" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference for more details.

5. Re-collect the database statistics. For example, you can connect to the WebCenter MDS schema using SQLPlus:

   ```sql
   execute dbms_stats.gather_schema_stats(ownname=>null, options=>'GATHER AUTO');
   ```

6. Stop your WLS_Spaces managed server and Administration Server.

For more information, see "Metadata Services (MDS) Custom WLST Commands" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.

### 6.7.4 Considerations for Upgrading Oracle WebCenter Content or Oracle ECM

**Note:** Beginning with Release 11.1.1.6.0, Oracle Enterprise Content Management Suite (Oracle ECM) and Oracle Universal Content Management (Oracle UCM) have been rebranded (renamed) as Oracle WebCenter Content, and Oracle Content Server has been renamed as Oracle WebCenter Content Server (short name Content Server).

Oracle WebCenter Content includes Content Server. If your WebCenter Portal instance uses Content Server as a content repository, consider the following:

- If you are running a version of Oracle ECM older than 10g Release 3 (10.1.3.5.1), you must upgrade to the 10g Release 3 (10.1.3.5.1) version before attempting to upgrade to Oracle WebCenter Content 11g or WebCenter Portal 11g.

- If your existing environment uses Oracle Content Server 10g as the content repository, you must upgrade to Oracle WebCenter Content 11.1.1.7.0. This is important to take advantage of the full set of features that the 11g release provides.

- If you are using Content Server, both WebCenter Portal and Oracle WebCenter Content must be of the same patch set level. For example, if you are patching to WebCenter Portal 11.1.1.7.0, you must also patch to Oracle WebCenter Content 11.1.1.7.0.

- WebCenter Portal and Oracle WebCenter Content can be within the same domain or in separate domains.

For information about upgrading to Oracle WebCenter Content 11g, see Oracle Fusion Middleware Upgrade Guide for Oracle WebCenter Content.
6.7.4.1 Upgrading Oracle ECM

If you are running a version of Oracle ECM older than 10g Release 3 (10.1.3.5.1), you must upgrade to the 10g Release 3 (10.1.3.5.1) version before attempting to upgrade to Oracle WebCenter Content 11g.

6.8 Post Patching Tasks for WebCenter Portal

This section describes all the tasks that you may need to perform to complete patching WebCenter Portal to release 11.1.1.7.0.

This section contains the following subsections:

- Section 6.8.1, "Configuring Security Policies for Spaces, Discussions, and Portlet Producer Web Service End Points"
- Section 6.8.2, "Extending the Domain Using the Pagelet Producer Upgrade Template"
- Section 6.8.3, "Updating SSO and OHS Configuration"
- Section 6.8.4, "Performing Post-Patching Tasks for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installations"
- Section 6.8.5, "Performing Post-Patching Tasks for Oracle WebCenter Spaces"
- Section 6.8.6, "Adding Oracle Single Sign-On Authentication Provider to the List of Authentication Providers"
- Section 6.8.7, "Adding New Features to WebCenter Portal"

6.8.1 Configuring Security Policies for Spaces, Discussions, and Portlet Producer Web Service End Points

When you patch your WebCenter Portal instance, the assigned Oracle Web Services Manager (OWSM) security policies are removed, and no other security policy is applied. You must restore your previous security policy configuration using the policy names you noted down in Section 6.7.1, "Determining OWSM Policy URIs for Spaces, Discussions, and Portlet Web Service End Points."
To restore or attach OWSM security policies to Web service end points:

1. Ensure the WC_Spaces, WC_Collaboration, and WC_Portlet managed servers are running. If custom portlet producers are deployed to any custom managed servers, ensure those servers are also up and running.

3. Run the following WLST command to attach the OWSM security policy to the Web service endpoint (SpacesWebService) for Spaces:

   ```
   attachWebServicePolicy('webcenter', 'webcenter', 'web', 'SpacesWebService', 'SpacesWebServiceSoapHttpPort', 'oracle/wss11_saml_or_username_token_with_message_protection_service_policy')
   ```

   Where `oracle/wss11_saml_or_username_token_with_message_protection_service_policy` is the policy you want to restore. Note that this is the same value you obtained by running the `listWebServicePolicies` WLST command against the Spaces Web service end point in Section 6.7.1.1, "Determining OWSM Policy URI for the Spaces Web Service End Point."

4. Run the following WLST command to attach the OWSM security policy to the Web service endpoint (OWCDiscussionsServiceAuthenticated) for Discussions:

   ```
   attachWebServicePolicy('owc_discussions', 'owc_discussions', 'web', 'OWCDiscussionsServiceAuthenticated', 'OWCDiscussionsServiceAuthenticated', 'oracle/wss10_saml_token_service_policy')
   ```

   Where `oracle/wss10_saml_token_service_policy` is the policy you want to restore. Note that this is the same value that you obtained by running `listWebServicePolicies` against the Discussions Web service end point in Section 6.7.1.2, "Determining OWSM Policy URI for the Discussions Web Service End Point."

5. Run the WLST command to attach the OWSM security policy to the Web service endpoint (WSRP_v2_Markup_Service) for a custom portlet producer. For example, if your portlet producer’s name is TestJSR286, and it is deployed to the WC_Portlet managed server with version 1.0, run the following command:

   ```
   attachWebServicePolicy('/wc_domain/WC_Portlet/TestJSR286#1.0', 'TestJSR286', 'web', 'WSRP_v2_Service', 'WSRP_v2_Markup_Service', 'oracle/wss10_saml_token_service_policy')
   ```

   Where `oracle/wss10_saml_token_service_policy` is the policy you want to restore. Note that this is the same value that you obtained by running `listWebServicePolicies` against the portlet producer’s Web service end point in Section 6.7.1.3, "Determining OWSM Policy URIs for Portlet Producer Web Service End Points."

---

**Note:** This step is required only if any custom portlet producers are deployed in your WebCenter Portal environment. To attach the OWSM security policy, you must run the WLST command for each custom portlet producer separately.

---
6. Run the following WLST command to attach the OWSM security policy to the Web service endpoint (services-producer) for the WebCenter Services Portlets producer:

```bash
attachWebServicePolicy('services-producer#11.1.1.6.0', 'services-producer', 'web', 'WSRP_v2_Service', 'WSRP_v2_Markup_Service', 'oracle/wss10_saml_token_service_policy')
```

Where `oracle/wss10_saml_token_service_policy` is the policy you want to restore.

---

**Note:** This step is required only if you are patching from release 11.1.1.6.0, and WebCenter Services Portlets producer is deployed.

WebCenter Services Portlets producer is available from release 11.1.1.6.0 onward. If you are patching from a previous release and want to deploy the WebCenter Services Portlets producer, you must first extend your domain as described in Section 6.8.7.1, "Installing Activity Graph, Analytics, Pagelet Producer, Personalization Server, and WebCenter Services Portlets." Then, attach the OWSM security policy for the Web services end point for WebCenter Services Portlets producer.

---

7. Restart the WC_Spaces, WC_Collaboration, and WC_Portlet managed servers. Also restart custom managed servers if custom portlet producers are deployed to those managed servers.

### 6.8.2 Extending the Domain Using the Pagelet Producer Upgrade Template

A new version of Pagelet Producer was released with WebCenter Portal 11.1.1.6.0. If your upgraded WebCenter instance already has Pagelet Producer installed, you can choose to apply the new Pagelet Producer upgrade template to your domain to take advantage of the new features.

To apply the Pagelet Producer upgrade template:

1. Stop the Admin server and all managed servers.
2. Start the Configuration Wizard on the machine running the Admin server.
   
   On UNIX, run `WebCenter_ORACLE_HOME/common/bin/config.sh`.
   
   On Windows, run `WebCenter_ORACLE_HOME\common\bin\config.cmd`.
3. Select **Extend an existing WebLogic domain** and click **Next**.
4. Select your domain and click **Next**.
5. Select the **Extend my domain using an existing extension template** option.
6. Specify the path to the template, `oracle.pagelet-producer-upgrade_template_11.1.1.jar` and click **Next**. The template is available at the following location:

   ```bash
   WebCenter_ORACLE_HOME/common/templates/applications/oracle.pagelet-producer-upgrade_template_11.1.1.jar
   ```
7. Click **Next** on the remaining screens until you get the Configuration Summary screen, then click **Extend**.
For more information on extending a domain, see "Extending a WebLogic Domain in Graphical Mode" in Oracle Fusion Middleware Creating Domains Using the Configuration Wizard.

8. Start the Admin server and all managed servers.

9. Reconfigure the Pagelet Producer connections for the Spaces application and WebCenter custom applications (Framework applications) by using Fusion Middleware Control or WLST. For information, see "Registering the Pagelet Producer" in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

**Note:** In the previous release, it was mandatory to deploy Pagelet Producer to the following path:

http://<pagelet-producer-server>:<port> /

Pagelet Producer could not be accessed if it was deployed at any other location other than the root '/'. From Release 11.1.1.6.0 onward, Pagelet Producer is deployed to the following path:

http://<pagelet-producer-server>:<port>/pagelets/

Where pagelets refers to any location of your choice where you want to deploy Pagelet Producer. Therefore, after extending the domain using the new Pagelet Producer upgrade template, you must reconfigure your Pagelet Producer connections.

If you have OHS and SSO configured, you must configure them to use the new context root. For information, see Section 6.8.3, "Updating SSO and OHS Configuration."

10. Undeploy the older version of Pagelet Producer.
    a. Stop WC_Portlet, the managed server on which Pagelet Producer is running.
    b. In WLS Console, click Deployments.
    c. Select the checkbox next to pagelet-producer (11.1.1.4.0) deployment.
    d. Click Delete.

11. Target the WebCenterDS data source to WC_Portlet. This is required to enable the OpenSocial feature.
    a. In WLS Console, go to Services > Data Source.
    b. Click WebCenterDS.
    c. On the Targets tab, select WC_Portlet and click Save.

### 6.8.3 Updating SSO and OHS Configuration

If you have Oracle HTTP Server (OHS) and Single Sign-on (SSO) configured in your upgraded WebCenter Portal environment, you may need to update the configuration for Pagelet Producer, Portlet Producer applications and Oracle SES.

This section includes the following subsections:

- Section 6.8.3.1, "Updating OHS Configuration for Pagelet Producer"
- Section 6.8.3.2, "Updating SSO Configuration for Pagelet Producer"
Section 6.8.3.3, "Updating SSO Configuration for Portlet Producer Applications"
Section 6.8.3.4, "Updating SSO Configuration for Oracle SES"
Section 6.8.3.5, "Verifying SSOFilter Grant"

6.8.3.1 Updating OHS Configuration for Pagelet Producer

Beginning with Release 11.1.1.6.0, Pagelet Producer's web context root has changed from "/" to "/pagelets", where pagelets refers to any location of your choice where Pagelet Producer is deployed. Before Release 11.1.1.6.0, since Pagelet Producer used "/" as a web context root, virtual host configuration was recommended, but it is no longer required.

If you have OHS configured, you must update the OHS entry in mod_wl_ohs.conf. This file is available at the following path:

```
WT_ORACLE_HOME/instances/your_instance/config/OHS/ohs1
```

Where, WT_ORACLE_HOME refers to the Web Tier Oracle Home.

Replace the following entries, if present:

```xml
<Location /pageletadmin>
    SetHandler weblogic-handler
    WebLogicHost webcenter.example.com
    WebLogicPort 8889
</Location>

<Location /authenticateWithApplicationServer>
    SetHandler weblogic-handler
    WebLogicHost webcenter.example.com
    WebLogicPort 8889
</Location>
```

With the following entry:

```xml
<Location /pagelets>
    SetHandler weblogic-handler
    WebLogicHost webcenter.example.com
    WebLogicPort 8889
</Location>
```

6.8.3.2 Updating SSO Configuration for Pagelet Producer

Beginning with Release 11.1.1.6.0, Pagelet Producer's web context root has changed from "/" to "/pagelets". If SSO is configured for your WebCenter environment, you must update your SSO configuration or policy to use the new context root for protected and public URIs.

This section describes how you can update the policy for OAM 11g, OAM 10g, and OSSO.

Updating OAM 11g policies for Pagelet Producer

Updating OAM 11g policies for Pagelet Producer involves creating the following resources:

- `/pagelets/* and /pagelets/.../*`
- `/pagelets/authenticateWithApplicationServer* and /pagelets/authenticateWithApplicationServer/.../*`
To update OAM 11g policies for Pagelet Producer:

1. Log in to the OAM Console using the following URL format:
   `http://host:port/oamconsole`

2. Go to **Policy Configuration > Application Domains**. The Policy Manager pane displays.

3. Locate the application domain created while registering the WebGate agent.

4. Open the **Resources** tab, and click **New Resource**.

5. Add the resources for Pagelet Producer applications.
   To add the `/pagelets/*` resource:
   a. In Resource Type, select **HTTP**.
   b. In the Host Identifier field, select the host created while registering the WebGate agent.
   c. In the Resource URL field, enter the following:
      `/pagelets/*`
   d. In the Description field, enter a description for the resource.
   e. Set Protection Level to **Unprotected**.
   f. Set Authentication Policy to **Public Resource Policy**.
   g. Set Authorization Policy to **Protected Resource Policy**.
   h. Click **Apply**.

6. Repeat step 5 to add `/pagelets/.../*` as a resource.

7. Add `/pagelets/authenticateWithApplicationServer/*` as a resource:
   a. In the Resource Type field, select **HTTP**.
   b. In the Host Identifier field, select the host created while registering the WebGate agent.
   c. In the Resource URL field, enter the following:
      `/pagelets/authenticateWithApplicationServer/*`
   d. In the Description field, enter a description for the resource.
   e. Set Protection Level to **Protected**.
   f. Set Authentication Policy to **Protected Resource Policy**.
   g. Set Authorization Policy to **Protected Resource Policy**.
   h. Click **Apply**.

8. Repeat step 7 to add
   `/pagelets/authenticateWithApplicationServer/.../*` as a protected resource.

9. Repeat step 7 to add `/pagelets/admin/*` as a protected resource.

10. Repeat step 7 to add `/pagelets/admin/.../*` as a protected resource.

11. On the **Resources** tab, search for `/pageletadmin/*` and `/authenticateWithApplicationServer/*` and remove these old resources.
12. Restart Web Tier and verify your changes.

**Updating OAM 10g Policies for Pagelet Producer**
Updating OAM 10g policies for Pagelet Producer involves creating the following resources:
- /pagelets
- /pagelets/authenticateWithApplicationServer
- /pagelets/admin

To update OAM 10g policies for Pagelet Producer:
1. Log in to the OAM Console using the following URL format:
   ```
   http://host:port/access/oblix
   ```
2. Select Policy Manager.
3. Locate the policy domain that you created to protect your WebCenter resources.
4. Open the Resources tab and click Add.
5. Add the /pagelets resource. For the resource:
   a. Select HTTP as the resource type.
   b. Select the Host Identifier for the WebCenter Web Tier.
   c. Enter /pagelets as the URL Prefix.
   d. Enter a description for the resource.
   e. Ensure that Update Cache is selected, and then click Save.
6. Repeat step 5 to add /pagelets/authenticateWithApplicationServer as a resource.
7. Repeat step 5 to add /pagelets/admin as a resource.
8. Go to the Policies tab and locate the public policy.
9. Open the public policy and select the resource created in step 5 (that is, /pagelets) to apply public policy to this resource.
   Do not select the other two resources (/pagelets/authenticateWithApplicationServer and /pagelets/admin) created as we want them to be protected by default.
10. Save your changes.
11. On the Resources tab, delete the old resource entries, /pageletadmin and /authenticateWithApplicationServer.
12. Restart Web Tier and verify your changes.

**Updating OSSO Configuration for Pagelet Producer**
If you have an OSSO setup, to update the policy for Pagelet Producer:
1. In the `mod_osso.conf` file, replace the following entry:
   ```
   <Location /pageletadmin>
   OssoSendCacheHeaders off
   require valid-user
   AuthType Osso
   </Location>
   ```
With:

```
<Location /pagelets/admin>
 OssoSendCacheHeaders off
 require valid-user
 AuthType Osso
</Location>
```

2. Replace the following entry:

```
<Location /authenticateWithApplicationServer*>  
 OssoSendCacheHeaders off
 require valid-user
 AuthType Osso
</Location>
```

With:

```
<Location /pagelets/authenticateWithApplicationServer*>  
 OssoSendCacheHeaders off
 require valid-user
 AuthType Osso
</Location>
```

3. Restart Web Tier and verify your changes.

**6.8.3.3 Updating SSO Configuration for Portlet Producer Applications**

Beginning with Release 11.1.1.6.0, you must explicitly exclude the portlets URI in an OAM setup. You must update all custom and out-of-the-box Portlet Producer applications configured with SSO. For information, see the following sections in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal*:

- Configuring Portlet Producer Applications for OAM 11g
- Configuring Portlet Producer Applications for OAM 10g

**6.8.3.4 Updating SSO Configuration for Oracle SES**

In Release 11.1.1.4.0 and 11.1.1.5.0, the recommendation was to use virtual host configuration to configure SES crawl and authorization end points. However, this is no longer required from Release 11.1.1.6.0 onward. You can consider marking the SES endpoints as excluded resources in OAM configuration. For information, see the following sections in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal*:

- For OAM 11g: Registering the WebGate Agent
- For OAM 10g: Configuring the WebCenter Portal Policy Domain

**6.8.3.5 Verifying SSOFilter Grant**

If your environment is configured with Oracle Access Manager SSO, check the OAM Asserter configured in your weblogic domain. Ensure the active types chosen are OAM_REMOTE_USER and ObSSOCookie. If OAM_IDENTITY_ASSERTION is also one of the chosen active types, you need to ensure the following:

1. Open the `jps-config.xml` file. The file is located at the following path:

   ```
   DOMAIN_HOME/config/fmwconfig/jps-config.xml
   ```
Where, \textit{DOMAIN\_HOME} is the domain home location for your Oracle WebCenter domain.

2. Ensure \texttt{AttributeService} is configured.
   - The default \texttt{jps} context must have the following entry for configuring the attribute service:
     \begin{verbatim}
     <serviceInstanceRef ref="attribute"/>
     \end{verbatim}
   - The \texttt{serviceProviders} list must contain the following entry:
     \begin{verbatim}
     <serviceProvider
class="oracle.security.jps.internal.attribute.impl.AttributeServiceProviderImpl" name="attribute.provider" type="ATTRIBUTE">
     <description>Attribute Service Provider</description>
     </serviceProvider>
     \end{verbatim}
   - The \texttt{serviceInstances} list must contain the following entry:
     \begin{verbatim}
     <serviceInstance provider="attribute.provider" name="attribute">
     <description>Attribute Service Instance</description>
     <property value="86400" name="attribute.expire.time.seconds"/>
     </serviceInstance>
     \end{verbatim}

3. Ensure that the \texttt{SSOFilter JAR} has the \texttt{AttributeAccessPermission} grant. To verify this, log in to WLST as described in "Running Oracle WebLogic Scripting Tool (WLST) Commands" in Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal. Then, run the following WLST command to list permissions:

   \begin{verbatim}
   listCodeSourcePermissions(codeBaseURL="file:${common.components.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar")
   \end{verbatim}

   If you get an output containing the following it means you already have the required grant.

4. If you do not have the required grant, add it using the following WLST command:

   \begin{verbatim}
   grantPermission(codeBaseURL='file:$common.components.home/modules/oracle.ssofilter_11.1.1/ssofilter.jar',
   permClass='oracle.security.jps.service.attribute.AttributeAccessPermission',
   permTarget='*', permActions='get, set, remove')
   \end{verbatim}

5. Restart all servers in your WebLogic domain.

\section*{6.8.4 Performing Post-Patching Tasks for Oracle WebCenter 11.1.1.2.0 or 11.1.1.3.0 Installations}

This section describes the tasks that you may need to perform, depending on your system environment, after patching to Oracle WebCenter Portal 11.1.1.7.0.

The section contains the following subsections:

- Section 6.8.4.1, "Migrating Oracle Wiki Pages and Blogs"
- Section 6.8.4.2, "Migrating Content Presenter Custom Templates"
- Section 6.8.4.3, "Updating the Configuration for WebCenter REST APIs"
6.8.4.1 Migrating Oracle Wiki Pages and Blogs

This section contains the following sections to help you migrate your existing Wiki pages and blogs for use in the newly patched Oracle WebCenter domain:

- Section 6.8.4.1.1, "How to Migrate Oracle Wiki Pages and Blogs"
- Section 6.8.4.1.2, "Troubleshooting Problems During Wiki Migration"

6.8.4.1.1 How to Migrate Oracle Wiki Pages and Blogs

If you had Oracle Wiki installed, you must run the Wiki Migrator utility `wiki-upgrade.jar` to migrate the wiki pages and blogs. The utility is available in the following directory in the WebCenter Oracle home:

`WebCenter_ORACLE_HOME/webcenter/archives/wiki-upgrade.jar`

This Wiki Migrator utility migrates your wiki pages and blogs into Space-specific folders in Content Server. Existing WebCenter Spaces pages for wikis and blogs are migrated, accordingly. The utility also migrates attachments and provide links to them in your wiki pages as appropriate. Links to other wiki pages within your wiki page content are updated to point to the new locations, provided that the URL in each link has the same WebCenter Spaces root that is provided in the migration parameters. The utility does not migrate comments, discussion threads, templates, nor it alters wiki or blog content.

If you encounter any errors during the migration process, check the output log, which is located in the same directory as the `wiki-upgrade.jar` file. For more information, see Section 6.8.4.1.2, "Troubleshooting Problems During Wiki Migration."

Before performing wiki migration, do the following:

1. Make sure you have upgraded to Oracle WebCenter Content 11.1.1.7.0 (see Section 6.7.4, "Considerations for Upgrading Oracle WebCenter Content or Oracle ECM.”)

2. Verify that the root folder `PersonalSpaces` exists in Oracle WebCenter Content; this is the folder in which all personal folders get created. Wiki migration may fail if the `PersonalSpaces` folder does not exist in Oracle WebCenter Content. The `PersonalSpaces` folder gets created when the Spaces managed server is started. Therefore, it is recommended that you start the Spaces managed server prior to performing wiki migration.

3. Update the folder limit in Oracle WebCenter Content as follows:
   a. Log in to the Oracle WebCenter Content user interface, go to Administration > Folder Configuration and change the "Maximum Folders Per Virtual Folder" and "Maximum Content Per Virtual Folder“ to 1000.
Post Patching Tasks for WebCenter Portal

b. Create a temporary folder that the Wiki migration utility will use to store the orphan data (for example, the data that does not have a corresponding Group Space). This does NOT have to be a root folder; it can be created as the Administrator user under the PersonalSpaces or Group Space root folder. If a root folder is preferred, the service using the URL `IdcService=COLLECTION_ADD` will need to be used. For example:

```
```

Note the `idcToken` can be retrieved via the browser’s Page Source from a logged in session to Oracle WebCenter Content. Alternatively, the attribute DisableAuthorizationTokenCheck can be disabled by selecting Administration > Content Server > General Configuration > Additional Configuration Variables -> DisableAuthorizationTokenCheck=true and then restarting the server.

4. Choose one of the following ways to run the `wiki-upgrade.jar` file from WebCenter Oracle home:

- Do not pass any arguments from the command line, as follows:
  ```
  > cd WebCenter_ORACLE_HOME/webcenter/archives
  > MW_HOME/jdk160_21/bin/java -jar wiki-upgrade.jar
  ```
  You will be prompted for each of the required arguments listed in Table 6–7.

- Pass a properties file (`WikiMigrator.properties`) as an argument:
  ```
  MW_HOME/jdk160_21/bin/java
  -jar WebCenter_ORACLE_HOME/webcenter/archives/wiki-upgrade.jar
  WikiMigrator.properties
  ```
  The `WikiMigrator.properties` must reside in the same directory as `wiki-upgrade.jar`. The following is a sample properties file:

  ```properties
  MDSConn = jdbc:oracle:thin:@exampleDB:1521:exampleSID
  MDSUser = dbuser_example_mds
  UCMConn = idc://examplehost:9444
  UCMUser = sysadmin
  UCMConnName = example_connection_name
  UCMTempFolderPath = /RootFolder/.../TempFolder
  wikiConn = jdbc:oracle:thin:@exampleDB:1521:exampleSID
  wikiUser = example_wiki
  SpacesRootURL = http://examplehost:port/webcenter
  ```
  You will be prompted for the MDS, UCM, and Wiki passwords from the command line.

- Pass all arguments from the command line:
  ```
  MW_HOME/jdk160_21/bin/java -jar wiki-upgrade.jar
  MDSConn MDSUser MDSpswd UCMConn UCMTempFolderPath UCMUser UCMpswd
  UCMConnName
  wikiConn wikiUser wikiPswd SpacesRootURL
  ```
  For example:

  ```
  java -jar WikiMigrator.jar
  ```
jdbc:oracle:thin:@exampleDB:1521:exampleSID
dbuser_example_mds
eample_mds_password
idc://examplehost:9444
sysadmin
eample_ucm_password
eample_ucm_connection_name
eample_path_to_ucm_temporary_folder
ejdbc:oracle:thin:@example:1521:exampleSID
eample_wiki
eample_wiki_password
http://examplehost:port/webcenter

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDSConn</td>
<td>Name of the connection used to connect to the MDS data source. For example:</td>
</tr>
<tr>
<td></td>
<td>jdbc:oracle:thin:@host:port:SID</td>
</tr>
<tr>
<td>MDSUser</td>
<td>Name of the database user used to connect to the MDS data source.</td>
</tr>
<tr>
<td>MDSPswd</td>
<td>Password to the database user that is used to connect to the MDS data source.</td>
</tr>
<tr>
<td>UCMConn</td>
<td>UCM connection URL over the idc protocol. For example: idc://host:port</td>
</tr>
<tr>
<td>UCMUser</td>
<td>Use sysadmin as the UCM user; the user weblogic does not get administrator</td>
</tr>
<tr>
<td></td>
<td>privileges with socket connections.</td>
</tr>
<tr>
<td>UCMPSwd</td>
<td>Password for the UCM user account.</td>
</tr>
<tr>
<td>UCMConnName</td>
<td>Name used in Enterprise Manager or WLST to create the connection to UCM.</td>
</tr>
<tr>
<td>UCMTempFolderPath</td>
<td>Temporary folder on UCM to store orphaned data</td>
</tr>
<tr>
<td></td>
<td>For example: /RootFolder/.../TempFolder</td>
</tr>
<tr>
<td>wikiConn</td>
<td>Name of the connection used to connect to the Wiki data source. For example:</td>
</tr>
<tr>
<td></td>
<td>jdbc:oracle:thin:@host:port:SID</td>
</tr>
<tr>
<td>wikiUser</td>
<td>Name of the database user that is used to connect to the Wiki data source.</td>
</tr>
<tr>
<td>wikiPswd</td>
<td>Password for the database user connecting to the Wiki data source.</td>
</tr>
<tr>
<td>SpacesRootURL</td>
<td>Spaces root URL. For example: <a href="http://host:port/context_root">http://host:port/context_root</a></td>
</tr>
</tbody>
</table>

**Note:** If you have wiki or blog pages that use Query String parameters, then after upgrade these parameters do not take effect. Any links that pointed to other wiki pages through a URL such as the following are converted to a Resource Action Handler URL that points to the corresponding wiki document in the content repository, assuming the server:port value entered for SpacesRootURL matches the server:port value in the URL.

http://server:port/owc_wiki/page/show.jz?inline=1&scope=#{communityContext.communityName}&theme=#{adfFacesContext.skinFamily}
Special Note for 10g and Release 1 (11.1.1.1.0) Users
If you are upgrading from a 10g release or Release 1 (11.1.1.1.0) version of Wiki, then after you run the Migrator utility wiki-upgrade.jar, there may be some wiki and blog folders that end up in the MigrationTemp folder. You must manually move these folders to the correct group space folders on Content Server.

Perform the following steps after migrating Oracle Wiki pages and blogs:

1. Log on to Content Server and go to the MigrationTemp folder under sysadmin (or the Content Server user running the migration program). Move the wiki and blog folders to the correct group space folders. You may need to rename the wiki and blog folders to match the corresponding group space names in WebCenter Spaces.

2. Log in to the Spaces application, navigate to the required group space and create a new page with Wiki or Blog page style. The name of the page must match the name of the wiki/blog folder in order for the page to properly display the wiki/blog content.

6.8.4.1.2 Troubleshooting Problems During Wiki Migration During wiki migration, you may see some error messages in the output log. Descriptions and available workarounds are described below.

Error Message 1

[INFO] PROCESSING Domain: domain_name
[INFO] migrating to temp folder - there is no webcenter page information stored on the domain: domain_name

This message indicates that there is no data specified in the domain to connect it with a group space page (the wcURL on the domain is missing).

Note: The last part of the migration program will find any remaining unmigrated group space pages that still point to owc_wiki and will try to gather domain information from the page's source URL to be matched against a jzwiki domain. If the proper information is found, it will move the folder and content out of migration temp and into the proper group space folder.

Error Message 2

[INFO] PROCESSING Domain: domain_name
[INFO] migrating to temp folder - invalid group space that corresponds to the guid: group_space_guid

This message indicates that there is either no group space information specified in the domain, or the group space guid specified is not valid (the group space guid specified in the wcURL is not valid).

Error Message 3

[INFO] PROCESSING Domain: domain_name
[INFO] migrating to temp folder - no group space that corresponds to the guid: group_space_guid

This message indicates that the domain's group space information points to a group space that no longer exists. Doing a lookup with the group space guid does not find a corresponding group space name. Most likely the group space has been deleted.
Error Message 4

[INFO] PROCESSING Domain: domain_name
[ERROR] migrating to temp folder - no UCM folder for the groupspace exists: page_name, gsname: group_space_name

This message indicates that the spaces page has been migrated already, but the Content Server folder for that group space does not exist.

To correct this, create the group space folder (by provisioning the Document service in the group space), and then move the folder (with the same name as the domain) from migration temp to the group space folder. Then rename the domain folder to have the same name as the page.

Error Message 5

[INFO] PROCESSING Domain: domain_name
[ERROR] migrating to temp folder - could not get UCM folder for the wiki domain, page: page_name, gsname: group_space_name

This message indicates that the spaces page has been migrated already, but the Content Server folder for domain could not be created in the group space folder.

To correct this, move the folder (with the same name as the domain) from migration temp to the group space folder. Then rename the domain folder to have the same name as the page.

Error Message 6

[INFO] PROCESSING Domain: domain_name
[ERROR] migrating to temp folder - no UCM folder exists for the user: user_name, page: page_name

This message indicates that the spaces page has been migrated already, but the Content Server folder for the user does not exist.

To correct this, create the user’s personal folder (this folder is created when the user accesses Documents from the home space), and then move the folder (with the same name as the domain) from migration temp to the personal folder. Then rename the domain folder to have the same name as the page.

Error Message 7

[INFO] PROCESSING Domain: domain_name
[ERROR] migrating to temp folder - could not get personal UCM folder for the user: user_name, page: page_name

This message indicates that the spaces page has been migrated already, but the Content Server folder for the domain could not be created in the user’s personal folder.

To correct this, move the folder (with the same name as the domain) from migration temp to the user’s personal folder. Then rename the domain folder to have the same name as the page.

Error Message 8

[INFO] PROCESSING Domain: domain_name
[INFO] migrating to temp folder - default scope, but no user specified on page: page_name

This message indicates that this is a personal wiki or blog, but the information stored on the domain (the wcURL passed in from the spaces page) does not indicate a user.

Error Message 9
This message indicates that there is more than one domain pointing to the same group space and page information, and the current domain being processed does not match the domain indicated in the source URL.

**Error Message 11**

This is a jzwiki user blog that is not connected with a domain. The message indicates that the Content Server folder for the user does not exist, so the content could not be migrated there.

**Error Message 12**

This is a jzwiki user blog that is not connected with a domain. The message indicates that the “Blogs” Content Server folder for the user does not exist and could not be created, so the content could not be migrated there.

### 6.8.4.2 Migrating Content Presenter Custom Templates

Content Presenter custom templates used in Release 11.1.1.3.0 applications are not automatically migrated when you upgrade to Release 11.1.1.7.0. You must register the required custom templates in Release 11.1.1.7.0 version of your applications.

To migrate Content Presenter custom templates from Release 11.1.1.3.0:

1. In JDeveloper 11.1.1.7.0, create or open a WebCenter Portal application.
2. On the filesystem, copy your Release 11.1.1.3.0 .jsff files to your Release 11.1.1.7.0 application.
   
   From the Release 11.1.1.3.0 version of your application, copy the required custom template from following folder:
   
   ```
   PROJECT_ROOT/public_html/oracle/webcenter/content/templates/custom
   ```
   
   Copy the custom template to the following folder of your upgraded Release 11.1.1.7.0 application:
   
   ```
   PROJECT_ROOT/public_html/oracle/webcenter/portalapp
   ```
3. In JDeveloper, create the Content Presenter custom template as a portal resource. The properties that you set for the custom template must match those that were previously registered in your Release 11.1.1.3.0 application.
   
   For information, see "Export a Content Presenter Display Template as a Portal Resource" in Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter Portal.
4. Redeploy your application using the new custom Managed Servers, as described in Section 6.8.4.8, "Redeploying your Custom Applications to Upgraded Custom Managed Servers."
5. If the custom template is also used in WebCenter Spaces, prepare the template to be used in your upgraded environment:
   a. Using JDeveloper, export the Content Presenter display template as a portal resource.
   b. Log in to the Spaces application and navigate to Spaces Administration.
   c. Select Resources > Content Presenter and upload your template.

For information, see "Using Content Presenter Display Templates in a Framework Application" in Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter Portal.

6.8.4.3 Updating the Configuration for WebCenter REST APIs

Before you can use the WebCenter Representational State Transfer (REST) APIs, you must perform the server-side configurations. You must configure an identity asserter. You must also seed the required entries in the credential store, which enables the REST security tokens to function properly.

This section includes the following subsections:

- Section 6.8.4.3.1, "Configure an Identity Asserter"
- Section 6.8.4.3.2, "Configure the Credential Store"

**Note:** This configuration is not required for the navigation REST APIs or for the CMIS REST APIs.

For more information about security tokens, see "Security Considerations for CMIS REST APIs" in Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter Portal.

6.8.4.3.1 Configure an Identity Asserter

You must configure an identity asserter before using the REST APIs. For detailed instructions, see "Configuring the REST Service" in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

6.8.4.3.2 Configure the Credential Store

You must seed entries in the credential store that enable the REST security tokens to function properly. Run the following WLST commands to configure the credential store:

```wlst
createCred(map="o.webcenter.jf.csf.map", key="keygen.algorith",
    user="keygen.algorithm", password="AES")
createCred(map="o.webcenter.jf.csf.map", key="cipher.transformation",
    user="cipher.transformation", password="AES/CBC/PKCS5Padding")
```

Run these commands while the Administration server is running. You do not have to restart the server after executing these commands. For more information, see "createCred" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.

6.8.4.4 Updating Multi-Calendar Layouts

In Release 11.1.1.2.0 and 11.1.1.3.0, the Calendar Overlay Style FULL could be used to enable multiple calendars for some events task flow and add multiple Space calendars in one events task flow. In the upgraded Release 11.1.1.7.0, the Events task flow no longer displays multiple calendars; only the current Space calendar is displayed.

To work around this issue, you must enable the calendar overlaying feature for the Events task flow. Go to the page editor, find the Calendar Overlay Style parameter and select Full from the list of available options. For more information, see

### 6.8.4.5 Restoring Your OmniPortlet and WebClipping Customizations

After you have saved your OmniPortlet and WebClipping customizations (as described in Section 6.7.2, "Saving Your OmniPortlet and WebClipping Customizations") and successfully patched your software, you must restore them.

---

**Note:** The Web Clipping portlet is deprecated in Release 11g (11.1.1.7.0). Consider using a clipper pagelet using Oracle WebCenter Portal's Pagelet Producer. For more information, see the "Oracle WebCenter Portal's Pagelet Producer" chapter in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.*

---

To restore OmniPortlet and WebClipping configuration and customizations:

1. **Navigate to the following directories:**
   
   **On UNIX operating systems:**
   - `path_to_war_directory/WEB-INF/providers/omniPortlet`
   - `path_to_war_directory/WEB-INF/providers/webclipping/

   Where `path_to_war_directory` refers to `DOMAIN_HOME/servers/WC_Portlet/tmp/_WL_user/portalTools_version/randomly_generated_directory/war`

   **On Windows operating systems:**
   - `path_to_war_directory\WEB-INF\providers\omniPortlet`
   - `path_to_war_directory\WEB-INF\providers\webclipping/

   Where `path_to_war_directory` refers to `DOMAIN_HOME\servers\WC_Portlet\tmp\_WL_user\portalTools_version\randomly_generated_directory\war`

   *DOMAIN_HOME* is the domain home locations for your Oracle Portal or Oracle WebCenter domain, as specified on the "Specify Domain Name and Location" screen in the Configuration Wizard.

   **Note:** Since the Patch Set Installer re-deployed the OmniPortlet and WebClipping applications, the new path may be different than the path from where you backed up customizations.

2. **Replace these directories with their backed up copies.**
   
   For example, to restore the `omniportlet` directory, you can use the following commands:

   **On a UNIX operating system:**
   ```bash
   cp -fr backup_location path_to_war_directory/WEB-INF/providers/omniPortlet
   ```

   **On a Windows operating system:**
   ```cmd
   xcopy /y/e backup_location path_to_war_directory\WEB-INF\providers\omniPortlet
   ```
3. Restart the Managed Server WC_Portlet.

6.8.4.6 Extending a Domain to Install Oracle WSM Policy Manager
If discussions server is the only WebCenter Portal application installed in the domain, you must extend the domain to install Oracle WSM Policy Manager, if not already installed.

To extend a WebCenter domain to install Oracle WSM Policy Manager:

1. Stop the Admin server and all managed servers.
2. Start the Configuration Wizard on the machine running the Admin server.
   - On UNIX, run `WebCenter_ORACLE_HOME/common/bin/config.sh`.
   - On Windows, run `WebCenter_ORACLE_HOME\common\bin\config.cmd`.
3. Select Extend an existing WebLogic domain and click Next.
4. Select your domain and click Next.
5. Select the checkbox for Oracle WSM Policy Manager and click Next.
6. Enter the connection details for OWSM MDS Schema and click Next.
7. Click Next on the remaining screens until you get the Configuration Summary screen, then click Extend.

For more information on extending a domain, see "Extending a WebLogic Domain in Graphical Mode" in Oracle Fusion Middleware Creating Domains Using the Configuration Wizard.

---

**Note:** If your domain is running on multiple machines, you must pack the domain on the machine running the Administration Server and unpack on the other machines. For information, see Section 6.4.3.2, "Updating Oracle WebCenter Using WLST Commands."

---

6.8.4.7 Remove openusage Properties in setDomainEnv
If you want to extend your WebCenter domain to install Oracle WebCenter Portal's Analytics Collector, you must remove the openusage properties:

1. Back up the `DOMAIN_HOME\bin\setDomainEnv.cmd` (on Windows operating systems) or `DOMAIN_HOME/bin/setDomainEnv.sh` (on UNIX operating systems).
2. Remove the openusage properties from `EXTRA_JAVA_PROPERTIES` in `setDomainEnv.sh` or `setDomainEnv.cmd`.

Specifically, the entries that need to be removed are:

```
EXTRA_JAVA_PROPERTIES=*
-Doracle.wc.openusage.clustername=localhost
-Doracle.wc.openusage.collectorport=port_number
-Doracle.wc.openusage.timeout=30
-Doracle.wc.openusage.unicast=true
-Doracle.wc.openusage.enabled=false
$(EXTRA_JAVA_PROPERTIES)*
export EXTRA_JAVA_PROPERTIES
```

3. Restart all the servers in the WebCenter domain.

6.8.4.8 Redeploying your Custom Applications to Upgraded Custom Managed Servers

If there are custom Managed Servers in your domain, they may not have the correct libraries targeted. Therefore you must upgrade them after patching WebCenter, and redeploy your custom applications.

To upgrade custom managed servers:

1. Remove the old custom Managed Servers.
2. Use Repository Creation Utility (RCU) to install the ACTIVITIES schema for the custom managed server. For information, see "Obtaining and Running Repository Creation Utility" in Oracle Fusion Middleware Repository Creation Utility User’s Guide.
3. Run the Configuration Wizard to extend your existing WebCenter domain and apply custom templates.
   a. On the "Select Extension Source" screen, select Extend my domain using an existing extension template.
   b. Navigate to the WebCenter_ORACLE_HOME/common/templates/applications (on UNIX operating systems) or WebCenter_ORACLE_HOME\common\templates\applications (on Windows operating systems) directory and locate the following templates:
      oracle.wc_custom_portal_template_11.1.1.jar (for WebCenter custom applications/Framework applications)
      oracle.wc_custom_services_producer_template_11.1.1.jar (for WebCenter Custom Producer/Portlet Producer applications)
   c. Select the desired template and complete the domain extension process.
4. Re-deploy your custom applications using the new custom Managed Servers.

6.8.4.9 Remove the LD_LIBRARY_PATH Entry from the setDomainEnv Script

After patching Oracle WebCenter, you must remove the following entry from the setDomainEnv script:

LD_LIBRARY_PATH="${WL_HOME}/server/native/linux/i686${CLASSPATHSEP}${LD_LIBRARY_PATH}"
export LD_LIBRARY_PATH

Note: Oracle recommends that you open your projects in Oracle JDeveloper and migrate your applications to the latest version before deploying to the new custom Managed Servers.
The `setDomainEnv` script is available at the following path:

- `DOMAIN_HOME/bin/setDomainEnv.sh` (on UNIX operating systems)
- `DOMAIN_HOME\bin\setDomainEnv.cmd` (on Windows operating systems)

**Note:** If you extend your domain to add new products, you may need to repeat this task.

6.8.4.10 Migrating WSRP Portlet Preferences

By default, all custom JSR286 portlets (created using Portlet Creation Wizard) use a file-based preference store. Post upgrade, you must move WSRP portlet preferences from:

`$MW_HOME/Oracle_WC1/portal/portletdata`

To:

`$MW_HOME/oracle_common/portal/portletdata`

Where, `$MW_HOME` refers to Middleware Home, and `Oracle_WC1` refers to WebCenter Portal Oracle Home.

You can move WSRP portlet preferences manually or by using a migration utility. For more information, see "Migrating a WSRP Producer Persistence Store" in *Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter Portal*.

6.8.5 Performing Post-Patching Tasks for Oracle WebCenter Spaces

This section contains the following topics:

- Section 6.8.5.1, "Setting the Web Server Context Root on the Content Server Connection"
- Section 6.8.5.2, "Configuring Group Space Workflows"
- Section 6.8.5.3, "Updating the Timezone Attribute in WebCenter Spaces"
- Section 6.8.5.4, "Updating the Group Spaces Display Mode"
- Section 6.8.5.5, "Choosing a Default Start (or Landing) Page"
- Section 6.8.5.6, "Migrating WebCenter Spaces Custom Library"
- Section 6.8.5.7, "Upgrading Process Spaces"

6.8.5.1 Setting the Web Server Context Root on the Content Server Connection

If Oracle WebCenter Content and WebCenter instances are configured for access through a common Oracle HTTP server, the Web Server Context Root property (`WebContextRoot`) on the existing Content Server connection can be set to make Content Server features available in the WebCenter application via an iFrame. The Content Server connection can be set either through Fusion Middleware Control or WLST using the `setJCRContentServerConnection` command. For information, see "Setting Connection Properties for the Spaces Content Repository" in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal*. 
6.8.5.2 Configuring Group Space Workflows

If your WebCenter instance had Group Space Workflows configured, after upgrading to the latest release, you must redeploy `sca_CommunityWorkflows.jar` and `WebCenterWorklistDetailApp.ear`.

To configure Group Space Workflows:

1. Log in to Fusion Middleware Control.
2. Deploy `sca_CommunityWorkflows.jar` to the SOA managed server. This file is located at the following path in your Oracle SOA Suite installation:
   
   \[SOA_ORACLE_HOME/webcenter/modules/oracle.webcenter.sca_11.1.1/sca_CommunityWorkflows.jar\]

   Where, \(SOA_ORACLE_HOME\) refers to the Oracle SOA Suite installation directory.

   Note that version 11.1.1.7.0 is active in the console, and other older versions like 11.1.1.5.0 are inactive.

   For information about deploying the JAR using Fusion Middleware Control, see "Deploying SOA Composite Applications" in *Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite*.

   For information about deploying the JAR using WLST, see the section "Deployment Commands" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

3. Undeploy `WebcenterWorklistDetailApp.ear`, and then redeploy it to the SOA managed server. You can find the application at the following location in your Oracle SOA Suite installation:

   \[SOA_ORACLE_HOME/webcenter/applications/WebCenterWorklistDetailApp.ear\]

   For information about deploying the EAR using WLST, see the chapter "Deploying Applications" in *Oracle Fusion Middleware Administrator’s Guide*. For information about deploying the EAR using Fusion Middleware Control, see "Deploying the Application to a WebLogic Managed Server" in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal*.

6.8.5.3 Updating the Timezone Attribute in WebCenter Spaces

In Release 11.1.1.2.0, the Timezone attribute in WebCenter Spaces is a free-form text field. From Release 11.1.1.4.0 onward, this attribute was changed to a drop-down list.

If you are upgrading WebCenter Spaces from Release 11.1.1.2.0, the Timezone attribute is not carried over, and you must manually select the appropriate timezone from the drop-down list.

6.8.5.4 Updating the Group Spaces Display Mode

If you are upgrading WebCenter Group Spaces from Release 11.1.1.2.0 or 11.1.1.3.0, you must update the metadata of your Group Spaces to ensure that they display correctly.

To update a Group Space to display correctly:

1. Export the group space. For information, see the “Exporting Spaces” section in *Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal*.

2. At a command prompt, go to the directory where you saved the export archive.
3. Extract the metadata from the export archive.

   For example, the following code extracts the export archive named export.ear, which contains transport.mar. The code further extracts transport.mar in a directory named mar.

   a. jar xvf export.ear transport.mar
   b. mkdir mar
   c. cd mar
   d. jar xvf ../transport.mar

   The transport.mar file contains space.xml that you must edit to update the group space's display mode.

4. Open the space.xml file from the following path:

   oracle/webcenter/space/metadata/spaces/spaceName/space.xml

   Where, spaceName refers to the name of the group space whose display mode you are updating.

5. Delete the entire <shell-chrome-type> entry from space.xml.

6. Update the export archive.

   For example, the following code updates the space.xml file in transport.mar, and then updates transport.mar in export.ear.

   a. jar uvfM ../transport.mar
      oracle/webcenter/space/metadata/spaces/spaceName/space.xml
   b. cd..
   c. jar uvfM export.ear transport.mar

7. Import the group space. For information, see the "Importing Spaces" section in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

6.8.5.5 Choosing a Default Start (or Landing) Page

By default, when you log in to the Spaces application, the last accessed page is displayed. This behavior can be overridden by setting the oracle.webcenter.spaces.disableLastAccessPageBehavior system property to false in the setDomainEnv domain startup script. This script is available at DOMAIN_HOME/bin/setDomainEnv.sh (on UNIX operating systems) or DOMAIN_HOME\bin\setDomainEnv.cmd (on Windows operating systems).

If you had overridden the default behavior, you must re-apply this change after patching Oracle WebCenter. For information, see section "Choosing a Default Start (or Landing) Page" in Oracle Fusion Middleware User’s Guide for Oracle WebCenter Portal: Spaces.

6.8.5.6 Migrating WebCenter Spaces Custom Library

WebCenter Spaces can be customized, for example to deploy additional shared libraries that include custom code or some additional resources like task flows, page styles, and skins. If you deployed any custom page styles by extending Spaces through the custom library custom.webcenter.spaces.war, then after patching you must modify the entry for each page style in the custom library and redeploy custom.webcenter.spaces.war.

If you migrated your WebCenter Spaces customizations:
1. In JDeveloper, open ExtendWebCenterSpaces.jws (11.1.1.2.0 or 11.1.1.3.0).

2. For each and every deployed page style, find the following:

   `<af:pageTemplate`

   And replace it with the following:

   `<af:pageTemplate
       value="#{bindings.shellTemplateBinding.templateModel}" id="T"
  `

3. For each and every pageDef, find the following:

   `<page`

   And replace it with the following:

   `<page
       viewId="#{WCAppContext.application.siteTemplateManager.currentSiteTemplateViewId}" id="shellTemplateBinding" Refresh="ifNeeded" />
  `

4. Redeploy the custom.webcenter.spaces.war shared library to your Spaces 11.1.1.7.0 managed server.

---

**Note:** Always use Oracle JDeveloper 11.1.1.2 or 11.1.1.3 to build and deploy extensions developed for this release. For detailed steps, see the links for white papers "Extending WebCenter Spaces (11.1.1.2.0)" or "Extending WebCenter Spaces (11.1.1.3.0)" on Oracle Technology Network:

http://www.oracle.com/technetwork/middleware/webcenter/portal/overview/index.html

---

### 6.8.5.7 Upgrading Process Spaces

Oracle Business Process Management (Oracle BPM) Process Spaces is a workspace built on top of Oracle WebCenter Spaces, and provides Spaces that are designed specifically for modeling and executing business processes. If you have Process Spaces installed, then after patching to WebCenter Portal 11.1.1.7.0, you must upgrade it by running the `install.xml` script. The installation script can be used for a single-server configuration as well as a cluster configuration.

---

**Note:** The procedure described in this section applies only if you already have Process Spaces enabled on Webcenter Spaces and are upgrading your existing WebCenter installation to the latest release.

For information about enabling Process Spaces in a new WebCenter installation (or new domain), see "Extending a Domain to Enable Oracle BPM Process Spaces" in Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal.

---

To upgrade Process Spaces installed in your upgraded WebCenter instance:

1. Take the Process Workspace and Modeling Space offline.
   a. Log in to WebCenter Spaces.
b. Click the **Administration** link to open WebCenter administration pages.

c. Under the **Spaces** tab, select the **Modeling Space** row.

d. From the **Edit** menu, select **Offline for Maintenance**.

e. In the Bring Space Offline dialog, click **OK**.

f. Repeat this procedure to take **Process Workspace** offline.

2. Copy the `process_spaces` folder from the SOA Oracle home directory to any location on the system where WebCenter is installed. Copy the folder from the following location:

   On UNIX: `SOA_ORACLE_HOME/bpm/process_spaces`
   
   On Windows: `SOA_ORACLE_HOME\bpm\process_spaces`

3. Open the `process-portal-install.properties` file from the newly copied `process_spaces` folder on your WebCenter Portal system.

4. Specify the required Oracle BPM and WebCenter properties as listed in **Table 6–8**.

---

**Note:** For security purposes, you can skip specifying the passwords, and provide them later when prompted.

---

**Table 6–8** Properties Specified in `process-portal-install.properties`

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extendSoa</code></td>
<td>The flag to decide whether to extend the existing BPM domain or create a new one. Specify the value as <code>true</code> if WebCenter Portal and SOA are in the same domain, else <code>false</code>.</td>
</tr>
<tr>
<td><code>promptForPasswords</code></td>
<td>The flag to decide whether to prompt for passwords or read them from the <code>process-portal-install.properties</code> file while running the installer.</td>
</tr>
</tbody>
</table>

**Oracle BPM Schema Details**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bpmDBUser</code></td>
<td>User name to connect to the database configured for Oracle BPM</td>
</tr>
<tr>
<td><code>bpmDBPassword</code></td>
<td>Password to connect to Oracle BPM’s database</td>
</tr>
<tr>
<td><code>bpmDBType</code></td>
<td>Database type configured for Oracle BPM</td>
</tr>
<tr>
<td><code>bpmDBDriver</code></td>
<td>Driver used to connect to Oracle BPM’s database</td>
</tr>
<tr>
<td><code>bpmDBUrl</code></td>
<td>URL of Oracle BPM’s database, like <code>jdbc:oracle:thin:@adc2170307:1521</code></td>
</tr>
</tbody>
</table>

**Oracle BPM MDS Details**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bpmMDSUser</code></td>
<td>User name for the MDS schema used for Oracle BPM</td>
</tr>
<tr>
<td><code>bpmMDSPassword</code></td>
<td>Password for Oracle BPM’s MDS schema</td>
</tr>
</tbody>
</table>

**Oracle BPM Runtime Details**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
Table 6–8 (Cont.) Properties Specified in process-portal-install.properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bpmServerURL</td>
<td>Oracle BPM server URL. For a single BPM server: t3://&lt;bpmHost&gt;:&lt;bpmRuntimePort&gt; For example: t3://myHost:8001 For BPM cluster, specify separated list of BPM server URLs for all servers in the cluster in the following format: t3://host1:port1,host2:port2,... For example, t3://myHost1:8001,myHost2:8002,myHost3:8003</td>
</tr>
<tr>
<td>bpmAdminUser</td>
<td>Name of the user that has Administrator privileges on the Oracle BPM server</td>
</tr>
<tr>
<td>bpmAdminPassword</td>
<td>Password for the Oracle BPM Admin user</td>
</tr>
<tr>
<td>WebCenter Spaces Installation Details</td>
<td>Path to the WebCenter Oracle home directory</td>
</tr>
<tr>
<td>wcOracleHome</td>
<td>Name of the domain where WebCenter is installed. If extendSoa flag is set to true, point to the BPM domain.</td>
</tr>
<tr>
<td>wcDomainName</td>
<td>Flag to control whether to set the domain realm password; set the value to either true or false.</td>
</tr>
<tr>
<td>wcSetDomainRealmPassword</td>
<td>Note: This property is for setting up Global Trust. It is recommended that you set Global Trust manually; so set this property to false.</td>
</tr>
<tr>
<td>wcDomainRealmPassword</td>
<td>Password to set up trusted domains. Same password must be set on Oracle BPM domain as well.</td>
</tr>
<tr>
<td>wc.server.port</td>
<td>Port on which WC_Spaces managed server is hosted</td>
</tr>
<tr>
<td>WebCenter's WebLogic Installation Details</td>
<td>Host name on which WebCenter's Administration server is running</td>
</tr>
<tr>
<td>wcHost</td>
<td>Port number on which WebCenter's Administration server is running</td>
</tr>
<tr>
<td>wcAdminPort</td>
<td>Admin user for the WebCenter Administration server</td>
</tr>
<tr>
<td>wcAdminUser</td>
<td>Password of the WebCenter Administration server</td>
</tr>
<tr>
<td>wcManagedServerName</td>
<td>In a single-server environment, specify the name of the managed server where Spaces is deployed. In a clustered environment, specify the name of any one of the Spaces managed servers that is part of the cluster.</td>
</tr>
</tbody>
</table>
5. Make sure you have ant and Java JDK installed.

   Ant is shipped with Oracle BPM. You can find the installer under the path \texttt{SOA/ORACLE_HOME/modules/org.apache.ant_1.7.0}.

6. Ensure that the \texttt{PATH} and \texttt{CLASSPATH} environment variables are set for both ant and Java JDK.

7. Run the ant script \texttt{install.xml}:

   \begin{verbatim}
   SOA/ORACLE_HOME/modules/org.apache.ant_1.7.0/bin/ant -f install.xml -DpromptForPasswords=true
   \end{verbatim}

   Use the \texttt{-DpromptForPasswords=true} argument \emph{only if} you did not specify passwords in the \texttt{process-portal-install.properties} file.

8. If \texttt{wcConfigServices} is set to \texttt{true} in \texttt{process-portal-install.properties}, do the following:
   
   a. Restart \texttt{WC_Spaces}. Running the \texttt{install.xml} script shuts down the \texttt{WC_Spaces} managed server.
   
   b. Run the install script again to complete the post upgrade steps. Use the following command:
ant -f install.xml post-install -DpiArgs -importGSOnly

---

**Note:** If wcConfigServices is set to false, you do not need to run the install script again.

---

9. If Oracle BPM and Oracle WebCenter have been configured in different domains, configure Trusted Domain Credentials in both the Oracle BPM and WebCenter domains, and restart the Oracle BPM Admin Server and the WebCenter Portal Admin Server. For more information, see "Enabling Trust Between WebLogic Server Domains" in Oracle Fusion Middleware Securing Oracle WebLogic Server.

---

**Note:** If Oracle BPM is not up and running, you may face problems logging into WebCenter Spaces.

If required, bring the Process Workspace and Modeling Space online by selecting **Bring the Space(s) Online** from the **Edit** menu, as described in step 1.

---

11. In WebCenter Spaces, delete the old process spaces, templates, and resources, if required.

When you run the install.xml ant script, Release 11.1.1.4.0 or 11.1.1.5.0 process spaces and related templates and resources are imported with '11.1.1.7.0' appended to their names. So, after the upgrade, there are two sets of process spaces and related templates and resources, for example 'Process Workspace 11.1.1.7.0' and 'Process Workspace'. If you do not want the old items, you can delete them manually. For information, see the following sections in Oracle Fusion Middleware User’s Guide for Oracle WebCenter Portal: Spaces: Deleting a Space, Deleting a Space Template, and Deleting a Resource Catalog.

---

### 6.8.6 Adding Oracle Single Sign-On Authentication Provider to the List of Authentication Providers

In the upgraded WebCenter environment, Oracle Single Sign-on (OSSO) Identity Asserter does not appear in the list of authentication providers. If you continue to use OSSO 10g even after upgrading to WebCenter Portal 11.1.1.7.0, you must update the setDomainEnv script to add the authentication provider.

To add the OSSO authentication provider:

1. Search for the following entry in the `DOMAIN_HOME/bin/setDomainEnv.sh` (on UNIX operating systems) or `DOMAIN_HOME\bin\setDomainEnv.cmd` (on Windows operating systems) file:

   
   ```
   ALT_TYPES_DIR="${ORACLE_HOME}/modules/oracle.ossoiap_11.1.1,${ORACLE_HOME}/modules/oracle.oamprovider_11.1.1
   ```

   Replace the entry with:

   ```
   ALT_TYPES_DIR="${COMMON_COMPONENTS_HOME}/modules/oracle.ossoiap_
   ```
2. Restart the Administration Server.

6.8.7 Adding New Features to WebCenter Portal

This section includes the following subsections:

- Section 6.8.7.1, "Installing Activity Graph, Analytics, Pagelet Producer, Personalization Server, and WebCenter Services Portlets"
- Section 6.8.7.2, "Adding Portal Framework Features to WebCenter Custom Applications"

6.8.7.1 Installing Activity Graph, Analytics, Pagelet Producer, Personalization Server, and WebCenter Services Portlets

Compared to Release 11.1.1.2.0 or 11.1.1.3.0, Oracle WebCenter Portal 11.1.1.7.0 includes several new features, including:

- Activity Graph, which provides suggestions of people that a user may be interested in connecting with, based on existing connections and shared interaction with objects within an application
- Analytics, which allows you to track and analyze Spaces usage

Note: If you want to extend your WebCenter domain to install Oracle WebCenter Portal's Analytics Collector, you must remove the openusage properties. For information, see Section 6.8.4.7, "Remove openusage Properties in setDomainEnv."

- Pagelet Producer, which provides a collection of useful tools and features that facilitate dynamic pagelet development
- Personalization Server, which can deliver targeted content
- WebCenter Services Portlets, which enables you to expose WebCenter Portal service task flows in other applications as WSRP portlets or pagelets. You can consume WebCenter Services Portlets in the following applications: Oracle Portal, Oracle WebLogic Portal, and Oracle WebCenter Interaction.

For more information about these features as well as other WebCenter components, see "Getting Started with WebCenter Portal Components" in Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal and see Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter Portal.

To take advantage of these new features, you must extend your domain by installing the required WebCenter components. For information about extending a domain in a:

- Simple topology, see "Extending an Existing Domain" in Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal.
- Cluster or distributed environment, refer to:
  - Chapter "Configuring High Availability for Oracle ADF and WebCenter Applications" in Oracle Fusion Middleware High Availability Guide.

Before you extend your domain, you must do the following:
Decide on the products and topology for your environment.

To verify that your system meets the necessary minimum requirements, refer to the following documents:

- **Oracle Fusion Middleware System Requirements and Specifications**:
  

  This document contains information related to hardware and software requirements, minimum disk space and memory requirements, database schema requirements, and required system libraries, packages, or patches.

- **Oracle Fusion Middleware Supported System Configurations**:
  

  This page contains various certification documents for current and previous product releases. The *System Requirements and Supported Platforms for Oracle Fusion Middleware 11g R1* document contains certification information related to supported 32-bit and 64-bit operating systems, databases, web servers, LDAP servers, adapters, IPv6, JDKs, and third-party products.

- **Oracle Fusion Middleware Interoperability and Compatibility Guide**

  This document covers the compatibility and interoperability issues that may arise when installing or upgrading Oracle Fusion Middleware 11g products.

Use Repository Creation Utility (RCU) to install any necessary schemas.

Analytics and Activity Graph require the ACTIVITES schema. WebCenter Services Portlets requires three additional schemas: MDS, WEBCENTER, and PORTLET. These schemas must be mapped to the data sources mds-ServicesProducerDS, WC-ServicesProducerDS, and Portlet-ServicesProducerDS, respectively. No additional schemas are required for Pagelet Producer or Personalization Server.

See "Oracle WebCenter Schemas" for information about required WebCenter schemas, and "Obtaining and Running Repository Creation Utility" for instructions on how to install the schemas with RCU. Both these topics are in *Oracle Fusion Middleware Repository Creation Utility User’s Guide*.

### 6.8.7.2 Adding Portal Framework Features to WebCenter Custom Applications

Oracle WebCenter Portal: Framework supports various new features such as page navigations and page hierarchies. If you want to use new features, the recommended best practice for migration of a release 11.1.1.2.0 or 11.1.1.3.0 custom application that contains portal components (like portlets) is to create a new release 11.1.1.7.0 Framework application using the WebCenter Portal - Framework Application template and then manually migrate the content, configurations, and logic from your old application (release 11.1.1.2.0 or 11.1.1.3.0) to the new Framework application. For information about adding features to your Framework application, see *Oracle Fusion Middleware Developer’s Guide for Oracle WebCenter Portal*. 
Patching Oracle Identity and Access Management

This chapter describes additional patching procedures for Oracle Identity and Access Management components.

**Note:** If you have a version of Oracle Identity Management that is earlier than 11g, you must upgrade your software and the patching instructions in this chapter are not applicable. For upgrade instructions, see the *Oracle Fusion Middleware Upgrade Guide for Oracle Identity Management*.

This chapter contains the following sections:

- Before You Begin
- Patching Oracle Identity and Access Management 11.1.1.3.0 Components
- Updating Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0
- Upgrading Oracle Identity Manager Remote Manager

### 7.1 Before You Begin

The procedures in this chapter should be used in conjunction with the procedures described in Chapter 3, "Applying the Latest Oracle Fusion Middleware Patch Set". Specifically, be sure that you have reviewed the following before you begin the patching procedures described in this chapter:

- Reviewing System Requirement and Certification
- Reviewing the Oracle Fusion Middleware Interoperability and Compatibility Guide
- Stopping the Servers and Processes
- Backing Up Your Middleware Home, Domain Home and Oracle Instances
- Backing Up Your Database and Database Schemas
- Backing Up Additional Configuration Information
7.2 Patching Oracle Identity and Access Management 11.1.1.3.0 Components

To apply the latest patch set to Oracle Identity Manager, Oracle Access Manager or Oracle Adaptive Access Manager 11.1.1.3.0, you must first patch to 11.1.1.5.0.

For information on how to patch your existing 11.1.1.3.0 components to 11.1.1.5.0, refer to the following sections in the Oracle Fusion Middleware Patching Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.5.0) documentation library:

- Preparing to Patch
- Updating Oracle Identity Manager 11.1.1.3.0 to 11.1.1.5.0
- Updating Oracle Access Manager 11.1.1.3.0 to 11.1.1.5.0
- Updating Oracle Adaptive Access Manager 11.1.1.3.0 to 11.1.1.5.0

**Note:** Be sure to review the Oracle Fusion Middleware Interoperability and Compatibility Guide for interoperability issues between Oracle Identity Management and Oracle Fusion Middleware Identity and Access Management components.

Once the components have been upgraded to 11.1.1.5.0, you can apply the 11.1.1.7.0 patch by following the steps in Section 3.6, "Patching Oracle Fusion Middleware".

7.3 Updating Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0

This section describes the steps needed to update your existing Oracle Identity Manager 11.1.1.5.0 environment to 11.1.1.7.0.

**Note:** The following steps are optional and are not required to complete the patching of Oracle Identity Manager.

1. Shut down the following servers running in the domain:
   - Administration Server for Oracle Identity Manager
   - Managed Servers for Oracle Identity Manager

   **Note:** The SOA server must be running while applying the patch set. If the SOA server is not running, you will receive an error message and the patch set will not be applied.

2. After stopping the servers, you must back up your old Oracle Identity Manager 11.1.1.5.0 environment before you upgrade to Oracle Identity Manager 11.1.1.7.0. Be sure that you have backed up the following:
   - MW_HOME directory, including the Oracle Home directories inside Middleware Home
   - Domain Home directory
   - Oracle Identity Manager schemas
   - MDS schema
3. Make sure you have patched your Oracle SOA Suite software to the latest supported version.

4. Run the Oracle Identity and Access Management 11g Release 1 (11.1.1.7.0) Patch Set Installer to patch your existing Oracle Identity and Access Management deployment as described in Applying the Patch Set.

5. Run Patch Set Assistant (located in the bin directory inside the ORACLE_HOME). Chapter 4, "Updating Your Schemas with Patch Set Assistant" contains information about using the Patch Set Assistant.

6. Select Oracle Identity Manager from the Select Component screen. The following schemas are automatically selected for upgrade:
   - Oracle Identity Manager schema _OIM
   - Oracle Metadata Services schema _MDS
     There will be two Oracle Metadata Services schemas selected:
     - Oracle Metadata Services schema used for OIM
     - Oracle Metadata Services schema used for SOA
   - Oracle SOA Infrastructure schema _SOAINFRA
   - User Messaging schema _ORASDPM
     Chapter 4, "Updating Your Schemas with Patch Set Assistant" contains information about using the Patch Set Assistant.

7. Oracle Identity Manager 11.1.1.7.0 provides an optional standalone patching utility that is used to automate some configuration tasks and optional features. After you have applied the 11.1.1.7.0 patch set, run this utility to:
   - Drop unused database objects
   - Deploy SOA-composites that were changed or introduced with this release
   - Seed new tasks, jobs and notifications
   - Change system properties that cannot be changed with MDS listeners (MBeans)
   - Apply domain specific changes like deployment of new ears, shared libraries to respective target servers

8. From your present working directory, navigate to the ORACLE_Home/server/bin directory on UNIX systems or ORACLE_Home\server\bin on Windows operating systems.

9. Navigate to ORACLE_HOME/server/bin and edit the oimPS1PS2upgrade.properties file with the following environment variables:
Updating Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0

For Windows operating systems, the following parameters must be set as environment variables. These variables are not read from the oimPS1PS2upgrade.properties file. Any variables set within the properties file will be ignored.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Sample Value</th>
</tr>
</thead>
</table>
| JAVA_HOME           | Where JAVA_HOME is the location of the JDK included in the installer.       | On UNIX operating systems:  
JAVA_HOME=/u01/oim/jrockit-jdk1.6.0_29-R28.2.0-4.0.1  
On Windows operating systems:  
C:\Program Files\Java\jdk1.6.0_02 |
| WEBLOGIC_USER       | Where WEBLOGIC_USER is the name of the WebLogic server administrator.      | WEBLOGIC_USER=weblogic                                                      |
| WEBLOGIC_HOST       | Where WEBLOGIC_HOST is the location of the machine hosting the server.     | WEBLOGIC_HOST=examplehost/exampleservice                                    |
| WEBLOGIC_PORT       | Where WEBLOGIC_PORT is the listening port of the server.                   | WEBLOGIC_PORT= 1521                                                         |
| WEBLOGIC.SERVER.DIR | Where WEBLOGIC.SERVER.DIR is the location of the Oracle WebLogic server installation. | On UNIX operating systems:  
WEBLOGIC.SERVER.DIR=/u01/oim/wlserver_10.3  
On Windows operating systems:  
WEBLOGIC.SERVER.DIR=\u01\oim\wlserver_10.3 |
| OIM_ORACLE_HOME     | Set OIM_ORACLE_HOME to the IAM Oracle Home, where Oracle Identity Manager is installed. | OIM_ORACLE_HOME=ORACLE_HOME\Oracle\Middleware/ORACLE_OIM1                   |
| ANT_HOME            | Where ANT_HOME is the location of the Ant Java library                     | ANT_HOME=\u01\oim\modules\org.apache.ant_1.7.1                            |
| WL_HOME             | Where WL_HOME is the Middleware home that contains the existing Oracle Identity Manager. | Drive:\Oracle\Middleware                                                   |

10. Depending on your environment configuration, you may also need to set the following environment variables to TRUE:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Sample Value (UNIX operating systems)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPSYNCEnabled</td>
<td>Set to TRUE to Enable LDAP sync.</td>
<td>LDAPSYNCEnabled=true</td>
</tr>
<tr>
<td>FAEnabled</td>
<td>Set to TRUE if your environment is FA. For non-FA environments set to FALSE.</td>
<td>FAEnabled=true</td>
</tr>
</tbody>
</table>
Run `oimPS1PS2upgrade.sh` (on UNIX) or `oimPS1PS2upgrade.bat` (on Windows).

12. Restart the Administration Server and Managed Server for Oracle Identity Manager.

13. Verify that the Upgrade utility completed successfully.

- Review the `oimPS1PS2upgrade.log` file created in the `ORACLE_HOME/server/upgrade/log` directory. End of file should state BUILD SUCCESSFUL.
- Verify all the required schema s are upgraded properly by running the following query:

  ```sql
  select comp_name,version,status,upgraded from schema_version_registry;
  ...
  SDP Messaging 11.1.1.7.0 VALID Y
  SOA Infrastructure Services 11.1.1.7.0 VALID Y
  Metadata Services 11.1.1.7.0 VALID Y
  Oracle Identity Manager 11.1.1.7.0 VALID Y
  ```

### 7.3.1 Upgrading Oracle Identity Manager Remote Manager

After you have updated your Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0, you must reinstall the Remote Manager, if you will be using Remote Manager features.

1. Back up configuration files

   Before starting the Remote Manager upgrade, back up the following Remote Manager configuration files:
Updating Oracle Identity Manager 11.1.1.5.0 to 11.1.1.7.0

2. Run the Oracle Identity and Access Management Installer to upgrade the Remote Manager home.
3. Restore configuration files.

Restore the backed up configuration files in the upgraded Remote Manager home.

7.3.2 Upgrading Oracle Identity Manager Design Console

The Oracle Identity Manager Design Console is used to configure system settings that control the system-wide behavior of Oracle Identity Manager and affect its users. The Design Console allows you to perform user management, resource management, process management, and other administration and development tasks. For more information about the Design Console, see "Design Console Overview" in the Oracle Fusion Middleware Developer’s Guide for Oracle Identity Manager.

Note: Oracle recommends that you install Oracle Identity Manager and the Design Console in different directory paths, regardless of whether the Design Console is on the same system as the Oracle Identity Management server.

To upgrade Design Console, complete the following steps:

1. Back up the following files:

   - On UNIX operating systems:
     
     $<XLDC_HOME>/xlclient.sh
     $<XLDC_HOME>/config/xlconfig.xml

   - On Windows operating systems:
     
     $<XLDC_HOME>/xlclient.cmd
     $<XLDC_HOME>/config/xlconfig.xml

2. Run the Oracle Identity and Access Management Installer to upgrade the Design Console home $<XLDC_HOME>.
3. Restore the backed up files in the upgraded Design Console home.
4. Build and copy the wlfullclient.jar file as follows:

   1. Go to WebLogic_Home/server/lib directory on UNIX and WebLogic_Home\server\lib directory on Windows.

   2. Set the JAVA_HOME environment variable and add the JAVA_HOME variable to the PATH environment variable.

      For example, you can set the JAVA_HOME to the jdk160_21 directory inside the Middleware home.

   3. Run the following command to build the wlfullclient.jar file:
java -jar <MW_HOME>/modules/com.bea.core.jarbuilder_1.7.0.0.jar

4. Copy the `wlfullclient.jar` file to the `<IAM_HOME>` where you installed the Design Console. For example:

   **On UNIX operating systems:**
   ```
cp wlfullclient.jar <Oracle_IDM2>/designconsole/ext
   ```

   **On Windows operating systems:**
   ```
copy wlfullclient.jar <Oracle_IDM2>\designconsole\ext
   ```
This chapter describes how to patch your existing Oracle Identity Management high availability environment to the latest version. To do so, complete the following tasks:

**See:** Types of Oracle Identity Management Environments in the Oracle Fusion Middleware Upgrade Guide for Oracle Identity Management for information on the topologies.

**Note:** Review Chapter 5, "Post-Patching Procedures" before completing the tasks in this chapter. You may need to perform additional tasks.

- Task 1: Stopping Servers and System Components
- Task 2: Updating Oracle WebLogic Server to Version 10.3.5
- Task 3: Updating the Oracle Identity Management Oracle Home using the Oracle Identity Management Patch Set Installer
- Task 4: Updating the Oracle HTTP Server Oracle Home Using the Oracle Web Tier Patch Set Installer
- Task 5: Updating the Oracle Identity Management Repository using Patch Set Assistant
- Task 6: Performing Manual Post-Patching Procedures
- Task 7: Restarting System Components and Servers
- Task 8: Updating the Version Number String Shown in Fusion Middleware Control

**Note:** Back up your Oracle software, inventory, schema, and domain before applying this patch set, or before making any other changes to your existing Oracle software. Refer to your product administrator's guide for instructions on backing up your Oracle software and inventory. For more information, see "Advanced Administration: Backup and Recovery" in the Oracle Fusion Middleware Administrator’s Guide.
8.1 Task 1: Stopping Servers and System Components

Before updating Oracle Identity Management, you must stop the following servers and components:

- Stopping Managed Servers
- Stopping the Administration Server
- Stopping the Node Manager
- Stopping the Oracle Management Agent
- Stopping the System Components
- Special Consideration for Patching OID Replication Environments

8.1.1 Stopping Managed Servers

You must stop the WLS_ODS1 and WLS_ODS2 Managed Servers running on IDMHOST1 and IDMHOST2 by using the Oracle WebLogic Server Administration Console. For more information, see the "Starting and Stopping Oracle Fusion Middleware" section in the Oracle Fusion Middleware Administrator’s Guide.

8.1.2 Stopping the Administration Server

You must stop the IDMHOST1 Administration Server, for more information see the "Starting and Stopping Administration Servers" in the Oracle Fusion Middleware Administrator’s Guide.

8.1.3 Stopping the Node Manager

Stop the Node Manager running on IDMHOST1 and IDMHOST2 by closing the command shell in which it is running or terminate the Node Manager Process. For example, run the following command on a UNIX operating system:

```
kill -9 pid
```

Replace `pid` with the process ID of the Node Manager process.

8.1.4 Stopping the Oracle Management Agent

To stop the Oracle Management Agent running on IDMHOST1 and IDMHOST2, run the following command:

```
opmnctl stopall
```

8.1.5 Stopping the System Components

You must stop all system components and processes running on Oracle Internet Directory (running on OIDHOST1 and OIDHOST2), Oracle Virtual Directory (running on OVDHOST1 and OVDHOST2), and Oracle HTTP Server (running on WEBHOST1 and WEBHOST2) by using the opmnctl command-line tool:

```
opmnctl stopall
```

8.1.6 Special Consideration for Patching OID Replication Environments

If you have configured OID replication in your environment:

1. Stop the replication server on all the nodes of Directory Replication Group (DRG).
2. Patch one node at a time to the latest version using the Patch Set Installer.
3. Restart the replication server after patching all the nodes of DRG.

8.2 Task 2: Updating Oracle WebLogic Server to Version 10.3.5

Your existing Oracle WebLogic Server must be updated to version 10.3.5 on IDMHOST1, IDMHOST2, OIDHOST1, OIDHOST2, OVDHOST1, and OVDHOST2.

In order to update your WebLogic Server, you must use the upgrade installer, which requires a My Oracle Support account. For more information, see "Downloading an Upgrade Installer From My Oracle Support" in Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server.

8.3 Task 3: Updating the Oracle Identity Management Oracle Home using the Oracle Identity Management Patch Set Installer

You must update your existing Oracle Identity Management ORACLE_HOME to the latest version on IDMHOST1, IDMHOST2, OIDHOST1, OIDHOST2, OVDHOST1, and OVDHOST2 by using the Patch Set Installer for Oracle Identity Management.

For instructions, see Chapter 3, "Applying the Latest Oracle Fusion Middleware Patch Set".

After the installation is complete, the oracleRoot.sh confirmation dialog box is displayed. This dialog box advises you to run configuration script as root before the installation can proceed. Leaving the confirmation dialog box open, open another shell window, log in as root, and run the oracleRoot.sh script file.

After the script completes, click OK on the Confirmation Dialog box.

8.4 Task 4: Updating the Oracle HTTP Server Oracle Home Using the Oracle Web Tier Patch Set Installer

If Oracle HTTP Server is configured in the ORACLE_INSTANCE, then you must update the Oracle HTTP Server ORACLE_HOME to the latest version on WEBHOST1 and WEBHOST2 by using the Patch Set Installer for Oracle Web Tier.

For instructions, see Chapter 3, "Applying the Latest Oracle Fusion Middleware Patch Set".

8.5 Task 5: Updating the Oracle Identity Management Repository using Patch Set Assistant

You must run Patch Set Assistant to update the database schema for Oracle Internet Directory to the latest version. Patch Set Assistant performs an in-place schema update on your existing schemas.

For instructions, see Chapter 4, "Updating Your Schemas with Patch Set Assistant".

Note: You must update the schema once for the entire topology.
Task 6: Performing Manual Post-Patching Procedures

Depending on the components you are upgrading, and the starting versions of those components, you may need to perform additional manual procedures after applying a patch set. Review "Chapter 5, "Post-Patching Procedures" to determine if any additional tasks are required.

Task 7: Restarting System Components and Servers

You must start the following:

- Starting System Components
- Starting Node Manager
- Starting the Oracle WebLogic Administration Server
- Starting the Managed Server
- Starting Oracle Management Agent

8.7.1 Starting System Components

You must start the following system components:

- Starting Oracle Internet Directory Processes
- Starting Oracle Virtual Directory Processes
- Starting Oracle HTTP Server

---

Note: If you have not started OPMN, then you must start OPMN by running the following command:

```
opmnctl start
```

---

8.7.1.1 Starting Oracle Internet Directory Processes

To start the Oracle Internet Directory processes, use the following OPMN command:

```
opmnctl startproc ias-component=oid_component_name
```

To verify that the Oracle Internet Directory Instances have started, run the following opmnctl status command:

```
opmnctl status
```

Example:

Processes in Instance: oid_inst1

<table>
<thead>
<tr>
<th>ias-component</th>
<th>process-type</th>
<th>pid</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid1</td>
<td>oidldapd</td>
<td>31522</td>
<td>Alive</td>
</tr>
<tr>
<td>oid1</td>
<td>oidldapd</td>
<td>31520</td>
<td>Alive</td>
</tr>
<tr>
<td>oid1</td>
<td>oidmon</td>
<td>31449</td>
<td>Alive</td>
</tr>
<tr>
<td>EMAGENT</td>
<td>EMAGENT</td>
<td>31448</td>
<td>Alive</td>
</tr>
</tbody>
</table>

8.7.1.2 Starting Oracle Virtual Directory Processes

To start the Oracle Virtual Directory processes, use the following OPMN command:

```
opmnctl startproc ias-component=ovd_component_name
```
To verify that the Oracle Virtual Directory Instances have started, run the following `opmnctl status` command:

```
opmnctl status
```

Example:

```
$ ovd_instance_home/bin/opmnctl status
```

Processes in Instance: ovd_inst1

```
<table>
<thead>
<tr>
<th>ias-component</th>
<th>process-type</th>
<th>pid</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>ovd1</td>
<td>OVD</td>
<td>31658</td>
<td>Alive</td>
</tr>
<tr>
<td>EMAGENT</td>
<td>EMAGENT</td>
<td>31657</td>
<td>Alive</td>
</tr>
</tbody>
</table>
```

8.7.1.3 Starting Oracle HTTP Server

If Oracle HTTP Server is configured in the ORACLE_INSTANCE, then start it using the following command:

```
opmnctl startproc ias-component=ohs_component_name
```

To verify that the Oracle HTTP Server instances have started, run the following `OPMN` command:

```
opmnctl status
```

Example:

```
[abcd@stajz13 Disk1]$ /u01/app/oracle/ps1/admin/ohs_inst1/bin/opmnctl status
```

Processes in Instance: ohs_inst1

```
<table>
<thead>
<tr>
<th>ias-component</th>
<th>process-type</th>
<th>pid</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>ohs1</td>
<td>OHS</td>
<td>7144</td>
<td>Alive</td>
</tr>
</tbody>
</table>
```

8.7.2 Starting Node Manager

You must start Node Manager, running on IDMHOST1 and IDMHOST2, by using the `startNodeManager.sh` script (UNIX, located at `WL_HOME/server/bin` directory) or `startNodeManager.cmd` script (Windows, located at `WL_HOME\server\bin` directory) as follows:

On UNIX operating systems:

```
MW_HOME/wl_server_n/server/bin/startNodeManager.sh
```

On Windows operating systems:

```
MW_HOME\wl_server_n\server\bin\startNodeManager.cmd
```

8.7.3 Starting the Oracle WebLogic Administration Server

You must start the IDMHOST1 Administration Server by running the following command:

On UNIX operating systems:

```
DOMAIN_HOME/bin/startWebLogic.sh
    -Dweblogic.management.username=weblogic
```
8.7.4 Starting the Managed Server

You must start Node Manager, running on IDMHOST1 and IDMHOST2. For more information see "Starting and Stopping Managed Servers Using Fusion Middleware Control" in Oracle Fusion Middleware Administrator’s Guide.

8.7.5 Starting Oracle Management Agent

To start the Oracle Management Agent for the Oracle WebLogic Server running on IDMHOST1 and IDMHOST2, use the following OPMN command:

```
opmnctl startproc ias-component=EMAGENT
```

To verify that the Oracle Management Agent Instances have started, run the following opmnctl status command:

```
opmnctl status
```

Example:

```
Processes in Instance: wls_ods1
------------------------------------------------------------------------+---------+---------
ias-component                       | process-type |     pid | status
------------------------------------------------------------------------+---------+---------
EMAGENT                              | EMAGENT     | 10971   | Alive
```

8.8 Task 8: Updating the Version Number String Shown in Fusion Middleware Control

If you are using existing Oracle Internet Directory or Oracle Virtual Directory components and you have patched those components to the latest version, you must use the opmnctl updatecomponentregistration command to manually update the version number string that is shown in Fusion Middleware Control.

For instructions, see "Updating the Component Registration of an Oracle Instance by Using opmnctl" in the Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory.
This appendix contains sample screenshots and descriptions for the Installer screens used to apply the patch. The screen functionality will be the same for most installers.
This page introduces you to the Oracle Fusion Middleware installer and provides two important pieces of information:

- A navigation pane on the left that summarizes the tasks the installer will help you complete. Each item in the navigation pane represents a specific installer screen that will prompt you for information required to install the software.

- Information about any prerequisites you might need to perform before continuing with the installation.

Review the information on this screen carefully to be sure you have performed all the necessary prerequisites.

If you are not sure about any of the prerequisite tasks, refer to the Oracle Fusion Middleware Installation Planning Guide, as well as the installation guide for the specific Oracle Fusion Middleware software you are about to install.
A.2 Install Software Updates

Use this screen to quickly and easily search for the latest software updates, including important security updates, via your My Oracle Support account.

The following table describes the fields on this screen.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip Software Updates</td>
<td>Select this option to skip this screen. The installer will not check for updates that might be applicable to the current product installation.</td>
</tr>
<tr>
<td>Search My Oracle Support for Updates</td>
<td>If you have a My Oracle Support account, then select this option to have the installer automatically search My Oracle Support for software updates that apply to the software products are about to install. Enter your My Oracle Support account name and password, and then click <strong>Search for Updates</strong>. The installer automatically downloads applicable software updates from My Oracle Support. Before you search for update, you can test your login credentials and the connection to My Oracle Support by clicking <strong>Test Connection</strong>. Click <strong>Proxy Settings</strong> to configure a proxy server if one is required.</td>
</tr>
<tr>
<td>Search Local Directory for Updates</td>
<td>Select this option if you already downloaded the latest software updates and you want the installer to search a local directory for updates applicable to the products you are about to install. When you select this option, the installer displays an additional field and <strong>Browse</strong> button that you can use to identify the local directory where your updates are located.</td>
</tr>
</tbody>
</table>
A.3 Prerequisite Checks

This screen analyzes the host computer to ensure that specific operating system prerequisites have been met.

If any of the prerequisite checks fail, then a short error message appears in the bottom portion of the screen. Fix the error and click Retry to try again. If you want to ignore the error or warning messages and continue with the installation, click Continue.

Click Abort to stop prerequisite checking for all components.
A.4 Specify Installation Location

Use this screen to identify where you want to install your Oracle Fusion Middleware software.

The following table describes the fields that appear on this page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Middleware Home</td>
<td>Use this field to specify the location of your Oracle Middleware home directory:</td>
</tr>
<tr>
<td></td>
<td>- <strong>If you are using Oracle WebLogic Server as your application server:</strong></td>
</tr>
<tr>
<td></td>
<td>In the Oracle Middleware Home field, specify the absolute path to your existing Oracle Middleware home directory; this is the directory that was created when you installed Oracle WebLogic Server. If you do not know the full path to your Middleware home, you can click <strong>Browse</strong> to select an existing directory in your system.</td>
</tr>
<tr>
<td></td>
<td>- <strong>If you are using IBM WebSphere as your application server:</strong></td>
</tr>
<tr>
<td></td>
<td>In the Oracle Middleware Home field, specify the absolute path to the directory you want to use as the Middleware home. This directory has no relation to the location of your WebSphere installation. If you specify a directory location that does not already exist, the installer will create the directory for you.</td>
</tr>
</tbody>
</table>
Specify Installation Location

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Home Directory</td>
<td>Use this field to specify the directory inside the Middleware home where you want to install your products.</td>
</tr>
<tr>
<td></td>
<td>If you specify a directory that already exists, it must be either:</td>
</tr>
<tr>
<td></td>
<td>■ An empty directory inside the Middleware home (for example, you have created an empty directory inside the Middleware home in advance of this installation and should specify this directory here).</td>
</tr>
<tr>
<td></td>
<td>■ An existing Oracle home directory (for example, you are reinstalling Oracle SOA Suite to an existing Oracle home because of an incomplete previous installation).</td>
</tr>
<tr>
<td></td>
<td>If you specify a new directory, it will be created inside the Middleware home.</td>
</tr>
</tbody>
</table>

**Note:** For the remainder of this document, the directory specified in the Oracle Home Directory field will be referred to as your SOA Oracle home to avoid any confusion with the Oracle home directories of other Oracle Fusion Middleware products.

For more information about the Oracle home and Middleware home directories, refer to "Oracle Fusion Middleware Directory Structure" in Oracle Fusion Middleware Installation Planning Guide.

If you are performing an installation on a Windows operating system, be sure that your directory paths are valid and do not contain double backslashes (\\).
A.5 Application Server

Use this screen to select the application server you want to use for this installation.

- If the installer detects a Middleware home with Oracle WebLogic Server installed, then this is the application server that will be used. All other fields in this screen will be inactive.

- If the installer detects a Middleware home without an Oracle WebLogic Server installed, you must select one of the application server options and then provide its location in the Application Server Location field.

- If the installer does not detect a Middleware home directory, the "WebLogic Server" option will be inactive. You must select "WebSphere" and then provide the location of your IBM WebSphere in the Application Server Location field.
A.6 Installation Summary

This screen summarizes the selections you have made during this installation session. It includes the following information:

- The location of your installation
- How much disk space will be used for the installation
- The applications you have selected for installation

Review information on this screen carefully, and take one of the following actions:

- If you want to make any changes to the configuration before starting the installation, use the navigation pane to select the Installer screen you want to return to and edit.
- If you are satisfied with the information, click Install to begin the installation procedure.
- If you want to save this configuration to a text file (called a response file), click Save. The resulting response file can be used later if you choose to perform the same installation from the command line.
A.7 Installation Progress

This screen shows you the progress of the installation.

If you want to quit before the installation is completed, click **Cancel**. Doing so will result in a partial installation; the portion of the software that was installed on your system before you click **Cancel** will remain on your system, and you will have to remove it manually.
A.8 Installation Complete

This screen summarizes the installation that was just completed.

If you want to save this summary information to a text file for future reference, click **Save**.

Click **Finish** to dismiss the screen.
This appendix contains screenshots and descriptions for the Patch Set Assistant screens:

- Welcome
- Select Component
- Prerequisites
- Schema
- Examine
- Upgrade Summary
- Upgrade Progress
- Upgrade Success
B.1 Welcome

The Welcome screen is displayed each time you start the installer.

You can click View Log at any time during the schema upgrade process to view the log file. A separate window (Log File Viewer) is displayed that contains the messages being written to the log file. The top of the Log File Viewer contains the location and name of the log file. You can click Refresh to see the most recent messages being logged.
B.2 Select Component

Use this screen to select the component schema you want to update.

The Patch Set Installer lists all components that are found in the Middleware home. For example, if you started the Patch Set Installer from the `MW_HOME/oracle_common/bin/psa` directory (on UNIX operating systems) or `c:\Products\Oracle\Middleware\Oracle_SOA1\bin` directory (on Windows operating systems), the Patch Set Installer will list all components found in `/home/Oracle/Middleware` directory (on UNIX operating systems) or `c:\Products\Oracle\Middleware` directory (on Windows operating systems).

You can only use Patch Set Assistant to update one top-level component at a time. In the figure above, notice that Oracle SOA is selected, which means Patch Set Assistant would update the SOAINFRA schema as well as the MDS schema, upon which the SOAINFRA schema is dependent. However, the top-level "Oracle Metadata Services" box is not selected even though that schema is going to be updated.

If you wanted to update either of the other two top-level schema found in this Middleware home (in this case, "Oracle Audit Services" or "Oracle Platform Security Services") you would have to restart the Patch Set Assistant and select those components separately.
Note: If you are upgrading from Release 11.1.1.2.0 or 11.1.1.3.0, the prefix_ACTIVITIES schema will not be available in your environment as this schema was not introduced until Release 11.1.1.4.0. Make sure you de-select this schema from the WebCenter Portal component; otherwise the Patch Set Assistant will ask for credentials for this schema.

B.3 Prerequisites

Use this screen to verify that you have satisfied the database prerequisites before you continue. You must check all the boxes acknowledging that all prerequisites for upgrade have been met, or else you will be unable to continue to the next screen.

Select **Database backup completed** to verify that you have backed up your database as described in Section 4.3.1, "Back Up Your Database and Database Schemas".

Select **Database version is certified by Oracle for Fusion Middleware upgrade** to verify that you have read the System Requirements and Supported Platforms for Oracle Fusion Middleware 11gR1 document on the Oracle Fusion Middleware Supported System Configurations page, and that your database is certified for use with Oracle Fusion Middleware.
Use this screen to specify database connection credentials and schema information for upgrade. This screen appears once for each component schema that needs to be updated; each time after the first time the screen will have all the database credential values filled in for you. If you have schemas on different databases then you will need to alter your database connection information accordingly.

The following table describes the fields on this screen:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Type</td>
<td>Select your database type from the drop-down list. Only database types that are valid for the schema are available in this list. The following database types are supported:</td>
</tr>
<tr>
<td></td>
<td>- Oracle Database</td>
</tr>
<tr>
<td></td>
<td>- Oracle Database enabled for editions-based redefinition</td>
</tr>
<tr>
<td></td>
<td>- Microsoft SQL Server</td>
</tr>
<tr>
<td></td>
<td>- IBM DB2</td>
</tr>
<tr>
<td></td>
<td>- MySQL</td>
</tr>
<tr>
<td></td>
<td>- MySQL</td>
</tr>
<tr>
<td></td>
<td>In addition, Oracle Data Integrator also supports the following databases:</td>
</tr>
<tr>
<td></td>
<td>- Sybase Adaptive Server Enterprise</td>
</tr>
<tr>
<td></td>
<td>- PostgreSQL</td>
</tr>
<tr>
<td></td>
<td>- Hypersonic SQL</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> The database type Oracle Database enabled for editions-based redefinition should only be selected when editions created in the EBR database require an upgrade. If this is not the intent, select Oracle Database.</td>
</tr>
<tr>
<td>Connect String</td>
<td>Specify the connection credentials to your database.</td>
</tr>
<tr>
<td></td>
<td>- For Oracle databases: <code>host:port/service_name</code></td>
</tr>
<tr>
<td></td>
<td>- For Microsoft SQL Server and IBM DB2 databases: <code>host:port;DatabaseName=dbname</code></td>
</tr>
<tr>
<td>DBA User Name</td>
<td>Specify the user name and role of the database administrator user.</td>
</tr>
<tr>
<td></td>
<td>- For Oracle databases, enter SYS or any user with DBA role (for example, <code>sys as sysdba</code> or any user with DBA privileges).</td>
</tr>
<tr>
<td></td>
<td>Note that the SYS database user can grant DBA privileges to an ordinary database user 'SCOTT' with the following SQL DDL statement: <code>GRANT DBA TO SCOTT;</code></td>
</tr>
<tr>
<td></td>
<td>- For Microsoft SQL Server databases, enter <code>sa</code> or any user with <code>db_owner</code> role.</td>
</tr>
<tr>
<td></td>
<td>- For IBM DB2 databases, enter <code>db2admin</code> or any user with <code>DBA</code> role.</td>
</tr>
<tr>
<td></td>
<td>- For Hypersonic databases, enter <code>sa</code>.</td>
</tr>
<tr>
<td></td>
<td>- For Sybase databases, enter <code>sa</code>.</td>
</tr>
<tr>
<td></td>
<td>- For MySQL databases, enter <code>root</code>.</td>
</tr>
<tr>
<td>DBA Password</td>
<td>Enter the password for your database administrator user.</td>
</tr>
</tbody>
</table>

After these values are filled in, click **Connect** to connect to your database. After the connection succeeds, two additional fields will become active on the screen:
B.5 Examine

This page displays the status of each component schema for upgrade. The meaning of the status indicators for the components is listed in the following table.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in progress</td>
<td>The Patch Set Assistant is examining whether or not the schema can be upgraded.</td>
</tr>
<tr>
<td>pending</td>
<td>The schema will be examined when the Patch Set Assistant is finished examining the preceding component.</td>
</tr>
</tbody>
</table>
B.6 Upgrade Summary

Use this page to review a summary of the options you have selected and to start the upgrade process.

Click **Save Response File** to save this upgrade information to a response file. This file can be used later if you want to run the Patch Set Assistant from the command line. For more information, see Section 4.4.2, "Using the Patch Set Installer from the Command Line".

### Status Description

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>already upgraded</td>
<td>The schema was previously successfully upgraded with the Patch Set Assistant or was created with the latest version of the Repository Creation Utility (RCU). No action will be taken on this schema.</td>
</tr>
<tr>
<td>failed</td>
<td>The schema can not be upgraded.</td>
</tr>
<tr>
<td>skipped</td>
<td>The examination of this schema was skipped. This is caused when the examination of a dependent schema fails.</td>
</tr>
<tr>
<td>succeeded</td>
<td>The examination of the schema was successful and the schema is ready to be upgraded.</td>
</tr>
</tbody>
</table>
B.7 Upgrade Progress

This screen shows you the progress of your schema upgrade. The "Upgrade Progress" bar moves from 0% at the beginning to 100% when the upgrade is complete.
B.8 Upgrade Success

This screen indicates that the upgrade was successful.

Be sure to view the log file located in the \MW_HOME/oracle_common/upgrade/logs (on UNIX operating systems) or \MW_HOME/oracle_common\upgrade\logs (on Windows operating systems) directory for details about the upgrade. (The exact directory path will be shown on your screen.) You can view the log file with any text editor, or you can click the View Log button.
This appendix contains the following sections:

- **Overview of Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Patch Assistant**
- **Migration Process**
- **Preparing to Migrate**
- **Migrating to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0)**

**Important Notes:** The information and procedures in this chapter apply only to users who have installed and configured Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0). If you are currently running Release 1 (11.1.1.1.0), then you must use this chapter to update your Oracle Fusion Middleware environment to Release 1 (11.1.1.2.0) before you can patch your environment.

If you are already running Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) or a later patch set, then disregard this appendix.

The procedures in this chapter are for installing and configuring and migrating to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0). As a result, for all cross-references in this section, refer to the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

### C.1 Overview of Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Patch Assistant

Patch Assistant enables you to migrate your existing configuration of Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) components, used in conjunction with the 11.1.1.1.0 and 11.1.1.2.0 installations. Patch Assistant is not a complete software distribution. You must run this Patch Assistant over an existing Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) installation. Patch Assistant is designed to work with all Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) products. You may see messages that an Oracle product is not present in a domain or instance. This message is informational and does not indicate an error.

Refer to Table C–7 for the Oracle Fusion Middleware components supported by Patch Assistant.
Patch Assistant helps to migrate the following from Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0):

- Oracle Fusion Middleware Domains

  **Note:** It is required that you migrate the entire Oracle WebLogic domain. When the domain is migrated, all components in the domain are also migrated.

- Oracle Instances

- Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) database schema created using Oracle Repository Creation Utility (RCU)

  **Note:** You must migrate both the schema and the middle tier.

When you run Patch Assistant tool, the configuration files contained in the Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) domain and Instance directories are copied to the new directories in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) installation. The Middleware home is the full path of the Oracle directory that contains the Oracle Fusion Middleware installation, and `MW_HOME` will be used in this documentation to refer to the directory where the product is installed.

  **Note:** `MW_HOME` must be replaced with the full path name of the installed Oracle Fusion Middleware instance.

## C.2 Migration Process

*Figure C–1* illustrates the migration process. Review this chart to get familiar with the steps you are required to take, based on your existing Oracle Fusion Middleware environment.
C.3 Preparing to Migrate

This section contains important information you should read before you migrate.

C.3.1 Evaluating and Reviewing your Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) Environment

The first step in the migrating process is to evaluate your current Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) environment. During the migration process, the topology of the deployment must not change, the port configuration must be retained, and there must be minimal changes in namespaces. All the changes in the namespaces are encapsulated by the properties in the patchMaster.properties file, which is included in the fmw11gR1ps1_patchassist.zip file.

For a list of products included in this patch set, see Section C.4.7, "Oracle Fusion Middleware Components Supported by Patch Assistant”.

C.3.2 Preparing to Migrate Your Configuration

This section discusses the following topics:

- Prerequisites
- Extracting the Contents of Patch Assistant
- Setting Up the Patch Assistant Environment
- Stopping Oracle Fusion Middleware
- Setting Logging Properties

C.3.2.1 Prerequisites

This section describes the general and product-specific prerequisites for running Patch Assistant.
This section discusses the following topics:

- General Prerequisites
- Product-Specific Prerequisites

C.3.2.1.1 General Prerequisites  The following are the general prerequisites for running Patch Assistant:

- Ensure that Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) is installed and configured.

- Ensure that you install 11.1.1.2.0 on the same operating system used by the 11.1.1.1.0 installation.

- Ensure that the system configuration meets the recommended system configuration described in your product documentation. For more information, see http://www.oracle.com/technology/software/products/ias/files/fusion_certification.html.

- Ensure that you have Apache Ant 1.7.0 and Java JDKs (Java SE 6 1.6.0_11 and jrockit_160_05_R27.6.2-20), which are packaged with Oracle WebLogic Server.

Note: If you are using Oracle Internet Directory, Oracle Virtual Directory, Oracle HTTP Server, or Oracle Web Cache as standalone Oracle Fusion Middleware installations, you must install and configure Apache Ant separately. For more information, see Installing Ant at http://ant.apache.org/manual/installlist.html and Section C.3.2.3, "Setting Up the Patch Assistant Environment".

- Make a detailed note of the topology used for the Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) installation.

- Ensure that you do not change the port configuration and instance names in your existing Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) installation.

- Ensure that the environment variables for tmp and temp directories for Microsoft Windows are set, as described in the Oracle Fusion Middleware Administrator’s Guide.

- Back up your Oracle software, inventory, schema, and domain before applying this patch set, or before making any other changes to your existing Oracle software. Refer to your product administrator’s guide for instructions on backing up your Oracle software and inventory. For more information, see the “Advanced Administration: Backup and Recovery” part in the Oracle Fusion Middleware Administrator’s Guide.

- On Windows, it is recommended that you edit the patchMaster.properties file in a Notepad. If you are using any other text editor, such as Windows WordPad, then save the file as Text Document. Do not save the file in Rich Text Format.

- On Windows, you must delete the service name for Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) before installing Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) because both the installations use the same service name. To do so, run the following Ant task on the command line:

  ant master-opmn-delete-service
Enter the required information when prompted by the Ant task.

---

**Note:** If you want to abort the migration and revert to the 11.1.1.1.0 deployment, run the following Ant task on the command line:

```
ant master-opmn-create-service```

---

- Heterogeneous nodes in a Cluster (one in 11.1.1.2.0, other in 11.1.1.2.0) is not supported during the migration process. You must migrate all nodes to 11.1.1.2.0 before environment can be used.

### C.3.2.1.2 Product-Specific Prerequisites

Depending on your Oracle Fusion Middleware component, you may have to meet additional prerequisites as follows:

- Oracle Fusion Middleware Audit Framework
- Oracle Directory Integration Platform
- Oracle Internet Directory and Oracle Virtual Directory
- Oracle WebCenter
- Oracle Portal

#### Oracle Fusion Middleware Audit Framework

For Oracle Fusion Middleware Audit Framework, the audit policy is configured for Java components in Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0), you must export the configuration before running Patch Assistant, as follows:

1. Log in to Oracle Enterprise Manager 11g Fusion Middleware Control.
2. Expand WebLogic Domain on the left pane, and select your domain. Your selected domain page is displayed.
3. From the WebLogic Domain, select **Security**, and then **Audit Policy**.
   - The **Audit Policy** page is displayed.
4. Select the Audit Policy, and click **Export**.
5. Save the **AuditConfiguration** file to your machine.

#### Oracle Directory Integration Platform

For the Oracle Directory Integration Platform, do the following:

1. Ensure that your Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Oracle Internet Directory is up and running in SSL No-Auth mode.
2. Extend the Oracle WebLogic domain created during the Oracle Internet Directory 11g Release 1 (11.1.1.2.0) installation, by running the following command:
   - **Windows**
     ```
     config.cmd (Located at: ORACLE_HOME\bin)
     ```
   - **UNIX**
     ```
     config.sh (Located at: ORACLE_HOME/bin)
     ```
   - The Oracle Fusion Middleware Configuration Wizard appears. Enter the Oracle Internet Directory 11g Release 1 (11.1.1.2.0) connection details and credentials.
3. Stop the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) domain.
Preparing to Migrate

Oracle Internet Directory and Oracle Virtual Directory

Depending on your installation, complete the following prerequisites:

- If your 11.1.1.1.0 configuration has Oracle Internet Directory and Oracle Virtual Directory created with a new Oracle WebLogic domain, then choose the Create a new WebLogic domain option on the Welcome screen of the Oracle Fusion Middleware Configuration Wizard when configuring the 11.1.1.2.0 domain.

  During the configuration of 11.1.1.2.0, if you select the Create a new WebLogic domain option, then you must deselect Oracle Internet Directory and Oracle Virtual Directory, and select Oracle Directory Services Manager.

- If your Oracle Internet Directory and Oracle Virtual Directory are not registered to any Oracle WebLogic domain in your 11.1.1.1.0 configuration, then 11.1.1.2.0 configuration is not required. You must set the property `patchMaster.Oracleinstancenewlist` in the `patchMaster.properties` file to a new directory for the instance. Ensure that you retain the same instance name used in 11.1.1.1.0.

- If your 11.1.1.1.0 configuration has Oracle Internet Directory and Oracle Virtual Directory registered to an existing Oracle WebLogic domain, then 11.1.1.2.0 configuration is not required. You must set the property `patchMaster.Oracleinstancenewlist` in the `patchMaster.properties` file to a new directory and register the instance with the existing 11.1.1.2.0 WebLogic domain using `Ant` target. Ensure that you retain the same instance name used in 11.1.1.1.0.

Oracle WebCenter

To migrate Oracle WebCenter, you may choose either of these approaches:

- Keep two parallel instances of Oracle WebCenter, that is 11.1.1.1.0 as well as 11.1.1.2.0. To do this, you must perform a complete installation of Oracle WebCenter 11.1.1.2.0. You can then migrate your Oracle WebCenter 11.1.1.1.0 data into the new WebCenter instance by using the export and import utilities. This approach enables you to use both instances of Oracle WebCenter, if required. For example, you may run the two instances in parallel to minimize downtime or to ensure that the 11.1.1.2.0 instance is set up to the same level as the 11.1.1.1.0 instance before you switch over to the 11.1.1.2.0 instance completely.

  For information more informatio, refer to the following resources in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library on the Oracle Technology Network (OTN):

  - Refer to the Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal for information about how to install Oracle WebCenter 11g Release 1 (11.1.1.2.0).

- Migrate the Oracle WebCenter 11.1.1.1.0 repository and mid-tier completely to Oracle WebCenter 11.1.1.2.0. This approach preserves your Oracle WebCenter 11.1.1.1.0 repository data and enables you to reuse the repository.

  This guide describes the tasks required to implement this migration approach for Oracle WebCenter.
Oracle Portal
Before updating, you should backup your OmniPortlet and WebClipping customizations.

C.3.2.2 Extracting the Contents of Patch Assistant
You can download the `fmw11gR1ps1_patchassist.zip`, which is included in the Oracle Fusion Middleware 11g Release 1 Patch Set 1 Patch Scripts media. The zip file is available in the same media pack as Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) on Oracle Technology Network (OTN) at the following URL:
http://oracle.com/technology

After downloading this zip file, extract its contents to its own location, in your local machine, where the old and new Oracle Fusion Middleware components are installed. Ensure that the same operating system is used for the 11.1.1.1.0 and 11.1.1.2.0 installations. The zip file includes the following files:

- **README** – Describes the environment.
- **patchMaster.properties** - The user input file.
- **build.xml** – The master build file. Each Oracle Fusion Middleware component has its own `build.xml` file.

C.3.2.3 Setting Up the Patch Assistant Environment
To set up the Patch Assistant environment for Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0), you must set up `ANT_HOME`, add it to your `PATH`, set the `JAVA_HOME` and the `permgen` size.

For example, on **Windows**:

```bash
set ANT_HOME=MW_HOME\modules\org.apache.ant_1.7.0
set PATH=%PATH%;%ANT_HOME%;bin
set JAVA_HOME=MW_HOME\jdk160_14_R27.6.4-18
set ANT_OPTS=-Xmx512M -XX:MaxPermSize=512m
```

For example, on **UNIX**:

```bash
setenv MW_HOME ##set mw home here##
setenv ANT_HOME $MW_HOME/modules/org.apache.ant_1.7.0
setenv PATH $ANT_HOME/bin:$PATH
setenv JAVA_HOME $MW_HOME/jdk160_14_R27.6.5-32
setenv ANT_OPTS "-Xmx512M -XX:MaxPermSize=512m"
```

C.3.2.4 Stopping Oracle Fusion Middleware
Before you run Patch Assistant, you must stop the following:

- Oracle WebLogic Server
- Administration Servers
- Managed Servers
- Oracle Management Agent
- Java EE Applications
- High Availability Environments

For more information, see the Starting and Stopping Oracle Fusion Middleware chapter in the *Oracle Fusion Middleware Administrator’s Guide*. 

C.3.2.5 Setting Logging Properties

You can use the log file to verify the migration or to detect any errors after running Patch Assistant. Patch Assistant creates a time stamp file in the Patch Assistant home. You can specify the following logging levels:

- info (This is the default setting)
- error
- warning
- verbose
- debug

**Note:** The debug and the verbose options may display sensitive information in the logs, and they are not recommended for typical use.

Before you use your log file, you must set the logging properties as follows:

Open the `patchMaster.properties` file in a text editor, and update the following properties:

```properties
# Description: Specifies the directory where the log files go
patchMaster.Logdir=${patchMaster.Dir}

# Description: Specifies the default location where the log file is saved.
patchMaster.Loglevel=info
```

Sets the logging level.

To override the default `patchMaster.properties` Log level, run the command as shown in the following example:

```
ant -DpatchMaster.Loglevel=error
```

**Note:** You can override the `patchMaster.properties` by setting properties on the command line. If the debug or verbose options are used on the command line, they override the logging level property set in the `patchMaster.properties` file. For more information, see Section C.4.6.1, "Overriding Properties Set in the patchMaster.properties File".

C.4 Migrating to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0)

This sections contains migration instructions. The following topics are covered:

- Migration Roadmap
- Migration Procedure
- Post-Migration Configuration for Oracle Fusion Middleware Components
- Installation Process
- Configuration Process
- Properties in the patchMaster.properties File
Oracle Fusion Middleware Components Supported by Patch Assistant

C.4.1 Migration Roadmap

Table C–1 describes the high-level tasks for migrating from Oracle Fusion Middleware 11.1.1.1.0 to 11.1.1.2.0. The table also provides information on where to get more details on each task.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
<th>Mandatory or Optional?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 1 - Prepare Environment with General Prerequisites, such as Backing Up Existing Configuration and Retaining Ports and Instance Names</td>
<td>Complete all general prerequisites for running Patch Assistant.</td>
<td>For more information, see Section C.3.2.1.1, &quot;General Prerequisites&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Task 2 - Prepare Environment with Product-Specific Prerequisites, if any</td>
<td>Complete all product-specific prerequisites for running Patch Assistant, as applicable.</td>
<td>For more information, see Section C.3.2.1.2, &quot;Product-Specific Prerequisites&quot;.</td>
<td>Optional</td>
</tr>
<tr>
<td>Task 3 - Stop All Oracle Fusion Middleware 11.1.1.0 Domains and Instances</td>
<td>Ensure that you stop all Oracle Fusion Middleware 11.1.1.0 domains and instances.</td>
<td>For more information, see Section C.3.2.4, &quot;Stopping Oracle Fusion Middleware&quot; and Section C.4.2.1, &quot;Stopping the Old Domain&quot;.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Task 4 - Install Software (Oracle WebLogic Server, Repository Creation Utility, and Oracle Products) for 11.1.1.2.0</td>
<td>Install Oracle software, including Oracle WebLogic Server, Repository Creation Utility, and Oracle products for 11.1.1.2.0. Do not create or configure a WebLogic domain at this stage of the migration process. Install the Oracle Fusion Middleware 11g Release 1 (11.1.2.0) and its components in a separate Middleware home on the same host as the Oracle Fusion Middleware 11g Release 1 (11.1.1) MW_HOME. Ensure that you stop the Oracle Fusion Middleware components for 11.1.1.0, before you begin the installation. This will enable the 11.1.1.2.0 installation to retain the same 11.1.1.0 port number, host name, and machine name.</td>
<td>For instructions about installing the Oracle WebLogic Server version required for Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0), refer to the Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server in the Oracle Fusion Middleware 11g Release 1 (11.1.2.0) documentation library on OTN. For system requirements information, go to: <a href="http://download.oracle.com/docs/html/E18558_01/fusion_requirements.htm">http://download.oracle.com/docs/html/E18558_01/fusion_requirements.htm</a> For certification information, go to: <a href="http://www.oracle.com/technetwork/middleware/ias/downloads/fusion-certification-100350.html">http://www.oracle.com/technetwork/middleware/ias/downloads/fusion-certification-100350.html</a> For information about installing Oracle products, refer to the product-specific installation guides.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Task 5 - Download the Patch Assistant Zip File</td>
<td>Download the Patch Assistant zip file and extract its contents. After unzipping, configure Patch Assistant before editing the properties.</td>
<td>For more information, see Section C.4.2.3, &quot;Downloading Patch Assistant&quot;.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
### Table C–1 (Cont.)  Tasks in the Migration Procedure

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
<th>Mandatory or Optional?</th>
</tr>
</thead>
</table>
| Task 6 - Set Up the patchMaster.properties File and Run Patch Assistant for Schema Only | Ensure that the Oracle database that contains the 11.1.1.1.0 schemas is up and running. This will allow access to the SCHEMA_VERSION_REPOSITORY table by Patch Assistant. Specify the schema-related properties in the patchMaster.properties file, and run the ant master-patch-schema command to migrate the schema only. Note: For Oracle Portal, you must complete the steps in Task 7, 8, and 9, and then follow the steps to migrate the schema. It is recommended that you refer to the following topics in the Oracle Fusion Middleware Upgrade Guide for Oracle Portal, Forms, Reports, and Discoverer before you run Patch Assistant to migrate the schema:  
  ■ Understanding the Impact of the Oracle Portal Schema Upgrade  
  ■ Checking for Invalid Objects in the Database Where the Oracle Portal 10g Schema Resides  
  ■ Backing Up the Database Where the Oracle Portal 10g Schema Resides  
  ■ Verifying the Required Database Parameters for Oracle Portal 11g  
  ■ Verifying That the Database and Oracle Internet Directory Are Running  
Log files specific to Oracle Portal migration are generated in the upgrade.log and precheck.log files in the ORACLE_HOME/upgrade/logs directory (UNIX).  
If your Oracle Portal repository is not stored in the Oracle Metadata Repository, and is instead installed in a separate database, then do not use the procedures in this section. Instead, refer to "Upgrading an Oracle Portal Repository in a Customer Database" in Oracle Fusion Middleware Upgrade Guide for Oracle Portal, Forms, Reports, and Discoverer. | For more information, see Section C.4.2.4, "Migrating the Schema".                                                                 | Mandatory               |
Migrating to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0)

Using Patch Assistant to Migrate from 11g Release 1 (11.1.1.1.0) to Release 1 (11.1.1.2.0)

C.4.2 Migration Procedure

Migrating your existing configuration from 11.1.1.1.0 to 11.1.1.2.0 involves the following tasks:

1. Stopping the Old Domain
2. Installing Oracle Software for 11.1.1.2.0
3. Downloading Patch Assistant
4. Migrating the Schema
5. Creating a WebLogic Domain for 11.1.1.2.0
6. Migrating the Domain
7. Migrating an Instance
8. Registering the Instance
9. Starting or Stopping the 11.1.1.2.0 Domain
10. Completing Post-Migration Tasks
11. Decommissioning the 11.1.1.1.0 Installation

C.4.2.1 Stopping the Old Domain
To stop the old 11.1.1.0 domain, complete the following steps:

---

**Note:** You can also use Fusion Middleware Control, Oracle WebLogic Server Administration Console, or WLST or OPMN commands to stop the Oracle Fusion Middleware components.
---

1. Open the `patchMaster.properties` file (Located in your `patchMaster` directory) in a text editor, and specify the following properties in the `patchMaster.properties` file, as applicable:

   - `patchMaster.Oraclehomeold`
   - `patchMaster.Oracleinstanceoldlist`
   - `patchMaster.Domainadminhost`
   - `patchMaster.Domainadminport`

   If the `patchMaster.Domainadminhost` property is not specified, the default value `local host` is used. If the `patchMaster.Domainadminport` property is not specified, the default value `7001` is used. After editing the properties, save the file and close. For more information about properties in the `patchMaster.properties` file, see Section C.4.6, "Properties in the `patchMaster.properties` File".

---

**Note:** If you have multiple Oracle products installed, then you must run Patch Assistant once for each product and setting the `patchMaster.Oraclehomeold` for each product.
---

2. Run the following command on the command line:

   ```
   ant master-stop-domain-old
   ```

3. Enter the domain user name and password, when prompted.

---

C.4.2.2 Installing Oracle Software for 11.1.1.2.0
You must install Oracle WebLogic Server, Repository Creation Utility (RCU), and Oracle products for 11.1.1.2.0:

- Create a new Middleware home directory.
- Install Repository Creation Utility.
- Perform a software-only installation of the product bundle.
Ensure that your system environment meets the general installation requirements for Oracle Fusion Middleware. Some Oracle Fusion Middleware Components require schemas that must be installed in an Oracle database. It is recommended that you do not install any new schemas for your existing 11g R1 (11.1.1.1.0) products. However, in the same environment, you can add new products for which you may have to create the appropriate schemas. For such products, you can create and load the schemas in your database by using RCU. Ensure that you have a supported Oracle database up and running. See [http://www.oracle.com/technology/software/products/ias/files/fusion_certification.html](http://www.oracle.com/technology/software/products/ias/files/fusion_certification.html) for more information.

Ensure that same instance name used in 11.1.1.1.0 and 11.1.1.2.0.

---

**Note:** When you migrate the mid-tier, you are installing a fresh mid-tier in your new 11.1.1.2.0 environment. Patch Assistant migrates the middle tier configuration to this new instance.

---

For information about the installation process, including Cluster scenarios, see Section C.4.4, "Installation Process".

### C.4.2.3 Downloading Patch Assistant

For information about downloading Patch Assistant and extracting its contents, see Section C.3.2.2, "Extracting the Contents of Patch Assistant".

### C.4.2.4 Migrating the Schema

Before you can update the repository, ensure that your 11.1.1.1.0 domain is configured and it includes tables populated from running the Repository Creation Utility (RCU).

---

**Note:** You can choose to install Oracle Content Server while installing Oracle WebCenter, or later by performing a standalone installation. In Oracle Fusion Middleware 11.1.1.0, if you performed a standalone installation of Oracle Content Server, then before you migrate the schemas, you must rename the Oracle Content Server’s schema so that it contains the standard suffix, `OCSERVER`. For information, see Section C.4.2.4.1, "Renaming the Oracle Content Server Schema".

---

To migrate the schema, complete the following steps:

1. **Open the** `patchMaster.properties` **file (Located in your** `patchMaster` **directory) in a text editor, and specify the following schema-related properties in the** `patchMaster.properties` **file:**

   ```
   patchMaster.Schemaurl
   patchMaster.Schemauser
   patchMaster.Schemaprefix
   patchMaster.Mwhomenew
   patchMaster.Mwhomeold
   patchMaster.Componentlist
   ```
After editing the properties, save the file and close. For more information about properties in the patchMaster.properties file, see Section C.4.6, "Properties in the patchMaster.properties File".

2. Run the following command on the command line to migrate the database schema, and provide the required user name and password when prompted:

```
ant master-patch-schema
```

Patch Assistant can only migrate one set of component schemas that share the same prefix. If different components in your deployment have different prefixes and you have multiple schemas sharing a repository, then you must invoke Patch Assistant multiple times, once for each prefix.

**Note:** If you migrate the Metadata Services schema for one component, it also affects all the other components using the same Metadata Services schema. If you are using Oracle SOA, you must enter `ant -q master-patch-schema` on the command line to migrate the schema.

During the schema migration, exceptions may occur. Some of these exceptions can be ignored. The following example shows one such exception:

```
[java] SEVERE: Error while registering Oracle JDBC Diagnosability MBean.
  [java] java.security.AccessControlException: access denied
  (javax.management.MBeanTrustPermission register)
  [java] at
  java.security.AccessControlContext.checkPermission(AccessControlContext.java:323)
```

**Note:** Patch Assistant ensures that all required properties are set for each of the operations.

Patch Assistant attempts to migrate all Oracle Fusion Middleware components. If a component is not installed or configured in the deployment, log messages indicating these attempts are generated.

Log files specific to Oracle Portal migration are generated in the upgrade.log and precheck.log files in the `ORACLE_HOME/upgrade/logs` directory (UNIX).

---

**C.4.2.4.1 Renaming the Oracle Content Server Schema** In Oracle Fusion Middleware 11.1.1.1.0, if you performed a standalone installation Oracle Content Server, then
before migrating the schemas, you must rename the Oracle Content Server's schema so that it contains the standard suffix, ocsERVER. You must also rebuild indexes on Oracle Content Server.

To rename the Oracle Content Server schema:

1. Create a new schema (for example, dev_ocSERVER) using the RCU. Ensure that you use the same password as that of your existing Oracle Content Server schema.
2. Export the existing schema (for example, IDC_IR10).
3. Import data into the new schema you created (dev_ocSERVER).

**Note:** Before you import data into the newly created schema, ensure that all the seeded database objects are removed from that schema.

4. Open the config/config.cfg file from the installation directory of your Oracle Content Server.
5. Change the Oracle Content Server schema name listed in the configuration file to the newly created schema. (for example, rename IDC_IR10 to dev_ocSERVER)
6. Access the Oracle Content Server administration console and ensure that the data exists.

After renaming the Oracle Content Server schema, you must migrate the schema, as described in the beginning of this section.

After migrating the schemas, you must rebuild the indexes on Oracle Content Server.

To re-create the index:

1. Log on to Oracle Content Server as a system administrator.
2. Access Repository Manager from the Admin Console by navigating to Administration > Admin Applets > Repository Manager.
3. Click the Indexer tab.
4. In the Collection Builder Cycle section, click **Start**. If the collection rebuild is already in progress, do not choose to restart the operation. First stop the collection rebuild operation, and then start the operation. Note that the collection rebuild operation is a time-consuming task.

**C.4.2.5 Creating a WebLogic Domain for 11.1.1.2.0**

Create a WebLogic domain for 11.1.1.2.0 as follows:

1. Run the \MW_HOME\oracle_common\common\bin\config.sh command (on UNIX) or the \MW_HOME\oracle_common\common\bin\config.cmd command (on Windows) on the command line. The Oracle Fusion Middleware Configuration Wizard appears.
   
   For Oracle Portal, Oracle Forms, Oracle Reports, and Oracle Discoverer the config.sh command is located at ORACLE_HOME/bin (on UNIX) and the config.cmd is located at ORACLE_HOME\bin (on Windows).

2. On the Welcome screen, select the **Create a new WebLogic domain** option. Click **Next**. The Select Domain Source screen appears.

3. On the Select Domain Source screen ensure that the **Generate a domain configured automatically to support the following products:** option is selected. Select templates for the products that are included in your existing 11.1.1.0
installation. For example, if the domain in your 11.1.1.1.0 installation had SOA configured, you must configure the new domain with SOA in 11.1.1.2.0. Click Next. The Select Domain Name and Location screen appears.

4. Enter a name and a location for the domain to be created, and click Next. Ensure that the domain name is same as the 11.1.1.1.0 domain. Click Next. The Configure Administrator User Name and Password screen appears.

5. Configure a user name and a password for the administrator. The default user name is weblogic. Click Next.

6. Choose a JDK in the Configure Server Start Mode and JDK screen.

7. Configure JDBC Component Schemas and ensure that you retain the same 11.1.1.1.0 topology during this configuration.

8. On the Select Optional Configuration screen, select the Administration Server and Managed Servers, Clusters, and Machines, and Deployments and Services check boxes. Click Next.

9. Configure the Administration Server, Managed Servers, Clusters, Machines, as required. Ensure that you retain the same 11.1.1.1.0 topology during this configuration.

10. On the Configuration Summary screen, review the domain configuration, and click Create to start creating the domain.

The WebLogic domain with your configuration attributes is created.

**Note:** Patch Assistant ensures that all required properties are set for each of the operations.

Patch Assistant attempts to migrate all Oracle Fusion Middleware components. If a component is not installed or configured in the deployment, log messages indicating these attempts are generated.

For more information about the configuration process, including Cluster scenarios, see Section C.4.5, "Configuration Process".

### C.4.2.6 Migrating the Domain

Before you can migrate the WebLogic domain, ensure that the database schemas are migrated, the new 11.1.1.2.0 products are installed, the new 11.1.1.2.0 domain is configured (as it was configured in the previous 11.1.1.1.0 installation), and all the WebLogic domains are shut down. When you migrate the 11.1.1.1.0 domain, the products configured in the domain are also migrated to the new 11.1.1.2.0 domain.

**Note:** If you have multiple Oracle products installed, then you must run Patch Assistant once for each product and setting the patchMaster.Oraclehomeold property for each product. You must patch all products in the domain being migrated.

To migrate the WebLogic domain, complete the following steps:

1. Open the patchMaster.properties file (Located in your patchMaster directory) in a text editor, and specify the following domain-related properties:

   patchMaster.Domainhomenew
   patchMaster.Domainapplicationshomenew
   patchMaster.Domainshomenew
C.4.2.7 Migrating an Instance

Before you can migrate the Oracle Instances, ensure that the database schemas are migrated, the new 11.1.1.2.0 products are installed, the new 11.1.1.2.0 domain is configured (as it was configured in the previous 11.1.1.1.0 installation), the domain is migrated, and the Oracle Instances are shut down.

**Note:** For Oracle Business Intelligence Discoverer in a High Availability (clustered) environment with multiple Managed Servers, you can override the default value $WLS\_DISCO$ by specifying the following java properties on the command-line:

- srcDiscoMgdServer
- destDiscoMgdServer

For example:

ant -DsrcDiscoMgdServer=WLS\_DISCO1 -DdestDiscoMgdServer=WLS\_DISCO1 master-patch-oinstance

To migrate an instance, complete the following steps:

1. Open the patchMaster.properties file (Located in your patchMaster directory) in a text editor, and specify the following properties related to your Oracle Instance homes:

   - patchMaster.Oracleinstanceoldlist
patchMaster.Oracleinstancenewlist

After editing the properties, save the file and close. For more information about properties in the patchMaster.properties file, see Section C.4.6, "Properties in the patchMaster.properties File".

2. Run the following command on the command line to migrate the Oracle Instances:
   ant master-patch-oinstance

---

**Note:** Patch Assistant ensures that all required properties are set for each of the operations.

Patch Assistant attempts to migrate all Oracle Fusion Middleware components. If a component is not installed or configured in the deployment, log messages indicating these attempts are generated.

---

### C.4.2.8 Registering the Instance

After migrating an instance, you must register the instance by completing the following steps:

---

**Note:** Before registering the instance, ensure that your Administration Server is up and running.

---

1. Open the patchMaster.properties file (Located in your patchMaster directory) in a text editor, and specify the following properties in the patchMaster.properties file, as applicable:
   patchMaster.Oracleinstancenewlist

   After editing the properties, save the file and close. For more information about properties in the patchMaster.properties file, see Section C.4.6, "Properties in the patchMaster.properties File".

2. Run the following command on the command line:
   ant master-register-oinstance

3. Enter the domain user name and password, when prompted.

---

**Note:** Patch Assistant ensures that all required properties are set for each of the operations.

Patch Assistant attempts to migrate all Oracle Fusion Middleware components. If a component is not installed or configured in the deployment, log messages indicating these attempts are generated.

---

### C.4.2.9 Starting or Stopping the 11.1.1.2.0 Domain

Starting or stopping the new 11.1.1.2.0 domain requires the patchMaster.Domainhomenew property to be specified in the patchMaster.properties file.

To start the new 11.1.1.2.0 domain, run the following command on the command line:
   ant master-start-domain-new
To stop the new 11.1.2.0 domain, run the following command on the command line:

`ant master-stop-domain-new`

### C.4.2.10 Completing Post-Migration Tasks

For information about post-migration tasks specific to your product, see Section C.4.3, "Post-Migration Configuration for Oracle Fusion Middleware Components".

---

**Note:** When the Oracle Portal, Forms, Reports, and Discoverer installation is performed on a Windows machine, the System `PATH` is updated so that the `ORACLE_HOME\bin` for that installation precedes `PATH`. You cannot run Oracle Forms from the first installation, by default. To access the 11.1.1.0 components, right-click on My Computer and then Properties, select the Advanced tab, and click the Environment Variables button. Edit the System variable `PATH` so that the `ORACLE_HOME\bin` that you want to use is the one that precedes `PATH`.

---

### C.4.2.11 Decommissioning the 11.1.1.0 Installation

After migrating to 11.1.2.0, you can deinstall Oracle Fusion Middleware 11g Release 1 (11.1.1.0). For more information, refer to the following:

- "Deinstalling Oracle Web Tier" chapter in the Oracle Fusion Middleware Installation Guide for Oracle Web Tier.

---

**Note:** When you deinstall 11.1.1.0, the Installer removes the previously created 11.1.2.0 windows service. Use the `Ant` command-line utility to re-create that service for each instance as follows:

`ant master-opmn-create-service`

Enter the required information when prompted by the Ant task.

---

### C.4.3 Post-Migration Configuration for Oracle Fusion Middleware Components

After running the Patch Assistant, you must manually configure some of the Oracle Fusion Middleware Components:

- Post-Migration Configuration for Oracle Fusion Middleware Audit Framework
- Post-Migration Configuration for Oracle Business Intelligence Discoverer
- Post-Migration Configuration for Oracle Directory Integration Platform
C.4.3.1 Post-Migration Configuration for Oracle Fusion Middleware Audit Framework

After running Patch Assistant for Oracle Fusion Middleware Audit Framework, you must complete the following tasks:

- **Update the Translation Table in Audit Schema**
- **Migrating Audit Policy Configuration for Java Components**
- **Creating the Audit Data Source**

C.4.3.1.1 Update the Translation Table in Audit Schema
If the `IAU_DISP_NAMES_TL` audit event translation data is defined in the 11.1.1.1.0, then you can migrate them to the 11.1.1.2.0, by completing the following steps:

1. Run SQLPlus, and connect to the database as the system user. For example:
   ```sql
   sqlplus sys as sysdba
   ```
2. Run SQL commands in the following order:
   ```sql
   SQL> alter session set current_schema=<Name_of_Your_Audit_Schema>;
   SQL> delete from iau_disp_names_tl;
   SQL> @disp_names.sql;
   ```

   `disp_names.sql` is located at `fmw11gR1ps1_patchassist\Audit` folder.

   **Note:** To avoid scrambled characters, a Unicode-supported database is required to store the translation data. In addition, to ensure proper character set conversion between SQL*Plus and the database server, a compatible character set, such as UTF8 or AL32UTF8, needs to be set for the `NLS_LANG` environment variable before running `disp_names.sql`.

   For the complete list of legal `NLS_LANG` values, see the Oracle Database Documentation Library at:

C.4.3.1.2 Migrating Audit Policy Configuration for Java Components
If the audit policy is configured for Java components in 11.1.1.0, you must import the configuration file after running Patch Assistant, as follows:

1. Log in to the Oracle Enterprise Manager 11g Fusion Middleware Control.
2. Expand the WebLogic Domain on the left pane, and select your domain.

   Your selected domain page is displayed.
3. From the WebLogic Domain, select Security, and then Audit Policy.
   The Audit Policy page is displayed.
4. Select the Audit Policy, and click Import.
5. Click Browse, and specify the path where your AuditConfiguration file is located.
6. Click Ok.

C.4.3.1.3 Creating the Audit Data Source
If the audit data source is used in Oracle Fusion Middleware 11.1.1.1.0, then you must re-create the audit data store used in 11.1.1.2.0.
To do so, perform the following steps:
1. Log in to the Oracle WebLogic Server administration console:
   http://host:7001/console
2. Under JDBC, click the Data Sources link.
   The Summary of JDBC Data Sources page is displayed.
3. Click New to create a new data source.
   The Create a New JDBC Data Source page is displayed.
4. Enter the following details for the new data source:
   ■ Name: Enter a name such as Audit Data Source-0
   ■ JNDI Name: jdbc/AuditDB
   ■ Database Type: Oracle
   ■ Database Driver: Oracle’s Driver (Thin XA) Versions: 9.0.1, 9.0.2, 10, 11
   If deploying to a managed cluster server, check AdminServer. This selection ensures that the data source is listed in the audit store when switching from file to database store.
5. Click Next.
   The Transaction Options page is displayed.
6. Click Next.
   The Connection Properties page is displayed.
7. In the Connection Properties page, enter the following information:
   ■ Database Name: Enter the name of the database to which you will connect. This usually maps to the SID.
   ■ Host Name: Enter the hostname of the database.
   ■ Port: Enter the database port.
   ■ Database User Name: This is the name of the audit schema that you created in RCU. The suffix is always IAU for the audit schema. For example, if you gave the prefix as test, then the schema name is test_iau.
   ■ Password: This is the password for the audit schema that you created in RCU.
   Click Next.
8. The next page lists the JDBC driver class and database details. Accept the default values, and click Test Configuration to test the connection. If you see the message “Connection established Successfully”, click Next. If it displays any error, go back and check the connection details.
9. In the Select Targets page, select the servers where this data source must be configured, and click Finish.

C.4.3.2 Post-Migration Configuration for Oracle Business Intelligence Discoverer

After running Patch Assistant, ensure that all your existing Oracle BI Discoverer Plus OLAP users have proper access privileges to the Oracle BI Discoverer 11g Release 1 (11.1.1.2.0) Discoverer Catalog. To set proper access privileges, perform the following tasks using the command-line utilities:

- Authorizing a New User to Access the Discoverer Catalog
- Updating the Privileges of an Existing Discoverer Catalog User

C.4.3.2.1 Authorizing a New User to Access the Discoverer Catalog

Use the following commands to authorize one or more users so they can access the Discoverer Catalog:

```
java -classpath path_to_d4o_jar_file load . java -classpath path_to_d4o_jar_file authorize -h hostname -po portname -sid database_SID -p d4osyspasswd -u user
```

For example, on Windows:

```
java -classpath C:\temp\d4o.jar load . java -classpath C:\temp\d4o.jar authorize -h sys42.example.com -po 1521 -sid disco_db1 -p nPword432 -u jones
```

For example, on UNIX:

```
java -classpath /home/abc/temp/d4o.jar load . java -classpath /home/abc/temp/d4o.jar authorize -h sys42.example.com -po 1521 -sid disco_db1 -p nPword432 -u jones
```

In this example, you must run the load command only once before authorizing any number of users. For example, if you want to authorize 10 users, run the load command once, and then run the authorize command once for each user.

C.4.3.2.2 Updating the Privileges of an Existing Discoverer Catalog User

To update the user’s privileges to access all private and shared folders, use the following command:

```
java -classpath path_to_d4o_jar_file updatePrivileges -h hostname -po portname -sid database_SID -p d4osyspasswd -u user
```

For example, on Windows:

```
java -classpath C:\temp\d4o.jar updatePrivileges -h sys42.example.com -po 1521 -sid disco_db1 -p nPword432 -u jones
```

For example, on UNIX:

```
java -classpath /home/abc/d4o.jar updatePrivileges -h sys42.example.com -po 1521 -sid disco_db1 -p nPword432 -u jones
```

In this example, if you specify the -u option, then the privileges are upgraded only for that user. If you do not specify the -u option, then the privileges are upgraded for all users.

C.4.3.3 Post-Migration Configuration for Oracle Directory Integration Platform

After running Patch Assistant, start your Oracle Directory Integration Platform 11g Release 1 (11.1.1.2.0) domain. For more information, see the “Starting and Stopping
Oracle Fusion Middleware " in the Oracle Fusion Middleware Administrator’s Guide and, then complete the following steps:

1. Log in to Oracle Enterprise Manager Fusion Middleware Control.
2. In the Oracle Enterprise Manager home page, select Farm, and then Agent-Monitored Targets.
   The Agent-Monitored Targets page is displayed.
3. From the Targets table, select the target used by the Oracle Directory Integration Platform, and click Configure.
   The Configure Target page is displayed.
4. Click Change Agent and, then select the Oracle Internet Directory Agent URL from the drop-down box.
5. Click Ok.
6. Click Apply.
7. Log out of Oracle Enterprise Manager.
8. Log in to Oracle Enterprise Manager again.
9. Unregister the ASInstance created during Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) Directory Integration Platform configuration by running the following command:
   Windows:
   `\ORACLE_INSTANCE\bin\opmnctl unregisterinstance -adminHost -adminPort -adminUserName`
   UNIX:
   `$ORACLE_INSTANCE/bin/opmnctl unregisterinstance -adminHost -adminPort -adminUserName`
10. Delete the ASInstance created during Oracle Fusion Middleware 11g Release 1 (11.1.2.0) Directory Integration Platform Configuration by running the following command:
    Windows:
    `\ORACLE_HOME\opmn\bin\opmnctl deleteinstance -oracleInstance <Oracle instance root directory>`
    UNIX:
    `$ORACLE_HOME/opmn/bin/opmnctl deleteinstance -oracleInstance <Oracle instance root directory>`

C.4.3.4 Post-Migration Configuration for Oracle Identity Federation

After running Patch Assistant, your Credential Store Framework (CSF) is not migrated to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0), if you are using an LDAP store. You must migrate the credentials manually from a source repository to a target repository by using the WLST command migrateSecurityStore.

For information, see "Migrating with the Script migrateSecurityStore" in Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library on OTN.
C.4.3.5 Post-Migration Configuration for Oracle Platform Security Services

You must manually migrate your existing Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) policy store because the corresponding schema changes when you install Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0). During this migration, any existing 11.1.1.1.0 installation policies are updated to 11.1.1.2.0 policies. You will find the existing 11.1.1.1.0 data provisioned in the 11.1.1.2.0 LDAP store.

However, you must redeploy your applications after installing Oracle Fusion Middleware (11.1.1.2.0), but the provisioned policies are already in the migrated LDAP store.

**Note:** When redeploying your applications, you should not migrate the policies as they already exist in the policy store.

Note that Oracle WebLogic Server domains are containers of application policy data that is used by Oracle Platform Security Services. Typically, a domain is identified by its name, as in the following example:

Relative DN (RDN) `cn=MyDomain,cn=JpsContext,cn=JpsTestNode`

The Relative DN (RDN) `cn=MyDomain` is the node on the LDAP server that corresponds to a domain. All data under such a domain, including Credential Store and Policy Store data, is preserved.

**Note:** If you are using Oracle WebLogic Server LDAP, then you must re-create the user. For more information, see “Security Data Migration” section in Oracle Fusion Middleware Developing Security Providers for Oracle WebLogic Server in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

Migration Scenarios

If you are migrating Oracle Platform Security Services 11.1.1.1.0 Policy Store to 1.1.1.2.0 Policy Store, consider the following migration scenarios:

- **Migrating File-Based Policy and Credential Store**
- **Migrating Oracle Internet Directory Policy and Credential Store and Reusing an Existing Oracle Internet Directory Server**

C.4.3.5.1 Migrating File-Based Policy and Credential Store

To migrate your existing file-based policy and credential store from 11.1.1.1.0 to 11.1.1.2.0, you must install Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0), which is configured to use the file-based policy (XML), credential (wallet) stores, and then migrate the credentials and application policies by using the WebLogic Scripting Tool (WLST) command `migrateSecurityStore`. For more information, see the "Migrating Credentials with the Command migrateSecurityStore" section in the Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

C.4.3.5.2 Migrating Oracle Internet Directory Policy and Credential Store and Reusing an Existing Oracle Internet Directory Server

To migrate your existing Oracle Internet Directory policy and credential store from Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0), start the servers in your Oracle Fusion Middleware domain and then complete the following steps:
1. Reconfigure the LDAP authenticator to use the same LDAP server used in the 11.1.1.0 installation. For information, see the Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

   **Note:** For information on reconfiguring the LDAP authenticator to use the same LDAP server used in Oracle WebCenter 11.1.1.0 installation, see the "Reassociating the Identity Store with an External LDAP" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

2. Update the Java Platform Security (JPS) LDAP schema in the LDAP store by using the WLST `reassociateSecurityStore` command. The reassociation creates a temporary node under a pre-existing jps root node. The temporary data is the domain, you specified during reassociation. The domain needs to be a new temporary name and the jpsroot should have the same name that contains the domain you are migrating from 11.1.1.0.

   For information, see "reassociateSecurityStore" in Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

   This command creates a temporary domain that will be deleted later. For example:

   ```java
   reassociateSecurityStore(domain="ps1_tmp_domain", admin="cn=orcladmin", password="welcome1", ldapurl="ldap://example.com:3060", servertype="OID", jpsroot="cn=jpsroot_r1_name")
   ```

   **Note:** Set a temporary name for the domain, and ensure that the jpsroot has the same name as in 11.1.1.0.

3. Ensure that the Oracle WebLogic Administration Server is stopped to change the server configuration. To stop the server, run the following command:

   **Windows:**

   ```cmd
   MW_HOME\user_projects\domains\<domain_name>\bin\stopWebLogic.cmd
   username password admin_url
   ```

   **UNIX:**

   ```sh
   $ MW_HOME/user_projects/domains/<domain_name>/bin/stopWeblogic.sh
   username password admin_url
   ```

4. Rebuild the Oracle Internet Directory catalog by running the following catalog commands from the Oracle Internet Directory machine:
Note: Before you start using the Oracle Identity Management command-line tools, you must configure your environment. This involves setting the appropriate environment variables as follows:

- `ORACLE_HOME` - The location of non-writable files in your LDAP-based identity store installation.
- `ORACLE_INSTANCE` - The location of writable files in your LDAP-based identity store installation.
- `TNS_ADMIN` - The location of tnsnames.ora file in your Oracle home.

Ensure that the tnsnames.ora file (Located at `ORACLE_HOME/network/admin`) contains the `conn_str` that will be used in the catalog command.

- `PATH` - Add the following directory locations to your `PATH`:
  
  `ORACLE_HOME/bin`  
  `ORACLE_HOME/ldap/bin`  
  `ORACLE_HOME/ldap/admin`  

Drop the catalog first before re-creating it as follows:

```plaintext
catalog connect="conn_str" delete=true  attribute= createtimestamp  
catalog connect="conn_str" delete=true  attribute= modifytimestamp  
catalog connect="conn_str" delete=true  attribute= orclJpsResourceName  
catalog connect="conn_str" delete=true  attribute= orclJPSObjGUID  
catalog connect="conn_str" delete=true  attribute= orclJpsResourceTypeActionNames
```

Then add the following:

```plaintext
catalog connect="conn_str" add=true  attribute= createtimestamp  
catalog connect="conn_str" add=true  attribute= modifytimestamp  
catalog connect="conn_str" add=true  attribute= orclJpsResourceName  
catalog connect="conn_str" add=true  attribute= orclJPSObjGUID  
catalog connect="conn_str" add=true  attribute= orclJpsResourceTypeActionNames
```

For more information, see "Performing Bulk Operations" in Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

5. Delete the temporary domain, created in step 1, by performing the following:

a. Disable the Server Entry Cache. For more information, see "Tuning Recommendations for Server Entry Cache" in Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

b. Stop Oracle Internet Directory by running the following command:

   Windows
   
   `ORACLE_INSTANCE\bin\opmnctl stopall`

   UNIX
   
   `ORACLE_INSTANCE/bin/opmnctl stopall`

c. Run the following command:
bulkdelete connect="connect string" basedn="cn=ps1_tmp_domain,cn=JPSContext,cn=jpsroot_r1_name"

Note: Do not use JXplorer or any other LDAP browser to delete the JPS root node.

For more information, see "Deleting Entries or Attributes of Entries by Using bulkdelete" in Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

d. Start Oracle Internet Directory by running the following command:
   Windows
   ORACLE_INSTANCE\bin\opmnctl startall
   UNIX
   ORACLE_INSTANCE/bin/opmnctl startall

e. Enable the Server Entry Cache. For more information, see the “Tuning Recommendations for Server Entry Cache” section and the "Attributes of the Instance-Specific Configuration Entry” section in the Oracle Fusion Middleware Administrator’s Guide for Oracle Internet Directory in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

f. Stop and start Oracle Internet Directory by running the following commands:
   Windows
   ORACLE_INSTANCE\bin\opmnctl stopall
   ORACLE_INSTANCE\bin\opmnctl startall
   UNIX
   ORACLE_INSTANCE/bin/opmnctl stopall
   ORACLE_INSTANCE/bin/opmnctl startall

6. Open the jps-config.xml file (located in your MW_HOME\user_projects\domains\<DomainName>\config\fmwconfig directory) in a text editor and replace the 11.1.1.2.0 domain name with 11.1.1.1.0 domain name. For example, replace cn=ps1_tmp_domain with cn=R1_domain_name.

7. Migrate the default system policies from the XML store to the LDAP store by using the WLST Command migrateSecurityStore.

   For more information, see the "Migrating Credentials with the Command migrateSecurityStore" section in the Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

   In the jps-config.xml file, add the entries to specify the source and the destination source JPS context. The source JPS context must be the one that uses the XML store as the policy store, and the destination JPS context must be the one that uses the LDAP store. For example, add the following entries in the jps-config.xml file:

   ```
   <jpsContext name="filestore">
     <serviceInstanceRef ref="policystore.xml"/>
   </jpsContext>
   <jpsContext name="ldapstore">
   ```
Ensure that the policystore.xml service instance in jps-config.xml file refers to the shipped system-jazn-data.xml file (out-of-the-box), as in the following example:

```xml
<serviceInstanceRef ref="policystore.ldap"/>
</jpsContext>
```

Migrate the system policies by using the WLST migrateSecurityStore command, as shown in the following example:

```bash
migrateSecurityStore(type="globalPolicies", configFile='<domain level jpsconfig.xml file loc>', src='filestore' ,dst='ldapstore')
```

For more information about the migrating system policies, see "Migrating Policies to the Domain Policy Store" in Oracle Fusion Middleware Security Guide in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

8. Ensure that the LDAP server contains the Role Categories entry under your application policy node.

a. Run the ldapsearch command to search for this Role Categories entry from the Oracle Internet Directory machine:

```bash
LDAP_OH/bin/ldapsearch -h <host> -p <port> -D "<Admin DN>" -w password -b "cn=Role Categories,cn=<app name>,cn=<domain name>,cn=JpsContext,cn=<jpsroot name>" -s base "(objectclass=*)"
```

   Where LDAP_OH/bin is the OID/IdM IDM_ORACLE_HOME/bin directory.

   Example:

   ```bash
   LDAP_OH/bin/ldapsearch -h oid.example.com -p 3060 -D "cn=orcladmin" -w password -b "cn=Role Categories,cn=appname,cn=domainname,cn=JpsContext,cn=jpsroot" -s base "(objectclass=*)"
   ```

   For detailed syntax, see the "ldapsearch" topic in the Oracle Fusion Middleware Reference for Oracle Identity Management in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

```
Note: If the Role Categories entry is not available, the following message is displayed:

```
ldap_search: No such object
```
```

b. If the Role Categories entry is not present, create an LDIF file named rolecat.ldif with the following content:

```ldif
dn: cn=Role Categories,cn=<app name>,cn=<domain name>,cn=JpsContext,cn=<jpsroot name>
objectclass: top
objectclass: orclContainer
cn: Role Categories
```

Example:
dn: cn=Role Categories,cn=webcenter,cn=R1_domain_name,cn=JPSContext,cn=jpsroot_r1_name
objectclass: top
objectclass: orclContainer
cn: Role Categories

c. Run the `ldapadd` command to add this node to the application policy store as follows:

```
LDAP_OH/bin/ldapadd -p <port> -h <host> -D "<Admin DN>" -w <password> -vf rolecat.ldif
```

Where `LDAP_OH/bin` is the OID/IDM IDM_ORACLE_HOME/bin directory.

Example:

```
LDAP_OH/bin/ldapadd -p 3060 -h oid.example.com -D "cn=orcladmin" -w password -vf rolecat.ldif
```

For detailed syntax, see the "ldapadd" topic in the Oracle Fusion Middleware Reference for Oracle Identity Management in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

---

**Note:** If the node exists, the output of the `ldapadd` command indicates that the object already exists.

---

**Note:** The `ldapadd` command for Role Categories must be run for every application that uses LDAP as policy store.

---

9. Start the Oracle WebLogic Administration Server, as shown in the following example:

```
MW_HOME/user_projects/domains/domain_name/bin/startWebLogic.sh
-Dweblogic.management.username=weblogic
-Dweblogic.management.password=password
```

For more information, see "Starting and Stopping Oracle Fusion Middleware" in Oracle Fusion Middleware Administrator's Guide.

10. Redeploy any user applications that were deployed in 11.1.1.0.

**C.4.3.6 Post-Migration Configuration for Oracle Reports**

After running Patch Assistant, your Oracle Internet Directory Policy and Credential Store (CSF) is not migrated to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0). For information about migrating the Oracle Internet Directory Policy and Credential Store (CSF), see Section C.4.3.5.2, "Migrating Oracle Internet Directory Policy and Credential Store and Reusing an Existing Oracle Internet Directory Server".

**C.4.3.7 Post-Migration Configuration for Oracle SOA**

After running Patch Assistant, you must perform the following:
1. Re-deploy your J2EE applications, including TaskDetail Application used in Human Workflow Applications. For more information, see "Deploying SOA Composite Applications" chapter in the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite.

2. Reconfigure any changes made to configuration files (For example: soa-infra-config) and component-level configuration files in 11.1.1.1.0 must be reconfigured for 11.1.1.2.0 using the Oracle Enterprise Manager Fusion Middleware Control.

3. Reconfigure the log level settings using the Oracle Enterprise Manager Fusion Middleware Control. For more information, see "Configuring Logging" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite.

4. Re-create the seeding of the Workflow users.

5. Reconfigure the Secure Sockets Layer (SSL) for the SOA composite application. For more information, see "Securing SOA Composite Applications" in Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite.

6. If you have configured the Oracle HTTP Server for 11.1.1.1.0, then you must reconfigure it for 11.1.1.2.0.

7. For composites involving BPEL Sensors with sensor action as JMS Queue, JMS Topic, JMS Adapter (remote JMS), re-create the JMS Queue, JMS topic, and the remote JMS set up.

8. Configure the identity and policy provider, as described in Section C.4.3.5.2, "Migrating Oracle Internet Directory Policy and Credential Store and Reusing an Existing Oracle Internet Directory Server".

9. Configure the SSO provider for 11.1.1.2.0.

10. Configure the adapters as follows:
   - Create the data source for the AQ adapter by following the steps described in the "Configuring the Data Sources in the Oracle WebLogic Server Administration Console" section in the Oracle Fusion Middleware User’s Guide for Technology Adapters.
   - Configure AQ JMS in Oracle WebLogic Server Administration Console. For more information, see the Oracle Fusion Middleware User’s Guide for Technology Adapters.
   - Create the foreign server for the AQJMS again and restart the server.
   - After migration, if the log was showing Queue Manager not available (with MQ reason code: 2059), you must modify the JNDI, which is used by the composite deployed to point to the Queue Manager, which was used for pre-upgrade. After making this change, you must restart SOA.
11. Migrate the B2B for 11.1.1.2.0 as follows:
   a. Import previously exported repository from 11.1.1.1.0 with the Replace Existing MetaData flag.
   b. Update the key store password and restart the B2B server.
   c. Select the certificate alias in delivery channel and save.

C.4.3.8 Post-Migration Configuration for Oracle User Messaging Service
After running Patch Assistant, you must perform the following:
- Migrating Configuration for Additional Custom-Deployed Drivers
- Migrating Configuration for User Messaging Service Worklist Driver

C.4.3.8.1 Migrating Configuration for Additional Custom-Deployed Drivers  If your Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) domain has configuration files for additional User Messaging Service driver deployments beyond those provisioned at install time, then you must migrate them to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0). Run the following Ant command on the command-line:

```
ant -f UMS/build.xml patch-ums-driver-config -Ddriver.name=<driver_name>
```

Where `<driver_name>` is the deployment name of the custom driver. The `build.xml` file is located in your `patchMaster` directory.

---

**Note:** This command only migrates the configuration to Oracle Fusion Middleware (11.1.1.2.0) domain and will not deploy the driver.

---

C.4.3.8.2 Migrating Configuration for User Messaging Service Worklist Driver  If your Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) domain has the User Messaging Service Worklist Driver installed and configured, then the configuration of the Worklist Driver is automatically migrated by the Patch Assistant. Patch Assistant does not install this additional driver. You must re-install the driver in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) domain.

For more information, see "Install the Worklist Driver" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle SOA Suite and Oracle Business Process Management Suite in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

C.4.3.9 Post-Migration Configuration for Oracle WebCenter
This section describes the tasks involved in getting your Oracle WebCenter 11.1.1.2.0 up and running after you have migrated the mid-tier.

C.4.3.9.1 Overview of Tasks for Configuring Oracle WebCenter Post Mid-Tier Migration
Table C-2 describes the tasks involved in configuring Oracle WebCenter 11.1.1.2.0 after the Patch Assistant script has been executed. The table also specifies whether these tasks are optional or mandatory.
You must migrate your existing identity store and credential store. Before doing so, be sure to start all the servers in your WebCenter domain.

If you are using the embedded LDAP based policy and credential store, for information about the tasks that you need to perform, see the "Exporting and Importing a File-based Policy Store" and "Exporting and Importing a File-based Credential Store" sections in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter in the Oracle Fusion Middleware 11g Release 1 (11.1.2.0) documentation library.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Mandatory/Optional?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reconfiguring Oracle WebCenter Identity Store and Migrating the Application Policy to the WebCenter Policy Store</td>
<td>Configure the identity store to use the same configuration as Oracle WebCenter 11.1.1.1.0. Also, run the <code>updateSpacesPolicy.py</code> script to update the application store to include appropriate security permissions for WebCenter Spaces. <strong>Note:</strong> You must run <code>updateSpacesPolicy.py</code> even if your Oracle WebCenter uses the embedded LDAP identity store.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Configuring Oracle WebCenter for Secure Sockets Layer (SSL)</td>
<td>Configure Oracle WebCenter 11.1.1.2.0 to use the same SSL configuration and keystore as Oracle WebCenter 11.1.1.0.</td>
<td>Mandatory if SSL is configured in Oracle WebCenter 11.1.1.0</td>
</tr>
<tr>
<td>Configuring Oracle WebCenter for Single Sign-On (SSO)</td>
<td>Configure your single sign-on (SSO) solution to use the same SSO configuration as Oracle WebCenter 11.1.1.1.0.</td>
<td>Mandatory if SSO is configured in Oracle WebCenter 11.1.1.0</td>
</tr>
<tr>
<td>Refreshing Group Space Data in WebCenter Spaces</td>
<td>Refresh the group space data and the data about group space members.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Reapplying Configuration Changes</td>
<td>Reapply any configuration changes made to Oracle WebCenter 11.1.1.0.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Importing Wiki Templates and Attachments</td>
<td>Migrate templates and attachments to the database repository of Oracle WebCenter Wiki and Blog Server.</td>
<td>Mandatory if Oracle WebCenter Wiki and Blog Server is configured for Oracle WebCenter 11.1.1.0</td>
</tr>
<tr>
<td>Migrating Oracle Content Server</td>
<td>Run the WebCenter configuration script <code>wc_contentserverconfig</code> to migrate to Oracle Content Server 10.1.3.5.1. Also, configure a JPS user provider in place of the existing LDAP user provider.</td>
<td>Mandatory if Oracle Content Server is configured for Oracle WebCenter 11.1.1.0</td>
</tr>
<tr>
<td>Configuring Oracle WebCenter Discussions for WebCenter Spaces</td>
<td>Configure Web Services Security (WS-Security) if you want to use Oracle WebCenter Discussions with Oracle WebCenter Spaces.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Migrating Custom WebCenter Applications</td>
<td>Migrate custom WebCenter applications to Oracle WebCenter 11.1.2.0.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
When Oracle WebCenter 11.1.1.1.0 is configured to use an external LDAP-based identity store, then post mid-tier migration you must migrate your identity store and credential store to Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0). For information about how to migrate Oracle Internet Directory policy and credential store, see Section C.4.3.5.2, "Migrating Oracle Internet Directory Policy and Credential Store and Reusing an Existing Oracle Internet Directory Server."

After migrating the identity and credential store, you must run the updateSpacesPolicy.py script to update the WebCenter Spaces application policy to include appropriate security permissions. If you do not run this script, WebCenter Spaces users will not be able to access their profile information or the service tabs in group spaces.

---

**Note:** You must run the updateSpacesPolicy.py script even if your Oracle WebCenter uses the embedded LDAP identity store.

---

To execute updateSpacesPolicy.py:

1. Launch WLST with this command:

   ```
   WC_ORACLE_HOME/common/bin/wlst.sh
   ```
   
   Where `WC_ORACLE_HOME` refers to the Oracle WebCenter installation directory.

2. At the WLST command prompt, enter the following command to connect to the Administration Server:

   ```
   wls:/offline> connect('user_name', 'password', 'host_name:port_number')
   ```
   
   For example, use the following command:

   ```
   connect('weblogic', 'weblogic', 'myhost.example.com:7001')
   ```

3. Use the following command to run the updateSpacesPolicy.py script:

   ```
   wls:/weblogic/serverConfig> execfile('WC_ORACLE_HOME/webcenter/scripts/updateSpacesPolicy.py')
   ```

4. Ensure that there are no errors logged on the console. If there are errors, use the error message as a guide and inspect the updateSpacesPolicy.py script to determine the grant command that failed. You must fix errors, if any, and run the grant command manually.

5. Restart the Administration Server and the WLS_Spaces Managed Server.

---

C.4.3.9.3 Configuring Oracle WebCenter for Secure Sockets Layer (SSL) Secure Sockets Layer (SSL) provides additional security for connections between WebCenter applications or components by providing an additional authentication layer, and by encrypting the data exchanged. During mid-tier migration, the SSL configuration does not get migrated. After running the Patch Assistant script, you must reconfigure SSL for Oracle WebCenter and, if required, for various WebCenter Services integrated into your WebCenter applications.

For information about how to configure SSL for WebCenter applications and WebCenter Services, see the "Configuring WebCenter Applications and Components to Use SSL" section in Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.
For example, in Oracle WebCenter 11.1.1.0, if secured portlets were used in WebCenter Spaces, then your keystore must have been set to the Custom Identity and Java Standard Trust keystore and you would have imported the required portlet certificates in the Java standard trust keystore (typically cacerts). Now, post mid-tier migration, you must configure the WLS_Spaces server, in your Oracle WebCenter 11.1.1.2.0 instance, to use the Custom Identity and Java Standard Trust keystore and other SSL-specific settings that were configured for Oracle WebCenter 11.1.1.1.0. Also, you must reimport all your portlet certificates into the trust keystore to access secured portlets in Oracle WebCenter 11.1.1.2.0.

C.4.3.9.4 Configuring Oracle WebCenter for Single Sign-On (SSO) For single sign-on (SSO) authentication, your Oracle WebCenter 11.1.1.1.0 may be configured to use Oracle Access Manager (OAM), Oracle Single Sign-on (OSSO), or a SAML-based single sign-on solution for WebCenter applications only. After mid-tier upgrade, you may need to perform the following configuration, depending on the SSO solution used.

For each of these cross-references, refer to the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library:

- Configuring OAM: Configure the authenticator and the OAM asserter to use the same configuration as used in Oracle WebCenter 11.1.1.1.0. For information, see the "Configuring Oracle Access Manager (OAM)" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

- Configuring OSSO: Configure the authenticator and the OSSO asserter to use the same configuration as used in Oracle WebCenter 11.1.1.1.0. For information, see the "Configuring Oracle Single Sign-On (OSSO)" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

- Configuring SAML-based SSO: You must set up your entire SAML-based SSO solution. For information, see the "Configuring SAML-based Single Sign-on" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

Note: If WebCenter is running with SSO, the OmniPortlet producer receives an authorization exception when it tries to store connection information in the Credential Store Framework (CSF) wallet. For information about how to resolve this issue, see the "OmniPortlet Producer Authorization Exception in SSO Environment" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

C.4.3.9.5 Refreshing Group Space Data in WebCenter Spaces After mid-tier migration, you must refresh the group space data. Also, refresh the member data for each group space individually.

To refresh the group space data:

1. Log on to WebCenter Spaces as an administrator.
2. Click the Administration link, and go to the Group Spaces tab.
3. Click the Refresh icon.

To refresh the member data for a group space:

1. Log on to WebCenter Spaces as an administrator.
2. Go to the desired group space, open the Settings tab, and then the Members tab.
3. Click the Refresh icon in the Manage Group Space Members section.
You must perform this procedure for each group space individually.

---

**Note:** In your migrated WebCenter instance if access is denied to a group space, ensure that the credential store has been migrated successfully and the group space data has been refreshed.

After you upgrade from Oracle WebCenter 11.1.1.1.0 to Oracle WebCenter 11.1.1.2.0, you may initially see a group space GUID in Activity Stream in lieu of a group space name in WebCenter Spaces. This can occur when you configure an Activity Stream task flow instance and select to display activity from a group space that was upgraded. You can work around this issue by generating some activity in that group space, like adding or removing a member. This refreshes the Activity Stream instance with the group space display name.

---

**C.4.3.9.6 Reapplying Configuration Changes**  If you want the same configuration as defined in your Oracle WebCenter 11.1.1.1.0, then you must reapply the configuration changes in Oracle WebCenter 11.1.1.2.0. Configuration changes may relate to the any of the following. All references are to the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library:

- **WebCenter Portlet Producers:** Any changes made to the `provider.xml` file of a portlet producer, like changing a proxy server, require that post mid-tier migration you reconfigure those changes, redeploy the portlet producer EAR application, and restart `WLS_Portlet` Managed Server. For information about redeploying portlet producers, see the "Managing Portlet Producers" chapter in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

- **WebCenter Services:** While installing Oracle Fusion Middleware 11.1.1.2.0, if you changed the host and port number of the back-end servers on which your WebCenter Services rely, you must reconfigure the required service connections to use the new server configuration. For information about specific services, see the "Managing Services, Portlet Producers, and External Applications" part in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

- **WebCenter Wikis and Blogs:** Any configuration changes made to your Oracle WebCenter Wiki and Blog Server 11.1.1.1.0, such as changing the theme or setting the attachment size, require that you reapply those changes in Oracle WebCenter Wiki and Blog Server 11.1.1.2.0. To reconfigure settings, use Administration mode of your Oracle WebCenter Wiki and Blog Server. For information, see the "Oracle WebCenter Wiki and Blog Server - Configuration" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

- **WebCenter Spaces and Workflows:** The WebCenter Spaces workflows functionality requires `sca_CommunityWorkflows.jar` and `WebCenterWorklistDetailApp.ear` to be deployed to a SOA server. If WebCenter Spaces workflows were enabled in Oracle WebCenter 11.1.1.1.0, you must redeploy these applications to the SOA server post mid-tier migration. For information, see the "Back-End Requirements for WebCenter Spaces Workflows" section in the Oracle Fusion Middleware Installation Guide for Oracle WebCenter.

- **WebCenter Spaces profile settings:** In WebCenter Spaces, profile settings set on the WebCenter Administration > Services > Profile screen are not retained when you upgrade from Oracle WebCenter 11.1.1.1.0 to Oracle WebCenter 11.1.1.2.0. After the upgrade, you must reapply the required profile settings on the WebCenter Administration > Services > People Connections > Profiles screen.
C.4.3.9.7 Importing Wiki Templates and Attachments

In Oracle WebCenter Wiki and Blog Server 11.1.1.1.0, regardless of the repository type configured for the server, templates and attachments are stored in a file-based repository. Oracle WebCenter Wiki and Blog Server 11.1.1.2.0 supports only a database repository; templates and attachments are also stored in the database repository.

If your Oracle WebCenter Wiki and Blog Server 11.1.1.1.0 used a database repository, then during migration templates and attachments are migrated to the database repository configured for Oracle WebCenter Wiki and Blog Server 11.1.1.2.0. If your Oracle WebCenter Wiki and Blog Server 11.1.1.1.0 used a file-based repository, then during migration wiki templates and attachments are migrated to a file-based repository. To make these templates and attachments available in Oracle WebCenter Wiki and Blog Server 11.1.1.2.0, you must manually migrate them to the database repository.

To import attachments for a wiki page, the user who owns that wiki page or you as an administrator must reupload the attachments on the wiki page. When you reupload an attachment, the attachment gets stored in the database repository. Note that attachments must be reuploaded for each wiki page individually.

To migrate templates:

1. Log on to Oracle WebCenter Wiki and Blog Server 11.1.1.2.0 as an administrator.
2. Click the Administration link to open Administration mode.
3. Click Templates.
4. Click import.
5. On the Import Templates page, in the Folder field, enter the path to templates. For example:
   
   $APPLICATIONS_DIRECTORY/owc_wiki/templates.

   Where, $APPLICATIONS_DIRECTORY is the directory where you installed Oracle WebCenter Wiki and Blog Server 11.1.1.2.0. That is, $APPLICATIONS_DIRECTORY = MW_HOME/user_projects/applications/DOMAIN_NAME.
6. Click Import Templates. The existing file-based templates are individually re-created in the wiki database repository.

C.4.3.9.8 Migrating Oracle Content Server

Oracle WebCenter 11.1.1.2.0 is compatible with Oracle Content Server 10.1.3.5.1. To migrate your existing Oracle Content Server and prepare it to work with Oracle WebCenter 11.1.1.2.0, you must perform the following tasks. All references are to the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library:

- Run the WebCenter configuration script, wc_contentserverconfig. This script is available on the Universal Content Management (UCM) media shipped with Oracle WebCenter. For information about how to run the script, see the "Oracle Content Server - Installation" section in the Oracle Fusion Middleware Installation Guide for Oracle WebCenter.

- Reconfigure the identity store for Oracle Content Server. To connect to an LDAP-based identity store, Oracle Content Server 10.1.3.5.1 requires a JPS user provider, instead of an LDAP user provider. Therefore, you must configure a JPS user provider and ensure that the existing LDAP user provider for Oracle Content Server is disabled. For information, see the "Configuring the Identity Store" section in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter.
C.4.3.9.9 Configuring Oracle WebCenter Discussions for WebCenter Spaces  When you migrate from Oracle Fusion Middleware 11.1.1.1.0 to Oracle Fusion Middleware 11.1.1.2.0, the patch assistant script migrates the database schema of your Oracle WebCenter Discussions server. Out-of-the-box, Oracle WebCenter Discussions 11.1.1.2.0 is configured to use the embedded LDAP identity store of Oracle WebLogic Server.

You must configure Web Services Security (WS-Security) if you want to use Oracle WebCenter Discussions with WebCenter Spaces.

To configure Oracle WebCenter Discussions:
1. Log on to the Oracle WebCenter Discussions 11.1.1.2.0 server as an administrator by using the following URL format:
   
   http://host:port/owc_discussions/admin

   Where host:port refer to the host name and port number of the system where Oracle WebCenter is installed.

2. To verify that Oracle WebCenter Discussions has been migrated successfully, in Jive Forums Admin Console, ensure that "Jive Forums Silver 5.5.20.2-oracle" is displayed in the top-right corner.

4. Reconfigure SSO for Oracle WebCenter Discussions, if required. For information, see the "Configuring a WebCenter Application to Use Single Sign-On" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

C.4.3.9.10 Migrating Custom WebCenter Applications  To make your custom WebCenter applications available in Oracle WebCenter 11.1.1.2.0, you must migrate them from your Oracle WebCenter 11.1.1.1.0 instance. You do not need to migrate the metadata of these applications because Oracle WebCenter 11.1.1.2.0 schemas are an in-place patch of your Oracle WebCenter 11.1.1.1.0 schemas for MDS, PORTLET, and WEBCENTER.

All references in this section are to the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

To migrate a custom WebCenter application:
1. Open the application in Oracle JDeveloper 11.1.1.2.0.
   
   This invokes the migration wizard that automatically migrates your application to Oracle WebCenter 11.1.1.2.0.

2. Save the application.

3. Create a WebLogic Managed Server instance and provision it with a required set of shared libraries. For information, see the "Creating and Provisioning a WebLogic Managed Server Instance" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

4. Create and register the Metadata Service (MDS) repository for your application on the WebLogic Domain’s Administration Server instance. For information, see the "Creating and Registering the Metadata Service Repository" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.
5. Deploy the application to a Managed Server. For information, see the "Deploying the Application to a WebLogic Managed Server Instance" section and the "Deploying Portlet Producer Applications" section in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

Your custom WebCenter applications may have WebCenter Services integrated that rely on back-end servers. For example, Discussions and Search services rely on Oracle WebCenter Discussions and Oracle SES, respectively. While installing Oracle Fusion Middleware 11.1.1.2.0, if you changed the host or port number of your back-end servers, you must reconfigure the required WebCenter Services to use the new server configuration. For information about specific services, see the "Managing Services, Portlet Producers, and External Applications" part in the Oracle Fusion Middleware Administrator’s Guide for Oracle WebCenter.

C.4.3.10 Post Migration Configuration for Oracle Web Services Manager

To migrate Oracle Web Services Manager (WSM), perform the following tasks:

- Purging the Policy Usage Analysis Information from the Metadata Services Repository
- Migrating the Oracle WSM Policies in the MDS Repository
- Migrating Custom Policy Accessor Properties

Note: Before you can migrate Oracle WSM, you must migrate components of the security environment, such as the identity store and key store configurations. For more information, see Section C.4.3.5, "Post-Migration Configuration for Oracle Platform Security Services".

C.4.3.10.1 Purging the Policy Usage Analysis Information from the Metadata Services Repository

In this release, the same Oracle Metadata Services (MDS) repository can be used to manage policies across multiple domains. In previous releases, an MDS repository could only be used by a single domain.

If you have analyzed policy usage using the Oracle Fusion Middleware 11g Release 1 (11.1.1.1.0) installation, you will need to purge the policy usage analysis information from the MDS repository to ensure that accurate usage results are reflected for the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) version.

To purge the policy usage analysis information from the MDS repository, use the deleteMetadata MDS command as follows:

```
deleteMetadata(application='wsm-pm',server='server_name',
docs='/policyAttachments/**')
```

server_name specifies the name of the server on which the Oracle WSM policy manager is running.

After purging the policy usage analysis information, you must restart the server.

For more information about managing MDS repositories, see "Maintaining the MDS Repository" section in the Oracle Fusion Middleware Security and Administrator’s Guide for Web Services in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.
C.4.3.10.2 Migrating the Oracle WSM Policies in the MDS Repository

In Oracle WSM 11g Release 1 (11.1.1), predefined and custom Oracle WSM policies are stored in the Oracle MDS repository. In this patch set, there are two new predefined policies available:

- `oracle/wss_saml_or_username_token_over_ssl_service_policy`
- `oracle/wss11_saml_or_username_token_with_message_protection_service_policy`

You can use Oracle WebLogic Scripting Tool (WLST) commands to upgrade the repository with the new predefined policies. You can also refresh the repository by deleting all Oracle WSM policies from the repository, including custom policies, and then repopulating it using the predefined policies provided in your installation. All of the policies in the repository are also revalidated when you upgrade the repository.

For more information, see "Upgrading the Oracle WSM Policies in the MDS Repository" in Oracle Fusion Middleware Security and Administrator’s Guide for Web Services in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

C.4.3.10.3 Migrating Custom Policy Accessor Properties

If you have customized the policy accessor properties, you must re-apply the policy manager connection information once you have migrated your installation. For more information, see "Configuring Platform Policy Properties" in the Oracle Fusion Middleware Security and Administrator’s Guide for Web Services in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library.

C.4.4 Installation Process

Table C–3 describes the 11.1.1.2.0 installation process that must be completed during the migration process.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Description and Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installing products in a new Middleware home</td>
<td>Before you can install 11.1.1.2.0 products in a new Middleware home, ensure that the repository is updated and the 11.1.1.1.0 schema is migrated to the 11.1.1.2.0 schema. To install products, complete the following steps: 1. Install Oracle WebLogic Server. This step is not required for Web tier. 2. Run product-specific Installers to install the new products. For more information, see the Oracle Fusion Middleware Installation Planning Guide and the product installation guides in the Oracle Fusion Middleware 11g Release 1 (11.1.1.2.0) documentation library for the products you are installing and configuring.</td>
</tr>
</tbody>
</table>
C.4.5 Configuration Process

Table C–4 describes the 11.1.1.2.0 configuration process that must be completed during the migration process.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Description and Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring Oracle Instances in a new Middleware home</td>
<td>Before you can configure Oracle Instances in a new Middleware home, ensure that the repository is updated, the 11.1.1.1.0 schema is migrated to the 11.1.1.2.0 schema, all 11.1.1.2.0 products are installed, and the WebLogic domain is migrated. To configure Oracle Instances, run the <code>ant master-patch-oinstance</code> command.</td>
</tr>
<tr>
<td>Configuring Oracle Instances in a new Middleware home, on a second machine, in a Cluster environment</td>
<td>Before you can configure Oracle Instances in a new Middleware home, ensure that the repository is updated, the 11.1.1.1.0 schema is migrated to the 11.1.1.2.0 schema, all 11.1.1.2.0 products are installed in the Cluster environment (on a second machine), and the WebLogic domain is migrated. To configure Oracle Instances, run the <code>ant master-patch-oinstance</code> command.</td>
</tr>
<tr>
<td>Configuring products in a new WebLogic domain</td>
<td>Before you can configure 11.1.1.2.0 products in a new WebLogic domain, ensure that the repository is updated, the 11.1.1.1.0 schema is migrated to the 11.1.1.2.0 schema, and the 11.1.1.2.0 products are installed in a new Middleware home. To configure products in a new WebLogic domain, complete the following steps: 1. Start the Oracle Fusion Middleware Configuration Wizard from your new Middleware home. 2. Choose product templates to match components on the old 11.1.1.1.0 domain. 3. For the new domain, choose the same domain name as the old 11.1.1.1.0 domain. 4. Configure servers, machines, or clusters to match the old 11.1.1.1.0 topology. 5. Create domain. 6. Optional: Start Node Manager.</td>
</tr>
</tbody>
</table>
C.4.6 Properties in the patchMaster.properties File

Table C–5 describes the properties that you can set in the patchMaster.properties file. All the properties are not mandatory. For the list of properties that are required for specific components, see Table C–6.

Note: On Windows, you must use / as the delimiter to specify the property path. For example:

c:/my/path/file

Table C–5: Patch Master Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchMaster.Componentlist</td>
<td>List the Fusion Middleware components, you want to patch from 11.1.1.1.0 to 11.1.1.2.0.</td>
</tr>
<tr>
<td></td>
<td>Example: patchMaster.Componentlist=Audit,BAM,DIP,Discoverer,Forms,JPS</td>
</tr>
<tr>
<td>patchMaster.Schemaurl</td>
<td>Specify the connection string to a single repository being patched.</td>
</tr>
<tr>
<td></td>
<td>Example: patchMaster.Schemaurl=jdbc:oracle:thin:@local host:1521:orcl</td>
</tr>
<tr>
<td>patchMaster.Schemauser</td>
<td>Specify the system user for the repository specified by patchMaster.Schemaurl.</td>
</tr>
<tr>
<td></td>
<td>Example: patchMaster.Schemauser=SYS AS SYSDBA</td>
</tr>
</tbody>
</table>

Configuring products in a new WebLogic domain, on a second machine, in a Cluster environment

Before you can configure 11.1.2.0 products in a new WebLogic domain, ensure that the repository is updated, the 11.1.1.1.0 schema is migrated to the 11.1.1.2.0 schema, and the 11.1.1.2.0 products are installed in a new Middleware home on a second machine in the Cluster environment.

To configure products in a new WebLogic domain, complete the following steps:

1. Start the Oracle Fusion Middleware Configuration Wizard from your new Middleware home.
2. Choose product templates to match components on the old 11.1.1.1.0 domain.
3. For the new domain, choose the same domain name as the old 11.1.1.1.0 domain.
4. Configure servers, machines, or clusters to match the old 11.1.1.1.0 topology.
5. Create domain.
7. Run the pack command on the new domain on the first machine.
8. Run the unpack command on the second machine.
<table>
<thead>

C.4.6.1 Overriding Properties Set in the patchMaster.properties File
You can use the Ant command-line utility to override the properties set in the patchMaster.properties file. You must specify the required property on the command line as follows:

`ant -D<property>=<value>`

For example, to select components to patch, enter the following command on the command line:

`ant -DpatchMaster.Componentlist=SOA,UMS,WebCenter master-patch-schema`

Note that `master-patch-schema`, in the above example, is the command that uses the new values.

Refer to Table C–5 for complete information about properties that you can specify on the command line or in the patchMaster.properties file.

---

**Note:** When you override the `patchMaster.Schemauser` property to specify the system user by using the command-line utility, ensure that you use double quotation marks, as in the following example:

`ant -DpatchMaster.Schemauser="SYS AS SYSDBA"`

Do not enter the double quotation marks if you edit the patchMaster.properties file directly.

---

C.4.7 Oracle Fusion Middleware Components Supported by Patch Assistant
Table C–7 lists Oracle Fusion Middleware components that are supported by Patch Assistant.

This appendix shows a sample `patchMaster.properties` file.

# This is the property file for the 11gR1-11ps1 patchMaster.
# Set values for the properties below to the desired value.
# If a property is not needed, it must be commented out.

# Description: List of components to patch from 11gR1 to 11ps1
# Example:
patchMaster.Componentlist=Audit,BAM,DIP,Discoverer,Discussions,Forms,JPS,JRF,MDS,MODplsql,OAM,OCServer,ODL,ODSM,OHS,OIF,Opmm,ODV,OWSM,Portal,Portlet,Reports,SOA,UMS,WebCenter,Webcache,Webservices,Wiki

# Description: Connection string to a single repository being patched.
# Example: patchMaster.Schemaurl=jdbc:oracle:thin:@<host>:<port>:<sid>

# Description: A system user for the repository specified by patchMaster.Schemaurl
# Example: patchMaster.Schemauser=SYS AS SYSDBA
patchMaster.Schemauser=<Value Unspecified>

# Description: The optional repository schema metadata namespace.
# Example: patchMaster.Schemaprefix=DEV
patchMaster.Schemaprefix=<Value Unspecified>

# Description: Fusion Middleware 11ps1 home.
# Example: patchMaster.Mwhomenew=/scratch/newhome
patchMaster.Mwhomenew=<Value Unspecified>

# Description: Fusion Middleware 11gR1 home.
# Example: patchMaster.Mwhomeold=/scratch/oldhome
patchMaster.Mwhomeold=<Value Unspecified>

# Description: WLS domain 11ps1 home.
# Example: patchMaster.Domainhomenew=/scratch/newhome/user_projects/domains/newDomain
patchMaster.Domainhomenew=<Value Unspecified>

# Description: WLS domain applications 11ps1 home.
# Example: patchMaster.Domainapplicationshomenew=/scratch/newhome/user_projects/applications/newDomain
patchMaster.Domainapplicationshomenew=<Value Unspecified>

# Description: WLS domain 11gR1 home.
# Example: patchMaster.Domainhomeold=/scratch/oldhome/user_projects/domains/oldDomain
# patchMaster.Domainhomeold=<Value Unspecified>

# Description: WLS domain username.
# Example: patchMaster.Domainusername=currentuser
# patchMaster.Domainusername=<Value Unspecified>

# Description: List paths to 11ps1 Oracle instances.
# Example: patchMaster.Oracleinstancenewlist=/scratch/newinst1,/scratch/newinst2
# patchMaster.Oracleinstancenewlist=<Value Unspecified>

# Description: List paths to 11gR1 Oracle instances corresponding to 11ps1 Oracle instance paths.
# Example: patchMaster.Oracleinstanceoldlist=/scratch/oldinst1,/scratch/oldinst2
# patchMaster.Oracleinstanceoldlist=<Value Unspecified>

# Description: Path to 11ps1 Oracle home.
# Example: patchMaster.Oraclehomenew=/scratch/mynewOhome
# patchMaster.Oraclehomenew=<Value Unspecified>

# Description: Path to 11gR1 Oracle home.
# Example: patchMaster.Oraclehomeold=/scratch/myOhome
# patchMaster.Oraclehomeold=<Value Unspecified>

# Description: Specifies the directory where the log files go if a custom location is desired.
# Example: patchMaster.Logdir=/scratch/patchMasterDir
# patchMaster.Logdir=<Value Unspecified>

# Description: Specifies the logging level to be recorded in the log file
# Values={error|warning|info|verbose|debug}  Default=info
# patchMaster.Loglevel=info

# Description: WLS domain Adminserver hostname.  This is *either* the R1 or PS1 Adminserver host
# depending the operation.  Used for start/stop domain and instance registration.
# Example: patchMaster.Domainadminhost=localhost
# patchMaster.Domainadminhost=<Value Unspecified>

# Description: WLS domain Adminserver port number.  This is *either* the R1 or PS1 Adminserver port
# depending the operation.  Used for start/stop domain and instance registration.
# Example: patchMaster.Domainadminport=7001
# patchMaster.Domainadminport=<Value Unspecified>
