The resource type taxonomy for the Connections and Profile features in the People Connections service is:

```
urn:oracle:webcenter:people
  urn:oracle:webcenter:people:person
  urn:oracle:webcenter:people:icon
  urn:oracle:webcenter:people:person:list
    urn:oracle:webcenter:people:person:listNames
    urn:oracle:webcenter:people:person:listName
    urn:oracle:webcenter:people:person:list:member
    urn:oracle:webcenter:people:person:status
  urn:oracle:webcenter:people:invitations
  urn:oracle:webcenter:people:invitation
```

## 41.2.3 Connections and Profile Security Considerations

You must be logged in to the REST service to access any of the People Connections REST APIs. After that, the underlying service handles permission checking and the like.

**See Also:** For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

## 41.2.4 Connections and Profile Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- "urn:oracle:webcenter:people"
- "urn:oracle:webcenter:people:person"
- "urn:oracle:webcenter:people:person:list"
- "urn:oracle:webcenter:people:person:listNames"
- "urn:oracle:webcenter:people:person:listName"
- "urn:oracle:webcenter:people:person:list:member"
- "urn:oracle:webcenter:people:person:status"
- "urn:oracle:webcenter:people:invitations"
- "urn:oracle:webcenter:people:invitation"

### **urn:oracle:webcenter:people**

The `people` response contains URIs for use in retrieving the profile of one or more users.

### **Navigation Paths to people**

This section shows how the client can navigate through the hypermedia to access the `people` resource:

```
resourceIndex
  people
```

### **Supported Methods for people**

The following method is supported by the `people` resource:

- GET
  - **request—Parameters:**
    - \* `startIndex` – See "[Common Request Query Parameters.](#)"
    - \* `itemsPerPage` – See "[Common Request Query Parameters.](#)"
    - \* `projection` – See "[Common Request Query Parameters.](#)"
    - \* `data` – The data parameter is a comma separated list that controls which data will be returned in the response. The predefined set `basic` is equivalent to `data=guid, id, displayName`. The predefined set `data` is a standard set that returns all the data for the user, but does not include `status`, `manager`, `reportees`, or `photos`. The full list of possible values includes the predefined sets `basic` and `data`, as well as the following individual data values: `guid`, `id`, `displayName`, `birthday`, `language`, `timeZone`, `name`, `addresses`, `organizations`, `workEmail`, `phoneNumbers`, `manager`, `reportees`, `photos`, and `status`.

If you specify the constant `'data'` as the `data` parameter, all the basic information will be returned for the resource. If both the `projection` and `data` query string parameters are present, the `data` parameter will be used to determine which data to return.

The `data` parameter can also take any of the following values comma-separated values to return the corresponding data: `guid`, `id`, `displayName`, `birthday`, `language`, `timeZone`, `name`, `addresses`, `organizations`,

workEmail, phoneNumbers, manager, reportees, photos, and/or status.

---

**Note:** The data parameter can accept a predefined set, a collection of values, or a mix of sets and values. For example, to get the basic data plus the user's birthday, you can specify `data=basic,birthday`.

---

- \* `links` – The links parameter is a comma-separated list that controls which links will be returned in the response. This parameter can accept predefined sets, individual data values, or a combination of predefined sets and individual data values. The predefined sets are `basic`, `data`, `activitiesSet`, `connectionsSet`, and `feedbackSet`. These predefined sets are described in "[Predefined Sets for the links Parameter](#)".

The individual values for the links parameter are: `person`, `profile`, `icon`, `status`, `messageBoard`, `activities`, `personActivities`, `connectionActivities`, `connections`, `listNames`, `invitation`, `givenFeedback`, `receivedFeedback`, `userGivenFeedback`, `manager`, `reportees`, `member`.

If both the `projection` and `links` query string parameters are present, the `links` parameter will be used to determine which links to return.

- **response—Body:** One or more person objects.

### Predefined Sets for the links Parameter

The following items are predefined sets that can be returned in the `links` parameter. For example, if you specify `links=basic`, it is the equivalent of specifying `data=person,profile,icon`. You can also specify additional parameters as needed. For example, you could specify `data=basic,birthday`.

---

**Note:** Links that are not currently available will not be returned even if they are specified in the `links` parameter.

---

- `basic` – A standard set that returns the basic information for the profile and includes `person`, `profile`, and `icon`.
- `data` – A standard set that returns all the basic links for the response plus the connections list, status, and activity stream template.
- `activitiesSet` – Includes `activities`, `personActivities`, and `connectionActivities`.
- `connectionsSet` – Includes `connections`, `listNames`, and `invitation`.
- `feedbackSet` – Includes `givenFeedback`, `receivedFeedback`, and `userGivenFeedback`.

### Resource Types Linked to from people

[Table 41–6](#) lists the resource types that the client can link to from the `people` resource.

**Table 41–6** *Related Resource Types for people*

rel	resourceType
urn:oracle:webcenter:people:icon	urn:oracle:webcenter:people:person

**Table 41–6 (Cont.) Related Resource Types for people**

rel	resourceType
urn:oracle:webcenter:people:person:list:connections	urn:oracle:webcenter:people:person:list
urn:oracle:webcenter:activities:stream:person	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream:connections	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:feedback:all-received	urn:oracle:webcenter:feedback
urn:oracle:webcenter:feedback:all-given	urn:oracle:webcenter:feedback
self	urn:oracle:webcenter:people:person:status
urn:oracle:webcenter:people:person:list:list	urn:oracle:webcenter:people:person:list
self	urn:oracle:webcenter:people:person:listName
urn:oracle:webcenter:activities:stream:list	urn:oracle:webcenter:activities:stream

**urn:oracle:webcenter:people:icon**

Use this resource type to get the icon used for the named profile (GET).

**Navigation Paths to people:icon**

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  people
    icon
```

**Supported Methods for icon**

The following methods are supported by this resource:

- GET – Returns the icon used for the named profile.

---

**Note:** This resource includes a template that lets you choose the size of the profile icon to use. The `size` template parameter can be set to `small`, `medium`, or `large`.

---

**Resource Types Linked to from icon**

Table 41–7 lists the resource types that the client can link to from this resource.

**Table 41–7 Related Resource Types for urn:oracle:webcenter:people:icon**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:people:icon</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:people</a>

**urn:oracle:webcenter:people:person**

The `person` response contains profile data and the URIs for use in retrieving a user profile.

**Navigation Paths to person**

This section shows how the client can navigate through the hypermedia to access the `person` resource:

```
resourceIndex
  people

resourceIndex
  people
  person

resourceIndex
  person

author
  person

resourceIndex
  activities:stream
  person
```

**Supported Methods for person**

The following method is supported by the `person` resource:

- GET

- **request—Parameters:** `q`

To retrieve a specified person, the format of `q` is:

```
q=[loginid>equals:username]
Or
q=[guid>equals:guid]
Or
q=[email>equals:email]
```

---

**Note:** The parameter `q` is only on the `resourceIndex` template for `person`.

---

- **response—Body:** `message`

**See Also:** For information about the response message, see ["Read-only Elements for person"](#).

**Read-only Elements for person**

[Table 41-8](#) lists the read-only elements for the `person` resource.

---

**Note:** The elements present in a person response depend on how the user repository is configured and the elements it supports. Additionally, several of the pieces of data represented in [Table 41–8](#), such as `address`, `emails`, `photos`, `phoneNumbers`, and `organization`, can have multiple instances.

---

**See Also:** Some of the elements listed in [Table 41–8](#) can be returned in predefined sets described in "[Predefined Sets for the links Parameter](#)".

**Table 41–8** Read-Only Elements for person

Element	Type	Description
<code>guid</code>	String	Unique GUID of the person
<code>id</code>	String	Unique login ID of the person (that is, the user name, for example, <code>pat_coi</code> )
<code>displayName</code>	String	Display name of the person (the user's name, for example, Pat Coi). This may have the same value as <code>id</code> , depending on the repository configuration.
<code>birthday</code>	Date (String) <sup>1</sup>	Birth date of the person
<code>connected</code>	Boolean (String) <sup>1</sup>	Whether or not this person is connected to the current user
<code>language</code>	String	Preferred language of the person
<code>timeZone</code>	String	Time zone of the person
<code>name</code>	name	Name information for the person name is a portable contact type. For more information, see <a href="#">Section 53.10.2.1, "name Portable Contact Type."</a>
<code>address</code>	address	Address information for the person address is a portable contact type. For more information, see <a href="#">Section 53.10.2.2, "address Portable Contact Type."</a>
<code>emails</code>	value	Emails for the person emails is derived from the value portable contact type. For more information, see <a href="#">Section 53.10.2.4, "value Portable Contact Type."</a>
<code>photos</code>	value	Profile photos for the person photos is derived from the value portable contact type. For more information, see <a href="#">Section 53.10.2.4, "value Portable Contact Type."</a>
<code>phoneNumbers</code>	value	Phone numbers for the person phoneNumber is derived from the value portable contact type. For more information, see <a href="#">Section 53.10.2.4, "value Portable Contact Type."</a>
<code>organizations</code>	organization	Organization information for the person organization is a portable contact type. For more information, see <a href="#">Section 53.10.2.3, "organization Portable Contact Type."</a>

**Table 41–8 (Cont.) Read-Only Elements for person**

Element	Type	Description
manager	<a href="#">personReference</a>	Manager of this person
reportees	<a href="#">personReference</a>	Direct reports of this person
status	<a href="#">urn:oracle:webcenter:people:person:status</a>	Person's profile status message

<sup>1</sup> Data types, such as DATE and BOOLEAN, are stored in the API as STRING.

### Resource Types Linked to from person

[Table 41–9](#) lists the resource types that the client can link to from the `person` resource.

**Table 41–9 Related Resource Types for person**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:people:person</a>
alternate	<a href="#">urn:oracle:webcenter:spaces:profile (HTML)</a>
<a href="#">urn:oracle:webcenter:people:person:list:connections</a>	<a href="#">urn:oracle:webcenter:people:person:list</a> <a href="#">urn:oracle:webcenter:people:person:listNames</a> <a href="#">urn:oracle:webcenter:people:person:status</a>
<a href="#">urn:oracle:webcenter:activities:stream:person</a>	<a href="#">urn:oracle:webcenter:activities:stream</a>
<a href="#">urn:oracle:webcenter:activities:stream:connections</a>	<a href="#">urn:oracle:webcenter:activities:stream</a>
<a href="#">urn:oracle:webcenter:activities:stream</a>	<a href="#">urn:oracle:webcenter:activities:stream</a> <a href="#">urn:oracle:webcenter:messageBoard</a>
<a href="#">urn:oracle:webcenter:feedback:all-given</a>	<a href="#">urn:oracle:webcenter:feedback</a>
<a href="#">urn:oracle:webcenter:feedback:all-received</a>	<a href="#">urn:oracle:webcenter:feedback</a>

### [urn:oracle:webcenter:people:person:list](#)

The `list` response contains URIs for use in retrieving all the profiles on a connections list (GET), inviting a user to be a connection or adding a connection to a connections list (POST), and removing a connections list (DELETE).

### Navigation Paths to list

This section shows how the client can navigate through the hypermedia to access the `list` resource:

```
resourceIndex
  person
    listNames
      list

resourceIndex
  person
    list (rel="urn:oracle:webcenter:people:person:list:connections")
```

### Supported Methods for list

The following methods are supported by the `list` resource:

- GET
  - **request—Parameters:** `startIndex`, `itemsPerPage`, `projection`

**See Also:** For information about REST API parameters, such as `startIndex` and `itemsPerPage`, see "[Common Request Query Parameters](#)".

- **response—Body:** 0 or more person items
- POST
  - **request—Body:** member
  - **response—Body:** member

**See Also:** For information about `member` in the request and response elements, see "[urn:oracle:webcenter:people:person:list:member](#)".

- DELETE
  - **request**

### Resource Types Linked to from list

[Table 41–10](#) lists the resource types that the client can link to from the `list` resource.

**Table 41–10** *Related Resource Types for list*

rel	resourceType
self urn:oracle:webcenter:people:person:list <sup>1</sup>	urn:oracle:webcenter:people:person:list
urn:oracle:webcenter:activities:stream	<a href="#">urn:oracle:webcenter:activities:stream</a>

<sup>1</sup> self rel currently includes "urn:oracle:webcenter:people:person:list:list" instead of the correct "urn:oracle:webcenter:people:person:list". For the @connections default list, it currently includes "urn:oracle:webcenter:people:person:list:connections".

### urn:oracle:webcenter:people:person:listNames

The `listNames` response contains the names of existing connections lists as well as the URIs for use in retrieving the lists (GET) and creating connections lists (POST).

### Navigation Paths to listNames

This section shows how the client can navigate through the hypermedia to access the `listNames` resource:

```
resourceIndex
  person
    listNames
```

### Supported Methods for listNames

The following methods are supported by the `listNames` resource:

- GET
  - **request**
  - **response: Body:** 0 or more listName items
- POST
  - **request—Body:** listName
  - **response—Body:** listName

**See Also:** For information about `listName`, see "[urn:oracle:webcenter:people:person:listName](#)".

### Resource Types Linked to from `listNames`

[Table 41–11](#) lists the resource types that the client can link to from the `listNames` resource.

**Table 41–11** *Related Resource Types for `listNames`*

rel	resourceType
self	<a href="#">urn:oracle:webcenter:people:person:listNames</a>

### `urn:oracle:webcenter:people:person:listName`

The `listName` response contains the names of connections lists and URIs for use in accessing the connections lists.

### Navigation Paths to `listName`

This section shows how the client can navigate through the hypermedia to access the `listName` resource:

```
resourceIndex
  person
    listNames
      listName
```

### Writable Elements for `listName`

[Table 41–12](#) lists the writable elements for the `listName` resource.

**Table 41–12** *Writable Elements for `listName`*

Element	Type	Required	Constraints	Description
name	String	Yes	1 or more characters	A single list name

### Resource Types Linked to from `listName`

[Table 41–13](#) lists the resource types that the client can link to from the `listName` resource.

**Table 41–13** *Related Resource Types for `listName`*

rel	resourceType
self	<a href="#">urn:oracle:webcenter:people:person:list</a>
<a href="#">urn:oracle:webcenter:activities:stream:list</a>	<a href="#">urn:oracle:webcenter:activities:stream</a>

### `urn:oracle:webcenter:people:person:list:member`

The `member` response contains URIs for use in deleting a connection from a connections list.

### Navigation Paths to `member`

This section shows how the client can navigate through the hypermedia to access the `member` resource:

```
resourceIndex
```

```

person
  list
    member

```

### Supported Methods for member

The following method is supported by the `member` resource:

- DELETE
  - **request**

### Writable Elements for member

[Table 41–14](#) lists the writable elements for the `member` resource. Writable elements for `member` are used when you add a connection to a list or invite a user to be a connection. The `member` resource itself is for deleting connections, and does not use writable elements.

**Table 41–14** Writable Elements for member

Element	Type	Required	Constraints	Description
<code>guid</code>	String	Yes	1 or more characters	GUID of the user
<code>message</code>	String	No	0 or more characters	Invitation message Use this only when inviting users to be connections (that is POSTing to the <code>@connections</code> list, not to user-created connections lists).

### urn:oracle:webcenter:people:person:status

The `status` response contains URIs for use in retrieving (GET) and updating (PUT) the profile status message of a specified user.

### Navigation Paths to status

This section shows how the client can navigate through the hypermedia to access the `status` resource:

```

resourceIndex
  people
    person
      status

```

### Supported Methods for status

The following methods are supported by the `status` resource:

- GET
  - **request**
  - **response—Body:** `status`
- PUT
  - **request—Body:** `status`
  - **response—Body:** `status`

### Writable Elements for status

[Table 41–15](#) lists the writable elements for the `status` resource.

**Table 41–15 Writable Elements for status**

Element	Type	Required	Constraints	Description
note	String	Yes	1 or more characters	Content of status message

**Resource Types Linked to from status**

[Table 41–16](#) lists the resource types that the client can link to from the `status` resource.

**Table 41–16 Related Resource Types for status**

rel	resourceType
self	urn:oracle:webcenter:people:person:status

**urn:oracle:webcenter:people:invitations**

The `invitations` response contains URIs for use in retrieving invitations (`GET`). You can also send an invitation (`POST`) to another user.

**Navigation Paths to invitations**

This section shows how the client can navigate through the hypermedia to access the `invitations` resource:

```
resourceIndex
  invitations
```

If you are not already connected to a user, you can also navigate to the `invitations` resource from that user's profile in order to invite them to connect. This path is only used for `POST`ing.

```
resourceIndex
  person
    invitations
```

**Supported Methods for invitations**

The following methods are supported by the `invitations` resource:

- `GET`
  - **Request—Parameters:** `q`  
To retrieve invitations sent to the current user, the format of `q` is:  
`q=[invitee>equals:@me]`  
  
To retrieve invitations sent from the current user, the format of `q` is:  
`q=[invitor>equals:@me]`
  - **Response—Body:** 1 or more invitations
- `POST`
  - **Request—Body:** invitation
  - **Response—Body:** invitation

**Writable Elements for invitations**

Table 41–17 lists the writable elements for the `invitations` resource.

**Table 41–17 Writable Elements for invitations**

Element	Type	Required	Constraints	Description
<code>message</code>	String	No	1 or more characters	Message attached to the invitation

**Resource Types Linked to from invitations**

Table 41–18 lists the resource types that the client can link to from the `invitations` resource:

**Table 41–18 Related Resource Types for invitations**

rel	resourceType
<code>self</code>	<a href="#">urn:oracle:webcenter:people:invitation</a>

**urn:oracle:webcenter:people:invitation**

The `invitation` response contains URIs for use in deleting (DELETE) invitations you have sent, or deleting (DELETE) or updating (PUT) invitations you have received.

**Navigation Paths to invitation**

This section shows how the client can navigate through the hypermedia to access the `invitation` resource:

```
resourceIndex
  invitations
    invitation
```

**Supported Methods for invitation**

The following methods are supported by the `invitation` resource:

- PUT
  - Request—Body: `invitation`
  - Response—Body: `invitation`
- DELETE
  - Request

**Writable Elements for invitation**

Table 41–19 lists the writable elements for the `invitation` resource.

**Table 41–19 Writable Elements for invitation**

Element	Type	Required	Constraints	Description
<code>status</code>	String	Yes (PUT)	ACCEPTED IGNORED	The status of the invitation. <b>Note:</b> When you accept or ignore an invitation, it is removed from your list of invitations.

**Read-only Elements for invitation**

Table 41–20 lists the read-only elements for the `invitation` resource.

**Table 41–20** *Read-only Elements for invitation*

Element	Type	Description
<code>id</code>	String	Unique ID of the invitation
<code>invitee</code>	<a href="#">personReference</a>	User to whom the invitation is sent
<code>invitor</code>	<a href="#">personReference</a>	User from whom the invitation is sent
<code>sentDate</code>	Date (String) <sup>1</sup>	Date the invitation was sent

<sup>1</sup> Data types, such as `DATE` and `BOOLEAN`, are stored in the API as `STRING`.

**Resource Types Linked to from invitation**

Table 41–21 lists the resource types that the client can link to from the `invitation` response.

**Table 41–21** *Related Resource Types for invitations*

rel	resourceType
<code>self</code>	<a href="#">urn:oracle:webcenter:people:invitation</a>

## 41.3 Feedback REST APIs

Use the Feedback REST APIs to read and delete feedback. This section provides information about the REST APIs to use to perform these actions. It includes the following subsections:

- [Section 41.3.1, "Feedback Entry Point"](#)
- [Section 41.3.2, "Feedback Resource Type Taxonomy"](#)
- [Section 41.3.3, "Feedback Security Considerations"](#)
- [Section 41.3.4, "Feedback Resource Types"](#)

### 41.3.1 Feedback Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. For the People Connections service, each feature has its own `link` element. To find the entry points for the Feedback feature of the People Connections service, find the `link` elements with a `resourceType` of:

```
urn:oracle:webcenter:feedback
```

The corresponding `href` or `template` element provides the URI entry point, which returns all received feedback for the current user. The client sends HTTP requests to this entry point to work with the Feedback feature of the People Connections service.

**See Also:** For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 41.3.2 Feedback Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 41.3.4, "Feedback Resource Types."](#)

the resource type taxonomy for the Feedback feature of the People Connections service is:

```
urn:oracle:webcenter:feedback
  urn:oracle:webcenter:feedback:message
```

### 41.3.3 Feedback Security Considerations

You must be logged in to the REST service to access any of the People Connections REST APIs. After that, the underlying service handles permission checking and the like.

**See Also:** For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 41.3.4 Feedback Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- ["urn:oracle:webcenter:feedback"](#)
- ["urn:oracle:webcenter:feedback:message"](#)

#### **urn:oracle:webcenter:feedback**

The `feedback` response contains URIs for use in reading Feedback messages.

#### **Navigation Paths to feedback**

This section shows how the client can navigate through the hypermedia to access the feedback resource:

```
resourceIndex
  feedback
```

```
resourceIndex
  person
    feedback
```

#### **Supported Methods for feedback**

The following methods are supported by the `feedback` resource:

- GET
  - **request—Parameters:** `startIndex`, `itemsPerPage`

**See Also:** For information about REST API parameters, such as `startIndex` and `itemsPerPage`, see ["Common Request Query Parameters"](#).

- **response—Body:** `message`

**See Also:** For information about `message`, see ["urn:oracle:webcenter:feedback:message"](#).

- POST – If permitted, lets you add feedback for a target user. This method is only available if the current user is connected to and has permission to add feedback for the target user.

– **request - body:** feedback

```
<message resourceType="urn:oracle:webcenter:feedback:message">
  <body>test from REST API</body>
  <receivedUser>
    <guid>4F16DD80393611DFBF895F177662C511</guid>
  </receivedUser>
</message>
```

### Resource Types Linked to from feedback

[Table 41–22](#) lists the resource types that the client can link to from the `feedback` resource.

**Table 41–22** *Related Resource Types for feedback*

rel	resourceType
self urn:oracle:webcenter:feedback:all-received	urn:oracle:webcenter:feedback
self urn:oracle:webcenter:feedback:all-given	urn:oracle:webcenter:feedback
	<a href="#">urn:oracle:webcenter:feedback:message</a>

### urn:oracle:webcenter:feedback:message

The `message` response contains the feedback message data and URIs for use in deleting a Feedback message.

### Navigation Paths to message

This section shows how the client can navigate through the hypermedia to access the `message` resource:

```
resourceIndex
  feedback
    message
```

```
resourceIndex
  person
    feedback
      message
```

### Supported Methods from message

The following method is supported by the `message` resource:

- DELETE
  - **request**

### Read-only Elements for message

[Table 41–23](#) lists the read-only elements for the `message` resource.

**Table 41–23 Read-only Elements for message**

Element	Type	Description
body	String	Message content
id	String	Unique ID of the message
author	<a href="#">personReference</a>	User who created the message
created	Date (String) <sup>1</sup>	Date the message was created
receivedUser	<a href="#">personReference</a>	A person reference to the user who received the feedback

<sup>1</sup> Data types, such as DATE and BOOLEAN, are stored in the API as STRING.

### Resource Types Linked to from feedback

Table 41–24 lists the resource types that the client can link to from the `feedback` resource.

**Table 41–24 Related Resource Types for message**

rel	resourceType
self	urn:oracle:webcenter:feedback:message

## 41.4 Message Board REST APIs

Use the Message Board REST APIs to post, read, and delete messages to a user's or a space message board.

This section provides information about the REST APIs to use to perform these actions. It includes the following subsections:

- [Section 41.4.1, "Message Board Entry Point"](#)
- [Section 41.4.2, "Message Board Resource Type Taxonomy"](#)
- [Section 41.4.3, "Message Board Security Considerations"](#)
- [Section 41.4.4, "Message Board Resource Types"](#)

### 41.4.1 Message Board Entry Point

Each REST service has a `link` element within the Resource Index that provides the entry point for that service. For the People Connections service, each feature has its own `link` element. To find the entry points for the Message Board feature of the People Connections service, find the `link` elements with a `resourceType` of:

```
urn:oracle:webcenter:messageBoard
```

---

**Note:** As well as an entry point from the Resource Index, to navigate to an individual user's message board, the Message Board feature also has an entry point from a space response for the space message board.

---

The corresponding `href` or `template` element provides the URI entry point, which returns the Message Board for the current user. The client sends HTTP requests to this entry point to work with the Message Board feature of the People Connections service.

**See Also:** For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

## 41.4.2 Message Board Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 41.4.4, "Message Board Resource Types."](#)

The resource type taxonomy for the Message Board feature of the People Connections service is:

```
urn:oracle:webcenter:messageBoard
  urn:oracle:webcenter:messageBoard:message
```

## 41.4.3 Message Board Security Considerations

You must be logged in to the REST service to access any of the People Connections REST APIs. After that, the underlying service handles permission checking and the like.

**See Also:** For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

## 41.4.4 Message Board Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- ["urn:oracle:webcenter:messageBoard"](#)
- ["urn:oracle:webcenter:messageBoard:message"](#)

### **urn:oracle:webcenter:messageBoard**

The `messageBoard` response contains URIs for use in reading (GET) and posting (POST) space and individual user Message Board messages.

### **Navigation Paths to `messageBoard`**

This section shows how the client can navigate through the hypermedia to access the `messageBoard` resource:

```
resourceIndex
  messageBoard

resourceIndex
  person
  messageBoard

resourceIndex
  spaces
  space
  messageBoard
```

### Supported Methods for messageBoard

The following methods are supported by the messageBoard resource:

- GET
  - **request—Parameters:** startIndex, itemsPerPage

**See Also:** For information about REST API parameters, such as startIndex and itemsPerPage, see "[Common Request Query Parameters](#)".

  - **response—Body:** message

---

**Note:** The REST GET command for reading (retrieving) messages retrieves all shown messages. Messages that are hidden through the application user interface are not retrieved. For information about hiding and showing messages, see "Working with Message Board Task Flows," in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

---

- POST
  - **request—Body:** message

The POST for messages supports including a link URL in the message.

**See Also:** For information about message, see "[urn:oracle:webcenter:messageBoard:message](#)".

### Read-only Elements for messageBoard

Table 41–25 lists the read-only elements for the messageBoard resource.

**Table 41–25 Read-only Elements for message**

Element	Type	Description
messageType	String	Returns link if the message has a link. Otherwise, returns null.
link	String	Contains link data for messages with links: name, url, icon, description, mimeType, objectId, objectType, serviceId.

### Resource Types Linked to from messageBoard

Table 41–26 lists the resource types that the client can link to from the messageBoard resource.

**Table 41–26 Related Resource Types for messageBoard**

rel	resourceType
self	urn:oracle:webcenter:messageBoard <a href="#">urn:oracle:webcenter:messageBoard:message</a>

### urn:oracle:webcenter:messageBoard:message

The message response contains the Message Board message data and URIs for use in reading (GET), revising (PUT), and deleting (DELETE) a space or individual user Message Board message.

### Navigation Paths to message

This section shows how the client can navigate through the hypermedia to access the message resource:

```
resourceIndex
  messageBoard
    message

resourceIndex
  person
    messageBoard
      message

resourceIndex
  spaces
    space
      messageBoard
        message
```

### Supported Methods for message

The following methods are supported by the message resource:

- GET
  - request
  - response—Body: message
- PUT
  - request—Body: message
  - response—Body: message
- DELETE
  - request

### Writable Elements for message

[Table 41–27](#) lists the writable elements for the message resource.

**Table 41–27** Writable Elements for message

Element	Type	Required	Constraints	Description
body	String	Yes	1 or more characters	message content

### Read-only Elements for message

[Table 41–28](#) lists the read-only elements for the message resource.

**Table 41–28** Read-only Elements for message

Element	Type	Description
id	String	Unique ID of the message
author	<a href="#">personReference</a>	User who created the message
created	Date (String) <sup>1</sup>	Date the message was created

<sup>1</sup> Data types, such as DATE and BOOLEAN, are stored in the API as STRING.

**Resource Types Linked to from message**

Table 41–29 lists the resource types that the client can link to from the message resource.

**Table 41–29 Related Resource Types for message**

rel	resourceType
self	urn:oracle:webcenter:messageBoard:message

## 41.5 Creating an Invitation

This section illustrates how to invite another user to join your connections list using the People Connections Service REST API. After the invitation is made, the invitee is given the option to accept or not. This example also illustrates how to delete an invitation.

This section includes the following subsections:

- [Section 41.5.1, "Creating an Invitation"](#)
- [Section 41.5.2, "Deleting an Invitation"](#)

### 41.5.1 Creating an Invitation

1. The first step, as always with the REST APIs, is to retrieve the resource index:

```
GET http://<host:port>/rest/api/resourceIndex
```

2. Next, find the person to whom you want to connect. To do this:

1. In the resource index listing, scan for the link with the following resource type:

```
urn:oracle:webcenter:people:person
```

2. Execute a search for the user who you wish to invite. In this example, the user is named Monty.

```
GET http://<host:port>/rest/api/people?q=loginid:equals:monty&utoken=ASDF
```

3. Locate Monty's GUID in the response, as shown in [Figure 41–1](#).

**Figure 41–1 Response With User's GUID**

```
<links>
<connected>false</connected>
<displayName>monty</displayName>
<guid>1AE5AF102E2611E09F062B573E287934</guid>
<id>monty</id>
- <name>
  <formatted>monty</formatted>
</name>
```

4. Save the GUID so that you can use it to connect to the user.
3. Now that you have the invitee's GUID, you must find the resource to which you would like to add him. In this case, you want to add him to your own connections list.

To find your connections list, first, scan the People Connections documentation (this chapter) for "connections." You will discover in [Table 41–9, "Related](#)

[Resource Types for person](#)" that connections are linked to from the person resource. For convenience, this table is shown in [Figure 41-2](#).

**Figure 41-2 Finding the connections Link**

rel	resourceType
self	urn:oracle:webcenter:people:person
alternate	urn:oracle:webcenter:spaces:profile (HTML)
urn:oracle:webcenter:people:person:list:connections	urn:oracle:webcenter:people:person:list
	urn:oracle:webcenter:people:person:listNames
	urn:oracle:webcenter:people:person:status
urn:oracle:webcenter:activities:stream:person	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream:connections	urn:oracle:webcenter:activities:stream
urn:oracle:webcenter:activities:stream	urn:oracle:webcenter:activities:stream
	urn:oracle:webcenter:messageBoard
urn:oracle:webcenter:feedback:all-given	urn:oracle:webcenter:feedback
urn:oracle:webcenter:feedback:all-received	urn:oracle:webcenter:feedback

Now that you know that connections are linked to from the person resource, you need to find the person resource. As the URN indicates, you get to the person resource from the people resource, as described in the following steps.

- Return to the resource index (or use a cached version of the resourceIndex from your previous visit):

```
GET http://<host:port>/rest/api/resourceIndex
```

- Scan for the people resource, and you will find:

```
urn:oracle:webcenter:people
```

- Use the link in the people resource to access *your* lists:

```
GET http://<host:port>/rest/api/people/@me/lists/@self?utoken=ASDF
```

- Scan the returned links for the resourceType and rel listed in [Table 41-9](#):

```
resourceType="urn:oracle:webcenter:people:person:list
rel="urn:oracle:webcenter:people:person:list:connections
```

- Make the invitation by using the URI to your connections list to execute a POST:

```
POST http://<host:port>/rest/api/people/@me/lists/@connections?utoken=ASDF
```

```
Headers -- Accept:application/json, Content-Type:application/json
```

```
Body -- {"message":"Monty, do you want to join my connections
list?", "guid":"1AE5AF102E2611E09F062B573E287934"}
```

- Now, if you log in to Monty's account and you can see the invitation has been added, as shown in [Figure 41-3](#).

**Figure 41–3 Activity Stream Showing Invitation**

## 41.5.2 Deleting an Invitation

After you initiate an invitation, you can view the invitation from your account by specifying `invitor:equals:@me`. For example:

```
GET
http://<host:port>/rest/api/people/invitations?q=invitor:equals:@me&utoken=ASDF
```

Each invitation element listed in the response contains a link that supports the DELETE operation and that looks something like this:

```
<links>
<link resourceType="urn:oracle:webcenter:people:invitation"
rel="self"
href="http://host_name:port_name/rest/api/people/invitations/
e9073cdb-56ab-423d-8b1f-1220c802bdd4?
utoken="FN0SEFwX420CntwtX9a1dSbhqocO_w**"
capabilities="urn:oracle:webcenter:delete"/>
</links>
```

The invitee can also delete an invitation from his or her own account. The invitee can get a list of his or her invitations by specifying:

```
GET
http://<host:port>/rest/api/people/invitations?q=invitee:equals:@me&utoken=ASDF
```

Note that the response from a DELETE is simply a status code of 204.

# Part VII

---

## Helping Users Find Content

Part VII contains the following chapters:

- [Chapter 42, "Integrating the Links Service"](#)
- [Chapter 43, "Integrating the Tags Service"](#)
- [Chapter 44, "Integrating the Search Service"](#)
- [Chapter 45, "Integrating the Activity Graph Service"](#)

---

---

## Integrating the Links Service

This chapter explains how to integrate the Links service in a WebCenter Portal: Framework application at design time.

For more information about managing and including links, see:

- "Setting up the WebCenter Portal Repository" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Links Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

This chapter includes the following sections:

- [Section 42.1, "Introduction to the Links Service"](#)
- [Section 42.2, "Basic Configuration for the Links Service"](#)
- [Section 42.3, "Advanced Information for the Links Service"](#)

### 42.1 Introduction to the Links Service

This section provides overview information about the Links service features and requirements. It includes the following subsections:

- [Section 42.1.1, "Understanding the Links Service"](#)
- [Section 42.1.2, "Requirements for the Links Service"](#)
- [Section 42.1.3, "What Happens at Runtime"](#)

#### 42.1.1 Understanding the Links Service

The Links service provides a way to view, access, and associate related information. For example, in a list of project assignments, you can link to the specifications relevant to each assignment. In a discussion thread about a problem with a particular task, you can link to a document that provides a detailed description of how to perform that task.

The Links service provides a means for the application developer to set up source objects (for example, the Discussions service) and target objects (for example, a document), thus enabling your users to create links between the two objects.

There are three actions associated with the Links service: create, delete, and manage. The manage action includes the create and delete actions.

The following custom JSF components are included in the service:

- **Links Detail Button:** This displays an icon and (optionally) a hyperlink that users click to open the Links Panel. To use the Links Detail Button, you must also include the Links - Dialog task flow as a region on the page.
- **Links Detail Menu Item:** This adds a menu item that opens the Links Panel. You can embed this item in an ADF menu. To use the Links Detail Menu Item, you must also include the Links - Dialog task flow as a region on the page.
- **Links Status Icon:** This has two versions:  
The gray **Links** icon (Figure 42-1) indicates that no links are present in the Links dialog.

**Figure 42-1 The Links Icon (No Links Present)**

The gold **Links** icon (Figure 42-2) indicates that links are present in the Links dialog.

**Figure 42-2 The Links Icon (Links Present)**

You can link **from** the following objects:

- Announcements
- Discussions
- Documents
- Events
- Lists
- Pages
- Any object that has a custom JSF component (such as the Links Detail button) bound to it

You can link **to** the following **new** objects:

- Discussions
- Documents
- Events
- Notes
- URLs

You can link **to** the following **existing** objects:

- Announcements
- Discussions
- Documents
- Events

---

---

**Note:** The Lists and Notes services are available in WebCenter Portal: Spaces only.

---

---

Links are *not* available for the other WebCenter Portal services, such as Mail and People Connections.

The Links service supports bidirectional links between objects. For example, when you create a link from a discussion topic to a document, a link from the document back to the discussion topic also is created. Similarly, when you *delete* the link from the discussion topic to a document, the link from the document back to the discussion topic is automatically deleted. Bidirectional linking is not available for URLs, notes, and specific list rows.

## 42.1.2 Requirements for the Links Service

Links automatically recognize any WebCenter Portal service in your application. After you have configured a service in your application, you can add links. However, links work only on secured pages. Links icons do not appear on unsecured pages. For more information, see [Section 42.2.3, "Setting Security for the Links Service."](#)

## 42.1.3 What Happens at Runtime

Linking provides an easy way for you to share information with your social network. Linking can help you realize a significant reduction of wasted time and effort normally spent looking for information.

The Links service exposes its features through a Links dialog ([Figure 42–3](#)), accessible wherever the **Links** icon ([Figure 42–1](#)) appears in your application.

**Figure 42–3 Links Dialog**

With the Links service, you can do the following:

- Link an object (such as a page) to an existing object (such as a discussion topic) by clicking the **Link** icon, selecting **Link to Existing**, choosing the resource **Discussions**. Optionally, you can choose a specific forum and click the topic title to choose a link.
- Link an object (such as a discussion topic) to a new object (such as a new note or URL) by clicking the **Link** icon for discussion topic, selecting **Link to New**, and choosing either **Note** or **URL**.
- Create multiple links from one object.
- Delete a link.

For more information about the Links service at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 42.2 Basic Configuration for the Links Service

This section describes the steps required for adding the Links service to your application. It includes the following subsections:

- [Section 42.2.1, "Setting up Connections for the Links Service"](#)
- [Section 42.2.2, "Adding the Links Service at Design Time"](#)
- [Section 42.2.3, "Setting Security for the Links Service"](#)
- [Section 42.2.4, "Troubleshooting the Links Service"](#)

### 42.2.1 Setting up Connections for the Links Service

The Links service requires a connection to the database where the WebCenter Portal schema is installed. The link map (that is, relationship information such as what object is linked to what other object) is stored in the database.

For details about setting up a database connection, see [Section 7.2.2, "Setting Up a Database Connection."](#)

### 42.2.2 Adding the Links Service at Design Time

This section explains a basic incorporation of the Links service. It includes the following subsections:

- [Section 42.2.2.1, "Links Service Task Flows."](#)
- [Section 42.2.2.2, "How to Add the Links Service to your Application."](#)

#### 42.2.2.1 Links Service Task Flows

The Links service includes one task flow: Links Dialog.

#### 42.2.2.2 How to Add the Links Service to your Application

To add the Links Dialog task flow to your Framework application:

1. Follow the steps described in [Chapter 3, "Preparing Your Development Environment"](#) to create a customizable page in your application.
2. Ensure that you have set up the database connection to a database with the WebCenter Portal schema installed ([Section 42.2.1](#)).
3. Open the page on which you want to add the Links service.
4. In the Component Palette, click **WebCenter Portal - Links Service**.
5. Drag and drop the **Links Detail Button** component onto your page inside the `panelGroupLayout`.

The button is placed inside of a `panelGroupLayout` for the purposes of this example only. It is not required that you always place the button inside a `panelGroupLayout`.

6. In the Insert Links Detail Button dialog ([Figure 42-4](#)), enter a unique object description, ID, and name.

**Figure 42–4 Insert Links Detail Button Wizard**

The properties in this dialog include:

- **objectDescription:** The description of the object to which you are binding the Links Detail Button
- **objectId:** A unique ID that identifies the object to which you are binding the Links Detail Button
- **objectName:** The name of the object to which you are binding the Links Detail Button
- **serviceId:** An application-wide ID that identifies your application

7. In the **ServiceId** field, enter OnDemand.

---

**Note:** The Links service combines the `serviceId` and `objectId` to uniquely identify the object to which you bind the Links Detail Button.

---

8. Click **OK**.

The new button displays in your page source ([Figure 42–5](#)).

**Figure 42–5 The Link Detail Button in Your Page Source**

```
<af:form> <af:panelGroupLayout id="top" layout="horizontal" valign="end"
inlineStyle="background-color:cyan;width:100%">
  <rel:linksDetailButton objectDescription="Link Details Button"
    serviceId="OnDemand" objectId="linkButton"
    objectName="linkButton"/>
</af:panelGroupLayout>
```

9. In the Resource Palette, open **My Catalogs**, then open the **Task Flows** folder.
10. Drag and drop the **Links Dialog** task flow next to the Link Detail button on your page, and select **Region** from the context menu.
11. Save and run your page to the browser.

### 42.2.3 Setting Security for the Links Service

The Links service requires secured pages. Links icons do not appear on unsecured pages.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see [Section 68.3, "Configuring ADF Security."](#)

### 42.2.4 Troubleshooting the Links Service

This section describes common problems and solutions for the Links service.

#### **Problem**

The **Links** icon does not appear.

#### **Solution**

The Links service requires a database connection to the WebCenter Portal schema, where links information is stored. Make sure that you have created the connection to the database and made it available in the Application Resources panel of the Application Navigator. If the connection is available in the Resource Palette but not in Application Resources, then simply drag the connection from the Resource Palette to the Connections folder in Application Resources.

#### **Problem**

Existing links appear, but you are not able to create new links or delete existing links.

#### **Solution**

The `RelationshipPermission` permission is automatically granted to administrators when Links components are consumed. Grant other users this permission through the ADF Security Policy Editor. For more information, see [Section 68.3.1, "Configuring ADF Security Settings."](#)

## 42.3 Advanced Information for the Links Service

This section describes optional features available with this service. It includes the following subsection:

- [Section 42.3.1, "Using the Links Service REST APIs"](#)

### 42.3.1 Using the Links Service REST APIs

WebCenter Portal provides REST APIs to support the Links service. Use the Links service REST APIs to post links between two objects. For example, you could create a link between an event and a document in a space.

This section describes the REST APIs associated with the Links service. It includes the following subsections:

- [Section 42.3.1.1, "Links Entry Point"](#)
- [Section 42.3.1.2, "Links Resource Type Taxonomy"](#)
- [Section 42.3.1.3, "Security Considerations"](#)
- [Section 42.3.1.4, "Links Resource Types"](#)

For an introduction to the REST APIs, see [Chapter 53, "Using Oracle WebCenter Portal REST APIs."](#)

#### 42.3.1.1 Links Entry Point

Each REST service has a link element within the resource index that provides the entry point for that service. To find the entry point for the Links service, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:links
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Links service.

For more information about the resource index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

#### 42.3.1.2 Links Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 53.5.2.1, "Resource Type."](#)

The taxonomy for the Links service is:

```
urn:oracle:webcenter:links
  urn:oracle:webcenter:links:results
```

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

#### 42.3.1.3 Security Considerations

Authentication is required before using Links REST API methods.

For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

#### 42.3.1.4 Links Resource Types

This section provides information about each resource type. It includes the following subsection:

- [Section 42.3.1.4.1, "urn:oracle:webcenter:links:results"](#)

**42.3.1.4.1 urn:oracle:webcenter:links:results** Use this resource type to identify the URI to use to create (POST) a link between two objects

The request is represented by the URL, and the response is a link, each with metadata to help the end user choose an item to drill down and cross links to the owning REST services, if available. If the owning REST service is unavailable, then an HREF link is provided.

##### Navigation Paths to results

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  links
```

```

    results
resourceindex
  spaces
    spaces:resourceindex
      spaces:links
        results

```

### Supported Methods for results

The following method is supported by this resource:

- POST
  - **request - body:** a source and a target object, each of which has a `serviceId`, `resourceId`, and `resourceName`; if the target is a URL link, then the target object also contains a `resourceUrl`, **Parameters:** `serviceId`, `resourceId`, `resourceName`
  - **response - body:** Status of "204 No Content" if successful, or "403 Forbidden" if the user has no permission to create a link

where:

- `serviceId={serviceId}`  
Optional: The service ID of the item, such as `services.oracle.webcenter.collab.calendar.community`
- `resourceId={resourceId}`  
The resource ID, such as `s833cddc4_caa5_416c_87e9_d702ef870b43;;3b0c6edb`
- `resourceName={resourceName}`  
The resource name, such as `New Event`.

For more information, see [Section 53.5.2.5, "Templates."](#)

### Resource Types Linked to From results

[Table 42–1](#) lists the resource types that the client can link to from this resource.

**Table 42–1** *Related Resource Types for links*

rel	resourceType
self	<a href="#">urn:oracle:webcenter:links:results</a>

---

---

## Integrating the Tags Service

This chapter explains how to integrate the Tags service in a WebCenter Portal Framework application at design time.

For more information about managing and including tags, see:

- "Setting up the WebCenter Portal Repository" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Tags Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

**See Also:** You must register a resource viewer to enable custom resources to be rendered using Search or Tags, or to make the resources linkable to and from each other. For more information, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

This chapter includes the following sections:

- [Section 43.1, "Introduction to the Tags Service"](#)
- [Section 43.2, "Basic Configuration for the Tags Service"](#)
- [Section 43.3, "Advanced Information for the Tags Service"](#)

### 43.1 Introduction to the Tags Service

Tags enable users to apply their own meaningful terms to items, making those items more easily discoverable in search results and the Tag Center. The Tag Center is a page that displays the interactions among all the tags, tagged items, and their taggers in an application.

Having multiple users tag objects contributes to the collective knowledge, which makes searching much more relevant. WebCenter Portal search takes advantage of the knowledge captured by tagging by indicating the relevance of results based on the quality and frequency of their applied tags.

Tags let the *users* of data (instead of the *publishers* of data) classify information. In this way, tags act as a personal productivity tool and a method to increase searchability for everyone.

For example, suppose your application includes a component that provides a view of departmental human resources contacts. If you enable tags for this component, then a user who comes to it can bookmark it for themselves and assign tags like HR or contacts or department to help others find it as well.

The Tags service is available for pages, documents, and custom objects. Creating a tag automatically publishes the event to the Activity Stream.

### 43.1.1 Understanding the Tags Service

You can apply one or more meaningful terms, called *tags*, to remind yourself and alert other users of the content they might expect to find at the tagged location. Anywhere you see the Tags icon (Figure 43-1), you can apply a tag.

**Figure 43-1** The Tags Icon

Tags let you apply your own classifications to items. For example, you could apply the tag *phone* to a product page that provides useful information about new phones. When you or other users search for phone, the tagged page displays in the search results.

When you access the Tag Center, you see all users who applied the same tag anywhere else in the application. Within the Tag Center, a tag cloud (Figure 43-2) displays all currently applied tags.

**Figure 43-2** A Tag Cloud

A tag cloud is a visual depiction of all tags. Tags are presented according to the frequency of their use—the larger the font, the more the tag has been applied to items. Click a tag in the tag cloud to run a search that returns a list of all items that use the tag.

### 43.1.2 Requirements for the Tags Service

The Tags service requires that you set up the WebCenter Portal schema and create a database connection to the schema. Tag information is stored in the database. For details, see [Section 7.2.2, "Setting Up a Database Connection."](#)

---

---

**Note:** Typically, when you add tags in a Framework application, you also should add a search toolbar to enable searching for the objects with the tags. To add the search toolbar, follow the instructions in [Section 44.2.3, "Adding the Search Service at Design Time."](#)

---

---

The Tags service requires security. If users are not authenticated, then they cannot tag objects. If the application is not secured, then pages are not returned in search results for tagged items.

To enable the ability to tag *documents*, you must have the Document Manager task flow in the Framework application. For more information, see [Chapter 29, "Integrating the Documents Service."](#)

### 43.1.3 What Happens at Runtime

At runtime, when you search for a tag word, results are returned in the Tagged Items section of the search results. By default, tagged items that are accessed through their tags are rendered in a full screen replacing the same window. You can override this and have it open in a popup window.

You can tag custom components, find those tags either through a search or in the Tag Center, and access tagged items through their associated tags.

For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. The Tags service uses this framework to allow acting on a search result. For more information, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

For more information about the service at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 43.2 Basic Configuration for the Tags Service

This section describes required steps for adding this service to your application. It includes the following subsections:

- [Section 43.2.1, "Setting up Connections for the Tags Service"](#)
- [Section 43.2.2, "Adding the Tags Service at Design Time"](#)
- [Section 43.2.3, "Setting Security for the Tags Service"](#)

### 43.2.1 Setting up Connections for the Tags Service

The Tags service requires a connection to the database with the WebCenter Portal schema installed.

For details about setting up a database connection, see [Section 7.2.2, "Setting Up a Database Connection."](#)

### 43.2.2 Adding the Tags Service at Design Time

To enable basic tagging, you must add either the **Tagging Button** component or the **Tagging Menu Item** component and the Tagging - Dialog task flow. In addition, to tag *custom* objects, you must register a resource viewer to visualize the tagged component when it is discovered by users.

This section describes how to enable tagging by adding the **Tagging Button** and the Tagging - Dialog task flow. It includes the following subsections:

- [Section 43.2.2.1, "Tags Service Components"](#)
- [Section 43.2.2.2, "Tags Service Task Flows"](#)
- [Section 43.2.2.3, "How to Add the Tags Service to your Page"](#)
- [Section 43.2.2.4, "How to Modify the Tags Service Task Flow Parameters"](#)

### 43.2.2.1 Tags Service Components

The following JSF components are included in the service:

- **Tagging Button:** When you add a Tagging Button, a Tags link on the page enables you to invoke the Tag This Item (or Tag This Page) dialog at runtime.
- **Tagging Menu Item:** When you add a Tagging Menu Item, a menu option on the page enables you to invoke the Tag This Item (or Tag This Page) dialog at runtime.

In the Component Palette, drag and drop components to the page. In the resulting dialog box, you can configure attributes in the Tags components. You can configure attributes in the Tags components. For example, the `SharedParam` attribute lets you disable the **Shared** checkbox. (With the `default` value, the checkbox is enabled, so users can check it or uncheck it at will. With the `always` value, the checkbox is disabled in the true state, so all tags are public. With the `never` value, the checkbox is disabled in the false state, so all tags are private.) As another example, the `ResourceScope` attribute lets users tag objects in a different scope, such as a list of search results with the Tagging button next to each result, where the search is done in the default scope but the results could be in other scopes. For more information about the component attributes, see the online help.

### 43.2.2.2 Tags Service Task Flows

Table 43–1 lists the Tags service task flows.

**Table 43–1 Tags Service Task Flows**

Task Flow	Definition
Tagging - Dialog	This task flow displays a dialog that appears to tag a particular object. This does not have any visible user interface rendering when dropped onto a page. It only becomes visible when the tagging button is clicked.
Tagging - Personal View	This task flow shows the tags created by the current user, objects tagged by those tags, and a cloud view of the tags. A service ID input parameter enables you to view tagged items of interest.  Because this is a non-public task flow, it requires authentication.
Tagging - Related Links	For an object identified by a unique ID, this task flow lists all the other objects that are tagged with similar tags.  The other objects listed include those that are similarly tagged; that is, their tag "sets" have an intersection of at least one. The list is ordered by the number of tags in the intersection.
Tagging - Tag Cloud	This task flow displays a tag cloud, which is a visual depiction of all the tags used. Tags are presented according to the frequency of their use. More frequently used tags display in bold fonts and varying font sizes—the larger the font, the more the tag has been applied.  When you click a tag in the tag cloud, you are redirected to Tag Center, where that tag is selected.  This task flow appears on a page with tagged items. It provides Resource Action Handling (RAH) links for all tags in the page.

**Table 43–1 (Cont.) Tags Service Task Flows**

Task Flow	Definition
Tagging - Tag Selection	<p>Similar to the Tag Cloud task flow, the Tag Selection task flow also displays a tag cloud. However, when you select a tag, it marks the tag as selected, and you see the results in the Related Resources task flow. You are not redirected to the Tag Center.</p> <p>With this task flow and the Tagging - Tagged Items task flow, you can click a tag in the tag cloud to see the items that use the tag. (In other words, selecting a tag in the Tagging - Tag Cloud task flow sends the tag word as an event to all interested event consumers, such as the Tagging - Tagged Items task flow.)</p>
Tagging - Tagged Items	This task flow displays items pages, or documents that have been tagged. It can refine itself to show only the items tagged with the tag passed to it. This task flow can listen for events sent by the Tagging - Tag Cloud task flow.

**See Also:** [Section 43.2.2.4, "How to Modify the Tags Service Task Flow Parameters"](#)

### 43.2.2.3 How to Add the Tags Service to your Page

To add the Tags service to your WebCenter Portal: Framework application:

1. Follow the steps described in [Chapter 3, "Preparing Your Development Environment"](#) to create a customizable page in your application.
2. Ensure that you have set up a database connection to a database with the WebCenter Portal schema installed.
3. Open the page where you included the search toolbar.
4. On the Component Palette (All Pages), select the **Tagging Button** and drop it on the page, inside a `PanelGroupLayout`. Make it the first child of the `PanelGroupLayout` by placing it to the left of the search toolbar. The Tagging Button enables users to start tagging.
5. Fill out the Insert Tagging Button dialog. [Table 43–2](#) provides descriptions and example values for the fields in the dialog.

**Table 43–2 Fields in the Insert Tagging Button Dialog**

Field	Description
ResourceId	<p>The ID that uniquely identifies the object to which you are binding the Tagging Button. The value in this field need not be static. For example, you could use EL to insert a unique value for each row in a table. For example:</p> <ul style="list-style-type: none"> <li>■ To tag pages, enter <code>#{facesContext.viewRoot.viewId}</code></li> <li>■ To tag custom components, enter <code>customComponent123</code></li> </ul>
ResourceName	<p>The name of the object to which you are binding the Tagging Button. The value in this field need not be static. For example, you could use EL to insert a unique value for each row in a table.</p> <ul style="list-style-type: none"> <li>■ To tag pages, enter <code>#{facesContext.viewRoot.viewId}</code></li> <li>■ To tag custom components, enter <code>Custom Component 1</code></li> </ul>

**Table 43–2 (Cont.) Fields in the Insert Tagging Button Dialog**

Field	Description
ServiceId	An application-wide ID. (With custom components, you add this to <code>service-definition.xml</code> when adding the resource viewer.) <ul style="list-style-type: none"> <li>■ To tag pages, enter <code>oracle.webcenter.page</code></li> <li>■ To tag custom components, enter <code>mycompany.myproduct.myapp.mycomponent</code></li> </ul>

**Figure 43–3 Insert Tagging Button Dialog for a Custom Component**

6. Click **OK**.

---

**Note:** The Tagging Button includes additional properties you can set. For example, `SharedParam` lets you disable the **Shared** checkbox. (With the default value, the checkbox is enabled, so users can check it or uncheck it at will. With the `always` value, the checkbox is disabled in the true state, so all tags are public. With the `never` value, the checkbox is disabled in the false state, so all tags are private.)

---

7. From the Resource Palette, expand **WebCenter Portal - Services Catalog and Task Flows**.
8. Drag and drop **Tagging Dialog** from the Resource Palette on the page, optionally adding a redirection URL for anonymous page login.
9. When prompted, select **Region** as the way to create the task flow.
10. For custom resources, follow the steps described in [Section 7.3, "Extending Your Framework Application with Custom Components"](#) to register a resource viewer. For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. The Tags service uses this framework to allow acting on a search result.

In the Source view where you added the Tags service, you should see something similar to [Example 43–1](#).

**Example 43–1 Tagging Button and Tagging - Dialog Task Flow Source**

```
<af:form id="f1">
  <af:region value="#{bindings.searchtoolbar1.regionModel}" id="r1"/>
  <tag:taggingButton resourceId="#{facesContext.viewRoot.viewId}"
    serviceId="oracle.webcenter.page"
    resourceName="#{facesContext.viewRoot.viewId}"
    id="tb1"/>
  <af:region value="#{bindings.tagginglaunchdialog1.regionModel}"
    id="r2"/>
</af:form>
```

---

---

**Note:** Even if there are multiple Tagging Buttons on the page, only one Tagging Dialog `af:region` is needed.

---

---

Run the page with the **Tagging Button** and Tagging - Dialog task flow. When the page renders in the browser, click the **Tags** link.

1. When the dialog appears, enter the tag home and click **Save**. Note that every user of the system can perform this same operation and assign the same tag, which means that you get a weighted collection of tags.
2. In the search toolbar, type the search term home, and click the **Search** icon.
3. You should see home as a search result under Tags and Custom Component 1 as a search result under Tagged Items.
4. Click Custom Component 1 and a dialog appears with the resource viewer you just created (Figure 43–4).

**Figure 43–4 Resource Viewer**

#### 43.2.2.4 How to Modify the Tags Service Task Flow Parameters

Some Tags service task flows have optional task flow binding parameters.

---

---

**Note:** You should not change the Tags service task flow properties unless you want to show items from a different resource or different service.

---

---

To see and adjust task flow binding parameter values after you have placed a task flow on a page:

1. Navigate to the Edit Task Flow Binding dialog by clicking the **Bindings** tab at the bottom of the page (next to the **Source** tab).
2. Under **Executables**, you'll see the task flow you added. Figure 43–5 shows an example of Tags task flows in the Executables section.

**Figure 43–5 Page Data Binding Definition**

**Page Data Binding Definition**

This shows the Oracle ADF data bindings defined for your page. Select a binding to see its relationship

Page Definition File: [portal/pageDefs/untitled1PageDef.xml](#)

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.
4. In the Edit Task Flow Binding dialog [Figure 43–6](#), revise the binding parameter values as required.

**Figure 43–6 Edit Task Flow Binding Dialog for Tags - Related Links Task Flow**

5. When you are finished, click **OK**.
6. Save and run your page to see the results.

[Table 43–3](#) describes the properties that are unique to the Tags service task flows.

**Table 43–3** Tags Service Task Flow Parameters

Property	Description	Task Flow
resourceId	Unique ID of the item or resource within a given service that is used to find similarly tagged items. This value is set automatically.  Do not change this value unless you want to show items similar to a different resource.	Tagging - Related Links
serviceId	This parameter has a different meaning for the Related Links task flow and the Personal View task flow. <ul style="list-style-type: none"> <li>In Related Links, it is a resourceId/serviceId pair that defines the item that has related links. This value is set automatically. Do not change this value unless you want to show items similar to a different resource belonging to a different service.</li> <li>In Personal View, it limits the tags to this service; for example, oracle.webcenter.page.</li> </ul>	Tagging - Related Links Tagging - Personal View
resourceScope	Scope of tags. This value is set automatically (either <code>#{spaceContext.currentSpaceGUID}</code> or something like <code>s8bba98ff_4cbb_40b8_beee_296c916a23ed</code> ).  Do not change this value.	Tagging - Tag Cloud Tagging - Tag Selection Tagging - Tagged Items
redirectURL	Optional redirection URL for anonymous page login. This must include the <code>/faces</code> prefix; for example, <code>/faces#{facesContext.viewRoot.viewId}</code> . If null or empty, then no login is displayed.	Tagging - Dialog

### 43.2.3 Setting Security for the Tags Service

The Tags service requires security. If users are not authenticated, then they cannot tag objects. If the application is not secured, then pages are not returned in search results for tagged items.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see [Section 68.3, "Configuring ADF Security."](#)

---

**Note:** You must register a resource viewer to allow custom objects to be found using Search or Tags. For information about how the resource viewer's `authorizerClass` determines whether users can view the resource, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

---

## 43.3 Advanced Information for the Tags Service

This section describes optional features available with this service. It includes the following subsections:

- [Section 43.3.1, "Using the Tags Service Java APIs"](#)
- [Section 43.3.2, "Using the Tags Service REST APIs"](#)
- [Section 43.3.3, "Optional Way to Show Tags on Pages"](#)
- [Section 43.3.4, "Using the Resource Action Handling Framework to Tag Custom Objects"](#)
- [Section 43.3.5, "Troubleshooting the Tags Service"](#)

---

---

**Note:** You can turn up logging levels for the tagging component (as you can with other components) in the `logging.xml` file, found under the WLS home.

---

---

### 43.3.1 Using the Tags Service Java APIs

Custom components can implement Tags APIs to create a tagging backend compatible with the WebCenter Portal REST APIs or Tags task flows and components.

For more information on the Java APIs, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

### 43.3.2 Using the Tags Service REST APIs

WebCenter Portal provides REST APIs to support tags. Use the Tags REST APIs to do the following:

- Find all tags or find a subset of tags by criteria
- Get a specific tag
- Delete tags
- Update or rename tags
- Get tagged items
- Untag an item
- Add a new tagged item
- Change tags for a tagged item
- Find all tagged items or find tagged items by a filter, such as a date or a tag word
- Get related user by tag

This section describes the REST APIs associated with the Tags service. It includes the following subsections:

- [Section 43.3.2.1, "Tags Entry Point"](#)
- [Section 43.3.2.2, "Tags Resource Type Taxonomy"](#)
- [Section 43.3.2.3, "Security Considerations"](#)
- [Section 43.3.2.4, "Tags Resource Types"](#)

For an introduction to the REST APIs, see [Section 53, "Using Oracle WebCenter Portal REST APIs."](#)

#### 43.3.2.1 Tags Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. To find the entry point for the Tags, find the link element with a `resourceType` of one of the following:

- `urn:oracle:webcenter:tagging:tags`
- `urn:oracle:webcenter:tagging:taggeditems`
- `urn:oracle:webcenter:tagging:users`

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Tags service.

For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 43.3.2.2 Tags Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 53.5.2.1, "Resource Type."](#)

The taxonomy for the Tags service is:

```
urn:oracle:webcenter:tagging:tags
  urn:oracle:webcenter:tagging:tag
urn:oracle:webcenter:tagging:taggedItems
  urn:oracle:webcenter:tagging:taggedItem
urn:oracle:webcenter:tagging:users
```

Under users, you can add the resource type for that object, such as `peopleprofile`.

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

Collection resources in the tags resources support pagination (`itemsPerPage` and `startIndex` for tags and users and `itemsPerPage` for `taggedItems`). Other query parameters (`search` and `projection`) are not supported.

### 43.3.2.3 Security Considerations

Authentication is required before using Tags REST API methods.

For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 43.3.2.4 Tags Resource Types

This section provides information about each resource type. It includes the following subsections:

- [Section 43.3.2.4.1, "urn:oracle:webcenter:tagging:tags"](#)
- [Section 43.3.2.4.2, "urn:oracle:webcenter:tagging:tag"](#)
- [Section 43.3.2.4.3, "urn:oracle:webcenter:tagging:taggedItems"](#)
- [Section 43.3.2.4.4, "urn:oracle:webcenter:tagging:taggedItem"](#)
- [Section 43.3.2.4.5, "urn:oracle:webcenter:tagging:users"](#)

**43.3.2.4.1 urn:oracle:webcenter:tagging:tags** Use this resource type to identify the URI to use to read (GET) tags. The response from a GET operation includes all tags, a specific tag, a subset of tags, or a tag related to a specific list of tags or users.

#### Navigation Paths to tags

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  tags

resourceindex
```

```
spaces
  spaces:resourceindex
  spaces:tags
```

### Supported Methods for tags

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters:** startIndex, itemsPerPage, keyword, serviceId, relatedTag, userId, scopeGuid, shared, tags, users
  - **response - body:** tag

where:

- **startIndex**—Specifies the index of the first matching result that should be included in the result set (0-*n* ... zero based). This is used for pagination.
- **itemsPerPage**—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.
- **keyword**—Specifies the keyword for substring matches.
- **serviceId**—Specifies the service ID for which you want to find tags (null for all).
- **relatedTag**—Specifies a tag that is related to the list of tags. For example, if you have tagged item1 as "webcenter help" and item2 as "webcenter document" and you set `relatedTag=webcenter`, then you would get returned both tags (for help and document).
- **userId**—Specifies a single user ID to find tags for (null for all). Uses logged-in user if null and not looking for shared tags.
- **scopeGuid**—Specifies the GUID of the portal. When set to the Home space, it shows all (unfiltered) tags.
- **shared**—Specify `true` to return personal resources only (that is, resources tagged privately only by that same user); `false` to return system resources (that is, resources with at least one public tag).
- **tags**—Specifies to filter by this list of tags separated by URL-encoded spaces ('+'); for example, an item tagged with "webcenter" and "help" could be searched with `tags=webcenter+help`.
- **users**—Specifies to filter by this list of users separated by URL-encoded spaces ('+'); for example, `users=monty+vicki+pat`.

---

**Note:** Parameters can be used in certain combinations only.

---

Table 43–4 shows the available parameter combinations for each operation. For example, the `tags` parameter cannot be specified with the `serviceId` parameter.

**Table 43–4 Parameter Combinations Available for Getting Tags**

API Method	keyword	serviceId	relatedTag	userId	scopeGuid	shared	tags	users
findRelatedSystemTags			X		X		X	X

**Table 43–4 (Cont.) Parameter Combinations Available for Getting Tags**

API Method	keyword	serviceld	relatedTag	userId	scopeGuid	shared	tags	users
findPopularTagsCommon	X	X		X				X
findPopularTags (with GUID)	X			X	X			X
findPopularTags	X			X				X

### Resource Types Linked to From tags

The resourceType link attribute indicates the type of resource to which the link points. Clients should use the resourceType to determine the expected response bodies for GET and POST and allowable request bodies for POST and PUT.

Table 43–5 lists the resource types that the client can link to from this resource. Tags have a reference link to themselves and to the next page or previous page of results.

**Table 43–5 Related Resource Types for tags**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:tagging:tags</a>
Previous/Next	<a href="#">urn:oracle:webcenter:tagging:tags</a>

**43.3.2.4.2 urn:oracle:webcenter:tagging:tag** Use this resource type to identify the URI to use to read (GET), rename (PUT), and delete (DELETE) a tag. The response from a GET operation includes all tags, a specific tag, a subset of tags, or a tag related to a specific list of tags or users.

### Navigation Paths to tag

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  tags
    tag

resourceindex
  spaces
    spaces:resourceindex
      spaces:tags
        spaces:tag
```

### Supported Methods for tag

The following methods are supported by this resource:

- GET
  - request - body: none, Parameters: none
  - response - body: tag
- PUT
  - request - body: tag
  - response - body: tag
- DELETE
  - request - body: none

- **response - body:** none

**Example 43–2 Body of the PUT command for Renaming a Tag**

```
<tag>
<name>newId</name>
</tag>
```

**Resource Types Linked to From tag**

The resourceType link attribute indicates the type of resource to which the link points. Clients should use the resourceType to determine the expected response bodies for GET and POST and allowable request bodies for POST and PUT.

Table 43–6 lists the resource types that the client can link to from this resource. A tag has a reference link to itself, to related taggedItems, to related users, and to related tags.

**Table 43–6 Related Resource Types for tag**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:tagging:tag</a> <a href="#">urn:oracle:webcenter:tagging:taggedItems</a> <a href="#">urn:oracle:webcenter:tagging:users</a> <a href="#">urn:oracle:webcenter:tagging:tags</a>

**43.3.2.4.3 urn:oracle:webcenter:tagging:taggedItems** Use this resource type to identify the URI to use to read tagged items and their related resources (GET) or to add tagged items (POST).

The response from a GET operation includes a tagged item or all tagged items, which can be filtered by date, tag words, and so on. Each tag includes links used to operate on that tag. The response from a POST operation includes the tagged items that were created in this collection of tags and a link to operate on them.

**Navigation Paths to taggedItems**

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  taggedItems

resourceindex
  spaces
    spaces:resourceindex
    spaces:taggedItems
```

**Supported Methods for taggedItems**

The following methods are supported by this resource:

- POST
  - **request - body:** taggedItem
  - **response - body:** taggedItem

```
<taggeditem>
  <serviceId>oracle.webcenter.page</serviceId>
```

```

<resourceId>/oracle/webcenter/page/somepath/someotherpath/a.jsp</resourceId>
  <tagWords>foo bar boo far</tagWords>
  <resourceTitle>This is renamed by me to be foofoo</resourceTitle>
  <scopeGuid>(optional) scope for the item</scopeGuid>
  <shared>(optional) make the item private </shared>
</taggeditem>

```

- GET

- **request - body:** none, **Parameters:** `serviceId`, `keyword`, `relatedRID`, `scopeGuid`, `tags`, `users`, `dt`, `shared`, `itemsPerPage`
- **response - body:** tagged items

where:

- `serviceId`—Specifies the service ID of the item.
- `keyword`—Specifies a keyword in the resource title.
- `relatedRID`—Specifies a related tag. For example, if you tagged item1 as "webcenter help" and item2 as "fusionapps documents" and item3 as "webcenter documents" and set `relatedRID=item3`, then you would get back item1 and item2, because they share tags in common with item3.
- `scopeGuid`—Specifies the GUID of the portal. When set to the Home space, it shows all (unfiltered) tags.
- `tags`—Specifies to filter by this list of tags separated by URL-encoded spaces ('+'); for example, an item tagged with "webcenter" and "help" could be searched with `tags=webcenter+help`.
- `users`—Specifies to filter by this list of users, separated by URL-encoded spaces ('+'); for example, `users=monty+vicki+pat`.
- `dt`—Specifies to filter bookmarks by this date, which defaults to the most recent date on which bookmarks were saved {DD-MM-CCYY}.
- `shared`—Specify `true` to return personal resources only (that is, resources tagged privately only by that same user); `false` to return system resources (that is, resources with at least one public tag).
- `itemsPerPage`—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.

---

**Note:** Parameters can be used in certain combinations only.

---

Table 43–7 shows the available parameter combinations for each operation. For example, the `tags` parameter cannot be specified with the `serviceId` parameter.

**Table 43–7** Parameter Combinations Available for Getting Tagged Items

API Method	<code>serviceId</code>	<code>keyword</code>	<code>relatedRID</code>	<code>scope Guid</code>	<code>tags</code>	<code>users</code>	<code>dt</code>	<code>shared</code>
<code>findRelatedSystemResources</code>	X		X					
<code>findUpdatedResources</code>				X			X	
<code>findSystemResources</code>				X	X	X		X

**Table 43–7 (Cont.) Parameter Combinations Available for Getting Tagged Items**

API Method	serviceId	keyword	relatedRID	scope				
				Guid	tags	users	dt	shared
findFilterPersonalResources	X	X		X				
findPersonalResources				X	X	X		X
findFilteredPersonalResources (no keyword)	X			X				

### Resource Types Linked to From taggedItems

The resourceType link attribute indicates the type of resource to which the link points. Clients should use the resourceType to determine the expected response bodies for GET and POST and allowable request bodies for POST and PUT.

Table 43–8 lists the resource types that the client can link to from this resource. Tagged items have a reference link to themselves and to the next page or previous page of results.

**Table 43–8 Related Resource Types for taggedItems**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:tagging:taggedItems</a>
Previous/Next	<a href="#">urn:oracle:webcenter:tagging:taggedItems</a>

**43.3.2.4.4 urn:oracle:webcenter:tagging:taggedItem** Use this resource type to identify the URI to use to read tagged items and their related resources (GET), add tagged items (POST), update tags for a tagged item (PUT), and remove all tags from an item (DELETE).

The response from a GET operation includes a tagged item or all tagged items, which can be filtered by date, tag words, and so on. Each tag includes links used to operate on that tag. The response from a POST operation includes the tagged item that was created in this collection of tags and a link to operate on that tagged item.

### Navigation Paths to taggedItem

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  taggedItem

resourceindex
  spaces
    spaces:resourceindex
    spaces:taggedItem
```

### Supported Methods for taggedItem

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters:** serviceId, keyword, tags, users, dt, shared, itemsPerPage
  - **response - body:** tagged item

where:

- `serviceId`—Specifies the service ID of the item.
  - `keyword`—Specifies a keyword in the resource title.
  - `tags`—Specifies to filter by this list of tags separated by URL-encoded spaces ('+'); for example, an item tagged with "webcenter" and "help" could be searched with `tags=webcenter+help`.
  - `users`—Specifies to filter by this list of users separated by URL-encoded spaces ('+'); for example, `users=monty+vicki+pat`.
  - `dt`—Specifies to filter bookmarks by this date, which defaults to the most recent date on which bookmarks were saved {DD-MM-CCYY}.
  - `shared`—Specify `true` to return personal resources only (that is, resources tagged privately only by that same user); `false` to return system resources (that is, resources with at least one public tag).
  - `itemsPerPage`—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.
- PUT
    - **request - body:** `taggedItem`
    - **response - body:** `taggedItem`

```
<taggeditem>
<tagWords>foo bar boo far</tagWords>
</taggeditem>
```
  - DELETE
    - **request - body:** none
    - **response - body:** none

### Resource Types Linked to From `taggedItem`

The `resourceType` link attribute indicates the type of resource to which the link points. Clients should use the `resourceType` to determine the expected response bodies for GET and POST and allowable request bodies for POST and PUT.

Table 43–9 lists the resource types that the client can link to from this resource. A `tagged item` has a reference link to itself, to related `tagged items`, and an external link.

**Table 43–9 Related Resource Types for `taggedItem`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:tagging:taggedItem</a> <a href="#">urn:oracle:webcenter:tagging:taggedItems</a>
alternate	The resource type depends on the type of resource tagged; for example, a page would be <code>urn:oracle:webcenter:page:page</code>

**43.3.2.4.5 `urn:oracle:webcenter:tagging:users`** Use this resource type to get a list of people related to a given list of tags.

### Navigation Paths to `users`

This section shows how the client can navigate through the hypermedia to access this resource:

`resourceindex`

```

taggingusers
resourceindex
  spaces
    spaces:resourceindex
    spaces:taggingusers

```

### Supported Methods for users

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters:** `startIndex`, `itemsPerPage`, `tags`, `users`
  - **response - body:** people profile

where:

- `startIndex`—Specifies the index of the first matching result that should be included in the result set (0-*n* ... zero based). This is used for pagination.
- `itemsPerPage`—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.
- `tags`—Specifies to filter by this list of tags separated by URL-encoded spaces ('+'); for example, an item tagged with "webcenter" and "help" could be searched with `tags=webcenter+help`.
- `users`—Specifies to filter by this list of users separated by URL-encoded spaces ('+'); for example, `users=monty+vicki+pat`.

### Resource Types Linked to From users

The `resourceType` link attribute indicates the type of resource to which the link points. Clients should use the `resourceType` to determine the expected response bodies for GET and POST and allowable request bodies for POST and PUT.

Table 43–10 lists the resource types that individual users can link to from this resource. Users have a reference link to themselves and to the next page or previous page of results.

**Table 43–10 Related Resource Types for users**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:tagging:users</a>
Previous/Next	<a href="#">urn:oracle:webcenter:tagging:users</a>

### 43.3.3 Optional Way to Show Tags on Pages

While it is possible to add the Tagging Button and task flows on a page-by-page basis, typically you want to add the search toolbar and tags as part of a page template that you can apply whenever building a page that requires it. To add tags through a page template:

1. Open the project where you plan to create pages with the Tags service.
2. Right-click the project name and select **New** from the context menu.
3. Under **Categories**, select **JSF** and, under **Items**, select **JSF Page Template**.
4. For **File Name**, enter `looksee1template`.

**Figure 43–7 Create JSF Page Template Dialog**

5. Click **OK**.
6. Go to the Source view and modify the code to be similar to that in [Example 43–3](#).

**Example 43–3 Sample JSF Page Template**

```

<af:pageTemplateDef var="attrs">
  <af:xmlContent>
    <component xmlns="http://xmlns.oracle.com/adf/faces/rich/component">
      <display-name>looksee1template1</display-name>
      <facet>
        <facet-name>content</facet-name>
      </facet>
    </component>
  </af:xmlContent>
  <af:panelGroupLayout layout="vertical">
    <!-- Our toolbar -->
    <af:panelGroupLayout id="toolbar" layout="horizontal" halign="end"
      inlineStyle="background-color:cyan;width:100%">
    </af:panelGroupLayout>
    <af:panelStretchLayout startWidth="300"
      inlineStyle="height:600px; width:100%;">
      <f:facet name="start">
        <af:panelSplitter id="sidebar" orientation="vertical">
          <f:facet name="first">
          </f:facet>
          <f:facet name="second">
          </f:facet>
        </af:panelSplitter>
      </f:facet>
    </af:panelStretchLayout>
  </af:panelGroupLayout>
</af:pageTemplateDef>

```

```

    <f:facet name="center">
        <af:facetRef facetName="content" />
    </f:facet>
</af:panelStretchLayout>
</af:panelGroupLayout>
</af:pageTemplateDef>

```

7. On the Component Palette, select the **Tagging Button** and drop it on the page, inside the `PanelGroupLayout`. Make it the first child of the `PanelGroupLayout`.
8. Fill out the Insert Tagging Button dialog as shown in [Figure 43–8](#).  
[Table 43–11](#) provides descriptions and example values for the fields in the dialog.

**Table 43–11 Fields in the Insert Tagging Button Dialog for a Page**

Field	Description
ResourceId	Unique identifier of your page.  In this case, because the resource ID is meant for a page, enter <code>#{facesContext.viewRoot.viewId}</code> .
ResourceName	Name of the page.  In this case, enter <code>#{facesContext.viewRoot.viewId}</code> . (You can enter a more user-friendly name.)
ServiceId	Service identifier that you add to <code>service-definition.xml</code> when adding the resource viewer.  In this case, enter <code>oracle.webcenter.page</code> .  Note: Because <code>oracle.webcenter.page</code> is available in the Page service library, nothing must be added to <code>service-definition.xml</code> .

**Figure 43–8 Insert Tagging Button Dialog for a Page**

9. Click **OK**.
10. From the Resource Palette, expand the **WebCenter Portal - Services Catalog** and the **Task Flows**.
11. Drag **Tagging Dialog** from the Resource Palette and drop it on the page inside of the `panelGroupLayout`.
12. When prompted, select **Region** as the way to create the task flow.
13. Drag **Search Toolbar** and drop it after the **Tagging Dialog** you just added to the page template in the `panelGroupLayout`.
14. When prompted, select **Region** as the way to create the task flow.
15. Drag **Document Library - Recent Documents** and drop it in the second facet of the `panelSplitter` with identifier `sidebar`.

16. When prompted, select **Region** as the way to create the task flow.
17. In the Edit Task Flow Binding dialog, for `connectionName`, enter the name of the connection to your document library's content repository; for example, `#{ 'MyFileSystem' }`. For information on how to set up a connection to your content repository, see [Section 26.2, "Configuring Content Repository Connections."](#)
18. The source for your page template should now look similar to [Example 43–4](#).

**Example 43–4 JSF Page Template with Tags and Search**

```
<af:pageTemplateDef var="attrs">
  <af:xmlContent>
    <component xmlns="http://xmlns.oracle.com/adf/faces/rich/component">
      <display-name>looksee1template1</display-name>
      <facet>
        <facet-name>content</facet-name>
      </facet>
    </component>
  </af:xmlContent>
  <af:panelGroupLayout layout="vertical">
    <!-- Our toolbar -->
    <af:panelGroupLayout id="top" layout="horizontal" valign="end"
      inlineStyle="background-color:cyan;width:100%">
      <tag:taggingButton resourceId="#{facesContext.viewRoot.viewId}"
        resourceName="#{facesContext.viewRoot.viewId}"
        serviceId="oracle.webcenter.page"/>
      <af:region value="#{bindings.tagginglaunchdialog1.regionModel}"
        id="tagginglaunchdialog1"/>
      <af:region value="#{bindings.searchtoolbar1.regionModel}"
        id="searchtoolbar1"/>
    </af:panelGroupLayout>
    <af:panelStretchLayout startWidth="300"
      inlineStyle="height:600px; width:100%;">
      <f:facet name="start">
        <af:panelSplitter orientation="vertical">
          <f:facet name="first">
            <af:region value="#{bindings.taskservicetaskflowdefinition1.regionModel}"
              id="taskservicetaskflowdefinition1"
              inlineStyle="position:absolute; left:0px; width:100%;
                height:100%"/>
          </f:facet>
          <f:facet name="second">
            <af:region value="#{bindings.doclibrecentdocuments1.regionModel}"
              id="doclibrecentdocuments1"/>
          </f:facet>
        </af:panelSplitter>
      </f:facet>
      <f:facet name="center">
        <af:facetRef facetName="content"/>
      </f:facet>
    </af:panelStretchLayout>
  </af:panelGroupLayout>
</af:pageTemplateDef>
```

19. Create two new pages based upon the page template you just created. In the Create JSF Page dialog, select `looksee1template1` from the **Use Page Template** list.

- Create a page called `Search.jspx` and add the **Search** task flow in the center facet.
- Create a page called `Documents.jspx` and add the **Document Library - List View** task flow as the center facet. In the Edit Task Flow Binding dialog, for `connectionName`, enter the name of the connection to your document library's content repository; for example, `#{ 'MyFileSystem' }`. For information on how to set up a connection to your content repository, see [Section 26.2, "Configuring Content Repository Connections."](#)

20. Save your pages.

To run your pages with tags:

1. In the Applications Navigator, run the `Search.jspx` page.
2. After you log in and the page comes up, click the **Tags** link.
3. In the Tag this Page dialog, enter `search page test customapp` for **Tags** (Figure 43–9).

**Figure 43–9 Tag this Page Dialog for Search Page**

4. Click **Save**.
5. Navigate to `Documents.jspx` (or run it separately).
6. Click the **Tags** link.
7. In the Tag this Page dialog, enter `doclib documents page test customapp` for **Tags** (Figure 43–10).

**Figure 43–10 Tag this Page Dialog for Documents Page**

8. Click **Save**.
9. In the search toolbar for the `Documents.jspx` page, enter `search` and click the **Search** icon.
10. Under **Tags**, click `search`.

### 43.3.4 Using the Resource Action Handling Framework to Tag Custom Objects

For services exposing resources to be tagged (and therefore searched and viewed) WebCenter Portal provides a Resource Action Handling framework. For example, rows in a table can be tagged.

To register a resource viewer, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

## 43.3.5 Troubleshooting the Tags Service

This section provides troubleshooting tips on implementing the Tags service. It includes the following subsections:

- [Section 43.3.5.1, "Tag Center Results Do Not Appear When Tag Is Clicked"](#)
- [Section 43.3.5.2, "The Tag Center Does Not Display Tagged Documents"](#)
- [Section 43.3.5.3, "The Tagging Button Does Not Display On Page"](#)
- [Section 43.3.5.4, "Clicking a Tagged Resource Does Not Go To The Correct Page"](#)

### 43.3.5.1 Tag Center Results Do Not Appear When Tag Is Clicked

#### Problem

A resource to which a user has View permission has been tagged, but the user cannot see the resource in the Tag Center.

#### Solution

1. In `service-definition.xml`, verify that the resource type has the Resource Authorizer configured properly.
2. Enable logging for the Resource Authorizer to ensure that it is giving you permission to see the required objects.

### 43.3.5.2 The Tag Center Does Not Display Tagged Documents

#### Problem

Tagged WebCenter Portal Content Server documents do not appear in the Tag Center.

#### Solution

Check the version listed for the WebCenter Portal component in the Content Server. The result set name changed in WebCenter Portal release 11.1.1.6.0.

### 43.3.5.3 The Tagging Button Does Not Display On Page

#### Problem

The Tagging Button component is dropped on a page, but it does not show up.

#### Solution

- The Tagging Button requires the Tagging Dialog task flow to be present on the page. Drop this task flow on the page or page template.
- The Tagging Button requires a valid database connection. Ensure that there is a database connection present.

#### 43.3.5.4 Clicking a Tagged Resource Does Not Go To The Correct Page

##### **Problem**

When clicking a tagging resource in Tag Center, users are not redirected to the correct page.

##### **Solution**

All tagging links are generated through the Resource Action Handling (RAH) framework. Ensure that RAH is configured properly.

- Check `service-definition.xml` for that resource type to see if a resource viewer is configured properly.
- Ensure that the `resourceID` and `serviceID` parameters passed for this resource are correct.

**See Also:** [Section 7.3, "Extending Your Framework Application with Custom Components"](#)

---

---

## Integrating the Search Service

This chapter explains how to integrate the Search service in a WebCenter Portal: Framework application at design time.

For more information about managing and including search, see:

- "Managing Oracle SES Search in WebCenter Portal" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the Search Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

This chapter includes the following sections:

- [Section 44.1, "Introduction to Search"](#)
- [Section 44.2, "Basic Configuration for the Search Service"](#)
- [Section 44.3, "Advanced Information for the Search Service"](#)

### 44.1 Introduction to Search

WebCenter Portal provides a unified, extensible framework that enables the discovery of information through an intuitive user interface. It honors application security settings by returning only the results a user is authorized to view. WebCenter Portal provides two ways of searching your application:

- Oracle Secure Enterprise Search (SES) adapter
- Oracle WebCenter Portal live search adapters

With Framework applications, Oracle SES is set as the default and preferred search platform. In addition to providing better scalability and performance than WebCenter's live search adapter, Oracle SES is beneficial for the following reasons:

- Oracle SES search provides unified ranking results, with the most relevant items appearing first.
- Oracle SES provides more thorough search. For example, when searching lists, WebCenter Portal live search only searches list names and descriptions, while Oracle SES also searches list column names and column contents.
- Oracle SES search allows search of repositories outside of WebCenter Portal. Oracle SES results appear in the same result set as WebCenter Portal's search results.
- Oracle SES search supports the Search service REST APIs and data control for customizing your search interface.

In addition to the Oracle SES or live search adapter functionality, the Documents tool provides its own search engine for file searches. This saves time and increases the relevancy of results by narrowing the scope of a search to files.

**See Also:** [Section 13.4, "Using Portal Navigation to Create a Sitemap"](#) for information about integrating an external search engine in your application

## 44.1.1 Understanding the Search Service

Oracle SES provides unified ranking results for the following resources:

- Documents, including wikis and blogs
- Announcements and Discussions
- Spaces, lists, page content, and people resources in WebCenter Portal: Spaces

---

---

**Note:** WebCenter Portal: Spaces applications include the Oracle SES crawler that indexes spaces, lists, pages, and people resources in Spaces. This crawler is not supported in Framework applications.

---

---

### 44.1.1.1 Understanding Search with the Oracle SES Adapter

Supported Oracle SES versions include 10.1.8.4.x and later. Oracle strongly recommends using Oracle SES release 11.1.2.2. Search with Oracle SES requires additional configuration in Oracle SES Administration, Oracle WebCenter Content: Content Server, and Oracle WebCenter Portal's Discussion Server.

**See Also:** [Section 44.3.4, "Configuring Search with the Oracle SES Adapter"](#)

### 44.1.1.2 Understanding Search with WebCenter Portal's Search Adapters

Although Oracle SES is the preferred search platform for best performance, you can manually override search with Oracle SES and have Framework applications search using WebCenter Portal's original search adapters. WebCenter Portal's search adapters span all enabled and searchable services, such as documents, tags, people, and pages.

**See Also:** [Section 44.3.5, "Configuring Search with WebCenter Portal's Search Adapters"](#)

### 44.1.1.3 Click Actions on Search Results

If no Resource Action Handling is specified in the Framework application, then the default action when a search result is clicked is to render the search result in a new browser window. Also, results from services that provide resource viewers, such as Documents, Discussions or Announcements, open in their resource viewers. For more information about resource viewers and the Resource Action Handling framework, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

## 44.1.2 What Happens at Runtime

At runtime, users can perform global (application-wide) searches from the Search task flow or from the Search toolbar and refine and save searches.

For more information about WebCenter Portal's search at runtime, see *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 44.2 Basic Configuration for the Search Service

This section provides the steps for adding the Search service to your application. It includes the following subsections:

- [Section 44.2.1, "Configuration Roadmap - Oracle SES"](#)
- [Section 44.2.2, "Setting up Connections for Oracle SES"](#)
- [Section 44.2.3, "Adding the Search Service at Design Time"](#)
- [Section 44.2.4, "Setting Security for the Search Service"](#)

### 44.2.1 Configuration Roadmap - Oracle SES

Use the roadmap in this section as a guide through the configuration process.

---

---

**Note:** If you override search with Oracle SES to use the original WebCenter Portal live search adapters, then no Oracle SES configuration is required. Skip ahead to section [Section 44.2.3, "Adding the Search Service at Design Time."](#)

---

---

[Figure 44-1](#) and [Table 44-1](#) provide an overview of the prerequisites and tasks required to get Oracle SES working in Framework applications.

Figure 44–1 Configuring Oracle SES for Framework Applications

**Table 44–1 Configuring Oracle SES for Framework Applications**

Actor	Task	Sub-task
Administrator	1. Install WebCenter Portal and Oracle SES 2. Configure Oracle SES with an identity management system 3. Set up a Document Service Manager in Oracle SES 4. Create a Federation Trusted Entity using one of the following tools: <ul style="list-style-type: none"> <li>■ Oracle SES Admin Tool</li> <li>■ WLST</li> </ul> 5. Create two crawl sources: Documents Crawler and Discussions Crawler using one of the following tools: <ul style="list-style-type: none"> <li>■ Oracle SES Admin Tool</li> <li>■ WLST</li> </ul> 6. Create a source group for the crawl sources using one of the following tools: <ul style="list-style-type: none"> <li>■ Oracle SES Admin Tool</li> <li>■ WLST</li> </ul>	
Developer	7. Integrate the Search service in your application	7.a Configure a connection to Oracle SES in JDeveloper  7.b Add a Search service task flow to a page in JDeveloper
Developer or Administrator	8. Deploy the application using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> <li>■ WLS Admin Console (Administrator)</li> </ul>	
Administrator	9. (Optional) Secure the connection to Oracle SES with SSL	
Administrator	10. Configure additional search parameters using one of the following tools: <ul style="list-style-type: none"> <li>■ Fusion Middleware Control</li> <li>■ WLST</li> <li>■ WLS Admin Console</li> </ul>	

## 44.2.2 Setting up Connections for Oracle SES

To search with Oracle SES, you must add the Oracle SES connection in the application. For more information, see [Section 44.3.4, "Configuring Search with the Oracle SES Adapter."](#)

---

---

**Note:** You can create a connection to Oracle SES to search repositories outside WebCenter Portal and override using Oracle SES as the default search crawler with Fusion Middleware Control or WLST. This allows users to search other Framework application resources, such as people.

---

---

1. Add the search toolbar to a page, following [Section 44.2.3, "Adding the Search Service at Design Time."](#)
2. Set up a connection to Oracle SES. In the Application Navigator, expand **Application Resources**. Right-click the **Connections** node, select **New Connection**, and then **Oracle Secure Enterprise Search**.

Select to create the connection in either the Application Resources or IDE connections. A connection in Application Resources is available only for that application, while a connection in IDE connections is available for all applications you create. If you plan to use the connection in other applications, then select IDE connections to avoid the need to re-create it.

---

---

**Note:** If you create the connection in IDE, then the connection must be added to the application later. For example, in the Resource Palette under IDE connections, right-click the connection and select **Add to Application**.

---

---

Enter values for the fields in the dialog. For example:

- a. For **Connection Name**, enter a meaningful name, for example, `SESconnection`. This name cannot be changed after it is created. (To use a different connection name, create a new connection.)
- b. For **SOAP URL**, enter the URL for the Oracle SES Web Services endpoint, for example:

`http://host:port/search/query/OracleSearch`

- c. Under **Federation Trusted Entity**, for **Entity Name**, enter the trusted entity defined for this application on the Oracle SES instance; for example, `wcsearch`.

A trusted entity allows the application to authenticate itself to Oracle SES and assert its users when making queries on Oracle SES. This trusted entity can be any user that either exists on the identity management server behind Oracle SES or is created internally in Oracle SES. You can find (or create) the trusted entity on the **Global Settings - Federation Trusted Entities** page of Oracle SES.

- d. For **Entity Password**, enter the password of the Federation Trusted Entity user.
- e. Under **Application Configuration**, select the box for **Set as default connection for the Search service**.

This ensures that your application uses that connection to access Oracle SES. The Search service uses only one Oracle SES connection.

---

---

**Note:** After you create a connection as the default connection, you cannot edit it so that it is *not* the default. To use a different default connection, you must create a new connection and mark that as the default connection.

---

---

- f. For **Source Group**, enter the Oracle SES source group in which to search. If a value is not provided, then all crawl sources in the Oracle SES instance are searched.

---

---

**Note:** Source groups present a good way to segment your searchable data on Oracle SES. Given an Oracle SES instance that keeps a search index on all corporate data, you can use source groups to make only a portion of your corporate data available to WebCenter Portal's search. For more information on creating source groups, see *Oracle SES Administrator's Guide*.

---

---

- g. Under **Testing**, for **User name**, enter the name of a user present in both the Oracle Identity Management server configured for your application and the Oracle Identity Management server configured for Oracle SES.

You should see something similar to [Figure 44-2](#).

**Figure 44–2 Create Oracle SES Connection Dialog**

Click **Test Connection** and check the status.

If the connection is successful, then click **OK**.

After you have included the Oracle SES connection in your application, you should see it in your Application Resources panel, as shown in [Figure 44–3](#).

**Figure 44–3 Oracle SES Connection in Application Resources**

The Oracle SES connection is now included in the `connections.xml` file and is the default connection in the `adf-config.xml` file, as shown in [Example 44–1](#).

**Example 44–1 Oracle SES Connection in adf-config.xml**

```
<ses-properties>
  <connection>SESconnection</connection>
  <data-group>MySources</data-group>
</ses-properties>
```

---

**Note:** After a Framework application has been deployed to an Oracle WebLogic managed server, you can configure it using WLST or Fusion Middleware Control. For more information, see *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

## 44.2.3 Adding the Search Service at Design Time

This section describes the Search service task flows and explains how to integrate the Search service into your application. It includes the following subsections:

- [Section 44.2.3.1, "Search Service Task Flows"](#)
- [Section 44.2.3.2, "How to Add the Search Service to Your Page"](#)
- [Section 44.2.3.3, "How to Modify the Search Service Task Flow Parameters"](#)

### 44.2.3.1 Search Service Task Flows

[Table 44–2](#) lists the Search service task flows.

**Table 44–2 Search Service Task Flows**

Task Flow	Definition
Search	This task flow provides a rich search experience with features for refining and saving search results.
Search - Saved Searches	This task flow enables you to create a simple launch pad for running saved searches within the application.
Search Preferences	This task flow enables users to select which WebCenter Portal services to search.
Search Toolbar	This task flow enables users to enter simple search criteria and run the search from the application. Search results are rendered as links.

### 44.2.3.2 How to Add the Search Service to Your Page

The Search Toolbar task flow offers the easiest way to add the Search service to your application. To add the Search Toolbar task flow to your Framework application:

1. Follow the steps described in [Chapter 3, "Preparing Your Development Environment"](#) to create a customizable page in your application.

---

**Note:** ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see [Section 68.3, "Configuring ADF Security."](#)

---

2. Open the page on which to add the Search service.
3. In the Resource Palette, expand **My Catalogs, WebCenter Portal - Services Catalog, and Task Flows**.

4. Drag and drop the **Search Toolbar** task flow onto the page.
5. When prompted, select **Region** as the way to create the task flow.  
If a prompt to confirm the ADF library appears, click **Add Library**.
6. Run your page with the search toolbar on it.  
In the Application Navigator, right-click this application and select **Run**. It may take a few moments for the operation to complete.  
Enter the user name and credentials that you created when you defined security.

---

**Note:** To return results, the Search service requires that other WebCenter Portal services are included in the application.

---

### 44.2.3.3 How to Modify the Search Service Task Flow Parameters

With the Search service task flow parameters, you can customize the appearance and behavior of a task flow instance. For example, you can restrict search results to include only specific services, document types, and spaces, or you can change the size of the search box.

**See Also:** "How to Set Parameters to Narrow Search" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* for detailed information about customizing the Search service with task flow parameters

To see and adjust task flow binding parameter values after you have placed a task flow on a page:

1. Navigate to the Edit Task Flow Binding dialog by clicking the **Bindings** tab at the bottom of the page containing the task flow (next to the **Source** tab).
2. Under **Executables**, you'll see the task flow you added. [Figure 44-4](#) shows an example of a Search task flow in the Executables section.

**Figure 44-4 Page Data Binding Definition**

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.

- In the Edit Task Flow Binding dialog [Figure 44–5](#), revise the binding parameter value by double-clicking the field and either changing the existing value or adding a new one.

**Figure 44–5** Edit Task Flow Binding Dialog for Search Task Flow

- When you are finished, click **OK**.
- Save and run your page to see the results.

[Table 44–3](#) describes the properties that are unique to the Search service task flows.

**Table 44–3** Search Service Task Flow Parameters

Property	Description	Task Flow
customAttributes	List of custom attributes to show when displaying search results.  To include one or more custom attributes in the search results, set this to a list of custom attribute names, separated by commas. An optional label prefix may be provided with the custom attribute name to display instead of its associated custom attribute name. Use the format: label:name.	Search Search Toolbar
hideRefiners	List of refiners to hide when displaying search results.  To hide one or more refiners, set this to a list of refiner names, separated by commas (choose from creator, date, space, content, and tags).	Search Search Toolbar
keywordsInputRendered	Show or hide the input box.  Set to true (default) to show the input box, or set to false to hide it.	Search

**Table 44–3 (Cont.) Search Service Task Flow Parameters**

Property	Description	Task Flow
mimeType	List of MIME types to limit the search.	Search
	<p>To limit the search to certain document types, set this to the list of MIME types of the documents (such as PDF, PPT, DOC), separated by commas.</p> <p>This also can be set to the Documents tool with <code>oracle.webcenter.doclib</code>.</p> <p><b>Note:</b> To limit search to Microsoft Word documents and WebCenter Portal pages, set this parameter to <code>application/msword</code>, and set the <code>serviceIds</code> parameter to <code>oracle.webcenter.doclib,oracle.webcenter.page</code>.</p> <p><b>See Also:</b> "Searching Specific Document Types" in <i>Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal</i></p>	Search Toolbar
searchScope	List of unique IDs to limit the search scope. To limit the search to a list of spaces, set this to the list of GUIDs of the spaces, separated by commas.	Search
	<p>For example:  <code># {spaceContext.currentSpaceGUID}</code> or  <code>s8bba98ff_4cbb_40b8_beee_296c916a23ed</code></p>	Search Toolbar
resourceScope	Unique ID to limit the search scope. To limit the search to a particular space, set this to the GUID of the space.	Search
	<p>For example:  <code># {spaceContext.currentSpaceGUID}</code> or  <code>s8bba98ff_4cbb_40b8_beee_296c916a23ed</code></p> <p><b>Note:</b> This parameter has been deprecated. It is included for backward-compatibility only.</p>	
searchBoxSize	Value to limit the size of the search box.	Search Toolbar
	The default value is 42. Enter a lower number (for example, 30) to shorten the length of the search box. This also changes the size of the search box in the Search task flow.	
serviceIds	List of IDs of services or executors to include when displaying search results.	Search
	<p>To display only people profiles and documents in the Content Server, set this parameter to <code>oracle.webcenter.peopleconnections.profile</code>, <code>oracle.webcenter.doclib</code>. If nothing is specified, then all services are searched.</p> <p>For a list of service IDs, see <a href="#">Table F–7, "Service IDs"</a>.</p>	Search Toolbar
resourceId	Either search keywords or the saved search GUID.	Search
	<p><b>Note:</b> This parameter is for internal use only. Do not change this value unless you want coded search main views. If you do change this value, then you must also specify <code>resourceType</code>.</p>	

**Table 44–3 (Cont.) Search Service Task Flow Parameters**

Property	Description	Task Flow
resourceType	Marker specifying whether the <code>resourceId</code> parameter searches keywords or saved search GUID.  <b>Note:</b> This value is set automatically and is for internal use only. Do not change it unless you want coded search main views.	Search
scope	Unique ID to limit the search scope. To limit the search to a particular space, set this to the scope object of the space; for example, <code>#{serviceCtx.scope}</code> .  <b>Note:</b> This parameter has been deprecated. Use the <code>searchScope</code> parameter instead. (If a value is set for this parameter, then any value in <code>searchScope</code> is ignored.)	Search Toolbar

---

**Note:** The All Saved Searches and the Search Preferences task flows do not have any unique properties.

---

## 44.2.4 Setting Security for the Search Service

The Oracle SES adapter must be configured with an identity management system to validate and authenticate users. This is necessary for searches to return only results that the user is allowed to view based on access privileges. Because WebCenter Portal uses identity propagation when communicating with Oracle SES, WebCenter Portal's user base must match that in Oracle SES. One way this can happen is by configuring WebCenter Portal and Oracle SES to the same identity management system. For detailed information, see the section "Oracle SES - Configuration" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

WebCenter Portal's original search adapters rely on individual services to ensure that the user performing the search can view results. Search results are returned based on user privileges. When unauthenticated, queries return only public content. Only authenticated users of an ADF-secured Framework application can save searches.

ADF security is configured by default if you created your application using WebCenter Portal's Framework application template. For information about configuring ADF security, see [Section 68.3, "Configuring ADF Security."](#)

## 44.3 Advanced Information for the Search Service

This section describes optional features available with this service. It includes the following subsections:

- [Section 44.3.1, "Adding the Search Task Flow"](#)
- [Section 44.3.2, "Adding the Search - Saved Searches Task Flow"](#)
- [Section 44.3.3, "Adding the Search Preferences Task Flow"](#)
- [Section 44.3.4, "Configuring Search with the Oracle SES Adapter"](#)
- [Section 44.3.5, "Configuring Search with WebCenter Portal's Search Adapters"](#)
- [Section 44.3.6, "Using the Search Service Java APIs"](#)
- [Section 44.3.7, "Using the Search Service REST APIs"](#)

- [Section 44.3.8, "Using the Search Service Data Control"](#)
- [Section 44.3.9, "Building Adapters for the Search Service"](#)
- [Section 44.3.10, "Customizing the Search UI Without WebCenter Portal's Search Service APIs"](#)
- [Section 44.3.11, "Troubleshooting the Search Service"](#)

---

---

**Note:** The Search service REST APIs and data controls are available only for search using Oracle SES. They are not supported with search using WebCenter Portal's original search adapters.

---

---

### 44.3.1 Adding the Search Task Flow

To add the Search task flow to your application, follow the instructions provided for the Search Toolbar task flow in [Section 44.2.3, "Adding the Search Service at Design Time,"](#) but instead, drag and drop the Search task flow onto the page.

To run the page with the Search view:

1. In the Application Navigator, right-click the page and select **Run**. As long as the application has been ADF-secured, you should see a login page. It may take a few moments for the operation to complete.
2. If you configured ADF security, then enter the user name and password that you provided and click **Submit**.
3. Enter some search criteria in the field and click the **Search** icon. You may get few, if any, results if the application is not populated with much besides the Search service itself.

### 44.3.2 Adding the Search - Saved Searches Task Flow

You can add the Search - Saved Searches task flow to provide a simple launch pad for running saved searches within the application. To add this task flow to your Framework application, follow the instructions provided for the Search Toolbar task flow in [Section 44.2.3, "Adding the Search Service at Design Time,"](#) but instead, drag and drop the Search - Saved Searches task flow onto the page.

The task flow renders links that, when clicked, run a saved search.

### 44.3.3 Adding the Search Preferences Task Flow

The Search Preferences task flow enables users to control which WebCenter Portal services are searched. By default, all enabled services are selected to be searched. Users can disable any service from which they do not want to see search results. Users also can select the order of services in their search results. For example, they may find that search results from the Documents tool prove more useful than search results from other services.

To add the Search Preferences task flow to your application, follow the instructions provided for the Search Toolbar task flow in [Section 44.2.3, "Adding the Search Service at Design Time,"](#) but instead, drag and drop the Search Preferences task flow onto the page.

### 44.3.4 Configuring Search with the Oracle SES Adapter

WebCenter Portal: Framework applications automatically set Oracle Secure Enterprise Search (SES) as the default search adapter, but additional configuration is required in Oracle SES, Oracle WebCenter Content: Content Server, and Oracle WebCenter Portal's Discussion Server. See the section "Managing the Search Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* for detailed information about the steps to set up search with the Oracle SES adapter.

After you have completed all configuration steps, validate the inclusion of Oracle SES results in WebCenter Portal's search.

1. In the Application Navigator, right-click the page you created with the Search Toolbar, and click **Run**.

As long as the application has been ADF-secured, you should see a login page. It may take a few moments for the operation to complete.

2. Enter the user name and credentials that you created when you defined security.
3. Click **Submit**.

When the page loads, you should see your search toolbar.

Figure 44–6 shows a sample results page for the search term *webcenter*, before Oracle SES has crawled anything.

**Figure 44–6 Search Results**

Figure 44–7 shows a sample results page after Oracle SES has been configured and crawled.

### 44.3.5 Configuring Search with WebCenter Portal's Search Adapters

You can manually override search with Oracle SES and have Framework applications search using WebCenter Portal's original live search adapters. WebCenter Portal's search adapters span all enabled and searchable services, such as documents, tags, people, and pages.

To enable search with WebCenter Portal's search adapters, edit the `adf-config.xml` file either to change all enable attributes in `crawl-properties` to false (Example 44–2) or to comment out the `crawl-properties` entirely (Example 44–3).

#### Example 44–2 Crawl Properties in `adf-config.xml` Set to False

```
<searchC:adf-search-config
xmlns="http://xmlns.oracle.com/webcenter/search/config">
  <display-properties>
    <common numSavedSearches="5"/>
    <region-specific>
      <usage id="simpleSearchResultUIMetadata" numServiceRows="5"/>
    </region-specific>
  </display-properties>
</searchC:adf-search-config>
```

```

        <usage id="searchResultUIMetadata" numServiceRows="5"/>
        <usage id="localToolBarRegion" numServiceRows="5"/>
    </region-specific>
</display-properties>
<execution-properties timeoutMs="7000" prepareTimeoutMs="3000"/>
<b><crawl-properties fullCrawlInterval="P5D" enableWcServicesCrawl="false"
                    enableWcDiscussionsCrawl="false" enableWcUcmCrawl="false"/>
</b>
<ses-properties>
    <connection/>
    <data-group/>
</ses-properties>
</searchC:adf-search-config>

```

#### Example 44–3 Crawl Properties in adf-config.xml Commented Out

```

<searchC:adf-search-config
xmlns="http://xmlns.oracle.com/webcenter/search/config">
    <display-properties>
        <common numSavedSearches="5"/>
        <region-specific>
            <usage id="simpleSearchResultUIMetadata" numServiceRows="5"/>
            <usage id="searchResultUIMetadata" numServiceRows="5"/>
            <usage id="localToolBarRegion" numServiceRows="5"/>
        </region-specific>
    </display-properties>
    <execution-properties timeoutMs="7000" prepareTimeoutMs="3000"/>
    <!--
    <b><crawl-properties fullCrawlInterval="P5D" enableWcServicesCrawl="true"
                    enableWcDiscussionsCrawl="true" enableWcUcmCrawl="true"/>
    -->
    <ses-properties>
        <connection/>
        <data-group/>
    </ses-properties>
</searchC:adf-search-config>

```

### 44.3.6 Using the Search Service Java APIs

Custom components can implement Search service APIs to expose their content to WebCenter Portal's search.

For more information, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

### 44.3.7 Using the Search Service REST APIs

WebCenter Portal provides REST APIs to support the Search service. Use the Search service REST APIs to read (get) searches. You can specify keywords and the scope of the search; for example, the iPhone could search for "smith" in all spaces, documents and wiki pages. The API also lets you build a customized search user interface on top of the Search service.

This section describes the REST APIs associated with the Search service. It includes the following subsections:

- [Section 44.3.7.1, "Search Entry Point"](#)
- [Section 44.3.7.2, "Search Resource Type Taxonomy"](#)
- [Section 44.3.7.3, "Security Considerations"](#)

- [Section 44.3.7.4, "Search Resource Types"](#)

For an introduction to the REST APIs, see [Chapter 53, "Using Oracle WebCenter Portal REST APIs."](#)

#### 44.3.7.1 Search Entry Point

Each REST service has a link element within the resource index that provides the entry point for that service. To find the entry point for the Search service, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:search
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Search service.

For more information about the resource index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

#### 44.3.7.2 Search Resource Type Taxonomy

When the client has identified the entry point, it then can navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 53.5.2.1, "Resource Type."](#)

The taxonomy for the Search service is:

```
urn:oracle:webcenter:search
  urn:oracle:webcenter:search:results
```

Beyond the service entry points, URL templates allow clients to pass query parameters to customize their requests and control the form of returned data.

Collection resources in the search resources support pagination (`startIndex` and `itemsPerPage`). Other query parameters are not supported (that is, `search` and `projection`).

#### 44.3.7.3 Security Considerations

Authentication is required before using Search REST API methods.

For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

#### 44.3.7.4 Search Resource Types

This section provides information about each resource type. It includes the following subsection:

- [Section 44.3.7.4.1, "urn:oracle:webcenter:search:results"](#)

**44.3.7.4.1 urn:oracle:webcenter:search:results** Use this resource type to identify the URI to use to read (GET) a query containing keywords and attribute-specific criteria.

The request is represented by the URL and the response is a list of search results, each with metadata to help the end user choose an item to drill down, as well as cross links to the owning REST services, if available. If the owning REST service is unavailable, then an HREF link is provided.

The response XML can be paginated with standard URL parameters, and appropriate previous and next links provided along with a general template (with the query prepopulated) for the consuming application to do its own custom pagination.

### Navigation Paths to results

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  search

resourceindex
  spaces
    spaces:resourceindex
    spaces:search
```

### Supported Methods for results

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters:** `serviceId`, `q`, `scopeGuid`, `refiners`, `startIndex` (pagination), `itemsPerPage` (pagination)
  - **response - body:** search results, and refiners (if `refiners=true`)

where:

- `serviceId={serviceId1}[,{serviceId2}...]`

Optional: This narrows the search to one or more WebCenter Portal services, such as `oracle.webcenter.doclib` or `oracle.webcenter.page`. For example, setting this to `oracle.webcenter.doclib` searches only documents. If omitted, this searches all services.

**See Also:** [Table F-7, "Service IDs"](#) for a list of service IDs

- `q={queryString}`

Searches may be specified using the following format

```
[[field1:[operand]][[:]value1[;field2:operand:value2]]
```

Where multiple clauses are joined by an implicit AND and are syntactically separated by the ";" semicolon. Square brackets [] denote optional values. Each clause can be one of the following types:

- `keywords` - simple string with no ":" colon separator
- `attribute1:value1` - shortcut for a clause meaning attribute1 equals value1
- `attribute1:operand1:value1` - a clause capturing a Boolean condition between attribute1 and value1

Search attributes include the following, but can be *any* attribute name:

- `title` - Name or title of the item
- `description` - Description of the item
- `creator` - Creator or contributors of the item
- `date` - Date on which the item was last modified

- tags - Tag words that the item may have (applicable to pages)

The attributes can be returned in search results, where `data=field1[, field2]`

Legal operands:

- equals - Strings and Numbers
- contains - Strings
- gt (greater than) - Numbers
- gte (greater than or equals) - Numbers
- lt (less than) - Numbers
- lte (less than or equals) - Numbers
- scopeGuid={...}
 

Optional: The GUID associated with the scope.
- refiners={true|false}
 

Optional: Whether to fetch refiners. If omitted, the default value is false.

**Example 44–4 Search REST Commands**

`http://examplehost:8888/rest/api/searchresults?q=document&serviceId=oracle.webcenter.doclib,oracle.webcenter.page&utoken={utoken}`

`http://examplehost:8888/rest/api/searchresults?q={keywords};dDocName:contains:handbook&data=dDocName,dOriginalName`

For more information, see [Section 53.5.2.5, "Templates."](#)

**Writable Elements for results**

[Table 44–4](#) lists the writable elements for this resource.

**Table 44–4 Writable Elements for results**

Element	Type	Required	Constraints	Description
author	String		1 or more characters	Name of the query author
resourceId				
serviceId				
title				
description	String	No	1 or more characters	Description of the query
lastModifiedDate				
size				

**Resource Types Linked to From results**

[Table 44–5](#) lists the resource types that the client can link to from this resource.

**Table 44–5 Related Resource Types for search**

rel	resourceType
self	

## 44.3.8 Using the Search Service Data Control

Use the Search service data control to build a customized search user interface with a Framework application or a custom task flow. Deploying this task flow into an ADF library allows for a portable consumption of the task flow; for example, you could add it to a WebCenter Portal: Spaces application Resource Catalog to build site templates.

### 44.3.8.1 Search Data Control Methods, Attributes, and Classes

The Search data control contains the `searchSes` method. [Table 44–6](#) describes its parameters for setting search refiners and limiting the scope of the search.

**Table 44–6** *searchSes Input Parameters*

Parameter	Required?	Type	Description
<code>scopeGuid</code>	No	String	GUID value to filter results by spaces.
<code>serviceId</code>	No	String	The service ID of the item; for example, <code>oracle.webcenter.doclib</code> searches only documents. If omitted, this searches across all services.
<code>keywords</code>	Yes	String	Search terms.
<code>predicates</code>	No	List	Collection of predicates.
<code>fetchRefiners</code>	No	Boolean	Whether to fetch refiners. If omitted, the default value is false.
<code>startIndex</code>	Yes	Integer	Specifies the index of the first matching result that should be included in the result set (0-n ... zero based). This is used for pagination.
<code>itemsPerPage</code>	Yes	Integer	Number of results to display.

The `searchSes` method returns:

- Collection of [SearchServiceDCRows](#) objects
- Collection of [SearchServiceDCRefiner](#) objects

#### 44.3.8.1.1 SearchServiceDCRows

- `author`
- `comments`
- `createDate`
- `description`
- `iconPath`
- `language`
- `largeIconPath`
- `lastModifiedDate`
- `resourceId`
- `scopeGuid`
- `serviceId`
- `size`
- `tagWords`

- title
- type
- urlSearchServiceDCRefiner

#### 44.3.8.1.2 SearchServiceDCRefiner

element

#### 44.3.8.1.3 SearchServiceDCRefinement

- keywords
- scopeGuid
- serviceId
- Collection of predicates

### 44.3.8.2 Integrating the Search Data Control

To use the Search data control:

1. In JDeveloper, create a Framework application with an Oracle SES connection. After the connection is available, the Search Data Control is listed in the Data Controls palette.
2. Drag and drop the `searchSes` method from `SearchServiceDC`.
3. Choose **ADF Parameter Form**, and the Edit Form Fields dialog opens. Click **OK**.
4. Drag the rows accessor, from the `SearchServiceDCResult` return object type, onto the form, and choose **Table - ADF Read-only Table**. Click **OK**.
5. Run the page, enter appropriate values. For example:
  - keywords: any search term
  - startIndex: 0
  - itemsPerPage: 10

For information about adding data controls to your application, see [Section 7.1.2, "Understanding WebCenter Portal APIs."](#)

## 44.3.9 Building Adapters for the Search Service

You can use search adapters to add other sources to your search results. WebCenter Portal framework automatically discovers these search adapters and consolidates them in formulating search results in your application. Subsequently, when you expose your custom component to the Search service in your application, it is included in the federated search.

This section describes how to extend WebCenter Portal's search through search adapters. It includes the following subsections:

- [Section 44.3.9.1, "How to Add a Search Source"](#)
- [Section 44.3.9.2, "How to Register a Custom Adapter"](#)
- [Section 44.3.9.3, "Search Adapter Attributes"](#)
- [Section 44.3.9.4, "What Happens at Runtime"](#)

### 44.3.9.1 How to Add a Search Source

To add a new search source, you must create Java classes for the new source to manage the incoming queries and return search results. After you add the necessary Java classes to your application, you must register them with the Search service.

When performing a search, the search framework calls `QueryManager.createRowQueryHandler` with a query object and a `List<QName>` that describes the columns sought. In return, the framework receives a `QueryHandler<Row>`.

A `QueryHandler` can be a `QueryFederator` or a `QueryExecutor`. A `QueryFederator` is just a collection of other `QueryHandlers`. With the `QueryFederator`, the framework can get a list of the child `QueryHandlers` and keep recursing until all `QueryExecutors` are found.

The framework calls the `execute` method on the `QueryExecutor` to get a `QueryResult<Row>`, which is an extension of `java.util.Iterator<Row>` that iterates and retrieves rows of results.

One possible implementation would be to create these classes:

- `SampleQueryManager ...`
- `SampleRowQueryExecutor ...`
- `SampleRowQueryResult ...`
- `SampleRow ...`

---

---

**Note:** With Framework applications, Oracle Secure Enterprise Search is set as the default search platform. For this sample code to work with WebCenter Portal's live search adapters instead, you must edit `crawl-properties` in `adf-config.xml`. For details, see [Section 44.3.5, "Configuring Search with WebCenter Portal's Search Adapters."](#)

---

---

To add a new search source with a similar query manager:

1. In Oracle JDeveloper, open the application in which to add the search source.
2. Confirm that the WebCenter Common library is included in your project:
  - a. In the Application Navigator, right-click your project and select **Project Properties** and then **Libraries and Classpath**.
  - b. If the **WebCenter Common** library is not included, as shown in [Figure 44-8](#), then click **Add Library** and select it.

Figure 44–8 WebCenter Common Library

c. Click OK.

3. Create a class called `SampleQueryManager.java` (Example 44–5).

**Example 44–5 SampleQueryManager.java**

```
package mycompany.myproduct.myapp.mycomponent.query;
import java.util.List;
import oracle.webcenter.search.QName;
import oracle.webcenter.search.Query;
import oracle.webcenter.search.QueryExecutor;
import oracle.webcenter.search.QueryManager;
import oracle.webcenter.search.Row;
public class SampleQueryManager
    implements QueryManager
{
    public SampleQueryManager()
    {
    }
    public QueryExecutor<Row> createRowQueryHandler(Query query,
                                                    List<QName> columns)
    {
        return new SampleRowQueryExecutor(query, columns);
    }
}
```

4. Create a class called `SampleRowQueryExecutor.java` (Example 44–6).

**Example 44–6 SampleRowQueryExecutor.java**

```
package mycompany.myproduct.myapp.mycomponent.query;
```

```

import java.text.DateFormat;
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.ArrayList;
import java.util.HashMap;
import java.util.Iterator;
import java.util.List;
import java.util.Map;

        m_query = query;
        m_columns = columns;
        m_properties = new HashMap<String, String>();
        // In actuality you may want to make sure this string is translatable
        m_properties.put(QueryHandler.TITLE, "Sample");
    }
    /**
     * Create several rows for "batchRepeat" times.
     */
    private static void createRows(List<Row> rows, int batchRepeat)
    {
        while (batchRepeat-- > 0)
        {
            rows.add(new SampleRow("23847", "Initial Sorting of Tables",
                "Bar", "2006-06-08", 5120));
            rows.add(new SampleRow("4827445", "Support for facelets?",
                "Foo", "2006-04-17", 1400000));
            rows.add(new SampleRow("952787", "For Thomas Kincade's validation demo",
                "Tiger", "2006-01-09", 1300000));
            rows.add(new SampleRow("4394588", "Page not showing in WYSIWYG fashion",
                "Ken Swartz", "2006-04-27", 3000));
            rows.add(new SampleRow("3920", "Tree table",
                "Scott", "2006-03-24", 1200));
        }
    }
    /**

```

```

    * Instead of doing a query execution here,
    * just create a bunch of rows.
    */
public QueryResult<Row> execute()
{
    List<Row> rows = new ArrayList<Row>();
    // To hit a certain count here but not go over the max
    int realLimit = Math.min(MAX_RESULT_LIMIT, m_resultLimit);
    createRows(rows, (realLimit / PRESET_VALUES_BATCH_SIZE));
    // Create the QueryResult
    QueryResult<Row> ret = new SampleRowQueryResult(rows.iterator());
    ret.getProperties().put(QueryResult.ESTIMATED_RESULT_COUNT,
        Integer.toString(PRESET_ESTIMATED_RESULT_COUNT));

    return ret;
}
/**
 * Remember the result start.
 */
public void setResultStart(int resultStart)
{
    m_resultStart = resultStart;
}
/**
 * Store away the result limit to use in the execute
 * to only get that number of results back.
 */
public void setResultLimit(int resultLimit)
{
    m_resultLimit = resultLimit;
}
/**
 * Expose our properties map containing our title.
 */
public Map<String, String> getProperties()
{
    return m_properties;
}
}

```

5. Create a class called `SampleRowQueryResult.java` ([Example 44-7](#)).

**Example 44-7 SampleRowQueryResult.java**

```

package mycompany.myproduct.myapp.mycomponent.query;
import java.util.Iterator;
import oracle.webcenter.search.util WrapperQueryResult;
import oracle.webcenter.search.Row;
public class SampleRowQueryResult extends WrapperQueryResult<Row>
{
    public SampleRowQueryResult(Iterator<Row> rows)
    {
        super(rows);
    }
}

```

6. Create a class called `SampleRow.java` ([Example 44-8](#)).

**Example 44-8 SampleRow.java**

```

package mycompany.myproduct.myapp.mycomponent.query;

```

```

import java.text.DateFormat;
import java.text.ParseException;
import java.text.SimpleDateFormat;
import java.util.Calendar;
import java.util.Date;
import java.util.HashMap;
import java.util.Iterator;
import java.util.Map;
import oracle.webcenter.search.QName;
import oracle.webcenter.search.Row;
import static oracle.webcenter.search.AttributeConstants.DCMI_EXTENT;
import static oracle.webcenter.search.AttributeConstants.DCMI_MODIFIED;
import static oracle.webcenter.search.AttributeConstants.DCMI_CREATOR;
import static oracle.webcenter.search.AttributeConstants.DCMI_TITLE;
import static oracle.webcenter.search.AttributeConstants.DCMI_URI;
import static oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER;
import static oracle.webcenter.search.AttributeConstants.WPSAPI_ICON_PATH;
public class SampleRow implements Row
{
    private Map<QName, Object> m_storage = new HashMap<QName, Object>();
    private DateFormat m_dateFormat = new SimpleDateFormat("yyyy-MM-dd");
    SampleRow(String id, String title,
              String creator, String lastModified,
              int size)
    {
        m_storage.put(DCMI_IDENTIFIER, id);
        // Only if you have an external URL to go to
        // m_storage.put(DCMI_URI, "http://my.external.url");
        m_storage.put(DCMI_TITLE, title);
        m_storage.put(DCMI_CREATOR, creator);
        // The below path points to a path accessible in the classpath to an icon
        m_storage.put(WPSAPI_ICON_PATH, "/adf/webcenter/search_qualifier.png");
        try
        {
            Date date = m_dateFormat.parse(lastModified);
            Calendar cal = Calendar.getInstance();
            cal.setTime(date);
            m_storage.put(DCMI_MODIFIED, cal);
        }
        catch (ParseException e)
        {
            e.printStackTrace();
        }
        m_storage.put(DCMI_EXTENT, new Long(size));
    }
    public Object getObject(QName columnName)
    {
        return m_storage.get(columnName);
    }
    public Iterator<QName> getColumns()
    {
        return m_storage.keySet().iterator();
    }
}

```

#### 44.3.9.2 How to Register a Custom Adapter

To register your query manager with the Search service, you must edit the `service-definition.xml` file. The `SampleQueryManager` line exposes the

custom adapter's query manager implementation to the Search service so that the custom adapter is included with any search user interface.

The entry should be similar to [Example 44–9](#).

**Example 44–9 SampleQueryManager Entry in service-definition.xml**

```
<service-definition id="mycompany.myproduct.myapp.mycomponent"
  version="11.1.1.0.0">
  <resource-view taskFlowId="/somepath/somefile.xml#someId"
    authorizerClass="some.service.id.Authorizer1"/>
  <name>Custom Component 1</name>
  <description>Description for Custom Component 1</description>
  <search-definition xmlns="http://xmlns.oracle.com/webcenter/search"
    id="mycompany.myproduct.myapp.mycomponent.query" version="11.1.1.0.0">
    <query-manager-class>
mycompany.myproduct.myapp.mycomponent.query.SampleQueryManager
    </query-manager-class>
  </search-definition>
</service-definition>
```

For more information about the `resource-view` tag (and WebCenter Portal's Resource Action Handling framework), see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

### 44.3.9.3 Search Adapter Attributes

This section describes the attributes available for searching a service. It includes the following subsections:

- [Section 44.3.9.3.1, "Searchable Attributes"](#)
- [Section 44.3.9.3.2, "Keywords"](#)
- [Section 44.3.9.3.3, "Date Condition"](#)
- [Section 44.3.9.3.4, "Complex Date Condition"](#)
- [Section 44.3.9.3.5, "Person Condition"](#)
- [Section 44.3.9.3.6, "Complex Person Condition"](#)
- [Section 44.3.9.3.7, "Access"](#)
- [Section 44.3.9.3.8, "Selectable Attributes"](#)

**44.3.9.3.1 Searchable Attributes** WebCenter Portal's search user interface exposes searches based on three fields: keywords, date, and person. Each service, in its own search implementation, honors these fields to the best of its capabilities. At minimum, it supports the keywords field. When you define your own search adapter, you must honor these fields to the best of your adapter's capabilities, as described in [Section 44.3.9.3.8, "Selectable Attributes."](#)

**44.3.9.3.2 Keywords** By default, the keyword field is in `oracle.webcenter.search.TextPredicate`. The field can comprise multiple words, with the service determining how to interpret multiple words. The Search service does not tokenize before the call comes to the service, but here are some guidelines:

- If two or more tokens are enclosed within quotes, then they should be interpreted as one word.

- Unless the OR operator is explicitly set, it is assumed that the default conjunction among the words in the keywords field is AND.

**44.3.9.3.3 Date Condition** For Search service to support filtering of query results by last modified date, the service implementation of the WPSAPI must support the use of `oracle.webcenter.search.AttributePredicate`, accessible from the query object, that uses `oracle.webcenter.search.AttributeConstants.DCMI_MODIFIED`. The supported comparators must include the following:

- `oracle.webcenter.search.ComparatorConstants.GREATER_THAN`
- `oracle.webcenter.search.ComparatorConstants.GREATER_THAN_OR_EQUALS`

They may also include the following:

- `oracle.webcenter.search.ComparatorConstants.EQUALS`
- `oracle.webcenter.search.ComparatorConstants.NOT_EQUALS`
- `oracle.webcenter.search.ComparatorConstants.LESS_THAN`
- `oracle.webcenter.search.ComparatorConstants.LESS_THAN_OR_EQUALS`

The literals for comparison should be of type `java.util.Calendar`.

**44.3.9.3.4 Complex Date Condition** You can use the BETWEEN clause for dates. The complex date condition, instead of being a simple `AttributePredicate`, is a `ComplexPredicate` that contains one `GREATER_THAN` `AttributePredicate` and one `LESS_THAN` `AttributePredicate` with an AND conjunction operator. This `ComplexPredicate` must apply the AND operator with the rest of the fields (that is, keywords and person).

To differentiate between this case and the default case, service authors must check on the type of the predicate that is meant for the date condition. If it is an `AttributePredicate`, then it is the default case. If it is a `ComplexPredicate`, then it is a special case.

**44.3.9.3.5 Person Condition** For Search to support filtering of query results by person, the service implementation of the WPSAPI must support `oracle.webcenter.search.AttributePredicate`, accessible from the query object, that uses `oracle.webcenter.search.AttributeConstants.WPSAPI_MODIFIER`.

The comparators supported must include the following:

- `oracle.webcenter.search.ComparatorConstants.EQUALS`
- `oracle.webcenter.search.ComparatorConstants.CONTAINS`
- `oracle.webcenter.search.ComparatorConstants.STARTS_WITH`
- `oracle.webcenter.search.ComparatorConstants.ENDS_WITH`

The literals for comparison should be of type `java.lang.String`.

**44.3.9.3.6 Complex Person Condition** Service authors must check on the type of predicate that is meant for the person condition. An `AttributePredicate` is the default case.

**44.3.9.3.7 Access** The Search service (as a caller) expects that the query's `getPredicate()` method likely returns an `oracle.webcenter.search.ComplexPredicate` that joins an

`oracle.webcenter.search.TextPredicate` holding the keyword, and an `oracle.webcenter.search.ComplexPredicate` holding the date condition, and an `oracle.webcenter.search.AttributePredicate` holding the person condition.

**44.3.9.3.8 Selectable Attributes** The following selectable attributes/columns should be supported by your search adapter in its search implementation:

- **Title (Required)**

For each resource returned, the Search service user interface can display the title column, if provided. It is strongly recommended that the title column comes with the QName `AttributeConstants.DCMI_TITLE`.

- **Resource ID (Required)**

For resources to communicate a unique identifier that allows the Search service to render a link to navigate to the resource view (or any declared views) of the service, the column with the name `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` must be returned as a column accessible from a row within the `QueryResult<Row>`.

The Search service extracts the `DCMI_IDENTIFIER` column and feeds it into the resource viewer as the value of the `resourceId` parameter when the link is clicked.

If your resource view (or any declared views) requires multiple columns in the primary key, then try to bundle all of them into a composite string value for the `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` column. The Search service treats that opaquely and passes it to your resource view, within which it may deconstruct the string into the various parts of the primary key.

- **Resource Type**

For each resource returned, the Search service user interface can display the type column, if provided. The type column comes with the QName `AttributeConstants.DCMI_TYPE`. If the `DCMI_TYPE` column is not found, then the value of the `DCMI_FORMAT` column is used in its place. In your resource viewer, you can make use of the resource type to aid in the rendering of a resource.

- **Resource URL (in place of Resource ID)**

In the absence of an `oracle.webcenter.search.AttributeConstants.DCMI_IDENTIFIER` column, WebCenter Portal's Search service constructs the link from the value of the column specified by `oracle.webcenter.search.AttributeConstants.DCMI_URI`. With absolute URLs, the `DCMI_URI` can launch a link from the search results to the URL.

This allows for things like the Documents tool and the Page service to invoke the browser plug-in to render various results link targets, instead of invoking a resource view.

- **Last Modified Date**

For each resource returned, the Search service user interface can display the last modified date column, if provided. To mirror the searchable attribute of the last modified date, it is important that users can see the last modified date as a returned column in the search result.

For most users, the last modified date is more relevant than the creation date. To have better consistency between the searchable attributes and the selectable attributes (so that users know what date to search with after seeing some values in the columns), it is strongly recommended that service authors return `AttributeConstants.DCMI_MODIFIED` rather than `AttributeConstants.DCMI_CREATED`. The last modified date is of type `java.util.Calendar`.

- **Creator**

For each resource returned, the Search service user interface can display the creator and last modified by column, if provided. The search user interface combines them in the same column as a list of contributors for the found resource. The QNames to use are `AttributeConstants.DCMI_CREATOR` and `AttributeConstants.WPSAPI_MODIFIED`, respectively. The creator is of type `java.lang.String`.

- **Icon**

For each resource returned, the Search service user interface can display the icon column, if provided. The icon column comes with the QName `AttributeConstants.WPSAPI_ICON_PATH` and corresponds to a valid path to an icon file that is accessible in the class path. The icon path is of type `java.lang.String`.

- **Size**

For each resource returned, the Search service user interface can display the size column, if provided. The size column comes with the QName `AttributeConstants.DCMI_EXTENT` and corresponds to the size of the resource found. The size is of type `java.lang.Number`.

#### 44.3.9.4 What Happens at Runtime

When you perform a search from the main view or toolbar, it should seamlessly include your new search source. For testing purposes, be sure to enter criteria that yields a result in your newly-added search source.

WebCenter Portal's Search service invokes a resource viewer using the Resource Action Handling framework. For information about registering a resource viewer to allow custom components to be found using Search, see [Section 7.3, "Extending Your Framework Application with Custom Components."](#)

### 44.3.10 Customizing the Search UI Without WebCenter Portal's Search Service APIs

You can develop a custom search user interface in a Framework application without WebCenter Portal's Search service API, but still with Oracle SES as the application's search engine by using the Oracle SES Web Service Query API to do search functions. Also, action handling for search results can be managed with WebCenter Portal's Resource Action Handling framework, so that when an application resource (for example, a document) is clicked in the search results, the resource is shown in the viewer of the resource (for example, the Documents resource viewer). Moreover, if the application uses WebCenter Portal Navigation, then certain resource types can be shown in the navigation node of the resource.

This section describes the required steps to enable Resource Action Handling for handling search result action.

1. Use the Document Service Manager provided by WebCenter Portal to crawl documents.

**See Also:** Section "Setting Up Oracle SES to Search Documents" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*

The Document Services Manager creates an attribute called `wc_url` in the Oracle SES index for each document. The value of the `wc_url` attribute is a URL that goes to the Resource Action Handling module of the application. The URL uses the value of the `WebCenter URL Prefix` parameter in the Document Service instance as the prefix.

Set the parameter value as the host and port where the application is deployed, plus the context root; for example:

```
http://myhost:8888/DocumentsServer
```

2. Use the `wc_url` attribute for action handling in the search UI.

Typically, the search UI uses the URL attribute for action handling. To use Resource Action Handling for action handling of search results of the Documents resource type, use the `wc_url` attribute. Note that only search results with the Documents resource type have the `wc_url` attribute. Therefore, this must be done conditionally in the search UI code.

3. Specify WebCenter Portal's Resource Action Handling class for click action of search result.

When a search result is clicked, the resource is rendered in the resource viewer of the resource, if available. The current search results page is over-written. Use Resource Action Framework to change this behavior.

Update the `adf-config.xml` file of the application to specify the Resource Action Handling class to use.

[Example 44-10](#) shows how to use `PopUpResourceActionViewHandler` to show the resource in a pop up window when a search result is clicked.

#### **Example 44-10 Specifying PopUp Behavior Handler**

```
xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  <wpsC:adf-service-config
xmlns="http://xmlns.oracle.com/webcenter/framework/service">
  <resource-handler
class="oracle.webcenter.framework.resource.view.PopUpResourceActionHandler"/>
  </wpsC:adf-service-config>
```

[Example 44-11](#) shows how to use `NavigationResourceActionHandler` to show the resource in the navigation node of the resource when a search result is clicked.

#### **Example 44-11 Specifying the Navigation Handler**

```
xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  <wpsC:adf-service-config
xmlns="http://xmlns.oracle.com/webcenter/framework/service">
  <resource-handler
class="oracle.webcenter.portalframework.sitestructure.handler.NavigationResourceAc
tionHandler"/>
  </wpsC:adf-service-config>
```

### 44.3.11 Troubleshooting the Search Service

This section describes common problems and solutions for the Search service.

#### **Problem**

There is a set timeout for querying each service. If a particular service does not return search results in the allotted time, then it times out. The Announcements and Discussions services are susceptible to timeouts. (In WebCenter Portal: Spaces, pages and spaces could have timeouts from search execution.)

#### **Solution**

To improve performance at design time, you can increase the values (in milliseconds) of `timeoutMs` and `prepare TimeoutMs` in `adf-config.xml`. The following is the relevant fragment of `adf-config.xml`, found in the Application Resources panel in the ADF META-INF folder:

```
<execution-properties timeoutMs="3000"prepare TimeoutMs="1000"/>
```

At runtime, you can configure timeouts using WLST or Fusion Middleware Control.

---

## Integrating the Activity Graph Service

This chapter explains how to integrate the Activity Graph service in a WebCenter Portal: Framework application at design time.

This chapter includes the following sections:

- [Section 45.1, "Introduction to the Activity Graph Service"](#)
- [Section 45.2, "Basic Configuration for the Activity Graph Service"](#)
- [Section 45.3, "Advanced Information for the Activity Graph Service"](#)
- [Section 45.4, "Extending the Activity Graph Service"](#)
- [Section 45.5, "Troubleshooting the Activity Graph Service"](#)

For more information about managing and using the Activity Graph service, see:

- "Managing the Activity Graph Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- "Working with the Activity Graph Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

### 45.1 Introduction to the Activity Graph Service

Users today contribute content at unprecedented rates. In view of this, there is now a need for better information retrieval technologies that are seamlessly integrated with Enterprise 2.0 products, such as Framework applications. The Activity Graph service provides the solution by leveraging collective intelligence to benefit search and social applications.

This section provides an overview of the Activity Graph service, its task flows, its benefits, and the underlying architecture. It includes the following subsections:

- [Section 45.1.1, "Understanding the Activity Graph Service"](#)
- [Section 45.1.2, "Requirements for the Activity Graph Service"](#)
- [Section 45.1.3, "What Happens at Runtime"](#)

#### 45.1.1 Understanding the Activity Graph Service

The Activity Graph service provides suggestions of people that a user may be interested in connecting with, based on existing connections and shared interaction with objects within the application. It also directs users to spaces or content that may be of interest, based on similar interactions with those spaces or items that the user is currently viewing.

The Activity Graph service presents these suggestions based on data gathered and analyzed by the Activity Graph engine. The Activity Graph engine provides a central repository for actions that are collected by enterprise applications. Thinking in terms of a mathematical graph, application users and the enterprise content with which they interact are *nodes*, and the actions between users and between users and content are *directed edges* (Figure 45–1).

**Figure 45–1 An Activity Graph**

In an enterprise, this analysis of the interaction of people with other people and with content produces similarity scores for making contextual recommendations based on an extensible set of actions, such as viewing, editing, tagging, and so on. For online vendors, for example, such contextual recommendations help provide a selection of suggested additional purchases. In a social networking environment, recommendations suggest additional connections to make based on the friends of the friends you have already connected with.

The Activity Graph engine also calculates an activity rank for content and passes this information to Oracle Secure Enterprise Search to enable more relevant content to appear higher in search results. For more information see the section "Setting Up Activity Rank for Oracle Secure Enterprise Search" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### Node Classes

Activity graph nodes are grouped into classes. The default *node classes* for WebCenter Portal are:

- Users (WC.user)
- Spaces (WC.group-space)
- Documents (WC.document)
- Wiki Pages (WC.wiki-page)

- Blogs (`WC.blog`)
- Discussion Topics (`WC.topic`)

If you want to extend the Activity Graph engine to integrate with other applications, then you can create custom node classes for the objects in those applications. For more information, see [Section 45.4.1, "Defining Custom Node Classes."](#)

### Actions

An *action* is a specific type of event. It has a source and a target. For example, if a user, say Monty, looks at a document, that is a `view` action with Monty as the source and the document as the target. Other actions between users and items include `create`, `like`, and `tag`. Actions can also occur between two users, for example, when two users `connect` with each other.

[Table 45–1](#) lists the default actions defined for WebCenter Portal.

**Table 45–1 WebCenter Portal Default Actions**

Action URN	Description
<code>connect</code>	Connecting with another user.
<code>create</code>	Creating a space, document, wiki, blog, topic, or message.
<code>edit</code>	For all items except spaces: <ul style="list-style-type: none"> <li>■ Checking in a new version of document</li> <li>■ Editing a wiki page or blog</li> <li>■ Replying to a topic</li> <li>■ Editing a message</li> </ul> For spaces: <ul style="list-style-type: none"> <li>■ All of the above plus</li> <li>■ Creating, editing, or deleting a page</li> <li>■ Creating, editing, or deleting a list</li> <li>■ Creating, editing, or deleting an event</li> </ul>
<code>comment</code>	Commenting on a document, wiki, or blog
<code>like</code>	Liking a document, wiki, blog, or message
<code>tag</code>	Tagging a document, wiki, or blog
<code>view</code>	Viewing a space page, document, wiki, blog entry, or discussion topic
<code>download</code>	Downloading a document, wiki, or blog
<code>edit-count</code>	Checking in a new version of a document, editing a wiki page or blog, replying to a topic, editing a message
<code>view-count</code>	Viewing a document, wiki page, blog, or discussion topic

When one of these WebCenter Portal actions occurs, for example, Monty `viewing` his document, it is picked up by the Events Collector, a component of WebCenter Portal's Analytics, and placed in an event table in the Activities database ([Figure 45–2](#)).

**Figure 45–2 Data Collection by WebCenter Portal's Analytics**

When the activity data gathering process starts, Analytics Activity Provider reads actions from the Analytics event tables and uses a registered set of mappings to generate activities (Figure 45–3). An *activity* is one occurrence of an action and is used to determine *relations*, aggregated occurrences of actions, which are stored in the relation tables. For example, the fact that Monty has viewed this particular document five times is a relation. Information in the relation tables is used to determine recommendations and search ranks.

**Figure 45–3 Data Gathering by the Activity Graph Engine**

If you want to integrate the Activity Graph engine with other applications, then you can create custom actions for the actions that users perform in those applications. For more information, see [Section 45.4.2, "Defining Custom Actions."](#)

## Similarity Calculations

The Activity Graph Query API is a Java API, used by the Activity Graph service task flows, that queries the relation tables for recommendations using a recipe (Figure 45-4). A *recipe* is a weighted list of similarity calculations. A *similarity calculation* provides a similarity score (a number between zero and one) that designates how similar two objects are to each other given a specific criterion. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

**Figure 45-4 Recommendations Calculation by the Activity Graph Service**

Table 45-2 lists the similarity calculations used by the Activity Graph service task flows (for information about the task flows, see Section 45.2.3.1, "Activity Graph Service Task Flows").

**Table 45-2 Activity Graph Service Similarity Calculations**

URN	Applies to	Description	Used by Task Flow
item-edit	Documents Wiki pages Blogs Topics	Users who edited the current item also edited the recommended item	Similar Items
item-like	Documents Wiki pages Blogs Topics	Users who liked the current item also liked the recommended item	Similar Items
item-comment	Documents Wiki pages Blogs Topics	Users who commented on the current item also commented on the recommended item	Similar Items

**Table 45–2 (Cont.) Activity Graph Service Similarity Calculations**

URN	Applies to	Description	Used by Task Flow
item-tag	Documents Wiki pages Blogs Topics	Users who tagged the current item also tagged the recommended item	
item-all	Documents Wiki pages Blogs Topics	Users who interacted in any way with the current item, including viewing it, also interacted in some way with the recommended item	Similar Items
user-connect	Users	The current user shares a number of connections with the recommended user	Recommended Connections
user-edit	Users	The current user edited some items that the recommended user also edited	Recommended Connections
user-like	Users	The current user likes some items that the recommended user also likes	Recommended Connections
user-comment	Users	The current user commented some items that the recommended user also commented on	Recommended Connections
user-tag	Users	The current user tagged some items that the recommended user also tagged	Recommended Connections
user-all	Users	The current user interacted in some way, including viewing, with some items with which the recommended user also interacted	Recommended Connections

You can edit these similarity calculations to change the weightings. If you want to integrate the Activity Graph engine with other applications, then you can create additional similarity calculations. For more information, see [Section 45.4.3, "Defining Custom Similarity Calculations."](#)

### Query Result Post-Processors (QRPPs)

After the initial list of recommendations for a particular object is generated, the results can be filtered into something more appropriate and useful to present to users. This is achieved using Query Result Post-Processors (QRPPs). QRPPs take the current list of recommendation results return a modified list as output. A QRPP may filter out recommendations, for example by removing recommendations for objects that the current user is not permitted to see, or may add or modify result metadata.

WebCenter Portal provides three QRPPs (run in the following order):

- **WebCenter Portal Security QRPP**—Filters out recommendations for objects for which the current user does not have view permissions by calling the Resource Authorizer, which is the same WebCenter Portal component used by the Search service for view authorization. For more information, see [Section 7.3.1, "Introducing the Resource Action Handling Framework."](#)
- **Analytics Metadata QRPP**—Retrieves additional metadata, for example, description and icon URL, for each recommended object from the Analytics tables.
- **WebCenter Portal URL QRPP**—Retrieves a URL for each recommended object by calling the Resource Action Handler, which is the same WebCenter Portal component used by the Search service.

You can create your own QRPPs to further filter the results or to integrate the Activity Graph engine with other applications. For more information, see [Section 45.4.6, "Registering Custom QRPPs."](#)

### Activity Graph Service Task Flows

Recommendations are presented to users via the Activity Graph service task flows. The Activity Graph service provides the following task flows:

- **Recommended Connections**—Recommends users that the current user may want to connect with based on his or her current connections and shared interactions with objects in the application.
- **Similar Items**—Suggests items with which users have interacted in a similar way as the current item.

---

---

**Note:** The **Similar Spaces** task flow is available only in WebCenter Portal Spaces applications. It suggests spaces with which users have interacted in a similar way as the current space.

---

---

For more information, see [Section 45.2.3.1, "Activity Graph Service Task Flows."](#)

## 45.1.2 Requirements for the Activity Graph Service

The Activity Graph service requires that the Activity Graph engine has been installed and configured. For more information, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

In addition, in your application you must create a connection to WebCenter Portal's schema and to the Activities database. For more information, see [Section 7.2.2, "Setting Up a Database Connection."](#)

The application must be configured to send usage events to the Analytics Event Collector. For more information, see the section "Registering an Analytics Collector for Your Application" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Before the Activity Graph service can make recommendations, the Activity Graph engines must have been run at least once to gather the data and calculate similarity scores. For more information see the section "Preparing Data for the Activity Graph Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The items suggested in the Similar Items task flow and the Recommendation data control depend on the tools and services available in your application. For example,

documents are only recommended if the Documents service is available. For information about making a service available in your application, refer to the appropriate chapter for that service. An item can also be filtered out of the recommendations by the Resource Authorizer of the service that owns the item.

### 45.1.3 What Happens at Runtime

At runtime, the context is provided for the Activity Graph service task flow:

- For the Recommended Connections task flow, the context is the current user.
- For the Similar Items task flow, the context is a WebCenter Portal resource, provided through task flow input parameters or through ADF UI events.

The task flow then queries the Activity Graph database for recommendations through the Activity Graph Query API, using the recipe provided in the task flow parameters. The list of recommendations returned from the Query API may be filtered by QRPPs before being listed in the task flow.

For more information about the service at runtime, see the section "Working with the Activity Graph Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 45.2 Basic Configuration for the Activity Graph Service

This section describes required steps for adding the Activity Graph service to your application. It includes the following subsections:

- [Section 45.2.1, "Configuration Roadmap for the Activity Graph Service"](#)
- [Section 45.2.2, "Setting Up Connections for the Activity Graph Service"](#)
- [Section 45.2.3, "Adding the Activity Graph Service at Design Time"](#)

### 45.2.1 Configuration Roadmap for the Activity Graph Service

The flow chart ([Figure 45-5](#)) and table ([Table 45-3](#)) in this section provide an overview of the prerequisites and tasks required to get the Activity Graph service working in Framework applications.

**Figure 45-5 Configuring the Activity Graph Service for WebCenter Portal: Framework Applications**

**Table 45–3 Configuring the Activity Graph Service for WebCenter Portal: Framework Applications**

Actor	Task	Sub-task
Administrator	1. Install WebCenter Portal and the back-end components for the Analytics and Activity Graph services	
Developer	2. Integrate the Activity Graph service in your application	<p><b>2.a</b> Configure a connection to WebCenter Portal's schema in JDeveloper</p> <p><b>2.b</b> Configure a connection to the Activities database in JDeveloper</p> <p><b>2.c</b> Configure a connection to the Analytics Collector in JDeveloper</p> <p><b>2.d</b> Add an Activity Graph task flow to a page in JDeveloper</p>
Administrator	3. (Optional) Set up the Activity Graph Engines schedule	
Developer/ Administrator	<p>4. Deploy the application using one of the following tools:</p> <ul style="list-style-type: none"> <li>■ JDeveloper (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> <li>■ WLS Admin Console (Administrator)</li> </ul>	
	<p>5. (Optional) Add/modify connection parameters using one of the following tools:</p> <ul style="list-style-type: none"> <li>■ JDeveloper, then redeploy the application (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> </ul>	
End User/ Administrator	6. Test that activity graph data is available in the application	<p><b>6.a</b> Log in and interact with the application, for example, by adding content (End User)</p> <p><b>6.b</b> Run the Activity Graph Engines (Administrator)</p> <p><b>6.c</b> View recommendations in the Activity Graph task flow, for example, the Recommended Connections task flow on your Profile page (End User)</p>

## 45.2.2 Setting Up Connections for the Activity Graph Service

The Activity Graph service requires the following connections:

- **WebCenter Portal schema**—This connection is used by the WebCenter Portal Security and WebCenter Portal URL QRPPs when querying the WebCenter Portal Resource Authorizer and Resource Action Handler respectively. For information about how to create this connection, see [Section 7.2.2, "Setting Up a Database Connection."](#)
- **Activities schema**—This connection is used to query recommendations and obtain metadata for results. This is the same connection as used by the Analytics Event Collector and the Activity Graph engine. If you have an existing connection, then that connection is used. If you do not have an existing connection, then you must

create one. For information about how to create this connection, see [Section 7.2.2, "Setting Up a Database Connection."](#)

- **Analytics Event Collector**—This connection is used to send usage events to the Analytics Event Collector. For more information, see the section "Registering an Analytics Collector for Your Application" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Additionally, the items suggested in the Similar Items task flow and the Recommendation data control depend on the tools and services available in your application. For example, documents are only recommended if the Documents tool is enabled.

- A connection to a content repository is required to see documents, wikis, and blogs.
- A connection to a discussions server is required to see discussions.

---

**Note:** While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

## 45.2.3 Adding the Activity Graph Service at Design Time

This section provides descriptions of the Activity Graph service task flows and steps you through the addition of the Activity Graph service to your application. It includes the following subsections:

- [Section 45.2.3.1, "Activity Graph Service Task Flows"](#)
- [Section 45.2.3.2, "How to Add Activity Graph Service Task Flows to a Page"](#)
- [Section 45.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters"](#)
- [Section 45.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters"](#)

### 45.2.3.1 Activity Graph Service Task Flows

This section describes and illustrates the task flows available through the Activity Graph service.

[Table 45–4](#) lists the task flows provided by the Activity Graph service.

**Table 45–4 Activity Graph Service Task Flows**

Task Flow	Description
Recommended Connections	This task flow enables viewing and connecting to users whom the Activity Graph engine has calculated to be similar to the current user.  For more information, see <a href="#">Section 45.2.3.1.1, "The Recommended Connections Task Flow."</a>
Similar Items	This task flow enables viewing and interacting with the WebCenter Portal items that the Activity Graph engine has calculated to be potentially of interest to the current user.  For more information, see <a href="#">Section 45.2.3.1.2, "The Similar Items Task Flow."</a>

---

---

**Note:** The **Similar Spaces** task flow is available only in WebCenter Portal Spaces applications. It suggests spaces with which users have interacted in a similar way as the current space.

---

---

**45.2.3.1.1 The Recommended Connections Task Flow** The Recommended Connections task flow enables viewing and connecting to users who have been calculated to be similar to the current user.

The Recommended Connections task flow is available by default on each user's Profile page.

For information about how to use this task flow at runtime, see the section "Working with the Recommended Connections Task Flow" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Table 45–5 shows the similarity calculations and their weightings used in the default recipe for the Recommended Connections task flow. You can change this recipe by editing the `similarityURNList` task flow binding parameter. For more information, see Section 45.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters."

**Table 45–5 Default Recipe for Recommended Connections**

Similarity Calculation	Weight
user-connect	100
user-edit	50
user-like	50
user-comment	10
user-tag	10
user-all	1

The user with the highest overall recommendation score is displayed first in the task flow. For each recommended user, if the highest scoring related similarity calculation has an associated reason string, that string is displayed underneath the user's name and description to provide details for why the user was recommended.

If no reason string is defined for the top similarity function, nothing is displayed. You can edit the similarity calculation reason strings, or provide additional strings. For more information, see the section "Customizing Reason Strings for Similarity Calculations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

**45.2.3.1.2 The Similar Items Task Flow** The Similar Items task flow enables viewing and interacting with the WebCenter Portal items that the Activity Graph engine has calculated to be potentially of interest to users of the currently selected item. The suggested items are not specific to the current user, however the task flow lists only those items that the current user has permission to see.

Items of interest may include a wiki page, a blog post, a document, or a discussion topic.

The Similar Items task flow determines the context for its recommendations based on items selected on other task flows on the page. This information is provided through task flow input parameters (typically using an EL expression) or through the

WebCenterResourceSelected ADF UI event. The task flows that determine the context of the Similar Items task flow are:

- Documents service task flows:
  - Recent Documents
  - Document List Viewer
  - Document Navigator
  - Document Explorer
  - Folder Viewer
  - Document Manager
  - Document Browser
- Discussions Manager task flow

The Similar Items task flow is included in the Document Explorer Related Items pane for files to show items similar to the currently viewed file.

For information about how to use this task flow at runtime, see the section "Working with the Similar Items Task Flow" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

[Table 45–6](#) shows the similarity calculations and their weightings used in the default recipe for the Similar Items task flow. You can change this recipe by editing the `similarityURNList` task flow binding parameter. For more information, see [Section 45.2.3.3, "How to Modify Activity Graph Service Task Flow Parameters."](#)

**Table 45–6 Default Recipe for Similar Items**

Similarity Calculation	Weight
item-edit	100
item-like	50
item-comment	20
item-tag	10
item-all	1

The item with the highest overall recommendation score is displayed first in the task flow. For each recommended item, if the highest scoring related similarity calculation has an associated reason string, that string is displayed underneath the item's name and description to provide details for why the item was recommended.

If no reason string is defined for the top similarity function, nothing is displayed. You can edit the similarity calculation reason strings, or provide additional strings. For more information, see the section "Customizing Reason Strings for Similarity Calculations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 45.2.3.2 How to Add Activity Graph Service Task Flows to a Page

The section describes how to add the Recommended Connections task flow to an application page. The steps provided here are the same for all Activity Graph service task flows.

To add the Recommended Connections task flow to your Framework application:

1. Prepare your application as described in [Section 45.1.2, "Requirements for the Activity Graph Service."](#)
2. Open the page on which you want to add the task flow.
3. In the Resource Palette, open **My Catalogs**, then **WebCenter Portal - Services Catalog**, then the **Task Flows** folder.
4. Drag and drop the Recommended Connections task flow (or whichever Activity Graph service task flow you prefer) onto the JSF (.jspx) page.
5. Select **Region** from the resulting context menu.

You may be prompted to add the Activity Graph service ADF library (`activitygraph-service-view.jar`) to the project. Confirm by clicking **Add Library**. This operation may take a moment to complete.
6. In the Edit Task Flow Binding dialog, enter values for the parameters, or accept the defaults.

For more information, see [Section 45.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters."](#)
7. Click **OK**.

The task flow is added to the page, and the project's libraries are configured to run the task flow.
8. Right-click the page in Design view and choose **Edit Authorization**. Navigate to **Granted to > Select authenticated-users**, and under **Actions**, grant `authenticated users Customize, Grant, Personalize, and View` privileges.
9. Save and run your page.

### 45.2.3.3 How to Modify Activity Graph Service Task Flow Parameters

Each Activity Graph service task flow has a set of required and optional task flow binding parameters. These provide a means of capturing information that is useful to the task flow's successful function.

In addition to providing required values for successful task flow rendering, you can use task flow binding parameters to customize the appearance and behavior of a task flow instance. For example, you can use parameter values to determine whether headers and footers are rendered, the number of rows and columns of information to show, whether to apply a filter to returned data, and the like.

You can provide task flow binding parameter values when you drag and drop a task flow onto an application page. Doing so opens the Task Flow Bindings dialog (for more information, see [Section 45.2.3.2, "How to Add Activity Graph Service Task Flows to a Page"](#)).

You can also adjust task flow binding parameter values after you have placed a task flow on a page.

To access the Edit Task Flow Binding dialog:

1. Click the **Bindings** tab at the bottom of the page (next to the **Source** tab) to go to the Bindings view.
2. Under **Executables**, you'll see the task flow you added.

[Figure 45–6](#) shows an example of a Recommended Connections task flow in the Executables section.

**Figure 45–6 Recommended Connections in the Page Data Binding Definition**

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.
4. In the Edit Task Flow Binding dialog (Figure 45–7), revise the binding parameter values as required (for more information, see Section 45.2.3.4, "Activity Graph Service Task Flows and Task Flow Parameters").

**Figure 45–7 Edit Task Flow Binding Dialog for Recommended Connections**

5. When you are finished, click **OK**.
6. Save and run your page to see the results.

#### 45.2.3.4 Activity Graph Service Task Flows and Task Flow Parameters

Table 45–7 lists and describes task flow binding parameters applicable to the Activity Graph service.

**Table 45–7 Activity Graph Service Task Flow Binding Parameters**

Parameter	Task Flows	Description
resourceId	Recommended Connections Similar Items	<p>The ID of the person, space, or item to use as a context for recommendations.</p> <p>For connections, the default value is the expression language token for the currently logged in user.</p> <p>For spaces, the default value is the expression language token for the resource ID of the space containing the task flow.</p> <p>For items, the value is derived from the selection event.</p>
classURN	Similar Items	<p>The node class of the context. By default the information is derived from the selection event.</p>
objectName	Similar Items	<p>The name of the space or item to use as a context for recommendations.</p> <p>For spaces, the default value is the expression language token for the resource ID of the space containing the task flow.</p> <p>For items, the value is derived from the selection event.</p>
recipe	Recommended Connections Similar Items	<p>A comma-separated list of registered similarity calculation = weight pairs. The list determines what recommendations appear and how they are ordered.</p> <p>The default recipes for each task flow are listed in <a href="#">Section 45.2.3.1, "Activity Graph Service Task Flows."</a></p>
classURNRestrictions	Similar Items	<p>A comma-separated list of the node classes to include in the recommendations. If non-null, then only objects from the given node classes are included in the recommendations.</p> <p>By default this is empty, meaning that there are no restrictions on which classes of objects may be returned.</p>

**Table 45–7 (Cont.) Activity Graph Service Task Flow Binding Parameters**

Parameter	Task Flows	Description
<code>excludeObjectActions</code>	Recommended Connections Similar Items	A comma-separated list of registered actions. The task flow will not show people, spaces, or items on which the logged in user took any of the listed actions.  For example, the default value for the Similar Items task flow is <code>create, edit, comment, tag</code> , meaning that users are not recommended items which they themselves created, edited, commented on, or tagged.  The WebCenter Portal default actions are listed in <a href="#">Table 45–1</a> .
<code>serviceId</code>	Similar Items	Used in conjunction with <code>resourceId</code> , and optionally <code>resourceType</code> , as an alternative to <code>classURN</code> for identifying the node class of an object.
<code>resourceType</code>	Similar Items	Used in conjunction with <code>resourceId</code> and <code>serviceId</code> , as an alternative to <code>classURN</code> for identifying the node class of a WebCenter Portal object.  For example <code>resourceType</code> is used by the Documents service to identify whether an object is a wiki, blog, or document.
<code>suppressPopup</code>	Similar Items	Determines whether links in the task flow launch content in inline popups ( <code>false</code> ) or in browser windows ( <code>true</code> ).  The default value is <code>false</code> .

## 45.3 Advanced Information for the Activity Graph Service

This section describes advanced features available with the Activity Graph service. It includes the following subsections:

- [Section 45.3.1, "Using the Recommendation Data Control"](#)
- [Section 45.3.2, "Using the Activity Graph Service REST APIs"](#)

### 45.3.1 Using the Recommendation Data Control

The Activity Graph service provides a data control that enables you to create your own user interface (task flows) for the service.

It exposes the following methods:

- `getSimilarObjects`—This returns a list of `SuggestionWrappers` for a given source and similarity calculation, with choices for complex similarity calculation recipes and filtering of node classes and actions.
- `queryCommonObjects`—Given two objects recommended by the Activity Graph as similar, this returns a list of other objects with which the two similar objects have interacted. This list can be used to provide links and details for the

application objects that were involved in the interactions that produced the recommendations.

- `recordNotInterested`—This records that the user is not interested in a given object.

For example, you could use the `getSimilarObjects()` method to get a list of users similar to the current user, using a recipe of `item-edit=100, item-all=1`. The recommendations are returned in the form of `SuggestionWrapper` objects. From the `SuggestionWrapper`, the application can obtain a string, representing the reason for the recommendation, as well as the URN for the similarity calculation that produced the top score for the suggestion. Suppose the current user is "bill" and the top recommended user returned from `getSimilarObjects()` is "cathy". The `SuggestionWrapper` for "cathy" might produce a reason string such as "You and Cathy edited 3 items in common," and the top similarity calculation would be `item-edit`.

Given this information, the application could obtain names, icons, and URLs for the three documents that both users edited by calling `queryCommonObjects()`, passing "bill" and "cathy" as the source and target objects, and `item-edit` as the similarity URN. The names, icon URLs, and application object URLs can be obtained from the `QueryResultWrapper` objects returned from `queryCommonObjects()`.

Typically, there are three things that you need to bind your data control to a method: a `MethodAction`, a `MethodIterator` to iterate through the results of the method, and a `Tree` to pick attributes of the resulting data structure. You can create these manually in a page definition file, or more easily, use the wizards that JDeveloper provides.

#### 45.3.1.1 Adding the `getSimilarObjects` and `queryCommonObjects` Methods

To add either the `getSimilarObjects` method or the `queryCommonObjects` method of the Recommendation data control to your project, follow these steps:

1. Add the **Recommendation Data Control** to your project (either by selecting it in the catalog, right-clicking and choosing **Add to Project** or by dragging and dropping it onto a JSP page (`.jspx`) in your project).
2. Drag an ADF Table to the JSP page.
3. When prompted, check the **bind to datasource** checkbox.
4. Navigate to the **Recommendation Data Control** and select the `SuggestionWrapper` result from the API method you want. This automatically creates a method action binding and an iterator to the resultant collection.
5. Select the nodes you want to expose. This automatically creates a tree to access values in the suggestion.
6. Configure the parameters for the method action. Typically, these are expressions that you would have defined as `pageFlowScope` variables.

For the `getSimilarObjects` method:

- `classURN`—The URN of the node class of the source for the recommendation. For example: `WC.user`

**See Also:** For more information about node classes, see [Section 45.1.1, "Understanding the Activity Graph Service."](#)

- `objectURN`—The URN of the source for the recommendation. For example: `#{securityContext.userName}`

- `userCredentialClass`—If null, the WebCenter Portal user type is used.
- `recipe`—A comma-separated list of similarity calculations to be used and their associated weights. For example:
  - For a Similar Items task flow:
 

```
item-edit=100,item-like=50,item-comment=20,item-tag=10,item-all=1
```
  - For a Recommended Connections task flow:
 

```
user-connect=100,user-edit=50,user-like=50,user-comment=10,user-tag=10,
user-all=1
```
- `classURNRestrictionList`—A comma-separated list of classes to filter the results.
- `excludeObjectActionList`—A comma-separated list of action URNs to use to filter the results.
- `maxResults`—The maximum number of recommendations to return.

For the `queryCommonObjects` method:

- `srcClassURN`—The URN of the node class of the source object of the recommendation. For example: `WC.user`

**See Also:** For more information about node classes, see [Section 45.1.1, "Understanding the Activity Graph Service."](#)

- `srcObjectURN`—The URN of the source object of the recommendation. For example: `#{securityContext.userName}`
- `trgClassURN`—The URN of the node class of the target object (that is, the recommended object).
- `trgObjectURN`—The URN of the target object (that is, the recommended object).
- `userCredentialClass`—If null, the WebCenter Portal user type is used.
- `similarityURN`—The URN of the similarity calculation used in the recommendation.
- `maxResults`—The maximum number of common objects to return. The results are sorted by most-recent action occurrence date, and the top `maxResults` objects are returned.

---

**Note:** For convenience, the `getSimilarObjects` method takes string arguments instead of the list and map arguments used at the lower levels of the APIs, since that is typically how you would configure them as task flow input parameters.

---

### 45.3.1.2 Adding the `recordNotInterested` Method

To add the `recordNotInterested` method of the Recommendation data control to your project, follow these steps:

1. Drag and drop a Button component (from ADF faces) onto a JSP page (`.jspx`) in your project.
2. Right-click the button control, then click **Bind to ADF Control**.

3. In the Bind to ADF Control window, expand the node Recommendation Data Control, then select the `recordNotInterested()` method.
4. Click **OK** to close the Bind to ADF Control window.
5. In the Edit Action Binding window, enter values for the following parameters:
  - `classURN`—The URN of the node class of the source for the recommendation. For example: `WC.user`  
  
**See Also:** For more information about node classes, see [Section 45.1.1, "Understanding the Activity Graph Service."](#)
  - `objectURN`—The URN of the source for the recommendation. For example: `#{securityContext.userName}`
6. Click **OK**.

## 45.3.2 Using the Activity Graph Service REST APIs

WebCenter Portal provides REST APIs to support the Activity Graph service. Use the Activity Graph service REST APIs to create your own interface for providing recommendations for connections, spaces, and items.

This section describes the REST APIs associated with the Activity Graph service. It includes the following subsections:

- [Section 45.3.2.1, "Activity Graph Entry Point"](#)
- [Section 45.3.2.2, "Activity Graph Resource Type Taxonomy"](#)
- [Section 45.3.2.3, "Security Considerations"](#)
- [Section 45.3.2.4, "Activity Graph Resource Types"](#)

For an introduction to the REST APIs, see [Chapter 53, "Using Oracle WebCenter Portal REST APIs."](#)

### 45.3.2.1 Activity Graph Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. For the Activity Graph service there are two entry points: one for recommendations and one for items. To find the entry points for the Activity Graph service, find the link element with one of the following `resourceTypes`:

```
urn:oracle:webcenter:activitygraph:recommendations  
urn:oracle:webcenter:activitygraph:items
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Activity Graph service.

For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 45.3.2.2 Activity Graph Resource Type Taxonomy

When the client has identified the entry point to use, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 45.3.2.2, "Activity Graph Resource Type Taxonomy."](#)

The taxonomy for the Activity Graph service is:

```
urn:oracle:webcenter:activitygraph:recommendations
  urn:oracle:webcenter:activitygraph:recommendations:recommendation
urn:oracle:webcenter:activitygraph:items
  urn:oracle:webcenter:activitygraph:items:item
```

### 45.3.2.3 Security Considerations

There are no specific security considerations for this service. For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 45.3.2.4 Activity Graph Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- [Section 45.3.2.4.1, "urn:oracle:webcenter:activitygraph:recommendations"](#)
- [Section 45.3.2.4.2, "urn:oracle:webcenter:activitygraph:recommendations:recommendation"](#)
- [Section 45.3.2.4.3, "urn:oracle:webcenter:activitygraph:items"](#)
- [Section 45.3.2.4.4, "urn:oracle:webcenter:activitygraph:items:item"](#)

**45.3.2.4.1 urn:oracle:webcenter:activitygraph:recommendations** Use this resource to identify the URI to use to retrieve (GET) recommended connections, spaces, or items based on their similarity to the specified object. The response from a GET operation includes each object in the requested list, and each object includes links used to operate on that object.

Nodes in the activity graph are identified by a combination of node class URN and object URN.

For example, to identify the user, monty, you can specify:

- classURN=WC.user
- objectURN=monty

The nodes provided out of the box are all WebCenter Portal resources (users, documents, spaces, and so on) and so have WebCenter Portal service and resource IDs. The Activity Graph REST APIs provide another way for you to identify these out of the box nodes using the `serviceId` and `objectURN` (which contains the resource ID).

For example, to identify the user, monty, you can specify:

- serviceId=oracle.webcenter.people
- objectURN=monty

If a service's objects are further classified by resource type, for example, the Documents service, you must also specify the resource type.

For example, to identify a particular document, you can specify:

- serviceId=oracle.webcenter.doclib
- resourceType=document
- objectURN=document1

Any new node classes that are created (that is, non-native WebCenter Portal objects) should be identified using node class and object URNs.

### Navigation Paths to recommendations

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
  recommendations
```

### Supported Methods for recommendations

The following methods are supported by this resource:

- GET

- **request - Parameters:** `startIndex`, `itemsPerPage`, `utoken`

For information about these common parameters, see "[Common Request Query Parameters](#)".

The following additional parameters are available:

- \* `classURN`—The node class URN that identifies the type of the object for which you are requesting recommendations. For example `WC.user`, `WC.group-document`.
- \* `objectURN`—The object URN that provides a unique identifier for the object for which you are requesting recommendations. For example `monty,1000`.
- \* `recipe`—A semicolon-separated list of similarity URNs and optional associated weights (indicated by a colon) that is used to determine which objects to recommend. For example, `gs-edit:10;gs-all:1`
- \* `classURNRestrictions`—A comma-separated list of the node classes to include in the recommendations. If non-null, then only objects from the given node classes are included in the recommendations.
- \* `excludeObjectActions`—A comma-separated list of actions, identified by action URN, used to exclude objects from the recommendations if the current user has performed that action on the object. For example, if the client is retrieving recommended spaces, the `gs-edit` action could be specified to exclude spaces that the current user has edited (since the user already knows about those spaces).
- \* `serviceId`—The WebCenter Portal service ID that identifies the type of object for which you are requesting recommendations (you can use this instead of `classURN` for out of the box objects).
- \* `resourceType`—The WebCenter Portal resource type of the object for which you are requesting recommendations, used in combination with `serviceId` if necessary.
- \* `userCredentialClassURN`—The node class URN of the user exercising the REST API. The default value is `WC.user`. If you are integrating the Activity Graph engine with another application, this may need to be a different node class.

- **response - body:** 0 or more recommendations

For more information, see [Section 53.5.2.5, "Templates."](#)

## Resource Types Linked to from recommendations

[Table 45–8](#) lists the resource types that the client can link to from this resource.

**Table 45–8 Related Resource Types for recommendations**

rel	resourceType
self	urn:oracle:webcenter:activitygraph:recommendations

**45.3.2.4.2 urn:oracle:webcenter:activitygraph:recommendations:recommendation** The recommendation response contains the recommended objects and the URIs for use in accessing those objects.

### Navigation Paths to recommendation

This section shows how the client can navigate through the hypermedia to access the recommendation resource:

```
resourceIndex
  recommendations
    recommendation
```

### Read-only Elements for recommendation

[Table 45–9](#) lists the read-only elements for the recommendations resource.

**Table 45–9 Read-only Elements for recommendation**

Element	Type	Description
score	Float	The overall score of this recommendation relative to the other recommendations in the list. This is the weighted sum of the component scores associated with each of the similarity URNs that comprise the recipe and is a floating point number between 0 and 1.
item	urn:oracle:webcenter:activitygraph:items:item	The recommended user, item, or space.
componentScores	A list of componentScore elements	A list of the component scores associated with the different similarity URNs in the recipe for the recommendation. A component score may have a reason and a link that can be used to retrieve the common items with which the user and the recommended object have interacted.

**45.3.2.4.3 urn:oracle:webcenter:activitygraph:items** Use this resource to identify the URI to use to retrieve (GET) objects that the source object and recommended object have in common. You can use this to determine the reasons why a particular object was recommended. The response from a GET operation includes each item in this collection of items, and each item includes links used to operate on that item.

### Navigation Paths to items

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
  items
```

## Supported Methods for items

The following methods are supported by this resource:

- GET
  - **request - Parameters:** `startIndex`, `itemsPerPage`, `utoken`

For information about these common parameters, see "[Common Request Query Parameters](#)".

The following additional parameters are available:

- \* `similarityURN`—The URN of the similarity calculation to be used determine which objects are similar to the recommended object. For example `item-tag`, `gs-edit`, `user-connect`
- \* `srcClassURN`—The node class URN that identifies the type of the object that was used to request the recommendations. For example `WC.user`, `WC.group-document`.
- \* `srcObjectURN`—The URN of the object that was used to request the recommendations. For example `monty`, `1000`.
- \* `trgClassURN`—The node class URN that identifies the type of the recommended object
- \* `trgObjectURN`—The object URN that provides a unique identifier for the recommended object
- \* `userCredentialClassURN`—The node class URN of the user exercising the REST API. The default value is `WC.user`. If you are integrating the Activity Graph engine with another application, this may need to be a different node class.

- **response - body:** 1 or more items

For more information, see [Section 53.5.2.5, "Templates."](#)

## Resource Types Linked to from items

[Table 45–10](#) lists the resource types that the client can link to from this resource.

**Table 45–10** *Related Resource Types for items*

rel	resourceType
self	urn:oracle:webcenter:activitygraph:items

**45.3.2.4.4 urn:oracle:webcenter:activitygraph:items:item** Use this resource type to identify the URI to use to update (PUT) a recommendation to indicate user interest in the recommended object.

## Navigation Paths to item

This section shows how the client can navigate through the hypermedia to access the item resource:

```
resourceIndex
  recommendations
    recommendation
      item
resourceIndex
  items
    item
```

**Supported Methods for item**

The following method is supported by this resource type:

- PUT
  - Request—Body: item
  - Response—Body: item

**Writable Elements for item**

[Table 45–11](#) lists the writable elements for this resource type.

**Table 45–11 Writable Elements for item**

Element	Type	Required	Constraints	Description
status	String	Yes	interested not interested	Whether the user is interested in the object

**Read-only Elements for item**

[Table 45–12](#) lists the read-only elements for this resource type. Not all of these elements are available for all objects.

**Table 45–12 Read-only Elements for item**

Element	Type	Description
classURN	String	Node class of the object
objectURN	String	Identifier for the object
name	String	Name of the object
description	String	Description of the object
modified	Date	Date on which the object was last updated
modifiedByUser	PersonReference	User information about the user who last updated the object, including GUID, ID, display name, and a link to the profile icon
author	PersonReference	User information about the user who created the object, including GUID, ID, display name, and a link to the profile icon

**Resource Types Linked to from item**

[Table 45–13](#) lists the resource types that the client can link to from this resource.

**Table 45–13 Related Resource Types for item**

rel	resourceType
self	urn:oracle:webcenter:activitygraph:items:item
via	resourceType of the underlying object

## 45.4 Extending the Activity Graph Service

Out of the box, Activity Graph includes metadata definitions for mapping WebCenter Portal service event data to WebCenter Portal's Analytics. This metadata is automatically loaded the first time the Activity Graph engines application starts.

You can extend Activity Graph metadata to change how actions are gathered from WebCenter Portal's Analytics by manipulating XML files. The XML files can be exported, edited in a text editor, and then imported.

To update Activity Graph metadata definitions, you must first export them to a local XML file:

- For information about exporting the Activity Graph metadata definitions, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- For information about exporting Analytics mapping metadata definitions, see the section "Exporting Provider Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

After exporting the metadata definitions to an appropriate file, you can then edit the file in an editor of your choice to add your own definitions. When you have made your changes, you must import the metadata file back to the managed server. For information about importing Activity Graph metadata definition files, see the section "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- [Section 45.4.1, "Defining Custom Node Classes"](#)
- [Section 45.4.2, "Defining Custom Actions"](#)
- [Section 45.4.3, "Defining Custom Similarity Calculations"](#)
- [Section 45.4.4, "Defining Custom Rank Calculations"](#)
- [Section 45.4.5, "Registering Custom Activity Providers"](#)
- [Section 45.4.6, "Registering Custom QRPPs"](#)

### 45.4.1 Defining Custom Node Classes

The Activity Graph metadata provide definitions for the node classes that represent WebCenter Portal objects, such as users, spaces, and documents. For more information and for a list of the default node classes supported by WebCenter Portal, see "[Node Classes](#)".

You can define your own node classes, for other WebCenter Portal objects or for objects from other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define a node class for service requests.

To define a custom node class:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

2. Edit the XML file to define the new node class. For each custom node class, you must specify:
  - `URN`—An attribute of the `nodeClass` element, this is a string that uniquely identifies the node class
  - `nodeType`—A sub-element that indicates whether objects defined by the node class are items or users. Valid values are `Item` or `User`.
  - `numericURNs`—A sub-element that indicates whether or not the URNs of the objects of this class are numeric. This enables you to integrate Activity Graph more efficiently with applications that use numeric IDs. Valid values are `true` or `false`.
  - `properties`—A list of name, value pairs. A node class's properties are available at runtime to provide additional metadata about the class. For example, all out-of-the-box WebCenter Portal objects modeled in Activity Graph define properties for `serviceID` and `resourceType`, which are used by the Activity Graph task flows to tailor the display of recommendations based on their service and resource type:

```
<properties>
  <property name="oracle.webcenter.resourceType" value="wiki" />
  <property name="oracle.webcenter.serviceID"
value="oracle.webcenter.doclib" />
</properties>
```

#### Example 45–1 Node Class Definition

```
<nodeClasses>
  <nodeClass URN="WC.wiki-page">
    <nodeType>Item</nodeType>
    <properties>
      <property name="oracle.webcenter.resourceType" value="wiki" />
      <property name="oracle.webcenter.serviceID" value="oracle.webcenter.doclib"
/>
    </properties>
  </nodeClass>
</nodeClasses>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 45.4.2 Defining Custom Actions

Activity Graph includes metadata definitions for the actions that occur in Framework applications. For more information, see "[Actions](#)".

You can define your own actions, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define new actions for opening a service request, assigning a service request to a customer service representative, and closing a service request.

To define a custom action:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting

Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

2. Edit the XML file to define the new action. For each custom action, you must specify:
  - `URN`—An attribute of the `action` element, this is a string that uniquely identifies the action
  - `actionType`—A sub-element. Valid values are:
    - `Simple`—These actions are useful for counting. They have no other metadata besides the source, the target, and the occurred time. For example, WebCenter Portal comes with a preregistered `view-count` simple action whose associated relation value increases each time the person clicks on the same item, but also decays over time.
    - `Boolean`—These actions are useful when you just want to know whether something has happened or not, but not how many times it has happened. Boolean actions have one additional Boolean as metadata. For example, WebCenter Portal comes with a Boolean `view` action whose associated relation value doesn't increase each time the person clicks on the same item. It just records whether a person has clicked on a specific item or not.
    - `Non-negative Integer`—Actions that have one additional integer as metadata, where the integer cannot be negative. Rating (assigning a number of stars) is the typical example.
    - `Integer`—Actions that have one additional integer as metadata. This can be used for ratings that allow negative values.
  - `symmetric`—A sub-element that indicates whether the source and target of the action are interchangeable. An example of a symmetric action is the `connect` action, which occurs when two users connect in the People Connections service. Valid values are `true` or `false`.
  - `sourceType`—A sub-element that identifies the type of object that performs the action. Valid values are `User` or `Item`.
  - `targetType`—A sub-element that identifies the type of object on which the action is performed. Valid values are `User` or `Item`.
  - `relationType`—A sub-element. Valid values are `Sum` or `LastAssigned`. `Sum` actions increment each time they occur, for example the `edit-count` action. `LastAssigned` actions keep whatever value was passed in the most recent occurrence of the action. Non-counting simple actions like `create` and `edit` are `LastAssigned`. An example of a `LastAssigned Integer` action would be a rating action.
  - `relationDecayPeriod`—(Optional) A sub-element that identifies the amount of time, in days, after which the action starts to lose (or decay) value. When computing the relation value, the value of each action is multiplied by the decay factor every decay period following the occurrence of the action.
  - `relationDecayFactor`—(Optional) A sub-element that is a floating value between 0 and 1 that determines how much the action's value decreases (or decays) after the decay period. When computing the relation value, the value of each action is multiplied by the decay factor every decay period following the occurrence of the action.

**Example 45–2 Action Definition**

```

<actions>
  ...
  <action URN="connect">
    <actionType>Boolean</actionType>
    <symmetric>true</symmetric>
    <sourceType>User</sourceType>
    <targetType>User</targetType>
    <relationType>LastAssigned</relationType>
    <relationIsNonNegative>true</relationIsNonNegative>
  </action>
  ...
  <action URN="edit-count">
    <actionType>Simple</actionType>
    <symmetric>>false</symmetric>
    <sourceType>User</sourceType>
    <targetType>Item</targetType>
    <relationType>Sum</relationType>
    <relationDecayPeriod>1</relationDecayPeriod>
    <relationDecayFactor>0.97</relationDecayFactor>
  </action>
  ...
</actions>

```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 45.4.3 Defining Custom Similarity Calculations

Activity Graph includes metadata definitions for the similarity calculations that are used by WebCenter Portal. For more information, see "[Similarity Calculations](#)".

You can define your own similarity calculations, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal. For example, if you want to integrate your CRM application with Activity Graph, you could define an `item-assign` similarity calculations for to help recommend other service requests that were assigned to the same person.

To define a custom similarity calculation:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new similarity calculation. For each similarity calculation, you must specify:
  - `URN`—An attribute of the `similarityCalculation` element that is a string that uniquely identifies the similarity calculation.
  - `similarityFunction`—A sub-element that identifies the function that measures the similarity of items. There is currently only one supported similarity function: `Tanimoto`. This function measures similarity between two items as the ratio of the number of common actions to the total number of actions on those items.

- **domainClasses**—A sub-element that identifies the node classes for which similarity scores are calculated. These are the targets of the actions represented in the similarity calculation's relation combination.
- **backgroundClasses**—A sub-element that identifies the node classes that are the sources of the actions in the similarity calculation's relation combination.
- **relationCombination**—A sub-element that defines a new relation by combining one or more registered relations. There are two types of relation combination:
  - **Boolean OR** (used by all WebCenter Portal out-of-the-box similarity calculations) The resulting relation combination has a value of 1 (meaning true) if any of the component relations have a positive value, and 0 (meaning false) otherwise.
  - **Weighted Sum** (used by all WebCenter Portal out-of-the-box rank calculations) The resulting relation combination is a weighted sum of the values for each of its component relations.

For each component relation, specify:

- **actionURN**—The URN of the action for the component relation
- **use inverse**—Set to `false` (the default) to use the component relation to calculate similarity directly for the target objects, or `true` to use the component relation to calculate similarity for the source objects rather than the target objects. For example, if the `view` relation has the source object (`user`) viewing a target object (`document`), then to calculate similarity for documents, set `use inverse=false`. To calculate similarity for source objects (`users`), set `use inverse=true`.
- **weight**—(for **Weighted Sum** relation combinations) The weight to apply to the component relation represented as a floating-point number

**Example 45–3 Similarity Calculation Definition**

```
<similarityCalculations>
  <similarityCalculation URN="item-edit">
    <similarityFunction>Tanamoto</similarityFunction>
    <domainClasses>
      <URN>document:wcServiceID=oracle.webcenter.doclib</URN>
      <URN>wiki-page:wcServiceID=oracle.webcenter.wiki</URN>
      <URN>blog:wcServiceID=oracle.webcenter.wiki</URN>
      <URN>topic:wcServiceID=oracle.webcenter.collab.forum</URN>
    </domainClasses>
    <backgroundClasses>
      <URN>user:wcServiceID=oracle.webcenter.people</URN>
    </backgroundClasses>
    <relationCombination type="BOOLEAN_OR">
      <component inverse="false" actionURN="create" />
      <component inverse="false" actionURN="comment" />
      <component inverse="false" actionURN="edit" />
    </relationCombination>
  </similarityCalculation>
</similarityCalculations>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is

deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 45.4.4 Defining Custom Rank Calculations

Activity Graph includes metadata definitions for the rank calculations that are used by the Activity Graph Rank Engine to calculate the importance of nodes in the activity graph. For more information, see the section "Setting Up Activity Rank for Oracle Secure Enterprise Search" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

You can define your own rank calculations, for WebCenter Portal or for other applications, by exporting the Activity Graph metadata definitions to an XML file, editing the file, and then importing the metadata back into WebCenter Portal.

To define a custom rank calculation:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new rank calculation. For each rank calculation, you must specify:
  - `URN`—An attribute of the `rankCalculation` element, this is a string that uniquely identifies the rank calculation.
  - `domainClasses`—A sub-element that identifies a list of node classes to which the rank calculation applies.
  - `relationCombination`—A sub-element that defines a new relation by combining one or more registered relations. There are two types of relation combination:
    - `Boolean OR` (used by all WebCenter Portal out-of-the-box similarity calculations) The resulting relation combination has a value of 1 (meaning true) if any of the component relations have a positive value, and 0 (meaning false) otherwise.
    - `Weighted Sum` (used by all WebCenter Portal out-of-the-box rank calculations) The resulting relation combination is a weighted sum of the values for each of its component relations.

For each component relation, specify:

- `actionURN`—The URN of the action for the component relation
- `use inverse`—Set to `false` (the default) to use the component relation to calculate similarity directly for the target objects, or `true` to use the component relation to calculate similarity for the source objects rather than the target objects. For example, if the `view` relation has the source object (`user`) viewing a target object (`document`), then to calculate similarity for documents, set `use inverse=false`. To calculate similarity for source objects (users), set `use inverse=true`.
- `weight`—(for `Weighted Sum` relation combinations) The weight to apply to the component relation represented as a floating-point number
- `resultAcceptorClass`—A sub-element that identifies the fully qualified class name for the class that implements the `IRankResultAcceptor` interface. This class receives a set of object rankings from the Rank Engine and

stores them in a search engine where they can later be used to influence search query ranking. WebCenter Portal includes one rank acceptor out of the box, which will persist ranks to Oracle Secure Enterprise Search.

#### Example 45–4 Rank Calculation Definition

```
<rankCalculations>
  <rankCalculation URN="activity-rank">
    <domainClasses>
      <URN>WC.user</URN>
      <URN>WC.document</URN>
      <URN>WC.wiki-page</URN>
      <URN>WC.blog</URN>
    </domainClasses>
    <relationCombination type="WEIGHTED_SUM">
      <component actionURN="connect" weight="10.0" />
      <component actionURN="edit" weight="20.0" inverse="true" />
      <component actionURN="view-count" weight="1.0" />
      <component actionURN="create" weight="100.0" inverse="true" />
      <component actionURN="create" weight="100.0" />
      <component actionURN="edit-count" weight="20.0" />
      <component actionURN="download" weight="5.0" />
      <component actionURN="tag" weight="10.0" />
      <component actionURN="comment" weight="10.0" />
    </relationCombination>
    <resultAcceptorClass>
      oracle.webcenter.activitygraph.providers.rankAcceptors.ses.SesRankResultAcceptor
    </resultAcceptorClass>
  </rankCalculation>
</rankCalculations>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 45.4.5 Registering Custom Activity Providers

Activity providers are used by the Activity Graph engine during the gathering process to generate activities from recorded occurrences of actions. For example, the Analytics Activity Provider reads actions from the Analytics event tables and uses a registered set of mappings to generate activities. These activities are then used to determine relations, which are used in turn to determine recommendations and search ranks.

If you want to integrate other applications with the Activity Graph engine, you can create your own activity providers to generate activities from those applications.

To make a custom activity provider available to the Activity Graph engine, you must register it by adding an activity provider assignment to the Activity Graph metadata definitions. An activity provider assignment maps the triple of the `action`, `srcClass`, and `trgClass` to the Java class that implements the activity provider.

---

**Note:** If more than one triple maps to the same provider class, there must be a provider assignment for each triple. For example, the out-of-the-box metadata declares a number of provider assignments mapping all triples to a single class, `AnalyticsActivityProvider`.

---

To register a custom activity provider:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to define the new activity provider assignment. For each activity provider assignment, you must specify:
  - `action`—An attribute of the `providerAssignment` element, this specifies which action is being mapped to the `providerClass`. Specify one registered action.
  - `srcClass`—An attribute of the `providerAssignment` element, this specifies which source class is being mapped to the `providerClass`. Specify one registered node class.
  - `trgClass`—An attribute of the `providerAssignment` element, this specifies which target class is being mapped to the `providerClass`. Specify one registered node class.
  - `providerClass`—A sub-element that identifies the fully qualified name of the Java class that implements the activity provider for the specified action, source class, and target class triple.

#### **Example 45–5 Activity Provider Assignment Definition**

```
<providerAssignments>
  <providerAssignment action="connect" srcClass="WC.user" trgClass="WC.user">
    <providerClass>
      oracle.webcenter.activitygraph.providers.activityProviders.analytics.AnalyticsActivityProvider
    </providerClass>
  </providerAssignment>
</providerAssignments>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 45.4.6 Registering Custom QRPPs

WebCenter Portal provides several QRPPs to filter recommendation results. For more information, see "[Query Result Post-Processors \(QRPPs\)](#)".

You can create your own QRPPs to further filter recommendation results or to provide display metadata for recommendations when you are integrating the Activity Graph engine with other applications. To make a QRPP available to the Activity Graph engine, you must register it by adding a QRPP registration to the Activity Graph metadata definitions.

To register a custom QRPP:

1. Use the WLST command `exportAGMetadata` to export the Activity Graph metadata to a local XML file. For more information, see the section "Exporting Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Edit the XML file to register the new QRPP. For each QRPP, you must specify:

- URN—An attribute of the QRPP element, this is a string that uniquely identifies the QRPP.
- priority—An attribute of the QRPP element, this is an integer indicating the order in which the QRPP should be run in relation to the other registered QRPPs.
- description—A sub-element that provides a brief description of what the QRPP does.
- providerClass—A sub-element that identifies the fully qualified name of the Java class that implements the QRPP.

**Example 45–6 QRPP Definition**

```
<QRPPs>
  <QRPP priority="1" URN="WebCenter Portal Security QRPP">
    <description>
      Uses the WebCenter Portal Resource Authorizer to perform security filtering.
    </description>
    <providerClass>
      oracle.webcenter.activitygraph.providers.qrpps.security.WCSecurityQueryResultPostProcessor
    </providerClass>
  </QRPP>
</QRPPs>
```

3. Use the WLST command `importAGMetadata` to import the updated Activity Graph metadata file to the managed server where the Framework application is deployed. For more information, see "Importing Activity Graph Metadata" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 45.5 Troubleshooting the Activity Graph Service

This section provides information to assist you in troubleshooting problems you may encounter while using the Activity Graph service.

The following troubleshooting solutions assume that:

- The Activity Graph engine is deployed correctly
- The `WC_Uutilities` managed server is up and running
- The property `openusage_enabled` is `true`

### 45.5.1 Troubleshooting the Activity Graph Service Task Flows (All Task Flows)

**Problem**

Recommendations are not shown in the task flows even after valid user activity.

**Solution**

Check whether the events are being captured by the Analytics Event Collector. You can verify this by checking the collector logs. If the logs do not show the events being captured, the problem is with the Analytics Event Collector.

For more information, see the section "Validating Analytic Event Collection" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

**Problem**

The Analytics Event Collector logs show that events are being captured but recommendations are not shown in the task flows.

**Solution**

Check the last run time of the Activity Graph engine on the Activity Graph Schedule and Status Page. You may need to adjust the schedule or launch an immediate run in order to gather and analyze recent events.

**Problem**

The Activity Graph engine has run successfully recently, but recommendations are not shown in the task flows.

**Solution**

Verify the relation tables in the Activities database (`ActivitiesDS`) for the presence of any data. If the Activity Graph engines are working correctly, these relation tables should have some data in them. If data is present in the tables and there are still no recommendations in the task flows, then the task flows might be broken.

## 45.5.2 Troubleshooting the Recommended Connections Task Flow

**Problem**

Some users are not shown as recommended connections in spite of valid user interactions.

**Solution**

This might happen if WebCenter Portal: Spaces and the services are not wired with the same OID. In this case, users who are not present in the OID to which the services are wired will not be suggested recommendation connections. The same users should be present in both the OIDs, or the WebCenter Portal: Spaces and services should be wired to the same OID.

## 45.5.3 Troubleshooting the Similar Items Task Flow

For recommended items to be displayed in the Similar Items task flow, the item for which the recommended items are to be displayed should be selected in another task flow on the page (for example, the Document Manager task flow).

**Problem**

An item is not suggested in the Similar Items task flow even after valid user interaction.

**Solution**

This could be because the current user does not have view privileges on the item. This is the correct behavior. Users should not see recommendations for items on which they do not have sufficient privileges. If the user should be able to see the item, grant the user sufficient privileges.

**Problem**

Specific types of items are not being displayed (for example, documents, wikis, and blogs are seen in the task flow, but not discussions).

**Solution**

Check the status of the specific service. If the service is unavailable items from that service will not be displayed in the Similar Items task flow.

**Problem**

Items are suggested only for some users; other users do not get any suggested items in the Similar Items task flow.

**Solution**

This might happen if WebCenter Portal: Spaces and the services are not wired with the same OID. In this case, users who not present in the OID to which the services are wired will not see suggested items from that service. The same users should be present in both the OIDs, or the WebCenter Portal: Spaces and services should be wired to the same OID.

# Part VIII

---

## Helping Users Keep Track

Part VIII contains the following chapters:

- [Chapter 46, "Integrating the Analytics Service"](#)
- [Chapter 47, "Integrating the Lists Service"](#)
- [Chapter 48, "Integrating Notifications"](#)
- [Chapter 49, "Integrating the Recent Activities Service"](#)
- [Chapter 50, "Integrating the Worklist Service"](#)
- [Chapter 51, "Integrating the Events Service"](#)
- [Chapter 52, "Integrating the RSS Service"](#)

---

---

## Integrating the Analytics Service

The Analytics service enables you to display usage and performance metrics for Framework applications. This chapter describes how to integrate the Analytics service into applications built using Oracle WebCenter Portal: Framework.

This chapter includes the following sections:

- [Section 46.1, "Introduction to the Analytics Service"](#)
- [Section 46.2, "Basic Configuration for the Analytics Service"](#)
- [Section 46.3, "Building Analytics Reports"](#)

For information about using any of the analytics task flows, see Chapter "Working with the Analytics Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

For a detailed list of database tables and parameters, see [Appendix G, "WebCenter Portal Analytics Database Schema."](#)

### 46.1 Introduction to the Analytics Service

The Analytics service offers real-time usage and activity reporting for your portal. This section provides an overview of the Analytics service, its task flows, and its usages. It includes the following subsections:

- [Section 46.1.1, "Understanding the Analytics Service"](#)
- [Section 46.1.2, "Requirements for the Analytics Service"](#)
- [Section 46.1.3, "What Happens at Runtime"](#)

#### 46.1.1 Understanding the Analytics Service

The Analytics service allows administrators and users to track and analyze traffic and usage in WebCenter Portal application. The Analytics service provides the following basic functionality:

- **Usage Tracking Metrics:** The Analytics service collects and reports metrics for common portal functions, including community, page, portlet, and document hits.
- **Behavior Tracking:** The Analytics service can be used to analyze WebCenter Portal metrics to determine usage patterns, such as page visit duration and usage over time.
- **User Profile Correlation:** The Analytics service can be used to correlate metric information with user profile information. Usage tracking reports can be viewed and filtered by user profile data such as country, company or title.

- **Custom Reporting:** Developers and business users can build custom reports that query the analytics data. For more details, see [Section 46.3.1, "Using SQL Data Controls"](#).

[Table 46–1](#) lists the analytics task flows available with WebCenter Portal. These task flows work similarly for Spaces and Framework applications. For detailed information about these task flows and how to use them, see "Understanding Analytics Task Flows in Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Table 46–1 Analytics Task Flows Available in JDeveloper**

Task Flows	Description
WebCenter Portal Traffic	A summarized view for common events within the portal.
Page Traffic	Displays the number of page hits and the number of unique users that visited any page within the portal.
Login Metrics	Reports portal logins.
Portlet Traffic	Displays usage data for a portlet.
Portlet Response Time	Displays performance data for a portlet.
Portlet Instance Traffic	Displays usage data for a portlet instance*.
Portlet Instance Response Time	Displays performance data for a portlet instance*.
Search Metrics	Tracks portal searches.
Document Metrics	Tracks document views.
Wiki Metrics	Tracks most popular/least popular wikis.
Blog Metrics	Tracks most popular/least popular blogs.
Discussion Metrics	Tracks most popular/least popular discussions.

\* If the same portlet is displayed on several different pages, each placement is known as a portlet instance.

## 46.1.2 Requirements for the Analytics Service

The Analytics service requires that the *analytics schema* (ACTIVITIES) is configured and running on an appropriate database. In addition, Oracle WebCenter Portal's *Analytics Collector* must be up and running on the WC\_utilities managed server. For detailed installation instructions, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

On install, the Analytics Collector is configured to receive events out-of-the-box, using installation defaults. If the default values are not suitable for your installation, you may need to configure different values using WLST or Fusion Middleware Control. For more details, see "Configuring Analytics Collector Settings" *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To display usage and performance metrics through analytics task flows you must enable event generation for your Framework application and configure a connection to the Analytics database (ACTIVITIES). For details on how to do this in JDeveloper, see [Section 46.2.2, "Setting up Connections for the Analytics Service"](#).

## 46.1.3 What Happens at Runtime

At runtime, user activity in your Framework application generates event data. For example, every time a user logs in, reads a discussion topic, views a document, and

so on, the event is recorded. The OpenUsage API sends event metrics to the Analytics Collector using UDP (User Datagram Protocol) and the event data is stored in the analytics database (ACTIVITIES).

In a non-clustered environment the Framework application is configured with the location of the collector, and all events are transmitted to that location.

---

---

**Note:** In the current release, the Analytics Collector cannot be clustered.

---

---

Analytics task flows and custom analytics reports (based on SQL data controls) that are included in Framework applications display the metrics collected for standard events by querying the analytics database at runtime. For more information about the task flows at runtime, see "Working with Analytics Task Flows" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 46.2 Basic Configuration for the Analytics Service

This section describes how to include the Analytics service in your Framework applications.

This section contains the following subsections:

- [Section 46.2.1, "Configuration Roadmap for the Analytics Service"](#)
- [Section 46.2.2, "Setting up Connections for the Analytics Service"](#)
- [Section 46.2.3, "Adding Analytics Event Code to Your Application"](#)
- [Section 46.2.4, "Configuring a Namespace for Analytics Customizations in MDS"](#)
- [Section 46.2.5, "Adding Analytics Task Flows at Design Time"](#)
- [Section 46.2.6, "Setting up Security for Analytics Task Flows and Usage Data"](#)

See also, [Section 46.1.2, "Requirements for the Analytics Service"](#).

### 46.2.1 Configuration Roadmap for the Analytics Service

The flow chart depicted in [Figure 46–1](#) and [Table 46–2](#) provide an overview of the prerequisites and tasks required to get the Analytics service working in Framework applications.

**Figure 46–1 Configuring the Analytics Service for Framework applications**

**Table 46–2 Configuring the Analytics Service for Framework applications**

Actor	Task	Sub-task
Administrator	1. Install Oracle WebCenter Portal: Framework and the back-end components for the Analytics service	
Developer	2. Integrate the Analytics service in your Framework application	2.a Configure a connection to the Activities database in JDeveloper 2.b Configure a connection to the Analytics Collector in JDeveloper 2.c Add an analytics task flow to a page in JDeveloper

**Table 46–2 (Cont.) Configuring the Analytics Service for Framework applications**

Actor	Task	Sub-task
Developer/ Administrator	3. Deploy the Framework application using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> <li>■ WLS Admin Console (Administrator)</li> </ul>	
Administrator	4. (Optional) Configure the Analytics Collector using either of the following tools: <ul style="list-style-type: none"> <li>■ System MBean Browser</li> <li>■ WLST</li> </ul>	
Developer	5. (Optional) Instrument events for pages and portlets using JDeveloper, then redeploy the application.	
Developer/ Administrator	6. (Optional) Add/modify connection parameters using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper, then redeploy the application (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> </ul>	
End User	7. Test that analytics data is available in the Framework application	6.a Log in to the Framework application 6.b Display the analytics task flow

## 46.2.2 Setting up Connections for the Analytics Service

The Analytics service requires that the Framework application is connected to the analytics database (ACTIVITIES). You must also configure the Framework application to send event information to a specific Analytics Collector.

---

**Note:** While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Fusion Middleware Control. For more information, see "Managing the Analytics Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

This section includes the following subsections:

- [Section 46.2.2.1, "How to Set Up a Connection to the Analytics Database"](#)
- [Section 46.2.2.2, "How to Set Analytics Collector Properties"](#)
- [Section 46.2.2.3, "How to Set Up a Connection to the Analytics Collector"](#)

### 46.2.2.1 How to Set Up a Connection to the Analytics Database

The Analytics service requires a connection to the analytics database (ACTIVITIES) where analytics event data is stored.

To set up the analytics database connection:

1. Ensure that the ACTIVITIES database is up and running.  
See [Section 46.1.2, "Requirements for the Analytics Service"](#).
2. In the Application Navigator, expand the Applications Resources panel.
3. Right-click **Connections**, then choose **New Connection**, and then **Database**.
4. In the Create Database Connection dialog, enter the following information for the database connection:
  - **Connection Name:** *connectionName* (for example, *myAnalyticsDatabaseConnection*)
  - **Connection Type:** Oracle (JDBC)
  - **Username:** *username* (a user with access to the database)
  - **Password:** *password* (the specified user's password)
  - **Host Name:** *host* (where the analytics database is installed, for example *localhost*)
  - **JDBC Port:** *port* (for example, 1521)
  - **SID:** *sid* (system identifier for the database)
5. Click **Test Connection**, and if it is successful, then click **OK**.
6. In the Associate to Data Source dialog, choose **ActivitiesDS** ([Figure 46-2](#)).

**Figure 46-2 Connecting to the Analytics Database**

This creates a data-source to the ACTIVITIES schema so that you can test analytics in your Framework application at design-time.

7. Click **OK**.

The connection appears as a node in the Application Resources pane, under Connections.

### 46.2.2.2 How to Set Analytics Collector Properties

Out-of-the-box, the Analytics Collector is installed on the *WC\_Utilities* managed server and is configured to receive events using the following default values:

<b>Analytics Collector Configuration</b>	<b>Default Value</b>
Collector Host Name	localhost
Default Port	31314
Maximum Port Number	31314
Broadcast Type	Multicast
Clustering	Disabled
Cluster Name	- null
Cluster Broadcast Frequency	- 10 seconds

If these defaults are not suitable for your installation, your administrator can configure suitable values using WLST or the Fusion Middleware Control. For more information, see "Configuring Analytics Collector Settings" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 46.2.2.3 How to Set Up a Connection to the Analytics Collector

The Analytics service requires a connection to the Analytics Collector that is collecting WebCenter Portal events and OpenUsage must be enabled in the Framework application.

Use the following OpenUsage JVM properties to set properties for the Analytics service:

- `oracle.wc.openusage.enabled` - Specifies whether to send analytics events raised using OpenUsage APIs to the Analytics Collector. Valid values are `true` and `false`. The default value is `false`.
- `oracle.wc.openusage.unicast` - Specifies whether events are sent to a clustered Analytics Collector in multicast mode or whether a single Analytics Collector using unicast communication is required. Valid values are `true` and `false`. The default value is `true` (unicast). Currently, clusters are not supported so specify only `true` here.
- `oracle.wc.openusage.clustername` - Name of the collector cluster or the host name of an Analytics Collector. Currently, clusters are not supported so specify only the host name here. The default value is `localhost`.
- `oracle.wc.openusage.collectorport` - Port on which the Analytics Collector listens for events. The default value is `31314`.
- `oracle.wc.openusage.timeout` - Period of time (in seconds) used to determine availability of the collector service in multicast mode. The default value is `30` seconds.

To set Analytics Collector JVM properties:

1. In JDeveloper, choose **Run, Active Run Configuration**, and then **Manage Run Configurations** from the main menu.
2. In the Project Properties dialog, select the **Default** run configuration, and then click **Edit**.
3. In the **Launch Settings** section, add the following OpenUsage options to the **Java Options** field as follows:

```
-Doracle.wc.openusage.enabled=true
-Doracle.wc.openusage.clustername=localhost
-Doracle.wc.openusage.collectorport=31314
```

```
-Doracle.wc.openusage.unicast=true  
-Doracle.wc.openusage.timeout=30
```

---

---

**Note:** In the current release the `oracle.wc.openusage.unicast` value must be set to `true`. The Analytics Collector cannot be clustered in this release, so multicast is not supported.

---

---

Ensure that the values you provide, shown here in bold, match your Analytics Collector installation.

4. Click **OK** to save the default run configuration, and then click **OK** again.

These steps enable OpenUsage in the Integrated WebLogic Server for the current Framework application. If the Integrated WebLogic Server is currently running you must restart it to pick up the new settings. See also, [Section 69.2, "Deploying a Framework Application to the Integrated WebLogic Server"](#).

### 46.2.3 Adding Analytics Event Code to Your Application

Most events are configured out-of-the-box, so no additional coding is required in your application to send events. The only exception is page view events, which require additional code, as described in [Section 46.2.3.1, "Including Event Code for Page Views."](#)

#### 46.2.3.1 Including Event Code for Page Views

To send page events, you must add event code to each page. Following is an example using a client JavaScript event on the page which, in turn, calls the Java Analytics API to send the actual event. To implement this example, you add the following code just below the `<af:document>` tag, replacing the `pageName` value with the name of the page for which you are sending events:

```
<af:resource type="javascript">  
    function initPageLoadEvent(event) {  
        AdfCustomEvent.queue(event.getSource(),  
            "generatePageEvent",  
            {pageName:"Page and Login Statistics"},  
            true);  
        event.cancel();  
    }  
</af:resource>  
<af:clientListener method="initPageLoadEvent" type="load"/>  
<af:serverListener type="generatePageEvent"  
    method="#{AnalyticsInstrumentation.sendPageEvent}"/>
```

The example above generates a client event when the ADF document gets loaded, then the defined server listener actually sends the event. Here is the java bean that sends the event:

```
public void sendPageEvent(ClientEvent event) {  
    // Checks whether Analytics events must be sent  
    if (!AnalyticsUtil.isSendingEvents())  
        return;  
  
    HttpServletRequest request =  
(HttpServletRequest) FacesContext.getCurrentInstance().getExternalContext().get  
Request();  
    String requestUser = request.getRemoteUser();
```

```

//SEND PAGE VIEW EVENT
String pageName = (String)event.getParameters().get("pageName");
if (pageName == null || pageName.isEmpty() || requestUser == null)
    return;

AnalyticsUtil.sendPageViewEvent(FacesContext.getCurrentInstance().getViewRoot().get
tViewId(),
    "PortalApp", //spaceDisplayName
    requestUser, //username
    0, pageName, false, request);
}

```

## 46.2.4 Configuring a Namespace for Analytics Customizations in MDS

Analytics task flows use MDS to store customizations made by the user and these customizations are stored in an MDS namespace specific to analytics. If you want to enable user customizations for analytics task flows in your Framework application, you must configure a namespace for the analytics metadata in `adf-config.xml`.

---

**Note:** In addition, each task flow must specify a unique MDS document in which to store user customizations details. See [Section 46.2.5.4, "How to Allow End Users to Customize Analytics Task Flows at Runtime"](#).

---

To configure a namespace for analytics metadata:

1. Open `adf-config.xml`.

Use the Application Resources panel to navigate to this file. The file is located in the `Descriptors\ADF META-INF` folder.

2. Under the `<metadata-namespaces>` element, add the following XML fragment:

```

<namespace path="/oracle/webcenter/analytics/scopedMD"
metadata-store-usage="WebCenterFileMetadataStore"/>

```

3. Save the file.

See also, [Chapter 22, "Performing Composer-Specific MDS Configurations"](#).

## 46.2.5 Adding Analytics Task Flows at Design Time

This section describes the Analytics service task flows and how to add analytics task flows to your application. It includes the following subsections:

- [Section 46.2.5.1, "Analytics Task Flows"](#)
- [Section 46.2.5.2, "How to Add Analytics Task Flows to a Page"](#)
- [Section 46.2.5.3, "How to Modify Analytics Task Flow Parameters"](#)
- [Section 46.2.5.4, "How to Allow End Users to Customize Analytics Task Flows at Runtime"](#)
- [Section 46.2.5.5, "Analytics Task Flows and Task Flow Parameters"](#)

### 46.2.5.1 Analytics Task Flows

Table 46–3 lists the analytics task flows available with WebCenter Portal. For detailed information about these task flows and the type of information that users can see at runtime, see "Understanding Analytics Task Flows in Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Table 46–3 Analytics Task Flows Available in JDeveloper**

Analytics Task Flows	Description
WebCenter Portal Traffic	A summarized view for common events within the portal.
Page Traffic	Displays the number of page hits and the number of unique users that visited any page within the portal.
Login Metrics	Reports portal logins.
Portlet Traffic	Displays usage data for a portlet.
Portlet Response Time	Displays performance data for a portlet.
Portlet Instance Traffic	Displays usage data for a portlet instance*.
Portlet Instance Response Time	Displays performance data for a portlet instance*.
Search Metrics	Tracks portal searches.
Document Metrics	Tracks document views.
Wiki Metrics	Tracks most popular/least popular wikis.
Blog Metrics	Tracks most popular/least popular blogs.
Discussion Metrics	Tracks most popular/least popular discussions.

### 46.2.5.2 How to Add Analytics Task Flows to a Page

To add an analytics task flow to your Framework application:

1. Prepare your application as described in [Section 46.1.2, "Requirements for the Analytics Service"](#).
2. Ensure that your application includes the services for which analytics event data is available, that is, portlets, discussions, documents, and search.

---

**Note:** If no usage data exists when you run the application, analytics task flows displays the message: `No data to display`

---

3. Open the JSF page (.jspx) on which you want to add the task flow.
4. In the Resource Palette, open the **WebCenter Portal Services Catalog**, then open the **Task Flows** folder ([Figure 46–3](#)).

**Figure 46–3 Analytics Task Flows Available Through the Resource Palette**

5. Drag and drop an **Analytics** task flow onto your page inside the `<af:form>` tag.
6. Choose **Region** from the Create context menu.

You may be prompted to add the ADF library for the Analytics service (`analytics-reporting-service-view.jar`) to the project. Confirm by clicking **Add Library** (Figure 46–4).

**Figure 46–4 Adding the ADF Library for the Analytics Service**

7. In the **Edit Task Flow Binding** dialog, enter values for analytics task flow parameters:
  - `applicationName` - Required

- analyticsResourceId - Required
- analyticsReportTitle - Optional
- maxDataPointsPerSeries - Optional

For more information, see [Section 46.2.5.5, "Analytics Task Flows and Task Flow Parameters"](#).

**8. Click OK.**

The task flow is added to the page, and the ViewController project's libraries are configured to run the task flow.

**9. Save your project and run the page to see the task flow running in the Framework application.**

If no usage data exists when you run the application, analytics task flows display the message: `No data to display`

You may create some data for the analytics task flow to display by performing actions that relate to the task flow you are testing. For example, to test discussion metrics, create and view discussions, to test page metrics, create and view pages, and so on.

### **46.2.5.3 How to Modify Analytics Task Flow Parameters**

Each analytics task flow has a set of required and optional task flow binding parameters. Required parameters are not mandatory but enable you to capture information that is essential to the task flow's successful function. For example, if you want user customizations for a particular task flow instance to be stored in MDS you must specify the MDS document required.

In addition, you can use task flow binding parameters to customize the appearance and behavior of a task flow instance. For example, you can use parameter values to specify a display title above your analytics data.

You can provide task flow binding parameter values when you drag and drop a task flow onto an application page. Doing so opens the Task Flow Bindings dialog (for more information, see [Section 46.2.5.2, "How to Add Analytics Task Flows to a Page"](#)).

You can also adjust task flow binding parameter values after you have placed a task flow on a page at run time. For details, see "Setting Analytics Task Flow Properties" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To access the Edit Task Flow Binding dialog:

- 1.** Click the **Bindings** tab at the bottom of the page (next to the **Source** tab) to go to the Bindings view.
- 2.** Under **Executables**, you will see a list of task flows added to the page. Select the analytics task flow ([Figure 46-5](#)).

**Figure 46–5 Accessing Input Parameters for Analytics Task Flows**

3. Next to the Executables heading, click the **Edit selected element** icon (a pencil).
4. In the Edit Task Flow Binding dialog (Figure 46–6), specify the binding parameter values as required

For more information, see [Section 46.2.5.5, "Analytics Task Flows and Task Flow Parameters"](#).

**Figure 46–6 Adding Binding Parameters for Analytics Task Flows**

5. When you are finished, save the page and run your page to see the results.

**46.2.5.4 How to Allow End Users to Customize Analytics Task Flows at Runtime**

If you want to enable user customizations for a particular task flow instance you must specify the MDS document where customizations are stored using the Analytics Resource Id parameter.

The ID must be unique, so consider using a consistent naming pattern such as <app\_name>\_<page\_name>\_<task\_flow>\_<sequence>. For example, set the analyticsResourceId parameter for a Page Traffic task flow to myapp\_analyticspage\_pagetraffic\_1.

For details, see [Section 46.2.5.3, "How to Modify Analytics Task Flow Parameters"](#).

### 46.2.5.5 Analytics Task Flows and Task Flow Parameters

Table 46–4 lists and describes task flow binding parameters applicable to the Analytics service.

**Table 46–4 Analytics Task Flow Binding Parameters**

Parameter (* = required)	Task Flows	Description
analyticsReportTitle	All	Specifies the display title that appears above the analytics data, that is, you can override the default report title. See also, <a href="#">Figure 46–7, "analyticsReportTitle - Example"</a> .
analyticsResourceId*	All	Specifies the MDS document that will be generated to store user customizations/application customizations for the task flow instance in MDS. For example: mymainloginmetrics
applicationName*	All	Specifies the name of the Framework application for which you want to display analytics data. For example: MyPortalApplication  The analytics database can be used to store event data from multiple applications so this parameter is required to identify which application data to display.  If omitted, the task flow display analytics data for all applications.
maxDataPointsPerSeries	All	Indicates the maximum number of data points to be displayed in a bar or line chart. Enter a value between 1 and 1000.  The default value is 25.  Increasing the number of data points can increase the time it takes to display the chart. See also, <a href="#">Figure 46–8, "maxDataPointsPerSeries - Example"</a> .

**Figure 46–7 analyticsReportTitle - Example**

Figure 46–8 *maxDataPointsPerSeries* - Example

## 46.2.6 Setting up Security for Analytics Task Flows and Usage Data

Analytics task flows are intended to make usage metrics visible to a limited set of administrative users who perform particular business functions, such as capacity planning, quality of service (QoS) analysis, return on investment (ROI) analysis, "best bet" customization for Search, and so on.

Analytics usage data is valuable for portal analysis but might be regarded as private or sensitive to portal users. For example, the Search, Document, and Portlet reports can be configured to display activity metrics for a particular user, based on user properties such as E-mail Address, First Name, or Last Name.

To protect security and privacy interests associated with analytics task flows and custom reports:

- Manage administrative access to the analytics task flows, custom reports, and any page that displays sensitive usage data.

To ensure that only a limited number of administrative users can add analytics task flows to pages, create reports based on custom analytics data controls, or view pages set up to display sensitive usage metrics, create a new administrative group and manage group membership accordingly.

- Manage user access to analytics task flows.

Ensure analytics task flows and custom reports do not contain private or sensitive data unless such a view is particularly intended. If the metrics in the report do contain private or sensitive data, configure security so that only appropriate, specified users have access to the task flow or the page.

For example, at design-time, developers can expose the analytics task flows to non-admin users by granting them appropriate privileges to the page. In addition, developers can customize the reports pre-deployment, to hide or show and predefine certain report options (such as time frame, chart type, user property filter, group by option, and so on). Administrators will be able to perform the same tasks at runtime, that is, grant page access and customize the information that

displays. Non-admin users can still personalize the reports they are allowed to see, but they cannot change customizations made by the administrator.

- Ensure that unauthenticated users are never allowed to add analytics task flows to pages or see sensitive data.

## 46.3 Building Analytics Reports

Out-of-the-box analytics task flows present common analytics event metrics in a specific display format. If you want to present analytics data in a different way or display custom event data, you can build a custom analytics report using SQL.

This section contains the following subsections:

- [Section 46.3.1, "Using SQL Data Controls"](#)
- [Section 46.3.2, "SQL Statements for Out-of-the-Box Analytics Reports"](#)
- [Section 46.3.3, "Sample Queries for User Metrics"](#)
- [Section 46.3.4, "Sample Analytics Database Queries for Specific Metrics"](#)

For a detailed list of database tables and parameters, see [Appendix G, "WebCenter Portal Analytics Database Schema."](#)

### 46.3.1 Using SQL Data Controls

Use SQL data controls to define, in an SQL query statement, the information you want to retrieve from the analytics database. When you expose data controls on a page you can choose whether the analytics data presents in a graph, table or a form, and you can also configure the bind parameters and other display options.

You can use JDeveloper to build SQL data controls at design-time. For detailed information about data controls, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

You can also create data controls in a running Framework application if runtime resource management features are enabled. To do this in the Spaces application, see "Creating a SQL Data Control" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. To create a data control in other Framework applications, see "Managing Application Resources" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Use a SQL data control to fetch data from the analytics database and display analytics data in your Framework application. [Figure 46–9](#) shows the sample SQL statement below in a Create/Edit SQL Data Control dialog in Spaces. A database connection to the analytics database (ActivitiesDS) is required, and you must provide a valid database password.

#### Sample SQL: Page Hits by Day

```
SELECT space.name_, page.name_, space.id, page.id, count(1), fact.page_,
page.resourceid_
FROM asfact_wc_pagevie_0 fact, asdim_wc_groupsp_0 space, asdim_wc_pages_0 page,
asdim_wc_applica_0 app
WHERE space.id = fact.groupspace_
and page.id = fact.page_
and app.id = fact.application_
and fact.occurred between to_date(:startdate, :dateformat)
and to_date(:enddate, :dateformat)
and app.name_ = :appname
```

```

and page.personal_ = :ispersonal
and space.name_ is not null
and page.name_ is not null
and space.id is not null
and page.id is not null
and fact.page_ is not null
and page.resourceid_ is not null
GROUP BY space.name_, page.name_, space.id, page.id, fact.page_, page.resourceid_
ORDER BY count(1) desc

```

**Figure 46–9** Creating SQL Data Control Dialog in Spaces

**Create New Data Control**

Database Connection: jdbc/WebCenterDS

Choose the connection from existing database objects: ActivitesDS

\* Enter password for verification: .....

**SQL Statement**

```

SELECT space.name_ page.name_ space.id, page.id, count(1), fact.page_ page.resourceid_
FROM asfact_wc_pagevie_0 fact , asdim_wc_groupsp_0 space , asdim_wc_pages_0 page ,
asdim_wc_applica_0 app
WHERE space.id = fact.groupspace_ and page.id = fact.page_ and app.id = fact.application_
and fact.occurred between to_date(:startdate, :dateformat) and to_date(:enddate,
:dateformat) and app.name_ = :appname and page.personal_ = :ispersonal
and space.name_ is not null and page.name_ is not null and space.id is not null and page.id is

```

Hint: Use :bind-name to refer to bind variables in the SQL Statement

Test

**Parameters**

startdate=, dateformat=, appname=webcenter, ispersonal=1, enddate=

Enter bind parameter values

\* Name: Page Hits By Day

Description: Number of page hits|grouped by day

You can add as many bind parameters as required. When you add parameters, you can restrict the data retrieved from the data source based on the parameter values you specify. As this example is for the Spaces application, the name of the application is set to webcenter and personal pages (pages in the Home space) are included in the report shown in [Figure 46–10](#).

**Figure 46–10** Setting Report Parameters

**Enter bind parameter values**

Bind parameter	Value
startdate	
dateformat	
appname	webcenter
ispersonal	1

OK Cancel

**Table 46–5 Report Parameters**

Parameter	Default Value	Description
appname	webcenter	The corresponding application name, always webcenter for Spaces. Other Framework application will have a different name.
ispersonal	0 or 1	For Spaces, determines whether or not pages created in the Home space are included in the report.
dateformat	mm/dd/yyyy hh24	Any valid pattern for dates in an Oracle database. Every component of the pattern is optional since it depends on the data you want to retrieve.
startdate	01/01/2010	Determines a start date for the data required.
enddate	01/01/2011	Determines an end date for the data required.

Figure 46–9 shows the custom report displayed as a graph.

**Figure 46–11 Sample Analytics Report - Page Hits by Day**

### 46.3.2 SQL Statements for Out-of-the-Box Analytics Reports

This section provides SQL statements that can be used as a starting point for custom reports. You can customize these statements in many ways by providing additional filters, groupings, and so on.

- [Analytics SQL: WebCenter Portal Traffic](#)
- [Analytics SQL: Page Traffic](#)
- [Analytics SQL: Login Metrics](#)
- [Analytics SQL: Space Traffic](#)
- [Analytics SQL: Space Response Time](#)
- [Analytics SQL: Portlet Traffic](#)
- [Analytics SQL: Portlet Instance Traffic](#)

- [Analytics SQL: Portlet Response Time](#)
- [Analytics SQL: Portlet Instance Response Time](#)
- [Analytics SQL: Search Metrics](#)
- [Analytics SQL: Document Metrics](#)
- [Analytics SQL: Wiki Metrics](#)
- [Analytics SQL: Blog Metrics](#)
- [Analytics SQL: Discussion Metrics](#)

For a detailed list of database tables and parameters, see [Appendix G, "WebCenter Portal Analytics Database Schema."](#)

### 46.3.2.1 Analytics SQL: WebCenter Portal Traffic

```

SELECT 'Spaces' Name, count(1) Hits
  FROM asfact_wc_groupssp_0 fact, asdim_wc_groupssp_0 space, asdim_wc_applica_0 app
 WHERE space.id = fact.groupspace_
       and app.id = fact.application_
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat)
       and app.name_ = :appname and space.personal_ = :ispersonal
UNION ALL
SELECT 'Pages' Name, count(1) Hits
  FROM asfact_wc_pagevie_0 fact , asdim_wc_pages_0 page , asdim_wc_applica_0 app
 WHERE page.id = fact.page_
       and app.id = fact.application_
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat)
       and app.name_ = :appname
       and page.personal_ = :ispersonal
UNION ALL
SELECT 'Portlets' Name, count(1) Hits
  FROM asfact_wc_portlet_0 fact, asdim_wc_applica_0 app
 WHERE app.id = fact.application_
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat)
       and app.name_ = :appname
UNION ALL
SELECT 'Logins' Name, count(1) Hits
  FROM asfact_wc_logins_0 fact , asdim_wc_applica_0 app
 WHERE app.id = fact.application_
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat)
       and app.name_ = :appname
UNION ALL
SELECT 'Searches' Name, count(1) Hits
  FROM asfact_wc_searche_0 fact , asdim_wc_applica_0 app
 WHERE app.id = fact.application_
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat)
       and app.name_ = :appname
UNION ALL
SELECT 'Wikis' Name, count(1) Hits
  FROM asfact_wc_doclib__0 fact, asdim_wc_documen_0 doc, asdim_wc_applica_0 app
 WHERE app.id = fact.application_
       and fact.document_ = doc.id
       and fact.occurred between to_date(:startdate, :dateformat)
       and to_date(:enddate, :dateformat) and app.name_ = :appname

```

```

        and doc.objecttype_ like '%WIKI%'
UNION ALL
SELECT 'Blogs' Name, count(1) Hits
FROM asfact_wc_doclib__0 fact, asdim_wc_documen_0 doc, asdim_wc_applica_0 app
WHERE app.id = fact.application_
      and fact.document_ = doc.id
      and fact.occurred between to_date(:startdate, :dateformat)
      and to_date(:enddate, :dateformat)
      and app.name_ = :appname
      and doc.objecttype_ like '%BLOG%'
UNION ALL
SELECT 'Documents' Name, count(1) Hits

    and portlet.id is not null
    and fact.portlet_ is not null
    and portlet.resourceid_ is not null
GROUP BY portlet.default_title_, portlet.id, fact.portlet_, portlet.resourceid_

```

#### 46.3.2.7 Analytics SQL: Portlet Instance Traffic

```

SELECT space.name_, space.id, page.name_, page.id, portletinst.title_,
portletinst.id, count(1), fact.portlet_instance_, portletinst.resourceid_
FROM asfact_wc_portlet_0 fact, asdim_wc_groupssp_0 space, asdim_wc_pages_0 page,
asdim_wc_portlet_1 portletinst, asdim_wc_applica_0 app
WHERE space.id = fact.groupspace_
    and page.id = fact.page_
    and app.id = fact.application_
    and portletinst.id = fact.portlet_instance_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname

```

```

and space.name_ is not null
and space.id is not null
and page.name_ is not null
and page.id is not null
and portletinst.title_ is not null
and portletinst.id is not null
and fact.portlet_instance_ is not null
and portletinst.resourceid_ is not null
GROUP BY space.name_, space.id, page.name_, page.id, portletinst.title_,
portletinst.id, fact.portlet_instance_, portletinst.resourceid_

```

#### 46.3.2.8 Analytics SQL: Portlet Response Time

```

SELECT portlet.default_title_, portlet.id, avg(fact.response_time_),
fact.portlet_, portlet.resourceid_
FROM asfact_wc_portlet_0 fact, asdim_wc_portlet_0 portlet, asdim_wc_applica_0
app
WHERE app.id = fact.application_
and portlet.id = fact.portlet_
and fact.occurred between to_date(:startdate, :dateformat)
and to_date(:enddate, :dateformat)
and app.name_ = :appname
and portlet.default_title_ is not null
and portlet.id is not null
and fact.portlet_ is not null
and portlet.resourceid_ is not null
GROUP BY portlet.default_title_, portlet.id, fact.portlet_, portlet.resourceid_

```

#### 46.3.2.9 Analytics SQL: Portlet Instance Response Time

```

SELECT space.name_, space.id, page.name_, page.id, portletinst.title_,
portletinst.id, avg(fact.response_time_), fact.portlet_instance_,
portletinst.resourceid_
FROM asfact_wc_portlet_0 fact, asdim_wc_groupsp_0 space, asdim_wc_pages_0 page,
asdim_wc_portlet_1 portletinst, asdim_wc_applica_0 app
WHERE space.id = fact.groupspace_
and page.id = fact.page_
and app.id = fact.application_
and portletinst.id = fact.portlet_instance_
and fact.occurred between to_date(:startdate, :dateformat)
and to_date(:enddate, :dateformat)
and app.name_ = :appname
and space.name_ is not null
and space.id is not null
and page.name_ is not null
and page.id is not null
and portletinst.title_ is not null
and portletinst.id is not null
and fact.portlet_instance_ is not null
and portletinst.resourceid_ is not null
GROUP BY space.name_, space.id, page.name_, page.id, portletinst.title_,
portletinst.id, fact.portlet_instance_, portletinst.resourceid_

```

#### 46.3.2.10 Analytics SQL: Search Metrics

```

SELECT search.phrase_, search.id, count(1)
FROM asfact_wc_searche_0 fact, asdim_wc_applica_0 app, asdim_wc_searche_0 search
WHERE app.id = fact.application_
and search.id = fact.searched_phrase_
and fact.occurred between to_date(:startdate, :dateformat)
and to_date(:enddate, :dateformat)

```

```

    and app.name_ = :appname
    and search.phrase_ is not null
    and search.id is not null
GROUP BY search.phrase_, search.id

```

#### 46.3.2.11 Analytics SQL: Document Metrics

```

SELECT doc.name_, doc.id, count(1), fact.document_, doc.resourceid_
FROM asfact_wc_doclib__0 fact, asdim_wc_documen_0 doc, asdim_wc_applica_0 app
WHERE app.id = fact.application_
    and fact.document_ = doc.id
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
    and doc.objecttype_ like '%DOCUMENT%'
    and doc.name_ is not null
    and doc.id is not null
    and fact.document_ is not null
    and doc.resourceid_ is not null
GROUP BY doc.name_, doc.id, fact.document_, doc.resourceid_

```

#### 46.3.2.12 Analytics SQL: Wiki Metrics

```

SELECT doc.name_, doc.id, count(1), fact.document_, doc.resourceid_
FROM asfact_wc_doclib__0 fact, asdim_wc_documen_0 doc, asdim_wc_applica_0 app
WHERE app.id = fact.application_
    and fact.document_ = doc.id
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
    and doc.objecttype_ like '%WIKI%'
    and doc.name_ is not null
    and doc.id is not null
    and fact.document_ is not null
    and doc.resourceid_ is not null
GROUP BY doc.name_, doc.id, fact.document_, doc.resourceid_

```

#### 46.3.2.13 Analytics SQL: Blog Metrics

```

SELECT doc.name_, doc.id, count(1), fact.document_, doc.resourceid_
FROM asfact_wc_doclib__0 fact, asdim_wc_documen_0 doc, asdim_wc_applica_0 app
WHERE app.id = fact.application_
    and fact.document_ = doc.id
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)
    and app.name_ = :appname
    and doc.objecttype_ like '%BLOG%'
    and doc.name_ is not null
    and doc.id is not null
    and fact.document_ is not null
    and doc.resourceid_ is not null
GROUP BY doc.name_, doc.id, fact.document_, doc.resourceid_

```

#### 46.3.2.14 Analytics SQL: Discussion Metrics

```

SELECT forum.name_, forum.id, count(1), fact.topic_, forum.resourceid_
FROM asfact_wc_discuss_0 fact, asdim_wc_discuss_0 forum, asdim_wc_applica_0 app
WHERE app.id = fact.application_
    and forum.id = fact.topic_
    and fact.occurred between to_date(:startdate, :dateformat)
    and to_date(:enddate, :dateformat)

```

```

and app.name_ = :appname
and forum.name_ is not null
and forum.id is not null
and fact.topic_ is not null
and forum.resourceid_ is not null
GROUP BY forum.name_, forum.id, fact.topic_, forum.resourceid_

```

### 46.3.3 Sample Queries for User Metrics

This section provides example queries for user-specific metrics. It includes the following samples:

- [Sample SQL: Filter by User Property](#)
- [Sample SQL: Group by User Property](#)

For a detailed list of database tables and parameters and information on user properties, see [Section G.5, "Analytics User Properties" in Appendix G, "WebCenter Portal Analytics Database Schema."](#)

#### 46.3.3.1 Sample SQL: Filter by User Property

The following query returns the names of the pages accessed by users in the Sales department, and the number of views for each of those pages.

```

SELECT p.name_ as page, count(*) as views
FROM asfact_wc_pagevie_0 f
JOIN asdim_wc_pages_0 p on f.page_ = p.id
JOIN asdim_userpropertyvalues pv on f.userid = pv.userid
JOIN asdim_userproperties pr on pv.propertyid = pr.id
WHERE pr.name = 'DEPARTMENT'
and pv.value = 'Sales'
GROUP BY p.name_

```

#### 46.3.3.2 Sample SQL: Group by User Property

The following query returns the total number of page views broken down into departments.

```

SELECT pv.value as department, count(*) as views
FROM asfact_wc_pagevie_0 f
JOIN asdim_userpropertyvalues pv on f.userid = pv.userid
JOIN asdim_userproperties pr on pv.propertyid = pr.id
WHERE pr.name = 'DEPARTMENT'
GROUP BY pv.value

```

### 46.3.4 Sample Analytics Database Queries for Specific Metrics

This section provides example queries for specific metrics. It includes the following samples:

- [Sample SQL: User Activities](#)
- [Sample SQL: Space Activities](#)
- [Sample SQL: Space Activities for a Specific Time Period](#)
- [Sample SQL: Activity for a Service During a Specific Time Period](#)
- [Sample SQL: Search Phrases](#)
- [Sample SQL: Page Views](#)

For a detailed list of database tables and parameters, see [Appendix G, "WebCenter Portal Analytics Database Schema."](#)

#### 46.3.4.1 Sample SQL: User Activities

The following query returns a list of all the activities executed by a specific user during a specific time period.

```
SELECT 'Logins' AS Activity, count(*) AS Events
FROM asfact_wc_logins_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
WHERE u.userid = 'user1'
  AND f.timeid >= (SELECT id
                  FROM asdim_time
                  WHERE year = 2011
                    AND monthofyear = 0
                    AND dayofmonth = 1
                    AND hourofday = 0)
  AND f.timeid < (SELECT id
                 FROM asdim_time
                 WHERE year = 2011
                   AND monthofyear = 1
                   AND dayofmonth = 1
                   AND hourofday = 0)
UNION ALL
SELECT 'Searches' AS Activity, count(*) AS Events
FROM asfact_wc_searche_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
WHERE u.userid = 'user1'
  AND f.timeid >= (select id
                  from asdim_time
                  where year = 2011
                    and monthofyear = 0
                    and dayofmonth = 1
                    and hourofday = 0)
  AND f.timeid < (select id
                 from asdim_time
                 where year = 2011
                   and monthofyear = 1
                   and dayofmonth = 1
                   and hourofday = 0)
UNION ALL
...
```

#### Sample Report Output

```
Activity  Events
-----
Logins    25
Searches  15
...
```

#### 46.3.4.2 Sample SQL: Space Activities

The following query returns a list of all activities executed in a specific space.

```
SELECT g.name_ AS Space, 'Page views' AS Activity,
       count(*) AS Events
FROM asfact_wc_pagevie_0 f
  JOIN asdim_time t ON f.timeid = t.id
```

```

        JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ IN ('Project1', 'Project2')
AND f.timeid >= (select id
                 from asdim_time
                 where year = 2011
                   and monthofyear = 0
                   and dayofmonth = 1
                   and hourofday = 0)

AND f.timeid < (select id
                from asdim_time
                where year = 2011
                  and monthofyear = 1
                  and dayofmonth = 1
                  and hourofday = 0)

GROUP BY g.name_
UNION ALL
SELECT g.name_ AS Space,
       'Portlet views' AS Activity, count(*) AS Events
FROM asfact_wc_portlet_0 f
JOIN asdim_time t ON f.timeid = t.id
JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ in ('Project1', 'Project2')
AND f.timeid >= (select id
                 from asdim_time
                 where year = 2011
                   and monthofyear = 0
                   and dayofmonth = 1
                   and hourofday = 0)

AND f.timeid < (select id
                from asdim_time
                where year = 2011
                  and monthofyear = 1
                  and dayofmonth = 1
                  and hourofday = 0)

GROUP BY g.name_

```

### Sample Report Output

Space	Activity	Events
Project1	PageViews	34
Project2	PageViews	42
Project1	PortletViews	98
Project2	PortletViews	74

#### 46.3.4.3 Sample SQL: Space Activities for a Specific Time Period

The following query returns a list of all activities executed in a specific space during a specific time period.

```

SELECT 'Page views' AS Activity, count(*) AS Events
FROM asfact_wc_pagevie_0 f
JOIN asdim_time t ON f.timeid = t.id
JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ = 'Project1'
AND f.timeid >= (select id
                 from asdim_time
                 where year = 2011
                   and monthofyear = 0
                   and dayofmonth = 1
                   and hourofday = 0)

```

```

AND f.timeid < (select id
                from asdim_time
                where year = 2011
                   and monthofyear = 1
                   and dayofmonth = 1
                   and hourofday = 0)
UNION ALL
SELECT 'Portlet views' AS Activity, count(*) AS Events
FROM asfact_wc_portlet_0 f
   JOIN asdim_time t ON f.timeid = t.id
   JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ = 'Project1'
   AND f.timeid >= (select id
                   from asdim_time
                   where year = 2011
                      and monthofyear = 0
                      and dayofmonth = 1
                      and hourofday = 0)
   AND f.timeid < (select id
                   from asdim_time
                   where year = 2011
                      and monthofyear = 1
                      and dayofmonth = 1
                      and hourofday = 0)
UNION ALL
...

```

### Sample Report Output

Activity	Events
Page views	15
Portlet views	200

#### 46.3.4.4 Sample SQL: Activity for a Service During a Specific Time Period

The following query returns activity for a specific service (in this example, the login service) during a specific time period and groups results by user.

```

SELECT u.userid AS "User", count(*) AS "Logins"
FROM asfact_wc_logins_0 f
   JOIN asdim_time t ON f.timeid = t.id
   JOIN asdim_users u ON f.userid = u.id
WHERE f.timeid >= (select id
                  from asdim_time
                  where year = 2011
                     and monthofyear = 0
                     and dayofmonth = 1
                     and hourofday = 0)
   AND f.timeid < (select id
                  from asdim_time
                  where year = 2011
                     and monthofyear = 1
                     and dayofmonth = 1
                     and hourofday = 0)
GROUP BY u.userid
ORDER BY "Logins" DESC

```

### Sample Report Output

User	Logins
-----	

```

user3      245
user1      240
user2      193

```

#### 46.3.4.5 Sample SQL: Search Phrases

The following query returns the phrases searched during a specific time and lists how many times each search was executed.

```

SELECT s.phrase_ AS "Search Phrase", count(*) AS "Times"
FROM asfact_wc_searche_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
  JOIN asdim_wc_searche_0 s ON f.searched_phrase_ = s.id
WHERE u.userid = 'user1'
  AND f.timeid >= (select id
                   from asdim_time
                   where year = 2011
                      and monthofyear = 0
                      and dayofmonth = 1
                      and hourofday = 0)
  AND f.timeid < (select id
                  from asdim_time
                  where year = 2011
                     and monthofyear = 1
                     and dayofmonth = 1
                     and hourofday = 0)
GROUP BY u.userid, s.phrase_
ORDER BY count(*) DESC, s.phrase_

```

#### Sample Report Output

```

Search Phrase      Times
-----
product prices      4
sales report 2011   1

```

#### 46.3.4.6 Sample SQL: Page Views

The following query returns the pages viewed by a specific user during a specific time period.

```

SELECT u.userid AS "User", count(*) AS "Views"
FROM asfact_wc_pagevie_0 f
  JOIN asdim_time t ON f.timeid = t.id
  JOIN asdim_users u ON f.userid = u.id
  JOIN asdim_wc_pages_0 p ON f.page_ = p.id
  JOIN asdim_wc_groupsp_0 g ON f.groupspace_ = g.id
WHERE g.name_ = 'Space 1'
  AND p.name_ = 'Page 1'
  AND f.timeid >= (select id
                   from asdim_time
                   where year = 2011
                      and monthofyear = 0
                      and dayofmonth = 1
                      and hourofday = 0)
  AND f.timeid < (select id
                  from asdim_time
                  where year = 2011
                     and monthofyear = 1
                     and dayofmonth = 1
                     and hourofday = 0)

```

```
GROUP BY u.userid  
ORDER BY count(*) DESC
```

**Sample Report Output**

User	Views
user3	245
user1	190
user2	65

---

---

## Integrating the Lists Service

This chapter provides an overview of the Lists service and describes how to integrate the Lists service with a Framework application. It includes the following sections:

- [Section 47.1, "Introduction to the Lists Service"](#)
- [Section 47.2, "Basic Configuration for the Lists Service"](#)
- [Section 47.3, "Adding Lists to a Resource Catalog"](#)
- [Section 47.4, "Using the Lists Service REST APIs"](#)
- [Section 47.5, "Troubleshooting the Lists Service"](#)

### 47.1 Introduction to the Lists Service

This section provides an overview of the Lists service features and requirements. It includes the following subsections:

- [Section 47.1.1, "Understanding the Lists Service"](#)
- [Section 47.1.2, "What Happens to the Lists Service at Runtime"](#)

#### 47.1.1 Understanding the Lists Service

The Lists service provides a means of creating lists and exposing them for placement on application pages at runtime. At design time, you can make the Lists task flow available in your runtime Resource Catalog. At runtime, users can add the task flow from the Catalog to a page and use the task flow to create lists.

At design time, you can add a code snippet to the Resource Catalog to ensure that populated lists are added to the Catalog at runtime, making them available for placement on your application pages.

By default, only users assigned the seeded role `Administrator` have manage permission on lists. This means at runtime such users can create, edit, and delete lists and edit list data. The default permission can be changed at deployment in `jazn-data.xml` or by using Enterprise Manager or the Application Policy Manager. Authorized users can change this permission at runtime at the component level (for more information, see [Chapter 23, "Modifying Default Security Behavior of Composer Components"](#)). Only role-based permission is supported.

#### 47.1.2 What Happens to the Lists Service at Runtime

At runtime, the Lists task flow provides controls for creating lists and adding list data. For information about these controls, see the sections, "Creating and Managing Lists,"

and "Adding and Managing List Data," in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Tip:** To enable users to work with lists at runtime, they must be explicitly permitted to do so. For more information, see [Section 47.2.3, "Enabling Users to Work with Lists at Runtime."](#)

## 47.2 Basic Configuration for the Lists Service

This section describes the steps required for adding the Lists service to your application. It includes the following subsections:

- [Section 47.2.1, "Setting Up Connections for the Lists Service"](#)
- [Section 47.2.2, "Adding the Lists Service at Design Time"](#)
- [Section 47.2.3, "Enabling Users to Work with Lists at Runtime"](#)

### 47.2.1 Setting Up Connections for the Lists Service

The Lists service requires a connection to the database where the `WEBCENTERSchema` is installed. The Lists service stores all list data in the database. For details about setting up a database connection to the database where the `WEBCENTERSchema` is installed, see [Section 7.2.2, "Setting Up a Database Connection."](#)

---

---

**Note:** For details about installing the database and the `WEBCENTERSchema`, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

---

---

### 47.2.2 Adding the Lists Service at Design Time

This section explains a basic integration of the Lists service. It includes the following subsections:

- [Section 47.2.2.1, "Lists Service Task Flows"](#)
- [Section 47.2.2.2, "How to Add the Lists Service to your Application"](#)

#### 47.2.2.1 Lists Service Task Flows

The Lists service includes one task flow: Lists ([Figure 47-1](#)).

**Figure 47–1 A List Rendered in the Lists Task Flow**

Standards Goals	
Title	Description
Merge collateral style sheets	Merge all style sheets for all collateral into one master style sheet with exception sheets as necessary for each type of collateral
Merge collateral templates	Merge all templates for all collateral into one template for each and establish annual review for updates
Merge collateral standards	Merge all standards for all collateral into one standard for each type of collateral
Make all visible and available	Publicize company-sanctioned standards, style sheets, and templates and make them easily available over the company intranet

For information about the Lists task flow, see [Section 47.1.2, "What Happens to the Lists Service at Runtime."](#)

#### 47.2.2.2 How to Add the Lists Service to your Application

To add the Lists task flow to your Framework application:

1. Follow the steps described in [Section 7.2, "Preparing Your Framework Application to Consume Services."](#) to implement security and create a new customizable page in your application.
2. Create a JSF page on which to add the Lists task flow.
3. Configure security on the page.

**See Also:** For more information, see [Chapter 23, "Modifying Default Security Behavior of Composer Components."](#)

4. In the Resource Palette, open **My Catalogs**, then **WebCenter Portal - Services Catalog**, then the **Task Flows** folder.
5. Drag and drop the **Lists** task flow onto your page, and select **Region** from the context menu.
6. Save and run your page to the browser.

### 47.2.3 Enabling Users to Work with Lists at Runtime

Out of the box, only the application administrator can work with lists. For users to see and work with lists at runtime, they must explicitly be granted, minimally, the permission `ListPermission:view`. At runtime, application administrators can assign this permission through the Role Manager task flow.

For example, to grant view access to lists to all authenticated users, the administrator can create the role `AllUsers` in the Role Manager task flow, add `authenticated-role` as a member, and grant view access on Lists.

If you plan to add the Lists service to your application, then you must also add the Role Manager task flow. If your application is based on a WebCenter Portal - Framework Application template, then the Role Manager task flow is available out of the box on the **Security** tab in **Administration** pages. At runtime, you can navigate to this page using the following URL:

`http://host:port/appcontxtroot/faces/admin`

---

---

**Note:** Roles and permissions created and granted through the Role Manager at design time are not packaged in the application and are not available after deployment. The provisioning steps described in this section must be taken after deployment.

---

---

**See Also:** For information about the Role Manager task flow, see [Section 68.4, "Using the Role Manager Task Flow."](#)

## 47.3 Adding Lists to a Resource Catalog

If properly configured, the Resource Catalog makes populated lists available at runtime, enabling authorized users to add them to pages in edit mode. The procedure for adding components to an existing resource catalog or creating a custom catalog are described in [Chapter 15, "Creating and Managing Resource Catalogs."](#) This section provides an example of a code snippet to use to add lists to a resource catalog ([Example 47-1](#)).

---

---

**Note:** The values in uppercase are message keys for translated strings.

---

---

### **Example 47-1 Code to Add Lists to a Resource Catalog**

```
<customFolder id="groupLists" visible="#{true}"
  factoryClass="oracle.webcenter.list.view.rc.ListServiceContextFactory">
  <attributes>
    <attribute value="LISTS_CUSTOM_FOLDER.TITLE" attributeId="Title"
      isKey="true"/>
    <attribute value="LISTS_CUSTOM_FOLDER.DESCRPTION"
      attributeId="Description" isKey="true"/>
    <attribute value="LISTS_CUSTOM_FOLDER.KEYWORDS"
      attributeId="Subject" isKey="true"/>
    <attribute value="oracle.webcenter.list"
      attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
    <attribute value="/adf/webcenter/folderlists_qualifier.png"
      attributeId="IconURI"/>
  </attributes>
</customFolder>
```

## 47.4 Using the Lists Service REST APIs

Oracle WebCenter Portal provides REST APIs to allow access to Lists functionality through interfaces other than the provided task flows. You can use the Lists service REST APIs to perform the following actions:

- Work with lists in a space, such as retrieving a list of lists or adding a new list
- Work with one list, such as retrieving or updating list metadata, or deleting the list
- Work with rows in a list
- Work with a list row, such as retrieving, updating, or deleting the row
- Work with list columns, such as adding a column
- Work with a list column, such as retrieving, updating, or deleting the column

This section describes the REST APIs associated with the Lists service. It includes the following subsections:

- [Section 47.4.1, "Entry Point for Lists"](#)
- [Section 47.4.2, "Lists Resource Type Taxonomy"](#)
- [Section 47.4.3, "Lists Security Considerations"](#)
- [Section 47.4.4, "Lists Resource Types"](#)

**See Also:** For an introduction to the REST APIs, see [Chapter 53, "Using Oracle WebCenter Portal REST APIs."](#)

### 47.4.1 Entry Point for Lists

To get to the REST entry point for lists in a space of the Spaces application, you must navigate to a specific space to see a link to lists in that space. For all the lists in a space, find the link elements with a `resourceType` of:

```
urn:oracle:webcenter:space:lists
```

The corresponding `href` or `template` element provides the URI entry point, which retrieves the lists in the space.

**See Also:** For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 47.4.2 Lists Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. The resource type taxonomy for lists is:

```
urn:oracle:webcenter:space:lists
urn:oracle:webcenter:space:list
  urn:oracle:webcenter:space:list:rows
  urn:oracle:webcenter:space:list:row
  urn:oracle:webcenter:space:list:columns
  urn:oracle:webcenter:space:list:column
```

### 47.4.3 Lists Security Considerations

You must be logged in to the REST service to access any of the Lists REST APIs. After that, the underlying service handles permission checking.

**See Also:** For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 47.4.4 Lists Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- [Section 47.4.4.1, "urn:oracle:webcenter:space:lists"](#)
- [Section 47.4.4.2, "urn:oracle:webcenter:space:list"](#)
- [Section 47.4.4.3, "urn:oracle:webcenter:space:list:rows"](#)

- [Section 47.4.4.4, "urn:oracle:webcenter:space:list:row"](#)
- [Section 47.4.4.5, "urn:oracle:webcenter:space:list:columns"](#)
- [Section 47.4.4.6, "urn:oracle:webcenter:space:list:column"](#)

#### 47.4.4.1 urn:oracle:webcenter:space:lists

The `lists` response provides a means of retrieving the lists in a given space (GET) and adding lists to a space (POST). This section includes the following subsections:

- [Section 47.4.4.1.1, "Navigation Paths to lists"](#)
- [Section 47.4.4.1.2, "Supported Methods for lists"](#)
- [Section 47.4.4.1.3, "Resource Types Linked to from lists"](#)

**47.4.4.1.1 Navigation Paths to lists** This section shows how the client can navigate through the hypermedia to access the `lists` resource:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
```

**47.4.4.1.2 Supported Methods for lists** The `lists` resource type supports the following methods:

- [Method \(lists\): GET](#)
- [Method \(lists\): POST](#)

#### Method (lists): GET

This method retrieves the lists in a space.

- Resource URI, for example:
 

```
http://host:port/rest/api/spaces/vs1/lists?q=name:equals:ProjectIssues&utoken=F
K1d81a1I3QRdi8TgQkOCGEzzL5x_w**
```
- Request body: none
- Request headers: [Accept = application/xml | application/json]
- Request parameters - `startIndex`, `itemsPerPage`, `q`, `projection`
  - `q` parameter for query, format '`q=attribute:operator:value`', for example:
 

```
'q=name:equals:ProjectIssues'
```

    - \* Supported operators for Strings: `equals`, `not.equals`, `contains`, `starts.with`
    - \* Supported operators for Dates: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`
    - \* May specify several conditions separated by semicolon (;)
- Searchable attributes ([Table 47–1](#))

**Table 47–1 Searchable Attributes for lists GET Method**

Element	Type	Description
<code>name</code>	string	Name of list

**Table 47-1 (Cont.) Searchable Attributes for lists GET Method**

Element	Type	Description
description	string	Description of list
creator	string	User who created list
created	date	Date the list was created
modifier	string	User who modified list
modified	date	Date the list was last modified

- Response status: 200 [OK]
- Response body: <lists>
- Example:

```
<lists resourceType="urn:oracle:webcenter:space:lists">
  <links>
    <link resourceType="urn:oracle:webcenter:list:lists"
      rel="self" href="opaque"/>
    <link template="opaque?startIndex={startIndex}&
      itemsPerPage={itemsPerPage}&q={searchTerms}&
      projection={projection}
      &token=FDgsOu7a2NTTM1cLJvnpkDXfihtHx5Q*"
      resourceType="urn:oracle:webcenter:list:lists"/>
  </links>
  <items>
    <list resourceType="urn:oracle:webcenter:space:list">
      <links>
        <link resourceType="urn:oracle:webcenter:list" rel="self"
          href="opaque"
          capabilities="urn:oracle:webcenter:update
            urn:oracle:webcenter:delete"/>
        <link resourceType="urn:oracle:webcenter:list:rows"
          href="opaque"
          capabilities="urn:oracle:webcenter:create"/>
        <link template="opaque?
          startIndex={startIndex}&
          itemsPerPage={itemsPerPage}&q={searchTerms}&
          token=FDgsOu7a2NTTM1cLJvnpkDXfihtHx5Q*"
          resourceType="urn:oracle:webcenter:list:rows"/>
        <link resourceType="urn:oracle:webcenter:list:columns"
          href="opaque"
          capabilities="urn:oracle:webcenter:create"/>
      </links>
      <id>/oracle/webcenter/list/scopedMD/
        se0dea180_e2c1_45ac_b08b_
        ba2c0b26aa72/lists/ProjectIssues.xml</id>
      <name>Project Issues</name>
      <description/>
    </list>
  </items>
</lists>
```

**Method (lists):** POST

This method creates a list in a space.

- Resource URI, for example:

```
http://host:port/rest/api/spaces/vs1/lists?utoken=FKld81a1I3QRdi8TgQkOCGEzxL5x_
```

w\*\*

- Request body: <list>
- Writable elements ([Table 47-2](#))

**Table 47-2 Create List Writable Elements**

Element	Type	Constraints	Description
name <sup>1</sup>	string	—	Name of list
description	string	—	Description of list
columns <sup>1</sup>	<a href="#">urn:oracle:webcenter:space:list:columns</a>	1 to 30	List columns

<sup>1</sup> Denotes required element

- Example:

```
<list>
  <name>RestExample</name>
  <description>Created using rest api</description>
  <columns>
    <items>
      <metaColumn>
        <name>No.</name>
        <dataType>number</dataType>
      </metaColumn>
      <metaColumn>
        <name>Description</name>
        <dataType>string</dataType>
      </metaColumn>
    </items>
  </columns>
</list>
```

- Request headers: Content-Type = application/xml | application/json, [Accept = application/xml | application/json]
- Response status: 201 [Created]
- Response body: <list>
- Retrieved elements ([Table 47-3](#))

**Table 47-3 Retrieved Elements from lists**

Element	Type	Description
id	string	List ID
name	string	List name
description	string	List description
scope.guid	string	GUID of space to which the list belongs
scope.name	string	Name of the space to which the list belongs
creator	string	Name of the user who created the list
created	date	Date the list was created
modifier	string	Name of the user who last modified the list
modified	date	Date the list was last modified

**Table 47-3 (Cont.) Retrieved Elements from lists**

Element	Type	Description
columns	<a href="#">urn:oracle:webcenter:space:list:columns</a>	List columns

- Example:

```
<list resourceType="urn:oracle:webcenter:space:list">
  <links>
    <link resourceType="urn:oracle:webcenter:space:list" rel="self"
      href="http://host:port/rest/api/spaces/vs1/

**47.4.4.1.3 Resource Types Linked to from lists** Table 47–4 lists the resource types that the client can link to from the `lists` resource.

**Table 47–4 Resource Types Linked to from lists**

rel	resourceType
self	urn:oracle:webcenter:space:lists
	urn:oracle:webcenter:space:list

#### 47.4.4.2 urn:oracle:webcenter:space:list

The `list` response provides a means of retrieving, updating, and deleting an individual list. This section includes the following subsections:

- [Section 47.4.4.2.1, "Navigation Paths to list"](#)
- [Section 47.4.4.2.2, "Supported Methods for list"](#)

- [Section 47.4.4.2.3, "Resource Types Linked to from list"](#)

**47.4.4.2.1 Navigation Paths to list** This section shows how the client can navigate through the hypermedia to access the `list` resource:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
        urn:oracle:webcenter:space:list
```

**47.4.4.2.2 Supported Methods for list** The list resource type supports the following methods:

- [Method \(list\): GET](#)
- [Method \(list\): PUT](#)
- [Method \(list\): DELETE](#)

**Method (list): GET**

Use this method to retrieve a list.

- Resource URI, for example:
 

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)?utoken=FK1d81alI3QRdi8TgQkOCGEzxL5x_w**
```
- Request body: none
- Request headers: [Accept = application/xml | application/json]
- Response status: 200 [OK]
- Response body: <list>
- Retrieved elements ([Table 47-5](#))

**Table 47-5 Retrieved Elements for list**

Element	Type	Description
id	string	ID of the list
name	string	Name of the list
description	string	Description of the list
scope.guid	string	GUID of the space to which the list belongs
scope.name	string	Name of the space to which the list belongs
creator	string	User who created the list
created	Date	Date on which the list was created
modifier	string	User who last modified the list
modified	Date	Date on which the list was last modified
columns	<a href="#">urn:oracle:webcenter:space:list:columns</a>	The columns that make up the list

- For example:
 

```
<list resourceType="urn:oracle:webcenter:space:list">
  <links>
```

```

<link resourceType="urn:oracle:webcenter:space:list" rel="self"
  href="http://host:port/rest/api/spaces/vs1/

```

**Method (list): PUT**

Use this method to update a list name or description.

- Resource URI, for example:

```

http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s35
5923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_
5fb62dc3514d.xml)?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**

```

- Request body: <list>
- Writable elements for list ([Table 47-6](#))

**Table 47-6 Writable Elements for list**

Element	Type	Required	Constraints	Description
name <sup>1</sup>	string	Yes	1 or more characters	Name of this list
description	string	No	none	Description of this list

<sup>1</sup> Denotes required element

- For example:

```

<list>
  <name>RestExampleUpdate</name>
  <description>Updated using rest api</description>
</list>

```

- Request headers: Content-Type = application/xml | application/json, [Accept = application/xml | application/json]
- Response status: 200 [OK]
- Response body: <list>

**Method (list): DELETE**

Use this method to delete a list.

- Resource URI, for example:  

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**
```
- Request body: none
- Response status: 204 [No Content]
- Response body: none

**47.4.4.2.3 Resource Types Linked to from list** Table 47-7 lists the resource types that the client can link to from the list resource.

**Table 47-7 Resource Types Linked to from list**

rel	resourceType
self	urn:oracle:webcenter:space:list
	<a href="#">urn:oracle:webcenter:space:list:rows</a>
	<a href="#">urn:oracle:webcenter:space:list:columns</a>

**47.4.4.3 urn:oracle:webcenter:space:list:rows**

The rows response provides a means of retrieving and adding rows to a list. This section includes the following subsections:

- [Section 47.4.4.3.1, "Navigation Paths to rows"](#)
- [Section 47.4.4.3.2, "Supported Methods for rows"](#)
- [Section 47.4.4.3.3, "Resource Types Linked to from rows"](#)

**47.4.4.3.1 Navigation Paths to rows** This section shows how the client can navigate through the hypermedia to access the rows resource:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
        urn:oracle:webcenter:space:list
          urn:oracle:webcenter:space:list:rows
```

**47.4.4.3.2 Supported Methods for rows** The rows resource type supports the following methods:

- [Method \(rows\): GET](#)
- [Method \(rows\): POST](#)

**Method (rows):** GET

Use this method to retrieve list rows.

- Resource URI, for example:

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_5fb62dc3514d.xml)/rows?q=lco_9bdd1418_6004_40ba_a052_04e8335b7ee8:equals:2&utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Request headers: [Accept = application/xml | application/json]
- Request parameters - startIndex, itemsPerPage, q, projection

- q parameter for query, format 'q=columnId:operator:value', for example:

```
'q=lco_9bdd1418_6004_40ba_a052_04e8335b7ee8:equals:2'
```

- \* Supported operators for Strings: equals, not.equals, contains, starts.with
- \* Supported operators for Numbers, Dates: equals, not.equals, greater.than, greater.than.or.equals, less.than, less.than.or.equals
- \* May specify several conditions separated by semi-colon (;)

- Searchable attributes for rows: Rows are searchable by column values.
- Response status: 200 [OK]
- Response body: <rows>
- For example:

```
<rows resourceType="urn:oracle:webcenter:space:list:rows">

```

**Method (rows):** POST

Use this method to create a row in a list.

- Resource URI, for example:

```

http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s35
5923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_bb806754_0652_4d49_9354_
5fb62dc3514d.xml)/rows?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**

```

- Request body: <row>
- Writable elements (Table 47–8)

**Table 47–8 Writable Elements for rows**

Element	Type	Constraints	Description
columns.column.id <sup>1</sup>	string	—	Column ID
columns.column.value <sup>1</sup>	string	Valid value for column data type	Column value

<sup>1</sup> Denotes required element

- For example:

```
<row>
  <columns>
    <column>
      <id>lco_9bdd1418_6004_40ba_a052_04e8335b7ee8</id>
      <value>1</value>
    </column>
    <column>
      <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
      <value>test</value>
    </column>
  </columns>
</row>
```

- Request headers: Content-Type = application/xml | application/json, [Accept = application/xml | application/json]
- Response status: 201 [Created]
- Response body: <row>
- Retrieved elements (Table 47–9)

**Table 47–9 Retrieved Elements for rows**

Element	Type	Description
id	string	Row ID
list id	string	List ID
scope	string	GUID of space to which list belongs
creator	string	Person who created the list
created	date	Date the list was created
modifier	string	Last user to modify the list
modified	date	Date the list was last modified
columns	—	Column values

- For example:

```
<row resourceType="urn:oracle:webcenter:space:list:row">
  <links>
    <link resourceType="urn:oracle:webcenter:space:list:row" rel="self"
      href="http://host:port/rest/api/spaces/vs1/

**47.4.4.3 Resource Types Linked to from rows** Table 47–10 lists the resource types that the client can link to from the rows resource.

**Table 47–10 Resource Types Linked to from rows**

rel	resourceType
self	urn:oracle:webcenter:space:list:rows
parent	urn:oracle:webcenter:space:list
	urn:oracle:webcenter:space:list:row

#### 47.4.4.4 urn:oracle:webcenter:space:list:row

The row response provides a means of retrieving and adding, and deleting an individual list row. This section includes the following subsections:

- [Section 47.4.4.4.1, "Navigation Paths to row"](#)
- [Section 47.4.4.4.2, "Supported Methods for row"](#)
- [Section 47.4.4.4.3, "Resource Types Linked to from row"](#)

**47.4.4.4.1 Navigation Paths to row** This section shows how the client can navigate through the hypermedia to access the row resource:

```

urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
        urn:oracle:webcenter:space:list
          urn:oracle:webcenter:space:list:rows
            urn:oracle:webcenter:space:list:row

```

**47.4.4.4.2 Supported Methods for row** The row resource type supports the following methods:

- [Method \(row\): GET](#)
- [Method \(row\): PUT](#)

- **Method (row):** DELETE

**Method (row):** GET

Use this method to retrieve data from a list row.

- **Resource URI, for example:**

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_a60e6e08668c)?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**
```

- **Request body:** none
- **Request headers:** [Accept = application/xml | application/json]
- **Response status:** 200 [OK]
- **Response body:** <row>
- **Retrieved elements** (Table 47–11)

**Table 47–11 Retrieved Elements for row**

Element	Type	Description
id	string	ID of the row
listId	string	ID of the parent list
scope	string	GUID of the space to which the list belongs
creator	string	User who created the row
created	Date	Date on which the row was created
modifier	string	User who last modified the row
modified	Date	Date on which the row was last modified
columns	urn:oracle:webcenter:space:list:columns	Column values

- **For example:**

```
<row resourceType="urn:oracle:webcenter:space:list:row">
  <links>
    <link resourceType="urn:oracle:webcenter:space:list:row"
      rel="self" href="http://host:port/

            <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
            <name>Description</name>
            <value>test</value>
        </column>
    </columns>
</row>

```

**Method (row):** PUT

Use this method to update row data.

- Resource URI, for example:

```

http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s35
5923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_
fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_
a60e6e08668c)?utoken=FKld8lalI3QRdi8TgQkOCGEzxL5x_w**

```

- Request body: <row>
- Writable elements (Table 47–12)

**Table 47–12** Writable Elements for row

Element	Type	Constraints	Description
columns.column.id <sup>1</sup>	string	—	Column ID
columns.column.value <sup>1</sup>	string	valid value for column data type	Column value

<sup>1</sup> Denotes required element

- For example:

```

<row>
    <columns>
        <column>
            <id>lco_9bdd1418_6004_40ba_a052_04e8335b7ee8</id>
            <value>1</value>
        </column>
        <column>
            <id>lco_3a31fd20_24f1_4422_99fd_c00d7bed4b24</id>
            <value>test</value>
        </column>
    </columns>
</row>

```

- Request headers: Content-Type = application/xml | application/json, [Accept = application/xml | application/json]
- Response status: 200 [OK]
- Response body: <row>

**Method (row):** DELETE

Use this method to delete a list row.

- Resource URI, for example:

```

http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s35
5923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_
fb03874979c0.xml)/rows/(lr_a14d427f_8515_4c82_956f_

```

```
a60e6e08668c)?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**
```

- Request body: none
- Response status: 204 [No Content]
- Response body: none

**47.4.4.4.3 Resource Types Linked to from row** Table 47–13 lists the resource types that the client can link to from the `row` resource.

**Table 47–13 Resource Types Linked to from row**

rel	resourceType
self	urn:oracle:webcenter:space:list:row

#### 47.4.4.5 urn:oracle:webcenter:space:list:columns

The `columns` response provides a means of retrieving and adding list columns. This section includes the following subsections:

- [Section 47.4.4.5.1, "Navigation Paths to columns"](#)
- [Section 47.4.4.5.2, "Supported Methods for columns"](#)
- [Section 47.4.4.5.3, "Resource Types Linked to from columns"](#)

**47.4.4.5.1 Navigation Paths to columns** This section shows how the client can navigate through the hypermedia to access the `columns` resource:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
        urn:oracle:webcenter:space:list
          urn:oracle:webcenter:space:list:columns
```

**47.4.4.5.2 Supported Methods for columns** The `columns` resource type supports the following methods:

- [Method \(columns\): GET](#)
- [Method \(columns\): POST](#)

#### **Method (columns): GET**

Use this method to retrieve columns in a list.

- Resource URI, for example:
 

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s355923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_fb03874979c0.xml)/columns?utoken=FKld81alI3QRdi8TgQkOCGEzxL5x_w**
```
- Request body: none
- Request headers: [Accept = application/xml | application/json]
- Request parameters: none
- Response status: 200 [OK]
- Response body: <metaColumns>
- For example:

```

<metaColumns resourceType="urn:oracle:webcenter:space:list:columns">

#### 47.4.4.6 urn:oracle:webcenter:space:list:column

The column response provides a means of retrieving, adding, and deleting an individual list column. This section includes the following subsections:

- Section 47.4.4.6.1, "Navigation Paths to column"
- Section 47.4.4.6.2, "Supported Methods for column"
- Section 47.4.4.6.3, "Resource Types Linked to from column"

**47.4.4.6.1 Navigation Paths to column** This section shows how the client can navigate through the hypermedia to access the column resource:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:spaces
    urn:oracle:webcenter:space:resourceindex
      urn:oracle:webcenter:space:lists
```

```
urn:oracle:webcenter:space:list
urn:oracle:webcenter:space:list:columns
urn:oracle:webcenter:space:list:column
```

**47.4.4.6.2 Supported Methods for column** The column resource type supports the following methods:

- **Method (column): GET**
- **Method (column): PUT**
- **Method (column): DELETE**

**Method (column): GET**

Use this method to retrieve a list column.

- **Resource URI.** for example:
 

```
http://host:port/rest/api/spaces/vs1/lists/(/oracle/webcenter/list/scopedMD/s35
5923f0_2f04_4fd0_83ad_f7dac2a7ceed/lists/ls_c9cecbc7_756b_417b_a35f_
fb03874979c0.xml)/columns/(lco_fe2b9856_32f3_449a_a277_

## 47.5 Troubleshooting the Lists Service

### Problem

The List task flow shows an error that the WebCenter Portal's repository is not available.

### Solution

The database connection is likely not configured. For more information, see [Section 7.2.2, "Setting Up a Database Connection."](#)

### Problem

A 401 Unauthorized error appears.

### Solution

It is likely that security is not set up for the application. Or it may be that there was insufficient permission to perform the attempted task.

---

---

## Integrating Notifications

Notifications provides a means of subscribing to services and application objects and, when those objects change, receiving notification across one or more selected messaging channels. This chapter describes how to integrate Notifications with your Framework applications. It includes the following sections:

- [Section 48.1, "Introduction to Notifications"](#)
- [Section 48.2, "Basic Configuration for Notifications"](#)
- [Section 48.3, "Advanced Information for Notifications"](#)

### 48.1 Introduction to Notifications

This section provides an overview of Notifications. It includes the following subsections:

- [Section 48.1.1, "Understanding Notifications"](#)
- [Section 48.1.2, "Requirements for Notifications"](#)
- [Section 48.1.3, "What Happens with Notifications at Runtime?"](#)

#### 48.1.1 Understanding Notifications

Notifications provides an automated means of triggering notices about subscribed services and objects across different messaging channels. Messages are triggered when the application services and objects to which a user has subscribed change. For example, a user can subscribe to a document and receive notification when another user changes the document.

Messaging channels can include phone text (SMS), mail, or Worklist, depending on what messaging servers are available and how the application administrator configures Notifications. For example, users can receive a mail message when a particular document changes, a text message when someone responds to a particular discussion topic, a Worklist alert when the user receives an invitation to connect. All messages contain links that take the user to the scene of the change.

Participating services and objects include People Connections (Connections, Message Board, and Feedback), Discussions, and Documents (including Wikis and Blogs).

[Table 48-1](#) describes the types of activities that can trigger a notification and indicates the level at which the subscription is made.

**Table 48–1 Activities that Can Trigger Notifications**

Activity	Level
A user sends you an invitation to connect	Application
A user posts a message to your Message Board	Application
A user likes your Message Board post (messages explicitly set on a Message Board and not those added from Publisher to the Activity Stream)	Application
A user comments on your Message Board post (messages explicitly set on a Message Board and not those added from Publisher to the Activity Stream)	Application
A user posts feedback for you	Application
A user replies to a discussion topic	Object
A user comments on a discussion topic	Object
A user deletes a discussion topic	Object
A user comments on a document	Object
A user likes a document	Object
A user updates a document	Object
A user deletes a document	Object
A user comments on a wiki document	Object
A user likes a wiki document	Object
A user updates a wiki document	Object
A user deletes a wiki document	Object
A user comments on a blog entry	Object
A user likes a blog entry	Object
A user updates a blog entry	Object
A user deletes a blog entry	Object

Notifications leverages message delivery platforms available in WebCenter, such as the User Messaging Service (UMS) or the Mail service, to deliver the messages it generates. The Mail service furnishes the default messaging delivery mechanism, though you can instead use the BPEL connection provided through the Worklist service to widen a user's choice of channels to phone text, mail, and the Worklist.

You can set defaults for application-level subscriptions for all users through an XML configuration file (`notification-service-settings.xml`). You create your own version of this default file, and then use it to supersede the file of the same name that is provided for this purpose out of the box.

## 48.1.2 Requirements for Notifications

Before your application can work with the Notifications service, you must specify the Notification namespace in the application's `adf-config.xml` file. For more information, see [Section 48.2.1, "Adding the Notifications Namespace."](#)

Subscription capability is built into the services that support it and do not require additional configuration.

Notifications messaging capability relies on the presence of a configured Mail or Worklist connection to enable delivery of notifications messages. For Notifications messaging, you must explicitly configure the application to use either the BPEL server

that is configured for the Worklist service or the Mail server that is configured for the Mail service. For more information, see [Section 48.2.2, "Creating a Notifications Connection to a Mail Server,"](#) and [Section 48.2.3, "Creating a Notifications Connection to a BPEL Server."](#)

To set application defaults for all users for application-level subscription preferences, you must provide your own version of the default file `notification-service-settings.xml`. For more information, see [Section 48.2.4, "Setting Application Defaults for Notifications."](#)

For Notifications to function properly, its task flows must reside on a secured page. This is because the current user must be known through authentication in order to track and report on subscribed actions. If the page or application that contains Notifications is not secured, you will encounter exception errors. For more information, see [Section 48.2.6, "Setting Security for Notifications."](#)

### 48.1.3 What Happens with Notifications at Runtime?

At runtime, users set up their preferred messaging channels through UMS Preferences. For more information, see the section "Establishing and Managing Your Messaging Channels and Filters" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

---

**Note:** In designing your application, you must provide users with a way to access UMS preferences. For example, you can add a link to them in your UI, or you can point users to the Worklist task flow, which includes a link to them.

---

Users establish their application-level subscriptions through the Notifications task flow *Subscription Preferences* ([Figure 48-1](#)).

**Figure 48-1 Subscription Preferences Task Flow**

Users establish their object-level subscriptions by subscribing to the object directly.

Users manage their application-level subscriptions through the Subscription Preferences task flow and their object-level subscriptions through the Notifications task flow *Subscription Viewer* ([Figure 48-2](#)).

**Figure 48–2 Subscription Viewer Task Flow**

The screenshot shows a web interface for managing subscriptions. At the top, there is a 'Subscription viewer' header with a dropdown arrow. Below it, there are controls for 'View' (a dropdown menu), an 'Unsubscribe' button, and a 'Filter' input field with a search icon and a refresh icon. The main content is a table with the following data:

Space Name	Service	Resource Type	Resource Name	Created On
Standards	Documents	Document	htmlplus_table.pdf	12/14/10 12:52 PM
Standards	Documents	Document	managed_servers.txt	12/14/10 12:53 PM

**See Also:** For more information about Notifications task flows, see [Section 48.2.5.1, "Notifications Task flows."](#)

## 48.2 Basic Configuration for Notifications

Notifications leverages your Mail or Worklist service connection to provide messaging channels for user notifications. If you plan to use the Mail server, then a connection to a mail server for the Mail service is required, but no further configuration is necessary for Notifications. If you plan to use the same BPEL connection for Notifications that is used by the Worklist service, you must add this configuration to the `adf-config.xml` file.

This section provides an overview of those connections and configurations and the process of adding Notifications task flows to an application page. It includes the following subsections:

- [Section 48.2.1, "Adding the Notifications Namespace"](#)
- [Section 48.2.2, "Creating a Notifications Connection to a Mail Server"](#)
- [Section 48.2.3, "Creating a Notifications Connection to a BPEL Server"](#)
- [Section 48.2.4, "Setting Application Defaults for Notifications"](#)
- [Section 48.2.5, "Adding Notifications Task Flows to Your Application"](#)
- [Section 48.2.6, "Setting Security for Notifications"](#)

### 48.2.1 Adding the Notifications Namespace

To establish the Notifications namespace with your application, add the following code to the `adf-config` element at the top of the file ([Example 48–1](#)):

**Tip:** You can find the `adf-config.xml` file in the Application Resources panel, under **Descriptors**, in the **ADF META-INF** folder.

**Example 48–1 Configuring the Application to Recognize Notifications Configuration**

```
xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
```

For example (bold) ([Figure 48–2](#)):

**Example 48–2 Notifications Configuration in the adf-config Element**

```
<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:sec="http://xmlns.oracle.com/adf/security/config"
  xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
  xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
```

```

xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"
xmlns:relC="http://xmlns.oracle.com/webcenter/relationship/config"
...

```

## 48.2.2 Creating a Notifications Connection to a Mail Server

To enable users to select a mail messaging channel, you must configure a connection to a Mail server (for more information, see [Section 35.2.2, "Setting up Connections for the Mail Service"](#)). Once this is established, you add the following entry in the `adf-config.xml` file to associate the Mail server with Notifications ([Example 48-3](#)).

### **Example 48-3 Associating a Mail Server with Notifications in adf-config.xml**

```

<notificationC:adf-notification-config
    xmlns="http://xmlns.oracle.com/webcenter/notification/config">
    <ConnectionType>MAIL</ConnectionType>
    <ConnectionName>someMailConnection</ConnectionName>
</notificationC:adf-notification-config>

```

Where `ConnectionName` is the name of a configured Mail server.

[Example 48-4](#) presents a code sample, with the previous code sample in place (bold).

### **Example 48-4 A Mail Connection for Notifications in adf-config.xml**

```

<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
    xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
    xmlns:sec="http://xmlns.oracle.com/adf/security/config"
    xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
    xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
    xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
    xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
    xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
    xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"
    xmlns:relC="http://xmlns.oracle.com/webcenter/relationship/config"
    xmlns:collabC="http://xmlns.oracle.com/webcenter/collab/config"
    xmlns:listC="http://xmlns.oracle.com/webcenter/list/config"
    xmlns:rsc="http://xmlns.oracle.com/adf/rsc/adf-config"
    xmlns:rcv="http://xmlns.oracle.com/adf/rsc/viewer/adf-config" xmlns:tagC=
        "http://xmlns.oracle.com/webcenter/tagging/config"
    xmlns:doclibC="http://xmlns.oracle.com/webcenter/doclib/config">
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="ps3stage2app-7762" />
</adf:adf-properties-child>
<sec:adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
    <CredentialStoreContext
        credentialStoreClass="oracle.adf.share.security.providers.jps.
        CSFCredentialStore"
        credentialStoreLocation="../../src/META-INF/jps-config.xml" />
    <sec:JaasSecurityContext
        initialContextFactoryClass="oracle.adf.share.security.
        JAASInitialContextFactory"
        jaasProviderClass="oracle.adf.share.security.providers.jps.
        JpsSecurityContext" authorizationEnforce="true"
        authenticationRequire="true" />
</sec:adf-security-child>

```

```

<wpsC:adf-service-config>
  <wpsC:data-source jndi-name="java:/comp/env/jdbc/WebCenterDSDS"/>
</wpsC:adf-service-config>
<notificationC:adf-notification-config
  xmlns="http://xmlns.oracle.com/webcenter/notification/config">
  <ConnectionType>MAIL</ConnectionType>
  <ConnectionName>someMailConnection</ConnectionName>
</notificationC:adf-notification-config>
<searchC:adf-search-config
  xmlns="http://xmlns.oracle.com/webcenter/search/config">
...

```

### 48.2.3 Creating a Notifications Connection to a BPEL Server

To furnish users with the option to select mail, phone text, or Worklist messaging channels, you must configure a connection to a BPEL server (for more information, see [Section 50.3.1, "Setting up Connections for the Worklist Service"](#)). Notifications leverages the BPEL server that is specified for the Worklist service to provide multiple messaging channels for the notifications it generates. Once a connection to a BPEL server is established, you add the following entry in the `adf-config.xml` file to associate the BPEL server with Notifications ([Example 48-5](#)).

#### **Example 48-5** Configuring Notifications to Use the BPEL Server for Messaging

```

<notificationC:adf-notification-config
  xmlns="http://xmlns.oracle.com/webcenter/notification/config">
  <ConnectionType>BPEL</ConnectionType>
  <ConnectionName>worklistConnection</ConnectionName>
  <SenderEmailAddress>example@company.com</SenderEmailAddress>
  <SenderSMSAddress>12345</SenderSMSAddress>
</notificationC:adf-notification-config>

```

Where:

- **ConnectionName** is the name you provided for the BPEL server when you set up that connection for the Worklist service.
- **SenderEmailAddress** is a mail address from which all Notifications messages are sent. The sender mail address must match at least one driver that is configured to send messages from a corresponding domain.
- **SenderSMSAddress** is the four- to six-digit number that is used by the User Messaging Server (UMS) as the driver from which all Notifications messages are sent. The sender SMS address must match at least one driver that is configured to send messages from a corresponding domain.

[Example 48-6](#) presents a code sample, with the previous code sample in place (bold).

#### **Example 48-6** Notifications Entries in the `adf-config.xml` File

```

<?xml version="1.0" encoding="US-ASCII" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:sec="http://xmlns.oracle.com/adf/security/config"
  xmlns:wpsC="http://xmlns.oracle.com/webcenter/framework/service"
  xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
  xmlns:worklistC="http://xmlns.oracle.com/webcenter/worklist/config"
  xmlns:notificationC="http://xmlns.oracle.com/webcenter/notification/config"
  xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config"
  xmlns:searchC="http://xmlns.oracle.com/webcenter/search/config"

```

## 48.2.4 Setting Application Defaults for Notifications

This section provides information about the XML file you use to set application-level defaults for all users for Notifications. It includes the following subsections:

- [Section 48.2.4.1, "What You Should Know About Subscription Defaults"](#)
- [Section 48.2.4.2, "Setting Notifications Subscription Defaults"](#)

### 48.2.4.1 What You Should Know About Subscription Defaults

Administrator-level subscription preferences are set in a custom XML file that you create and then use to supersede the file that is provided in the `notification-repository.jar` for this purpose out of the box (`notification-service-settings.xml`). The settings in the custom XML file are analogous to the application-level subscriptions settings available to users through the Subscription Preferences task flow.

Each setting provides the following attributes:

- `id`—for specifying the service ID:
  - `oracle.webcenter.peopleconnections.connections`, the Connections feature of the People Connections service

- `oracle.webcenter.peopleconnections.wall`, the Message Board feature of the People Connections service
- `oracle.webcenter.peopleconnections.kudos`, the Feedback feature of the People Connections service
- `subscription-enabled`—For specifying the default value for the preference option: `true` or `false`

**Tip:** Rather than enabling or disabling the entire subscription capability, the `subscription-enabled` attribute merely sets the initial state of the preference option. For example, if `subscription-enabled="true"`, then the associated subscription option is checked by default in the Subscription Preferences task flow. If `subscription-enabled="false"`, then the associated subscription option is not checked by default in the task flow.

- `end-user-configurable`—For enabling users to change the established default or preventing users from doing so: `true` or `false`

These attributes work together to determine the initial state of the Subscription Preferences task flow.

[Table 48–2](#) illustrates the effect of custom administrator-level subscriptions settings on the appearance of the Subscription Preferences task flow.

**Table 48–2 Effect of Administrator Defaults on Subscriptions Preferences**

<code>subscription-enabled</code> <sup>1</sup>	<code>end-user-configurable</code>	Option in Preferences
True	True	Rendered normally, checkbox is checked
True	False	Grayed out, checkbox is checked
False	True	Rendered normally, checkbox is clear
False	False	Hidden, checkbox is hidden

<sup>1</sup> Rather than enabling or disabling the entire subscription capability, the `subscription-enabled` attribute merely sets the initial state of the subscription.

**Tip:** The most typical scenario for most notifications is `False, True, Rendered normally, checkbox is clear`.

[Table 48–3](#) lists the types of actions that can trigger an application-level notification and associates them with their related service ID.

**Table 48–3 Application-Level Activities that Can Trigger Notifications**

Activity	Related Service ID
A user sends you an invitation to connect	<code>oracle.webcenter.peopleconnections.connections</code>
A user posts a message to your Message Board	<code>oracle.webcenter.peopleconnections.wall</code>
A user likes your post on another user's Message Board	<code>oracle.webcenter.peopleconnections.wall</code>
A user comments on your post on another user's Message Board	<code>oracle.webcenter.peopleconnections.wall</code>
A user posts feedback for you	<code>oracle.webcenter.peopleconnections.kudos</code>

#### 48.2.4.2 Setting Notifications Subscription Defaults

To set defaults for application-level Subscription preferences:

1. Navigate to a directory with a path that contains `/oracle/webcenter/notification`, and create the folder `custom`.

**Tip:** The directory structure can start or end with any directory or directories, as long as it has `/oracle/webcenter/notification/custom` in the path.

2. In the `custom` folder, or in any subdirectory under `/oracle/webcenter/notification/custom/`, create the file `notification-service-settings.xml`.
3. In the XML file, enter values for all application-level subscription options.

[Example 48-7](#) provides sample content for an application-wide subscription preferences setting file and an example of each required option.

##### **Example 48-7 Sample Subscriptions Settings XML File**

```
<notification-service_settings xmlns="http://xmlns.oracle.com/webcenter/notification">
  <subscription-settings>
    <service id="oracle.webcenter.peopleconnections.connections" subscription-enabled="true"
      end-user-configurable="false"/>
    <service id="oracle.webcenter.peopleconnections.wall" subscription-enabled="false"
      end-user-configurable="true"/>
    <service id="oracle.webcenter.peopleconnections.kudos" subscription-enabled="false"
      end-user-configurable="true"/>
  </subscription-settings>
</notification-service_settings>
```

---

**Note:** If an option is not provided, the default values `false/false` are assigned for the service.

---

4. Run the WLST command `importMetadata`, and import the directory content into your metadata store.

**See Also:** For information about the `importMetadata` command (and other WLST commands), see the section "importMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For example:

```
wls: /wc_domain/serverConfig> importMetadata(application='webcenter',
  server='serverName', fromLocation='directoryPath', docs='/**')
```

Where:

- `application` is the name that identifies your application
- `serverName` is the name of the server on which the application is running
- `directoryPath` is the directory path under which `oracle/webcenter/notification/custom/<any_sub_dir_after_this>/notification-service-settings.xml` is located.

For example, if the directory path to `notification-service-settings.xml` is `/scratch/mydir/oracle/webcenter/notification/custom`, enter `/scratch/mydir` for `directoryPath`.

- `docs` identifies the content to be imported, in this example, the path and files that fall under those specified for `directoryPath`.

[Table 48–4](#) describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.connections`.

**Table 48–4 Effects of Subscription Configurations for Connections**

subscription-enabled	end-user-configurable	Effect
true	true	<ul style="list-style-type: none"> <li>■ The subscribing user receives a notification message when another user sends him an invitation to connect.</li> <li>■ The user can change this default.</li> </ul>
true	false	<ul style="list-style-type: none"> <li>■ The subscribing user receives a notification message when another user sends him an invitation to connect.</li> <li>■ The user cannot change this default.<sup>1</sup></li> </ul>
false	true	<ul style="list-style-type: none"> <li>■ The subscribing user does not receive a notification message when another user sends him an invitation to connect.</li> <li>■ The user can change this default.</li> </ul>
false	false	<ul style="list-style-type: none"> <li>■ The subscribing user does not receive a notification message when another user sends him an invitation to connect.</li> <li>■ The option for changing this default is hidden.</li> </ul>

<sup>1</sup> This is the out-of-the-box default

[Table 48–5](#) describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.wall`.

**Table 48–5 Effects of Subscription Configurations for Message Board**

subscription-enabled	end-user-configurable	Effect
true	true	<ul style="list-style-type: none"> <li>■ The subscribing user receives a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post.</li> <li>■ The user can change this default.</li> </ul>

**Table 48–5 (Cont.) Effects of Subscription Configurations for Message Board**

subscription-enabled	end-user-configurable	Effect
true	false	<ul style="list-style-type: none"> <li>The subscribing user receives a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post.</li> <li>The user cannot change this default.</li> </ul>
false	true	<ul style="list-style-type: none"> <li>The subscribing user does not receive a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post.</li> <li>The user can change this default.</li> </ul>
false	false	<ul style="list-style-type: none"> <li>The subscribing user does not receive a notification message when another user posts a message on his Message board, likes his Message Board post, or comments on his Message Board post.</li> <li>The option for changing this default is hidden.</li> </ul>

Table 48–6 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.kudos`.

**Table 48–6 Effect of Subscription Configurations for Feedback**

subscription-enabled	end-user-configurable	Effect
true	true	<ul style="list-style-type: none"> <li>The subscribing user receives a notification message when another user leaves feedback for him.</li> <li>The user can change this default.</li> </ul>
true	false	<ul style="list-style-type: none"> <li>The subscribing user receives a notification message when another user leaves feedback for him.</li> <li>The user cannot change this default.</li> </ul>
false	true	<ul style="list-style-type: none"> <li>The subscribing user does not receive a notification message when another user leaves feedback for him.</li> <li>The user can change this default.</li> </ul>
false	false	<ul style="list-style-type: none"> <li>The subscribing user does not receive a notification message when another user leaves feedback for him.</li> <li>The option for changing this default is hidden.</li> </ul>

## 48.2.5 Adding Notifications Task Flows to Your Application

This section provides a brief overview of Notifications task flows and describes how to add them to your application pages. It includes the following subsections:

- [Section 48.2.5.1, "Notifications Task flows"](#)
- [Section 48.2.5.2, "How to Add a Notifications Task Flow to a Page"](#)

### 48.2.5.1 Notifications Task flows

Notification Services exposes two task flows for managing user subscriptions:

- Subscription Preference provides controls for taking, viewing, and unsubscribing from application-level subscriptions ([Figure 48–3](#))

**Figure 48–3 Subscription Preferences Task Flow**

Subscription Preferences

Save 

**Notify Me About**

- Message Board  
New posts for me; Commented on my posts; Liked my posts
- Spaces Management  
My new membership; My role changes; My membership removal
- Connections  
Connection invitations to me
- Feedback  
New posts for me

- Subscription Viewer provides controls for viewing and unsubscribing from object-level subscriptions (Figure 48–4).

**Figure 48–4 Subscription Viewer Task Flow**

Subscription viewer

View ▾ Unsubscribe Filter   

Space Name	Service	Resource Type	Resource Name	Created On
Standards	Documents	Document	<a href="#">htmlplus_table.pdf</a>	12/14/10 12:52 PM
Standards	Documents	Document	<a href="#">managed_servers.txt</a>	12/14/10 12:53 PM

### 48.2.5.2 How to Add a Notifications Task Flow to a Page

To add a Notifications task flow to a page:

1. Follow the steps in [Section 7.2.1, "How to Prepare Your Application to Consume Services"](#) to implement security and create a customizable page in your application.
2. Open the page on which to add the task flow.
3. In the Resource Palette, in the My Catalogs pane, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
4. Drag the task flow onto a page region, then choose **Region** from the pop-up list.
5. In the Confirm Add ADF Library dialog, click **Add Library** to add all required libraries for the component.
6. For Subscription Preferences only, optionally, in the Edit Task Flow Binding dialog, provide a path to your input parameter map and values for the task flow's input parameters, and click **OK**.

**See Also:** For information about Subscription Preferences task flow input parameters, see [Section 48.2.5.3, "Subscription Preferences Task Flow Input Parameters."](#)

The task flow displays on the page. For example, in the Source view, you will see the content depicted in [Example 48–8](#).

**Example 48–8 Source View Content of the Subscription Preferences Task Flow**

```
<af:region value="#{bindings.SubscriptionPreferences1.regionModel}" id="r1"/>
```

7. In the Confirm Add Form Element dialog, click **No**, to avoid wrapping a form element around the task flow.
8. Save your project, then run your page to a browser.  
The task flow appears in your browser (Figure 48–5).

**Figure 48–5 Subscription Preferences Task Flow****48.2.5.3 Subscription Preferences Task Flow Input Parameters**

The Subscription Preferences task flow has input parameters that you can use to control the behavior of a given task flow instance. Table 48–7 lists and describes the input parameters associated with this task flow.

**Table 48–7 Subscription Preferences Task Flow Input Parameters**

Input Parameter	Description
hideActions	A control for showing or hiding the <b>Save</b> button and <b>Refresh</b> icon on the task flow <ul style="list-style-type: none"> <li>▪ <code>#{true}</code> to hide these controls</li> <li>▪ <code>#{false}</code> to show them (default)</li> </ul>
scopeName	The name of the scope for which to set subscription preferences.

**48.2.6 Setting Security for Notifications**

Notifications must know the identity of a user to preserve the user's Notifications settings and to track the user's activities on subscribed services and objects. To that end, you must at least configure your application to authenticate users such that they have distinct identities for the purposes of personalization and user preferences.

For details on how to implement a basic security solution for your Framework application, see [Section 68.3, "Configuring ADF Security."](#) For details on how to implement a complete security solution for your Framework application, see [Chapter 68, "Securing Your WebCenter Portal: Framework Application."](#)

After you configure ADF security for your application, you can open the `jazn-data.xml` file and modify your sample user's privileges for each task flow. To

open the ADF Security Policies Editor, locate the file in the Application Resources panel and double-click its name. You can further configure grants in this view.

---

---

**Note:** To successfully grant user permissions for Notifications, you must configure user permissions after deployment.

---

---

## 48.3 Advanced Information for Notifications

This section provides information about the APIs that are available for use with Notifications. It includes the following subsections:

- [Section 48.3.1, "Using Notifications Java APIs"](#)
- [Section 48.3.2, "Using Notifications Data Controls"](#)

### 48.3.1 Using Notifications Java APIs

This section provides an overview of Notifications Java APIs. It includes the following subsections:

- [Section 48.3.1.1, "Configuration Settings Required to Use Notifications Java APIs"](#)
- [Section 48.3.1.2, "Introduction to Notifications Java APIs"](#)
- [Section 48.3.1.3, "How to Set up Your Application to Use Notifications Java APIs"](#)

**See Also:** For detailed information about the Notifications Java APIs, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

#### 48.3.1.1 Configuration Settings Required to Use Notifications Java APIs

To use Notifications Java APIs, you must have the following entries in your `adf-config.xml` file:

```
<namespace path="/oracle/webcenter/page/scopedMD"
  metadata-store-usage="WebCenterFileMetadataStore"/>
<namespace path="/pageDefs" metadata-store-usage="WebCenterFileMetadataStore"/>
```

If these entries are not present in `adf-config.xml`, you can add them using your preferred text editor.

#### 48.3.1.2 Introduction to Notifications Java APIs

Notifications Java APIs are located in the class `oracle.webcenter.notification`. Within the class, `SubscriptionManager` provides the interface for creating and managing user subscriptions using the following Java APIs:

- `FilterOption`—Provides the filter criteria. Use an instance of this class while querying a user's subscriptions.
- `NotificationServiceFactory`—Factory for creating and retrieving instances that correspond to Notifications interfaces. This is the entry point to the Notifications API.
- `SortOption`—Defines the sort attributes for fetching subscriptions. Use an instance of this class in `SubscriptionManager` methods to query a user's subscriptions.
- `Subscription`—Contains information about a user's subscription. Subscriptions for a user are created via the method that is exposed by `SubscriptionManager`.

Instances of this class are returned by the methods exposed in `SubscriptionManager`.

- `SubscriptionPreference`—Represents application- or scope-level subscriptions as a preference and enables setting and unsetting of subscriptions for the corresponding service.

**See Also:** For detailed information about the Notifications Java APIs, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

### 48.3.1.3 How to Set up Your Application to Use Notifications Java APIs

To use the Notifications Java APIs, WebCenter Portal extension must be present in your JDeveloper application. In JDeveloper, go to the **Help - About** menu, and click the **Extensions** tab. Look for the Service, as shown in [Figure 48–6](#). For information about adding the WebCenter Portal extension, see [Chapter 3, "Preparing Your Development Environment."](#)

**Figure 48–6** JDeveloper Extensions

After confirming that Notifications is included with the WebCenter Portal extension, you must add the Notifications libraries to the project if they are not already present.

To add Notifications libraries to your project:

1. Right-click your project and select **Project Properties** and then **Libraries and Classpath**.
2. Click **Add Library** and select the **WebCenter Notification Service** and **WebCenter Notification Service View** libraries ([Figure 48–7](#)).
3. Click **OK**.

Figure 48–7 Libraries and Classpath in Project Properties

4. Click OK.

### 48.3.2 Using Notifications Data Controls

Notifications provides a data control that enables you to create your own visualization of the subscription management functionality. This section provides an overview of the data control **Notification Subscription Data Control**, and lists and describes its supported methods, attributes, and classes.

**See Also:** For information about using data controls in a Framework application, see [Section 7.1.3, "Using WebCenter Portal Data Controls."](#)

This section includes the following subsections:

- [Section 48.3.2.1, "Adding a Data Control to Your Project"](#)
- [Section 48.3.2.2, "Understanding the Notification Subscription Data Control"](#)
- [Section 48.3.2.3, "Notification Subscription Data Control Methods and Attributes"](#)
- [Section 48.3.2.4, "Notification Subscription Data Control Classes"](#)

#### 48.3.2.1 Adding a Data Control to Your Project

Add a data control to your project by right-clicking it in the Resource Palette and selecting **Add to Project** from the resulting context menu. Once added, you can browse the data control's methods and attributes by expanding it in the Data Controls panel in the Application Navigator.

Add a data control to an application page by dragging it onto the page from the Data Controls panel.

**See Also:** For information about using data controls in a Framework application, see [Section 7.1.3, "Using WebCenter Portal Data Controls."](#)

### 48.3.2.2 Understanding the Notification Subscription Data Control

The Notification Subscription Data Control enables you to create a custom UI that is equivalent to the Subscription Preferences and Subscription Viewer task flows should these prove insufficient for your requirements.

You can use the data control as a means of adding application-level subscription preferences. For example, if you have developed your own preferences mechanism in your application, you can use the data control to add subscription preferences to that existing mechanism rather than using the Subscription Preferences task flow directly. Or you can build a custom subscription viewer UI, where all of the current user's object-level subscriptions are listed.

### 48.3.2.3 Notification Subscription Data Control Methods and Attributes

This section lists and describes the methods exposed in the Notification Subscription Data Control. It includes the following subsections:

- [Section 48.3.2.3.1, "Method: getUserSubscriptionPreferences"](#)
- [Section 48.3.2.3.2, "Method: getScopeSubscriptionPreferences"](#)
- [Section 48.3.2.3.3, "Method: saveUserSubscriptionPreferences"](#)
- [Section 48.3.2.3.4, "Method: saveScopeSubscriptionPreferences"](#)
- [Section 48.3.2.3.5, "Method: getSubscriptions"](#)
- [Section 48.3.2.3.6, "Method: unsubscribe"](#)

**48.3.2.3.1 Method: getUserSubscriptionPreferences** This method returns application-level subscription preferences for the current user.

#### Input Parameters

None

#### Return Values

Returns a collection of [SubscriptionPreference](#) objects. The [SubscriptionPreference](#) object indicates the user's preference for each service.

**48.3.2.3.2 Method: getScopeSubscriptionPreferences** This method returns the scope level subscription preferences for the current user.

This method is primarily useful in a Spaces application. In a Framework application, it is expected that the scope will always be the default scope, that is, the application. For the default scope, this method returns application-level preferences.

#### Input Parameters

The input parameter `scopeGuid` takes a value of type `String`. The value specifies the GUID of the scope for which the user's scope-level preferences are returned. In a Spaces application, the scope referenced here is equivalent to a *space*.

**Return Values**

Returns a collection of [SubscriptionPreference](#) objects. Each object indicates the current user's subscription preferences for each service within the specified scope.

**48.3.2.3.3 Method: saveUserSubscriptionPreferences** This method enables the application to commit and save changes to the user's application-level preferences. For example, if the user subscribes to all available services, then these changes can be committed by binding this method to the appropriate component on the UI (for example, an **Apply** button).

**Input Parameters**

None

**Return Values**

None

**48.3.2.3.4 Method: saveScopeSubscriptionPreferences** This method enables the application to commit and save changes to the user's scope-level preferences. For example, if the user subscribes to all the available services in the given scope, then these changes can be committed and saved by binding this method to the appropriate component on the UI (for example, an **Apply** button).

**Input Parameters**

The input parameter `scopeGUID` takes a value of type `String`. The value specifies the GUID of the scope for which the modified preferences are to be saved.

**Return Values**

None

**48.3.2.3.5 Method: getSubscriptions** The primary method for returning a list of the current user's object-level subscriptions. You can use this method to build a custom Subscription Viewer UI for showing all of a user's object-level subscriptions.

**Input Parameters**

[Table 48–8](#) lists and describes the input parameters supported by this method.

**Table 48–8** *Input Parameters Supported by the method getSubscriptions*

Input Parameter	Description
<code>FilterOption</code>	An object that contains filter conditions for querying a user's subscriptions. <code>FilterOption</code> supports filtering based on space name (Spaces only) and object name.
<code>SortOption</code>	An object that contains the sort or ordering condition for querying subscriptions. It supports sorting by object name, scope name (Spaces only), or the creation date of subscription.
<code>offset</code>	This input parameter takes an integer as a value. The offset for querying subscriptions. This is typically used while fetching the result set with pagination.
<code>fetchSize</code>	This input parameter takes an integer as a value. The maximum number of rows to be returned in one call.

## Return Values

Returns a collection of [Subscription](#) objects matching the filter criteria and other input parameters in the order specified by the sort option.

**48.3.2.3.6 Method: unsubscribe** Used to unsubscribe from, or remove, a specific subscription. This method is typically used to add the unsubscribe action to the Subscription Viewer UI, where object-level subscriptions are exposed.

Note that unsubscribing from a particular service at the application and space level, or at either level, can be achieved by setting the appropriate flag in [SubscriptionPreference](#) and saving those via the appropriate `save*()` method listed above. The `Unsubscribe` method is useful within Subscription Viewer functionality.

## Input Parameters

[Table 48–9](#) lists and describes the input parameters supported by this method.

**Table 48–9 Input Parameters Supported by the method Unsubscribe**

Input Parameter	Description
<code>scopeGuid</code>	Takes a value of type <code>String</code> . The value specifies the GUID of the scope for which the user's scope-level preferences are returned. In a Spaces application, the scope referenced here is equivalent to a <i>space</i> .
<code>serviceId</code>	The ID of the unsubscribed service Valid service IDs include: <ul style="list-style-type: none"> <li>▪ <code>oracle.webcenter.collab.forum</code></li> <li>▪ <code>oracle.webcenter.doclib</code></li> </ul>
<code>objectId</code>	The GUID of the unsubscribed object.

## Return Values

None

## 48.3.2.4 Notification Subscription Data Control Classes

The Notification Subscriptions Data Control exposes two classes as return values:

- [SubscriptionPreference](#)
- [Subscription](#)

**48.3.2.4.1 SubscriptionPreference** The class `SubscriptionPreference` represents application- or scope-level subscriptions as a preference and enables setting and unsetting of subscriptions for the corresponding service (this is followed by `save` call on the data control).

[Table 48–10](#) lists and describes the properties associated with the `SubscriptionPreference` class.

**Table 48–10 Properties Associated with the SubscriptionPreference Class**

Property	Description
<code>hintsText</code>	A string containing the concatenation of all the applicable activities (description) within the service that generates notifications  This is useful to display on the UI to tell the user what he is subscribing to.

**Table 48–10 (Cont.) Properties Associated with the SubscriptionPreference Class**

Property	Description
serviceIcon	An icon for the service
serviceId	ID of the corresponding service
serviceName	Display name of the service
subscriptionEnabled	A flag that indicates whether the subscription is enabled This attribute also has a setter to support the check/uncheck or select/deselect operation on the UI.
userOverrideAllowed	A flag that indicates whether to allow the user to override the default setting

**48.3.2.4.2 Subscription** The class `Subscription` is purely read-only and represents space- (Spaces only) and object-level subscriptions.

[Table 48–11](#) lists and describes the properties associated with the **Subscription** class.

**Table 48–11 Properties Associated with the Subscription Class**

Property	Description
creationDate	The datetime this subscription was created
objectId	The ID of the object, if this represents object level subscription, otherwise null.
objectName	The name of the object, if this represents object level subscription, otherwise null.
objectType	The object type (as defined by the corresponding service) when this subscription represents object level subscriptions, otherwise null.
scopeGuid	The GUID of the scope or space.
scopeName	The display name of the scope or space.
serviceId	The ID of the service for this subscription object.
serviceName	The name of the service.
userId	The ID of the user who created this subscription.

---

---

## Integrating the Recent Activities Service

This chapter describes how to integrate the Recent Activities service into your WebCenter Portal: Framework application. This service enables you to display the most recent changes to the services in your application.

This chapter includes the following sections:

- [Section 49.1, "Introduction to the Recent Activities Service"](#)
- [Section 49.2, "Basic Configuration for the Recent Activities Service"](#)
- [Section 49.3, "Advanced Information for the Recent Activities Service"](#)

For information about using the Recent Activities service, see Chapter "Working with the Recent Activities Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

### 49.1 Introduction to the Recent Activities Service

Oracle WebCenter Services are preconfigured to work with the Recent Activities service. Recent Activities enable users to view the most recent changes to the services in your application. For example, once you add the Documents service, it automatically produces the information that the Recent Activities service will use to display the most recent changes to the document library. This service is useful to your users who want a quick and easy way to view any additions or changes to a particular area of the application.

The Recent Activities service can track information from the following WebCenter Services:

- Documents added by the Documents service
- Announcements created by the Announcements service
- Discussion Forums created by the Discussions service
- Pages created or modified by the Page service
- List definitions created or modified by the Lists service

For more information about these services, see [Chapter 32, "Integrating the Announcements Service,"](#) [Chapter 33, "Integrating the Discussions Service,"](#) [Chapter 29, "Integrating the Documents Service,"](#) and [Chapter 18, "Enabling Runtime Creation and Management of Pages."](#)

This section contains the following subsections:

- [Section 49.1.1, "Understanding the Recent Activities Service"](#)
- [Section 49.1.2, "What Happens at Runtime"](#)

## 49.1.1 Understanding the Recent Activities Service

The Recent Activities service provides a summary view of recent changes to a variety of services. You can specify the range of time to consider recent by selecting a time range from a list at the top of the task flow. Recorded activities include additions or revisions of pages, documents, discussion forums, and the like.

By default, the Recent Activities service works with the Documents, Announcements, Discussions, and Page services. You can narrow the services that the Recent Activities service tracks. For more information about this setting, see the next section, [Section 49.3, "Advanced Information for the Recent Activities Service."](#) You can also learn more about using Oracle WebCenter Portal: Services in [Section 2.4, "Introducing Oracle WebCenter Portal: Services."](#)

The Recent Activities service compares somewhat to Activity Stream (for more information, see [Section 37.1.1.1, "Activity Stream"](#)). Both track the application activities of integrated services, though Activity Stream tracks a broader range of services. For example, Recent Activities tracks the Documents, Announcements, Discussions, and Page services. Activity Stream tracks these services as well as People Connections and Wikis and Blogs. Recent Activities tracks activities no matter who performs the action. Activity Stream tracks activities performed by a user's connections and includes information about who performed the activity. Recent Activities does not include names.

The basic difference between these two services can be summarized as follows: Recent Activities provides an overview of what is happening in an application. Activity Stream provides an overview of what is happening with a user's connections.

## 49.1.2 What Happens at Runtime

At runtime, the Recent Activities task flow fetches latest information about the services that are configured and running in your application. [Figure 49–1](#) shows an example of the Recent Activities task flow at runtime, and displays the following activities that have occurred in the application since yesterday:

- one document has been uploaded or added using the Documents service
- five discussion threads have been modified or added using the Discussions service
- one announcement has been modified or added using the Announcements service

The time range choices (Last 30 days, Today, Since Yesterday, and so on) display based on the default values set for the Recent Activities Time Range parameter values at design time (see [Table 49–1](#)).

The Recent Activities service uses the search capabilities of WebCenter to query activities for specified periods. Search capabilities are implemented across the following WebCenter Portal service: Documents, Announcements, Discussions, and Pages. These services, if configured in an application, respond to queries of the Recent Activities service and return items pertinent to the search criteria. Responses to queries (search results) are always based on the search predicate, `DCMI_MODIFIED > [start time]`. Here `start time` is one of the time periods that you configured in the Edit Task Flow Binding dialog at design time. You can select a time period in the **Show** dropdown list at runtime.

**Figure 49–1 Recent Activities Service at Runtime**

## 49.2 Basic Configuration for the Recent Activities Service

This section describes how to add the Recent Activities service to your Framework application.

This section contains the following subsections:

- [Section 49.2.1, "Setting up Connections for the Recent Activities Service"](#)
- [Section 49.2.2, "Adding the Recent Activities Service at Design Time"](#)
- [Section 49.2.3, "Modifying Recent Activities Service Task Flow Parameters"](#)
- [Section 49.2.4, "Setting Security for the Recent Activities Service"](#)

### 49.2.1 Setting up Connections for the Recent Activities Service

You do not need to set up specific connections for the Recent Activities service. You only need to ensure that the service(s) you are tracking with the Recent Activities service is configured. For more information about setting up connections for other services, see the individual services chapters in this guide.

### 49.2.2 Adding the Recent Activities Service at Design Time

To use the Recent Activities service, you must add its task flow to your application. Ensure that you have at least one of the services it tracks in your application. There is a single Recent Activities task flow available in the WebCenter Portal - Services Catalog, which you can add to your application to display information about services in your application to your users.

The Recent Activities service automatically picks up other services in your application and looks for recent activities within these services. Before running your application containing the Recent Activities service, however, you may want to ensure your application contains at least one of the services you wish to monitor.

To add the Recent Activities task flow to your application:

1. Follow the steps in [Section 7.2.1, "How to Prepare Your Application to Consume Services"](#) to implement security and create a customizable page in your Framework application.
2. Open the source of the customizable page.

3. Ensure that your application includes at least one of the services that the Recent Activities service tracks.

---

**Note:** If you run an application that does not contain one of these services, the Recent Activities service displays an error saying `Warning: Unable to obtain recent activity data.`

---

4. Create a new external application by right-clicking the **ViewController** project in your application, then choosing **New**.
5. In the New Gallery, under General, select **External Applications**, then select **External Application** from the Items list.
6. Click **OK**.
7. In the **Application Name** field, enter a name for your application, such as `MyExternalApplication`, then click **Next**.
8. On the **General** page, leave the **Login URL** field empty.
9. In the **User Name/ID Field Name** field, enter a user name. The user name should match the login credentials of the servers you are tracking. For example, if you are tracking the Documents service with Oracle Content Server, the login credentials must match those of the user on Oracle Content Server.
10. In the **Password Field Name** field, enter a password.
11. Under Authentication Details, choose **POST**, then click **Next**.
12. On the **Additional Fields** page, click the **Add Field** button.
13. For the Field Name, enter `Account`.
14. Select the **Display to User** checkbox.

**Figure 49–2 Additional Fields Page**

Register External Application - Step 4 of 6

**Additional Fields**

Enter the names and values of any additional fields submitted by the external application's login form

Field Name	Default Field Value	Display to User
Account		<input checked="" type="checkbox"/>

Add Field Delete Field

Help < Back Next > Finish Cancel

15. Click **Finish**.

16. In the Resource Palette, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
17. Click **Recent Activities** and drag it onto your page after the `<af:form>` tag, and choose **Region**.

**Figure 49–3 Edit Task Flow Binding Dialog**

In the Edit Task Flow Binding dialog shown in [Figure 49–4](#), you can set the values for the time range that displays at runtime. This time range controls what activities display, as you will see in the next section. If you leave these parameters empty, the Recent Activities service will use the default values of the service.

[Table 49–1](#) describes the possible values for these parameters. The default values specified in this table come from the `adf-config.xml` file, as described in [Section 49.3.1, "Refining the Behavior of the Recent Activities Service."](#)

**Table 49–1 Recent Activities Time Range Parameter Values**

Parameter	Values
groupSpace	Leave the value of this parameter as null. Note: This parameter is only used within the Spaces application and is not relevant in non-scoped applications.
timePeriodShort	Default value: Today Possible values: Today, Yesterday, or a Time in Minutes
timePeriodMedium	Default value: Since Yesterday Possible values: Today, Yesterday, or a Time in Minutes
timePeriodLong	Default value: 10080 (10080 minutes is equivalent to 7 days.) Possible values: Today, Yesterday, or a Time in Minutes
timePeriodLongest	Default value: 43200 (43200 minutes is equivalent to 30 days.) Possible values: Today, Yesterday, or a Time in Minutes

**Figure 49–4 Example of the Edit Task Flow Binding Dialog for the Recent Activities Service**

18. Click **OK**. The binding displays on your page, as shown in [Figure 49–5](#).

**Figure 49–5 The Recent Activities Task Flow on a Page in the Design View**

19. Save your project and run your page to the browser.

---

**Note:** When you add the Recent Activities task flow to your page, you will see a task flow parameter called **groupSpace**. The default value of this parameter is `null`, which tells the task flow to search the entire application for recent activities.

---

### 49.2.3 Modifying Recent Activities Service Task Flow Parameters

The Recent Activities service task flows have required and optional task flow binding parameters. You can adjust the parameter values when you drop the task flows onto a page or after you have placed a task flow on a page. For information about modifying parameters, see [Section 32.2.2.3, "How to Modify Announcements Service Task Flow Parameters."](#) The procedure for modifying parameters is identical across all task flows.

### 49.2.4 Setting Security for the Recent Activities Service

The Recent Activities service uses the security applied to the underlying services being analyzed. So, the information returned by the services only contains content for which the current user has at least View privileges. For example, a user who does not have View privileges to view content in a document library will not see recently added documents in the Recent Activities view. Similarly, a public user will only see activities returned on services exposed to the public, and do not require authentication to view.

## 49.3 Advanced Information for the Recent Activities Service

This section explains that in addition to the task flow parameters, you can further refine the behavior of the Recent Activities service. It also describes how you can obtain RSS news feed for your Recent Activities service.

This section contains the following subsections:

- [Section 49.3.1, "Refining the Behavior of the Recent Activities Service"](#)
- [Section 49.3.2, "Obtaining RSS News Feed URL for the Recent Activities Service"](#)

### 49.3.1 Refining the Behavior of the Recent Activities Service

You can change a variety of the Recent Activities service parameters after you have added it to your application. When you add the task flow to your page, you also automatically add the following entry to the `adf-config.xml` file, located in the Application Resources panel, under **Descriptors**, in the **ADF META-INF** folder:

```
<recentactivityC:adf-recent-activity-config
xmlns="http://xmlns.oracle.com/webcenter/recentactivity/config">
  <display-properties numServiceRows="25" shortPeriod="TODAY"
    mediumPeriod="YESTERDAY" longPeriod="10080"
    longestPeriod="43200"/>
  <services-filter>
    <exclude/>
  </services-filter>
</recentactivityC:adf-recent-activity-config>
```

You can change the settings described in [Table 49–2](#) in this entry.

**Table 49–2** Recent Activities Settings in the *adf-config.xml* File

Setting	Description
<code>numServiceRows</code>	<p>Default value: 25</p> <p>The maximum number of rows displayed for a single service.</p> <p>If there are more recent activity results than this, the most recent ones up to this number are returned. For example, if there are 32 recently modified documents and this setting is 25 then only the most recent 25 will show up in the results.</p>

**Table 49–2 (Cont.) Recent Activities Settings in the *adf-config.xml* File**

Setting	Description
<code>shortPeriod</code>	<p>Default value: Today</p> <p>See <a href="#">Table 49–1</a>. This setting is the same as the <code>timePeriodShort</code> task flow parameter, and is used when the task flow parameter is not specified.</p>
<code>mediumPeriod</code>	<p>Default value: Yesterday</p> <p>See <a href="#">Table 49–1</a>. This setting is the same as the <code>timePeriodMedium</code> task flow parameter and is used when the task flow parameter is not specified.</p>
<code>longPeriod</code>	<p>Default value: 10080 (Last 7 Days)</p> <p>See <a href="#">Table 49–1</a>. This setting is the same as the <code>timePeriodLong</code> task flow parameter and is used when the task flow parameter is not specified.</p>
<code>longestPeriod</code>	<p>Default value: 43200 (Last 30 Days)</p> <p>See <a href="#">Table 49–1</a>. This setting is the same as the <code>timePeriodLongest</code> task flow parameter and is used when the task flow parameter is not specified.</p>
<code>services-filter</code>	<p>Default value: null</p> <p>Use this tag to filter out services you do not wish to track with this service. The following example omits any changes to the Page service from displaying in the Recent Activities service:</p> <pre>&lt;services-filter&gt;   &lt;exclude&gt;oracle.webcenter.page&lt;/exclude&gt; &lt;/services-filter&gt;</pre> <p>By default, no services are omitted.</p>

### 49.3.2 Obtaining RSS News Feed URL for the Recent Activities Service

You can expose WebCenter Portal: Spaces functionality in a Framework application. Your Framework application users can find out what is happening in a specific group space through RSS news feeds.

Configure RSS news feeds for the Recent Activities service to enable users to view group space recent activities from within a portal. To obtain the group space RSS news feed URL for the Recent Activities service, use either of the following WebCenter Portal: Spaces APIs:

- `getServiceRssFeedURL`
- `getServiceRssFeedURLbyGUID`

To obtain an RSS feed URL, you must identify the group space (by name or GUID) and specify the service required (by service ID). The service ID for the Recent Activities service is `GroupSpaceWClient.RECENT_ACTIVITY_SERVICE_ID`. For information about how to use these APIs, see [Section 56.2.5.3.9, "Retrieving RSS Feed URLs for Space Services."](#)

---

---

## Integrating the Worklist Service

This chapter describes how to integrate the Worklist service into your application. Worklists enable users to view and take action on all tasks and notifications from a BPEL (Business Process Execution Language) server all in one place.

This chapter includes the following sections:

- [Section 50.1, "Introduction to the Worklist Service"](#)
- [Section 50.2, "Roadmap - Configuring the Worklist Service for WebCenter Portal: Framework Applications"](#)
- [Section 50.3, "Basic Configuration for the Worklist Service"](#)
- [Section 50.4, "Advanced Information for the Worklist Service"](#)

For information about managing and using the Worklist service, see:

- Chapter "Managing the Worklist Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- Chapter "Working with the Worklist Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

### 50.1 Introduction to the Worklist Service

The Worklist service enables you to show Business Process Execution Language (BPEL) Worklist items assigned to the currently authenticated user. The BPEL Worklist items are open BPEL tasks from one or more BPEL Worklist Repositories to which your application is connected. The Worklist displays BPEL Worklist items that are a result of a task invoked as part of a BPEL Workflow process, or are a result of a message being sent to the Worklist channel on the Oracle User Messaging Service.

This section contains the following subsections:

- [Section 50.1.1, "Understanding Worklists"](#)
- [Section 50.1.2, "Requirements for the Worklist Service"](#)
- [Section 50.1.3, "What Happens at Runtime"](#)

#### 50.1.1 Understanding Worklists

The Worklist service provides a personal, at-a-glance view of business processes that require your users' attention. These can include a request for document review or other types of business processes that come directly from your enterprise applications.

Worklist items come from a variety of sources. Some Worklist items are kicked off by events that are associated with an externally defined workflow. A workflow maps the

route an item follows once an event kicks off. This type of workflow is defined in a Worklist BPEL server, such as Oracle BPM Worklist.

Messages, alerts, and notifications might also come from the User Messaging Service (UMS). The Worklist task flow includes a control for accessing messaging preferences on this server. Use these controls to specify the channels over which to receive Oracle User Messaging Service messages and to define messaging filters.

**See Also:** *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* for more information about the service at runtime.

## 50.1.2 Requirements for the Worklist Service

To use the Worklist service, you must have a BPEL server installed. For information on installing BPEL for the Worklist service, see the "Back-End Requirements for the Worklist Service" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

For the Worklist to properly function, it must reside on a secured page, as the service uses the currently authenticated user to access the BPEL server. If the page or application that contains the Worklist service is not secured, you will encounter exception errors.

## 50.1.3 What Happens at Runtime

At runtime, the Worklist task flow fetches latest Worklist workflow items from BPEL workflows configured in the BPEL server. For more information, see the chapter "Working with the Worklist Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To get a list of the items assigned to a user, the Worklist service uses the `WebService` access function of the public BPM client API. The Worklist service uses SAML authentication to authorize the logged-in user to fetch the list of latest items from the BPEL repository. The Worklist service fetches 25 most recent items for each Worklist connection, and determines the order of these items by using a predicate on the `TaskQueryService` API. For more information, see "Building a Custom Worklist Client" in *Oracle Fusion Middleware Developer's Guide for Oracle SOA Suite*.

[Figure 50-1](#) shows the Worklists service at runtime.

**Figure 50–1 Worklist Service at Runtime**

## 50.2 Roadmap - Configuring the Worklist Service for WebCenter Portal: Framework Applications

Figure 50–2 and Table 50–1 in this section provide an overview of the prerequisites and tasks required to get the Worklist service working in Framework applications.

**Figure 50–2 Configuring the Worklist Service for WebCenter Portal: Framework Applications**

**Table 50–1 Configuring the Worklist Service for WebCenter Portal: Framework Applications**

Actor	Task	Sub-Task
Administrator	1. Install Oracle WebCenter Portal and the Oracle SOA Suite	
Developer	2. Integrate the Worklist service in your Framework application	2.a Create a Worklist connection 2.b Add the Worklist task flow to a page in JDeveloper

**Table 50–1 (Cont.) Configuring the Worklist Service for WebCenter Portal: Framework Applications**

Actor	Task	Sub-Task
Developer/Administrator	<b>3.</b> Deploy the Framework application using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> <li>■ WLS Admin Console (Administrator)</li> </ul>	
Administrator	<b>4.</b> Deploy additional BPEL workflows using the Oracle BPM Worklist application

End User	<b>8.</b> Test that the Worklist service is working	<b>8.a</b> Log in to the Framework application <b>8.b</b> Generate a worklist event <b>8.c</b> Verify event information displays in the task flow

## 50.3 Basic Configuration for the Worklist Service

This section describes how to set up a connection for the Worklist service and add the task flow to your Framework application.

This section contains the following subsections:

- [Section 50.3.1, "Setting up Connections for the Worklist Service"](#)
- [Section 50.3.2, "Adding the Worklist Service at Design Time"](#)
- [Section 50.3.3, "Setting Security for the Worklist Service"](#)

### 50.3.1 Setting up Connections for the Worklist Service

To use the Worklist service, you must establish a connection to one or more BPEL servers. This section describes these connections and how to create them in a Framework application.

### 50.3.1.1 Worklist Service Connections

The Worklist service relies on a BPEL server. Once you create a connection using the Create Worklist Connection dialog, the connection is registered in your application's `connections.xml` and referenced in your application's `adf-config.xml`. You can see the connections to your BPEL Worklist Repositories in the Application Resources pane.

---

---

**Note:** While you can set up the connections to back-end servers at design time in Oracle JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

### 50.3.1.2 How to Set Up Connections for the Worklist Service

The Worklist service provides a task flow that you can add to your application at design time or at runtime. Before you can run the task flow, you create a connection from your application to a BPEL server.

---

---

**Note:** The application you use must be prepared for service consumption. For information about doing so, see [Chapter 7, "Preparing Your Application for WebCenter Portal Services."](#)

---

---

To set up the connection for the Worklist service:

1. In the Application Resources panel for your application, right-click **Connections**, then choose **New Connection > Worklist**.
2. In the Create Worklist Connection dialog, choose whether to create the connection in the Application Resources (only the current application can use this connection) or IDE Connections (other applications you create can use the same connection).
3. In the **Connection Name** field, enter a name for your connection. This name will be used as the display name of the Worklist server.

---

---

**Note:** At runtime, when users view their worklist items, they can choose to group the items by "Worklist Server." The Worklist Server name used is the name you enter in the Connection Name field.

---

---

4. In the **URL** field, enter the location of your BPEL/SOA server, such as `http://bpel.example.com`. This is the URL for the managed server running the SOA processes.
5. Select the **SAML Token Policy URI** to use for this server ([Figure 50-3](#)).

SAML (Security Assertion Markup Language) is an XML-based standard for passing security tokens defining authentication and authorization rights. An attesting entity (that already has trust relationship with the receiver) vouches for the verification of the subject by method called sender-vouches. Options available are:

- SAML Token Client Policy (`oracle/wss10_saml_token_client_policy`) - Select to verify your basic configuration without any additional security. This is the default setting.

- SAML Token With Message Client Policy (**oracle/wss10\_saml\_token\_with\_message\_protection\_client\_policy**) - Select to increase the security using SAML-based BPEL Web Services. If selected, you must configure keys stores both in your Framework application and in the BPEL application. For more information about this configuration, see the "Configuring Policies" in the *Oracle Application Server Web Services Security Guide*.

**Figure 50–3 Create Worklist Connection Dialog**

Choose Application Resources to create a BPEL connection owned by and deployed with the current application myWebCenterPortalApp.jws. Choose IDE Connections to create a connection that can be added to any application.

Create Connection in:  Application Resources  IDE Connections

Connection Name:

URL:

SAML Token Policy URI:

Advanced

Optional advanced settings

Link URL:

Recipient Key Alias:

Services to be configured to use this connection:

**6. To enable advanced settings, select **Advanced**:**

- In the **Link URL** field, specify the URL used to link to the BPEL server. Only required if it is different to the BPEL SOAP URL, for example, when SSO or HTTPS is configured. Use the format: `protocol://host:port`.

For example, `http://mySSO.host.com:7777`.

This URL is used to build SSO- or HTTPS-enabled URL links to worklist items. Whereas the URL property of the Worklist service is used to access the BPEL Task Query Service, which for performance reasons does not need to go through HTTPS or an SSO server.

- In the **Recipient Key Alias** field, enter the recipient key alias to be used for message protected SAML policy authentication. Only required when the BPEL server connection is using a SAML token policy for authentication and the application's Worklist service is using multiple BPEL server connections. For information about working with recipient key alias and WS-security, see the

chapter "Configuring WS-Security" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

7. Click **Test Connection** to validate the URL.
8. Click **OK**.

The new connection displays in the Application Resources panel under **Connections**.

## 50.3.2 Adding the Worklist Service at Design Time

This section describes the Worklist task flow and how to add it to your application.

### 50.3.2.1 Worklist Service Task Flows

There is one task flow associated with the Worklist service, called "Worklist." You can find this task flow in the WebCenter Portal - Services Catalog in the Resource Palette.

### 50.3.2.2 How to Add the Worklist Service to your Application

You can add the Worklist service to your application before or after you have created your connection. However, you must set up your connection before you run the service.

To add the Worklist task flow to your application:

1. Follow the steps in [Section 7.2.1, "How to Prepare Your Application to Consume Services"](#) to implement security and create a customizable page in your application.
2. Open the page where you wish to add the Worklist task flow.
3. In the Resource Palette, in the My Catalogs pane, open the **WebCenter Portal - Services Catalog**, then open the **Task Flows** folder.
4. Drag the worklist task flow onto the desired region on the page, then choose **Region** from the pop-up list. The task flow displays on the page. For example, in the Source view, you will see [Figure 50-4](#).

**Figure 50-4 Worklist Task Flow in the Page Source**

```
<f:facet name="first">
  <af:region value="#{bindings.worklist1.regionModel}"
    id="worklist1"/>
</f:facet>
```

5. Save your project, then run your page to a browser. The Worklist service displays in your browser.

## 50.3.3 Setting Security for the Worklist Service

The Worklist service displays the tasks for the currently authenticated user. So, for users to store and retrieve Worklist tasks on the BPEL server from your application, you must set up security on the application (as described in [Section 7.2.1.1, "Implementing Security for Services"](#)). The user names need to either exist in a shared user directory (LDAP), or set up similarly (same user name) on both the Framework application and the BPEL Server. For example, if the user `rsmith` needs to use the Worklist service in your Framework application to store and retrieve tasks from the

BPEL server, you must ensure that the user `rsmith` exists on both the BPEL server and within your application.

To enable users to perform actions on assigned Worklist tasks, you can configure SSO. If you do not configure SSO, the users will be prompted to log into the Worklist Task Details page on the BPEL server. For more information, see the *Oracle Containers for J2EE Security Guide*.

Only authenticated users can view Worklist tasks on the BPEL server to which they have permissions to view. If the application end user does not supply appropriate credentials, or if the page containing the Worklist service is not secured, she will not see any Worklist items stored on the BPEL server and exception errors may occur.

## 50.4 Advanced Information for the Worklist Service

The Worklist service collates all the Worklist items for the authenticated user from all connections in your application defined for the Worklist service. You can use the create connection method described in [Section 50.3.1.2, "How to Set Up Connections for the Worklist Service"](#) to create additional connections, or right-click the connection name in the Application Resources list and choose **Delete** to remove a connection.

---

---

## Integrating the Events Service

This chapter explains how to integrate the Events service into a WebCenter Portal: Framework application at design time.

This chapter includes the following sections

- [Section 51.1, "Introduction to the Events Service"](#)
- [Section 51.2, "Basic Configuration for the Events Service"](#)
- [Section 51.3, "Using the Events Service REST APIs"](#)
- [Section 51.4, "Troubleshooting the Events Service"](#)

For information about managing and including events, see:

- "Managing the Events Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- "Working with the Events Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

### 51.1 Introduction to the Events Service

In Framework applications, the Events service provides access to your personal Microsoft Exchange calendar.

This section includes to following subsections:

- [Section 51.1.1, "Understanding the Events Service"](#)
- [Section 51.1.2, "Requirements for the Events Service"](#)
- [Section 51.1.3, "What Happens at Runtime"](#)

#### 51.1.1 Understanding the Events Service

With the Events service, users can:

- Display their Microsoft Exchange calendars in the Framework application.
- Create, edit, and delete events in their Exchange calendars.
- Change the view of the Events task flow to view calendar events by month, week, or day, or as a list.
- Personalize the Events task flow to display events based on the start time, secondary time zone, list type, and list count

The Events service is integrated with many WebCenter Portal services, such as Links, Mail, and Search.

Figure 51–1 shows an example of a personal calendar in a Framework application.

Figure 51–1 Personal Calendar

### 51.1.2 Requirements for the Events Service

The Events service integrates with Microsoft Exchange Server to provide access to personal calendars. You must install and configure the appropriate server.

For information about installing and configuring Exchange Server, see "Events Service Prerequisites" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 51.1.3 What Happens at Runtime

At runtime, users can view events from their Microsoft Exchange calendars.

For more information about the service at runtime, see the chapter "Working with the Events Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

---

**Note:** *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces* discusses both personal events and space events. Only the information on personal events applies to Framework applications.

---

## 51.2 Basic Configuration for the Events Service

This section includes the following subsections:

- [Section 51.2.1, "Configuration Roadmap for the Events Service"](#)
- [Section 51.2.2, "Setting Up a Connection for the Events Service"](#)

- Section 51.2.3, "Adding the Events Service at Design Time"
- Section 51.2.4, "Setting Security for the Events Service"

## 51.2.1 Configuration Roadmap for the Events Service

The flow chart (Figure 51–2) and table (Table 51–1) in this section provide an overview of the prerequisites and tasks required to get the Events service working in Framework applications.

**Figure 51–2 Configuring the Events Service for WebCenter Portal: Framework Applications**

**Table 51–1 Configuring the Events Service for WebCenter Portal: Framework Applications**

Actor	Task	Sub-task	Notes
Administrator	1. Install WebCenter Portal and Microsoft Exchange Server		MS Exchange Server is the back-end component for personal calendars
	<ul style="list-style-type: none"> <li>■ Use MS Exchange Server 2007</li> </ul>	<b>1.a</b> Configure MS Exchange Server 2007 <b>1.b</b> Edit security settings <b>1.c</b> (Optional) Enable SSL	
	<ul style="list-style-type: none"> <li>■ Use MS Exchange Server 2003</li> </ul>	<b>1.a</b> Download and install WebCenter Portal's Personal Events Web Service Plug-in <b>1.b</b> Configure MS Exchange Server 2003 <b>1.c</b> (Optional) Enable SSL	
Developer	2. Integrate the Events service in your application	<b>2.a</b> Configure a connection to the events server in JDeveloper <b>2.b</b> Add an Events task flow to a page in JDeveloper	
Developer/ Administrator	3. Deploy the application using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> <li>■ WLS Admin Console (Administrator)</li> </ul>		
Developer/ Administrator	4. Add/modify connection parameters using one of the following tools: <ul style="list-style-type: none"> <li>■ JDeveloper, then redeploy the application (Developer)</li> <li>■ Fusion Middleware Control (Administrator)</li> <li>■ WLST (Administrator)</li> </ul>		
End User	5. Access personal calendar		Click <b>Login to Personal Calendar</b> on the Events task flow and enter your MS Exchange login credentials

## 51.2.2 Setting Up a Connection for the Events Service

To take advantage of the Events service, you must first create a connection to the Exchange server from your Framework application. To do this, ensure that you have the connection information for the server.

You can register several server connections for the Events service, but only one connection is active at a time.

---

**Note:** While you can set up the connections to back-end servers at design time in JDeveloper, you can later add, delete, or modify connections in your deployed environment using Enterprise Manager Fusion Middleware Control. For more information, see the section "Registering Events Servers Using Fusion Middleware Control" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

To set up a connection for the Events service:

1. In JDeveloper, open the application in which you plan to consume the Events service.
2. To create a connection that is available to all applications, in the Resource Palette, click the **New** icon and choose **New Connection** and then **WebCenter Personal Event Connection**.

To create a connection that is available to the current application only, in the Application Resources panel of the Application Navigator, right-click **Connections** and choose **New Connection** and then **WebCenter Personal Event Connection**.

3. In the Create Events Connection dialog, in the **Connection Name** field, enter a meaningful name, for example `ExchangeServerForEvents` (Figure 51-3).

**Figure 51-3 Create Events Connection Dialog**

4. In the **Web Service URL** field, enter the URL of the web service exposing the event application. Use the format:

`protocol://host:port/appWebServiceInterface/WSName`

For example:

http://myexchange.com:80/ExchangeWS/PersonalEventsWebService.asmx  
 http://myexchange.com:80/EWS/Services.wsdl

5. From the **Service Adapter** dropdown list, select the version of the Microsoft Exchange server to connect to:
  - **MSExchange2003**
  - **MSExchange2007**
6. Select **Default Connection** to use this connection for the Events service. You can have multiple connections, but only one can be active (default).

---

**Note:** After you create a connection as the active connection, you cannot edit it so that it is not the default. To use a different active connection, you must create a new connection and mark that as the default connection.

---

7. Click **Test Connection**, and if it is successful, then click **OK**.  
 If the test is not successful, check the settings and try again.
8. If you created the connection in the Resource Palette, you must add it to the application.  
 In the Resource Palette, under IDE Connections, right-click the connection and choose **Add to Application**.  
 The connection is listed in the Application Resources panel of the Application Navigator (Figure 51–4). An external application connection is also created to store the user names and passwords of users who connect to the Exchange server.

**Figure 51–4 Application Resources - Personal Event Connection**

### 51.2.3 Adding the Events Service at Design Time

This section includes the following subsections:

- [Section 51.2.3.1, "Events Task Flows"](#)
- [Section 51.2.3.2, "How to Add the Events Service to Your Application"](#)

#### 51.2.3.1 Events Task Flows

The Events service task flows enable you to add a main view or quick view of events to a page.

**Table 51–2 Events Service Task Flows**

Task Flow	Description
Calendar Main View	This task flow displays a calendar of events and provides users with options to view events in day, week, month, or list view.
Calendar Mini View	This task flow displays a calendar, similar to Calendar Main View, however, it requires less space. Only users with permission to edit the page and task flow can configure the event view (available in day or list view).

### 51.2.3.2 How to Add the Events Service to Your Application

To add an Events task flow to your application:

1. Follow the steps described in [Section 7.2, "Preparing Your Framework Application to Consume Services,"](#) to implement security and create a new customizable page in your application.
2. Open the page on which you want to add the task flow.
3. In the Resource Palette, expand **My Catalogs, WebCenter Portal - Services Catalog, and Task Flows**.
4. Drag **Calendar Main View** or **Calendar Mini View** and drop it onto the page, inside the `af:form` tags.
5. When prompted, select **Region** as the way to create the task flow.
6. The Events task flows are contained within the `event-view.jar` library, so click **Add Library** to add the library to your project. This operation may take a moment to complete.
7. Click **OK**.
8. Save and run your page.

[Figure 51–5](#) shows the Calendar Main View task flow at runtime.

**Figure 51–5 Calendar Main View Task Flow**

Figure 51–6 shows the Calendar Mini View task flow at runtime.

**Figure 51–6 Calendar Mini View Task Flow**

## 51.2.4 Setting Security for the Events Service

When you create the connection to the Microsoft Exchange Server for the Events service, an external application connection is also created. This external application connection is created to store the user name and password of users in the Microsoft Exchange Server. For more information, see [Section 51.2.2, "Setting Up a Connection for the Events Service."](#)

## 51.3 Using the Events Service REST APIs

WebCenter Portal provides REST APIs to support the Events service. Use the Events service REST APIs to create your own interface for providing access to space events.

---

**Note:** The Events service REST APIs are available for space events only. You cannot use REST APIs to work with personal events.

---

This section describes the REST APIs associated with the Events service. It includes the following subsections:

- [Section 51.3.1, "Events Entry Point"](#)

- [Section 51.3.2, "Events Resource Type Taxonomy"](#)
- [Section 51.3.3, "Security Considerations"](#)
- [Section 51.3.4, "Events Resource Types"](#)

### 51.3.1 Events Entry Point

The entry point for the Events service can be reached only through a space. First you need to navigate to the appropriate space and then find the link element with a `resourceType` of:

```
urn:oracle:webcenter:events:gsEvents
```

The corresponding `href` or `template` element provides the URI entry point. The client sends HTTP requests to this entry point to work with the Events service.

For more information about the Resource Index, see [Section 53.5.1, "The Resource Index."](#)

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 51.3.2 Events Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resources types, see the appropriate section in [Section 51.3.4, "Events Resource Types."](#)

The taxonomy for the Events service is:

```
urn:oracle:webcenter:events:gsEvents
  urn:oracle:webcenter:events:gsEvent
urn:oracle:webcenter:events:gsCategories
  urn:oracle:webcenter:events:gsCategory
```

### 51.3.3 Security Considerations

There are no specific security considerations for this service. For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 51.3.4 Events Resource Types

This section provides you with all the information you need to know about each resource type. It includes the following subsections:

- [Section 51.3.4.1, "urn:oracle:webcenter:events:gsEvents"](#)
- [Section 51.3.4.2, "urn:oracle:webcenter:events:gsEvent"](#)
- [Section 51.3.4.3, "urn:oracle:webcenter:events:gsCategories"](#)
- [Section 51.3.4.4, "urn:oracle:webcenter:events:gsCategory"](#)

#### 51.3.4.1 urn:oracle:webcenter:events:gsEvents

Use this resource to identify the URI to use to retrieve (GET) and create (POST) space events. The response from a GET operation includes each space event in this collection of events, and each event includes links used to operate on that event. The response from a POST operation includes the event that was created in this collection of events and a link to operate on that event.

### Navigation Paths to gsEvents

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
  spaces
    gsEvents
```

### Supported Methods for gsEvents

The following methods are supported by this resource:

- GET
  - **request - body:** none, **Parameters:** `startIndex`, `itemsPerPage`, `utoken`

For information about these common parameters, see "[Common Request Query Parameters](#)".

The following additional parameters are available:

- \* `startDate`—the date from which to start listing space events
- \* `endDate`—the date at which to stop listing space events

For the start and end dates, use the format `YYYY-MM-DD`, for example `2011-09-01`. You can also specify a time (for example, `2011-09-01T09:00:00`) and a timezone sign (for example, for UTC, `2011-09-01T09:00:00Z`).

- **response - body:** 0 or more events
- POST
  - **request - body:** event
  - **response - body:** event

### Resource Types Linked to From gsEvents

[Table 51-3](#) lists the resource types that the client can link to from this resource.

**Table 51-3 Related Resource Types for gsEvents**

rel	resourceType
self	urn:oracle:webcenter:events:gsEvents

#### 51.3.4.2 urn:oracle:webcenter:events:gsEvent

Use this resource type to identify the URI to use to read (GET), update (PUT), or delete (DELETE) a specific space event. The response from a GET operation includes the specific event identified by the URI. The response from a PUT operation includes the modified version of the event identified by the URI. The response from a DELETE operation is a 204.

### Navigation Paths to gsEvent

```
resourceIndex
  spaces
    gsEvents
      gsEvent
```

### Supported Methods for gsEvent

The following methods are supported by this resource:

- GET
  - request - body: none
  - response - body: event
- PUT
  - request - body: event
  - response - body: event
- DELETE
  - request - body: none
  - response - body: none

### Writable Elements for gsEvent

[Table 51–4](#) lists the writable elements for this resource.

**Table 51–4** Writable Elements for gsEvent

Element	Type	Required	Constraints	Description
category	String	No	The name of an event category defined for the space	The category to which the event belongs
details	String	No	1 or more characters	Additional details about the event
endTime	Date	Yes	YYYY-MM-DDT HH:MM:SS  endTime must be greater than or equal to startTime	The date and time at which the event ends
location	String	No	1 or more characters	The location at which the event takes place
priority	String?	No	1 - Highest 2 - High 3 - Normal 4 - Low 5 - Lowest	The priority of the event, which determines where it appears when events clash
startTime	Date	Yes	YYYY-MM-DDT HH:MM:SS	The date and time at which the event starts
summary	String	Yes	1 or more characters	A brief description of the event to serve as the title of the event

### Read-only Elements for gsEvent

[Table 51–5](#) lists the read-only elements for this resource.

**Table 51–5 Read-only Elements for gsEvent**

Element	Type	Description
author	personReference	User who created the event
created	Date	Date on which the event was created
duration	String	The length (in minutes) of the event
groupSpace	groupSpaceReference	The space to which the event belongs
id	String	Unique ID of the event
isAllDayEvent	Boolean	Indicates whether the event takes place over an entire day
modified	Date	Date on which the event was last updated
modifiedByUser	personReference	User who last updated the event

### Resource Types Linked to from gsEvent

[Table 51–6](#) lists the resource types that the client can link to from this resource.

**Table 51–6 Related Resource Types for gsEvent**

rel	resourceType
self	urn:oracle:webcenter:events:gsEvent

### 51.3.4.3 urn:oracle:webcenter:events:gsCategories

Use this resource to identify the URI to use to retrieve (GET) and create (POST) space event categories. The response from a GET operation includes each category in this collection of categories, and each category includes links used to operate on that category. The response from a POST operation includes the category that was created in this collection of categories and a link to operate on that category.

### Navigation Paths to gsCategories

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceIndex
  spaces
    gsCategories
```

### Supported Methods for gsCategories

The following methods are supported by this resource:

- GET
  - **request - body:** none
  - **response - body:** 0 or more categories
- POST
  - **request - body:** category
  - **response - body:** category

### Resource Types Linked to From gsCategories

[Table 51-7](#) lists the resource types that the client can link to from this resource.

**Table 51-7 Related Resource Types for gsCategories**

rel	resourceType
self	urn:oracle:webcenter:events:gsCategories

#### 51.3.4.4 urn:oracle:webcenter:events:gsCategory

Use this resource type to identify the URI to use to read (GET), update (PUT), or delete (DELETE) a specific space event category. The response from a GET operation includes the specific category identified by the URI. The response from a PUT operation includes the modified version of the category identified by the URI. The response from a DELETE operation is a 204.

#### Navigation Paths to gsCategory

This section shows how the client can navigate through the hypermedia to access the gsCategory resource:

```
resourceIndex
  spaces
    gsCategories
      gsCategory
```

#### Supported Methods for gsCategory

The following methods are supported by this resource type:

- GET
  - request - body: none
  - response - body: category
- PUT
  - request - body: none
  - response - body: category
- DELETE
  - request - body: none
  - response - body: none

#### Writable Elements for gsCategory

[Table 51-8](#) lists the writable elements for the resource.

**Table 51-8 Writable Elements for gsCategory**

Element	Type	Required	Constraints	Description
name	String	Yes	1 or more characters	The name of the category

#### Resource Types Linked to from gsCategory

[Table 51-9](#) lists the resource types that the client can link to from this resource.

**Table 51–9 Related Resource Types for gsCategory**

rel	resourceType
self	urn:oracle:webcenter:events:gsCategory

## 51.4 Troubleshooting the Events Service

This section provides information to assist you in troubleshooting problems you may encounter while using the Events service.

### Problem

Error message displayed in calendar taskflow:

```
Personal Event Service is not configured properly. Rectify the service
configuration and then click Try Again.
```

### Solution

Confirm that you have created a Personal Event Connection. For more information, see [Section 51.2.2, "Setting Up a Connection for the Events Service."](#)

### Problem

After logging into the calendar with the right credentials, you continue to see the **Login to Personal Calendar** link rather than your events.

### Solution

Confirm that the page on which calendar taskflow is added is a secured page. Anonymous users cannot log into the Personal Event Calendar server.

---

---

## Integrating the RSS Service

The RSS service enables your application users to add and view RSS 2.0 formatted feeds within your application. This chapter describes how to integrate the RSS Viewer into a Framework application at design time.

This chapter includes the following sections:

- [Section 52.1, "Introduction to the RSS Service"](#)
- [Section 52.2, "Basic Configuration for the RSS Service"](#)

For more information about managing and including RSS feeds, see:

- "Managing the RSS Service" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*
- "Working with the RSS Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*

### 52.1 Introduction to the RSS Service

Really Simple Syndication (RSS) provides a means of accessing the content of many different web sites from a single location—a news reader. Oracle WebCenter Portal provides the RSS service that encompasses the RSS Viewer and the service to show RSS feeds from various WebCenter Portal services. The RSS Viewer enables you to view external news feeds from different web sites from within your Framework applications.

---

---

**Note:** In WebCenter Portal: Spaces, RSS is supported within discussion forums. Portal Framework applications do not support RSS within discussion forums.

---

---

This section provides an overview of the features and requirements of the RSS service. It includes the following subsections:

- [Section 52.1.1, "Understanding the RSS Service"](#)
- [Section 52.1.2, "Requirements for the RSS Service"](#)
- [Section 52.1.3, "What Happens at Runtime"](#)

#### 52.1.1 Understanding the RSS Service

To display news feeds from external sources on your application pages, you add the RSS Viewer task flow and specify the URL for the required RSS feed, as shown in [Figure 52-1](#). Your application users can then view the RSS feed at runtime.

For accessing secure application content, the RSS Viewer task flow supports integration with external applications to provide credential mapping services to authenticate with a remote feed. For information about using external applications, see [Section 68.13, "Working with External Applications."](#)

**Figure 52–1 RSS Details Specified at Design Time**

## 52.1.2 Requirements for the RSS Service

The RSS service does not require any back-end server. You do not need to set up a connection to use this service. However, you can set up a proxy server for the RSS service, if required.

## 52.1.3 What Happens at Runtime

At runtime, RSS news feeds are displayed from the RSS feed location specified at design time. Users can click the RSS icon on the top-right corner of the application page to open the URL specified as the RSS feed location.

Any user who has permissions to modify the application page can access the RSS Viewer parameters and change the URL of the RSS feed that is rendered.

For information about the RSS service at runtime, see the "Working with the RSS Service" chapter in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Figure 52–2 RSS Feed at Runtime**

## 52.2 Basic Configuration for the RSS Service

This section describes how to set up the proxy server for the RSS service and add the RSS Viewer task flow to your Framework application.

This section includes the following subsections:

- [Section 52.2.1, "Setting Up a Proxy Server for the RSS Service"](#)
- [Section 52.2.2, "Adding the RSS Service at Design Time"](#)
- [Section 52.2.3, "Setting Security for the RSS Viewer Service"](#)

### 52.2.1 Setting Up a Proxy Server for the RSS Service

The RSS service does not require any connections. You can simply point to the URL of the RSS feed. However, if you want to point to an RSS feed that is external to your intranet and application, you may need to set up a proxy server for your application.

To set up a proxy server for the RSS service:

1. In Oracle JDeveloper, from the **Tools** menu, choose **Preferences**.
2. In the Preferences dialog, scroll down the list on the left side and select **Web Browser and Proxy**.
3. In the right pane, under Web Browser and Proxy, select **Use HTTP Proxy Server** and enter the host name and port number of your proxy server, and note any exceptions ([Figure 52–3](#)).
4. Click **OK**.

**Figure 52–3 Setting Up a Proxy Server**

## 52.2.2 Adding the RSS Service at Design Time

This section describes the RSS Viewer task flow and how to add it to your application.

This section contains the following subsections:

- [Section 52.2.2.1, "About RSS Viewer Task Flow"](#)
- [Section 52.2.2.2, "How to Add the RSS Viewer Task Flow to Your Application"](#)
- [Section 52.2.2.3, "How to Modify RSS Viewer Task Flow Parameters"](#)

### 52.2.2.1 About RSS Viewer Task Flow

The RSS service has a single task flow called RSS Viewer, which you can add to your application to enable your users to access an RSS feed. You can add multiple instances of the task flow to your application and use the Edit Task Flow Binding dialog to point to multiple RSS feed locations.

### 52.2.2.2 How to Add the RSS Viewer Task Flow to Your Application

To add the RSS Viewer task flow to your application:

1. Follow the steps in [Section 7.2.1, "How to Prepare Your Application to Consume Services"](#) to implement security, and create a customizable page in your application, if necessary.
2. Open the customizable page on which you want to add the RSS Viewer task flow.
3. If the RSS feed you want to use requires authentication, create an external application. If it does not require authentication, proceed to Step 4.

---

**Note:** For more information about external applications, refer to [Section 68.13, "Working with External Applications."](#)

---

4. In the Resource Palette, open the **WebCenter Portal - Services Catalog**, then expand the **Task Flows** folder.
5. Click **RSSViewer**, drag it to your page in the Design view, and choose **Region**.
6. In the Edit Task Flow Binding dialog, specify the URL of the RSS feed. If an external application is used for authenticating the RSS feed, specify its name (the application name, not the application display name), as shown in [Figure 52-4](#).

**Figure 52-4 Example of the Edit Task Flow Binding Dialog for the RSS Service**

[Table 52-1](#) describes the possible values for the RSS Viewer task flow binding parameters.

**Table 52-1 RSS Viewer Task Flow Binding Parameters**

Parameter	Value
rssFeedLocation	Enter the location of the RSS feed. For example, to use the Oracle Press Releases RSS feed, enter: <pre>#{ 'http://www.oracle.com/rss/rss_ocom_pr.xml' }</pre>
extAppId	Enter the name of the external application you want to use to authenticate the Framework application with the RSS feed. If the RSS feed does not require authentication, you do not need to set up and identify an external application for this service.

7. Click **OK** and save your page. The binding displays on your page.

If you look at the Source tab of your page, you can see the RSS Viewer task flow in the page source, as shown in [Example 52-1](#).

**Example 52-1 RSS Viewer Task Flow in the Page Source**

```
<af:form id="f1">
  <af:region value="#{bindings.RSSViewerTaskFlow1.regionModel}" id="r1"/>
  <af:region value="#{bindings.RSSViewerTaskFlow2.regionModel}" id="r2"/>
</af:form>
```

### 52.2.2.3 How to Modify RSS Viewer Task Flow Parameters

The RSS Viewer task flow has required and optional task flow binding parameters.

You can adjust the parameter values when you drop the task flow onto a page or after you have placed a task flow on a page:

1. Click the **Bindings** tab at the bottom of the page (next to the **Source** tab).
2. Under **Executables**, the RSS Viewer task flow you added is listed (Figure 52–5).

**Figure 52–5 Page Data Binding Definition**

3. Select the task flow, and next to the Executables heading, click the **Edit selected element** (pencil) icon.
4. In the Edit Task Flow Binding dialog, revise the binding parameter values as required.
5. When you are finished, click **OK**.
6. Save and run your page to see the results.

### 52.2.3 Setting Security for the RSS Viewer Service

To use the RSS service with a public RSS feed, you do not need to set security. To use the RSS service with an RSS feed that requires authentication, you can set up an external application for your Framework application that sets up either user credentials or public credentials for accessing the RSS feed.

---

---

**Note:** For secure application content, your news reader must support BASIC authentication.

---

---

For more information about using external applications, see [Section 68.13, "Working with External Applications."](#)

Only authenticated users can view secure RSS feeds. If a user is not authenticated and the RSS feed is secured, the user will not see any content in the RSS Viewer unless the external application specifies public credentials.

---

---

**Note:** When you add the RSS Viewer task flow to your Framework application, the View grant is automatically added to the authenticated-role.

---

---

# Part IX

---

## Extending Your WebCenter Portal Application

Part IX contains the following chapters:

- [Chapter 53, "Using Oracle WebCenter Portal REST APIs"](#)
- [Chapter 54, "Integrating Other Oracle Applications"](#)
- [Chapter 55, "Extending the Spaces Application Using JDeveloper"](#)
- [Chapter 56, "Integrating with Oracle WebCenter Portal: Spaces"](#)

---

## Using Oracle WebCenter Portal REST APIs

---

Oracle WebCenter Portal provides a set of REST APIs for retrieving and modifying server data. This chapter discusses the WebCenter Portal REST APIs.

This chapter includes the following sections:

- [Section 53.1, "Introduction to REST"](#)
- [Section 53.2, "Understanding the Username-Based Security Token Encryption"](#)
- [Section 53.3, "Benefits of Using REST"](#)
- [Section 53.4, "Introduction to WebCenter Portal's REST APIs"](#)
- [Section 53.5, "Understanding the Link Model"](#)
- [Section 53.6, "Understanding Items Hypermedia"](#)
- [Section 53.7, "Navigating Hypermedia Using HTTP"](#)
- [Section 53.8, "Security Considerations for WebCenter Portal REST APIs"](#)
- [Section 53.9, "Security Considerations for CMIS REST APIs"](#)
- [Section 53.10, "Understanding Common Types"](#)
- [Section 53.11, "Managing Caches"](#)
- [Section 53.12, "Configuring a Proxy Server"](#)
- [Section 53.13, "WebCenter Portal's REST API Examples"](#)

This chapter includes some examples that demonstrate how to use WebCenter Portal REST APIs. For more examples, see the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

[http://www.oracle.com/technology/products/webcenter/release11\\_demos.html](http://www.oracle.com/technology/products/webcenter/release11_demos.html)

### 53.1 Introduction to REST

REST (REpresentational State Transfer) is an architectural style for making distributed resources available through a uniform interface that includes uniform resource identifiers (URIs), well-defined operations, hypermedia links, and a constrained set of media types. Typically, these operations include reading, writing, editing, and removing, and media types include JSON and XML/ATOM.

REST commands use standard HTTP methods as requests to point to the resource being used. Every request returns a response, indicating the status of the operation. If the request results in an object being retrieved, created, or updated, the response includes a standard representation of that object.

REST supports multiple clients, both from client machines and other servers, and it can be used from just about any client or development technology, including Java, JavaScript, Ruby on Rails, PHP, .Net, and so on.

**Tip:** For a good general introduction to REST, see the Wikipedia article Representational State Transfer at [http://en.wikipedia.org/wiki/Representational\\_State\\_Transfer](http://en.wikipedia.org/wiki/Representational_State_Transfer).

REST is typically used with Rich Internet Applications (RIA) that are client-side scripted and require the ability to interact with data from a server-side application. For example, the WebCenter iPhone App uses WebCenter Portal REST APIs to interact with a WebCenter Portal: Spaces application. The native iPhone client is written in Objective-C, and the REST APIs enable the client to send and retrieve application data.

## 53.2 Understanding the Username-Based Security Token Encryption

To provide additional security, every URI, for both `href` and `template` attributes, includes a security token parameter that is based on the authenticated username (a `utoken`).

The security generation algorithm uses a randomly generated "salt" along with the username. The salt ensures that if any of the parameters used to perform encryption become compromised, existing tokens can be invalidated and new ones generated. Most importantly, because the username is used as part of the user token generation algorithm, the salt prevents having to change all user names in the event of a compromise.

The salt is stored in the Credential Store Framework (CSF) in the map `o.webcenter.jf.csf.map` against key `user.token.salt`. You can change the value of this key (and other keys used for token encryption) by accessing CSF in Oracle Enterprise Manager.

---

---

**Caution:** If you change the encryption key values, all existing username based security tokens will immediately become invalid. Only change these values under extraordinary circumstances, like an algorithm parameter compromise.

---

---

## 53.3 Benefits of Using REST

Many excellent articles have been published about REST and the benefits of the RESTful style of software architecture. Some of these benefits include:

- Using "Hypermedia As The Engine Of Application State" (HATEOAS) links to access the REST API helps promote API robustness. Since the clients only use URIs returned from the server, if the server changes the URI format, the client will continue to function properly. See also [Section 53.5, "Understanding the Link Model."](#)
- Using the standard HTTP protocol allows network infrastructure to cache REST requests where appropriate, reducing load on both the client and server. See also [Section 53.11, "Managing Caches."](#)
- Stateless REST requests allow each request to be served by any number of different servers, helping with scalability.

- Using the standard HTTP protocol allows a wide variety of clients to interact with the REST APIs without requiring specialized libraries.

## 53.4 Introduction to WebCenter Portal's REST APIs

In addition to enabling mobile access, WebCenter Portal REST APIs allow you to take advantage of Web 2.0 technologies like Ajax, JavaScript, and JSON to create rich, interactive browser-based user interfaces and to access and modify Oracle WebCenter Portal: Framework and WebCenter Portal: Spaces data. In general, the WebCenter REST commands provide a more natural and easy-to-use alternative to a SOAP-style web services approach.

Table 53–1 describes the Oracle WebCenter Portal REST APIs provided for WebCenter Portal: Services features.

**Table 53–1 Summary WebCenter Portal: Services Features Supported by REST APIs**

REST API	Description	Chapter
Discussions	Enable a client to post, read, update, and delete discussion forums, topics, and messages.	<a href="#">Section 33.3.8, "Using the Discussions Service REST APIs."</a>
Lists	Enables a client to browse all the lists associated with a named group space; search list columns given a search term; create new lists; add, update, and remove list rows; and similar sorts of list-related tasks	<a href="#">Section 47.4, "Using the Lists Service REST APIs."</a>
People Connections	Enable a client to view profile data; manage connection lists, feedback, and messages; create new activities and view activities for users, lists, and group spaces.	<a href="#">Chapter 41, "People Connections Service REST APIs."</a>
WebCenter Portal: Spaces	Enable a client to retrieve group space metadata and view, create, update, and delete group space lists and list items. You can also retrieve group space membership information.	<a href="#">Section 56.3, "Using the WebCenter Portal: Spaces REST APIs."</a>
Content Management	Uses the CMIS (Content Management Interoperability Services) RESTful server binding to provide access to the CM VCR (Content Management Virtual Content Repository).	<i>Oracle Fusion Middleware Content Management REST Service Developer's Guide.</i>
Activity Graph	Enables you to retrieve recommendations for connections, group spaces, and items using the underlying Activity Graph engine.	<a href="#">Section 45.3.2, "Using the Activity Graph Service REST APIs."</a>
Events	Lets you access calendar events associated with a named group space.	<a href="#">Section 51.3, "Using the Events Service REST APIs."</a>
Feedback	Enables a client to create, read, and delete feedback in a social networking application.	<a href="#">Chapter 41.3, "Feedback REST APIs."</a>
Search	Lets you post, read, update, and delete searches. You can specify keywords and the scope of the search; for example, the iPhone could search for "smith" in all spaces, documents and wiki pages.	<a href="#">Section 44.3.7, "Using the Search Service REST APIs."</a>
Tags	Enables a client to read, post, update, and delete tags and tagged items.	<a href="#">Section 43.3.2, "Using the Tags Service REST APIs."</a>

**Table 53–1 (Cont.) Summary WebCenter Portal: Services Features Supported by REST**

REST API	Description	Chapter
Navigation	Use the navigation REST APIs to create your own interface for displaying navigations.  <b>Note:</b> The navigation REST APIs do not share the resource index described in this chapter.	<a href="#">Section 13.3.2, "Using the Navigation REST APIs."</a>
Personalization	Enables you to access the Personalization Conductor.	<a href="#">Section 66.4, "Extending Personalization."</a>
Pagelets	Allows remote web services to retrieve information about resources and pagelets. Inject pagelets into non-proxied pages, allowing the Pagelet Producer to act as a portlet provider for Oracle WebCenter Interaction, Oracle WebLogic Portal, or other third-party portals.	<a href="#">Section 65.2.2.2, "Accessing Pagelets Using REST."</a>

## 53.5 Understanding the Link Model

Hypermedia is at the core of two of the most successful web-based formats: HTML and ATOM. HTML and ATOM allow consumers to navigate to other hypermedia documents through links—for example, clicking on a link to go to a news article.

Hypermedia drives RESTful application state (known as HATEOAS: Hypermedia As The Engine Of Application State).

---

**Note:** HATEOAS analogy to define application state:

Suppose you are completing your taxes in your favorite browser. You finish entering your W-2 data and move on to deductions when the browser crashes. The state you lost—the fact that you were on deductions and still needed to enter data—is the application state; not the W-2 data entered (that is, change states from the current state).

HATEOAS dictates that *this* state—the application state—be captured wholly in hypermedia. Application state is where you are in the application, not what data you've entered into the application. One of the benefits of this approach is that it simplifies the client and server, because they do not need to be aware of the state they are in. The link contains all the state information necessary to process the request, so, when the browser restarts and returns to the link, the user will be at the same place in the tax process.

---

Given a set of top-level URI entry points to a RESTful service, all interactions beyond those entry points are driven by hypermedia links returned in response representations. This link-centered approach helps keep the client from becoming too tightly coupled to the server URLs. The client is using URLs given to it by the server, therefore the client code does not break if the server URLs change format.

Understanding this link model helps you understand how to use the data the service returns to navigate the REST APIs.

This section describes the hypermedia link model used by WebCenter's RESTful services. It includes the following subsections:

- [Section 53.5.1, "The Resource Index"](#)
- [Section 53.5.2, "The Anatomy of a Link"](#)

### 53.5.1 The Resource Index

In WebCenter, the *Resource Index* is your starting point for all authenticated access. The Resource Index provides access to the set of top-level URI entry points. It provides the way in to all the available WebCenter RESTful services. The Resource Index URI is the only URI that you need to know.

The WebCenter Resource Index URI is:

```
http://host:port/rest/api/resourceIndex
```

---

---

**Note:** Access to the Resource Index always requires authentication; however, you can (optionally) access the CMIS resource entry point anonymously using the following URI:

```
http://host:port/rest/api/cmis/repository
```

See also [Section 53.9, "Security Considerations for CMIS REST APIs."](#)

---

---

The first step in using the WebCenter Portal REST APIs is to send a GET request to the Resource Index. The response varies depending on the services available and the media type of the request. [Example 53–1](#) shows how the response might look if you made an Ajax request using JavaScript (and possibly a client-side scripting library, such as Dojo) to retrieve the JSON data for the Resource Index. Note that this is an abridged sample response and does not include all of the links actually present in a real response.

**Example 53–1 Response to a GET on the Resource Index**

```
{
  "resourceType": "urn:oracle:webcenter:resourceindex",
  "links": [
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "resourceType": "urn:oracle:webCenter:cmis",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:discussions:forums",
      "href": "opaque-uri",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "resourceType": "urn:oracle:webcenter:resourceindex",
      "rel": "self",
      "href": "http://host:port/rest/api/resourceIndex",
      "capabilities": "urn:oracle:webcenter:read"
    },
    {
      "template": "opaque-template-uri",
      "resourceType": "urn:oracle:webcenter:activities:stream",

```

```

    "href": "opaque-uri",
    "capabilities": "urn:oracle:webcenter:read"
  },
  {
    "template": "opaque-template-uri",
    "resourceType": "urn:oracle:webcenter:people:person",
    "capabilities": "urn:oracle:webcenter:read"
  },
  {
    "template": "opaque-template-uri",
    "resourceType": "urn:oracle:webcenter:feedback",
    "href": "opaque-uri",
    "capabilities": "urn:oracle:webcenter:read"
  },
  {
    "template": "opaque-template-uri",
    "resourceType": "urn:oracle:webcenter:spaces",
    "href": "opaque-uri",
    "capabilities": "urn:oracle:webcenter:read"
  },
  {
    "template": "opaque-template-uri",
    "resourceType": "urn:oracle:webcenter:people",
    "href": "opaque-uri",
    "capabilities": "urn:oracle:webcenter:read"
  }
}
]
}

```

By interpreting the links returned in the Resource Index data, you can retrieve the URI entry point for an individual service by locating the URI for the resource type you want to use. You can then continue navigating through the hypermedia until you can perform the required operation. [Example 53–2](#) shows a method that locates a URI given the Resource Index JSON data.

**Example 53–2 Locating the URI for a Particular Service in the Resource Index**

```

/* Parse the resourceIndex to find the specified URL and
 * return it.
 *
 * @Param jsonData the JSON data retrieved from calling
 *     the /rest/api/resourceIndex URL.
 * @Param strResourceType the resource type of the URL
 *     you want to retrieve from the resourceIndex data.
 *     E.g., 'urn:oracle:webcenter:activities:stream'
 */
function getResourceURL(jsonData, strResourceType)
{
  // Using the HATEOAS model, we browse the returned links
  // looking for the one with the correct resource type.
  for (var i = 0; i < data.links.length; i++) {
    if (data.links[i].resourceType == strResourceType) {
      return data.links[i].href;
    }
  }
}
}

```

## 53.5.2 The Anatomy of a Link

[Example 53–3](#) and [Example 53–4](#) show the anatomy of a hypermedia link as XML and in JSON document fragments, respectively.

### **Example 53–3 Link in an XML Document Fragment**

```
<links>
  <link href="opaque-URI"
        template="opaque-template-URI (optional)"
        rel="rel-name"
        title="human-readable-title (optional)"
        type="media-type (optional)"
        resourceType="resource-type"
        capabilities="operation"/>
  ...repeat as needed...
</links>
```

### **Example 53–4 Link in a JSON Document Fragment**

```
"links": [
  {
    "href": "opaque-URI",
    "template": "opaque-template-URI (optional)",
    "rel": "rel-name",
    "title": "human-readable-title (optional)",
    "type": "media-type (optional)",
    "resourceType": "resource-type",
    "capabilities": "operation"
  },
  ...repeat as needed...
]
```

The `resourceType`, `rel`, and `capabilities` attributes of the hypermedia link provide metadata that enable clients to determine which URI (`href` or `template`) to use, without having to parse the URIs directly. The URIs are opaque—the metadata determines which link is useful in a given circumstance.

Multiword field, element, and attribute names are formatted in camel case, unless the representation is attempting to conform to a specification not under the service author's direct control. Acronyms are treated as normal words with their case adjusted accordingly (for example, `fooXml` or `xmlFoo`). See [Example 53–5](#) and [Example 53–6](#).

### **Example 53–5 XML Naming Convention**

```
<myElement>text</myElement>
```

### **Example 53–6 JSON Naming Convention**

```
{"myElement": "text"}
```

This section includes the following subsections that describe the different attributes of the hypermedia link:

- [Section 53.5.2.1, "Resource Type"](#)
- [Section 53.5.2.2, "Relationship"](#)
- [Section 53.5.2.3, "Capabilities"](#)
- [Section 53.5.2.4, "Media Type"](#)

- [Section 53.5.2.5, "Templates"](#)

### 53.5.2.1 Resource Type

The `resourceType` link attribute indicates the type of resource to which the link points. Clients should use the `resourceType` to determine the expected response bodies for `GET` and `POST` and allowable request bodies for `POST` and `PUT`.

For more information, see [Section 53.7, "Navigating Hypermedia Using HTTP."](#)

### 53.5.2.2 Relationship

The `rel` link attribute indicates the relationship of the linked object to the current object (that is, the object that contains the list of links). The value of this attribute is a space-separated list of the following currently supported values:

- `self`—The linked object is the current object
- `related`—The linked object is related to the current object
- `via`—The linked object is the source of the information for the current object
- `alternate`—The linked object is a substitute for the current object (typically, the same object in another format, such as an HTML page that displays the current object)
- `urn:oracle:webcenter:parent`—The linked object is the parent of the current object. That is, the linked object owns the current object

---

---

**Note:** Some REST APIs for some WebCenter features may contain additional `rel` link attributes. See the REST API documentation for each specific feature for more information.

---

---

### 53.5.2.3 Capabilities

The `capabilities` link attribute indicates which methods are supported by the linked resource.

Links are returned only if a client is allowed to access that resource. User authorization can affect the capabilities a client has with the links returned in a response representation. In general, services only return the capabilities that the current authorized user has permission to execute and that the resource supports.

If there is no link, then the client cannot access the resource. If a link has no capabilities, then it is not returned to the client, meaning that the client does not have permission to do anything with that link (even read it).

Capability-based expression of hypermedia links communicates the range of operations that the client can expect to succeed, which allows the client to dynamically configure any associated UI to provide the best overall user experience.

The value of this attribute is a space-separated list of the following values:

- `urn:oracle:webcenter:create`—This maps to the HTTP verb `POST`
- `urn:oracle:webcenter:read`—This maps to the HTTP verb `GET`
- `urn:oracle:webcenter:update`—This maps to the HTTP verb `PUT`
- `urn:oracle:webcenter:delete`—This maps to the HTTP verb `DELETE`

---

---

**Note:** The top-level `resourceIndex` links only returns the `read` capability, even if the user is authorized with additional capabilities.

---

---

---

---

**Note:** Querying a resource for the allowed HTTP verbs using `OPTIONS` returns the verbs that the resource can support in general, and does not take a user's access into account. The `capabilities` attribute in a link describes exactly what the current user can do with the current resource. `OPTIONS` may return more HTTP verbs than the current user is allowed.

---

---

#### 53.5.2.4 Media Type

The `type` link attribute indicates the media types supported by the linked object.

All REST services, except for CMIS, support both XML (`application/xml`) and JSON (`application/json`) media type. CMIS currently supports only ATOM. For more information about CMIS REST APIs, see the *Oracle Fusion Middleware Content Management REST Service Developer's Guide*.

#### 53.5.2.5 Templates

The `template` link attribute indicates that the client can use a URI template, instead of the `href` URI, to provide parameterized values for the linked object. Links must include at least an `href` or a `template` URI, but can include both.

Some hypermedia links support request query parameters that allow the client to configure the link in different ways. Rather than force the client to know the URI format and manually build the URI, URI templates are used. These templates allow client code to easily insert data into a URI without having to understand exactly how the URI works. This maintains the opacity of hypermedia URIs and protects the client from changes to the URI format.

[Example 53-7](#) shows a URI template including several request query parameters.

##### **Example 53-7 URI Template**

```
http://host:port/.../lists?startIndex={startIndex}&itemsPerPage={itemsPerPage}&q={searchTerms}&projection={projection}
```

WebCenter Portal REST APIs use a simple slot replacement syntax that follows many industry URI template schemes.

For example, using the template in [Example 53-7](#), to see 10 list items on the first page, the client would provide a value of 1 for the `startIndex` parameter and a value of 10 for the `itemsPerPage` parameter, as shown in [Example 53-8](#).

##### **Example 53-8 URI Template with Parameter Values**

```
http://host:port.../lists?startIndex=1&itemsPerPage=10
```

---

---

**Note:** All unused parameters must be removed from a template before it can be used. Clients may not submit unprocessed templates to the service that produced it; doing so results in undefined behavior, generally returning a status code of 500.

Clients must process templates into valid URI form before submitting to the server. Clients must replace slots with appropriate values, taking care to properly URI encode any value replacing the slot token. If a client does not have a suitable value for one or more of the slots in the template, then it must replace the slot token with an empty string.

---

---

You must URL-encode special or reserved character in parameter values. For example, to search lists for a person named Günter, you must URL-encode the ü as shown in [Example 53-9](#).

**Example 53-9 Encoding Special Characters in URI Templates**

```
http://host:port.../lists?q=G%FCnter
```

### Common Request Query Parameters

Many resources support a common set of request query parameters. For example, when retrieving a collection of entities, it is common to change the shape of the results set by limiting the quantity or details of the results. The REST framework uses the following request parameters to scope results and provide security:

- `startIndex`—Specifies the index of the first matching result that should be included in the result set (0-*n* ... zero based). This is used for pagination.
- `itemsPerPage`—Specifies the maximum number of results to return in the response (1-*n*). This is used for pagination.
- `q`—Specifies implementation-specific searching. Searches may be specified using the following format (square brackets [] denote optional values):

```
[[field1:[operand]][:]value1[;field2:operand:value2]]
```

For example:

```
&q=login>equals:monty  
&q=title:contains:issues  
&q=creator>equals:monty;description:contains:Urgent
```

While each resource uses the same format for the `q` parameter, the way search is implemented is different depending on the resource being searched. For more information about how each resource implements search, see the chapter for the specific service.

- `projection`—Reserved for implementation-specific projection of model representations, such as variable recursion depth, field or attribute filtering. Valid values are `summary` or `details`.

For example, requesting a projection of `summary` for a collection of lists, returns only the title, description, and hypermedia links. Requesting a projection of `details` results in the server sending back a collection of lists that includes all the column metadata for each list. This may require additional processing time or database queries on the server.

The following example request results in the response entity containing a deeper object graph.

```
http://host:port/...lists&projection=details
```

- data**—This parameter accepts a comma separated list of data sets and items. This parameter lets clients specify what data they would like to receive. For example, a mobile device application might use this parameter to limit the amount of XML data returned. If both the `projection` and `data` query string parameters are present, the `data` parameter will be used to determine which data to return. If you specify the constant `'data'` as the data parameter, all the standard information will be returned for the resource.

For information about how these parameters are supported by specific resources, see the chapter for the appropriate service.

## 53.6 Understanding Items Hypermedia

A collection of `items` makes up the actual content of responses. This is at the same level as the `links` section described previously. Each item (including the top-level tag in each response) has one common attribute (`resourceType`) in addition to resource-specific content and format. For details beyond the `resourceType`, see the chapter for the specific service.

See [Example 53-13](#) for an example that describes a collection of entities/items. [Example 53-15](#) describes a single entity/item.

## 53.7 Navigating Hypermedia Using HTTP

You can navigate REST service hypermedia in a similar way to that used to browse and interact with HTML or an ATOM feed. Interactions are performed on the resources identified by links using HTTP methods. The REST services return response codes and response bodies to the client, and the client uses the hypermedia in the response to drive further interactions.

[Table 53-2](#) describes the general pattern followed when constructing opaque resource URIs. The `resourceType` differentiates whether the HTTP method operates on a collection of resources or an individual resource.

**Table 53-2 HTTP Methods**

HTTP Method	Response for a Collection of Resources	Response for an Individual Resource
GET	Returns resource collection container (200 HTTP response code)	Returns resource (200 HTTP response code)
PUT	Cannot update a collection of resources (405 HTTP response code)	Updates and returns resource (200 HTTP response code)
POST	Creates and returns a new resource within the collection. <b>Note:</b> Can return a 201 or 204 HTTP response code. The returned code depends on whether the newly created object is directly addressable or not. For instance, activities cannot be addressed individually, so they return a 204 no-content response code.	Cannot create a resource within an individual resource (405 HTTP response code)

**Table 53–2 (Cont.) HTTP Methods**

HTTP Method	Response for a Collection of Resources	Response for an Individual Resource
DELETE	Cannot delete a collection of resources (405 HTTP response code)	Deletes resource (204 HTTP response code)

Collection resources generally support reading a collection (GET) and creating a subordinate to that collection (POST). Individual resources generally support reading a resource (GET), updating a resource (PUT), and deleting a resource (DELETE).

**HTTP Response Status Codes**

Table 53–3 describes the potential response status codes.

**Table 53–3 HTTP Response Status Codes**

HTTP Response Status Code	Description
200	OK. Upon successful completion of a GET or PUT. This is accompanied by a resource representation as a response body.
201	Created. Upon successful completion of a POST. This has a location header to the newly-created resource.
204	No content, or any request that does not return content. For example, creating an object that cannot be linked. Upon successful completion of a DELETE.
400	Bad Request. The URI was malformed or could not be processed; for example, the IDs were not formatted correctly, or the ID was supplied in the URI on a POST.
401	Unauthorized. Client may retry by submitting credentials. This may be accompanied with a fault response body to help diagnose the issue.
403	Forbidden. Client does not have permission to perform a particular action, such as creating or deleting a resource. Re-authenticating as the same user does not help. This may be accompanied with a fault response body to help diagnose the issue.
404	Not Found. Referencing a specific resource with an ID, but that resource does not exist.
405	Method Not Allowed. This includes a list of valid methods for the requested resource.
406	Not Acceptable. The Accept header media type(s) sent by the client are not supported for the requested operation. This may be accompanied with a fault response body to help diagnose the issue.
409	Conflict. Possibly the resource ID is in use, or an entity has been modified by another process during an update. This may be accompanied with a fault response body to help diagnose the issue.
422	Bad entity body, the data in the body, although syntactically correct, was not valid, or could not be processed; for example, invalid data when updating a row.
500	Internal server error. The server encountered an unexpected condition that prevented it from fulfilling the request.
501	Not Implemented. The server does not support the functionality required to fulfill the request. This is the appropriate response when the server does not recognize the request method and is not capable of supporting it for any resource.

## 53.8 Security Considerations for WebCenter Portal REST APIs

All of the WebCenter REST URIs reference protected resources (similar to protected web pages) and require authentication for access.

---

---

**Note:** The one exception to the authenticated access rule is access to the CMIS resources. CMIS resources can be accessed anonymously through the CMIS URI entry point:

```
http://host/port/rest/api/cmisis/repository
```

See also [Section 53.9, "Security Considerations for CMIS REST APIs."](#)

---

---

You can pass this authentication in with the request using basic authentication, or you can configure the client and the WebCenter REST service to use single sign-on. For more information about single sign-on, see the section "Configuring Framework Applications for Single Sign-On" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

Basic authentication sends the user's password in plain text. If you use this type of authentication, you should consider securing the connection using SSL. For more information, see the section "Configuring SSL" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To provide additional security, every URI, for both `href` and `template` attributes, includes a security token parameter. The security token is user-scoped. This means that it is based on and scoped to an authenticated user and can be bookmarked or cached across that user's sessions. These security tokens help prevent Cross-Site Request Forgery (CSRF) attacks.

For example:

```
<link
  template="opaque-template-uri/@me?startIndex={startIndex}&itemsPerPage={itemsPerPage}
    &token=generated-token" resourceType="urn:oracle:webcenter:messageBoard"
  href="opaque-uri/@me?token=generated-token" capabilities="urn:oracle:webcenter:read"
/>
```

---

---

**Note:** The security token is not used for authentication or identity propagation.

---

---

WebCenter Portal REST APIs operate under the identity of the authenticated user. For example, the group space REST APIs only return information for, and allow changes to, group spaces to which the user has access.

## 53.9 Security Considerations for CMIS REST APIs

The CMIS REST APIs do not use the same authentication scheme as the other WebCenter Portal REST APIs. Whereas other WebCenter Portal REST APIs do not allow unauthenticated access and prompt the user for authentication before allowing access, the CMIS REST APIs do allow unauthenticated access.

If a document requires authentication information and does not receive that information (because it is being accessed by an unauthenticated user), a 404 error is returned. This does not necessarily mean that the document cannot be found, rather that the (unauthenticated) user does not have the appropriate permissions to access

the document. For the request to succeed, it should include basic authentication headers to identify the current user.

CMIS stands for Content Management Interoperability Services, a standard REST interface for Enterprise Content Management Systems. For more information, see *Oracle Fusion Middleware Content Management REST Service Developer's Guide*.

## 53.10 Understanding Common Types

This section describes the common types that are shared by multiple WebCenter Portal REST APIs.

- [Section 53.10.1, "Common Types"](#)
- [Section 53.10.2, "Portable Contact Types"](#)

### 53.10.1 Common Types

Common types provide a consistent way to reference objects used in the WebCenter Portal REST APIs.

This section includes the following subsections:

- [Section 53.10.1.1, "personReference"](#)
- [Section 53.10.1.2, "groupSpaceReference"](#)

#### 53.10.1.1 personReference

This is a generic data type that represents a user in the system. It is used by several APIs, for example to identify the author of a message board or feedback message, or a user's manager or direct reports. It is made up of the following elements:

- `guid`—The GUID of the user
- `id`—The login ID of the user
- `displayName`—The display name of the user

The `personReference` also includes a link to the user's profile icon. You can control the size of the icon by providing values: `small`, `medium`, or `large`.

Depending on where the `personReference` type is included, it can also return links to the associated REST APIs of the generating response. For example, if the `personReference` type is included as the author in a message board response, it includes links to message board services.

#### 53.10.1.2 groupSpaceReference

This is a generic data type that represents a group space. It is used by several APIs, for example in the activity stream, to identify a group space in which a particular activity occurred. It is made up on the following elements:

- `guid`—The GUID of the group space
- `name`—The name of the group space
- `displayName`—The display name of the group space

The `groupSpaceReference` also includes an `html link`, `rest link`, and `icon link`.

## 53.10.2 Portable Contact Types

Portable Contact types provide users with a standard way to access their address books and friends lists over the web. Portable Contact types are used by the Profile component of the People Connections service.

---

---

**Note:** These types are based on the Portal Contact Types in WebCenter. They may include additional data.

---

---

This section includes the following subsections:

- [Section 53.10.2.1, "name Portable Contact Type"](#)
- [Section 53.10.2.2, "address Portable Contact Type"](#)
- [Section 53.10.2.3, "organization Portable Contact Type"](#)
- [Section 53.10.2.4, "value Portable Contact Type"](#)

### 53.10.2.1 name Portable Contact Type

This is a portable contact type that provides information about the user's name. It is made up of the following elements:

- `formatted`—The formatted version of the full name of the user, for example, Michael David Jones Ph.D.
- `familyName`—The family name, or last name, of the user, for example Jones
- `givenName`—The given name, or first name, of the user, for example Michael
- `honorificSuffix`—The honorific suffix of the user, for example, Esq. or Ph.D.
- `initials`—The first initials of the user, for example, M. D.
- `maidenName`—The maiden name of the user

Some of the elements may not be present depending on the user repository configuration and data.

### 53.10.2.2 address Portable Contact Type

This is a portable contact type that provides information about the user's address. It is made up of the following elements:

- `formatted`—The formatted version of the full address
- `type`—The type of the address, for example, Home, Work
- `streetAddress`—The street address
- `poBox`—The post office box number
- `locality`—The city or locality
- `region`—The state or region
- `postalCode`—The zip code or postal code
- `country`—The country

Some of the elements may not be present depending on the user repository configuration and data.

### 53.10.2.3 organization Portable Contact Type

This is a portable contact type that provides information about the user's organizational affiliation. It is made up of:

- `name`—The name of the organization
- `employeeNumber`—The employee number of the user
- `employeeType`—The employee type of the user.
- `department`—The department within the organization to which the user belongs
- `defaultGroup`—The default group to which the user belongs
- `title`—The job title of the user within the organization
- `description`—A textual description of the user's role within the organization
- `expertise`—The expertise of the user within the organization
- `startDate`—The date when the user joined the organization

Some of the elements may not be present depending on the user repository configuration and data.

### 53.10.2.4 value Portable Contact Type

This is a generic object that contains data for a wide variety of contact information. It is made up of the following elements:

- `primary`—A boolean value that identifies whether this is the primary piece of information of this type for this person. The primary element may not be present and is only relevant if there are multiple values for the same type of data.
- `value`—The value for this type
- `type`—The type of information. Valid types are:
  - `standard`: with valid values of `work`, `home`, `other`
  - `phoneNumber`: with valid values of `work`, `home`, `fax`, `pager`, `mobile`
  - `photos`: with a valid value of `thumbnail`

## 53.11 Managing Caches

Client-side developers need to know how to handle HTTP cache headers in both requests and responses. Individual resources that have a "last modified" date are also return entity tags. The entity tags can be used to make retrieval of a specific entity more efficient. To learn more about the use of entity tags in caching, please see the Hypertext Transfer Protocol specification.

## 53.12 Configuring a Proxy Server

A proxy server is typically employed to avoid cross-domain request problems associated with making XMLHttpRequest (XHR) calls from a browser client. These calls are typically associated with the Ajax development technique for creating rich, interactive client-side interfaces. REST APIs are typically used within this kind of client-side development scenario.

For more information on setting up a proxy server, see "Configuring a Proxy Server" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 53.13 WebCenter Portal's REST API Examples

This section includes some examples illustrating how to use the WebCenter Portal REST APIs. It includes the following subsections:

- [Section 53.13.1, "Navigating the Message Board Hypermedia"](#)
- [Section 53.13.2, "Displaying Activity Stream Data"](#)
- [Section 53.13.3, "Using the WebCenter People Connections Service REST APIs with Ext"](#)
- [Section 53.13.4, "Updating User Status"](#)

### 53.13.1 Navigating the Message Board Hypermedia

This section includes examples to illustrate how to navigate the REST service hypermedia. The examples show how to read messages on a message board, post messages to another user's message board, and delete unwanted messages.

This section includes the following subsections:

- [Section 53.13.1.1, "Accessing the Resource Index"](#)
- [Section 53.13.1.2, "Reading Messages"](#)
- [Section 53.13.1.3, "Creating a New Message"](#)
- [Section 53.13.1.4, "Updating a Message"](#)
- [Section 53.13.1.5, "Deleting a Message"](#)

#### 53.13.1.1 Accessing the Resource Index

The first step is always to access the Resource Index ([Example 53–10](#)).

##### *Example 53–10 Accessing the Resource Index*

```
GET /resourceIndex
```

This request returns a list of the top-level URI entry points to the RESTful services, including the entry point for the message board ([Example 53–11](#)).

##### *Example 53–11 Response to Accessing the Resource Index*

```
200 OK
Accept: application/json;charset=UTF-8
```

```
{
  "resourceType": "urn:oracle:webcenter:resourceindex",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:resourceindex",
      "capabilities": "urn:oracle:webcenter:read",
      "rel": "self",
      "href": "http://host:port/rest/api/resourceIndex"
    },
    {
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "capabilities": "urn:oracle:webcenter:read",
      "href": "opaque-messageBoard-URI"
    },
    ...repeating for other services...
  ]
}
```

You can examine this list to find the URI that you require to access your message board. You should look for the link with a `resourceType` of `urn:oracle:webcenter:messageBoard`. The `href` for this link is the one that you require to access your message board.

For other resources `rel`, `type`, and `template` also help find the correct link.

### 53.13.1.2 Reading Messages

Once you have determined the correct URI for your message board, you can send a GET request to that URI to read your messages (Example 53-12).

To read messages on a message board, you must be logged in.

#### **Example 53-12 Retrieving Messages from Your Message Board (GET)**

```
GET /opaque-messageBoard-URI
```

The response provides information about all the messages on your message board (Example 53-13).

#### **Example 53-13 Response to Retrieving Messages from Your Message Board**

```
200 OK
Accept: application/json;charset=UTF-8

{
  "resourceType": "urn:oracle:webcenter:messageBoard",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:create",
      "rel": "self",
      "href": "opaque-messageBoard-URI"
    }
  ]
  "items": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard:message",
      "links": [
        {
          "resourceType": "urn:oracle:webcenter:messageBoard:message",
          "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:delete",
          "rel": "self",
          "href": "opaque-message-URI"
        }
      ]
      "id": "89add57c-7a35-4d35-b24f-ea9259612eb8",
      "body": "What's up? It's been a while. Some of us are going to Conner
O'Neal's after work. Want to go?",
      "created": "2009-09-10T11:18:46.696-0700",
      "author": {
        "id": "carl",
        "displayName": "carl",
        "guid": "649A27F09D5C11DEBFAA799CBD41D9B8",
        "links": [
          {
            "resourceType": "urn:oracle:webcenter:people:person",
            "capabilities": "urn:oracle:webcenter:read",
            "rel": "via",

```

```

        "href": "opaque-person-URI"
      },
      {
        "resourceType": "urn:oracle:webcenter:messageBoard",
        "capabilities": "urn:oracle:webcenter:read
urn:oracle:webcenter:create",
        "href": "opaque-messageBoard-URI-for-Carl"
      },
      {
        "type": "text/html",
        "resourceType": "urn:oracle:webcenter:spaces:profile",
        "capabilities": "urn:oracle:webcenter:read",
        "rel": "alternate",
        "href": "opaque-profile-URI"
      }
    ]
  },
  "startIndex": 0,
  "itemsPerPage": 1,
}

```

From the response you can see that you have `read` and `create` capabilities on your message board. So you can read its contents and post new messages.

In addition, the response also includes a collection of items (in this case the collection consists of just a single item). These items, with a `resourceType` of `urn:oracle:webcenter:messageBoard:message`, are the messages on your message board. The `capabilities` attribute for the message indicates that, for this particular message, you can read it or delete it from your message board.

For each message, the response provides the following information:

- `id`—the identifier of the message
- `body`—the text of the message
- `author`—the author of the message. The author element is also made up of several other elements:
  - `id`—the identifier, or user name, of the author of the message
  - `displayName`—the name of the author, formatted for display
  - `guid`—the globally unique identifier of the author

Within the `author` element there is also a collection of three links. The `resourceType` of these links are:

- `urn:oracle:webcenter:people:person`—enables you to view information about the author of the message
- `urn:oracle:webcenter:messageBoard`—enables you to read or create a message on the author's message board
- `urn:oracle:webcenter:spaces:profile`—enables you to read a `text/html` document of the author's profile

### 53.13.1.3 Creating a New Message

Now that you have read the message on your message board, you probably want to reply to Carl on his message board. To do this you should send a `POST` request to the URI for Carl's message board.

To find the correct URI, use the href from the author link with resourceType of urn:oracle:webcenter:messageBoard.

A POST request creates a subordinate resource of the resource to which you post it. In this case, we are posting to the messageBoard, so we should post its subordinate resource: message ([Example 53–14](#)).

**Example 53–14 Creating a Message on Another User's Message Board (POST)**

```
POST opaque-messageBoard-URI-for-Carl
Accept: application/json;charset=UTF-8
Content-Type: application/json;charset=UTF-8
```

```
{
  "body": "sure; see you guys at 6."
}
```

The response shows that your message was successfully created on Carl's message board ([Example 53–15](#)).

**Example 53–15 Response to Creating a Message on Another User's Message Board**

```
201 Created
Content-Type: application/json;charset=UTF-8
```

```
{
  "id": "36b8464f-afda-44b5-90ad-8ecedcb040a3",
  "body": "sure; see you guys at 6.",
  "created": "2009-09-10T12:21:09.785-0700",
  "resourceType": "urn:oracle:webcenter:messageBoard:message",
  "links": [
    {
      "resourceType": "urn:oracle:webcenter:messageBoard:message",
      "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:update",
      "rel": "self",
      "href": "opaque-message-URI"
    },
    {
      "resourceType": "urn:oracle:webcenter:people:person",
      "capabilities": "urn:oracle:webcenter:read",
      "rel": "self",
      "href": "opaque-person-URI"
    },
    {
      "resourceType": "urn:oracle:webcenter:messageBoard",
      "capabilities": "urn:oracle:webcenter:read urn:oracle:webcenter:create",
      "href": "opaque-messageBoard-URI"
    }
  ],
  "author": {
    "id": "mike",
    "displayName": "mike",
    "guid": "649657609D5C11DEBFAA799CBD41D9B8",
    "links": [
      {
        "resourceType": "urn:oracle:webcenter:people:person",
        "capabilities": "urn:oracle:webcenter:read",
        "rel": "self",
        "href": "opaque-person-URI"
      }
    ]
  },
  "type": "text/html",
  "resourceType": "urn:oracle:webcenter:spaces:profile",
  "capabilities": "urn:oracle:webcenter:read",
  "rel": "alternate",
  "href": "opaque:profile:URI"
}
```

```

    }
  ]
}
]
}

```

#### 53.13.1.4 Updating a Message

A PUT request is very similar to a POST request, except that it is performed on the resource being edited, instead of on the parent resource.

From the response to your earlier POST request, when you created your message on Carl's message board, you can see that you have `read`, `update`, and `delete` capabilities on the message. You can also see that the `href` provides the URI for your message. Something came up at work and you must stay a bit later. Using the URI for your message, you can now send a PUT request to update the message and let Carl know that you are going to be late ([Example 53–16](#)).

##### **Example 53–16 Updating a Message (PUT)**

```

PUT opaque:message:URI
Accept: application/json;charset=UTF-8
Content-Type: application/json;charset=UTF-8

{
  "body": "working late; see you guys at 7."
}

```

The response is nearly identical to that of POST, except that the body contains your updated message ([Example 53–17](#)).

##### **Example 53–17 Updating a Message**

```

200 OK
Content-Type: application/json;charset=UTF-8

{
  "id": "36b8464f-afda-44b5-90ad-8ecedcb040a3",
  "body": "working late; see you guys at 7.",
  ...deleted for brevity...
}

```

#### 53.13.1.5 Deleting a Message

Performing a DELETE request on a resource deletes it, if you have the `delete` capability on the resource. The link to your message on Carl's message board supports `delete`.

You decide to delete the message that you left on Carl's message board ([Example 53–18](#)).

##### **Example 53–18 Deleting a Message (DELETE)**

```

DELETE opaque:message:URI

```

The response is simply a status code of 204 ([Example 53–19](#)).

**Example 53–19 Response to Deleting a Message**

204 NO CONTENT

---

**Note:** DELETE is idempotent, meaning that it can be sent multiple times with the same result. Therefore if you try to delete the same object twice, you still receive the same 204 response even though it has previously been deleted.

---

**53.13.2 Displaying Activity Stream Data**

To properly display Activity Stream data, you must:

- Retrieve the Activity Stream URI entry point
- Retrieve the Activity Stream data
- Process the Activity Stream data for display

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

[http://www.oracle.com/technology/products/webcenter/release11\\_demos.html](http://www.oracle.com/technology/products/webcenter/release11_demos.html)

In **Example 53–20**:

- The `getResourceURL` method shows you how to retrieve the URI entry point for the Activity Stream service by retrieving the JSON data for the main Resource Index (`/rest/api/resourceIndex`) and locating the URI for the Activity Stream resource in that data.
- The `formatMessage` method processes the Activity Stream data into a displayable format. This involves locating an individual message and replacing any template parameters in the message with the name of the object or user that corresponds to that parameter. The parameters also include links to display the object or user. They may contain links to REST services for those objects or users, if available.

---

**Note:** To get the Resource Index and Activity Stream JSON data, make Ajax requests using Javascript (and possibly a client-side scripting library like Dojo) and pass the resulting data into the appropriate methods.

---

**Example 53–20 Displaying Activity Stream Data**

```

/* Parse the resourceIndex to find the specified URL and
 * return it.
 *
 * @Param jsonData the JSON data retrieved from calling
 * the /rest/api/resourceIndex URL.
 * @Param strResourceType the resource type of the URL
 * you want to retrieve from the resourceIndex data.
 * E.g., 'urn:oracle:webcenter:activities:stream'
 */
function getResourceURL(jsonData, strResourceType)
{
    // Using the HATEOAS model, we browse the returned links
    // looking for the one with the correct resource type.

```

```

    for (var i = 0; i < data.links.length; i++) {
        if (data.links[i].resourceType == strResourceType) {
            return data.links[i].href;
        }
    }
}

/* Parse the resourceIndex to find the activity stream URL and
 * then load it.
 *
 * @Param jsonData the JSON data retrieved from calling
 *       the /rest/api/resourceIndex URL.
 */
function getActivitiesURL(jsonData)
{
    // Parse the JSON data to get the activities URI entry point.

    var strHref = getResourceURL(jsonData,
        'urn:oracle:webcenter:activities:stream');

    // INSERT CODE HERE: Implement getting the JSON data from the
    // strHref URL with the Accept header set to "application/json",
    // and use the formatMessage(index, jsonData) function to get
    // the displayable activity message for each activity.

}

/* Replace activity message parameters.
 *
 * @Param index the index of the activity to process
 * @Param jsonData the JSON data retrieved from calling
 *       the /rest/api/resourceIndex URL.
 */
function formatMessage(index, jsonData)
{
    var activity = jsonData.items[index];
    var strMessage = activity.message;

    // Look for activity parameters and replace them in the message.

    if (activity.templateParams && activity.templateParams.items) {
        for (var i = 0; i < activity.templateParams.items.length; i++) {
            var param = activity.templateParams.items[i];

            // Each parameter also has a set of links which at least
            // includes an HTML link and possibly a REST API link.

            strMessage = strMessage.replace(param.key, param.displayName);
        }
    }
    if (activity.detail) {
        strMessage = strMessage + "<br><font size='1'>" +
            activity.detail + "</font>";
    }
    return strMessage;
}

```

### 53.13.3 Using the WebCenter People Connections Service REST APIs with Ext

Ext is a popular JavaScript library for building tables and forms and linking them to REST web services. The following example illustrates how to display a list of connections from the People Connections service REST APIs using an Ext `JsonStore` and `GridPanel`.

For more information about Ext, see:

<http://www.extjs.com/>

---

**Note:** You must run Ext on a web server. If that server is not your WebCenter instance, then you will run into cross-site scripting problems. If you cannot run the example on your WebCenter server, and you want to use Ext, then consider a proxy, such as Apache or WebCenter Ensemble.

---

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

[http://www.oracle.com/technology/products/webcenter/release11\\_demos.html](http://www.oracle.com/technology/products/webcenter/release11_demos.html)

This section includes the following subsections:

- [Section 53.13.3.1, "Creating the HTML Page"](#)
- [Section 53.13.3.2, "Creating the JavaScript File"](#)
- [Section 53.13.3.3, "The Result"](#)

#### 53.13.3.1 Creating the HTML Page

[Example 53–21](#) shows the simple HTML page. The HTML page must reference the required Ext files and the JavaScript file, `connections.js`. The body of the page contains a destination `div`. The `GridPanel` is rendered in this `div`.

#### **Example 53–21** The HTML Page

```
<head>
  <link rel="stylesheet" type="text/css" href="../../extjs/resources/css/ext-all.css" />
  <script type="text/javascript" src="../../extjs/adaptor/ext/ext-base.js"></script>
  <script type="text/javascript" src="../../extjs/ext-all.js"></script>
  <script type="text/javascript" src="connections.js"></script>
</head>

<body>
  <div id="connections"></div>
</body>
```

#### 53.13.3.2 Creating the JavaScript File

The JavaScript file, `connections.js`, enables the population of the list when the page loads. [Example 53–22](#) shows that all of the JavaScript is a parameter to `Ext.onReady()`.

#### **Example 53–22** `connections.js` as a Parameter to `Ext.onReady`

```
Ext.onReady(function() {
  //our code goes here
```

```
});
```

The JavaScript does the following:

1. First, it queries the Resource Index ([Example 53–23](#)).

Notice that the example asks for responses in JSON format.

#### **Example 53–23 Querying the Resource Index**

```
//Connection Information
var resourceIndexURL = "http://webcenter_server/rest/api/resourceIndex";
var peopleServiceURN = "urn:oracle:webcenter:people";
var connectionsURN = "urn:oracle:webcenter:people:person:list";
var connectionsRel = "urn:oracle:webcenter:people:person:list:connections";

//create a request for the resourceIndex
Ext.Ajax.request({
    url: resourceIndexURL,
    method: 'GET',
    success: function(response, opts) {
        //locate the people connections entry point
        var index = Ext.decode(response.responseText);
        for (x in index.links) {
            if (index.links[x].resourceType == peopleServiceURN)
                getMe(index.links[x].href);
        }
    },
    failure: function(response, opts) {
        alert('Could not communicate with the REST server.');
```

2. Next, the JavaScript sends an authenticated request to the People Connections entry point, and gets the Connections list URL from the response ([Example 53–24](#)).

By default, the REST API uses Basic authentication for secure APIs. In the example, credentials for passing to the Connections list URL are Base64 encoded. Ext does not have a Base64 utility object itself, but one has been developed for it at:

<http://extjs.com/forum/showthread.php?p=167166>

#### **Example 53–24 Getting the Connections List URL**

```
function getMe(requestURL) {
    //Encode a token to identify yourself with secure parts of the REST API.
    var unencodedToken = "username" + ":" + "password";
    var encodedToken = "Basic " + Ext.util.base64.encode(unencodedToken);

    //call the connections entry point
    Ext.Ajax.request({
        url: requestURL,
        method: 'GET',
        success: function(response, opts) {
            //locate the link for my connections
            if (index.links[x].resourceType == connectionsURN) {
                if (index.links[x].rel == connectionsRel)
                    getMyConnections(index.links[x].href, encodedToken);
            }
        }
    });
}
```

```

    },
    failure: function(response, opts) {
        alert('Could not communicate with the REST server.');
```

3. The next step is to send an authenticated request to the Connections list URL ([Example 53–25](#)).

#### **Example 53–25 Sending an Authenticated Request to the Connections List URL**

```

function getMyConnections(requestURL, encodedToken) {
    Ext.Ajax.request({
        url: requestURL,
        method: 'GET',
        success: function(response, opts) {
            displayData(response, opts);
        },
        failure: function(response, opts) {
            alert('Could not communicate with the REST server.');
```

4. Then, the JavaScript adds the response to a `JsonStore` ([Example 53–26](#)).

Previously, this example named `displayData()` as the handler for a successful call to the Connections list URL. Now, it creates the function and adds the `JsonStore` code. In the `JsonStore`, the data model for the data is defined and mapped to results expected from the REST call.

#### **Example 53–26 Adding the Response to a JsonStore**

```

function displayData(response, opts) {
    //create a datamodel to display the JSON
    var store = new Ext.data.JsonStore({
        // store configs
        autoDestroy: true,
        storeId: 'forumStore',
        // reader configs
        root: 'items',
        idProperty: 'id',
        fields: ['displayName', {name:'email', mapping:'emails.value'},
            {name:'phone', mapping:'phoneNumbers[0].value'}]
    });
}
```

5. The JavaScript creates an `Ext.GridPanel` to display the `JsonStore` by including the code in [Example 53–27](#) in `displayData()`.

The grid defines columns and a title. It also includes other display options, such as the size of the table.

**Example 53–27 Creating a GridPanel to Display the JsonStore**

```
//create the Grid
var grid = new Ext.grid.GridPanel({
    store: store,
    columns: [
        {id: 'conn', header: 'Connection', width: 80, sortable: true, dataIndex: 'displayName'},
        {header: 'Email', width: 120, sortable: true, dataIndex: 'email'},
        {id: 'phone', header: 'Phone', width: 120, sortable: true, dataIndex: 'phone'}
    ],
    stripeRows: true,
    autoExpandColumn: 'conn',
    height: 200,
    width: 400,
    title: 'My Connections',
    viewConfig: {scrollOffset: 2}
});
```

- Finally, the code renders the GridPanel by including the line in [Example 53–28](#) in `displayData()`.

**Example 53–28 Rendering the GridPanel**

```
grid.render('connections');
```

**53.13.3.3 The Result**

[Figure 53–1](#) shows the list of connections from the People Connections service REST APIs.

**Figure 53–1 The Connections List**

My Connections		
Connection	Email	Phone
monty	monty@example.com	555-555-5551
pat	pat@example.com	555-555-5552
vicki	vicki@example.com	555-555-5553

**53.13.4 Updating User Status**

The following example shows how to use REST APIs to update a user's WebCenter profile status.

---

**Note:** You must host the sample on a web server (for example, Apache or Oracle HTTP Server) or an application server. To avoid cross site scripting errors, you should proxy URL access to the REST service. On Apache or OHS, the conf commands would look like (change *myspaceshost* and *port* accordingly):

```
ProxyPass /webcenter/ http://myspaceshost:port/webcenter/
ProxyPassReverse /webcenter/ http://myspaceshost:port/webcenter/
ProxyPass /rest/ http://myspaceshost:port/rest/
ProxyPassReverse /rest/ http://myspaceshost:port/rest/
ProxyPreserveHost on
```

---

This sample is available on the Oracle WebCenter Portal Demonstrations and Samples page on the Oracle Technology Network (OTN) at:

[http://www.oracle.com/technology/products/webcenter/release11\\_demos.html](http://www.oracle.com/technology/products/webcenter/release11_demos.html)

Updating user status involves making a sequence of asynchronous AJAX calls to get the URL for the status object:

```
urn:oracle:webcenter:resourceindex
  urn:oracle:webcenter:people
    urn:oracle:webcenter:people:person:status
```

The HTML page for updating user status ([Example 53–29](#)) includes an input field where users can enter the new status message (`statusMessage`). Clicking the **Update Status** button (or pressing Enter) calls the `updateStatus` method to make the initial call to the Resource Index.

#### **Example 53–29 HTML Body**

```
<body>
<div>New status message:&nbsp;<input id="statusMessage" type="text"
  onkeyup="{if (event.keyCode==13) updateStatus();}" maxlength="250"
  size="60" /></div>
<div>
<button id="button1" onclick="updateStatus();">Update Status</button>
</div>
<div id="statusResults"></div>
</body>
```

[Figure 53–2](#) shows the HTML page.

**Figure 53–2 New Status Message HTML Page**

The screenshot shows a web form with a text input field labeled "New status message:" and a button labeled "Update Status". The input field is empty and has a light blue border. The button is rectangular with rounded corners and a light blue background.

The code in [Example 53–30](#) retrieves the Resource Index (`resourceIndexURL` variable set to `/rest/api/resourceIndex`). The Resource Index is returned as an AJAX request object (`resourceIndexRequest`).

#### **Example 53–30 Retrieving the Resource Index**

```
function updateStatus() {
  // Set the UI to busy state. This is cleared in the success and error callbacks
  setUIBusy("Updating status...");
  //get the Resource Index
  resourceIndexRequest.get(
    resourceIndexURL,
    resourceIndexCallback,
    clearUIBusy);
}
```

The `getResourceURL` method shown in [Example 53–31](#) traverses the links in the data returned by a REST call to find a specified string (URN) that identifies the required resource type.

**Example 53–31 Traversing the Links**

```
function getResourceURL(data, strResourceType) {
  for (var i = 0; i < data.links.length; i++) {
    if (data.links[i].resourceType == strResourceType) {
      return data.links[i].href;
    }
  }
  return null;
}
```

[Example 53–32](#) uses `getResourceURL` to parse the Resource Index to find the user profile URL. The data is returned as an AJAX request object (`profileRequest`).

**Example 53–32 Retrieving the User Profile**

```
function resourceIndexCallback(data) {
  //get my user profile
  profileRequest.get(
    getResourceURL(data, 'urn:oracle:webcenter:people'),
    profileCallback,
    clearUIBusy);
}
```

[Example 53–33](#) takes the new status message provided by the user in the HTML page (`statusMessage`) and uses `request.put` to update the status object (retrieved by again calling `getResourceURL`).

**Example 53–33 Retrieving the Status Object**

```
function profileCallback(data) {
  profile = data;
  // get the URL for the status object
  var url = getResourceURL(data, 'urn:oracle:webcenter:people:person:status');
  // get the new status and escape double quotes
  var newStatus = document.getElementById(
    ('statusMessage').value.replace(/\"/g. "\\\""));
  //send a JSON string representing the new status object
  var statusMessage = '{"note": "' + newStatus + '"}';
  statusRequest.put(
    getResourceURL(data, 'urn:oracle:webcenter:people:person:status'),
    statusMessage, renderStatusPutResults, clearUIBusy);
}
```

The `renderStatusPutResults` method, shown in [Example 53–34](#), renders the new status object.

**Example 53–34 Rendering the New Status Object**

```
function renderStatusPutResults(data) {
  var name = profile.displayName;
  // get the URL for my profile HTML page in WebCenter Portal: Spaces
  var profileURL = getResourceURL(profile,
    'urn:oracle:webcenter:spaces:profile');
  var html = 'Status for <a href="' + profileURL + '" target="_blank">'
    + name + '</a> is: ' + data.note;
  // clear the UI busy state and print the new status message
  clearUIBusy(html);
}
```

[Example 53–35](#) shows the code for disabling and reenabling the UI.

**Example 53–35 Disabling the UI**

```
function setUIBusy(message) {
    document.getElementById('statusResults').innerHTML = message;
    document.getElementById('button1').disabled = true;
    document.getElementById('statusMessage').disabled = true;
}

function clearUIBusy(message) {
    document.getElementById('statusResults').innerHTML = message;
    document.getElementById('button1').disabled = false;
    document.getElementById('statusMessage').disabled = false;
}
```

[Example 53–36](#) shows the library that assists in AJAX calls. Most of this is not WebCenter specific and works for any XHR requests to a service that returns JSON.

The library includes a reusable XHR object. This object supports HTTP GET, POST, PUT, and DELETE. All functions are asynchronous and take a URL and two callback functions, one for success, and one for failure. Success calls are made with a JavaScript object containing the return data. Failure calls are made with an error string. POST and PUT also take a data argument which must be a JSON string.

**Example 53–36 AJAX Library**

```
function AjaxRequest() {
    // constructor to create an object oriented AJAX request
    var xhr = null;

    // get XHR object. Should work for IE 6+, Safari, and Mozilla based browsers
    if (window.XMLHttpRequest) {
        xhr = new window.XMLHttpRequest;
    } else {
        try {
            xhr = new ActiveXObject('MSXML2.XMLHTTP.3.0');
        } catch (ex) {
            xhr = null;
        }
    }
    if (xhr == null) {
        alert("Your browser does not support AJAX");
    }

    this.get = function(url, callback, errorCallback) {
        xhr.open('GET', url, true);
        // the REST APIs return XML by default. Please return JSON
        xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
        sendRequest(null, callback, errorCallback);
    };

    this.post = function(url, data, callback, errorCallback) {
        xhr.open('POST', url, true);
        // set headers to send and receive JSON
        xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
        xhr.setRequestHeader('Content-Type', 'application/json; charset=utf-8');
        sendRequest(data, callback, errorCallback);
    };

    this.put = function(url, data, callback, errorCallback) {
        xhr.open('PUT', url, true);
        // set headers to send and receive JSON
```

```
xhr.setRequestHeader('Accept', 'application/json; charset=utf-8');
xhr.setRequestHeader('Content-Type', 'application/json; charset=utf-8');
sendRequest(data, callback, errorCallback);
};

this.deleteResource = function(url, callback, errorCallback) {
    xhr.open('DELETE', url, true);
    sendRequest(null, callback, errorCallback);
};

// set the callbacks and send the request with data, if any
function sendRequest(data, callback, errorCallback) {
    xhr.onreadystatechange = function () {
        processResponse(xhr, callback, errorCallback);
    };
    xhr.send(data);
}

function processResponse(xhr, callback, errorCallback) {
    var data = null;
    // can get called here many times. 4 means really done
    if (xhr.readyState == 4) {
        // let's call any HTTP codes in the 200s success
        if (xhr.status >= 200 && xhr.status <300) {
            // convert response text into a JSON object. This is insecure.
            // data should not be blindly evaluated from the server return.
            // consider using json2.js http://www.JSON.org/js.html
            data = eval('(' + xhr.responseText + ')');
            callback(data);
        } else {
            // we got an error. Format an error string
            data = 'Error: ' + xhr.status + ' ' + xhr.statusText + '<br />'
                + xhr.responseText;
            errorCallback(data);
        }
    }
}
}
```

---

## Integrating Other Oracle Applications

This chapter describes how you can integrate other Oracle applications with your WebCenter Portal application.

This chapter contains the following sections:

- [Section 54.1, "Integrating Oracle and Other Applications in WebCenter Portal"](#)
- [Section 54.2, "Integrating Siebel Applications"](#)
- [Section 54.3, "Integrating E-Business Suite Applications"](#)
- [Section 54.4, "Integrating JD Edwards Applications"](#)
- [Section 54.5, "Integrating PeopleSoft Applications"](#)
- [Section 54.6, "Integrating Oracle Business Intelligence Presentation Services"](#)

### 54.1 Integrating Oracle and Other Applications in WebCenter Portal

Oracle WebCenter Portal is an integrated suite of technology designed to deliver a unified, context-aware user experience. WebCenter Portal integrates structured and unstructured content, business intelligence, business processes, communication, and collaboration services, and removes the boundaries between enterprise applications. By integrating other applications available within the enterprise with WebCenter Portal, you can create context-centric, composite applications that leverage the capabilities of these applications, extending WebCenter Portal and changing the way people work.

WebCenter Portal uses industry-standard technologies to integrate (primarily as WSRP and JPDK portlets) other application components. [Figure 54-1](#) shows the technologies involved in WebCenter Portal integration with other Oracle applications.

**Figure 54–1 WebCenter Portal Integration**

Although not all applications support the same integration mechanisms, the integration process is generally quite simple, consisting of exposing the application object to be integrated as a portlet, registering the portlet with WebCenter Portal, adding the portlet to a page, and then running and testing the results.

In [Figure 54–1](#) we show the applications that can be integrated as Siebel, E-Business Suite, JD Edwards, PeopleSoft, and Oracle Business Intelligence. These Oracle applications are fully supported and documented within this chapter. However, you can integrate virtually any application that can expose objects as WSRP or JPDK portlets. The process for integrating them is the same as for the Oracle applications documented here: expose the object as a portlet, register the portlet in WebCenter Portal, and add the portlet to a page. Refer to the documentation for one of the supported Oracle applications for a description of how to consume an exposed portlet in WebCenter Portal.

## 54.2 Integrating Siebel Applications

This section describes how to integrate a Siebel Web service in a Framework application. It also describes how to integrate Siebel objects using the Siebel Web Engine (SWE). Siebel and WebCenter Portal can work together to include Siebel's CRM capabilities as portlets within your Framework application. You can integrate Siebel applications as Web services, or using the Siebel Web Engine (SWE) as described in the following subsections:

- [Section 54.2.1, "Integrating Siebel Applications as Web Services"](#)
- [Section 54.2.2, "Integrating Siebel Applications Using the Siebel Web Engine"](#)

### 54.2.1 Integrating Siebel Applications as Web Services

This section describes how to integrate Siebel applications as Web services in a Framework application.

This section contains the following subsections:

- [Section 54.2.1.1, "Preparing the Siebel Application"](#)
- [Section 54.2.1.2, "Consuming a Siebel Web Service in a Framework Application"](#)

### 54.2.1.1 Preparing the Siebel Application

This section describes how to create an inbound Web service, set up operations for the inbound service, and generate a WSDL that you will later use to create a data control to your Framework application.

This section contains the following subsections:

- [Section 54.2.1.1.1, "Creating an Inbound Web Service"](#)
- [Section 54.2.1.1.2, "Creating Operations for the Inbound Web Service"](#)

#### 54.2.1.1.1 Creating an Inbound Web Service

To create an inbound Web service:

1. Log into the Siebel application.
2. Navigate to the Administration - Web Services page.
3. Click **Inbound Web Services**.

The Inbound Web Services page shows the out-of-the-box Web services and any other Web services that are currently exposed.

4. Click **Menu** and select **New Record** from the drop-down list.
5. Enter the values for **Namespace**, **Name**, **Status** and **Comment** as appropriate for the Web service you want to set up. For example:

Field Name	Value
Namespace	http://xmlns.oracle.com
Name	Siebel Customer Account
Status	Active
Comment	For Fusion Middleware

6. Scroll to the Service Ports pane and select **New Record** from the **Menu** drop-down list.
7. Enter `CustAccount` as the **Name** and click **Type**.
8. In the **Inbound Web Service Port Type** pick `applet`, open the **New** tab.
9. Select `Business Service` as the **Implementation Type**.
10. From the **Service Name** list, select `Siebel Account`.
11. In the **Inbound Web Service Port Type** pick `applet`, click **OK** to create the inbound Web service.
12. From the Service Ports dialog's **Transport** drop-down list, select `HTTP`.
13. In the **Address** field, set the URL to your Siebel instance. For example:

```
http://xmlns.oracle.com/eai_
enu/start.swe?SWEExtSource=WebService&SWEExtCmd=Execute&UserName=SADMIN&Passwor
d=SADMIN
```

14. From the **Menu** drop-down list, select `Save Record`.

#### 54.2.1.1.2 Creating Operations for the Inbound Web Service

To add operations to the inbound Web service and then create a WSDL file, perform the following steps:

1. Scroll to the Operations section and select `New` from the **Menu** drop-down list.
2. In the **Operation Name** field, enter `AccountInsert`.
3. Click **Method Display Name** to open the Business Service Method dialog.
4. Select `Insert` as the **Method**, and click **OK**.
5. From the **Authentication Type** drop-down list, select an appropriate authentication type:

Authentication Type	Session Type	Description
None	None	A single request is sent with an anonymous user login, and the session is closed after the response is sent out.  In order for the anonymous session to be identified by the SWSE Plug-in, <code>UsernameToken</code> and <code>PasswordText</code> must be excluded in the SOAP headers.
Username and password	None	A single request is sent with the username and password used to log in, and the session is closed after the response is sent out.
Username and password	Stateless	The initial request to log in establishes a session that is to remain open and available for subsequent requests. Username/password are used to log in and a session token is returned in a SOAP header included in the outbound response. The session remains open.
Session token (stateless)	Stateless	Request to reconnect to an established session, using the information contained in the session token. If the session has been closed, automatic re-login occurs. The Siebel servers include the session token in the SOAP header of the response. The session remains open.
Session token (stateless)	None	When a SOAP header carries a session token and has the session type set to <code>None</code> , then the Session Manager on the SWSE closes (logs out) of this session, and invalidates the session token. The session token is not used after the session is invalidated.

6. Click **New** to create a new operation.
7. In the **Operation Name** field, enter a name for the new operation (for example, `AccountQueryByExample`).
8. Click **Method Display Name** for the new operation.
9. In the Business Service Method dialog, select the query method (for example, **Query By Example**) and click **OK**.
10. Continue by adding any additional operations you may need as described in steps 6 to 9 above.
11. In the Service Ports pane, select `Save Record` from the **Menu** drop-down list.
12. In the Inbound Web Services pane, select `Save Record` from the **Menu** drop-down list.

13. Select `Clear Cache` from the **Menu** drop-down list.
14. Click the **Generate WSDL**.
15. On the File Download dialog, click **Open**.
16. Select **File --> Save As...**
17. Locate the directory where you want to save the WSDL file, enter a name for the file and click **Save**.

### 54.2.1.2 Consuming a Siebel Web Service in a Framework Application

This section describes how to consume Siebel applications that have been set up as Web services in a Framework application, including how to set up a WSDL-based data control and, how to use JDeveloper's JSF Navigation Modeler to diagrammatically create your application's pages and the navigation between them.

This section contains the following subsections:

- [Section 54.2.1.2.1, "Creating a Data Control Based on a Siebel Web Service"](#)
- [Section 54.2.1.2.2, "Creating a Page Flow Diagram"](#)
- [Section 54.2.1.2.3, "Adding Pages and Navigation to the Page Flow Diagram"](#)
- [Section 54.2.1.2.4, "Creating the Query Page"](#)
- [Section 54.2.1.2.5, "Creating the Results Page"](#)
- [Section 54.2.1.2.6, "Testing the Application"](#)

#### 54.2.1.2.1 Creating a Data Control Based on a Siebel Web Service

This section describes how to create a WSDL-based data control based on a Web service created from a Siebel application.

To create a WSDL-based data control:

1. Open your Framework application or create a new Framework application in JDeveloper.
2. In the Applications Navigator, right-click the `Model` node and select **New** from the context menu.
3. In the New Gallery, select `All Technologies` from the **Filter By** drop-down list.
4. Select `Business Tier | Web Services` as the category, select the `Web Service Data Control` item, and click **OK**.
5. In the Create Web Service Data Control wizard, click **Next** to leave the Welcome page.
6. In Step 1, enter the Web service name in the **Name** field.
7. Click **Browse** for the **URL** field, locate the directory where you downloaded the WSDL file, select the file and click **Open**.

In the wizard, note the URL generated in the **Service** field.

8. Click **Next**.

Step 2 shows all the operations available from the selected Web service.

9. Using the **Add** button, shuttle the operations you want to the Selected pane., and then click **Next**.

When you expand the `Model` node in the Applications Navigator, you should see nodes for the entries that you have created.

10. Click the **Save All** icon to save your changes.

#### 54.2.1.2.2 Creating a Page Flow Diagram -

This section describes how to create the page flow diagram to which you can add source and query pages.

To create a page flow diagram:

1. In the Applications Navigator, right-click the `ViewController` node and select **New** from the context menu.
2. In the New Gallery, expand the `Web Tier` node and select **JSF**.
3. In the Items pane, select **JSF Page Flow & Configuration (faces-config.xml)** and click **OK**.
4. In the Create JSF Configuration File dialog, click **OK** to accept default values.

An empty page flow diagram opens with a Component Palette and Data Control Palette to the right of the diagram editor. You use this to create components for the JSF Navigation Model.

5. Click the **Save All** icon to save your changes.

#### 54.2.1.2.3 Adding Pages and Navigation to the Page Flow Diagram

This section describes how to add pages and navigation to the page flow diagram.

To add pages to the page flow diagram:

1. In the JSF Navigation Diagram Component Palette, create a source page by selecting **JSF Page**, clicking the diagram and naming the page appropriately (for example, `QueryByID`). Typically, you will have at least a source and query page.
2. To create the query page, click and drag another JSF Page from the Component Palette and drop it next to the previous one, renaming it appropriately (for example, `ShowResult`).
3. Select **JSF Navigation Case** in the JSF Navigation Diagram Component Palette. Click the icon for the source JSF page, and then click the icon for the destination JSF page for the navigation case.
4. Modify the default label (`success`) by clicking it and entering an appropriate name (for example, `toResult`).
5. Open the Overview tab and click **Navigation Rules**.

The rule you just created in the diagram should be listed in the table.

JDeveloper gives you three views of the `faces-config.xml` file: The same information that is presented in the diagram is also accessible through a declarative dialog and directly from the source. If you open the source view (by clicking the Source tab) the `<from-view-id>` tag identifies the source page, and the `<to-view-id>` tag identifies the destination page.

6. From the diagram view, select **JSF Navigation Case** in the Component Palette. Click the icon for the source JSF page, and then click the icon for the destination JSF page for the navigation case.
7. Modify the default label by clicking it and entering an appropriate name (for example, `toQuery`).

- Click the **Save All** icon to save the diagram.

#### 54.2.1.2.4 Creating the Query Page

This section describes how to create and set up navigation for the query page.

To create the query page:

- On the Page Flow diagram, double-click the source page icon (`QueryById`) to launch the Create JSF JSP Wizard.
- Click **Next** to leave the Welcome page.
- In Step 1 of the wizard, select **JSP Document (\*.jspx)** and click **Next**.
- In Step 2, make sure **Do Not Automatically Expose UI Components in a Managed Bean** is selected and click **Next**.
- In Step 3, make sure the following libraries are selected:

```
ADF Faces Components 10_1_3_2_0
ADF Faces HTML 10_1_3_2_0
JSF Core 1.0
Customizable Components Core 10_1_3_2_0
```

- Click **Finish** to create the page.

An empty JSF page opens in the Design tab of the editor.

- In the Customizable Components Core component palette, click **ShowDetailFrame**.

The ShowDetailFrame appears in the page.

---

**Note:** Oracle WebCenter Portal provides two customizable components: PanelCustomizable and ShowDetailFrame. These two components make it very easy to organize the content of your Web application, treating different panels as if they are almost stand-alone, portlet-like objects that can be minimized, rearranged, have their own drop-down menus, and so on.

---

- With the ShowDetailFrame selected, modify the Text property in the Properties Inspector to Query By ID. Press **[Enter]** to update the page in the Visual Editor.
- Open the Data Control palette and expand the Siebel Web services node. Drag and drop the `AccountQueryById(String)` node onto the ShowDetailFrame on the page.
- In the popup menu, select **Create | Parameters | ADF Parameter Form**.
- In the Edit Form Fields, click **OK**.
- Select the AccountQueryById button generated in the page and in the Property Inspector pane, change the following properties:
 

```
Text Submit
Action toResult
```
- Select the input field corresponding to the input value, and in the Property Inspector, change the **Label** property to `Account ID`:
- Click the **Save All** icon to save your work.

#### 54.2.1.2.5 Creating the Results Page

This section describes how to create and add navigation for the results page.

To create the results page:

1. Click the `faces-config.xml` tab to return to the Page Flow diagram and double-click the **ShowResult** icon to launch the page wizard.
2. Click **Next** to skip the Welcome page.
3. In Step 1 of the wizard, select **JSP Document (\*.jspx)** and click **Next**.
4. In Step 2, make sure **Do Not Automatically Expose UI Components in a Managed Bean** is selected and click **Next**.
5. In Step 3, make sure the following libraries are selected:

```
ADF Faces Components 10_1_3_2_0
ADF Faces HTML 10_1_3_2_0
JSF Core 1.0
```

6. Click **Finish** to create the page.

An empty JSF page opens in the Design tab of the editor.

7. In the Customizable Components Core component palette, click **ShowDetailFrame**.

The ShowDetailFrame appears in the page.

8. With the ShowDetailFrame selected, modify the Text property in the Properties Inspector to Query Results. Press **[Enter]** to update the page in the Visual Editor.
9. In the Data Control palette, expand **AccountQueryById | Return | SiebelMessage | ListofAccountInterface**, select the Account node and drop it on the page on the ShowDetailFrame.
10. In the popup menu, select **Create | Forms | ADF Read-only Form**.
11. In the Edit Form Fields, delete all fields except for the following:

```
AccountID
AccountStatus
NumberOfEmployees
CurrencyCode
Location
MainPhoneNumber
Name
Type
```

12. Check the **Include Submit Button** checkbox and click **OK**.
13. In the Action Binding Editor, click **OK**.
14. Click **Submit** and in the Property Inspector change the title to `Back to Query`, and in the **Action** field select `toQuery` from the list.
15. Click the **Save All** icon to save your work.

#### 54.2.1.2.6 Testing the Application

This section describes how to test the application's JSF pages in JDeveloper. Before you can query a Siebel Account using an ID, you need to determine the IDs that are available in your Siebel instance. To perform the following steps you must have access to Siebel Call Center.

To determine the IDS and test your JSF pages:

1. Log into Siebel Call Center, providing the appropriate user ID and password.
2. Navigate to the Accounts List using Site Map.
3. Click **Accounts**, then **Accounts List**.
4. From the returned list, highlight the account you want to query.
5. From the Help menu, select **About Record**.
6. Find the ID value in the **Row #** field and make a note of it.
7. Return to the page flow diagram and right-click the QueryById page icon and select **Run** from the context menu.

The page is loaded in your default browser.

8. In the ID field, enter the value you previously noted in the the **Row #** field and click **Submit**.

The Details page displays the detail information for the corresponding account.

## 54.2.2 Integrating Siebel Applications Using the Siebel Web Engine

As well as integrating Siebel applications using Web Services, you can also integrate Siebel applications in a Framework application using the Siebel Web Engine (SWE).

Siebel Web Engine (SWE) is responsible for rendering the Siebel User Interface. Siebel Web Templates provide this HTML layout information (markup information) to the Siebel Web Engine when rendering Siebel objects in the repository definition of the application. The markup that SWE returns can also be XML for rendering within XML-aware applications or WML (wireless markup language) for rendering on wireless devices. This lets you request the SWE to return a Siebel View as XML, parse the data elements, and display the result in a Framework application.

For instructions on how to use SWE within a Framework application, follow the tutorial *Using the Siebel Web Engine (SWE) to View Data in a WebCenter Application*.

To complete the tutorial, you will need the following:

- Have access to or have installed Oracle JDeveloper Studio Edition
- Have access to or have installed Oracle's Siebel eBusiness Applications.
- Have access to a supported version of Windows Internet Explorer (IE) (see the *System Requirements and Supported Platforms Guide* for Siebel that is available on OTN).

Also refer to the Siebel Bookshelf Guides: *Siebel Portal Framework Guide* (specifically, the section on delivering content to external Web applications), and *Configuring Siebel Business Applications Guide* for details on SWE and Web Templates.

## 54.3 Integrating E-Business Suite Applications

This section describes how to integrate E-Business Suite applications in WebCenter Portal applications.

This section contains the following subsections:

- [Section 54.3.1, "Introduction to Integrating EBS Applications"](#)
- [Section 54.3.2, "Integrating EBS Applications in a Framework Application"](#)

- [Section 54.3.3, "Integrating EBS Applications in Spaces"](#)

## 54.3.1 Introduction to Integrating EBS Applications

This section describes the integration points and requirements integrating Oracle E-Business Suite portlets in WebCenter Portal applications.

This section includes the following subsections:

- [Section 54.3.1.1, "Understanding EBS Integration"](#)
- [Section 54.3.1.2, "Requirements for Integrating EBS Applications"](#)

### 54.3.1.1 Understanding EBS Integration

Out-of-the-box, Oracle E-Business Suite OA Framework-based portlets, such as Applications Navigator, Favorites, and Worklist are WSRP and JSR 168-compliant. That means that you can access these Oracle E-Business Suite portlets from WSRP-compliant portal servers such as WebCenter Portal: Framework applications or WebCenter Portal: Spaces, by simply adding the portlet onto an application page. Follow the instructions in [Section 54.3.2.3, "Creating a JSF Page to Consume the Remote Producer"](#) to add them to a Framework application page, or [Section 54.3.3.3, "Adding the EBS Portlet to a Spaces Page"](#) to add them to a Spaces page.

You can also create new E-Business Suite portlets that are WSRP and JSR 168-compliant that can similarly be added to a Framework application. Creating and consuming WSRP and JSR 168 compliant portals in WebCenter Portal is described in [Section 54.3.2, "Integrating EBS Applications in a Framework Application"](#) and [Section 54.3.3, "Integrating EBS Applications in Spaces."](#)

### 54.3.1.2 Requirements for Integrating EBS Applications

The following requirements apply for integrating Oracle E-Business Suite portals into WebCenter Portal applications:

- Regions to be exposed as portlets must be created using Oracle E-Business Suite OA Framework Release 12 as previous versions are not WSRP/JSR 168-compliant.
- Oracle E-Business Suite should be configured to use Oracle Internet Directory (OID) and one of following single sign-on solutions:
  - Oracle Single Sign-On (OSSO)
  - Oracle Access Manager (OAM)

If you are using OSSO, follow the steps in My Oracle Support document 376811.1 to integrate E-Business Suite Release 12 with OID and OSSO.

If you are using OAM, follow the steps in My Oracle Support document 975182.1 to integrate E-Business Suite Release 12 with OAM.

- You must have granted the WebCenter Portal application access to the E-Business Suite Portlet Producer and added and configured the appropriate users.

---

---

**Note:** To complete some steps, you may need system administrator permissions.

---

---

## 54.3.2 Integrating EBS Applications in a Framework Application

This section includes the following subsections:

- Section 54.3.2.1, "Preparing the EBS Portlet for Remote Access"
- Section 54.3.2.2, "Registering the EBS WSRP Producer in the Framework Application"
- Section 54.3.2.3, "Creating a JSF Page to Consume the Remote Producer"
- Section 54.3.2.4, "Testing the Framework Application"

### 54.3.2.1 Preparing the EBS Portlet for Remote Access

The Oracle E-Business Suite OA Framework lets you expose any standalone regions (except pageLayout regions) as portlets. Page layout regions cannot be exposed as portlets because portlets are always rendered inside an HTML table cell and page layout regions contain HTML constructs that cannot be rendered within a table cell.

---

**Note:** The Oracle Application Framework Provider handles the form submission using HTTP GET as per the Java Portlet Specification. (Refer to PLT.16.3 The Include Method - "Servlets and JSPs included from portlets must be handled as HTTP GET requests."). Due to this limitation, any regions requiring data entry (like search criteria regions, LOVs, text inputs, etc.) should not be exposed as portlets.

---

---

**Tip:** You can also use an Oracle E-Business Suite tool called Portlet Generator to convert existing standalone Oracle Application Framework regions into portlets. For more information about Portlet Generator, see the *Oracle E-Business Suite System Administrator's Guide - Configuration*.

---

To expose your region as a portlet:

1. Create a UI Function to register your region as a portlet. See Tabs/Navigation for more information regarding the creation of UI Functions.
2. Set the following properties within your new UI Function:
  - Function Type = Web Provider Portlet (internal value is WEBPORTLET).

In order to define a WSRP/JSR168-compliant portlet, a user needs to add an extra parameter to the portlet function definition. # Parameters = OA\_JS168\_PORTLET=Y

- HTML call = OA.jsp?region=<your region Reference>

For example:

OA.jsp?region=/oracle/apps/fnd/wf/worklist/webui/WorklistPrtleRG

If your portlet includes a drill-down page, append a parameter to the above URI specifying the target of the drill down using a page reference or a function name. For example:

- a. &detailPage=<target page>

For example:

OA.jsp?region=/oracle/apps/fnd/wf/worklist/webui/WorklistPrtleRG  
&detailPage=/oracle/apps/fnd/wf/worklist/webui/AdvancWorklistPG

- b. &detailFunction=<Form Function name>

For example:

```
OA.jsp?region=/oracle/apps/fnd/wf/worklist/webui/WorklistPrtletRG
&detailFunction=WF_WORKLIST_DRILL_FUNC
```

### 3. Optionally disable portlet personalization.

By default, all portlets rendered using the OA Framework Web Provider include a Customize link in the title bar. Clicking on the link displays a customization page that lets you change the portlet title and responsibility. With this page you can customize the portlet title and assign a responsibility to it. Customizing the responsibility is useful when a portlet content is dependent on the responsibility context, and is associated with multiple responsibilities.

To disable portlet customization, append `&dispRespCustPg=N` to the HTML call URI.

For example:

```
OA.jsp?region=/oracle/apps/fnd/wf/worklist/webui/WorklistPrtletRG&dispRespCustPg=N
```

### 4. Associate help text defined using Oracle online Help with your portlet.

When you associate help text with your portlet, the OA Framework Web Provider renders a help text icon (?) in the portlet title bar. Clicking the icon displays the help text.

To associate help text with your portlet, append `&oawpHelpTarget=<Oracle online Help reference>` to the HTML call URI.

For example:

```
OA.jsp?region=/oracle/apps/fnd/wf/worklist/webui/WorklistPrtletRG&oawpHelpTarget=worklistHelp
```

After creating the portlets, grant access to your new UI Function by adding it to a menu and associating the menu with a responsibility. Before adding the portlets in WebCenter Portal, be sure to bounce the Apache listener as the menu and function definitions are cached. Note that you'll need system administrator permissions to do this.

#### 54.3.2.2 Registering the EBS WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the EBS WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) EBS portlet.
2. Under Application Resources, right-click **Connection** and select **WSRP Producer**.

Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays.

3. Enter a name for the WSRP producer and click **Next**.

The Specify Connection Details page displays.

4. Enter the WSDL for the EBS producer in the **WSDL URL** field as shown below:

```
WSDL URL: http://[Release_12_host]:[port]/OA_HTML/portlets/WSRPBaseService?WSDL
```

For example:

```
http://myEBSServer.example.com:8001/OA_HTML/portlets/WSRPBaseService?WSDL
```

5. Click **Next** and then **Finish**.

The WSRP producer should now appear under Connections.

6. Continue by creating a JSF page to consume the WSRP producer as described in [Section 54.3.2.3, "Creating a JSF Page to Consume the Remote Producer."](#)

#### 54.3.2.3 Creating a JSF Page to Consume the Remote Producer

Use the following procedure to add or use an existing JSF page to consume the EBS remote producer in your Framework application.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.

The New Gallery dialog displays.

2. In the Categories field's tree structure, locate and expand the Web Tier.

A list with the descriptions of the available options display in the Items field.

3. From this list, select **JSF Page** and click **OK**.

The Create JSF Page dialog displays.

4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.

5. Click **OK**.

The newly created JSF page displays.

6. Under connections, expand the newly created WSRP producer and drag the portlet for the EBS page onto the JSF page.

7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to `True`.

8. Add any other components that you need onto the page, and save the application.

9. Continue by running the page and testing that modifications made in the Framework application appear in the EBS application as described in [Section 54.3.2.4, "Testing the Framework Application."](#)

#### 54.3.2.4 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the EBS application.

1. Run the `.jspx` page that you created.
2. In the running page, modify some information that you can verify the changes for in the EBS application.
3. Save your changes and confirm that the changes also appear in the EBS application.

### 54.3.3 Integrating EBS Applications in Spaces

This section contains the following subsections:

- [Section 54.3.3.1, "Preparing the EBS Portlet for Remote Access"](#)
- [Section 54.3.3.2, "Registering the EBS WSRP Producer in Spaces"](#)
- [Section 54.3.3.3, "Adding the EBS Portlet to a Spaces Page"](#)
- [Section 54.3.3.4, "Testing the Spaces Portlet Connection"](#)

### 54.3.3.1 Preparing the EBS Portlet for Remote Access

Prepare the standalone regions to be portletized as described the section on [Section 54.3.2.1, "Preparing the EBS Portlet for Remote Access."](#)

Before adding the portlets in Spaces, be sure to bounce the Apache listener as the menu and function definitions are cached.

### 54.3.3.2 Registering the EBS WSRP Producer in Spaces

You can register the EBS WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the EBS WSRP producer using Fusion Middleware Control as described in the steps below.

To register the EBS WSRP producer using Fusion Middleware Control:

1. Prepare the EBS page that you want to consume in Spaces for remote access as described in [Section 54.3.3.1, "Preparing the EBS Portlet for Remote Access."](#)
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand **Spaces** in the Navigation bar and from the WebCenter Portal menu, and select **Register Producer**.

The Add Portlet Producer page displays.

4. Enter a **Connection Name**, set the **Producer Type** to **WSRP Producer**, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. Click **OK** and verify that the producer connection was created successfully.
6. Continue by adding the portlet to a Spaces page as described in [Section 54.3.3.3, "Adding the EBS Portlet to a Spaces Page."](#)

### 54.3.3.3 Adding the EBS Portlet to a Spaces Page

Use the following procedure to consume the EBS remote producer in Spaces.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the EBS portal.
3. Click **Add Content** to open Composer.
4. From the Resource Catalog, select **Portlets**.

Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the EBS portlet you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.

9. Open the Display Options tab and set the **Render Portlet in IFrame** option to True and click **OK**.
10. Continue by checking the portlet connection as described in [Section 54.3.3.4, "Testing the Spaces Portlet Connection."](#)

#### 54.3.3.4 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the EBS application.

1. On the Spaces page that you added the EBS portlet to, modify some information that you can verify the changes for in the EBS application.
2. Save your changes and confirm that the changes also appear in the EBS application.

## 54.4 Integrating JD Edwards Applications

This section describes how to integrate JD Edwards applications into WebCenter Portal applications.

This section contains the following subsections:

- [Section 54.4.1, "Integrating JD Edwards Applications in a Framework Application"](#)
- [Section 54.4.2, "Integrating JD Edwards Applications in Spaces"](#)

### 54.4.1 Integrating JD Edwards Applications in a Framework Application

This section includes the following subsections:

- [Section 54.4.1.1, "Preparing the JD Edwards Application for Remote Access"](#)
- [Section 54.4.1.2, "Registering the JD Edwards WSRP Producer in the Framework Application"](#)
- [Section 54.4.1.3, "Creating the JSF Page to Consume the Remote Producer"](#)
- [Section 54.4.1.4, "Testing the Framework Application"](#)

#### 54.4.1.1 Preparing the JD Edwards Application for Remote Access

Before you can add JD Edwards standalone regions to Framework applications, you must first prepare them to be portletized within JD Edwards by making them available externally as portlets and locating the pre-configured WSDL in the `webclient.war/wsd1` directory. The WSDL URL is needed so that you can register the JD Edwards WSRP producer and consume it from a Framework application page.

#### 54.4.1.2 Registering the JD Edwards WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the JD Edwards WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) JD Edwards portlet.
2. Under Application Resources, right-click Connection and select **WSRP Producer**.  
Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays.
3. Enter a name for the WSRP producer and click **Next**.

The Specify Connection Details page displays.

4. Paste the WSDL URL for the JD Edwards producer into the **WSDL URL** field.
5. Click **Next** and then **Finish**.

The WSRP producer should now appear under Connections.

6. Continue by creating a JSF page to consume the WSRP producer as described in [Section 54.4.1.3, "Creating the JSF Page to Consume the Remote Producer."](#)

#### 54.4.1.3 Creating the JSF Page to Consume the Remote Producer

Use the following procedure to add or use an existing JSF page to consume the JD Edwards remote producer in your Framework application.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.

The New Gallery dialog displays.

2. In the Categories field's tree structure, locate and expand the Web Tier.

A list with the descriptions of the available options display in the Items field.

3. From this list, select **JSF Page** and click **OK**.

The Create JSF Page dialog displays.

4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.
5. Click **OK**.

The newly created JSF page displays.

6. Under connections, expand the newly created WSRP producer and drag the portlet for the JD Edwards page onto the JSF page.
7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to `True`.
8. Add any other components that you need onto the page, and save the application.
9. Continue by running the page and testing that modifications made in the Framework application appear in the JD Edwards application as described in [Section 54.4.1.4, "Testing the Framework Application."](#)

#### 54.4.1.4 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the JD Edwards application.

1. Run the `.jspx` page that you created.
2. In the running page, modify some information that you can verify the changes for in the JD Edwards application.
3. Save your changes and confirm that the changes also appear in the JD Edwards application.

## 54.4.2 Integrating JD Edwards Applications in Spaces

This section contains the following subsections:

- [Section 54.4.2.1, "Registering the Producer"](#)
- [Section 54.4.2.2, "Adding the JD Edwards Portlet to a Spaces Page"](#)
- [Section 54.4.2.3, "Testing the Spaces Portlet Connection"](#)

### 54.4.2.1 Registering the Producer

You can register the JD Edwards WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the JD Edwards WSRP producer using Fusion Middleware Control as described in the steps below.

To register the JD Edwards WSRP producer using Fusion Middleware Control:

1. Prepare the JD Edwards page that you want to consume in Spaces for remote access as described in [Section 54.4.1.1, "Preparing the JD Edwards Application for Remote Access."](#)
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand **Spaces** in the Navigation bar and from the WebCenter Portal menu, and select **Register Producer**.

The Add Portlet Producer page displays.

4. Enter a **Connection Name**, set the **Producer Type** to `WSRP Producer`, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. Click **OK** and verify that the producer connection was created successfully.
6. Continue by adding the portlet to a Spaces page as described in [Section 54.4.2.2, "Adding the JD Edwards Portlet to a Spaces Page."](#)

### 54.4.2.2 Adding the JD Edwards Portlet to a Spaces Page

Use the following procedure to consume the JD Edwards remote producer in Spaces.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the JD Edwards portal.
3. Click **Add Content** to open Composer.
4. From the Resource Catalog, select **Portlets**.

Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the JD Edwards portlet you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.
9. Open the Display Options tab and set the **Render Portlet in IFrame** option to **True** and click **OK**.

10. Continue by checking the portlet connection as described in [Section 54.4.2.3, "Testing the Spaces Portlet Connection."](#)

### 54.4.2.3 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the JD Edwards application.

1. On the Spaces page that you added the JD Edwards portlet to, modify some information that you can verify the changes for in the JD Edwards application.
2. Save your changes and confirm that the changes also appear in the JD Edwards application.

## 54.5 Integrating PeopleSoft Applications

This section describes how to integrate PeopleSoft applications in a WebCenter Portal application.

This section contains the following subsections:

- [Section 54.5.1, "Introduction to Integrating PeopleSoft Applications"](#)
- [Section 54.5.2, "Preparing the PeopleSoft Application for Remote Access"](#)
- [Section 54.5.3, "Integrating PeopleSoft Applications in a Framework Application"](#)
- [Section 54.5.4, "Integrating PeopleSoft Applications in Spaces"](#)
- [Section 54.5.5, "Setting up WS-Security for PeopleTools"](#)

### 54.5.1 Introduction to Integrating PeopleSoft Applications

This section describes the benefits and methods involved in integrating PeopleSoft applications into WebCenter Portal applications.

This section includes the following subsections:

- [Section 54.5.1.1, "Understanding PeopleSoft Integration"](#)
- [Section 54.5.1.2, "Requirements for Integrating PeopleSoft Applications"](#)

#### 54.5.1.1 Understanding PeopleSoft Integration

PeopleTools 8.48 and later lets you expose PeopleSoft applications as WSRP portlets in remote applications such as WebCenter Portal. This allows people who only need access to a small portion of PeopleSoft's functionality to access it through a WebCenter Portal application without needing to open or learn the entire PeopleSoft application.

#### 54.5.1.2 Requirements for Integrating PeopleSoft Applications

This section the prerequisites for integrating PeopleSoft objects in Framework applications, and Spaces.

- PeopleTools 8.48 or later
- When using WS-Security for automatic sign on to PeopleSoft, in order for the SAML assertion to be valid, the date/time on the PeopleSoft and WebCenter Portal servers must be synchronized. If this is problematic, then the PeopleSoft web server's time may be set to be slightly ahead of WebCenter Portal server.

- For PeopleTools 8.5.1 and earlier, you may need to create and configure a custom OWSM policy in order to fully support WS-Security. For more information, see [Section 54.5.5, "Setting up WS-Security for PeopleTools."](#)

## 54.5.2 Preparing the PeopleSoft Application for Remote Access

This section describes how to prepare the PeopleSoft application so that it can be consumed by Spaces or a Framework application.

To prepare the PeopleSoft application:

1. Log into PeopleSoft as an administrator.
2. Select PeopleTools from the main menu.
3. From the People Tools main menu, expand **Employee Self-Service**, and then **Portal**.
4. Select **Structure and Content**.
5. Navigate to the folder containing the page that you want to consume in WebCenter Portal and click **Edit** to open it.

The Content Ref Administration page displays.

6. On the General tab, select the **WSRP Producible** checkbox.
7. Save the page.
8. From the main menu, select **WSRP Production**.  
The Producer Offered Portlets page displays.
9. Verify that the page is exposed, and then expand Web Service Endpoint URL and copy the URL (the WSDL).
10. Open a new tab in your browser, and paste the copied URL into the Navigation Bar to access the WSDL page.
11. Copy the URL to the clipboard.
12. Continue by integrating the PeopleSoft WSRP producer in Spaces or Framework application as described in [Section 54.5.3, "Integrating PeopleSoft Applications in a Framework Application"](#) and [Section 54.5.4, "Integrating PeopleSoft Applications in Spaces."](#)

## 54.5.3 Integrating PeopleSoft Applications in a Framework Application

This section describes how to create or modify a Framework application that integrates with PeopleSoft Applications.

This section includes the following subsections:

- [Section 54.5.3.1, "Registering the PeopleSoft WSRP Producer in the Framework Application"](#)
- [Section 54.5.3.2, "Creating the JSF Page to Consume the Remote \(WSRP\) Producer"](#)
- [Section 54.5.5, "Setting up WS-Security for PeopleTools"](#)
- [Section 54.5.3.3, "Testing the Framework Application"](#)

### 54.5.3.1 Registering the PeopleSoft WSRP Producer in the Framework Application

Follow the instructions below to create or open an existing Framework application, and register the PeopleSoft WSRP producer.

1. Create a new Framework application or open an existing one in which you would like to consume the remote (WSRP) PeopleSoft portlet.
2. Under Application Resources, right-click Connection and select **WSRP Producer**.  
Page 1 (Specify Producer Name) of the Register WSRP Portlet Producer wizard displays (see [Figure 54-2](#)).

**Figure 54-2 Specify Producer Name**

The screenshot shows the 'Specify Producer Name' wizard page. The title bar reads 'Specify Producer Name'. Below the title bar, the instruction says 'Provide a unique name for the WSRP portlet producer registration.' There are two radio buttons for 'Create Connection in:': 'Application Resources' (selected) and 'Resource Palette'. A 'Target Project' dropdown menu is set to 'Portal'. The 'Producer Registration Name' text field contains 'PeopleSoftPortletProducer'. At the bottom, there are buttons for 'Help', '< Back', 'Next >', 'Finish', and 'Cancel'.

3. Enter a name for the WSRP producer and click **Next**.  
The Specify Connection Details page displays (see [Figure 54-3](#)).

**Figure 54-3 Specify Connection Details**

The screenshot shows the 'Specify Connection Details' wizard page. The title bar reads 'Specify Connection Details'. Below the title bar, the instruction says 'Provide information to enable applications to connect to the WSRP portlet producer.' The 'WSDL URL' text field contains 'http://peoplesoft.example.com:8888/ExamplePage'. There is a checkbox for 'Use Proxy for Contacting Producer' which is unchecked. Below it is a 'Proxy Details' section with two text fields: 'Proxy Host' and 'Proxy Port'. At the bottom, there are buttons for 'Help', '< Back', 'Next >', 'Finish', and 'Cancel'.

4. Paste the WSDL (the URL you copied earlier) into the **WSDL URL** field and click **Next**.
5. If you need to configure WS-Security, click **Next**.  
For more information about configuring WS-Security, refer to [Section 54.5.5, "Setting up WS-Security for PeopleTools."](#)
6. Click **Finish**.  
The WSRP producer should now appear under Connections.
7. Continue by creating a JSF page to consume the WSRP producer as described in [Section 54.5.3.2, "Creating the JSF Page to Consume the Remote \(WSRP\) Producer."](#)

---

**Note:** Compression must be turned off in WLS to expose WSRP Portlets. Compression is enabled by default in the Producer Web Server running with Weblogic 10.3.2 and must be disabled in the Server Manager setting for compression available for each instance.

---

### 54.5.3.2 Creating the JSF Page to Consume the Remote (WSRP) Producer

Use the following procedure to add a JSF page to consume the PeopleSoft remote producer.

To create a JSF page:

1. In the application's Navigation panel, right-click on the application name and select **New**.  
The New Gallery dialog displays.
2. In the Categories field's tree structure, locate and expand the Web Tier.  
A list with the descriptions of the available options display in the Items field.
3. From this list, select **JSF Page** and click **OK**.  
The Create JSF Page dialog displays.
4. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the **Help** button to access the online help.
5. Click **OK**.  
The newly created JSF page displays.
6. Under connections, expand the newly created WSRP producer and drag the portlet for the PeopleSoft page onto the JSF page.
7. In the Portlet Property Inspector, set the **RenderPortletInIFrame** property to **True**.
8. Add any other components that you need onto the page, and save the application.
9. Continue by running the page and testing that modifications made in the Framework application appear in the PeopleSoft application as described in [Section 54.5.3.3, "Testing the Framework Application."](#)

### 54.5.3.3 Testing the Framework Application

Use this procedure to test the Framework application by modifying content on the JSF page in the Framework application and checking that the modification shows up in the PeopleSoft application.

1. Run the `.jspx` page that you created.
2. In the running page, modify some information that you can verify the changes for in the PeopleSoft application.
3. Save your changes and confirm that the changes also appear in the PeopleSoft application.

## 54.5.4 Integrating PeopleSoft Applications in Spaces

This section describes how to integrate a PeopleSoft application in Spaces.

This section contains the following subsections:

- [Section 54.5.4.1, "Registering the PeopleSoft WSRP Producer for Spaces"](#)
- [Section 54.5.4.2, "Adding the PeopleSoft Portlet to a Spaces Page"](#)
- [Section 54.5.4.3, "Testing the Spaces Portlet Connection"](#)

### 54.5.4.1 Registering the PeopleSoft WSRP Producer for Spaces

You can register the PeopleSoft WSRP producer directly in Spaces, as described in the section on "Registering Portlet Producers" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. You can also register the PeopleSoft WSRP producer using Fusion Middleware Control as described in the steps below.

To register the PeopleSoft WSRP producer using Fusion Middleware Control:

1. Prepare the PeopleSoft page that you want to consume in Spaces for remote access as described in [Section 54.5.2, "Preparing the PeopleSoft Application for Remote Access."](#)
2. Log into Fusion Middleware Control for the Spaces domain.
3. Expand **Spaces** in the Navigation bar and from the WebCenter Portal menu, select **Register Producer**.

The Add Portlet Producer page displays.

4. Enter a **Connection Name**, set the **Producer Type** to `WSRP Producer`, and paste the WSDL endpoint URL that you copied in step 1 into the **URL End Point** field.
5. If required, configure WS-Security in WebCenter Portal as described in [Section 54.5.5, "Setting up WS-Security for PeopleTools."](#)
6. Click **OK** and verify that the producer connection was created successfully.
7. Continue by adding the portlet to a Spaces page as described in [Section 54.5.4.2, "Adding the PeopleSoft Portlet to a Spaces Page."](#)

### 54.5.4.2 Adding the PeopleSoft Portlet to a Spaces Page

Follow the steps below to add the PeopleSoft portlet to a Spaces page.

1. Log into Spaces.
2. Go to the page, or create a new page, where you want to add the PeopleSoft portal.
3. Click **Add Content** to open Composer.
4. From the Resource Catalog, select **Portlets**.

Note that if you've created a custom catalog, **Portlets** may not appear, in which case you will need to add it to the Resource Catalog. For information about

managing Resource Catalogs, see the chapter "Working with Resource Catalogs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

5. Click the portlet you added in Fusion Middleware Control.
6. Click **Add** for the PeopleSoft page you want to add to your Spaces page.
7. Click **Close** to close Composer.
8. On the Spaces page, click the **Edit** (pencil) icon.
9. Open the Display Options tab and set the **Render Portlet in IFrame** option to **True** and click **OK**.
10. Continue by checking the portlet connection as described in [Section 54.5.4.3, "Testing the Spaces Portlet Connection."](#)

#### 54.5.4.3 Testing the Spaces Portlet Connection

Use this procedure to test the Spaces portlet connection by modifying content and checking that the modification shows up in the PeopleSoft application.

1. On the Spaces page that you added the PeopleSoft portlet to, modify some information that you can verify the changes for in the PeopleSoft application.
2. Save your changes and confirm that the changes also appear in the PeopleSoft application.

### 54.5.5 Setting up WS-Security for PeopleTools

This section describes the supported OWSM policies for PeopleTools releases. It is important to note that PeopleTools release 8.5.1 (and earlier) does not support outgoing WS-Security headers in its messages. However, some out-of-the-box WebCenter Portal/OWSM policies require that both outgoing and incoming messages be secured. To bridge this gap you may need to create custom OWSM policies. The different integration scenarios that would require you to create custom WS-Security policies, and the steps required on the WebCenter Portal side to configure them are also described in this section.

Note that:

- For integration scenarios with PeopleTools 8.5.1 and older, you can use WSS10 SAML Token with Message Integrity, WSS10 SAML Token with Message Protection, or WSS10 Username Token with Password as OWSM the policy.
- For integration scenarios with PeopleTools 8.5.2, only WSS10 SAML Token with Message Integrity or Configuring WS-Security for WSS10 Username Token without Password should be used.

This section includes the following subsections:

- [Section 54.5.5.1, "Configuring WS-Security for WSS10 SAML Token with Message Integrity"](#)
- [Section 54.5.5.2, "Configuring WS-Security for WSS10 SAML Token with Message Protection"](#)
- [Section 54.5.5.3, "Configuring WS-Security for WSS10 Username Token with Password"](#)
- [Section 54.5.5.4, "Configuring WS-Security for WSS10 Username Token Without Password"](#)

### 54.5.5.1 Configuring WS-Security for WSS10 SAML Token with Message Integrity

(Peoplesoft policy: WSRPBaseService with SAMLToken Full Security Option (timestamp) )

This section describes how to configure WS-Security for the WSS10 SAML Token with Message Integrity (oracle/wss10\_saml\_token\_with\_message\_integrity\_client\_policy) policy.

To configure WS-Security:

1. Configure the WebCenter Portal/OWSM keystore as shown in the chapter "Configuring WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Generate a certificate containing the public key of the WebCenter Portal domain and send it to the PeopleTools administrator so it can be imported in the PeopleTools configuration.
3. When you register the producer, choose wss10\_saml\_token\_with\_message\_integrity\_client\_policy.
4. Continue by adding the WSRP portlet to a WebCenter Portal page.

### 54.5.5.2 Configuring WS-Security for WSS10 SAML Token with Message Protection

(Peoplesoft policy: WSRPBaseService with SAMLToken Full Security Option (timestamp) With WSS Response)

The default WSS10 SAML Token with Message Protection (oracle/wss10\_saml\_token\_with\_message\_protection\_client\_policy) policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.5.1 and earlier cannot send WS-Security headers in response (only the initial cookie/get portlet handle call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the oracle/wss10\_saml\_token\_with\_message\_protection\_client\_policy policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal domain (wc\_domain by default).
2. From the WebLogic Domain menu, select **Web Services > Policies**.
3. Select the wss10\_saml\_token\_with\_message\_protection\_client\_policy and click **Create Like**.
4. Give the policy a new name (for example, oracle/wss10\_saml\_token\_with\_message\_protection\_plaintext\_response\_client\_policy).
5. Open the Response tab, uncheck the **Include Entire Body** checkboxes under Message Signing Setting and Message Encrypt Setting , and save the policy.
6. Check that the public certificate of the PeopleSoft keystore is imported into the keystore used in the WebCenter domain.
7. Use WLST to register the producer using the newly created policy as shown in the following example:

```
registerWSRPProducer('webcenter', 'wc-pt851-saml_msg-protection',
'http://xmlns.oracle.com/pspc/pswsl/ps/EMPLOYEE', timeout=100,
tokenType='oracle/wss10_saml_token_with_message_protection_plaintext_response_client_policy',
enforcePolicyURI='false', issuer='www.oracle.com',
```

```
sigKeyAlias='webcenter',sigKeyPswd='welcome1', encKeyAlias='webcenter',
encKeyPswd='welcome1', recptAlias='peopleTools_public')
```

Use the alias for the imported `peoplesft` public key as the value for the `recptAlias` parameter.

---

---

**Note:** You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in `enforcePolicyURI='false'`.

---

---

### 54.5.5.3 Configuring WS-Security for WSS10 Username Token with Password

(Peoplesoft policy: `WSRPBaseService` with `UsernameToken Full Security Option With WSS Response`)

The default `WSS10 Username Token with Password (oracle/wss10_username_token_with_message_protection_client_policy)` policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.5.1 and earlier cannot send WS-Security headers in response (only the initial `cookie/get portlet handle` call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the `oracle/wss10_username_token_with_message_protection_client_policy` policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal domain (`wc_domain` by default).
2. From the WebLogic Domain menu, select **Web Services > Policies**.
3. Select the `wss10_username_token_with_message_protection_client_policy` and click **Create Like**.
4. Give the policy a new name (for example, `oracle/wss10_username_token_with_message_protection_plaintext_response_client_policy`).
5. Open the Response tab, uncheck the **Include Entire Body** checkboxes under Message Signing Setting and Message Encrypt Setting, and save the policy.
6. Check that the public certificate of the PeopleSoft keystore is imported into the keystore used in the WebCenter domain.
7. Use WLST to register the producer using the newly created policy as shown in the following example:

```
registerWSRPProducer('webcenter', 'wc-pt851-saml_msg-protection',
'http://xmlns.oracle.com/pspc/pswsdl/ps/EMPLOYEE', timeout=100,
tokenType='oracle/wss10_saml_token_with_message_protection_plaintext_response_client_policy',
enforcePolicyURI='false', issuer='www.oracle.com',
sigKeyAlias='webcenter',sigKeyPswd='welcome1', encKeyAlias='webcenter',
encKeyPswd='welcome1', recptAlias='peopleTools_public')
```

Use the alias for the imported `peoplesft` public key as the value for the `recptAlias` parameter.

---

---

**Note:** You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in `enforcePolicyURI='false'`.

---

---

#### 54.5.5.4 Configuring WS-Security for WSS10 Username Token Without Password

(PeopleSoft policy: `WSRPBaseService` with UsernameToken, No Password Full Security Option With WSS Response)

This section describes how to configure WS-Security for the WSS10 Username Token without Password (`oracle/wss10_username_id_propagation_with_msg_protection_client_policy`) policy for PeopleTools release 8.5.2:

1. Configure the WebCenter Portal/OWSM keystore as described in the chapter on "Configuring WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Generate a certificate containing the public key of the WebCenter Portal domain and send it to the PeopleTools administrator so it can be imported in the PeopleTools configuration.
3. Check that the public certificate of the PeopleSoft keystore is imported into the keystore used in the WebCenter domain. Use the alias for the imported `peoplesft` public key as the value for the `recptAlias` parameter when you register the PeopleSoft WSRP producer.
4. When you register the producer, choose `wss10_username_id_propagation_with_msg_protection_client_policy`.
5. Continue by adding the WSRP portlet to a WebCenter Portal page.

## 54.6 Integrating Oracle Business Intelligence Presentation Services

This section explains how to use JDeveloper to create and configure a WebCenter Portal application that integrates with the Oracle Business Intelligence Presentation Services catalog. At runtime, users can add business intelligence objects to their Framework application or Spaces pages.

This section includes the following subsections:

- [Section 54.6.1, "Introduction to Integrating Oracle Business Intelligence Presentation Services"](#)
- [Section 54.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog"](#)
- [Section 54.6.3, "Integrating Oracle Business Intelligence Presentation Services in Framework Applications"](#)
- [Section 54.6.4, "Integrating Oracle Business Intelligence Objects in WebCenter Portal: Spaces"](#)

### 54.6.1 Introduction to Integrating Oracle Business Intelligence Presentation Services

This section explains how you use JDeveloper to create a Framework application, or configure Spaces to integrate with the Oracle Business Intelligence Presentation Services catalog. For more information about adding Oracle Business Intelligence objects to Framework applications, see "Embedding Business Intelligence Objects in

ADF Applications" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

This section includes the following subsections:

- [Section 54.6.1.1, "Understanding Oracle Business Intelligence Presentation Services Integration"](#)
- [Section 54.6.1.2, "Requirements for Integrating Oracle Business Intelligence Presentation Services"](#)

### 54.6.1.1 Understanding Oracle Business Intelligence Presentation Services Integration

You can use JDeveloper to create Framework applications that integrate with Oracle Business Intelligence Presentation Services. At runtime, these applications include the Presentation Services catalog in the WebCenter Portal - Resource catalog. Users can then browse for and add business intelligence analyses, dashboard pages, dashboards, or scorecard components (strategy maps, strategy trees, KPI watchlists, cause and effect maps, and custom views) to their Framework application pages. Any filters, prompts, and actions links included in the Business Intelligence objects will work within the Framework application or Spaces pages.

At runtime, WebCenter Portal users can expand and browse the Presentation Services catalog's folders to view an analysis' views. The following view types display in the Presentation Services catalog: table, pivot table, chart, funnel chart, gauge, narrative, ticker and title. The following view types do not display in the Presentation Services catalog: view selector, column selector, logical SQL, and no-results view.

Users can also browse the dashboard folder for the pages associated with the dashboard; however, users cannot browse within the dashboard pages to see their components (for example, any analyses embedded in the dashboard). Users cannot include entire Scorecards (only a Scorecard's components) in their Framework application pages.

### 54.6.1.2 Requirements for Integrating Oracle Business Intelligence Presentation Services

To create a Framework application that integrates with Oracle Business Intelligence Presentation Services, you must have installed Oracle JDeveloper 11g Release 1 (11.1.1.6) or later and the required Oracle BI EE and WebCenter Portal extensions.

To properly create the Framework application, you must configure the library settings, update the `weblogic.xml` and `weblogic-application.xml` files, and have properly configured security.

For both Framework applications and Spaces, you must also set up a connection to the BI application as well as configuring security as described in "Creating an Oracle BI EE Presentation Services Connection" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*. You will also need to specify the credentials for the connection, as described in [Section 54.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog."](#)

## 54.6.2 Configuring Credentials for Connecting to the Oracle BI Presentation Catalog

At design time, you need to specify credentials to connect to the Oracle BI Presentation Catalog. These credentials are used to retrieve the list of business intelligence objects (for example, analyses, dashboards, and scorecard components) from the Oracle BI Presentation Catalog.

This process ensures that the login to the Presentation Server is the same as the current user of the application and any access checks are performed as the current user, and data is fetched as the current user. If the ADF page contains business intelligence objects to which the user does not have access, the ADF page returns a message stating that the user does not have the proper permissions to access these objects.

Note that the **Perform impersonation** parameter should be set to `true` when security is enabled.

This section contains the following subsections:

- [Section 54.6.2.1, "Creating the BIImpersonateUser"](#)
- [Section 54.6.2.2, "Granting Permissions to BIImpersonateUser"](#)

### 54.6.2.1 Creating the BIImpersonateUser

Use the following procedures to create a BIImpersonateUser user to secure an application that uses an Oracle BI EE Presentation Services connection and includes Oracle BI EE objects. ADF security must be enabled for your application before you can apply the impersonate user credentials to the Oracle BI EE Presentation Services connection.

The Impersonate User feature secures applications that contain Oracle BI EE objects when Oracle BI EE and ADF are not sharing an Oracle Internet Directory (OID). Before you begin the process of creating and using Impersonate User, you must confirm that this capability is configured in your environment.

Before you perform this procedure, make sure that either you or the Administrator have created users in the WebLogic Server's Oracle BI EE realm and assigned the BICConsumer role to each user in this realm. For more information, see "How to Create and Use Impersonate User" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

Follow the steps below to create the BIImpersonateUser user:

1. Open WebLogic Server for your Oracle BI EE instance.
2. Locate the Domain Structure pane and select Security Realm.  
The Realms pane displays.
3. In the Realms pane, select **<myrealm>**.  
The Settings dialog displays.
4. In the Settings dialog, open the Users and Groups tab.
5. Confirm that the Users tab is displaying and click **New**.
6. Enter BIImpersonateUser for the user name and enter a password.
7. Click **OK**.

### 54.6.2.2 Granting Permissions to BIImpersonateUser

Follow the steps below to use Fusion Middleware Control to grant permissions to BIImpersonateUser:

1. Open Fusion Middleware Control for your Oracle BI EE instance.
2. Locate and select `bifoundation_domain`.  
The `bifoundation_domain` pane displays.

3. In the `bifoundation_domain` pane, click the **WebLogic Domain** list, highlight `Security`, and select **Application Policies**.  
The Search pane displays.
4. In the **Select Application Name to Search** field's list, select `obi`.
5. Click **Create**.  
The Add Permission dialog displays.
6. In the **Permission Class** field, select `oracle.security.jps.ResourcePermission`. In the Resource Name field, select `oracle.bi.server.impersonateUser`.
7. Click **OK**.
8. In the Grantees pane, click **Add User**.  
The Add User dialog displays.
9. In the Available Users list, select `BIImpersonateUser` and click **Move** to move it to the Selected Users list.
10. Click **OK**.
11. In the `bifoundation_domain` pane, click **OK**.
12. If the changes that you made do not display, stop and restart the following servers:
  - Oracle BI EE Server
  - Oracle BI EE Presentation Server
  - WebLogic Server

### 54.6.3 Integrating Oracle Business Intelligence Presentation Services in Framework Applications

This section describes how to install the required BI extensions, and create or modify a Framework application that integrates with Oracle Business Intelligence Presentation Services.

This section includes the following subsections:

- [Section 54.6.3.1, "Installing the Required Business Intelligence Extensions"](#)
- [Section 54.6.3.2, "Creating a Framework Application that Integrates with Oracle BI Presentation Services"](#)
- [Section 54.6.3.3, "Testing the Framework Application"](#)
- [Section 54.6.3.4, "Post-Deployment Connection Configuration"](#)
- [Section 54.6.3.5, "Securing Oracle BI EE Objects Included in a Framework Application"](#)

#### 54.6.3.1 Installing the Required Business Intelligence Extensions

Use this procedure to install the required Business Intelligence extensions:

1. From the JDeveloper Help menu, select **Check for Updates**.
2. Follow the steps in the wizard to locate, download, and install the Oracle BI EE extensions. Be sure to install the bundles in the following order:
  - `bi-soap-cn_bundle`

- `bi-vo_bundle`
  - `bi-adf_bundle`
  - `bi-adf-taskflow-extension_bundle`
3. Also use the wizard to download and install the Oracle Webcenter Framework Extension bundle (`oracle.webcenter.framework_bundle.zip`).

### 54.6.3.2 Creating a Framework Application that Integrates with Oracle BI Presentation Services

Use the following procedures to create or modify a Framework application that can access the Oracle Business Intelligence Presentation Services catalog at runtime. Before following these steps you should already have created the `BIImpersonateUser`, as described in [Section 54.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog."](#)

This section includes the following subsections:

- [Section 54.6.3.2.1, "Creating the Framework Application and JSF Page"](#)
- [Section 54.6.3.2.2, "Configuring the Application to Display the Oracle BI EE Presentation Catalog"](#)
- [Section 54.6.3.2.3, "Enabling the BI ADF Task Flow Permission"](#)

#### 54.6.3.2.1 Creating the Framework Application and JSF Page

Use the following procedure to create a Framework application and add a JSF page.

To create a Framework application and JSF page:

1. In Oracle JDeveloper, create a new `WebCenter Portal - Framework application` (be sure to check the checkbox for **Configure the Application with Standard Portal Features**).

The user name/password in this case should be `BIImpersonateUser/<password>`, where `<password>` is the password that you set when you created the user.

2. Create a connection to the BI application as described in the section "How to Configure SSL and Create an Oracle BI EE Presentation Services Connection" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

When you create the connection, be sure to set **Perform impersonation when security is enabled** the to `true` and change the username and password to the Impersonate User credentials (`BIImpersonateUser/<password>`) as described above.

3. In the Navigation panel, right-click on the Portal project and select **New**.  
The New Gallery dialog displays.
4. In the **Categories** field's tree structure, locate and expand the Web Tier.  
A list with the descriptions of the available options display in the **Items** field.
5. From this list, select **JSF Page** and click **OK**.  
The Create JSF Page dialog displays.
6. Create the JSF page, making sure that the `Create an XML Document (*.jspx)` field is selected. For more information about setting up the JSF page, click the Help button to access the online help.

7. Click **OK**.

The newly created JSPX page displays.

8. In the Component Palette pane, select **Composer**.

The field updates to display the corresponding components, layouts, and operations.

9. From the Common Components category, select **Change Mode Link** and drag and drop it onto your page.10. From the Common Components category, select **Page Customizable**.

## 11. Save the application.

12. Right-click the page in Design view and choose **Edit Authorization**.13. Navigate to **Granted to > Select authenticated-users** and under **Actions** grant authenticated users *Customize, Grant, Personalize, and View* privileges.

#### 54.6.3.2.2 Configuring the Application to Display the Oracle BI EE Presentation Catalog

Use this procedure to add the Presentation Catalog to the Framework application's folder list. At runtime, the catalog displays in the WebCenter Portal - Resource Catalog where the users can browse to business intelligence objects and add them to their Framework application page.

To display the Presentation Catalog in the Framework application's folder list:

1. In the Framework application that you created with Oracle JDeveloper, from the Application menu, right-click **Portal Project** and select **Project Properties**.

The Project Properties dialog displays.

2. In the available properties pane, select **Technology Scope** and from the Available field, select **Business Intelligence ADF View Components**, and click the **Add (>)** icon to add it to the project's technology scope. Note that you can also add the BI technology libraries when you create a new application.3. In the available properties pane, select **Libraries and Classpath**, and click **Add Library**.

The Add Library dialog displays.

4. Add the following libraries to the project, and click **OK**.

- BI ADF Runtime
- BI ADF Taskflow
- BI SOAP Connection Runtime
- BI View Object Runtime

## 5. Save the application.

6. In JDeveloper, open the default resource catalog file (`default-catalog.xml`) located in **Portal > Web Content > Oracle > webcenter > portalapp > catalogs**.7. Add the following `<customFolder>` entry under the `<catalogDefinition>` - `><contents>` folder:

```
<customFolder id="oracleBIContent"
  name="Oracle BI"
  description="Oracle BI Presentation Services Content"
  factoryClass="oracle.bi.presentation.rescat.
    BICatalogInitialContextFactory"/>
```

8. Edit `Weblogic.xml` and add references to `oracle.bi.adf.view.slib` and `oracle.bi.adf.webcenter.slib` as shown below:

```
<library-ref>
  <library-name>oracle.bi.adf.view.slib</library-name>
</library-ref>
<library-ref>
  <library-name>oracle.bi.adf.webcenter.slib</library-name>
</library-ref>
</weblogic-web-app>
```

9. Edit `weblogic-application.xml` and add a reference to `oracle.bi.adf.model.slib` as shown below:

```
  <library-ref>
    <library-name>oracle.bi.adf.model.slib</library-name>
  </library-ref>
</weblogic-application>
```

### 54.6.3.2.3 Enabling the BI ADF Task Flow Permission

Use the following procedure to enable the BI ADF task flow permissions in your application's security settings.

To enable the BI ADF task flow permissions:

1. Open the `jazn-data.xml` file from **Application Resources Pane > META-INF > jazn-data.xml**.
2. Locate the following code in the file:

```
<grantee>
  <principals>
    <principal>
      <class>
        oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl
      </class>
      <name>anonymous-role</name>
    </principal>
  </principals>
</grantee>
```

3. Add the following element:

```
<permission>
  <class>oracle.adf.controller.security.TaskFlowPermission</class>
  <name>/WEB-INF/oracle/bi/presentation/taskflow/
    task-flow-definition.xml#task-flow-definition</name>
  <actions>customize,personalize,view</actions>
</permission>
```

For example:

```
<grant>
  <grantee>
    <principals>
      <principal>
        <class>oracle.security.jps.internal.core.principals
          .JpsAnonymousRoleImpl</class>
        <name>anonymous-role</name>
      </principal>
    </principals>
```

```

    </grantee>
  <permissions>
    <permission>
      <class>oracle.adf.controller.security.TaskFlowPermission</class>
      <name>/WEB-INF/oracle/bi/presentation/taskflow/
        task-flow-definition.xml#task-flow-definition</name>
      <actions>customize,personalize,view</actions>
    </permission>
  </permissions>

```

### 54.6.3.3 Testing the Framework Application

This section describes how to test the Framework application by performing the following procedures:

- Adding Oracle BI Presentation Services catalog content and modifying a report or dashboard's prompt values
- Confirming and modifying a business intelligence object's initialization parameters.

This section includes the following subsections:

- [Section 54.6.3.3.1, "Adding Oracle BI Objects to the Resource Catalog"](#)
- [Section 54.6.3.3.2, "Adding Business Intelligence Content at Runtime"](#)
- [Section 54.6.3.3.3, "Modifying a Business Intelligence Object's Prompt Values"](#)
- [Section 54.6.3.3.4, "Modifying a Business Intelligence Task Flow's Initialization Parameters"](#)

#### 54.6.3.3.1 Adding Oracle BI Objects to the Resource Catalog

Before you can add Oracle BI content to a Framework application page, you must add objects stored in the Oracle BI Presentation Catalog to the WebCenter Portal - Resource Catalog.

1. Run the application in a browser.
2. Log into the Framework application as an administrator.
3. Click **Administration**.

The WebCenter Portal Administration Console displays.

4. Open the **Resources** tab.
5. Click **Resources Catalogs**.
6. Click **Create a Resource Catalog**.
7. In the **Name** field, enter the name of the catalog you are creating. Complete the other fields on this dialog, as necessary.
8. Click **Edit > Show** for the resource catalog.
9. Click the **Edit** menu and then choose **Edit**.
10. From the **Add** menu, choose **Add From Library...**
11. Double-click **Connections**.

The BI Presentation Services folder displays in the right frame. Open this folder to display the Oracle BI objects.

12. Browse to and select the objects that you want to add.
13. Click **Add** to add the selected objects to the catalog.

14. Open the Configuration tab and select the resource catalog you just created as the **Default Resource Catalog**.

#### 54.6.3.3.2 Adding Business Intelligence Content at Runtime

Use this procedure to test the Framework application by adding business intelligence content to the Framework application.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Click **Add Content**.  
The WebCenter Portal - Resource Catalog displays.
4. Browse to and open the Oracle BI folder.
5. Click the BI connection or host machine to which you want to connect.  
The contents of the catalog display.
6. Browse to and click the **Add** link for the object that you want to add to the `.jspx` page.
7. Confirm that the application correctly added the object.

#### 54.6.3.3.3 Modifying a Business Intelligence Object's Prompt Values

Use this procedure to test the Framework application by changing an analysis or dashboard's filter or prompt values.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Add an analysis or dashboard that contains a filter or prompt.  
For more information about adding business intelligence content to the `.jspx` page, see [Section 54.6.3.3.2, "Adding Business Intelligence Content at Runtime."](#)
4. Click **Parameters**.  
The Editing Page dialog displays.
5. Modify the values and click **Save**.
6. Confirm that the application correctly applied the modified prompt values.

#### 54.6.3.3.4 Modifying a Business Intelligence Task Flow's Initialization Parameters

Use the following procedure to test the business intelligence task flow's initialization parameters.

1. Run the `.jspx` page that you created.
2. In the running page, click the **Edit** link to enter the edit mode.
3. Add a business intelligence object.  
For more information about adding business intelligence content to the `.jspx` page, see [Section 54.6.3.3.2, "Adding Business Intelligence Content at Runtime."](#)
4. Locate the business intelligence object and click the **Edit** (wrench) icon.  
The Component Properties dialog displays.
5. Open the Parameters tab, modify the object's parameters, and click **OK**.

6. Confirm that the application correctly applied the modified prompt values.

#### 54.6.3.4 Post-Deployment Connection Configuration

After an application has been deployed, use Fusion Middleware Control to add a new Oracle BI EE Presentation Services connection to the application, or modify the application's existing Oracle BI EE Presentation Services connection with the user name and password for BIImpersonateUser.

For more information about modifying these connections, see "Adding or Modifying a Presentation Services Connection After Deployment" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

---

**Note:** If the Framework application and the Oracle Business Intelligence application do not share the same identity store, you must create the relevant users in both system.

---

#### 54.6.3.5 Securing Oracle BI EE Objects Included in a Framework Application

Impersonate User lets you secure a Framework application that integrates with Oracle BI EE Presentation Services. For more information about Impersonate User and how to implement it to secure your application, see "How to Create and Use Impersonate User" in the *Oracle Fusion Middleware Developer's Guide for Oracle Business Intelligence Enterprise Edition*.

### 54.6.4 Integrating Oracle Business Intelligence Objects in WebCenter Portal: Spaces

Use the following procedures to test the WebCenter Portal: Spaces integration with the BI objects.

- [Section 54.6.4.1, "Adding or Modifying a Presentation Services Connection After Deployment"](#)
- [Section 54.6.4.2, "Adding Oracle BI Objects to the Spaces Resource Catalog"](#)
- [Section 54.6.4.3, "Adding Oracle BI Content at Runtime"](#)
- [Section 54.6.4.4, "Modifying a Business Intelligence Object's Prompt Values"](#)
- [Section 54.6.4.5, "Modifying a Business Intelligence Task Flow's Initialization Parameters"](#)

#### 54.6.4.1 Adding or Modifying a Presentation Services Connection After Deployment

Before you can begin integrating BI objects in Spaces, you must first configure a connection from Spaces to the BI server. Oracle BI EE provides an ADF MBean that allows you to add a new connection to a deployed BI ADF or WebCenter Portal: Spaces application. You can also modify a deployed application's existing connection. MBeans are deployed with the application and can be accessed post-deployment using Fusion Middleware Control.

Prior to following the steps below, you should already have followed the steps in [Section 54.6.2, "Configuring Credentials for Connecting to the Oracle BI Presentation Catalog"](#) to specify credentials to connect to the Oracle BI Presentation Catalog.

---

---

**Note:** If the Spaces application and the Oracle Business Intelligence application do not share the same identity store, you must create the relevant users in both system.

---

---

Follow the steps below to configure the connection after the application was deployed.

1. Open Fusion Middleware Control and select your WebLogic domain by doing one of the following:
  - If your application is deployed in the BI ADF domain, select the **Application Deployments <your domain>** tree node.
  - If your application is deployed in the Spaces domain, select the **WebCenter** tree node, and then the **Spaces** tree node, and then the **webcenter(11.1.1.4.0) (WC\_Spaces)** tree node. Note that the WC\_Spaces server must be running in order to perform this step.
2. From the list, select **System MBean Browser**.

The System MBean Browser pane displays.
3. In the System MBean Browser pane, navigate to the ADF Connections tree node by following the below path:
  - a. Select the **Application Defined MBeans** tree node.
  - b. Select the **oracle.adf.share.connections** tree node.
  - c. Select the **Server: <my server name>** tree node.

For example, `Server:DefaultServer` or `Server:WC_Spaces`.
  - d. Select the **Application:<your application's name>** tree node.

For example, `Application:Application2` or `Application:webcenter`.
  - e. Open the ADF Connections tree node.
  - f. Open the child ADF Connections tree node.

The corresponding MBean information displays in the Application Defined MBean pane.
4. In the Application Defined MBean pane, open the Operations tab and then click **createConnection/findOrCreateConnection** to create a Presentation Services connection.

The Operation:createConnection dialog displays.
5. Specify the required values for the connection.

In the connection type **Value** field, enter `BISoapConnection`, enter a name in the connection name **Value** field and click **Invoke** to create the connection.
6. In the System MBean Browser pane, click **Refresh** to refresh the tree so that the new connection displays.
7. To modify the connection, locate it in the System MBean Browser pane and click it.

The connection's information displays in the Application Defined MBean pane.
8. Navigate to ADF Connections from the System MBean Browser pane and open the Attributes tab.
9. Enter the BISoap connection information as shown below, and then click **Apply** to apply your changes.

- From the OBIEE URL to the login page you need:

```
context = analytics
host = <host name>
port = 7001 or the local value
protocol = HTTP
```

- From BIImpersonateUser you need:

```
username = BIImpersonateUser
password = <password>
```

10. Click on the ADFConnections folder in the Navigation pane, open the Operations tab, and then click **Save** to save the connection.
11. When you click **Invoke**, you should get the following message "Confirmation Operation executed successfully."

#### 54.6.4.2 Adding Oracle BI Objects to the Spaces Resource Catalog

Before you can add Oracle BI content to a Spaces page, you must add objects stored in the Oracle BI Presentation Catalog to the Spaces Resource Catalog.

1. Log into Spaces as an administrator.
2. In Spaces, click **Administration**.  
The Spaces Administration pages displays.
3. Open the **Resources** tab.
4. Click **Resources Catalogs**.
5. Click **Create a Resource Catalog**.
6. In the **Name** field, enter the name of the catalog you are creating. Complete the other fields on this dialog, as necessary.
7. Make the Resource Catalog available by choosing **Edit > Show**.
8. From the **Edit** menu, choose **Edit**.
9. Select the **Add** menu and then choose **Add From Library.....**
10. Double-click **Connections**.

The BI Presentation Services folder displays.

11. Open this folder to display the Oracle BI objects and browse to and select the objects that you want to add.
12. Click **Add** to add the selected objects to the catalog.

Continue by adding the object to a space or Framework application. For more information about managing **Resource Catalogs** at runtime, see "Working with Resource Catalogs" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*. For information about managing Resource Catalogs in JDeveloper, see [Chapter 15, "Creating and Managing Resource Catalogs."](#)

#### 54.6.4.3 Adding Oracle BI Content at Runtime

Use this procedure to create a WebCenter Portal: Spaces page and add Oracle BI objects to it. Before you perform this procedure, you must have added Oracle BI objects to the WebCenter Portal: Spaces resource catalog.

1. Log into Spaces and create a new space or access an existing space.

2. Make the Resource Catalog the default catalog for the space.
  - a. Navigate to **Space Settings > General** and select the catalog created in [Section 54.6.4.2, "Adding Oracle BI Objects to the Spaces Resource Catalog"](#) as the default catalog for **Resource Catalog for Pages**.
  - b. Click **Apply**.
  - c. Click **Back to Space**.
3. Create a new page.
4. In the page, click **Add Content**.
5. Browse to the folder containing the Oracle BI objects.
6. Select an analysis or dashboard and click **Add**.

The object that you selected is added to the page.
7. Click **Close** to exit the Add Content dialog.

#### 54.6.4.4 Modifying a Business Intelligence Object's Prompt Values

Use this procedure to test the WebCenter Portal: Spaces page by changing an analysis or dashboard's filter or prompt values.

1. Open the page that you created.
2. In the running page, click **Page Actions** and then click the **Edit** link to enter edit mode.
3. Add an analysis or dashboard that contains a filter or prompt. For more information about adding Oracle BI objects to the page, see [Section 54.6.4.3, "Adding Oracle BI Content at Runtime."](#)
4. Without exiting the edit mode of the page, save the Spaces page.
5. In the Spaces page, modify the prompt values and click **OK**.
6. Exit edit mode, save the page and confirm that the application correctly applied the prompt values.

#### 54.6.4.5 Modifying a Business Intelligence Task Flow's Initialization Parameters

Use the following procedure to test the business intelligence task flow's initialization parameters.

1. Open the page that you created.
2. In the running page, click **Page Actions** and then click the **Edit** link to enter the edit mode.
3. Add an analysis or dashboard that is part of a task flow. For more information about adding business intelligence content to the `.jspx` page, see [Section 54.6.4.3, "Adding Oracle BI Content at Runtime."](#)
4. Without exiting the edit mode for the page, save the Spaces page.
5. Locate the business intelligence object and click the **Edit** (wrench) icon.

The Component Properties dialog displays.
6. On the Spaces page, open the **Parameters** tab and modify the object's parameters and click **OK**.
7. Open the Parameters tab, modify the object's parameters, and click **OK**.

8. Exit edit mode, save the page and confirm that the application correctly applied the modified parameter values.

---

## Extending the Spaces Application Using JDeveloper

WebCenter Portal's Spaces application can be customized using browser-based tools and also using JDeveloper. This chapter describes how to customize the Spaces application and Spaces resources in JDeveloper and subsequently utilize them in the Spaces application. For example, you may want to deploy additional shared libraries that include custom code or some additional task flows. Or, you might want to edit Spaces resources, such as skins, page templates, and navigations, in JDeveloper.

It includes the following sections:

- [Section 55.1, "Downloading a Workspace for Spaces Development"](#)
- [Section 55.2, "Including Additional Shared Libraries in Spaces"](#)
- [Section 55.3, "Developing Resources for the Spaces Application"](#)

### Audience

This section is intended for developers who have basic knowledge of JDeveloper with WebCenter Portal: Framework extensions and want to perform advanced customizations for their Spaces deployment.

## 55.1 Downloading a Workspace for Spaces Development

A JDeveloper workspace for developing Spaces extensions is available as a download from Oracle Technology Network - this workspace is named **DesignWebCenterSpaces.jws**.

To download the Spaces development workspace:

1. Ensure the Spaces application is installed, configured, and working as expected.
2. Download and install Oracle JDeveloper 11g (11.1.1.6.0).

Oracle JDeveloper 11g (11.1.1.6.0) is available for download from:

<http://www.oracle.com/technetwork/developer-tools/jdev/downloads/jdeveloper11116-1377208.html>.

3. Download and install Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions:
  - a. In JDeveloper, select **Help > Check for Updates**.
  - b. Click **Next**, and then **Next** again to display all available updates.
  - c. Use the search field to filter the list, for example, enter 'webcenter'.

**Figure 55–1 Download Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions**

d. Select **WebCenter Framework and Services Design Time**.

e. Click **Finish**.

See also, [Section 3.2, "Installing WebCenter Portal's Extension for Oracle JDeveloper."](#)

- Download the Spaces development ZIP file (DesignWebCenterSpaces\_PS6.zip) from Oracle Technology Network:

[http://download.oracle.com/otndocs/tech/webcenter/files/DesignWebCenterSpaces\\_PS6.zip](http://download.oracle.com/otndocs/tech/webcenter/files/DesignWebCenterSpaces_PS6.zip)

- Unzip the content locally ([Table 55–1](#)).

**Table 55–1 DesignWebCenterSpaces\_PS6.zip - Unzip Folders**

Unzip Folders	Description
\DesignWebCenterSpaces	Includes DesignWebCenterSpaces.jws.  This workspace enables you to configure your shared library list, that is, you can specify one or more shared libraries containing various customizations (such as custom java code, custom task flows, and so on) that you want to utilize in the Spaces application.  The workspace also provides a design environment for editing and uploading Spaces resources.
\copy_to_common	Includes a common directory that contains WebCenter Portal WLST commands.  WebCenter Portal's WLST commands are required to upload customized resources directly to the Spaces application from DesignWebCenterSpaces.jws.

**Table 55–1 (Cont.) DesignWebCenterSpaces\_PS6.zip - Unzip Folders**

Unzip Folders	Description
\copy_to_jdev_ext	Includes oracle.webcenter.portal.jar. Required update to Oracle JDeveloper WebCenter Portal Framework and Services Design Time Extensions.

6. Copy WebCenter Portal's WLST (WebLogic Scripting Tool) commands to the Oracle home directory where JDeveloper is installed:
  - a. Navigate to: <DesignWebCenterSpaces\_Unzip\_Location>\copy\_to\_common
  - b. Make a copy of the common directory.  
The common directory is located under <DesignWebCenterSpaces\_Unzip\_Location>\copy\_to\_common.
  - c. Navigate to: <JDeveloper\_install\_directory>\oracle\_common  
**Tip:** The JDeveloper\_install\_directory is the base directory under which JDeveloper is also installed, that is, the same directory that you configure as the jdeveloper.install.home.directory in config.properties (see also [Table 55–2](#)).
  - d. Copy the content of the common directory here.  
**Tip:** On Linux, use the following command: `cp -r <DesignWebCenterSpaces_Unzip_location>/copy_to_common/common/.`
7. Copy new version of oracle.webcenter.portal.jar to the Oracle JDeveloper extensions directory:
  - a. Navigate to: <DesignWebCenterSpaces\_Unzip\_Location>\copy\_to\_jdev\_ext
  - b. Make a copy of oracle.webcenter.portal.jar.  
The oracle.webcenter.portal.jar file is located under <DesignWebCenterSpaces\_Unzip\_Location>\copy\_to\_jdev\_ext.
  - c. Navigate to: <JDeveloper\_install\_directory>\jdeveloper\jdev\extensions\  
**Tip:** The JDeveloper\_install\_directory is the base directory under which JDeveloper is also installed, that is, the same directory that you configure as the jdeveloper.install.home.directory in config.properties (see also [Table 55–2](#)).
  - d. Copy the oracle.webcenter.portal.jar file here.
8. Restart JDeveloper if it is open.

## 55.2 Including Additional Shared Libraries in Spaces

This section includes the following subsections:

- [Section 55.2.1, "What You Should Know About Shared Library Deployment for Spaces"](#)
- [Section 55.2.2, "Deploying Your Own Custom Code and Task Flows in Shared Libraries"](#)
- [Section 55.2.3, "Rebuilding the Spaces Shared Library List"](#)

## 55.2.1 What You Should Know About Shared Library Deployment for Spaces

The Spaces application includes the standard shared library `extend.spaces.webapp.war`. This .WAR file includes a deployment descriptor (`weblogic.xml`) which can reference other libraries that contain Spaces customizations.

Therefore, if you have custom code or task flows deployed in several shared libraries from multiple sources you can add them to the `extend.spaces.webapp` shared library list, as illustrated in [Figure 55–2](#).

**Figure 55–2 Referencing Custom Shared Libraries in `extend.spaces.webapp.war`**

This development model provides an easy way to utilize additional shared libraries in Spaces from multiple contributors, including developers, customers, partners.

Whenever you deploy a new shared library that includes Spaces extensions you must modify the Spaces shared library dependency list and redeploy `extend.spaces.webapp.war`. [Figure 55–3](#) illustrates the process.

**Figure 55–3 Overview - Including Additional Shared Libraries in Spaces**

For more detail, see [Section 55.2.2, "Deploying Your Own Custom Code and Task Flows in Shared Libraries"](#) and [Section 55.2.3, "Rebuilding the Spaces Shared Library List"](#).

## 55.2.2 Deploying Your Own Custom Code and Task Flows in Shared Libraries

Developers can build extensions for the Spaces application, package them in ADF Library JARs, and then deploy them as shared libraries for use in Spaces. For example, you can:

- Develop custom code in JDeveloper and make it available in the Spaces application.
- Develop custom task flows in JDeveloper and make them available to the Spaces application

To help you get started, Oracle provides a sample workspace in which you can develop extensions, and build and deploy Spaces shared libraries that contain your custom code.

---

**Note:** "Shared libraries can include other shared libraries. For details on this approach, see "Assembling Shared Java EE Library Files" in *Oracle Fusion Middleware Developing Applications for Oracle WebLogic Server*.

---

The sample workspace, `SampleWebCenterSpacesExtension.jws`, contains sample extensions and scripts that enable you to deploy custom code for Spaces. For more information, download the accompanying whitepaper, *Using Spaces Extension*

*Samples (11.1.1.6.0)*, from Oracle Technology Network at <http://www.oracle.com/technetwork/index.htm>.

## 55.2.3 Rebuilding the Spaces Shared Library List

Whenever you deploy a new shared library that includes Spaces extensions you must update the Spaces shared library dependency list and redeploy `extend.spaces.webapp.war`.

This section describes:

- [Editing the Shared Library List](#)
- [Setting Build and Deployment Options \(config.properties\)](#)
- [Building and Deploying the Shared Library List \(extend.spaces.webapp.war\)](#)
- [Troubleshooting Shared Library Deployment](#)
- [Reverting to a Previous Shared Library List](#)

### 55.2.3.1 Editing the Shared Library List

Use the `WebCenterSpacesExtensionLibrary` project to build and deploy `extend.spaces.webapp.war`—a shared library containing `weblogic.xml` in which you configure the Spaces shared library dependency list.

1. Download and unzip the Spaces development workspace.  
See [Section 55.1, "Downloading a Workspace for Spaces Development"](#).
2. Navigate to the unzip directory, and open `DesignWebCenterSpaces\DesignWebCenterSpaces.jws` in JDeveloper ([Figure 55-4](#)).

**Figure 55-4** Projects in the `DesignWebCenterSpaces` Workspace

3. Expand the `WebCenterSpacesExtensionLibrary` project.
4. Navigate to `weblogic.xml`, under `Resources\WebCenterSpacesExtensionLibrary\public_html\WEB-INF` ([Figure 55-5](#)).

Out-of-the-box, this file is blank, that is, no additional shared libraries are listed in the file.

**Figure 55–5 WebCenterSpacesExtensionLibrary - Out-of-the-box weblogic.xml**

5. Add a `<library-ref>` entry for each shared library that you want to use in Spaces.

For example, you can include a single library entry, as shown in [Figure 55–6](#):

```
<library-ref>
  <library-name>com.mycompanyname.shared.lib.1</library-name>
</library-ref>
```

**Figure 55–6 weblogic.xml - Single Shared Library Reference**

Or, reference multiple shared libraries, as shown in [Figure 55–7](#):

```
<library-ref>
  <library-name>com.mycompanyname.shared.lib.1</library-name>
</library-ref>
<library-ref>
  <library-name>com.mycompanyname.shared.lib.2</library-name>
</library-ref>
<library-ref>
  <!--reference to the shared library (custom.wecenter.spaces.war) that
    includes customizations from WebCenter 11gR1 11.1.1.3.0 or earlier-->
  <library-name>custom.webcenter.spaces</library-name>
</library-ref>
```

**Figure 55–7 weblogic.xml - Multiple Shared Library References**

**Note:** If you want to use custom extensions developed for a previous WebCenter Spaces release (11.1.1.3.0 or earlier), include the name of the old shared library, **custom.webcenter.spaces**, in `weblogic.xml`, as shown in [Figure 55-7](#).

6. Ensure each shared library that you reference is deployed on the Spaces managed server.

The next section describes how to set build and deployment options for the shared library list (`extend.spaces.webapp.war`).

### 55.2.3.2 Setting Build and Deployment Options (config.properties)

Before you can build the shared library list and deploy `extend.spaces.webapp.war` to the Spaces managed server, you must provide some information about your environment and your WebCenter Portal installation in the configuration file `config.properties`.

To set build and deployment properties for the `extend.spaces.webapp` shared library:

1. Open **DesignWebCenterSpaces.jws**.  
See also, [Section 55.1, "Downloading a Workspace for Spaces Development"](#)
2. Expand the **WebCenterSpacesExtensionLibrary** project.
3. Open **config.properties**.
4. Enter information about your JDeveloper environment and WebCenter Portal installation, as shown in [Table 55-2](#).

The `config.properties` file describes each property and offers examples. The defaults provided are only samples and must be replaced with your own, installation-specific values.

**Table 55-2 Configuring config.properties to Enable Deployment to the Managed Server**

Configuration Property	Description
<code>jdeveloper.install.home.directory</code>	Base directory where JDeveloper is installed. The directory you specify contains other folders such as <code>jdeveloper</code> , <code>wlserver_10.3</code> , <code>modules</code> , and so on.
<code>wlst.executable</code>	Name of the WebLogic Scripting Tool (WLST) executable file. Either <code>wlst.cmd</code> (on Windows) or <code>wlst.sh</code> (on Linux).
<code>extending.spaces.home.dir</code>	Path to the Spaces development workspace directory. For example, <code>C:\DesignWebCenterSpaces</code>
<code>oracle.jdeveloper.ojdeploy.path</code>	Path to <code>ojdeploy.exe</code> (Windows) or <code>ojdeploy</code> (Linux).
<code>wls.port</code>	Port number on which the WebLogic Server Administration Console is running
<code>wls.host</code>	Host machine on which the Spaces application is running and where the custom shared library is to be deployed
<code>wls.userkey</code>	Name and location of the file storing administrator passwords. <code>config.properties</code> describes how to generate the file using WLST. The file can be copied to any suitable, accessible location.
<code>wls.userconfig</code>	Name and location of the file storing administrator user details. <code>config.properties</code> describes how to generate the file using WLST. The file can be copied to any suitable, accessible location.

**Table 55–2 (Cont.) Configuring config.properties to Enable Deployment to the Managed**

Configuration Property	Description
wls.target	Managed server on which the Spaces shared library is to be deployed. For example, WC_Spaces.  In a clustered environment, enter a comma separated list of servers, for example, WC_Spaces1,WC_Spaces2.
wls.webcenter.app.target	Managed server on which the Spaces application (webcenter.ear) is deployed. For example, WC_Spaces.  In a clustered environment, enter a comma separated list of servers, for example, WC_Spaces1,WC_Spaces2.
webcenter.app.name	Name of the Spaces application. Always webcenter.
restart.implementation.version.suffix	Controls incremental implementation version numbers.

#### 5. Save your updates to config.properties.

Updates to config.properties are available immediately so there is no need to restart JDeveloper.

The next section describes how to build and deploy the shared library list extend.spaces.webapp.war.

#### 55.2.3.3 Building and Deploying the Shared Library List (extend.spaces.webapp.war)

You must rebuild and redeploy the extend.spaces.webapp.war shared library whenever you modify the shared library list (weblogic.xml).

To build and deploy the shared library list:

1. Open DesignWebCenterSpaces.jws in JDeveloper.  
See also, [Section 55.1, "Downloading a Workspace for Spaces Development"](#).
2. Expand the WebCenterSpacesExtensionLibrary project.
3. If you have not done so already, specify environment details in config.properties.  
See also, [Section 55.2.3.2, "Setting Build and Deployment Options \(config.properties\)"](#).
4. To rebuild extend.spaces.webapp.war, open the **Run Ant** dropdown menu, and then select **clean-stage** ([Figure 55–8](#))

**Figure 55–8 Building a Customized WebCenter Portal: Spaces Extension Library**

This generates a new version of the shared library list `extend.spaces.webapp.war`. The implementation version number associated with the new WAR is saved to `MANIFEST.MF` as follows:

```
<UnzipDir>/DesignWebCenterSpaces/WebCenterSpacesExtensionLibrary/META-INF/MANIFEST.MF
```

5. To redeploy the Spaces shared library list, open the **Run Ant** dropdown menu, and then select **deploy-shared-lib**.

A new version of the shared library list is deployed to the Spaces managed server. To verify the new deployment, login to the WLS Administration Console, navigate to the deployment overview page, and check the implementation version, that is, navigate to:

**Deployments> extend.spaces.webapp>Overview**

If the latest version is not active, refer to the [Section 55.2.3.5, "Troubleshooting Shared Library Deployment"](#).

#### 55.2.3.4 Reverting to a Previous Shared Library List

If there is a problem with the latest shared library list or you want to revert to a previous version for some reason, you can undeploy (remove) the current version and revert to the previous version, using the WLS Administration Console.

You can remove unwanted shared library versions too. If you go through several "change-build-deploy-test" iterations, each incremental version is retained by default. As the Spaces application only uses the latest shared library version you can clean up or delete previous versions if you want.

Before undeploying the latest version, you must shut down the managed server on which the Spaces application is running. Once you have removed the latest version, you can restart the managed server.

**Note:** Oracle recommends that you do not delete the original `extend.spaces.webapp` shared library (version 11.1.1) as this enables you to revert to the out-the-box version if necessary.

1. Run the following script to stop the managed server on which the Spaces application is deployed:
  - UNIX: `DOMAIN_HOME/bin/stopManagedWeblogic.sh`

- Windows: DOMAIN\_HOME\bin\stopManagedWeblogic.cmd
- 2. Login to the WLS Administration Console, navigate to the deployment overview page (**Deployments**> **extend.spaces.webapp**>**Overview**), and remove the latest shared library version.

To revert to the out-of-the-box Spaces deployment, revert to the original `extend.spaces.webapp.war` shared library, that is, delete all other Spaces shared library versions, except for `extend.spaces.webapp.war` version 11.1.1.

- 3. Run the following script to start the managed server on which the Spaces application is deployed:
  - UNIX: DOMAIN\_HOME/bin/startManagedWeblogic.sh
  - Windows: DOMAIN\_HOME\bin\startManagedWeblogic.cmd

### 55.2.3.5 Troubleshooting Shared Library Deployment

- **Changes are not available after deployment even though deployment successful.**

The Spaces application always uses the latest shared library version. Check that the implementation version in MANIFEST.MF matches the implementation version displayed in the WLS Administration Console.

For example, check the value in

```
<UnzipDir>/DesignWebCenterSpaces/WebCenterSpacesExtensionLibrary/META-INF/MANIFEST.MF
```

is the same as that displayed in the WLS Admin Console under **Deployments**> **extend.spaces.webapp**>**Overview**

- **"Security: 090219" error displays:**

```
weblogic.security.internal.encryption.EncryptionServiceException:
weblogic.security.internal.encryption.EncryptionServiceException:
weblogic.security.internal.encryption.EncryptionServiceException:
[Security:090219]Error decrypting Secret Key com.rsa.jsafe.JSAFE_
InputException: Invalid input length for decryption. Should be a multiple of
the block size - 8
```

Check that `wls.userconfig` and `wls.userkey` are both set correctly in the `config.properties` file, and verify that both security files specified are accessible

- **"DeployerException: Task 9 failed" displays:**

```
weblogic.Deployer$DeployerException:
weblogic.deploy.api.tools.deployer.DeployerException: Task 9 failed:
[Deployer:149117]deploy library custom.webcenter.spaces
[LibSpecVersion=11.1.1.2,LibImplVersion=11.1.1.2.5] on AdminServer,WC_Spaces.
```

This error occurs if the implementation version of the new deployment and the existing deployment are the same. Use the WLS Administration Console to verify the current implementation version and then change the `restart.implementation.version.suffix` property in `config.properties` to this value. When you rebuild and redeploy the shared library, the implementation version should increment by '1'.

- **"ReDeploy Spaces Failed" displays:**

```
Failed to redeploy the application with status failed
Current Status of your Deployment:
Deployment command type: redeploy
```

```
Deployment State      : failed
Deployment Message: weblogic.application.ModuleException:[exec] No stack trace
available.
####
##### ReDeploy Spaces Failed
```

Restart the managed server on which the Spaces application is deployed.

- **"java.lang.IllegalArgumentException" displays:**  
Restart the managed server on which the Spaces application is deployed.
- **Deployment hangs:**  
If you encounter issues during the deployment phase (**Run Ant Target > deploy-shared-lib**) and the process hangs, end/kill the Ant process from inside JDeveloper, and then restart the Administration Server and the managed server for the Spaces application.
- **Newly deployed Spaces shared library is not active:**  
If a newly deployed shared library is not active, use WLS Administration Console to manually delete the non-active shared library version, and then rebuild (**Run Ant Target>clean-dist**) and redeploy (**Run Ant Target > deploy-shared-lib**) the Spaces shared library.
- **webcenter.ear redeployment fails in a clustered environment:**  
Sometimes redeployment of `webcenter.ear` fails. Either restart all the managed servers or wait for 5 minutes and attempt to redeploy again (**Run Ant Target > deploy-shared-lib**).
- **Unable to access Spaces after deploying a custom shared library in a clustered environment**  
If you cannot access any of the Spaces applications after deploying a custom shared library to a cluster (**Run Ant Target > deploy-shared-lib**), restart all the managed servers.
- **"Error occurred attempting to display the list of pages you can access. Please contact the administrator" displays after logging in:**  
Restart the managed server on which the Spaces application is deployed.
- **"WCS#2009.12.22.00.49.35: Fatal error occurred while getting members" displays:**  
Restart Spaces.

## 55.3 Developing Resources for the Spaces Application

This section describes the `WebCenterSpacesResources` project—a design environment for Spaces resource development. Through this project, you can upload resources, developed or customized through JDeveloper, to the Spaces application.

This section includes the following subsections:

- [Section 55.3.1, "Using the WebCenterSpacesResources Project for Round-Trip Development"](#)
- [Section 55.3.2, "Opening and Exploring the WebCenterSpacesResources Project"](#)
- [Section 55.3.3, "Enabling Direct Uploads to the Spaces Application"](#)
- [Section 55.3.4, "Editing Spaces Resources in JDeveloper"](#)

- [Section 55.3.5, "Uploading Resources Directly to the Spaces Application"](#)
- [Section 55.3.6, "Exporting Spaces Resources to an Archive"](#)
- [Section 55.3.7, "Troubleshooting Resource Round-Trip Development"](#)

### 55.3.1 Using the WebCenterSpacesResources Project for Round-Trip Development

WebCenter Portal's round-trip development features provide a simple, convenient way to modify Spaces resources without redeploying the entire application. Round-trip development refers to features and techniques that allow you to download resources from a deployed application and upload them to JDeveloper for maintenance or enhancement. Once modified, you can upload the resource back to the Spaces application for immediate use or for testing.

Out-of-the-box, Spaces provides some default resources, such as skins and page templates, for people to use or modify. To keep Spaces easy to use, the built-in functionality for creating and editing resources within Spaces is purposely somewhat limited. If your resource requirements extend beyond the editing capabilities of the Spaces application, you can further develop resources using a JDeveloper project that is especially designed for that purpose—*WebCenterSpacesResources*.

Oracle recommends that you use this project to build and manage custom skins, page templates, page styles, navigations, content display templates, mashup styles, and resource catalogs. The project provides some sample resources, as well as other files and folders you might need. You do not have to develop resources from scratch; you can export existing resources from the Spaces application and edit them in JDeveloper, or use one of the samples as your starting point.

---

---

**Note:** This chapter describes how to use the *WebCenterSpacesResources* project to manage resource customizations. If you need more information on how to build/develop resources, see [Section 55.3.4.3, "How to Build Spaces Resources"](#).

---

---

When you are ready to deploy new resources, you can upload them directly from JDeveloper to a live Spaces application simply by providing JDeveloper with the name of the host and port where the Spaces application is running.

**Note:** You do not need to deploy customized resources to a shared library.

Alternatively, you can login to Spaces and upload new resources through the Resource Manager. If you decide to use this method you must save the resource to an export archive (.ear).

**Figure 55–9 Designing Resources Using the WebCenterSpacesResources Project**

### 55.3.2 Opening and Exploring the WebCenterSpacesResources Project

1. Download and unzip the Spaces workspace.  
See [Section 55.1, "Downloading a Workspace for Spaces Development"](#).
2. Navigate to the unzip directory, and open `DesignWebCenterSpaces\DesignWebCenterSpaces.jws` in JDeveloper ([Figure 55–10](#)).  
  
This workspace contains a project dedicated to resource development called **WebCenterSpacesResources**.

**Figure 55–10 Projects in the DesignWebCenterSpaces Workspace**

3. Expand the **WebCenterSpacesResources** project.

The `WebCenterSpacesResources` project contains several files and folders (Figure 55–11):

**Figure 55–11 Exploring the `WebCenterSpacesResources` Project in JDeveloper**

Table 55–3 describes the files and folders in the `WebCenterSpacesResources` project.

**Table 55–3 Files and Folders in the `WebCenterSpacesResources` Project**

Configuration Property	Description
\Application Sources	Supporting files and folders.
\Web Content	Contains Spaces resources.
\oracle\webcenter\siteresources	Directory containing Spaces resources. You can develop and manage all your application resources under this folder.
\scopedMD	Contains application-level and space-level resources. <ul style="list-style-type: none"> <li>■ Application-level resources are stored under the "default scope" directory <code>s8bba98ff_4cbb_40b8_beee_296c916a23ed</code></li> <li>    Out-of-the box, this directory contains several sample application resources.</li> <li>■ Space-level resources are stored under space-specific directories with the same name as the space's internal ID.</li> <li>    No space-level resources are provided out-of-the-box.</li> </ul>
\<Default Scope ID>	Contains sample application-level resources.
\contenttemplates	Includes a sample Content Presenter display template ( <code>content-default-list-item-view.jsff</code> ) - Sample Content List Item View.
\navigation	includes a sample navigation ( <code>Navigation.xml</code> ) - SampleNavigation.
\pageStyle	Includes a blank page style ( <code>TemplateHome.jspx</code> ) - Sample Home Page Style.

**Table 55–3 (Cont.) Files and Folders in the WebCenterSpacesResources Project**

Configuration Property	Description
\resourceCatalog	Includes a sample catalog ( <code>ResourceCatalog.xml</code> ) - Sample Home Space Catalog
\siteTemplate	Includes a sample page templates ( <code>Template.jspx</code> ) - Sample Side Navigation  <b>Note:</b> This directory is the correct directory for developing page templates (even though the directory name is <code>siteTemplate</code> ).
\skin	Includes a sample skin ( <code>Skin.css</code> ) - Sample Spaces FX Skin.
\taskFlowStyle	Includes files for a sample mashup style ( <code>pform.jsff</code> and <code>pform-definition.xml</code> ) - Sample Parameter Form.
\shared	Content directory for images/content used by resources, such as, icons, images, and so on.  When you upload a resource to the Spaces application, content in the <code>\shared</code> directory is copied to Spaces automatically.  Ensure that you copy <i>all files</i> that your resources reference to this <code>\shared</code> directory and verify that all references to such content point to this location, for example: <code>&lt;af:image source="/oracle/webcenter/siteresources/scopedMD/shared/mylogo.gif id="pt_12"&gt;</code>
\Page Flows	Supporting files and folders.

### 55.3.3 Enabling Direct Uploads to the Spaces Application

If you build or modify skins, page templates, and so on, for a Spaces application that is live or running in a test environment you can upload your updates directly to the application from JDeveloper. To enable direct updates from the JDeveloper **WebCenterSpacesResources** project you must:

- Specify the name of the host and port where the Spaces application is running in `config.properties`.
- Check that you have the appropriate roles and permissions to upload the resource to Spaces. You must have the following:
  - **WebLogic Server role** - `monitor` AND
  - **Resource permissions** - For example, to upload a new skin you must have the `Create, Edit, Delete Skins` permission. For details, see [Table 55–5](#).

Configuring the Spaces hostname and port, enables the *Upload Portal Resource* option in your project. The first time you use this option, within a JDeveloper session, you must enter your Spaces login name and password. For security reasons, your credentials are not saved for future sessions but they are stored in memory for the current JDeveloper session.

Once you are logged in to Spaces you can upload resources, providing, of course, that you have the appropriate permissions to manage Spaces resources.

---

**Note:** Out-of-the-box, only the default Fusion Middleware administrator (`weblogic`) has all the required permissions.

---

To set connection properties in `config.properties` and grant permissions:

1. Open `config.properties`, available at:  
`<Unzip_Directory>\DesignWebCenterSpaces\config.properties`
2. Enter details relating to JDeveloper and your Spaces installation, as shown in [Table 55-4](#):

The `config.properties` file describes each property and offers examples. The defaults provided are only samples and must be replaced with your own, installation-specific values.

**Table 55-4** *config.properties Settings to Enable Direct Uploads*

Configuration Property	Description
<code>jdeveloper.install.home.directory</code>	Base directory where JDeveloper is installed. In addition to <code>\jdeveloper</code> , the directory you specify must contain <code>\wls_server_10.3</code> , <code>\modules</code> , and so on.
<code>wlst.executable</code>	Name of the WebLogic Scripting Tool (WLST) executable file.  Either <code>wlst.cmd</code> (on Windows) or <code>wlst.sh</code> (on Linux).
<code>wls.port</code>	Port number on which the WebLogic Server Administration Console is running
<code>wls.host</code>	Host machine on which the Spaces application is running and where the custom shared library is to be deployed
<code>wc.host</code>	Name of the host machine where the Spaces application is running.
<code>wc.port</code>	Port number on which the Spaces application is running.
<code>wc.protocol</code>	Specify whether the Spaces URL protocol is <b>http</b> or <b>https</b> .
<code>wls.webcenter.app.target</code>	Managed server on which the Spaces application ( <code>webcenter.ear</code> ) is deployed. For example, <code>WC_Spaces</code> .  In a clustered environment, enter a comma separated list of servers, for example, <code>WC_Spaces1,WC_Spaces2</code> .
<code>webcenter.app.name</code>	Name of the Spaces application. Always <code>webcenter</code> .

3. Save your updates to `config.properties`.
4. Verify and, if necessary, request permissions as shown in [Table 55-5](#).

See also, "Managing Roles and Permissions for a Space" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Table 55–5 (Cont.) Permissions to Upload and Manage Resources Through JDeveloper**

Resource	Required Role or Permission	Type	Description
<b>Application-level resource</b>	▪ monitor	WebLogic Server Role	▪ This role enables you to run the WLST scripts which upload resources from JDeveloper to the Spaces application. .
	▪ Create, Edit, Delete <resourcetype>	WebCenter Portal: Spaces Permission	▪ This permission enables you to create and manage application-level resources for Spaces.
	▪ Manage Configuration	WebCenter Portal: Spaces Permission	▪ The application-level Manage Configuration permission gives you access to the Spaces administration page.  <b>Note:</b> The Administrator role in WebCenter Portal: Spaces includes both these permissions, that is, Create, Edit, Delete Resources and Manage Configuration.
<b>Space-level resource</b>	▪ monitor	WebLogic Server Role	▪ This role enables you to run the WLST scripts which upload resources from JDeveloper to the Spaces application.
	▪ Create, Edit, Delete Resources (standard permission model) OR Create, Edit, Delete <resourcetype> (advanced permission model)	WebCenter Portal: Spaces Permission	▪ These permissions enable you to create and manage resources for a particular space. Either standard or advanced permissions will apply, depending on the space.
	▪ Manage Configuration	WebCenter Portal: Spaces Permission	▪ The space-level Manage Configuration permission gives you access to the resource administration page for a particular space.  <b>Note:</b> The Moderator role in WebCenter Portal: Spaces includes both these permissions, that is, Create, Edit, Delete Resources/<resourcetypes> and Manage Configuration.

5. Upload a sample resource, to test the connection, and verify that the resource is available in Spaces:

For details, see [Section 55.3.5, "Uploading Resources Directly to the Spaces Application"](#).

See also, [Section 55.3.7, "Troubleshooting Resource Round-Trip Development."](#)

### 55.3.4 Editing Spaces Resources in JDeveloper

Oracle recommends that you extend Spaces resources in the JDeveloper project, *WebCenterSpacesResources*. This project provides everything you need to create, modify, and upload the following Spaces resources:

- Page Templates
- Navigations
- Page Styles
- Skins
- Content Display Templates
- Resource Catalogs
- Mashup Styles

### Where To Start...

You do not have to develop Spaces resources from scratch. Most developers will download an existing resource from the Spaces application and edit it in JDeveloper. There are two techniques for bringing Spaces resources into JDeveloper. The first is downloading the resource into JDeveloper directly from the server. The second is exporting the resource from Spaces and then importing it into JDeveloper.

For more information, see:

- [Downloading a Spaces Resource Directly into JDeveloper](#)
- "Downloading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- [Importing a Spaces Resource into JDeveloper](#)

See, also [How to Build Spaces Resources](#).

### Application-Level vs Space-Level Resources

The difference between application- and Space-level resources is one of scope. In the Spaces application:

- **Application-level resources are available to all Spaces.**

You must develop all application-level resources under the WebCenterSpacesResources project directory  
`oracle/webcenter/siteresources/scopedMD/s8bba98ff_4cbb_40b8_`  
`beee_296c916a23ed.`

To upload application resources to the Spaces application you must have Spaces permissions: Application-Manage Configuration plus Create, Edit, Delete <Resource\_Type>.

- **Space-level resources are only available within a particular Space.**

You must develop a resource for a specific space under the appropriate namespace, so that it can be uploaded to that space:

`oracle/webcenter/siteresources/scopedMD/<space_internal_id>`

Similarly, resources downloaded from an existing space and imported into JDeveloper, can only be uploaded back to the same space. You cannot upload such resources to a different space.

To upload resources to a particular space you must have the Space-Manage Configuration permission, plus one of:

Create, Edit, Delete Resources (standard permission model)  
 Create, Edit, Delete <Resource\_Type> (advanced permission model)

If you want to upload resources directly from JDeveloper, you must also have the WebLogic Server monitor role. See [Section 55.3.3, "Enabling Direct Uploads to the Spaces Application"](#).

For information on how to create and edit Spaces resources, see:

- [Section 55.3.4.1, "Downloading a Spaces Resource Directly into JDeveloper"](#)
- [Section 55.3.4.2, "Importing a Spaces Resource into JDeveloper"](#)
- [Section 55.3.4.3, "How to Build Spaces Resources"](#)

### 55.3.4.1 Downloading a Spaces Resource Directly into JDeveloper

You can download a Spaces resource directly into JDeveloper from within the WebCenterSpacesResources project.

1. Be sure the configuration properties and permissions are set properly, as described in [Section 55.3.3, "Enabling Direct Uploads to the Spaces Application."](#) See also [Section 55.2.3.2, "Setting Build and Deployment Options \(config.properties\)."](#)
2. In the Navigator, right-click the WebCenterSpacesResources project and select **Download Portal Resource from Server**, as shown in [Figure 55–12](#).

**Figure 55–12 Download Portal Resource from Server Menu**

3. In the Download Portal Resources dialog, choose to download either an Application-Level Resource or a Space-Level Resource, as shown in [Figure 55–13](#). See ["Application-Level vs Space-Level Resources"](#) for information on these selections.

**Figure 55–13 Download Portal Resources Dialog**

4. To filter the list of possible resource names, select the type of resource you wish to download from the Resource Type menu, as shown in [Figure 55–14](#).

**Figure 55–14 Selecting a Resource Type to Download**

5. Finally, select the name of the resource you wish to download from the Resource Name menu.
6. Click OK.

#### 55.3.4.2 Importing a Spaces Resource into JDeveloper

When you import a Spaces resource archive (.ear) into the *WebCenterSpacesResources* project the resource is uploaded to the appropriate project directory.

- **Application-level resources are imported to:**

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scope
dMD\
application_ID\resource_type\resource_ID
```

For example, an application-level skin with the resource ID `gsr5a8c2fcc_bc7f_4cba_9254_36df58d66e60` is created under the application directory `s8bba98ff_4cbb_40b8_bee_296c916a23ed`:

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scope
dMD\
s8bba98ff_4cbb_40b8_bee_296c916a23ed\skin\gsr5a8c2fcc_bc7f_
4cba_9254_36df58d66e60
```

- **Space-level resources are imported to:**

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scope
dMD\
Space_ID\resource_type\resource_ID
```

For example, a Space-level skin with the resource ID `gsre9cbef77_28b2_4f46_a69a_25beac543382` is created under the Space directory `sc48d77f4_ca06_4fa9_8d51_0e23bed74eac`:

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scope
dMD\
sc48d77f4_ca06_4fa9_8d51_0e23bed74eac\skin\gsre9cbef77_28b2_
4f46_a69a_25beac543382
```

It's important to know the internal IDs of Spaces resources and the parent space (space-level resources only) so that you can locate the appropriate resource folders in JDeveloper. In the Spaces application, internal IDs are published in the resource's About dialog (Figure 55–15). For details, see "Viewing Information About a Resource" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Figure 55–15** Checking Resource IDs in Spaces

Internal IDs are not easy to remember like display names. If you want to identify an imported resource you can check its display name using the **Update Resource** option. Navigate to the resource directory, drill down to the resource file (for example, `mynavigation.xml`, `myskin.css`, `mypagetemplate.jspx`, `mycatalog.xml`), and then click **Update Resource** from the right mouse menu (Figure 55–16).

**Figure 55–16** Checking Resource Display Names in JDeveloper

To import a Spaces resource from an archive:

1. In the Application Navigator, right-click the **WebCenterSpacesResources** project, and choose **Import Portal Resource**.
2. In the Import Portal Resource dialog, enter the name or browse for the archive file (EAR) that contains the resource that you want to import.

If the archive does not exist yet, login to Spaces and download the resource to an EAR file. See "Downloading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

3. Click **OK**.
4. Navigate to the resource:
  - Locate application resources under:
 

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\s8bba98ff_4cbb_40b8_beee_296c916a23ed
```
  - Locate space-level resources under:
 

```
WebCenterSpacesResources\oracle\webcenter\siteresources\scopedMD\

```

### 55.3.4.3 How to Build Spaces Resources

To learn more about building resources, read the appropriate chapter:

- Page Templates - [Working with Page Templates](#)
- Page Styles - [Working with Page Styles](#)
- Skins - [Creating and Managing Skins](#)
- Navigations - [Building a Navigation Model for Your Portal](#)
- Content Display Templates - [Creating Content Presenter Display Templates](#)
- Resource Catalogs - [Creating and Managing Resource Catalogs](#)

- Mashup Styles - [Working with Mashup Styles](#)

### 55.3.5 Uploading Resources Directly to the Spaces Application

If the Spaces application is up and running you can deploy new or updated resources directly to the application from your JDeveloper environment.

You must have appropriate resource management permissions in the Spaces application to upload resources in this way. If you do not have the correct privileges, you are not allowed to upload resources. See also [Section 55.3.3, "Enabling Direct Uploads to the Spaces Application"](#).

1. If you have not done so already, configure Spaces connections details in `config.properties` and request the appropriate resource management permissions.

See also, [Section 55.3.3, "Enabling Direct Uploads to the Spaces Application"](#).

2. In JDeveloper, open the `WebCenterSpacesResources` project, and navigate to the resource you want to upload.

For example, to upload the sample application-level navigation `SampleNavigation`, navigate to ([Figure 55–17](#)):

`WebCenterSpacesResources\Web Content\oracle\  
webcenter\siteresources\scopedMD\s8bba98ff_4cbb_40b8_beee_  
296c916a23ed\navigation\gsrcc8dab1c_6161_4bb8_8764_127b4ecee01b`

**Figure 55–17 Navigating to Spaces Resource Folders**

3. Verify that the resource is complete.
4. Ensure that all content used by the resource, such as images, icons, and so on, are located under the *content directory* `/oracle/webcenter/siteresources/scopedMD/shared` and verify that all references to such content point to this location, for example:

```
<af:image
source="/oracle/webcenter/siteresources/scopedMD/shared/mylog
o.gif id="pt_12">
```

5. Right-click the file associated with the resource you want to upload to Spaces, and choose **Upload Portal Resource**.

There is a single file associated with most resource types. The exception is mashup style which has two files: `definition.xml` and `.jsff`. To upload a mashup style you must right-click the `definition.xml` file.

6. If the selected resource references content under the shared directory, specify whether or not you want to upload the content from JDeveloper.
  - Entire content directories are uploaded rather than individual files. For example, if a skin references two files (`...\shared\skins\logos\mylogo.gif` and `...\shared\skins\icons\myicon.gif`), the entire content of both directories (`\logos` and `\icons`) are uploaded.
  - On upload, all files under the resource's content directories are uploaded to the target application and existing files with the same name are overwritten. While you can opt not to upload content directories, it's an all or nothing approach, that is, you cannot only upload files referenced by this resource.
7. If prompted, enter your Spaces username and password and click **OK**.

An information message displays to indicate that the upload process is complete and also provides the name and location of the upload log file—`upload_<resource_type_id>.log`.

**Figure 55–18 Resource Upload Complete Message**

8. Review the upload log file.
 

The following message indicates that the upload was successful.

```
Imported <temp_log_directory>\<resource_type_id>.ear
```

If you do not see this message, refer to [Section 55.3.7, "Troubleshooting Resource Round-Trip Development"](#)
9. Log in to the Spaces application and verify that the resource is available through Resource Manager as expected.

- a. Log in to Spaces.
- b. Navigate to the Resource Manager as follows:

To verify an application-level resource, navigate to the following URL:

```
http://host:port/webcenter/spaces/admin/resources
```

To verify a space-level resources, navigate to the following URL:

```
http://host:port/webcenter/spaces/spaceName/admin/resources
```

- c. Select the appropriate resource type from the panel on the left, and verify that the resource you just uploaded is available and working as expected.

Dependent images, and so on, must be located in the Spaces content directory. If an image is missing, check that you copied it to the appropriate content directory in JDeveloper (under `/oracle/webcenter/siteresources/scopedMD/shared`).

### 55.3.6 Exporting Spaces Resources to an Archive

When your resource is ready for use in the Spaces application you can upload it directly to Spaces or you can export the resource to an EAR file format which you (or someone else) can upload at any time using Spaces Resource Manager.

To export a Spaces resource:

1. In the Application Navigator, navigate to the resource directory and drill down to the resource file (for example, `myskin.css`, `mypagetemplate.jspx`, `mycatalog.xml`).

---

**Note:** Ensure that all dependent content such as images, icons, style sheets, and so on, are copied to the `/oracle/webcenter/siteresources/scopedMD/shared/` directory and verify that all references to such content point to this location, for example: `<af:image source="/oracle/webcenter/siteresources/scopedMD/shared/mylogo.gif id="pt_12">`

---

2. Click **Export Portal Resource** from the right mouse menu.
3. In the Export Portal Resource dialog, enter or browse for the path and file name for the export archive file. For example: `C:\myskin.ear`
4. If the selected resource references content under the shared directory, specify whether or not you want to **Include Content Directories** in the resource archive.

Do one of the following:

- Select **Include Content Directories** to export content referenced by the portal resource, such as images and icons, in the export archive.

Consider the following before exporting content directories for the resource:

- Entire content directories are exported rather than individual files. For example, if a skin references two files (`...\shared\skins\logos\mylogo.gif` and `...\shared\skins\icons\myicon.gif`), the entire content of both directories (`\logos` and `\icons`) are exported.
- On import, all files under the content directories are uploaded to the target Spaces application and existing files with the same name are overwritten. While you can opt not to upload content directories on import, it's an all or nothing approach, that is, you cannot upload individual files for this specific resource.
- Click **No** to exclude content under the `\shared` directory that is referenced by portal resources.

5. Click **OK**.

The steps to upload resource archives to Spaces are available in "Uploading a Spaces Resource" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 55.3.7 Troubleshooting Resource Round-Trip Development

This troubleshooting section includes the following subsections:

- [Examining the Resource Upload Log File](#)
- [Unable to Upload Resources to Spaces - Access denied](#)
- [Unable to Upload a Resource to Spaces - java.lang.Exception](#)

### Examining the Resource Upload Log File

When you upload a resource to the Spaces application progress details are recorded in a log file. The name of the log file includes the type of resource you are uploading and a unique ID, in the format—`upload_resource_type_id.log`. For example, `upload_siteTemplate_17283.log`.

The location of the log file depends on your local `temp` directory settings. The exact log file location displays in an information message such as this:

**Figure 55–19 Resource Upload Log File Location**

The following log entry indicates that the upload process was successful.

```
Imported <temp_log_directory>\<resource_type_id>.ear
```

Insufficient permissions result in "Access denied" or "java.lang.Exception" errors, as described below.

### Unable to Upload Resources to Spaces - Access denied

The following error displays in the *resource upload log file* if you do not have the monitor role:

```
Operation: getScopeName(java.lang.String) Detail: Access denied. Required roles:
Admin, Operator, Monitor, executing subject: principals=[yourusername]
```

The monitor role is a Weblogic Server role. This role enables you to run the WLST scripts which upload resources from JDeveloper to the Spaces application. Ask your Spaces administrator to grant you this role through the WebLogic Server Administration Console.

### Unable to Upload a Resource to Spaces - java.lang.Exception

The following error displays in the *resource upload log file* if you do not have permission to manage any resources in Spaces or the particular type of resource you are trying to upload:

```
javax.management.MBeanException at
weblogic.rjvm.ResponseImpl.unmarshalReturn(ResponseImpl.java:234) Root Cause:
Caused by: java.lang.Exception at
oracle.webcenter.portalframework.genericresources.model.lifecycle.SiteResource
sHelper.updateResource(SiteResourcesHelper.java)
```

Ask your Spaces administrator to grant you appropriate permissions through Spaces Administration. Or, if the resource you are trying to upload is for a particular space, contact the space moderator to request the required permission. See also, [Table 55-5, "\(Cont.\) Permissions to Upload and Manage Resources Through JDeveloper"](#).

---

---

## Integrating with Oracle WebCenter Portal: Spaces

This chapter describes how to expose WebCenter Portal: Spaces functionality in a WebCenter Portal: Framework application, using Spaces APIs. Through these APIs, you can create new spaces, manage space membership, retrieve space information, and more, from your Framework applications.

The chapter also describes how to expose information from other applications, such as Framework applications in Spaces.

This chapter includes the following sections:

- [Introduction to WebCenter Portal: Spaces](#)
- [Exposing Spaces in WebCenter Portal Applications Using APIs](#)
- [Using the WebCenter Portal: Spaces REST APIs](#)
- [Exposing Enterprise Applications in Spaces](#)

---

---

**Note:** Custom-built task flows that implement Spaces APIs (described in this chapter) can be deployed on WebCenter Portal: Framework applications, but you cannot deploy them to WebCenter Portal: Spaces.

---

---

### **Audience**

This section is intended for developers who want to expose Spaces functionality in their WebCenter Portal: Framework applications.

## 56.1 Introduction to WebCenter Portal: Spaces

WebCenter Portal's Spaces application is a Web-based application, built using the WebCenter Portal: Framework, WebCenter Portal services, and Composer. The Spaces application furnishes all the tools you require to rapidly create portals, communities, and social sites capable of accommodating thousands of users and encompassing diverse populations with differing languages. [Figure 56-1](#) shows a typical Spaces home page.

**Figure 56–1 WebCenter Portal: Spaces**

Out of the box, Spaces offers a configurable work environment that enables individuals and groups to work and collaborate more effectively. The application is a self-service solution for managing individual and group interactions. It also provides intuitive tools that allow business users to come together and share information by adding pages and resources such as documents, charts, reports, portlets, business applications, services, and other ADF resources or views.

The Spaces application provides two work environments within a single application: the *Home space* and *group spaces*. The Home space provide each user with a private work area for storing personal content, viewing and responding to business process assignments, and performing many other tasks relevant to his or her unique working day. Group spaces (from hereon referred to as *spaces*) support discrete work areas organized around an area of interest or a common goal.

Spaces support the formation and collaboration of project teams and communities of interest. Spaces bring people together in a virtual environment for ongoing interaction and information sharing—in essence, forming a social network. [Figure 56–2](#) shows an example of a space.

**Figure 56–2 Standards - Sample Space**

Structurally, spaces comprise pages, many of which are dedicated to a particular service. For example, a *Lists page* provides the means to create and publish multicolumn lists. A *Documents page* provides a central library for uploading, organizing, and managing group content. A *Search page* includes features for saving searches and managing search results. In addition to these and other default pages, a space supports custom pages created by authorized users. Page creation is easy with a wide selection of predefined layouts. With little effort, users can provide pages neatly tailored to the unique needs of their team or community. For more information about spaces, see the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

WebCenter Portal provides various *services* that spaces can use to offer a wide variety of functionality in support of group objectives. For example, a Documents service provides features for uploading and managing content; a Discussions service provides features for creating, managing, and participating in discussion forums. Some other examples of these services include Events, Lists, Announcements, and Search. These services are what helps to make Spaces a productive, collaborative working environment. Services expose subsets of their features and functionality through *task flows*. A task flow is a reusable view that may expose all or a subset of the features available from a particular service. For example, a Recent Documents task flow provides a subset of the functionality offered through the Documents service by listing documents that have recently been opened, added, or affected in some way.

To help users get spaces up and running quickly, they can be based on out-of-the-box templates. Additionally, Spaces allows users to turn any space into a template, so they can design spaces to suit specific audiences and offer them up as templates for others to use. For information about creating templates, see "Creating Custom Space Templates" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

Spaces can consume portlets from any WSRP, Oracle PDK-Java, or pagelet producer if the producer is registered first. Therefore, any portlets you create for Framework applications can be used in Spaces too. For more information, see the "Managing

Portlet Producers" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 56.2 Exposing Spaces in WebCenter Portal Applications Using APIs

This section includes the following subsections:

- [Introduction to Spaces APIs](#)
- [Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers](#)
- [Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations](#)
- [How to Set Up Your WebCenter Portal Application to Use the Spaces APIs](#)
- [How to Provide Spaces Functionality in WebCenter Portal Applications](#)
- [How to Handle Exceptions Raised by Spaces APIs](#)
- [Finding More Information on Spaces APIs](#)
- [Troubleshooting Issues with Spaces APIs](#)

### 56.2.1 Introduction to Spaces APIs

While using your WebCenter Portal: Framework application, users may encounter situations where Spaces would be useful to help them complete a particular task. In such cases, it would be much less disruptive to remain within the context of the current application, rather than having to switch to the Spaces application. To this end, Spaces provides access to a subset of its functionality through several APIs. Using these APIs, you can integrate powerful Spaces functionality into your Framework application.

You can use Spaces APIs to:

- **Create and manage spaces and space templates.** You can create and delete spaces, and add custom attributes. For more information, see [Section 56.2.5.1, "Managing Spaces and Space Template."](#)
- **Manage space membership.** You can add and remove space members. For more information, see [Section 56.2.5.2, "Managing Space Membership."](#)
- **Retrieve information about apaces and space templates.** For example, you can retrieve the Spaces application URL or the URL of a specific space. You can also retrieve space and space template metadata. For more information, see [Section 56.2.5.3, "Retrieving Information for Spaces and Space Templates."](#)

Spaces APIs are contained within several classes. [Table 56–1](#) lists the different classes and describes the purpose of the APIs within each class.

**Table 56–1 Spaces API Classes**

Class	Contains APIs for	More Information
GroupSpaceWSClient	Creating and managing spaces and space templates Managing space membership Retrieving space information	<a href="#">Section 56.2.5, "How to Provide Spaces Functionality in WebCenter Portal Applications"</a>
GroupSpaceWSContext	Establishing context before calling the APIs	<a href="#">Section 56.2.4.4, "Setting Up the Spaces Client Context"</a>

**Table 56–1 (Cont.) Spaces API Classes**

Class	Contains APIs for	More Information
GroupSpaceWSException	Managing exceptions raised by the APIs	<a href="#">Section 56.2.6, "How to Handle Exceptions Raised by Spaces APIs"</a>
GroupSpaceWSMembers	Retrieving information about space members	<a href="#">Section 56.2.5.3, "Retrieving Information for Spaces and Space Templates"</a>
GroupSpaceWSMetadata	Retrieving space information	<a href="#">Section 56.2.5.3, "Retrieving Information for Spaces and Space Templates"</a>

Spaces can have many different applications. From your perspective, as a WebCenter Portal: Framework application developer, here are a couple of case studies describing scenarios where building and working with Spaces through the APIs might come in useful:

- In a purchasing application, a purchasing manager may create a space to discuss the suitability of a new supplier. For more information, see [Section 56.2.2, "Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers."](#)
- In a Customer Support Center application, a support analyst may create a space to collaborate with other users about a customer escalation. For more information, see [Section 56.2.3, "Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations."](#)

## 56.2.2 Case Study 1: Purchasing Application Uses a Space to Evaluate Suppliers

Consider a purchasing application built using the Oracle WebCenter Portal: Framework. This application tracks suppliers, pricing, lead-time requirements, delivery time estimates, and performance history.

Users of the purchasing application must also be able to select and evaluate supplier candidates. Supplier evaluation is a collaborative process; it requires people from various areas of a company. For example, a design engineer and manufacturing representative must verify that an item being purchased meets the required technical specifications; a purchasing agent can negotiate prices, logistics and contractual issues; and a manager or executive has to approve the deal. How could the purchasing application initiate supplier evaluations?

Typically, the purchasing manager receives a purchase requisition from the manufacturing department. Sometimes the purchase order cannot be completed because the requisition cannot be delivered by the usual supplier in the time frame required by manufacturing. Therefore, a new supplier that can meet delivery and pricing requirements must be determined. The purchasing manager can add a candidate supplier into the system but the purchasing manager needs a way to organize and share information, and collaborate with people in and outside his team so that he can assess the supplier.

A space can provide this collaborative environment. So the purchasing application includes a call to the `createGroupSpace` API, and this enables the purchasing manager to click a link (**Create a New Space**) that displays a "Create Space" dialog, directly from the purchasing application, as shown in [Figure 56–3](#).

**Figure 56–3 Purchasing Application Includes a Space Creation Link**

When the purchasing manager clicks the link a custom dialog prompts him for some information. The purchasing manager enters a name and description for the space, and also selects a template (Purchasing Projects) as shown in Figure 56–4. The Purchasing Projects template sets up the space quickly so it is ready to use right away. For example, the template defines which services are required (events, a document library, and so on) and any custom pages that may be required. Because the APIs enable you to create your own "Create Space" dialog, you can apply your own look and feel and terminology.

**Figure 56–4 Custom Create Space Dialog**

In this scenario, the purchasing manager chooses the Purchasing Projects template from the template list. Another approach would be to have the purchasing application pass in a default template value. With this additional default, there would be one less thing (determining which template to use) for the purchasing manager to think about. You could even generate the name of the space from the Supplier ID so that the purchasing manager would not have to enter any details at all. The space could then be created with just the click of a link.

When the purchasing manager clicks **OK**, the new Supplier Evaluation space displays, similar to that shown in [Figure 56-5](#).

**Figure 56-5** *Supplier Evaluation Space*

[Figure 56-5](#) shows a Home page for the Supplier Evaluation space, which includes an events calendar, documents the group may find useful, an area for announcements, and so on. Each of these areas was determined by the Purchasing Projects template. In addition a link to the purchasing application transaction instance from which the space was created is also provided. Clicking this link (**Add/Update Vendors**) displays the screen Add/Update Vendor transaction for the supplier Shaker Distribution.

In the Spaces application, the purchasing manager becomes the moderator of the space automatically. The moderator can add content to the space, initiate discussions, invite members, and collaborate with interested parties. Once consensus is reached regarding the supplier, the purchasing manager is can approve or reject the supplier concerned.

### 56.2.3 Case Study 2: Customer Support Center Application Uses a Space to Discuss Customer Escalations

Consider a Customer Support Center application built using the Oracle WebCenter Portal: Framework that tracks customer calls and issues.

A support analyst is notified that a customer has escalated the service request that the analyst has been working on. The analyst knows that she can find a quicker resolution to the issue if she can involve other people from different areas of the company. For example:

- The project manager whose team implemented the project can provide more in depth knowledge of the project.
- An account manager who has been in constant touch with the customer can provide specific information about the implementation of the project at the customer site.
- Another support analyst, who has worked on a similar escalation before, can provide information about how that escalation was resolved.

This problem can be solved collaboratively using a space. The support analyst creates a space from within the Customer Support Center application and adds the required members. These members are then notified and use the space to start discussing the customer situation. The support analyst views their updates to the space inside the support application, navigating to the space whenever necessary to obtain more specific details. Based on the information she gets from the other members of the space, she can diagnose the problem and offer the customer a solution very quickly.

## 56.2.4 How to Set Up Your WebCenter Portal Application to Use the Spaces APIs

Before you can use the Spaces APIs you must ensure that the Spaces application is up and running and that your project is set up correctly in JDeveloper.

This section includes the following subsections:

- [Verifying That the Spaces Application Is Up and Running](#)
- [Setting Up the WebCenter Portal Application to Use Spaces APIs](#)
- [Securing the Connection Between the Application and Spaces](#)
- [Setting Up the Spaces Client Context](#)

### 56.2.4.1 Verifying That the Spaces Application Is Up and Running

If you want to use the Spaces APIs, the Spaces application must be up and running.

#### To verify that Spaces is up and running:

1. Start Spaces. The URL is:

```
http://host:port/webcenter
```

You do not need to log in.

2. Verify that the Spaces Web service is up and running. The URL is:

```
http://host:port/webcenter/SpacesWebService?WSDL
```

You should see a page similar to the one shown in [Figure 56-6](#). If you do not see this page, contact your Fusion Middleware administrator.

**Figure 56–6 SpacesWebService WSDL**

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```

- <wsdl:definitions name="SpacesWebService"
  targetNamespace="http://oracle.webcenter.spaces.internal.view.ws/"
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Fault_Policy"></wsp:Policy>
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Input_Policy"></wsp:Policy>
  + <wsp:Policy wsu:Id="SpacesWebServiceSoapHttpPort_Output_Policy"></wsp:Policy>
  + <wsp:Policy orawsp:provides="(http://schemas.com/ws/2006/01/policy) token.x509, (http://docs.oasis-
  ...
  wsu:Id="wss11_saml_or_username_token_with_message_protection_service_policy"></wsp:Policy>
- <wsdl:types>
  - <xs:schema version="1.0" targetNamespace="http://oracle.webcenter.spaces.internal.view.ws/types">
    - <xs:complexType name="gsMetadataImpl">
      - <xs:sequence>
        <xs:element name="closed" type="xs:boolean"/>
        <xs:element name="createdBy" type="xs:string" minOccurs="0"/>
        <xs:element name="createdDate" type="xs:dateTime" minOccurs="0"/>
        <xs:element name="customAttributes" type="tns:gsCustomAttribute" nillable="true" minOccurs="0"
        minOccurs="unbounded"/>
        <xs:element name="description" type="xs:string" minOccurs="0"/>
        <xs:element name="discoverable" type="xs:boolean"/>
        <xs:element name="displayName" type="xs:string" minOccurs="0"/>
        <xs:element name="groupSpaceURI" type="xs:string" minOccurs="0"/>
        <xs:element name="guid" type="xs:string" minOccurs="0"/>
        <xs:element name="iconURI" type="xs:string" minOccurs="0"/>
        <xs:element name="keywords" type="xs:string" minOccurs="0"/>
        <xs:element name="lastUpdateDate" type="xs:dateTime" minOccurs="0"/>
        <xs:element name="listServiceConfigData" type="tns:gsServiceConfigData" nillable="true"
        minOccurs="0" maxOccurs="unbounded"/>
        <xs:element name="logoURI" type="xs:string" minOccurs="0"/>
        <xs:element name="mailingList" type="xs:string" minOccurs="0"/>

```

For more information about setting up Spaces, see the "Getting the Spaces application Up and Running" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 56.2.4.2 Setting Up the WebCenter Portal Application to Use Spaces APIs

Before you can call the Spaces APIs in your WebCenter Portal: Framework application, you must ensure that your application contains the correct libraries and that there is a connection to the Spaces Web service.

##### To set up your application to use the Spaces APIs:

1. Start JDeveloper.
2. In the Application Navigator, expand the application for which you want to provide Spaces functionality.

The application should be based on the WebCenter Portal Application template.

3. Right-click the view-controller project and choose **Project Properties**.
4. Select **Libraries and Classpath**.
5. Check that the following libraries are available in your project, adding any as necessary:
  - ADF DVT Faces Runtime
  - ADF Model Generic Runtime

- ADF Model Runtime
  - JAX-RPC Client
  - JAX-WS Client
  - JAXB
  - Oracle JWT
  - Spaces Client
  - `JDEV_HOME/jdeveloper/oracle_common/modules/oracle.adf.model_11.1.1/adfm.jar`
  - `JDEV_HOME/jdeveloper/oracle_common/modules/oracle.xdk_11.1.1/xml.jar`
6. Click **OK**.
  7. In the Application Resources panel of the Application Navigator, right-click **Connections** and choose **New Connection > URL**.
  8. In the **Name** field, enter `SpacesWebServiceEndpoint`.
  9. In the **URL Endpoint** field, enter the Spaces Web service URL:  
`http://host:port/webcenter/SpacesWebService`
  10. Click **OK**.  
  
The connection information is added to the `connections.xml` file in the application's `META-INF` directory, for example:  
`C:\JDeveloper\mywork\mySpacesApplication\adf\META-INF`  
  
If the `connections.xml` file does not exist, it is created.
  11. Open the `connections.xml` file and verify that the code shown in [Example 56–1](#) appears:

**Example 56–1 Spaces Web Service Endpoint URL Connection**

```
<Reference name="SpacesWebServiceEndpoint"
className="oracle.adf.model.connection.url.HttpURLConnection">
<Factory className="oracle.adf.model.connection.url.URLConnectionFactory"/>
<RefAddresses>
  <XmlRefAddr addrType="SpacesWebServiceEndpoint">
    <Contents>
      <urlconnection name="SpacesWebServiceEndpoint"
url="http://host:port/webcenter/SpacesWebService"/>
    </Contents>
  </XmlRefAddr>
</RefAddresses>
</Reference>
```

If you need to set the SpacesWeb service endpoint at runtime, you can use the `setGroupSpaceWebServiceEndpoint` API ([Example 56–2](#)). You can write a wrapper API that takes the endpoint as a parameter and then calls `setGroupSpaceWebServiceEndpoint`, passing the parameter. An exception is reported as INFO in the log file if the endpoint is not set in `connections.xml`.

**Example 56–2 Setting the Spaces Web Service Endpoint at Runtime**

```
client.setGroupSpacesWebServiceEndpoint("http://xmlns.oracle.com/webcenter/SpacesW
```

```
ebService");
```

### 56.2.4.3 Securing the Connection Between the Application and Spaces

Before using the Spaces APIs in your WebCenter Portal: Framework application, you must ensure that the communication between the application (the consumer) and Spaces (the producer) is secure. This is so that the identity of the user invoking the APIs is propagated to Spaces in a secure manner where the integrity and confidentiality of the communication is maintained.

To do this, the Spaces APIs use a policy of SAML based token passing with message protection. Your administrator must create a Java keystore and update the credential store so that Spaces can verify the authenticity of the security tokens received from your application. You must then register this keystore and update the credential store using JDeveloper.

For information about the steps that the administrator must perform, see "Securing Spaces for Applications Consuming Spaces Client APIs with WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 56.2.4.4 Setting Up the Spaces Client Context

Before calling any of the Spaces APIs in your application code, a few setup steps are required.

#### To set up the Spaces client context

1. Domain-wide configuration settings are used when you call Spaces APIs from an application deployed on WebLogic Server (WLS), unless you specifically choose to override them. To override or set security configuration parameters, use the APIs provided by the `GroupSpaceWSContext` class.

In particular, you must set the SAML issuer name and the public key alias for Spaces, which are required for data encryption. If the Spaces Web service endpoint is not set in the `connections.xml` file, you can set this too.

For example:

```
GroupSpaceWSContext context = new GroupSpaceWSContext();

context.setEndPoint("endPointUrl");
context.setSamlIssuerName("samlIssuer");
context.setRecipientKeyAlias("producer");

groupSpaceWSClient = new GroupSpaceWSClient(context);
```

Where:

- `endPointUrl` is the Spaces Web service endpoint, for example, `http://xmlns.oracle.com:8912/webcenter/SpacesWebService`.
- `samlIssuer` is the issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party, for example, `www.oracle.com`. Out-of-the-box, `www.oracle.com` is the only trusted SAML issuer.
- `producer` is the public key alias for Spaces, for example, `orakey` if you are using a simple topology.

For information about the steps that the administrator must perform, see "Securing Spaces for Applications Consuming Spaces Client APIs with WS-Security" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

For a full list of the APIs provided by the `GroupSpaceWSContext` class, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

2. Initialize the Spaces client by passing the context. For example:

```
GroupSpaceWSClient client = new GroupSpaceWSClient(context);
```

3. Once you have initialized the client, check everything is set up correctly by calling:

```
getWebCenterSpacesURL();
```

If the correct URL is returned, everything is set up correctly and you can start using the Spaces APIs.

## 56.2.5 How to Provide Spaces Functionality in WebCenter Portal Applications

The Spaces APIs enable you to perform common space-related operations within a WebCenter Portal: Framework application. Most of these APIs are provided by the `GroupSpaceWSClient` class. The APIs can be grouped into three main categories:

- [Managing Spaces and Space Template](#)
- [Managing Space Membership](#)
- [Retrieving Information for Spaces and Space Templates](#)

Table 56–2 lists the APIs in the `GroupSpaceWSClient` class.

**Table 56–2 APIs for Performing Common SpacesOperations**

Spaces API	Category	Description
<code>createGroupSpace</code>	Managing Spaces and Space Templates	Creates a new space based on a template. See <a href="#">Section 56.2.5.1.1, "Creating a Space."</a>
<code>setCustomAttribute</code>	Managing Spaces and Space Templates	Creates one or more custom attributes for a space. See <a href="#">Section 56.2.5.1.2, "Creating a Custom Attribute."</a>
<code>deleteGroupSpace</code>	Managing Spaces and Space Templates	Permanently removes a space from Spaces. See <a href="#">Section 56.2.5.1.4, "Deleting a Space."</a>
<code>createGroupSpaceTemplate</code>	Managing Spaces and Space Templates	Creates a new space template based on an existing space. See <a href="#">Section 56.2.5.1.3, "Creating a Space Template."</a>
<code>addMember</code>	Managing Space Membership	Makes a user (or a group) a space member with a specific role. See <a href="#">Section 56.2.5.2.1, "Adding Members to a Space."</a>
<code>inviteMember</code>	Managing Space Membership	Invites a list of users to become members of a space. See <a href="#">Section 56.2.5.2.2, "Inviting Users to Join a Space."</a>
<code>removeMember</code>	Managing Space Membership	Revokes space membership. See <a href="#">Section 56.2.5.2.3, "Removing Members from a Space."</a>
<code>getRoles</code>	Managing Space Membership	Retrieves all the roles for a given space. See <a href="#">Section 56.2.5.2.4, "Retrieving Role Information."</a>

**Table 56–2 (Cont.) APIs for Performing Common Spaces Operations**

Spaces API	Category	Description
getGroupSpaces	Retrieving Information for Spaces and Space Templates	Retrieves a list of spaces for a given query string. See <a href="#">Section 56.2.5.3.1, "Retrieving a List of Spaces."</a>
getPublicGroupSpaces	Retrieving Information for Spaces and Space Templates	Retrieves a list of public spaces for a given query string. See <a href="#">Section 56.2.5.3.2, "Retrieving a List of Public Spaces."</a>
getDiscoverableGroupSpaces	Retrieving Information for Spaces and Space Templates	Retrieves a list of discoverable spaces for a given query string. See <a href="#">Section 56.2.5.3.3, "Retrieving a List of Discoverable Spaces."</a>
getGroupSpaceMetadata	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space. See <a href="#">Section 56.2.5.3.4, "Retrieving Space Metadata."</a>
getGroupSpaceMetadataByGuid	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about a space given the space's GUID. See <a href="#">Section 56.2.5.3.4, "Retrieving Space Metadata."</a>
getGroupSpaceTemplates	Retrieving Information for Spaces and Space Templates	Retrieves a list of space templates for a given query string. See <a href="#">Section 56.2.5.3.5, "Retrieving a List of Space Templates."</a>
getGroupSpaceTemplateMetadata	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space template. See <a href="#">Section 56.2.5.3.6, "Retrieving Space Template Metadata."</a>
getGroupSpaceTemplateMetadataByGuid	Retrieving Information for Spaces and Space Templates	Retrieves information (metadata) about the space template given the template's GUID. See <a href="#">Section 56.2.5.3.6, "Retrieving Space Template Metadata."</a>
getWebCenterSpacesURL	Retrieving Information for Spaces and Space Templates	Retrieves the Spaces application URL. See <a href="#">Section 56.2.5.3.7, "Retrieving the Spaces URL."</a>
getGroupSpaceURL	Retrieving Information for Spaces and Space Templates	Retrieves a space URL. See <a href="#">Section 56.2.5.3.8, "Retrieving a Space URL."</a>
getServiceRSSFeedURL	Retrieving Information for Spaces and Space Templates	Retrieves RSS feed URLs for the specified space service.
getServiceRSSFeedURLbyGuid	Retrieving Information for Spaces and Space Templates	Retrieves RSS feed URL for a given space by GUID and a given service.

### 56.2.5.1 Managing Spaces and Space Template

Use the following Spaces APIs to manage your spaces and space templates:

- createGroupSpace
- setCustomAttribute
- createGroupSpaceTemplate
- deleteGroupSpace

**Before you begin**

Before using any of these APIs, you must complete all the steps listed in [Section 56.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."](#)

This section includes the following subsections

- [Creating a Space](#)
- [Creating a Custom Attribute](#)
- [Creating a Space Template](#)
- [Deleting a Space](#)

**56.2.5.1.1 Creating a Space** Use the `createGroupSpace` API to create a space that is based on an existing space template.

To use this API, specify:

- The internal name of the new space. This name can contain blank spaces.
- A display name for the new space.
- A description of the space. Although this is not mandatory, we recommend that you provide a description to help users identify the space's purpose.
- The name of the space template you want to use. This should be the internal name of the template, not the display name.

Optionally, you can provide a comma separated list of keywords to help users locate the space in searches.

[Example 56-3](#) creates a space with the name *Databases* that is based on the *CommunityofInterest* template. The example also specifies two search keywords (*databases* and *Oracle*).

**Example 56-3 Creating a Space**

```
//create the space
GroupSpaceWSMetadata gsMetadata =
client.createGroupSpace("Databases", "Databases" "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
//print the space GUID to provide confirmation of creation
System.out.println("GUID: " + gsMetadata.getGuid());
```

For an example of how to provide custom attributes for a new space, see [Section 56.2.5.1.2, "Creating a Custom Attribute."](#)

**56.2.5.1.2 Creating a Custom Attribute** Every space comes with built-in attributes such as name, description, date created, icon, and so on. In addition, you can define custom attributes that store additional information (metadata) that is unique to the space and its characteristics.

Use the `setCustomAttribute` API to specify a custom attribute for a space. To use this API, specify the name of the space and a name, description, type, and value for the custom attribute.

[Example 56-4](#) creates the *Databases* space and then creates a custom attribute for that space. The attribute is named *Vendors*, with the description *List of vendors*. It takes string values of *Oracle* and *IBM*.

**Example 56-4 Creating a Custom Attribute**

```
//create the space
```

```

client.createGroupSpace("Databases", "Databases", "A community for people
interested in databases", null, "CommunityofInterest");
//create the custom attribute
client.setCustomAttribute("Databases", "Vendors", "List of vendors",
"java.lang.String", "Oracle, IBM");

```

**56.2.5.1.3 Creating a Space Template** Use the `createGroupSpaceTemplate` API to create a space template based on an existing space. To use this API specify a name, display name, and description for the template, and the name of the space to use to create the template.

[Example 56–5](#) creates a space template based on the *Databases* space.

**Example 56–5 Creating a Space Template**

```

GroupSpaceWSMetadata templMetadata =
client.createGroupSpaceTemplate("DatabasesTemplate", "Databases Template",
"A template based on the Databases space", "Databases");
//print the template GUID to provide confirmation of creation
System.out.println("GUID: " + templMetadata.getGuid());

```

**56.2.5.1.4 Deleting a Space** Use the `deleteGroupSpace` API to permanently delete a space from the Spaces application. To use this API, specify the name of the space to delete. The API returns a boolean value to indicate whether the deletion was successful.

[Example 56–6](#) deletes the space with the name *Databases*. The example uses the boolean value returned by the API to print a message about the success or failure of the operation.

**Example 56–6 Deleting a Space**

```

//delete the space
Boolean success = client.deleteGroupSpace("Databases");
//print a message depending on the result of the deletion
if(success)
{
    System.out.println("Operation Succeeded");
}
else
{
    System.out.println("Operation Failed");
}

```

### 56.2.5.2 Managing Space Membership

Use the following Spaces APIs to manage space membership:

- `addMember`
- `inviteMember`
- `removeMember`
- `getRoles`

**Before you begin**

Before using any of these APIs, you must complete all the steps listed in [Section 56.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."](#)

This section includes the following subsections:

- [Adding Members to a Space](#)
- [Inviting Users to Join a Space](#)
- [Removing Members from a Space](#)
- [Retrieving Role Information](#)

**56.2.5.2.1 Adding Members to a Space** Use the `addMember` API to give users (and groups) space membership and assign the new members to a specific role. To use this API, specify the name of the space, and a list of users/groups. The list must contain objects of type `GroupSpaceWSMembers` that specify the user/group name and the role to give that user/group in the space.

You must specify the name of a valid user or user group that exists in the Spaces identity store. For the role, choose one of the default roles (Moderator, Participant, Viewer) or a custom role (if any). To retrieve a list of the available roles for a space, use the `getRoles` API. For more information, see [Section 56.2.5.2.4, "Retrieving Role Information."](#) For more information about roles, see the "Managing Roles and Permissions for a Space" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**Example 56–7** makes users (of type `GroupSpaceWSMembers`) named *Pat* and *Vicki* and everyone in the *Sales* and *Marketing* user group, members of the *Databases* space. *Pat* and everyone in *Sales* and *Marketing* are granted the *Viewer* role. *Vicki* is assigned the *Participant* role.

---

---

**Note:** Use `setGroup(true)` to indicate when you are adding a *group of users*.

---

---

**Example 56–7 Adding Members to a Space**

```
//create the list of users
List addMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat", "Viewer");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki", "Participant");
GroupSpaceWSMembers grp1 = new GroupSpaceWSMembers("Sales", "Viewer");
grp1.setGroup(true);
GroupSpaceWSMembers grp2 = new GroupSpaceWSMembers("Marketing", "Viewer");
grp2.setGroup(true);
//add the GroupSpaceWSMembers objects to the list of users
addMem.add(mem1);
addMem.add(mem2);
addMem.add(grp1);
addMem.add(grp2);
//add the users to the Space
client.addMember("Databases", addMem);
//print a list of members to confirm the new members were added
GroupSpaceWSMetadata memMetData = client.getGroupSpaceMetadata("Databases");
for (GroupSpaceWSMembers mems: memMetData.getMembers())
{
    System.out.println(mems.getMember());
    System.out.println(mems.getRole());
}
```

```
}

```

**56.2.5.2.2 Inviting Users to Join a Space** Use the `inviteMember` API to invite users to become members of a space. To use this API, specify the name of the space and a list of users to invite. The list must contain objects of type `GroupSpaceWSMembers` that specify the user name and the role to give that user in the space. An invitation to join the space is sent to each user, and each user can then accept or reject that invitation.

You must specify a valid user name that exists in the Spaces identity store. For the role, choose one of the default roles (Moderator, Participant, Viewer) or a custom role (if any). To retrieve a list of the available roles for a space, use the `getRoles` API. For more information, see [Section 56.2.5.2.4, "Retrieving Role Information."](#) For more information about roles, see the "Managing Roles and Permissions for a Space" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

[Example 56–8](#) invites users (of type `GroupSpaceWSMembers`) named *Pat* and *Vicki* to become members of the *Databases* space with *Viewer* and *Participant* roles respectively.

**Example 56–8 Inviting Users to Join a Space**

```
//create the list of users
List inviteMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat", "Viewer");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki", "Participant");
//add the GroupSpaceWSMembers objects to the list of users
inviteMem.add(mem1);
inviteMem.add(mem2);
//invite the list of users to join the space
client.inviteMember("Databases", inviteMem);

```

**56.2.5.2.3 Removing Members from a Space** Use the `removeMember` API to revoke space membership. To use this API, specify the name of the space, and a list of users. The list must contain objects of type `GroupSpaceWSMembers` that specify the user name. To obtain a list of current space members, use the `getGroupSpaceMetadata` API. For more information, see [Section 56.2.5.3.4, "Retrieving Space Metadata."](#)

[Example 56–9](#) removes users (of type `GroupSpaceWSMembers`) *Pat* and *Vicki* from the membership of the *Databases* space.

**Example 56–9 Removing Members from a Space**

```
//create the list of users
List remMem = new ArrayList();
//create the GroupSpaceWSMembers objects
GroupSpaceWSMembers mem1 = new GroupSpaceWSMembers("pat");
GroupSpaceWSMembers mem2 = new GroupSpaceWSMembers("vicki");
2 lines
//add the GroupSpaceWSMembers objects to the list of users
remMem.add(mem1);
remMem.add(mem2);

//remove the users from the space
client.removeMember("Databases", remMem);
//print a list of members to confirm the members were removed
GroupSpaceWSMetadata memMetData = client.getGroupSpaceMetadata("Databases");
for (GroupSpaceWSMembers mems: memMetData.getMembers())
{
    System.out.println(mems.getMember());
    System.out.println(mems.getRole());
}

```

```
}
```

**56.2.5.2.4 Retrieving Role Information** Use the `getRoles` API to retrieve all the roles for a given space. This is useful for determining which roles are available when adding or inviting members to a space. Roles include out-of-the box roles (Moderator, Participant, Viewer) and also custom roles (if any). To use this API, specify the name of the space.

**Example 56–10** retrieves and displays role information for the *Databases* space.

**Example 56–10 Retrieving Role Information**

```
//retrieve the list of roles
List<String> roles = client.getRoles("Databases");
//print the list of roles
for (String role: roles)
{
    System.out.println(role);
}
```

### 56.2.5.3 Retrieving Information for Spaces and Space Templates

Use the following Spaces APIs to retrieve space information:

- `getGroupSpaces`
- `getPublicGroupSpaces`
- `getDiscoverableGroupSpaces`
- `getGroupSpaceMetadata`
- `getGroupSpaceMetadataByGuid`
- `getGroupSpaceTemplates`
- `getGroupSpaceTemplateMetadata`
- `getGroupSpaceTemplateMetadataByGuid`
- `getWebCenterSpacesURL`
- `getGroupSpaceURL`

#### Before you begin

Before using any of these APIs, you must complete all the steps listed in [Section 56.2.4, "How to Set Up Your WebCenter Portal Application to Use the Spaces APIs."](#)

This section includes the following subsections

- [Retrieving a List of Spaces](#)
- [Retrieving a List of Public Spaces](#)
- [Retrieving a List of Discoverable Spaces](#)
- [Retrieving Space Metadata](#)
- [Retrieving a List of Space Templates](#)
- [Retrieving Space Template Metadata](#)
- [Retrieving the Spaces URL](#)
- [Retrieving a Space URL](#)
- [Retrieving RSS Feed URLs for Space Services](#)

**56.2.5.3.1 Retrieving a List of Spaces** Use the `getGroupSpaces` API to obtain a list of spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* spaces that are accessible to the current user.

The API returns spaces that are accessible to the current user, up to a maximum of 500.

[Example 56–11](#) returns a list of spaces containing the string *Database*.

**Example 56–11 Retrieving a List of Specific Spaces**

```
List<String> allGroupSpaces = client.getGroupSpaces("Database");
```

[Example 56–12](#) returns a list of *all* spaces to which the current user has access. This is achieved by specifying a *null* query string.

**Example 56–12 Retrieving a List of All Spaces**

```
List<String> allGroupSpaces = client.getGroupSpaces(null)
```

**56.2.5.3.2 Retrieving a List of Public Spaces** Use the `getPublicGroupSpaces` API to obtain a list of public spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* public spaces.

The API returns spaces that are accessible to all users, even those who are not logged in to the Spaces application, up to a maximum of 500.

[Example 56–13](#) returns a list of public spaces containing the string *Database*.

**Example 56–13 Retrieving a List of Specific Public Spaces**

```
List<String> allPublicGroupSpaces = client.getPublicGroupSpaces("Database");
```

[Example 56–14](#) returns a list of *all* public spaces. This is achieved by specifying a *null* query string.

**Example 56–14 Retrieving a List of All Public Spaces**

```
List<String> allPublicGroupSpaces = client.getPublicGroupSpaces(null)
```

**56.2.5.3.3 Retrieving a List of Discoverable Spaces** Use the `getDiscoverableGroupSpaces` API to obtain a list of discoverable spaces that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* discoverable spaces.

The API returns spaces that are accessible to all users who are logged in to the Spaces application, up to a maximum of 500.

[Example 56–13](#) returns a list of discoverable spaces containing the string *Database*.

**Example 56–15 Retrieving a List of Discoverable spaces**

```
List<String> allDiscoverableGroupspaces =
client.getDiscoverableGroupspaces("Database");
```

[Example 56–14](#) returns a list of *all* discoverable spaces. This is achieved by specifying a *null* query string.

**Example 56–16 Retrieving a List of All Discoverable Spaces**

```
List<String> allDiscoverableGroupSpaces = client.getDiscoverableGroupSpaces(null)
```

**56.2.5.3.4 Retrieving Space Metadata** Use the `getGroupSpaceMetadata` or `getGroupSpaceMetadataByGuid` APIs to obtain information (metadata) about a particular space. This includes information such as the description of the space, the name of the user who created it, the date on which it was last updated, and so on.

To use the `getGroupSpaceMetadata` API, specify the name of the space. To use the `getGroupSpaceMetadataByGuid` API, specify the GUID of the space. Note that while the space name may be changed during the existence of the space, the GUID always remains the same. You can obtain the GUID of a space as follows:

```
getGroupSpaceMetadata("spaceName").getGuid();
```

Both APIs return a bean object that contains more APIs that you can then use for retrieving the space metadata. These APIs are provided by the `GroupSpaceWSMetadata` class. [Table 56–3](#) lists the APIs returned by the bean object:

**Table 56–3 APIs for Retrieving Space Metadata**

Spaces API	Description
<code>getCreatedBy</code>	Returns the name of the person who created the space.
<code>getSpaceAttributes</code>	Returns the custom attributes for a space.
<code>getDescription</code>	Returns the description of the space.
<code>getDisplayName</code>	Returns the display name of the space.
<code>getGroupSpaceState</code>	Returns the state of the space: active, offline, deleted.
<code>getGuid</code>	Returns the GUID of the space.
<code>getIconURL</code>	Returns the location of the space icon.
<code>getKeywords</code>	Returns a comma separated list of keywords used to describe the space.
<code>getLastUpdated</code>	Returns the date the space was last updated.
<code>getLogoURL</code>	Returns the location of the space logo.
<code>getMailingList</code>	Returns the mailing list for the space.
<code>getMembers</code>	Returns the current list of space members.
<code>getName</code>	Returns the internal name of the space.
<code>isDiscoverable</code>	Returns if the space is returned in searches made by users who are not members of the space.
<code>isPublic</code>	Returns if the space is available to users who are not logged in.

[Example 56–17](#) retrieves the *Description*, *Keywords*, and *Last Updated Date* information for the *Databases* space given the space's name.

**Example 56–17 Retrieving Space Metadata Using the Space Name**

```
//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
    //retrieve the metadata
    GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
    //get space description
    System.out.println("Description: " + metadata.getDescription());
    //get space keywords
```

```

System.out.println("Keywords: " + metadata.getKeywords());
//get the date the space was last updated
System.out.println("Last Updated Date: " + metadata.getLastUpdated().toString());
}

```

**Example 56–18** retrieves the *Display Name*, *Creator*, and *Last Updated Date* information for the *Databases* space given the space GUID.

**Example 56–18 Retrieving Space Metadata Using Space GUID**

```

GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadataByGuid("Guid");
//get space display name
System.out.println("Display Name: " + metadata.getDisplayName());
//get the name of the user who created the space
System.out.println("Created By: " + metadata.getCreatedBy());
//get the date the space was last updated
System.out.println("Last Updated Date: " + metadata.getLastUpdated().toString());

```

**Example 56–19** retrieves the *Name*, *Description*, *Type*, and *Value* for every custom attribute associated with the *Databases* space.

**Example 56–19 Retrieving Custom Attribute Metadata**

```

//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
    //retrieve the metadata
    GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
    //get list of custom attributes
    List<GSCustomAttribute> attributes = metadata.getCustomAttributes();
    //get name, description, type, and value for each custom attribute
    for(GSCustomAttribute attribute: attributes)
    {
        System.out.println("Name : " + attribute.getName());
        System.out.println("Description : " + attribute.getDescription());
        System.out.println("Type : " + attribute.getType());
        System.out.println("value.toString() : " + attribute.getValue().toString());
    }
}

```

**Example 56–20** retrieves a list of members of the *Databases* space.

**Example 56–20 Retrieving Membership Information**

```

//get the exact name of the space
List<String> myGroupSpace = client.getGroupSpaces("Databases");
//check that the API returns a single result
if(myGroupSpace.size() == 1)
{
    //retrieve the metadata
    GroupSpaceWSMetadata metadata = client.getGroupSpaceMetadata(myGroupSpace);
    //get the list of members
    for(String member: metadata.getMembers())
    {
        System.out.println("Member UID: " + member);
    }
}

```

**56.2.5.3.5 Retrieving a List of Space Templates** Use the `getGroupSpaceTemplates` API to obtain a list of space templates that match a given query string. To use this API, specify a query string. A null value query string returns a list of *all* templates that are accessible to the current user.

The API returns templates that are accessible to the current user, up to a maximum of 500.

[Example 56–21](#) returns a list of space templates containing the string *Interest*.

**Example 56–21 Retrieving a List of Specific Space Templates**

```
List<String> allGroupSpaceTemplates = client.getGroupSpaceTemplates("Interest");
```

[Example 56–22](#) returns a list of *all* space templates to which the current user has access. This is achieved by specifying a *null* query string.

**Example 56–22 Retrieving a List of All Space Templates**

```
List<String> allGroupSpaceTemplates = client.getGroupSpaceTemplates(null);
```

**56.2.5.3.6 Retrieving Space Template Metadata** Use the `getGroupSpaceTemplateMetadata` and `getGroupSpaceTemplateMetadataByGuid` APIs to obtain information (metadata) about a particular space template. This includes information such as the description of the template, the name of the user who created it, and so on.

To use the `getGroupSpaceTemplateMetadata` API, specify the name of the template. To use the `getGroupSpaceTemplateMetadataByGuid` API, specify the GUID of the template. Note that while the space template name may be changed during the existence of the template, the GUID always remains the same.

Both APIs return a bean object that contains more APIs that you can then use for retrieving the space template metadata. These APIs are provided by the `GroupSpaceWSMetadata` class. [Table 56–4](#) lists the APIs returned by the bean object:

**Table 56–4 APIs for Retrieving Space Template Metadata**

Spaces API	Description
<code>getCreatedBy</code>	Returns the name of the person who created the template.
<code>getDescription</code>	Returns the description of the template.
<code>getDisplayName</code>	Returns the display name of the template.
<code>getGuid</code>	Returns the GUID of the template.
<code>getIconURL</code>	Returns the location of the template icon.
<code>getKeywords</code>	Returns a comma separated list of keywords used to describe the template.
<code>getLogoURL</code>	Returns the location of the template logo.
<code>getName</code>	Returns the internal name of the template.

[Example 56–23](#) retrieves the *GUID*, *Description*, and *Created By* information for the *CommunityofInterest* space template given the template name.

**Example 56–23 Retrieving Template Metadata Using the Template Name**

```
GroupSpaceWSMetadata metadata =
client.getGroupSpaceTemplateMetadata(myGroupSpaceTemplate);
```

```
//get the exact name of the space template
List<String> myGroupSpaceTemplate =
client.getGroupSpaceTemplates("CommunityofInterest");
//check that the API returns a single result
if(myGroupSpaceTemplate.size() == 1)
{
    //retrieve the metadata -- get GUID
    System.out.println("GUID: " + metadata.getGuid());
    //get template description
    System.out.println("Description: " + metadata.getDescription());
    //get name of user who created the template
    System.out.println("Keywords: " + metadata.getCreatedBy());
}
}
```

[Example 56–24](#) retrieves the *name* of a space template given the template GUID.

**Example 56–24 Retrieving Template Metadata Given the Template GUID**

```
GroupSpaceWSMetadata templGuidMetadata =
client.getGroupSpaceTemplateMetadataByGuid("Guid");
System.out.println("Template Name: " + templGuidMetadata.getName());
```

**56.2.5.3.7 Retrieving the Spaces URL** Use the `getWebCenterSpacesURL` API to obtain the URL of the Spaces application.

[Example 56–25](#) retrieves the URL of the currently running instance of Spaces.

**Example 56–25 Retrieving the WebCenter Portal: Spaces URL**

```
String myWebCenterSpacesURL = client.getWebCenterSpacesURL();
```

**56.2.5.3.8 Retrieving a Space URL** Use the `getGroupSpaceURL` API to obtain the URL of a specific space. This is useful for when you want to construct a hyperlink for a space or you have a relative URL that you need to make into an absolute URL. To use this API, specify the name of the space.

[Example 56–26](#) retrieves the URL of the *Databases* space.

**Example 56–26 Retrieving a Space URL**

```
String myGroupSpaceURL = client.getGroupSpaceURL("Databases");
```

[Example 56–27](#) prints a list of spaces as hyperlinks.

**Example 56–27 Printing a List of Spaces as Hyperlinks**

```
//get the list of spaces
List<String> spaces = client.getGroupSpaces("");
//print the list of spaces as hyperlinks
for (String spaceName : spaces)
{
    print("<a href =\"" + client.getGroupSpaceURL(spaceName) + "\">" + spaceName +
"</a><br>");
}
}
```

To construct the URL of a particular page in a space, retrieve the space URL and then add the page information. For information about how to create pretty URLs for space pages, see "Spaces Pretty URLs" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

**56.2.5.3.9 Retrieving RSS Feed URLs for Space Services** Space members can find out what is happening in a space through various RSS news feeds. The following space RSS feeds are available:

- Announcements RSS - View space announcements
- Discussions RSS - Track contributions to discussion forums
- Lists RSS - Watch for revisions to lists
- Recent Activity RSS - Monitor recent activities

You can retrieve the RSS feed URLs for these space services, from a WebCenter Portal application, using the following Spaces APIs:

- `getServiceRSSFeedURL`
- `getServiceRSSFeedURLbyGuid`

To obtain an RSS feed URL, you must identify the space (by name or GUID) and specify the service required (using a service ID). Service IDs are available as constants in `GroupSpaceWSSClient` as follows:

- Announcements - `GroupSpaceWSSClient.ANNOUNCEMENT_SERVICE_ID`
- Discussions - `GroupSpaceWSSClient.DISCUSSION_FORUM_SERVICE_ID`
- Lists - `GroupSpaceWSSClient.LIST_SERVICE_ID`
- Recent Activities - `GroupSpaceWSSClient.RECENT_ACTIVITY_SERVICE_ID`

#### **Retrieving Space RSS News Feed URLs Using `getServiceRSSFeedURL`**

Use the `getServiceRSSFeedURL` API to obtain service-related RSS news feed URLs for a particular space by specifying the space name.

To retrieve the RSS news feed URL for a service using `getServiceRSSFeedURL`, use the following:

```
String service_URL = client.getServiceRSSFeedURL("groupspace_name", service_ID);
```

Where:

*service\_URL* refers to the service parameter being retrieved

*groupspace\_name* is the name of the space

*service\_ID* is the ID of the service for which you want to retrieve the RSS news feed URL. Use one of the following: `ANNOUNCEMENT_SERVICE_ID`, `DISCUSSION_FORUM_SERVICE_ID`, `RECENT_ACTIVITY_SERVICE_ID`, or `LIST_SERVICE_ID`.

Therefore, depending on the service required, you can use the following:

- ```
String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSSClient.ANNOUNCEMENT_SERVICE_ID)
```
- ```
String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSSClient.DISCUSSION_FORUM_SERVICE_ID)
```
- ```
String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSSClient.LIST_SERVICE_ID)
```
- ```
String service_URL = client.getServiceRSSFeedURL("groupspace_name", GroupSpaceWSSClient.RECENT_ACTIVITY_SERVICE_ID)
```

**Example 56–28** retrieves the recent activity RSS feed URL for a space named Finance Project:

**Example 56–28 Retrieving the RSS Feed URL for Recent Activity**

```
String recentActivityURL = client.getServiceRSSFeedURL("Finance_Project",
GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID);
```

**Retrieving RSS News Feed URLs Using getServiceRSSFeedURLbyGuid**

Use the `getServiceRSSFeedURLbyGuid` API to obtain service-related RSS news feed URLs for a particular space by specifying the space's GUID.

To retrieve the RSS news feed URL for a service using `getServiceRSSFeedURLbyGuid`, use the following:

```
String service_URL = client.getServiceRSSFeedURLbyGuid("groupspace_GUID", service_
ID);
```

Where:

`service_URL` refers to the service parameter being retrieved

`groupspace_GUID` is a space GUID. For information about obtaining a space's GUID, see [Section 56.2.5.3.4, "Retrieving Space Metadata."](#)

`service_ID` is the ID of the service for which you want to retrieve the RSS news feed URL. Use one of the following: `ANNOUNCEMENT_SERVICE_ID`, `DISCUSSION_FORUM_SERVICE_ID`, `RECENT_ACTIVITY_SERVICE_ID`, or `LIST_SERVICE_ID`.

[Example 56–29](#) retrieves the recent activity RSS feed URL for a space with the GUID: `s2201fa44_b441_4bdd_950e_47307f6f9800`:

**Example 56–29 Retrieving the RSS Feed URL for Recent Activity**

```
String recentActivityURL = client.getServiceRSSFeedURLbyGuid("s2201fa44_b441_4bdd_
950e_47307f6f9800", GroupSpaceWSClient.RECENT_ACTIVITY_SERVICE_ID);
```

## 56.2.6 How to Handle Exceptions Raised by Spaces APIs

The `GroupSpaceWSEException` class provides APIs for handling exceptions raised by Spaces APIs.

**Table 56–5 Spaces APIs in the GroupSpaceWSEException Class**

API	Class	Description
<code>getLocalizedMessage</code>	<code>GroupSpaceWSEException</code>	Composes the localized error message.
<code>printStackTrace</code>	<code>GroupSpaceWSEException</code>	Prints the exception and its back trace to the standard error stream.

This section includes the following subsections:

- [Providing Localized Error Messages](#)
- [Listing the Error Stack](#)

### 56.2.6.1 Providing Localized Error Messages

Sometimes you may find that the default error messages provided by the APIs are not specific enough for your particular application. In these cases you can provide your own error messages.

Use the `getLocalizedMessage` API to compose application-specific error messages.

[Example 56–30](#) shows a servlet that includes code to create a space. If any exceptions are raised during the creation process, a localized message is printed.

**Example 56–30 Printing a Localized Error Message**

```
servlet1.java

doGet()
{
...
print("<b>Output</b>");
try
{
    GroupSpaceWSClient client = new GroupSpaceWSClient(context);
    client.createGroupSpace("Databases", "Databases", "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
    print("Successfully created space");
}
catch(GroupSpaceWSException ex)
{
    if(ex instanceof GroupSpaceNameNullException)
        print(ex.getLocalizedMessage());
    else if (ex instanceof GroupSpaceDescNullException)
        print(ex.getLocalizedMessage());
}
...
}
```

### 56.2.6.2 Listing the Error Stack

For debugging purposes, it is often useful to see which errors ultimately led to the failure of a particular operation to discover the underlying cause of the problem. Use the `printStackTrace` API to list all the errors that caused a particular exception.

[Example 56–31](#) prints the exception and all the errors leading up to it.

**Example 56–31 Listing the Error Stack**

```
servlet1.java

doGet()
{
...
print("<b>Output</b>");
try
{
    GroupSpaceWSClient client = new GroupSpaceWSClient(context);
    client.createGroupSpace("Databases", "Databases", "A community for people
interested in databases", "databases, oracle", "CommunityofInterest");
    print("Successfully created space");
}
catch(GroupSpaceWSException ex)
{
    ex.printStackTrace();
}
...
}
```

## 56.2.7 Finding More Information on Spaces APIs

---

### API Reference Documentation

---

For detailed syntax information for each API, see the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

---

## 56.2.8 Troubleshooting Issues with Spaces APIs

If you experience issues with Spaces APIs, check the following:

1. Verify that the credential stores for both WebCenter Portal: Spaces and the client WebCenter Portal application are configured correctly.

See "Updating the Credential Stores" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

2. Ensure the Spaces client context is set up correctly in the WebCenter Portal application by checking the alias passed in the `context.setRecipientKeyAlias`. The alias should be the public key alias of the producer (Spaces), for example:

```
GroupspaceWSContext context = new GroupspaceWSContext();
context.setEndPoint(endPointUrl);
context.setRecipientKeyAlias("orakey");
groupspaceInternalWSClient = new GroupspaceWSInternalClient(context);
```

In this example, the public key alias of the producer is **orakey**. See also, [Setting Up the Spaces Client Context](#).

3. Check that keystores exist at both ends of the connection. For example:

- webcenter.jks (copied to Spaces end)
- clientapi.jks (copied to WebCenter Portal application end)

For example, the following commands generate `clientapi.jks` and `webcenter.jks` for a simple topology:

```
keytool -genkeypair -keyalg RSA -dname "cn=spaces,dc=example,dc=com" -alias
orakey -keypass mypassword -keystore webcenter.jks -storepass mypassword
-validity 360
keytool -exportcert -v -alias orakey -keystore webcenter.jks
-storepass mypassword -rfc -file webcenter.cer
keytool -importcert -alias webservice_client_api
-file webcenter.cer -keystore clientapi.jks -storepass mypassword
keytool -genkeypair -keyalg RSA -dname "cn=clientapi,dc=example,dc=com"
-alias clientapi -keypass mypassword -keystore clientapi.jks -storepass
mypassword -validity 360
keytool -exportcert -v -alias clientapi -keystore clientapi.jks -storepass
mypassword -rfc -file clientapi.cer
keytool -importcert -alias clientapi -file clientapi.cer -keystore
webcenter.jks -storepass mypassword
```

See also, [Securing the Connection Between the Application and Spaces](#).

## 56.3 Using the WebCenter Portal: Spaces REST APIs

Oracle WebCenter Portal: Spaces provides REST APIs to support various space-related operations. You can use REST APIs to perform the following actions in the Spaces application:

- List all spaces in the Spaces application, list public spaces only, list joined spaces, list discoverable spaces.
- View details for a single space.
- List members of a space.
- List role assignments for space members.
- List custom attributes defined for a space.
- View the details of a particular custom attribute.
- View and add lists for a space.
- View and update list items (rows) for a list.
- View, update, and delete list item details (columns).

This section describes the WebCenter Portal: Spaces REST APIs. It contains the following subsections:

- [Section 56.3.1, "WebCenter Portal: Spaces Entry Point"](#)
- [Section 56.3.2, "WebCenter Portal: Spaces Resource Type Taxonomy"](#)
- [Section 56.3.3, "WebCenter Portal: Spaces Security Considerations"](#)
- [Section 56.3.4, "WebCenter Portal: Spaces Resource Types"](#)

For an introduction to the REST APIs, see [Section 53, "Using Oracle WebCenter Portal REST APIs."](#)

### 56.3.1 WebCenter Portal: Spaces Entry Point

Each REST service has a link element within the Resource Index that provides the entry point for that service. To find the entry point for WebCenter Portal: Spaces REST APIs, find the link element with a `resourceType` of:

```
urn:oracle:webcenter:spaces
```

The corresponding `href` or `template` element provides the URI entry point which returns a list of spaces accessible to the current user. The client sends HTTP requests to this entry point to work with WebCenter Portal: Spaces.

For more information about the Resource Index, see [Section 53.5.1, "The Resource Index"](#).

For more information about resource types, see [Section 53.5.2.1, "Resource Type."](#)

### 56.3.2 WebCenter Portal: Spaces Resource Type Taxonomy

When the client has identified the entry point, it can then navigate through the resource type taxonomy to perform the required operations. For more information about the individual resource types, see the appropriate section in [Section 56.3.4, "WebCenter Portal: Spaces Resource Types"](#).

The taxonomy for WebCenter Portal: Spaces is:

```
urn:oracle:webcenter:spaces
urn:oracle:webcenter:spaces:siteresources
urn:oracle:webcenter:spaces:resource:templates
urn:oracle:webcenter:spaces:resource:template
  urn:oracle:webcenter:space:attributes
  urn:oracle:webcenter:space:roles
urn:oracle:webcenter:space
```

```

urn:oracle:webcenter:space:icon
urn:oracle:webcenter:space:members
  urn:oracle:webcenter:space:member
urn:oracle:webcenter:space:attributes
  urn:oracle:webcenter:space:attribute
urn:oracle:webcenter:space:roles
  urn:oracle:webcenter:space:role
urn:oracle:webcenter:space:resourceindex
  urn:oracle:webcenter:space:lists
  urn:oracle:webcenter:space:list
    urn:oracle:webcenter:space:rows
      urn:oracle:webcenter:space:row
    urn:oracle:webcenter:space:columns
      urn:oracle:webcenter:space:column

```

### 56.3.3 WebCenter Portal: Spaces Security Considerations

There are no specific security considerations for this service. For general security considerations, see [Section 53.8, "Security Considerations for WebCenter Portal REST APIs."](#)

### 56.3.4 WebCenter Portal: Spaces Resource Types

The following sections provide all the information you need to know about each resource type:

- [urn:oracle:webcenter:spaces](#)
- [urn:oracle:webcenter:siteresources](#)
- [urn:oracle:webcenter:spaces:resource:templates](#)
- [urn:oracle:webcenter:space](#)
- [urn:oracle:webcenter:space:resourceindex](#)
- [urn:oracle:webcenter:space:roles](#)
- [urn:oracle:webcenter:space:attributes](#)
- [urn:oracle:webcenter:space:attribute](#)
- [urn:oracle:webcenter:space:members](#)
- [urn:oracle:webcenter:space:member](#)
- [urn:oracle:webcenter:space:lists](#)
- [urn:oracle:webcenter:space:list](#)
- [urn:oracle:webcenter:space:list:rows](#)
- [urn:oracle:webcenter:space:list:row](#)
- [urn:oracle:webcenter:space:list:columns](#)
- [urn:oracle:webcenter:space:list:column](#)

#### 56.3.4.1 urn:oracle:webcenter:spaces

Use this resource type to identify the URI to use to view a list of spaces (GET) and to create a new space (POST). The response from a GET operation includes each space, and each space includes links to operate on that space.

### Navigation Paths to spaces

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
```

### Supported Methods for spaces

The following methods are supported by this resource:

- GET – Returns information on all spaces.
  - **request - body:** None
  - **query parameters:**
    - \* `startIndex`
    - \* `itemsPerPage`
    - \* `projection` - Allowed values are `summary` and `details`. The default is `summary`.
    - \* `visibility` - Determines which spaces are included in the list: `all spaces`, `public spaces only`, `joined spaces`, or `discoverable spaces`.  
Allowed values are `all`, `public`, `joined` and `discoverable`. The default is `joined`.
  - **response - body:** collection of spaces
- POST – Creates a new space.
  - **request - body:** space
 

```
<space>
  <name>aName</name>
  <description>aDescription</description>
  <templateName>aTemplate</templateName>
</space>
```

---

**Note:** The `templateName` parameter must be a valid template name returned from [urn:oracle:webcenter:spaces:resource:templates](#). For example, the default template names are:

```
Basic
CommunityOfInterest
ProjectSpace
```

---

### Resource Types Linked to from spaces

[Table 56–6](#) lists the resource types that the client can link to from this resource.

**Table 56–6** *Related Resource Types for `urn:oracle:webcenter:spaces`*

rel	resourceType
self	<a href="#">urn:oracle:webcenter:spaces</a> <a href="#">urn:oracle:webcenter:space</a>

### 56.3.4.2 urn:oracle:webcenter:siteresources

Use this resource type to identify the URI to use to retrieve a list of Site Resources (GET). The response from a GET operation includes a list of all site resource names. The main purpose of retrieving site resource names is to know what all resources is available in the space.

The returned list includes the resources that are found under the Resources tab of the Spaces application Administration console, and include resources like page templates, navigations, skins, page styles, and others.

#### Navigation Paths to siteresources

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    siteresources
```

#### Supported Methods for siteresources

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - \* startIndex
    - \* itemsPerPage
    - \* projection - Allowed values are summary and details. The default is summary.
    - \* q - You can search on siteResourceType and/or seeded.

If siteResourceType is specified, the query returns all site resource names for that site resource type.

The format is: q = siteResourceType>equals:<value>

The possible values are siteTemplate, contentPresenter, pageStyle, navigation, resourceCatalog, or skin.

#### Example:

```
q=siteResourceType>equals:siteTemplate
```

If seeded is specified as true, the query returns all site resources names that are seeded.

The format is: q=seeded>equals:<value>.

The possible values are true or false.

#### Example:

```
q=seeded>equals:false (returns all non-seeded resources)
```

If a non-seeded site template is required, the query is:

```
siteResourceType>equals:siteTemplate;seeded>equals:false
```

- **response - body:** list of all site resource names for all the site resource types for the specified scope. If the `siteResourceType` is specified, returns all the site resource names for that site resource type.

### Read-Only Elements for siteresources

Table 56-7 lists the read-only elements for siteresources.

**Table 56-7 Read-Only Elements for `urn:oracle:webcenter:siteresources`**

Element	Type	Description
guid	String	Global ID for the site resource.
displayName	String	Name of the site resource as displayed to end users.
name	String	The name of the site resource. A complete list of all of the site resources, by name, is provided in Table 56-8.
description	String	Description of the site resource.
siteResourceType	String	Type of the site resource.
scopeName	String	Either the name of the space or the default scope at the application level.
seeded	Boolean	Set to true if the site resource is pre-populated.
visible	Boolean	Set to true if this site resource is visible in the user interface.
createdBy	String	Username of the user who created the site resource.
createdDate	Date	Date the site resource was created.
modifiedBy	String	Username of the user who updated the site resource.
modifiedDate	Date	Date on which the site resource was modified.
version	String	Version of the site resource.

### List of Site Resources by Name

Table 56-8 lists the site resources by name, and gives the type and description of each resource.

**Table 56-8 List of Site Resources by Name Provided by WebCenter Portal**

Name	Type	Description
Accordion View	contentPresenter	Displays multiple content items in an accordion (stacked) format. When an item is clicked, the other items collapse to reveal the selected items details.
Blank	pageStyle	Blank Page Style
Blank	taskFlowStyle	Blank
Blog	pageStyle	Blog Page Style
Bulleted View	contentPresenter	Displays multiple content items as a bulleted list. Only content items are displayed; sub-folders are omitted.

**Table 56–8 (Cont.) List of Site Resources by Name Provided by WebCenter Portal**

<b>Name</b>	<b>Type</b>	<b>Description</b>
Bulleted with Folder Label View	contentPresenter	Displays multiple content items as a bulleted list. The name of the parent folder is displayed as a label above the list. Only content items are displayed; sub-folders are omitted.
Carousel View	contentPresenter	Displays multiple content items in a carousel format. Users browse through items using a slider bar from left to right.
Default Document Details View	contentPresenter	Displays detailed information about a single content item, including creation date, modification date, creator, user who last modified the item, and path, as well as any comments.
Default Home Space Catalog	resourceCatalog	Used when editing application-level pages and task flows in your Home space.
Default List Item View	contentPresenter	Used by a single content item view to display a single line with an icon and item name as a link that either displays or downloads the item when clicked.
Default List Item View for Folders	contentPresenter	Used by a single content item view to display a single line with an icon and item name as a link that either displays or downloads the item when clicked.
Default Page Template Catalog	resourceCatalog	Used when editing page templates
Default Space Catalog	resourceCatalog	Used when editing space-level pages and task flows
Default View	contentPresenter	Displays a single content item. Image and HTML content items are displayed directly in the browser. For other item types, details are displayed, along with a link to download the associated file.
Fusion FX	skin	
Fusion Side Navigation	siteTemplate	Stretching Page Layout with Side Navigation. Use Fusion FX Skin.
Fusion Top Navigation	siteTemplate	Stretching Page Layout with Top Navigation. Use Fusion FX Skin.
Home Page	pageStyle	Home Page style
Icon View	contentPresenter	Displays multiple content items in a tiled format, using icons to represent sub-folders and content items.
Left Narrow	pageStyle	Left Narrow Page Style
List View	contentPresenter	Displays multiple content items in a simple list.
List with Details Panel View	contentPresenter	Displays multiple content items in a list on the left. A panel on the right displays the details of a selected item.
Parameter Form	taskFlowStyle	
Right Narrow	pageStyle	

**Table 56–8 (Cont.) List of Site Resources by Name Provided by WebCenter Portal**

<b>Name</b>	<b>Type</b>	<b>Description</b>
Sortable Table View	contentPresenter	Displays multiple content items in a sortable table that includes the document name, date created, and date modified.
Html Page	pageStyle	HTML page style
Spaces Default Navigation Model	navigation	Navigation model that displays current pages in a space
Spaces Navigation with Blogs/Wikis/Lists Submenus	navigation	Navigation model that displays current pages and submenus for blogs, wikis and lists
Stretch	taskFlowStyle	
Tabbed View	contentPresenter	Displays multiple content items as tabs. Clicking a tab displays the associated item's details.
Three Column	pageStyle	Three Column Page Style
Web Page	pageStyle	Web Page Page Style
Public-Pages Template	siteTemplate	Default Page Template for Public pages.
Collaborative with Top Navigation	siteTemplate	Page Template for Collaborative Spaces, with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Spaces FX	skin	WebCenter Spaces FX Skin
Portal-centric with Top Navigation	siteTemplate	Page Template for Portal-centric Sites, with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Side Navigation	siteTemplate	Flowing Page Layout with Side Navigation. Use WebCenter Spaces FX Skin.
Side Navigation (Stretch)	siteTemplate	Stretching Page Layout with Side Navigation. Use WebCenter Spaces FX Skin.
Top Navigation	siteTemplate	Default Page Template with Flowing Layout and Top Navigation. Use WebCenter Spaces FX Skin.
Top Navigation (Stretch)	siteTemplate	Stretching Page Layout with Top Navigation. Use WebCenter Spaces FX Skin.
Wiki	pageStyle	Wiki Page Style

**Writeable Elements for siteresources**

There are no writeable elements for this resource.

**56.3.4.3 urn:oracle:webcenter:spaces:resource:templates**

Use this resource type to identify the URI to use to retrieve a list of space templates (GET). The response from a GET operation includes a list of template names. The main purpose of retrieving template names is to provide a value for the `templateName` parameter for the create space command.

**Navigation Paths to templates**

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resource
      templates
```

### Supported Methods for templates

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - \* `startIndex`
    - \* `projection` - Allowed values are `summary` and `details`. The default is `summary`.
    - \* `q` - Performs searches.
    - \* `itemsPerPage`
  - **response - body:** list of template names

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Resource Types Linked to from templates

[Table 56–9](#) lists the resource types that the client can link to from this resource.

**Table 56–9** *Related Resource Types for `urn:oracle:webcenter:spaces`*

rel	resourceType
self	<a href="#">urn:oracle:webcenter:spaces:resource:templates</a>

#### 56.3.4.4 `urn:oracle:webcenter:space`

Use this resource type to identify the URI to use to view details for a single space (GET), create a nested space (POST), or delete a space (DELETE). The response from a GET operation includes the specific space identified by the URI, including its creator, description, members, and custom attributes.

---

**Note:** The response from this resource also includes a link to the space's message board.

---

### Navigation Paths to space

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
```

### Supported Methods for space

The following methods are supported by this resource:

- GET
  - **request - body:** None

- **query parameters:**
  - \* `projection` - Allowed values are `summary`, and `details`. The default is `details`. Choose `summary` to exclude member and custom attribute details.
- **response - body:** Space
- **POST** – Creates a new space that is a child of the named space (a subspace). This feature supports creating hierarchical or nested spaces.
- **request - body:** Space

```
<space>
  <name>FooSpace</name>
  <description>foobar</description>
  <templateName>CommunityOfInterest</templateName>
</space>
```

---

**Note:** The `templateName` parameter must be a valid template name returned from [urn:oracle:webcenter:spaces:resource:templates](#). For example, the default template names are:

```
Basic
CommunityOfInterest
ProjectSpace
```

---

- **DELETE** – Deletes the named space.
  - **request - body:** None

On delete, a 204 status code is returned whether or not the space existed.

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Writable Elements for space

[Table 56–10](#) lists the writable elements for this resource.

**Table 56–10 Writable Elements for `urn:oracle:webcenter:space`**

Element	Type	Description
<code>description</code>	String	Description of the space.
<code>name</code>	String	Internal name for the space.
<code>templateName</code>	String	Must be a valid template name returned from <a href="#">urn:oracle:webcenter:spaces:resource:templates</a> . For example, the default template names are:  Basic CommunityOfInterest ProjectSpace

### Read-only Elements for space

[Table 56–11](#) lists the read-only elements for this resource.

**Table 56–11 Read-only Elements for `urn:oracle:webcenter:space`**

Element	Type	Description
guid	String	Global ID for the space.
creator	String	ID of the user who created the space.
author	<a href="#">personReference</a>	User information about the user who created the space, including GUID, ID, display name, and a link to the profile icon (same user as <code>creator</code> ).
displayName	String	Name of the space as displayed to members.
iconUrl	String	Fully qualified URL for the space's icon image.
logoUrl	String	Relative URL for the space's logo image.
isOffline	Boolean	Indicates whether the space is offline or online.
isDiscoverable	Boolean	Specifies whether the space is discoverable.
isPublic	Boolean	Specifies whether the space is public.
keywords	String	Lists keywords for the space.
mailingList	String	Lists the mailing list email for the space if it has one.
parentDisplayName	String	Shows the parent display name if the space is a child space and has a parent. In this case, there will also be an <code>isInheritFromParent</code> boolean element that signifies whether the permissions of the parent space are inherited by the child space or not. Specifically, members of the parent space will be inherited.
serviceDataCopied	String	List of service ids whose data is to be copied to new spaces/templates when created based off this space.
defaultLanguage	String	The default language.
landingPage	String	URI to the space landing page if specified.
isTemplate	Boolean	Specifies whether or not this is a Template.
isUnsubscriptionApprovalRequired	Boolean	Specifies whether or not you need approval to unsubscribe.
isPublishRss	Boolean	Specifies whether or not the space has an associated RSS feed.
isClosed	Boolean	Specifies whether or not the space is closed.
isBlockAllAccess	Boolean	Specifies whether or not all access to space is blocked (not sure how this happens).
members	String	Returns the members element for the space.

**Table 56–11 (Cont.) Read-only Elements for `urn:oracle:webcenter:space`**

Element	Type	Description
attributes	String	Returns the attributes element for the space.

**Resource Types Linked to from space**

[Table 56–12](#) lists the resource types that the client can link to from this resource.

**Table 56–12 Related Resource Types for `urn:oracle:webcenter:space`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space</a> <a href="#">urn:oracle:webcenter:space:attributes</a> <a href="#">urn:oracle:webcenter:space:members</a> <a href="#">urn:oracle:webcenter:space:roles</a> <a href="#">urn:oracle:webcenter:space:icon</a> <a href="#">urn:oracle:webcenter:activities:stream</a> <a href="#">urn:oracle:webcenter:messageBoard</a>

**56.3.4.5 `urn:oracle:webcenter:space:resourceindex`**

Use this resource type to identify the URI to use to view the Spaces resource index.

**Navigation Paths to resourceindex**

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
```

**Supported Methods for resourceindex**

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** resource index

**Resource Types Linked to From resourceindex**

[Table 56–13](#) lists the resource types that the client can link to from this resource.

**Table 56–13 Related Resource Types for `urn:oracle:webcenter:space:resourceindex`**

rel	resourceType
	<a href="#">urn:oracle:webcenter:space:lists</a> <a href="#">urn:oracle:webcenter:discussions:forum</a>

### 56.3.4.6 urn:oracle:webcenter:space:roles

Use this resource type to get a list of roles for the named space (GET). The results returned from this call can be used to add a new member to a space with [urn:oracle:webcenter:space:members](#).

#### Navigation Paths to space:roles

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      roles
```

#### Supported Methods for roles

The following methods are supported by this resource:

- GET – Returns the list of roles assigned to the named space.

#### Resource Types Linked to from roles

[Table 56–14](#) lists the resource types that the client can link to from this resource.

**Table 56–14 Related Resource Types for urn:oracle:webcenter:spaces:roles**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:roles</a> <a href="#">urn:oracle:webcenter:space:role</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

### 56.3.4.7 urn:oracle:webcenter:space:role

Use this resource type to get a named role (GET).

Use this resource type to get a list of roles for the named space (GET). The results returned from this call can be used to add a new member to a space with [urn:oracle:webcenter:space:members](#).

#### Navigation Paths to space:role

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      role
```

#### Supported Methods for role

The following methods are supported by this resource:

- GET – Returns the named role.

#### Resource Types Linked to from role

[Table 56–14](#) lists the resource types that the client can link to from this resource.

**Table 56–15 Related Resource Types for `urn:oracle:webcenter:spaces:roles`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:role</a> <a href="#">urn:oracle:webcenter:space:role</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

#### 56.3.4.8 `urn:oracle:webcenter:space:icon`

Use this resource type to get the icon used for the named space (GET).

---

---

**Note:** This resource type is used for space references, not for space responses. This resource can be used anywhere a space is referenced, like in an activity stream or a space event.

---

---

#### Navigation Paths to `space:icon`

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      icon
```

#### Supported Methods for `icon`

The following methods are supported by this resource:

- GET – Returns the icon used for the named space.

#### Resource Types Linked to from `icon`

[Table 56–14](#) lists the resource types that the client can link to from this resource.

**Table 56–16 Related Resource Types for `urn:oracle:webcenter:spaces:roles`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:icon</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

#### 56.3.4.9 `urn:oracle:webcenter:space:attributes`

Use this resource type to identify the URI to use to view a list of custom attributes defined for a space (GET). The response from a GET operation includes each custom attribute for the space, and each attribute includes links to operate on that attribute. Also use this resource type to add custom attributes to a space (POST).

#### Navigation Paths to `attributes`

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      attributes
```

### Supported Methods for attributes

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** collection of attributes
- POST – Adds a custom attribute to the named space.
  - **request - body:**

```
<attribute>
  <name>anAttribute</name>
  <value>aValue</value>
</attribute>
```

### Writeable Elements for attributes

Table 56–17 lists the writeable elements for this resource.

**Table 56–17** Writeable Resources for `space:attributes`

Element	Type	Description
name	String	Attribute name.
value	String	Attribute value.

### Resource Types Linked to From attributes

Table 56–18 lists the resource types that the client can link to from this resource.

**Table 56–18** Related Resource Types for `urn:oracle:webcenter:space:attributes`

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:attributes</a> <a href="#">urn:oracle:webcenter:space:attribute</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

#### 56.3.4.10 `urn:oracle:webcenter:space:attribute`

Use this resource type to identify the URI to use to view the name and value of single space attribute (GET). The response from a GET operation includes the specific attribute identified by the URI.

### Navigation Paths to attribute

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      attributes
```

### Supported Methods for attribute

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** attribute

#### Read-only Elements for attribute

Table 56–19 lists the read-only elements for this resource.

**Table 56–19 Read-only Elements for `urn:oracle:webcenter:space:attribute`**

Element	Type	Description
name	String	Name of the custom attribute.
description	String	Description of the custom attribute.
type	String	Data type of the custom attribute.
value	String	Value of the custom attribute.

#### Resource Types Linked to From attribute

Table 56–20 lists the resource types that the client can link to from this resource.

**Table 56–20 Related Resource Types for `urn:oracle:webcenter:space:attribute`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:attribute</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

#### 56.3.4.11 `urn:oracle:webcenter:space:members`

Use this resource type to identify the URI to use to view a list of members for the space (GET). The response from a GET operation includes each member of the space, each member includes links to operate on that member.

#### Navigation Paths to members

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
```

#### Supported Methods for members

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** collection of members
- POST – Adds a member to the space.
  - **request - body:** member
  - `<member>`

```
<name>vicki</name>
<role>Participant</role>
</member>
```

- DELETE – Removes the named member from the space. You can obtain the member guid with [urn:oracle:webcenter:space:member](#).

– **request - body:** None

```
DELETE
http://hostname:portnum/rest/api/spaces/spacename/members/member_guid
```

### Writeable Elements of spaces:space:members

**Table 56–21 Writeable Elements of spaces:space:members**

Element	Type	Description
name	String	The member's name.
role	String	The member's role. Obtain this value from <a href="#">urn:oracle:webcenter:space:roles</a> .

### Resource Types Linked to From members

[Table 56–22](#) lists the resource types that the client can link to from this resource.

**Table 56–22 Related Resource Types for urn:oracle:webcenter:space:members**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:members</a> <a href="#">urn:oracle:webcenter:space:member</a>
urn:oracle:webcenter:parent	<a href="#">urn:oracle:webcenter:space</a>

#### 56.3.4.12 urn:oracle:webcenter:space:member

Use this resource type to identify the URI to use to view details for a space member and their current role assignments (GET). The response from a GET operation includes the specific member identified by the URI, including a hyperlink to the member's profile.

### Navigation Paths to member

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    space
      members
```

### Supported Methods for member

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** member

**Read-only Elements for member**

Table 56–23 lists the read-only elements for this resource.

**Table 56–23 Read-only Elements for `urn:oracle:webcenter:space:member`**

Element	Type	Description
guid	String	Global ID for the space member.
name	String	User ID of the space member.
role	String	Role assigned to the member.
displayName	String	Display name of the member.

**Resource Types Linked to From member**

Table 56–24 lists the resource types that the client can link to from this resource.

**Table 56–24 Related Resource Types for `urn:oracle:webcenter:space:member`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:member</a> <a href="#">urn:oracle:webcenter:people:person</a>
<a href="#">urn:oracle:webcenter:people:icon</a>	<a href="#">urn:oracle:webcenter:people:person</a>

**56.3.4.13 `urn:oracle:webcenter:space:lists`**

Use this resource type to identify the URI to use to view (GET) and add (POST) lists for the space. The response from a GET operation includes each list in the space, and each list includes links used to operate on that list. The response from a POST operation includes the list that was created in this collection of lists and a link to operate on that list.

**Navigation Paths to lists**

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resourceindex
      space
        lists
```

**Supported Methods for lists**

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - \* `startIndex`
    - \* `itemsPerPage`
    - \* `q`

You can search on name, title, description, creator, created, modifier, and modified.

For string type elements (that is, name, title, description, creator, and modifier), you can use the following supported operands: equals, not.equals, and contains. For example:

```
q=name:contains:issues
q=creator:equals:monty
```

For date type elements (that is, created and modified), you can use the following supported operands: equals, not.equals, greater.than, greater.than.or.equals, less.than, less.than.or.equals. For example:

```
q=created:greater.than:10-SEP-2009
```

\* projection - Allowed values are summary and details. The default is summary.

- **response - body:** collection of lists
- POST
  - **request - body:** list
  - **response - body:** list

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Resource Types Linked to From lists

[Table 56–25](#) lists the resource types that the client can link to from this resource.

**Table 56–25 Related Resource Types for urn:oracle:webcenter:space:lists**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:lists</a> <a href="#">urn:oracle:webcenter:space:list</a>

#### 56.3.4.14 urn:oracle:webcenter:space:list

Use this resource type to identify the URI to use to view (GET), update (PUT), and delete (DELETE) a list belonging to a space. The response from a GET operation includes the specific list identified by the URI. The response from a PUT operation includes the modified version of the list identified by the URI. The response to a DELETE operation is a 204 status code.

#### Navigation Paths to list

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resourceindex
      lists
        list
```

#### Supported Methods for list

The following methods are supported by this resource:

- GET
  - **request - body:** None

- **query parameters:** None
- **response - body:** list
- PUT
  - **request - body:** list
  - **response - body:** list
- DELETE
  - **request - body:** None
  - **response - body:** None

### Writable Elements for list

Table 56–26 lists the writable elements for this resource.

**Table 56–26 Writable Elements for `urn:oracle:webcenter:space:list`**

Element	Type	Required	Constraints	Description
name	String	Yes	1 or more characters	Name of the space list.
description	String	No	0 or more characters	Description of the list.
columns	<a href="#">urn:oracle:webcenter:space:list:columns</a>	Yes	1 or more characters	Columns that make up the list.

### Read-only Elements for list

Table 56–27 lists the read-only elements for this resource.

**Table 56–27 Read-only Elements for `urn:oracle:webcenter:list`**

Element	Type	Description
id	String	ID of the list.
name	String	Name of the list.
description	String	Description of the list.
scopeguid	String	Global ID of the parent space.
scopename	String	Name of the parent space.
creator	String	ID of the user that created the list.
author	<a href="#">personReference</a>	User information about the user that created the list, including GUID, ID, display name, and a link to the profile icon (same user as creator).
created	Date	Date the list was created.
modifier	String	ID of the user that last modified the list.
modifiedByUser	<a href="#">personReference</a>	User information about the user that last modified the list, including GUID, ID, display name, and a link to the profile icon (same user as modifier).
modified	Date	Date the list was last modified.
columns	String	Columns that make up the list.

## Resource Types Linked to From list

Table 56–28 lists the resource types that the client can link to from this resource.

**Table 56–28 Related Resource Types for `urn:oracle:webcenter:space:list`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:list</a> <a href="#">urn:oracle:webcenter:space:list:rows</a> <a href="#">urn:oracle:webcenter:space:list:columns</a>

### 56.3.4.15 `urn:oracle:webcenter:space:list:rows`

Use this resource type to identify the URI to use to view (GET) and create (POST) list rows (list items). The response from a GET operation includes each row in this list, each row includes links to operate on that row. The response from a POST operation includes the row that was created in this list and a link to operate on that row.

#### Navigation Paths to rows

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resourceindex
      lists
        list
          rows
```

#### Supported Methods for rows

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - \* `startIndex`
    - \* `itemsPerPage`
    - \* `q`

You can search on `name`, `title`, `description`, `creator`, `created`, `modifier`, and `modified`.

For string type elements (that is, `name`, `title`, `description`, `creator`, and `modifier`), you can use the following supported operands: `equals`, `not.equals`, `contains`, and `starts.with`. For example:

```
q=name:contains:issues
q=creator>equals:monty
```

For date type elements (that is, `created` and `modified`), you can use the following supported operands: `equals`, `not.equals`, `greater.than`, `greater.than.or.equals`, `less.than`, `less.than.or.equals`. For example:

```
q=created:greater.than:10-SEP-2009
```

- **response - body:** collection of rows
- POST
  - **request - body:** row
  - **response - body:** row

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Resource Types Linked to From rows

[Table 56–29](#) lists the resource types that the client can link to from this resource.

**Table 56–29 Related Resource Types for `urn:oracle:webcenter:space:list:rows`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:list:rows</a>
parent	<a href="#">urn:oracle:webcenter:space:list</a> <a href="#">urn:oracle:webcenter:space:list:row</a>

### 56.3.4.16 `urn:oracle:webcenter:space:list:row`

Use this resource type to identify the URI to use to view (GET), update (PUT), and delete (DELETE) a list row (list item). The response to a GET operation includes the specific row identified by the URI. The response to a PUT operation includes the modified version of the row identified by the URI. The response to a DELETE operation is a 204 status code.

### Navigation Paths to row

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resourceindex
      lists
        list
          rows
            row
```

### Supported Methods for row

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** row
- PUT
  - **request - body:** row
  - **response - body:** row
- DELETE
  - **request - body:** None
  - **response - body:** None

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Writable Elements for row

[Table 56–30](#) lists the writable elements for this resource.

**Table 56–30 Writable Elements for `urn:oracle:webcenter:space:list:row`**

Element	Type	Required	Constraints	Description
columns.column.id	String	Yes	1 or more characters	ID of the column (containing list item detail).
columns.column.name	String	No	1 or more characters	Name of the column.
columns.column.value	String	Yes	1 or more characters	Value of the column.

### Read-only Elements for row

[Table 56–31](#) lists the read-only elements for this resource.

**Table 56–31 Read-only Elements for `urn:oracle:webcenter:space:list:row`**

Element	Type	Description
id	String	ID of the row (list item).
listId	String	ID of the list.
scope	String	Global ID of the parent space.
creator	String	ID of the user that created the list item.
author	<a href="#">personReference</a>	User information about the user that created the list item, including GUID, ID, display name, and a link to the profile icon (same user as <code>creator</code> ).
created	Date	Date the list item was created.
modifier	String	ID of the user that last modified the list item.
modifiedByUser	<a href="#">personReference</a>	User information about the user that last modified the list item, including GUID, ID, display name, and a link to the profile icon (same user as <code>modifier</code> ).
modified	Date	Date the list item was last modified.

### Resource Types Linked to From row

[Table 56–32](#) lists the resource types that the client can link to from this resource.

**Table 56–32 Related Resource Types for `urn:oracle:webcenter:space:list:row`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:list:row</a>

#### 56.3.4.17 `urn:oracle:webcenter:space:list:columns`

Use this resource type to identify the URI to use to view (GET) and create (POST) list columns (list item detail). The response from a GET operation includes each column in this list, each column includes link to operate on that column. The response from a

POST operation includes the column created in this list and a link to operate on that column.

### Navigation Paths to columns

This section shows how the client can navigate through the hypermedia to access this resource:

```
resourceindex
  spaces
    resourceindex
      lists
        list
          columns
```

### Supported Methods for columns

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:**
    - \* `startIndex`
    - \* `itemsPerPage`
    - \* `q` - Search parameters `STARTS.WITH` and `END.WITH` are not supported.
  - **response - body:** collection of columns
- POST
  - **request - body:** column
  - **response - body:** column

For more information about query parameters, see [Section 53.5.2.5, "Templates."](#)

### Resource Types Linked to From columns

[Table 56–33](#) lists the resource types that the client can link to from this resource.

**Table 56–33 Related Resource Types for `urn:oracle:webcenter:space:list:columns`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:list:columns</a>
parent	<a href="#">urn:oracle:webcenter:space:list</a> <a href="#">urn:oracle:webcenter:space:list:column</a>

#### 56.3.4.18 `urn:oracle:webcenter:space:list:column`

Use this resource type to identify the URI to use to view (GET), update (PUT), and delete (DELETE) a list column (list item detail). The response from a GET operation includes the specific column identified by the URI. The response from a PUT operation includes the modified version of the column identified by the URI. The response from a DELETE operation is a 204 status code.

### Navigation Paths to column

This section shows how the client can navigate through the hypermedia to access this resource:

```

resourceindex
  spaces
    resourceindex
      lists
        list
          columns
            column

```

### Supported Methods for column

The following methods are supported by this resource:

- GET
  - **request - body:** None
  - **query parameters:** None
  - **response - body:** column
- PUT
  - **request - body:** column
  - **response - body:** column
- DELETE
  - **request - body:** None
  - **response - body:** None

### Writable Elements for column

[Table 56–34](#) lists the writable elements for this resource.

**Table 56–34** Writable Elements for `urn:oracle:webcenter:space:list:column`

Element	Type	Required	Constraints	Description
columns.column.id	String	Yes	1 or more characters	ID of the column (containing list item detail).
columns.column.name	String	No	1 or more characters	Name of the column.
columns.column.value	String	Yes	1 or more characters	Value of the column.

### Read-only Elements for column

[Table 56–35](#) lists the read-only elements for this resource.

**Table 56–35** Read-only Elements for `urn:oracle:webcenter:space:list:column`

Element	Type	Description
id	String	ID of the column (list item detail).

### Resource Types Linked to From column

[Table 56–28](#) lists the resource types that the client can link to from this resource.

**Table 56–36 Related Resource Types for `urn:oracle:webcenter:space:list:column`**

rel	resourceType
self	<a href="#">urn:oracle:webcenter:space:list:column</a>

## 56.4 Exposing Enterprise Applications in Spaces

You can expose various enterprise applications inside the Spaces application, including:

- WebCenter Portal applications—applications developed using the WebCenter Portal: Framework.
- Other portals in the WebCenter Suite—for example, Oracle Portal.
- Oracle Applications Unlimited products—for example, E-Business Suite, Siebel, PeopleSoft, and JDEdwards.
- Other custom applications—applications developed using non-Oracle platforms.

Technologies such as WSRP, Oracle JSF Portlet Bridge, ADF task flows, and WebCenter Portal support for external applications, enable the Spaces application to consume and present application data in a unified way. The following sections tell you how.

This section includes the following subsections:

- [Exposing WebCenter Portal Applications in Spaces](#)
- [Exposing Oracle Applications in Spaces](#)
- [Exposing Non-Oracle Applications in Spaces](#)

### 56.4.1 Exposing WebCenter Portal Applications in Spaces

You can expose WebCenter Portal: Framework applications, built using the WebCenter Portal: Framework, as portlets and task flows in the Spaces application:

- **Portlets:** Web components that are deployed inside a container and generate dynamic content. For more information, see [Chapter 57, "Introduction to Portlets."](#)
- **Oracle JSF Portlet Bridge:** A technology that enables you to easily expose existing ADF applications and task flows as JSR 168 portlets. For more information, see [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge."](#)
- **Task flows:** ADF navigational components that define the transition between states and activities using call methods on managed beans, evaluating an EL expression, and so on. For more information see, "Getting Started with ADF Task Flows" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### 56.4.2 Exposing Oracle Applications in Spaces

You can expose Oracle Applications Unlimited products, for example, E-Business Suite, Siebel, PeopleSoft, and JDEdwards, in the Spaces application, using:

- **Web services and ADF:** Enterprise applications like Siebel expose various web service interfaces. You can leverage these web service interfaces to build data controls, ADF task flows, and portlets that can be consumed in Spaces.

- **Prebuilt portlets:** Enterprise applications such as Oracle E-Business Suite ship portlets out of the box that you can register with Spaces and consume in the same way as any other portlet.

### 56.4.3 Exposing Non-Oracle Applications in Spaces

You can expose Web applications developed using non-Oracle platforms in the Spaces application, as follows:

- **Support for external applications:** External applications enable credential stores to pass mapped user identities to web applications that require their own authentication. For more information, see "Registering External Applications" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* and "Registering External Applications" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Composer iframe-level integration:** The Composer *Web Page* page style and component displays any Web page content, including pages from applications built using a different Web technology. For more information, see "Adding a View into Another Web Page to a Page" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Raw HTML markup injection in Composer:** The Composer *HTML Markup* layout component injects HTML or JavaScript snippets into pages in Spaces. You can use this component to display content from an external source. For more information see "Adding Markup, Such as HTML, JavaScript, and EL, to a Page" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **OmniPortlet:** A portlet that publishes data from various data sources using a variety of layouts. For more information, see [Chapter 63, "Creating Portlets with OmniPortlet."](#)

# Part X

---

## Working with Portlets and Pagelets

Part X contains the following chapters:

- [Chapter 57, "Introduction to Portlets"](#)
- [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge"](#)
- [Chapter 59, "Building Standards-Based Java Portlets Using JSR 286"](#)
- [Chapter 60, "Building Java Portlets Using the Oracle PDK-Java"](#)
- [Chapter 61, "Deploying Portlet Producers"](#)
- [Chapter 62, "Consuming Portlets"](#)
- [Chapter 63, "Creating Portlets with OmniPortlet"](#)
- [Chapter 64, "Creating Content-Based Portlets with Web Clipping"](#)
- [Chapter 65, "Creating Pagelets with Oracle WebCenter Portal's Pagelet Producer"](#)

---

---

## Introduction to Portlets

This chapter provides an overview of portlets and describes their uses. It explains portlet anatomy and the resources you can use to create portlets. This chapter also explains the features, technologies, and tools to help you decide which portlet building technology best suits your needs.

This chapter includes the following sections:

- [Section 57.1, "Introduction to Portlets"](#)
- [Section 57.2, "Portlet Anatomy"](#)
- [Section 57.3, "Portlet Resources"](#)
- [Section 57.4, "Portlet Development"](#)

### 57.1 Introduction to Portlets

A *portlet* is a reusable web component that can draw content from many different sources. Portlets can contain anything from static HTML content to Java controls to complex web services and process-heavy applications.

Portlets provide a means of presenting data from multiple sources in a meaningful and related way. Portlets can display excerpts of other web sites, generate summaries of key information, perform searches, and access assembled collections of information from a variety of data sources. Because several different portlets can be placed on a single page, users benefit from a single-source experience even though, in reality, the content may be derived from multiple sources.

Portlets can communicate with each other using events and other techniques. A single portlet can also have multiple instances—in other words, it can appear on a variety of different pages within a single portal, or even across multiple portals. Page designers can customize portlets to meet the needs of their specific audience. With the correct privileges, individual end users can further personalize portlets for their own particular requirements.

Oracle WebCenter Portal supports the development of portlets using JSR 286, an industry standard. You can also create portlets from existing JSF applications using the Oracle JSF Portlet Bridge. For more information, see [Section 57.3, "Portlet Resources."](#)

### 57.2 Portlet Anatomy

Portlet anatomy is the visual representation of the portlet on a page. [Figure 57–1](#) shows some aspects of portlet anatomy that you might expect to see in a typical portlet in a WebCenter Portal: Framework application. Note that the same portlet displayed in a different application could look different.

**Figure 57–1 A Sample Portlet Showing Typical Portlet Anatomy**

Aspects of portlet anatomy (some, but not all, of which are illustrated in [Figure 57–1](#)) include:

- **Portlet chrome**—A collective term for the different types of decoration that surround the portlet, including the header, shadow, resize handle, Actions menu, and icons.
- **Portlet header**—The area of the portlet that displays the portlet icon, title, **Actions** menu, and **Customize** and **Personalize** icons.
- **Portlet icon**—A small image in the portlet header used to visually identify the portlet.
- **Portlet title**—Text in the portlet header that indicates the purpose of the portlet. End users may be able to personalize this title at runtime to make it more meaningful to their particular usage.
- **Personalize icon**—An icon in the portlet header that enables end users to make changes to the portlet that only they can see.

The **Personalize** icon is displayed only to authenticated users (that is, users who are logged in). It does not display to public users or unauthenticated users. You must implement some form of application security for users to be able to personalize their portlet views.

- **Customize icon**—An icon in the portlet header that enables application administrators to make changes to the default settings of the portlet at runtime. These changes are visible to all users.

A typical customization setting is the portlet title. At runtime, the application administrator can determine what title should appear in the portlet header.

- **Actions icon**—An icon in the portlet header that displays the **Actions** menu when clicked.
- **Actions menu**—A menu that lists various actions that users can perform on the portlet. The actions listed depend on whether the user is logged in, what privileges that user has, the functionality provided by the portlet, and the options specified when the portlet was added to the page at design time. Actions include **Move**, **Remove**, **Refresh**, **Move Up**, and **Move Down**. The **Actions** menu also provides

access to other portlet modes available for the portlet, such as About, Help, Configure, and Print.

If the user who added the portlet to the page chose to not display the portlet header, the **Actions** menu is displayed on a fade in/fade out toolbar that displays on mouse rollover.

- **Minimize/Restore icon**—The **Minimize** icon in the portlet header collapses the portlet content so that only the portlet header is displayed. This saves space on the page and reduces clutter without permanently removing the portlet from the page. When the portlet is minimized, the icon becomes a **Restore** icon that displays the content again when clicked.
- **Resize handle**—An area at the bottom right of the portlet that enables users to change the size of the portlet.
- **Scroll bars**—Display when the portlet content does not fit the width and height specified for the portlet, providing access the content that is not initially displayed.
- **Portlet content**—The actual content of the portlet as determined by the portlet logic.

The portlet anatomy rendered on the page is controlled by two factors:

- The portlet's own logic, as determined by the portlet developer. This includes which portlet modes are supported by the portlet.
- The attributes of the portlet tag that binds the portlet to the page, as determined by the application developer who added the portlet to the page at design time.

For example, when designing the portlet, the portlet developer may implement Help mode for the portlet. When an application developer adds the portlet to the page, he or she can determine, using the portlet tag attribute `isHelpModeAvailable`, whether or not to include the **Help** command in the portlet's **Actions** menu. If the application developer sets `isHelpModeAvailable` to false, the **Help** command is not included in the **Actions** menu even though it is provided in the portlet logic. Conversely, if the portlet developer has not implemented Help mode for a portlet, the **Help** command is not displayed in the **Actions** menu, even if `isHelpModeAvailable` is set to true.

For information about the different attributes available for the portlet tag, see [Section 62.7, "Setting Attribute Values for the Portlet Tag."](#)

## 57.3 Portlet Resources

The portlets in your applications can come from a variety of sources, including other Oracle products and third-party vendors. Portlet resources also include custom built Java portlets built using WebCenter Portal's Java portlet wizard for JSR 286. Each of these resources offers different product features and are targeted toward users with different levels of experience.

This section includes the following subsections:

- [Section 57.3.1, "Prebuilt Portlets"](#)
- [Section 57.3.2, "Java Server Faces \(JSF\) Portlets"](#)
- [Section 57.3.3, "Custom Java Portlets"](#)
- [Section 57.3.4, "OmniPortlet"](#)
- [Section 57.3.5, "Web Clipping Portlet"](#)
- [Section 57.3.6, "Portlet Technologies"](#)

## 57.3.1 Prebuilt Portlets

### What Are They?

Oracle provides integration with other Oracle applications by enabling you to expose functionality as portlets:

- **Peoplesoft**—You can expose Peoplesoft applications as WSRP portlets. For more information, see [Section 54.5, "Integrating PeopleSoft Applications."](#)
- **JD Edwards**—You can expose JD Edwards standalone regions as portlets. For more information, see [Section 54.4, "Integrating JD Edwards Applications."](#)
- **Oracle E-Business Suite**—Oracle E-Business Suite provides several prebuilt portlets, such as Applications Navigator, Favorites, and Worklist, that you can add to your Framework applications. For more information, see [Section 54.3, "Integrating E-Business Suite Applications."](#)

Other prebuilt portlets are available through Oracle's partnerships with leading system integrators, software vendors, and content providers.

### Who Is the Intended User?

Fully developed, downloadable portlets are best suited for use by application developers who understand how to download, install, and register producers in WebCenter Portal. They are available for use by all levels of experience.

### When Should They Be Used?

Use prebuilt portlets when your needs are met by the functions the portlets offer and the level of personalization readily available is sufficient to complete the desired task.

Consider alternatives when you want to extend or personalize the portlet, for example, when you need a different user interface or when the functionality you require is not available out of the box.

## 57.3.2 Java Server Faces (JSF) Portlets

### What Are They?

*JSF portlets* are created from JSF applications using the *Oracle JSF Portlet Bridge*. The Oracle JSF Portlet Bridge enables application developers to expose their existing JSF applications and task flows as JSR 286 Java portlets. The Oracle JSF Portlet Bridge simplifies the integration of JSF applications with WSRP portlet consumers, such as WebCenter Portal.

JSF portlets do not require separate source code from that of the JSF application. Since these portlets are created using the Oracle JSF Portlet Bridge, you need only maintain one source for both your application and your portlets. Similarly, when you deploy your portletized JSF application, the JSF portlets are also deployed with it. Therefore, using the Oracle JSF Portlet Bridge eliminates the requirement to store, maintain, and deploy your portlets separately from your application.

For more information about creating JSF portlets, see [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge."](#)

### Who Is the Intended User?

Application developers with knowledge of Faces and WSRP.

### When Should They Be Used?

JSF portlets are best suited when application developers intend to display content from a JSF application, or from individual task flows within the application, as a portlet without hosting the entire application, or without separately building a portlet for the same. When portletized, the consumption of the portlet is the same as registering any WSRP producer.

## 57.3.3 Custom Java Portlets

Custom Java portlets are portlets that you write yourself, in Java, using the Java Portlet Specification 2.0 (JSR 286). WebCenter Portal provides a declarative wizard in JDeveloper for simplifying the creation of standards-based JSR 286 Java portlets. This wizard assists in the construction of the framework within which you create the portlet.

---

---

**Note:** You can consume legacy JSR 168 and WSRP 1.0 portlets in your applications, for example from Oracle WebLogic Portal. There is no need to convert these portlets to JSR 286 first. However, when creating new Java portlets we recommend using JSR 286 to take advantage of features such as public render parameters and portlet events.

---

---

### Who Is the Intended User?

Use of the wizard is easy, but creation of the portlet logic is best performed by experienced and knowledgeable Java developers who are comfortable with JSR 286 and who understand the configuration of producers.

### When Should They Be Used?

Consider using custom Java portlets when you cannot find a prebuilt portlet or existing JSF application to address your requirements.

Use custom Java portlets when you have very specialized business rules or logic, or when you require personalized authentication, granular processing of dynamic results, or complete user interface control.

For more information about creating custom Java portlets, see [Chapter 59, "Building Standards-Based Java Portlets Using JSR 286."](#)

## 57.3.4 OmniPortlet

*OmniPortlet* is a declarative portlet-building tool that enables you to build portlets against a variety of data sources, including XML files, character-separated value files (CSV, for example, spreadsheets), web services, databases, and web pages. OmniPortlet users can also choose a prebuilt layout for the data. Prebuilt layouts include tabular, news, bullet, form, chart, or HTML. HTML layout enables OmniPortlet users to write their own HTML and inject the data into the HTML.

### Who Is the Intended User?

Business users with a minimum knowledge of the URLs to their targeted data and limited programming skills may find OmniPortlet a valuable tool.

**When Should It Be Used?**

Use OmniPortlet when you want to build portlets rapidly against a variety of data sources with a variety of layouts. Consider alternatives when you want complete control of the design and functionality of the portlet.

For more information about OmniPortlet, see [Chapter 63, "Creating Portlets with OmniPortlet."](#)

As an alternative to OmniPortlet, if you want to expose data from a SQL database or web service, you should consider using business mashups. For more information, see the "Creating Business Mashups" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 57.3.5 Web Clipping Portlet

---

---

**Note:** The Web Clipping portlet is deprecated in Release 11g (11.1.1.7.0). Consider using a clipper pagelet using Oracle WebCenter Portal's Pagelet Producer. For more information, see the "Managing Oracle WebCenter Portal's Pagelet Producer" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

**What Is It?**

The Web Clipping portlet is a browser-based declarative tool that enables the integration of any web application with a Framework application. The Web Clipping portlet is designed to provide quick integration by leveraging the web application's existing user interface. The Web Clipping portlet has been implemented as an Oracle PDK-Java portlet.

To create a Web Clipping portlet, the Framework application developer uses a web browser to navigate to a web page that contains desired content. Through the Web Clipping Studio, the application developer can drill down through a visual rendering of the target page to choose the desired content.

**Who Is the Intended User?**

The Web Clipping portlet is best suited for use by application developers and component developers who want to leverage an existing web page for rapid portlet development. This portlet can be added to a page by any user with the appropriate privileges.

**When Should It Be Used?**

Use Web Clipping when you want to repurpose live content and functionality from an existing web page and expose it in your Framework application as a portlet. Consider alternatives to change the way information is presented in the clipped portlet. That is, you do not want to control the User Interface (UI) or application flow, and you are accessing web-based applications. For a greater level of control, use OmniPortlet's Web Page data source instead of the Web Clipping portlet. (For more information, see [Section 57.3.4, "OmniPortlet."](#))

For more information about using the Web Clipping portlet, see [Chapter 64, "Creating Content-Based Portlets with Web Clipping."](#)

## 57.3.6 Portlet Technologies

When creating new portlets, there are several different technologies you can use. The technology you use depends on several factors.

[Table 57–1](#) outlines the implications of choosing a particular portlet technology for implementing components for use with WebCenter Portal against various criteria.

**Table 57–1 Portlet Building Technologies Comparison Matrix**

Local Oracle ADF Pages and Task Flows	WebCenter WSRP Producer for .NET	JSR 286 Portlets	JSF Portlets
<b>Distributed Architecture</b>			
No.	Yes, using WSRP SOAP/HTTP.	Yes, using WSRP SOAP/HTTP.	Yes, using WSRP SOAP/HTTP.
<b>Data Access Support</b>			
Full support for working with databases, web services, and legacy systems.	No restrictions. This leverages the underlying .NET framework, which provides data access to a wide variety of data repositories.	No restrictions, but must be implemented by the portlet developer, possibly using a third party framework.	Full support for working with databases, web services, and legacy systems.
<b>Navigation/Control Flow Support</b>			
Provides comprehensive support for declarative navigation.	Provides comprehensive support for declarative navigation.	No restrictions, but must be implemented by the portlet developer, possibly using a third party framework.	Provides comprehensive support for declarative navigation.
<b>Richness of UI</b>			
Provides a rich, web-based UI with many AJAX-enabled components.	No restrictions. Supports both standard AJAX and ASP.NET AJAX toolkit.	No restrictions, but must be implemented by the portlet developer, possibly using a third party framework.	Provides a rich, web-based UI with many AJAX-enabled components.
<b>Security</b>			
Fully integrated with the application	User identity propagated using WS-Security or asserted by consumer using WSRP.  Authorization checks must be implemented by the developer.  User profile information can be passed using WSRP user profile items.	User identity propagated using WS-Security or asserted by consumer using WSRP.  Authorization checks must be implemented by the developer.  User profile information can be passed using WSRP user profile items.	User identity propagated using WS-Security.  Authorization is implemented by Oracle ADF.
<b>Inter-Component Communication (Events)</b>			
ADF contextual events enable task flows to communicate.	We provide samples to show how it can be accomplished client-side. Current version does not support WSRP server-side eventing model.	Full support for JSR 286 events, including automatic event delivery between portlets and event mapping between portlet events and ADF contextual events in the consumer.	As per JSR 286 portlets in addition to ADF contextual events allowing task flows to communicate as in the local case.
<b>Consumer to Component Interaction (Parameters)</b>			

**Table 57–1 (Cont.) Portlet Building Technologies Comparison Matrix**

<b>Local Oracle ADF Pages and Task Flows</b>	<b>WebCenter WSRP Producer for .NET</b>	<b>JSR 286 Portlets</b>	<b>JSF Portlets</b>
Task flow input parameters can take values from various sources.	Full support for WSRP portlet parameters. All parameters can be passed from the consumer application.	Full support for JSR 286 parameters, including passing public parameter values to and from the consumer and automatic sharing of parameter values between portlets.	As per JSR 286 portlets in addition to task flow input parameters taking values from various sources in the consumer application as in the local case.
<b>Performance and Caching</b>			
No additional network hop since the component runs on the local server.	Remote component requires additional network hop.  Configuration parameters allow for resources (CSS, JavaScript, and .axd resource files) to be proxied via the consumer or direct access to reduce load and take advantage of browser caching.	Remote component requires additional network hop.  Resources should be proxied by the consumer.  Component performance depends on implementation.  Expires and validation based caching are supported and controlled by the portlet developer.	Remote component requires additional network hop.  Many resources are proxied via the consumer.  Heavyweight nature of framework means simple applications are likely to suffer performance-wise versus handcrafted JSR 286 equivalents. However, for applications offering more complex functionality, the performance benefits of using the framework (for example, partial page rendering) become more apparent.  JavaScript, CSS, and other resources are cached in the browser. Caching is controlled by the framework.
<b>Concurrency</b>			
Multiple task flows are invoked sequentially.	Portlets are invoked in parallel.	Portlets are invoked in parallel.	Portlets are invoked in parallel.
<b>Geometry Management</b>			
Components are rendered directly in the containing page.	Portlets are automatically rendered in a proxied inline frame and resized accordingly. The slider bars are hidden from view.	Portlet geometry and inline versus framed rendering is controlled by the portlet developer.  Complex UIs are more likely to require rendering in an inline frame.	Portlets must be rendered in an inline frame.
<b>Use of JavaScript</b>			

**Table 57–1 (Cont.) Portlet Building Technologies Comparison Matrix**

<b>Local Oracle ADF Pages and Task Flows</b>	<b>WebCenter WSRP Producer for .NET</b>	<b>JSR 286 Portlets</b>	<b>JSF Portlets</b>
<p>JavaScript used heavily as a fundamental part of the framework to provide a rich user experience.</p> <p>Developer does not generally need to write JavaScript.</p>	<p>JavaScript used heavily as a fundamental part of the framework to provide a rich user experience.</p> <p>Developer does not generally need to write JavaScript, but samples are provided to show how JavaScript can be used.</p> <p>All scripts can be proxied via the consumer.</p>	<p>Level of JavaScript use and packaging are controlled by the portlet developer.</p> <p>Developers must be aware of special considerations regarding the use of JavaScript if portlets are to be rendered inline.</p>	<p>JavaScript used heavily as a fundamental part of the framework to provide a rich user experience.</p> <p>Developer does not generally need to write JavaScript.</p> <p>All scripts must be proxied via the consumer.</p>
<b>Skills Requirements/Ease of Development</b>			
<p>Requires knowledge of ADF and possibly Java.</p> <p>ADF provides an integrated framework across all layers.</p> <p>JDeveloper provides a fully integrated environment for developing ADF applications. This includes declarative options for all layers of the framework.</p>	<p>Requires knowledge of .NET web parts development or ASP.NET web application development.</p>	<p>Requires knowledge of Java, Java portlets, and any other frameworks used to implement components.</p> <p>Development time comparable with that required to develop a servlet-based component.</p>	<p>Requires knowledge of ADF and possibly Java. Development time is likely to be reduced (versus handcrafted portlets) for all but the most simple of applications due to the rich UI and control framework provided by ADF.</p> <p>ADF provides an integrated framework across all layers.</p> <p>JDeveloper provides a fully integrated environment for developing ADF applications. This includes declarative options for all layers of the framework.</p>
<b>Debugging</b>			
<p>JDeveloper provides a comprehensive solution for debugging application code.</p>	<p>.NET framework provides a comprehensive solution for debugging application code and network trace for SOAP and HTTP traffic.</p> <p>Log4net plug-in for WSRP consumer-producer debug messages.</p>	<p>Made more difficult by remote nature of deployment.</p> <p>Producer provides tool for monitoring consumer-producer communication.</p> <p>JDeveloper provides a comprehensive solution for debugging application code.</p>	<p>Made more difficult by remote nature of deployment.</p> <p>Producer provides tool for monitoring consumer-producer communication.</p> <p>JDeveloper provides a comprehensive solution for debugging application code.</p>
<b>Deployment</b>			

**Table 57–1 (Cont.) Portlet Building Technologies Comparison Matrix**

<b>Local Oracle ADF Pages and Task Flows</b>	<b>WebCenter WSRP Producer for .NET</b>	<b>JSR 286 Portlets</b>	<b>JSF Portlets</b>
Components are deployed as part of the client application. Entire application can be packaged into a single EAR file and deployed.	Deployment requires copying .NET applications under a particular folder hierarchy and filling out a configuration XML file. Components can easily be run standalone under this folder hierarchy if required.	Made more complex by distributed nature of deployment and multiple applications.	Made more complex by distributed nature of deployment and multiple applications. Components can easily be run standalone if required.
<b>Level of Support</b>			
The ADF framework is an Oracle product and is supported as such.	The WebCenter WSRP Producer for .NET is an Oracle product and is supported as such.	The JSR 286 producer is an Oracle product and is supported as such.	The ADF framework, Oracle JSF Portlet Bridge, and JSR 286 producer are Oracle products and are supported as such.

## 57.4 Portlet Development

This section includes the following subsections:

- [Section 57.4.1, "Portlet Modes"](#)
- [Section 57.4.2, "Interportlet Communication"](#)
- [Section 57.4.3, "Portlet Personalization and Customization"](#)
- [Section 57.4.4, "Portlet Performance"](#)
- [Section 57.4.5, "Multilanguage Portlets"](#)
- [Section 57.4.6, "Portlet Deployment"](#)

### 57.4.1 Portlet Modes

Portlet modes exhibit the runtime functionality seen by users. WebCenter Portal supports the following standard portlet modes:

- [View Mode](#)
- [Edit Mode](#)
- [Edit Defaults Mode](#)
- [Help Mode](#)
- [About Mode](#)

WebCenter Portal defines an extended set of modes that it supports. Different modes are available to JSR 286 portlets. For example, the Create JSR 286 Java Portlet Wizard includes Print mode, which you can use to provide a printer-friendly version of the portlet.

If you are coding portlets to JSR 286, then you can also declare your own custom portlet modes in the `portlet.xml` file. You can use these to accommodate any other functionality you may want the portlet to provide.

Defining custom portlet modes is especially useful if the portlet must interoperate with portal implementations from other vendors. You can offer any of these modes to users. In fact, it is recommended that some modes like Edit Defaults are offered.

---

---

**Note:** Third party portal products may have their own set of extended modes (JSR 286 custom modes) that producers can offer. In Framework applications, the chrome UI for portlets shows only the custom modes that are defined in WebCenter Portal. Arbitrary custom modes that a third party or custom portlet producer offers are ignored and therefore are not supported.

---

---

This section includes the following subsections:

- [Section 57.4.1.1, "View Mode"](#)
- [Section 57.4.1.2, "Edit Mode"](#)
- [Section 57.4.1.3, "Edit Defaults Mode"](#)
- [Section 57.4.1.4, "Help Mode"](#)
- [Section 57.4.1.5, "About Mode"](#)

### 57.4.1.1 View Mode

A portlet uses *View mode* to appear on a page with other portlets. This is the mode most people think about when they envision a portlet. A JSR 286 portlet must have a View mode, other modes are optional.

When developing portlets, you must consider all of the factors that may influence the portlet's appearance on the page, such as the portlet's containing object and the other portlets with which your portlet shares the page. For example, suppose you choose to place your portlet inside an HTML table cell. The portlet should display only content that can be rendered within a table cell. Furthermore, the actual size of the table cell may vary depending on end user settings, the browser width, and the amount and style of content in the portlet.

**57.4.1.1.1 HTML Guidelines for Rendering Portlets** Plain HTML is the most basic way to render portlets and provides a great deal of flexibility to portlet developers. You can use almost any standard HTML paradigm, such as links, forms, images, and tables, if it can display within an HTML table cell. Improperly written HTML may appear inconsistently across different browsers and, in the worst case, could cause parts of your page to not appear at all. Ensure that you adhere to the following rules:

- **Use standard HTML**—The official HTML specification is available from the W3C. For more information, see <http://www.w3c.org/>.
- **Avoid lengthy, complex HTML**—The HTML you use affects the perceived performance of your site. Users judge performance based on how long it takes for them to see the page they requested, and browsers require time to interpret and display HTML. If portlets must render complex HTML or wait for external resources, such as third party applications, then it can greatly slow down the rendering of the page.
- **Avoid unterminated and extraneous tags**—The behavior of pages with improperly terminated tags is unpredictable because it depends on what the browser chooses to do.
- **Consider restrictions imposed by container objects**—If your portlet is contained inside an HTML element, such as a table cell, then you must ensure that your portlet can be rendered within that container. For example, if you place a portlet in a table cell, then you cannot use frames in the portlet because they do not appear when inserted in a table.

- **Keep portlet content concise**—Do not try to take full screen content and expose it through a small portlet. You may end up with portlet content too small or cramped for smaller monitors.
- **Do not create fixed-width HTML tables in portlet**—You have no way to tell how wide a column your portlet has on a user's page. If your portlet requires more room than given, then it might overlap with another portlet in some browsers.
- **Avoid long, unbroken lines of text**—The result is similar to what happens with fixed-width tables. Your portlet might overlap other portlets in some browsers.
- **Check behavior when resizing the page**—Test your portlet's behavior when the browser window is resized to ensure that it works in different browser window sizes.
- **Check behavior when the default browser font changes**—End users may choose whatever font size they want and they can change it at any time. Your portlet should handle these situations gracefully.

**57.4.1.1.2 CSS Guidelines for Rendering Portlets** The fonts and colors of every portlet on a page should match the style settings chosen by the user. To accomplish this goal, these style selections are embedded automatically using Cascading Style Sheets (CSS). The portlets access these settings for their fonts and colors, either directly or using the Application Programming Interface (API).

While different browsers have implemented varying levels of the full CSS specification, WebCenter Portal uses a very basic subset of this specification to allow for consistent fonts and colors. CSS implementation levels should not affect the consistency of your pages across browsers. Consider the following guidelines for using CSS:

- **Use CSS instead of hard coding**—Hard coding fonts and colors is not advised. If you hard code fonts and colors, then your portlet may look out of place if the end user changes the page style settings. Since you have no way of knowing the end user's font and color preferences, you might also choose to hard code a font color that turns out to be the same as the user's chosen background color, in which case your portlet's content will not be visible to that user.
- **Use the CSS APIs to format your text**—The style sheet definition is available at the top of pages, but you should not call it directly. Instead, use the APIs provided to format your text appropriately. This method ensures that your portlets work even if the style sheet changes in the future.
- **Avoid using CSS for absolute positioning**—Since users may be able to personalize pages, you cannot guarantee that your portlet can appear in a particular spot on the page.
- **Follow accessibility standards**—You should ensure that you code your style sheets according to existing accessibility standards. For more information, see <http://www.w3c.org/TR/WCAG10-CSS-TECHS>.

### 57.4.1.2 Edit Mode

A portlet uses *Edit mode* to enable users to *personalize* the behavior of the portlet. Personalizations are visible only to the user who performs them, not to other users. Edit mode provides a list of settings that the user can change. These settings may include the title, type of content, formatting, amount of information, defaults for form elements, and anything else that affects the appearance or content of the portlet.

Users typically access a portlet's Edit mode by clicking the **Personalize** icon in the portlet header (Figure 57-2).

**Figure 57–2 The Personalize Icon for Accessing a Portlet's Edit Mode**

When users click **Personalize**, a new page appears in the same browser window. The portlet typically creates a web page representing a dialog to choose the portlet's settings. After applying the settings, users automatically return to the original page.

**57.4.1.2.1 Guidelines for Edit Mode Operations** The following guidelines should govern what you expose to users in Edit mode:

- **Enable users to personalize the title of the portlet**—The same portlet may be added to the same page several times. Enabling the end user to personalize the title helps alleviate confusion.
- **If using caching, invalidate the content**—If personalizations cause a change in portlet display or content, then you must ensure that the portlet content is regenerated from the cache. If you do not do this, the user may see incorrect content.
- **Do not use Edit mode as an administrative tool**—Edit mode is meant to give end users a way of changing the behavior of portlets. If you want to change producer settings or perform other administrative tasks, then you should create secured portlets specifically for these tasks.

**57.4.1.2.2 Guidelines for Buttons in Edit Mode** For consistency and user convenience, Edit mode should implement the following buttons in the order listed:

- **OK**—Saves the end user's personalizations and returns the portlet to View mode.
- **Apply**—Saves the end user's personalizations and reloads the current page.
- **Cancel**—Returns the portlet to View mode without saving changes.

### 57.4.1.3 Edit Defaults Mode

A portlet uses *Edit Defaults mode* to enable application administrators to customize the default behavior of a particular portlet instance at runtime. Edit Defaults mode provides a list of settings that the application administrator can change. These settings may include the title, type of content, formatting, amount of information, defaults for form elements, or anything that affects the appearance or content of the portlet.

Whereas personalizations affect a portlet instance for an individual user, *customizations* made in Edit Defaults mode affect the portlet instance for all users. Because Edit Defaults mode defines the system-level defaults for what a portlet displays and how it displays it, this mode should not be used as an administrative tool or for managing other portlets.

Application administrators access Edit Defaults mode, when editing a page, by clicking the **Customize** icon in the portlet header (Figure 57–3).

**Figure 57–3 The Customize Icon for Accessing a Portlet's Edit Defaults Mode**

When users click **Customize**, a new page appears in the same browser window. The portlet typically creates a web page representing a dialog to customize the portlet

instance settings. After applying the settings, users are automatically returned to the original page.

**57.4.1.3.1 Guidelines for Edit Defaults Mode Operation** The following guideline should govern what you expose to application administrators in Edit Defaults mode:

- **Do not use Edit Defaults mode as an administrative tool**—Edit Defaults mode gives application administrators a way of changing the behavior of their portlets. If you want to change producer settings or do other administrative tasks, then you should create secured portlets specifically for those tasks.

**57.4.1.3.2 Guidelines for Buttons in Edit Defaults Mode** For consistency and user convenience, Edit Defaults mode should implement the following buttons in the order listed:

- **OK**—Saves the application administrator's customizations and returns the portlet to View mode.
- **Apply**—Saves the application administrator's customizations and reloads the current page.
- **Cancel**—Returns the portlet to View mode without saving changes.

**57.4.1.3.3 Guidelines for Rendering Customization Values** When you show the forms used to change customization settings, you should default the values so that the application administrator does not have to constantly reenter settings. When rendering customization values, use the following sequence to provide consistent behavior:

- **Instance preferences**—Query and display system defaults for the portlet instance.
- **Portlet defaults**—If no system default customizations are found, then display general portlet defaults, which may be blank. General portlet defaults are sometimes hard coded into the portlet but should be overwritten by system defaults.

#### 57.4.1.4 Help Mode

A portlet uses *Help mode* to display information about the functionality of the portlet and how to use it. The user should be able to find useful information about the portlet, its contents, and its capabilities with this mode.

Users access a portlet's Help mode by choosing the **Help** option in the **Actions** menu (Figure 57-4).

**Figure 57-4 The Help Option in the Portlet Actions Menu**

**57.4.1.4.1 Guidelines for Help Mode** The following guideline should govern what you expose in Help mode:

- **Describe how to use the portlet**—Users may not be able to ascertain all the features your portlet offers just from its interface. Describe the features and how to get the most out of them.

### 57.4.1.5 About Mode

A portlet uses *About mode* to provide users with information such as the version of the portlet that is currently running, its publication and copyright information, and how to contact the portlet developer. Portlets that require registration could also use About mode to link to a web-based registration application or contact information.

Users access a portlet's About mode by choosing the **About** option in the **Actions** menu (Figure 57-5).

**Figure 57-5 The About Option in the Portlet Actions Menu**

A new page appears in the same browser window. The portlet can either generate the content for this page or take the user to an existing page or application.

**57.4.1.5.1 Guidelines for About Mode** The following guideline should govern what you expose to users in About mode:

- **Display relevant copyright, version, and developer information**—Users want to know what portlet they are using and where they can get more information. The About page may become important when supporting your portlets.

## 57.4.2 Interportlet Communication

Interportlet communication enables portlets to share data and react to events. WebCenter Portal supports interportlet communication through parameters and events:

- **Parameters**—Public render parameters enable interportlet communication by sharing parameter values between portlets. For example, if a Map portlet and a Weather portlet are both configured to use a Zipcode parameter, entering a zip code in the Map portlet updates the same parameter value in the Weather portlet.

For information about public render parameters, see [Section 59.3.5, "How to Use Public Render Parameters in JSR 286 Portlets."](#)

- **Events**—Events enable interportlet communication by providing portlets with the ability to respond to actions that occur outside of the portlet itself, for example, an action performed on the page that contains the portlet or on another portlet on the same page. Portlet events can be cascaded so that a portlet may respond to an

event by triggering an event of its own, which in turn affects other portlets on the page.

For information about portlet events, see [Section 59.3.6, "How to Use Portlet Events in JSR 286 Portlets."](#)

In WebCenter Portal, interportlet communication happens automatically by default, as long as parameters and events share the same name or define an appropriate alias. You do not need to supply any extra code to enable this communication. For more information, see [Section 62.6.3, "What You May Need to Know About Interportlet Communication."](#)

For interportlet communication guidelines specific to portlets created using the Oracle JSF Portlet Bridge, see [Section 58.5, "Using Events to Link JSF Portlets with Other Portlets."](#)

### 57.4.3 Portlet Personalization and Customization

Portlet preferences enable end users to personalize or customize portlets at runtime. Personalizations are visible only to the user that performs them; not to other users. Customizations are visible to all users who have not personalized the portlet.

Portlet preferences greatly enhance the reusability of portlets. The same portlet can be instantiated on multiple pages, or multiple times on the same page. Using portlet preferences, each instance of the portlet can behave in a different way, but still use the same code and user interface.

For example, by default when you create a JSR 286 portlet using the JDeveloper wizard, a portlet preference is created to enable users to change the title of the portlet at runtime. You can create additional portlet preferences, either during portlet creation or by editing the `portlet.xml` file after portlet creation, to enable users to perform other modifications on the portlet at runtime.

Portlet preferences are stored in the persistence store, along with information about the registration and portlet instances, such as registration and portlet handles. Portlet producers can use one of three types of persistence store:

- **Consumer**—A consumer persistence store ties the producer metadata to the consumer application. It is recommended that you should use a consumer persistence store in your production environment.
- **Database**—A database persistence store persists data using a relational database.
- **File**—A file-based persistence store persists data using the file system.

A file-based or consumer persistence store may be used for testing, since it removes the dependency on a database. But, for highly available configuration, it is recommended that you use a database or consumer persistence store.

By default, JSR 286 and JSF portlets use a consumer persistence store. For information about how to change this default setting, see [Section 59.3.13.1, "Setting Up a Persistence Store for a WSRP Producer."](#)

For information about migrating the persistence store, for example, when moving from a test to production environment, see [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store."](#)

### 57.4.4 Portlet Performance

*Caching* is a common technique for enhancing the performance of web sites that include a great deal of dynamic content. The overhead involved in retrieving data and

generating the output for dynamic content can be significantly reduced by proxying requests through a local agent backed by a large, low-latency data store, known as a cache. The cache agent responds to a request in one of two ways:

- If a valid version of the requested content exists in the cache, then the agent simply returns the existing cache copy, thus skipping the costly process of content retrieval and generation. This condition is known as a *cache hit*.
- If a valid version of the requested content does not exist in the cache, then the agent forwards the request to its destination and awaits the return of the content. The agent returns the content to the requester and stores a local copy in its cache for reuse if a subsequent request for the same content arises. This condition is known as a *cache miss*.

Portlet producers generate dynamic content (that is, portlets) and they reside remotely from the Framework application instance on which they are deployed. As such, caching might improve their performance. The architecture lends itself well to caching. You can cache the portlets rendered by your producer and reuse the cached copies to handle subsequent requests, minimizing the overhead your producer imposes on page assembly. Portlet caching is key to rapid response to user requests.

For JSR 286 portlets there are two different caching methods. The methods differ mainly in how they determine whether content is still valid:

- **Expiry-based caching**—When a producer receives a render request, it stamps its response with an expiry time. The rendered response remains in the cache and fills all subsequent requests for the same content until its expiry time passes. This caching scheme is perhaps the simplest and most performant because the test for cache validity requires very little overhead and does not involve any network round trips. Expiry-based caching suits applications where the content has a well-defined life span. For content with a less certain life span however, expiry-based caching is less effective.

Consider using expiry-based caching when the portlet content is static or when it is not critical that the most up-to-date content be displayed.

For information about how to implement expiry-based caching for your portlets, see [Section 59.3.9.1, "Implementing Expiry-Based Caching in JSR 286 Portlets."](#)

- **Validation-based caching**—When a producer receives a render request, it stamps a response with a version identifier (or ETag). The response goes into the cache, but before the consumer can reuse the cached content, it must determine whether the cached content is still valid. It sends the producer a render request that includes the version identifier of the cached content. The producer determines whether the version identifier remains valid. If the version identifier is still valid, then the producer immediately sends a lightweight response to the consumer without any content that indicates that the cached version can be used. Otherwise, the producer generates new content with a new version identifier, which replaces the previously cached version. In this form of caching, the consumer must always confirm with the producer whether the content is up to date. The validity of the cached copy is determined by some logic in the producer. The advantage of this approach is that the producer controls the use of cached content, rather than relying on a fixed period.

Consider using validation-based caching for portlets with dynamic content that changes frequently or unpredictably.

For information about how to implement validation-based caching for your portlets, see [Section 59.3.9.2, "Implementing Validation-Based Caching in JSR 286 Portlets."](#)

Caching rules can be specified at a portlet's container level, encoded in the portlet's own logic, or established through the portlet wizard. Provided it is specified, container-level caching takes over when caching is not part of the portlet code.

At the application level, WebCenter Portal: Framework supports use of a Java cache for the establishment of application-level caching rules.

When you enable caching at the application level, you instruct the Java cache to maintain a copy of the portlet content. When data that was previously cached is requested, no time is lost in contacting the data source and regenerating its content. Instead, the previously cached portlet content is returned.

JSF portlets and custom Java portlets support expiry- and validation-based caching. These portlets can be cached in full, or you can use Edge Side Includes (ESI) to cache fragments of portlets.

### 57.4.5 Multilanguage Portlets

There are three steps involved in making your portlets available in multiple languages:

- Declare the locales supported by the portlet using the `<supported-locale>` element in the `portlet.xml` file. For example:

```
<portlet id="1328624289503">
  ...
  <supported-locale>en</supported-locale>
  <supported-locale>fr</supported-locale>
  <supported-locale>es</supported-locale>
  ...
</portlet>
```

- Make the portlet metadata that is displayed in the portlet (for example, the portlet title, description, keywords, and so on) translatable.

You can include the translations directly in the `portlet.xml` file, for example:

```
<portlet id="1328624289503">
  <portlet-name>LotteryPortlet</portlet-name>
  <display-name xml:lang="en">Lottery Numbers</display-name>
  <display-name xml:lang="fr">Numéros de Loterie</display-name>
  <display-name xml:lang="es">Números de la Lotería</display-name>
  ...
  <supported-locale>en</supported-locale>
  <supported-locale>fr</supported-locale>
  <supported-locale>es</supported-locale>
  ...
</portlet>
```

Alternatively, you can provide translations in a separate resource bundle. You must declare the resource bundle in the `portlet.xml` file, for example:

```
<portlet id="1328624289503">
  <portlet-name>LotteryPortlet</portlet-name>
  <display-name>Lottery Numbers</display-name>
  ...
  <supported-locale>en</supported-locale>
  <supported-locale>fr</supported-locale>
  <supported-locale>es</supported-locale>
  <resource-bundle>portlet.resource.LotteryPortletBundle</resource-bundle>
  ...
</portlet>
```

Then, provide the translations in the resource bundle, for example:

```
# English Resource Bundle
#
# filename: LotteryPortletBundle_en.properties
javax.portlet.display-title=Lottery Numbers

# French Resource Bundle
#
# filename: LotteryPortletBundle_fr.properties
javax.portlet.display-title=Numéros de Loterie

# Spanish Resource Bundle
#
# filename: LotteryPortletBundle_es.properties
javax.portlet-title=Números de la Lotería
```

- Make the portlet content translatable the same way as you would for any other web application.

## 57.4.6 Portlet Deployment

Before a portlet can be registered with and consumed by an application, you must first deploy it. JSR 286 portlets are deployed to a *WSRP producer*, which is remote and communicates with the consumer application through Web Services for Remote Portlets (WSRP). JSF portlets are deployed as JSR 286 portlets, that is, to a WSRP producer, either from JDeveloper or manually.

WebCenter Portal supports WSRP versions 1.0 and 2.0. This standard provides support for interportlet communication and export or import of portlet customizations.

WSRP is a communication protocol between portlet consumer applications and portlet containers. WSRP is a standard that enables the plug-and-play of visual, user-facing web services with intermediary web applications.

Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as JSR 286, .NET, or Perl) and any WSRP portal. So, a portlet (regardless of language) deployed to a WSRP-enabled container can be rendered on any application that supports this standard.

[Figure 57–6](#) illustrates the basic architecture of WSRP producers.

**Figure 57–6 WSRP Producer Architecture**

When end users display a page in their web browsers, the flow of the request works as follows:

1. The end user requests a page from the web browser by entering a URL in the browser's Location field.
2. The browser transmits the request to the consumer application over HTTP.
3. The application contacts the portlet producers that provide the portlets that display on the requested page.
4. The producers make the necessary calls to their portlets so that the portlets generate the portlet content in the form of HTML or XML code.
5. The producers return the portlet content back to the consumer application using the WSRP 1.0 or 2.0 protocol:
6. The consumer application transmits the portlet content to the browser over HTTP.

To make standards-based portlets available to a consumer application in WebCenter Portal, you must package them in a Portlet Producer application and deploy them to a WSRP container. For more information, see [Chapter 61, "Deploying Portlet Producers."](#)

## Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge

This chapter describes how to use the Oracle JSF Portlet Bridge to expose a JSF application as a portlet.

This chapter includes the following sections:

- [Section 58.1, "Introduction to the Oracle JSF Portlet Bridge"](#)
- [Section 58.2, "Creating a Portlet from a JSF Application"](#)
- [Section 58.3, "Testing a JSF Portlet Using the Integrated WebLogic Server"](#)
- [Section 58.4, "Deploying JSF Portlets to a WebLogic Managed Server"](#)
- [Section 58.5, "Using Events to Link JSF Portlets with Other Portlets"](#)
- [Section 58.6, "What You May Need to Know When Creating a JSF Portlet"](#)
- [Section 58.7, "Copying a Runtime-Created Skin to a JSF Portlet Producer Application"](#)

### 58.1 Introduction to the Oracle JSF Portlet Bridge

The Oracle JSF Portlet Bridge enables application developers to quickly and easily expose their existing JSF applications and Oracle ADF applications and task flows as JSR 286 portlets.

---

---

**Note:** Unless otherwise noted, the term JSF applications encompasses Oracle ADF applications.

---

---

The Oracle JSF Portlet Bridge:

- Simplifies portlet development by enabling you to provide portlet functionality using JSF rather than relying on the JSR 286 portlet APIs.
- Simplifies exposing your JSF application to JSR 286 portlet consumers, such as Oracle WebCenter Portal.
- Eliminates the requirement to store, maintain, and deploy your portlets separately from your application by enabling the application to run simultaneously as a regular web application and as a portlet from the same installation.
- Enables you to create portlets at a more granular level by exposing task flows as portlets. Because portletized task flows are JSR 286 portlets, this also enables you to use your task flows in a distributed environment.

---

---

**Note:** The Oracle JSF Portlet Bridge extends the Apache Reference implementation of JSR 329. JSR 329 is the standards effort to define the functionality for the Portlet 2.0 Bridge for JavaServer Faces. Oracle is the specification lead for this standard. More information is available at:

<http://www.jcp.org/en/jsr/detail?id=329>

---

---

## 58.2 Creating a Portlet from a JSF Application

The Oracle JSF Portlet Bridge enables you to expose a JSF application or task flow as a portlet. You do this declaratively, using the Create Portlet Entry dialog; no coding is required. Using the Create Portlet Entry dialog, you can configure Oracle JSF Portlet Bridge on a JSF application to expose the application as a JSR 286 portlet. As part of this configuration, you indicate the initial JSF view (or task flow) to invoke when the portlet is rendered. From that point on the Oracle JSF Portlet Bridge works with the JSF application to navigate through the additional views that are reachable from this initial view. So in the typical situation when you are exposing the entire JSF application as the portlet, you configure the Oracle JSF Portlet Bridge to render the application's initial view in the portlet and the rest of the navigation works naturally within that same portlet.

This section includes the following subsections:

- [Section 58.2.1, "How to Create a JSF Portlet Based on a Page"](#)
- [Section 58.2.2, "What Happens When You Create a JSF Portlet Based on a Page"](#)
- [Section 58.2.3, "How to Create a JSF Portlet Based on a Task Flow"](#)
- [Section 58.2.4, "What Happens When You Create a Portlet Based on a Task Flow"](#)

### 58.2.1 How to Create a JSF Portlet Based on a Page

The simplest way to create a portlet from a JSF application is to generate a portlet based upon a page.

To create a JSF portlet from an existing application page:

1. In JDeveloper, open the application that contains the JSPX page that you want to portletize.
2. In the Application Navigator, right-click the JSPX page and choose **Create Portlet Entry**.
3. In the Create Portlet Entry dialog, in the **Portlet Name** field, enter a name for the portlet.
4. In the **Display Name** field, enter a descriptive name for your portlet.
5. In the **Portlet Title** field, enter a descriptive title for your portlet.

The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.

6. In the **Short Title** field, enter a shorter title for your portlet. This short title is displayed on the portlet header when the portlet appears on a page on a mobile device.

7. In the **Description** field, enter a description for your portlet.
8. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the page. This option is selected by default.

Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.

9. Click **OK**.

## 58.2.2 What Happens When You Create a JSF Portlet Based on a Page

When you create a JSF portlet based on a page, a `portlet.xml` file is created (or updated if it already exists) to contain the portlet entry ([Example 58-1](#)) for the page. The file is opened ready for viewing or editing. By default, the file is opened in Design view. To view or edit the source code, click the **Source** tab.

### **Example 58-1** Generated Portlet Entry for a Page

```
<portlet id="adf_jsf__testPage_jsp">
  <description>PortletBridgeApplication_testPage_jsp</description>
  <portlet-name>PortletBridgeApplication_testPage_jsp</portlet-name>
  <display-name>PortletBridgeApplication_testPage_jsp</display-name>
  <portlet-class>
    oracle.portlet.bridge.adf.application.ADFBridgePortlet
  </portlet-class>
  <init-param>
    <name>javax.portlet.faces.defaultViewId.view</name>
    <value>/myPage.jsp</value>
  </init-param>
  <supports>
    <mime-type>text/html</mime-type>
    <portlet-mode>VIEW</portlet-mode>
  </supports>
  <supported-locale>en</supported-locale>
  <portlet-info>
    <title>PortletBridgeApplication_testPage_jsp</title>
    <short-title>PortletBridgeApplication_testPage_jsp</short-title>
  </portlet-info>
  <supported-processing-event id="DepartmentSelectedEvent">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:DepartmentSelectedEvent
    </qname>
  </supported-processing-event>
  <supported-publishing-event id="DepartmentSelectedEvent">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:DepartmentSelectedEvent
    </qname>
  </supported-publishing-event>
  <supported-public-render-parameter>
    _adf_event_DepartmentSelectedEvent
  </supported-public-render-parameter>
  <container-runtime-option>
    <name>com.oracle.portlet.requireIFrame</name>
    <value>true</value>
  </container-runtime-option>
  <container-runtime-option>
    <name>com.oracle.portlet.minimumWsrpVersion</name>
    <value>2</value>
  </container-runtime-option>
</portlet>
```

The page you selected is used as the entry point for the portlet View mode. This is indicated in the `portlet.xml` file by the `javax.portlet.faces.defaultViewId.view` initialization parameter. You can manually edit the `portlet.xml` file to define the pages for other default and extended portlet modes supported by WebCenter Portal:

- Edit mode: `javax.portlet.faces.defaultViewId.edit`
- Help mode: `javax.portlet.faces.defaultViewId.help`
- About mode: `javax.portlet.faces.defaultViewId.about`
- Config mode: `javax.portlet.faces.defaultViewId.config`
- Edit Defaults mode: `javax.portlet.faces.defaultViewId.edit_defaults`
- Preview mode: `javax.portlet.faces.defaultViewId.preview`
- Print mode: `javax.portlet.faces.defaultViewId.print`

---

---

**Note:** The value for the `defaultViewId` is relative to the application context root and must always start with a `/`. In [Example 58-1](#), the value for `defaultViewId.view` is `/myPage.jspx`.

If you add `defaultViewId` for other portlet modes, then ensure that you also add the mode to the `<supports>` tag. For example, `<portlet-mode>HELP</portlet-mode>`.

---

---

For information about portlet modes, see [Section 57.4.1, "Portlet Modes."](#)

### 58.2.3 How to Create a JSF Portlet Based on a Task Flow

An advantage of using Oracle ADF is the existence of task flows, which provide a modular approach for defining control flow in an application. Instead of representing an application as a single large JSF page flow, you can break it up into a collection of reusable task flows. In each task flow, you identify application activities, the work units that must be performed in order for the application to complete. An activity represents a piece of work that can be performed when running the task flow.

Task flows can be unbounded or bounded:

- An **unbounded task flow** is a set of activities, control flow rules, and managed beans interacting to allow a user to complete a task. An unbounded task flow consists of all activities and control flows in an application that are not included within any bounded task flow.
- A **bounded task flow** is a specialized form of task flow, having a single entry point and one or more exit points. It contains its own set of private control flow rules, activities, and managed beans. An Oracle ADF bounded task flow allows reuse, parameters, transaction management, and reentry. It can have zero to many exit points. Bounded task flows can use pages or page fragments, however only those that use page fragments can be portletized.

A typical application is a combination of an unbounded and one or more bounded task flows. The application can then call bounded task flows from activities within the unbounded task flow. For more detailed information about bounded and unbounded

task flows, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

This section includes the following subsections:

- [Section 58.2.3.1, "Creating a Portlet From a Task Flow Using the Create Portlet Entry Dialog"](#)
- [Section 58.2.3.2, "Creating a Portlet From a Task Flow Using the Manage Portlet Entries of Task Flows Dialog"](#)

### 58.2.3.1 Creating a Portlet From a Task Flow Using the Create Portlet Entry Dialog

Use the Create Portlet Entry dialog to create a portlet from a single task flow.

To make a portlet from a task flow using the Create Portlet Entry dialog:

1. In JDeveloper, open the JSF application that contains the task flow from which you want to make a portlet.
2. In the Application Navigator, right-click the task flow that you want to portletize, and choose **Create Portlet Entry**.
3. In the Create Portlet Entry dialog, in the **Portlet Name** field, enter a name for the portlet.
4. If the task flow is unbounded, the **Entry Point View** dropdown list displays all the view activities of the task flow. From this dropdown list, choose the view activity to use as the entry point for the portlet. By default, the first view activity in the task flow is chosen.

If the task flow is bounded, there is only a single possible entry point, so you do not see the **Entry Point View** dropdown list.

5. In the **Display Name** field, enter a descriptive name for your portlet.
6. In the **Portlet Title** field, enter a descriptive title for your portlet.

The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.

7. In the **Short Title** field, enter a shorter title for your portlet. This short title is displayed on the portlet header when the portlet appears on a page on a mobile device.
8. In the **Description** field, enter a description for your portlet.
9. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the task flow. This option is selected by default.

Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.

10. Click **OK**.

### 58.2.3.2 Creating a Portlet From a Task Flow Using the Manage Portlet Entries of Task Flows Dialog

If your project includes a lot of task flows, you may find it easier to select the task flows to create as portlets from a list. You can do this using the Manage Portlet Entries

of Task Flows dialog. This dialog also lets you create portlets from multiple task flows at the same time, rather than having to create them individually.

To create a portlet from a task flow using the Manage Portlet Entries of Task Flows dialog:

1. From the main menu, choose **File** and then **New**.
2. In the New Gallery, expand **Web Tier**, select **Portlets** and then **Manage Portlet Entries of Task Flows**, and click **OK**.
3. In the Manage Portlet Entries of Task Flows dialog, use the shuttle buttons to select which task flows you want to create as portlets.
4. Select **Create portlet events for contextual events** to create portlet events in the `portlet.xml` file for any contextual events exposed by the task flows. This option is selected by default.

Portlet events enable a portlet to communicate with the page on which it resides and with other portlets on that page.

5. Click **OK** to create portlets for the selected task flows.

## 58.2.4 What Happens When You Create a Portlet Based on a Task Flow

When your portlet, or portlets, have been created, you should receive a message that says:

```
New portlet has been successfully created
```

In addition, the `portlet.xml` file is created. The `portlet.xml` file contains the portlet entry ([Example 58-2](#)) and is opened ready for viewing or editing.

### Example 58-2 Generated Portlet Entry for a Task Flow

```
<portlet id="adf_taskflow_WEB_INF_department_xml">
  <description>PortletBridgeApplication department</description>
  <portlet-name>PortletBridgeApplication_department</portlet-name>
  <display-name>PortletBridgeApplication_department</display-name>
  <portlet-class>oracle.portlet.bridge.adf.application.ADFBridgePortlet</portlet-class>
  <init-param>
    <name>javax.portlet.faces.defaultViewId.view</name>
    <value>
      /adf.task-flow?adf.tfDoc=/WEB-INF/adfp-portlet-bridge-container.xml
      &adf.tfId=adfp-portlet-bridge-container&_fragmentTaskFlowDoc=/WEB-INF/
      department.xml&_fragmentTaskFlowId=department
    </value>
  </init-param>
  <supports>
    <mime-type>text/html</mime-type>
    <portlet-mode>VIEW</portlet-mode>
  </supports>
  <supported-locale>en</supported-locale>
  <portlet-info>
    <title>PortletBridgeApplication_department</title>
    <short-title>PortletBridgeApplication_department</short-title>
  </portlet-info>
  <supported-publishing-event id="DepartmentSelectedEvent">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:DepartmentSelectedEvent
    </qname>
  </supported-publishing-event>
```

```

<supported-public-render-parameter>
  _adf_event_DepartmentSelectedEvent
</supported-public-render-parameter>
<container-runtime-option>
  <name>com.oracle.portlet.requireIFrame</name>
  <value>true</value>
</container-runtime-option>
<container-runtime-option>
  <name>com.oracle.portlet.minimumWsrpVersion</name>
  <value>2</value>
</container-runtime-option>
</portlet>

```

---

**Note:** The `portlet.xml` file can include multiple portlets and can have a combination of pages and task flows exposed as portlets. The file can also include standard JSR 286 (non bridge) portlets.

---

## 58.3 Testing a JSF Portlet Using the Integrated WebLogic Server

When you have created your JSF portlet you can test it using the Integrated WebLogic Server that comes packaged with JDeveloper.

### Before You Begin

Before you test your portletized page or task flow, it is a good idea to first test that the page or task flow works correctly in the running ADF application. You can do this, using the Integrated WebLogic Server, by running the page or, for task flows, adding the task flow to a page and running that page.

For more information, see the "Running an ADF application in Integrated WebLogic Server" section in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

To test a JSF portlet:

1. From the main menu, choose **Run** and then **Start Server Instance**.

It may take a few moments for the Integrated WLS to start. When the instance has started, you should see a message similar to the following in your Log panel:

```
IntegratedWebLogicServer started.
```

For more information, see [Section 3.4, "Working with the Integrated WebLogic Server."](#)

2. You are now ready to run your Portlet Producer application on the Integrated WLS. Because your web application and Portlet Producer application are one and the same (the Portlet Producer application is your existing web application with additional portlet artifacts), you can run your web application as you normally would (see the "Running an ADF application in Integrated WebLogic Server" section in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*) or you can run your portlet following the instructions in [Section 59.4.1, "How to Run a WSRP Portlet Producer on Integrated WebLogic Server."](#)
3. When the application is deployed, you can view the WSRP Producer Test Page by going to:

```
http://host:port/context-root/info
```

where:

- *host* is the server to which the application has been deployed.
  - *port* is the HTTP Listener port. Typically it is 7101. When the server is started, the port is displayed in the console.
  - *context-root* is the web application's context root.
4. Once you have successfully deployed the application containing the portlet, you can register it as a portlet producer with any other application. For more information see [Section 62.2.1, "How to Register a WSRP Portlet Producer."](#)

---

---

**Note:** Because the Oracle JSF Portlet Bridge uses WSRP 2.0 features, you should register the producer using the **WSRP v2 WSDL** URL listed in the WSRP Producer Test Page.

---

---

You can continue to access the application as a regular web application or consume it as a portlet producer.

5. Now that your portlet producer is deployed and registered, you can consume your JSF portlet as you would any other portlet. For more information, see [Section 62.6, "Adding Portlets to a Page."](#)

## 58.4 Deploying JSF Portlets to a WebLogic Managed Server

When you are satisfied that the application works correctly both as a web application and a portlet application, you can deploy it to your production Oracle WebLogic Managed Server.

Because your web application and portlet application are one and the same (the portlet application is your existing web application with additional portlet artifacts), deploying the web application also deploys the portlet producer application.

For information about how to deploy an application to a WebLogic Managed Server, see the "Deploying Fusion Web Applications" chapter in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

---

---

**Note:** Ensure that you deploy your application to a Java EE container with the Oracle Portlet Container installed. The Integrated WLS has the container installed, which is why it is recommended for testing.

---

---

After successful deployment, you can access both the application and the portlet producer test page. For example, the application URL would be similar to:

```
http://host:port/appcontextroot/faces/pagename.jspx
```

And the portlet producer test URL would be similar to:

```
http://host:port/appcontextroot/info
```

## 58.5 Using Events to Link JSF Portlets with Other Portlets

If you portletize an Oracle ADF task flow that triggers a contextual event, the Oracle JSF Portlet Bridge creates a JSR 286 portlet event to wrap the contextual event. This means that when the portletized task flow is consumed on a page, it can be linked to other JSF portlets or to JSR 286 portlets.

The examples in this section use the following portlets:

- **Departments portlet**, a portletized ADF task flow that displays a list of departments. The list of departments can be restricted by location ID. This portlet raises a contextual event, `departmentSelected`, when a department row is selected in the portlet. The payload of the `departmentSelected` event is an object of type `hr.Department` (a Java object representing one row of the Departments table).
- **Employees portlet**, a portletized ADF task flow that displays a list of employees. The list of employees can be restricted by department ID.
- **Department Address portlet**, a JSR 286 portlet that displays the address of a specified department.
- **Department Locations portlet**, a JSR 286 portlet that displays a list of locations. This portlet raises a portlet event, named `locationId` with the namespace `http://xmlns.oracle.com/adfm/contextualevent`, when one of the listed locations is selected.

This section includes the following subsections:

- [Section 58.5.1, "How to Link a JSF Portlet to Another JSF Portlet"](#)
- [Section 58.5.2, "How to Link a JSF Portlet to a JSR 286 Portlet"](#)
- [Section 58.5.3, "How to Link a JSR 286 Portlet to a JSF Portlet"](#)
- [Section 58.5.4, "What You May Need to Know About Portlet Events in the Oracle JSF Portlet Bridge"](#)

**Tip:** You can download a ZIP file containing all the examples in this section from:

<http://www.oracle.com/technetwork/middleware/webcenter/ps3-samples-176806.html>

## 58.5.1 How to Link a JSF Portlet to Another JSF Portlet

The Departments task flow raises a contextual event, `departmentSelected`, when a department row is selected within the task flow. The event is ultimately raised by an `eventBinding` which is triggered from a row selection listener in the page definition for the Departments view, which is used in the Departments task flow ([Example 58–3](#)).

The payload of the event (an object of type `hr.Department`, a Java object representing one row of the departments table) is generated by using the `customPayload` attribute which points to the current row from the `departments` table iterator.

For more information about standard ADF contextual event techniques, like the ones used in this example, see the "Creating Contextual Events" section in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### **Example 58–3 Contextual Event in the Page Definition for the Departments Task Flow (DepartmentsPageDef.xml)**

```
<eventBinding Listener="org.apache.myfaces.trinidad.event.SelectionListener"
  id="DepartmentSelectedEvent">
  <events xmlns="http://xmlns.oracle.com/adfm/contextualevent">
    <event name="departmentSelected"
      customPayload="#{bindings.departments.currentRow.dataProvider}"/>
  </events>
</eventBinding>
```

When the Departments task flow is portletized, using the steps described in [Section 58.2.3, "How to Create a JSF Portlet Based on a Task Flow,"](#) a `portlet.xml` file is created containing a definition for a portlet event that is used to transfer the corresponding contextual event during portlet communication with the portlet over WSRP ([Example 58–4](#)).

**Example 58–4 Portlet Entry for the Portletized Departments Task Flow (portlet.xml)**

```
<portlet id="adf_taskflow_WEB_INF_departments_xml">
  ...
  <supported-publishing-event id="departmentSelected">
    <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
      x:departmentSelected
    </qname>
  </supported-publishing-event>
  ...
</portlet>
```

There is also a corresponding event definition in `portlet.xml` for the Departments portlet's `departmentSelected` event ([Example 58–5](#)).

**Example 58–5 Event Definition for the departmentSelected Event (portlet.xml)**

```
<event-definition id="departmentSelected">
  <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
    x:departmentSelected
  </qname>
  <value-type>
    oracle.portlet.bridge.adf.lifecycle.ADFmPayloadWrapper
  </value-type>
</event-definition>
```

---

**Note:** The namespace for contextual events that are converted into portlet events is always:

```
http://xmlns.oracle.com/adfm/contextualEvent
```

The payload type is always:

```
oracle.portlet.bridge.adf.lifecycle.ADFmPayloadWrapper
```

The `ADFmPayloadWrapper` is used to ensure that any serializable contextual event payload is wrapped in a JAXB marshallable wrapper. It also ensures that a fixed type can be declared for the portlet event, even though it is not possible to know the payload type until the event is raised. The payload is unwrapped when extracting the contextual event from the portlet event.

---

The Employees task flow uses standard ADF techniques to handle a `departmentSelected` event. This is in the form of a `methodAction` binding that invokes a method on a data control, delivering the event payload from the `departmentSelected` event as a parameter to that method. [Example 58–6](#) shows the definition of the `methodAction` binding in the page definition for the Employees view, which is used in the Employees task flow.

**Example 58–6 Definition of methodAction in the Page Definition for the Employees Task Flow (EmployeesPageDef.xml)**

```
<methodAction id="updateTableForDepartmentId" RequiresUpdateModel="true"
  Action="invokeMethod" MethodName="updateTableForDepartmentId">
```

```

        IsViewObjectMethod="false" DataControl="EmployeesDataControl"
        InstanceName="EmployeesDataControl.dataProvider">
    <NamedData NDName="departmentIdPayload" NDType="hr.Department" />
</methodAction>

```

The `updateTableForDepartmentId` method takes the `hr.Department` object, passed as the payload of the `departmentSelected` event, and filters the data queried from the `EmployeesDataControl` so that it shows only employees who are in the selected department. It also takes steps to ensure that the iterator is re-executed and that the table view component is marked as needing to be re-rendered in this request.

The `Employees` task flow includes an event map in the page definition to specifically map the incoming event onto the appropriate `methodAction` when the task flow is portletized (Example 58–7).

**Example 58–7 Event Map in the Page Definition for the Portletized Employees Task Flow (EmployeesPageDef.xml)**

```

<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
  <event name="departmentSelected">
    <producer region="*">
      <consumer region="" handler="updateTableForDepartmentId"
        handleCondition="{ADFPortletBridge.bridgeRequest}">
        <parameters>
          <parameter name="p1" value="{payLoad}"/>
        </parameters>
      </consumer>
    </producer>
  </event>
</eventMap>

```

---

**Note:** The `<producer region="*">` attribute accepts events from any region. This is because when the task flow is running as a portlet, with the event coming into the portlet from a remote application, the remote application does not have any knowledge of the producer region.

The EL expression within `handleCondition="{ADFPortletBridge.bridgeRequest}"` evaluates to `true` if the current request is running under the Oracle JSF Portlet Bridge. This ensures that this event map is used only when the task flow is running as a portlet. It is not essential to have this `handleCondition`. However it can be useful to be able to define a separate `eventMap` which is used only when the task flow is running as a portlet.

---

When the two portletized task flows are added to a page, as long as the name of the event triggered by the `Departments` portlet is the same as that expected by the `Employees` portlet, no further coding is required; the portlets are automatically linked and when a department is selected in the `Departments` portlet, the `Employees` portlet is updated to display employees belong to the selected department.

**Figure 58–1 Linking JSF Portlets**

The screenshot shows two portlets. The top portlet, 'Departments (ADF Bridge Portlet)', contains a table with columns: Department Id, Department Name, Manager Id, and Location. The bottom portlet, 'Employee (ADF Bridge Portlet)', contains a table with columns: Employee Id, First Name, Last Name, Job Id, Telephone No., Hire Date, Department No., and Manager Id. A red arrow originates from the 'IT' row (Department Id: 60) in the top table and points to the 'Department No.' column in the bottom table.

Department Id	Department Name	Manager Id	Location
10	Administration	200	1000
20	Marketing	201	1800
30	Purchasing	114	1200
40	Human Resources	203	1100
50	Shipping	121	1600
60	IT	103	1400
70	Public Relations	204	2700
80	Sales	145	2500
90	Executive	100	1300
100	Finance	108	2900
110	Accounting	205	1600
120	Treasury	0	1600
130	Corporate Tax	0	1600
140	Control And Credit	0	1700
150	Shareholder Servic...	0	2700
160	Benefits	0	1800
170	Manufacturing	0	1900
180	Construction	0	2000

Employee Id	First Name	Last Name	Job Id	Telephone No.	Hire Date	Department No.	Manager Id
103	Alexander	Hunold	IT_PROG	590.423.4567	1/3/2006	60	102
104	Bruce	Ernst	IT_PROG	590.423.4568	5/21/2007	60	103
105	David	Austin	IT_PROG	590.423.4569	6/25/2005	60	103
106	Valli	Pataballa	IT_PROG	590.423.4560	2/5/2006	60	103
107	Diana	Lorentz	IT_PROG	590.423.5567	2/7/2007	60	103

You may choose to not use automatic event listening, for example, if you have multiple portlets on the same page that use the same events and you wish to control the flow of events between them. Or perhaps the names of the contextual events used by the JSF portlets that you want to link do not match. In this case you must explicitly create an event map in the page definition of the page containing the portletized task flows. This event map links the portlet events of the portlets that you want to wire together. [Example 58–8](#) shows how this would work in our example if the Employees task flow was expecting an event named `departmentId` instead of `departmentSelected`.

**Example 58–8 Event Map in the Page Definition for the Consuming Page to Manually Link JSF Portlets (BridgeToBridgeExplicitMappingPageDef.xml)**

```
<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
  <event name="departmentSelected">
    <producer region="EventSampleProducerdepartments1_1">
      <consumer handler="EventSampleProduceremployees1_1.
        {http://xmlns.oracle.com/adfm/contextualEvent}departmentId"/>
    </producer>
  </event>
</eventMap>
```

---

**Note:** In the case of portletized task flows, the `handler` attribute must specify not only the specific binding object that is to handle the event, it must also specify the full QName of the portlet event, using the format `<portletBindingId>.<eventQName>`. The namespace does not have to be the ADFm namespace; it can be any portlet event, provided the payload is compatible.

---

## 58.5.2 How to Link a JSF Portlet to a JSR 286 Portlet

As well as linking JSF portlets to other JSF portlets, you can also link a JSF portlet to a regular JSR 286 portlet. To do this, you must ensure that the JSR 286 portlet explicitly declares that it can receive contextual events.

For example, we can link the Departments task flow from our previous example to a Department Address portlet, a JSR 286 portlet, to display the address of a selected department.

For automatic event wiring to work, the Department Address portlet must declare that it can receive the contextual event from the Department portlet. It can do this in two ways:

- In the portlet producer application's `portlet.xml` file, the Department Address portlet directly supports the `departmentSelected` contextual event:

```
<supported-processing-event id="departmentSelected">
  <qname xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
    x:departmentSelected
  </qname>
</supported-processing-event>
```

- The event definition for the Department Address portlet's `department` event (defined in the `portlet.xml` file), provides an alias to associate it with the `departmentSelected` contextual event:

```
<event-definition id="department">
  <qname xmlns:x="http://xmlns.oracle.com/portlet/EventSample">
    x:department
  </qname>
  <alias xmlns:x="http://xmlns.oracle.com/adfm/contextualEvent">
    x:departmentSelected
  </alias>
  <value-type>hr.Department</value-type>
</event-definition>
```

---

**Note:** The namespace for portlet events used to carry contextual event is always:

```
http://xmlns.oracle.com/adfm/contextualEvent
```

The namespace is used in the event declarations or alias given above. This namespace indicates to the consumer that the portlet wishes to receive a contextual event with the given name as a portlet event. This is essential for automatic event wiring to work.

---

The Department Address portlet includes code in its `processEvent` implementation to handle the event ([Example 58–9](#)). This method looks for either the `departmentSelected` or the `department` event with the alias as defined above. The payload type for both of these events is `hr.Department`. However, the method shown in [Example 58–9](#) illustrates how to use the `ADFmPayloadWrapper` to unwrap the payload. `ADFmPayloadWrapper` is the event type that the Oracle JSF Portlet Bridge uses by default when raising events.

---

**Note:** As the Department Address portlet is an extension of the Department Location portlet, the code in [Example 58–9](#) is provided in the `DepartmentLocationPortlet.java` class that contains methods the Department Location portlet.

---

**Example 58–9 Portlet Code to Handle the departmentSelected Event**

```
public void processEvent(EventRequest request, EventResponse response)
    throws PortletException, IOException
{
    response.setRenderParameters(request);

    Event event = request.getEvent();
    String eventName = event.getName();
    if ("departmentSelected".equals(eventName) ||
        "department".equals(eventName))
    {
        Object payload = event.getValue();
        if (payload instanceof ADFmPayloadWrapper)
        {
            payload = ((ADFmPayloadWrapper)payload).getPayload();
        }
        if (payload instanceof Department)
        {
            Department department = (Department)payload;
            int locationId = department.getLocation();
            response.setRenderParameter("locationId", Integer.toString(locationId));
        }
    }
}
```

When these two portlets are displayed together on a page, selecting a department in the Departments portlet automatically updates the Department Address portlet to display the address of the selected department.

**Figure 58–2 Linking a JSF Portlet to a JSR 286 Portlet**

If the Department Address portlet does not explicitly support the `departmentSelected` event or define an appropriate alias, you can still link the two portlets by creating an event map in the page definition for the page that consumes the portlets (Example 58–10).

**Example 58–10 Event Map to Explicitly Link the Departments and Department Address Portlets**

```
<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
  <event name="departmentSelected">
    <producer region="EventSampleProducerdepartments1_1">
      <consumer handler="DepartmentAddress1_1."
        {http://xmlns.oracle.com/portlet/EventSample}department"/>
    </producer>
  </event>
</eventMap>
```

The result of this event mapping is that when the `departmentSelected` contextual event is raised by the `EventSampleProducerdepartments1_1` portlet binding, the event is delivered to the `DepartmentAddress1_1` portlet binding, which in turn sends the event on to the portlet using the portlet event, `department`.

---

**Note:** The payload of the `departmentSelected` contextual event is a `hr.Departments` object. This is the same payload type that the portlet's `department` portal event is expecting, so that matches and everything works correctly. It is also possible for the portlet to declare that it expects a payload of type `ADFmPayloadWrapper`. In this case, the portlet consumer detects this and automatically wraps the contextual event payload in an `ADFmPayloadWrapper` object.

---

### 58.5.3 How to Link a JSR 286 Portlet to a JSF Portlet

You can also send portlet events from a JSR 286 portlet to a JSF portlet. The portlet event is converted into a contextual event by the Oracle JSF Portlet Bridge and is then delivered into the producer ADF application to be consumed using standard contextual event techniques.

The page definition for the Departments view, which is used in the Departments task flow, contains a `methodAction` binding that binds to a method on the `DepartmentsDataControl` (Example 58–11).

**Example 58–11 Definition of `methodAction` in the Page Definition for the Departments Task Flow (`DepartmentsPageDef.xml`)**

```
<methodAction id="updateTableForLocationId" RequiresUpdateModel="true"
  Action="invokeMethod" MethodName="updateTableForLocationId"
  IsViewObjectMethod="false"
  DataControl="DepartmentsDataControl"
  InstanceName="DepartmentsDataControl.dataProvider">
  <NamedData NDName="locationId" NDType="int"/>
</methodAction>
```

The `updateTableForLocationId` method receives, as a parameter, a location ID that causes the list of departments returned by the data control to be filtered by that location ID.

The task flow contains an event map in the page definition to map the contextual event onto the appropriate `methodAction` (Example 58–12).

**Example 58–12 Event Map in the Page Definition for Portletized Departments Task Flow (DepartmentsPageDef.xml)**

```

<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
  <event name="locationId">
    <producer region="*">
      <consumer region="" handler="updateTableForLocationId"
        handleCondition="{ADFPortletBridge.bridgeRequest}">
        <parameters>
          <parameter name="p1" value="{payload}" />
        </parameters>
      </consumer>
    </producer>
  </event>
</eventMap>

```

---

**Note:** The event map cannot reference the region where the event originates because it is not present when the task flow is running as a portlet, so we use a wildcard as the event source in the event map

---

In the Department Locations portlet, when a location is selected, the `processAction` method raises a portlet event, `locationId`, giving the location ID of the selected location (Example 58–13).

**Example 58–13 Definition of processAction in the Portlet Code for the Department Locations Portlet (DepartmentLocationsPortlet.java)**

```

public void processAction(ActionRequest request, ActionResponse response)
    throws PortletException
{
    String locationId = request.getParameter("locationId");
    Location location = getLocation(Integer.parseInt(locationId));

    if (location != null)
    {
        // QName matches the event declared as a supported-publishing-event in
        // portlet.xml for this portlet.

        // LocationId event. Raised in the ContextualEvent namespace makes it readily
        // consumable by ADF Bridge portlets. Likewise we wrap with the
        // ADFmPayloadWrapper payload object that the ADF Bridge expects.
        response.setEvent(new QName("http://xmlns.oracle.com/adfm/contextualEvent",
            "locationId"),
            new ADFmPayloadWrapper(Integer.valueOf(location.getLocationId())));
    }
}

```

---

**Note:** The `locationId` event raised in the `processAction` method has a payload of type of `Integer`. However, because JSF portlets always expect portlet events with the contextual event payloads wrapped with `ADFMPayloadWrapper`, we must wrap the payload to suit the receiving portlet's requirements if we want automatic delivery of events to work.

Likewise, the `QName` for the event we raise must be:

```
{http://xmlns.oracle.com/adfm/contextualEvent}locationId
```

---

When you drop the portlets on a page, selecting a location in the Department Location portlet automatically updates the Departments portlet to display the departments at the selected location.

**Figure 58–3 Linking a JSR 286 Portlet to a JSF Portlet**

If the two portlets do not declare events with matching names (for example the contextual event from the Departments portlet is called `locId`), or if automatic event listening is disabled, you can still link the two portlets by creating an event map in the page definition for the page that consumes the portlets to map the contextual event from the Departments portlet to the portlet event from the Department Location portlet (Example 58–14).

**Example 58–14 Event Map to Explicitly Link the Departments and Department Locations Portlets**

```
<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
  <event name="locationId">
    <producer region="DepartmentLocations1_1">
      <consumer handler="DepartmentsADFBridgePortlet1_1.
        {http://xmlns.oracle.com/adfm/contextualEvent}locId">
      </consumer>
    </producer>
  </event>
</eventMap>
```

## 58.5.4 What You May Need to Know About Portlet Events in the Oracle JSF Portlet Bridge

### Using a Serialized Type for the Contextual Event Payload

Part of the JSR 286 event's payload is the wrapped contextual event payload, which is serialized. Therefore, while contextual event payloads can be any object type, when you are sending contextual events via WSRP, only serialized types are supported.

When this wrapped contextual event is delivered, the contextual event payload must be deserialized on the consumer before the contextual event can be forwarded into the consumer application. To deserialize the event, the payload class must be available on

the consumer as well as on the producer. This condition is automatically met when the original payload is a Java Runtime Environment class, such as `java.lang.String`.

### Raising Undeclared Events

If your Oracle ADF task flow includes ADFm events that do not have corresponding portlet events declared in the `portlet.xml` file, you can enable the Oracle JSF Portlet Bridge to raise these undeclared events.

To raise undeclared events, set the following container runtime option for the portletized task flow:

```
<portlet id="Application5untitled1jspx1_1">
  ...
  <container-runtime-option>
    <name>oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents</name>
    <value>true</value>
  </container-runtime-option>
  ...
</portlet>
```

Setting this option to `true` means that any ADFm event raised is forwarded on as a portlet event. If this option is not provided or is set to `false`, then only events with corresponding portlet event declarations are forwarded. For information about setting container runtime options, see [Section 59.3.4.3, "Setting Container Runtime Options for Individual Portlets."](#)

You can also enable undeclared portlet events to automatically be forwarded on from the portlet binding in the consumer application as ADFm events.

In the portlet binding, set the `raiseUndeclaredContextualEvent` attribute to `true`, for example:

```
<portlet id="Application5untitled1jspx1_1"
  portletInstance="/oracle/adf/portlet/WsrpPortletProducer4/ap/
    Application5untitled1jspx_2943bd23_012e_1000_8004_0aa7c0849010"
  class="oracle.adf.model.portlet.binding.PortletBinding"
  retainPortletHeader="false"
  listenForAutoDeliveredPortletEvents="true"
  listenForAutoDeliveredParameterChanges="true"
  raiseUndeclaredContextualEvents="true"
  xmlns="http://xmlns.oracle.com/portlet/bindings"/>
```

Setting this option to `true` means that if a portlet event is received, a corresponding ADFm event is raised, even if there is no event declaration in the portlet binding. The name of the ADFm event is directly taken from the QName of the portlet event. This is so that ADFm events raised from the Oracle JSF Portlet Bridge have the same name as that used when the event was raised on the remote application.

### Using Partial Page Rendering

The Oracle JSF Portlet Bridge uses portlet events to transport contextual events to and from the consumer application. However, partial page rendering (PPR) requests are implemented using Portlet 2.0 resource requests. It is not possible to send or receive portlet events in resource requests. Therefore proprietary mechanisms are used to transport the contextual events from the JSF Portlet to the consumer application in the case of PPR requests. This means that in portals that do not support these non-standard mechanisms, the events are not sent.

## 58.6 What You May Need to Know When Creating a JSF Portlet

You must code your JSF pages such that they produce markup that conforms with JSR 286 portlet markup fragment rules. If you have chosen to use Oracle ADF, the markup in your page comes mainly from the Oracle ADF Faces components, which naturally render markup in a style that is either compatible with JSF portlets or can be automatically interpreted by the Oracle JSF Portlet Bridge into a compatible style (for example, by rendering the portlet in an inline frame).

The sections that follow provide some guidance on how to avoid common issues that you may encounter as you code Oracle ADF pages that you later choose to publish as portlets.

This section includes the following subsections:

- [Section 58.6.1, "General Guidelines"](#)
- [Section 58.6.2, "Portlet Guidelines"](#)
- [Section 58.6.3, "Security Guidelines"](#)
- [Section 58.6.4, "JSF Guidelines"](#)
- [Section 58.6.5, "Oracle ADF Guidelines"](#)

### 58.6.1 General Guidelines

General guidelines are as follows:

- [Section 58.6.1.1, "Application Must Run as a Web Application"](#)
- [Section 58.6.1.2, "The Portlet Is Contained by a Different Page"](#)
- [Section 58.6.1.3, "Servlet Dependencies"](#)
- [Section 58.6.1.4, "Secured Applications"](#)
- [Section 58.6.1.5, "Deep Links"](#)
- [Section 58.6.1.6, "Java EE Authentication"](#)
- [Section 58.6.1.7, "Timeout Period"](#)

#### 58.6.1.1 Application Must Run as a Web Application

Prior to creating a portlet from your JSF application, the application, including all of its pages and task flows, must run properly after you deploy it to Integrated WLS. If it cannot run as a regular web application, it cannot run as a portlet producer either.

#### 58.6.1.2 The Portlet Is Contained by a Different Page

One area that you should consider when creating task flows that will be exposed as portlets is that the page on which you render the task flow as a portlet is different to the one in the original producer application.

Some common errors that occur include:

- Expecting to access JavaScript in the consuming page.
- Expecting to find managed beans or objects added to scopes as part of the consuming page.
- Expecting components in the JSF component tree from the consumer to be present.

### 58.6.1.3 Servlet Dependencies

When writing an application that is supposed to run in both servlet and portlet environments, avoid casting to `HttpServletRequest` objects (or you get a `ClassCastException` when running as a portlet). Instead, use the abstraction provided by the Faces `ExternalContext` object. For example, instead of:

```
HttpServletRequest request = getRequestFromFacesContext();
String localContextPath = request.getContextPath();
```

Use the following:

```
String localContextPath=
FacesContext().getCurrentInstance().getExternalContext().getRequestContextPath();
```

To the extent that `ExternalContext` does not provide that abstraction for you, you can write servlet or portlet specific code. You can use the following method to check if the application runs as portlet:

```
public static boolean isPortletRequest()
{
    Map<String, Object> m =
        FacesContext.getCurrentInstance().getExternalContext().getRequestMap();
    Object phase = m.get("javax.portlet.faces.phase");
    if (phase != null)
    {
        return true;
    }
    else
    {
        return false;
    }
}
```

### 58.6.1.4 Secured Applications

If your application is secured, ensure that you have secured identity propagation as described in [Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."](#)

### 58.6.1.5 Deep Links

For normal interactions with a portlet, there is a session maintained between the consumer and the producer. This is done by storing a session cookie in the consumer and sending it to the producer on each request. On the original request, the session is established and on subsequent requests, the portlet sends the session cookie to the producer and the session is reused.

For deep links, that is, links from the portlet to the producer application, the request is from the browser direct to the producer application. In this case, the session cookie cannot be sent so a new session is established. If a shared session is required for deep links, then this must be implemented by the developer. A common implementation is to write this state to a common location, accessible from the producer and the application, and pass a reference to this state in the deep link.

### 58.6.1.6 Java EE Authentication

Java EE login is not supported. Java EE applications can be configured with different authentication techniques, such as Basic and Digest. As portlets are fragments incorporated into a consumer's page, it is generally expected that direct authentication

occurs between the client and the consumer, not the client and the portlet producer. As a result, these authentication techniques are not supported in JSR 286. In the JSR 286 case, Java EE authentication occurs through WS-Security mechanisms that allow the Web service consumer to be authenticated and verified by the producer, and propagate the user identity for user authentication and authorization. Published Oracle ADF artifacts must not contain login links that trigger Java EE authentication.

#### 58.6.1.7 Timeout Period

For applications that take a long time to render, consider increasing the time out period when you register a producer that was created by the Oracle JSF Portlet Bridge. Note however that the time out period specified during producer registration is limited by the maximum time out period (`maximumTimeout` element) specified in `adf-config.xml`.

## 58.6.2 Portlet Guidelines

Guidelines specific to portlets are as follows:

- [Section 58.6.2.1, "Portlet Sizing"](#)
- [Section 58.6.2.2, "Resources and Links"](#)
- [Section 58.6.2.3, "Redirecting Requests"](#)
- [Section 58.6.2.4, "Memory Consumption"](#)
- [Section 58.6.2.5, "WSRP Version"](#)

### 58.6.2.1 Portlet Sizing

When consuming a JSF portlet, the consumer application automatically renders the portlet content within an inline frame. This means that any inline popup is then confined within the inline frame. You should take this into consideration when specifying the size of the portlet.

If the JSF portlet is a portletized page, then you have full control of the content and can decide how that content fills the inline frame window, utilizing exactly the same techniques as you would to determine how the content would fill the browser window.

If the portlet is being stretched by its ancestor in the consumer application, then the `maximized` attribute is set to `true` on the `af:document` component in the document produced by the Oracle JSF Portlet Bridge. This means that components that support it, such as `panelStretchLayout`, will fill the entire inline frame.

For more information about portlet sizing, see [Section 62.6.5, "What You May Need to Know About Portlet Sizing."](#)

### 58.6.2.2 Resources and Links

For resources and links, you must specify the location relative to the `web-app-context-root`. Otherwise, your images and other resources cannot be found by the portlet. Do not use relative (`../`) path notation. Portlets in Oracle WebCenter Portal: Framework run remotely and are accessed using a SOAP protocol (WSRP). The latter means that the regular web application concept of request path does not apply in a JSR 286 container. The JSR 286 specification reflects this by mandating that all resource URLs either be absolute or context path relative.

### 58.6.2.3 Redirecting Requests

Do not redirect or forward a request within your JSP. JSR 286 only supports `requestDispatcher.include()`. The use of `httpServletResponse.sendRedirect()` or `requestDispatcher.forward()` results in exceptions and errors. To work properly in a portlet environment, you must implement JSF navigation rules in `faces-config.xml` or Oracle ADF task flow control flow rules.

### 58.6.2.4 Memory Consumption

The Oracle JSF Portlet Bridge stores the content of the request scope between requests so that the request scope is preserved between a portlet Action and a portlet Render (which are two separate requests). Because of this, to minimize overall memory consumption, you must especially avoid storing too much data in the request scope when the application contains JSF portlets.

### 58.6.2.5 WSRP Version

The Oracle JSF Portlet Bridge makes use of Portlet 2.0 features. Consequently, it should be used only with WSRP V2. The portlet's `minimumWsrpVersion` container runtime option should be set to 2. For more information, see [Section 59.3.4, "How to Customize the Runtime Environment for JSR 286 Portlets."](#)

## 58.6.3 Security Guidelines

Guidelines specific to security are as follows:

- [Section 58.6.3.1, "Oracle ADF Secured Applications"](#)
- [Section 58.6.3.2, "Role Based Authorization"](#)

### 58.6.3.1 Oracle ADF Secured Applications

When you use the Create Portlet Entry or Manage Portlet Entries of Task Flows dialog to portletize a task flow in an Oracle ADF secured application (the security scheme being Authentication and Authorization), you must manually grant permission to the following wrapper task flow in the `jazn-data.xml` file of the producer application:

```
/WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
```

If you do not grant the permissions, the portlet does not render.

For example, if you have an application with two roles: `authenticated-role`, with view permission; and `testrole`, with `customize`, `edit`, `grant`, `personalize`, and `view` permissions, you must add the following entries inside the `<permissions>` tag of each role:

- For `authenticated-role`:

```
<permission>
  <class>oracle.adf.controller.security.TaskFlowPermission</class>
  <name>
    /WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
  </name>
  <actions>view</actions>
</permission>
```

- For `testrole`:

```
<permission>
  <class>oracle.adf.controller.security.TaskFlowPermission</class>
```

```

<name>
  /WEB-INF/adfp-portlet-bridge-container.xml#adfp-portlet-bridge-container
</name>
<actions>customize,edit,grant,personalize,view</actions>
</permission>

```

### 58.6.3.2 Role Based Authorization

If you are portletizing a task flow or page that has role based authorization (that is, the task flow or page has been granted certain roles), WS-Security is required to propagate the user correctly. If you set up WS-Security, the JSF portlet does not render the content if the propagated user does not have permission to view the task flow.

For information about setting up WS-Security on the producer, see [Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."](#)

When registering the producer with the consuming application, you must ensure that you set the appropriate security properties. For more information, see [Section 62.2.1, "How to Register a WSRP Portlet Producer."](#)

## 58.6.4 JSF Guidelines

Guidelines specific to JSF are as follows:

- [Section 58.6.4.1, "Using h:commandLink"](#)

### 58.6.4.1 Using h:commandLink

When using the `h:commandLink` JSF standard HTML component ensure that you set the following `context-param` in `web.xml` so that the JSF Reference Implementation does not generate any external JavaScript resource. This is to work around an issue in the JSF Reference Implementation where the reference to the JavaScript resource is not properly encoded.

```

<context-param>
  <param-name>com.sun.faces.externalizeJavaScript</param-name>
  <param-value>>false</param-value>
</context-param>

```

## 58.6.5 Oracle ADF Guidelines

Guidelines specific to Oracle ADF are as follows:

- [Section 58.6.5.1, "Task Flow Returns"](#)
- [Section 58.6.5.2, "Mismatched Style Sheets"](#)
- [Section 58.6.5.3, "ADF Faces Dialog Framework"](#)
- [Section 58.6.5.4, "Composer Components"](#)
- [Section 58.6.5.5, "The fileDownloadActionListener Component"](#)
- [Section 58.6.5.6, "The prepareModel Phase"](#)
- [Section 58.6.5.7, "Accessing Request Parameters"](#)
- [Section 58.6.5.8, "Referencing Page Parameters"](#)
- [Section 58.6.5.9, "Trinidad Components"](#)
- [Section 58.6.5.10, "Using ADF Faces Client-Side APIs to Find Components"](#)
- [Section 58.6.5.11, "Encoded URLs"](#)

### 58.6.5.1 Task Flow Returns

When an ADF bounded task flow completes it may use a task flow return to send control back to the calling task flow. In a portletized task flow, there is no calling task flow, so the task flow return does not make any sense in this context. This may cause what appears to be an empty portlet to display as the task flow navigates to a state where there is no view selected. The task flow will stay in this state until it is refreshed either when the input parameters change or the session on the producer is reset.

If you plan to portletize your task flow, you should avoid using task flow returns. If you must use a task flow return, you can provide a dummy task flow with a default activity of the task flow that you want to portletize. When the task flow return is executed, it returns to the dummy task flow. The dummy task flow then executes its default activity, which is to call back to the original task flow and thus restart the task flow when the portlet is next called.

### 58.6.5.2 Mismatched Style Sheets

In general, when you consume a task flow using the Oracle JSF Portlet Bridge, the portlet producer tries to use the skin of the consumer page. When the producer cannot match the consumer skin, the portlet generates and references its own style sheet. This is known as a *mismatched skin*. A mismatched skin can occur when:

- The consumer and producer use different versions of ADF Faces. In this case, the producer still uses the consumer skin.
- The consumer has additional `skin-additions` that the producer does not have, or vice versa. In this case, the producer still uses the consumer skin.
- The producer does not have the consumer skin. In this case, the producer uses the portlet skin.

Mismatched skins can cause performance problems because the browser has to fetch an extra style sheet and the generated portlet markup uses uncompressed styles resulting in larger markup.

If a mismatched skin occurs, the producer log includes the following:

```
The skin skinName specified on the requestMap will not be used because the
styleSheetDocument id on the requestMap does not match the local skin's
styleSheetDocument's id. It could mean the jars are not identical. For example,
one might have trinidad-skins.xml skin-additions in a jar file on the class path
that the other does not have.
```

The portlet markup inside the inline frame also includes a link tag to the portlet style sheet resource, for example:

```
<link rel=\ "stylesheet\ " charset=\ "UTF-8\ " type=\ "text/css\ "
href=\ "http: . . . /resourceproxy/portletId. . . 252525252Fadf%252525252Fstyles%252525252
Fcache%252525252Fblafplus-rich-portlet-d1062g-en-ltr-gecko.css. . .
```

You can use an HTTP monitoring tool to see that a request is made to the portlet style sheet resource.

There are a number of reasons for mismatched skins. For a skin to match, the producer and consumer must be the same for all the following conditions:

- The ADF Faces version; a different version of ADF Faces may have different style selectors.
- The style compression, defined in `web.xml`, for example:

```
<context-param>
```

```

<param-name>
  org.apache.myfaces.trinidad.DISABLE_CONTENT_COMPRESSION
</param-name>
<param-value>false</param-name>
</context-param>

```

- Tonal style or themes, defined in `web.xml`, for example:

```

<context-param>
  <param-name>xyz</param-name>
  <param-value>xyz</param-value>
</context-param>

```

- Availability of skin additions. Skin additions are defined in `META-INF/trinidad-skins.xml` in a JAR file. These are then aggregated from all the JAR files in the class path. If there are any JAR files that exist on the producer but not on the consumer, or vice versa, you get a mismatch.

```

<skin-addition>
  <skin-id>blafplus-rich.desktop</skin-id>
  <style-sheet-name>
    adf/styles/flexComponents-blafplus-rich-desktop.css
  </style-sheet-name>
</skin-addition>

```

To determine if the JAR files match, turn on Trinidad logging to show which `skin-addition` it is processing. To do this, update the `logging.xml` log level of both the producer and consumer WebLogic Servers to `FINEST` then restart the servers:

```

<logger name="org.apache.myfaces.trinidadinternal.skin.SkinUtils"
level="FINEST"/>

```

When you run the consumer page, any skin entries that do not match in the consumer and producer log files are the cause of the skin mismatch.

### 58.6.5.3 ADF Faces Dialog Framework

ADF Faces Dialog Framework is not supported. If your application includes any buttons or icons that launch secondary browser windows, then the contents of the new windows are not displayed properly when the application is run as a portlet. As such, you should avoid using these components if you plan to portletize your application. Examples of components that launch secondary windows are:

- `<tr:inputDate>`
- `<tr:inputColor>`
- `<tr:popup>`
- the `useWindow` attribute of `<af:commandButton>`

### 58.6.5.4 Composer Components

Portletization of pages that contain Composer components is not supported.

### 58.6.5.5 The `fileDownloadActionListener` Component

The `<af.fileDownloadActionListener>` component is not supported.

### 58.6.5.6 The prepareModel Phase

Oracle ADF components/code that handle `prepareModel` must be idempotent. Any code running during the `prepareModel` phase must be rerunnable without effect to the underlying data/business logic. When running in the portlet environment, `prepareModel` is called twice during the complete JSF life cycle as opposed to being called once when running within a regular web application.

The reason for this difference is that the Oracle JSF Portlet Bridge runs JSF in two requests not one. It is implemented as if every JSF request redirected before the render phase. The consequence of this approach is that the JSF `restoreView` phase is called both when the request is first submitted and then again when request to render is received.

### 58.6.5.7 Accessing Request Parameters

Do not access or reference request parameters from model code except in page parameters. Besides being a cleaner MVC2 implementation, following this guideline avoids problems when such artifacts are published as portlets. Where regular JSF artifacts run their entire lifecycle in a single request, the Oracle JSF Portlet Bridge runs these artifacts in two requests, as if every JSF request redirected before the render phase.

This two phase model enables the clearing of submitted parameters before rendering in a manner that allows such clearing to be communicated all the way back to the client, which makes this request something you could bookmark. As a result, request parameters do not exist during the render phase. As described previously, `prepareModel` is invoked again in this rendering phase. Therefore, any references to request parameters in this phase handler fail. You should avoid code like either of the following fragments:

```
<invokeAction id="doExecuteWithParams"
              Binds="ExecuteWithParams"
              Refresh="prepareModel"
              RefreshCondition="{param.id != null}"
/>
```

```
<invokeAction id="doExecuteWithParams"
              Binds="ExecuteWithParams"
              Refresh="renderModel"
              RefreshCondition="{param.id != null}"
/>
```

### 58.6.5.8 Referencing Page Parameters

Do not reference page parameters in the `prepareModel` phase. This issue relates to the same problem described for request parameters in [Section 58.6.5.7, "Accessing Request Parameters."](#) Generally, page parameters depend on request parameters and are evaluated during the `restoreView` phase. As this phase is called a second time during portlet rendering and request parameters are not available, such use fails. Instead, move any dependency on a page parameter value into the model before JSF transitions from its execute phases to its render phase.

### 58.6.5.9 Trinidad Components

If you are portletizing an application that contains only Trinidad components (`<tr:>` tags only), then you must manually include the following libraries in your project:

- `jdeveloper\modules\oracle.adf.view_11.1.1\adf-richclient-api-11.jar`
- `jdeveloper\modules\oracle.adf.view_11.1.1\adf-richclient-impl-11.jar`

This is so that the URLs to icons in the style sheet generated for the producer are encoded correctly.

### 58.6.5.10 Using ADF Faces Client-Side APIs to Find Components

Because a portlet is a naming container, special consideration should be taken when using ADF Faces client-side APIs to find components. An example component ID:

- When run as a regular web application: `id="demoTemplate:popup"`
- When run as a Portlet Producer application: `id="___ns12345678:demoTemplate:popup"`

Things to watch out for specifically are:

- Avoid using the `AdfPage.PAGE.findComponentByAbsoluteId()` API. Use `getSource()` and `findComponent()` methods instead. For example:

```
<trh:script text="
function showPopup(event) {
    event.cancel();
    // var popup =
    // AdfPage.PAGE.findComponentByAbsoluteId("demoTemplate:popup");
    var source = event.getSource();
    var popup = source.findComponent("popup");
    popup.show({align:"after_end", alignId:"button"});
}
"/>
```

- Use a relative path for `clientId` instead of an absolute path (starting with a ':'). For example, use:

```
<af:showPopupBehavior popupId="demoTemplate:iteratorpop"
    triggerType="mouseHover"/>
```

Instead of:

```
<af:showPopupBehavior popupId=":demoTemplate:iteratorpop"
    triggerType="mouseHover"/>
```

- For more information, see "What You May Need to Know About Using Naming Containers" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

### 58.6.5.11 Encoded URLs

By default, URLs in the portletized page or task flow are encoded such that they are proxied by the consumer application. In some circumstances, you may not want to encode these URLs, for example, when requesting JavaScript libraries from content delivery networks or accessing resources directly from the user's browser to make use of a locally configured HTTP proxy.

Another example is if your task flow includes an inline frame (for example, using an `af:inlineFrame` tag). In this case you need to ensure that the inline frame URL does not get encoded to go via the portlet resource proxy in the consumer. If you do not do this, any relative URLs in the content inside the inline frame will not work because

they will be relative to the URL to the resource proxy rather than their correct location relative to the original URL for the inline frame.

To bypass the URL encoding, set the `_xEncodeUrl` parameter to `false` on URLs that are passed to the Oracle JSF Portlet Bridge for encoding. This parameter is picked up by the Oracle JSF Portlet Bridge, which ensures that the URL does not get encoded via the resource proxy. The parameter is ignored if the task flow is not running as a portlet.

For example, replace:

```
<af:inlineFrame source="http://myiframe.example.com">
```

with:

```
<af:inlineFrame source="http://myiframe.example.com?_xEncodeUrl=false">
```

---

---

**Note:** Do not use this parameter to access resources that reside on the producer server. These resources must be accessed using the portlet client's proxy.

---

---

#### 58.6.5.12 Issues with goLink

The `adf:goLink` component encodes the link URL as an action for the current JSF application. In other words, it encodes the link using `ExternalContext.encodeActionURL(...)`. This is different to the JSF `h:outputLink` component, which encodes the URL as a resource URL using `ExternalContext.encodeResourceURL(...)`. If you are using `goLink` to link to a resource that is not a Faces View, then the URL must be encoded as a Resource URL. To do this, you must tell the Oracle JSF Portlet Bridge the link is not a Faces View by adding the following parameter to the URL:

```
javax.portlet.faces.ViewLink=false
```

For example:

```
<af:goLink text="goLink 1" id="gl1"
destination="/mynonfaceslink?javax.portlet.faces.ViewLink=false"/>
```

#### 58.6.5.13 In-Protocol Resource Requests

Within a JSF application running under the Oracle JSF Portlet Bridge, when a resource URL is created using `ExternalContext.encodeResourceURL(...)`, that resource URL is encoded in such a way that it is executed as an out-of-protocol resource request. This means that when the portlet consumer accesses that resource it does so by making a direct call to the target URL. It is also possible for resource URLs to be in-protocol. This means that the portlet consumer accesses the resource by making a WSRP web service call to the producer application, which in turn ultimately leads to the `serverResource` method being called on the portlet. It is then the portlet's responsibility to provide the resource which is sent back in the WSRP response. When that portlet is the Oracle JSF Portlet Bridge, it serves the resource by using a request dispatcher to forward to the target URL.

Generally out-of-protocol resource requests are to be preferred as they do not incur the additional overhead of the web service call. In-protocol requests can also cause large amounts of memory to be allocated as the WSRP SOAP response is constructed, if the resource being served is large. In the case of the Oracle JSF Portlet Bridge, the only time that you would want to use in-protocol resources is when you need to share the

portlet scoped HTTP session between the resource requests and the other portlet requests, such as portlet action or render requests.

To cause the Oracle JSF Portlet Bridge to encode resource URLs as in-protocol resource requests, add the following parameter to the URL, before `ExternalContext.encodeResourceURL(...)` is called:

```
javax.portlet.faces.InProtocolResourceLink=true
```

For example:

```
<af:goLink text="goLink 1" id="gl1"
destination="/mynonfaceslink?javax.portlet.faces.ViewLink=false&javax.portlet.faces.InProtocolResourceLink=true"/>
```

## 58.7 Copying a Runtime-Created Skin to a JSF Portlet Producer Application

In a WebCenter Portal application, you can create skins at runtime, using the Resource Manager. When you do this, you may encounter rendering issues on pages that include JSF portlets. This is because the skin used by the WebCenter Portal application is not available to the remote application rendering the task flow.

To rectify this issue, you must copy the runtime-created skin to the Portlet Producer application created when the task flow was portletized.

To copy a runtime-created skin to a Portlet Producer application:

1. Export the skin from the Framework application to an EAR file.

For information about how to do this, see [Section 16.4.1, "How to Download a Resource Using the Resource Manager."](#)

2. Repackage the exported skin as a shared library (a JAR file):

- a. Extract the `transport.mar` file:

```
$ jar xvf myskin.ear
inflated: transport.mar
```

- b. Extract the metadata files:

```
$ jar xvf transport.mar
inflated: oracle/webcenter/siteresources/.../Skin.css
inflated: oracle/webcenter/siteresources/.../generic-site-resources.xml
...
```

- c. Locate and view the file `generic-site-resources.xml` among the metadata files. Normally, this file is in a directory like:

```
oracle/webcenter/siteresources/scopedMD/scopeGUID/generic-site-resources.xml
1
```

The file should have a section that describes the exported skin, similar to the following example:

```
<resourceType name="skin" ...>
  <resource displayName="MySkin"
    metadataFile="/oracle/webcenter/siteresources/.../Skin.css" ...>
    <customAttributes>
      <customAttribute name="skinId"
        value="gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a.desktop" .../>
      <customAttribute name="skinFamily"
```

```

        value="gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a" ...>
        <customAttribute name="skinExtends"
            Value="webcenter-fusion-internal.desktop" .../>
    </customAttributes>
</resource>
</resourceType>

```

d. Note the following information from `generic-site-resources.xml`:

- `skinId` (for example, `gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a.desktop`)
- `skinFamily` (for example, `gsr616d879d_99e0_4bd9_8c10_98e7ea272a6a`)
- `skinExtends` (for example, `webcenter-fusion-internal.desktop`)

e. Build the directory structure for the JAR file:

```
$ mkdir META-INF
```

f. Copy the `Skin.css` file into the `META-INF` directory:

```
$ cp oracle/webcenter/siteresources/.../Skin.css META-INF
```

g. Create a new file called `trinidad-skins.xml` under the `META-INF` directory:

```
$ edit META-INF/trinidad-skins.xml
```

h. Add the following XML to the new `trinidad-skins.xml` file:

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<skins xmlns="http://myfaces.apache.org/trinidad/skin">
  <skin>
    <style-sheet-name>Skin.css</style-sheet-name>
    <id>skinId</id>
    <family>skinFamily</family>
    <extends>skinExtends</extends>
    <render-kit-id>org.apache.myfaces.trinidad.desktop</render-kit-id>
  </skin>
</skins>

```

where ***skinId***, ***skinFamily***, and ***skinExtends*** are the values noted earlier.

i. Package the JAR file:

```

$ jar cvf myskin.jar META-INF
adding: META-INF/trinidad-skins.xml(in = 359) (out= 171) (deflated 52%)
adding: META-INF/Skin.css(in = 5560) (out= 1413) (deflated 74%)

```

The JAR file should contain two files: `Skin.css` and `trinidad-skins.xml`.

3. Copy the new `myskin.jar` file to the Portlet Producer application.

The easiest way to do this is to copy the file to the `WEB-INF/lib` directory of the Portlet Producer web application.

---

# Building Standards-Based Java Portlets Using JSR 286

This chapter shows how to build standards-based Java portlets using the Java Portlet Specification, JSR 286.

This chapter includes the following sections:

- Section 59.1, "Introduction to Standards-Based Java Portlets"
- Section 59.2, "Creating a JSR 286 Java Portlet"
- Section 59.3, "Developing JSR 286 Java Portlets"
- Section 59.4, "Testing JSR 286 Portlets"
- Section 59.5, "Deploying JSR 286 Portlets to a WebLogic Managed Server"
- Section 59.6, "Migrating WebLogic Portal Portlets to WebCenter Portal"
- Section 59.7, "Troubleshooting JSR 286 Java Portlets"

## 59.1 Introduction to Standards-Based Java Portlets

WebCenter Portal supports standards-based Java portlets built using the JSR 286 standard.

*JSR 286* is a specification that defines a set of APIs to enable interoperability between portlets and portals, addressing the areas of aggregation, personalization, presentation, and security. JSR 286 defines container services that provide:

- A portlet API for coding portlet functionality
- The URL-rewriting mechanism for creating user interaction within a portlet container
- The security and personalization of portlets
- Interportlet communication using portlet events and public render parameters

For more information, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

*WSRP* is a web services standard that enables the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container and any WSRP portal. WSRP defines:

- Web Services Definition Language (WSDL) interface for the invocation of WSRP services

- Markup fragment rules for markup emitted by WSRP services
- The methods to publish, find, and bind WSRP services and metadata

WSRP provides communication between a portlet client (for example, a WebCenter Portal: Framework application) and a portlet container running on a remote server. JSR 286 describes the Java Portlet API for running portlet producer applications. Combining these standards enables developers to integrate their applications from any internal or external source as portlets with WSRP portals. Building pages becomes as simple as selecting portlets from the JDeveloper Resource Palette or Application Resources pane of the Application Navigator.

Figure 59–1 shows the architecture of the WSRP specification with JSR 286 portlets.

**Figure 59–1 WSRP Specification Architecture**

For a description of how JSR 286 security concepts are exposed through WSRP, see [Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."](#)

## 59.2 Creating a JSR 286 Java Portlet

WebCenter Portal provides a wizard, available in JDeveloper, for quickly and easily creating the initial framework of your JSR 286 standards-based Java portlets.

This section includes the following subsections:

- [Section 59.2.1, "How to Create a JSR 286 Java Portlet"](#)
- [Section 59.2.2, "What Happens When You Create a JSR 286 Portlet Using the JDeveloper Wizard"](#)

## 59.2.1 How to Create a JSR 286 Java Portlet

In the Create JSR 286 Java Portlet wizard, you can choose which portlet modes you want to implement and the implementation method (JSP, HTTP servlet, Java class, or HTML) to use for each mode. The wizard then creates a simple implementation for each of the selected modes.

To create a JSR 286 Java portlet using the JDeveloper wizard:

1. In JDeveloper, open the portlet producer application under which you want to create your portlet, or create a new portlet producer application.

For information about how to create a portlet producer application, see [Section 5.5, "Creating a Portlet Producer Application."](#)

---

**Note:** If you do not use the WebCenter Portal - Portlet Producer Application template to create the portlet producer application, you must manually add the appropriate portlet building technology scopes to the application.

Applications built using the WebCenter Portal - Framework Application template are *not* scoped for portlet creation.

---

2. Right-click the project under which you want to create your portlet (for example **Portlets**), and choose **New**.
3. In the New Gallery, expand **Web Tier**, select **Portlets** and then **Standards-based Java Portlet (JSR 286)**, and click **OK**.

**Tip:** If the project already contains JSR 286 portlets, you can also create a new portlet by:

- Right-clicking `portlet.xml` and choosing **Add Portlet**.
- Opening `portlet.xml`, clicking the **Design** tab, and clicking the **Add** icon on the **Portlets** tab.

4. On the General Portlet Information page of the Create JSR 286 Java Portlet wizard, replace the default name provided in the **Name** field with one that better describes the purpose of the portlet.
5. In the **Class** field, enter a name for the class for the portlet. You can accept the default name provided or supply your own. If you supply your own name, it must be a valid Java name.
6. From the **Package** dropdown list, select the package in which to create the class, or enter a package name.

Click the **Browse** button to find packages within the project, if required. If you do not select a specific package, the wizard uses the default package of the project.

7. From the **Default Language** dropdown list, select the default language that your portlet supports. The wizard uses English by default.
8. Select **Enable users to edit portlet content** if you want your portlet to support Edit mode. In the wizard, this option is selected by default.

Edit mode enables users to personalize the portlet at runtime. For more information, see [Section 57.4.1.2, "Edit Mode."](#)

If you select this option, you can specify implementation details for the portlet's Edit mode later on in the wizard.

9. Click **Next**.

10. On the Additional Portlet Information page, in the **Portlet Title** field, enter a descriptive title for your portlet.

The portlet title is displayed in the Resource Palette or Application Resources panel, so make the title something to help users decide whether the portlet is useful to them. The portlet title is also displayed on the portlet header when the portlet appears on a page.

**Tip:** The **Display Name**, **Short Title**, **Description**, and **Keyword** attributes are not implemented in WebCenter Portal. You do not need to enter any values for these fields unless your portlet is likely to be consumed by other applications.

For example, Oracle Portal uses the portlet display name in the Portlet Repository.

11. At this point in the wizard, you can click **Finish** to create the portlet immediately, using the default values for all remaining settings.

To provide additional details for your portlet, click **Next** and follow the remaining steps.

12. On the Content Types and Portlet Modes page, in the **Content Types and Portlet Modes** list, select **view**.

13. In the Implementation Method section, select how you want to implement View mode for your portlet (for more information about View mode, see [Section 57.4.1.1, "View Mode"](#)):

- Select **Generate JSP** to generate a skeleton JSP file for the portlet mode. Enter a name for the JSP in the corresponding field, or accept the default.

When you complete the wizard, the generated JSP displays in the Application Navigator where you can select it for further development. This is the default selection for all portlet display modes.

- Select **Generate ADF-Faces JSPX** to generate a page to which you can add ADF-Faces components. Enter a name for the JSPX in the corresponding field, or accept the default.

If you choose this option, the portlet implementation class is created as a subclass of `oracle.portlet.bridge.adf.application.ADFBridgePortlet`, instead of as a subclass of `javax.portlet.GenericPortlet`. That is, the wizard generates a portlet producer application which uses the Oracle JSF Portlet Bridge. For more information about the Oracle JSF Portlet Bridge, see [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge."](#)

- Select **Map to Path** to map the portlet mode to a web resource in the portlet producer application, such as a page. The resource is not generated by the wizard. Enter the name and path in the corresponding field. You can create this resource after completing the wizard if necessary.

With this selection, you must write the targeted resource or file yourself. The target could be, for example, a JSP, a servlet, or an HTML file. This selection enters code in the generated portlet Java class that routes requests for the given mode to the specified target.

- Select **Custom Code** to implement the portlet mode through a custom coded object. You must create this object later. This selection generates a skeleton method to render content (`private void doMODE_NAMECONTENT_TYPE`) in the generated portlet java class. You must update this code to render useful content.

**Tip:** If you want this portlet mode to support a different content type, for example `text/xml`, see Step 16.

14. If you selected **Enable users to edit portlet content** on the first page of the wizard, select **edit** and then select the implementation method for Edit mode (for information about Edit mode, see [Section 57.4.1.2, "Edit Mode"](#)), as described in step 13.

15. To implement another portlet mode for your portlet:

- a. In the **Content Types and Portlet Modes** list, select an existing mode (for example, **view**) under the appropriate content type (for example, **text/html**).
- b. Click **Add**.
- c. In the Portlet Modes dialog, move the required mode or modes to the **Selected** list and click **OK**.

The Portlet Modes dialog lists the standard modes supported by JSR 286 and the extended modes supported by WebCenter Portal.

For more information, see [Section 57.4.1, "Portlet Modes."](#)

- d. Select each of the portlet modes and specify the implementation method to use for rendering content, as described in step 13.

16. To add a new content type:

- a. In the **Content Types and Portlet Modes** list, select an existing content type (for example, **text/html**).
- b. Click **Add**.
- c. In the Content Types dialog, move the required content types to the **Selected** list and click **OK**.

17. Click **Next**.

If you selected **Enable users to edit portlet content** on the General Portlet Information page earlier in the wizard, then you can create portlet preferences to enable users of the portlet to specify values for the portlet at runtime. Go to step 18.

If you did not select this option, go to step 24.

18. On the Customization Preferences page, click **Add** to add a new portlet preference to the portlet.

By default, the wizard includes a portlet preference to enable users to customize the portlet title.

19. In the Add New Preference dialog, in the **Name** field, enter a name for the new preference.

The name must be unique in the portlet. Use only letters, numbers, and the underscore character.

20. In the **Default Values** field, enter one or more default values for the new preference. Separate multiple values with commas.

21. Select the **Translate Preference** checkbox if you want to be able to make the preference available in different languages.

For example, if the portlet is likely to be consumed by a multilingual portal you want to ensure that the preference displays in the appropriate language.

If you enable this option, then entries for the preference are added to the resource bundle class that JDeveloper generates for the portlet.

**Tip:** Edit the resource bundle to provide translations for the preference name and default values. The name will almost always require translating, but the default values may not, for example, if the value is an integer.

22. Click **OK**.
23. Repeat the preceding steps to add more preferences. When you are done click **Next**.

24. On the Security Roles page, to add an existing security role to your portlet, select the security role and move it to the **Selected** list.

Security roles enable you to set tiered levels of access to the portlet. For example, a *View* user can view the portlet but cannot edit it; a *Customize* user can customize portlet settings; a *Manage* user can perform all available functions associated with the portlet.

The **Available** list displays the security roles defined for the application in which you are creating the portlet. Moving a security role to the **Selected** list creates a reference of the security role in the application's portlet deployment file (`portlet.xml`) that refers to the security role in the application's web deployment file (`web.xml`).

You can create new security roles for the application by editing `web.xml`. For more information, see the JDeveloper online help.

25. Click **Next**.
26. On the Caching Options page, select **Cache Portlet** to enable expiry-based caching for your portlet.

For more information about expiry-based caching, see [Section 57.4.4, "Portlet Performance"](#) and [Section 59.3.9.1, "Implementing Expiry-Based Caching in JSR 286 Portlets."](#)

Selecting this option indicates that portlet caching is managed by the portlet container. The portlet itself may choose to cache content for any given response. The settings on this page apply only when the portlet itself does not specify a caching condition for a response.

If you do not want any default caching for this portlet, choose **Do Not Cache By Default**. In this case, the wizard actually sets a cache duration of 0 seconds. As stated earlier, this cache setting only comes into play when the portlet itself does not specify a caching condition for a response.

If you choose no caching here and you later decide to implement default caching for the portlet, then you can change the cache duration value in the `portlet.xml` file, which is generated by the wizard, to a number greater than zero.

For information about how to implement validation-based caching, see [Section 59.3.9.2, "Implementing Validation-Based Caching in JSR 286 Portlets."](#)

27. If you chose to cache the portlet, in the Default Expiry Conditions section, select:

- **Cache Content Expires After [ ] seconds** to expire the cached portlet content after a certain amount of time. Specify the time limit in the corresponding field.
- **Cache Content Never Expires** to never expire the cached portlet content. You may want to select this option if the portlet contains static content that is unlikely to change.

28. Click **Next**.

29. On the Initialization Parameters page, you can add initialization parameters to your portlet.

Initialization parameters provide the application developer, who decides what goes into the WAR file, an alternative to JNDI variables for configuring the behavior of all of the different components of the application (for example, servlets and portlets) in a compatible way. These initialization parameters are added to the `portlet.xml` file.

- a. Click **New** to add a new initialization parameter to the portlet.
- b. In the newly added row, double-click each field to provide a **Name**, default **Value**, and **Description** for the parameter.
- c. Repeat these steps to add more initialization parameters.
- d. When you are done, click **Finish** to create the portlet.

## 59.2.2 What Happens When You Create a JSR 286 Portlet Using the JDeveloper Wizard

When you use the Create JSR 286 Java Portlet wizard, JDeveloper generates a default implementation of the portlet. Specifically, the following files are created:

- Two Java classes:
  - `portletName.java` is invoked by the portlet container and contains all the methods required by the portlet standards.
  - `portletnameBundle.java` contains all the translation strings for the portlet.
- `portlet.xml` is the portlet deployment descriptor file for the application.
- `web.xml` is the web deployment descriptor file for the application.
- Files for each portlet mode you selected for the portlet:
  - If you selected **Generate JSP** for the portlet mode, a JSP page is created for the mode, for example, `view.jsp`.
  - If you selected **Generate ADF-Faces JSPX**, a JSPX page is created for the mode, for example, `view.jspx`. You can add Faces components to this page.
  - If you selected **Map to Path**, no additional files are created as the code for the portlet mode resides in an existing resource. Code is added to the portlet's Java class to route requests to the specified target.
  - If you selected **Custom Code**, no additional files are created, but the code for the portlet mode resides in the portlet's Java class.

You can see all these files in the Application Navigator, as shown in [Figure 59–2](#).

**Figure 59–2 Files Generated for a JSR 286 Java Portlet**

## 59.3 Developing JSR 286 Java Portlets

When you have built your initial portlet implementation using the Create JSR 286 Java Portlet wizard, the next step is to create the code that drives the portlet content and behavior. Because JSR 286 portlets adhere to the Java standards, you can find substantial information about enhancing them from many different sources, such as third-party books and web pages, including:

<http://jcp.org/en/jsr/detail?id=286>

This section includes the following subsections:

- [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File"](#)
- [Section 59.3.2, "How to Add Custom Portlet Modes to JSR 286 Portlets"](#)
- [Section 59.3.3, "How to Access User Information in JSR 286 Portlets"](#)
- [Section 59.3.4, "How to Customize the Runtime Environment for JSR 286 Portlets"](#)
- [Section 59.3.5, "How to Use Public Render Parameters in JSR 286 Portlets"](#)
- [Section 59.3.6, "How to Use Portlet Events in JSR 286 Portlets"](#)
- [Section 59.3.7, "How to Add Portlet Preferences to JSR 286 Portlets"](#)
- [Section 59.3.8, "How to Use Portlet Filters in JSR 286 Portlets"](#)
- [Section 59.3.9, "How to Enhance JSR 286 Portlet Performance with Caching"](#)

- [Section 59.3.10, "How to Implement Rewritten URLs for Resource Proxy"](#)
- [Section 59.3.11, "How to Implement Stateless Resource Proxying"](#)
- [Section 59.3.12, "How to Implement Security for JSR 286 Portlets"](#)
- [Section 59.3.13, "How to Manage the Persistence Store for JSR 286 Portlets"](#)
- [Section 59.3.14, "How to Export and Import Portlet Producers at Design Time"](#)

### 59.3.1 How to Edit the Portlet Deployment Descriptor File

The portlet deployment descriptor file for the application, `portlet.xml`, specifies the portlet resources in the application. [Example 59–1](#) shows an example portlet deployment descriptor file.

#### **Example 59–1 Example Portlet Deployment Descriptor File**

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<portlet-app version="2.0"
  xsi:schemaLocation="http://java.sun.com/xml/ns/portlet/portlet-app_2_0.xsd
    http://java.sun.com/xml/ns/portlet/portlet-app_2_0.xsd"
  xmlns="http://java.sun.com/xml/ns/portlet/portlet-app_2_0.xsd"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <portlet id="1328624289503">
    <portlet-name>myPortlet</portlet-name>
    <display-name xml:lang="en-US">Portlet1</display-name>
    <display-name xml:lang="en">English Display Name</display-name>
    <portlet-class>portlet.Portlet1</portlet-class>
    <expiration-cache>300</expiration-cache>
    <supports>
      <mime-type>text/html</mime-type>
      <portlet-mode>edit</portlet-mode>
    </supports>
    <supported-locale>en-US</supported-locale>
    <resource-bundle>portlet.resource.Portlet1Bundle</resource-bundle>
    <portlet-info>
      <title>This Is My Portlet</title>
      <short-title>My Portlet</short-title>
      <keywords/>
    </portlet-info>
    <portlet-preferences>
      <preference>
        <name>portletTitle</name>
      </preference>
    </portlet-preferences>
  </portlet>
  <custom-portlet-mode>
    <portlet-mode>about</portlet-mode>
  </custom-portlet-mode>
  <custom-portlet-mode>
    <portlet-mode>config</portlet-mode>
  </custom-portlet-mode>
  <custom-portlet-mode>
    <portlet-mode>edit_defaults</portlet-mode>
  </custom-portlet-mode>
  <custom-portlet-mode>
    <portlet-mode>preview</portlet-mode>
  </custom-portlet-mode>
  <custom-portlet-mode>
    <portlet-mode>print</portlet-mode>
  </custom-portlet-mode>
</portlet-app>
```

```
</custom-portlet-mode>  
</portlet-app>
```

After you have created your JSR 286 portlet using the wizard, you can edit the `portlet.xml` file to edit the portlet resources.

When you open the `portlet.xml` file in JDeveloper, you can edit the source code or you can use the Overview Editor to edit portlet resources without having to manually modify it in the Source view.

To edit the portlet deployment descriptor file:

1. In the Application Navigator, open the portlet producer application.
2. Expand the portlet project (for example, **Portlets**).
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click `portlet.xml` and choose **Open**.
5. Click the **Design** tab to open the Overview Editor for `portlet.xml`.

**Tip:** If you prefer to edit the source code directly, click the **Source** tab.

6. The Overview Editor for `portlet.xml` contains the following tabs:
  - **Application**—Use to specify general information for the portlet producer application. These properties apply to all portlets within the application.
  - **Portlets**—Use to specify information for individual portlets within the application. For example, you can specify the portlet events and public render parameters supported by a portlet.
  - **Events**—Use to create and manage portlet events for use by all portlets in the application. For more information, see [Section 59.3.6, "How to Use Portlet Events in JSR 286 Portlets."](#)
  - **Parameters**—Use to create and manage public render parameters for use by all portlets in the application. For more information, see [Section 59.3.5, "How to Use Public Render Parameters in JSR 286 Portlets."](#)
  - **Filters**—Use to specify filter information for the portlets in the application. For more information, see [Section 59.3.8, "How to Use Portlet Filters in JSR 286 Portlets."](#)
  - **Filter Mappings**—Use to assign portlet filters to individual portlets. For more information, see [Section 59.3.8, "How to Use Portlet Filters in JSR 286 Portlets."](#)

## 59.3.2 How to Add Custom Portlet Modes to JSR 286 Portlets

In the Create JSR 286 Java Portlet wizard, you add portlet modes by adding them to a list on the Content Types and Portlet Modes page. For more information about using the wizard, see [Section 59.2, "Creating a JSR 286 Java Portlet."](#) The wizard enables you to implement the standard modes supported by JSR 286 and the extended modes provided by WebCenter Portal.

The standard modes supported by JSR 286 are:

- View
- Edit
- Help

WebCenter Portal supports the following additional custom modes for JSR 286 portlets:

- About
- Config
- Edit Defaults
- Preview
- Print

After the initial creation of the portlet, you can also define your own custom portlet modes.

The principles of implementing portlet modes are the same for all modes.

To add a custom portlet mode:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Application** tab, if necessary.
3. Expand the Custom Modes section, if necessary.  
This section lists all the custom modes available to the portlets within the application. It includes the WebCenter Portal extended portlet modes.
4. Click the **Add Custom Mode** icon to create a new row for the portlet mode.
5. In the **Portlet Mode** field, enter the name of the portlet mode.  
The name must be unique within the application.
6. In the **Description** field, enter a brief description to explain the purpose of the mode.
7. Deselect the **Portal Managed** checkbox if applications that consume the portlet do not need to be aware of the portlet mode, that is, the mode is used internally by the portlet.
8. Save the `portlet.xml` file.
9. After adding the custom portlet mode to the application, you must then create the code for the mode in the portlet implementation file.

### 59.3.3 How to Access User Information in JSR 286 Portlets

You can create user attributes in the portlet producer application to access commonly used user information, such as `user.login.id` or `user.name.family`. At runtime, these user attributes are mapped to the actual attributes of the current user. Portlets can use this information to obtain information about the current user.

To access user information:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Application** tab, if necessary.
3. Expand the User Attributes section, if necessary.

4. Click the **Add User Attribute** icon to create a new row for the attribute.
5. In the **Name** field, enter the name of the user attribute, for example `user.login.id`.

For a list of attribute names, see the "User Information Attribute Names" appendix in the Java Portlet Specification.

**Tip:** For a list of the user information attributes supported by WebCenter Portal, see the "Mapping User Attributes to LDAP Directories" section in the *Oracle Containers for J2EE Security Guide*.

6. In the **Description** field, enter a description for the user attribute.
7. Save the `portlet.xml` file.

At runtime, the portlet container maps the defined user attributes to the appropriate values. For example, if the current user is John Doe, then the `user.name.family` user attribute is mapped to Doe. Portlets can obtain a `Map` object containing the user attributes from the `PortletRequest` interface.

### 59.3.4 How to Customize the Runtime Environment for JSR 286 Portlets

When a portlet is run, the portlet container provides the runtime environment and provides an interface between the portlet producer application and the portlet.

Container runtime options provide a way to customize the behavior of the portlet container and therefore customize the runtime environment.

This section includes the following subsections:

- [Section 59.3.4.1, "Supported Container Runtime Options"](#)
- [Section 59.3.4.2, "Setting Container Runtime Options for All Portlets in an Application"](#)
- [Section 59.3.4.3, "Setting Container Runtime Options for Individual Portlets"](#)

#### 59.3.4.1 Supported Container Runtime Options

[Table 59–1](#) lists the container runtime options supported by the WebCenter Portal portlet container.

For more information about the JSR 286 container runtime options, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

**Table 59–1 Supported Container Runtime Options**

Container Runtime Option	Supported by	JSR 286 Standard
<a href="#">javax.portlet.actionScopedRequestAttributes</a>	Application Portlet	Yes
<a href="#">javax.portlet.escapeXml</a>	Application Portlet	Yes
<a href="#">java.portlet.renderHeaders</a>	Not supported	Yes
<a href="#">javax.portlet.servletDefaultSessionScope</a>	Application Portlet	Yes

**Table 59–1 (Cont.) Supported Container Runtime Options**

<b>Container Runtime Option</b>	<b>Supported by</b>	<b>JSR 286 Standard</b>
<code>com.oracle.portlet.allowEventPayloadsWithoutJAXBBinding</code>	Application	No
<code>com.oracle.portlet.allowWsrpExport</code>	Application	No
<code>com.oracle.portlet.compatibilityMode</code>	Application Portlet	No
<code>com.oracle.portlet.defaultProxiedResourceRequiresWsrpRewrite</code>	Application Portlet	No
<code>com.oracle.portlet.defaultServedResourceRequiesWsrpRewrite</code>	Application Portlet	No
<code>com.oracle.portlet.disallowResourceServing</code>	Application Portlet	No
<code>com.oracle.portlet.escapeXmlEncodeUrls</code>	Application Portlet	No
<code>com.oracle.portlet.eventPayloadsXmlType</code>	Application	No
<code>com.oracle.portlet.excludedActionScopeRequestAttributes</code>	Application Portlet	No
<code>com.oracle.portlet.externalScopeRequestAttributes</code>	Application Portlet	No
<code>com.oracle.portlet.importCssToIFrame</code>	Application Portlet	No
<code>com.oracle.portlet.minimumWsrpVersion</code>	Application Portlet	No
<code>com.oracle.portlet.offerPortletOverWsrp</code>	Application Portlet	No
<code>com.oracle.portlet.portalInfoProvider</code>	Application Portlet	No
<code>com.oracle.portlet.redirectAfterAction</code>	Application Portlet	No
<code>com.oracle.portlet.renderHeaders</code>	Application Portlet	No
<code>com.oracle.portlet.requireIFrame</code>	Application Portlet	No
<code>com.oracle.portlet.streamingOptimized</code>	Application Portlet	No
<code>com.oracle.portlet.suppressWsrpOptimisticRender</code>	Application Portlet	No
<code>com.oracle.portlet.trapWsrpRenderExceptions</code>	Application Portlet	No
<code>com.oracle.portlet.trimEncodeUrls</code>	Application Portlet	No

**Table 59–1 (Cont.) Supported Container Runtime Options**

Container Runtime Option	Supported by	JSR 286 Standard
<code>com.oracle.portlet.useWsrpUserContextForUserAuthentication</code>	Application	No
<code>com.oracle.portlet.wsrpHeaderMode</code>	Application Portlet	No
<code>com.oracle.portlet.wsrpLegacyPortletHandle</code>	Portlet	No
<code>com.oracle.portlet.wsrpPortletHandle</code>	Portlet	No
<code>oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents</code>	Portlet	No

**javax.portlet.actionScopedRequestAttributes**

Specifies whether to store action-scoped request attributes so that they are available to portlets until a new action occurs.

You can use the WebCenter Portal-specific `excludedActionScopeRequestAttributes` container runtime option to limit which request attributes are stored in the scopes.

Valid values:

- `true`—store request attributes starting at `processAction` until the next `processAction`. You can specify a second value of `numberOfCachedScopes` and a third value indicating the number of scopes to be cached by the portlet container.
- `false`—do not store request attributes.

**javax.portlet.escapeXml**

Specifies whether to XML encode URLs returned from `actionUrl`, `renderUrl`, and `resourceUrl` JSR 286 tag library tags.

You can override this option on a per-tag basis using the `encodeXml` attribute.

Valid values:

- `true`—(default) the URLs returned by the `actionUrl`, `renderUrl`, and `resourceUrl` tags are XML encoded (using ampersand entities for parameter separation).
- `false`—the URLs returned by the `actionUrl`, `renderUrl`, and `resourceUrl` tags are not XML encoded (and use just ampersand characters).

---

**Note:** This option does not have any effect on the return value of `PortletURL.toString()` or `ResourceURL.toString()`. In both these cases, for JSR 286, the output uses only ampersand characters. To use ampersand entities or to be able to specify the XML encoding to use when generating URLs not using the tag libraries, see the `BaseURL.write()` methods.

---

**javax.portlet.servletDefaultSessionScope**

Specifies the scope of the session object provided to servlets or JSPs that are included or forwarded from a Java portlet.

Valid values:

- `APPLICATION_SCOPE`—(default) map the portlet session with application scope.
- `PORTLET_SCOPE`—map the portlet session with portlet scope.

**com.oracle.portlet.allowEventPayloadsWithoutJAXBBinding**

Allows event payload types declared in `portlet.xml` and event payloads sent from JSR 286 portlets to bypass the JSR 286 spec requirement that these types have a valid JAXB binding.

Valid values:

- `true`—event payloads without valid JAXB bindings are allowed.
- `false`—event payloads without valid JAXB bindings are not allowed, per the JSR 286 specification.

**com.oracle.portlet.allowWsrpExport**

Allows the WSRP export-portlets operation to be disabled for the web application. This option is provided only for backward-compatibility.

Valid values:

- `true`—(default) export-portlets is allowed.
- `false`—export-portlets is not allowed.

**com.oracle.portlet.compatibilityMode**

Set to `owc168` to invoke the WebCenter Portal JSR 286 container JSR 168 compatibility mode.

This also automatically sets the `disallowResourceServing` runtime option to `true` if no other value for that option is specified.

**com.oracle.portlet.defaultProxiedResourceRequiresWsrpRewrite**

Specifies the default WSRP `requiresRewrite` flag to use when encoding URLs for resources not served by the portlet. This setting is used for all URLs returned by the `PortletResponse.encodeURL()` method, unless overridden by the presence of the `oracle.portlet.server.resourceRequiresRewriting` request attribute when the `PortletResponse.encodeURL()` method is called.

Valid values:

- `true`—(default) the `requiresRewrite` flag is set to `true`, indicating that the resource should be rewritten by the consumer.
- `false`—the `requiresRewrite` flag is set to `false`, indicating that the resource does not necessarily need to be rewritten by the consumer.

**com.oracle.portlet.defaultServedResourceRequiresWsrpRewrite**

Specifies the default WSRP `requiresRewrite` flag to use when generating resource URLs for portlet-served resources.

This setting is used for all resource URLs created by the portlet, unless overridden by the presence of the `resourceRequiresRewriting` request attribute when the resource URL methods `write()` or `toString()` are called. This setting is also used to specify the WSRP `requiresRewriting` flag on the served resource response, but can be overridden by the presence of the `resourceRequiresRewriting` request attribute when the portlet's `serveResource()` method returns.

Valid values:

- `true`—the `requiresRewrite` URL flag and `requiresRewriting` response flag are set to `true`, indicating that the resource should be rewritten by the consumer

- `false`—the `requiresRewrite` URL flag and `requiresRewriting` response flag are set to `false`, indicating that the resource does not necessarily need to be written by the consumer, although the consumer may choose to rewrite the URL.

If unspecified, the `requiresRewrite` URL flag is not given a value, and the `requiresRewriting` response flag for a `serveResource` operation is based on the MIME type of the response.

#### **com.oracle.portlet.disallowResourceServing**

Specifies whether portlets are allowed to serve resources. This is useful if JSR 168 portlets are run in the 286 container, as any JSR 168 portlet extending `javax.portlet.GenericPortlet` automatically inherits the JSR 286 functionality, which automatically forwards resource requests to a file in the web application named after the resource ID, creating a potential security problem. For the same security reason, JSR 286 portlets that do not serve resources are safest to disallow resource serving.

Valid values:

- `true`—portlets are not allowed to serve resources.
- `false`—portlets are allowed to serve resources.

#### **com.oracle.portlet.escapeXmlEncodeUrls**

Specifies whether the JSR 286 container should XML-encode URLs generated from the `PortletResponse.encodeURL()` method.

Valid values:

- `true`—URLs generated by the `PortletResponse.encodeURL()` method are XML-encoded.
- `false`—(default) URLs generated by `PortletResponse.encodeURL()` are not XML-encoded.

#### **com.oracle.portlet.eventPayloadsXmlType**

Specifies optional XML schema types for JAXB-bindable Java object event payloads if events are sent over WSRP. This is a multi-valued runtime option; each value consists of a Java class name and QName pair, separated by a colon (:). The QName should use the standard Java String representation of a QName (`{namespace}localpart`). For each value specified, the QName is used as the XML schema type to annotate WSRP event payloads of the specified Java object type after the object has been marshalled to XML. This may be useful when using events to communicate across portlets on multiple producers.

#### **com.oracle.portlet.excludedActionScopeRequestAttributes**

This is a multi-valued property with each value being a regular expression. Request attributes which match any of the regular expressions are not stored as action-scoped request attributes if the `javax.portlet.actionScopedRequestAttributes` container runtime option is used, in addition to any request parameters whose values match the regular expressions defined in the `com.oracle.portlet.externalScopeRequestAttributes` container runtime option.

#### **com.oracle.portlet.externalScopeRequestAttributes**

This is a multi-valued property with each value being a regular expression. Request attributes which match any of the regular expressions are considered outside of portlet scope, and are shared with the underlying portal request.

If the `javax.portlet.actionScopedRequestAttributes` option is used, any request attributes matching the regular expressions declared in `externalScopeRequestAttributes` are not stored in the action scope request attributes.

#### **com.oracle.portlet.importCssToIFrame**

Specifies to a portal consumer whether the CSS file should be imported to an IFRAME portlet.

Valid values:

- `true`—(default) the CSS file from the consumer is applied to an IFRAME portlet.
- `false`—nothing is done.

#### **com.oracle.portlet.minimumWsrpVersion**

Specifies minimum required WSRP version for the portlet to work. If the WSRP version being used is less than the value specified, the portlet will not be included in a WSRP `getServiceDescription`, `getPortletDescription`, `getMarkup` and other WSRP responses.

Valid values:

- 1
- 2

#### **com.oracle.portlet.offerPortletOverWsrp**

Specifies whether the portlet is offered in the WSRP producer's service description.

Any `offerRemote` setting in a `.portlet` file referencing the JSR 168/286 portlet overrides this container runtime option.

Valid values:

- `true`—(default) the portlet is offered in the WSRP producer's service description.
- `false`—the portlet is not included in the service description.

If not specified at all, the default value specified in the `WEB-INF/producer-config.xml` is used.

#### **com.oracle.portlet.portalInfoProvider**

Specifies the class name of an optional implementation of `com.bea.portlet.container.IPortalInfo` interface. This implementation defines the value returned by the JSR 286 container's `request.getPortalContext().getPortalInfo()`. The default implementation returns the producer/local server name and version, but a custom implementation could pass both the consumer server information and the producer server information in a WSRP scenario.

#### **com.oracle.portlet.redirectAfterAction**

Causes the JSR 286 container to send a redirect to the browser to the portlet's render URL after a `processAction` is run (and after events are handled) so that reloading the resulting page will not result in another `processAction`.

Valid values:

- `true`—a redirect is issued after every portlet action.
- `false`—no redirect is not automatically issued after portlet actions.

**com.oracle.portlet.requireIFrame**

Specifies whether the portlet must be rendered inside an IFRAME.

Valid values:

- `true`—renders the portlet inside an IFRAME.
- `false`—does not force the portlet to be rendered inside an IFRAME.

**com.oracle.portlet.streamingOptimized**

Indicates the portlet is optimized to run in streaming mode, which may enhance performance.

Valid values:

- `true`—the portlet is optimized to run in streaming mode.
- `false`—the portlet is not optimized to run in streaming mode.

**com.oracle.portlet.suppressWsrpOptimisticRender**

Suppresses the optimistic render of a portlet after the action and/or event lifecycles if the portlet is being run over WSRP.

Valid values:

- `true`—optimistic render is always suppressed.
- `false`—optimistic render may be performed.

**com.oracle.portlet.trapWsrpRenderExceptions**

Specifies whether the JSR 286 container should send exceptions during render as WSRP SOAP faults, or render an exception message for the portlet markup instead.

Valid values:

- `true`—(default) exceptions are not sent as SOAP faults but instead as rendered exception stack traces.
- `false`—exceptions generated by the portlet during render are treated as SOAP faults.

**com.oracle.portlet.trimEncodeUrls**

Specifies whether the JSR 286 container should trim whitespace from URLs passed to the `PortletResponse.encodeURL()` method.

Valid values:

- `true`—(default) leading and trailing whitespace is trimmed from the URL passed into `PortletResponse.encodeURL()`.
- `false`—whitespace is not trimmed from the URL passed into `PortletResponse.encodeURL()`.

**com.oracle.portlet.useWsrpUserContextForUserAuthentication**

Specifies whether the `PortletRequest` methods `getRemoteUser()`, `getUserPrincipal()` and `isUserInRole()` are based on the WSRP user context information or on standard J2EE security.

Valid values:

- `true`—the user information is based on the WSRP user context, if the portlet is run over WSRP. This can be a security problem so use this option with care.

- `false`—(or the portlet is not being run over WSRP) the user information is based on the J2EE authenticated user.

#### **`com.oracle.portlet.wsrpHeaderMode`**

Used only when portlets are being rendered as WSRP remote portlets, to indicate where cookies and headers should be put in the WSRP SOAP response as a hint to the WSRP consumer for the header or cookie's intended final destination.

When portlets are run locally (not over WSRP), headers and cookies set by portlets are always assumed to go to the client. Setting this container runtime option sets a default value for the `PortletRequest` attribute `com.oracle.portlet.wsrpHeaderMode`, which can still be overridden by the portlet at runtime on a per-header basis.

Valid values:

- `client`—headers and cookies set by the portlet are directed to go to the client (for example, the browser).
- `consumer`—headers and cookies set by the portlet are directed to go to the consumer and not passed on to the client.
- `both`—headers and cookies set by the portlet are directed to go to the client and the consumer.

If not set, the portlet container assumes the default value for the producer as specified in the `WEB-INF/wsrp-producer-config.xml` file.

#### **`com.oracle.portlet.wsrpLegacyPortletHandle`**

Allows the specification of a legacy WSRP portlet handle to be used for the portlet, which must be unique within the web application. This is useful for backward-compatibility with WebCenter Portal consumers that use the legacy, portlet-position-based WSRP portlet handles.

If specified, the legacy portlet handle is published in the WSRP `serviceDescription` as a legacy-handle extension on the portlet, and consumers are able to access the portlet using the legacy portlet handle, although the portlet will not be published in the WSRP `serviceDescription` under the legacy portlet handle.

#### **`com.oracle.portlet.wsrpPortletHandle`**

Allows the specification of the WSRP portlet handle to be used for the portlet, which must be unique within the web application.

#### **`oracle.portlet.bridge.adf.raiseUndeclaredContextualEvents`**

Allows the Oracle JSF Portlet Bridge to raise ADFm events that do not have corresponding portlet events declared in the `portlet.xml` file.

Valid values:

- `true`—any ADFm event raised is forwarded on as a portlet event.
- `false`—only events with corresponding portlet event declarations are forwarded.

### **59.3.4.2 Setting Container Runtime Options for All Portlets in an Application**

Setting container runtime options at the application level affects all the portlets in the application.

To set application-level container runtime options:

1. Open the Overview Editor for the `portlet.xml` file.

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)

2. Click the **Application** tab, if necessary.
3. Expand the Container Runtime Options section, if necessary.
4. Click the **Add Container Runtime Option** icon to display a list of available options.

The list includes all container runtime options supported by the WebCenter Portal portlet container, which are listed in [Table 59–1](#).

If you are using a different portlet container that supports additional container runtime options that are not listed, select **<Customize>** and enter the name of the option in the **Name** field.

If you specify a container runtime option that is not supported by the portlet container, it is ignored.

5. In the **Value** field, enter a value for the container runtime option.

The container runtime option is added to the `portlet.xml` code, for example:

```
<container-runtime-option>
  <name>com.oracle.portlet.requireIFrame</name>
  <value>true</value>
</container-runtime-option>
```

6. Save the `portlet.xml` file.

### 59.3.4.3 Setting Container Runtime Options for Individual Portlets

You can set container runtime options at the individual portlet level to override the application-wide settings.

To set portlet-level container runtime options:

1. Open the Overview Editor for the `portlet.xml` file.

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)

2. Click the **Portlets** tab, if necessary.
3. Click the **Advanced** tab.
4. Click the **Add Container Runtime Option** icon to display a list of available options.

The list includes all container runtime options supported by the WebCenter Portal portlet container, which are listed in [Table 59–1](#).

If you are using a different portlet container that supports additional container runtime options that are not listed, select **<Customize>** and enter the name of the option in the **Name** field.

If you specify a container runtime option that is not supported by the portlet container, it is ignored.

5. In the **Value** field, enter a value for the container runtime option.

The container runtime option is added to the `portlet.xml` code, for example:

```
<container-runtime-option>
  <name>com.oracle.portlet.requireIFrame</name>
  <value>false</value>
```

```
</containter-runtime-option>
```

6. Save the `portlet.xml` file.

### 59.3.5 How to Use Public Render Parameters in JSR 286 Portlets

*Public render parameters* enable portlets to share parameter values, allowing a form of interportlet communication.

For example, if a Map portlet and a Weather portlet are both configured to use a Zipcode public render parameter, entering a zip code in the Map portlet updates the same parameter value in the Weather portlet.

Any public render parameters supported by a portlet must be declared in the application section of the portlet deployment descriptor file (`portlet.xml`). Public render parameters defined at the application level in this way are available to all the portlets in the application.

Individual portlets within the application can then specify which of these public render parameters they want to use.

If you declare and define public render parameters as described below, interportlet communication happens automatically, without any further coding required on your part. For more information, see [Section 62.6.3, "What You May Need to Know About Interportlet Communication."](#)

This section includes the following subsections:

- [Section 59.3.5.1, "Declaring a Public Render Parameter at the Application Level"](#)
- [Section 59.3.5.2, "Defining a Public Render Parameter for a Portlet"](#)
- [Section 59.3.5.3, "Example: Public Render Parameters"](#)

For more information about public render parameters and how to implement them, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

#### 59.3.5.1 Declaring a Public Render Parameter at the Application Level

For a public render parameter to be available to a portlet, it must first be declared in the application section of the portlet deployment descriptor file (`portlet.xml`).

To define a public render parameter at the application level:

1. Open the Overview Editor for the `portlet.xml` file.
 

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Parameters** tab.
3. Click the **Add** icon to create a new public render parameter.
4. From the dropdown list, select whether you are specifying a fully qualified name (QName) for the parameter, or just the local part of the name.
  - **Qualified Name**—A *QName* uniquely identifies the public render parameter across applications by specifying a namespace for the parameter as well as a local name. Within the portlet code, a public render parameter is accessed by its identifier, which identifies the parameter uniquely within the application. However, a page typically contains multiple portlets which may come from different applications. Using QNames ensures that public render parameters

from one portlet do not unintentionally interfere with the other portlets on a page regardless of where those portlets come from.

- **Unqualified Name**—If the namespace for the parameter is the same as the application default namespace, you can omit the namespace when defining the parameter by specifying an unqualified name. If the application default namespace has not been defined, a parameter with an unqualified name uses the XML default namespace.

**Tip:** To check whether an application default namespace has been defined, click the **Application** tab and see if a value has been entered in the **Default Namespace** field.

5. Enter a name for the parameter.
  - If you selected **Qualified Name**—in the **Namespace** field, enter the namespace for the parameter and in the **Name** field, enter the local part of the parameter name.
  - If you selected **Unqualified Name**—in the **Name** field, enter the local part of the parameter name. The parameter uses the application default namespace as the namespace for the parameter (or the XML default namespace if no default namespace is defined for the application).

6. In the **Identifier** field, enter a name to identify the public render parameter within the application.

The identifier must be unique within the application and is used to identify the parameters used by a portlet and in the portlet code to access the parameter. Using the identifier means that portlet developers do not need to be aware of the parameter's fully qualified name; they simply need to know the simpler application-specific identifier.

7. In the **Description** field, enter a description for the public render parameter. The description should provide enough information so that portlet developers can determine how to use this parameter in their portlets.
8. (Optional) In the Aliases panel, you can provide a list of aliases so that the parameter can accept values from other public render parameters even if they have different QNames.
  - a. Click the **Create** icon to create a new alias for the parameter.
  - b. In the **Namespace** field, enter the namespace of the parameter to use for the alias.
  - c. In the **Name** field, enter the local part of the parameter to use for the alias.

**Tip:** When creating aliases for public render parameters, it is a good idea to set up reciprocal aliases. So if a parameter in portlet A has an alias to a parameter in portlet B, you should also, if possible, create an alias for the parameter in portlet B to the parameter in portlet A.

9. The public render parameter is added to the application definition section of the `portlet.xml` file:

```
<portlet-app ...>
  <portlet>...</portlet>
  <portlet>...</portlet>
  ...
  <public-render-parameter>
```

```

        <description>Parameter for zip code</description>
        <identifier>Zip</identifier>
        <qname xmlns:x="http://example.com/params">x:Zip</qname>
        <alias xmlns:x="http://example.com/params">x:ZipCode</alias>
    </public-render-parameter>
    ...
</portlet-app>

```

10. Save the `portlet.xml` file.

### 59.3.5.2 Defining a Public Render Parameter for a Portlet

If you want a portlet to support a public render parameter, add it to the portlet.

To add a public render parameter to a portlet:

1. Open the Overview Editor for the `portlet.xml` file.

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)

2. If the public render parameter has not yet been defined within the Portlet Producer application, you must do this first.

For more information, see [Section 59.3.5.1, "Declaring a Public Render Parameter at the Application Level."](#)

3. Click the **Portlets** tab and select the portlet in which you want to use the public render parameter.

4. Click the **Parameters** tab.

In the Publishing Events panel, the **Available** list shows all the portlet events that have been defined for the application.

5. Click the **Parameters** tab.

In the Public Render Parameters panel, the **Available** list shows all the public render parameters that have been defined for the application.

6. Select the public render parameter that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

This adds the public render parameter to the portlet definition in `portlet.xml`:

```

<portlet-app ...>
  <portlet id="1234567890">
    ...
    <supported-public-render-parameter>Zip</supported-public-render-parameter>
    ...
  </portlet>
  ...
  <public-render-parameter>
    <identifier>Zip</identifier>
    <name>Zip</name>
  </public-render-parameter>
  ...
</portlet-app>

```

7. Save the `portlet.xml` file.
8. You can now use this public render parameter in the code for your portlet.

### 59.3.5.3 Example: Public Render Parameters

The following example shows how to use public parameters to link the behavior of two portlets using parameters with different names. In the example, we take a generic Parameter Form portlet that allows us to update public render parameters, and show how that can be linked to a Stock Price portlet that renders stock prices, taking the stock symbol from a public render parameter. The generic name of the parameter from the Parameter Form portlet (`parameter1`) does not match the name of the parameter in the Stock Price portlet (`stocksymbol`), so the developer of the Stock Price portlet uses an alias to provide a link between the two parameters.

[Example 59–2](#) shows an excerpt from the `portlet.xml` file for the portlet producer application that contains the Parameter Form portlet. The portlet producer application defines a public render parameter (`parameter1`) that is supported by the Parameter Form portlet.

#### **Example 59–2** Parameter Definition for the Parameter Form Portlet

```
<portlet-app ...>
  <portlet id="1234567890">
    ...
    <supported-public-render-parameter>
      parameter1
    </supported-public-render-parameter>
    ...
  </portlet>
  ...
  <public-render-parameter>
    <description xml:lang="en">First parameter set by portlet</description>
    <identifier>parameter1</identifier>
    <qname xmlns:op="http://xmlns.oracle.com/portlet/oracle-portlet-app">
      op:parameter1
    </qname>
  </public-render-parameter>
  ...
</portlet-app>
```

The code for the Parameter Form portlet sets the value of the `parameter1` portlet when a value is entered in the portlet ([Example 59–3](#)).

#### **Example 59–3** Parameter Processing for the Parameter Form Portlet

```
public void processAction(ActionRequest request,
                        ActionResponse actionResponse)
    throws PortletException, IOException
{
    //
    // Read the new parameter value posted in the portlet form
    //
    String param1 = actionResponse.getParameter("form_param1");

    //
    // Set the new parameter values. These will be interpreted by the
    // container as public render parameters as the names match the names
    // of the declared parameters.
    //
    actionResponse.setRenderParameter("parameter1", param1);
}
```

[Example 59–4](#) shows an excerpt from the `portlet.xml` file for the portlet producer application that contains the Stock Price portlet. This portlet producer application also defines a public render parameter (`stocksymbol`) that is supported by the Stock Price portlet. For the `stocksymbol` parameter to link to the Parameter Form portlet's parameter, an alias for `parameter1` is added.

**Example 59–4 Parameter Definition for the Stock Price Portlet**

```
<portlet-app ...>
  <portlet>
    ...
    <supported-public-render-parameter>
      stocksymbol
    </supported-public-render-parameter>
    ...
  </portlet>
  ...
  <public-render-parameter>
    <description xml:lang="en">The stock symbol</description>
    <identifier>stocksymbol</identifier>
    <qname xmlns:s="http://www.oracle.com/stocks">s:stocksymbol</qname>
    <!-- Alias matches the Parameter Form portlet's first parameter name -->
    <alias xmlns:op="http://xmlns.oracle.com/portlet/oracle-portlet-app">
      op:parameter1
    </alias>
  </public-render-parameter>
  ...
</portlet-app>
```

The code for the Stock Price portlet reads the value of the public render parameter posted by the Parameter Form portlet ([Example 59–5](#)).

**Example 59–5 Parameter Processing for the Stock Price Portlet**

```
public void doView(RenderRequest request, RenderResponse response)
    throws PortletException, IOException
{
    response.setContentType("text/html; charset=UTF-8");
    PrintWriter out = response.getWriter();

    // Retrieve any values for the public render parameter.
    // The parameter is looked up in the request using its identifier in portlet.xml
    // (not it's name or alias).
    String symbol = request.getParameter("stocksymbol");
    ...
}
```

When these two portlets are dropped onto the same page, they are automatically linked together. Entering a value in the first parameter field of the Parameter Form portlet causes the Stock Price portlet to be updated with the new value.

### 59.3.6 How to Use Portlet Events in JSR 286 Portlets

*Portlet events* are a JSR 286 feature that enables interportlet communication by providing portlets with the ability to respond to actions that occur outside of the portlet itself, for example an action performed on the page that contains the portlet or on another portlet on the same page. Portlet events can be cascaded so that a portlet may respond to an event by triggering an event of its own, which in turn affects other portlets on the page.

Any portlet events supported by a portlet must be declared in the application section of the portlet deployment descriptor (`portlet.xml`). Portlet events defined at the application level in this way are available to all the portlets in the application.

Individual portlets within the application can then specify which of these portlet events they want to use. Portlets can declare events that they are interested in receiving, called *processing events*, and events that they trigger, called *publishing events*.

If you declare and define portlet events as described below, interportlet communication happens automatically, without any further coding required on your part. For more information, see [Section 62.6.3, "What You May Need to Know About Interportlet Communication."](#)

This section includes the following subsections:

- [Section 59.3.6.1, "Declaring a Portlet Event at the Application Level"](#)
- [Section 59.3.6.2, "Defining a Processing Event for a Portlet"](#)
- [Section 59.3.6.3, "Defining a Publishing Event for a Portlet"](#)
- [Section 59.3.6.4, "Example: Portlet Events"](#)

For more information about portlet events and how to implement them, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

### 59.3.6.1 Declaring a Portlet Event at the Application Level

For a portlet event to be available to a portlet, it must first be declared in the application section of the portlet deployment descriptor file (`portlet.xml`).

To define a portlet event at the application level:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Events** tab.
3. Click the **Add** icon to create a new portlet event.
4. From the dropdown list, select whether you are specifying a fully qualified name (QName) for the portlet event, or just the local part of the name.
  - **Qualified Name**—A *QName* uniquely identifies the portlet event across applications by specifying a namespace for the event as well as a local name. A page typically contains multiple portlets which may come from different applications. Using QNames ensures that portlet events from one portlet do not unintentionally interfere with the other portlets on a page regardless of where those portlets come from.
  - **Unqualified Name**—If the namespace for the portlet event is the same as the application default namespace, you can omit the namespace when defining the event by specifying an unqualified name. If the application default namespace has not been defined, a portlet event with an unqualified name uses the XML default namespace.

**Tip:** To check whether an application default namespace has been defined, click the **Application** tab and see if a value has been entered in the **Default Namespace** field.

5. Enter a name for the portlet event.
  - If you selected **Qualified Name**—In the **Namespace** field, enter the namespace for the portlet event and in the **Name** field, enter the local part of the event name.
  - If you selected **Unqualified Name**—In the **Name** field, enter the local part of the portlet event name. The event uses the application default namespace as the namespace for the event (or the XML default namespace if no default namespace is defined for the application).
6. In the **Payload Type** field, enter or browse for the data type of the payload provided by the portlet event.
7. In the **Description** field, enter a description for the portlet event.
8. (Optional) In the Aliases panel, you can provide a list of aliases so that a portlet event can be recognized by the portlet even if it has a different QName from the one defined by the portlet.
  - a. Click the **Create** icon to create a new alias for the portlet event.
  - b. In the **Namespace** field, enter the namespace of the portlet event to use for the alias.
  - c. In the **Name** field, enter the local part of the portlet event to use for the alias.
9. The portlet event is added to the application definition section of the `portlet.xml` file:

```

<portlet-app ...>
  <portlet>...</portlet>
  <portlet>...</portlet>
  ...
  <event-definition>
    <description>This is my event</description>
    <qname xmlns:x="http://example.com/events">myEvent</qname>
    <value-type>java.lang.Integer</value-type>
  </event-definition>
  ...
</portlet-app>

```

10. Save the `portlet.xml` file.

### 59.3.6.2 Defining a Processing Event for a Portlet

If you want a portlet to listen for a particular portlet event, define it as a processing event.

To add a processing event to a portlet:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. If the portlet event has not yet been defined within the Portlet Producer application, you must do this first.  
For more information, see [Section 59.3.6.1, "Declaring a Portlet Event at the Application Level."](#)
3. Click the **Portlets** tab and select the portlet in which you want to use the portlet event.

4. Click the **Events** tab.

In the Processing Events panel, the **Available** list shows all the portlet events that have been defined for the application.

5. Select the portlet event that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

This adds the portlet event as a processing event to the portlet definition in `portlet.xml`:

```
<portlet-app ...>
  <portlet id="1234567890">
    ...
    <supported-processing-event>
      <name>myEvent</name>
    </supported-processing-event>
    ...
  </portlet>
  ...
  <event-definition>
    <description>This is my event</description>
    <qname xmlns:x="http://example.com/events">myEvent</qname>
    <value-type>java.lang.Integer</value-type>
  </event-definition>
  ...
</portlet-app>
```

6. Save the `portlet.xml` file.

You can now use this portlet event in the code for your portlet.

### 59.3.6.3 Defining a Publishing Event for a Portlet

If you want a portlet to trigger a particular portlet event, define it as a publishing event.

To add a publishing event to a portlet:

1. Open the Overview Editor for the `portlet.xml` file.

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)

2. If the portlet event has not yet been defined within the Portlet Producer application, you must do this first.

For more information, see [Section 59.3.6.3, "Defining a Publishing Event for a Portlet."](#)

3. Click the **Portlets** tab and select the portlet in which you want to use the portlet event.
4. Click the **Events** tab.

In the Publishing Events panel, the **Available** list shows all the portlet events that have been defined for the application.

5. Select the portlet event that you want to use in the portlet and click the **Add** icon to move it to the **Selected** list.

This adds the portlet event as a publishing event to the portlet definition in `portlet.xml`:

```
<portlet-app ...>
```

```

<portlet id="1234567890">
  ...
  <supported-publishing-event>
    <name>myEvent</name>
  </supported-publishing-event>
  ...
</portlet>
...
<event-definition>
  <description>This is my event</description>
  <qname xmlns:x="http://example.com/events">myEvent</qname>
  <value-type>java.lang.Integer</value-type>
</event-definition>
...
</portlet-app>

```

#### 6. Save the portlet.xml file.

You can now use this portlet event in the code for your portlet.

#### 59.3.6.4 Example: Portlet Events

The following example shows how to use portlet events to use the actions in one portlet to affect another portlet on the same page. In the example, we have a portlet, the Department Locations portlet, that lists the geographical locations of a company's various offices. The example shows how that portlet can be linked to another portlet, the Map portlet, which displays a Google map of the location selected in the Department Locations portlet.

**Tip:** You can download a ZIP file containing the example in this section from:

<http://www.oracle.com/technetwork/middleware/webcenter/ps3-samples-176806.html>

[Example 59-6](#) shows an excerpt from the portlet.xml file for the portlet producer application that contains the two portlets. The portlet producer application defines a portlet event (latLong) that is supported by the two portlets. The payload of the event is an object that encapsulates the latitude and longitude of a location.

#### **Example 59-6 Portlet Event Definition**

```

<event-definition id="latLong">
  <qname xmlns:x="http://xmlns.oracle.com/portlet/EventSample">x:latLong</qname>
  <value-type>portlet.LatLong</value-type>
</event-definition>

```

[Example 59-7](#) shows that the Department Locations portlet uses the latLong event as a publishing event. That is, it raises the event under particular circumstances.

#### **Example 59-7 Publishing Event Definition for the Location Portlet**

```

<portlet id="locations">
  ...
  <supported-publishing-event>
    <qname xmlns:x="http://xmlns.oracle.com/portlet/EventSample">x:latLong</qname>
  </supported-publishing-event>
  ...
</portlet>

```

The Department Locations portlet raises the `latLong` event in its `processAction` method if a location is selected in the portlet ([Example 59–8](#)). It also sets the payload of the event to the latitude and longitude of the selected location.

**Example 59–8 Event Processing for the Department Locations Portlet**

```
public void processAction(ActionRequest request, ActionResponse response)
    throws PortletException
{
    String locationId = request.getParameter("locationId");
    Location location = getLocation(Integer.parseInt(locationId));

    if (location != null)
    {
        // QName matches the event declared as a supported-publishing-event in
        // portlet.xml for this portlet.

        // LatLong event used by the Map portlet.
        response.setEvent(new QName("http://xmlns.oracle.com/portlet/EventSample", "latLong"),
            new LatLong(location.getLatitude(), location.getLongitude()));
    }
}
```

[Example 59–9](#) shows that another portlet, the Map portlet, also uses the `latLong` event, but this time as a processing event. That is, it listens out for the event and takes a particular action if the event is raised elsewhere on the page.

**Example 59–9 Processing Event Definition for the Map Portlet**

```
<portlet id="map">
    ...
    <supported-processing-event id="latLong">
        <qname xmlns:x="http://xmlns.oracle.com/portlet/EventSample">x:latLong</qname>
    </supported-processing-event>
    ...
</portlet>
```

The `processEvent` method for the Map portlet receives the `latLong` event and uses the payload from that event to set the `LAT_LONG_PARAMETER` render parameter, which the portlet uses during rendering to determine the location to display in the Google map ([Example 59–10](#)).

**Example 59–10 Event Processing for the Map Portlet**

```
@Override
public void processEvent(EventRequest request,
    EventResponse response)
    throws PortletException, IOException
{
    response.setRenderParameters(request);

    Event event = request.getEvent();
    if (event.getName().equals("latLong"))
    {
        response.setRenderParameter(LAT_LONG_PARAMETER, event.getValue().toString());
    }
}
```

**Tip:** In this case, the events used by the Department Locations and Map portlets have the same name (`latLong`). If the Map portlet listens for an event using a different name (for example, `geolocation`), the two portlets could still be automatically linked by defining an alias for the `geolocation` event in the `portlet.xml` file as follows:

```
<event-definition id="geolocation">
  <qname xmlns:x="http://xmlns.oracle.com/portlet/Map">
    x:geolocation
  </qname>
  <alias xmlns:x="http://xmlns.oracle.com/portlet/EventSample">
    x:latLong
  </alias>
  <value-type>portlet.LatLong</value-type>
</event-definition>
```

Note, however, that the payload type of the two events must be the same for automatic linking to work.

---

**Note:** For an event payload to be passed between portlets it must be possible to form an XML payload from event payload. For this to be possible one of the following must be true:

- The payload must have a JAXB binding, for example by adding the `XmlRootElement` annotation to the portlet class:

```
package portlet;

import java.io.Serializable;
import javax.xml.bind.annotation.XmlRootElement;

@XmlRootElement(namespace="http://xmlns.oracle.com/portlet/EventSample")
public class LatLong implements Serializable
{
    private final double _latitude;
    private final double _longitude;
    ...
}
```

- The `allowEventPayloadsWithoutJAXBBindings` container runtime option must be set to `true` in `portlet.xml`.

For more information, see [Section 59.3.4, "How to Customize the Runtime Environment for JSR 286 Portlets."](#)

---

### 59.3.7 How to Add Portlet Preferences to JSR 286 Portlets

*Portlet preferences* enable end users to personalize or customize portlets at runtime. Personalizations are visible only to the user that performs them; not to other users. Customizations are visible to all users who have not personalized the portlet.

By default, when you create a JSR 286 portlet using the JDeveloper wizard, a portlet preference is created to enable users to change the title of the portlet at runtime. You can create additional portlet preferences, either during portlet creation or by editing the `portlet.xml` file after portlet creation, to enable end users to make other modifications to the portlet at runtime.

The procedure below describes how to add a portlet preference to the `portlet.xml` file after portlet creation. For information about how to add a portlet preference during portlet creation, see [Section 59.2.1, "How to Create a JSR 286 Java Portlet."](#)

This section includes the following subsections:

- [Section 59.3.7.1, "Adding a Portlet Preference to a JSR 286 Portlet"](#)
- [Section 59.3.7.2, "Example: Simple Portlet Personalization"](#)

### 59.3.7.1 Adding a Portlet Preference to a JSR 286 Portlet

To enable users to modify portlet behavior or content at runtime, you must create portlet preferences for those attributes of the portlet that you want users to be able to modify.

To add a portlet preference to a portlet:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Portlets** tab and select the portlet for which you want to add the portlet preference.
3. Click the **Advanced** tab.  
The Preferences panel lists any existing portlet preferences that exist for the portlet, for example, the `portletTitle` preference.
4. Click the **Add** icon to create a new portlet preference.
5. In the **Name** field, enter a name for the preference.  
The name must be unique within the portlet and use only letters, numbers, and the underscore character.
6. In the **Value** field, enter one or more default values for the preference.  
Separate multiple entries with commas.
7. Select **Read-only** if you do not want users to be able to update the value of the preference.

The portlet preference is added to the application definition section of the `portlet.xml` file:

```
<portlet-app ...>
  <portlet>...</portlet>
  <portlet>...</portlet>
  ...
  <portlet-preference>
    <name>portletTitle</name>
  </portlet-preference>
  <portlet-preference>
    <name>myPreference</name>
    <value>7</value>
  </portlet-preference>
  ...
</portlet-app>
```

8. Save the `portlet.xml` file.

You can now use this preference in your portlet code using the `getPreference` method.

**Tip:** If you want the preference to be translatable, you must add the appropriate key-value pairs to the resource bundle class.

### 59.3.7.2 Example: Simple Portlet Personalization

The following example provides a simple illustration of how you can enable personalization in portlets.

To add simple personalization to a portlet:

1. In JDeveloper, create a Portlet Producer application, accepting the default values.
2. Create a JSR 286 portlet, accepting the default values.
3. In the Application Navigator, expand the **Portlets** project.
4. Right-click `portlet.xml` and choose **Open**.
5. Click the **Portlets** tab and select **portlet1**.
6. Click the **Advanced** tab.
7. Click the **Add** icon to create a new portlet preference.
8. In the **Name** field, enter `portletContent`.
9. In the Application Navigator, right-click `view.jsp` and choose **Open**.
10. In the visual editor, click the **Source** tab and add the code indicated in bold in [Example 59–11](#) to display the `portletContent` portlet preference:

#### **Example 59–11** *view.jsp Sample Code*

```
<%@ page contentType="text/html"
    import="javax.portlet.*,java.util.*,Portlets.Portlet1,
    Portlets.resource.Portlet1Bundle"%>
<%@ taglib uri="http://java.sun.com/portlet" prefix="portlet"%>

<portlet:defineObjects/>
<%
String[] str = {"Portlet Content"};
PortletPreferences prefs = renderRequest.getPreferences();
str = prefs.getValues("portletContent",str);
for (int i=0; i<str.length; i++)
{
%><%= (i<str.length-1)?str[i]+"", ":str[i]%"><%}%>

```

11. In the Application Navigator, right-click `edit.jsp` and choose **Open**.  
Notice that the JSP consists of a form field, a form input field, and two form button fields.
12. In the visual editor, click the **Source** tab and add the code indicated in bold in [Example 59–12](#) to implement a form field for users to enter a value for the `portletContent` customization preference:

#### **Example 59–12** *edit.jsp Sample Code*

```
<%@ page contentType = "text/html; charset=windows-1252"
    pageEncoding = "windows-1252"
    import = "javax.portlet.*, java.util.*,
    Portletenhance.Portletenhance,
    Portletenhance.resource.PortletenhanceBundle"%>
@ <%@ taglib uri = "http://java.sun.com/portlet" prefix="portlet"%>
<portlet:defineObjects/>
```

```

<%
    PortletPreferences prefs = renderRequest.getPreferences();
    ResourceBundle res =
        portletConfig.getResourceBundle(renderRequest.getLocale());
%>
<form action="<portlet:actionURL/>" method="POST">
    <table border="0">
        <tr>
            <td width="20%">
                <p class="portlet-form-field" align="right">
                    <%= res.getString(PortletenhanceBundle.PORTLETCONTENT) %>
                </p>
            </td>
            <td width="80%">
                <input class="portlet-form-input-field"
                    type="TEXT"
                    name="<%= Portletenhance.PORTLETCONTENT_KEY %>"
                    value="<%= Portletenhance.buildValue(prefs,
Portletenhance.PORTLETCONTENT_KEY) %>"
                    size="20">
            </td>
        </tr>
        <tr>
            <td width="20%">
                <p class="portlet-form-field" align="right">
                    <%= res.getString(PortletenhanceBundle.PORTLETTITLE) %>
                </p>
            </td>
            <td width="80%">
                <input class="portlet-form-input-field"
                    type="TEXT"
                    name="<%= Portletenhance.PORTLETTITLE_KEY %>"
                    value="<%= prefs.getValue(Portletenhance.PORTLETTITLE_KEY,
res.getString("javax.portlet.title")) %>"
                    size="20">
            </td>
        </tr>
    <%
        String[] str = {"Portlet Content"};
        str = prefs.getValues("portletContent", str);
    %>
    <tr><td width="20%">
    <p class="portlet-form-field" align="right">
    Content
    </p>
    </td><td width="80%">
    <textarea rows="10" cols="60" class="portlet-form-input-field"
        name="portletContent"><%
    for (int i=0; i<str.length; i++)
    {%><%= (i<str.length-1) ? str[i]+", " : str[i] %><%}%>
    </textarea>
    </td></tr>
    <tr>
        <td colspan="2" align="center">
            <input class="portlet-form-button" type="submit"

name="<%=Portletenhance.OK_ACTION%>"

value="<%=res.getString(PortletenhanceBundle.OK_LABEL) %>">
            <input class="portlet-form-button" type="submit"

```

```

name="<%=Portletenhance.APPLY_ACTION%>"

value="<%=res.getString(PortletenhanceBundle.APPLY_LABEL)%>"
    </td>
</tr>
</table>
</form>

```

13. In the Application Navigator, right-click `Portlet1.java` and choose **Open**.

14. In the visual editor, click the **Source** tab and add the following two lines of code (indicated in bold) to the `processAction` method:

```

// Save the preferences.
PortletPreferences prefs = request.getPreferences();
String param = request.getParameter(PORTLETTITLE_KEY);
prefs.setValues(PORTLETTITLE_KEY, buildValueArray(param));
String contentParam = request.getParameter("portletContent");
if (contentParam != null)
{
    prefs.setValues("portletContent", buildValueArray(contentParam));
}
prefs.store();

```

When this portlet is available on a page, users can personalize it. The Edit mode of the portlet provides a **Portlet Content** field, where users can enter text. The text entered is then displayed as the content of the portlet.

### 59.3.8 How to Use Portlet Filters in JSR 286 Portlets

Portlet filters are a JSR 286 feature that enables you to alter the content of a portlet at runtime. A *portlet filter* is a reusable Java component that can transform the content of portlet requests and portlet responses. Filters do not generally create a response or respond to a request as portlets do, rather they modify or adapt the requests and responses.

This section includes the following subsections:

- [Section 59.3.8.1, "Adding a Portlet Filter to an Application"](#)
- [Section 59.3.8.2, "Applying a Portlet Filter to a Portlet"](#)

For more information about portlet filters and how to implement them, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

#### 59.3.8.1 Adding a Portlet Filter to an Application

For a portlet to be able to use a portlet filter, the filter must first be defined within the application.

To add a portlet filter to an application:

1. Open the Overview Editor for the `portlet.xml` file.
 

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Filters** tab.
3. Click the **Add** icon to create a new portlet filter.

4. In the Create Portlet Filter dialog you can either create a new portlet filter, or select a previously created portlet filter:
    - To create a new portlet filter:
      - a. Select **New Portlet Filter**.
      - b. In the **Name** field, enter a name for the portlet filter.  
The name must be unique within the application and use only letters, numbers, and the underscore character.
      - c. In the **Package** field, enter or browse for the package to contain the new filter class.
      - d. Select one or more of the **Lifecycle Phase** checkboxes to specify which of the `javax.portlet.filter` interfaces the filter class implements:
        - Action**—The filter class implements the `ActionFilter` interface
        - Event**—The filter class implements the `EventFilter` interface.
        - Render**—The filter class implements the `RenderFilter` interface.
        - Resource**—The filter class implements the `ResourceFilter` interface.
- Tip:** When you create a new filter class using the Create Portlet Filter dialog, you can specify which of the filter interfaces the filter class implements. After the filter class has been created, you cannot add or remove filter interfaces through the Overview Editor. Instead, you must edit the source of the filter class directly to manually add or remove the interfaces and the `doFilter` methods defined for those interfaces.
- To select an existing portlet filter:
    - a. Select **Choose from Existing Class**.
    - b. Enter or browse for the filter class.
5. Click **OK**.
  6. In the **Display Name** field, enter a more user-friendly name for the portlet filter.
  7. In the **Description** field, enter a description for the portlet filter.
  8. In the Initialization Parameters panel, you can specify initialization parameters that pass values to the `init()` method of the filter class.
    - a. Click the **Add** icon to specify an initialization parameter for the portlet filter.
    - b. In the **Name** field, enter the name of the initialization parameter.
    - c. In the **Value** field, enter the value to pass to the initialization parameter.
    - d. In the **Description** field, enter a description of the initialization parameter.

The portlet filter is added to the application definition section of the `portlet.xml` file:

```
<portlet-app ...>
  <portlet>...</portlet>
  <portlet>...</portlet>
  ...
  <filter>
    <display-name>Test Filter</display-name>
    <filter-name>filter_1</filter-name>
```

```

        <filter-class>javaportlets.MyFilter</filter-class>
        <lifecycle>ACTION_PHASE</lifecycle>
        <lifecycle>RENDER_PHASE</lifecycle>
    </filter>
    ...
</portlet-app>

```

9. Save the `portlet.xml` file.

### 59.3.8.2 Applying a Portlet Filter to a Portlet

After the portlet filter has been defined in the application, you can then apply it to one or more portlets within the application. You can also specify the order in which portlet filters are applied to portlets.

To apply a portlet filter to a portlet:

1. Open the Overview Editor for the `portlet.xml` file.

For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)

2. Click the **Filter Mappings** tab.
3. Click the **Add** icon to add a row to the filter mappings table.
4. From the **Filter Name** dropdown list, select the portlet filter that you want to apply to the portlet.

The dropdown list is populated with all the portlet filters that are defined in the `portlet.xml` file.

5. From the **Portlet Name** dropdown list, select the portlet to which you want to apply the portlet filter.

The dropdown list is populated with all the portlets that are defined in the `portlet.xml` file.

Alternatively, you can use wildcards to apply the portlet filter to more than one portlet. For example, you can enter `*` to apply the portlet filter to all the portlets in the application.

The filter mapping is added to the application definition section of the `portlet.xml` file:

```

<portlet-app ...>
  <portlet>...</portlet>
  <portlet>...</portlet>
  ...
  <filter>
    <display-name>My Filter</display-name>
    <filter-name>myFilter</filter-name>
    <filter-class>javaportlets.MyFilter</filter-class>
    <lifecycle>ACTION_PHASE</lifecycle>
    <lifecycle>RENDER_PHASE</lifecycle>
  </filter>
  <filter-mapping>
    <filter-name>myFilter</filter-name>
    <portlet-name>myPortlet</portlet-name>
  </filter-mapping>
  ...
</portlet-app>

```

6. Use the **Top**, **Up**, **Down**, and **Bottom** icons to order the portlet filters in the `portlet.xml` file. The order of the portlet filters determines the order in which the filters are applied to the portlets.

---

---

**Note:** Portlet filters can be mapped to multiple portlets. If you have multiple portlets mapped to (sharing) a filter, arbitrarily changing the filter order can produce undesired side effects. That is, if you change the order in which filters are applied in one portlet, the reordering will apply to all other portlets that share the filter.

---

---

7. Save the `portlet.xml` file.

### 59.3.9 How to Enhance JSR 286 Portlet Performance with Caching

When you have completed the basic functionality of your portlet, you may want to turn your attention to portlet performance.

Caching is a common technique for enhancing the performance of web sites that include a great deal of dynamic content. JSR 286 portlets support expiry-based and validation-based caching.

For more information about caching, see [Section 57.4.4, "Portlet Performance."](#)

This section includes the following subsections:

- [Section 59.3.9.1, "Implementing Expiry-Based Caching in JSR 286 Portlets"](#)
- [Section 59.3.9.2, "Implementing Validation-Based Caching in JSR 286 Portlets"](#)

#### 59.3.9.1 Implementing Expiry-Based Caching in JSR 286 Portlets

You can choose to implement expiry-based caching when you first create a portlet using the Create JSR 286 Portlet Wizard. However, during the initial development of a portlet, you may prefer to turn portlet caching off and implement it later in the development cycle when the portlet content becomes more stable. You may also want to edit the expiration period, or change the cache scope.

To implement expiry-based caching:

1. Open the Overview Editor for the `portlet.xml` file.  
For more information, see [Section 59.3.1, "How to Edit the Portlet Deployment Descriptor File."](#)
2. Click the **Portlets** tab and select the portlet for which you want to implement expiry-based caching.
3. Click the **Advanced** tab.
4. In the Cache Management panel, select **Cache Portlet**.

---

---

**Note:** To disable portlet caching, deselect **Cache Portlet**. This sets the cache expiration period to 0, meaning that the cached content is always expired.

---

---

5. Select the **Cache Scope**:
  - Select **Public** to share the cached content across users
  - Select **Private** if the cached content should not be shared across users.

## 6. Specify the cache expiration period:

- Select **Cache Content Never Expires** to set the cache expiration period to -1. This means that the cached content never expires and the content is always retrieved from the cache. Use this option if you are confident that the portlet contains static content that is unlikely to change. Setting this option results in the following code being added to the `portlet.xml` file:

```
<portlet>
...
<expiration-cache>-1</expiration-cache>
...
</portlet>
```

- Select **Cache Content Expires After** to expire the cached portlet content after a specified number of seconds. Enter the expiration period ( $n$ ), in seconds, in the adjacent field. Setting this option results in the following code being added to the `portlet.xml` file:

```
<portlet>
...
<expiration-cache>n</expiration-cache>
...
</portlet>
```

## 7. Save the `portlet.xml` file.

### 59.3.9.2 Implementing Validation-Based Caching in JSR 286 Portlets

Implementation of validation-based caching takes place after the initial portlet creation and requires hand coding.

[Example 59–13](#) shows how a `GenericPortlet` would typically implement its `doView()` method such that the consumer caches the markup using validation-based caching. The example also shows how expiry-based caching can be defined programmatically (using the `CacheControl.setExpirationTime()` method) and used in conjunction with validation-based caching to further reduce the load on the producer. This would work equally well for `serveResource()`.

#### **Example 59–13 A JSR 286 Portlet Implementing Validation-Based Caching**

```
protected void doView (RenderRequest request, RenderResponse response)
    throws PortletException, IOException
{
    CacheControl cacheControl = response.getCacheControl();
    String eTag = request.getETag();
    if (isMarkupStillValid(eTag))
    {
        // Wait 30 seconds before checking ETag again
        cacheControl.setExpirationTime(30);

        // Tell consumer to use its cached content
        cacheControl.setUseCachedContent(true);
        return;
    }

    // ETag not valid so set a new one ...

    // Define a new ETag
    cacheControl.setETag(generateETag(...));
}
```

```
// Wait 60 seconds before checking ETag again
cacheControl.setExpirationTime(60);

// ... and generate fresh portlet markup
createMarkup(request, response);
}

private boolean isMarkupStillValid(String eTag)
{
    if (eTag == null)
    {
        return false; // No ETag was supplied
    }

    // Perform portlet specific checks for the consumer's cached
    // copy of the markup still being valid based on the given ETag
    ...
}

private String generateETag(...)
{
    // Portlet specific code to generate an ETag, for example, a hash
    // of the data on which the portlet's markup is based
    ...

    return eTag;
}
```

For more information about validation-based caching in JSR 286 portlets, see the JSR 286 specification at:

<http://jcp.org/en/jsr/detail?id=286>

### 59.3.10 How to Implement Rewritten URLs for Resource Proxy

Resource proxying is the standard way to retrieve resources with WSRP. To avoid problems with URLs within your portlet, you can set a flag to rewrite all of the URLs within a specified resource. For example, if you have an HTML fragment that contains URLs, then you could set this flag to rewrite its URLs taking into account the WSRP resource proxying.

To indicate that URLs should be rewritten, set the `PortletRequest` attribute, `oracle.portlet.server.resourceRequiresRewriting`, to `true`. For example, you might include code similar to the excerpt in [Example 59–14](#) to use resource proxying for a URL that you are encoding. Encapsulate this code within a method to avoid repeating it for every URL individually.

#### **Example 59–14 Resource Proxy for WSRP**

```
request.setAttribute("oracle.portlet.server.resourceRequiresRewriting",
    Boolean.TRUE);
String url = response.encodeURL(pathToResourceForRewriting);
request.removeAttribute("oracle.portlet.server.resourceRequiresRewriting");
```

If you do not specifically set `oracle.portlet.server.resourceRequiresRewriting`, then it defaults to `false`, meaning that URLs are not rewritten. You must explicitly activate the feature by setting this attribute to `true`.

You can use the `defaultProxiedResourceRequiresWsrpRewrite` container runtime option to specify the default WSRP `requiresRewrite` flag to use. The option specified

by this container runtime option (which is set to `true` by default) is used unless overridden by the request attribute. For more information, see ["com.oracle.portlet.defaultProxiedResourceRequiresWsrpRewrite."](#)

### 59.3.11 How to Implement Stateless Resource Proxying

If you have out of protocol resources that do not require rewriting, you may want to use stateless resource proxying. Stateless resource proxying means that the URLs returned to the browser do not require portlet IDs or any other contextual information. This increases the cache hit ratio for such resources. You might find stateless resource proxying useful for functionality such as static JavaScript files, static images, and so on.

To indicate that stateless proxying is required, set the `PortletRequest` attribute `oracle.portlet.server.useStatelessProxying` to `true`. For example, you might include code similar to the excerpt in [Example 59–15](#) to use stateless proxying for a URL that you are encoding. Encapsulate this code within a method to avoid repeating it for every URL individually.

#### *Example 59–15 Stateless Resource Proxying*

```
request.setAttribute("oracle.portlet.server.useStatelessProxying", Boolean.TRUE);
String url = response.encodeURL(pathToResource);
request.removeAttribute("oracle.portlet.server.useStatelessProxying");
```

If you do not specifically set `oracle.portlet.server.useStatelessProxying`, it defaults to `false`. You must explicitly activate the feature by setting this attribute to `true`.

### 59.3.12 How to Implement Security for JSR 286 Portlets

You can secure JSR 286 portlets that are deployed to a WSRP producer by configuring security at the WSRP producer end and the client end. For information about securing a JSR 286 portlet through its WSRP producer, see [Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."](#)

### 59.3.13 How to Manage the Persistence Store for JSR 286 Portlets

The portlet persistence store is used for persisting consumer registration handles and portlet preference data. Portlet producers can use one of three types of persistence store:

- **Consumer**—Ties the producer metadata to the consumer application. This is the recommended method.
- **Database**—Persists data using a relational database. This is mainly provided for backward compatibility but may be useful if there is likely to be a large number of customizations.
- **File**—Persists data using the file system. This is provided for backward compatibility. You should not use a file based persistence store in your production environment as it does not support multi-tier or high availability environments.

For more information, see [Section 57.4.3, "Portlet Personalization and Customization."](#)

This section includes the following subsections:

- [Section 59.3.13.1, "Setting Up a Persistence Store for a WSRP Producer"](#)
- [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store"](#)

- [Section 59.3.13.3, "Enabling Java Object Cache for Database Persistence Store Access"](#)

### 59.3.13.1 Setting Up a Persistence Store for a WSRP Producer

WSRP portlet producers use a JNDI variable (`persistentStore`) to determine which type of preference store to use. When you create a portlet for the first time in an application, by default this variable is set to `Consumer`. You can change the value of this variable in the `web.xml` file of the portlet producer application.

---

**Note:** If you create a portlet in an application that already contains other portlets, the existing persistence store setting is maintained.

---

If you use a File persistence store, you must also use the `fileStoreRoot` JNDI variable to specify the path to the root directory to be used by the persistence store.

[Table 59–2](#) lists and describes the JNDI variables used to specify the persistence store for WSRP producers.

**Table 59–2 WSRP Producer Database Preference Store-Related JNDI Variable**

Variable Name	Variable Value	Description
oracle/portal/wsrp/server/persistentStore	Database	Determines which data store (File, Database, or Consumer) is used for persisting a portlet producer application's consumer registration handles and portlet preferences.
	File	
	Consumer	
oracle/portal/wsrp/server/fileStoreRoot	portletdata	<p>Defines the path to the root directory to be used by the file preference store.</p> <p>Absolute paths are interpreted relative to the file system root. Relative paths are interpreted relative to the <code>WC_ORACLE_HOME/portal</code> directory.</p> <p>Note that all producers running within the same WebLogic Server must use the same path for this variable. Otherwise, you get a <code>Portlet unavailable</code> error for some portlets.</p>

To set up the persistence store for a WSRP portlet producer:

1. In JDeveloper, open the portlet producer application for which you want to set up the persistence store.
2. Expand the portlet project (for example, **Portlets**).
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click `web.xml` and choose **Open**.
5. Click the **Source** tab.
6. To specify a Database persistence store, add the following code:

```
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
```

```

    <env-entry-type>java.lang.String</env-entry-type>
    <env-entry-value>Database</env-entry-value>
</env-entry>

```

To specify a File-based persistence store, add the following code:

```

<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>File</env-entry-value>
</env-entry>
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/fileStoreRoot</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>myPrefStore</env-entry-value>
</env-entry>

```

To specify a Consumer persistence store, add the following code:

```

<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>Consumer</env-entry-value>
</env-entry>

```

7. Save the `web.xml` file.
8. Restart your WebLogic Server.

### 59.3.13.2 Migrating a WSRP Producer Persistence Store

If you want to change the type of persistence store used by your portlet producer, for example when moving from a testing to production environment, you can migrate the existing data from the old to the new persistence store.

This section includes the following subsections:

- [Section 59.3.13.2.1, "Migrating a Database or File-Based Persistence Store"](#)
- [Section 59.3.13.2.2, "Migrating to or from a Consumer Persistence Store"](#)
- [Section 59.3.13.2.3, "Moving a WSRP Portlet Producer"](#)

**59.3.13.2.1 Migrating a Database or File-Based Persistence Store** The WSRP portlet producer persistence store migration utility, `PersistenceMigrationTool`, enables you to migrate existing data between Database and File-based persistence stores (for example, from a File-based persistence store used for testing to a production Database persistence store). This utility also enables upgrading users to ensure that their existing locale-specific portlet preference data uses a naming format compatible with the latest JPS release. You can also use this utility to migrate between source and destination stores of the same type, enabling data to be moved from one database store to another.

---

---

**Note:** There are several libraries that must be referenced in the classpath when running the `PersistenceMigrationTool` utility:

- `portlet-producer-container-persistence.jar`
- `portlet-producer-container-common.jar`
- `adf-share-base.jar`
- `portlet-utils.jar`
- `wcs-producer-spi.jar`
- `adflogginghandler.jar`
- `ojdbc6.jar`

The `ojdbc6.jar` library referenced in the classpath must be the same as the one used by your database.

---

---

To migrate a database or file-based persistence store:

1. Ensure that the appropriate libraries are referenced in the classpath:

```
./java -classpath
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-persistence.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-common.jar:
ORACLE_COMMON_HOME/modules/oracle.adf.share.ca_11.1.1/adf-share-base.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.portlet.server_
11.1.1/portlet-utils.jar:
ORACLE_COMMON_HOME/webcenter/modules/com.bea.wsrp_
10.3.2.0/system/wcs-producer-spi.jar:
ORACLE_COMMON_HOME/modules/oracle.adf.share_11.1.1/adflogginghandler.jar:
DB_ORACLE_HOME/jdbc/lib/ojdbc6.jar
```

2. Run the `PersistenceMigrationTool` using the following syntax:

```
java oracle.portlet.server.containerimpl.PersistenceMigrationTool
-sourceType [file | db]
-destType [file | db]
{-sourcePath [dir |
-sourceUsername username -sourcePassword password -sourceDatabase db
-sourceDriver srcDriver]}
{-destPath [dir | destUsername username -destPassword password -destDatabase db
-destDriver dstDriver]}
[-debug]
```

where:

- `sourceType` indicates whether the source store is in a file (`file`) or database (`db`). You can have source and destination stores of the same type. Hence, you can migrate from one database to another or one file system to another.
- `destType` indicates whether the destination store is in a file (`file`) or database (`db`). You can have source and destination stores of the same type. Hence, you can migrate from one database to another or one file system to another.
- `sourcePath` is the location of a file-based persistence store. This argument is required when `sourceType` is `file`.

- `sourceUsername` is the database user name for a persistence store database. This argument is required when `sourceType` is `db`.
- `sourcePassword` is the database password for a persistence store database. This argument is required when `sourceType` is `db`.
- `sourceDatabase` is the name of a persistence store database. This argument is required when `sourceType` is `db`.
- `sourceDriver` is the name of a database driver to use. For example, for a SQL Server database, the database driver is `com.microsoft.sqlserver.jdbc.SQLServerDriver`. If you do not specify a value for this argument, the migration tool attempts to determine the correct driver to use from the `sourceDatabase` argument.
- `destPath` is the location of a file-based persistence store. This argument is required when `destType` is `file`.
- `destUsername` is the database user name for a persistence store database. This argument is required when `destType` is `db`.
- `destPassword` is the database password for a persistence store database. This argument is required when `destType` is `db`.
- `destDatabase` is the name of a persistence store database. This argument is required when `destType` is `db`.
- `destDriver` is the name of a database driver to use. For example, for a SQL Server database, the database driver is `com.microsoft.sqlserver.jdbc.SQLServerDriver`. If you do not specify a value for this argument, the migration tool attempts to determine the correct driver to use from the `destDatabase` argument.
- `debug` turns on full logging through standard output to enable users to diagnose issues that arise when the tool runs.

[Example 59–16](#) demonstrates running the `PersistenceMigrationTool` utility. In this example, preferences from a File store are copied to a Database store.

#### **Example 59–16** Running the `PersistenceMigrationTool` Utility

```
./java -classpath
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-persistence.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.webcenter.framework_
11.1.1/portlet-producer-container-common.jar:
ORACLE_COMMON_HOME/modules/oracle.adf.share.ca_11.1.1/adf-share-base.jar:
ORACLE_COMMON_HOME/webcenter/modules/oracle.portlet.server_11.1.1/portlet-utils.jar:
ORACLE_COMMON_HOME/webcenter/modules/com.bea.wsrp_10.3.2.0/system/wcs-producer-spi.jar:
ORACLE_COMMON_HOME/modules/oracle.adf.share_11.1.1/adflogginghandler.jar:
DB_ORACLE_HOME/jdbc/lib/ojdbc6.jar
oracle.portlet.server.containerimpl.PersistenceMigrationTool
-sourceType file \
-sourceRoot /data/prefs
-destType db \
-destUsername scott \
-destPassword tiger \
-destDatabase abc.mycompany.com:1521:yourdatabase \
```

where:

- `ORACLE_COMMON_HOME` is your Oracle Common home

- `DB_ORACLE_HOME` is your database Oracle home if it is on the same machine as the WebCenter Portal Oracle home. If the database Oracle home is on a separate machine, then you must copy the `DB_ORACLE_HOME/jdbc/lib` directory into a temporary directory on the WebCenter Portal Oracle home and reference the `ojdbc6.jar` library from this temporary directory in the classpath.

**59.3.13.2.2 Migrating to or from a Consumer Persistence Store** If you move a portlet producer to a different server, you may also have to move the persistence store for the producer.

After installing the new producer, move the persistence store according to the following:

- Consumer persistence store—Because the data is stored with the consumer, there is no requirement to move the persistence store.
- Database persistence store—Perform one of the following:
  - Configure the new producer to point the WebLogic Server data source to the same database as the original producer.
  - Migrate the persistence store using the Persistence Store Migration Utility (see [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store"](#) for more information).
- File persistence store—Perform one of the following:
  - Configure the new producer to point the same file system location as the original producer.
  - Migrate the persistence store using the Persistence Store Migration Utility (see [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store"](#) for more information).

Finally, update the URL of the producer registration by using Enterprise Manager Fusion Middleware Control or the WLST commands: `setWSRPProducerRegistration` or `setPDKJavaProducerRegistration`.

**59.3.13.2.3 Moving a WSRP Portlet Producer** If you move a portlet producer to a different server, you may also have to move the persistence store for the producer.

After installing the new producer, move the persistence store according to the following:

- Consumer persistence store—Because the data is stored with the consumer, there is no requirement to move the persistence store.
- Database persistence store—Perform one of the following:
  - Configure the new producer to point the WebLogic Server data source to the same database as the original producer.
  - Migrate the persistence store using the Persistence Store Migration Utility (see [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store"](#) for more information).
- File persistence store—Perform one of the following:
  - Configure the new producer to point the same file system location as the original producer.
  - Migrate the persistence store using the Persistence Store Migration Utility (see [Section 59.3.13.2, "Migrating a WSRP Producer Persistence Store"](#) for more information).

Finally, update the URL of the producer registration by using Enterprise Manager Fusion Middleware Control or the WLST commands: `setWSRPProducerRegistration` or `setPDKJavaProducerRegistration`.

### 59.3.13.3 Enabling Java Object Cache for Database Persistence Store Access

If you are using a database persistence store, you can improve performance by using Java Object Cache for persistence store access. This avoids the need to access the persistence store on each request. Enable Java Object Cache for the persistence store using the `enableJavaObjectCache` JNDI variable.

To enable Java Object Cache for persistence store access:

1. In JDeveloper, open the portlet producer application for which you want to set up the persistence store.
2. Expand the portlet project (for example, **Portlets**).
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click `web.xml` and choose **Open**.
5. Click the **Source** tab.
6. Add the following code:

```
<env-entry>
  <env-entry-name>
    oracle/portal/wsrp/server/enableJavaObjectCache
  </env-entry-name>
  <env-entry-type>java.lang.Boolean</env-entry-type>
  <env-entry-value>true</env-entry-value>
</env-entry>
```

7. Save the `web.xml` file.

## 59.3.14 How to Export and Import Portlet Producers at Design Time

You can export and import portlet producers at design time.

This section includes the following subsections:

- [Section 59.3.14.1, "Exporting Portlet Producers at Design Time"](#)
- [Section 59.3.14.2, "Importing Portlet Producers at Design Time"](#)

### 59.3.14.1 Exporting Portlet Producers at Design Time

When you package an application for deployment, any portlet producers referenced by the application are contacted so that the producer data can be included in the MAR file. If any of the producers are not running, they cannot be contacted and the data cannot be included.

By creating an export archive of the producer data at design time instead, you can ensure that the producers are running, therefore all the producer data, including remote customizations and client-side metadata, can be retrieved. WebCenter Portal: Framework can then use the export archive at deployment, instead of having to contact the remote producers.

To export portlet producers at design time:

1. Edit the `WC_ORACLE_HOME/jdeveloper/jdev/bin/jdev.conf` file and set the following JVM flag:

```
AddVMOption -Doracle.webcenter.portlet.dt.disableRemoteExport=true
```

Setting this flag ensures that, when the application is packaged for deployment, the export archive you create in the following steps is included in the MAR file, rather than the remote producers being contacted to retrieve producer data.

2. Restart JDeveloper to apply the new setting.
3. Open the application that consumes the producers to export.
4. From the menu, choose **Application** and then **Export Portlet Producers**.  
This menu option appears only if the current application contains producers.
5. In the Export Portlet Producers dialog, in the **Export Archive File Name (.ear)** field, enter the absolute path and file name to use for the export set.
6. Click **OK**.

When the application is packaged for deployment, because you set the `disableRemoteExport` flag to `true`, WebCenter Portal: Framework checks for the presence of the export archive at the location specified in the dialog. If the export archive exists, the contents of the archive are included in the MAR file instead of contacting the remote producers to retrieve producer data.

---

---

**Note:** If the `disableRemoteExport` flag is set and there is no export archive, a default export archive, without the remote producer data, is created and included in the MAR file.

---

---

#### 59.3.14.2 Importing Portlet Producers at Design Time

You can import producer data, including customizations made at runtime, from a deployed application into your application at design time.

---

---

**Note:** The producers in the export archive (EAR file) must be the same as those in the application into which they are being imported.

---

---

For information about how to create an export archive of producer metadata from a deployed application, see the section "Exporting Portlet Client Metadata (WebCenter Portal: Framework Application)" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To import portlet producers at design time:

1. Edit the `WC_ORACLE_HOME/jdeveloper/jdev/bin/jdev.conf` file and set the following JVM flag:  

```
AddVMOption -Doracle.webcenter.portlet.dt.enableImport=true
```
2. Restart JDeveloper to apply the new setting. This ensures that the **Import Portlet Producers** menu option is available.
3. Open the application into which you want to import the producers.
4. From the menu, choose **Application** and then **Import Portlet Producers**.
5. In the Import Portlet Producers dialog, in the **Import Archive File Name (.ear)** field, enter the absolute path and file name of the export archive to import.
6. Click **OK**.

---

---

**Note:** If the application into which you import producers is currently running in Integrated WLS, you must re-run the application to see the updated producers. Simply refreshing the page may result in errors caused by the different MDS instances used at design time and runtime.

---

---

## 59.4 Testing JSR 286 Portlets

Before making your portlets available in a production environment, it is highly advisable to test them first to make sure that they behave as expected.

This section includes the following subsections:

- [Section 59.4.1, "How to Run a WSRP Portlet Producer on Integrated WebLogic Server"](#)
- [Section 59.4.2, "What Happens When You Run a WSRP Portlet Producer on Integrated WebLogic Server"](#)
- [Section 59.4.3, "How to Deploy a WSRP Portlet Producer to the Integrated WebLogic Server"](#)
- [Section 59.4.4, "Testing Portlet Personalization"](#)
- [Section 59.4.5, "Hiding or Removing the WSRP Test Page"](#)

### 59.4.1 How to Run a WSRP Portlet Producer on Integrated WebLogic Server

The Integrated WebLogic Server (Integrated WLS) provides a quick and easy way of testing your portlets because it is preconfigured so that you can run applications within JDeveloper without needing to create deployment profiles.

To test a JSR 286 portlet on Integrated WLS:

1. In JDeveloper, open the portlet producer application that owns the portlet that you want to test.
2. Expand the portlet project (for example, **Portlets**).
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click **portlet.xml** and choose **Run**.

Running `portlet.xml` triggers the packaging and deployment of your portlet producer application on an Integrated WLS instance named after the application.

5. Check the IntegratedWebLogicServer - Log window to monitor the deployment progress. The log shows the URL of the application page. The WSRP producer URL uses the following syntax:

```
http://host:port/applicationname-Portlets-context-root/info
```

where:

- `host` is the server to which your producer has been deployed.
- `port` is the HTTP Listener port. Typically, it is 7101. When the server is started, the port is displayed in the console.
- `context-root` is the Web application's context root.

A test page similar to [Figure 59–3](#) displays in a browser window.

Figure 59–3 WSRP Producer Test Page

**ORACLE WebCenter Portal : Portlets**

## WSRP Producer Test Page

**Your WSRP Producer Contains the Following Portlets:**

**Portlet Name (Minimum WSRP Version)**

- Hello World Portlet (1.0)
- CSS (1.0)
- Lottery (1.0)
- CacheTest (1.0)
- Session (1.0)
- ParameterForm (2.0)
- Upload (1.0)
- Snoop (1.0)
- FormSubmission (1.0)
- ReadOnlyParameterForm (2.0)
- HTML Portlet (1.0)
- Chart (1.0)

**Container Configuration**

**Persistent Store Type:** Consumer  
Value obtained from environment entry java:comp/env/oracle/portal/wsrp/server/persistentStore

**Container Version**

Implementation version: 12.1.1.0.0 , Label: WORKPLACE\_MAIN\_GENERIC\_110919.0101

**WSDL URLs**

[WSRP v1 WSDL](#)  
[WSRP v2 WSDL](#)

**SOAP Monitor**

[SOAP Monitor](#)

6. While the application is running, you can switch back and forth between JDeveloper and your browser to make changes at design time in your application, save the changes, and then refresh the test page in your browser.
7. When the producer is successfully running, you should register it with an application and add one or more portlets to a page to check that it is working correctly. Registering a producer gives applications the information they require to locate and communicate with that producer. After you register a producer, it is exposed as a connection, and the producer and its portlets become available in the Application Resources panel under the Connections node, or in the Resource Palette.

To register producers of JSR 286 portlets, follow the instructions provided in [Section 62.2.1, "How to Register a WSRP Portlet Producer."](#)

To add your portlets to a page, follow the instructions provided in [Section 62.6, "Adding Portlets to a Page."](#)

8. To stop an Integrated WLS instance, in the Run Manager tab, select **DefaultServer** and click the red **Stop** icon. When the instance stops, the application is undeployed, and therefore, becomes unavailable.

**Tip:** You can also stop an Integrated WLS instance by clicking the red **Stop** icon in the IntegratedWebLogicServer - Log window and selecting **DefaultServer**.

## 59.4.2 What Happens When You Run a WSRP Portlet Producer on Integrated WebLogic Server

When you run a WSRP portlet producer on Integrated WLS, the following happens:

- WSDLs and other configuration files are added to the WEB-INF directory to configure the portlets as a web service.
- The `web.xml` file is updated with listener and server classes, filters, parameters, and other configurations that are required to run the JSR 286 portlet producer application successfully.

For example, the `oracle.portlet.server.adapter.web.ServerContextListener` class, `WSRP_v2_PortletManagement_Service` and `WSRPBaseService` filters, and so on.

- Libraries required for JSR 286 portlets are added to the `weblogic.xml` file, for example, `oracle.portlet-producer.wsrp`.

These configurations vary depending upon the portlet requirements.

### 59.4.3 How to Deploy a WSRP Portlet Producer to the Integrated WebLogic Server

When you run a WSRP portlet producer application on the Integrated WLS instance, when the instance stops, the application is undeployed and therefore becomes unavailable. For a more persistent testing scenario, you can deploy your portlet producer application to the Integrated WLS so that it is always available while the Default Server is running.

If you choose this method, then you must first create deployment profiles, as described in [Section 61.2, "Creating a WAR Deployment Profile."](#) If you deploy your application to the Integrated WLS, then the Deployment Configuration dialog displays to enable you to configure and customize deployment settings. The file system MDS repository precreated by JDeveloper displays in the **Repository Name** field.

For information about deploying and running an application on the Integrated WLS, see [Section 69.2, "Deploying a Framework Application to the Integrated WebLogic Server."](#)

### 59.4.4 Testing Portlet Personalization

If you have implemented personalization for your portlet, then the **Personalize** icon appears on the portlet only for authenticated users. Hence, to test the personalization of a portlet, you must have some form of security implemented for the application consuming the portlet. For testing purposes, you may prefer to just configure the most basic authentication possible. For more information, see [Section 68.12, "Configuring Basic Authentication for Testing Portlet Personalization."](#)

### 59.4.5 Hiding or Removing the WSRP Test Page

For security purposes, you may want to hide the WSRP test page so that it is visible only to administrators, or you may want to remove it entirely.

This section includes the following subsections:

- [Section 59.4.5.1, "Hiding the WSRP Test Page"](#)
- [Section 59.4.5.2, "Removing the WSRP Test Page"](#)

---

---

**Note:** There is also a Webservice test page, which enables you to build up SOAP requests to the producer in a web browser. For WSRP portlet producers this test page is disabled by default. Although this test page does not provide any useful information for testing your portlet producers, you can enable it, if desired, by extracting the `oracle-webservices.xml` file from the deployed producer's WAR file, setting the `expose-testpage` flag to `true` for both WSRP v1 and WSRP v2 producers, and then repacking the WAR and EAR files and redeploying the producer.

---

---

#### 59.4.5.1 Hiding the WSRP Test Page

If you do not want all users to be able to see the WSRP test page, you can protect it so that only administrators can see it.

To hide the WSRP test page:

1. In JDeveloper, open the portlet producer application for which you want to hide the test page.
2. Expand the portlet project (for example, **Portlets**).
3. Expand the **Web Content** node and then the **WEB-INF** node.
4. Right-click **web.xml** and choose **Open**.
5. Click the **Source** tab.
6. Add the following code:

```
<security-role>
  <description>AdministratorRole</description>
  <role-name>Admin</role-name>
</security-role>
<security-constraint>
  <display-name>TestPageInfo</display-name>
  <web-resource-collection>
    <web-resource-name>TestPageInfo</web-resource-name>
    <description>Protect the test page servlet.</description>
    <url-pattern>/info/*</url-pattern>
  </web-resource-collection>
  <auth-constraint>
    <description>Administrators</description>
    <role-name>Admin</role-name>
  </auth-constraint>
  <user-data-constraint>
    <transport-guarantee>NONE</transport-guarantee>
  </user-data-constraint>
</security-constraint>
```

7. Save the `web.xml` file.

#### 59.4.5.2 Removing the WSRP Test Page

You can remove the WSRP test page completely.

To remove the WSRP test page, you must edit an element that is injected into the `web.xml` file at packaging time, so you must edit the `web.xml` file in the resulting EAR file.

To remove the WSRP test page:

1. Extract the `web.xml` file from the EAR file created at packaging time and open it in an editor of your choice.
2. Comment out the following code:

```
<servlet-mapping>
  <servlet-name>WSRPTestPage</servlet-name>
  <url-pattern>/info</url-pattern>
</servlet-mapping>
```

3. Save the `web.xml` file and add the edited file to the EAR file.

## 59.5 Deploying JSR 286 Portlets to a WebLogic Managed Server

For information about how to deploy JSR 286 portlets to a WebLogic Managed Server, see [Chapter 61, "Deploying Portlet Producers."](#)

When you deploy a portlet producer containing JSR 286 portlets to a WebLogic Managed Server, the configuration settings described in [Section 59.4.2, "What Happens When You Run a WSRP Portlet Producer on Integrated WebLogic Server"](#) are added to the EAR file.

## 59.6 Migrating WebLogic Portal Portlets to WebCenter Portal

This section discusses migrating WebLogic Portal portlets developed with the WebLogic Portal's Eclipse IDE to WebCenter Portal's JDeveloper environment.

---

---

**Note:** There is no direct support or tooling available for migrating WLP portlets to a WebCenter Portal project. In many cases, significant refactoring and recoding is required. This section highlights some of the migration issues and offers recommendations as appropriate.

---

---

### 59.6.1 Migrating Java Portlets from WebLogic Portal to WebCenter Portal

In general, JSR 286 standard portlets (Java portlets) that were developed in WebLogic Portal can be moved directly to a WebCenter Portal/JDeveloper environment. Simply copy all of the portlet artifacts (`portlet.xml`, `.java` files, `.jsp` files, and so on) into a JDeveloper Portlet Producer application project.

---

---

**Note:** Any WebLogic Portal specific APIs used by the portlet must be rewritten to use WebCenter Portal APIs. WebLogic Portal specific APIs will not work in a WebCenter environment.

---

---

**Tip:** You can use the WebLogic Portal Export feature to export your Java portlets to an archive file and then import the archive file into your JDeveloper project. This technique may be simpler than manually copying all the portlet artifacts from one environment to another. See "Exporting Java Portlets for Use on Other Systems" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*.

## 59.6.2 Problems With Migrating WLP Portlets to a WebCenter Portal Application

Moving portlets from a WLP development environment to a WebCenter Portal development environment is not directly supported. In general, this process can involve substantial rewriting or refactoring of the migrated portlet code and related files.

---

---

**Note:** If a portlet (regardless of type) was capable of running over WSRP in WebLogic Portal, the portlet can be consumed directly from the WebLogic Portal's portlet producer in a WebCenter Portal consumer. See "WSRP Interoperability with WebCenter Framework" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

---

---

Problems inherent in moving WebLogic Portal portlets directly to a WebCenter Portal project in JDeveloper can include the following:

- **URL Generation** – Some URL types supported by WebLogic Portal do not work in WebCenter Portal, including DesktopURL, CustomEventURL, PageURL, WindowURL, StandalonePortletURL, and possibly others.
- **Events** – The WebCenter Portal consumer does not generate all of the events that the WebLogic Portal framework generates. These unsupported events include Init, LookAndFeelReinit, Notification, Refresh, WindowActivation, WindowDeactivation, and possibly others.
- **Render Dependencies** – WLP render dependencies do not work in WebCenter.
- **WLP Framework APIs** – Many WLP APIs are not supported in WebCenter Portal.

## 59.6.3 General Tips for Migrating WLP Portlets to a WebCenter Portal Portlet Producer Application

This section provides general guidance on moving WLP portlets into WebCenter Portal's portlet producer environment. Although portlet migration is not directly supported, this section lists tips that might help you with the manual migration process of the various WLP portlet types.

---

---

**Caution:** This section provides general guidance only. As discussed in [Section 59.6, "Migrating WebLogic Portal Portlets to WebCenter Portal,"](#) direct migration of WLP portlet types to WebCenter Portal application or portlet producer application is not directly supported. In almost all cases, rewriting and refactoring of existing portlet code is required when moving portlets from WLP to WebCenter Portal.

As noted previously, any WebLogic Portal specific APIs used by the portlet must be rewritten to use WebCenter Portal APIs. WebLogic Portal specific APIs will not work in a WebCenter environment.

---

---

- **JSP portlets** – Moving JSP portlets directly into a WebCenter Portal project is not supported. You can consider refactoring the JSP portlet into a JSR286 portlet and then migrate it as explained in [Section 59.6.1, "Migrating Java Portlets from WebLogic Portal to WebCenter Portal."](#)
- **JSR 168/286 portlets** – Most Java (JSR 168 / 286) portlets can be directly imported to a WebCenter Portal portlet producer and run as JSR286 portlets. Some JSR168

portlets that take advantage of specific error conditions guaranteed by the JSR168 specification may need to be run in a JSR168 compatibility mode. See "JSR-286/JSR-168 Portlet Compatibility" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*. JSR168 portlets using WLP's proprietary eventing (event subscriptions declared in a `.portlet` file) must be re-written to use JSR286 events.

- **Java Page Flow portlets** – JPF portlets are not supported by WebCenter Portal's portlet producer and must be either consumed from a WebLogic Portal WSRP producer or refactored to become JSR286 or JSF portlets.
- **JSF portlets** – If the portlet is written to the JSR329 JSF Portlet bridge in WLP, it should run on a WebCenter producer with no changes. For portlets using the WLP "native" JSF portlet bridge, the portlet must be consumed from a WebLogic Portal producer or upgraded to a JSF 1.2 portlet using the JSR329 bridge. See also "Working With JSF-Java Portlets" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*.
- **Clipper portlets** – Clipper portlets are not supported in WebCenter portal, but the web clipping features in WebCenter Portal's pagelet producer provide equivalent functionality.
- **Struts portlets** – Moving Struts portlets directly into a WebCenter Portal project is not supported. You can consider refactoring the JSP portlet into a JSR286 portlet and then migrate it as explained in [Section 59.6.1, "Migrating Java Portlets from WebLogic Portal to WebCenter Portal."](#)
- **Content Presenter portlets** – WLP Content Presenter portlets will not work over WSRP and will not work with WebCenter. Portal However, equivalent functionality is available in WebCenter Portal's content presenter. See "Publishing Content Using Content Presenter" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.
- **Remote (WSRP) portlets** – Remote (WSRP) portlets consumed in WLP can be consumed in a WebCenter Portal's consumer instead. Remote portlets taking advantage of WLP-specific WSRP features may need modification. For example the custom data transfer feature must be replaced by using events or shared parameters to convey data. See "WSRP Interoperability With WebCenter Framework" and "Configuring WSRP Security Between WLP and WebCenter Framework" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

## 59.7 Troubleshooting JSR 286 Java Portlets

This section provides information to assist you in troubleshooting problems you may encounter while creating and testing JSR 286 portlets.

This section includes the following subsections:

- [Section 59.7.1, "Issues with Creating JSR 286 Portlets"](#)
- [Section 59.7.2, "Issues with Testing JSR 286 Portlets"](#)

### 59.7.1 Issues with Creating JSR 286 Portlets

This section includes the following subsections:

- [Section 59.7.1.1, "Cannot Access the Create Portlet Wizard"](#)
- [Section 59.7.1.2, "Cannot Add the Portlet Functionality that I Want to the Portlet"](#)

### 59.7.1.1 Cannot Access the Create Portlet Wizard

#### Problem

In the New Gallery, I cannot find the Standards-based Java Portlet (JSR 286) option.

#### Cause

The application in which you are trying to create the JSR 286 portlet was created using WebCenter Portal's Framework application template and therefore is not scoped for portlet creation.

#### Solution

1. Try creating the portlet in a Portlet Producer Application or any application scoped for portlet creation (any application except for those built using WebCenter Portal's Framework application template).
2. In the New Gallery, click the All Technologies tab to list all available options regardless of the technology scope of the application.

### 59.7.1.2 Cannot Add the Portlet Functionality that I Want to the Portlet

#### Problem

I cannot find the option to add certain features, for example portlet events or public render parameters, to the portlet in the Create JSR 286 Java Portlet wizard.

#### Cause

The Create JSR 286 Java Portlet wizard does not provide the option to add certain features to portlets.

#### Solution

After you create the portlet using the Create JSR 286 Java Portlet wizard, edit the `portlet.xml` file using the Overview Editor to add advanced functionality. For more information, see [Section 59.3, "Developing JSR 286 Java Portlets."](#)

## 59.7.2 Issues with Testing JSR 286 Portlets

For a list of the issues you may encounter when consuming portlets during the testing phase of portlet development, see [Section 62.12, "Troubleshooting Portlets."](#)

---

# Building Java Portlets Using the Oracle PDK-Java

This chapter describes how to build Java portlets using the Oracle PDK-Java. Oracle PDK-Java is an Oracle proprietary technology for building Java portlets.

**Tip:** For building new Java portlets, you should consider using the JSR 286 standard. For more information, see [Chapter 59, "Building Standards-Based Java Portlets Using JSR 286."](#)

This chapter includes the following sections:

- [Section 60.1, "Introduction to PDK-Java Portlets"](#)
- [Section 60.2, "Creating a PDK-Java Portlet"](#)
- [Section 60.3, "Developing PDK-Java Portlets"](#)
- [Section 60.4, "Testing PDK-Java Portlets"](#)
- [Section 60.5, "Deploying PDK-Java Portlets"](#)
- [Section 60.6, "Creating a Struts Portlet"](#)
- [Section 60.7, "Troubleshooting PDK-Java Portlets"](#)

## 60.1 Introduction to PDK-Java Portlets

PDK-Java gives you a framework to simplify the development of Java portlets by providing commonly required utilities and enabling you to leverage existing development skills and application components such as JSPs, servlets, and static HTML pages. PDK-Java also enables you to create portlets without having to deal directly with the complexity of communications between WebCenter Portal: Framework and producers.

The PDK-Java framework is divided into the following areas:

- The **Producer Adapter** insulates the developer from the HTTP syntax defined by WebCenter Portal: Framework for communication with web producers. It translates the information passed between WebCenter Portal: Framework and your Java web producer. Without an adapter, your producer would not only manage portlets, but it would also have to communicate this information directly to WebCenter Portal: Framework in the expected language. The adapter eliminates the need for your web producer to understand the portal language and vice-versa.
- The **Producer Interface** defines the APIs (functions) required by your Java implementation to integrate with the Producer Adapter. The Producer Adapter

receives messages from the Framework application, translates them into calls to the Producer Interface, and translates the producer's response into a format that the application can understand. The Producer Interface contains a set of Java classes that define the methods your producer implements and, in often, provides a standard implementation. Some of the primary classes are as follows:

- `ProviderDefinition (oracle.portal.provider.v2.ProviderDefinition)`
  - `ProviderInstance (oracle.portal.provider.v2.ProviderInstance)`
  - `PortletDefinition (oracle.portal.provider.v2.PortletDefinition)`
  - `PortletInstance (oracle.portal.provider.v2.PortletInstance)`
  - `ParameterDefinition (oracle.portal.provider.v2.ParameterDefinition)`
  - `EventDefinition (oracle.portal.provider.v2.EventDefinition)`
- The **Producer Runtime** provides a base implementation that follows the specification of the Producer Interface. The Producer Runtime includes a set of default classes that implement each of the Producer Interfaces and enables you to leverage the rendering, personalization, and security frameworks provided with PDK-Java. These classes and the associated frameworks simplify the development of a producer by implementing common functions for WebCenter Portal: Framework requests and providing a declarative mechanism for configuring the producer. Using the Producer Runtime, you can focus your development efforts on the portlets themselves rather than the infrastructure needed to communicate with the Framework application. If the standard behavior of the Producer Runtime does not meet your requirements, then you can easily extend or override specific behaviors. Some of the primary classes are as follows:
- `DefaultProviderDefinition (oracle.portal.provider.v2.DefaultProviderDefinition)`
  - `DefaultProviderInstance (oracle.portal.provider.v2.DefaultProviderInstance)`
  - `DefaultPortletDefinition (oracle.portal.provider.v2.DefaultPortletDefinition)`
  - `DefaultPortletInstance (oracle.portal.provider.v2.DefaultPortletInstance)`
  - `PortletRenderer (oracle.portal.provider.v2.render.PortletRenderer)`
  - `PortletPersonalizationManager (oracle.portal.provider.v2.personalize.PortletPersonalizationManager)`
  - `PortletSecurityManager (oracle.portal.provider.v1.http.DefaultSecurityManager)`
- The **Producer Utilities** provide methods for simplifying the rendering of portlets. The utilities include methods for constructing valid links (`hrefs`), rendering the portlet's container (including the header), rendering HTML forms that work within a page, and supporting portlet caching.

Oracle JPDK producers use open standards, such as XML, SOAP, HTTP, or Java EE for deployment, definition, and communication with applications. WebCenter Portal incorporates portlets from a Oracle JPDK producer, which communicates with the consumer application using SOAP over HTTP.

There are several benefits to developing portlets and exposing them through Oracle JPDK producers:

- Deploy portlets remotely
- Leverage existing web application code to create portlets
- Specify producers declaratively
- Use standard Java technologies (for example, servlets and JSPs) to develop portlets.

To expose your portlets using a Oracle JPDK producer, you must first create a producer that manages your portlets and communicates with WebCenter Portal using SOAP. For more information, see [Section 60.5, "Deploying PDK-Java Portlets."](#)

For more information about the PDK-Java, see the *Oracle Fusion Middleware Java API Reference for Oracle PDK-Java* at:

[http://docs.oracle.com/cd/E23943\\_01/apirefs.1111/e10691/index.html?overview-summary.html](http://docs.oracle.com/cd/E23943_01/apirefs.1111/e10691/index.html?overview-summary.html)

## 60.2 Creating a PDK-Java Portlet

WebCenter Portal provides a wizard, available in JDeveloper, for quickly and easily creating the initial framework of your PDK-Java portlets.

This section includes the following subsections:

- [Section 60.2.1, "How to Create a PDK-Java Portlet"](#)
- [Section 60.2.2, "What Happens When You Create a PDK-Java Portlet"](#)

### 60.2.1 How to Create a PDK-Java Portlet

Using the Create Oracle PDK-Java Portlet wizard in JDeveloper you can quickly and easily create PDK-Java portlets. You can choose which portlet modes you want to implement and the implementation method (JSP, HTTP servlet, Java class, or HTML) to use for each mode. The wizard then creates a simple implementation for each of the selected modes.

To create a PDK-Java portlet using the JDeveloper wizard:

1. In JDeveloper, open the portlet producer application under which you want to create your portlet, or create a new portlet producer application.

For information about how to create a portlet producer application, see [Section 5.5, "Creating a Portlet Producer Application."](#)

---

---

**Note:** If you do not use the WebCenter Portal - Portlet Producer Application template to create the portlet producer application, you must manually add the appropriate portlet building technology scopes to the application.

Applications built using the WebCenter Portal - Framework Application template are *not* scoped for portlet creation.

---

---

2. Right-click the project under which you want to create your portlet (for example, **Portlets**), and choose **New**.

---

---

**Note:** To create the portlet in an existing producer, right-click the producer's `provider.xml` file and choose **Add Portlet**. This takes you directly to the General Portlet Information page of the Create Oracle PDK-Java Portlet wizard (step 8).

---

---

3. In the New Gallery, expand **Web Tier**, select **Portlets** and then **Oracle PDK-Java Portlet**, and click **OK**.
4. On the Provider Details page of the Create Oracle PDK-Java Portlet wizard, enter a name for the new producer to contain your portlet. This name must be unique within the project.

**Tip:** In the PDK-Java, the term provider is used instead of producer. A provider is the same thing as a producer.

5. Select **Generate Deployment Properties File**.

This automatically generates two `.properties` files:

- `serviceID.properties` defines properties for a producer with that service ID. The service ID has the same value as the producer name.
- `_default.properties` is a default properties file. A producer application may have multiple producers, each with its own service ID. On registration, if no service ID is defined, then the default properties file is used.

6. Select **Generate XML Entries**.

This automatically generates a producer definition file (`provider.xml`) for the producer that contains details of the portlets belonging to the producer, including those generated by the wizard.

7. Select **Generate Index JSP** and then click **Next**.

This automatically generates an `index.jsp` file that lists all the producers that reside in the application with hyperlinks that enable easy access to producer test pages.

8. On the General Portlet Information page, enter a name and display name for your portlet.

The name is used internally and is not exposed to users. The display name is displayed to users in portlet selection lists, such as the Component Palette.

The description is not implemented in Framework applications so you do not need to enter a value in this field unless your portlet is likely to be consumed by other applications, such as Oracle Portal.

9. In the **Timeout Interval (Seconds)** field, enter the number of seconds to allow for rendering the portlet.
10. In the **Timeout Message** field, enter a message to display if the rendering of the portlet exceeds the timeout interval specified and then click **Next**.
11. On the View Modes page, under Show Page, from the **Implementation Style** dropdown list, select the implementation style to use for the portlet's Shared Screen mode.
  - Select **JSP** to implement the portlet's Shared Screen mode as a JavaServer Page. In the **File Name** field, enter the name of the file to be generated by the wizard.

- Select **HTTP Servlet** to implement the portlet's Shared Screen mode as an HTTP servlet. In the **Package Name** field, enter the name of the package that contains the HTTP servlet. In the **Class Name** field, enter the Java class to be referenced with the portlet's Shared Screen mode.
- Select **HTML File** to implement the portlet's Shared Screen mode as an HTML file. In the **File Name** field, enter the name of the file to be generated by the wizard. Note that, when you choose **HTML File**, the following code is added inside the `<renderer>` element of your `provider.xml` file:

```
<showPage class="oracle.portal.provider.v2.render.http.ResourceRenderer">
  <resourcePath>provider_id/portlet_name/file.html</resourcePath>
  <contentType>content_type</contentType>
  <charSet>char_set</charSet>
</showPage>
```

`charSet` indicates the character set that the producer must use to encode the HTML page. The default character set is determined by JDeveloper preferences. If you require a different character set, you must update this element of `provider.xml` accordingly.

- Select **Java Class** to implement the portlet's Shared Screen mode as a Java class. In the **Package Name** field, enter the name of the package that contains the Java class. In the **Class Name** field, enter the name of the Java class.

For more information about Shared Screen mode, see [Section 57.4.1.1, "View Mode."](#)

12. To implement Full Screen mode for your portlet, select **Show Details Page** and then select an implementation style as described for Shared Screen mode in step 11.
13. At this point in the wizard, you can click **Finish** to create the portlet immediately, using the default values for all remaining settings.

To provide additional details for your portlet, click **Next** and follow the remaining steps.

14. On the Customize Modes page, **Edit Page** is selected by default. To implement Edit mode for your portlet, select an implementation style as described for Shared Screen mode in step 11. If you do not want to implement Edit mode, then deselect **Edit Page**.

For more information about Edit mode, see [Section 57.4.1.2, "Edit Mode."](#)

15. To implement Edit Defaults mode for your portlet, select **Edit Defaults Page**, and then select an implementation style as described for Shared Screen mode in step 11.

For more information about Edit Defaults mode, see [Section 57.4.1.3, "Edit Defaults Mode."](#)

16. Click **Next**.

17. On the Additional Modes page, to implement Help mode for your portlet, select **Help Page**, and then select an implementation style as described for Shared Screen mode in step 11.

For more information about Help mode, see [Section 57.4.1.4, "Help Mode."](#)

18. To implement About mode for your portlet, select **About Page**, and then select an implementation style as described for Shared Screen mode in step 11.

For more information about About mode, see [Section 57.4.1.5, "About Mode."](#)

19. Click **Next**.

20. On the Public Portlet Parameters page, click **Add** to add a public parameter to your portlet.

This adds a new row to the table of parameters. Double-click each field in the row to provide a name, display name, and description for the parameter.

Repeat this step to add more public parameters. When you are done, click **Next**.

Public portlet parameters enable a portlet to communicate with the page on which it resides and with other portlets on that page. For more information, see [Section 60.3.3, "How to Implement Public Parameters."](#)

21. Oracle PDK-Java events are not supported in Framework applications, so on the Public Portlets Events page, click **Finish**.

For more information about events, see the *Oracle Fusion Middleware Developer's Guide for Oracle Portal*.

## 60.2.2 What Happens When You Create a PDK-Java Portlet

When you use the Create Oracle PDK-Java Portlet wizard, JDeveloper generates a default implementation of the portlet. Specifically, the following files are created:

- Files for each portlet mode you selected, for example `portletnameEditPage.jsp`.
- `provider.xml` is the producer definition file that contains details of the portlets belonging to the producer.
- `web.xml` is the web deployment descriptor file for the application.
- `weblogic.xml` includes a shared library definition pointing to the PDK-Java shared library.
- `index.jsp` is used by JDeveloper for testing purposes.
- `_default.properties` is the default properties file.
- `serviceID.properties` is the properties file for the producer identified by `serviceID`.

All these files are required to deploy and run the portlet successfully, except for `index.jsp`.

You can see all these files in the Application Navigator, as shown in [Figure 60-1](#).

**Figure 60–1 Files Generated for a PDK-Java Portlet**

## 60.3 Developing PDK-Java Portlets

When you have built your initial portlet implementation using the Create Oracle PDK-Java Portlet wizard, the next step is to create the code that drives the portlet content and behavior.

You can find the JavaDoc reference for the PDK-Java in the *Oracle Fusion Middleware Java API Reference for Oracle PDK-Java* at:

[http://docs.oracle.com/cd/E23943\\_01/apirefs.1111/e10691/index.html?overview-summary.html](http://docs.oracle.com/cd/E23943_01/apirefs.1111/e10691/index.html?overview-summary.html)

This section includes the following subsections:

- Section 60.3.1, "General Guidelines for PDK-Java Portlets"
- Section 60.3.2, "How to Add Portlet Modes"
- Section 60.3.3, "How to Implement Public Parameters"
- Section 60.3.4, "How to Implement Private Parameters"
- Section 60.3.5, "How to Use JNDI Variables"
- Section 60.3.6, "How to Access Session Information"
- Section 60.3.7, "How to Enhance PDK-Java Portlet Performance with Caching"
- Section 60.3.8, "How to Manage the Persistence Store for PDK-Java Portlets"
- Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store"
- Section 60.3.9, "How to Move a PDK-Java Portlet Producer"
- Section 60.3.10, "How to Export and Import PDK-Java Portlet Producers at Design Time"

The source code for many of the examples referenced in this section is available as part of the Portlet Developer's Kit (PDK).

When you unzip the PDK-Java, you can find the examples in:

```
../pdk/jpdk/v2/src/oracle/portal/sample/v2/devguide
```

### 60.3.1 General Guidelines for PDK-Java Portlets

When you build PDK-Java portlets for use in WebCenter Portal, you should consider the following:

- Your portlet must not contain any code that relies upon the URL format or parameters in the request that were not explicitly added by your portlet.
- You should never assume that your portlet is the only one on a page, regardless of the portlet mode. For example, even if your portlet is in Edit mode, you should not assume that it is the only portlet on the page.
- Never write a portlet mode that simply redirects. A redirect can only be issued while processing a post to your portlet or following a link generated by your portlet.

### 60.3.2 How to Add Portlet Modes

In the Create Oracle PDK-Java Portlet wizard, you add portlet modes by checking boxes on the wizard pages. For more information about using the wizard, see [Section 60.2.1, "How to Create a PDK-Java Portlet."](#) For each portlet mode that you select in the wizard, a basic skeleton is created. If you want to add a portlet mode after creating the portlet, you can do that by updating `provider.xml` and creating HTML or JSPs in JDeveloper.

The principles of implementing portlet modes using `RenderManager` are the same for all modes.

For more detailed information about the PDK runtime classes used in this section, see the JavaDoc in the *Oracle Fusion Middleware Java API Reference for Oracle PDK-Java* at:

[http://docs.oracle.com/cd/E23943\\_01/apirefs.1111/e10691/index.html?overview-summary.html](http://docs.oracle.com/cd/E23943_01/apirefs.1111/e10691/index.html?overview-summary.html)

To add a portlet mode:

1. In JDeveloper, open the application that contains the portlet.
2. Expand the project that contains the portlet.
3. Expand the **Web Content** node and then the **htdocs** node and then the node for the producer.
4. Right-click the node for the portlet and choose **New**.

**Tip:** The node for the portlet is located under **Web Content > htdocs > provider**.

5. In the New Gallery, expand **Web Tier**, select **HTML** or **JSP**, and click **OK**.

You must create an HTML file or a JSP for each mode to add to your portlet. For example, to implement Help mode, create an HTML file to provide the help content.

6. In the resulting dialog, enter a file name for the HTML file or JSP and click **OK**.
7. In the visual editor, edit the content of the page to implement the desired functionality.

For example, for Help mode, you could add the following HTML:

```
<p>This is the <i>Help</i> mode of your portlet!</p>
```

8. In the Application Navigator, right-click the `provider.xml` file for the provider that owns the portlet and choose **Open**.

**Tip:** The `provider.xml` file is located under **Web Content > WEB-INF > providers > provider**.

9. Change the value of the appropriate tag for the mode you are adding to `true`. For example, if you are adding Help mode, change the `hasHelp` tag as follows:

```
<hasHelp>true</hasHelp>
```

This indicates to the PDK Framework that a link or icon to that mode should be rendered.

10. Add the code to point to the HTML page or JSP that you created earlier for the mode.

For example, for the Help page, add the following code:

```
<helpPage>/htdocs/myprovider/myportlet/myHelpPage.html</helpPage>
```

11. Save your changes.

### 60.3.3 How to Implement Public Parameters

PDK-Java and WebCenter Portal: Framework provide public and private portlet parameters to enable you to easily write reusable, complex portlets. The Create Oracle PDK-Java Portlet wizard creates portlets that are set up to use parameters. This feature enables you to focus solely on adding business logic to your portlets and does not require any changes to `provider.xml`.

Using the Create Oracle PDK-Java Portlet wizard, you can easily create a portlet with public parameters. When you register the producer and drop the portlet on a page, the portlet's parameters are automatically linked to page variables.

---

---

**Note:** Each portlet is limited to 4K of data. The lengths of parameter and event names, display names, and descriptions all contribute toward this 4K limit. Hence, you should not use too many parameters and events for each portlet, or give them lengthy names and descriptions.

---

---

To create a portlet with public parameters:

1. In JDeveloper, open the application that contains the portlet.
2. Right-click the project under which you want to create your portlet, and choose **New**.

---

---

**Note:** To create the portlet in an existing producer, right-click the producer's `provider.xml` file and choose **Add Portlet**. This takes you directly to the General Portlet Information page of the Create Oracle PDK-Java Portlet wizard.

---

---

3. In the New Gallery, expand **Web Tier**, select **Portlets** and then **Oracle PDK-Java Portlet**, and click **OK**.
4. Proceed through the Create Oracle PDK-Java Portlet wizard until you reach the Public Portlet Parameters page.  
See [Section 60.2.1, "How to Create a PDK-Java Portlet"](#) for basic information about going through the wizard.
5. On the Public Portlet Parameters page, click **Add**.  
This adds a new row to the table of parameters.
6. Replace the default values in the **Name**, **Display Name**, and **Description** fields with something more meaningful for your parameter.
7. Add more parameters as required and then click **Finish**.
8. In the Application Navigator, right-click the `provider.xml` file for the provider that owns the portlet and choose **Open**.

The `provider.xml` file is located under **Web Content > WEB-INF > providers > *provider***.

You should see entries for the parameters that you added on the Public Portlet Parameters page in the wizard, for example, as shown in [Example 60-1](#).

**Example 60-1 `provider.xml` Sample, Public Parameters**

```
<?xml version = '1.0' encoding = 'UTF-8'?>
<?providerDefinition version="3.1"?>
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
  <session>false</session>
  <passAllUrlParams>false</passAllUrlParams>
  <preferenceStore class=
    "oracle.portal.provider.v2.preference.FilePreferenceStore">
    <name>prefStore1</name>
    <useHashing>true</useHashing>
  </preferenceStore>
  <portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
    <id>1</id>
    <name>MyPortlet</name>
    <title>My Portlet</title>
    <description>My Portlet Description</description>
    <timeout>40</timeout>
    <showEditToPublic>false</showEditToPublic>
    <hasAbout>false</hasAbout>
    <showEdit>true</showEdit>
    <hasHelp>false</hasHelp>
    <showEditDefault>false</showEditDefault>
    <showDetails>false</showDetails>
    <inputParameter class=
      "oracle.portal.provider.v2.DefaultParameterDefinition">
      <name>Parameter_01</name>
      <displayName>Parameter_01</displayName>
      <description>My first parameter</description>
    </inputParameter>
    <inputParameter class=
      "oracle.portal.provider.v2.DefaultParameterDefinition">
      <name>Parameter_02</name>
      <displayName>Parameter_02</displayName>
      <description>My second parameter</description>
    </inputParameter>
```

```

<inputParameter class=
  "oracle.portal.provider.v2.DefaultParameterDefinition">
  <name>Parameter_03</name>
  <displayName>Parameter_03</displayName>
</inputParameter>
<renderer class="oracle.portal.provider.v2.render.RenderManager">
  <renderContainer>true</renderContainer>
  <renderCustomize>true</renderCustomize>
  <autoRedirect>true</autoRedirect>
  <contentType>text/html</contentType>
  <showPage>/htdocs/myportlet/MyPortletShowPage.jsp</showPage>
  <editPage>/htdocs/myportlet/MyPortletEditPage.jsp</editPage>
</renderer>
<personalizationManager class=
  "oracle.portal.provider.v2.personalize.PrefStorePersonalizationManager">
  <dataClass>
    oracle.portal.provider.v2.personalize.NameValuePersonalizationObject
  </dataClass>
  </personalizationManager>
</portlet>
</provider>

```

9. In the Application Navigator, right-click the `portletnameShowPage.jsp` for your portlet and choose **Open**.

The file is located under **Web Content > htdocs > provider > portlet**.

The portlet includes logic for retrieving the parameters, for example, as shown in [Figure 60–2](#).

#### Example 60–2 ShowPage.jsp Sample

```

<%@page contentType="text/html; charset=windows-1252"
  import="oracle.portal.provider.v2.render.PortletRenderRequest"
  import="oracle.portal.provider.v2.http.HttpCommonConstants"
  import="oracle.portal.provider.v2.ParameterDefinition"
%>
<%
  PortletRenderRequest pReq = (PortletRenderRequest)
    request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
%>
<P>Hello <%= pReq.getUser().getName() %>.</P>
<P>This is the <b><i>Show</i></b> render mode!</P>
<%
  ParameterDefinition[] params =
    pReq.getPortletDefinition().getInputParameters();
%>
<p>This portlet's input parameters are...</p>
<table align="left" width="50%" ><tr><td><span
class="PortletHeading1">Name</span></td><td><span
class="PortletHeading1">Value</span></td></tr>
<%
  String name = null;
  String value = null;
  String[] values = null;
  for (int i = 0; i < params.length; i++)
  {
    name = params[i].getName();
    values = pReq.getParameterValues(name);
    if (values != null)
    {

```

```

        StringBuffer temp = new StringBuffer();
        for (int j = 0; j < values.length; j++)
        {
            temp.append(values[j]);
            if (j + 1 != values.length)
            {
                temp.append(", ");
            }
        }
        value = temp.toString();
    }
    else
    {
        value = "No values have been submitted yet.";
    }
}
%>
<tr>
    <td><span class="PortletText2"><%= name %></span></td>
    <td><span class="PortletText2"><%= value %></span></td>
</tr>
<%
}
%>
</table>

```

10. Add logic to your portlet that allows it to submit parameter values entered by users.
11. Create a second portlet using the same steps that simply displays parameter values that it retrieves.
12. Register the producer with a Framework application. For more information, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)
13. Add the two portlets to a page in the application. For more information, see [Section 62.6, "Adding Portlets to a Page."](#)
14. In the Structure window of the Application Navigator, right-click an element of the page and choose **Go to Page Definition**.

The page definition should look similar to [Example 60-3](#). Notice the variables at the page level and the parameters at the portlet level (indicated in bold).

#### **Example 60-3 Page Definition File Sample**

```

<?xml version="1.0" encoding="UTF-8"?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
    version="10.1.3.38.90" id="untitled1PageDef"
    Package="view.pageDefs">
    <executables>
        <variableIterator id="variables">
            <variable Name="portlet1_Parameter_01" Type="java.lang.Object"/>
            <variable Name="portlet1_Parameter_02" Type="java.lang.Object"/>
            <variable Name="portlet1_Parameter_03" Type="java.lang.Object"/>
        </variableIterator>
        <portlet id="portlet1"
            portletInstance="/oracle/adf/portlet/PdkPortletProducer1_1153936627784
                /applicationPortlets/Portlet1_abfc5a10_010c_1000_8003_82235f50d831"
            class="oracle.adf.model.portlet.binding.PortletBinding"
            xmlns="http://xmlns.oracle.com/portlet/bindings">
            <parameters>

```

```

        <parameter name="Parameter_01" pageVariable="portlet1_Parameter_01"/>
        <parameter name="Parameter_02" pageVariable="portlet1_Parameter_02"/>
        <parameter name="Parameter_03" pageVariable="portlet1_Parameter_03"/>
    </parameters>
</portlet>
</executables>
</pageDefinition>

```

15. Run the application.
16. Enter values in the first portlet and the same values should be displayed in the second portlet.

## 60.3.4 How to Implement Private Parameters

In some cases, you might need a parameter that is known only to the portlet instance. These parameters are known as private parameters because they have no connection to the page and are known only to the portlet. Private parameters often come in handy when you are building navigation for your portlet. For example, if you have a portlet made up of multiple pages, then you can use private parameters to jump to another resource of the portlet.

This section includes the following subsections:

- [Section 60.3.4.1, "About Private Parameters"](#)
- [Section 60.3.4.2, "About Portlet URL Types"](#)
- [Section 60.3.4.3, "Building Links with the Portlet URL Types"](#)
- [Section 60.3.4.4, "Building Forms with the Portlet URL Types"](#)
- [Section 60.3.4.5, "Implementing Navigation within a Portlet"](#)
- [Section 60.3.4.6, "Restricting Navigation to Resources"](#)

### 60.3.4.1 About Private Parameters

Private parameters are used in classic web applications to pass information from links or forms in the browser back to the server. The server in turn takes actions and returns the appropriate content. For example, if the user of a dictionary web site asks for information about hedgehogs, then the URL submitted to the server might append a private parameter as follows:

```
http://dictionary.reference.com/search?q=Hedgehog
```

If the server is responsible for rendering the whole page and the client communicates directly with the server, then this form of URL works well. In a Framework application, the client does not communicate directly with portlets. Instead, WebCenter Portal: Framework mediates between the client and the portlet. Moreover, because most pages have multiple portlets, WebCenter Portal: Framework communicates with multiple portlets.

For example, suppose a page contains two portlets, a thesaurus portlet and a dictionary portlet. Both portlets use `q` as a parameter to record the search queries made by the user. If the user queries the thesaurus portlet, then the URL used to rerequest the page with the updated thesaurus portlet must contain the thesaurus portlet's parameter, `q`. The thesaurus parameter must also be distinguished from dictionary portlet parameter 1, which performs the same function for that portlet.

You must ensure that the portlet meets the following criteria:

- It properly qualifies its own parameters when they are built into links and forms.

- It leaves unchanged any parameters that do not belong to it.

The following API call transforms an unqualified parameter name into a qualified parameter name:

```
HttpPortletRendererUtil.portletParameter(HttpServletRequest request, String param);
```

`HttpPortletRendererUtil` is in the package `oracle.portal.provider.v2.render.http`.

For example:

```
qualParamQ = HttpPortletRendererUtil.portletParameter(r, "q");
```

To fetch the value of a portlet parameter from the incoming request, you can use the following API:

---

---

**Note:** The API converts the parameter name into the qualified parameter name before fetching the value from the incoming request. Hence, you need not perform this step.

---

---

```
PortletRenderRequest.getQualifiedParameter(String name)
```

`PortletRenderRequest` is in the package `oracle.portal.provider.v2.render`.

For example:

```
valueQ = r.getQualifiedParameter("q");
```

The other aspect of a portlet's responsibilities with private parameters is to not disturb the parameters on the URL that it does not own. The utilities you may use to ensure adherence to this rule are discussed in [Section 60.3.4.3, "Building Links with the Portlet URL Types"](#) and [Section 60.3.4.4, "Building Forms with the Portlet URL Types."](#)

### 60.3.4.2 About Portlet URL Types

When a portlet renders itself, WebCenter Portal: Framework passes it various URLs, which the portlet can then use to render links. You can fetch and manipulate these URLs to simplify the task of creating links. The following is a list of the URLs provided to portlets:

- **PAGE\_LINK** is a URL to the page upon which the portlet instance resides. You use this URL as the basis for all intraportlet links. If the portlet renders a link that navigates the user to another section of the same portlet, then this navigation must be encoded as a set of parameters using the **PAGE\_LINK**.
- **DESIGN\_LINK** is a URL to the portlet's personalization (Edit mode) page. A portlet's Edit and Edit Defaults modes are not rendered on the same page as the portlet. The Edit and Edit Defaults modes take over the entire browser window. The portlet's Edit and Edit Defaults modes are not necessarily accessible to every user. It represents a minimal, static framework in which the portlet is free to render its personalization options. This URL is only of use when rendering Personalize links.
- **BACK\_LINK** is a URL to a useful return point from the current page where the portlet renders itself. For example, when the portlet is rendering its personalization page (Edit mode), this link refers to the page on which the portlet

resides and from which the user navigated to the personalization page. Consequently, it is the link you encode in the buttons that accept or cancel the pending action. This URL is only useful for the desktop rendering of portlets (usually in Edit or Edit Defaults mode).

### 60.3.4.3 Building Links with the Portlet URL Types

To build links with Portlet URL types, you must access them and use them when writing portlet rendering code. To fetch the URL for a link, you call the following APIs in PDK-Java:

```
portletRenderRequest.getRenderContext().getPageURL()
portletRenderRequest.getRenderContext().getEventURL()
portletRenderRequest.getRenderContext().getDesignURL()
portletRenderRequest.getRenderContext().getLoginServerURL()
portletRenderRequest.getRenderContext().getBackURL()
```

In portlet navigation, you must add (or update) your portlet's parameters in the page URL. To perform this task, you can use the following API to build a suitable URL:

```
UrlUtils.constructLink(
    PortletRenderRequest pr,
    int linkType, -- UrlUtils.PAGE_LINK in this case
    NameValue[] params,
    boolean encodeParams,
    boolean replaceParams)
```

`UrlUtils` resides in the package called `oracle.portal.provider.v2.url`. Notice that you do not actually fetch the page URL yourself. Rather you use the supplied portlet URL type, `UrlUtils.PAGE_LINK`.

The parameter names in the `params` argument should be fully qualified. Moreover, if you properly qualify the parameters, `UrlUtils.constructLink` with the appropriate `linkType` does not disturb other URL parameters that are not owned by the portlet.

An alternative version of `UrlUtils.constructLink` accepts a URL as the basis for the returned URL. If you require an HTML link, then you can use `UrlUtils.constructHTMLLink` to produce a complete anchor element.

The following example portlet, `ThesaurusLink.jsp`, uses the parameter `q` to identify the word for which to search the thesaurus. It then creates links on the found, related words that the user may follow to get the thesaurus to operate on that new word. To see the initial submission form that sets the value of `q`, see the example in [Section 60.3.4.4, "Building Forms with the Portlet URL Types."](#)

```
<%
    String paramNameQ = "q";
    String qualParamNameQ =
        HttpPortletRendererUtil.portletParameter(paramNameQ);
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramValueQ = pRequest.getQualifiedParameter(paramNameQ);
%>
<!-- Output the HTML content -->
<center>
    Words similar to <%= paramValueQ %>
    <br>
    Click the link to search for words related to that word.
    <br>
```

```

<ul>
<%
    String[] relatedWords = Thesaurus.getRelatedWords(paramValueQ);
    NameValue[] linkParams = new NameValue[1];
    for (int i=0; i<=relatedWords.length; i++)
    {
        linkParams[0] = new NameValue(
            qualParamNameQ, relatedWords[i]);
    }
    <li>
    <b> <%= relatedWords[i] %> </b>
    <%= UrlUtils.constructHTMLLink(
        pRequest,
        UrlUtils.PAGE_LINK,
        "(words related to " + relatedWords[i] + ")",
        "",
        linkParams,
        true,
        true)%>
    </li>
<%
    }
%>
</ul>
</center>

```

#### 60.3.4.4 Building Forms with the Portlet URL Types

The use of portlet parameters in forms is similar to their use in links. The following two fundamental rules continue to apply:

- Qualify the portlet's parameter names.
- Do not manipulate or remove the other parameters on the incoming URL.

In terms of markup and behavior, forms and links differ quite considerably. However, just as with links, PDK-Java contains utilities for complying with these two basic rules.

A parameter name is just a string, whether it is a link on a page or the name of a form element. Therefore, the code for properly qualifying the portlet's parameter name is the same as that described in [Section 60.3.4.3, "Building Links with the Portlet URL Types."](#)

Forms differ from links in the way you ensure that the other parameters in the URL remain untouched. Once you open the form in the markup, you can make use of the following APIs:

```

UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName);
UrlUtils.htmlFormHiddenFields(someURL);

```

where `formName = UrlUtils.htmlFormName(pRequest,null)`.

---

**Note:** Just as parameters in URLs and element names in forms require qualification to avoid clashing with other portlets on the page, form names must be fully qualified because any given page might have several forms on it.

---

The `htmlFormHiddenFields` utility writes HTML hidden form elements into the form, one form element for each parameter on the specified URL that is not owned by the portlet.

```
<INPUT TYPE="hidden" name="paramName" value="paramValue">
```

Thus, you need only to add their portlet's parameters to the form.

The other item of which you should be aware is how to derive the submission target of your form. In most cases, the submission target is the current page:

```
formTarget = UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK)
```

The value of `formTarget` can be the action attribute in an HTML form or the target attribute in a `SimpleForm`. Even though the method name includes HTML, it actually just returns a URL and thus you can use it in mobile portlets, too.

The following example form renders the thesaurus portlet's submission form. For the portlet that results from the submission of this form, see the example in [Section 60.3.4.3, "Building Links with the Portlet URL Types."](#)

```
<%
String paramNameSubmit = "submit";
String paramNameQ = "q";
String qualParamNameQ =
    HttpPortletRendererUtil.portletParameter(paramNameQ);
String qualParamNameSubmit =
    HttpPortletRendererUtil.portletParameter(paramNameSubmit);
PortletRenderRequest pRequest = (PortletRenderRequest)
    request.getAttribute(HttpCommonConstants.PORLET_RENDER_REQUEST);
String formName = UrlUtils.htmlFormName(pRequest,"query_form");
%>
<!-- Output the HTML content -->
<center>
<b>Thesaurus</b>
Enter the word you want to search for
<form name="<%= formName %%" method="POST"
    action="<%= UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK) %%">
<%= UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName)%>
<table><tr><td>
    Word of interest:
</td><td>
    <input
        type="text"
        size="20"
        name="<%= qualParamNameQ %%"
        value="">
    </td></tr></table>
<input type=submit name="<%= qualParamNameSubmit %%" Value="Search">
</form>
</center>
```

#### 60.3.4.5 Implementing Navigation within a Portlet

You can implement navigation within a portlet in one of three ways:

- Pass navigation information in rendered URLs using private portlet parameters. Branching logic within the portlet code then determines which section of the portlet to render based on the URL. This option represents a small extension to the thesaurus example presented in [Section 60.3.4.3, "Building Links with the Portlet URL Types"](#) and [Section 60.3.4.4, "Building Forms with the Portlet URL Types."](#)

Basically, instead of performing thesaurus search operations using the value of parameter `q`, the portlet branches based on the parameter value and renders different content accordingly.

- Pass navigation information as described in the previous item but use PDK-Java to interpret the parameter and thus branch on its value. This option requires some further changes to the thesaurus example and is more fully explained later in this section.
- Use session storage to record the portlet state and private parameters to represent actions rather than explicit navigation. This method provides the only way that you can restore the portlet to its previous state when the user navigates off the page containing the portlet. Once the user leaves the page, all private portlet parameters are lost and you can only restore the state from session storage, assuming you previously stored it there. This option requires that you understand and implement session storage. For more information about implementing session storage, see [Section 60.3.6, "How to Access Session Information."](#)

The following portlet code comes from the multi-page example in the sample producer of PDK-Java:

```
<portlet>
  <id>11</id>
  <name>Multipage</name>
  <title>MultiPage Sample</title>
  <shortTitle>MultiPage</shortTitle>
  <description>
    This portlet depicts switching between two screens all
    in an application page.
  </description>
  <timeout>40</timeout>
  <timeoutMessage>MultiPage Sample timed out</timeoutMessage>
  <renderer class="oracle.portal.provider.v2.render.RenderManager">
    <contentType>text/html</contentType>
    <showPage>/htdocs/multipage/first.jsp</showPage>
    <pageParameterName>next_page</pageParameterName>
  </renderer>
</portlet>
```

---

**Note:** The value of `pageParameterName` is the name of a portlet parameter, `next_page`, that the PDK-Java framework intercepts and interprets as an override to the value of the `showPage` parameter. If the PDK-Java framework encounters the qualified version of the parameter when the multipage portlet is requested, then it renders the resource identified by `next_page` rather than `first.jsp`. PDK-Java does not render the parameter within the portlet, that responsibility falls to the portlet.

---

You can modify the thesaurus example to operate with the use of this parameter. Specifically, you can use the form submission portlet to be the input for the thesaurus (the first page of the portlet), then navigate the user to the results page, which contains links to drill further into the thesaurus. The following examples illustrate these changes.

---

---

**Note:** The example that follows is most useful for relatively simple cases, such as this thesaurus example. If your requirements are more complex (for example, you want to build a wizard experience), then you should consider using an MVC framework such as Struts. For information about how to build portlets from struts applications, see [Section 60.6, "Creating a Struts Portlet."](#)

---

---

**ThesaurusForm.jsp:**

```
<%
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramNameSubmit = "submit";
    String paramNameQ = "q";
    String qualParamNameQ =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameQ);
    String qualParamNameSubmit =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameSubmit);
    String formName = UrlUtils.htmlFormName(pRequest, "query_form");
%>
<!-- Output the HTML content -->
<center>
    <b>Thesaurus</b>
    Enter the word you want to search for
    <form name="<%= formName %%" method="POST"
        action="<%= UrlUtils.htmlFormActionLink(pRequest,UrlUtils.PAGE_LINK) %%">
        <%= UrlUtils.htmlFormHiddenFields(pRequest,UrlUtils.PAGE_LINK, formName)
    %>

        <%= UrlUtils.emitHiddenField(
            HttpPortletRendererUtil.portletParameter(request, "next_page"),
            "htdocs/path/ThesaurusLink.jsp" ) %>
    <table><tr><td>
        Word of interest:
    </td><td>
        <input
            type="text"
            size="20"
            name="<%= qualParamNameQ %%"
            value="">
        </td></tr></table>
        <input type=submit name="<%= qualParamNameSubmit %%" Value="Search">
    </form>
</center>
```

Notice how `next_page` must be explicitly set to point to `ThesaurusLink.jsp`. If you do not explicitly set `next_page` in this way, then it defaults to the resource registered in `provider.xml`, which is `ThesaurusForm.jsp`.

**ThesaurusLink.jsp:**

```
<%
    PortletRenderRequest pRequest = (PortletRenderRequest)
        request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
    String paramNameQ = "q";
    String paramNameNextPage = "next_page";
    String qualParamNameQ =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameQ);
    String qualParamNameNextPage =
        HttpPortletRendererUtil.portletParameter(pRequest, paramNameNextPage);
%>
```

```

        String paramValueQ = pRequest.getQualifiedParameter(paramNameQ);
    %>
    <!-- Output the HTML content -->
    <center>
        Words similar to <%= paramValueQ %>
        <br>
        Click the link to search for words related to that word.
        <br>
        <ul>
    <%
        Thesaurus t = new Thesaurus();
        String[] relatedWords = t.getRelatedWords(paramValueQ);
        NameValue[] linkParams = new NameValue[2];
        linkParams[0] = new NameValue(
            qualParamNameNextPage, "htdocs/path/ThesaurusLink.jsp");
        for (int i=0; i<relatedWords.length; i++)
        {
            linkParams[1] = new NameValue(
                qualParamNameQ, relatedWords[i]);
    %>
        <li>
            <b> <%= relatedWords[i] %> </b>
            <%= UrlUtils.constructHTMLLink(
                pRequest,
                UrlUtils.PAGE_LINK,
                "(words related to " + relatedWords[i] + ")",
                "",
                linkParams,
                true,
                true)%>
        </li>
    <%
        }
    %>
    </ul>
    <a href="<%=XMLUtil.escapeXMLAttribute
        (pRequest.getRenderContext().getPageURL())%>">
        Reset Portlet
    </a>
</center>

```

#### 60.3.4.6 Restricting Navigation to Resources

One limitation of implementing navigation with private parameters is that users could potentially navigate to portlet resources that you prefer to restrict. To control navigation to restricted resources, you can create a *whitelist* of acceptable resources to which a user may navigate. If you do not construct a whitelist to restrict navigation, then your portlet's resources are accessible according to the following default rules:

- Any path immediately beneath the servlet root context is navigable. For example, `/index.jsp` is accessible but `/WEB-INF/web.xml` is not.
- Any path under the `htdocs` directory is navigable. For example, both `/htdocs/multipage/first.jsp` and `/htdocs/lottery/lotto.jsp` are accessible.

To change this default behavior, you can add allowable path values to the provider definition file, `provider.xml`. For example, suppose you have a portlet where a JSP is used as a controller to forward requests to other pages depending on the `pageParameterName` private parameter. The XML excerpt in [Example 60-4](#) allows resources under `/htdocs/multiportlet` to be shown. All other resources are restricted.

**Example 60–4 Whitelist Excerpt from the provider.xml File**

```

<portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
  <id>1</id>
  <name>Multipage</name>
  <title>A MultiPage Portlet</title>
  ...
  <renderer class="oracle.portal.provider.v2.render.RenderManager">
    <contentType>text/html</contentType>
    <showPage>/htdocs/multiportlet/controller.jsp</showPage>
    <pageParameterName>show_page</pageParameterName>
    <allowedPath>/htdocs/multiportlet/*</allowedPath>
  </renderer>
</portlet>

```

The pattern matching rules for this feature are similar to URL pattern matching in `web.xml` files. The rules are as follows:

- To match the defined patterns, the resource path must exactly match unless wildcards are used.
- The first wildcard is for path matching and consists of a string beginning with `/` and ending with `/*`. Any resource whose path starts with this string is matched. For an `<allowedPath>` value of `/htdocs/sub1/*`, valid values of the private parameter include `/htdocs/sub1/file.jsp` and `/htdocs/sub1/sub2/file2.jsp`.
- The second wildcard is for file type matching and consists of a string starting with `*` and ending with a file extension. Valid values for the page parameter end with that file extension. For an `<allowedPathvalue>` of `*.jsp`, valid values of the private parameter include `/htdocs/sub1/file.jsp` and `/htdocs/sub1/file2.jsp`.

### 60.3.5 How to Use JNDI Variables

When writing Java portlets, you may set deployment-specific properties through the JNDI service such that their values may be retrieved from your producer code. In this way, you can specify any property in a producer deployment and then easily access it anywhere in your producer code.

You can use JNDI variables to change producer property values after the producer has been deployed. The environment entry must be declared in `web.xml`. It can then be updated on deployment using a deployment plan.

PDK-Java provides utilities to enable the retrieval of both producer and non-producer JNDI variables within a Java EE container.

This section includes the following subsections:

- [Section 60.3.5.1, "Declaring JNDI Variables"](#)
- [Section 60.3.5.2, "Setting JNDI Variable Values"](#)
- [Section 60.3.5.3, "Retrieving JNDI Variables"](#)

#### 60.3.5.1 Declaring JNDI Variables

You declare JNDI variables in the `web.xml` file for your producer. The format for declaring a JNDI variable is as follows:

```

<env-entry>
  <env-entry-name>variableName</env-entry-name>
  <env-entry-type>variableType</env-entry-type>
  <env-entry-value>variableValue</env-entry-value>
</env-entry>

```

The `env-entry-name` element contains the name by which you want identify the variable. `env-entry-type` contains the fully qualified Java type of the variable. `env-entry-value` contains the variable's default value.

This section includes the following subsections:

- [Section 60.3.5.1.1, "Variable Types"](#)
- [Section 60.3.5.1.2, "Variable Naming Conventions"](#)
- [Section 60.3.5.1.3, "Examples"](#)

**60.3.5.1.1 Variable Types** In the `env-entry-type` element, you must supply the fully qualified Java type of the variable, which is expected by your Java code. The Java types you may use in your JNDI variables are as follows:

- `java.lang.Boolean`
- `java.lang.String`
- `java.lang.Integer`
- `java.lang.Double`
- `java.lang.Float`

The Java EE container uses these type declarations to automatically construct an object of the specified type and gives it the specified value when you retrieve that variable in your code.

**60.3.5.1.2 Variable Naming Conventions** The PDK-Java defines environment variables that can be set at the individual producer service level or at the web application level. To avoid naming conflicts between different producer services or different application components packaged in the same web application, Oracle recommends you devise some naming convention.

---

---

**Note:** If you use the `EnvLookup` method, then you must use `oracle/portal/provider/service/property`. You cannot substitute your own company name or component in this case.

---

---

For example:

- Producer service-specific names should be of the form:

*company/component name/producer name/variable name*

- Shared names must be of the form:

*company/component name/producer name/global*

where:

- *company* is the name of the company owning the application.
- *component name* is the name of the application or component with which the producer is associated.
- *producer name* is the service name of the producer.
- *variable name* is the name of the variable itself.

As you can see, these naming conventions are similar to those used for Java packages. This approach minimizes the chance of name collisions between applications or

application components. PDK-Java provides utilities that enable you to retrieve variables in this form without hard coding the service name of the producer into your servlets or JSPs. The service name need only be defined in the producer's WAR file. For more information about retrieving JNDI variables, see [Section 60.3.5.3, "Retrieving JNDI Variables."](#)

**60.3.5.1.3 Examples** The following examples illustrate producer variable names:

```
oracle/portal/myProvider/myDeploymentProperty
oracle/portal/myprovider/myProperties/myProperty
```

The following example illustrates non-producer variable names:

```
oracle/portal/myOtherProperty
```

### 60.3.5.2 Setting JNDI Variable Values

In your producer deployment, you may want to set a new value for some or all of your JNDI variables. You can perform this task by setting the values manually within a WLS deployment plan. Deployment plans can be created for the producer deployment through the WLS console.

To set variable values manually within a deployment plan:

1. Go to the producer deployment with the WLS console and create a new deployment plan if one does not exist.
2. Edit the deployment plan XML file. For each deployment property you want to set, add the following variable definition directly under the `<deployment-plan>` tag:

```
<variable-definition>
  <variable>
    <name>jndi_var_def</name>
    <value>>false</value>
  </variable>
</variable-definition>
```

3. To tie this variable definition to the actual JNDI variable, add the following for each property under the `WEB-INF/web.xml` module descriptor (oracle/portal/sample/rootDirectory is used as an example):

```
<module-descriptor external="false">
  <root-element>web-app</root-element>
  <uri>WEB-INF/web.xml</uri>
  <variable-assignment>
    <name>jndi_var_def</name>

    <xpath>/web-app/env-entry/[env-entry-name="oracle/portal/sample/rootDirectory"]
    /env-entry-value</xpath>
  </variable-assignment>
</module-descriptor>
```

4. Save and close the file.
5. Select Update on the producer deployment to apply the deployment plan for the new settings to take effect.

### 60.3.5.3 Retrieving JNDI Variables

JNDI is a standard Java EE technology. As such, you can access JNDI variables through Java EE APIs. For example:

```
String myVarName = "oracle/portal/myProvider/myVar"
String myVar = null;
try
{
    InitialContext ic = new InitialContext();
    myVar = (String)ic.lookup("java:env/" + myVarName);
}
catch(NamingException ne)
{
    exception handling logic
}
}
```

In addition to the basic Java EE APIs, PDK-Java includes a simple utility class for retrieving the values of variables defined and used by the PDK itself. These variables conform to the naming convention described in [Section 60.3.5.1.2, "Variable Naming Conventions"](#) and are of the form:

```
oracle/portal/provider_service_name/variable_name
oracle/portal/variable_name
```

To use these APIs, you need only provide the *provider\_service\_name* and the *variable\_name*. The utilities construct the full JNDI variable name, based on the information you provide, and look up the variable using code similar to that shown earlier and return the value of the variable.

The `EnvLookup` class (`oracle.portal.utils.EnvLookup`) provides two `lookup()` methods. One retrieves producer variables and the other retrieves non-producer variables. Both methods return a `java.lang.Object`, which can be cast to the Java type you are expecting.

The following code example illustrates the retrieval of a producer variable:

```
EnvLookup el = new EnvLookup();
String s = (String)el.lookup(myProviderName, myVariableName);
```

*myProviderName* represents the service name for your producer, which makes up part of the variable name. *myVariableName* represents the portion of the variable name that comes after the producer's service name. The example assumes the variable being retrieved is of type `java.lang.String`.

To retrieve a non-producer variable, you use the same code, you pass only one parameter, the variable name, to the `lookup()`, again excluding the `oracle/portal` prefix.

```
EnvLookup el = new EnvLookup();
Object o = el.lookup(myVariableName);
```

[Table 60–1](#) shows the JNDI variables provided by default with PDK-Java. If you do not declare these variables, then PDK-Java looks for their values in their original locations (`web.xml` and the deployment properties file).

**Table 60–1 PDK-Java JNDI Variables**

Variable	Description
<code>oracle/portal/provider/provider_name/autoReload</code>	Boolean auto reload flag. Defaults to true.
<code>oracle/portal/provider/provider_name/definition</code>	Location of producer's definition file.

**Table 60–1 (Cont.) PDK-Java JNDI Variables**

Variable	Description
oracle/portal/provider/global/log/logLevel	Log setting (0 through 8). 0 being no logging and 8 the most possible logging.
oracle/portal/provider/provider_name/maxTimeDifference	Producer's HMAC time difference.
oracle/portal/provider/<service_name>/resourceUrlKey	Authentication key for resource proxying through the Parallel Page Engine.
oracle/portal/provider/provider_name/rootDirectory	Location for producer personalizations. No default value.
oracle/portal/provider/provider_name/sharedKey	HMAC shared key. No default value.
oracle/portal/provider/provider_name/showTestPage	(non-producer) A Boolean flag that determines if a producer's test page is accessible. Defaults to true.
oracle/portal/provider/global/transportEnabled	A Boolean flag that determines whether Edit Defaults personalizations may be exported and imported.

### 60.3.6 How to Access Session Information

When a user accesses a page, it initiates a public, unauthenticated session and tracks information about the session across requests. If the user logs in, then this session becomes an authenticated session of the logged-in user. This session terminates when any of the following occur:

- The browser session terminates (that is, the user closes all the browser windows).
- The user explicitly logs out.
- The session times out because the user's idle time exceeds the configured limit.

As part of the metadata generation, all of the producers that contribute portlets to the page are contacted, if they specified during registration that they be called for some special processing. This call allows producers to do processing based on the user session, log the user in the producer's application if needed, and establish producer sessions. For producers, this call is referred to as `initSession`. As most web-enabled applications track sessions using cookies, this API call enables the producer of the application to return cookies.

You can use the session store to save and retrieve information that persists during the portal session. This information is only available, and useful, to you during the life of the session. You should store only temporary information in the session store. Application developers may use the session store to save information related to the current user session. Data in the session store can be shared across portlets.

If the information you want to store must persist across sessions, then you may want to store it in the preference store instead. Some common applications of the session store are as follows:

- To cache data that is expensive to load or calculate (for example, search results).

- To cache the current state of a portlet (for example, the current range, or page, of search results displayed in the portlet, or sequence of events performed by user).

Before you implement session storage, you should carefully consider the performance costs. Because portlets and producers are remote, it can be a relatively expensive operation to create and maintain even a small amount of information in the session store. For this reason, you may want to avoid altogether any session storage for public pages that are accessed frequently by many users.

Furthermore, while using the session store with producers, you create a stateful application that tracks state information in memory. Similarly, you create a stateful application if you use the file-system implementation of preference store.

If scalability is an important concern for you, then a stateful application may cause you problems. Stateful applications can affect the load-balancing and failover mechanism for your configuration. Even though you may deploy multiple middle-tiers, you must implement sticky routing (where the same node handles subsequent requests in the same session) to track state. Sticky routing may result in lopsided load-balancing or loss of session data in case a node crashes, affecting failover. This issue is one reason why many developers prefer to build stateless applications. However, if scalability is not a concern, then a stateful application should present no problems for you.

The PDK Framework represents the session with a `ProviderSession` object, which is established during the call to the Provider Instance's `initSession` method. This object is associated with the `ProviderUser`. To make data persistent between requests, you must write data into the session object using the `setAttribute` method on the `ProviderSession` object. This method maps a `java.lang.Object` to a `java.lang.String` and stores that mapping inside the session object. The `String` can then be used to retrieve the `Object` during a subsequent request, provided the session is still valid.

A producer session may become invalid for the following reasons:

- The session times out.
- The `invalidate` method on `ProviderSession` is called.
- The JVM process running the servlet container is terminated.

All portlets contained by the same `ProviderInstance` share the same session for a particular `ProviderUser`. Therefore, data unique to a particular portlet instance must be mapped to a unique `String` in the session. This is accomplished using the `portletParameter` method in the `PortletRendererUtil` class. This method makes a supplied `String` parameter or attribute name unique to a `PortletInstance`, by prefixing it with a generated identifier for that instance. You can use the returned instance-specific name to write portlet instance data into the session.

For more detailed information about the PDK Framework classes, see the JavaDoc in the *Oracle Fusion Middleware Java API Reference for Oracle PDK-Java* at:

[http://docs.oracle.com/cd/E23943\\_01/apirefs.1111/e10691/index.html?overview-summary.html](http://docs.oracle.com/cd/E23943_01/apirefs.1111/e10691/index.html?overview-summary.html)

In the example in this section, session storage is used to count the number of times your portlet has rendered in Shared Screen mode.

To implement session storage:

- Import `ProviderSession`, `PortletRendererUtil`, and `HttpPortletRendererUtil`.
- Retrieve the producer session.
- Read and write the session by accessing it from within your Java portlet.

- Set the session to true in `provider.xml`.
- Register the producer for session storage and set the Login Frequency.

The steps that follow describe how to add a session count to your portlet that displays how many times the portlet has been rendered for the current session.

1. After using the wizard to create a portlet, you can edit the JSP for the Show page in Oracle JDeveloper. You must import the following classes:

```
<%@page contentType="text/html; charset=windows-1252"
import="oracle.portal.provider.v2.render.PortletRenderRequest"
import="oracle.portal.provider.v2.http.HttpCommonConstants"
import="oracle.portal.provider.v2.ProviderSession"
import="oracle.portal.provider.v2.render.PortletRenderUtil"
import="oracle.portal.provider.v2.render.http.HttpPortletRenderUtil"
%>
```

2. Insert code that checks for a valid session first and then increments the count and displays it. If the session is valid and a previously stored value exists, then you display the value, increment the count, and store the new value. If the session is valid but no previously stored value exists, then you initialize a new count starting with 1, and display and store the value. You also want to obtain the unique string key for this portlet and then use it in an array to count the session. If no session information was received, then you want to provide information to the user indicating they may need to log in again.

```
<%
PortletRenderRequest pReq = (PortletRenderRequest)
request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
ProviderSession pSession = pReq.getSession();
    if (pSession != null)
    {
        String key = PortletRenderUtil.portletParameter(pReq, "count");
        Integer i = (Integer)pSession.getAttribute(key);
        if (i == null)
        {
            i = new Integer(0);
        }
        i = new Integer(i.intValue()+1);
        pSession.setAttribute(key, i);
    }
%>
```

```
<p>Render count in this session: <%=i%> </p>
```

```
<%
}
else
{
%>
```

```
<p>The session has become invalid</p>
<br>
Please log out and log in again.
<%
}
%>
```

3. By default, the wizard does not set session to true in `provider.xml`. You must update this flag in order for the producer to receive session information from the portal. You should only set this tag to true if you are using session information in

your producer or portlets. By setting this flag to true, extra load is added to the producer calls.

```
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
  <session>true</session>
```

4. Register your producer with session support. For a reminder on how to register your portlet, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)
5. If you have not added your Java portlet to a page, then do so now. Ensure that you perform the following tasks:
  - Refresh the producer to accept the new changes.
  - Re-login in case your session is no longer valid.

### 60.3.7 How to Enhance PDK-Java Portlet Performance with Caching

When you have completed the basic functionality of your portlet, you may want to turn your attention to portlet performance.

Caching is a common technique for enhancing the performance of web sites that include a great deal of dynamic content. JSR 286 portlets support expiry-based and validation-based caching.

For more information about caching, see [Section 57.4.4, "Portlet Performance."](#)

This section includes the following subsections:

- [Section 60.3.7.1, "Activating Caching for PDK-Java Portlets"](#)
- [Section 60.3.7.2, "Implementing Expiry-Based Caching in PDK-Java Portlets"](#)
- [Section 60.3.7.3, "Implementing Validation-Based Caching in PDK-Java Portlets"](#)

#### 60.3.7.1 Activating Caching for PDK-Java Portlets

To use the caching features in your producers, you must first activate the middle tier cache. This cache is known as the PL/SQL Cache because it is the same cache used by `mod_plsql`, the Oracle HTTP Server plug-in that calls database procedures, and hence database producers, over HTTP.

Usually, your administrator is responsible for the configuration details of caching.

#### 60.3.7.2 Implementing Expiry-Based Caching in PDK-Java Portlets

Expiry-based caching is a simple caching scheme to implement, and can be activated declaratively in your XML producer definition. You can set an expiry time for the output of any `ManagedRenderer` you use by setting its `pageExpires` property to the number of minutes you want the output to be cached for.

To add expiry-based caching:

1. After you have used the Create Oracle PDK-Java Portlet wizard to build a portlet as described in [Section 60.2.1, "How to Create a PDK-Java Portlet,"](#) edit the `provider.xml` file and set the `pageExpires` property tag of `showPage` to the required value. For example, to cache portlet output for 1 minute, set `pageExpires` to 1.

By default the wizard generates a standard and compressed tag for `showPage`. Expand the tag to include a subtag of `pageExpires`:

```
<showPage class="oracle.portal.provider.v2.render.http.ResourceRenderer">
```

```

<resourcePath>/htdocs/mycacheportlet/MyCachePortletShowPage.jsp
</resourcePath>
<pageExpires>1</pageExpires>
</showPage>

```

2. Test that the portlet is cached for 1 minute by adding some JSP code to your show page. You can simply add the current time to your JSP.

```

<%@page contentType="text/html; charset=windows-1252"
import="oracle.portal.provider.v2.render.PortletRenderRequest"
import="oracle.portal.provider.v2.http.HttpCommonConstants"
import="java.util.Date"
import="java.text.DateFormat"
%>

<%
PortletRenderRequest pReq = (PortletRenderRequest)
request.getAttribute(HttpCommonConstants.PORTLET_RENDER_REQUEST);
DateFormat df = DateFormat.getDateTimeInstance(DateFormat.LONG,
DateFormat.LONG,pReq.getLocale());
String time = df.format(new Date());
%>

<P>Hello <%=pReq.getUser().getName() %>.</P>
<P>This is the <b><i>Edit</i></b> render mode!</P>
<P>This information is correct as of <%=time%>.</P>

```

When viewing the portlet, you see that the time (including seconds) is constant for one minute. After the time has expired, the portlet displays the most current time and a new cache is set.

### 60.3.7.3 Implementing Validation-Based Caching in PDK-Java Portlets

Adding validation-based caching requires slightly more effort, but gives you explicit control over exactly which requests to your producer are cache hits. As an example, you may want to update the cache only when data within the portlet has changed. To implement this algorithm, you must override the `prepareResponse` method. The signature of the `BaseManagedRenderer.prepareResponse` method is:

```

public boolean prepareResponse(PortletRenderRequest pr)
    throws PortletException,
           PortletNotFoundException

```

In your version of `prepareResponse()`, do the following:

- Retrieve the cached version identifier set by the consumer in the render request by calling the `HttpPortletRendererUtil.getCachedVersion()` method:

```

public static java.lang.String getCachedVersion
(PortletRenderRequest request)

```

- If the portlet finds the previously cached version valid, then the appropriate header must be set by calling the `HttpPortletRendererUtil.useCachedVersion()` method. It also instructs the `RenderManager` that it is not necessary to call `renderBody()` to render the portlet body.

```

public static void useCachedVersion(PortletRenderRequest request)

```

Otherwise, use `HttpPortletRendererUtil.setCachedVersion()` to generate a new version of the portlet, which is cached. It also indicates to the consumer that the `renderBody()` method has to be called to regenerate the portlet content.

```
public static void setCachedVersion(PortletRenderRequest request,
                                   java.lang.String version,
                                   int level)
    throws java.lang.IllegalArgumentException
```

For validation-based caching, you need not update `provider.xml`. You can view the portlet by refreshing the page or adding the portlet to a page and updating the content. If the content has changed, then the portlet shows the new content. If the content has not changed, then a cached version of the portlet is displayed.

## 60.3.8 How to Manage the Persistence Store for PDK-Java Portlets

The portlet persistence store is used for persisting consumer registration handles and portlet preference data. PDK-Java portlet producers can use one of two types of persistence store: File or Database. The database used for the persistence store must be JDBC-compatible.

For more information, see [Section 57.4.3, "Portlet Personalization and Customization."](#)

This section includes the following subsections:

- [Section 60.3.8.1, "Setting up a Persistence Store for a PDK-Java Producer"](#)
- [Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store"](#)

### 60.3.8.1 Setting up a Persistence Store for a PDK-Java Producer

The type of persistence store used for PDK-Java producers is determined by the `preferenceStore` tag in the `provider.xml` file.

[Table 60–2](#) lists and describes the attributes and parameters used with the `preferenceStore` tag.

**Table 60–2 Attributes and Parameters of the preferenceStore Tag**

Attribute/Parameter	Description
class	<p>This required attribute specifies the Java class that defines the location and other details of portlet preferences. For example, a file-based persistence store might use:</p> <pre>&lt;preferenceStore class="oracle.portal.provider.v2.preference.FilePreferenceStore"&gt;</pre> <p>A database persistence store might use:</p> <pre>&lt;preferenceStore class="oracle.portal.provider.v2.preference.DBPreferenceStore"&gt;</pre> <p>OmniPortlet uses its own class, for example:</p> <pre>&lt;preferenceStore class="oracle.webdb.reformlet.ReformletFilePreferenceStore"&gt;</pre>
name	<p>This required parameter provides a name for the persistence store. Use any value you choose. For example:</p> <pre>&lt;preferenceStore class="oracle.portal.provider.v2.preference.DBPreferenceStore"&gt;   &lt;name&gt;MyPDKProducerPreferenceStore&lt;/name&gt; &lt;/preferenceStore&gt;</pre>
connection	<p>This required parameter for a database persistence store points to a JNDI connection that connects with a schema containing the portlet persistence store. For example:</p> <pre>&lt;preferenceStore class="oracle.portal.provider.v2.preference.FCFDBPreferenceStore"&gt;   &lt;name&gt;MyPDKProducerPreferenceStore&lt;/name&gt;   &lt;connection&gt;java:comp/env/jdbc/portletPrefs&lt;/connection&gt; &lt;/preferenceStore&gt;</pre>
rootDirectory	<p>This optional parameter specifies the location where the file-based persistence store preferences are stored.</p> <p>When this parameter is not included with the preferenceStore tag, the default file-based persistence store location is used. This is the same folder where the producer's provider definition file is stored.</p>
useHashing	<p>This optional parameter is used when specifying a file based persistence store, and accepts the value true or false. When it is set to true, each preference data file is stored in an extra subdirectory with a name determined by hashing the data file name. Using this parameter can improve file system performance by limiting the number of preference data files stored in a single directory.</p> <p>For example:</p> <pre>&lt;preferenceStore class="oracle.portal.provider.v2.preference.FilePreferenceStore"&gt;   &lt;name&gt;PDKProducerPreferenceStore&lt;/name&gt;   &lt;useHashing&gt;true&lt;/useHashing&gt; &lt;/preferenceStore&gt;</pre>

### 60.3.8.2 Migrating a PDK-Java Producer Persistence Store

PDK-Java has two PreferenceStore implementations, DBPreferenceStore and FilePreferenceStore. DBPreferenceStore persists data using a JDBC-compatible relational database and FilePreferenceStore persists data using the file system.

If you have installed Oracle PDK-Java, then you can manage the information stored in the persistence store by using the Preference Store Migration and Upgrade Utility, which is included in the pdkjava.jar file. Note that you must run this tool from WC\_ORACLE\_HOME.

---

---

**Note:** You must set the classpath when running this tool to include `pdkjava.jar`, `ptlshare.jar`, and `ojdbc6.jar`. For example:

```
java -classpath WC_ORACLE_HOME\jdeveloper\modules\oracle.dms_
11.1.1\dms.jar;
WC_ORACLE_HOME\wlserver_10.3\server\lib\ojdbc6.jar;WC_ORACLE_
HOME\jdeveloper\webcenter\modules\oracle.portlet.server_
11.1.1\pdkjava.jar;
WC_ORACLE_HOME\jdeveloper\webcenter\modules\oracle.portlet.server_
11.1.1\ptlshare.jar
oracle.portal.provider.v2.preference.MigrationTool
```

---

---

The syntax of the migration utility is:

```
java oracle.portal.provider.v2.preference.MigrationTool
-mode [file | db | filetodb | filetofile | dbtofile | dbtodb]
[-remap language | locale]
[-countries iso_country_code]
[-pref1UseHashing true | false]
[-pref1Driver driver]
{-pref1RootDirectory directory |
-pref1User username -pref1Password password -pref1URL url}
[-pref2UseHashing true | false]
[-pref2Driver driver]
{-pref2RootDirectory directory |
-pref2User username -pref2Password password -pref2URL url}
[-upfixwpi filename]
```

where

- `-mode` is the mode in which you want to run the Preference Store Migration and Upgrade Utility
  - `filetodb`, `filetofile`, `dbtofile`, or `dbtodb` indicates to run in migration mode. See [Section 60.3.8.2.1, "Migration Mode"](#) for more information about this mode.
  - `file` or `db` indicates to run in upgrade mode. See [Section 60.3.8.2.2, "Upgrade Mode"](#) for more information about this mode.
- `-remap` is the `localePersonalizationLevel` (language or locale). Note that you only must use this option to change `localePersonalizationLevel` as part of your upgrade or migration.
- `-countries` specifies a prioritized list of ISO country codes, indicating your order of preference in a collision between remapped preferences for different countries. `-countries` is only meaningful if you also specified the `-remap` option.
- `-pref1UseHashing` specifies whether you want to employ hashing on the source for this operation.
- `-pref1Driver` is the driver for the source database. If you do not specify this parameter, the nearest matched driver is used.
- `-pref1RootDirectory` is the path of a source file system, for example, `j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample`.
- `-pref1User` is the user name for a source database.
- `-pref1Password` is the password for a source database.
- `-pref1URL` is the URL to a source database, for example, `jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid`.

- `-pref2UseHashing` specifies whether you want to employ hashing on the destination for this operation.
- `-pref2Driver` is the driver for the destination database. If you do not specify this parameter, the nearest matched driver is used.
- `-pref2RootDirectory` is the path of a destination file system, for example, `j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample`.
- `-pref2User` is the user name for a destination database.
- `-pref2Password` is the password for a destination database.
- `-pref2URL` is the URL to a destination database, for example, `jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid`.
- `-upfixwpi` indicates a log file for the operation.

This section includes the following subsections:

- [Section 60.3.8.2.1, "Migration Mode"](#)
- [Section 60.3.8.2.2, "Upgrade Mode"](#)

**60.3.8.2.1 Migration Mode** Use a migration mode to copy data from a source persistence store to a target persistence store. When the utility is run in this mode, the persistence stores for all the portlet definitions are updated.

[Table 60–3](#) describes the migration modes in which you can run the utility.

**Table 60–3 Migration Modes in Which to Run the Utility**

Mode	Description
filetodb	Use when data must be copied from a <code>FilePreferenceStore</code> to a <code>DBPreferenceStore</code> .
filetofile	Use when data must be copied from one <code>FilePreferenceStore</code> to another <code>FilePreferenceStore</code> that is in a different location.
dbtofile	Use when data must be copied from a <code>DBPreferenceStore</code> to a <code>FilePreferenceStore</code> .
dbtodb	Use when data must be copied from one <code>DBPreferenceStore</code> to another <code>DBPreferenceStore</code> that is based on a different database table.

If the destination for the operation is a database, you must ensure that the destination WebLogic Server is created using the WebCenter Portal portlet template and the appropriate schemas have been created using the RCU. For more information, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

When using a migration mode, you can also use the `-remap` and `-countries` options to specify that the data must be upgraded while being migrated. Specifically, you use these options to ensure that the locale-specific preferences are appropriately remapped.

You can use the other options accepted by the utility to specify the properties of the persistence stores involved in the upgrade or migration process. These options must correspond to the tags you specify in `provider.xml` to describe the persistence stores.

Properties beginning with the prefix `-pref1` correspond to properties of the source persistence store (in an upgrade mode, this is the only persistence store). For example, specifying `-pref1UseHashing true -pref1RootDirectory`

j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample sets the useHashing and rootDirectory properties of a source FilePreferenceStore.

When a migration basic mode is selected, properties beginning with the prefix -pref2 correspond to properties of the target persistence store. For example, specifying -pref2User portlet\_prefs -pref2Password portlet\_prefs -pref2URL jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid sets the database connection details on a target DBPreferenceStore.

**Example 60–5 PDK-Java Migration Utility Command Line, Migration**

```
java -classpath WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_
11.1.1/pdkjava.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/ptlshare.jar:WC_
ORACLE_HOME/ucm/shared/classes/ojdbc14.jar \
oracle.portal.provider.v2.preference.MigrationTool \
-mode dbtofile \
-pref1User portlet_prefs \
-pref1Password portlet_prefs \
-pref1URL jdbc:oracle:thin:@myserver.mydomain.com:1521:mysid \
-pref2RootDirectory /mydirectory/preferences
```

**60.3.8.2.2 Upgrade Mode** Use an upgrade mode to upgrade data in place, and to modify existing locale-specific preferences in the persistence store so that the naming format used is compatible with the current version of WebCenter Portal and a given localePersonalizationLevel setting.

Table 60–4 describes the upgrade modes in which you can run the utility.

**Table 60–4 Upgrade Modes in Which to Run the Utility**

Mode	Description
file	Use when data in a FilePreferenceStore must be upgraded.
db	Use when data in a DBPreferenceStore must be upgraded.

An upgrade mode can be used in the following scenarios:

- You have upgraded from Oracle PDK 9.0.4.0.0 or earlier and want to use existing portlets with the default localePersonalizationLevel setting of language (In earlier releases, the default setting was locale).
- You have upgraded from Oracle Portal 9.0.2.0.0 or earlier and want to use existing portlets with a localePersonalizationLevel setting of locale (Oracle Portal now uses different names for some locales and therefore some existing data must be remapped).
- You want to change the localePersonalizationLevel for an existing portlet from locale to language or vice-versa.

When using an upgrade mode, you must use the -remap option to specify the localePersonalizationLevel (language or locale) that you are upgrading to. You can also use the -countries option to specify a prioritized list of ISO country codes, indicating your order of preference in a collision between remapped preferences for different countries. For example, if you specify -remap language -countries GB,US in the command, then it means that if the utility comes across both US English and British English preferences (en\_US and en\_GB) in a given preference store, it remaps the British English preference to become the English-wide preference (en).

**Example 60–6 PDK-Java Migration Utility Command Line, Upgrade**

```
java -classpath WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_
11.1.1/pdkjava.jar:
WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1/ptlshare.jar:WC_
ORACLE_HOME/ucm/shared/classes/ojdbc14.jar \
  oracle.portal.provider.v2.preference.MigrationTool \
  -mode file -remap language
  -countries GB,US -pref1UseHashing true
  -pref1RootDirectory j2ee/home/applications/jpdk/jpdk/WEB-INF/providers/sample
```

**60.3.9 How to Move a PDK-Java Portlet Producer**

In some situations, you may want to move a portlet producer. For example, you may need to move it to a new server.

To move a PDK-Java portlet producer:

1. Install the new producer.
2. Make the persistence store of the original producer available to the new producer by performing one of the following tasks:
  - Migrate the persistence store using the Preference Store Migration and Upgrade Utilities (see [Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store"](#) for more information), or
  - Configure the new producer to use the same persistence store as the original producer. If the database persistence store is being used, then you must point the WebLogic Server data source to the same database as the original producer.
3. Update the URL of the producer registration by using Enterprise Manager Fusion Middleware Control or the WLST commands: `setWSRPProducerRegistration` or `setPDKJavaProducerRegistration`.

**60.3.10 How to Export and Import PDK-Java Portlet Producers at Design Time**

You can export and import portlet producers at design time. For more information, see [Section 59.3.14, "How to Export and Import Portlet Producers at Design Time."](#)

**60.4 Testing PDK-Java Portlets**

Before making your portlets available in a production environment, it is highly advisable to test them first to make sure that they behave as expected.

This section includes the following subsections:

- [Section 60.4.1, "How to Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server"](#)
- [Section 60.4.2, "What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server"](#)
- [Section 60.4.3, "How to Deploy a PDK-Java Portlet Producer to the Integrated WebLogic Server"](#)
- [Section 60.4.4, "How to Test Portlet Personalization"](#)

## 60.4.1 How to Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server

The Integrated WebLogic Server (Integrated WLS) provides a quick and easy way of testing your portlets because it is preconfigured so that you can run applications within JDeveloper without needing to create deployment profiles.

To test a PDK-Java portlet on Integrated WLS:

1. In JDeveloper, open the portlet producer application that owns the portlet that you want to test.
2. Expand the portlet project (for example, **Portlets**).
3. Right-click a JSP page, for example, `index.jsp` in the project folder and select **Run**. Running `index.jsp` triggers packaging and deployment of your portlet producer application on an instance of Integrated WLS named after the application.
4. Check the IntegratedWebLogicServer - Log window to monitor the deployment progress. The log shows the URL of the application test page, as shown in [Figure 60–2](#). The format of the URL is `http://host:port/application_name-Portlets-context-root/index.jsp`.

**Figure 60–2 DefaultServer - Log**

```

Running: DefaultServer - Log
Deploying 2 profiles...
Wrote Web Application Module to C:\Oracle\Middleware\jdeveloper\system11.1.1.32.52.19\o.j2...
Wrote Enterprise Application Module to C:\Oracle\Middleware\jdeveloper\system11.1.1.32.52...
Deploying Application...
<Nov 28, 2008 11:35:15 AM IST> <Warning> <J2EE> <BEA-160195> <The application version lifecycle...
Application Deployed Successfully.
Elapsed time for deployment: 5 seconds
---- Deployment finished. ----
Run startup time: 6157 ms.
[Application portletapp deployed to Server Instance DefaultServer]

Target URL -- http://127.0.0.1:7101/portletapp-Portlets-context-root/index.jsp

```

5. The PDK-Java Application Test page displays in a browser window, as shown in [Figure 60–3](#).

**Figure 60–3 Portlet Producer Application Test Page**

**Portlet Application Test Page**

This page lists the portlet providers available in this Web application. Use the registration URL in combination with the provider's service name to register the provider. Click the service name link to view the provider's test page.

**Registration URL** <http://127.0.0.1:7101/portletapp-Portlets-context-root/providers/>

**Service Name**  
[myprovider](#)

6. Click the link underneath **Service Name**. Your browser should open with a page similar to the one shown in [Figure 60–4](#). The URL of this page is the one required to register the producer with another application.

**Figure 60–4 Producer Test Page**

7. Alternatively, you can construct the URL yourself as follows:

```
http://host:port/context-root/providers/producer_name
```

where:

- *host* is the server to which your producer has been deployed.
- *port* is the HTTP Listener port. Typically, it is 7101. When the server is started, the port is displayed in the console.
- *context-root* is the Web Application's Context Root, which you specified earlier and can be found in the WAR Deployment Profile Properties under General.
- *producer\_name* is the name of the portlet's producer. A WAR file may contain multiple producers, hence you should always include the name of the producer for clarity. Otherwise, you get the default producer, which is the first producer created. The default producer is defined by the `_default.properties` file. This is created with the first producer in a project.

If you enter this URL in your browser, you should see a page similar to the one in [Figure 60–4](#).

8. While the application is running, you can switch back and forth between JDeveloper and your browser to make changes at design time in your application, save the changes, and then refresh the test page in your browser.
9. When the producer is successfully running, you should register it with an application and add one or more portlets to a page to check that it is working correctly. Registering a producer gives applications the information they require to locate and communicate with that producer. After you register a producer, it is exposed as a connection, and the producer and its portlets become available in the Application Resources panel under the Connections node, or in the Resource Palette.

To register producers of PDK-Java portlets, follow the instructions provided in [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

To add your portlets to a page, follow the instructions provided in [Section 62.6, "Adding Portlets to a Page."](#)

10. To stop an Integrated WLS instance, in the Run Manager tab, select **DefaultServer** and click the red **Stop** icon. When the instance stops, the application is undeployed, and therefore, comes unavailable.

**Tip:** You can also stop an Integrated WLS instance by clicking the red **Stop** icon in the IntegratedWebLogicServer - Log window and selecting **DefaultServer**.

## 60.4.2 What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server

When you run PDK-Java portlets on Integrated WLS the following happens:

- Configuration files for PDK-Java portlets are added to the `WEB-INF` directory.
- The `web.xml` file is updated with listener and server classes, filters, parameters, and other configurations that are required to run the portlet producer application successfully.

For example, the `ResourceServlet` `pdkresource`, the `oracle.portlet.server.service.ContextFilter` filter, and so on. These configurations vary depending upon the portlet requirements.

- Libraries required for PDK-Java portlets are added to the `weblogic.xml` file, for example, `oracle.portlet-producer.jpdk`.

## 60.4.3 How to Deploy a PDK-Java Portlet Producer to the Integrated WebLogic Server

When you run a PDK-Java portlet producer application on the Integrated WLS instance, when the instance stops, the application is undeployed and therefore becomes unavailable. For a more persistent testing scenario, you can deploy your portlet producer application to the Integrated WLS so that it is always available while the Default Server is running.

If you choose this method, then you must first create deployment profiles, as described in [Section 61.2, "Creating a WAR Deployment Profile."](#) If you deploy your application to the Integrated WLS, then the Deployment Configuration dialog displays to enable you to configure and customize deployment settings. The file system MDS repository precreated by JDeveloper displays in the **Repository Name** field.

For information about deploying and running an application on the Integrated WLS, see [Section 69.2, "Deploying a Framework Application to the Integrated WebLogic Server."](#)

## 60.4.4 How to Test Portlet Personalization

If you have implemented personalization for your portlet, then the **Personalize** link only appears on the portlet for authenticated users. Hence, to test the personalization of a portlet (the **Personalize** link), you must have some form of security implemented for the application consuming the portlet. For testing purposes, you may prefer to just configure the most basic authentication possible. For more information, see [Section 68.12, "Configuring Basic Authentication for Testing Portlet Personalization."](#)

## 60.5 Deploying PDK-Java Portlets

You can deploy your portlet producer to any WebLogic Managed Server that is configured to support WebCenter Portal portlet producers. For a list of prerequisites

that you must complete before deployment, see [Section 61.1, "Introduction to Deploying Portlet Producers."](#)

The first step of deploying a PDK-Java portlet producer is to create a WAR deployment profile to indicate how the producer and its associated files should be packaged. For more information, see [Section 61.2, "Creating a WAR Deployment Profile."](#)

You can deploy PDK-Java portlets only as EAR files, so after creating the WAR deployment profile, you must also create an EAR deployment profile to package the entire application. For more information, see [Section 69.3.2.2, "Creating Deployment Profiles."](#)

---

---

**Note:** While creating the EAR deployment profile, ensure that the WAR file is included in the application's EAR file.

---

---

After you have created the EAR deployment profile, you can deploy your portlet producer to the managed server. For more information, see [Section 61.3, "Deploying a Portlet Producer to a WebLogic Managed Server."](#)

---

---

**Note:** When deploying a PDK-Java portlet producer, you will not see the Select deployment type dialog, as the producer does not contain JSR 286 portlets.

---

---

When you deploy a PDK-Java portlet producer to a WebLogic Managed Server, the configuration settings described in [Section 60.4.2, "What Happens When You Test PDK-Java Portlet Producer Applications on Integrated WebLogic Server"](#) are added to the application EAR file at design time.

## 60.6 Creating a Struts Portlet

Oracle PDK contains extensions to integrate Apache Struts applications. This section explains how to build a portlet from an existing struts application. You can also follow these steps to create a portlet that uses the Model View Controller paradigm. The PDK-Java extensions described in this section rely on Apache Struts 1.1.

You can use the Struts framework to enhance portlet behavior. For example, a Struts controller may be used for page flow within a portlet. A portlet renderer is used as a bridge between portlet render requests and Struts servlet requests

The following code shows a portion of the producer definition file (`provider.xml`):

```
...
<renderContainer>true</renderContainer>
  <renderCustomize>true</renderCustomize>
  <autoRedirect>true</autoRedirect>
  <contentType>text/html</contentType>
  <showPage class="oracle.portal.provider.v2.render.http.StrutsRenderer">
    <defaultAction>showCustomer.do</defaultAction>
  </showPage>
</renderer>
...
```

The `showPage` of the Struts portlet contains two important components:

- The renderer class (`oracle.portal.provider.v2.render.http.StrutsRenderer`) receives the render requests and forwards them to the Struts Action Servlet.

- The `defaultAction` tag defines the Struts action that is used by default when the portlet is called for the first time.

The PDK-Java enables you to easily develop a view (portlet view) of your Struts application. This view enforces a consistent look and feel of your Struts portlet using portal styles, and enables the end user to use the application within the portal.

To create a Struts portlet, you must use the PDK-Java Struts tags, which are extensions of the default Struts JSP tags. This development process is similar to that of creating a standalone Struts application. For portlets in a producer application to use the Struts framework, the Struts components must be part of the same web application.

To publish a part of an existing Struts application as a portlet, Oracle recommends that you first create a new view to serve as the portlet view of your application. This view uses existing objects (Actions, ActionForm, and so on) with a new mapping and new JSPs.

---

**Note:** Although Oracle recommends that you create a portlet view of your application, you could alternatively replace your application's struts tags with PDK-Java struts tags. This approach enables your application to run both as a standalone struts application and a portlet.

---

In this example, you create a portlet that enables you to add a new entry to a blog. [Figure 60–5](#) and [Figure 60–6](#) show how you submit a blog and save a blog entry.

**Figure 60–5** *Submitting a Blog*

**Figure 60–6** *Saving a Blog Entry*

prepareNewBlog is a simple empty action that redirects the request to the enterNewBlog.jsp page. This page shows a form for submitting a new blog.

The corresponding entry in the struts-config.xml is:

```
<action path="/prepareNewBlog" scope="request"
  type="view.PrepareNewBlogAction" >
  <forward name="success" path="/view/enterNewBlog.jsp"/>
</action>
<action path="/saveNewBlog" name="blogForm" scope="request"
  type="view.SaveNewBlogAction" input="/view/enterNewBlog.jsp" >
  <forward name="success" path="/view/newBlogConfirmation.jsp"/>
</action>
```

This section includes the following subsections:

- [Section 60.6.1, "How to Create a New Flow and View to Host the Portlet Actions"](#)
- [Section 60.6.2, "How to Create the New JSPs"](#)
- [Section 60.6.3, "How to Create a Portlet"](#)
- [Section 60.6.4, "How to Extend the Portlet to Add Business Logic"](#)
- [Section 60.6.5, "How to Register the Producer"](#)

## 60.6.1 How to Create a New Flow and View to Host the Portlet Actions

To create a new view, first create a new set of ActionMappings (page flow) that redirects the various actions and requests to Portal-specific JSPs.

```
<action path="/portal/prepareNewBlog" scope="request"
  type="view.PrepareNewBlogAction" >
  <forward name="success" path="/view/portal/enterNewBlog.jsp"/>
</action>
<action path="/portal/saveNewBlog" name="blogForm" scope="request"
  type="view.SaveNewBlogAction" input="/view/enterNewBlog.jsp" >
  <forward name="success" path="/view/portal/newBlogConfirmation.jsp"/>
</action>
```

As you can see, only the path attributes are modified. The FormBean Action responsible for the application business logic remains unchanged.

## 60.6.2 How to Create the New JSPs

As specified in the previous step, the actions forward the request to new JSPs, which are responsible for rendering the portlet content. Your new portlet view JSPs can share the HTML with the standalone view, but ensure the portlet meets the following criteria:

- Uses styles that enforce a consistent look and feel with the rest of the page.
- Contains HTML code that is allowed in HTML table cells (that is, no <html>, <body>, and <frame> tags).
- Uses the PDK-Java version of the Struts HTML tag library. This renders URLs in the correct format to work in a portlet context.

The PDK Struts HTML tag library contains versions of the Struts HTML tags that can be used in portlet markup.

---

---

**Note:** You can register the Oracle PDK with Oracle JDeveloper so that you can drop the tags from the Oracle JDeveloper Components Palette. For more information, see the *Registering a Custom Tag Library in JDeveloper* section in the Oracle JDeveloper online Help.

---

---

### 60.6.3 How to Create a Portlet

You can create your Struts portlet either manually or by using the Create Oracle PDK-Java Portlet wizard. Although the wizard does not explicitly offer Struts support, you can use the wizard to build your Struts portlet.

To create a portlet:

1. In JDeveloper, open the Oracle PDK-Java Portlet wizard.  
For more information, see [Section 60.2.1, "How to Create a PDK-Java Portlet."](#)
2. On the View Modes page of the wizard, for the Show Page mode, select an **Implementation Style of Java Class**.
3. For the **Package Name**, enter `oracle.portal.provider.v2.render.http`.
4. For the **Class Name**, enter `StrutsRenderer`. This generates the skeleton of the portlet renderer class, `StrutsRenderer`.
5. As the `StrutsRenderer` is part of the PDK, you do not need this generated file. So, when you finish the wizard, you must delete the file generated by the wizard. To do so, click the file in the System Navigator window, then from the **File** menu, select **Erase from Disk** in JDeveloper.
6. Edit the `provider.xml` and change the following properties:

At the producer level, perform the following:

- If the Struts application uses sessions (for example, the form synchronizer token mechanism is used or `<actionInSession>` is set to true), then enable session handling:

```
<session>true</session>
```

At the portlet level, perform the following:

- If you want users to always return to the same portlet state as when they left the container page, then you can configure the struts renderer to save the struts action in the struts context:

```
<actionInSession>true</actionInSession>
```

If you prefer that users always start from the beginning of the portlet when they return from outside the container page, then you should not save the struts action:

```
<actionInSession>false</actionInSession>
```

Note that this setting is the default behavior.

- Specify the first action to raise when the portlet is called. Use the following code:

```
<showPage class="oracle.portal.provider.v2.render.http.StrutsRenderer">  
<defaultAction>/portal/prepareNewBlog.do</defaultAction>  
</showPage>
```

## 60.6.4 How to Extend the Portlet to Add Business Logic

In your application, you should add code specific to your environment, such as the user's information, personalization, and localization. To do so, you can create a new `Action` class that is only called in context, and handles all business logic.

## 60.6.5 How to Register the Producer

Now that your portlet is ready to be used by consumers, you must make it accessible by registering it. For information about how to register your PDK-Java portlet, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

## 60.7 Troubleshooting PDK-Java Portlets

This section provides information to assist you in troubleshooting problems you may encounter while creating and testing PDK-Java portlets.

This section includes the following subsections:

- [Section 60.7.1, "Cannot Access the Create Portlet Wizard"](#)
- [Section 60.7.2, "Cannot Add the Portlet Functionality that I Want to the Portlet"](#)

### 60.7.1 Cannot Access the Create Portlet Wizard

#### Problem

In the New Gallery, I cannot find the Oracle PDK-Java Portlet option.

#### Cause

The application in which you are trying to create the PDK-Java portlet was created using WebCenter Portal's Framework application template and therefore is not scoped for portlet creation.

#### Solution

1. Try creating the portlet in a Portlet Producer Application or any application scoped for portlet creation (any application except for those built using WebCenter Portal's Framework application template).
2. In the New Gallery, click the All Technologies tab to list all available options regardless of the technology scope of the application.

### 60.7.2 Cannot Add the Portlet Functionality that I Want to the Portlet

#### Problem

I cannot find the option to add certain features, for example portlet events or public render parameters, to the portlet in the Create Oracle PDK-Java Portlet wizard.

#### Cause

The Create Oracle PDK-Java Portlet wizard does not provide the option to add certain features to portlets.

**Solution**

After you create the portlet using the Create Oracle PDK-Java Portlet wizard, edit the portlet to add advanced functionality. For more information, see [Section 60.3, "Developing PDK-Java Portlets."](#)

---

---

## Deploying Portlet Producers

This chapter describes how to use Oracle JDeveloper to deploy portlet producers to an Oracle WebLogic Managed Server configured to test application deployment or host applications for production.

This chapter includes the following sections:

- [Section 61.1, "Introduction to Deploying Portlet Producers"](#)
- [Section 61.2, "Creating a WAR Deployment Profile"](#)
- [Section 61.3, "Deploying a Portlet Producer to a WebLogic Managed Server"](#)

For information about how to deploy producers using Fusion Middleware Control, Oracle WebLogic Server Administration Console, or WLST, see the "Deploying Portlet Producer Applications" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

For more general information about deployment of applications, see [Chapter 69, "Deploying and Testing Your WebCenter Portal: Framework Application."](#)

### 61.1 Introduction to Deploying Portlet Producers

You can deploy your portlet producer to any Oracle WebLogic Managed Server that is configured to support WebCenter Portal portlet producers.

Before you can deploy your portlet producer to a WebLogic Managed Server, there are a couple of steps you must complete:

1. Create and provision a WebLogic Managed Server instance that contains all the required shared libraries. For more information, see the section "Creating a Managed Server" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
2. Create a WebLogic Managed Server connection for instances that reside outside JDeveloper. For more information, see [Section 69.3.3.4, "Creating a WebLogic Managed Server Connection."](#)

To deploy your portlet producer to a WebLogic Managed Server, you must first create an application WAR deployment profile.

---

---

**Note:** Before you deploy the portlet producer, you must remove the `test-all` application role if you enabled the automatic grants feature in the Configure ADF Security wizard. Because the `test-all` role makes all ADF resources public, its presence increases the risk that your application may leave some resources unprotected. You must therefore remove the role before you migrate the application-level policy store.

For more information, see the section "How to Remove the test-all Role from the Application Policy Store" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

---

---

## 61.2 Creating a WAR Deployment Profile

To deploy portlet producers to a Managed Server that resides outside JDeveloper, you must create a deployment profile to indicate how the producer and its associated files should be packaged. To do this, you must create a Web Application Archive (WAR) file.

To create a WAR deployment profile:

1. In the Application Navigator, right-click the project folder, for example, **Portlets**, and choose **New**.
2. In the New Gallery, expand **General**, select **Deployment Profiles**, then **WAR File**, and click **OK**.
3. In the Create Deployment Profile -- WAR File dialog, enter a name for your deployment profile and click **OK**.
4. In the Edit WAR Deployment Profile Properties dialog, select **Specify Java EE Web Context Root**, enter a context root, then click **OK**.
5. In the Project Properties dialog, under Deployment Profiles, select the WAR file you just created and click **OK**.

## 61.3 Deploying a Portlet Producer to a WebLogic Managed Server

After you have created the deployment profile and deployment descriptor, you can deploy your portlet producer to the managed server.

To deploy a portlet producer to a WebLogic Managed Server:

1. In the Application Navigator, right-click the project folder, for example, **Portlets**, and choose **Deploy**, then the deployment profile (WAR file) that you created in [Section 61.2, "Creating a WAR Deployment Profile."](#)
2. In the Deploy dialog, on the Deployment Action page, select **Deploy to Application Server**, then click **Next**.
3. On the Select Server page, select the connection to the Managed Server, then click **Next**.
4. On the WebLogic Options page, select the Managed Server, for example, **WLS\_Portlet**, and click **Finish**.
5. If your application contains JSR 286 portlets, the Select deployment type dialog displays. Click **Yes** to add the configuration required to expose this application as a WSRP service.

**6. Click Deploy.**

The message `Deployment started` displays in the Deployment - Log window. If the application is successfully deployed to the targeted server instance, the message `Deployment finished` displays in the log.

---

**Note:** If you are deploying your portlet producer in a cluster environment, you will receive the following warning:

WARNING:

```
oracle.webcenter.lifecycle.exception.LifecycleLockedException: A  
lock exists that prevents export set import.
```

This is expected behavior. When you deploy your application, the producer metadata exported into the EAR file (as a MAR file) needs to be imported into an MDS schema for use in the production environment. Importing the metadata occurs automatically during deployment. This import only needs to happen with one node in the cluster, so a lock is created to prevent other nodes in the cluster trying to perform the same operation.

---

---

---

## Consuming Portlets

This chapter describes how to add portlets to the pages of your WebCenter Portal: Framework application and the options that accompany this process.

This chapter includes the following sections:

- [Section 62.1, "Introduction to Consuming Portlets"](#)
- [Section 62.2, "Registering a WSRP Portlet Producer with a WebCenter Portal: Framework Application"](#)
- [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application"](#)
- [Section 62.4, "Managing Portlet Producer Connections"](#)
- [Section 62.5, "Adding the Portlet Producer Task Flow"](#)
- [Section 62.6, "Adding Portlets to a Page"](#)
- [Section 62.7, "Setting Attribute Values for the Portlet Tag"](#)
- [Section 62.8, "Manually Wiring Parameters and Events in JSR 286 Portlets"](#)
- [Section 62.9, "Copying Portlets"](#)
- [Section 62.10, "Deleting Portlets from Application Pages"](#)
- [Section 62.11, "Consuming WebCenter Services Portlets"](#)
- [Section 62.12, "Troubleshooting Portlets"](#)

This chapter does not cover Oracle JDeveloper or Oracle ADF page creation basics. It covers only those aspects of page creation that are specific to Framework application pages. Therefore, you should familiarize yourself with the information covered in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework* before reading this chapter.

For information about creating portlets, which can then be consumed by Framework application pages, see the following chapters:

- [Chapter 57, "Introduction to Portlets"](#)
- [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge"](#)
- [Chapter 59, "Building Standards-Based Java Portlets Using JSR 286"](#)

## 62.1 Introduction to Consuming Portlets

Oracle WebCenter Portal: Framework enables you to consume a portlet by registering its producer with the application. Your application can consume portlets that you build and portlets that you receive from a third party, such as a packaged-application vendor.

You can register portlet producers in two ways:

- Register the portlet producer with a specific application. Use this option if you are not likely to want to register the producer with other applications.
- Register the portlet producer using the Resource Palette. Use this option to use the producer's portlets in multiple applications.

A portlet that is available in the Resource Palette can be added to any of your Framework applications by dropping it on the page as you would any other component. When you add a portlet from the Resource Palette, its producer gets registered with the application if that producer is not already registered with the application. You can drag and drop a whole producer connection from the Resource Palette into the Application Resources panel of the Application Navigator. This registers the producer with the application. Alternatively, you can right-click a producer in the Resource Palette and choose **Add to Application** from the context menu to register the producer with the currently open application.

JDeveloper provides wizards for registering both WSRP producers and Oracle PDK-Java producers.

---

---

**Note:** If your application is source controlled, you must manually create elements in the source control system for any new files created during producer registration. Any files that are already source controlled are checked out automatically by the producer registration process.

---

---

There are many options associated with portlet consumption. For example, you can choose to place portlets straight onto a page or nest them in a Composer component, you can adjust many attributes of the portlet tag, and you can wire portlets to each other.

## 62.2 Registering a WSRP Portlet Producer with a WebCenter Portal: Framework Application

When you register a WSRP portlet producer, you provide basic information that describes the producer's operational parameters. This information is used by the portlet-consuming application to communicate with the producer and with the portlets through the producer.

WebCenter Portal: Framework supports both WSRP 1.0 and WSRP 2.0 producers. The WSRP 2.0 standard, among others, provides support for inter-portlet communication and export and import of portlet customizations. You can leverage the benefits of WSRP 2.0 while building standards-based JSR 286 portlets.

This section includes the following subsections:

- [Section 62.2.1, "How to Register a WSRP Portlet Producer"](#)
- [Section 62.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles"](#)

## 62.2.1 How to Register a WSRP Portlet Producer

The Register WSRP Portlet Producer wizard is the entry point for registering both WSRP 1.0 and 2.0 producers. When registration is successful, the newly registered producer displays in JDeveloper either in the Application Resources panel of the Application Navigator, or in the Resource Palette, depending on where you created the connection. You can then select portlets from the producer for placement on your application (.jspx) pages.

---

---

**Note:** If you are registering a producer provided by Oracle WebLogic Portal, and the portlet uses ADF Rich Components, you should register the WSRP 2.0 WSDL URL to ensure that the portlet functions correctly.

---

---

You also use the Register WSRP Portlet Producer wizard to register JSF portlets, which are portletized JSF applications or portletized ADF task flows. Once you create a portlet from a JSF application, you can deploy the portlet to a WLS instance and register the JSF portlet producer as you would register any WSRP portlet producer. The Oracle JSF Portlet Bridge exposes JSF applications and task flows as JSR 286 portlets. For more information, see [Chapter 58, "Creating Portlets from JSF Applications Using the Oracle JSF Portlet Bridge."](#)

To register a WSRP portlet producer:

---

---

**Note:** In the Register WSRP Portlet Producer wizard, if you click **Cancel** after you have clicked **Finish**, the registration is not canceled.

---

---

1. In the Application Resources panel of the Application Navigator, right-click **Connections**, choose **New Connection** and then choose **WSRP Producer**.  
For other methods of invoking the wizard, such as from the Resource Palette, see [Section 1.6.2, "How Do I Access the Connection Wizards?"](#)
2. In the Specify Producer Name page of the Register WSRP Portlet Producer wizard, the **Create Connection in** option is set depending on how you accessed the wizard. The default selection is **Application Resources** if you invoked the wizard from an application, and **Resource Palette** if you invoked the wizard from the Resource Palette. You can change this option at this point.
3. From the **Target Project** dropdown list, select the project to be configured for the WSRP producer connection.  
This should be the same project as the one in which you intend to consume the portlets.  
You can change this option only if you invoked the wizard from the Application Navigator.
4. In the **Producer Registration Name** field, enter a name for the producer registration that is unique among all connections and then click **Next**.
5. In the Specify Connection Details page, in the **WSDL URL** field, enter the producer's URL.

The syntax varies according to your WSRP implementation, for example, the sample WSRP producer uses the following syntax:

- `http://host:port/context-root/portlets/wsrp1?WSDL`

- `http://host:port/context-root/portlets/wsrp2?WSDL`
- `http://host:port/context-root/portlets?WSDL` (WSRP 1.0 for backward compatibility)

Where:

- *host* is the server to which your producer has been deployed.
- *port* is the port to which the server is listening for HTTP requests.
- *context-root* is the Web application's context root.
- `portlets[/wsrp(1|2)]?WSDL` is static text. The text entered here depends on how the producer is deployed.

For example:

`http://myhost.example.com:7101/portletapp/portlets/wsrp2?WSDL`

You can access the producer test page through the URL:

`http://host:port/context-root/info`

6. If the application and the producer are separated by a firewall, an HTTP proxy is needed for communication between the application and the producer. If this is the case for your application, select **Use Proxy for Contacting Producer** and specify the URL and port number of the proxy.

---

---

**Note:** The proxy fields in this step default to the proxy preferences set in JDeveloper Preferences (from the main menu, choose **Tools > Preferences**, and then select **Web Browser and Proxy**).

---

---

7. Click **Next**.

The connection to the producer is tested. If there are any problems, an error message displays. You must resolve any problems before you can continue.

8. In the Specify Additional Registration Details page, in the **Default Timeout Interval (Seconds)** field, enter the number of seconds to wait for the producer to respond during design time operations.

Some producers define additional registration properties. In such cases, the properties are displayed in a table on this page of the wizard. You can enter values for these additional properties in the table. These properties are producer-specific and are used only at registration time. That is, they collect information that consumer applications send to producers at registration time; the producers store this information against the consumers and use it subsequently.

9. If you are registering the producer in the Resource Palette, click **Finish** to complete the registration.

If you are registering the producer in the Application Resources panel, and plan to request authentication whenever the producer (and consequently, its portlet) is accessed, click **Next** and follow the remaining steps. If you do not want to configure security, click **Finish**.

If the producer declares user categories, when you click **Finish**, the Register WSRP Portlet Producer dialog displays. Click **Yes** and see [Section 62.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles."](#) Click **No** to decline this opportunity and complete the registration process.

---

---

**Note:** If you decline to map the user categories to security roles at this point, you can do so later by editing the producer registration.

---

---

10. In the Configure Security Attributes page, from the **Token Profile** dropdown list, select the type of token profile to use for authentication with the WSRP producer:
- **None**—No token; no WS-Security header is attached to the SOAP message.  
If you select this option, you do not want to complete the rest of the wizard. Click **Finish**.
  - **WSS 1.0 SAML Token with Message Integrity**—Provides message-level integrity protection and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies and SHA-1 hashing algorithm for message integrity.
  - **WSS 1.0 SAML Token with Message Protection**—Provides message-level protection (integrity and confidentiality) and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. The Web service consumer includes a SAML token in the SOAP header and the confirmation type is sender-vouches. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.  
When you select this policy, you must also specify the **Recipient Alias**.
  - **WSS 1.0 User Name Token without Password**—Provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security v1.0 standard. Both plain text and digest mechanisms are supported. This policy uses WS-Security's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanism for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.  
Use this token profile if the WSRP producer has a different identity store. You must define an external application pertaining to the producer and associate the external application with this producer. The external application defined here is used to retrieve and propagate the user credentials to the producer. The producer verifies this against the identity store configured for the external application.  
When you select this policy, you must also specify the **Recipient Alias**.
  - **WSS 1.0 User Name Token with Password**—provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security 1.0 standard. Credentials (username only) are included in outbound SOAP request messages through a WS-Security UsernameToken header. No password is included. Message protection is provided using WS-Security 1.0's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.  
When you select this policy, you must also specify the **Recipient Alias**.

- **WSS 1.0 SAML Token**—Provides SAML-based authentication for outbound SOAP request messages in accordance with the WS-Security 1.0 standard. The policy propagates user identity and is typically used in intra departmental deployments where message protection and integrity checks are not required. This policy does not require any keystore configuration.
- **WSS 1.1 SAML Token with Message Protection**—Provides message-level protection (integrity and confidentiality) and SAML token population for outbound SOAP requests in accordance with the WS-Security 1.1 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses the symmetric key technology for signing and encryption, and WS-Security's Basic128 suite of asymmetric key technologies for endorsing signatures.

11. Select the configuration type:

- **Default**—If you choose default, then all the default keystore attributes, that is location, password, keystore type, signature key and alias, encryption key and alias are picked up from the JPS (Java Platform Security) configuration. The value for **Recipient Alias** is taken from the policy being used. The WebLogic Server where the application is deployed must be configured for WS-Security. For more information, see "Securing a WSRP Producer with WS-Security" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- **Custom**—If you select this option, then you must enter the appropriate keystore attributes in the next page of the wizard.

12. In the **Default User** field, enter a user name to assert to the remote producer when the user has not authenticated to the Framework application.

When unauthenticated, the identity `anonymous` is associated with the application user. OWSM does not currently support the propagation of an anonymous identity, so you must specify an alternative identity here. Keep in mind though, that in this case, the Framework application has not authenticated the user so the default user you specify should be a low privileged user in the remote producer that is an appropriate identity to use for showing public content. For example, you may want to create a guest account in the identity store for this purpose. If the user has authenticated to the application, then the user's identity is asserted rather than the default user.

---

---

**Note:** If you specify a **Default User**, the remote producer must be set up to accept this information.

---

---

The **Default User** field does not appear if you selected **User Name Token with Password**.

13. In the **Issuer Name** field, enter the name of the issuer of the SAML Token, for example `www.oracle.com`.

This field appears only if you selected an SAML Token option from the **Token Profile** dropdown list, and **Custom** from the **Configuration** options. The issuer name is the attesting entity that vouches for the verification of the subject.

14. Select **Associate Producer with External Application**, then select the application, if this producer must provide authentication to an external application.

For more information, see [Section 68.13.3, "Managing External Applications."](#)

This option is available only if you selected **User Name Token with Password**.

**15. Click Next.**

If you selected **Default** as the configuration option, then the fields on the Specify Key Store page are disabled. Click **Finish** to complete the registration.

If the producer declares user categories, when you click **Finish**, the Register WSRP Portlet Producer dialog displays. Click **Yes** and see [Section 62.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles."](#) Click **No** to decline this opportunity and complete the registration process.

**16. In the Specify Key Store page, in the **Store Path** field, provide the full path to the keystore that contains the certificate and the private key that is used for signing some parts (security token and SOAP message body) of the SOAP message.**

If you are not sure of the full path, click **Browse** to navigate to and select the file. The selected file should be a keystore created with the Java keytool.

**17. In the **Store Password** field, provide the password to the keystore that was set when the keystore was created.**

The keystore password must be correct for the **Store Type** field and the **Signature Key Alias** dropdown list to populate.

If an incorrect keystore path or password is entered, then an error message appears stating that the password is invalid and must be corrected. All fields on this screen except for **Store Path** and **Store Password** are disabled until you specify the correct values.

**18. After you provide the correct keystore path and password, press the Tab key to move to another active field (for example, the **Store Path** field). This ensures that the **Store Type** field and the **Signature Key Alias** dropdown list are properly populated.****19. The **Store Type** value is read from the keystore and is never editable. The store type is always **JKS** (Java Key Store).****20. From the **Signature Key Alias** dropdown list, select the signature key alias.**

This list populates automatically when the correct password is entered in the **Store Password** field. The **Signature Key Alias** is the identifier for the certificate associated with the private key that is used for signing. The key aliases found in the specified keystore are available in the list. Select the one to be used for signing.

**21. In the **Signature Key Password** field, specify the password for accessing the key identified by the alias specified in **Signature Key Alias**.****22. Optionally, from the **Encryption Key Alias** dropdown list, select the encryption key alias.**

This list populates automatically when the correct password is entered in the **Store Password** field. The key aliases found in the specified keystore are available in the list. Select the one to be used for encryption.

**23. Optionally, in the **Encryption Key Password** field, specify the password for accessing the key identified by the alias specified in **Encryption Key Alias**.****24. From the **Recipient Alias** field, select the keystore alias that is associated with the producer's certificate and then click **Finish**.**

This certificate is used to encrypt the message to the producer.

This field is not displayed if you selected **SAML Token with Message Integrity** as the **Token Profile** in the Configure Security Attributes page of the wizard.

If the producer declares user categories, when you click **Finish**, a dialog displays asking whether you want to map the user categories to Java EE roles. Click **Yes** and see [Section 62.2.2, "How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles."](#) Click **No** to decline this opportunity and complete the registration process.

## 62.2.2 How to Map a Producer's Declared User Categories to an Application's Defined Java EE Security Roles

The user categories the producer declares come from the portlets it contains. For example, if the producer contains one or more JSR 286 portlets created with the Standards-based Java Portlet (JSR 286) wizard, then any security roles added during portlet creation are included in the user categories the producer declares. Java EE security roles can be specified through the Framework application's `web.xml` file properties.

For more information about security roles in JSR 286 portlets, see [Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security."](#)

This procedure continues forward from [Section 62.2.1, "How to Register a WSRP Portlet Producer."](#)

To map producer-declared user categories with application-defined Java EE security roles:

1. After clicking **Finish** in the Register WSRP Portlet Producer wizard, click **Yes** in the resulting dialog.
2. In the User Categories dialog, for each **User Category**, click the corresponding field in the **J2EE Security Role** column.

The User Categories dialog is also accessible when you edit producer registration settings. For more information see [Section 62.4.1, "Editing Portlet Producer Registration Settings."](#)

3. From the resulting list, select the security role to map to the producer user category.
4. Click **OK** when all user categories are mapped.

## 62.3 Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application

When you register a PDK-Java portlet producer, you provide basic information that describes the producer's operational parameters. This information is used by the portlet-consuming application to communicate with the producer and with the portlets through the producer.

When registration is successful, the newly registered producer is displayed in JDeveloper either in the Application Resources panel of the Application Navigator, or in the Resource Palette, depending on where you created the connection. You can then select portlets from the producer for placement on your application (.jspx) page.

---

**Note:** In the Register Oracle PDK-Java Portlet Producer wizard, if you click **Cancel** after you have clicked **Finish**, the registration is not canceled.

---

To register a PDK-Java portlet producer:

1. In the Application Resources panel of the Application Navigator, right-click **Connections**, choose **New Connection** and then choose **Oracle PDK-Java Producer**.

For other methods of invoking the wizard, such as from the Resource Palette, see [Section 1.6.2, "How Do I Access the Connection Wizards?"](#)

2. In the Specify Producer Name page of the Register Oracle PDK-Java Portlet Producer wizard, the **Create Connection in** option is set depending on how you accessed the wizard. The default selection is **Application Resources** if you invoked the wizard from an application, and **Resource Palette** if you invoked the wizard from the Resource Palette. You can change this option at this point.

3. From the **Target Project** dropdown list, select the project to be configured for the PDK-Java producer connection.

This should be the same project as the one in which you intend to consume the portlets.

You can change this option only if you invoked the wizard from the Application Navigator.

4. In the **Producer Registration Name** field, enter a name for the producer registration that is unique among all connections and then click **Next**.
5. In the Specify Connection Details page, in the **URL Endpoint** field, enter the producer's URL using the following syntax:

```
http://host:port/context-root/providers
```

Where:

- *host* is the server to which your producer has been deployed.
- *port* is the port to which the server is listening for HTTP requests.
- *context-root* is the Web application's context root.
- *providers* is static text. The text entered here depends on how the producer is deployed.

For example:

```
http://myhost.example.com:7101/myEnterprisePortlets/providers
```

6. In the **Service ID** field, enter the unique identifier for this producer.

PDK-Java enables you to deploy multiple producers under a single adapter servlet. The producers are identified by their unique service IDs. A service ID is required only when a service ID or producer name is not appended to the URL endpoint. For example the following URL endpoint requires the service ID, sample:

```
http://myhost:7101/myEnterprisePortlets/providers
```

However, the following URL endpoint, does not require a service ID:

```
http://myhost:7101/myEnterprisePortlets/providers/sample
```

7. If the application and the producer are separated by a firewall, an HTTP proxy is needed for communication between the application and the producer. If this is the case for your application, select **Use Proxy for Contacting Producer** and specify the URL and port number of the proxy.

---

---

**Note:** The proxy fields in this step default to the proxy preferences set in JDeveloper Preferences (from the main menu, choose **Tools > Preferences**, and then select **Web Browser and Proxy**.)

---

---

8. Select **Associate Producer with External Application**, then select the application, if this producer must provide authentication to an external application.

For more information, see [Section 68.13.3, "Managing External Applications."](#)

This option is available only if you invoked the wizard from the Application Navigator, as external applications are scoped to individual applications.

9. Select **Enable Producer Sessions** to enable sessions between the producer and the consuming application.

When sessions are enabled, the server maintains session-specific information, such as user name. Message authentication uses sessions, so if the shared key is set, then this option should also be selected.

For sessionless communication between the producer and the server, deselect this option.

10. At this point in the wizard, you can click **Finish** to complete the registration, using the default values for all remaining steps.

To provide additional details, click **Next** and follow the remaining steps.

11. In the Specify Additional Details page, in the **Default Timeout Interval (Seconds)** field, enter the number of seconds to wait for the producer to respond during design time operations.

12. In the **Subscriber ID** field, enter a string to identify the consumer of the producer being registered.

When a producer is registered, a call is made to the producer. During the call, the consumer passes the value for **Subscriber ID** to the producer. This value is also passed every time a portlet call is made. If the producer does not see the expected value for **Subscriber ID**, then it might reject the registration call.

---

---

**Note:** Editing the producer registration to change the **Subscriber ID** after the initial registration has no effect. To specify a different **Subscriber ID**, you must reregister the producer.

---

---

13. In the **Shared Key** field, enter a shared key to use for producers that are set up to handle encryption and then click **Finish**.

The shared key is used by the encryption algorithm to generate a message signature for message authentication. Producer registration fails if the producer is set up with a shared key and you enter an incorrect shared key here. The shared key can contain between 10 and 20 alphanumeric characters.

## 62.4 Managing Portlet Producer Connections

After registering a portlet producer, you can edit the registration settings, test the connection, refresh the producer to obtain the latest list of portlets, or delete the connection to the portlet producer.

This section includes the following subsections:

- [Section 62.4.1, "Editing Portlet Producer Registration Settings"](#)
- [Section 62.4.2, "Testing a Portlet Producer Connection"](#)
- [Section 62.4.3, "Refreshing a Portlet Producer"](#)
- [Section 62.4.4, "Deleting a Portlet Producer"](#)

### 62.4.1 Editing Portlet Producer Registration Settings

Both the WSRP and PDK-Java portlet producer registration wizards enable you to access and revise many of the values you entered when you registered the producer.

To edit portlet producer registration settings:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to edit, and choose **Properties**.
3. Edit the producer registration properties as required, clicking **Next** to step through the pages of the wizard.

You can also go directly to a specific step by clicking the links in the navigation panel on the left side of the wizard.

- For information about WSRP Producer settings, see [Section 62.2, "Registering a WSRP Portlet Producer with a WebCenter Portal: Framework Application."](#)
- For information about Oracle PDK-Java Producer settings, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

You cannot edit the **Producer Registration Name**.

4. When you have changed all the necessary settings, click **Finish**.
5. Editing some properties, such as the **WSDL URL** or **URL Endpoint**, requires a producer refresh. When you make such a change, a dialog displays allowing you to refresh the producer immediately, save the changes but do not refresh the producer, or return to the edit producer registration wizard. Click **Yes**, **No**, or **Cancel** as appropriate.

---

---

**Note:** While you can edit the value of the **WSDL URL** field, you can point to a different producer only if the new producer has access to the preference store of the old producer, or if the preference store of the old producer has been migrated to that of the new producer.

---

---

6. Click **OK** when the producer has been successfully refreshed, if necessary.
7. Once you have completed your edits, consider testing the producer connection to be sure the connection information is valid. For more information, see [Section 62.4.2, "Testing a Portlet Producer Connection."](#)

### 62.4.2 Testing a Portlet Producer Connection

The connection testing feature provides a means of testing the validity of a portlet producer connection.

To test a portlet producer connection:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer to test, and choose **Test Producer Connection**.
3. A progress bar appears while the test is underway. A success or failure dialog displays when the test is complete. Click **OK** to close this dialog.

If the failure dialog displays, consider editing the producer registration details and retesting the producer connection. Additionally, especially if the failure dialog takes a long time to display, ensure that the producer is available. For example, if the producer is provided through the Integrated WLS, ensure that the Integrated WLS is running, and then retest the connection.

### 62.4.3 Refreshing a Portlet Producer

When you refresh a portlet producer, the portlets from that producer are also refreshed. Newly added portlets and any updates to existing portlets become available to any applications that are consuming portlets from this producer.

---

---

**Tip:** When a portlet is removed from a producer, be sure to manually delete the portlet from all application pages on which it has been placed. For more information, see [Section 62.10, "Deleting Portlets from Application Pages."](#)

---

---

To refresh a portlet producer:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer you want to refresh, and choose **Refresh Producer Registration**.
3. In the Portlet Producer Refresh dialog, click **Yes**.

### 62.4.4 Deleting a Portlet Producer

If you no longer want to use a particular producer with your application, you can delete the producer. For information about deleting portlets and relevant page variables, see [Section 62.10, "Deleting Portlets from Application Pages."](#)

---

---

**Note:** if you delete a producer, any pages that consume portlets from that producer display an error message that the portlet is unavailable. The portlets continue to be unavailable even if you re-register the producer using the same name.

---

---

To delete a portlet producer:

1. Navigate to the producer in the Application Resources panel of the Application Navigator or in the Resource Palette.
2. Right-click the producer you want to delete, and choose **Delete**.
3. In the Delete Confirmation dialog, click **Yes**.

## 62.5 Adding the Portlet Producer Task Flow

The portlet producer task flow (Producer) enables users to manage portlet producer connections at runtime.

For applications created using WebCenter Portal's Framework application template, the portlet producer task flow is available out of the box through the WebCenter Portal Administration console (Services tab). For details, see the chapter "Managing Services, Portlet Producers, and External Applications" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

In addition, just like other task flows, you can add the portlet producer task flow to your application pages. This might be especially useful if you are not using WebCenter Portal's Framework application template and the WebCenter Portal Administration console is therefore not part of your project. Special permissions are required to manage or view portlet producer connections through the Producer task flow:

- **AppConnectionManager**—Users with this role can register, modify, and delete portlet producer connections at runtime.
- **AppConnectionViewer**—Users with this role can view portlet producer connections at runtime. By default, any user who is logged in (that is, has the authenticated-user role) is granted this role.

By default, users with the Administrator role can manage portlet producers. If you want other users to manage connections through the portlet producer task flow, you must grant them the AppConnectionManager role.

To add the portlet producer task flow:

1. Create or open the JSF page in your application on which you want to add the task flow (see [Section 5.3, "Adding Pages to a Portal"](#)).
2. In the Resource Palette, expand **My Catalogs, WebCenter Portal - Services Catalog, and Task Flows**.
3. Drag **Producer** from the Resource Palette and drop it onto the page inside the `af:form` tag.
4. Grant the AppConnectionManager role to one or more test users, if required:
  - a. Add the test user TEST\_PROD.
  - b. Grant the AppConnectionManager role.

For information about how to add a user and grant this role, see the section "Creating Test Users" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

5. Save and run your page. Login as an administrator or the TEST\_PROD user defined in the previous step. The screen shown in [Figure 62-1](#) appears.

**Figure 62-1 The Portlet Producer Task Flow**

---

---

**Note:** At runtime, application administrators can grant users the `AppConnectionManager` and `AppConnectionViewer` roles through WebCenter Portal Administration (see the section "Adding Members to Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*). Alternatively, system administrators can grant `AppConnectionManager` and `AppConnectionViewer` roles through Fusion Middleware Control (see "Granting Application Roles Using Fusion Middleware Control" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*).

---

---

## 62.6 Adding Portlets to a Page

Placing a portlet on a Framework application page is a simple matter of dragging the portlet from the Application Resources panel or Resource Palette and dropping it on the page.

This section includes the following subsections:

- [Section 62.6.1, "How to Add a Portlet to a Page"](#)
- [Section 62.6.2, "What Happens When You Add a Portlet to a Page"](#)
- [Section 62.6.3, "What You May Need to Know About Interportlet Communication"](#)
- [Section 62.6.4, "What You May Need to Know About Inline Frames"](#)
- [Section 62.6.5, "What You May Need to Know About Portlet Sizing"](#)
- [Section 62.6.6, "What You May Need to Know About Minimize, Restore, and Move"](#)
- [Section 62.6.7, "What Happens at Runtime"](#)

### Before You Begin

Before you can place a portlet on a page, there are a few preparatory steps you must perform before you can take this simple action. These include:

1. Creating a Framework application. For more information, see [Section 5.2.1, "How to Create a Framework Application."](#)
2. Creating an application page. For more information, see [Section 5.3, "Adding Pages to a Portal."](#)
3. Registering the portlet's producer with the application. For more information, see [Section 62.2, "Registering a WSRP Portlet Producer with a WebCenter Portal: Framework Application"](#) or [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)
4. Some of the portlets you plan to consume may come from applications that handle their own authentication. In such cases, you must register the application as an external application and identify it to the portlet producer that provides it. For more information, see [Chapter 68, "Securing Your WebCenter Portal: Framework Application."](#)
5. Some of the portlets you plan to consume may come from producers that are Secure Sockets Layer (SSL) enabled. When you try to access an SSL-enabled producer, you may be presented with a Security Alert dialog, prompting you to view the producer's certificate and add it to the list of trusted certificates. The Security Alert dialog displays only if the producer uses a security certificate issued

by a certificate authority that is not widely accepted. To consume portlets from such a producer, you must first add the producer's security certificate to the keystore. For more information, see [Section 68.14, "Registering Custom Certificates with the Keystore."](#)

## 62.6.1 How to Add a Portlet to a Page

You can add a portlet to a page by dragging and dropping it from the Application Resources panel of the Application Navigator or from the Resource Palette.

To add a portlet to a page:

1. In the Application Navigator, open the application that contains the page (.jspx file) to which you want to add the portlet.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. Under the **Connections** node in the Application Resources panel of the Application Navigator, or in the Resource Palette:
  - If the producer is a WSRP producer, expand the **WSRP Producer** node.
  - If the producer is a PDK-Java producer, expand the **Oracle PDK-Java Producer** node.
5. Expand the node for the portlet producer that contains the portlet to add to the page.
 

Under the selected producer, all portlets contained by that producer are listed.
6. Drag the portlet from the producer node directly onto the page.

You should drag the portlet onto a form on the page. If you do not, a dialog displays prompting you to create a form to contain the portlet. Select:

- **ADF Faces - Form** if the page contains rich client components. This adds an `af:form` component to the page.
- **JSF HTML - Form** if the page contains HTML components (for example, if it is an upgraded 10.1.3.2 page). This adds an `h:form` or `tr:form` component to the page, depending on the surrounding document tag.

Do not select **HTML - Form** as this is not valid for portlets.

---

---

**Note:** You can include any Oracle ADF Faces component or task flow as a child component of a `Show Detail Frame` component. However, portlets contain headers similar to those provided by the `Show Detail Frame` component and can be added to a `Panel Customizable` component directly. There are no additional benefits to including portlets in `Show Detail Frame` components.

---

---

---

---

**Note:** If you add a portlet as a Trinidad component, that is, inside a `tr:form` component, and the portlet implements modes other than View mode, you must include the following in the application's `web.xml` file:

```
<context-param>
  <param-name>
    oracle.adf.view.rich.newWindowDetect.OPTIONS
  </param-name>
  <param-value>off</param-value>
</context-param>
```

---

---

**Note:** If you are adding a PeopleSoft portlet to a page in a Framework application, you must set the `renderPortletInIFrame` portlet tag attribute to `true`.

For more information, see [Section 62.7, "Setting Attribute Values for the Portlet Tag."](#)

---

---

## 62.6.2 What Happens When You Add a Portlet to a Page

When you add a portlet to a page, a portlet tag (`adfp:portlet` or `adfph:portlet`) is added to the page source. This is the tag that represents the portlet component. This tag includes attributes that you can edit using the Property Inspector, or in the page source, to further control the behavior and appearance of the portlet. For information about these attributes, see [Section 62.7, "Setting Attribute Values for the Portlet Tag."](#)

The type of portlet tag used is determined by the following:

- If the project is configured for rich client components alone, the `adfp:portlet` tag is used.
- If the project is configured for Trinidad components alone, the `adfph:portlet` tag is used.
- If the project is configured for both rich client and Trinidad components, a dialog displays where you can choose which portlet tag to use.
- If the project is not configured for rich client or Trinidad components, the `adfp:portlet` tag is used and the project is automatically configured for rich client components.

This is so that the look and feel of the portlet matches that of other components on the page. For example, if you created your page as described in [Section 5.3, "Adding Pages to a Portal,"](#) the page is a rich client page. In this case, the portlet is added using the `adfp:portlet` tag, as shown in [Example 62-1](#).

### **Example 62-1 A Rich Client Page Containing a Portlet**

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.0"
  xmlns:h="http://java.sun.com/jsf/html"
  xmlns:f="http://java.sun.com/jsf/core"
  xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
  xmlns:adfp="http://xmlns.oracle.com/adf/faces/portlet">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <af:document>
```

```

<af:form>
  <adfp:portlet value="#{bindings.Portlet11_1}"
              id="portlet1"
              renderPortletInIFrame="true"/>
</af:form>
</af:document>
</f:view>
</jsp:root>

```

If you are working with an upgraded 10.1.3.2 application or an application that contains Trinidad components, the application uses HTML components, rather than rich client components. In this case, when you drag a portlet onto a page, the `adfp:portlet` tag is used, as shown in [Example 62-2](#).

#### **Example 62-2 A Trinidad Page Containing a Portlet**

```

<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.0"
          xmlns:h="http://java.sun.com/jsf/html"
          xmlns:f="http://java.sun.com/jsf/core"
          xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
          xmlns:tr="http://myfaces.apache.org/trinidad"
          xmlns:adfp="http://xmlns.oracle.com/adf/faces/portlet/html">
  <jsp:directive.page contentType="text/html;charset=US-ASCII"/>
  <f:view>
    <tr:document title="Title 1">
      <tr:form>
        <adfp:portlet value="#{bindings.Portlet12_1}"
                    id="portlet1"/>
      </tr:form>
    </tr:document>
  </f:view>
</jsp:root>

```

If the application page includes one or more Composer components, this may influence where the portlet is placed. For example, in the Structure panel, a portlet placed on a page with a `cust:panelCustomizable` tag, would be placed as illustrated in [Example 62-3](#):

#### **Example 62-3 Hierarchical Placement of the Portlet Tag**

```

af:document
  af:form
    cust:panelCustomizable
      adfp:portlet

```

---

**Note:** We recommend that you do not mix ADF Faces rich client components with HTML or Trinidad components on the same page. Doing so may produce unexpected results at runtime. Therefore, do not place a rich client portlet inside a Composer HTML component or an HTML portlet inside a Composer rich client component.

---

For information about Composer tags, see [Chapter 19, "Enabling Runtime Editing of Pages Using Composer."](#)

---

---

**Note:** When you drop an instance of OmniPortlet onto your page, open the Property Inspector and ensure that the `AllModesSharedScreen` property, under the Display Mode category, is set to `false`, the default value. Setting this property to `true` may prevent you from editing certain sections of your OmniPortlet in the OmniPortlet wizard.

---

---

### 62.6.3 What You May Need to Know About Interportlet Communication

One way to make your WebCenter Portal: Framework application more interactive is by linking related components such that their contents are synchronized based upon the context. For example, suppose you have two stock portlets on a page, one provides data about a stock's price while the other provides headline news items for a stock. Both portlets are based upon the stock ticker symbol, hence it would make sense that, when the ticker symbol is changed in the stock price portlet, the stock headlines portlet picks up that change and refreshes itself with headlines pertaining to the same ticker symbol.

The JSR 286 standard introduces public render parameters, which you can use to link portlets on a page. For more information, see [Section 59.3.5, "How to Use Public Render Parameters in JSR 286 Portlets."](#)

The JSR 286 standard also supports portlet events. You can use portlet events to drive the content of a portlet based on actions that occur elsewhere on the page. Portlet events can be cascaded so that a portlet may respond to an event by triggering an event of its own, which in turn affects other portlets on the page. Portlet events can also be consumed by ADF contextual events and contextual events can be consumed by portlets. You can use this to contextually link portlets and task flows. For more information, see [Section 59.3.6, "How to Use Portlet Events in JSR 286 Portlets."](#)

When you add a portlet to a page, a portlet binding is added to the page definition file. This portlet binding includes attributes that specify whether the portlet should automatically listen for parameter changes and events ([Example 62-4](#)).

#### Example 62-4 Portlet Binding

```
<portlet id="LotteryPortlet2_1"
  portletInstance="oracle/adf/portlet/SamplePortlets/ap/Ei7default_03ba18be_012d_1000_8002_
0ae8827e9493"
  class="oracle.adf.model.portlet.binding.PortletBinding"
  retainPortletHeaders="false"
  listenForAutoDeliveredPortletEvents="true"
  listenForAutoDeliveredParameterChanges="true"
  xmlns="http://xmlns.oracle.com/portlet/bindings"/>
```

Setting these attributes to `true` (the default) means that any parameters that are changed or events that are raised elsewhere on the page that match those supported by the portlet (that is, they have the same QName) automatically cause the portlet to be updated accordingly. In addition, the portlet can define aliases for its parameters and events to match parameters and events with different QNames.

You can set these attributes to `false` to disable this automatic parameter and event listening. For example, your page might contain multiple instances of the same portlet that require values to come from different sources. If you disable automatic parameter and event listening, or if your portlet defines parameters or events with names that do not match those you want to use for linking, you must manually configure the portlet

wiring. For more information, see [Section 62.8, "Manually Wiring Parameters and Events in JSR 286 Portlets."](#)

## 62.6.4 What You May Need to Know About Inline Frames

Rendering a portlet directly on a page provides a better user experience as compared to placing it in an inline frame (`iframe`). However, at times, it may be required to include the portlet markup inside an inline frame. You can use the `renderPortletInIFrame` attribute to determine whether or not a portlet should be rendered in an inline frame.

The default setting of the `renderPortletInIFrame` attribute is `auto`. This causes the portlet consumer to attempt to rewrite the portlet markup whenever possible, so that it renders correctly within the Oracle ADF page without the need for an inline frame.

However, in the following circumstances, the portlet is rendered within an inline frame:

- The parser throws an exception as it is not able to parse the markup.
- The portlet code contains a multi-part form post.
- The portlet code contains a file upload element.
- The portlet developer explicitly requested that the portlet be rendered in an inline frame by setting the `com.oracle.portlet.requireIFrame` container runtime option in the `portlet.xml` file to `true`.

---

---

**Note:** Portlets created using the Oracle JSF Portlet Bridge have the `requireIFrame` container runtime option set to `true` as these portlets are too complex to render directly on Oracle ADF pages due to JavaScript issues.

---

---

In some circumstances, the portlet consumer may be unable to rewrite the portlet markup and JavaScript to accommodate the portlet in the Oracle ADF page. If this is the case, you may find that the portlet does not behave as expected, for example, buttons do nothing or you get JavaScript errors in the console. If this happens, you should set the `renderPortletInIFrame` attribute to `true` so that the portlet is always rendered in an inline frame.

Some examples of when you should set `renderPortletInIFrame` to `true` are when:

- The portlet code builds up element names dynamically in JavaScript.
- The portlet code uses multiple forms and references them in JavaScript by index.
- JavaScript library code references elements within the portlet.

---

---

**Note:** If you render a portlet within an inline frame, then manipulating `window.location` may give unexpected results. If your portlet uses `window.location`, then you should ensure that your JavaScript is robust enough to handle the case where the portlet renders itself inside an inline frame.

---

---

If you want to ensure that a portlet is never rendered in an inline frame, for example for accessibility reasons, set the `renderPortletInIFrame` attribute to `false`. Note

however, that HTML markup from a portlet that is not rendered in an inline frame may interfere with other components on the Oracle ADF page.

For more information about the accessibility implications of using inline frames, see [Section 2.9, "Overview of WebCenter Accessibility Features."](#)

## 62.6.5 What You May Need to Know About Portlet Sizing

ADF Faces components can stretch their children, or not. It is usually a requirement that a parent only contains a single child for it to be able to stretch that child. Components also support being stretched or not. When a component that supports being stretched is placed inside a parent that is stretching its child, the dimension of the child is determined by those of the parent. The child is said to be stretched by the parent and it is sized to fill the parent.

When a component is not stretched by its parent, it is said to be in a flow layout. Here it is not taking its size from its parent. It must determine its own size, either from its children or from dimension style settings specified by the page designer.

The `portlet` Faces component supports being stretched by its parent. It does not explicitly stretch its children.

There are three ways the size of a `portlet` component is determined, depending on the portlet's parent component and attributes set on the `portlet` component itself.

- If the portlet is being stretched by its parent, the size is determined only by the parent. The portlet is in a stretch layout.
  - It does not matter how big the content is, this is irrelevant to the size of the portlet. If the content is bigger than the portlet, scrollbars are provided to enable users to display all the content.
  - If you specify a height for the portlet, it is ignored; stretching takes precedence.
  - This is the preferred layout method; it is always reliable.
  - The ADF Faces Tag documentation tells you whether each component stretches its children or not.
- If the portlet is not being stretched by its parent and explicit sizes are set, they are used.
  - This is also always reliable; you'll get the size you specified.
  - If the content is bigger than the specified size, scrollbars are provided to enable users to display all the content.
  - The size is fixed; the size of the content is not taken into account.
- If the portlet is not being stretched by its parent and no explicit sizes are set, the portlet attempts to auto-size to the content.

### Auto-Sizing

When a portlet is in a flow layout and has no explicit size set, it attempts to set the size of the portlet so that it is exactly big enough to display all of the portlet content without scrollbars.

The portlet does this by asking the browser how much space is required to show the content without scrollbars and using that to set the height of the portlet. More specifically, it looks at the `scrollHeight` property of the inline frame window.

How well this works depends on what is inside the portlet. Some layouts have a nice intrinsic size which auto-sizes well. However, some layouts and components inside the portlet, typically those that allow their content to overflow invisibly or with scrollbars, effectively hide the size of their contents. In specific terms of the HTML markup are HTML elements with overflow setting of `hidden`, `auto`, or `scroll`. This can come from inline styles or CSS styles applied to the element.

The problem arises because the `scrollHeight` is the minimum height required to correctly display the content. If you have, for example, a `div` element with an `overflow="auto"`, then if that `div` is smaller than its content, then it uses scroll bars. So, when you ask what minimum size is needed to display the `div`, unless it has an explicit height or minimum height set, the answer is 0. That means that the content of this `div`, even if it has a definite height does not contribute to the overall scroll height of the content.

In ADF terms, this is often associated with components that expect to take their dimensions from their parents, for example `panelStretchLayout` with `dimensionFrom="parent"` or that scroll their contents, for example, `panelGroupLayout` with `layout="scroll"`. These are the components that tend to have hidden or scrollable overflows.

Thinking about the ADF Faces layout model also gives us an alternative way of understanding the problem. The ADF Faces layout guidelines dictate starting with an unbroken chain of the components that are stretched by their parents and within that islands of flow layout, usually initiated by an `af:panelGroupLayout` where the components have fixed heights or take their dimensions from their children. If in the root of the portlet, we have that unbroken chain of components looking to take their dimensions from their parent but the portlet itself is in a flow layout and therefore is looking to take its dimensions from the content there is an impasse. The portlet is looking to take its dimensions from its parent for the size. It should be clear then that the solution to this is to stretch the portlet (that is, take it out of the flow layout island), set a height on the portlet, or make the content of the portlet entirely and island of flow layout content.

If the content cannot be auto-sized, the height defaults to 200px in Firefox and 0px in Internet Explorer. The fact that Internet Explorer is 0 is caused by incorrect behavior where the `scrollHeight` does not correctly respect the `min-height` CSS style setting. In Firefox, the 200px height comes from the `minheight` setting on the region that renders the portletized task flow. To work around this, you can set the `height` or `min-height` CSS in the consumer.

### Auto-Sizing Best Practice

To get the best results when using the portlet in a flow layout where you want it auto-size the content:

- Make the portlet content an unbroken chain of components that take their dimensions from their children.
- Use the `dimensionsFrom="children"` attribute on components that support it, for example, `af:panelStretchLayout`, to make them take their dimensions from their children.
- Use `layout="vertical"` rather than `layout="scroll"` on `panelGroupLayout` to make the size of its children contribute to the overall auto-sized dimensions.
- When switching from the flow layout chain of components to a stretch layout, set an explicit height on the first component that stretches its children. Typically, this

will be where you have used `panelStretchLayout` with `dimensionsFrom="parent"`.

## 62.6.6 What You May Need to Know About Minimize, Restore, and Move

To accommodate the needs of the development environment, the behavior of the actions Minimize, Restore, and Move for Show Detail Frame and portlet components differs between design time and runtime. At design time, these actions persist in a given WLS session, but do not persist over sessions (*session* means the time between starting and stopping WLS). At runtime, these actions persist both during a given WLS session and across sessions.

This difference has been introduced to enable an automatic reset of an application page at design time.

If persisting across sessions is not required at runtime, then a simple modification to the application's `web.xml` file can turn it off. Go to the following parameter setting in the application's `web.xml` file ([Example 62-5](#)):

### **Example 62-5 Persistence Setting in the Application's web.xml File**

```
<context-param>
  <param-name>oracle.adf.view.faces.CHANGE_PERSISTENCE</param-name>
  <param-value>oracle.adfinternal.view.faces.change.HybridChangeManager</param-value>
</context-param>
```

Replace it with the following ([Example 62-6](#)):

### **Example 62-6 Turning Runtime Persistence Off in the Application's web.xml File**

```
<context-param>
  <param-name>oracle.adf.view.faces.CHANGE_PERSISTENCE</param-name>
  <param-value>oracle.adf.view.faces.change.SessionChangeManager</param-value>
</context-param>
```

If security has been implemented on the application, then the Minimize, Restore, and Move actions display only to users with Customize privileges. They do not display to users with Personalize privileges. Customize users can test the effect of these actions by following these steps at design time:

1. Run the application page using JDeveloper's Integrated WLS.
2. Log in as the administrator.
3. Minimize a portlet, move portlets around, make whatever changes you want using the relevant actions commands.
4. Log out, then log in as a user and check the effects of your actions.

## 62.6.7 What Happens at Runtime

Once you place a portlet on a page, right-click the page and choose **Run**. This displays the page and runs the portlet in your default browser using JDeveloper's Integrated WLS. Different portlets may require additional runtime configuration. Notably, the content of an OmniPortlet or Web Clipping portlet instance is defined at runtime. For more information about OmniPortlet, see [Chapter 63, "Creating Portlets with OmniPortlet."](#) For more information about the Web Clipping portlet, see [Chapter 64, "Creating Content-Based Portlets with Web Clipping."](#) For more information about portlets generally, see [Chapter 57, "Introduction to Portlets."](#)

When running a portlet that has an Edit mode (in a Framework application, this renders as a Personalize icon (pencil icon) in the portlet header), the Personalize icon displays only to authenticated users (that is, users who have logged in). Anonymous or public users do not see the option to personalize the portlet. Some form of security must be implemented for the portlet-consuming application before users can personalize their view of a portlet. If you are a developer creating portlets and pages, you may want to test your portlet's Edit mode without creating a complete security model for your application. For information about how to add security to enable testing of a portlet's Edit mode, see [Section 68.12, "Configuring Basic Authentication for Testing Portlet Personalization."](#)

---

**Note:** To be able to add portlets to your page at runtime, you must add at least one portlet to that page at design time. Adding a portlet at design time ensures that the following is added to the `<definitionFactories>` element of the `DataBindings.cpx` file:

```
<factory namespace="http://xmlns.oracle.com/portlet/bindings"
className="oracle.adf.model.portlet.binding.PortletBindingDefFactoryImpl"/>
<dtfactory
className="oracle.adfdtinternal.view.faces.portlet.PortletDefinitionDTFactory"/>
```

This entry is required to enable consumption of portlets at runtime.

---

If a portlet supports parameters or events and the automatic parameter and event listening is enabled, any changes to the supported parameters and events (or to parameters and events that are aliased) automatically update the portlet.

When running a portlet from a producer associated with an external application, a link to update login information is displayed. Clicking the link displays a credential provisioning page for entering external application credentials. After specifying valid credentials the portlet displays content appropriately. For more information about external applications, see [Section 68.13, "Working with External Applications."](#)

## 62.7 Setting Attribute Values for the Portlet Tag

In the source code view of a page, each portlet is represented by an `adfp:portlet` tag (or `adfph:portlet` tag), which includes a set of required and optional attributes. Required attributes, `value` and `portletType`, are provided automatically by the framework, and must not be altered. Optional attribute values are relevant when support for the attribute is built into the portlet. For example, you can set `isAboutModeAvailable` to `true`, but if no About mode has been defined for the portlet, then the attribute setting does not affect the portlet.

Portlets also support a set of style-related attributes, which are discussed more fully in [Section 21.10, "Applying Styles to Components."](#)

The portlet tag uses many attributes, which you can set at design time either through the JDeveloper Property Inspector or in the source code as attributes of the tag.

This section includes the following subsections:

- [Section 62.7.1, "How to Set Attribute Values for the Portlet Tag Using the Property Inspector"](#)
- [Section 62.7.2, "How to Set Attribute Values for the Portlet Tag in Source Code"](#)

- [Section 62.7.3, "Common Attributes of the Portlet Tag"](#)
- [Section 62.7.4, "Appearance Attributes of the Portlet Tag"](#)
- [Section 62.7.5, "Behavior Attributes of the Portlet Tag"](#)
- [Section 62.7.6, "Portlet Modes Attributes of the Portlet Tag"](#)
- [Section 62.7.7, "Style Attributes of the Portlet Tag"](#)
- [Section 62.7.8, "Binding Attributes of the Portlet Tag"](#)
- [Section 62.7.9, "Customization Attributes of the Portlet Tag"](#)
- [Section 62.7.10, "Other Attributes of the Portlet Tag"](#)

### 62.7.1 How to Set Attribute Values for the Portlet Tag Using the Property Inspector

The Property Inspector provides a quick and easy way to set attribute values for the portlet tag without having to edit the source code yourself.

To set attribute values for the portlet tag using the Property Inspector:

1. In the Application Navigator, open the application that contains the page on which the portlet appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. In the design view, select the portlet whose attributes you want to set.
5. In the Property Inspector, click the appropriate tab and set the desired attribute. Repeat this step as often as required.
6. Save your changes.
7. To test the changes you have made, right-click the page and choose **Run**.

### 62.7.2 How to Set Attribute Values for the Portlet Tag in Source Code

If you prefer working in source code, you can set attribute values for the portlet tag directly there.

To set attribute values for the portlet tag in source code:

1. In the Application Navigator, open the application that contains the page on which the portlet appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. In the design view, select the portlet whose attributes you want to set.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Make your changes directly to the source code. [Example 62-7](#) shows an edited portlet tag.

**Example 62–7 An Edited Portlet Tag**

```
<adfp:portlet value="#{bindings.portlet1}"
  portletTypes="/oracle/adf/portlet/WsrpPortletProducer1/applicationPortlets/
    E0default_b452f828_010a_1000_8002_82235f57eaa8"
  allModesSharedScreen="true"
  isMaximizable="true"
  isMinimizable="true"/>
```

7. Save your changes.
8. To test the changes you have made, right-click the page and choose **Run**.

**62.7.3 Common Attributes of the Portlet Tag**

Table 62–1 describes the common attributes of the portlet tag.

**Table 62–1 Common Attributes of the Portlet Tag**

Attribute	Value	Description
id	Text string. For example: id="newsBrief"  The value must follow a subset of the syntax allowed in HTML: <ul style="list-style-type: none"> <li>■ Must not be a zero-length String.</li> <li>■ First character must be an ASCII letter (A-Z a-z) or an underscore (_).</li> <li>■ Subsequent characters must be ASCII letter or digits (a-Z a-z 0-9), underscores (_), or dashes (-).</li> </ul>	The unique identifier of the portlet. This attribute is populated with a unique value by default when you add the portlet to a page.
title	Text string. For example: title="Announcements"	The portlet title, which is displayed in the portlet header.  The value specified here takes precedence over any title specified elsewhere (for example, in the portlet markup).  If no value is specified here, the portlet extracts its title from the portlet markup (response).  If no value is specified either here or in the portlet markup, the portlet extracts its title from the portlet definition.  <b>Note:</b> Supplying a value to the <code>title</code> attribute at design time means that any change made to the title at runtime in Edit or Edit Defaults mode is ignored.
width	Number expressed in pixels or as a percentage of available area: <ul style="list-style-type: none"> <li>■ For pixels, enter <i>npx</i>, for example: width = 300px</li> <li>■ For percentage, enter <i>n%</i>, for example: width = 50%</li> </ul>	The width of the area to allow for portlet display.  If the actual portlet width is larger than the <code>width</code> value entered here, a scrollbar appears, provided <code>displayScrollBar</code> is set to <code>auto</code> or <code>true</code> . If <code>displayScrollBar</code> is set to <code>false</code> , and the actual portlet width exceeds the value expressed for the <code>width</code> attribute, the <code>width</code> attribute value is considered and the portlet content is truncated.

**Table 62–1 (Cont.) Common Attributes of the Portlet Tag**

Attribute	Value	Description
height	Number expressed in pixels, for example:  height = 300px	The height of the area to allow for portlet display.  If the actual portlet height is larger than the height value entered here, a scrollbar appears, provided displayScrollBar is set to auto or true. If displayScrollBar is set to false, and the actual portlet height exceeds the value expressed for the height attribute, the height attribute value is considered and the portlet content is truncated.
icon	URI to an image. For example:  icon="coffee.png"  In the Property Inspector, click the Property Menu icon next to the field and then choose <b>Edit</b> to locate and select the required image.  The value must be an absolute URI or a URI that is resolvable relative to the current page or the application context root. The URI provided in the preceding example is stored at the application context root, therefore a full path is not required.	A URI specifying the location of an image to use as an icon, displayed to the left of the portlet title in the portlet header. You can use the icon to indicate the portlet's purpose, to reinforce branding, as a content indicator, or for some other reason.
partialTriggers	One or more component IDs. For example:  partialTriggers="_id1 _id2 componentID5"  Separate component IDs with spaces.	The IDs of the components that trigger a partial update. The portlet listens on the specified trigger components. If a trigger component receives a trigger event that causes it to update in some way, this portlet also requests to be updated.

#### 62.7.4 Appearance Attributes of the Portlet Tag

Table 62–2 describes the appearance attributes of the portlet tag.

**Table 62–2 Appearance Attributes of the Portlet Tag**

Attribute	Value	Description
expansionMode	minimized normal Default: normal	The default state of the portlet: <ul style="list-style-type: none"> <li>minimized—The portlet's default display mode is collapsed (minimized).</li> <li>normal—The portlet's default display mode is neither collapsed nor expanded to the width of the page.</li> </ul>
allModesSharedScreen	auto false true Default: auto	Whether a change in portlet mode renders the new mode on a new page, rather than the page on which the portlet resides. <ul style="list-style-type: none"> <li>auto—All portlet modes are displayed inline if the remote portlet is configured, through the <code>com.oracle.portlet.requireIFrame</code> container runtime option in its <code>portlet.xml</code> file, to require an inline frame (IFRAME). This ensures that Oracle Bridge portlets are displayed inline.</li> <li>false—All portlet modes, except View (JSR 286) or Show (PDK-Java), are rendered each on their own page. This is useful for portlets such as OmniPortlet and the Web Clipping portlet, which require that modes other than Show mode display on pages other than the page on which the portlet resides.</li> <li>true—All portlet modes are displayed inline. One mode is swapped out for another on the same page. In other words, this attribute enables all portlet modes to display without leaving the context of a given page.</li> </ul>
renderPortletInIFrame	auto false true Default: auto	Whether the portlet is rendered in an IFRAME: <ul style="list-style-type: none"> <li>auto—Whenever possible, the portlet consumer attempts to rewrite the portlet markup so that it renders correctly in an ADF page. Otherwise, the portlet is rendered in an IFRAME.</li> <li>false—The portlet is never rendered in an IFRAME.</li> <li>true—The portlet is always rendered in an IFRAME.</li> </ul> <p>For more information, see <a href="#">Section 62.6.4, "What You May Need to Know About Inline Frames."</a></p>
displayScrollBar	auto false true Default: auto	Whether a scroll bar is displayed: <ul style="list-style-type: none"> <li>auto—Render a scroll bar if the portlet content does not fit the width and height specified.</li> <li>false—Never render a scroll bar. If the portlet content does not fit the height and width specified, the portlet renders in its actual size.</li> <li>true—Always render a scroll bar.</li> </ul>

**Table 62–2 (Cont.) Appearance Attributes of the Portlet Tag**

Attribute	Value	Description
displayHeader	false true Default: true	Whether the portlet header is displayed: <ul style="list-style-type: none"> <li>■ false—The portlet header is not displayed. Icons and links normally displayed in the header are hidden. If <code>isSeededInteractionAvailable</code> is set to <code>true</code>, users can access portlet menus and icons by rolling the mouse over the portlet. A fade-in/fade-out toolbar appears, from which users can select Actions menu options.</li> <li>■ true—The portlet header is displayed. Consequently, header-based icons and links are displayed.</li> </ul>
displayShadow	false true Default: true	Whether to display a shadow decoration around the portlet: <ul style="list-style-type: none"> <li>■ false—Do not display a shadow decoration.</li> <li>■ true—Display a shadow decoration.</li> </ul>
rendered	false true Default: true	Whether the portlet is rendered. <ul style="list-style-type: none"> <li>■ false—Do not render the portlet. No output is rendered.</li> <li>■ true—Render the portlet. This is the recommended setting. Setting this attribute to <code>false</code> causes problems when you run the page.</li> </ul>
background	dark light medium Default: medium	The style selector to apply to the skin used by the portlet: <ul style="list-style-type: none"> <li>■ dark—Apply the dark style selector to the skin.</li> <li>■ light—Apply the light style selector to the skin.</li> <li>■ medium—Apply the medium style selector to the skin.</li> </ul> <p>This provides a way for you to apply a different look and feel to each portlet on an page.</p>
shortDesc	Text string. For example: <code>shortDesc="Portlet for entering display text in place."</code>	A short description of the portlet.
displayActions	always onHover Default: always	Whether seeded interactions for the portlet are shown: <ul style="list-style-type: none"> <li>■ always—Always show seeded interactions.</li> <li>■ onHover—Show seeded interactions when users move the mouse over the portlet.</li> </ul>

**Table 62–2 (Cont.) Appearance Attributes of the Portlet Tag**

Attribute	Value	Description
showMoveAction	menu none Default: menu	<p>Whether to display the <b>Move</b> command in the portlet's <b>Action</b> menu:</p> <ul style="list-style-type: none"> <li>■ menu—Display the <b>Move</b> command on the portlet's <b>Action</b> menu.</li> <li>■ none—Do not display the <b>Move</b> command.</li> </ul> <p>There is a difference in the way that the <b>Move</b> command behaves at design time and at runtime. For more information, see <a href="#">Section 62.6.6, "What You May Need to Know About Minimize, Restore, and Move."</a></p>
showRemoveAction	menu none Default: menu	<p>Whether to display the Remove icon on the portlet chrome:</p> <ul style="list-style-type: none"> <li>■ menu—Display the <b>Remove</b> command on the portlet's <b>Action</b> menu.</li> <li>■ none—Do not display the Remove icon.</li> </ul> <p>There is a difference in the way that the Remove icon behaves at design time and at runtime. For more information, see <a href="#">Section 62.6.6, "What You May Need to Know About Minimize, Restore, and Move."</a></p> <p><b>Note:</b> This attribute is available only for the <code>adfp:portlet</code> tag and not for the <code>adfph:portlet</code> tag.</p>
showResizer	always never Default: always	<p>Whether to display the resize handle at the bottom right corner of the portlet.</p> <ul style="list-style-type: none"> <li>■ always—Always display the resize handle.</li> <li>■ never—Never display the resize handle.</li> </ul> <p><b>Note:</b> This attribute is available only for the <code>adfp:portlet</code> tag and not for the <code>adfph:portlet</code> tag.</p>
showMinimizeAction	chrome none Default: chrome	<p>Whether to display the Minimize icon on the portlet chrome:</p> <ul style="list-style-type: none"> <li>■ chrome—Display the Minimize icon on the portlet chrome.</li> <li>■ none—Do not display the Minimize icon.</li> </ul> <p>There is a difference in the way that the Minimize icon behaves at design time and at runtime. For more information, see <a href="#">Section 62.6.6, "What You May Need to Know About Minimize, Restore, and Move."</a></p>

## 62.7.5 Behavior Attributes of the Portlet Tag

[Table 62–3](#) describes the behavior attributes of the portlet tag.

**Table 62–3 Behavior Attributes of Portlet Tag**

Attribute	Value	Description
partialTriggers	One or more component IDs. For example: partialTriggers="_id1 _id2 componentID5"  Separate component IDs with spaces.	The IDs of the components that trigger a partial update. The portlet listens on the specified trigger components. If a trigger component receives a trigger event that causes it to update in some way, this portlet also requests to be updated.
submitUrlParameters	false true Default: false	Whether parameters in portlet links that point to the page on which the portlet is placed are made available to the page: <ul style="list-style-type: none"> <li>■ false—Parameters are not made available to the page. Rather, they are available only inside the portlet initiating the request.</li> <li>■ true—Parameters available on the container page.</li> </ul>

### 62.7.6 Portlet Modes Attributes of the Portlet Tag

Portlet Modes attributes control the rendering of mode-switching UI actions, such as entering edit mode. The ability to render a portlet in a particular mode depends on the modes supported by the portlet and the user authorization. For example, if the `isCustomizeModeAvailable` attribute is set to `true`, but the action is not supported in the portlet, then the attribute setting does not affect the portlet.

Portlet Modes attributes, described in [Table 62–4](#), are value binding expressions that evaluate to `true` or `false`:

- `true` means the portlet is allowed to render in the named mode.
- `false` means the portlet is not allowed to render in the named mode.

**Table 62–4 Portlet Modes Attributes of the Portlet Tag**

Attribute	Value	Description
isAboutModeAvailable	false true Default: true	Whether to render an <b>About</b> command on the portlet's <b>Actions</b> menu.  Users choose <b>About</b> to invoke the portlet's About mode.
isConfigModeAvailable	false true Default: true	Whether to render a <b>Configure</b> command on a JSR 286 portlet's <b>Actions</b> menu.  Users choose <b>Configure</b> to open the portlet's Configuration settings.
isCustomizeModeAvailable	false true Default: true	Whether to render a <b>Customize</b> icon in the portlet header.  Site administrators choose <b>Customize</b> to edit a portlet's default personalization data.
isDetailModeAvailable	false true Default: true	Whether to render a <b>Details</b> command on a PDK-Java portlet's <b>Actions</b> menu.  Users choose <b>Details</b> to open the portlet in Full Screen mode.

**Table 62–4 (Cont.) Portlet Modes Attributes of the Portlet Tag**

Attribute	Value	Description
isHelpModeAvailable	false	Whether to render a <b>Help</b> command on the portlet's <b>Actions</b> menu.
	true Default: true	Users choose <b>Help</b> to open the portlet's Help page.
isPrintModeAvailable	false	Whether to render a <b>Print</b> command on a JSR 286 portlet's <b>Actions</b> menu.
	true Default: true	Users choose <b>Print</b> to displays a printer-friendly version of the portlet.
isNormalModeAvailable	false	Whether to render a <b>Refresh</b> command on the portlet's <b>Actions</b> menu.
	true Default: true	Users choose <b>Refresh</b> to redraw the portlet independent of any other content on the page (also known as a partial-page refresh).
isPersonalizeModeAvailable	false	Whether to render a <b>Personalize</b> icon in the portlet header.
	true Default: true	<p>Users choose <b>Personalize</b> to alter their personal view of the portlet. This mode is equivalent to the Edit mode selection in the Standards-based Java Portlet (JSR286) Wizard.</p> <p>The <b>Personalize</b> icon displays only to authenticated users (that is, users who are logged in). It does not display to public or unauthenticated users. You must implement some form of application security for users to be able to personalize their portlet views.</p> <p>If you are a developer creating portlets, and you want to test the Personalize mode without creating a complete security model for your application, then see <a href="#">Section 68.12, "Configuring Basic Authentication for Testing Portlet Personalization."</a></p> <p><b>Note:</b> A typical personalization setting is Portlet Title. You can set Portlet Title at design time, by providing a value for the <code>title</code> attribute. Consider however that supplying a value to the <code>title</code> attribute at design time prevents personalization and customization of the portlet title at runtime.</p>
isPreviewModeAvailable	false	Whether to enable previewing of portlet content.
	true Default: false	This mode has no particular application in Framework applications, but it is used in Oracle Portal's Portlet Repository, where it renders as a magnifying glass icon, which users click to preview a portlet.

### 62.7.7 Style Attributes of the Portlet Tag

[Table 62–5](#) describes the style attributes of the portlet tag.

**Table 62–5 Style Attributes of the Portlet Tag**

Attribute	Value	Description
<code>contentType</code>	One or more CSS styles. These should be in compliance with, at least, CSS 2.0 and take the following format: <code>contentType="color:rgb(255,0,255); font-family:Arial Helvetica Geneva sans-serif;font-size:large;"</code>	The CSS style to apply to the portlet content. Values entered here take precedence over styles specified in the <code>inlineStyle</code> attribute and those included in a CSS or skin on the specific portlet instance. For more information, see <a href="#">Understanding contentType and inlineStyle Properties</a> .
<code>inlineStyle</code>	One or more CSS styles. These should be in compliance with, at least, CSS 2.0 and take the following format: <code>inlineStyle="color:rgb(255,0,255); font-family:Arial Helvetica Geneva sans-serif;font-size:large;"</code>	The CSS style to apply to the whole portlet. Values entered here take precedence over styles included in a CSS or skin on the specific portlet instance. For more information, see <a href="#">Understanding contentType and inlineStyle Properties</a> .

## 62.7.8 Binding Attributes of the Portlet Tag

[Table 62–6](#) describes the binding attributes of the portlet tag.

**Table 62–6 Binding Attributes of the Portlet Tag**

Attribute	Value	Description
<code>binding</code>	Name of a managed bean. For example: <code>binding="#{frameActionsBean.Binding}"</code>  In the Property Inspector, click the Property Menu icon next to the field and then choose <b>Edit</b> to select a managed bean and specify the relevant managed bean property.	A binding reference to store the component instance. The binding reference binds an instance of the portlet to a managed bean property. Managed beans are any JavaBeans used by the application that are registered in the JSF <code>faces-config.xml</code> file.

## 62.7.9 Customization Attributes of the Portlet Tag

[Table 62–7](#) describes the customization attributes of the portlet tag.

**Table 62–7 Customization Attributes of the Portlet Tag**

Attribute	Value	Description
<code>customizationAllowed</code>	<code>false</code> <code>true</code> Default: <code>true</code>	Whether design time customizations of the portlet tag are allowed on this portlet.
<code>customizationAllowedBy</code>	Text string	The roles for which design time customizations are allowed. This attribute enables you to allow customizations, but restrict who can actually perform them.

## 62.7.10 Other Attributes of the Portlet Tag

[Table 62–8](#) describes the other attributes of the portlet tag.

**Table 62–8 Other Attributes of the Portlet Tag**

Attribute	Value	Description
iframeDtd	loose none strict  Default: loose	Which DTD, if any, is specified in the <code>doctype</code> declaration that is created when portlet content is rendered inside a IFRAME: <ul style="list-style-type: none"> <li>▪ none—No DTD is specified. This relaxes the restrictions on the HTML content being technically conformant HTML. Browsers usually handle such HTML acceptably, however, because some CSS style sheet from the ADF Faces page consuming the portlet is also imported into the IFRAME document, for that style sheet to work correctly, it may be necessary to declare the content conformant to the loose or strict DTDs.</li> <li>▪ loose—The DTD <code>http://www.w3.org/TR/html/loose.dtd</code> is used.</li> <li>▪ strict—The DTD <code>http://www.w3.org/TR/html/strict.dtd</code> is used</li> </ul>

## 62.8 Manually Wiring Parameters and Events in JSR 286 Portlets

If the portlet that you add to your page defines parameters or events that it uses to dynamically alter its content, for the most part this happens automatically. For more information, see [Section 62.6.3, "What You May Need to Know About Interportlet Communication."](#)

However, in some circumstances you may find it necessary to turn off the default automatic parameter and event listening, or you may be using portlets with parameters or events with names that do not match or define appropriate aliases. In such situations, you must manually wire the parameters and events in your portlets.

This section includes the following sections:

- [Section 62.8.1, "How to Manually Link Portlets with Public Render Parameters"](#)
- [Section 62.8.2, "How to Manually Link Portlets with Portlet Events"](#)

### 62.8.1 How to Manually Link Portlets with Public Render Parameters

When you place a portlet on a page, any public render parameters with the same QName are automatically linked. For example, if one portlet publishes a value to a parameter with the name `myParam`, then if a second portlet on the page accepts values from a parameter with the same name, the second portlet is automatically updated with the appropriate value.

Portlets can also link together using parameters with different QNames if the portlet developer has set up aliases for the parameter.

The following example shows how to use public render parameters to link the behavior of two portlets using parameters with different names and no defined aliases. In the example, we take a generic Parameter Form portlet that allows us to update public render parameters, and show how that can be linked to a Stock Price portlet that renders stock prices, taking the stock symbol from a public render parameter.

When these two portlets are dropped onto the same page, they are not automatically linked together. This is because none of the generic parameter names in the Parameter Form portlet match the `stocksymbol` parameter in the Stock Price portlet, and the Stock Price portlet does not define any aliases for the `stocksymbol` parameter that match the generic parameter names in the Parameter Form portlet.

There are two methods for manually linking parameters:

- [Section 62.8.1.1, "Manually Linking Parameters Using Page Variables"](#)
- [Section 62.8.1.2, "Manually Linking Parameters Using the ParametersChange ADF Contextual Event"](#)

### 62.8.1.1 Manually Linking Parameters Using Page Variables

When the portlets are dropped onto a page, page variables are created for each of the parameters supported by the portlets. In our example, there are three page variables for the Parameter Form portlet and one for the Stock Price portlet ([Example 62–8](#)).

#### **Example 62–8** Page Variables Created for Portlet Parameters

```
<pageDefinition ...>
  <parameters/>
  <executables>
    <variableIterator id="variables">
      <variable Name="ParameterFormPortlet1_1_Parameter1"
        Type="java.lang.Object"/>
      <variable Name="ParameterFormPortlet1_1_Parameter2"
        Type="java.lang.Object"/>
      <variable Name="ParameterFormPortlet1_1_Parameter3"
        Type="java.lang.Object"/>
      <variable Name="StockPricePortlet1_1_stocksymbol"
        Type="java.lang.Object"/>
    </variableIterator>
    <portlet id="ParameterFormPortlet1_1"
      ...>
      <parameters>
        <parameter name="Parameter1"
          pageVariable="ParameterFormPortlet1_1_Parameter1"/>
        <parameter name="Parameter2"
          pageVariable="ParameterFormPortlet1_1_Parameter2"/>
        <parameter name="Parameter3"
          pageVariable="ParameterFormPortlet1_1_Parameter3"/>
      </parameters>
      <events>
        <event eventType="ParametersChange"
          name="ParameterFormPortlet1_1_Event"/>
      </events>
    </portlet>
    <portlet id="StockPricePortlet1_1"
      ...>
      <parameters>
        <parameter name="stocksymbol"
          pageVariable="StockPricePortlet1_1_stocksymbol"/>
      </parameters>
      <events>
        <event eventType="ParametersChange"
          name="StockPricePortlet1_1_Event"/>
      </events>
    </portlet>
  </executables>
```

```
<bindings/>
</pageDefinition>
```

To link the portlets, you can make the Stock Price portlet use the value from one of the page variables created for the Parameter Form portlet ([Example 62–9](#)).

**Example 62–9 Linking Portlet Parameters Using Page Variables**

```
<portlet id="StockPricePortlet1_1"
...>
<parameters>
<parameter name="stocksymbol"
pageVariable="ParameterFormPortlet1_1_Parameter1"/>
</parameters>
<events>
<event eventType="ParametersChange"
name="StockPricePortlet1_1_Event"/>
</events>
</portlet>
```

Now, entering a value in the first parameter field of the Parameter Form portlet sets the corresponding page variable to the same value, which in turn causes the Stock Price portlet to be updated with the new value.

### 62.8.1.2 Manually Linking Parameters Using the ParametersChange ADF Contextual Event

When you drop a portlet that supports parameters, as well as the page variables discussed in the previous section, an ADF `ParametersChange` contextual event is created for the portlet. This event is triggered when the values of the portlet's parameters change. The payload of the event is the new value of the parameter. You can use this event to set the value of another portlet's parameter by creating an event map in the page definition that maps the payload of the first portlet's event to the second portlet's parameter. [Example 62–10](#) shows how this event map would look for our example.

**Example 62–10 Linking Portlet Parameters Using the ParametersChange ADF Contextual Event**

```
<eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
<event name="ParameterFormPortlet1_1_Event">
<producer region="ParameterFormPortlet1_1">
<consumer handler="StockPricePortlet1_1">
<parameters>
<parameter name="stocksymbol">
value="{payload.Parameter1}"/>
</parameters>
</consumer>
</producer>
</event>
</eventMap>
```

Entering a value in the first parameter field of the Parameter Form portlet triggers the `ParametersChange` event. The payload of this event, the new parameter value, is then sent to the Stock Price Portlet and used to specify the value of the `stocksymbol` parameter.

## 62.8.2 How to Manually Link Portlets with Portlet Events

The following example shows how to manually link portlets using portlet events in the case where the names of the events defined for the different portlets do not match.

**Tip:** You can download a ZIP file containing the example in this section from:

<http://www.oracle.com/technetwork/middleware/webcenter/ps3-samples-176806.html>

In the example, we have a portlet, the Department Locations portlet, which lists the geographical locations of a company's various offices. The Department Locations portlet raises a portlet event (`latLong`) when a particular department is selected in the portlet.

There is another portlet, the Map portlet, which displays a Google map. The Map portlet listens out for a portlet event (`geolocation`) to use to determine a location to display on a map.

When the two portlets are dropped on a page, there is no way for the Map portlet to know that the event raised by the Department Locations portlet provides information that it can use to display a map. To make this link between the two portlets, you must edit the page definition to explicitly create the mapping between the two events, as shown in [Example 62-11](#).

### Example 62-11 Explicit Event Mapping in the Page Definition

```
<pageDefinition ...>
  <parameters/>
  <executables>
    <variableIterator id="variables"/>
    <portlet id="DepartmentLocations1_1"
      ...
      <events>
        <event name="latLong">
          <portletevent namespace-uri="http://xmlns.oracle.com/portlet/EventSample"
            localpart="latLong"/>
        </event>
      </events>
    </portlet>
    <portlet id="Map1_1"
      ...
      <events>
        <event name="geolocation">
          <portletevent namespace-uri="http://xmlns.oracle.com/portlet/EventSample"
            localpart="geolocation"/>
        </event>
      </events>
    </portlet>
  </executables>
  <bindings/>
  <eventMap xmlns="http://xmlns.oracle.com/adfm/contextualEvent">
    <event name="{http://xmlns.oracle.com/portlet/EventSample}latLong">
      <producer region="DepartmentLocations1_1">
        <consumer handler="Map1_1.{http://xmlns.oracle.com/portlet/EventSample}geolocation"/>
      </producer>
    </event>
  </eventMap>
</pageDefinition>
```

## 62.9 Copying Portlets

When you copy portlets, the portlets and their copies must reside within the same application. For example, you can copy a portlet from one page in an application to another page in the same project in that application, or from one place on a page to another place on the same page. You can also copy a portlet from one project to another project in the same application, if the target project is configured for consuming portlets. The copies are references to the same portlet instance, so customizations or personalizations made to any instance of the portlet (original or copy) affect all the other instances.

Copying a portlet is more than a matter of copying and pasting the portlet view tag. It involves copying portlet-related entries from the application page's source. It may also involve copying portlet-related entries from the page definition file and removing duplicate portlet binding information or creating a new method in the copied portlet's binding bean.

When a portlet is copied, the target page must be an Oracle ADF Faces page. Any preexisting code on the target page must reflect that. This is quite easy to accomplish. When JDeveloper creates a new JSF page, it contains pure JSF tags. The first time you drop an Oracle ADF Faces component onto the page, tags are automatically updated to be Oracle ADF Faces tags. For example, an `<html>` tag becomes `<afh:html>`, `<head>` and `<title="title">` tags become `<afh:head title="title">`, and so on. Therefore, a simple way to ensure the conversion of the target page to an Oracle ADF Faces page is to place any Oracle ADF Faces component on the target page. This performs any required code conversion for you automatically.

This section includes the following subsections:

- [Section 62.9.1, "How to Copy a Portlet and Place it on the Same Page"](#)
- [Section 62.9.2, "How to Copy a Portlet from One Application Page to Another"](#)

### 62.9.1 How to Copy a Portlet and Place it on the Same Page

Because all of the page's resources are available to both portlet instances when you copy a portlet to the same page, there is no requirement to copy portlet-related information from the page's Page Definition file. It is just a matter of copying and pasting the portlet's view tag, and assigning a unique identifier to the copy.

To copy and place a portlet on the same page:

1. In the Application Navigator, open the application that contains the page on which the portlet to copy appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. In the design view, select the portlet to copy.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Copy the portlet tag ([Example 62-12](#)).

**Example 62-12 Code Fragment to be Copied When Copying a Portlet**

```
<f:view>
  <afh:html binding="#{backing_portlet_page.html1}" id="html1">
```

```

<afh:head title="portlet_page" binding="#{backing_portlet_page.head1}"
  id="head1">
  <meta http-equiv="Content-Type"
    content="text/html; charset=windows-1252" />
</afh:head>
<afh:body binding="#{backing_portlet_page.body1}" id="body1">
  <h:form binding="#{backing_portlet_page.form1}" id="form1">
    <adfp:portlet value="#{bindings.portlet1}"
      portletType="/oracle/adf/portlet/
      pdksampleproducer_1153245807295/applicationPortlets/
      Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
      binding="#{backing_portlet_page.portlet1}"
      id="portlet1"
      isCustomModesAvailable="true"/>
  </h:form>
</afh:body>
</afh:html>
</f:view>

```

7. Paste the copied code fragment into the desired location of the page source.
8. Provide a unique value for the copy's `id` attribute (Example 62–13).

**Example 62–13 Changing the Portlet ID**

```

<adfp:portlet value="#{bindings.portlet1}"
  portletType="/oracle/adf/portlet/
  pdksampleproducer_1153245807295/applicationPortlets/
  Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
  binding="#{backing_portlet_page.portlet1}"
  id="portlet2"
  isCustomModesAvailable="true"/>

```

---

**Note:** On a given page, each portlet must have a unique ID.

---

9. In the page source, if the copied portlet's `adfp:portlet` tag has a binding attribute, for example:

```
binding="#{backing_untitled2.portlet1}"
```

Then either remove this binding, or create a new method in the binding bean by opening the managed bean class for this managed bean and defining the new method.

For example, if `portlet1` is copied, the pasted copy becomes `portlet2` in the managed bean class, as shown in Example 62–14.

**Example 62–14 Creating a New Method for a Managed Bean in the Managed Bean Class**

```

.
private PortletBase portlet2;
public void setPortlet2(PortletBase portlet2) {
    this.portlet2 = portlet2;
}
.
public PortletBase getPortlet2() {
    return portlet2;
}

```

10. From the main menu, choose **File > Save All**.

## 62.9.2 How to Copy a Portlet from One Application Page to Another

When you copy a portlet from one page to another in an application, portlet-related code must also be copied from the source page's Page Definition file. This section describes the steps related to both copying from one application page to another and from one application project to another.

To copy a portlet from one page to another:

1. In the Application Navigator, open the application that contains the page on which the portlet to copy appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. In the design view, select the portlet to copy.
5. Click the **Source** tab. The portlet that you selected is highlighted in the source code.
6. Copy the portlet tag ([Example 62–15](#)).

### **Example 62–15 Source Page Code Fragment to Be Copied When Copying a Portlet**

```
<f:view>
  <afh:html binding="#{backing_portlet_page.html1}" id="html1">
    <afh:head title="portlet_page" binding="#{backing_portlet_page.head1}"
      id="head1">
      <meta http-equiv="Content-Type"
        content="text/html; charset=windows-1252" />
    </afh:head>
    <afh:body binding="#{backing_portlet_page.body1}" id="body1">
      <h:form binding="#{backing_portlet_page.form1}" id="form1">
        <adf:portlet value="#{bindings.portlet1}"
          portletType="/oracle/adf/portlet/
            pdksampleproducer_1153245807295/applicationPortlets/
            Portlet2_82d49b79_010c_1000_8006_82235ffc4e2b"
          binding="#{backing_portlet_page.portlet1}"
          id="portlet1"
          isCustomModesAvailable="true"/>
        </h:form>
      </afh:body>
    </afh:html>
  </f:view>
```

7. Go to the application page to which to copy the portlet (the target page).

Portlets can reside only on Oracle ADF Faces pages. If the target page does not contain Oracle ADF Faces components, then ensure that the container objects—that is, any tags the portlet tag is nested in—use Oracle ADF tags.

If you are copying the portlet to a page in a different project, the target project must be configured for consuming portlets. To configure the project, you must register a portlet producer with the project. For information, see [Section 62.2, "Registering a WSRP Portlet Producer with a WebCenter Portal: Framework](#)

Application" or Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."

8. Click the **Source** tab and paste the copied code fragment into the desired location of the page source.
9. In the Application Navigator, right-click the source page (the page from which the portlet was copied), and choose **Go to Page Definition**.
10. Click the **Source** tab and copy the portlet binding from the source page's page definition file (Example 62–16).

**Example 62–16 Code Fragment to Be Copied From a Page Definition File**

```
<portlet id="portlet1"
  portletInstance="/oracle/adf/portlet/pdksampleproducer_
1153245/applicationPortlets/Portlet2_82d49_010c_1000_8006_82235"
  class="oracle.adf.model.portlet.binding.PortletBinding"
  xmlns="http://xmlns.oracle.com/portlet/bindings" />
```

---

---

**Note:** When the portlet being copied includes parameters, be sure to include the copied portlet's portlet parameters and the page variables linked to the portlet parameters in the copy.

---

---

11. In the Application Navigator, right-click the target page and choose **Go to Page Definition**.

If a page definition does not exist for the page, you are asked if you want to create one. Click **Yes**.

12. Click the **Source** tab and paste the portlet binding you copied from the source (along with relevant portlet parameters and the page variables associated with those parameters).

Paste the code between the `<executables>` tags. You may need to add a closing `</executables>` tag and ensure that the opening tag does not contain a slash (/).

13. From the main menu, choose **File > Save All**.

## 62.10 Deleting Portlets from Application Pages

When you delete a portlet from an application page, if the portlet had parameters, then you should also delete page variables associated with those parameters from the application page's Page Definition file.

To delete a portlet and its related page variables from a page:

1. In the Application Navigator, open the application that contains the page on which the portlet to delete appears.
2. Expand the project that contains the page.
3. Locate the page, right-click it, and then choose **Open**.

**Tip:** You can also double-click the page to open it.

4. In the design view, right-click the portlet to delete and choose **Delete**.

This deletes the portlet from the page and the portlet binding from the Page Definition file.

5. If the portlet included variables, in the Application Navigator, right-click the page and choose **Go to Page Definition**.
6. Click the **Source** tab and locate the page variables associated with the deleted portlet, and delete them from the page definition file.

For example, if you deleted portlet1, you would also delete the highlighted variables in [Example 62–17](#):

**Example 62–17 Deleting Portlet-Related Page Variables from a Page Definition File**

```
<?xml version="1.0" encoding="UTF-8" ?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
  version="10.1.3.38.97" id="untitled1PageDef"
  Package="project1.pageDefs">
  <parameters/>
  <executables>
    <variableIterator id="variables">
      <variable Name="portlet1_param1" Type="java.lang.Object"/>
      <variable Name="portlet1_param2" Type="java.lang.Object"/>
      <variable Name="portlet2_param1" Type="java.lang.Object"/>
      <variable Name="portlet2_param2" Type="java.lang.Object"/>
    </variableIterator>
    <portlet id="portlet2" portletInstance="/oracle/adf/portlet/
      PdkPortletProducer2_1154100666247/applicationPortlets/
      Portlet1_b5e49696_010c_1000_8008_8c5707ef9c4f"
      class="oracle.adf.model.portlet.binding.PortletBinding"
      xmlns="http://xmlns.oracle.com/portlet/bindings">
      <parameters>
        <parameter name="param1" pageVariable="portlet2_param1"/>
        <parameter name="param2" pageVariable="portlet2_param2"/>
      </parameters>
    </portlet>
  </executables>
  <bindings/>
</pageDefinition>
```

7. From the main menu, choose, select **File > Save All**.

## 62.11 Consuming WebCenter Services Portlets

WebCenter Services Portlets is a preconfigured, out-of-the-box producer that enables you to expose WebCenter Portal service task flows in other applications as WSRP portlets or pagelets.

WebCenter Services Portlets provides the following portlets:

- Document Manager—Displays folders, files, and wikis from the WebCenter Content repository
- Blogs—Displays blog posts from a selected location in the WebCenter Content repository
- Discussion Forums—Displays all discussions and their respective replies and enables users to perform various operations based on their privileges
- Announcements—Displays all current announcements and enables users to perform various operations based on their privileges

- Lists—Displays user-created lists and provides controls for creating lists and adding list data
- Polls Manager—Enables users to perform administrative operations on polls
- Take Polls—Displays the most recently published available poll, or a specific poll identified by the pollId parameter
- Mail—Displays a mail inbox
- Activity Stream—Provides an overview of the most recent activities performed by a user's connections
- Tag Cloud—Displays a tag cloud, which is a visual depiction of all the tags used on the page

You can consume WebCenter Services Portlets in the following applications:

- Oracle Portal
- Oracle WebLogic Portal
- Oracle WebCenter Interaction, using Oracle WebCenter Portal's Pagelet Producer

The WebCenter Services Portlets producer is a WSRP producer. As such, you register it with your application in the same way as you would any other WSRP producer.

---

---

**Note:** The WebCenter Services Portlets producer is a secured producer, so when you register the producer, you must use the same token as was used when configuring the producer in WebCenter Portal.

For information about configuring the WebCenter Services Portlets producer, see the "Configuring WebCenter Services Portlets" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

This section includes the following subsections:

- [Section 62.11.1, "How to Consume WebCenter Services Portlets in Oracle Portal"](#)
- [Section 62.11.2, "How to Consume WebCenter Services Portlets in Oracle WebLogic Portal"](#)
- [Section 62.11.3, "How to Consume WebCenter Services Portlets in Oracle WebCenter Interaction"](#)
- [Section 62.11.4, "How to Set WebCenter Services Portlets Parameters"](#)
- [Section 62.11.5, "WebCenter Services Portlets Limitations"](#)
- [Section 62.11.6, "Troubleshooting Problems with WebCenter Services Portlets"](#)

### 62.11.1 How to Consume WebCenter Services Portlets in Oracle Portal

To consume WebCenter Services Portlets in Oracle Portal:

1. Register the WebCenter Services Portlets WSRP producer in Oracle Portal.

For information about how to do this, see the "Securing Access to Web Services Remote Portlets" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.

2. After registering the producer, you can then add any of the portlets provided by the producer to pages in your Oracle Portal application.

For information about how to do this, see the "Adding a Portlet to a Page" section in the *Oracle Fusion Middleware User's Guide for Oracle Portal*.

### 62.11.2 How to Consume WebCenter Services Portlets in Oracle WebLogic Portal

To consume WebCenter Services Portlets in Oracle WebLogic Portal:

1. Register the WebCenter Services Portlets WSRP producer in Oracle WebLogic Portal.

For information about how to do this, see the "Adding a Producer" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

2. Add the remote portlets to the Portal Library.

For information about how to do this, see the "Adding a Remote Portlet to the Portal Library" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

3. The WebCenter Services Portlets producer is a secured WSRP producer, so you must set up the SAML security.

For information about how to do this, see the "SAML Security Between a WebLogic Portal Consumer and a WebCenter Portal: Framework Application Producer" section in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

4. After registering the producer and setting up the security, you can then add any of the portlets provided by the producer to pages in your Oracle WebLogic Portal application.

For information about how to do this, see the "Adding Contents to a Page" section in the *Oracle Fusion Middleware Portal Development Guide for Oracle WebLogic Portal*.

### 62.11.3 How to Consume WebCenter Services Portlets in Oracle WebCenter Interaction

To consume WebCenter Services Portlets in Oracle WebCenter Interaction:

1. To make WebCenter Services Portlets available in Oracle WebCenter Interaction, you must first register the producer as a pagelet producer using Oracle WebCenter Portal's Pagelet Producer.

For information about how to do this, see the "Registering WSRP and Oracle JPDK Portlet Producers in the Pagelet Producer" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

**Note:** You must select the same **Token Profile** that was specified when configuring WS-Security for WebCenter Services Portlets.

---

2. After creating the pagelet producer, you must then register it with Oracle WebCenter Interaction.

For information about how to do this, see the "Creating the Oracle WebCenter Pagelet Producer Remote Server" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

[http://docs.oracle.com/cd/E23010\\_01/wci.1034/e14107/toc.htm](http://docs.oracle.com/cd/E23010_01/wci.1034/e14107/toc.htm)

3. When the pagelet producer is registered with your Oracle WebCenter Interaction application, you must then create remote pagelet web services for each of the pagelets that you want to use.

For information about how to do this, see the "Creating or Editing a Remote Pagelet Web Service" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

[http://docs.oracle.com/cd/E23010\\_01/wci.1034/e14107/toc.htm](http://docs.oracle.com/cd/E23010_01/wci.1034/e14107/toc.htm)

4. Next, create portlets for the pagelets.

For information about how to do this, see the "Creating or Editing a Portlet" section in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

[http://docs.oracle.com/cd/E23010\\_01/wci.1034/e14107/toc.htm](http://docs.oracle.com/cd/E23010_01/wci.1034/e14107/toc.htm)

5. Finally, you can add the portlets to your Oracle WebCenter Interaction community pages.

For information about how to do this, see the "Creating a Community Page" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Interaction* at:

[http://docs.oracle.com/cd/E23010\\_01/wci.1034/e14107/toc.htm](http://docs.oracle.com/cd/E23010_01/wci.1034/e14107/toc.htm)

## 62.11.4 How to Set WebCenter Services Portlets Parameters

Each portlet provided by WebCenter Services Portlets defines various parameters that enable you to change the appearance or behavior of the portlet when you consume it in your application.

This section includes the following subsections:

- [Section 62.11.4.1, "Common WebCenter Services Portlets Parameters"](#)
- [Section 62.11.4.2, "Document Manager Portlet Parameters"](#)
- [Section 62.11.4.3, "Discussion Forums Portlet Parameters"](#)
- [Section 62.11.4.4, "Blogs Portlet Parameters"](#)
- [Section 62.11.4.5, "Lists Portlet Parameters"](#)
- [Section 62.11.4.6, "Polls Manager Portlet Parameters"](#)
- [Section 62.11.4.7, "Take Polls Portlet Parameters"](#)
- [Section 62.11.4.8, "Announcements Portlet Parameters"](#)
- [Section 62.11.4.9, "Mail Portlet Parameters"](#)
- [Section 62.11.4.10, "Activity Stream Portlet Parameters"](#)
- [Section 62.11.4.11, "Tag Cloud Portlet Parameters"](#)

### 62.11.4.1 Common WebCenter Services Portlets Parameters

[Table 62–9](#) lists the parameters that are available for all the portlets provided by WebCenter Services Portlets.

**Table 62–9 Common Parameters for WebCenter Services Portlets**

Parameter	Description
width	Specifies the width of the portlet on the consuming page. If not specified, the portlet takes up as much horizontal space as the page allows.
height	Specifies the height of the portlet on the consuming page. If not specified, the portlet height is determined by the portlet consumer.

#### 62.11.4.2 Document Manager Portlet Parameters

[Table 62–10](#) lists the additional parameters available for the Document Manager portlet.

**Table 62–10 Document Manager Portlet Parameters**

Parameter	Description
connectionName	<p>The name of the Oracle Content Server connection used by WebCenter Services Portlets. If no value is selected, the default connection specified by the application developer or administrator is used. For information about configuring content repository connections, see the "Registering Content Repositories" section in the <i>Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal</i>.</p> <p>Default: The connection selected as default in the Create Content Repository Connection dialog box by the application developer, which can be changed by the administrator.</p>
featuresOff	<p>A list of disabled features for the portlet. Use commas or spaces to separate items. Valid values are exposed in the JavaDoc: checkin, checkout, clipboard, close, delete, download, dnd, editwiki, editoffice, newfolder, newwiki, rename, upload, multifile-upload, profile-upload, search, advancedSearch, workflow, properties, history, comments, likes, links, tags, recommendations, autovue, title, related-items, social, sidebars, ils.</p> <p>Example:</p> <pre> \${'search, advancedSearch, clipboard, dnd, rename, newfolder, upload, newwiki, checkin, checkout, editoffice, edithtml, delete, sidebars, history'} </pre>
layout	<p>A target layout for the task flow. Select from:</p> <ul style="list-style-type: none"> <li>▪ <code>explorer</code>—(default) Displays folders and files in two panes; the left pane shows folders, and the right pane show the contents of the currently selected folder</li> <li>▪ <code>table</code>—Displays only the contents of the current folder in a single pane, with the capability to click a folder to drill down, refreshing the pane with the folder contents</li> <li>▪ <code>treeTable</code>—Displays the folder hierarchy in a single pane, beginning with the root folder, with the capability to expand and collapse folders</li> </ul>

**Table 62–10 (Cont.) Document Manager Portlet Parameters**

Parameter	Description
pageSize	<p>The maximum number of rows to show in the portlet. If the listing of folders and files in the portlet is larger than the specified number of rows, the portlet displays a scroll bar. Default: 27</p> <p><b>Note:</b> If you set <code>pageSize</code> to a value that is too big for the size of the screen, the end user will experience difficulty coordinating the portlet scroll bar with the application scroll bar.</p>
readOnly	<p>Specifies whether to disable and hide all content management operations:</p> <ul style="list-style-type: none"> <li>▪ <code>{true}</code>—Disable content management</li> <li>▪ <code>{false}</code>—(Default) Expose content management to users</li> </ul>
resourceId	The currently focused resource. This value can be a folder ID or a document ID.
startFolderPath	<p>The name of the folder to use as the root folder in the current portlet instance.</p> <p>This is a content-scoping parameter that assists with determining the source and range of content to display in the portlet instance.</p> <p>You can specify an EL expression to set this value.</p> <p>Example: <code>{ '/WebCenterB5/Proj_X/Specs' }</code></p>

#### 62.11.4.3 Discussion Forums Portlet Parameters

Table 62–11 lists the additional parameters available for the Discussion Forums portlet.

**Table 62–11 Discussion Forums Portlet Parameters**

Parameter	Description
categoryId	<p>An identifier for an existing category in WebCenter Portal's Discussion Server to which the view should be scoped.</p> <p>When no value is supplied, it defaults to the appropriate root category of the discussions server. (This root category ID can be overridden by supplying an additional property named <code>application.root.category.id</code> in the connection.)</p> <p>For testing purposes, you may want to create a category through the discussions server administrator interface and then reference that category identifier here.</p>
forumId	<p>An identifier for an existing forum in your discussions server for which popular topics should be fetched.</p> <p>If both <code>categoryId</code> and <code>forumId</code> are given, then only <code>categoryId</code> is honored.</p>
showRecursiveForums	<p>Determines if the portlet shows forums either in a category only or in subcategories.</p> <p>True means all forums under a given category/subcategory are shown; false means only the category's direct child forums are shown. The default value is false.</p> <p>Note: A value of true can impact performance.</p>

**Table 62–11 (Cont.) Discussion Forums Portlet Parameters**

Parameter	Description
<code>isCategoryView</code>	<p>Determines if the forums are grouped under the Category ID category or the topics are grouped under the Forum ID forum.</p> <p>True means the portlet displays the forums classified under <code>categoryId</code>; false means the portlet displays the topics associated with the specified <code>forumId</code>. The default value is false.</p> <p>This parameter works in combination with other parameters.</p>

#### 62.11.4.4 Blogs Portlet Parameters

[Table 62–12](#) lists the additional parameters available for the Blogs portlet.

**Table 62–12 Blogs Portlet Parameters**

Parameter	Description
<code>hideComments</code>	<p>Specifies whether or not to display blog post comments:</p> <ul style="list-style-type: none"> <li>■ <code>true</code>—Comments are shown for blog posts</li> <li>■ <code>false</code>—(Default) Comments are hidden for blog posts</li> </ul>
<code>pageSize</code>	<p>Specifies how many blog posts to show before pagination is displayed and users can select to go to the next page. By default, up to 10 blog posts can be displayed on a blog page.</p>
<code>resourceId</code>	<p>Specifies the unique identifier of the selected folder.</p> <p>The value can be specified in the following formats:</p> <ul style="list-style-type: none"> <li>■ <code>connection_name/path_to_folder</code> Where, <code>connection_name</code> is the name of the Oracle Content Server connection used by WebCenter Services Portlets, and <code>path_to_folder</code> is the path to the folder on Oracle Content Server that you want to expose as a blog.</li> <li>■ <code>connection_name#dCollectionID:dCollectionId</code> Where, <code>connection_name</code> is the name of the Oracle Content Server connection used by WebCenter Services Portlets, and <code>dCollectionId</code> is the collection ID of the folder on Oracle Content Server that you want to expose as a blog.</li> </ul>

#### 62.11.4.5 Lists Portlet Parameters

The Lists portlet does not include any additional parameters.

#### 62.11.4.6 Polls Manager Portlet Parameters

[Table 62–13](#) lists the additional parameters available for the Polls Manager portlet.

**Table 62–13 Polls Manager Portlet Parameters**

Parameter	Description
<code>showUserDataOnly</code>	<p>Determines whether to display all polls or only those polls created by the user. The default (No) is to show all polls.</p> <p>Set to Yes to display only those polls created by the user.</p>

#### 62.11.4.7 Take Polls Portlet Parameters

[Table 62–14](#) lists the additional parameters available for the Take Polls portlet.

**Table 62–14 Take Polls Portlet Parameters**

Parameter	Description
pollId	The ID of the poll to display.

#### 62.11.4.8 Announcements Portlet Parameters

Table 62–15 lists the additional parameters available for the Announcements portlet.

**Table 62–15 Announcements Portlet Parameters**

Parameter	Description
parentId	The forum ID in the discussions server under which announcement objects are maintained. Each application should create a forum on the discussions server. Enter that forum ID here, for example <code>{2}</code> .  If this parameter is not specified, then amusements default to global announcements.

#### 62.11.4.9 Mail Portlet Parameters

Table 62–16 lists the additional parameters available for the Mail portlet.

**Table 62–16 Mail Portlet Parameters**

Parameter	Description
tabularView	Using the EL value type, enter a value of true to display the information associated with a mail message, such as its subject, sender, and, date sent, in a tabular format. If this parameter is set to false, then mail messages render in a list view.

#### 62.11.4.10 Activity Stream Portlet Parameters

Table 62–17 lists the additional parameters available for the Activity Stream portlet.

**Table 62–17 Activity Stream Portlet Parameters**

Parameter	Description
advancedQuery	A field for specifying a custom query to filter streamed items.  For more information, see <a href="#">Section 39.3, "What You Should Know About the Activity Stream Advanced Query Option."</a>
enableContextInfo	A means of showing or omitting detailed information about the object in the current context (that is, in a popup or other contextual instrument). <ul style="list-style-type: none"> <li>■ Enter <code>{true}</code> to enable Activity Stream to display the <code>af:contextInfo</code> component (a small, red dot). Users can click this dot to view object detail information.</li> <li>■ Enter <code>{false}</code> to omit object detail information.</li> </ul> When this parameter is true and the <code>contextInfoTaskFlowId</code> in the service definition is defined, the activity from the service displays the <code>af:contextInfo</code> . Otherwise, no context information is shown.
hideComments	A means of showing or hiding the Comments feature on streamed activities.  Enter <code>true</code> to hide the Comments feature. Enter <code>false</code> to show it.

**Table 62–17 (Cont.) Activity Stream Portlet Parameters**

Parameter	Description
hideConfigure	A means of hiding the personalization option on the task flow instance.
hideInlinePreview	A means of allowing or omitting an inline preview of files attached to streamed activities. Enter <code>true</code> to omit a file preview. Enter <code>false</code> to show it.
hideLike	A means of showing or hiding the Like link on a streamed activity. Enter <code>true</code> to hide the Like link. Enter <code>false</code> to show it.
hideShare	A means of showing or hiding the Share menu on streamed activities. Enter <code>true</code> to hide the Share menu. Enter <code>false</code> to show it.
pageSize	The number of items to stream in a given task flow instance.
pagination	The form of pagination to use on a multipage stream. <ul style="list-style-type: none"> <li>■ Enter <code>#{true}</code> to show Previous and Next links.</li> <li>■ Enter <code>#{false} hide</code> to omit Previous and Next links. Instead, a more link is rendered, enabling users to navigate to a fuller view of the task flow where all streamed activities are shown.</li> </ul>
profileOnly	A means of streaming activities only from user profiles. <ul style="list-style-type: none"> <li>■ Enter <code>true</code> to stream only those activities associated with user profiles</li> <li>■ Enter <code>false</code> to stream other types of activities along with those associated with user profiles</li> </ul>
resourceId	The current user ID. Enter <code>#{securityContext.userName}</code> to return the current user.
serviceCategories	A field for entering a comma-separated list of names of services from which to stream activities. Use this parameter to limit the display of streamed activities to only those associated with the specified service or services. Enter one or more service IDs, for example: <code>oracle.webcenter.collab.announcement,</code> <code>oracle.webcenter.collab.forum</code> For a list of valid service ID, see <a href="#">Table F-7</a> . Note that all listed service IDs cannot be used because all services do not stream items to the Activity Stream. For example, the RSS service does not stream any activities.

#### 62.11.4.11 Tag Cloud Portlet Parameters

The Tag Cloud portlet does not include any additional parameters.

### 62.11.5 WebCenter Services Portlets Limitations

This section identifies limitations with WebCenter Portal services when they are accessed remotely using WebCenter Services Portlets.

- WebCenter Services Portlets do not include the **Send Mail** option to email links to resources, for example wikis.

- WebCenter Services Portlets do not support the **View Profile** option when clicking a user name.
- WebCenter Services Portlets do not support recommendations.
- WebCenter Services Portlets do not support anonymous access.
- WebCenter Services Portlets no longer provides a Worklist portlet.

Consider using the Task List task flow provided by Oracle Business Process Management instead. For more information, see the "Creating Custom ADF Applications with Oracle Business Process Management Workspace Task Flows" appendix in *Oracle Fusion Middleware User's Guide for Oracle Business Process Management*.

- When creating a link to a discussion forum from another WebCenter Services Portlet, such as the Document Manager or Blogs portlet, only discussion forums with a category ID of 0 are listed.
- RSS is not supported within the Discussion Forums, Lists, and Announcements portlets.
- The Mail portlet does not support the **Find Users** option when composing messages. Recipients must be entered manually.
- The **Download URL** option is not available from the **View** menu in the Document Manager portlet. Instead, users must access the URL provided in the **Direct URL** field to view the document, and then click the Download button.
- The **Edit with Word** option is not available from the **File** menu in the Document Manager portlet.
- When using a link from the **Get a Link** option of the Document Manager or Blogs portlet, you must open the link in a new browser session. You cannot open the link in a new tab of the same browser session that is currently running the portlet.
- The **Subscribe** option, accessed from the **File** menu, is not supported in the Document Manager or Blogs portlets.
- The **Share** option is not available from the **Edit** menu when viewing a blog in the Blogs portlet.

### 62.11.6 Troubleshooting Problems with WebCenter Services Portlets

This section provides information to assist you in troubleshooting problems you may encounter when using WebCenter Services Portlets.

This section includes the following troubleshooting notes:

- [Section 62.11.6.1, "External Link in Announcements or Discussion Forum Portlet Not Working"](#)
- [Section 62.11.6.2, "Get a Link Option in Document Manager and Blogs Portlets Not Working"](#)
- [Section 62.11.6.3, "Recommendations Tab in Document Manager and Blogs Portlets Is Empty"](#)
- [Section 62.11.6.4, "Unable to Embed an Image into a Blog"](#)
- [Section 62.11.6.5, "Selected Text is Lost When Creating a Link in a Blog Post or Wiki"](#)

### 62.11.6.1 External Link in Announcements or Discussion Forum Portlet Not Working

#### Problem

When users click a link to an external web page in the Announcements or Discussion Forum portlet nothing displays.

#### Cause

WebCenter Services Portlets are displayed inside inline frames. Some web sites, for example Google, do not display inside an inline frame if the parent frame does not have the same origin. Therefore, if you link to one of these web sites within the Announcements or Discussion Forum portlet, the link does not display.

#### Solution

When linking to an external web page from the Announcements or Discussion Forums portlet, it is recommended that you display the target in a new browser tab or window. To do this, add the `target="_blank"` attribute to the link. For example:

```
<a href="http://www.google.com" target="_blank">Google</a>
```

### 62.11.6.2 Get a Link Option in Document Manager and Blogs Portlets Not Working

#### Problem

When consuming the Document Manager or Blogs portlet in Oracle WebCenter Interaction, the link provided from the **Get a Link** option of the **View** menu does not work in Microsoft Internet Explorer.

#### Oracle WebCenter InteractionCause

Oracle WebCenter Interaction accesses WebCenter Services Portlets through a pagelet producer. As such, when you consume a WebCenter Services Portlets portlet on a page in Oracle WebCenter Interaction, the portlet's underlying pagelet is accessed using an `injectpagelet` JavaScript call. This can result in links within the portlet that exceed Internet Explorer's 2KB limit for URLs.

#### Solution

In Oracle WebCenter Interaction, instead of placing the Document Manager or Blogs portlet directly on a page, create an HTML portlet to call the Document Manager or Blogs pagelet. When you add the HTML portlet to the page, the pagelet is referenced in an inline frame, which results in shorter URLs that are less likely to exceed Internet Explorer's 2KB limit.

For example, if you add the Document Manager portlet directly to a page, the call to the pagelet is as follows:

```
<script type='text/javascript'>
  injectpagelet("ServicesPortlets_PS6_49823a17-f56d-41cf-b50e-3506b4394f25",
    "Document_Manager", "iframe ifheight=650px ifwidth=100%", "",
    "resourceId=dev-ucm%23dDocName%3ADSS000411", "", "", "", "none", false);
</script>
```

Adding an HTML portlet that calls the Document Manager pagelet produces the following inline frame:

```
<iframe id="pt-pagelet-iframe-1" frameborder="0" height='650px' width='100%'
  src='http://server.example.com:7777/inject/v2/pagelet/'
```

```
ServicesPortlets_PS6_49823a17-f56d-41cf-b50e-3506b4394f25/Document_Manager
?content-type=html&csapi=true&instanceid=1&chrome=none&consumepage=true
&resourceId=dev-ucm%23dDocName%3ADSS000411'>
</iframe>
```

### 62.11.6.3 Recommendations Tab in Document Manager and Blogs Portlets Is Empty

#### Problem

The **Recommendations** tab in the Documentation Manager and Blogs portlets does not list any recommendations.

#### Cause

WebCenter Services Portlets do not support recommendations.

#### Solution

To remove the **Recommendations** tab from the Document Manager or Blogs portlet, edit the portlet and set the `featureOff` parameter to `recommendations`.

### 62.11.6.4 Unable to Embed an Image into a Blog

#### Problem

When consuming the Blogs portlet in Oracle WebCenter Interaction, images cannot be embedded in a blog post.

#### Cause

If the file name of the image is long, for example 250 characters or more, the length of the resource URL used for the image in the blog may exceed the supported limit.

#### Solution

Reduce the length of the image file name.

Alternatively, it is recommended that when consuming WebCenter Services Portlets in Oracle WebCenter Interaction, you should place portlets within an HTML portlet. For more information, see the solution in [Section 62.11.6.2, "Get a Link Option in Document Manager and Blogs Portlets Not Working."](#)

### 62.11.6.5 Selected Text is Lost When Creating a Link in a Blog Post or Wiki

#### Problem

When you select text in a blog post or wiki and click the **Select Resource** or **New Resource** icon to create a link, the selected text disappears.

#### Cause

The selected text is temporarily replaced with an insertion cursor while the link is created.

#### Solution

No action is required. When you finish creating the link, or cancel the operation, the selected text is restored.

## 62.12 Troubleshooting Portlets

This section provides information to assist you in troubleshooting problems you may encounter while using portlets. It contains the following subsections:

- [Section 62.12.1, "Diagnostic Tools for Troubleshooting Portlets"](#)
- [Section 62.12.2, "Configuring the Portlet Logging File"](#)
- [Section 62.12.3, "Portlet Displays a Portlet Consumer Error"](#)
- [Section 62.12.4, "Portlet Displays a Portlet Timeout"](#)
- [Section 62.12.5, "Portlet Displays a Remote Portlet Communication Error"](#)
- [Section 62.12.6, "Portlet Displays a Remote Portlet Error"](#)

### 62.12.1 Diagnostic Tools for Troubleshooting Portlets

There is a set of tools available for both the consumer and producer to help identify and resolve issues with portlets.

If you encounter a portlet error message when a portlet is rendered, or if the portlet displays but you cannot interact correctly with it, there are some general steps using these tools that you should follow to diagnose the issue.

This section includes the following subsections:

- [Section 62.12.1.1, "Identify the Portlet Instance"](#)
- [Section 62.12.1.2, "Examine the Portlet Consumer Test Page"](#)
- [Section 62.12.1.3, "Examine the Producer Test Page"](#)

#### 62.12.1.1 Identify the Portlet Instance

The first step when you encounter a portlet error, is to identify which portlet producer and portlet instance is being invoked. Execute the `portletDebugShow()` JavaScript from your browser to display this information in the main portlet content area.

To identify the portlet instance:

1. Enter the following command in the Location field of your browser:

```
javascript:portletDebugShow()
```

**Tip:** In Internet Explorer and Google Chrome, you must type this command in the Location field. If you paste the command into the field, the `javascript` piece is removed.

In Firefox 6 and above, you cannot enter JavaScript in the Location field, you must enter the command in JavaScript console.

2. After running the script, every portlet now displays the following information:
  - Producer name
  - Portlet name
  - Portlet instance ID
  - Execution Context IDs (ECIDs)

The ECIDs are unique IDs used to identify a portlet request. Use the ECIDs to correlate the messages across different consumer and producer log files using

Fusion Middleware Control. The same ECID is propagated from the consumer to the producer. For more information, see the "Correlating Messages Across Log Files and Components" section in the *Oracle Application Server Administrator's Guide*.

---

**Note:** Broken portlets show two ECIDs: one for the request in which the error occurred and one for request in which the error was reported. For inline portlets (that is, portlets that are not displayed in an IFRAME), these two ECIDs are the same.

For IFRAME portlets, for example Oracle JSF Portlet Bridge portlets, the ECIDs are different. This is because the error is reported in a later request than the one in which the original exception occurred. When checking the logs, you should look for both ECIDs, as either may contain relevant information.

---

You can use this information in the subsequent diagnostic steps to help locate the issue.

---

**Note:** The ECIDs shown in the portlet diagnostic information do not reflect partial page rendering requests that have been made to the portlet producer (using the portlet consumer resource proxy). These requests may update the portlet, but the ECIDs are not recorded in the portlet diagnostic information. Errors that occur during these requests are logged on the producer and by the portlet resource proxy on the consumer but you cannot use the ECID information reported in the portlet diagnostic information to help you determine the ECIDs for the relevant log entries.

---

- When you have finished debugging the portlets, enter the following command to hide the portlet debugging information:

```
javascript:portletDebugHide()
```

**Tip:** In Internet Explorer and Google Chrome, you must type this command in the Location field. If you paste the command into the field, the `javascript` piece is removed.

In Firefox 6 and above, you cannot enter JavaScript in the Location field, you must enter the command in JavaScript console.

### 62.12.1.2 Examine the Portlet Consumer Test Page

The next step in diagnosing a portlet error is to access the Portlet Consumer Test Page (shown in Figure 62–2) to locate the portlet producer and, if necessary, test the portlet in isolation.

**Figure 62–2** The Portlet Consumer Test Page

The Portlet Consumer Test Page contains three tabs:

- **Producers:** This tab lists all the producers registered with the consumer application. Selecting a producer provides specific information about that producer.
- **Sanity Checks:** This tab may contain a predefined set of portlet instances and required parameters that can be run in the consumer application, as configured by the consumer application developer. Any failures within these portlets indicate a problem with the corresponding producer and/or portlet.
- **Configuration:** This tab enables you to identify the consumer configuration entries for portlet consumption. You cannot change these values as they are stored within the application; they are displayed for reference information only.

After accessing the Portlet Consumer Test Page, you can perform further diagnostic steps.

This section includes the following subsections for using the Portlet Consumer Test Page to diagnose portlet issues:

- [Section 62.12.1.2.1, "Access the Portlet Consumer Test Page"](#)
- [Section 62.12.1.2.2, "Locate the Portlet Producer"](#)
- [Section 62.12.1.2.3, "Locate and Run the Portlet Instance"](#)
- [Section 62.12.1.2.4, "Perform Sanity Checks"](#)
- [Section 62.12.1.2.5, "Check Consumer Configuration Entries"](#)

**62.12.1.2.1 Access the Portlet Consumer Test Page** The Portlet Consumer Test Page provides diagnostic information about the portlet consumer.

To access the Portlet Consumer Test Page:

1. In your browser, enter the URL for the Portlet Consumer Test Page:

```
http://host:port/context-root/faces/oracle/portlet/client/adf/ diagnostic/pages/
ConsumerTestPage.jspx
```

---

---

**Note:** If the consumer application is secured, the Portlet Consumer Test Page can be accessed only by users granted permission to view those pages.

---

---

2. In the Portlet Consumer Test Page, you can perform further diagnostic steps as described in the following sections.

**62.12.1.2.2 Locate the Portlet Producer** The Producers tab of the Portlet Consumer Test Page lists all the producers that have been registered with the consumer application. If a portlet instance in your application displays an error message, you can view information about the producer that owns the portlet by selecting it on this tab.

To locate the portlet producer:

1. In the Portlet Consumer Test Page, select the portlet producer that owns the portlet instance that is reporting the error.

You noted this information in [Section 62.12.1.1, "Identify the Portlet Instance."](#)

2. The following information is provided for the selected producer:

- Producer Test Page: A link to the Producer Test Page.
- Configuration: Details of potential issues surrounding skins, security, and timeouts associated with the using producer.
- Offered Portlets: A list of all portlets offered by the producer. If there are no offered portlets listed, this indicates that there is a problem with the registration metadata for the producer.
- Portlet Instances: A list of all portlet instances for the selected producer in the consumer application. This list may be empty.

You can use this information to identify potential issues with the producer.

**62.12.1.2.3 Locate and Run the Portlet Instance** If you have still not been able to identify the cause of the portlet error, the issue may lie with the portlet instance itself.

To locate and run the portlet instance:

1. In the Portlet Consumer Test Page, select the portlet producer that owns the portlet instance that is reporting the error.

You noted this information in [Section 62.12.1.1, "Identify the Portlet Instance."](#)

2. Under Portlet Instances, select the portlet instance to display the Consumer Test Page: Portlet page.

You noted this information in [Section 62.12.1.1, "Identify the Portlet Instance."](#)

3. The Portlet Consumer Test Page: Portlet page renders the portlet in a standalone page. If the portlet runs correctly on this page, the problem is most likely caused by other components on the page containing the broken portlet.
4. The Parameters section enables you to experiment with how the portlet looks using a stretch or flow layout
5. If the portlet contains parameters, the Parameters section also lists all the public parameters for the portlet. Enter values for any parameters to test that the portlet is receiving parameters correctly.
6. To navigate back to the Portlet Consumer Test Page, click the producer name link at the top of the page.

**62.12.1.2.4 Perform Sanity Checks** The Sanity Checks tab of the Portlet Consumer Test Page (shown in Figure 62–3) provides a quick overview of the state of portlet communication in your application across all producers.

**Figure 62–3 The Sanity Checks Tab**

The Sanity Checks tab references portlet instances used within the consumer application. This list is configured by the application developer who chose the portlets to include and the parameters to pass to these portlets.

The checks on this page do not render the output in the UI, but simply create a runnable instance of the portlet under the covers and report any failures if any exception is returned by the portlet.

To perform sanity checks:

1. In the Portlet Consumer Test Page, click the **Sanity Checks** tab.
2. Click the **check** link next to the portlet that you want to test.

The results of the sanity tests are displayed in the **Status** column.

3. To run sanity checks on all listed portlets, click the **Run all Sanity Checks** link.

**62.12.1.2.5 Check Consumer Configuration Entries** The Configuration tab of the Portlet Consumer Test Page (shown in [Figure 62–4](#)) enables you to identify the consumer configuration entries for portlet consumption. This tab displays settings defined in the `adf-config.xml` file, for example, the minimum and maximum timeout values and the consumer version number. You cannot change these values as they are stored within the application; they are displayed for reference information only.

**Figure 62–4 The Configuration Tab**

### 62.12.1.3 Examine the Producer Test Page

If you cannot identify the cause of the error in the consumer application, the next step is to use the Producer Test Page (shown in [Figure 62–5](#)) to identify potential issues with the portlet producer application.

Figure 62–5 The Producer Test Page

**ORACLE WebCenter Portal : Portlets**

## WSRP Producer Test Page

**Your WSRP Producer Contains the Following Portlets:**

**Portlet Name (Minimum WSRP Version)**

- PPRPortlet (1.0) Test pages: [run as servlet](#)
- TestPortlet (1.0) Test pages: [run as servlet](#)
- Taskflow test portlet (2.0) Test pages: [hide parameters](#) | [run as servlet](#)
  - inputParameter1 param1
  - inputParameter2
  - inputParameter3 param3
- MyOraclePortlet (2.0) Test pages: [run as servlet](#)

**Container Configuration**

**Persistent Store Type:** Consumer  
Value obtained from environment entry java:comp/env/oracle/portal/wsrp/server/persistentStore

**Container Version**

Implementation version: 12.1.1.0.0 , Label: WORKPLACE\_MAIN\_GENERIC\_110919.0101

**WSDL URLs**

[WSRP v1 WSDL](#)  
[WSRP v2 WSDL](#)

**SOAP Monitor**

[SOAP Monitor](#)

Access to the main Producer Test Page is public, but links to the test pages for each portlet are accessible only to users granted permission on the underlying pages and task flows.

The Producer Test Page contains five sections:

- **Portlets**  
A list of all the portlets within the producer. For Oracle JSF Portlet Bridge portlets, each portlet also provides a separate link to run the portlet as a servlet (this is a prerequisite to running them as portlets: if a portlet does not run as a servlet, it cannot run as a portlet).
- **Container Configuration**  
Information on where the consumer preference information is stored.
- **Container Version**  
The version number of the Portlet Producer Container.
- **WSDL URLs**  
Links to the Web Service Definition Language (WSDL) documents to use for registration.
- **SOAP Monitor**  
A link to the WSRP SOAP monitor where users with the `Monitor` or `Admin` role can track the SOAP messages between the consumer and producer.

After accessing the Producer Test Page, you can perform further diagnostic steps.

This section includes the following subsections:

- [Section 62.12.1.3.1, "Access the Producer Test Page"](#)

- [Section 62.12.1.3.2, "Run the JSF Portlet as a Servlet"](#)
- [Section 62.12.1.3.3, "Examine the SOAP Monitor"](#)

**62.12.1.3.1 Access the Producer Test Page** The Producer Test Page provides diagnostic information about the portlet producer.

To access the Producer Test Page:

1. In your browser, enter the URL for the Producer Test Page:  
`http://host:port/context-root/info`
2. In the Producer Test Page, you can perform further diagnostic steps as described in the following sections.

**62.12.1.3.2 Run the JSF Portlet as a Servlet** To verify that an Oracle JSF Portlet Bridge portlet producer is running correctly, you must first verify that the producer application runs correctly through standard HTTP requests. If the artifacts the producer exposes as portlets do not run as servlets, they will not run as portlets.

To run a JSF portlet as a servlet:

1. In the Producer Test Page, click the **run as servlet** link next to the portlet.
2. The portlet is called using standard HTTP to request the underlying page or task flow. The results of the request are displayed in a new browser window.  
  
If the resulting page or task flow does not render correctly, then there is a problem with the producer application that must be resolved before you can run the page or task flow as a portlet.
3. If the portlet accepts parameters, click **show parameters** to list them and provide values. When you click **run as servlet**, the portlet call includes the parameter values.

**62.12.1.3.3 Examine the SOAP Monitor** The SOAP monitor provides access to the SOAP requests between the consumer and producer when rendering a portlet. This is very useful in diagnosing problems at the communication level.

To examine the SOAP monitor:

1. In the Producer Test Page, click the SOAP Monitor link at the bottom of the page.
2. When prompted, enter your user name and password.

---

---

**Note:** To access the SOAP monitor you must be a member of the `Monitors or Administrators` role in the Identity Management System.

---

---

3. By default, the SOAP monitor is disabled, so the page is empty. You must first enable the monitor by clicking the **Enable** link at the top of the page.
4. The page does not automatically refresh, so to display SOAP messages, you must click the **Refresh** link.
5. To force a request to the failing portlet, go to the Portlet Consumer Test Page: Portlet page for the portlet and select **Refresh Portlet**.
6. When the portlet has rendered, or failed, click the Refresh link in the SOAP monitor to display the captured request.

- Now, you can investigate the SOAP messages that were sent and the responses to try to narrow down the cause of the problem.

---

**Note:** If, after rerunning the portlet and refreshing the SOAP monitor, you see no messages displayed, this indicates that there may be a security issue between the producer and the consumer. You must verify that the correct WS-Security settings are set up for the producer and consumer to communicate.

---

## 62.12.2 Configuring the Portlet Logging File

To troubleshoot portlet issues, it is useful to add portlet log-handlers and loggers to the logging configuration file, `logging.xml`.

[Example 62–18](#) shows how to add the portlet log-handlers and loggers. The example assumes that you are running the consumer and producer applications on the same WebLogic Server instance. If you are running the consumer and producer applications on different instances, you must split them up appropriately.

---

**Note:** Add the log entries at the end of the file to ensure that they override any seeded settings.

---

### **Example 62–18** Configuring Log Files for Troubleshooting Portlet Issues

```
<!-- NOTE: You need to change the path where the logfile is located -->
<log_handlers>
...
  <!-- Portlet Consumer -->
  <log_handler name="portlet-consumer-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
    <property name="format" value="ODL-Text"/>
  </log_handler>
</log_handlers>
```

```

    <property name="path" value="/scratch/logs/portlet-consumer.log"/>
</log_handler>

<!-- Portlet Producer -->
<log_handler name="portlet-producer-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
    <property name="format" value="ODL-Text"/>
    <property name="path" value="/scratch/logs/portlet-producer.log"/>
</log_handler>

<!-- Portlet Bridge -->
<log_handler name="portlet-bridge-handler" class="oracle.core.ojdl.logging.ODLHandlerFactory">
    <property name="format" value="ODL-Text"/>
    <property name="path" value="/scratch/logs/portlet-bridge.log"/>
</log_handler>
...
</log_handlers>

<loggers>
...
    <!-- Portlet Consumer -->
    <logger name="oracle.portlet.client" level="FINEST" useParentHandlers="false">
        <handler name="portlet-consumer-handler"/>
    </logger>

    <!-- Portlet Servers -->
    <logger name="com.bea.portlets" level="FINEST" useParentHandlers="false">
        <handler name="portlet-producer-handler"/>
    </logger>
    <logger name="com.bea.netuix" level="FINEST" useParentHandlers="false">
        <handler name="portlet-producer-handler"/>
    </logger>
    <logger name="com.bea.wsrp" level="FINEST" useParentHandlers="false">
        <handler name="portlet-producer-handler"/>
    </logger>
    <logger name="oracle.portlet.producer" level="FINEST" useParentHandlers="false">
        <handler name="portlet-producer-handler"/>
    </logger>

    <!-- Portlet Bridge -->
    <logger name="oracle.portlet.bridge" level="FINEST" useParentHandlers="false">
        <handler name="portlet-bridge-handler"/>
    </logger>
    <logger name="oracle.portlet.server.bridge" level="FINEST" useParentHandlers="false">
        <handler name="portlet-bridge-handler"/>
    </logger>
...
</loggers>

```

The logging configuration file is located in:

*DOMAIN\_HOME*/config/fmwconfig/servers/server/logging.xml

The log file name is also defined in logging.xml. By default the log file name is:

*DOMAIN\_HOME*/servers/server/logs/server-diagnostic.log

### 62.12.3 Portlet Displays a Portlet Consumer Error

The message **Portlet Consumer Error** (shown in [Figure 62–6](#)) typically indicates that an error occurred within the operation of the portlet parts of the portlet consumer application.

**Figure 62–6** *Portlet Displaying a Portlet Consumer Error*

#### Problem

An error has occurred within the operation of the portlet parts of the portlet consumer application. In other words, the error is unrelated to the remote portlet producer application.

#### Solution

Consult the diagnostic log file to determine the cause of the exception.

If the `DebugErrorRenderer` is enabled, the cause exception is displayed in the portlet along with links to the log file. If running in production mode, then consult the consumer-side logs.

The exception that caused the error message to be displayed is logged. Wherever possible, a message is included in the log at the start of the exception stack to indicate for which portlet binding the exception occurred. [Example 62–19](#) shows a message logged for a portlet error.

#### **Example 62–19** *Example Message Logged for a Portlet Error*

```
<PortletRenderer> <setErrorState> An error has occurred for Portlet Binding
portlet1.
oracle.portlet.client.container.PortletContentTypeException: Unexpected content
type "null" in WSRPGetMarkup response.
...
```

Pay particular attention to the cause exceptions in the stack as this is likely to indicate what the real underlying problem is.

The cause is likely to be an internal error and the appropriate course of action is to contact Oracle Support.

### 62.12.4 Portlet Displays a Portlet Timeout

If a **Portlet Timeout** is displayed in the area of the page that you would expect to contain a portlet (as shown in [Figure 62–7](#)), this means that the consumer waited for a configured period of time for the producer to respond and did not get a response during that time, or the response did not complete during that time. There are a number of possible causes.

**Figure 62–7 Portlet Displaying a Portlet Timeout Error**

**Problem 1**

The producer machine is overloaded.

**Solution 1**

Check the load on the producer managed server (the tools used to do this vary depending on the operating system that is running on the producer). If the load is high, check whether a particular process is causing this high load, and whether such a process could be run on another machine, or at a less busy time. If no single process is causing the high load, or if the Oracle WebLogic Server is causing the high load, and if the load is consistently high, consider whether the producer hardware is adequate, or whether it is necessary to upgrade it (or add further nodes to the cluster). Also consider adjusting the Oracle WebLogic Server configuration to increase the size of the request thread pool. For more information, see the Oracle WebLogic Server documentation.

**Problem 2**

The network is overloaded, or there are problems with the network affecting communication between the consumer and producer.

**Solution 2**

Check that you can ping the producer machine from the consumer machine. Check that you can access the producer's WSRP Producer Test Page in your local browser. If this works, check that you can access this same page from a browser running on the consumer machine. If any of these steps cause problems, and the machine is not overloaded, this could be a network problem, which should be investigated by a system administrator.

**Problem 3**

There is a deadlock (or a stuck thread) on the producer machine causing the request thread to hang.

**Solution 3**

This should not happen during normal operation. If it does occur, there will generally be an error in the producer's log files indicating the point at which the deadlock occurred. This may help diagnose the problem. In some cases, it may be possible to alleviate this by modifying the configuration of Oracle WebLogic Server. For more information, see the Oracle WebLogic Server documentation.

**Problem 4**

The producer application is running slowly (for example, due to processing large quantities of data).

**Solution 4**

In this case, the producer application may be processing large quantities of data, causing it to spend too long building the response. If the application will regularly deal with large quantities of information, it may be necessary to either add or improve producer hardware, or to increase the portlet timeout duration. The portlet timeout can be configured on the producer connection in the consumer application using Enterprise Manager or the WLST `setWSRPProducerConnection` command. Additionally, minimum and maximum timeouts for all producer connections within the application can be configured within the portlet section of the `adf-config.xml` file.

**Problem 5**

The producer application is waiting for a response from another resource, such as a database, that is taking too long (for example, if the database is overloaded).

**Solution 5**

Check that the resource in question is functioning correctly. If it is, the solution is same as [Solution 4](#).

**Problem 6**

The portlet timeout values have been misconfigured such that the timeout period is too short.

**Solution 6**

Typically, the timeout for a portlet is set on the registration of the producer. This may have been set to a value that does not give time for the portlet to respond.

Also, the portlet section of the `adf-config.xml` file allows minimum, maximum, and default values for portlet timeouts to be configured across the whole application. The maximum timeout imposes an upper limit on timeouts specified by portlet producers, so if the maximum timeout is too short, this could cause unwanted portlet timeout errors even if the timeout specified on the producer connection is longer.

**62.12.5 Portlet Displays a Remote Portlet Communication Error**

When a section of the screen shows the **Remote Portlet Communication Error** message (as shown in [Figure 62-8](#)), and there is an otherwise blank region surrounding it, this area is expected to be filled with a portlet, which the application is not able to contact.

**Figure 62-8** Portlet Displaying a Remote Portlet Communication Error

**Problem 1**

The producer is down.

### Solution 1

It could be that the producer application is not running, or the managed server on which it is deployed is not started. In this case, it will need to be started. Identify the application that needs to be started based on the task being attempted at the time of the portlet failure.

### Problem 2

The web services security is incorrectly configured.

### Solution 2

Troubleshooting steps for web services security depend on the type of security profile being used, for example AuthN, SSL, or Message Security.

For more information about troubleshooting web service security, see the "Diagnosing Problems" chapter in the *Oracle Application Server Web Services Security Guide*.

### Problem 3

The producer managed server cannot be reached.

### Solution 3

The producer may be in a location that cannot be reached by the consumer application, due to intervening firewalls or incorrect routing rules. In an environment that is installed by Oracle's provisioning software, this should not be the case, but it is worth checking that you are able to access the WSDL endpoint for the producer from the machine hosting the consumer, by going to:

```
http://host:port/context-root/portlets/wsrp2?WSDL
```

Where:

- *host* is the server to which the portlet producer is deployed
- *port* is the port to which the server is listening for HTTP requests
- *context-root* is the producer web application's context root

For example:

```
http://portlets.example.com:9999/sample/portlets/wsrp2?WSDL
```

## 62.12.6 Portlet Displays a Remote Portlet Error

If the portlet displays a **Remote Portlet Error** (as shown in [Figure 62-9](#)), this indicates that the producer responded with an error message. The error message is returned in the form of a SOAP fault message inside the response document. There are a number of reasons the producer might return an error. The best strategy to diagnose these errors is to first find the corresponding exception stack trace in the consumer diagnostic logs. This stack trace shows what kind of fault was returned by the producer, plus any further information required in the response. Some faults you may encounter are listed in the following sections.

**Figure 62–9 Portlet Displaying a Remote Portlet Error****Problem 1**

`OperationFailedException`. This is the most common type of Remote Portlet Error and it is a catch-all for most unhandled exceptions raised in the producer application.

**Solution 1**

To resolve an `OperationFailedException`, examine the exception in the consumer diagnostic logs. This generally shows any exception that was raised in the producer application to trigger the fault response as the final `Caused by` exception.

If required, you can then examine the diagnostic logs on the producer application for more detail, or for any related exceptions that occurred prior to the fault being triggered. In some cases, the exception in the producer log indicates a problem that can be simply resolved, such as a database connection failure or configuration problem. In other cases, the exception might indicate a product bug.

**Problem 2**

`InvalidRegistrationException`. This error indicates that the producer has not been properly registered with the consumer before the consumer attempted to communicate with it. This could also occur if the producer's preference store has been moved or deleted since the consumer registered it.

**Solution 2**

The most likely cause is a problem during provisioning. It is also worth checking the producer application's `web.xml` file setting to ensure that the entry shown in [Example 62–20](#) is present.

**Example 62–20 Persistent Store Setting in web.xml**

```
<env-entry>
  <env-entry-name>oracle/portal/wsrp/server/persistentStore</env-entry-name>
  <env-entry-type>java.lang.String</env-entry-type>
  <env-entry-value>Consumer</env-entry-value>
</env-entry>
```

**Problem 3**

`InvalidHandleException`. This indicates that the consumer has asked the producer to render, or otherwise interact with, a portlet instance that the producer does not know about. This could occur if the producer's preference store has been corrupted in some way since the portlet was added to the page.

**Solution 3**

This error is most likely caused by a problem during provisioning, or a missing `persistentStore` setting in the `web.xml` file, as described in [Solution 2](#).

**Problem 4**

`AccessDeniedException`. This indicates that the producer application decided that the current user did not have access to the portlet or task flow in question.

**Solution 4**

This could either be a legitimate error message or an indication of a configuration problem. In most cases, WebCenter Portal should deal with authorization errors gracefully, without a Portlet Remote Error being displayed.

---

---

## Creating Portlets with OmniPortlet

OmniPortlet is a data publishing portlet that you add to your application at design time, and customize at runtime. It provides a runtime, wizard-based experience to allow page designers to publish data from a variety of data sources, including SQL, XML, web services, spreadsheets, and web pages to several different layouts, such as customizable charts and tables.

This chapter covers the information you may find useful if you are planning to use OmniPortlet in your Oracle JDeveloper environment. For information on how to use the OmniPortlet wizard, refer to *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This chapter includes the following sections:

- [Section 63.1, "Introduction to OmniPortlet"](#)
- [Section 63.2, "Adding OmniPortlet to Your Application"](#)
- [Section 63.3, "Customizing OmniPortlet"](#)
- [Section 63.4, "OmniPortlet Configuration Tips"](#)
- [Section 63.5, "Troubleshooting OmniPortlet Problems"](#)

For information about registering OmniPortlet, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

---

---

**Note:** You can find more information about developing different types of portlets and information about producers and other portlet technologies in [Chapter 57, "Introduction to Portlets."](#)

---

---

### 63.1 Introduction to OmniPortlet

OmniPortlet is a subcomponent of Oracle WebCenter Framework that enables developers to easily publish data from various data sources using a variety of layouts without writing any code. You can base an OmniPortlet on almost any kind of data source, such as a web service, a SQL database, spreadsheet (character-separated values), XML, and even application data from an existing web page. [Figure 63-1](#) shows an example of a portlet created using OmniPortlet.

**Figure 63–1 Example of an OmniPortlet**

OmniPortlet enables the WebCenter Portal: Framework application developer and component developer to do the following:

- Display data from multiple sources (CSV, XML, web service, SQL, and so on)
- Sort the data to display
- Format data using a variety of layouts (bulleted list, chart, HTML, and so on)
- Use portlet parameters
- Expose personalizable settings to page viewers

To display personalized data, you can refine the retrieved data by filtering the results returned from a data source, and parameterize the credential information used to access secure data. Out of the box, OmniPortlet provides the most common layout for portlets: tabular, chart, HTML, news, bulleted list, and form.

## 63.2 Adding OmniPortlet to Your Application

As described in [Chapter 62, "Consuming Portlets,"](#) you can add an OmniPortlet to a page created through Oracle JDeveloper. OmniPortlet is included in the Integrated WebLogic Server (Integrated WLS) that is installed with Oracle JDeveloper. After you start the Integrated WLS, you can register the OmniPortlet producer by using the Register Oracle PDK-Java Producer wizard. When this producer is registered, the portlets become available on the Oracle JDeveloper Resource Palette or in the Application Resources panel. For example, if you register the OmniPortlet producer as "OmniProducer," OmniPortlet displays in your IDE Connections list in the Resource Palette, as shown in [Figure 63–2](#).

**Figure 63–2 OmniPortlet in the Resource Palette**

---

---

**Note:** For more information about:

- Registering the producer, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)
  - Installing, initializing, and stopping the default server and pointing Oracle JDeveloper to it, see [Section 3.4, "Working with the Integrated WebLogic Server."](#)
  - Adding an instance of OmniPortlet to your page, see [Section 62.6, "Adding Portlets to a Page."](#)
- 
- 

After you register the portlet producer, you can simply drag OmniPortlet onto your \*.jspx page.

---

---

**Note:** When you add an instance of OmniPortlet onto your page in Oracle JDeveloper, open the Property Inspector for the portlet and ensure that the `AllModesSharedScreen` and `RenderPortletInIFrame` properties are set as follows:

- **AllModesSharedScreen** is set to `False` to display the Customize and Personalize in full page size.
  - **RenderPortletInIFrame** is set to `True` to display the OmniPortlet in its own inline frame (IFRAME) in the View mode.
- 
- 

For information on configuring OmniPortlet in Oracle JDeveloper, refer to [Section 63.4, "OmniPortlet Configuration Tips."](#)

## 63.3 Customizing OmniPortlet

After you add an OmniPortlet to your application at design time, you can customize the content, layout, and other options, by running your application to a browser. This section provides a high-level introduction to the runtime customization experience. For more detailed information on using and customizing this portlet, refer to *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

---

---

**Note:** For more information about configuring OmniPortlet, see [Appendix 63.4, "OmniPortlet Configuration Tips."](#)

---

---

The OmniPortlet wizard initially contains five steps. When you first define your OmniPortlet, you set the data source type, data source options, filter options, view options, and layout. When you have completed these steps of the wizard, you can reenter the wizard by clicking the **Customize** link for the portlet. When you reenter the wizard, you can change the definitions on the Source, Filter, View, and Layout tabs.

---

---

**Note:** On the IBM Linux on Power platform, if the action buttons (Next, Previous, Finish, and Cancel) are minimized to dots when defining the OmniPortlet, increase the stack size shell limit to unlimited and restart the `WLS_portlet` instance. Run the following command to set the stack size shell limit to unlimited:  
`prompt> ulimit -s unlimited.`

---

---

You can use several different data sources with OmniPortlet:

- Spreadsheet
- SQL
- XML
- Web Service
- Web Page

For more information on using these data sources with OmniPortlet, refer to the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 63.4 OmniPortlet Configuration Tips

This section contains configuration information for OmniPortlet. To learn more about the OmniPortlet wizard, see [Chapter 63, "Creating Portlets with OmniPortlet."](#) This section contains configuration information for the following areas:

- [Section 63.4.1, "Configuring the OmniPortlet Producer to Access Data Outside a Firewall"](#)
- [Section 63.4.2, "Configuring the OmniPortlet Producer to Access Other Relational Databases"](#)
- [Section 63.4.3, "Configuring Portal Tools and Web Producers \(Optional\)"](#)

---

**Note:** In this section, *OmniPortlet\_WAR\_DIR* indicates the directory where *omniPortlet.war* is deployed in the WebLogic Server. The exact path can vary depending on your installation. To determine this path, search for *omniPortlet/provider.xml* in the file system. For example, run the following command in UNIX:

```
> find DOMAIN_DIR -name "provider.xml" | grep -i omniportlet
```

In the Integrated WebLogic Server (Integrated WLS or Default Server), the path of OmniPortlet's *provider.xml* is located here:

```
JDEV_SYSTEM_DIRECTORY/DefaultDomain/servers/DefaultServer/tmp/_WL_
user/portalTools_11.1.1.2.0/RANDOMLY_GENERATED_
DIRECTORY/war/WEB-INF/providers/omniPortlet/provider.xml
```

Note that, on a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the *JDEV\_SYSTEM\_DIRECTORY* path does not contain spaces.

In the Fusion Middleware 11g installation, the path of OmniPortlet's *provider.xml* is located here:

```
FMW_HOME/user_projects/domains/wc_domain/servers/WLS_Portlet/tmp/_
WL_user/portalTools_version_number/RANDOMLY_GENERATED_
DIRECTORY/war/WEB-INF/providers/omniPortlet/provider.xml
```

---

### 63.4.1 Configuring the OmniPortlet Producer to Access Data Outside a Firewall

If the OmniPortlet producer is inside your firewall, then you must configure the proxy information so that OmniPortlet can access URLs of data (such as CSV, XML, or web services) located outside the firewall. To do so, you can either set the proxy information in the command line when you start your WebLogic server. Or, you can set up the proxy information in OmniPortlet's *provider.xml* file, located here: *OmniPortlet\_WAR\_DIR/WEB-INF/providers/omniPortlet/provider.xml*.

---

**Note:** For the Web Service data source, you must set the proxy information in both the *provider.xml* file and using the command line parameters.

---

- To set the proxy information in the command line when starting the WebLogic server, set the parameters as described in [Table 63–1](#), if you are using an HTTP Proxy Host, or [Table 63–2](#), if you are using an HTTPS Proxy Host.

**Table 63–1 HTTP Proxy Information Command Line Parameters**

Parameter	Description
<code>http.proxyHost</code>	The host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
<code>http.proxyPort</code>	The port number for the HTTP Proxy Host.
<code>http.nonProxyHosts</code>	The name of any domain or hosts to which you can directly connect, bypassing a proxy server, such as your local machine: localhost   localhost.localdomain Hosts can be fully qualified host names or can be IP addresses.

**Table 63–1 (Cont.) HTTP Proxy Information Command Line Parameters**

Parameter	Description
<code>http.proxyUser</code>	The user to log in to the proxy server if the proxy server requires authentication.
<code>http.proxyPassword</code>	The password to log in to the proxy server if the proxy server requires authentication.
<code>http.proxyAuthType</code>	The authentication type of the proxy server. Acceptable values: <code>Basic</code>   <code>Digest</code> .
<code>http.proxyAuthRealm</code>	The name of the realm of the proxy server. If you do not know the name of the realm, contact the proxy server administrator.

**Table 63–2 HTTPS Proxy Information Command Line Parameters**

Parameter	Description
<code>https.proxyHost</code>	The host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
<code>https.proxyPort</code>	The port number for the HTTPS Proxy Host.
<code>https.nonProxyHosts</code>	The name of any domain or hosts to which you can directly connect, bypassing a proxy server, such as your local machine: <code>localhost</code>   <code>localhost.localdomain</code> Hosts can be fully qualified host names or can be IP addresses.
<code>https.proxyUser</code>	The user to log in to the proxy server if the proxy server requires authentication.
<code>https.proxyPassword</code>	The password to log in to the proxy server if the proxy server requires authentication.
<code>https.proxyAuthType</code>	The authentication type of the proxy server. Acceptable values: <code>Basic</code>   <code>Digest</code> .
<code>https.proxyAuthRealm</code>	The name of the realm of the proxy server. If you do not know the name of the realm, contact the proxy server administrator.

The following are examples of three parameters and their values:

```
-Dhttps.proxyHost=myProxyServer.mycompany.com
-Dhttps.proxyPort=80
-Dhttps.nonProxyHosts=localhost|localhost.localdomain|127.0.0.1|
```

- To configure the proxy information in the `provider.xml` file, see [Table 63–3](#) for a list of parameters and their descriptions.

**Table 63–3 Provider.xml Tags**

Parameter	Description
<code>httpProxyHost</code>	Enter the host name of a proxy server if one is required to make a URL connection from the OmniPortlet producer to its data sources.
<code>httpProxyPort</code>	Enter the port number for the HTTP Proxy Host.

**Table 63–3 (Cont.) Provider.xml Tags**

Parameter	Description
dontProxyFor	Enter the name of any domain or hosts to which you can directly connect, bypassing a proxy server. Domain names are the part of a URL that contain the names of a business, or organization, or government agency, for example:  *.company.com, *.us.company.com  Hosts can be fully qualified host names or can be IP addresses.
proxyUseAuth	Acceptable values: true   false  Enter true if your proxy server requires authentication. The authentication parameters are specified by the following tags: proxyType, proxyRealm, proxyUseGlobal, proxyUserName, and proxyPassword.
proxyType	Acceptable values: Basic   Digest  Choose the type of proxy server this provider.  For more information about basic or digest authentication, see <a href="http://www.faqs.org/rfcs/rfc2617.html">http://www.faqs.org/rfcs/rfc2617.html</a> .
proxyRealm	Enter the name of the realm of the proxy server that is accessed by the user according to the login information described later in the table. If you do not know the name of the realm, then contact the administrator of the proxy server.
proxyUseGlobal	Acceptable values: true   false  If true, then the <proxyUser> and <proxyPassword> values are used for all users. Users do not see the Proxy Authentication section on the Source tab and Personalize page. If false, then page designer must log in using the Proxy Authentication section on the Source tab when they define the portlet.  The end user must log in using the Proxy Authentication section on the Personalize screen. If <proxyUsername> and <proxyPassword> are given, then they are only used for public users.
proxyUserName	Enter the user name to log in to the proxy server.
ProxyPassword	Enter the password for the specified user name. You must prefix ! before your plain password text. It is then encrypted in the provider.xml file for protection when the producer starts.

The following is a basic example of using a proxy to access data outside a firewall:

```
<proxyInfo class="oracle.portal.provider.v2.ProxyInformation">
<httpProxyHost>www-proxy.example.com</httpProxyHost>
<httpProxyPort>80</httpProxyPort>
<proxyUseAuth>>false</proxyUseAuth>
</proxyInfo>
```

The following example requires a login and basic authentication for all users for the proxy server:

```
<proxyInfo class="mycompany.portal.provider.v2.ProxyInformation">
<httpProxyHost>myport.example.com</httpProxyHost>
<httpProxyPort>8080</httpProxyPort>
<proxyUseAuth>>true</proxyUseAuth>
<proxyType>Basic</proxyType>
<proxyRealm>myport</proxyRealm>
<proxyUseGlobal>>false</proxyUseGlobal>
</proxyInfo>
```

## 63.4.2 Configuring the OmniPortlet Producer to Access Other Relational Databases

The OmniPortlet SQL data source is preconfigured to access Oracle databases using the Oracle JDBC drivers, and ODBC data sources using Sun Microsystems's JDBC-ODBC driver. Oracle allows developers to access other relational databases using DataDirect JDBC drivers.

**See Also:** For a list of supported databases, Certification Matrix for Oracle Application Server and DataDirect JDBC available on the Oracle Technology Network (<http://www.oracle.com/technetwork/index.html>).

This section contains the following steps:

- [Section 63.4.2.1, "Installing DataDirect JDBC Drivers"](#)
- [Section 63.4.2.2, "Registering DataDirect Drivers in OmniPortlet"](#)

### 63.4.2.1 Installing DataDirect JDBC Drivers

The following DataDirect JDBC drivers are included with the WebLogic Server installation:

- `YUtil.jar`
- `Ysybase.jar`
- `Ysqlserver.jar`
- `Ymspy.jar`
- `Yinformix.jar`
- `Ymdb2.jar`
- `Ybase.jar`

If you do not plan to use these DataDirect drivers, you can instead download DataDirect JDBC drivers to access the desired database. These drivers are packaged in a single ZIP, which you can download from the following location:

<http://www.oracle.com/technetwork/topics/datadirect-index-091847.html>

To install DataDirect JDBC drivers:

1. Unzip the contents of the ZIP file into a temporary directory, for example `/temp/datadirect`.
2. Copy the DataDirect JDBC drivers from the temporary directory to your WebLogic Server directory: `WLS_DOMAIN_DIRECTORY/lib`.

### 63.4.2.2 Registering DataDirect Drivers in OmniPortlet

OmniPortlet is implemented as a Web producer and all the configuration properties are stored in the `provider.xml` file. To use DataDirect JDBC drivers with OmniPortlet, you must register these drivers in the `provider.xml` file.

To register the new DataDirect JDBC drivers:

1. Back up the file, `OmniPortlet_WAR_DIRECTORY/WEB-INF/providers/omniPortlet/provider.xml`, and then open the file.
2. Add the drivers to use for the SQL data source configuration entry:

- a. Search for the XML tag, `driverInfo`.
- b. Add a new entry after the last `driverInfo` tag.

The following are examples of the `driverInfo` for WebLogic DataDirect drivers:

- Microsoft SQL Server (default connection):

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCdriverInfo">
  <name>Microsoft SQL Server</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:sqlserver</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.sqlserver.SQLServerDriver
</driverClassName>
  <dataSourceClassName>weblogic.jdbcx.sqlserver.SQLServerDataSource
</dataSourceClassName>
  <connHandlerClass>oracle.webdb.reformlet.data.jdbc.JDBCConnectionHandler
</connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeout>30</loginTimeout>
</driverInfo>
```

- Microsoft SQL Server (named connection, for example, `mycompany.com:port;databaseName=mydb`):

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCdriverInfo">
  <name>Microsoft SQL Server</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:sqlserver</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.sqlserver.SQLServerDriver
</driverClassName>
  <connHandlerClass>
oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler
</connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeout>60</loginTimeout>
</driverInfo>
```

- Sybase:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCdriverInfo">
  <name>Sybase</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:sybase</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.sybase.SybaseDriver
</driverClassName>
  <connHandlerClass>
oracle.webdb.reformlet.data.jdbc.JDBCODBCConnectionHandler
</connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeout>30</loginTimeout>
</driverInfo>
```

- DB2:

```
<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCdriverInfo">
  <name>DB2</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:db2</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
```

```

<driverClassName>weblogic.jdbc.db2.DB2Driver
</driverClassName>
<connHandlerClass>
oracle.webdb.reformlet.data.jdbc.JDBCDBCCConnectionHandler
</connHandlerClass>
<connPoolSize>5</connPoolSize>
<loginTimeout>30</loginTimeout>
</driverInfo>

```

■ **Informix:**

```

<driverInfo class="oracle.webdb.reformlet.data.jdbc.JDBCdriverInfo">
  <name>Informix</name>
  <sourceDataBase>other</sourceDataBase>
  <subProtocol>weblogic:informix</subProtocol>
  <connectString>mainProtocol:subProtocol://databaseName</connectString>
  <driverClassName>weblogic.jdbc.informix.InformixDriver
  </driverClassName>
  <connHandlerClass>
oracle.webdb.reformlet.data.jdbc.JDBCDBCCConnectionHandler
  </connHandlerClass>
  <connPoolSize>5</connPoolSize>
  <loginTimeout>30</loginTimeout>
</driverInfo>

```

Table 63–4 describes the parameters in the driverInfo property.

**Table 63–4 Parameters in the driverInfo Property**

Parameter	Description
name	Name of the database you want to use. This name is used on the Source tab of the OmniPortlet wizard.
sourceDataBase	Internal value. Set the value to other.
subProtocol	JDBC subprotocol name used by OmniPortlet to create the connection string, for example <code>sqlserver</code> , <code>sybase</code> , or <code>db2</code> . To get the list of subprotocol names, see the DataDirect JDBC driver documentation using the links provided at the end of this section.
connectString	Description of the connect string format. For DataDirect drivers, the format is: <code>mainProtocol:subProtocol://databaseName</code>
driverClassName	Name of the driver class. To get the different values, see the DataDirect JDBC driver documentation using the links provided at the end of this section.
dataSourceClassName	Name of the data source class that implements connection pooling. This parameter is only available in OmniPortlet version 9.0.4.1 or later. See Table 63–5 for the right data source class name for your driver.
connHandlerClass	Class used by OmniPortlet to manage the driver and connection pooling. The value is either of the following: <ul style="list-style-type: none"> <li>■ For OmniPortlet version 9.0.4.1 or later: <code>oracle.webdb.reformlet.data.jdbc.JDBCConnectionHandler</code></li> <li>■ For OmniPortlet versions before 9.0.4.1: <code>oracle.webdb.reformlet.data.jdbc.JDBCDBCCConnectionHandler</code></li> </ul>

**Table 63–4 (Cont.) Parameters in the driverInfo Property**

Parameter	Description
connPoolSize	Minimum number of connections that are opened by the connection pool.
loginTimeOut	Maximum time, in seconds, that this data source waits while attempting to connect to a database.

Table 63–5 lists the values for the `driverClassName` and `dataSourceClassName` properties for specific DataDirect JDBC drivers.

**Table 63–5 Parameters and Values for driverClassName and dataSourceClassName**

DataDirect Drivers Supported	Properties
Microsoft SQL Server	Parameter: <code>driverClassName</code> Value: <code>weblogic.jdbc.sqlserver.SQLServerDriver</code>
Sybase	Parameter: <code>driverClassName</code> Value: <code>weblogic.jdbc.sybase.SybaseDriver</code>
DB2	Parameter: <code>driverClassName</code> Value: <code>weblogic.jdbc.db2.DB2Driver</code>
Informix	Parameter: <code>driverClassName</code> Value: <code>weblogic.jdbc.informix.InformixDriver</code>

3. Save the `provider.xml` file.
4. Stop and start the Oracle WebLogic Managed Server instance where your portlet producer was deployed.

To do so, navigate to `FMW_HOME/user_projects/domains/wc_Domain/bin` then issue the following command:

```
./startManagedWebLogic.sh WC_Portlet
```

---

**Note:** If you are using OmniPortlet in a multiple nodes configuration, for example, in a clustering or load-balancing environment, then you must manually copy the `provider.xml` file on each node.

---

**See Also:** For more information about how to use DataDirect JDBC drivers, see [Chapter 63, "Creating Portlets with OmniPortlet."](#)

### 63.4.3 Configuring Portal Tools and Web Producers (Optional)

To ensure that the OmniPortlet producer, locally built, and custom built Web producers work properly in the middle-tier environment, some additional configuration may be needed. If OmniPortlet or any other web producers have customizations in the file system, then PDK-Java provides a Preference Store Migration/Upgrade Utility that you can use to migrate the existing customizations to the database and upgrade customizations from earlier releases. See [Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store"](#) for more information about the PDK Preference Store Migration Utility.

## Configuring Portal Tools Producers in the Multiple Middle-Tier Environment

By default, the OmniPortlet producer uses the Database Preference Store. It can work in a multiple middle-tier environment without additional configuration.

You can find more information about configuring the database Preference Store in [Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store."](#)

1. If you have created an OmniPortlet instance with customizations in the file system, then you must migrate these customizations to the database using the Preference Store Migration Utility.

To run the migration utility:

1. Navigate to the WebCenter Portal Oracle home directory using the following command:

```
cd WC_ORACLE_HOME
```

2. Run the following command to migrate OmniPortlet data from a file-based Preference Store (`FilePreferenceStore`) to the database Preference Store (`DBPreferenceStore`):

```
java -classpath
lib/dms.jar:jdbc/lib/ojdbc14dms.jar:portal/jlib/pdkjava.jar:portal/jlib/
ptlshare.jar oracle.portal.provider.v2.preference.MigrationTool -mode
filetodb -pref1UseHashing true -pref1RootDirectory
portal/portletdata/tools/omniPortlet
-pref2User User_Name -pref2Password User_Password -pref2URL
jdbc:oracle:thin:@infra.host.com:1521:orcl
```

See [Section 60.3.8.2, "Migrating a PDK-Java Producer Persistence Store"](#) for more information about the PDK Preference Store Migration Utility.

2. Typically, you perform the HTTP Proxy configuration for OmniPortlet and Web Clipping before you configure the Load Balancing Router (LBR). To do it after the LBR is configured, perform the following steps:
  - a. The Portal Tools configuration information is stored in the `provider.xml` file on the middle-tier server. You must update the configuration directly on one middle tier (for example, **M1**) and then propagate it across all middle tiers front-ended by the LBR. You must first shut down all middle tiers except **M1**.
  - b. You can change the HTTP Proxy settings in the `provider.xml` file. For more information, see [Section 63.4.1, "Configuring the OmniPortlet Producer to Access Data Outside a Firewall."](#)
  - c. Propagate the changes made to the `provider.xml` file to middle tier **M2**:
    - Copy `OmniPortlet_WAR_DIR/WEB-INF/providers/omniPortlet/provider.xml` from **M1** to **M2**.
    - Copy `WebClipping_WAR_DIR/WEB-INF/providers/webClipping/provider.xml` from **M1** to **M2**.
3. Restart middle tier **M2**.
4. Update portlet producer registration in your Framework application. Change the first part of the producer registration URL from `http://m1.abc.com:7777/` to `http://lbr.abc.com/`.

5. Verify that the OmniPortlet and Web Clipping producers work properly through the LBR, by going to the test pages at the following URLs:
  - **OmniPortlet Producer:**  
`http://lbr.abc.com/portalTools/omniPortlet/producers/omniPortlet`  
  
If you see the "No Portlets Available" message under the Portlet Information section in the OmniPortlet Producer test page, then you may not have configured OmniPortlet correctly in Step 1. If OmniPortlet is configured correctly, then the OmniPortlet and Simple Parameter Form portlets are available on the test page.
  - **Web Clipping Producer:**  
`http://lbr.abc.com/portalTools/webClipping/producers/webClipping`

---

---

**Note:** To use the Web Clipping portlet or the Web Page Data Source for OmniPortlet, you must also enable session binding in Oracle Web Cache.

---

---

## 63.5 Troubleshooting OmniPortlet Problems

This section provides information to help you troubleshoot problems you may encounter while using OmniPortlet.

---

---

**Note:** As the OmniPortlet producer exists and executes in a tier different from the Framework application and does not have access to the session information, you must expose XML files as PUBLIC in order for OmniPortlet to access them.

---

---

### Cannot Define OmniPortlet Using the Define Link

You are not able to define the OmniPortlet at runtime.

#### Problem

OmniPortlet only supports a `RenderPortletInIFrame` value of `true`, meaning that OmniPortlet must be rendered within an IFRAME. Therefore, the OmniPortlet property, `RenderPortletInIFrame`, must be set to `true`. In the Property Inspector, the `RenderPortletInIFrame` property is available under Display Options.

Currently, the `RenderPortletInIFrame` property has a value of `false`. Consequently, when you click the **Define** link at runtime, the **Type** tab may not display and you cannot proceed with defining the OmniPortlet.

#### Solution

You can choose **Customize** from the Action list to define OmniPortlet, or select the OmniPortlet in the Structure window in Oracle JDeveloper, and in the Property Inspector, set `RenderPortletInIFrame` to `true`.

---

## Creating Content-Based Portlets with Web Clipping

Web Clipping is a publishing portlet that enables you to integrate any web application with your WebCenter Portal: Framework application. Web Clipping is designed to give you quick integration by leveraging the existing user interface of a web application. With Web Clipping, you can collect web content into portlets in a single centralized web page. You can use Web Clipping to consolidate content from web sites scattered throughout a large organization.

This chapter includes the information you are required to know to use Web Clipping in your Oracle JDeveloper environment. For information about how to use Web Clipping at runtime, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This chapter includes the following sections:

- [Section 64.1, "Introduction to Web Clipping"](#)
- [Section 64.2, "Adding Web Clipping to Your Application"](#)
- [Section 64.3, "Integrating Authenticated Web Content Using Single Sign-On"](#)
- [Section 64.4, "Advanced Features of Web Clipping"](#)
- [Section 64.5, "Web Clipping Portlet Configuration Tips"](#)
- [Section 64.6, "Current Limitations of Web Clipping"](#)
- [Section 64.7, "Troubleshooting Web Clipping"](#)

For information about the different types of portlets, producers, and other portlet technologies, see [Chapter 57, "Introduction to Portlets."](#)

---

**Note:** The Web Clipping portlet is deprecated in Release 11g (11.1.1.7.0). Consider using a clipper pagelet using Oracle WebCenter Portal's Pagelet Producer. For more information, see the "Managing Oracle WebCenter Portal's Pagelet Producer" chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

### 64.1 Introduction to Web Clipping

With Web Clipping you can clip an entire web page or a portion of it and reuse it as a portlet. You can clip basic and HTML-form-based sites. Use Web Clipping when you want to copy content from an existing web page and expose it in your Framework application as a portlet.

Web Clipping supports the following features:

- **Navigation through various styles of login mechanisms**

Web Clipping supports various login mechanisms including form- and JavaScript-based submission and HTTP Basic and Digest Authentication with cookie-based session management.

- **Fuzzy matching of clippings**

Fuzzy matching enables the Web Clipping engine to correctly identify a web clipping and deliver it as portlet content even if the web clipping is reordered within the source page or if its character font, size, or style changes.

- **Personalization**

Personalization enables you to expose input parameters that end users can modify when they personalize the portlet. Parameters can be exposed as public parameters that you can map as page parameters. This feature enables end users to obtain personalized clippings.

- **Integrated authenticated web content through single sign-on**

You can use external applications and leverage Oracle Single Sign-On to clip content from authenticated external web sites.

- **Inline rendering**

Inline rendering enables you to set up Web Clipping portlets to display links within the context of the portlet. When a user clicks a link in the Web Clipping portlet, the results display within the same portlet. You can use this feature with internal and external web sites.

- **Proxy authentication**

Web Clipping supports proxy authentication, including global proxy authentication and authentication for each user. You can use this feature if proxy servers require authentication. You can specify proxy server authentication details, including type (Basic or Digest) and realm in the `provider.xml` file. In addition, you can specify a scheme for entering user credentials:

- All users automatically log in using a user name and password that you provide.
- All users are required to log in using a user name and password that they provide.
- All public users (not authenticated into the Framework application) automatically log in using a user name and password that you provide, while valid users (authenticated into the Framework application) log in using a user name and password that they provide.

For more information, see [Section 64.5.2, "HTTP or HTTPS Proxy Configuration."](#)

- **Support for HTTPS**

Web Clipping enables you to clip content from HTTPS-based external web sites if appropriate server certificates are acquired. For information about server certificates, see [Section 64.5.3.1, "Adding Certificates for Trusted Sites."](#)

- **Open Transport API**

By default, the Web Clipping provider supports only HTTP challenge-based authentication methods, such as Basic and Digest and form submission logins. To support custom authentication methods, such as Kerberos proxy authentication,

you can use the Web Clipping Transport API. For more information, see [Section 64.4.1, "Using the Web Clipping Transport API."](#)

- **Reuse of a wide range of web content**

Web Clipping provides basic support of pages written with JavaScript, applets, and plug-in enabled content, retrieved through HTTP GET and POST methods of form submission.

Web Clipping also supports clipping of content from pages written with HTML 4.01, including:

- Clipping of `<applet>`, `<body>`, `<div>`, `<embed>`, `<img>`, `<object>`, `<ol>`, `<span>`, `<table>`, and `<ul>` tagged content
- Preservation of `<head>` styles and fonts, and CSS
- Support for UTF-8 compliant character sets
- Navigation through hyperlinks (HTTP GET), form submissions (HTTP POST), frames, and URL redirection

- **Globalization support**

Web Clipping provides globalization support in URLs and URL parameters. For information about how Web Clipping determines the character set of clipped content, see [Section 64.6, "Current Limitations of Web Clipping."](#)

- **Persistent storage of Web Clipping definitions**

Web Clipping definitions are stored persistently in a repository. By default, in JDeveloper, the Web Clipping producer is configured to use the file-based Oracle Metadata Service (MDS) as a repository. If you prefer, you can use a database schema for your Web Clipping repository. For information about configuring a Web Clipping repository, see [Section 64.5.1, "Web Clipping Repository Configuration."](#)

- **Encryption of secure information**

Any secure information, such as passwords, is stored in an encrypted form, according to the Data Encryption Standard (DES), using Oracle encryption technology.

## 64.2 Adding Web Clipping to Your Application

You can add a Web Clipping portlet to a JSP document created through JDeveloper. The Web Clipping portlet producer is included in:

- Integrated WebLogic Server (WLS), the default server installed with JDeveloper
- The `WLS_Portlets` managed server in the default domain in a full Oracle Fusion Middleware installation

To add a Web Clipping portlet to your application:

1. In JDeveloper, start Integrated WLS. For information, see [Section 3.4, "Working with the Integrated WebLogic Server."](#)
2. In JDeveloper, register the Web Clipping producer. For more information, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

During this step, you must provide the endpoint URL, for example:

```
http://localhost:7101/portalTools/webClipping/providers/webClipping
```

You can choose to register the Web Clipping portlet producer from the `WLS_Portlets` managed server or Integrated WLS.

When the producer is registered, portlets become available either in the Application Resources panel or the Resource Palette.

3. From the Application Resources panel or the Resource Palette, drag the Web Clipping portlet onto your `.jspx` page. For more information, see [Section 62.6, "Adding Portlets to a Page."](#)

If you are using a `PanelCustomizable` or `ShowDetailFrame` component, then drag the portlet on top of that component instead of `af:form`. In the Structure pane, the Web Clipping portlet must display under the `PanelCustomizable` or `ShowDetailFrame` component. In the Page Editor, the portlet must display inside the `PanelCustomizable` or `ShowDetailFrame` component.

---

---

**Note:** When you add an instance of Web Clipping to your page in JDeveloper, open the Property Inspector for the portlet and ensure that the `AllModesSharedScreen` and `RenderPortletInIFrame` properties are set as follows:

- **AllModesSharedScreen** is set to `false` to display the Customize and Personalize in full page size. If you do not set this property to `false`, then when you edit the Web Clipping portlet at runtime, the text displayed on the page may be distorted.
  - **RenderPortletInIFrame** is set to `true` to display the Web Clipping in its own inline frame (IFRAME) in the View mode.
- 
- 

4. Right-click the `.jspx` page and choose **Run**.

The Web Clipping portlet displays in your default browser.

5. Customize the Web Clipping portlet to define its contents. For more information, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

---

---

**Note:** To clip SSL-enabled web sites, you must add certificates of those sites to the certificate store. You are not required to add certificates of SSL-enabled web sites that use Equifax, VeriSign, or Cybertrust certificates because these certificates are included in the default certificate store.

For information about adding certificates, see [Section 64.5.3.1, "Adding Certificates for Trusted Sites."](#)

---

---

## 64.3 Integrating Authenticated Web Content Using Single Sign-On

You can leverage Oracle Single Sign-On to integrate content from external web sites that require authentication, into a Web Clipping portlet.

---

**Note:** You can associate only one external application with a producer. For each external application, you must register a new producer. Framework application users access the authenticated content by using their user name and password for that system, not your credentials.

---

To integrate an external application that requires authentication:

1. Open your Framework application in JDeveloper.
2. Register the external application, specifying the authentication information. For more information, see [Section 68.13.3.2.1, "Registering an External Application in Oracle JDeveloper."](#)
3. Register the Web Clipping producer. For information, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

While registering the producer by using the Register Oracle PDK-Java Portlet Producer wizard, on the Specify Connection Details page, select the **Associate Producer with External Application** checkbox, and from the list of values, select the external application that you just registered. The **Enable Producer Sessions** checkbox gets selected automatically.

[Figure 64–1](#) shows the external application named MyOracleSupport associated with a Web Clipping producer.

**Figure 64–1 Associating a Web Clipping Producer with an External Application**

4. Add the Web Clipping portlet from the producer that you just registered to a `.jspx` page.
5. Right-click the `.jspx` page and choose **Run**.
6. If you did not specify shared or public credentials for the external application, then the portlet contains an **Update login information** link. Click this link.

7. Enter your credentials, and then click **OK** to log in to the external web site.

Figure 64–2 shows the login screen of an external application named MyOracleSupport.

**Figure 64–2 Logging into the Integrated External Application**

8. Click the **Actions** icon on the header of the Web Clipping portlet, and select **Customize**.

The Find a Web Clipping page displays, with the default URL for the external application displayed in the **URL Location** field (Figure 64–3).

**Figure 64–3 Finding a Web Clipping**

You can now select any section of a web page that you intend to display in your Web Clipping portlet. For information about how to customize a Web Clipping portlet, see the "Working with the Web Clipping Portlet" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

After you clip the required page of the external application, the web clipping, even though it is from a page requiring authentication, is available in your portlet.

## 64.4 Advanced Features of Web Clipping

Web Clipping supports certain advanced features. You can configure custom authentication methods by using the Web Clipping Transport API and rewrite image links to use a resource proxy.

This section includes the following subsections:

- [Section 64.4.1, "Using the Web Clipping Transport API"](#)

- [Section 64.4.2, "Rewriting Image Links to Use a Resource Proxy"](#)

## 64.4.1 Using the Web Clipping Transport API

To support custom authentication methods, you can use the Web Clipping Transport API. To extend the Web Clipping transport layer to support custom authentication methods, you must perform several implementation and deployment procedures.

This section includes the following subsections:

- [Section 64.4.1.1, "Implementing the Web Clipping Transport API"](#)
- [Section 64.4.1.2, "Deploying the Web Clipping Transport API"](#)

### 64.4.1.1 Implementing the Web Clipping Transport API

If you want to support a custom authentication method, such as Kerberos, you must first implement your own transport classes.

To implement custom transport classes:

1. Override two use cases of the `oracle.portal.wcs.transport.http.HttpTransportLiaison` interface.

In Web Clipping, this interface is used to abstract the HTTP transport layer. By default, the two use cases of this interface are manifested by the following implementations:

- `HttpClientStudioTransportLiaison`, which handles HTTP transport in Web Clipping Studio mode
- `HttpClientProviderTransportLiaison`, which handles HTTP transport in Web Clipping Producer show mode

To support more authentication methods, you must override the `addRequestHeaders` methods for both the Studio and Provider `HttpClientTransportLiaison` implementations to add your own authentication-specific headers. For more information, see the *Oracle WebLogic Server Web Clipping Transport API Reference*.

2. Compile the new subclasses and package them into a JAR file.

For example, to compile the new subclasses, use the following command:

```
javac -classpath path_to_wcejars -d classes/
```

Where, `path_to_wcejars` refers to the path to the `wce.jar` file.

To create the JAR file, for example, run the following command from the `classes` directory:

```
jar cvf ../mytransport.jar
```

Where, `mytransport.jar` refers to the JAR file users want to create.

### 64.4.1.2 Deploying the Web Clipping Transport API

After implementing the new transport classes, you must deploy the JAR file to support the custom authentication method.

To deploy the JAR file:

1. Place the JAR file into the class path or shared library that is used by the Web Clipping producer at runtime.

2. Register the transport class in the `web.xml` file for the Web Clipping producer by making the following modifications to the context parameters defined for `HttpClientProviderTransportLiaison` and `HttpClientStudioTransportLiaison`:
  - Change the parameter value for `oracle.webclipping.provider.TransportLiaisonClass` to the name of the new class extended from the `HttpClientProviderTransportLiaison` class.
  - Change the parameter value for `oracle.webclipping.studio.TransportLiaisonClass` to the name of the new class extended from the `HttpClientStudioTransportLiaison` class.
3. Restart the producer server for the changes to take effect.

### 64.4.2 Rewriting Image Links to Use a Resource Proxy

Web Clipping enables you to rewrite image links to use a resource proxy. To enable this feature, you must add the following entry to the `web.xml` file of the Web Clipping producer:

```
<env-entry>
  <env-entry-name>oracle/webclipping/rewriteImageLink</env-entry-name>
  <env-entry-type>java.lang.Boolean</env-entry-type>
  <env-entry-value>>false</env-entry-value>
</env-entry>
```

## 64.5 Web Clipping Portlet Configuration Tips

Before you use Web Clipping, you must perform some administrative tasks, including the following:

- [Section 64.5.1, "Web Clipping Repository Configuration"](#)
- [Section 64.5.2, "HTTP or HTTPS Proxy Configuration"](#)
- [Section 64.5.3, "Web Clipping Producer Security"](#)

### 64.5.1 Web Clipping Repository Configuration

Web clippings have definitions that must be stored persistently in an Oracle Metadata Services (MDS) store or an Oracle database.

---

---

**Note:** You cannot use a Microsoft SQL Server or IBM DB2 database as the Web Clipping repository.

---

---

You can view the Web Clipping repository configuration by accessing the Web Clipping Producer Test Page at:

```
http://host:port/portalTools/webClipping/providers/webClipping
```

Where, *host* is the server to which your Web Clipping producer has been deployed and *port* is the port to which the server is listening for HTTP requests.

---

**Note:** Integrated WLS and the `WLS_Portlet` managed server are deployed to different ports even if they may be available on the same system. By default, Integrated WLS is deployed to port 7101 and `WLS_Portlet` is deployed to port 8889.

---

The Provider Test Page automatically detects whether the Web Clipping producer is configured with a valid repository. If it is not, then the **Status** column for the Web Clipping Repository displays **Not Configured**. Figure 64-4 shows the Provider Test Page of Web Clipping.

**Figure 64-4 Web Clipping - Provider Test Page**

Provider Test Page: Web Clipping

---

**Portlet Information**

Your producer contains the following portlets:

WebClippingPortlet

---

**Producer Initialization Parameters**

The following parameters are defined in the Web application configuration file (`web.xml`):

Name	Value
<code>invalidation_caching</code>	<code>true</code>

---

**Producer Configuration**

You can configure each of the following settings. For more information, see the "Web Clipping Portlet Configuration Tips" section in the Additional Portlet Configuration appendix of the Oracle WebCenter Framework Developer's Guide. [Learn More...](#)

Setting	Status
<b>Web Clipping Repository</b> <small>To change settings, edit <code>&lt;repositoryInfo&gt;</code> tag in the <code>provider.xml</code>.</small>	Configured
<b>HTTP Proxy</b> <small>To change settings, edit <code>&lt;proxyInfo&gt;</code> tag in the <code>provider.xml</code>.</small>	Not Configured
<b>Portlet Caching</b> <small>To change settings, edit <code>&lt;cacheExpires&gt;</code> tag in the <code>provider.xml</code>.</small>	Use Portal Cache (Validation)

---

[Home](#)

You cannot change the Web Clipping configuration information by using the Provider Test Page. You can configure the Web Clipping repository by setting appropriate values in the `provider.xml` file. In this file, you use the `repositoryInfo` tag to specify the Web Clipping repository settings.

---

---

**Note:** To determine the path of `provider.xml`, search for `webClipping/provider.xml` in the file system. For example, run the following command in UNIX:

```
> find DOMAIN_DIR -name "provider.xml" | grep -i webClipping
```

In Oracle JDeveloper's Integrated WLS, Web Clipping's `provider.xml` is located here:

```
JDEV_SYSTEM_DIRECTORY/DefaultDomain/servers/DefaultServer/tmp/_WL_
user/portalTools_11.1.1.2.0/RANDOMLY_GENERATED_
DIRECTORY/war/WEB-INF/providers/webClipping/provider.xml
```

Note that, on a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the `JDEV_SYSTEM_DIRECTORY` path does not contain spaces.

In the Fusion Middleware 11g installation, Web Clipping's `provider.xml` is located here:

```
FMW_HOME/user_projects/domains/wc_domain/servers/WLS_Portlet/tmp/_
WL_user/portalTools_11.1.1.2.0/RANDOMLY_GENERATED_
DIRECTORY/war/WEB-INF/providers/webClipping/provider.xml
```

---

---

This section includes the following subsections:

- [Section 64.5.1.1, "Using Oracle Metadata Services \(MDS\) as the Web Clipping Repository"](#)
- [Section 64.5.1.2, "Using an Oracle Database as the Web Clipping Repository"](#)
- [Section 64.5.1.3, "Configuring Web Clipping Repository in provider.xml"](#)
- [Section 64.5.1.4, "Attributes and Child Tags of the repositoryInfo Tag"](#)

### 64.5.1.1 Using Oracle Metadata Services (MDS) as the Web Clipping Repository

By default, in Oracle JDeveloper, the Web Clipping producer hosted on Integrated WLS, the default server, is configured to use MDS, which is file-based, as the Web Clipping repository.

---

---

**Note:** In a full Oracle Fusion Middleware installation, the Web Clipping portlet producer is also included within the `WLS_Portlets` managed server in the default domain. By default, this Web Clipping portlet producer is configured to use the Oracle database, which is installed as part of Oracle WebLogic Server, as the Web Clipping repository.

---

---

[Example 64-1](#) shows MDS as the default repository in `provider.xml`.

#### **Example 64-1 MDS as the Default Web Clipping Repository in provider.xml**

```
<repositoryInfo class="oracle.portal.wcs.provider.info.MdsInformation">
  <mdsConfigLocation>mds-config.xml</mdsConfigLocation>
</repositoryInfo>
```

For an MDS repository, the `repositoryInfo` tag is set to the `MdsInformation` class. The `mdsConfigLocation` entry specifies the path to the `mds-config.xml`

file, which contains the metadata store configuration information, including the path to the actual metadata store. In Oracle JDeveloper, the `mds-config.xml` file is located at the following path:

```
JDEV_SYSTEM_DIRECTORY/DefaultDomain/servers/DefaultServer/tmp/_WL_
user/portalTools_11.1.1.2.0/RANDOMLY_GENERATED_DIRECTORY/war/WEB-INF
```

---

---

**Note:** On a Windows platform, pages in Framework applications are not rendered if there is a space in the path to the system directory in JDeveloper. Therefore, ensure that the `JDEV_SYSTEM_DIRECTORY` path does not contain spaces.

---

---

The `mds-config.xml` file specifies the location of the repository in a property tag:

```
<property name="metadata-path" value="portletdata/tools/webClipping"/>
```

The location specified for `value` is relative to `JDEV_HOME/portal`. Any relative path specified is interpreted to be relative to `JDEV_HOME/portal`. To use another location, for example, a location outside the Oracle JDeveloper home, then specify an absolute path, such as `c:\mds`.

---

---

**Note:** For a multiple middle tier deployment, change the metadata path to a shared file system.

---

---

#### 64.5.1.2 Using an Oracle Database as the Web Clipping Repository

Although MDS is the default repository in Oracle JDeveloper, you can alternatively select to use a database schema for your Web Clipping repository.

---

---

**Note:** If you use a database as your Web Clipping repository, any customizations are retained even if the Web Clipping producer or the consuming application is redeployed.

---

---

You can use either of the following database schemas for Web Clipping:

- The default `PORTLET` database schema created by RCU for Oracle WebLogic Server
- A user-defined database schema for Oracle 9i or later

---

---

**Note:** You cannot use a Microsoft SQL Server or IBM DB2 database as the Web Clipping repository.

---

---

This section includes the following subsections:

- [Section 64.5.1.2.1, "Using the Database Schema Created by RCU"](#)
- [Section 64.5.1.2.2, "Creating a Database Schema"](#)

**64.5.1.2.1 Using the Database Schema Created by RCU** For Web Clipping repository, you can use the Oracle database installed as part of Oracle WebLogic Server, through a JNDI data source named `jdbc/portletPrefs`. To access the database, the schema named `PORTLET` is used.

---

---

**Note:** The PORTLET schema must be created in the Oracle database configured for WebCenter Portal. For more information, see the "Installing WebCenter Portal" chapter in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

---

---

**64.5.1.2.2 Creating a Database Schema** You can use any user-defined schema for an Oracle 9i or later database as the Web Clipping repository. To create a database schema for Web Clipping definitions and clippings, run the Java command described in [Example 64-2](#).

**Example 64-2 Java Command for Creating a Schema for Web Clipping Portlet Definitions and Clippings**

```
java -classpath WC_ORACLE_HOME/lib/xmlparserv2.jar:  
WC_ORACLE_HOME/jdbc/lib/ojdbc14.jar:WC_ORACLE_HOME/portal/jlib/wce.jar  
oracle.portal.wcs.Installer -installSchema -username dbuser -password  
dbpassword -dburl jdbc:oracle:thin:@//host:port/dbid
```

Where:

- *WC\_ORACLE\_HOME* is the path to your WebCenter Portal Oracle home directory
- *dbuser* is the database user for the schema

Consider using the same database user you use to create the WSRP and PDK-Java preference store database schema. If you do not use the same user, then you must create a new user and grant it connect and resource privileges.

- *dbpassword* is the specified user's password
- *dburl* is the URL for the database

This is the database that contains the schema that you create for Web Clipping portlet definitions and clippings by using the following syntax:

```
jdbc:oracle:thin:@//dbhost:dbport/service_name
```

For example:

```
jdbc:oracle:thin:@//shobeen:1521/sales_us
```

---

---

**Note:** The classpath in [Example 64-2](#) uses different separators for UNIX and Windows. On UNIX systems, the `classpath` uses a colon (:) separator. On Windows systems, the `classpath` uses a semicolon (;) separator.

---

---

### 64.5.1.3 Configuring Web Clipping Repository in `provider.xml`

To change the repository configuration for the Web Clipping producer deployed to Integrated WLS:

1. Open the `provider.xml` file in a text editor.
2. Specify the setting for your Web Clipping repository:
  - Use the PORTLET schema referred by the JNDI data source created by RCU. Specify the entries shown in [Example 64-3](#).

**Example 64–3 Oracle Database as the Web Clipping Repository**

```
<repositoryInfo class="oracle.portal.wcs.provider.info.JdbcDbInformation">
  <connectionName>jdbc/portletPrefs</connectionName>
  <useRAA>>false</useRAA>
  <useASO>>false</useASO>
</repositoryInfo>
```

For information about tag parameters, see [Section 64.5.1.4, "Attributes and Child Tags of the repositoryInfo Tag."](#)

- Use the database schema, created for an Oracle database 9*i* or later, where you can manually specify connection information.

To specify Oracle 9*i* or later database as the Web Clipping repository, specify database connection parameters in the entry shown in [Example 64–4](#).

**Example 64–4 Setting Oracle Database 9*i* or Later as Web Clipping Repository**

```
<repositoryInfo class="oracle.portal.wcs.provider.info.DatabaseInformation">
  <useRAA>>false</useRAA>
  <databaseHost>dbhost.mycompany.com</databaseHost>
  <databasePort>1521</databasePort>
  <databaseSid>iasdb</databaseSid>
  <databaseUsername>scott</databaseUsername>
  <databasePassword>!tiger</databasePassword>
  <useASO>>false</useASO>
</repositoryInfo>
```

For information about tag parameters, see [Section 64.5.1.4, "Attributes and Child Tags of the repositoryInfo Tag."](#)

If you require a secure database connection, then enable the Advanced Security Option (ASO) by setting the `useASO` entry to `true`. For more information about configuring ASO, see [Section 64.5.3, "Web Clipping Producer Security."](#)

---

**Note:** Only one entry of `<repositoryInfo>` can exist in `provider.xml`. Depending on the Web Clipping repository you choose, you must uncomment only that entry.

---

3. Save the `provider.xml` file.
4. Restart Integrated WLS.

**64.5.1.4 Attributes and Child Tags of the repositoryInfo Tag**

[Table 64–1](#) lists and describes the attributes and child tags of the `repositoryInfo` tag.

---

---

**Note:** The attributes and child tags of the `repositoryInfo` tag are also described in the comments in the `Web Clipping provider.xml` file.

In the comments in the `provider.xml` file, the example provided for *Oracle9i Database or later using Oracle infrastructure database* is specific to Oracle Portal and its infrastructure database and application programming interfaces. That example must not be used for Framework application implementations.

---

---

**Table 64–1 Attributes and Child Tags of the `repositoryInfo` Tag**

Attributes/Parameter	MDS/Database	Description
<code>class</code>	Both	<p>The <code>class</code> attribute specifies the type of repository used to store Web Clipping definitions. The possible values for this attribute are:</p> <ul style="list-style-type: none"> <li>▪ <code>oracle.portal.wcs.provider.info.MdsInformation</code> This value signifies that MDS is used to store Web Clipping definitions and that MDS configuration is pushed to the <code>mds-config.xml</code> file.</li> <li>▪ <code>oracle.portal.wcs.provider.info.DatabaseInformation</code> This value signifies that an Oracle9i Database or later is used to store Web Clipping definitions and that the database connection details are included as children in the <code>repositoryInfo</code> tag.</li> <li>▪ <code>oracle.portal.wcs.provider.info.JdbcDbInformation</code> This value signifies that Oracle database installed as part of Oracle WebLogic Server is used to store Web Clipping definitions.</li> </ul>
<code>mdsConfigLocation</code>	MDS	<p>Use the <code>mdsConfigLocation</code> tag when the value for the <code>class</code> attribute indicates an MDS repository. It points to the MDS configuration file <code>mds-config.xml</code>, which specifies the actual MDS location. The <code>mds-config.xml</code> file is located at:</p> <pre><i>MW_HOME</i>/wlserver_10.3/wc_domain/servers/WLS_Portlet/tmp/_ WL_user/portalTools_11.1.1.2.0/yygg17/war/WEB-INF</pre>
<code>connectionName</code>	Database	<p>Specifies the JNDI name of the data source where the Web Clipping repository has been installed using the RCU. By default, the connection name is <code>jdbc/portletPrefs</code>, which points to the <code>PORTLET</code> schema in Oracle WebLogic Server.</p> <p>In an interoperability scenario where an Oracle WebLogic Server 11g Middle Tier is paired with an Oracle Application Server 10g repository, the connection points to the <code>PORTAL</code> schema in the Oracle Application Server 10g repository.</p>
<code>useASO</code>	Database	<p>Set to <code>true</code> or <code>false</code>:</p> <ul style="list-style-type: none"> <li>▪ Specify <code>true</code> to use Oracle Advanced Security Option (ASO) to encrypt the communication channel between the Web Clipping producer and the database. This is provided for introducing added security if case-sensitive data is contained in the clipped content.</li> <li>▪ Specify <code>false</code> to omit this option.</li> </ul>

**Table 64–1 (Cont.) Attributes and Child Tags of the repositoryInfo Tag**

Attributes/Parameter	MDS/Database	Description
useRAA	Database	Set to <code>true</code> or <code>false</code> : <ul style="list-style-type: none"> <li>Specify <code>true</code> if Repository Access APIs are used to access the database connection parameters. Specifying <code>true</code> is equivalent to making the Web Clipping producer use the default Oracle infrastructure database as the repository. Specifying <code>true</code> removes the need for other <code>repositoryInfo</code> child tags.</li> <li>Specify <code>false</code> to omit this option.</li> </ul>
databaseHost	Database	Specify the host name of the Oracle database. Use only version 9i or later. For example: <code>mycompany.dbhost.com</code>
databasePort	Database	Specify the port number of the Oracle database listener. This is usually 1521.
databaseSid	Database	Specify the Oracle SID of the database that hosts the Web Clipping repository.
databaseUsername	Database	Enter the user name used to log in to the database.
databasePassword	Database	Enter a plain text password for the specified database user name. Prefix the password with an exclamation point (!) to allow the Web Clipping producer to encrypt the password when the producer starts. For example: <code>!AX3tR</code>

### 64.5.1.5 Migrating the Web Clipping Repository

By default, Web Clipping uses MDS, which is file-based, to store Web Clipping definitions and associated metadata. But you can configure Web Clipping to use a database. To migrate this repository for Framework applications, you can use the Predeployment tool in `export` and `import` mode to go from MDS to a database, or vice versa. This procedure must be done for each application as follows:

1. Run the Predeployment tool in `export` mode on all Framework applications that use the Web Clipping producer.
2. Update the producer to use a different repository. For information, see [Section 64.5.1.3, "Configuring Web Clipping Repository in provider.xml."](#)
3. Run the Predeployment tool in `import` mode on all Framework applications that use the Web Clipping producer.

## 64.5.2 HTTP or HTTPS Proxy Configuration

Your HTTP or HTTPS proxy settings must be set to allow the Web Clipping Studio to connect to web sites outside of your firewall. You can specify the settings by manually editing the `provider.xml` file.

Framework application administrators can set proxy settings manually according to the HTTP or HTTPS configuration. Edit the appropriate entries in the `provider.xml` file.

[Example 64–5](#) shows the relevant portion of `provider.xml`.

**Example 64–5 Proxy Settings**

```
- <!--
proxy information: Fill the following up if you have a proxy
server between the provider and external sites.
  <proxyInfo class="oracle.portal.provider.v2.ProxyInformation">
    <httpProxyHost>proxy.mycompany.com</httpProxyHost>
    <httpProxyPort>80</httpProxyPort>
    <dontProxyFor>*.mycompany.com</dontProxyFor>
    <proxyUseAuth>true</proxyUseAuth>
    <proxyType>Basic</proxyType>
    <proxyRealm>realm1</proxyRealm>
    <proxyUseGlobal>>false</proxyUseGlobal>
    <proxyUser>scott</proxyUser>
    <proxyPassword>!tiger</proxyPassword>
  </proxyInfo>

-->
```

It is optional to specify values for the following tags: <proxyUseAuth>, <proxyType>, <proxyRealm>, <proxyUseGlobal>, <proxyUser>, and <proxyPassword>.

Table 64–2, describes the proxy settings you specify in the provider.xml file.

**Table 64–2 Provider.xml Tags**

Parameter	Description
httpProxyHost	Enter the host name of a proxy server if one is required to make a URL connection from the Web Clipping producer to its data sources.
httpProxyPort	Enter the port number for the HTTP Proxy Host.
dontProxyFor	Enter the name of any domain or hosts to which you can directly connect, bypassing a proxy server. Domain names are the part of a URL that contain the names of a business, or organization, or government agency, for example: *.company.com, *.us.company.com Hosts can be fully qualified host names or can be IP addresses.
proxyUseAuth	Acceptable values: true   false Enter true if your proxy server requires authentication. The authentication parameters are specified by the following tags: proxyType, proxyRealm, proxyUseGlobal, proxyUserName, and proxyPassword.
proxyType	Acceptable values: Basic   Digest Choose the type of proxy server this provider. For more information about basic or digest authentication, see <a href="http://www.faqs.org/rfcs/rfc2617.html">http://www.faqs.org/rfcs/rfc2617.html</a> .
proxyRealm	Enter the name of the realm of the proxy server that is accessed by the user according to the login information described later in the table. If you do not know the name of the realm, then contact the administrator of the proxy server.

**Table 64–2 (Cont.) Provider.xml Tags**

Parameter	Description
proxyUseGlobal	<p>Acceptable values: true   false</p> <p>If true, then the <code>&lt;proxyUser&gt;</code> and <code>&lt;proxyPassword&gt;</code> values are used for all users. Users do not see the Proxy Authentication section on the Source tab and Personalize page. If false, then page designer must log in using the Proxy Authentication section on the Source tab when they define the portlet.</p> <p>The end user must log in using the Proxy Authentication section on the Personalize screen. If <code>&lt;proxyUsername&gt;</code> and <code>&lt;proxyPassword&gt;</code> are given, then they are only used for public users.</p>
proxyUserName	Enter the user name to log in to the proxy server.
ProxyPassword	Enter the password for the specified user name. You must prefix ! before your plain password text. It is then encrypted in the <code>provider.xml</code> file for protection when the producer starts.

---

**Note:** For environments that use a proxy server to reach external web sites, you can use the `dontProxyFor` entry to specify the proxy exception list. Web Clipping uses the proxy exception list to restrict users from clipping content from unauthorized external web sites. Users attempting to reach a web site in a listed domain, from the Web Clipping Studio, receive an HTTP timeout error.

---

### 64.5.3 Web Clipping Producer Security

The preceding sections described the administrative tasks that must be performed before you are able to use the Web Clipping producer. The following sections describe some security configuration options that you must implement to enable the Web Clipping producer to access Secure Sockets Layer (SSL)-enabled web sites and encrypt the channel between itself and the database:

- [Section 64.5.3.1, "Adding Certificates for Trusted Sites"](#)
- [Section 64.5.3.2, "Configuring Oracle Advanced Security for the Web Clipping Producer"](#)

#### 64.5.3.1 Adding Certificates for Trusted Sites

When a user navigates to a secure site, the web site typically returns a certificate, identifying itself to the user when asking for secure information. If the user accepts the certificate, then the certificate is placed into the list of trusted certificates of the browser so that a secure channel can be opened between the browser and that server. Like a web browser, the Web Clipping producer acts as an HTTP client to external web sites. To keep track of trusted sites, the Web Clipping producer uses the `cacerts` file, which is the Java keystore to store trusted certificates.

By default, the `cacerts` file stores various certificates including the Equifax, VeriSign, and Cybertrust certificates. However, it does not include all possible server certificates that exist on the web. For this reason, when a user navigates to a secure server using HTTPS, the user can get an SSL handshake failed exception in the Web Clipping Studio. To solve this problem, you must add the certificate of that site to the `cacerts` file.

To add a certificate to the `cacerts` file:

1. Download the certificate of the HTTPS web site and save the certificate in the PEM format.

**Tip:** Mozilla Firefox 3.0 or later enable you to save a certificate file in the PEM format.

2. Locate the path to the `cacerts` file:
  - a. Log in to the Oracle WebLogic Server Administration Console by using the following URL format:
 

```
http://host:port/console
```
  - b. Open the **Keystore** tab for the **WLS\_Portlets** managed server.
  - c. Note down the location of the `cacerts` file given in the **Java Standard Trust Keystore** field.

**Figure 64–5 Locating the `cacerts` file**

The screenshot shows the 'Settings for WLS\_Portlet' page in the Oracle WebLogic Server Administration Console. The 'Keystores' tab is selected, and the 'Java Standard Trust Keystore' field is highlighted, showing the path: `/scratch/wcwlinstall/0408/wlshome/jrockit_160_05_R27.6.2-20/jre/lib/security/cacerts`.

3. At the command prompt, navigate to the location of the `cacerts` file and run the following command to add the certificate:

```
keytool -importcert -alias certi_alias -file certifi_name
-keystore cacerts -storepass password
```

Where, *certi\_alias* refers to the alias used for the certificate, *certifi\_name* refers to the certificate file name, and *password* refers to the password of the `cacerts` file. The default password is `changeit`.

For example,

```
keytool -importcert -alias stamf05 -file stamf05.crt
-keystore cacerts -storepass changeit
```

**Tip:** It is advisable to import trusted certificate into the `cacerts` file by using an alias. It makes it easier for you to delete or list the entries in the keystore.

### 64.5.3.2 Configuring Oracle Advanced Security for the Web Clipping Producer

The Web Clipping producer can use Oracle Advanced Security Option (ASO) to secure and encrypt the channel between itself and the database that hosts the Web Clipping repository. This feature is available only if you have selected any Oracle database as the Web Clipping repository. This feature is disabled by default as Oracle Metadata Services is the default Web Clipping repository in Oracle JDeveloper.

To enable ASO:

1. Open `provider.xml` in a text editor.
2. Under the repository settings section in the file (shown in [Example 64-3](#)), set the `useASO` entry to `true`.
3. Save the `provider.xml` file.

In addition, you must set the following ASO configuration parameters in the `sqlnet.ora` file to ensure that the database connections created between the Web Clipping producer and the database hosting the Web Clipping repository are using ASO.

- `SQLNET.AUTHENTICATION_SERVICES` -- This parameter is used to select a supported authentication method in making database connections with ASO. For more information about setting this parameter, see the *Oracle Database Advanced Security Administrator's Guide*.
- `SQLNET.CRYPTO_SEED` -- This parameter denotes the cryptographic seed value (FIPS 140-1 setting), used in making database connections with ASO.

For more information about setting parameters and about the values to use for various possible combinations of parameters, see the *Oracle Database Advanced Security Administrator's Guide*.

---

**Note:** When setting these parameters after the initial configuration (where the database parameters are already set up), database connections are assumed to be open. Because enabling the ASO affects all connections made to the database, it is advisable to restart Integrated WLS containing the Web Clipping producer to reset all the current connections to use ASO. You must also do this when disabling ASO.

---

## 64.6 Current Limitations of Web Clipping

When you use Web Clipping, you should be aware of the following limitations.

- If the site that you intend to clip uses a large amount of JavaScript to manipulate cookies or uses the `document.write` JavaScript method to modify the HTML document being written, then you may not be able to clip content from the site.
- When you integrate with partner applications (by using `mod_osso`), you cannot clip directly through those partner applications in an authenticated manner. However, you can use partner applications through the external application framework.

- You cannot use the Web Clipping portlet to clip Oracle Portal pages and ADF pages. As a workaround, reregister the same producer in the destination portal and edit the portal manually.
- You cannot use the Web Clipping portlet to clip a web page that contains multiple frames, that is, a frameset.
- Note the following about Web Clipping and the use of a CSS:
  - If a web page contains multiple portlets that use a CSS, then they should not conflict if the CSS uses distinct style names, such as `OraRef`, to specify a style within an HTML tag, rather than using an HTML tag name, such as `<A>`, as the name of the style.
  - If one portlet uses a CSS, and that CSS overwrites the behavior of HTML tags by using the name of the tag, such as `<A>`, as the name of the style, and a second portlet on the same page does not use a CSS, the second portlet is affected by the style instructions of the CSS of the first portlet.
  - If two portlets on the same page use a different CSS and each CSS overwrites the behavior of HTML tags by using the name of an HTML tag, such as `<A>`, as the name of the style, then the style that is displayed depends on the browser.
- Web Clipping checks for globalization support settings in the following way:
  1. Web Clipping checks the `Content-Type` in the HTTP header for the `charset` attribute. If this is present, then it assumes that this is the character encoding of the HTML page.
  2. If the `charset` attribute is not present, then Web Clipping checks the HTML `META` tag on the page to determine the character encoding.
  3. If the HTML `META` tag is not found, then Web Clipping uses the `charset` in the previous browsed page. If this is the first page, then it defaults to the ISO-8859-1 character encoding.
  4. If the value of the `charset` for `Content-Type` or `META` tag is not supported (for example, if the `charset` was specified as `NONE`), then Web Clipping uses the default character set, ISO-8859-1, not the `charset` in the previously browsed page.
- To use the Web Clipping portlet, you must use Netscape 7.0 or later, Microsoft Internet Explorer 5.5 or later for Windows 2000, or Microsoft Internet Explorer 6.0 or later for Windows XP. If you use browser versions older than these, then you may encounter JavaScript errors.

## 64.7 Troubleshooting Web Clipping

This section provides information to help you troubleshoot problems you may encounter while using Web Clipping.

**Encountered "x" at line n, column n. Was expecting one of: "x", "y" ...**

Parser error message written to the log file.

### **Problem**

The web content displayed in the Web Clipping portlet contains invalid HTML or JavaScript.

**Solution**

This is a site-specific issue, not a Web Clipping error. Contact the site's administrator for assistance.

---

## Creating Pagelets with Oracle WebCenter Portal's Pagelet Producer

A pagelet is a reusable user interface component. Any HTML fragment can be a pagelet, but pagelet developers can also write pagelets that are parameterized and configurable, to dynamically interact with other pagelets, and respond to user input. Pagelets are similar to portlets, but while portlets were designed specifically for portals, pagelets can be run on any web page, including within a portal or other web application. Pagelets can be used to expose platform-specific portlets in other web environments.

Oracle WebCenter Portal's Pagelet Producer (previously known as Oracle WebCenter Ensemble) provides a collection of useful tools and features that facilitate dynamic pagelet development. This chapter includes detailed information about pagelet development and configuration using the Pagelet Producer. For additional information see the Pagelet Producer blog (<https://blogs.oracle.com/ensemble/>).

- [Section 65.1, "About Server Communication and the Proxy"](#): This section explains how the Pagelet Producer acts as a proxy server, brokering transactions between client computers and external resources.
- [Section 65.2, "Using Pagelets in Web Applications"](#): This section explains how to use pagelets in your WebCenter Portal applications.
  - [Section 65.2.1, "Adding a Pagelet to a JSF Page in Oracle JDeveloper"](#): This section explains how to use Oracle JDeveloper to drag and drop pagelets onto a JSF page.
  - [Section 65.2.2, "Adding a Pagelet to a Web Page"](#): This section explains how to insert a pagelet into a proxied or non-proxied page using JavaScript or REST.
  - [Section 65.2.3, "Adding a Pagelet to a Page in WebCenter Portal: Spaces"](#): This section explains how to add a pagelet to a space using Composer.
- [Section 65.3, "Building Pagelets Using the Pagelet Producer"](#): This section provides detailed information about building pagelets using the Pagelet Producer.
  - [Section 65.3.1, "Using the Adaptive Pagelet Scripting Framework"](#): This section explains how the adaptive pagelet scripting framework can be used to create a coordinated page with dynamic, interactive functionality.
  - [Section 65.3.2, "Using Pagelet Producer Credential Mapping"](#): This section explains how to configure security settings for pagelets and resources to manage authentication for users.

- [Section 65.3.3, "Modifying Pagelet Functionality at Runtime"](#): This section explains how to use custom web injectors and parsers to modify pagelet functionality at runtime.
- [Section 65.3.4, "Debugging Pagelets"](#): This section explains how to access advanced logging traces for debugging pagelets.
- [Section 65.4, "Working with WSRP and Oracle JPKD Portlets"](#): This section explains how the Pagelet Producer can be used to present WSRP and Oracle JPKD portlets for use in any web application.
  - [Section 65.4.1, "Using Pagelet Chrome"](#): This section explains how to use pagelet chrome to modify markup at runtime in WSRP or Oracle JPKD portlets.
- [Section 65.5, "Working with OpenSocial Gadgets"](#): This section summarizes Pagelet Producer support for standard OpenSocial APIs and explains how to use gadgets to store preferences and retrieve user information from WebCenter Portal using OpenSocial APIs.
  - [Section 65.5.1, "Configuring Authentication"](#)
  - [Section 65.5.2, "Storing User Preferences"](#)
  - [Section 65.5.3, "Accessing WebCenter Portal Profile Information"](#)

## 65.1 About Server Communication and the Proxy

The Pagelet Producer acts as a proxy server, brokering transactions between client computers and external resources.

Services on external resources communicate with the Pagelet Producer via HTTP. For example, when a browser requests a page, the Pagelet Producer makes simultaneous requests to each external resource to retrieve the pagelet content for the page. The external resource reads the current user's preferences from the HTTP headers sent by the Pagelet Producer and sends back the appropriate HTML. The Pagelet Producer inserts the HTML into the page markup. Any images stored in the Image Service are retrieved and displayed by the browser.

## 65.1.1 The Pagelet Producer Proxy

A proxy server acts as a middleman, brokering transactions between a client computer and another server. This configuration is typically used to serve content to clients that would otherwise be unable to access the external resource, but it can be used to impose additional security restrictions on the client, including the use of policies. The proxy hides the external resource; to the end user, the content appears to come directly from the proxy server.

This architecture makes the Pagelet Producer the single point of access for content, and allows external resources to reside on a private network or behind a firewall. As long as the Pagelet Producer can connect to the external resource, users can view the content, even if they cannot access it directly. To the browser, the Pagelet Producer appears to be the source of content on the external resource.

When a user interacts with a service, any request made to a URL in the proxy is automatically rerouted through the Pagelet Producer. To the user, the content appears to come from the Pagelet Producer; the external resource is an unknown back-end system.

There are many benefits to this configuration. The most useful to services are:

- **Dynamic functionality and personalization:** The Pagelet Producer intercepts requests from pagelets, which allows it to include information stored in the MDS in HTTP requests and responses.
- **Security:** Services can allow users to access content that is not publicly available. Files stored on a secure server can be made available by including specific URLs in the configuration of the proxy.

---

**Note:** The proxy is a powerful feature, and can compromise security if incorrectly configured. Allowing direct access to a external resource that hosts unprotected private content could create a dangerous security gap.

---

- **Performance:** The Pagelet Producer caches proxied content, decreasing response time for end users and improving performance on the external resource. While proxying works efficiently for content like HTML, it is generally not appropriate for binary data like static images. Images do not need to be transformed, and proxying large images can adversely affect performance. This is one reason the Image Service should be used to prevent routing static images through the proxy.

The collection of URLs that should be proxied for a service is configured in the Resource editor. All URLs that use the Internal URL prefix configured for the resource or point to other proxied CSP or web resources will be proxied unless **Enable URL Rewriting** is deselected.

Keep the following warnings and best practices in mind when implementing services that use the proxy:

- **URL transformation:** The Pagelet Producer must transform code so that proxied URLs open correctly. Before the Pagelet Producer sends a response, it parses the HTML and looks for any URLs that use the Internal URL prefix configured for the associated producer resource. The Pagelet Producer transforms any URLs that should be proxied before returning the response to the client. Relative URLs are transformed to point to the correct location.
- **Scripting limitations:** JavaScript constructs that dynamically create URLs can cause problems, because they are run after content is already transformed.

VBScript is not transformed by the proxy; you can continue to use dynamic scripts and VBScript as long as your code is proxy-aware. Parsers and web injectors can be used to implement targeted control over URL rewriting. For details on configuring parsers and web injectors, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

- **URL encoding:** It is a best practice to encode all headers that are URLs to prevent unexpected transformation. In JSP, encode all URLs that are written. If the code writes URLs in the body of a page (for example, a link to a preferences page) it should be encoded. The standard Java servlet command `response.encodeURL()` is the preferred method, but you can also use `URLEncoder.encode(url)`. In the .NET Framework, the `HttpUtility.UrlEncode` class provides the necessary functionality.

#### 65.1.1.1 About Pagelets and the Proxy

All pagelets are designed to be displayed with other pagelets. As explained in the previous section, the Pagelet Producer acts as a proxy, processing and combining pagelets from multiple applications to create a single, unified page with a range of functionality.

The code returned by a pagelet is parsed by the Pagelet Producer server and inserted into the HTML markup that makes up the page. Pagelets from the same back-end application can interact with each other within the page.

---

---

**Note:** In .NET, there is no need to encode the redirect URL; this is handled automatically on the back end.

---

---

### 65.1.2 About HTTP and CSP

HTTP is a protocol used mostly for transferring web page content and XML between a server and a client. CSP is a platform-independent protocol based on the open standard of HTTP 1.1 that defines the syntax of communication between the Pagelet Producer and external CSP resources.

#### 65.1.2.1 HTTP

HTTP communication is made up of Requests and Responses. Requests and Responses are essentially lists of name-value pairs of metadata in headers, along with an optional body. The body is the data that is being transferred (an HTML page or XML file). The metadata in the headers is information about the Request or Response itself (what language the content is in, or how long the browser should cache it). The Request and Response each contain specific information, outlined next. For more detailed information on HTTP, see RFC 2616 (<http://www.faqs.org/rfcs/rfc2616.html>).

The client sends the server an **HTTP Request**, asking for content. The Request body is used only for requests that transfer data to the server, such as POST and PUT.

HTTP Request Format:

```
[METHOD] [REQUEST-URI] HTTP/[VERSION]
[fieldname1]: [field-value1]
[fieldname2]: [field-value2]
[request body, if any]
```

HTTP Request Example:

```
GET /index.html HTTP/1.1
```

```
Host: www.xmlns.oracle.com
User-Agent: Mozilla/3.0 (compatible; Opera/3.0; Windows 95/NT4)
Accept: */*
Cookie: username=JoeSmith
```

The server sends back an **HTTP Response** that contains page content and important details, such as the content type, when the document was last modified, and the server type. The Response contains an error message if the requested content is not found.

#### HTTP Response Format:

```
HTTP/[VERSION] [CODE] [TEXT]
[fieldname1]: [field-value1]
[fieldname2]: [field-value2]
[response body, if any (document content here)]
```

#### HTTP Response Example:

```
HTTP/1.0 200 Found
Last-modified: Thursday, 20-Nov-97 10:44:53
Content-length: 6372
Content-type: text/html
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 3.2 Final// EN"><HTML>
...followed by document content...
```

Custom HTTP headers can be configured to include specialized information.

---

---

**Note:** Header size limits are controlled by the server that hosts the code. The standard limit for IIS/ASP is 60K. Java Application Servers range from 2K to 10K. These limits are generally configurable; see your server documentation for details.

---

---

Services can also access standard HTTP headers, such as the Set-Cookie header or HTTP 1.1 basic authentication header. If you want to investigate HTTP further, you can view all the headers being passed back and forth between your browser and Web server using logging (as described in [Section 65.3.4, "Debugging Pagelets"](#)). HTTP is used in conjunction with SSL to serve up secure content. Single Sign-On (SSO) also uses HTTP headers for basic authentication.

#### 65.1.2.2 CSP

CSP extends HTTP and defines proprietary headers to pass settings between Pagelet Producer and external CSP resources (i.e., Oracle WebCenter Interaction portlets). CSP outlines how these services use HTTP to communicate and modify settings. The latest version is 1.4, and is available here:

[http://download.oracle.com/docs/cd/E13158\\_01/alui/wci/docs103/devguide/references/CSP1.4.pdf](http://download.oracle.com/docs/cd/E13158_01/alui/wci/docs103/devguide/references/CSP1.4.pdf).

The custom CSP headers used to communicate system and user configuration variables can also be used by pagelets.

**Table 65–1 Pagelet Producer Headers**

Header Name	Description
User ID	The User ID of the currently logged in user. This value can be used to determine if the session has expired. If UserID=2, the default 'Guest' user is logged in; any other user's session has ended.
User Name	The name of the logged in user. The user's name can be used to personalize display or pre-fill form fields.
Image Service URL	The URL to the root virtual directory of the Image Service in the user's implementation of the Pagelet Producer. This location should be used for all static images used in services.
Stylesheet URL	The URL to the current user's style sheet. In each implementation of the Pagelet Producer, the UI is customized. In some portals, users can choose between a selection of stylesheets. Using these styles ensures that pagelets appear in the style of the current user's implementation of the Pagelet Producer.
Pagelet ID	The ID for the current resource (pagelet), and the instance ID for the current pagelet. This value is useful for appending to the names of HTML forms and client-side JavaScript functions to ensure unique form and function names on the page to avoid name conflicts.
Host Page URL	The URL to the page that hosts the pagelet. Preference pages need this URL to return the user to the correct page after settings are configured. This value can also be used to allow a single pagelet to display different content on different pages.

## 65.2 Using Pagelets in Web Applications

This section describes how to add pagelets to a JSF page in JDeveloper, to any web page, or to a page in WebCenter Portal: Spaces. Before you can add a pagelet to any web application, you must deploy and configure the resource and pagelet in the Pagelet Producer as described in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following subsections:

- [Section 65.2.1, "Adding a Pagelet to a JSF Page in Oracle JDeveloper"](#)
- [Section 65.2.2, "Adding a Pagelet to a Web Page"](#)
- [Section 65.2.3, "Adding a Pagelet to a Page in WebCenter Portal: Spaces"](#)

### 65.2.1 Adding a Pagelet to a JSF Page in Oracle JDeveloper

Oracle JDeveloper allows you to drag and drop pagelets onto a JSF page. In this section, you will register the Pagelet Producer with your WebCenter Portal: Framework application, add a pagelet to a JSF page, and view the page in a browser to test the pagelet.

This section includes the following subsections:

- [Section 65.2.1.1, "Registering the Pagelet Producer with a WebCenter Portal: Framework Application"](#)
- [Section 65.2.1.2, "Adding a Pagelet to a JSF Page"](#)
- [Section 65.2.1.3, "Securing a Pagelet"](#)

#### 65.2.1.1 Registering the Pagelet Producer with a WebCenter Portal: Framework Application

Before you can add a pagelet to a JSF page, you must register the Pagelet Producer with your application. You can register a Pagelet Producer in two ways:

- Register a producer with a specific application. By default, the IDE Connection option is selected in the New Pagelet Producer dialog that creates the connection under the Application Resources panel.
- Register a producer using the Resource Palette. This option enables you to use the producer's pagelets in multiple applications. A pagelet that is available in the Resource Palette can be added to any of your Framework applications by dropping it on the page. When you add a pagelet from the Resource Palette, its producer gets registered with the application if that producer is not already registered with the application. You can drag and drop a whole producer connection from the Resource Palette into the Application Resources panel of the Application Navigator. This registers the producer with the application. Alternatively, you can right-click a producer in the Resource Palette and choose **Add to Application** from the context menu to register the producer with the currently open application

To register a Pagelet Producer through Oracle JDeveloper:

1. In the Application Resources panel of the Application Navigator, right-click **Connections**, choose **New Connection** and then choose **Pagelet Producer**.

For other methods of invoking the wizard, such as from the Resource Palette, see [Section 1.6.2, "How Do I Access the Connection Wizards?"](#)

2. In the **Name** field of the New Pagelet Producer dialog, enter a meaningful name for your producer. For example, `myPageletProducer`.
3. In the **URL** field, enter the URL of your Pagelet Producer in the format:  
`http://hostname:portnumber/pagelets`.
4. Click **OK**. In the Application Resources panel, the Pagelet Producer is created under the Pagelet Producer directory in the Connections directory, as shown in [Figure 65–1](#).

**Figure 65–1 Pagelet Producer in the Application Resources Panel**

### 65.2.1.2 Adding a Pagelet to a JSF Page

To add a pagelet to a page:

1. In JDeveloper, open your JSF page in Design View, if it is not open already.
2. Go to the Application Resources panel or the IDE Resources panel in the Resource Palette. Under **Pagelet Producer**, expand your producer to display its contents.
3. From the producer's contents, drop a pagelet onto the JSF page.
4. In the **Add Pagelet to Page** dialog, choose **Yes** in the Use IFrame section if you would like to enable IFRAME for this pagelet.
5. In the **IFrame Height** field, specify the required height in pixels or leave it blank. You can also specify the height as "auto" to use automatic resizing. (To use this

- option, you must add the IFrame resizing page to the project. For details, see [Section 65.2.2.3, "Using Automatic Resizing with IFrames."](#) Click **OK**.
6. In the **Edit Task Flow Binding** dialog input parameters are specified by default. Change any parameters, if required, and then click **OK**.
  7. Save the page. In the Structure window, the page looks like [Figure 65–2](#).

**Figure 65–2 Pagelet in the Structure Window**

8. In the Application Navigator, right-click your JSF page under Projects, and choose **Run**.
9. If presented with a login page, enter user name and password so you can view the pagelet. [Figure 65–3](#) shows a sample pagelet in a browser window.

**Figure 65–3 Sample Pagelet**

### 65.2.1.3 Securing a Pagelet

For information about securing pagelets, see the section "Policy" and the section "Configuring Oracle Single Sign-On (OSSO)" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 65.2.2 Adding a Pagelet to a Web Page

Once you have deployed a pagelet, you can insert it into a proxied or non-proxied page using JavaScript or REST.

This section includes the following subsections:

- [Section 65.2.2.1, "Inserting Pagelets Using Javascript"](#): The Pagelet Producer allows you to insert pagelets into non-proxied pages using a simple JavaScript function.
- [Section 65.2.2.2, "Accessing Pagelets Using REST"](#): Pagelet Producer REST APIs allow remote web services to retrieve information about resources and pagelets from the Pagelet Producer, and inject pagelets into proxied and non-proxied pages.

- [Section 65.2.2.3, "Using Automatic Resizing with IFrames"](#): The pagelet inject function can automatically resize the IFrame that encapsulates pagelet content.

### 65.2.2.1 Inserting Pagelets Using Javascript

You can insert pagelets into non-proxied pages using a simple JavaScript function.

To activate this feature, add the following HTML snippet in the <HEAD> section of the page.

```
<script type="text/javascript" src="http://proxy:port/pagelets/inject/v2/csapi">
</script>
```

This script injects all CSAPI and pagelet inject functions into the page to display the pagelet. One of the sections injected is the following function:

```
function injectpagelet(library, name, iframe_options, payload, params, context_id,
element_id, is_in_community, chrome, forward_params)
{
    ...
}
```

This function injects a pagelet as a widget into the parent page. The method interface uses the following parameters:

- **library**: Required. A string representing the library name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **name**: Required. A string representing the name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **iframe\_options**: Specifies whether to use IFRAME around the pagelet content. Sample IFRAME options: `iframe width=100% height=auto frameborder=0`. If omitted or left blank, the pagelet content is rendered inline.
- **payload**: The XML payload to send with the pagelet request.
- **params**: The pagelet parameters in query string format. For example, `'param1=value1&param2=value2&param3=value3'`.
- **context\_id**: The external identifier of the pagelet instance, used to scope preferences on the Pagelet Producer server. Must be an integer.
- **element\_id**: The HTML element ID in which the pagelet content is injected. If omitted or left blank, the pagelet content is injected using `document.write()` when the `injectpagelet` call is evaluated.
- **is\_in\_community**: Specifies whether this pagelet is on a community or group page. If the value is set to `true`, it sends the `context_id` in the community ID header to the pagelet. Defaults to `false`.
- **chrome**: Specifies the name of the chrome template to use for WSRP/JPDK pagelets. To suppress chrome, use a value of `none`.
- **forward\_params**: Specifies whether to forward query string arguments from the consuming page to the back-end server. To suppress this functionality, use a value of `false`.

---

**Note:** These arguments are positional; they must be provided in the given order. If you do not want to specify a particular argument, but do want to specify an argument that follows it, you must pass in an empty value (") for the former. All arguments are optional except for library and name.

---

The script also creates a new `<div>` with a unique name that includes a reference to the `injectpagelet` function. Several examples are shown below:

```
<div>
  <script type="text/javascript">
    injectpagelet('library', 'name');
  </script>
</div>
<div>
  <script type="text/javascript">
    injectpagelet('library', 'name', 'iframe', 'payload',
'param1=value1&param2=value2&param3=value3');
  </script>
</div>

<div>
  <script type="text/javascript">
    injectpagelet('library', 'name', 'iframe width=100% height=200', 'payload');
  </script>
</div>
```

**65.2.2.1.1 Adding a Preference Editor Using Javascript** The `injecteditor` function lets you add preference editors that enable users to set personal and shared preferences for pagelets that support this capability. This functionality is analogous to personalization and customization functionality in Oracle WebCenter Portal.

```
injecteditor(library, name, type, iframe_options, context_id, element_id, is_in_
community, chrome)
```

where:

- **library:** Required. The library name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **name:** Required. The name of the pagelet to inject. Accepts Unicode letters and numbers only; no spaces.
- **type:** The editor type. This argument supports these values: 'admin', 'pagelet', 'community'. In case of the 'community' argument, `context_id` is sent to pagelet in the community ID CSP header.
- **iframe\_options:** Specifies whether to use IFRAME around the pagelet editor content. Sample IFRAME options: `iframe width=100% height=auto frameborder=0`. If omitted or left blank, the editor content is rendered inline.
- **context\_id:** The external identifier of the pagelet instance, used to scope preferences on the Pagelet Producer server. Must be an integer.
- **element\_id:** The HTML element ID in which the pagelet content is injected. If omitted or left blank, the pagelet content is injected using `document.write()` when the `injecteditor` call is evaluated.
- **is\_in\_community:** Specifies whether this pagelet is on a community or group page. If the value is set to `true`, it sends the `context_id` in the community ID header to the pagelet. Defaults to `false`.
- **chrome:** Specifies the name of the chrome template to use for WSRP/JPDK pagelets. To suppress chrome, use a value of `none`.

---

---

**Note:** These arguments are positional; they must be provided in the given order. If you do not want to specify a particular argument, but do want to specify an argument that follows it, you must pass in an empty value ("") for the former. All arguments are optional except for library and name.

---

---

### 65.2.2.2 Accessing Pagelets Using REST

REST stands for Representational State Transfer and is a simple way of providing APIs over HTTP. The basic principles of REST are:

- API URLs point to the resource rather than a generic method endpoint.
- Requests use standard HTTP verbs for simplified CRUD methods. This is a read-only API and allows GET requests only.
- Every request returns a full representation of the object retrieved (pagelet or resource).

Pagelet Producer REST APIs provide the following functionality:

- Inject pagelets into non-proxied pages, allowing the Pagelet Producer to act as a portlet provider for Oracle WebCenter Interaction, Oracle WebLogic Portal, or other third-party portals. For details, see [Section 65.2.2.2.1, "Pagelet Inject API"](#).
- Allow remote web services to retrieve information about resources and pagelets from the Pagelet Producer. For details, see [Section 65.2.2.2.2, "Data Retrieval APIs"](#).

**65.2.2.2.1 Pagelet Inject API** The pagelet inject URL can be used in portals to specify the location of a remote portlet (this is how a pagelet can be used as a portlet). The inject URL can also be used as the src attribute of an IFrame tag in any HTML page.

The URL must use the following format:

```
http://host:port/pagelets/inject/v2/pagelet/libraryname/pageletname?content-type=html
```

where `libraryname` and `pageletname` refer to the library and pagelet configured in the Pagelet Producer.

---

---

**Note:** When using the pagelet inject API as the URL for a Portlet Web Service in Oracle WebCenter Interaction, you must switch "pagelet" to "portlet" in the URL. For example, the above URL would become:

```
http://host:port/pagelets/inject/v2/portlet/libraryname/pageletname?content-type=html
```

---

---

The query string arguments to the above call define how the pagelet is to be returned. The following parameters are defined:

- **instanceid:** Optional. The instance ID of the pagelet, used to uniquely identify the pagelet on the page to facilitate inter-pagelet communication. Must be unique to the page.
- **context:** Optional. The external identifier of the pagelet instance, used for scoping preferences on the Pagelet Producer server. Must be an integer.
- **content-type:** The return type. Three types are supported:

- **javascript**: Returns injectable code.
- **html**: Returns the pagelet markup with its associated PTPortlet object.
- **iframe**: Returns an IFrame that points back to the inject api, filling the IFrame with the pagelet content, instead of directly inline with the page. The IFrame can be styled by providing a set of query string parameters.

Parameter	Description	Default
ifwidth	Sets the width of the IFrame; can be specified in percent '%' or pixels 'px', for example: ifwidth=500px. Can be set to 'auto' to automatically resize the IFrame to fit the content within. For details, see <a href="#">Section 65.2.2.3, "Using Automatic Resizing with IFrames"</a> .	100%
ifheight	Sets the height of the IFrame; can be specified in percent '%' or pixels 'px', for example: ifheight=500px. Can be set to 'auto' to automatically resize the IFrame to fit the content within. For details, see <a href="#">Section 65.2.2.3, "Using Automatic Resizing with IFrames"</a> .	No default
ifborder	Sets the border of the IFrame.	'none'
ifalign	Sets the align rule within the IFrame, for example: ifalign=center.	No default
ifdesc	Sets the description of the IFrame.	No default
ifmarginheight	Sets the margin height; can be specified in percent '%' or pixels 'px', for example: ifmarginheight=500px.	No default
ifmarginwidth	Sets the margin width; can be specified in percent '%' or pixels 'px', for example: ifmarginwidth=500px.	No default
ifscrolling	Sets the scrollbars of the IFrame. Accepted values: yes/no/auto.	auto
ifstyle	Sets the CSS style of the IFrame	No default
ifclass	Sets the CSS class of the IFrame.	No default

- **csapi**: Optional. Sets whether the CSAPI will be included with the pagelet response (true or false). Including the CSAPI is optional, but the pagelet included in the response relies on the CSAPI libraries being present on the page where the pagelet is to be rendered. If csapi=false, then the CSAPI libraries must be included with the parent page (usually in the HEAD section).
- **onhttperror**: Optional. When a pagelet request results in a 403, 404 or any other error code, the Pagelet Producer can forward the error code and the error page itself to the browser for display to the user. The onhttperror parameter accepts the following values:
  - **comment** (default): The Pagelet Producer will create an HTML comment in place of the failing pagelet (the failing pagelet will simply not be displayed).
  - **inline**: The pagelet error along with the server error page will be displayed inline where the pagelet would normally be shown on the page.
  - **fullpage**: The http error will consume the whole page. This mode is only available if the Pagelet Producer controls the parent page.

For example, the following URL points to the linkspagelet in the samples library:

```
http://host:port/pagelets/inject/v2/pagelet/samples/linkspagelet?content-type=iframe&csapi=true&ifheight=123px&ifclass=myclass
```

This URL should result in markup similar to the code below.

---

**Note:** The IFrame source points back to the inject API, but this time the content-type parameter is set to `html`. This feature adds an additional step in the pagelet retrieval. The `csapi` parameter is set to `true` on the subsequent call to get the IFrame contents so that the required CSAPI content is included in the IFrame (if this was not the case, JavaScript resolve errors would be returned because the pagelet code cannot access any CSAPI script included outside the IFrame).

---

```
<html>
<head>
</head>
<body>
  <iframe frameborder="none" class="myclass" width="100%" height="123px"
scrolling="auto"
src="http://proxy:port/inject/v2/pagelet/samples/linkspagelet?asdg=asdfgas&param=true&content-type=html&jswrap=false&csapi=true">
  <html>
  <head>
    <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/common/private/js/jsutil/LATEST/PTUtil.js" type="text/javascript"> </script>
    <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/common/private/js/jsutil/LATEST/PTDateFormats.js" type="text/javascript"></script>
    <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/common/private/js/jsxml/LATEST/PTXML.js" type="text/javascript"></script>
    <script
src="http://proxy:loginserverport/loginserver/ensemblestatic/imageserver/plumtree/common/private/js/jsportlet/LATEST/PTPortletServices.js"
type="text/javascript"></script>
  </head>

  <body>
    <div id="pt-pagelet-content-1" class="pagelet-container" style="display:
inline;">
      <span xmlns:pt="http://www.xmlns.oracle.com/xmlschemas/ptui/">
        Pagelet links:
        <br/>
        <a href="http://proxy:port/inject/RP_PID393219_I1/headpagelet1.html">The
first pagelet</a>
        <br/>
        <a href="http://proxy:port/inject/RP_PID393219_I1/headpagelet2.html">The
second pagelet</a>
        <br/>
        <a href="http://proxy:port/inject/RP_PID393219_I1/csapipagelet.html">The
csapi pagelet</a>
        <br/>
        <a href="http://proxy:port/inject/RP_PID393219_I1/linkspagelet.html">This
pagelet</a>
        <br/>
      </span>
```

```
</div>
</body>
</html>
</iframe>
</body>
</html>
```

**65.2.2.2.2 Data Retrieval APIs** Two REST APIs are available to retrieve data from the Pagelet Producer:

- **Pagelet API:** Allows remote applications to retrieve pagelet data from the Pagelet Producer. (See [Example 65–1, "All Pagelets"](#) and [Example 65–2, "Pagelets By Library and Name"](#).)
- **Resource API:** Allows remote applications to retrieve resource data from the Pagelet Producer. (See [Example 65–3, "All Resources"](#) and [Example 65–4, "Resource By Name"](#).)

The base URL for all requests is

```
http://host:port/pagelets/restservice/pageletproducer/.
```

**Example 65–1 All Pagelets**

```
http://host:port/pagelets/restservice/pageletproducer/pagelets/
http://host:port/pagelets/restservice/pageletproducer/pagelets/?format=xml
```

**Example 65–2 Pagelets By Library and Name**

```
http://host:port/pagelets/restservice/pageletproducer/pagelet/libraryname/pageletname/
http://host:port/pagelets/restservice/pageletproducer/pagelet/libraryname/pageletname/?format=xml
```

**Example 65–3 All Resources**

```
http://host:port/pagelets/restservice/pageletproducer/resources/
http://host:port/pagelets/restservice/pageletproducer/resources/
```

**Example 65–4 Resource By Name**

```
http://host:port/pagelets/restservice/pageletproducer/resource/name
http://host:port/pagelets/restservice/pageletproducer/resource/name/?format=xml
```

### 65.2.2.3 Using Automatic Resizing with IFrames

The Pagelet Producer pagelet inject API can automatically resize the IFrame that encapsulates pagelet content. The resizing is done so that the IFrame stretches to fit the content within. To use this feature, the `ifwidth` and `ifheight` parameters must be set to 'auto' as shown in the example below:

```
http://proxy:port/inject/v2/pagelet/samples/linkspagelet?content-type=iframe&csapi=true&ifheight=auto&ifwidth=auto&ifclass=myclass
```

In addition, this feature relies on an external page on the same domain as the consumer page. This page is included into the pagelet IFrame as an internal hidden IFrame. This page collects the sizing information and passes it on to the parent consumer page. This page must be deployed in the same directory as the consumer page.

The example below resizes the pagelet IFrame after it finishes loading. To add dynamic auto-resizing capabilities to user interaction activities after the initial load, simply add more event listeners for mouse and keyboard events.

```
<html>
  <head>
    <title>Resizing Page</title>
    <script type="text/javascript">
      function onLoad() {
        var params = window.location.search.substring( 1 ).split( '&' );
        var height;
        var width;
        var iframe;

        for( var i = 0, l = params.length; i < l; ++i ) {
          var parts = params[i].split( '=' );
          switch( parts[0] ) {
            case 'height':
              height = parseInt( parts[1] );
              break;
            case 'width':
              width = parseInt( parts[1] );
              break;
            case 'iframe':
              iframe = parts[1];
              break;
          }
        }
        window.top.updateIFrame( iframe, height, width );
      }

      if (window.addEventListener) {
        window.addEventListener("load", onLoad, false)
      } else if (window.attachEvent) {
        window.detachEvent("onload", onLoad)
        window.attachEvent("onload", onLoad)
      } else {
        window.onload=onLoad
      }
    </script>
  </head>
</body>
</body>
</html>
```

### 65.2.3 Adding a Pagelet to a Page in WebCenter Portal: Spaces

In WebCenter Portal: Spaces, you can add a pagelet to a page using Composer. By default, pagelets appear in the Mash-Ups folder in the Resource Catalog. To add a pagelet to a page, navigate to the pagelet in the Resource Catalog and select it.

For detailed information about how to add resources to pages in Spaces, see the section "Adding Resource Catalog Components to Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To configure a pagelet within a page, view the page in Edit mode and click the edit button (wrench icon) for the pagelet. The Pagelet Properties tab in the Component Properties dialog allows you to define pagelet parameters and IFrame options.

**Figure 65–4 Component Properties Dialog: Pagelet Properties**

## 65.3 Building Pagelets Using the Pagelet Producer

This section provides information on building pagelets using the Pagelet Producer.

- [Section 65.3.1, "Using the Adaptive Pagelet Scripting Framework"](#)
- [Section 65.3.2, "Using Pagelet Producer Credential Mapping"](#)
- [Section 65.3.4, "Debugging Pagelets"](#)

### 65.3.1 Using the Adaptive Pagelet Scripting Framework

The **Adaptive Pagelet Scripting Framework** is a client-side JavaScript library that provides services to CSP pagelets and proxied pages. This section explains how to use the scripting framework to implement dynamic functionality in pagelets.

- [Section 65.3.1.1, "Handling Structured HTTP Responses"](#): The adaptive pagelet scripting framework can be used as a client-side response handler for structured HTTP, typically encoded as XML.
- [Section 65.3.1.2, "Using Event Notification"](#): A pagelet can respond when specific events happen, such as when the page loads or when the browser focus changes.
- [Section 65.3.1.3, "Using In-Place Refresh"](#): Pagelets can reload their internal content without refreshing the page.
- [Section 65.3.1.4, "Using Session Preferences"](#): Browser-level variables can be stored and shared among pagelets, even if they are not on the same page. For example, a value entered by the user in one pagelet can be retrieved by another. The scripting framework acts as an intermediary, allowing all pagelets access to all values stored in a common session.

For a full list of classes and methods, see the JSPortlet API documentation.

For additional information on adaptive pagelets, see [Section 65.3.1.5, "Adaptive Pagelet Development Tips"](#).

### 65.3.1.1 Handling Structured HTTP Responses

In many cases it can be expensive and inefficient to send large amounts of HTML back in response to some HTTP request, if only a small part of the user interface needs to be changed. This is especially true with more complex user interfaces. In these cases, the response can be encoded in XML. The client-side response handler can then parse the XML, and update the user interface (or perform some other action) based on that response. Use the Structured Response design pattern to redraw a small area of the user interface after making an HTTP request, or to access a simple HTTP/URI type web service from a pagelet. The example code below (`structuredresponse_portlet.html`) accesses an RSS feed from a selection of news sites.

```

<!-- jsxml includes -->
<a id="imgServerHref" href="/images/plumtree" style="display:none"></a>
<script type="text/javascript"
src="/images/plumtree/common/private/js/PTLoader.js"></script>
<script type="text/javascript">
var oImgServer = new Object();
oImgServer.location = document.getElementById('imgServerHref').href;
var imageServerURL = document.getElementById('imgServerHref').href;
var imageServerConnectionURL = oImgServer.location;
new PTLoader(imageServerURL, imageServerConnectionURL).include('jsxml','en');
</script>

<!-- jscontrols includes -->
<link rel="stylesheet" type="text/css"
href="/portal-remote-server/js/jscontrols/styles/css/PTMenu.css"/>
<link rel="stylesheet" type="text/css"
href="/portal-remote-server/js/jscontrols/styles/css/PTRichTextEditor.css"/>
<script type="text/javascript"
src="/portal-remote-server/js/jscontrols/strings/PTControls-en.js"></script>
<script type="text/javascript"
src="/portal-remote-server/js/jscontrols/PTControls.js"></script>

<!-- Inline JS helper functions -->
-->

<script defer type="text/javascript" id="structured-response-portlet-A-script">
// Function that gets the RSS XML feed found at the specified url
getRSSFeed = function(url)
{
    // First clear out any existing rows in the table
    channelTable.clearRows();

    // Force the transformer to fix up the url
    var oURL = new Object();
    oURL.location = url;

    // Do the http get
    var get = new PTHTTPGETRequest(oURL.location, handleRSSResponse);
    get.invoke();
}

// Function that handles the RSS XML response and updates the table based on the
RSS items
handleRSSResponse = function(response)
{
    // Get the rss xml
    var xml = response.responseText;
    if (!xml || xml.indexOf('<?xml') == -1) { return; }
}

```

```

// Parse into a dom, and get the channel node
var xmlDoc = new PTXMLParser(xml);
var rssNode = xmlDoc.selectSingleNode('rss');
var channelNode = rssNode.selectSingleNode('channel');

// Get the channel title and set the status bar text in the table
var channelTitle = channelNode.selectSingleNode('title').getNodeValue();
channelTable.statusBarText = '<b>Loaded Channel</b>: ' + channelTitle;

// Get channel item nodes
var itemNodes = channelNode.selectNodes('item');

// Build table rows
channelTable.rows = new Array();

  channelTable.areColumnsResizable = true;
  channelTable.clientSortEnabled = true;
  channelTable.scrollHeight = 250;
  channelTable.init();
  channelTable.draw();
</script>
</div>

```

### 65.3.1.2 Using Event Notification

The adaptive pagelet scripting framework allows pagelets to respond to both page-level events and custom events raised by other pagelets.

The `registerForWindowEvent` and `registerOnceForWindowEvent` methods in the scripting framework provide pagelets with access to page-level events. For a complete list, see [Section 65.3.1.2.1, "Page-Level Events for Use with the Scripting Framework"](#). To register for notification of these events, pass in the name of the event and the name of the method that should be called when it occurs. When a page-level event is raised, the JavaScript event object is passed to the event handler as an argument. The scripting framework also allows pagelets to raise and respond to custom events using `raiseEvent` and `registerForEvent`. The Broadcast-Listener design pattern illustrates an important example of using notification services with session preferences. Users can select an item or perform some other action in a "broadcast" pagelet, which causes the content in other related "listener" pagelets to be redrawn. In the following example, the broadcast pagelet displays a form that allows you to enter a number in a text box.

**Figure 65–5 Broadcast Portlet**

When the user enters a number in the text box, the values in the listener pagelets change. The first listener pagelet displays the square root of the number entered in the broadcast pagelet.

**Figure 65–6 Listener -1 Portlet**

The second listener pagelet displays the cube root of the number entered in the broadcast pagelet.

**Figure 65–7 Listener -2 Portlet**

The following steps summarize how the pagelets work:

- On load, each listener pagelet calls its own instance method (`registerForEvent`) to register for events of type 'onBroadcastUpdate'.
- On each onkeyup event that occurs in the "Enter number" text box, the broadcast pagelet sets a session preference to the value entered in the text box, and calls its own instance method (`raiseEvent`) to raise an event of type 'onBroadcastUpdate'.
- When the onBroadcastUpdate event is raised or the page is reloaded, each listener pagelet retrieves the session preference set by the broadcast pagelet and computes a new value to display based on the value of the preference.

### Broadcast Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Enter number:</b>
&nbsp; <input type="text"
style="font-size:22px;font-weight:bold;text-align:center;"
id="broadcast_prefName" value="4" size="7" onkeyup="broadcast_
setPrefs(this.value)" ></p>
<br>
</div>
```

```

<script type="text/javascript">
function broadcast_setPrefs(val)
{
    var prefName = 'broadcastNumber';
    var prefValue = val;
    PTPortlet.setSessionPref(prefName,prefValue);
    var broadcastPortlet =
PTPortlet.getPortletByGUID('{D9DFF3F4-EAE7-5478-0F4C-2DBD94444000}');

    if (!broadcastPortlet)
    {
        broadcast_debug('Could not locate PTPortlet object which corresponds to
<b>Broadcast Portlet</b> on page.');
```

### Listener Pagelet #1

```

<div style="padding:10px;" align="center">
<p><b>Square root:</b>
<div style="height:21px;border:2px solid
black;padding:2px;overflow:visible;font-size:14px;" id="listener1-swatch">
</div>
</div>

<script>
function listener1_update()
{
    var broadcastNumber = parseFloat(PTPortlet.getSessionPref('broadcastNumber'));
    if (isNaN(broadcastNumber))
    {
        listener1_error('<b>Listener-1 Portlet</b> cannot parse number from
session pref broadcastNumber');
```

```

    }

    function listener1_error(str)
    {
        if (window.PTDebugUtil)
        {
            PTDebugUtil.error(str);
        }
    }

    function listener1_getPortlet()
    {
        var portletGUID = '{D9DF3F4-EAE7-5478-0F4C-2DBDB4F4A000}';
        var listener1Portlet = PTPortlet.getPortletByGUID(portletGUID);
        return listener1Portlet;
    }

    var listener1Portlet = listener1_getPortlet();
    if (listener1Portlet)
    {
        listener1Portlet.registerForEvent('onBroadcastUpdate', 'listener1_update');
        listener1_debug('<b>Listener-1 Portlet</b> registered refreshOnEvent for event
onBroadcastUpdate');
        listener1Portlet.registerForEvent('onload', 'listener1_update');
    }
}

</script>

```

### Listener Pagelet #2

```

<div style="padding:10px;" align="center">
<p><b>Cube root:</b>
<div style="height:21px;border:2px solid
black;padding:2px;overflow:visible;font-size:14px;" id="listener2-swatch">
</div>
</div>

<script>
var listener2_oneThird = (1/3);
function listener2_update()
{
    var broadcastNumber = parseFloat(PTPortlet.getSessionPref('broadcastNumber'));
    if (isNaN(broadcastNumber))
    {
        listener2_error('<b>Listener-2 Portlet</b> cannot parse number from
session pref broadcastNumber');
        return;
    }

    listener2_debug('<b>Listener-2 Portlet</b> computing square root of ' +
broadcastNumber);
    var swatch = document.getElementById('listener2-swatch');
    swatch.innerHTML = Math.pow(broadcastNumber,listener2_oneThird);
}

function listener2_debug(str)
{
    if (window.PTDebugUtil)
    {
        PTDebugUtil.debug(str);
    }
}

```

```

}

function listener2_error(str)
{
    if (window.PTDebugUtil)
    {
        PTDebugUtil.error(str);
    }
}

function listener2_getPortlet()
{
    var portletGUID = '{D9DFF3F4-EAE7-5478-0F4C-2DBDCA1C7000}';
    var listener2Portlet = PTPortlet.getPortletByGUID(portletGUID);
    return listener2Portlet;
}

var listener2Portlet = listener2_getPortlet();
if (listener2Portlet)
{
    listener2Portlet.registerForEvent('onBroadcastUpdate', 'listener2_update');
    listener2_debug('<b>Listener-2 Portlet</b> registered refreshOnEvent for event
onBroadcastUpdate');
    listener2Portlet.registerForEvent('onload', 'listener2_update');
}
}

</script>

```

**65.3.1.2.1 Page-Level Events for Use with the Scripting Framework** The scripting framework automatically has access to the following page-level events.

**Table 65–2 Page-Level Events**

Event	Triggered:
onload	immediately after the browser loads the page
onbeforeunload	prior to a page being unloaded (browser window closes or navigates to different location)
onunload	immediately before the page is unloaded (browser window closes or navigates to different location)
onactivate	the page is set as the active element (receives focus)
onbeforeactivate	immediately before the page is set as the active element (receives focus)
ondeactivate	when the active element is changed from the current page to another page in the parent document
onfocus	when the page receives focus
onblur	when the page loses focus
oncontrolselect	when the user is about to make a control selection of the page
onresize	when the size of the page is about to change
onresizestart	when the user begins to change the dimensions of the page in a control selection
onresizeend	when the user finishes changing the dimensions of the page in a control selection
onhelp	when the user presses the F1 key while the browser is the active window

**Table 65–2 (Cont.) Page-Level Events**

Event	Triggered:
onerror	when an error occurs during page loading
onafterprint	immediately after an associated document prints or previews for printing

### 65.3.1.3 Using In-Place Refresh

To refresh pagelet content in place, without affecting other content on the page, use the scripting framework to implement in-place refresh.

Many pagelets display data that is time sensitive. In some cases, users should be able to navigate across links within a pagelet without changing or refreshing the rest of the page. You can refresh pagelet content on command, associate the refresh action with an event (`refreshOnEvent`), or program the pagelet to refresh at a set interval (`setRefreshInterval`). The scripting framework also contains methods for expanding and collapsing pagelets. In the simplified example below, the refresh pagelet displays a "Refresh Portlet" button. Clicking the button updates the date and time displayed in the pagelet.

**Figure 65–8 Refresh Portlet**

The in-place refresh is executed by calling the `refresh()` method on the pagelet object instance. You can also set a new URL to be displayed within the pagelet upon refresh. (The title bar cannot be altered on refresh.)

```
<div style="padding:10px;" align="center">
<p><button onclick="refresh_portlet()">Refresh Portlet</button></p>
<p><b>Current time is:</b><br> <span id="refreshTimeSpan"></span></p>
</div>

<script type="text/javascript">
function refresh_portlet()
{
var refreshPortlet = PTPortlet.getPortletByID($PORTLET_ID$);
if (!refreshPortlet)
{
refresh_debug('Could not locate PTPortlet object which corresponds to <b>Refresh
Portlet</b> on page.');
```

```
return;
```

```
}
```

```
refresh_debug('<b>Refresh Portlet</b> calling refresh() method.');
```

```
refreshPortlet.refresh();
```

```
}
```

```
function refresh_debug(str)
```

```
{
```

```
if (window.PTDebugUtil)
```

```
{
```

```

    PTDebugUtil.debug(str);
  }
}

var t = new Date();
document.getElementById('refreshTimeSpan').innerHTML = t;
</script>

```

### 65.3.1.4 Using Session Preferences

To store and share settings within the client browser, use session preferences.

Pagelets can use preferences to communicate with each other, but accessing preferences usually requires a round trip to a database. Session preferences provide a way to store and share settings in the user's session within the client browser. The Master-Detail design pattern illustrates the most basic usage of session preferences. This design pattern splits control and display between two pagelets. For example, the "master" pagelet could summarize data in list form, and the "detail" pagelet could display details on each data item in response to user selection. In the example below, the master pagelet displays a form that allows you to enter a color code in a text box.

**Figure 65–9 Color Code**

When the user enters a color code in the text box, the color in the detail pagelet changes.

**Figure 65–10 Color Swatch**

For each onkeyup event that occurs in the "Enter color" text box in the master pagelet, the following steps are executed:

1. The master pagelet sets the session preference using the current value of the text box.
2. The master pagelet calls an update method on the detail pagelet.
3. The detail pagelet retrieves the session preference to get the color value.
4. The detail pagelet redraws its color swatch area to reflect the new color value.

---

---

**Note:** Shared session preferences must be specified by name on the Preferences page for the pagelet in the Pagelet Producer Console or they will not be sent to the pagelet.

---

---

The adaptive pagelet scripting framework provides an easy way to detach the relationship between pagelets and use a common event interface for communication.

---

---

**Note:** The example below is oversimplified; the master pagelet makes a direct call to a JavaScript method of the detail pagelet. Unless the master pagelet takes extra measures to ensure that the detail pagelet is actually present on the same page, calls from master to detail could generate errors.

---

---

### Master Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Enter color:</b> &nbsp;</p>
<input type="text" style="font-size:22px;font-weight:bold;text-align:center;"
id="master_prefName"
value="#FFFFFF" size="8" onkeyup="master_setPrefs(this.value)"></p><br>
</div>

<script type="text/javascript">
function master_setPrefs(val)
{
var prefName = 'masterColor';
var prefValue = val;
PTPortlet.setSessionPref(prefName,prefValue);

master_debug('<b>Master Portlet</b> called
PTPortlet.setSessionPref(\'masterColor\',\' ' + prefValue + '\'.');

if (window.detail_update)
{
master_debug('<b>Master Portlet</b> calling detail_update().');
detail_update();
}
else
{
master_debug('Could not locate portlet <b>Detail Portlet</b> on page.');
```

### Detail Pagelet

```
<div style="padding:10px;" align="center">
<p><b>Color swatch</b> &nbsp;</p>
<div style="width:100px;height:100px;border:2px solid
black;padding:2px;" id="detail-swatch"></div>
```

```

<script>
function detail_update()
{
var color = PTPortlet.getSessionPref('masterColor');
detail_debug('<b>Detail Portlet</b> received value="' + color + '" for
PTPortlet.getSessionPref(\'masterColor\')');

var swatch = document.getElementById('detail-swatch');
if (swatch)
{
swatch.innerHTML = '<div style="background-color:' + color +
';width:100%;height:100%;"></div>';
}
else
{
detail_debug('<b>Detail Portlet</b> cannot find \'detail-swatch\' DIV
element. ');
}
}

function detail_debug(str)
{
if (window.PTDebugUtil)
{
PTDebugUtil.debug(str);
}
}
</script>

```

### 65.3.1.5 Adaptive Pagelet Development Tips

These tips apply to most pagelets that use the adaptive pagelet scripting framework.

- **Use unique names for all forms and functions.** Use the GUID of a pagelet to form unique names and values to avoid name collisions with other code on the page.
- **Proxy all URLs.** You cannot make a request to a URL with a host/port that is different from that of the calling page. All URLs requested through JavaScript must be proxied. For details, see [Section 65.3, "Building Pagelets Using the Pagelet Producer"](#)
- **If you are using the adaptive pagelet scripting framework, check for support.** It is good practice to include code that determines whether or not the component is present. Ideally, your pagelet should be able to handle either situation. The simplest solution is to precede your code with an If statement that alerts the user if the scripting framework is not supported.

```

<script>
if (PTPortlet == null)
{
if (document.PCC == null)
{
alert("This pagelet only works in portals that support the JSPortlet API .
The pagelet will be displayed with severely reduced
functionality. Contact your Administrator.");
}
}
else
{
[scripting code here]
}
}

```

```
</script>
```

- **Close all popup windows opened by a pagelet when the window closes.** The scripting framework can be used to close popup windows using the `onunload` event.
- **Add all required JavaScript to the page in advance.** Browsers might not process script blocks/includes added to the page through the `innerHTML` property.
  - Microsoft Internet Explorer: Add the `defer` attribute to the script tag.
  - Netscape: Use RegExp to parse the response and look for the script, then eval it.
- **JavaScript HTTP and proxied HTTP must use the same authentication credentials.** JavaScript brokered HTTP requests send the same authentication token (cookie) as when you make a normal gatewayed HTTP request.

### 65.3.2 Using Pagelet Producer Credential Mapping

The Pagelet Producer manages authentication with each proxied application based on the settings defined for the associated resource.

The Pagelet Producer provides an API for creating custom mappings to external credential stores, allowing you to authenticate users against a custom credential source.

The `IVendorCredentialMapper` interface defines the Pagelet Producer interface for objects capable of obtaining an appropriate set of credentials needed for secondary authentication for a particular user in an application. To implement this interface, follow the directions below.

1. Create a java class that implements the `com.plumtree.runner.credentialmapper.IVendorCredentialMapper` interface.
2. Map the `getCredential` and `setCredential` methods of this interface to your credential vault. The simplified example below uses an internal class called `VConnector` and calls `VConnector.getInstance().getCredentialsForDomain`. Note: This step is vendor-specific. It will probably include a network hop, since the credential store will most likely reside on another server. You must give the mapper a unique name, and localized ones if necessary. See the `IVendorCredentialMapper` API documentation for all required names.
3. Compile the class into a jar. The build process must link to `common.jar`, included with the Pagelet Producer distribution.
4. Load the custom vault into the Pagelet Producer. For details, see the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
5. Restart the Pagelet Producer server (both proxy and adminui if they are on separate servers). The custom credential vault should show up in the list of credential sources on the Credential Mapping page of the Resource editor.

The example below is simplified for illustration purposes.

```
package com.oracle.credentialvault;
import com.oracle.connector.CredentialsSet;
import com.oracle.connector.VConnector;
import com.plumtree.runner.credentialmapper.Credential;
import com.plumtree.runner.credentialmapper.IVendorCredentialMapper;
```

```

public class OracleCredentialVault implements IVendorCredentialMapper {

    /*
    * Pagelet Producer will pass credential types as following:
    * Runner_*, where * is what the credential value type associated with this login
    * form in the adminui. For example, if the credential value type is
    * 'username' then "Runner_username" will be passed to the mapper.
    */
    public Credential getCredential(String initiator, String credType)
    {
        System.out.println("OracleCredentialVault::getCredential, initiator: " +
            initiator + ", credType: " + credType);

        /*
        * Since this vault stores credentials per user and domain, we need to devise
        * a scheme to map Pagelet Producer's credential type to a domain.
        * One way to do this is to specify the credential type as something like:
        * "domain_type", which would translate to credTypes like:
        * Runner_domain.com_username and Runner_domain.com_password
        */

        String username = initiator.toLowerCase(); // assume that the vault stores all
            usernames in lowercase
        String domain = "oracle.com"; //getDomain(credType);
        String type = credType; //getType(credType);

        CredentialsSet credSet =
            VConnector.getInstance().getCrededentialsForDomain(username, domain);
        if( credSet != null ) {
            System.out.println("OracleCredentialVault::getCredential, found vault set:

    return unname;
}
*/
}

```

For details on configuring resources to use credential mappings, see the section "Creating Pagelet Producer Resources and Pagelets" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 65.3.3 Modifying Pagelet Functionality at Runtime

The Pagelet Producer allows you to modify pagelet functionality at runtime using custom injectors and parsers.

#### 65.3.3.1 Creating Web Injectors

A web injector inserts content into a specified location in the proxied resource page. The content may be any text, including HTML, CSS, JavaScript, and pagelet declarations. An empty injector may also be used to remove unwanted content from a page. Injectors cannot be created for OpenSocial resources. While injecting simple HTML content has a limited use case, you can also inject JavaScript that directly modifies the pagelet's HTML markup.

To create a web injector, select the **Injectors** section under the resource you want to use and click the **Create** icon in the toolbar.

The injector can be applied to a subset of the resource by typing a URL pattern into the **URL Filter** field. The injector will be applied only to those URLs within the resource that begin with the text in the URL Filter box. If the box is empty or contains only a '/', the injector will be applied to the entire resource.

To restrict the injector to specific kinds of content, type a comma separated list of MIME types in the **MIME Filter** box. For example, *text/html* restricts the injector to HTML content, while *text/css* only restricts the injector to CSS content.

Define where in the resource's output the injection will be made:

- **Top** puts the content first in the page. Do not use this option to inject pagelet declarations.
- **Bottom** puts the content last in the page.
- The **Before/After/Replace** options put the content into the page relative to the unique string specified in the field provided. You can choose to ignore the case of the string by selecting **Ignore case**.

The **Enclose tag** option identifies the unique string and replaces both the text and the enclosing tag with the content specified on the next page.

**Figure 65–11 Pagelet Producer Console: Injectors - General Page**

Enter the content to be injected on the **Content** page. This content may be any text, including HTML, CSS, JavaScript, and pagelet declarations.

For example, the following code could be injected at the top of a page. This example registers a handler function with the page load event and then uses the handler to modify the page markup (by finding and hiding the header and footer).

```
<script type="text/javascript">
if (window.addEventListener) {
    window.addEventListener('load', hideHeaderFooter, false);
} else if (document.attachEvent) {
    window.attachEvent('onload', hideHeaderFooter);
}
function hideHeaderFooter() {
    var header = null;
    // find the header table by class
    if (document.getElementsByClassName) {
        header = document.getElementsByClassName('page_header')[0];
    } else {
        // for older versions of IE
        var tables = document.getElementsByTagName('table');
        for (var table in tables) {
            if (table.class == 'page_header') {
                header = table;
                break;
            }
        }
    }
    if (header != null) {
        header.style.display = 'none';
    }
    // now find and hide the footer (easier to find, since it has an id)
    var footer = document.getElementById('t23PageFooter');
    if (footer != null) {
        footer.style.display = 'none';
    }
}
</script>
```

### 65.3.3.2 Creating Custom Parsers

Custom parsers allow you to supplement or change built-in logic for parsing content and finding URLs. When the built-in parsers fail to identify URLs or identify sections that must not be rewritten as URLs, custom parsers can be used to change the default behavior. Parsers cannot be created for WSRP or Oracle JPDK portlet producers or for OpenSocial gadget producers.

To create a custom parser, select the **Parsers** section under the resource you want to use and click the **Create** icon in the toolbar.

- Enter a **Name** for the parser.
- The parser can be applied to a subset of the resource by typing a URL pattern into the **URL Filter** box. The parser will be applied only to those URLs within the resource that begin with the text in the URL Filter box. If the box is empty or contains only a '/', the parser will be applied to the entire resource.
- To add a new parsing rule, click **Create** to add a new row to the **Fragment Locations** section.
- In the **Regular Expressions** column, enter the regular expression for identifying the URL fragment that should be transformed. The first grouping expression (in parentheses) identifies the fragment, and the rest of the expression provides the context for finding it.
- Choose the **Fragment Type** to define how the selected location should be parsed:
  - **Static URLs** are transformed on the server.
  - **Dynamic URLs** are transformed using JavaScript on the client.
  - **HTML Fragment** and **Javascript Fragment** types are used for content that is embedded in another content type, such as XML.
  - **No Rewriting** specifies a location that should not be searched for URLs. This option is used to prevent rewriting of markup mistakenly identified as URLs.
- Click the **Save** icon in the navigator toolbar.

**Figure 65–12 Pagelet Producer Console: Parsers - General Page**

For example, the regular expression `XMLFile=(.*?)"` would identify URLs to XML files defined within a tag, as in `<embed src="/i/flashchart/anychart_5/swf/OracleAnyChart.swf?>XMLFile=http://apex.oracle.com/pls/apex/apex_util.flash?p=53557:1:74175370346201:FLOW_FLASH_CHART5_R45192463162785599619_en"`.

## 65.3.4 Debugging Pagelets

The Pagelet Producer provides advanced logging traces for debugging pagelets. Logging is configured in the Settings section of the Pagelet Producer Console, where you can define different levels of logging for each Pagelet Producer component. (For details on Pagelet Producer configuration settings, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.)

**Figure 65–13 Pagelet Producer Console: Settings - Logging**

The Pagelet Producer logs messages to the standard Oracle Diagnostic Logging facility. In Oracle WebLogic Server, the logs are stored at `user-projects/domains/<domain>/servers/<server>/logs/<server>-diagnostic.log`.

### 65.3.4.1 HTTP Tracing

To view the HTTP requests and responses received and sent by the Pagelet Producer, set the **HTTP** component on the Logging Settings page to **Finest**. The example traces below were captured from a test environment.

#### **Example 65–5 HTTP Request Received By Pagelet Producer**

```

}
```

### 65.3.4.2 Transformation Tracing

To view the content proxied by the Pagelet Producer before and after transformation, set the **Transform** component on the Logging Settings page to **Finest**. The purpose of these traces is to log response content at different stages of transformation, allowing you to compare them and view the result of different transformers. The example traces below were captured from a test environment.

#### **Example 65–9 Untransformed Markup**

## 65.4 Working with WSRP and Oracle JPDK Portlets

The Pagelet Producer can be used to present WSRP and Oracle JPDK portlets for use in any web application. For details on configuring the Pagelet Producer to connect to a WSRP or Oracle JPDK portlet producer, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. The Pagelet Producer can also modify portlet markup at runtime as explained in the next section, [Section 65.4.1, "Using Pagelet Chrome."](#)

### 65.4.1 Using Pagelet Chrome

Pagelet chrome allows you to modify markup at runtime in pagelets created from portlets imported from a WSRP or JPDK portlet producer.

A pagelet chrome template is an HTML file that specifies:

- How portlet markup should be rendered stylistically
- How to display the portlet title
- How to render mode switching options

The default chrome template displays the portlet name and a dropdown menu that allows the user to switch into different modes. The dropdown menu is dynamically populated with all the standard modes supported by the underlying portlet. Templates uses the following reserved tokens to identify key portlet elements, which the Pagelet Producer substitutes at runtime.

**Table 65–3 Pagelet Chrome Template Tokens**

Token	Description
\$\$PORTLET TITLE\$\$	Portlet title
\$\$REPEAT MENU ITEM\$\$	Used to indicate the beginning of a repeating section for navigational items
\$\$END REPEAT MENU ITEM\$\$	Used to indicate the end of a repeating section for navigational items
\$\$MENU ITEM URL\$\$	Navigation URL (to switch portlet modes or window states)
\$\$MENU ITEM\$\$	Display name of navigational item (for example, Customize)
\$\$TOKEN\$\$	Unique identifier for pagelet instance on the page
\$\$PORTLET CONTENT\$\$	Portlet content
pt://images	Tag used to indicate the imageserver URL

The example below is a very simple pagelet chrome template:

```

<script type="text/javascript">
function goto(url)

```

```

{
  document.location = url;
  return false;
}
</script>
<div style="border: 1px solid">
<span><b><!-- $$PORTLET TITLE$$ --></b></span>
<span style="align: right">
  Switch Mode:
  <select size="1" name="mode">
    <!-- $$REPEAT MENU ITEM$$ -->
    <option onclick="goto('$$MENU ITEM URL$$')"><!-- $$MENU ITEM$$ --></option>
    <!-- $$END REPEAT MENU ITEM$$ -->
  </select>
</span>
</div>
<!-- $$PORTLET CONTENT$$ -->

```

---

**Note:** The pagelet chrome template file must be hosted on the classpath of the Pagelet Producer web application.

If you configured Pagelet Producer to use an external image server, copy the files from `ensemblestatic.war/imageserver/yahoo` to your image server to properly render the default chrome template.

---

To implement the chrome template, add it as a parameter to the pagelet inject URL (REST or JavaScript). For details on pagelet inject URLs, see [Section 65.2.2, "Adding a Pagelet to a Web Page."](#) For example:

- REST: `/inject/v2/pagelet/pagelet_lib/pagelet_name?chrome=mychrome.html`
- JavaScript: `injectpagelet(library, name, iframe_options, payload, params, context_id, element_id, is_in_community, chrome)`

The value of the chrome parameter can be the name of the file containing the chrome template or the special reserved value "none", which suppresses all chrome and sends back portlet markup only. If the chrome parameter is omitted, the default chrome is returned with the portlet markup. The default chrome template uses YUI menu control to display a gradient title bar and a DHTML dropdown menu for switching modes. (When ADF content is detected, a different chrome template is used by default. This template can be overridden with a custom template or with the standard default template by setting `chrome=chrometemplate.html`.)

## 65.5 Working with OpenSocial Gadgets

Any OpenSocial gadget reachable by the Pagelet Producer server can be registered as a pagelet and used in any web application, including a portal. For details on registering OpenSocial pagelets with the Pagelet Producer, see *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The Pagelet Producer supports most of the standard OpenSocial APIs excluding OAuth. The complete OpenSocial API reference documentation can be found here: <http://docs.opensocial.org/display/OSD/Javascript+API+Documentation>.

The Pagelet Producer also allows gadgets to store preferences, retrieve WebCenter Portal profile and connection information, and access a user's activity stream using OpenSocial APIs. For more details on using these features, see the sections that follow.

### 65.5.1 Configuring Authentication

In order for gadgets to request user-level data (preferences or people connections), the end user's identity must be established. If any OpenSocial gadgets need to access user-level data from the server, you must configure a security policy for the parent OpenSocial resource in the Pagelet Producer Console. The first time a user accesses an OpenSocial gadget, a login page will be presented. After the initial login, subsequent requests for OpenSocial gadgets will use the established user identity.

For details on configuring a security policy for a Pagelet Producer resource, see the *Managing Pagelets* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 65.5.2 Storing User Preferences

OpenSocial gadgets may use user preferences to store data at the container. User preferences are scoped to a particular user and may optionally be scoped to an appId (the gadget appId is the pagelet context ID). If you choose to use the OpenSocial gadget.Prefs API, the user preferences will be scoped to the user and pagelet instance. Alternatively, you may use the opensocial.DataRequest API to manage preferences at the user level that can be shared with other pagelets.

When registered as a pagelet, a gadget's user preferences are treated as pagelet preferences. In WebCenter Portal, for example, non-hidden user preferences can be edited by the end user using the Personalize button. Additionally, to simulate preferences shared between users, you may pass in user preferences via pagelet parameters. Note that a pagelet preference, if set, will always override the corresponding pagelet parameter (in other words, personalization takes precedence over customization).

Outside of WebCenter Portal, gadget-backed pagelets are provided with a simple chrome that displays the gadget title and buttons for accessing the preference editor and minimizing/maximizing the gadget. The chrome may be suppressed by passing in the value of 'none' to the chrome parameter in the Pagelet Inject API. The preference editor UI supports all four types of user preferences:

- string: rendered as a text field
- bool: rendered as a checkbox
- enum: rendered as a dropdown list
- list: rendered as a text field (values must be separated with a pipe "|" character)

### 65.5.3 Accessing WebCenter Portal Profile Information

OpenSocial gadgets can query the current user's profile data and people connections via the standard OpenSocial APIs. To use this feature, you must manually target the WebCenterDS data source to the WC\_Portlet server as described in *Managing the Oracle WebCenter Portal's Pagelet Producer* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

**Note:** The OpenSocial API cannot be used to update profile or connection information.

---

---

The supported user profile fields are listed in the table below.

**Table 65–4 User Profile Fields**

OpenSocial Field	Type	Description
aboutme	string	A general statement about the person.
addresses	Plural-Field <Address>	A physical mailing address for the person.
appData	Plural-Field <AppData>	A collection of AppData keys and values, used for preferences.
birthday	Date	The birthday of the person. The value <b>MUST</b> be a valid Date. The year may be set to 0000 when the age of the person is private or the year is not available.
emails	Plural-Field <string>	E-mail address for the person.
location	string	Physical address for the person.
name	Name	The broken-out components and formatted version of the person's real name.
organizations	Plural-Field <Organization>	Current or past organizational affiliation of the person.
phoneNumbers	Plural-Field <string>	Phone number for the person. In addition to the standard canonical values for type, this field defines the additional values mobile, fax, and pager.
photos	Plural-Field <string>	URL to a photo of the person. The value <b>MUST</b> point to an actual image file (e.g. a GIF, JPEG, or PNG image file) rather than to a web page containing an image. Note that this field <b>SHOULD NOT</b> be used to send down arbitrary photos taken by this user, but specifically profile photos of the contact suitable for display when describing the contact.
preferredUsername	string	The preferred username of this person on sites that ask for a username (e.g. jsmarr or daveman692).
status	string	The person's status, headline or shoutout.
thumbnailUrl	string	The person's photo thumbnail URL, specified as a string. This URL <b>MUST</b> be fully qualified.

#### 65.5.4 Accessing a User's Activity Stream

OpenSocial gadgets can operate on a user's activity stream using OpenSocial APIs. The following operations are supported:

- get activities
- create activity

The following operations are not supported:

- update activity
- delete activity

The supported activity stream fields are listed in the table below.

**Table 65–5 Activity Stream Fields**

OpenSocial Field	Type	Description
appId	Object-Id	The application with which the activity is associated.
body	string	An optional expanded version of the activity. Bodies may only have the following HTML tags: <b> <i>, <a>, <span>, but this formatting may be ignored.
externalId	Object-Id	An optional ID generated by the posting application.
id	Object-Id	An ID that is permanently associated with the activity.
postedTime	string	The time at which the activity took place in milliseconds since the epoch.

**Table 65–5 (Cont.) Activity Stream Fields**

OpenSocial Field	Type	Description
priority	number	A number between 0 and 1 representing the relative priority of the activity in relation to other activities from the same source.
title	string	The primary text of the activity. Titles may only have the following HTML tags: <b> <i>, <a>, <span>, but this formatting may be ignored.
userId	Object-Id	ID of the user for whom the activity is defined.

### 65.5.5 Using Gadget Eventing

The Pagelet Producer supports the OpenSocial pubsub inter-gadget eventing model. A gadget may publish events over any number of arbitrary channels (defined by simple string names) in JavaScript. On the receiving end, a gadget may subscribe to receive events over any number of channels, again in JavaScript, and take appropriate actions based on the events.

```
function connSelected(element) {
    var connId = element.id;
    var connName = element.lastChild.textContent;
    gadgets.pubsub.publish(channel, {id: connId, name: connName});
}
```

For a complete JavaScript reference to the supported eventing API, see

<http://docs.opensocial.org/display/OSD/Javascript+API+Documentation>. Also see

<http://docs.opensocial.org/display/OSD/Core-Gadget++PubSub>.

### 65.5.6 Example: Consuming an External OpenSocial Gadget

The example that follows is simplified for illustration. For details on Pagelet Producer Console settings, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

1. Using the Pagelet Producer Console, create a new Resource and choose **OpenSocial** as the type. Define URLs and policies as necessary. Save the new Resource.
2. Using the Pagelet Producer Console, create a new pagelet and enter the location of the gadget XML schema in the **Gadget URL** field.
  - To import the gadget name and any user preferences defined for the gadget, click the **Import Gadget Metadata** button. If any of the preferences are editable, the Pagelet Producer will create a preference editor using the imported preferences.
  - To configure or customize the generated preference editor, go to the **Pagelet Parameters** page.
3. Go to the **Documentation** page to view sample code to access the pagelet and preference editor using either the JavaScript or REST API.
4. Save the new pagelet.

### 65.5.7 Example: Consuming a Local OpenSocial Gadget

The example that follows is simplified for illustration. For details on Pagelet Producer Console settings, see the *Managing Oracle WebCenter Portal's Pagelet Producer* chapter in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

1. Using the Pagelet Producer Console, create a new Resource and choose **OpenSocial** as the type. Define URLs and policies as necessary. Save the new Resource.
2. Create or upload the gadget file.

---

---

**Note:** If you choose to host OpenSocial gadget XML files, the files must be placed under an anonymous resource (with no security policy) or gadget functionality will not work correctly.

---

---

- a. Select the **Files** section under the resource and click the **Create** icon in the toolbar.
  - b. On the **General** page, enter the relative path to the file in the **Name** field. Do not use a leading forward-slash ("/"). For example, "gadgets/activities.xml". Any path and name can be used; the path is a 'virtual' URL that the Pagelet Producer will use to serve the file. The visual directory structure of the Files collection in the navigator is updated to match the path to the file.
  - c. Go to the **Content** page to upload or create the gadget file.  
  
To upload a gadget file, enter the path to the file or click the Browse button to navigate to the file, then click the **Upload** button to upload the file to the Pagelet Producer server.  
  
To create a gadget file, use the editor on the **Content** page to enter and edit content.
  - d. Click the **Save** icon in the navigator toolbar.
3. Create or upload any other files required by the gadget (JavaScript, images, etc.) in the **Files** section of the resource. Define paths for the files that match the paths in the gadget code. For example, if the gadget uses JavaScript files in a subfolder called "js", include that directory in the Name field when you upload the files, e.g., "gadgets/js/activities.js".
  4. Using the Pagelet Producer Console, create a new pagelet and enter the relative path to the gadget XML schema (created or uploaded in step 2) in the **Gadget URL** field. For local files, this is the same path defined in the Name field for the file object; for example, "gadgets/activities.xml".
    - To import the gadget name and any user preferences defined for the gadget, click the **Import Gadget Metadata** button. If any of the preferences are editable, the Pagelet Producer will create a preference editor using the imported preferences.
    - To configure or customize the generated preference editor, go to the **Pagelet Parameters** page.
  5. Go to the **Documentation** page to view sample code to access the pagelet and preference editor using either the JavaScript or REST API.
  6. Save the new pagelet.

## 65.6 Using Pagelets to Integrate Markup from Portlets, ADF Taskflows, and Oracle Applications into Oracle WebCenter Sites

This section is aimed at developers who need to integrate content into Oracle WebCenter Sites 11g pages, including existing WSRP portlets or elements of web UI

exposed by backend applications such as Oracle EBS. Developers should be familiar with Oracle WebCenter Sites and Oracle WebCenter Pagelet Producer and have a solid understanding of web technologies.

This section includes the following subsections:

- [Section 65.6.1, "Adding Pagelets to Oracle WebCenter Sites"](#)
- [Section 65.6.2, "Using Identity Propagation"](#)
- [Section 65.6.3, "Propagating Identity from the Pagelet Producer to the Backend Application"](#)
- [Section 65.6.4, "Consuming WSRP Portlets as Pagelets"](#)
- [Section 65.6.5, "Consuming WebCenter Portal Services as Pagelets in Sites"](#)
- [Section 65.6.6, "Consuming Applications as Pagelets \(An Example Using EBS11i\)"](#)

## 65.6.1 Adding Pagelets to Oracle WebCenter Sites

Once a pagelet and its related resources are configured, you can insert it into a web page using JavaScript or REST. For more information, see [Section 65.2.2, "Adding a Pagelet to a Web Page."](#)

Here, we'll use an approach in which pagelets are added directly to a page template in Oracle WebCenter Sites using an iFrame with a REST URL for accessing pagelets as a content source. This requires an addition to the page template script tag to load the CSAPI JavaScript library (which adds necessary functions into the parent page), as well as the actual iFrame that loads pagelet content:

```
<script type="text/javascript" src="http://%PAGELET_PRD_
HOST%/pagelets/inject/v2/csapi"/>
<iframe id="pt-pagelet-iframe-1" width="100%" frameborder="0"
src="http://%PAGELET_PRD_HOST%/pagelets/inject/v2/pagelet/lib_name/pagelet_
name?content-type=html&consume=true&ifheight=auto"></iframe>
```

Where `lib_name` and `pagelet_name` refer to the library and pagelet configured in the Pagelet Producer. For more information about parameters, see [Section 65.2.2.2, "Accessing Pagelets Using REST."](#)

### 65.6.1.1 Enabling iFrame Auto-Resizing

To provide a more seamless integration of the pagelet into the consuming page, you can make the pagelet iFrame behave more like inline markup by dynamically resizing to accommodate its content. To enable this feature, some extra configuration is required in both Sites and the Pagelet Producer.

This section uses the AviSports sample site shipped with WebCenter Sites. To add any new asset to this site, you must log in to the Sites Administration page and open the Dev section in the left hand navigation as shown below:

**Figure 65–14 Sites Administration Page**

First, create a new template with the following settings:

- **Name**
  - Name: iFrameResizeRelay (or name of your choice)
  - For Asset Type: Applicable to various asset types (typeless)
- **Element**
  - Usage: Element defines a whole HTML page and can be called externally
  - Element Storage Path/Filename: iframe-resize.html (or name of your choice)
  - Element Logic:

```
<html>
  <head>
    <title>Resizing Page</title>
    <script type="text/javascript">
function onLoad() {
var params = window.location.search.substring( 1 ).split( '&' );
var height;
var width;
var iframe;
for( var i = 0, l = params.length; i < l; ++i ) {
var parts = params[i].split( '=' );
switch( parts[0] ) {
case 'height':
height = parseInt( parts[1] );
break;
case 'width':
width = parseInt( parts[1] );
break;
case 'iframe':
iframe = parts[1];
break;

```

```

    }
    }
    window.top.updateIFrame( iframe, height, width );
    }
    if (window.addEventListener) {
    window.addEventListener("load", onLoad, false);
    } else if (window.attachEvent) {
    window.detachEvent("onload", onLoad);
    window.attachEvent("onload", onLoad);
    } else {
    window.onload=onLoad;
    }
    </script>
</head>
<body>
</body>
</html>

```

- Site Entry
  - Cache Rules: Cached (default)
- Save
- Record SiteCatalog Pagename as %PAGENAME% (if you used the default name, this would be <site\_name>/iFrameResizeRelay)

The new template is addressable as follows:

```
http://%SITES_HOST%/cs/Satellite?pagename=%PAGENAME%
```

Make a note of this URL; it will be used to configure the Injector for the pagelet.

Next, apply the iFrame resizing feature by adding a new Injector to the pagelet via the Pagelet Producer Administration Console. Open the pagelet, select Injectors and create a new Injector with the following settings:

- General
  - Name: auto\_resizer (or name of your choice)
  - URL Filter: <none>
  - MIME Filter: text/html
  - Inject Location: Before </head>
- Content: Select Text (default) and copy the JavaScript below into the text area

Replace SITES\_RESIZE\_RELAY\_PAGE in the JavaScript below with the URL to the template you created in the previous step.

```

<script type="text/javascript">
var SITES_RESIZE_RELAY_PAGE = "http://%SITES_
HOST%/cs/Satellite?pagename=%PAGENAME%"; // CHANGE ME!

if (window.addEventListener) {
    window.addEventListener("load", calculateSizeFixed, false);
} else if (window.attachEvent) {
    window.attachEvent("onload", calculateSizeFixed);
} else {
    window.onload=calculateSizeFixed;
}
function calculateSizeFixed() {
    var PTRresizeIFrame = PTRresizeIFrame || {};

```

```

if (PTPortalPage && PTPortalPage.portlets) {
  for (var i in PTPortalPage.portlets) {
    if ( PTPortalPage.portlets[i].id != "page") {
      PTResizeIFrame.pageletInstanceID = PTPortalPage.portlets[i].id;
      break;
    }
  }
}
else if (!PTResizeIFrame.pageletInstanceID) {
  PTResizeIFrame.pageletInstanceID = 1;
}

if (!PTResizeIFrame.pageletResizePage) {
  var match = window.location.search.match(/resizepage=[^&]*\/);
  if (match != null && match.length > 0) PTResizeIFrame.pageletResizePage =
unescape(match[0].substr("resizepage=" .length));
  else PTResizeIFrame.pageletResizePage = SITES_RESIZE_RELAY_PAGE;
}
var agent = navigator.userAgent;
var ffversion = agent.indexOf("Firefox") >= 0 ?
agent.substring(agent.indexOf("Firefox")).split("/") [1] : -1;
var FFextraHeight = parseFloat(ffversion)>=0.1? 25 : 0;
var scrollHeightExtra = 15;
if (agent.indexOf('MSIE') > 0) {
  scrollHeightExtra = 35;
}
if (FFextraHeight > 0) scrollHeightExtra = FFextraHeight;
var wrapper = document.getElementById( 'pt-inner-iframe-wrapper-' +
PTResizeIFrame.pageletInstanceID);
if (wrapper == null) wrapper =
createRelayIFrame(PTResizeIFrame.pageletInstanceID);
var iframe = document.getElementById( 'pt-inner-iframe-' +
PTResizeIFrame.pageletInstanceID);
var height = 0;
var width = 0;
var iframename = '';

if( (document.contentDocument) &&
(document.contentDocument.documentElement.offsetHeight) ) {
  height = document.contentDocument.documentElement.offsetHeight +
FFextraHeight;
} else if( (document.contentDocument) &&
(document.contentDocument.body.offsetHeight) ) {
  height = document.contentDocument.body.offsetHeight+FFextraHeight;
} else if (document && document.documentElement.scrollHeight) {
  height = document.documentElement.scrollHeight + scrollHeightExtra;
} else if( document && document.body.scrollHeight) {
  height = document.body.scrollHeight + scrollHeightExtra;
} else {
  height = wrapper.offsetHeight;
}
width = wrapper.offsetWidth;
iframename = 'pt-pagelet-iframe-' + PTResizeIFrame.pageletInstanceID;
var qsSeparator = PTResizeIFrame.pageletResizePage.indexOf("?") >= 0 ? "&" :
"?";

iframe.setAttribute("src", PTResizeIFrame.pageletResizePage + qsSeparator +
'height=' + height + '&' + 'width=' + width + '&' + 'iframe=' + iframename);
}

```

```

function createRelayIFrame(pageletInstanceId) {
    var wrapper = document.createElement("div");
    wrapper.id = "pt-inner-iframe-wrapper-" + pageletInstanceId;
    var iframe = document.createElement("iframe");
    iframe.id = "pt-inner-iframe-" + pageletInstanceId;
    iframe.setAttribute("height", 0);
    iframe.setAttribute("frameborder", 0);
    iframe.setAttribute("width", 0);
    wrapper.appendChild(iframe);
    document.body.appendChild(wrapper);
    return wrapper;
}
</script>

```

Add the pagelet to the page template in Sites using a REST URL within an IFrame. In the IFrame, the id parameter should use the unique number identifying the pagelet IFrame (for example, "pt-pagelet-iframe-1"). You must add the following query string parameters to the pagelet URL to support IFrame auto-resizing:

- `resizepage=http://%SITES_HOST%/cs/Satellite?pagename=%PAGENAME%`
- `ifheight=auto`

For example:

```

<script type="text/javascript" src="http://%PAGELET_PRD_HOST%/pagelets/inject/v2/csapi"/>
<iframe id="pt-pagelet-iframe-1" width="100%" frameborder="0"
src="http://%PAGELET_PRD_HOST%/pagelets/inject/v2/pagelet/lib_name/pagelet_name?content-type=html& consumepage=true&resizepage=http://%SITES_HOST%/cs/Satellite?pagename=%PAGENAME%&ifheight=auto">
</iframe>

```

---

**Note:** In certain situations automatic resizing may not work properly when multiple pagelets are present on a page. This is known to occur with pagelets that require form auto-login to external authentication servers. In this case, only one pagelet can be configured for auto-resizing, while the others should use static IFrame sizing.

---

### 65.6.1.2 Changing Pagelet Styling

To make a pagelet fit better visually in a consuming WebCenter Sites page, an Injector may be used to add styles that override the original CSS. In order for the override to work correctly, it is important that the style definitions supplied by the Injector come after the styles defined by the backend application. The following example does this by injecting replacement CSS into the end of the <HEAD> section.

To restyle a pagelet, add a new Injector to the pagelet via the Pagelet Producer Administration Console. Open the pagelet, select Injectors and create a new Injector with the following settings:

- General:
  - Name: `new_styles` (or name of your choice)
  - URL Filter: `<none>`
  - MIME Filter: `text/html`

- Injector Location: Before </head>
- Content
  - Injector Location: Before </head>

Section 65.6.6, "Consuming Applications as Pagelets (An Example Using EBS11i)" includes a working example of an Injector used to re-style the EBS UI to match the sample AviSports site in WebCenter Sites.

## 65.6.2 Using Identity Propagation

The core purpose of the Pagelet Producer is to proxy backend applications. Since the Pagelet Producer acts as a "middle-man" between the browser and the backend application, identity propagation must be broken into two parts:

- Section 65.6.2.1, "Establishing Identity in the Pagelet Producer"
- Section 65.6.2.2, "Using a Login Page Supplied by Pagelet Producer"

### 65.6.2.1 Establishing Identity in the Pagelet Producer

The Pagelet Producer typically injects web content into WebCenter Sites using an IFrame as shown in Figure 65–15.

**Figure 65–15 Pagelet Producer Content as IFrame in Sites**

Since the content is injected as an IFrame, user identity must be established in both the Sites container and the Pagelet Producer container as shown in Figure 65–16. Note that Figure 65–16 leaves out the user directory that is assumed to be shared between the two authentication schemes.

**Figure 65–16 Different authentication schemes for Sites and Pagelet Producer**

The ideal way to manage identity between the browser and the two containers would be to use Oracle Access Manager (OAM) as shown in Figure 65–17. Note that

Figure 65–17 leaves out the user directory that is assumed to be shared between the two authentication schemes, and excludes the OAM access server. Note also that this configuration is not supported for pre-11g versions.

**Figure 65–17 Ideal Frontend Authentication Configuration Using OAM**

To set up OAM for WebCenter Sites 11g, refer to the chapter on "Oracle Access Manager Integration Setup" in *Oracle WebCenter Sites Configuring Supporting Software*.

### 65.6.2.2 Using a Login Page Supplied by Pagelet Producer

Before setting up OAM, it is sometimes useful to test the integration of the Pagelet Producer in Sites. Without OAM, users must authenticate separately with the Pagelet Producer and with Sites (see Figure 65–16). This section describes how to configure separate authentication with the Pagelet Producer.

If OAM SSO is not present on either the Pagelet Producer or Sites, the authentication scheme shown in Figure 2 must be supported by ensuring that the Pagelet Producer provides a login form. To force the Pagelet Producer to display a login form:

1. Identify a J2EE role to restrict access to the pagelet(s) or create a new role in the J2EE application server hosting the Pagelet Producer.  
This example uses the global WebLogic Server (WLS) "Anonymous" J2EE role that is present in a default WLS installation.
2. Log in to the Pagelet Producer Administration Console, navigate to the resource(s) containing the pagelet(s) that must be surfaced in Sites and add the role you chose in step 1.

Roles are defined on the Policy page for the resource.

**Figure 65–18 Pagelet Producer Administration Console - Policy Page**

### 65.6.3 Propagating Identity from the Pagelet Producer to the Backend Application

The way in which identity is established depends on the type of application as described in the following sections:

- [Section 65.6.3.1, "WSRP/JPKD Portlet"](#)
- [Section 65.6.3.2, "Stand-alone Backend Application Protected with Native Authentication \(Non-SSO\)"](#)
- [Section 65.6.3.3, "Identity Propagation with Autologin"](#)
- [Section 65.6.3.4, "Stand-alone Backend Application Protected with SSO"](#)
- [Section 65.6.3.5, "Reference: Common Auto-Login Configurations"](#)

#### 65.6.3.1 WSRP/JPKD Portlet

WSRP portlets must use WSS tokens for identity propagation. For details on configuring security tokens, see "Registering WSRP and Oracle JPKD Portlet Producer" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*, and [Section 65.6.4, "Consuming WSRP Portlets as Pagelets."](#)

Each Oracle JPKD portlet that requires an identity will be passed credentials based upon information supplied by the external application's login form. For details, see "Managing External Applications" and "Registering Oracle JPKD Portlet Producers" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 65.6.3.2 Stand-alone Backend Application Protected with Native Authentication (Non-SSO)

The Pagelet Producer has a feature called Autologin that allows the Pagelet Producer to interact with the "native" authentication mechanism established by a backend application.

#### 65.6.3.3 Identity Propagation with Autologin

Since each backend application has its own means of authentication, a separate login prompt must be initiated by the Pagelet Producer to collect any required credentials. Pagelet Producer resources can be configured to send credentials to backend applications as basic authentication headers, NTLM tokens, or Kerberos tokens, as well as manage forms-based authentication (typically via session cookie). For details, see "Autologin" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

**Note:** Set the Username and Password fields to use the User Vault so that each user will be prompted for his or her own unique credentials to access the backend application.

---

---

#### 65.6.3.4 Stand-alone Backend Application Protected with SSO

Determining the proper Autologin settings for a backend application can be very challenging. Doing so requires looking at request headers, identifying redirects, and examining markup (sometimes dynamically generated). This inspection and configuration process can be daunting if there are multiple applications for which Autologin is required. Therefore, if Oracle Access Manager (OAM) SSO or Oracle SSO (OSSO) is available, it is highly recommended that one of these SSO solutions be used to protect backend applications.

Once the backend application is protected with OAM, there are two ways that the Pagelet Producer can supply credentials as described in the following subsections:

- [Section 65.6.3.4.1, "Using Direct Identity Propagation to OAM Protected Backend Application"](#)
- [Section 65.6.3.4.2, "Using Identity Propagation with Autologin and SSO"](#)

##### 65.6.3.4.1 Using Direct Identity Propagation to OAM Protected Backend Application

An OAM 11g WebGate is an Apache module running on Oracle HTTP Server (OHS) that manages all validation of user credentials with the OAM server. Once it has established the validity of a user it sends the OAM\_REMOTE\_USER header to the web application on the application server that OHS is proxying. The application server will have an OAM identity asserter running on it that will set the JAAS user principal name to the OAM\_REMOTE\_USER header value.

If the Pagelet Producer is protected with an OAM 11g WebGate it will receive an OAM\_REMOTE\_USER header. All web applications that it proxies will also receive this header. If the web application it proxies is on an application server with the OAM Identity Asserter, then the OAM Identity Asserter will use the OAM\_REMOTE\_USER header value passed from the Pagelet Producer to set the user principal. This will all work as long as the Pagelet Producer is not trying to proxy the URL to the WebGate for the protected web application. The rest of this section describes in details how this can be achieved in the context of Sites integration.

#### Example Setup

This example assumes that both WebCenter Sites and the Pagelet Producer are protected by OAM WebGate as illustrated in [Figure 65–18](#) above, and the following hosts and ports are used by the applications:

- OAM SSO WebGate: `www.example.com:80`
- WebCenter Sites: `sites_host:8080`
- WebCenter Pagelet Producer: `pp_host:8889`
- Backend application: `backendhost:8001`
- Full URL to backend application as viewed from browser (via WebGate)  
`http://www.example.com/backend/console`
- Full URL to backend application if accessed directly through application server (available only in internal network) `http://backendhost:8001/console`

Set up the Pagelet Producer resource to use the direct URL to the backend application, thus bypassing the WebGate (i.e., `http://backendhost:8001/console`).

**Figure 65–19 Pagelet Producer Administration Console - General Properties Page**

By setting up the Pagelet Producer to call directly into the backend application (bypassing the WebGate) all the OAM secure headers that the Pagelet Producer receives are passed to the OAM Identity Asserter on the application server hosting the backend application. Once the OAM Identity Asserter on the application server hosting the backend application receives the OAM headers it will set the proper user principal (see [Figure 65–19](#)). Note that [Figure 65–19](#) leaves out the user directory that is assumed to be shared between the two authentication schemes. It also excludes the OAM access server.

**Figure 65–20 Pagelet Producer Calling the Backend Application Directly**

**Note:** Although setting up the Pagelet Producer to bypass the WebGate will achieve single sign-on, this solution should not always be applied. In cases where the OHS server hosting the WebGate is also managing load balancing for the backend application, bypassing the WebGate will also bypass load-balancing. All traffic to the application will be routed to one server. In this case we recommend configuring Pagelet Producer for Autologin as described in [Section 65.6.3.4.2, "Using Identity Propagation with Autologin and SSO."](#)

#### 65.6.3.4.2 Using Identity Propagation with Autologin and SSO

If bypassing the OAM WebGate (as described in [Section 65.6.3.4.1, "Using Direct Identity Propagation to OAM Protected Backend Application"](#)) is not a feasible option then credentials can still be supplied using the Autologin feature of the Pagelet Producer. The advantage of utilizing Autologin with an Oracle SSO solution (OAM or OSSO) login page as opposed to individual login forms for each backend application (see Identity Propagation with Autologin) is that Autologin only has to be set up once and the configuration steps are the same for every implementation.

The steps for setting up Autologin with OSSO are detailed in the Configure Autologin section of Example 1: Consuming E-Business Suite 11i in this document. In a production environment, these steps can be followed as is with one exception: the `ssousername` and `password` form fields should be linked to the "User Vault".

Backend applications protected with OAM can also be set up following the steps described for OSSO in the Configure Autologin section in this document with the following exceptions:

- The login form URL will be a set location (e.g., `http://oam11g.mycompany.com:14100/oam/server/obrareq.cgi`).  
Be sure to remove the query string after the fixed location argument when setting the Autologin form identification URL.
- The form action URL will be a different value, but it should be a static value. Inspect the OAM form to determine the form action URL.
- The username and password fields may be different values. Inspect the OAM form fields to determine these values.
- Include the following two generated values: "request\_id" and "OAM\_REQ".

### 65.6.3.5 Reference: Common Auto-Login Configurations

This section provides a quick reference of autologin settings in the Pagelet Producer for common backend SSO scenarios.

#### 65.6.3.5.1 Oracle Access Manager (OAM)

Login Form Identification:

- URL: `http://%OAM_ROOT%/server/obrareq.cgi`

Form Submit Location:

- URL: `/oam/server/auth_cred_submit`

Form Fields:

- `actionURL` : static : `/oam/server/auth_cred_submit`
- `request_id` : Generated
- `username` : Static or Credential Vault
- `OAM_REQ` : Generated
- `password` : Static or Credential Vault

#### 65.6.3.5.2 Oracle SSO (OSSO)

Login Form Identification:

- URL: `%OSSO_HOST%/sso/jsp/login.jsp`

Form Submit Location:

- URL: %OSSO\_HOST/sso/auth - POST

Form Fields:

- appctx: Generated
- locale: Generated
- password : Static or Credential Vault
- site2pstoretoken : Generated
- ssousername: Static or Credential Vault
- v: Generated

## 65.6.4 Consuming WSRP Portlets as Pagelets

Pagelet Producer incorporates the WebCenter Common Consumer and therefore can expose WSRP and Oracle JPDK portlets as pagelets for use in WebCenter Sites or any other web container that does not include a WSRP consumer.

The WSRP Portlet Producer can be registered with Pagelet Producer using Enterprise Manager, WLST or the Pagelet Producer Administrative Console. For details see "Registering WSRP and Oracle JPDK Portlet Producers in the Pagelet Producer" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. Once registration is complete, the WSRP producer will appear as a resource in the Pagelet Producer Administrative Console, and the portlets associated with the WSRP endpoint will be listed in the pagelets collection for the resource.

---

---

**Note:** Auto-generated WSRP resources and pagelets cannot be modified. To create a version that can be modified, choose the resource in the Pagelet Producer Administrative Console and click **Copy**. The cloned version of the resource can be edited and various elements such as Injectors can be added to customize pagelet functionality. For example, a custom Injector could be used to inject CSS classes to modify portlet markup to make it look and feel like the Sites that will host the pagelet.

---

---

If the WSRP Producer that you are registering with Pagelet Producer requires authentication, the following steps are required:

- Configure WS-Security between Pagelet Producer and the WSRP Producer as described in *Configuring WS-Security in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. You must ensure that the Java Key Store (JKS) is properly configured between the WSRP producer and the Pagelet Producer; for details, see *Setting Up the WebCenter Portal Domain Keystore in the Configuring WS-Security chapter*.
- During the WSRP Producer registration, select the appropriate Token Profile in the Security section and enter the necessary configuration information. The path to the keystore must be absolute

### 65.6.4.1 Exposing Custom ADF Taskflows as WSRP Portlets

Although it is possible to consume an ADF taskflow in the Pagelet Producer by 'clipping' it out of the page on which it is hosted, this is not the recommended approach. Considering the complexity of the markup generated by an ADF page and potential dependencies on other taskflows or ADF page parameters, the recommended

approach is to create a WSRP portlet based on the taskflow and then consume the portlet in the Pagelet Producer. One advantage of this approach is that ADF taskflow parameters become portlet parameters that can be mapped to pagelet parameters, allowing information to be passed from the Sites page to the taskflow. For step-by-step instructions on how to make a portlet from an ADF taskflow, see [Section 58.2.3, "How to Create a JSF Portlet Based on a Task Flow."](#)

After the ADF taskflow is exposed as a portlet, deploy a new WSRP Producer to a managed server in your WLS domain (for example, the WC\_Portlet server on your WebCenter domain). Obtain the WSDL URL from the info page ([http://%PRODUCER\\_HOST%/ %APP\\_CONTEXT%/ info](http://%PRODUCER_HOST%/ %APP_CONTEXT%/ info)) and make note of it. To register the new WSRP Producer with the Pagelet Producer, see "Registering WSRP and Oracle JPDK Portlet Producers in the Pagelet Producer" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

**65.6.4.1.1 Exposing WSRP Portlets Developed for Oracle WebLogic Portal** Oracle WebLogic Portal (WLP) supports a variety of portlet types, including Java Portlets, Java Server Faces Portlets, Java Server Page and HTML Portlets (for a complete list see "Portlet Types" in the *Oracle Fusion Middleware Portlet Development Guide for Oracle WebLogic Portal*). Remote (Proxy) Portlets are WSRP portlets and can be directly exposed as pagelets by registering the WSRP Producer with the Pagelet Producer. This section describes how to expose local WLP portlets such as JSF, JSP or Java Portlets as pagelets for use in Sites.

#### **65.6.4.1.2 Exposing WLP Portlets Using WLP as WSRP Producer**

WLP can expose Java, Page Flow, JSP, JSF, and Struts Portlets as a "complex producer" that includes the required WSRP interfaces, optional interfaces and some extended interfaces (for details see "WebLogic Portal Producers" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*). Consequently, native WLP portlets can be consumed by the Pagelet Producer as any other WSRP portlets. Configuration and best practices for WSRP interoperability between WLP and the WebCenter Common Consumer are described in "WSRP Interoperability with Oracle WebCenter Portal and Oracle Portal" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*.

---

**Note:** WLP portlets are WSRP-enabled by default since version 9.2. In earlier versions, you must edit the portlet properties and set the "Offer as Remote" property to true.

---

#### **65.6.4.1.3 Configuring WS Security between WLP WSRP Producer and WebCenter Consumer**

To consume WSRP portlets exposed by WLP in the WebCenter Common Consumer (Pagelet Producer), configuration is required on both the producer and consumer sides.

Typically it is impossible to consume WSRP portlets exposed by WebLogic Portal as an anonymous user, so it is necessary to configure SAML security on WLP for the producer and the WebCenter Common Consumer. Step-by-step instructions can be found in "SAML Security Between a WebCenter Portal: Framework Application Consumer and a WebLogic Portal Producer" in the *Oracle Fusion Middleware Federated Portals Guide for Oracle WebLogic Portal*. These instructions are comprehensive, with the following adjustments:

- In section 5 of Configuring the Producer, the steps for configuring keystore information on the WSRP consumer are executed in JDeveloper. You must

complete this step in the WebCenter Common Consumer (Pagelet Producer). You can specify the signing alias and keystore password through WLST or Oracle Enterprise Manager. For details, see *Configuring the Keystore Using WLST* or *Configuring the Keystore Using Fusion Middleware Control* in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

**Note:** Once you have configured the keystore values you must restart both the managed server hosting the Pagelet Producer (by default WC\_Portlet) and the WLS Admin Server for the JPS configuration changes to be picked up.

---

---

- In section 4 of *Configuring the Producer*, the instructions do not emphasize the importance of the issuer name. The name placed here must match that sent by the consumer. For Oracle JPS, the default issuer ID sent is `www.oracle.com`.

#### 65.6.4.1.4 Registering the WLP WSRP Producer in the Pagelet Producer

To register the WLP WSRP Producer in the Pagelet Producer, follow the standard steps for creating and configuring a new WSRP Producer described in "Registering WSRP and Oracle JPDK Portlet Producers in the Pagelet Producer" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*. Make sure to include the following settings:

- WSDL URL:  
`http://%WLP_HOST%/%PORTAL_APP_NAME%/producer/wsrp-1.0/markup?WSDL`
- Security:  
Token Profile: Select "WSS 1.0 Token with Message Integrity"

After registration, a new Pagelet Producer resource is automatically created and populated with pagelets to represent the WLP portlets associated with this WSRP endpoint.

---

---

**Note:** To allow user identity propagation to the portlets, both WLP and the Pagelet Producer should be configured as described in [Section 65.6.3, "Propagating Identity from the Pagelet Producer to the Backend Application."](#) (For testing purposes or for portlet content that can be accessed without authentication, you can specify a valid username in the Default User field under Security.)

---

---

#### 65.6.4.1.5 Adding WLP WSRP Portlets to Sites

To add WLP WSRP portlets to a page in Sites, follow the steps in [Section 65.6.1, "Adding Pagelets to Oracle WebCenter Sites."](#) The URL to use for the `src` attribute in the `IFrame` tag that loads pagelet content can be found under "Documentation" in [Section 65.2.2.2, "Accessing Pagelets Using REST."](#)

Auto-generated WSRP resources and pagelets cannot be modified. To use Pagelet Producer features to alter the markup of the WLP portlet such as modify look and feel of the portlet UI by injecting custom CSS styles, you must create a new version of the resource. Choose the resource that was created for your WLP WSRP Producer in the Pagelet Producer Administrative Console and click **Copy**. The cloned version can be modified, including adding elements such as Injectors to customize pagelet functionality.

## 65.6.5 Consuming WebCenter Portal Services as Pagelets in Sites

WebCenter Portal includes tools, such as announcements and documents, that can be used to facilitate user collaboration in WebCenter Sites. For an overview of these tools, see "Services: Announcements through Links" and "Services: Lists through Worklist" in the Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces.

The recommended approach for exposing these services in Sites is to consume the associated WSRP portlets in the Pagelet Producer by leveraging the Services Producer component included with Oracle WebCenter Portal (11.1.1.6 and above).

The following portal tools are exposed as WSRP portlets by default:

- Activity Stream
- Discussion Forums
- Mail
- Polls Manager
- Document Manager
- Lists
- Tag Cloud
- Blogs
- Work list
- Polls
- Announcements

---

---

**Note:** Additional tools can be exposed by extending the Services Producer to a new JSPX page and then adding the taskflow to the page.

---

---

### 65.6.5.1 Requirements

Install WebCenter Portal following the instructions in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*. Make sure that all dependent components are also installed and configured, including WebCenter Content, the Discussions server, and Pagelet Producer.

By default the Services Producer is automatically deployed to the `WC_Portlet` managed server in the WebCenter Portal domain. If the `WC_Portlet` managed server was not created during installation or there is a requirement to run the Services Producer separately, the Oracle WebCenter Portal 11.1.1.6 release added a custom Services Producer template that can be used to create the `WC_CustomServicesProducer` managed server. This managed server contains the Oracle WebCenter Services Producer component as well as pre-configured JDBC data sources for accessing the Portal, Activities, and MDS schemas. For details, see "Oracle WebCenter Custom Services Producer Template" in the Oracle Fusion Middleware Domain Template Reference.

### 65.6.5.2 Configuring Security and Single Sign-On

There are two prerequisites to allow access to WebCenter Portal services from a Sites-driven web site:

- Create a common user base between the web site and WebCenter Portal

- Establish user identity propagation from the web site to WebCenter Portal

These are described in the following subsections:

- [Section 65.6.5.2.1, "Creating a Common User Base: LDAP Integration"](#)
- [Section 65.6.5.2.2, "Establishing User Identity Propagation: OAM Configuration"](#)
- [Section 65.6.5.2.3, "Configuring the GUID Attribute in the Identity Store"](#)
- [Section 65.6.5.2.4, "Configuring SSO for Discussions Server"](#)

#### **65.6.5.2.1 Creating a Common User Base: LDAP Integration**

Creating a common user base requires configuring a common LDAP repository to be used by WebCenter Sites and all WebCenter Portal components. When selecting an LDAP server, make sure it is compliant with the WebLogic Server that runs WebCenter Portal components.

Things to remember when configuring security on WLS:

- Set the priority of the Authenticators to SUFFICIENT
- Set the Control Flag (in parenthesis) and order of authentication providers as follows:
  - OAM Identity Asserter (REQUIRED)
  - LDAP Authenticator (SUFFICIENT)
  - Default Authenticator (SUFFICIENT)
  - Default Identity Asserter (SUFFICIENT)

#### **65.6.5.2.2 Establishing User Identity Propagation: OAM Configuration**

To establish user identity propagation, we recommend configuring the SSO solution for WebCenter Sites and WebCenter Portal using Oracle Access Manager (OAM).

If you are using OAM, make sure it is configured to pass the user principal name in the ORACLE\_REMOTE\_USER header. Both ObSSOCookie and OAM\_REMOTE\_USER must be set to active on the OAM Identity Asserter on the WebLogic Server.

#### **65.6.5.2.3 Configuring the GUID Attribute in the Identity Store**

Specify the GUID attribute value to ensure that the value that is used in the identity store matches the value configured in the LDAP authentication provider. This value is configured in the jps-config.xml file.

Set the GUID for your LDAP authenticator in the jps-config.xml file.

```
<serviceInstance provider="idstore.ldap.provider" name="idstore.ldap">
  <property
    value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider"
    name="idstore.config.provider"/>
  <property value="oracle.security.idm.providers.stdldap.JNDIPool" name="CONNECTION_
    POOL_CLASS"/>
  <property value="GUID=uuid" name="PROPERTY_ATTRIBUTE_MAPPING"/>
</serviceInstance>
```

#### **65.6.5.2.4 Configuring SSO for Discussions Server**

To use discussions, configure the Discussion server for SSO before ordering the Authenticators in WebLogic Server (using the Default Authenticator and Default Identity Asserter). It is also possible to use WLST to configure SSO for the Discussion

server. For details, see "Configuring the Discussions Server for SSO" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

### 65.6.5.3 Registering WebCenter Services Exposed as WSRP Portlets

To import the WSRP portlets that expose WebCenter Services into the Pagelet Producer, simply register the Services Producer as a WSRP Producer in the Pagelet Producer using Enterprise Manager, WLST or the Pagelet Producer Administrative Console.

The screenshot below is an example of WSRP endpoint registration in the Pagelet Producer Administrative Console. For details, see "Registering WSRP and Oracle JPKD Portlet Producers in the Pagelet Producer" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

**Figure 65–21 Pagelet Producer Administrative Console - Registering WSRP Endpoint**

The screenshot displays the 'Edit Portlet Producer' configuration page. It is divided into several sections:

- Name And Type:** Shows 'Producer Name' as 'Services Producer' and 'Producer Type' as 'WSRP Producer'.
- Portlet Producer URL:** Contains a 'WSDL URL' field with the value 'http:// oracle.com:7777/services-producer/portlets/wsrp2?WSDL'. Below it are checkboxes for 'Use Proxy?' (unchecked) and input fields for 'Proxy Host' and 'Proxy Port'.
- Advanced Configuration:** Includes a 'Default Execution Timeout (Seconds)' field set to '300'.
- Security:** Features a dropdown menu for 'Token Profile' set to 'WSS 1.0 SAML Token' and an empty 'Default User' field.

The Token Profile in the Security section of this page must be set to WSS 1.0 SAML Token to support the Services Producer. You should also enter a suitable execution timeout for requests made by the Pagelet Producer to the Services Producer (the default is 30 seconds).

Once registration is complete, the Services Producer will appear as a resource in the Pagelet Producer Administrative Console and all WSRP portlets exposed by the Producer will be listed in the pagelets collection for the resource:

#### 65.6.5.3.1 Adding Pagelets to Sites Pages

Any pagelet exposing WebCenter Services can be added to a WebCenter Sites page following the steps described in Adding Pagelets to Oracle WebCenter Sites.

Figure 65–22 shows the Document Manager Service embedded into a page of the AviSports sample site in WebCenter Sites.

---

**Note:** Auto-generated WSRP resources and pagelets such as the ones associated with the Services Producer cannot be modified. To add an Injector or make other modifications, you must create a version that can be edited. Choose the resource in the Pagelet Producer Administrative Console and click **Copy**. The cloned version of the resource can be edited and various elements such as Injectors can be added to customize pagelet functionality.

---

**Figure 65–22** *AviSports Sample Site with Document Embedded*

### 65.6.6 Consuming Applications as Pagelets (An Example Using EBS11i)

This section provides detailed instructions for consuming the Oracle E-Business Suite 11i Order Information module UI as a pagelet. It covers autologin, navigation suppression, restyling, and URL rewriting.

This example was created using an EBS 11i instance that is protected with Oracle SSO. The following common terms and variables are used in the example:

- `%EBS_HOST%`: root URL of the EBS host (for example, `http://my-ebs.company.com:port/`)
- `%OSSO_HOST%`: root URL of the OSSO host (for example, `http://sso.company.com:port/`)

This section contains the following subsections:

- [Section 65.6.6.1, "Creating a Resource for Basic URL Mapping \(Proxy\)"](#)
- [Section 65.6.6.2, "Configuring Autologin"](#)
- [Section 65.6.6.3, "Creating a Pagelet"](#)
- [Section 65.6.6.4, "Making Corrective Configurations"](#)

### 65.6.6.1 Creating a Resource for Basic URL Mapping (Proxy)

The following steps set up the basic URL mapping for a new EBS resource in the Pagelet Producer:

1. Create new "Web" resource with the following settings:
  - Name: EBS 11 (or your choice)
  - Source URL: %EBS\_HOST%  
Make sure the URL is not more specific to avoid missing URLs used in the UI
  - Destination URL: /ebs11/ (or your choice)
  - URL Rewriting: on
  - DHTML Rewriting: on
2. Click **Save**.

### 65.6.6.2 Configuring Autologin

This step assumes that the EBS System is protected by OSSO and that the Pagelet Producer will be configured to provide form Autologin rather than participate in SSO (a common scenario if the web site is not protected by SSO). EBS credentials may be shared for all users (good for testing) or stored in the Pagelet Producer credential vault for each user.

1. Create a new "Web" resource with the following settings:
  - Name: OSSO (or your choice)
  - Source URL: %OSSO\_HOST%
  - Destination URL: /osso/ (or your choice)
  - URL Rewriting: on
  - DHTML Rewriting: off
2. Click **Save**.
3. Under the newly created OSSO resource, configure Autologin using the Form Login option as follows:
  - Login Form Identification: URL - %OSSO\_HOST%/sso/jsp/login.jsp
  - Form Submit Location: URL - %OSSO\_HOST%/sso/auth - POST
  - Form Fields:
    - appctx: Generated
    - locale: Generated
    - password: Static or User Vault
    - site2pstoretoken: Generated
    - ssusername: Static or User Vault
  - v: Generated
4. Click **Save**.

---

---

**Note:** The names of login form fields are usually obtained by investigating the HTML source for the login page that protects the backend resource.

---

---

### 65.6.6.3 Creating a Pagelet

This step associates a pagelet with the Order Status page in the EBS Order Information module. To create a new pagelet, select the Pagelets section under the EBS resource you created and click the Create icon. Create the new pagelet with the following settings:

- Name: order\_status (or your choice)
- Library: ebs11 (or your choice)
- URL Suffix: OA\_HTML/RF.jsp?function\_id=1005664&resp\_id=22480&resp\_appl\_id=660&security\_group\_id=0&lang\_code=US
- Refresh Inline: off

You can test the configured pagelet by accessing it via the REST link on the Documentation page. You should be taken to the Sales Order page without logging in (unless the pagelet uses the User Vault to store credentials and you are accessing it for the first time). From this page, you can use Simple Search to locate orders, using '%' as a wildcard character.

### 65.6.6.4 Making Corrective Configurations

After a pagelet has been created, it often requires additional features (Parser, Injector and/or Clipper) to either address issues with URL re-writing in the proxied markup, or simply to modify the markup for style or to hide unnecessary elements. This section describes corrective configurations that were applied to the sample pagelet that exposes the Order Information UI in EBS.

#### Creating a Pluggable Parser for Popup URL Rewriting

Parsers allow you to supplement or change the built-in logic for parsing content and finding URLs that need to be rewritten. When built-in parsers fail to identify URLs, custom parsers can be used to correct this failure. In the case of the EBS 11i UI, this step is required to fix popup handling in Advanced Search.

Under the EBS Resource, create a new Parser with the following settings:

- Name: popupRewriter (or your choice)
- URL Filter: \*.jsp\*
- Use Base Parser: on
- Fragment Locations
  - var \_jspDir='(. \*?)'; (type Static URL)
  - <frame .? src="(. ?) (type Static URL)

Figure 65–23 shows the settings for the popupRewriter.

**Figure 65–23** *popupRewriter*

Regular Expression	Fragment Type
var _jspDir='(.*?)';	Static URL
<frame .*? src='(.*?)'	Static URL

### Creating an Injector to Disable Frame-busting

Injectors insert content into a specified location in the proxied resource page. The content can be any text, including HTML, CSS, JavaScript, and pagelet declarations. An empty injector may also be used to remove unwanted content from the page. The following injector was created for the EBS pagelet to prevent it from taking over the page, which was happening on the first displayed page where the user is asked to choose responsibility.

Under the EBS resource create a new Injector with the following settings:

- General
  - Name: frameBustDisabler
  - URL Filter: <none>
  - MIME Filter: text/html
  - Inject Location: Replace target=\_top
- Content: (Text) alt= ''

Figure 65–24 shows the parameter settings for the new Injector.

**Figure 65–24** *frameBustDisabler Injector*

### Creating an Injector to Auto-Resize the iFrame

In order to provide a more seamless integration into the consuming page, the pagelet iFrame can be configured to behave more like inline content by dynamically resizing to accommodate its contents. For details, see Enabling iFrame Auto-Resizing in this document.

## Setting Up Clipping by JavaScript Injection

One option for suppressing page elements exposed as a pagelet is to create a clipper using graphical or RegEx-based clipping, available in the Pagelet Producer. However, the recommended approach is to use custom JavaScript that is injected into the proxied page. This approach is often more flexible as it can easily accommodate the need to dynamically adjust rules that identify the element(s) to suppress or accommodate rules for suppressing multiple elements on the page.

Custom JavaScript can be added to the proxied resource page using an injector. To suppress EBS 11i standard header and navigation elements, use the following injector definition to insert a snippet of JavaScript that hides the unnecessary elements at page load time. (The standard Clipper feature in the Pagelet Producer is not used due to the complexity of the EBS web UI.)

Under the EBS Resource, create a new Injector with the following settings:

- General:
  - Name: nav\_suppressor (or your choice)
  - URL Filter: <none>
  - MIME Filter: text/html
  - Inject Location: Before </body>
- Content: (Text - copy and paste the content below)

```
<script type="text/javascript">
// this script is injected into the page by ensemble
// it hides header and footer tables at page load

// register handler function to the page load event
if (window.addEventListener) {
    window.addEventListener('load', hideHeaderFooter, false);
} else if (document.attachEvent) {
    window.attachEvent('onload', hideHeaderFooter);
}

// this function does the actual hiding
function hideHeaderFooter() {
    var form = document.forms[0];
    if (typeof(form) == 'undefined') return;
    // main span is form's second child span
    var spansFound = 0;
    var mainSpan = null;
    for (var i = 0; i < form.childNodes.length; i++) {
        var child = form.childNodes[i];
        if (child.tagName && child.tagName.toLowerCase() == 'span') {
            if (++spansFound == 2) {
                mainSpan = child;
                break;
            }
        }
    }
    if (typeof(mainSpan) != "undefined" && mainSpan != null) {
        for (var i = 0; i < mainSpan.childNodes.length; i++) {
            var child = mainSpan.childNodes[i];
            if (child.tagName && child.tagName.toLowerCase() == 'table') {
                child.style.display = 'none';
            }
        }
    }
}
</script>
```

```

    }
  }
  // call this function directly
  hideHeaderFooter();
</script>

```

### Creating an Injector for Pagelet Restyling

To make the EBS pagelet fit better visually in the consuming page, an injector can be used to add styles to override the original CSS.

The example injector definition below shows how to implement restyling for the AviSports sample web site in WebCenter Sites.

---

---

**Note:** In order for the override to work correctly, it is important that the style definitions supplied by the injector come after the styles defined by the backend application. In the example below, the content is injected into the end of the <HEAD> section on the page.

---

---

Under the EBS Resource, create a new Injector with the following settings:

- General:
  - Name: avisports\_styles
  - URL Filter: <none>
  - MIME Filter: text/html
  - Inject Location: Before </head>
- Content: (Text - copy and paste the content below)
 

```

<style>
* {
  font: 11px Arial,Helvetica,sans-serif;
}
body {
  background: url("http://sites-host:port/cs/avisports/images/BlueSliver.png")
  repeat-x scroll center bottom transparent;
}
.OraTableCellText, .x1l, .OraTableCellNumber, .x1n, .OraTableCellIconButton,
.x1p, .OraTableCellSelect, .x55,
.OraTableControlBarTop, .x1i, .OraTableControlBarBottom, .x1j {
  background-color: #ecef1;
  border-color: #0b2a55;
}
.OraTableColumnHeader, .x1r, .OraTableSortableColumnHeader, .x20,
.OraTableSortableHeaderLink, .x23 {
  background-color: #0b2a55;
  border-color: #F7F7E7;
  color: #336699;
}
.OraTableHeaderLink, .x24, .OraTableColumnHeaderNumber, .x1s,
.OraTableColumnHeaderIconButton, .x1t {
  background-color: #0b2a55;
  color: #ffffff;
}
.p_InContextBrandingText, .x21, .OraHGridNavRowInactiveLink, .x3v,
.OraNavBarInactiveLink, .x42,

```

```

.OraBINavBarInactiveLink, .x7n, .OraBINavBarInactiveLink_small, .x7o {
    color: #000000;
}
.OraLink:link, .xd:link, .OraBreadCrumbs, .xh, .OraBulletedList a, .xj a,
.OraLinkText, .x2v,
.OraHGridNavRowActiveLink, .x3u, .OraNavBarActiveLink, .x41,
.OraBINavBarActiveLink, .x71, .OraBINavBarActiveLink_small, .x7m {
    color: #0b2a55;
}
.OraBreadCrumbs a, .xh a {
    color: #0b2a55;
}
</style>

```

### Testing the Pagelets

The EBS11 resource now includes the pagelet, the custom injectors, and the custom parser as shown in [Figure 65–25](#).

**Figure 65–25 EBS11 Project Resources**

Test the pagelet by browsing to the Documentation page and using the URL shown below, substituting the local host ID for "example.com."

```

http://example.com:8889/pagelets/inject/v2/pagelet/ebs11/order_
status?content-type=iframe&csapi=true&ifheight=300px

```

### Troubleshooting

If some images are not rendered properly, make sure DHTML rewriting is enabled. (The DHTML Rewriting setting is on the General page for the resource.)

### Final Result

The following screenshots show the EBS 11i Order Information screens embedded into a page of the AviSports sample site in WebCenter Sites using a REST URL for pagelet access in an iFrame:

# Part XI

---

## Delivering Personalized Content

Part XI contains the following chapter:

- [Chapter 66, "Personalizing WebCenter Portal Applications"](#)
- [Chapter 67, "Using Personalization APIs Externally"](#)

---

---

# Personalizing WebCenter Portal Applications

Personalization for WebCenter Portal delivers targeted content based on both user and application context. WebCenter Portal's Personalization also provides a run-time system and associated tools that allow the declarative definition of application flow.

This chapter describes how to integrate Personalization into a WebCenter Portal: Framework application and includes the following sections:

- [Section 66.1, "Introduction to Personalization"](#)
- [Section 66.2, "Integrating Personalization in Your Application"](#)
- [Section 66.3, "Tutorial: Creating, Testing and Deploying a Simple Application"](#)
- [Section 66.4, "Extending Personalization"](#)

For more information about Personalization, see:

- [Appendix F.9, "ELs Related to the Personalization Service"](#)
- "Managing the Personalization Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*

## 66.1 Introduction to Personalization

Personalization provides a dynamically derived user experience for your WebCenter Portal application. Personalization evaluates defined sources of input data, generates a decision based on that evaluation, and applies this information to a declaratively defined Personalization scenario. Personalization, for example, can return content or change application flow based on information about a user in a Human Resources database, targeting the application experience for that specific user.

This section provides an overview of the features and requirements of Personalization, and contains the following subsections:

- [Section 66.1.1, "Personalization Architecture"](#)
- [Section 66.1.2, "Personalization Conductor"](#)
- [Section 66.1.3, "Personalization Property Service"](#)
- [Section 66.1.4, "Personalization Providers"](#)

## 66.1.1 Personalization Architecture

Figure 66–1 shows the architecture and out-of-the-box services and components that comprise Personalization. These and other Personalization components are described in:

- [Section 66.1.2, "Personalization Conductor"](#)
- [Section 66.1.3, "Personalization Property Service"](#)
- [Section 66.1.4, "Personalization Providers"](#)

**Figure 66–1 Personalization Services Architecture**

## 66.1.2 Personalization Conductor

This section describes the role of the *Personalization Conductor*. The Conductor is the heart of the Personalization engine, and contains and runs the units of work called *scenarios*. The Conductor runs the prepared scenarios, and provides access to provider extensions that plug into the Conductor. These aspects of the Conductor are described in the following sections:

- [Section 66.1.2.1, "Personalized Scenarios"](#)
- [Section 66.1.2.2, "Personalized Application Flow"](#)
- [Section 66.1.2.3, "Property Set Integration"](#)
- [Section 66.1.2.4, "Provider Integration"](#)

### 66.1.2.1 Personalized Scenarios

A *scenario* is defined by a script you create using the Scenario Editor in JDeveloper (or provide as an XML file) based on a simple syntax that allows conditional statement evaluation resulting in the return (to the client) of some form of content. Based on function provider expressions, a script action may then return filtered content to the client application using a Data Provider and a query. A scenario, rather than returning

targeted content, can also be used to make dynamic changes to application flow, resulting in a personalized user experience within the application.

In JDeveloper, you can use the Scenario Editor to graphically design your scenario. You can also create XML file-based scenarios. See [Section 66.2.2.4, "Specifying Scenario Flow Using Node Types"](#) and [Section 66.2.3, "Creating File-Based Scenarios"](#) for more information about creating scenarios.

### 66.1.2.2 Personalized Application Flow

As well as returning content targeted to a specific user, scenarios executing within the Conductor can also control application flow, render user interface components, and execute application-related events. Using the Conductor's public Java and Expression Language (EL) API, you can provide seamless integration with an existing Java or Web-based application. See [Chapter 67, "Using Personalization APIs Externally"](#) for more information about using Java and EL APIs.

### 66.1.2.3 Property Set Integration

The Property Service uses *property sets* to organize sets of user or application data, and *property definitions* to assign a data type to property data. You can extend the Property Service to access additional user profile data in an enterprise LDAP repository, or to access additional repositories such as Oracle MDS. For more information about the Property Service and property sets, see [Section 66.1.3, "Personalization Property Service."](#)

### 66.1.2.4 Provider Integration

*Providers* provide a way to access external resources within your scenario. As well as three out-of-the-box providers for the Property Service, Content Server Provider (CMIS), and Activity Graph, the Conductor also supports an extensible architecture that lets you implement and access custom providers from within your Scenarios. For more information about providers, see [Section 66.1.4, "Personalization Providers."](#)

## 66.1.3 Personalization Property Service

This section describes the *Personalization Property Service*. The Property Service provides a simple yet scalable way for developers to access user data.

This section includes the following subsections:

- [Section 66.1.3.1, "Property Service Architecture"](#)
- [Section 66.1.3.2, "Property Sets"](#)
- [Section 66.1.3.3, "Property Locators"](#)

### 66.1.3.1 Property Service Architecture

The Property Service uses Java and REST APIs to store and retrieve properties about a user, such as their age or gender, or other information such as the current time. These properties are part of a *property set*. A property set can have a schema defined (the schema defines types for properties), or it can be created on demand without a schema. A property set can have properties that are retrieved from different locations such as the Identity Store LDAP server, a file, or using a SQL query. For more information about using Java and REST APIs, see [Chapter 67, "Using Personalization APIs Externally"](#)

The Property Service uses the default Personalization cache (or Coherence cache if available) and by default stores property sets in a database. The Property Service is also extensible allowing additional repositories such as Oracle MDS to be configured.

**Figure 66–2 Property Service Architecture**

### 66.1.3.2 Property Sets

The Property Service uses *property sets* to organize sets of user or application data, and *property definitions* to assign a data type to property data. The existing user profile data in an enterprise LDAP repository can also be made accessible by extending the Property Service. See [Section 66.2.2.5, "Defining Property Sets and Property Locators"](#) for more information about the property sets. In a JDeveloper project for a WebCenter Portal application, the PropertySet Editor creates property namespace files containing namespace, PropertySet, and Property definitions.

### 66.1.3.3 Property Locators

A property locator is invoked by the Property Service to access external stores of properties. For example, Personalization provides an out-of-the-box People Connections property locator that uses the People Connections REST service to access profile information for users. For more information about property locators, see [Section 66.2.2.5, "Defining Property Sets and Property Locators."](#) For more information about the People Connections property locator, see [Section 66.1.4.1.4, "People Connections Locator."](#)

## 66.1.4 Personalization Providers

A provider is an interface point for the Conductor that lets it communicate with external services. Personalization provides out-of-the-box providers for the Property Service, Oracle WebCenter Content: Content Server, and Activity Graph, and a locator used by the Property Service provider to allow integration with People Connections.

There are also two types of custom providers you can implement: *data providers* and *function providers*.

This section describes the out-of-the-box providers and the two types of custom providers in the following subsections:

- [Section 66.1.4.1, "Out-of-the-Box Providers"](#)
- [Section 66.1.4.2, "Custom Data Providers"](#)
- [Section 66.1.4.3, "Function Providers"](#)

#### **66.1.4.1 Out-of-the-Box Providers**

This section describes the out-of-the-box providers you can access from within your scenarios, and a locator used by the Property Service provider to allow integration with People Connections.

This section contains the following subsections:

- [Section 66.1.4.1.1, "Property Service Provider"](#)
- [Section 66.1.4.1.2, "CMIS Provider"](#)
- [Section 66.1.4.1.3, "Activity Graph Provider"](#)
- [Section 66.1.4.1.4, "People Connections Locator"](#)

##### **66.1.4.1.1 Property Service Provider**

The Property Service Provider allows integration with the Property Service. This provider allows you to retrieve property sets for a particular property set definition, retrieve a property set by name, or return a specific property from a property set. For more information about the Property Service Provider, see [Section 66.2.2.8.1, "Using the Property Service Provider."](#)

##### **66.1.4.1.2 CMIS Provider**

The CMIS Provider provides services to retrieve and search for content from standards-based CMIS (Content Management Interoperability Services) content servers, specifically provided by the Oracle WebCenter Content Server. The CMIS Provider also has utility function providers to convert results to simplified form. For information about integrating the CMIS Provider, see [Section 66.2.2.8.2, "Using the CMIS Provider."](#) For information about creating and editing connection configuration for the Content Server provider, see "Configuring the REST Service Identity Asserter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

##### **66.1.4.1.3 Activity Graph Provider**

The Activity Graph Provider (ActivityGraphProvider) provides integration with the Activity Graph engine (the basis for the Activity Graph service), which provides recommendations about what a user may be interested in connecting with based on analytics within WebCenter. For example, the Activity Graph Provider method `recommendedUsers`, queries the Activity Graph engine for a list of users that a given user might want to connect with.

The Activity Graph engine provides a central repository for actions that are collected by enterprise applications. For more information about the Activity Graph service and the Activity Graph engine, see [Section 45, "Integrating the Activity Graph Service."](#)

The Activity Graph provider is built on two REST services for Activity Graph running on the WebCenter Portal: Spaces server, and consequently requires that WebCenter Portal: Spaces be installed in your environment. For more information about

integrating the Activity Graph provider in your scenario, see [Section 66.2.2.8.3, "Using the Activity Graph Provider."](#) For information about creating and editing connection configuration for the Activity Graph provider, see "Configuring the Activity Graph Provider" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 66.1.4.1.4 People Connections Locator

Although The People Connections locator is an ILocator used by the Property Provider to interface with the WebCenter People Connections service. One of the benefits of the People Connections service is that it can access user profile information stored on WebCenter Portal: Spaces. For more information about the People Connections service, see [Part VI, "Working with the People Connections Service"](#). For more information about the People Connections locator, see [Section 66.2.2.8.1, "Using the Property Service Provider."](#) For information about creating and editing connection configuration for the People Connections locator, see "Configuring the Oracle People Connections Locator" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 66.1.4.2 Custom Data Providers

A *data provider* is a component that plugs into the Conductor architecture and acts as a delegate for some service. Data returned from a data provider can be used as-is (Java classes), or chained to be used as input to other data providers in the same scenario.

The Property Service Provider, Activity Graph Provider, and the CMIS Provider are all examples of data providers that are available out-of-the-box. But data providers (`oracle.wcps.conductor.provider.IDataProvider`) also provide an extension point for the Conductor so that you can write a custom data provider to, for example, integrate with legacy systems or external data stores. You can then call your custom (or out-of-the-box) data provider using the `Invoke Provider` node from within a scenario.

Data providers typically operate on the input context of a given user or an external application data set (or both). Personalization includes a Property Service that can provide typed data storage for user or application data, and is accessible as input to providers. For more information about creating your own data provider, see [Section 66.4.1, "Adding Custom Providers."](#)

#### 66.1.4.3 Function Providers

*Function providers* (`oracle.wcps.conductor.provider.IFunctionProvider`) also provide an extension point for the Conductor to create utility methods (for example, for data manipulation or transformation, or business rule calculation) that can be invoked using Expression Language (EL) expressions. A simple example might be: `${strings:concat('string1','string2')}`. The CMIS and Activity Graph providers each have their own function provider to facilitate data transformations, among other utilities. For more information about Personalization ELs, see [Appendix F.9, "ELs Related to the Personalization Service."](#)

## 66.2 Integrating Personalization in Your Application

This section describes how to integrate Personalization in your Framework application.

This section contains the following subsections:

- [Section 66.2.1, "Personalization Requirements"](#)

- [Section 66.2.2, "Authoring Personalized Scenarios in JDeveloper"](#)
- [Section 66.2.4, "Displaying Targeted Content at Runtime"](#)

## 66.2.1 Personalization Requirements

This section describes the design-time system requirements and dependencies for developing WebCenter Portal applications with JDeveloper that integrate Personalization services. For a complete list of requirements, dependencies, and options for Personalization, see "Personalization Prerequisites" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

- WebCenter Portal: Spaces must be installed if the CMIS Provider, Activity Graph Provider, or People Connections locator are being used in a scenario. Note that for basic iterative development WebCenter Portal: Spaces is not required to be installed on your domain.
- Before you can use REST APIs, you must take the steps outlined in "Before You Begin: Performing Required Configurations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- Personalization relies on WebCenter Trust Services to provide single sign-on (SSO) between different managed servers within the WebCenter domain, including the Oracle WebCenter Content: Content Server that is accessed through the CMIS Provider. For JDeveloper's integrated domain, the Trust Services must be configured using a WLST script (`configureWCPS.py`) located in the `DefaultDomain/scripts-wcps` directory. For more information about configuring the WebCenter Trust Services and single sign-on using this script see "Configuring Single Sign-on" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
- The REST service must be configured. For information about how to configure the REST service, see the chapter "Managing REST Services" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

**Note:** Although you can optionally include the out-of-the-box providers for Activity Graph and People Connections in your application, you will not be able to test results in JDeveloper. Note also that these providers are only partially configured, and you must complete their configuration as described in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal* in the sections on "Configuring the Oracle People Connections Service" and "Configuring the Activity Graph Service."

---

---

## 66.2.2 Authoring Personalized Scenarios in JDeveloper

This section describes how to author personalized scenarios using the Personalization tools in JDeveloper, and includes the following subsections:

- [Section 66.2.2.1, "Creating a Properties Namespace"](#)
- [Section 66.2.2.2, "Creating Property Sets and Property Definitions"](#)
- [Section 66.2.2.3, "Creating a New Scenario in the Scenario Editor"](#)
- [Section 66.2.2.4, "Specifying Scenario Flow Using Node Types"](#)
- [Section 66.2.2.5, "Defining Property Sets and Property Locators"](#)
- [Section 66.2.2.6, "Implementing and Calling Function Providers"](#)

- [Section 66.2.2.7, "Implementing and Calling Data Providers"](#)
- [Section 66.2.2.8, "Using the Out-of-the-Box Providers"](#)

### 66.2.2.1 Creating a Properties Namespace

The Properties Namespace file contains the property definitions and property set definitions you define.

To create a Properties Namespace file in JDeveloper:

1. From within your application in JDeveloper, right-click the application in the navigation bar and select **New**.

The New Gallery dialog displays (see [Figure 66–3](#)).

**Figure 66–3** *New Gallery Dialog*

---

**Note:** If the Personalization category doesn't display, open the All Technologies tab and select it, or click **selected technologies** and add the Personalization technology to the project.

---

2. Choose **Properties Namespace** and click **OK**.

The Create Namespace dialog displays (see [Figure 66–4](#)).

**Figure 66–4** *Create Namespace Dialog*

3. Enter a name for the namespace, select the **Include default property definitions** checkbox to add initial default property definitions to the namespace, and click **OK**.

The **Include default property definitions** checkbox controls whether initial default property definitions are added to the namespace file. These are: `IntDef`, `NumberDef`, `StringDef`, `BooleanDef`, `DateTimeDef`, `ClobDef`, `IntArrayDef`, `NumberArrayDef`, `StringArrayDef`, `BooleanArrayDef`, `DateTimeArrayDef`, `ClobArrayDef`.

The property definitions can be removed, if needed afterwards. Or, you can leave the checkbox unselected to start with no initial property definitions and create them as needed in the Scenario Editor.

A graphic representation of the namespace file displays in the Design pane (see [Figure 66-5](#)).

**Figure 66-5 Design Pane - Namespace Definition**

4. Continue by defining the property sets and properties that you will need in your scenario as described in [Section 66.2.2.2, "Creating Property Sets and Property Definitions."](#)

### 66.2.2.2 Creating Property Sets and Property Definitions

Properties are the bits of data about someone or something on which, for example, you can base evaluations of conditionals in your scenario's flow. A property, for example, could contain a person's age or gender. A property set is simply a collection or container of related properties.

To define a property set and associated properties:

1. From within your application in JDeveloper, right-click the namespace in the Design pane, select **Create New Property Set Definition**, and click **OK**.

The Create New Property Set dialog displays (see [Figure 66-6](#)).

**Figure 66-6 Create New Property Set Dialog**

2. Enter a name for the property set and click **OK**.

A node for the new property set displays in the Design pane (see [Figure 66-7](#)).

**Figure 66–7 Design Pane - New Property Set Definition**

- To add properties to the new property set, right-click the property set, and select **Create New Property Definition Mapping**.

The Create Property Definition dialog displays (see [Figure 66–8](#)).

**Figure 66–8 Create Property Definition**

Create/Edit the attributes of a Property Mapping

Property Name:

Definition:

Locator Class:

Buttons: Help, OK, Cancel

- Enter a **Property Name** and **Definition** (the value type), and click **OK**.

To create a new property definition, select **New Definition** in the **Definition** drop down list.

The new property appears as part of the property set's graphic representation (see [Figure 66–9](#)).

**Figure 66–9 Design Pane - Property Definition**

- Add any additional properties required to the property set (or create new property sets) and then continue by creating the scenario as described in [Section 66.2.2.3, "Creating a New Scenario in the Scenario Editor."](#)

### 66.2.2.3 Creating a New Scenario in the Scenario Editor

The Conductor's Scenario Editor provides a visual tool for viewing and editing scenario definitions managed by the Conductor. The Scenario Editor stores scenarios in both file and visual formats and is available from within JDeveloper. Before creating a scenario, you should have created a namespace and at least some of the property sets and properties you need for the scenario.

To create a new scenario using the Scenario Editor in JDeveloper:

1. From within your application in JDeveloper, right-click the application in the navigation bar and select **New**.

The New Gallery dialog displays (see [Figure 66–10](#)).

**Figure 66–10** *New Gallery Dialog*

---

**Note:** If the Personalization category doesn't display, open the All Technologies tab and select it, or click **selected technologies** and add the Personalization technology to the project.

---

2. Select **Conductor Scenario** and click **OK**.

The Scenario Definition dialog displays (see [Figure 66–11](#)).

**Figure 66–11** *Scenario Definition Dialog*

3. Select **Create a new conductor scenario file** and modify the file name and where the file is stored if necessary. Note that the scenario name's extension (`.scenarios_diagram`) cannot be changed.

The Scenario Editor displays with a new Start node (see [Figure 66–12](#)).

**Figure 66–12 Scenario Editor - Start Node**

- To add nodes to the scenario, right-click the node to which you want to add a new node, select **Add Following Statement**, and chose the node type from the list as shown in [Figure 66–13](#).

**Figure 66–13 Adding a Node in the Scenario Editor**

Right-click the new node to expose options for setting node properties and extending the flow. For a description of available node types, see [Section 66.2.2.4, "Specifying Scenario Flow Using Node Types."](#)

#### 66.2.2.4 Specifying Scenario Flow Using Node Types

The Scenario Editor uses a tree-structured fixed layout where the flow is represented by a combination of subtrees (for decisions) and internal label references to represent flow for loops and complex nested if/else decisions.

##### Node Types

- **Start:** The Start node is a root level node that defines where a scenario begins.
- **Return:** The Return node halts execution of the scenario, and returns the specified results of evaluation of an EL expression to the caller.
- **Variable Assignment:** The variable assignment node lets you define a variable that is scoped within the context of the currently running scenario and initialize it with an expression.
- **Execute:** The Execute node invokes a specified EL expression with no expected return value. Similar to Variable Assignment, only the results of the expression are not stored within the Scenario context.
- **Condition/Otherwise:** The Condition node evaluates an EL expression and executes the contained statements if the EL expression evaluate to true. Statements within the Otherwise block will only execute if all condition statements evaluate to false.
- **For Each:** For Each nodes are a matched pair of nodes that provide looping/iterating functionality over a collection of things.

- **While:** Provides looping/iterating functionality as long as a specified EL expression evaluates to true.
- **Raise Error:** Raise and throw an error with the specified error message
- **Invoke Provider:** Invokes a named implementation of IDataProvider. Results are stored within the context of the currently running Scenario.
- **Invoke Scenario:** Invokes another named Scenario within the same namespace. Results are stored within the context of the currently running Scenario

### 66.2.2.5 Defining Property Sets and Property Locators

The Property Editor lets you view and edit the property set definitions and their associated property definitions managed by the Property Service. The Property Editor communicates and persists data through the Property Service.

Property sets and properties within a property set can be stored in many different locations and formats, so a locator facility is needed to retrieve them. A default property set locator is provided that retrieves and stores property set data to a pre-configured database. This default locator is used when no other is specified for the property set.

A custom locator for the People Connections service is also provided out-of-the-box (for more information, see [Section 66.1.4.1.4, "People Connections Locator"](#)), but you may want to define additional locators for other data sources. You can define multiple locators for properties and property sets, and they can also be defined in order of precedence. For step-by-step instructions for how to implement a locator see [Section 66.4.2, "Adding Custom Locators."](#)

### 66.2.2.6 Implementing and Calling Function Providers

The IFunctionProvider is a marker interface that allows utility code to be accessible from the Expression Language services within the Conductor. Implementations of IFunctionProvider contain annotated public and static methods. [Example 66–1](#) shows an example function provider:

#### **Example 66–1 Example Function Provider**

```
@FunctionProvider
(
    prefix="interpreter",
    resourceBundle="sample.InterpreterResources",
    nameBundleKey="provider.name",
    descriptionBundleKey="provider.description"
)
public class InterpreterProvider
implements IFunctionProvider
{

    @PublicFunction
    (
        functionName="english",
        descriptionBundleKey="english.description"
    )
    public static String
        interpretEnglish(@PublicParameter(parameterName="phrase",
descriptionBundleKey="phrase.description")String phrase)
    {
        String result = "Not Understood";
```

```
        if ("Bonjour".equals(phrase))
        {
            result = "Hello";
        }

        return result;
    }

    @PublicFunction
    (
        functionName="french",
        descriptionBundleKey="french.description"
    )
    public static String
        interpretFrench(@PublicParameter(parameterName="phrase",
descriptionBundleKey="phrase.description")String phrase)
    {
        String result = "Non compris";

        if ("Hello".equals(phrase))
        {
            result = "Bonjour";
        }

        return result;
    }
}
```

You would call the function provider in [Example 66–1](#) using the following expression syntax:

```
#{interpreter:english("Bonjour")}
#{interpreter:french("Hello")}
```

Here is an example of how to assign a variable to the results of a function provider based on [Example 66–1](#):

```
<assign-variable>
    <variable>greetings</variable>
    <expression>#{interpreter:english("Bonjour")}</expression>
</assign-variable>
```

### 66.2.2.7 Implementing and Calling Data Providers

Data provider implementations are a more structured way of integrating custom functionality with scenario execution. Unlike function providers, data providers have access to a connection configuration framework built into the Conductor so that environment-specific configuration data can be used. The following diagram illustrates the class interaction for data providers:

Figure 66–14 Class Interaction for Data Providers

### IDataProvider

Data providers are responsible for returning abstract named connection implementations of `IConnection`. These named connections are usually backed by environmental configurations provided by the Conductor's connection configuration service, but do not have to be. Should the data provider happen to use the configuration service, the implementation must return a class that extends `oracle.wcps.connection.configuration.AnnotatedConfiguration` from the `getConnectionConfigClass()` method. This class must contain public annotated fields that represent configuration data specific to the data provider.

### IConnection

Implementations of `oracle.wcps.conductor.provider.IConnection` are responsible for returning (named and default) Executable Resources. Each instance of `IConnection` can represent a single connection configuration and should be constructed within the instance of `IDataProvider` (not static).

### IExecutableResource

Implementations of `oracle.wcps.conductor.provider.IExecutableResource` contain most of the integration code with the external system and the instance should be constructed within the instance of `IConnection` (not static). The default method from within `IExecutableResource` is the `execute` method that takes no arguments, but custom annotated methods can be written within the implementation if `IExecutableResource` and exposed to scenario execution. For example, the following custom method can be invoked from a scenario:

```
@PublicFunction
(
```

```

        functionName="custom",
        descriptionBundleKey="customFunction.description"
    )
    public String callCustomMethod(@PublicParameter(parameterName="customParam",
        descriptionBundleKey="customParam.description") String param)
    {
        return param + " Results";
    }
}

```

Here is how the provider with the custom method is invoked from within the scenario:

```

<call-provider>
  <provider-name>myCustomProvider</provider-name>
  <connection-name>${connectionName}</connection-name>
  <method-name>custom</method-name>
  <variable>searchResults</variable>
  <input>
    <parameter>
      <common:name>customParam</common:name>
      <common:value>${someScenarioVariable}</common:value>
    </parameter>
  </input>
</call-provider>

```

### 66.2.2.8 Using the Out-of-the-Box Providers

Personalization provides three providers out-of-the-box providers for use within scenarios: the Property Service Provider, the Content Server Provider (CMIS), and Activity Graph. This section describes how you can integrate these providers in your application in the following subsections:

- [Section 66.2.2.8.1, "Using the Property Service Provider"](#)
- [Section 66.2.2.8.2, "Using the CMIS Provider"](#)
- [Section 66.2.2.8.3, "Using the Activity Graph Provider"](#)

#### 66.2.2.8.1 Using the Property Service Provider

The Property Service Provider (`oracle.PropertiesServiceProvider`) allows integration with the Personalization Server Property Service. This provider lets you to retrieve property sets for a particular property set definition, retrieve a property set by name, or return a specific property from a property set. If you are using the People Connections locator to integrate profile data into your scenario, then you must configure the Property Service before using it. For more information about the People Connections locator, see [Section 66.1.4.1.4, "People Connections Locator."](#) For information about configuring the Property Service provider, see "Configuring the Oracle People Connections Locator" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 66.2.2.8.2 Using the CMIS Provider

The CMIS provider (`CMISProvider`) provides services to search for and retrieve content from standards-based CMIS (Content Management Interoperability Services) content servers. For WebCenter, this is specifically provided by the Oracle WebCenter Content: Content Server. The CMIS provider also has a utility function provider (`CMISFunctionProvider`) to convert results to simplified form. Before trying the examples below, be sure to configure your CMIS provider connection as shown in the section on "Configuring the CMIS Provider" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

### Example CMIS Provider Scenario

Create a scenario using the following (remember to set the content-type of application/xml):

#### Request URI:

```
POST http://localhost:8891/wcps/api/conductor/namespaces/myNameSpace/scenarios
```

#### Request Body:

```

<scenarioMetadata>
<scenario xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"
xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <body>
    <call-provider>
      <provider-name>CMISProvider</provider-name>
      <connection-name>CmisConfigConnection</connection-name>
      <variable>exprString</variable>
      <input>
        <parameter>
          <common:name>search</common:name>
          <common:value>SELECT * FROM cmis:document WHERE cmis:name LIKE
'flowers'</common:value>
        </parameter>
      </input>
    </call-provider>
    <return>
      <expression>${exprString}</expression>
    </return>
  </body>
  <name>CMIS Scenario</name>
  <comments>CMIS Scenario comments</comments>
  <tags>
    <tag>CMIS Scenario tag</tag>
  </tags>
</scenario>
</scenarioMetadata>

```

### Executing the Scenario

#### Request URI:

```

POST
http://localhost:8891/wcps/api/conductor/namespaces/myNameSpace/scenarios/CMIS%20S
enario

```

#### Request Body:

```
<parameters/>
```

### Using the CMISFunctionProvider

A function provider is a utility class that can be invoked from within a scenario. The CMISFunctionProvider supports several methods (see the JavaDoc for the class for more information). Here are two example methods:

```

/**
 * Convert the array of input IDs to a CMIS query in the form of 'IN'
 * @param ids Array of document IDs, in the form of dDocName only
 * @return CMIS query String
 */
public static String getCMISQueryForDocIDs(

```

```

@PublicParameter(parameterName="repository",descriptionBundleKey="getCMISQueryForDocIDs.parameter.description.inputList") String repository,

@PublicParameter(parameterName="ids",descriptionBundleKey="getCMISQueryForDocIDs.parameter.description.inputList") List<String> ids)
...

/**
 * Convert the array of input IDs to a CMIS query in the form of 'IN'
 * @param ids, in the form of a WebCenter document ObjectURN. For example:
stanl18-ucm11g#dDocName:MOUNTAINS
 * @return CMIS query String
 */
public static String
    getCMISQueryForDocIDsFromFullID(@PublicParameter(parameterName="ids",
descriptionBundleKey="getCMISQueryForDocIDs.parameter.description.inputList")
List<String> ids)

```

### Using the CMISFunctionProvider in a Scenario

The following scenario snippet shows how data might be fed into the `CMISFunctionProvider` to create a CMIS query for multiple nodes, where the query is then sent to the CMIS provider. (In a more realistic case, rather than generate the data, we could have passed the results from an Activity Graph provider call, for example.)

```

<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <comments>testFunctionProviderScenario4 comments</comments>
  <body>
    <assign-variable>
      <variable>ids</variable>
      <expression>${collections:new()}</expression>
    </assign-variable>
    <execute>

    <expression>${collections:append(ids, 'StellentRepository#dDocName:MOUNTAINS')}</expression>
    </execute>
    <execute>

    <expression>${collections:append(ids, 'StellentRepository#dDocName:PARKS')}</expression>
    </execute>
    <execute>

    <expression>${collections:append(ids, 'StellentRepository#dDocName:PATAGONIAPARKS')}</expression>
    </execute>

    <!-- Assign those as IDs to send to CMIS -->
    <assign-variable>
      <variable>cmisQuery</variable>

    <expression>${cmisfunction:getCMISQueryForDocIDsFromFullID(ids)}</expression>
    </assign-variable>

```

```

<!-- Make the call to CMIS -->
<call-provider>
  <provider-name>CMISProvider</provider-name>
  <connection-name>NonProxyConnection</connection-name>
  <variable>cmisResults</variable>
  <input>
    <parameter>
      <common:name>search</common:name>
      <common:value>${cmisQuery}</common:value>
    </parameter>
  </input>
</call-provider>
<return>
  <expression>${cmisResults}</expression>
</return>
</body>
<name>testFunctionProviderScenario4</name>

</scenario:scenario>

```

### 66.2.2.8.3 Using the Activity Graph Provider

The Activity Graph Provider (`ActivityGraphProvider`) provides integration with the Activity Graph service, which provides recommendations based on analytics within WebCenter. Before attempting the examples below, be sure to configure the connection for the Activity Graph service as shown in the section on "Configuring the Activity Graph Provider" in the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal.

#### Example Activity Graph Provider Scenario

Create a scenario using the following (remember to set the `content-type` of `application/xml`):

#### Request URI:

POST `http://localhost:8891/wcps/api/conductor/namespaces/default/scenarios`

#### Request Body:

```

<scenarioMetadata>
<scenario xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0">
  <body>
    <call-provider>
      <provider-name>ActivityGraphProvider</provider-name>
      <connection-name>ActivityGraphConfigConnection</connection-name>
      <resource-name>QueryCommonItems</resource-name>
      <method-name>queryCommonItems</method-name>
      <variable>providerResults</variable>
      <input>
        <parameter>
          <common:name>sourceClassURN</common:name>
          <common:value>WC.user</common:value>
        </parameter>
        <parameter>
          <common:name>sourceObjectURN</common:name>
          <common:value>car1</common:value>
        </parameter>
        <parameter>
          <common:name>targetClassURN</common:name>
          <common:value>WC.user</common:value>
        </parameter>
      </input>
    </call-provider>
  </body>
</scenario>

```

```

        </parameter>
        <parameter>
            <common:name>targetObjectURN</common:name>
            <common:value>monty</common:value>
        </parameter>
        <parameter>
            <common:name>similarityURN</common:name>
            <common:value>user-edit</common:value>
        </parameter>
    </input>
</call-provider>
<return>
    <expression>${providerResults}</expression>
</return>
</body>
<name>QueryCommonItemsScenario</name>
<comments>QueryCommonItemsScenario comments</comments>
<tags>
    <tag>invoke</tag>
    <tag>sample</tag>
    <tag>provider</tag>
    <tag>resource</tag>
    <tag>input</tag>
    <tag>parameters</tag>
    <tag>overloaded</tag>
</tags>
</scenario>
</scenarioMetadata>

```

### Executing the Scenario

Before continuing, you must set the header values: `Accept=application/xml` and `content-type=application/xml`.

#### Request URI:

```

POST
http://localhost:8891/wcps/api/conductor/namespaces/default/scenarios/QueryCommonI
temsScenario

```

#### Request Body:

```
<parameters/>
```

### Using the AGFunctionProvider

A function provider is a utility class that can be invoked from within a scenario. The `AGFunctionProvider` supports these methods:

```

/**
 * Return the value of 'ObjectURN', only for WC.document, from the input
Object.
 * @param agResults From call to 'QueryRecommendations' or QueryItems. Can be
one of the following Classes:
 *
 * From AG REST 'recommendations'
 * <ul>
 * <li> Recommendations
 * <li> RecommendedItems
 * <li> List<Recommendation>
 * </ul>
 *
 */

```

```

* From AG REST 'items' (common items)
* <ul>
* <li> Results
* <li> Items
* <li> List<Item>
* </ul>
*
* @param dDocNameOnly If true, just the last part of the ObjectURN for
* document will be returned; otherwise, the entire ObjectURN will be.
* For example, if ObjectURN is example-ucml1g#dDocName:EXAMPLEACL000116,
* if this value is 'true', then only EXAMPLEACL000116 will be returned.
* Otherwise, all of stan118-ucml1g#dDocName:EXAMPLEACL000116 is returned.
*
* @return a List of ObjectURN representing the document ID
*/
@PublicFunction

public static List<String> getDocumentIDs(
@PublicParameter(parameterName="agResults",descriptionBundleKey="getContentIDs.par
ameter.description.inputList")Object agResults,
@PublicParameter(parameterName="dDocNameOnly",
descriptionBundleKey="getContentIDs.parameter.description.inputList")boolean
dDocNameOnly)
{
...
/**
* Return the value of 'ObjectURN' for the 'ClassURN' from the input Object.
* @param agResults From call to 'QueryRecommendations' or QueryItems. Can be
one of the following Classes:
*
* From AG REST 'recommendations'
* <ul>
* <li> Recommendations
* <li> RecommendedItems
* <li> List<Recommendation>
* </ul>
*
* From AG REST 'items' (common items)
* <ul>
* <li> Results
* <li> Items
* <li> List<Item>
* </ul>
*
* param filterClassURN return content only of this type. Examples are:
WC.wiki-page, WC.group-space, WC.user, WC.blog,
* WC.topic, WC.document. If this is null, return all types.
*
* @return a List of ObjectURN representing the item identifier.
*/
@PublicFunction
(
functionName="getContentIDs",
descriptionBundleKey="getContentIDs.method.description"
)
public static List<String>
getContentIDs(@PublicParameter(parameterName="agResults",
descriptionBundleKey="getContentIDs.parameter.description.inputList")Object

```

```

agResults,

@PublicParameter(parameterName="filterClassURN",

descriptionBundleKey="getContentIDs.parameter.description.filterClassURN") String
filterClassURN)
    ...

/**
 * Filter recommendations by score. Only those recommendations with a score
 * >= the cutoff will be preserved.
 */
@PublicFunction
    (
        functionName="filterRecsByScore",
        descriptionBundleKey="filterRecsByScore.method.description"
    )
    public static Recommendations filterRecsByScore(
        @PublicParameter(parameterName="recommendations",
            descriptionBundleKey="filterRecsByScore.parameter.description.agRecs")
        Recommendations recs,
        @PublicParameter(parameterName="cutoffScore",

descriptionBundleKey="filterRecsByScore.parameter.description.cutoffScore") float
        cutoffScore
    )
    {

```

### Using the AGFunctionProvider in a Scenario

In the following scenario, a call is first made to the Activity Graph REST service. The results of that call are in the `agRecommendations` variable. The next call in the scenario is to the `AGFunctionProvider.getContentIDs()` method, passing in the results of the `agRecommendations` (an Activity Graph object), and returning a `List<String>` of document IDs, held in the evaluation of the expressions call.

```
<expression>${agfunction:getContentIDs(agRecommendations,'WC.user')}</expression>
```

```

<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <comments>CallProviderScenario comments</comments>
  <body>
    <call-provider>
      <provider-name>ActivityGraphProvider</provider-name>
      <connection-name>AgTestServerConnection</connection-name>
      <resource-name>QueryRecommendations</resource-name>
      <method-name>getRecommendationsUsingDefaultRecipe</method-name>
      <variable>agRecommendations</variable>
      <input>
        <parameter>
          <common:name>classURN</common:name>
          <common:value>WC.user</common:value>
        </parameter>
        <parameter>
          <common:name>objectURN</common:name>
          <common:value>carl</common:value>
        </parameter>
      </input>
    </call-provider>

```

```

        <!-- Now call function provider to translate into user IDs. A more
specific call is available for WC.document; this just tests
the ability of the function provider to handle different types of content
-->
        <return>

<expression>${agfunction:getContentIDs(agRecommendations,'WC.user')}</expression>
        </return>
    </body>
    <name>CallProviderScenario</name>
</scenario:scenario>

```

### 66.2.3 Creating File-Based Scenarios

As well as using the Scenario Editor, you can also create file-based scenarios in XML format. Note that file-based scenarios are only supported through the Conductor's import/export function and JDeveloper MDS integration. To import a file-based scenario into the Scenario Editor, select the **Create from file** option when you create the scenario.

[Table 66-1](#) shows the statements that make up the contents of a scenario file. For more detailed information about the statements, refer to the node descriptions in [Section 66.2.2.4, "Specifying Scenario Flow Using Node Types."](#)

**Table 66-1 Scenario Statements**

Statement	Description	Example
Variable Assignment	Creates a variable that is scoped within the context of the currently running scenario.	<pre> &lt;assign-variable&gt;   &lt;variable&gt;index&lt;/variable&gt;   &lt;expression&gt;3&lt;/expression&gt; &lt;/assign-variable&gt; </pre>
Execute	Invokes a specified EL Expression with no expected return value. Similar to Variable Assignment, only results of the expression are not stored within the Scenario Context.	<pre> &lt;execute&gt;   &lt;comments&gt;Adds to an existing collection.&lt;/comments&gt;    &lt;expression&gt;\${collections:append(respo nses,'The outlook is not so good.')}&lt;/expression&gt; &lt;/execute&gt; </pre>

**Table 66–1 (Cont.) Scenario Statements**

Statement	Description	Example
Condition/Otherwise	Evaluates an EL expression and executes the contained statements should the EL expression evaluate to true. Statements within the otherwise block will only execute if all condition statements evaluate to false.	<pre> &lt;conditions&gt;   &lt;body&gt;     &lt;condition&gt;       &lt;body&gt;         &lt;assign-variable&gt;  &lt;variable&gt;customerType&lt;/variable&gt;       &lt;expression&gt;Great Customer&lt;/expression&gt;       &lt;/assign-variable&gt;     &lt;/body&gt;  &lt;expression&gt;\${customer.totalMoneySpent }&gt;= 100000}&lt;/expression&gt;     &lt;/condition&gt;     &lt;otherwise&gt;       &lt;body&gt;         &lt;assign-variable&gt;  &lt;variable&gt;customerType&lt;/variable&gt;       &lt;expression&gt;Good Customer&lt;/expression&gt;       &lt;/assign-variable&gt;     &lt;/body&gt;     &lt;/otherwise&gt;   &lt;/body&gt; &lt;/conditions&gt; </pre>
ForEach	Provides looping/iterating functionality over a collection of things.	<pre> &lt;for-each&gt;   &lt;body&gt;     &lt;execute&gt;       &lt;comments&gt;         Let's send each great customer an email, thanking them for their loyalty.       &lt;/comments&gt;       &lt;expression&gt;  \${emailService.sendMail(customer, 'Subj ect:Thanks for being a great customer')}     &lt;/expression&gt;     &lt;/execute&gt;   &lt;/body&gt;   &lt;variable&gt;customer&lt;/variable&gt;  &lt;max-iterations&gt;10&lt;/max-iterations&gt;   &lt;items&gt;\${greatCustomers}&lt;/items&gt; &lt;/for-each&gt; </pre>

**Table 66–1 (Cont.) Scenario Statements**

Statement	Description	Example
While	Provides looping/iterating functionality as long as the specified EL expression evaluates to true.	<pre> &lt;while&gt;   &lt;body&gt;     &lt;assign-variable&gt;       &lt;comments&gt;Sum up customer invoices to arrive at customer total expenditure.&lt;/comments&gt;  &lt;variable&gt;customerTotalSpent&lt;/variable &gt;  &lt;expression&gt;\${customerTotalSpent+order .invoiceTotal}&lt;/expression&gt;     &lt;/assign-variable&gt;   &lt;/body&gt;   &lt;expression&gt;\${customer.id = currentCustomerId }&lt;/expression&gt;  &lt;max-iterations&gt;-1&lt;/max-iterations&gt; &lt;/while&gt; </pre>
Invoke Scenario	Invokes another named scenario within the same namespace. Results are stored within the context of the currently running scenario.	<pre> &lt;call-scenario &gt;   &lt;variable&gt;greeting&lt;/variable&gt;  &lt;scenario&gt;randomGreetingGenerator&lt;/sce nario&gt;   &lt;input&gt;     &lt;parameter&gt;  &lt;ns2:name&gt;greetingsList&lt;/ns2:name&gt;     &lt;ns2:value&gt;hello, Bonjour, Buenos días&lt;/ns2:value&gt;     &lt;/parameter&gt;   &lt;/input&gt; &lt;/call-scenario&gt; </pre>
Invoke Provider	Invokes a named implementation of IDataProvider. Results are stored within the context of the currently running scenario	<pre> &lt;call-provider&gt;   &lt;provider-name&gt;CRM_ Provider&lt;/provider-name&gt;   &lt;connection-name&gt;crm_ db&lt;/connection-name&gt;  &lt;resource-name&gt;getGreatCustomers&lt;/reso urce-name&gt;  &lt;variable&gt;greatCustomers&lt;/variable&gt;   &lt;input&gt;     &lt;parameter&gt;  &lt;ns2:name&gt;minMoneySpent&lt;/ns2:name&gt;  &lt;ns2:value&gt;100000&lt;/ns2:value&gt;     &lt;/parameter&gt;   &lt;/input&gt; &lt;/call-provider&gt; </pre>

**Table 66–1 (Cont.) Scenario Statements**

Statement	Description	Example
Return	Returns the specified results of evaluation of an EL Expression.	<pre>&lt;return&gt;   &lt;comments&gt;Return the sales rep who sold the most widgets this month.&lt;/comments&gt;  &lt;expression&gt;\${bestSalesRep.id}&lt;/expres sion&gt; &lt;/return&gt;</pre>
Raise Error	Raise and throw an error with the specified error message	<pre>&lt;raise-error&gt;   &lt;comments&gt;User is unauthorized, so let's return a 401.&lt;/comments&gt;   &lt;statusCode&gt;401&lt;/statusCode&gt;   &lt;message&gt;User \${ScenarioContext.scenarioRequest.user Principal.name} is unauthorized to execute this scenario.&lt;/message&gt; &lt;/raise-error&gt;</pre>

**Example 66–2 Example File-based Scenario**

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <comments>sampleScenarioWithIf comments</comments>
  <body>
    <assign-variable>
      <variable>index</variable>
      <expression>3</expression>
    </assign-variable>
    <conditions>
      <body>
        <condition>
          <body>
            <assign-variable>
              <variable>ResultVar</variable>
              <expression>conditionSatisfied</expression>
            </assign-variable>
          </body>
          <expression>${index == 3}</expression>
        </condition>
        <otherwise>
          <body>
            <assign-variable>
              <variable>ResultVar</variable>
              <expression>otherwiseInvoked</expression>
            </assign-variable>
          </body>
        </otherwise>
      </body>
    </conditions>
    <return>
      <expression>${ResultVar}</expression>
    </return>
  </body>
</name>sampleScenarioWithIf</name>
</tags>
```

```

    <tag>if</tag>
    <tag>condition</tag>
    <tag>otherwise</tag>
  </tags>
</scenario:scenario>

```

## 66.2.4 Displaying Targeted Content at Runtime

This section describes how targeted content is displayed using the Content Presenter to the user at runtime for WebCenter Portal: Spaces and WebCenter Portal: Framework applications. It also describes how you can use REST APIs to create your own user interface for presenting content.

This section contains the following subsections:

- [Section 66.2.4.1, "Presenting Content with Content Presenter"](#)
- [Section 66.2.4.2, "Presenting Content with a Custom User Interface"](#)

### 66.2.4.1 Presenting Content with Content Presenter

Content Presenter is tightly integrated with the Conductor's dynamic content query generation and enables simple surfacing of dynamic content. For more information about using Content Presenter in your application, see [Chapter 28, "Creating Content Presenter Display Templates."](#)

For information about using Expression Language expressions in WebCenter Portal: Spaces to access a Personalization server scenario, see "Personalizing Pages" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

### 66.2.4.2 Presenting Content with a Custom User Interface

Using REST APIs, you can create your own user interface for presenting content rather than using Content Presenter. For more information about REST APIs, see [Chapter 53, "Using Oracle WebCenter Portal REST APIs."](#)

## 66.3 Tutorial: Creating, Testing and Deploying a Simple Application

This section describes how to create a simple application in JDeveloper containing a scenario that returns a simple string ("Hello World"). You'll then test the results of that scenario by adding it to a JSP page and running the application in the integrated WebLogic server to display the results in a browser.

This section also covers the steps to configure and start the integrated WebLogic server, define a connection to the Personalization Server Conductor, and how to deploy the scenario and JSP artifacts to the server domain for testing.

---

**Note:** as a prerequisite to this tutorial, you should already have installed WebCenter Portal's extension for Oracle JDeveloper (`oracle.webcenter.framework_bundle.zip`). If you have not already added this extension, use the Update Wizard in JDeveloper to check for updates by clicking **Check for Updates** from the **Help** menu.

---

1. Create a simple WebCenter Portal application (`Hello_Application`) using the default options and technologies.
  - a. From the File menu select **New...**

The New Gallery appears.

- b. From the All Technologies tab, select **Applications**.
- c. Select Fusion Web Application (ADF) from the list and click **OK**.

The Create Fusion Web Application (ADF) wizard appears (see [Figure 66–15](#)).

**Figure 66–15** *Creating the Hello\_Application - Step 1*

- d. Enter the **Application Name** as Hello\_Application.
- e. Click **Next** until you arrive at Step 4 of 5, the wizard page for the Portal project.

The Project Technologies tab displays a list of available technologies to install for the application.

Figure 66–16 Creating the Hello\_Application - Step 4

- f. Add Webcenter Personalization to the list of selected technologies for the Portal project, and click **Finish** to create the configured Hello\_Application application.
2. Configure JDeveloper's integrated server's (integrated WLS) default domain.
 

The domain will automatically be extended to include necessary server artifacts required for running the Personalization components (i.e., the Personalization Conductor and the Property Service).

  - a. From the View menu, select Application Server Navigator and expand the Application Servers tree node to display the IntegratedWeblogicServer.
 

The current status should be (domain unconfigured).
  - b. Right-click IntegratedWeblogicServer to display the context menu and select Create Default Domain...

**Figure 66–17 Application Server Navigator - Creating the Default Domain**

- c. When prompted, enter `weblogic1` as the Administrator password and click **OK**.

The status displays `(domain building)` and the Message Log window displays the output as the domain is being built. Wait for the domain to finish building. This may take some time to complete. When complete, the message log should display `"Integrated Weblogic domain processing completed successfully."`

- d. Start the server by right-clicking `IntegratedWeblogicServer` to display the context menu, and selecting `Start Server Instance`.

The `Running: IntegratedWeblogicServer - Log` view should appear and display output as the server is starting. Wait for the server to finish starting. This may take some time to complete. When complete, the `IntegratedWeblogicServer` Message Log should display `IntegratedWebLogicServer started.`

**Figure 66–18 Application Server Navigator - Starting the Server**

3. Configure the Personalization (WCPS) Trust service on the running server to enable single sign-on (SSO) for JDeveloper's IntegratedWebLogicServer domain.
  - a. From the Tools menu, select Configure WCPS Trust Service.

The external tool to perform this task will begin running and its output will be directed to the Configure WCPS Trust Service - Log view. Wait for the configuration to complete. This may take a while. When complete, the log will display the message "YOU HAVE MADE CHANGES THAT REQUIRE THE DOMAIN TO BE RESTARTED. PLEASE RESTART ALL DOMAIN SERVERS."

**Figure 66–19 Configuring the WCPS Trust Service**

- b. Stop the application server by clicking Terminate on the Running: IntegratedWeblogicServer - Log view.
 

When shutdown is complete you will see the message "Process Exited". You can then proceed to restart the server as shown in step 2c.
4. Configure an application URL connection to the Personalization Conductor component of the application server.
  - a. From the Application menu select Application Properties...
 

The Application Properties dialog displays.

**Figure 66–20 Application Properties Dialog - Configuring the Personalization Server Connection**

- b. Select the Personalization Server category, and from the URL Connection: drop-down list and select < New URL Connection... >.

The Create URL Connection dialog displays (see Figure 66–21).

**Figure 66–21 Create URL Connection Dialog - Conductor URL Connection**

- c. Enter the (default) data entry fields as shown below to create the connection.

Field Name	Value
Name	Conductor
URL Endpoint	http://localhost:7101/wcps/api/conductor/resourceIndex
Authentication Type	Basic
Username	weblogic
Password	weblogic1 (the Administrator password you provided in step 2c)
Realm	WCPS

- d. Click **Test Connection**.

The Status should display as "The connections successfully established."

- e. Click **OK** to create the Conductor URL connection.

- f. On the Personalization Server page, leave the default Scenario Namespace set to the application name (`Hello_Application`), and click **OK** in the Application Properties dialog to accept the settings.

5. Configure the server deployment descriptor for the `Hello_Application` such that the Personalization Services (WCPS) libraries are available to the application.

- a. In the Application Navigator, expand the folder `Portal/Web Content/WEB-INF`.

- b. Double-click the `weblogic.xml` deployment descriptor to open it.

The WebLogic Descriptor Editor displays.

- c. Select the `Libraries` category.

- d. Click the Plus (+) icon to create a new library entry.

- e. In the Library Name column of the table enter the following library name:

`wcps-services-client-web-lib`

**Figure 66–22 WebLogic Descriptor Editor - Adding the WCPS Library**

- f. When finished, select **Save** from the **File** menu to save the `weblogic.xml` descriptor.
6. Create a simple `hello_world` scenario that returns the string "Hello World" when invoked by the Personalization Conductor.
  - a. Right-click the `Portal` project in the Application Navigator and select **New...** The New Gallery appears.
  - b. From the **Current Project Technologies** tab, select the **Personalization** category.
  - c. Select **Conductor Scenario** and click **OK**.  
The New Conductor Scenario dialog displays.

**Figure 66–23 New Conductor Scenario Dialog**

- d. Leave the option **Create a new conductor scenario file** selected, enter a **New scenario filename** called `hello_world.scenarios_diagram`, and click **OK** to create the scenario.
- e. In the **Scenario Editor's Diagram view**, right-click the **Start** node and select **Add Following Statement->Return**.  
A **Return** node is added and connected.
- f. Right-click the **Return** node and select **Set Expression...**  
The **Scenario Expression** builder displays (see [Figure 66–24](#)).

**Figure 66–24 Scenario Expression Builder**

- g. In the Expression text area, enter the following EL expression and click OK.  
`${'Hello World'}`

Your scenario diagram should look like the one shown in [Figure 66–25](#).

**Figure 66–25 Scenario Editor - hello\_world Scenario**

- h. From the File menu, select Save to save the `hello_world.scenarios_diagram`.

7. Create a JSP page that invokes the `hello_world` scenario and displays the results.

Before creating the JSP page we need to add some libraries to the `Portal` project that contain resources required by the JSP page.

- a. Right-click `Portal` project in the Application Navigator and select Project Properties...

The Project Properties dialog displays.

- b. Select the `Libraries` and `Classpath` category, and click Add Library...

The Add Library dialog displays (see [Figure 66–26](#)).

**Figure 66–26 Project Properties Dialog - Adding the Extension Libraries**

- c. Select the following Extension library from the list and click OK to add it.

`Webcenter Personalization Client`

- d. Click OK on the Project Properties dialog when finished.

Now we can create the JSP page that executes the `hello_world` scenario on the Personalization Conductor and displays the result.

- e. Right-click the `Portal` project in the Application Navigator and select New...

The New Gallery appears.

- f. From the Current Project Technologies tab, select the JSP category.

- g. From the item list select JSP and click OK.

The Create JSP dialog displays (see [Figure 66–27](#)).

Figure 66–27 Create JSP Dialog

- h. Enter the File Name as `hello_world.jsp` and click **OK** to create the JSP page.
- i. When the JSP Editor launches, select the Source view and replace the template text with the following JSP code:

Notice in the `c:out` command how the Personalization Context Bean `p13nContext` is being used to invoke the Conductor connection (Conductor) you created earlier using the scenario namespace `Hello_Application` specified earlier in the Application Properties dialog, invoking the scenario called `hello_world`, and finally displaying the results.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
<%@ page contentType="text/html; charset=UTF-8"%>
<%@ taglib uri="http://java.sun.com/jsp/jstl/core" prefix="c"%>
<html>
  <head>
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8"/>
    <title>hello_world</title>
  </head>
  <body>
    <jsp:useBean id="p13nContext"
class="oracle.wcps.client.PersonalizationContext" scope="session"/>

    <% ((oracle.wcps.client.PersonalizationContext)session.getAttribute("p13nContext")).reset(); %>
    <c:out value="\${p13nContext.conductor['Conductor'].namespaces['Hello_application'].scenario['hello_world'].results}"/>
  </body>
</html>
```

---

**Note:** If you haven't configured single sign-on and the trust service as outlined in step 3, then the Conductor URL connection specified here will generate a 401 "Unauthorized" return code when the page is run. As a shortcut (for testing purposes only) you can substitute an inline connection:

```
http://weblogic:weblogic1@localhost:7101/wcps/api/conductor/resourceIndex
```

in place of the Conductor URL to get around the single sign-on constraint.

---

- j. From the File menu, select Save to save the `hello_world.jsp`.
8. Finally, to build and deploy the `Hello_Application`, right-click the runnable artifact the `hello_world.jsp` page in the Application Navigator and select Run.
- JDeveloper starts several background processes in sequence, including:
- Building the application,
  - Starting the integrated server (if not already started),
  - Deploying the application artifacts (including any Personalization artifacts) to the default domain, and
  - Launching an external web browser to display the artifact `hello_world.jsp`.

**Figure 66–28 Application Navigator - Building and Deploying the Application**

The resulting `hello_world.jsp` JSP page appears in the browser.

**Figure 66–29 Hello\_Application's hello\_world.jsp Page Displayed in Browser**

## 66.4 Extending Personalization

This section describes how you can create new ways to personalize application flow or content by adding custom providers and locators.

This section includes the following sub-sections:

- [Section 66.4.1, "Adding Custom Providers"](#)
- [Section 66.4.2, "Adding Custom Locators"](#)

### 66.4.1 Adding Custom Providers

Providers provide an extension point to Personalization, with which you can add custom function providers and custom data providers. [Table 66–2](#) shows the available extension points for Function and Data Providers.

**Table 66–2 Extension Points**

Extension	Description
oracle.wcps.provider.IFunctionProvider	A Function Provider extension point for the Conductor to create utility methods for data manipulation/transformation, business rule calculation, and so forth that can be invoked using EL. A simple example might be: <code>\${strings:concat('string1','string2')}</code>
oracle.wcps.provider.IDataProvider	A Data Provider extension point for the Conductor. Custom data providers can be written to integrate with legacy systems or external data stores.

#### 66.4.1.1 Extending the AnnotatedConfiguration Class

The `AnnotatedConfiguration` class describes the connection parameters required for a data provider, and can be found in:

**Location:**

```
\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\connections-service-1.0.jar
```

You will need to extend this class and add any other properties your custom provider may require. Create this class first, as the other components will build upon it (see [Example 66-3](#)).

**Example 66-3 HelloWorldConnectionConfig**

```
import oracle.wcps.connection.annotation.ConnectionProperty;
import oracle.wcps.connection.configuration.AnnotatedConfiguration;

@ConnectionConfiguration
(connectionType="hello.world.provider.connection")
@L10n
(bundle="demo.provider.resources.HelloWorldProviderResources")
public class HelloWorldConnectionConfig extends AnnotatedConfiguration
{
    @ConnectionProperty(propertyName="sampleProperty", required=true)
    String sampleProperty;
}
```

### 66.4.1.2 Implementing the Required Interfaces

#### IMetadata

##### Location:

\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services\_11.1.1.4.0\conductor-server-1.0.0.0.jar

```
public interface IMetadata
{
    public String getName();
    public Set<? extends IMetadata> getMetadata();
}
```

Next, implement the IMetadata interface. This provides information to the tools to surface the connection parameters, essentially representing the information in your HelloWorldConnectionConfig class as metadata (see [Example 66-4](#)). Each of the properties in the HelloWorldConnectionConfig class becomes a child metadata object. This is not so intuitive for simple structures, but is useful when the connection configuration may contain nested classes that relate to other components in the 'model'.

**Example 66-4 HelloWorldConfigMetadata**

```
public class HelloWorldConfigMetadata implements IMetadata
{
    private String name;
    private Object value ;
    private Map<String, IMetadata> childMDataMap = new HashMap<String,
IMetadata>();

    public HelloWorldConfigMetadata(HelloWorldConnectionConfig config)
    {
        name = config.name;
    }

    public HelloWorldConfigMetadata(String name, Object value)
    {
        this.name = name;
        this.value = value;
    }
}
```

```

public void addMetadata(IMetadata childMetadata)
{
    childMDataMap.put(childMetadata.getName(), childMetadata);
}

public String getName()
{
    return name;
}

public Object getValue()
{
    return value;
}

public Object getProperty(String propName)
{
    IMetadata md = childMDataMap.get(propName);
    if (md != null)
    {
        return ((HelloWorldConfigMetadata)md).getValue();
    }
    return null;
}

public Set<IMetadata> getMetadata()
{
    Set<IMetadata> rv = new HashSet<IMetadata>();
    Set<String> childKeySet = childMDataMap.keySet();
    for (String key : childKeySet)
    {
        rv.add(childMDataMap.get(key));
    }

    return rv;
}

public Properties getProperties()
{
    Properties props = new Properties();
    Set<String> childKeySet = childMDataMap.keySet();
    for (String key : childKeySet)
    {
        HelloWorldConfigMetadata cmd =
            (HelloWorldConfigMetadata)childMDataMap.get(key);
        props.put(key, cmd.getValue());
    }
    return props;
}

@Override
public String toString()
{
    return (name + ", properties: " + getProperties());
}
}

```

## **IExecutableResource**

An executable resource is a class having public methods annotated to designate them as executable by the Conductor. These methods could execute code directly, or delegate the call to an external REST service.

### **Location:**

```
\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_11.1.1.4.0\conductor-server-1.0.0.0.jar
```

```
public interface IExecutableResource
{
    public Object execute();
}
```

Your `ExecutableResources` can specify additional methods for execution by virtue of this annotation. Note the use of resource bundles (see section on Resource Bundles for more info). You can create any number of `ExecutableResources` and add them to your connection (see [Example 66-5](#)).

### **Example 66-5 SayHelloExecutableResource**

```
package demo.provider;

import oracle.wcps.annotation.PublicFunction;
import oracle.wcps.annotation.PublicParameter;
import oracle.wcps.provider.IExecutableResource;

public class SayHelloExecutableResource implements IExecutableResource
{
    // This method will execute if no specific method is given

    public Object execute()
    {
        return "Hello from my custom provider";
    }

    // This method can be named explicitly in a Scenario to be invoked

    @PublicFunction(functionName = "sayHello",
                    descriptionBundleKey = "provider.method.sayHello.description")
    public String sayHello(@PublicParameter(parameterName = "user",
                    descriptionBundleKey =
"provider.parameter.sayHello.user.description")
        String user)
    {
        return "Hello, " + user + ". Enjoy using the new Personalization
feature!";
    }
}
```

## **IConnection**

Once you have implemented your `IExecutableResources` and `IMetadata`, you can construct your actual connection object. Each connection has a specific set of configuration parameters, so your provider could possibly have multiple connection objects (see [Example 66-6](#)).

### **Location:**

```
\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_
11.1.1.4.0\conductor-server-1.0.0.0.jar
```

```
public interface IConnection
{
    public void setScenarioContext(IScenarioContext context);

    public Map<String, IExecutableResource> getNamedResources();

    public IExecutableResource getDefaultResource();

    public Map<String, IMetadata> getConnectionMetadata();
}

```

### **Example 66–6 HelloWorldConnection**

```
package demo.provider;

import java.util.Collections;
import java.util.HashMap;
import java.util.Iterator;
import java.util.Map;

import java.util.concurrent.ConcurrentHashMap;

import oracle.wcps.provider.IConnection;
import oracle.wcps.provider.IExecutableResource;
import oracle.wcps.provider.IMetadata;
import oracle.wcps.scenario.IScenarioContext;

public class HelloWorldConnection implements IConnection
{
    private IScenarioContext scenarioContext;

    private Map<String, IExecutableResource> executableResources =
        new ConcurrentHashMap<String, IExecutableResource>();

    private IExecutableResource defaultResource;
    private HelloWorldConfigMetadata configMetadata;
    private Map<String, IMetadata> metadataMap = new HashMap<String, IMetadata>();

    /**
     * Create metadata about this connection from the incoming config
     * @param config
     */
    public HelloWorldConnection(HelloWorldConnectionConfig config)
    {
        configMetadata = new HelloWorldConfigMetadata(config);

        // Loop over config properties and add as child metadata
        Iterator<Map.Entry<String, Object>> iter =
            config.entrySet().iterator();
        while (iter.hasNext())
        {
            Map.Entry<String, Object> entry = iter.next();
            String key = entry.getKey();
            Object value = entry.getValue();
            if (value != null)
            {
                configMetadata.addMetadata(new HelloWorldConfigMetadata(key,
```

```

        value));
    }
}
metadataMap.put(config.name, configMetadata);

// Now create the executable resources for this connection
createExecutableResources(config);
}

public void setScenarioContext(IScenarioContext scenarioContext)
{
    this.scenarioContext = scenarioContext;
}

public Map<String, IExecutableResource> getNamedResources()
{
    return executableResources;
}

public IExecutableResource getDefaultResource()
{
    return defaultResource;
}

public Map<String, IMetadata> getConnectionMetadata()
{
    return metadataMap;
}

/**
 * Create the IExecutableResources for this connection. An executable resource
 * is a class having one or more public methods.
 * @param config
 */
private void createExecutableResources(HelloWorldConnectionConfig config)
{
    // NOTE: you may or may not need to use the config information with your
    executable resources

    IExecutableResource helloResource = new SayHelloExecutableResource();
    IExecutableResource addingResource = new AddingExecutableResource();

    executableResources.put("HelloResource", helloResource);
    executableResources.put("AddingResource", addingResource);

    // Make one of them the default
    defaultResource = helloResource;
}
}

```

An instance of your `HelloWorldConnection` will be instantiated for each entry in your `provider-connections.xml` file that corresponds to the connection type specified in `HelloWorldConnectionConfig` (`connectionType="hello.world.provider.connection"`).

### **IDataProvider**

Finally, we are ready to roll all this into our top-level provider class `HelloWorldProvider`. This is the access point for the Conductor to configure our connections and invoke our `IExecutableResource(s)`.

**Location:**

\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services\_11.1.1.4.0\conductor-server-1.0.0.0.jar

Project Properties -> Libraries and Classpath -> add Jar/Directory -> (point to above conductor-server-1.0.0.0.jar)

**Example 66–7 IDataProvider**

```
public interface IDataProvider
{
    /**
     * Returns a map of connections keyed by connection name
     */
    public Map<String, ? extends IConnection> getNamedConnections();

    /**
     * Returns the "default" connection to use
     */
    public IConnection getDefaultConnection();

    /**
     * Called by the framework to set the current scenario context.
     */
    public void setScenarioContext(IScenarioContext scenarioContext);

    /**
     * Return the annotated class used to house connection configuration.
     *
     * <p>
     * Returning null disables this feature.
     */
    public Class<?> getConnectionConfigClass();

    /**
     * If getConnectionConfigClass returns a valid configuration class,
     * configurations are provided through this method, if any exist.
     * @param configurations The collection of configurations.
     */
    public void setConnectionConfigurations(List<?> configurations);
}
```

**Required annotations:**

```
@ContextualProvider
(
    contextName="HelloWorldProvider",

    resourceBundle="demo.provider.resources.HelloWorldProviderResources",
    nameBundleKey="provider.name",
    descriptionBundleKey="provider.description"
)
```

See [Example 66–8](#) on resource bundles below for more information.

**Example 66–8 Resource Bundles**

```
package demo.provider;

import java.util.Collections;
```

```

import java.util.List;
import java.util.Map;

import java.util.concurrent.ConcurrentHashMap;

import oracle.wcps.annotation.ContextualProvider;
import oracle.wcps.provider.IConnection;
import oracle.wcps.provider.IDataProvider;
import oracle.wcps.scenario.IScenarioContext;
@ContextualProvider
    (
        contextName="HelloWorldProvider",

resourceBundle="demo.provider.resources.HelloWorldProviderResources",
        nameBundleKey="provider.name",
        descriptionBundleKey="provider.description"
    )
public class HelloWorldProvider implements IDataProvider
{
    // Never used, but there is a required public method to set this.
    private IScenarioContext scenarioContext;

    // ConnectionConfigurations may come in via
classes/META-INF/connection-providers.xml
    private List<HelloWorldConnectionConfig> connectionConfigurations;

    // Each IConnection is uniquely identified via the AGConnectionConfig
private static Map<String, HelloWorldConnection> connections =
        new ConcurrentHashMap<String, HelloWorldConnection>();

    // One of the connections will become the default
private IConnection defaultConnection;

    public HelloWorldProvider() {
        super();
    }

    /**
     * Return a map of all our Connections, keyed by config.name.
     * @return
     */
    public Map<String, HelloWorldConnection> getNamedConnections()
    {
        return connections;
    }

    /**
     * One of the connections will be designated the default
     * @return
     */
    public IConnection getDefaultConnection()
    {
        return defaultConnection;
    }

    /**
     * Used to hold parameters specific to a given scenario
     * @param scenarioContext
     */
    public void setScenarioContext(IScenarioContext scenarioContext)

```

```

    {
        this.scenarioContext = scenarioContext;
    }

    /**
     * The config class is specific to each data provider
     * @return
     */
    public Class<HelloWorldConnectionConfig> getConnectionConfigClass()
    {
        return HelloWorldConnectionConfig.class;
    }

    /**
     * Create a HelloWorldConnection instance from each of the incoming configs.
     * These configs are created when the provider-connections.xml file is loaded.
     * @param configs
     */
    public void setConnectionConfigurations(List<?> configurations)
    {
        List<HelloWorldConnectionConfig> configs =
(List<HelloWorldConnectionConfig>)configurations;
        for (HelloWorldConnectionConfig config : configs)
        {
            // Create a HelloWorldConnection from the config
            HelloWorldConnection connection = new HelloWorldConnection(config);
            if (config.isDefault)
            {
                defaultConnection = connection;
            }
            connections.put(config.name, connection);
        }
    }
}

```

### 66.4.1.3 Creating the Resource Files

These files also go in the same directory as your classes, so they will be added to your final JAR file. The location of the files must correspond to the package name given in `HelloWorldProvider:bundle="demo.provider.resources.HelloWorldProviderResources"`

File name: `HelloWorldProviderResources.properties`

File contents: `provider.name=Hello World`  
`provider.description=Data provider for Hello World`

`provider.parameter.sayHello.user.description=Method to say hello to a named user`  
`provider.parameter.addTwoIntegers.int1.description=First number to add`  
`provider.parameter.addTwoIntegers.int2.description=Second number to add`

### 66.4.1.4 Wiring the Data Provider to the Conductor

Configure your connection in as described in

Name your provider for the Conductor by creating this file in the `META-INF/services` directory (in the same directory structure as your classes, so they will be added to your final jar file):

file name: `oracle.wcps.provider.IDataProvider`

file contents: demo.provider.HelloWorldProvider (fully-qualified name of your provider)

### 66.4.1.5 Invoking your Data Provider in a Scenario

Note the resource name is the same as in your HelloWorldConnections source code.

#### **Example 66–9 Scenario Calling the Provider**

```
<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"

xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <body>
    <call-provider>
      <provider-name>HelloWorldProvider</provider-name>
      <connection-name>HelloWorldConnection</connection-name>
      <resource-name>HelloResource</resource-name>
      <method-name>sayHello</method-name>
      <variable>providerResults</variable>
      <input>
        <parameter>
          <common:name>user</common:name>
          <common:value>cindymc</common:value>
        </parameter>
      </input>
    </call-provider>
    <return>
      <expression>${providerResults}</expression>
    </return>
  </body>
  <name>TestMyProviderScenario</name>
</scenario:scenario>
```

## 66.4.2 Adding Custom Locators

This section describes how you can extend your personalized WebCenter Portal application by adding custom locators.

This section contains the following subsections:

- [Section 66.4.2.1, "Understanding Property Locators"](#)
- [Section 66.4.2.2, "Implementing the Required Interfaces"](#)
- [Section 66.4.2.3, "Implementing Security"](#)
- [Section 66.4.2.4, "Creating a Property Set Definition"](#)
- [Section 66.4.2.5, "Putting It All Together"](#)
- [Section 66.4.2.6, "Invoking the Property Locator"](#)

### 66.4.2.1 Understanding Property Locators

A property locator is invoked by the Property Service to access external stores of properties. For example, Personalization provides an out-of-the-box `PeoplePropertyLocator` that uses the People Connections REST service to access profile information for users. The locator is not invoked directly by the Conductor/Scenario, but is instantiated by the Property Set service, which then

delegates calls for retrieving properties and property sets to the underlying locator implementation.

The example in the following sections will walk you through creating your own `BookPropertyLocator` to find a book by title in a library, and load its attributes into a property set you have created to represent a `Book` object.

There are two major steps to implementing this example:

1. Define the `PropertySet` for `Book`, and let the `Property Set` service know about it
2. Implement the `IPropertyLocator` to load properties from a `Book` object.

### 66.4.2.2 Implementing the Required Interfaces

**Location:**

```
\Oracle\Middleware\jdeveloper\webcenter\modules\wcps-services_
11.1.1.4.0\properties-common-1.0.0.0.jar
```

```
public interface IPropertyLocator
{
    public void loadProperties(IContext context, IPropertySet propertySet,
                             IPropertySetDefinition propertySetDefinition,
                             List<IPropertyName> propertyNames);

    public void storeProperties(IContext context, propertySet,
                              IPropertySetDefinition propertySetDefinition,
                              List<IPropertyName> propertyNames);

    public void removeProperties(IContext context, propertySet,
                                List<IPropertyName> propertyNames);

    public void removeProperties(IContext context, namespaceName,
                                IPropertySetDefinitionName name);

    public IPagedList<IPropertySet> filter(IContext context, namespaceName,
                                           IPropertySetDefinitionName
                                           setDefinitionName, PropertySetFilterContext filterContext);

    public int count(IContext context, namespaceName, PropertySetExpression
                    expression);
}
```

### 66.4.2.3 Implementing Security

The `IContext` object is the vehicle for authentication, passed in from the `Property Service`. There are two ways you can access the credentials:

- Using the request: `HttpServletRequest request = context.getProperty(IContext.HTTP_REQUEST_KEY)`
- Using the user/password: `String user = context.getProperty(IContext.USERNAME_KEY); String pw = context.getProperty(IContext.PASSWORD_KEY);`

### 66.4.2.4 Creating a Property Set Definition

This section describes how to create a `PropertySetDefinition` that will be used with your locator.

Follow the steps below to create the `PropertySetDefinition`:

1. Create a new JDeveloper project for your source files.
2. Add the required Personalization classes to the project classpath.
  - a. Right-click on the project name and select **Project Properties**.
  - b. Select **Libraries and Classpath**, then select **Add Library**.
  - c. Enter the name of the library to search for (for example, IPropertyLocator) and select it when it appears.
  - d. Repeat these steps for other classes your source code will need to reference.
3. Compile the project and deploy it to a JAR file.
4. Copy the JAR file to the Personalization extensions directory in  
/DefaultDomain/locator-extensions-library/WEB-INF/lib.

### 66.4.2.5 Putting It All Together

This section describes how to implement the property locator, data object, and data layer.

#### Implement the IPropertyLocator

(read-only for demo simplicity)

```
/**
 * Our locator will be read-only
 */
public class BookPropertyLocator implements IPropertyLocator
{
    // Let's delegate all the hard work to a BookPropertyDAO
    private BookPropertyDAO dao;

    // Must have a public default constructor, since the Property Service
    // instantiates
    // this

    public BookPropertyLocator()
    {
        // todo: show how connection properties could be initialized and passed in
        dao = new BookPropertyDAO();
    }

    /**
     * Load property values, optionally returning only a subset of those.
     * @param iPropertySet The PropertySet into which the retrieved values will be
    loaded
     * @param iPropertySetDefinition The PropertySetDefinition defining the
    'shape' of the properties
     * @param list List of PropertyNames to load. If null, all will be loaded.
     */
    public void loadProperties(IContext context, IPropertySet iPropertySet,
        IPropertySetDefinition iPropertySetDefinition,
        List<IPropertyName> list)
    {
        try
        {
            // Delegate to BookProperDAO
            dao.loadProperties(iPropertySet, list);
        } catch (Exception e)
        {
        }
    }
}
```

```

        throw new RuntimeException("Cannot load properties ", e);
    }
}

/**
 * Filter properties; load/return those properties that only match the filter
 * criteria.
 * @param iNamespaceName
 * @param iPropertySetDefinitionName
 * @param propertySetFilterContext
 * @return
 */
public IPagedList<IPropertySet> filter(IContext context, INamespaceName
iNamespaceName,
                                     IPropertySetDefinitionName
iPropertySetDefinitionName,
                                     PropertySetFilterContext
propertySetFilterContext)
{
    return null; // todo: possibly implement for demo
}

public int count(IContext context, INamespaceName iNamespaceName,
                PropertySetExpression propertySetExpression)
{
    return 0;
}

// As a read-only implementation, we don't support this
public void storeProperties(IContext context, IPropertySet iPropertySet,
                           IPropertySetDefinition iPropertySetDefinition,
                           List<IPropertyName> list)
{
    throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
}

// As a read-only implementation, we don't support this
public void removeProperties(IContext context, IPropertySet iPropertySet,
                            List<IPropertyName> list)
{
    throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
}

// As a read-only implementation, we don't support this
public void removeProperties(IContext context, INamespaceName iNamespaceName,
                            IPropertySetDefinitionName
iPropertySetDefinitionName)
{
    throw new UnsupportedOperationException("BookPropertyLocator is
read-only");
}
}

```

### Implement the Data Access Object for retrieving property values

```

/**
 * Data access class, to load books from a backing store (perhaps a database or

```

```

    * some REST service)
    */
class BookPropertyDAO
{
    // Generate the library that will provide our backing store.
    static
    {
        Library.generateLibrary();
    }

    /**
     * Assume the name of the PropertySet is the title of the book.
     * @param propertySet
     * @param list
     */
    void loadProperties(IContext context, IPropertySet propertySet,
        List<IPropertyName> list) throws Exception
    {
        String title = propertySet.getPropertySetName().getName();
        Book book = Library.getBook(title);
        loadProperties(book, propertySet, list);
    }

    private void loadProperties(IContext context, Book book, IPropertySet
propertySet,
        List<IPropertyName> propertyNames) throws
Exception
    {
        // Loop over all property names, create a Property value, and add it to
the Property set
        for (IPropertyName pname : propertyNames)
        {
            // System.err.println("Getting property: " + pname + ", with name: " +
pname.getName());
            String value = book.getProperty(pname.getName());
            if (value != null)
            {
                addProperty(value, pname, propertySet);
            }
        }
    }

    private void addProperty(IContext context, String value, IPropertyName pname,
IPropertySet propertySet)
    {
        IProperty<String> ps =
            Property.<String>builder().withProperty(pname,
value).buildWithoutValidation();
        propertySet.putProperty(pname, ps);
    }
}

```

### Implement the data layer (Books within a Library)

```

/**
 * Simple class to demonstrate loading properties. It could be improved by adding
 * support for non-String attributes (Date, arrays, etc) and using Java Bean
 * Introspection/Reflection to get the property values.
 */
public class Book

```

```
{
    String title;
    String author;
    String ISBN;

    public Book(String title, String author, String ISBN)
    {
        setTitle(title);
        setAuthor(author);
        setISBN(ISBN);
    }

    public void setTitle(String title)
    {
        this.title = title;
    }

    public String getTitle()
    {
        return title;
    }

    public void setAuthor(String author)
    {
        this.author = author;
    }

    public String getAuthor()
    {
        return author;
    }

    public void setISBN(String ISBN)
    {
        this.ISBN = ISBN;
    }

    public String getISBN()
    {
        return ISBN;
    }

    String getProperty(String propName)
    {
        // Here, we could use introspection on the Book class, but since there
are only // three properties, we can code it simpler
        if (propName.equals("ISBN"))
        {
            return getISBN();
        }
        if (propName.equals("title"))
        {
            return getTitle();
        }
        if (propName.equals("author"))
        {
            return getAuthor();
        }
        return null; // todo: perhaps throw Exception here
    }
}
```

```

    }
}

/**
 * Class to generate a library of Books
 */
class Library
{
    static String [] titles = {"Into Thin Air", "Climbing Everest", "Rocky
Mountains"};
    static String [] ISBNs = {"0-201-69581-2", "0-423-78123-1", "0-321-23425-2"};
    static String [] authors = {"Jon Krakauer", "Foey Handley", "Rick Bicknell"};

    // Keyed by title
    private static Map<String, Book> library = new HashMap<String,Book>();

    static void generateLibrary()
    {
        for (int i=0; i<titles.length; i++)
        {
            Book book = new Book(titles[i], authors[i], ISBNs[i]);
            library.put(book.getTitle(), book);
        }
    }

    static Book getBook(String title)
    {
        return library.get(title);
    }
}

```

#### 66.4.2.6 Invoking the Property Locator

The `PropertyLocator` is invoked by the `Property Service`, which is itself part of the `PropertiesServiceProvider`. We can invoke the `GetProperty` method on that provider in a scenario, as shown below:

```

<scenario:scenario
xmlns:common="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"
xmlns:scenario="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <body>
    <call-provider>
      <provider-name>oracle.PropertiesServiceProvider</provider-name>
      <method-name>GetProperty</method-name>
      <variable>property</variable>
      <input>
        <parameter>
          <common:name>namespace</common:name>
          <common:value>book.property.locator</common:value>
        </parameter>
        <parameter>
          <common:name>definition</common:name>
          <common:value>BookPropertySetDefinition</common:value>
        </parameter>
        <parameter>
          <common:name>set</common:name>
          <common:value>Into Thin Air</common:value>
        </parameter>
        <parameter>
          <common:name>property</common:name>
          <common:value>ISBN</common:value>

```

```
        </parameter>
    </input>
</call-provider>
<return>
    <expression>${property}</expression>
</return>
</body>
<name>BookPropertyScenario</name>
</scenario:scenario>
```

---

---

## Using Personalization APIs Externally

A client can access the WebCenter Personalization public APIs using Java APIs or public Rest APIs as described in the following sections:

- [Section 67.1, "Using Java APIs"](#)
- [Section 67.2, "Using the Property Service REST APIs"](#)
- [Section 67.3, "Property Service REST APIs"](#)
- [Section 67.4, "Using the Conductor REST APIs"](#)
- [Section 67.5, "Calling Personalization Client Services Using ELs"](#)

### 67.1 Using Java APIs

The service interfaces shown in [Table 67–1](#) define the remote Conductor API.

**Table 67–1 Remote Conductor APIs**

Interface/Service	Description
oracle.wcps.conductor.services.IScenariosService	General management, retrieval, and execution of stored Scenarios.
oracle.wcps.conductor.services.INamespaceService	General management of stored namespaces known to the Conductor.
oracle.wcps.conductor.services.IProviderService	Retrieval of provider metadata known to the Conductor server.

For more information about Personalization Java APIs, see the JavaDoc for WebCenter in the *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

### 67.2 Using the Property Service REST APIs

This section provides examples of how you can use the Property Service's REST APIs to programmatically carry out basic Personalization tasks, such as:

- Creating a namespace
- Viewing and creating property set definitions
- Viewing and creating property definitions
- Viewing, creating, and executing scenarios
- Viewing data provider details

This section contains the following subsections:

- [Section 67.2.1, "Accessing the Property Service's Resource Index"](#)
- [Section 67.2.2, "Creating a Namespace Using the Property Service"](#)
- [Section 67.2.3, "Viewing Property Set Definitions Within a Namespace Using the Property Service"](#)
- [Section 67.2.4, "Creating a Property Definition Within a Namespace Using the Property Service"](#)
- [Section 67.2.5, "Viewing Property Definitions Within a Namespace Using the Property Service"](#)
- [Section 67.2.6, "Creating a Property Set Definition Within a Namespace Using the Property Service"](#)
- [Section 67.2.7, "Creating a Property Set Within a Namespace Using the Property Service"](#)
- [Section 67.2.8, "Viewing a Property Set Within a Namespace Using the Property Service"](#)
- [Section 67.2.9, "Accessing the Conductor ResourceIndex"](#)
- [Section 67.2.10, "Accessing Namespaces Using the Conductor"](#)
- [Section 67.2.11, "Creating a Scenario Within a Namespace Using the Conductor"](#)
- [Section 67.2.12, "Viewing Scenarios Within a Namespace Using the Conductor"](#)
- [Section 67.2.13, "Executing a Scenario Using the Conductor"](#)
- [Section 67.2.14, "Viewing Data Providers Within a Namespace Using the Conductor"](#)
- [Section 67.2.15, "Viewing Detailed Data Provider Properties Within a Namespace Using the Conductor"](#)
- [Section 67.2.16, "Viewing Data Provider Connections Within a Namespace Using the Conductor"](#)
- [Section 67.2.17, "Viewing Data Provider Connection Resources Within a Namespace Using the Conductor"](#)
- [Section 67.2.18, "Viewing Data Provider Connection Resources Method Within a Namespace Using the Conductor"](#)
- [Section 67.2.19, "Viewing Function Providers Within a Namespace Using the Conductor"](#)

### **67.2.1 Accessing the Property Service's Resource Index**

The Property Service resource index's response contains links and templates to access other resources of the Property Service. For the request and response for accessing the Property Service's resource index, see [Section 67.3.1.1, "ResourceIndex."](#)

### **67.2.2 Creating a Namespace Using the Property Service**

Creating an object using the REST HTTP interface requires setting the request method to POST and adding a header `content-type` with the value `application/xml`. For the request and response for creating a namespace using the Property Service, see [Section 67.3.2.1, "Create Namespace."](#)

### 67.2.3 Viewing Property Set Definitions Within a Namespace Using the Property Service

For the request and response for viewing property set definitions within a namespace using the Property Service, see [Section 67.3.4.3, "Retrieve All Property Set Definitions."](#)

### 67.2.4 Creating a Property Definition Within a Namespace Using the Property Service

For the request and response for creating a property definitions within a namespace using the Property Service, see [Section 67.3.3.1, "Create Property Definition - Create Integer Property Definition."](#)

### 67.2.5 Viewing Property Definitions Within a Namespace Using the Property Service

For the request and response for viewing property definitions within a namespace using the Property Service, see [Section 67.3.3.6, "Retrieve all Property Definitions."](#)

### 67.2.6 Creating a Property Set Definition Within a Namespace Using the Property Service

For the request and response for creating a property set definition within a namespace using the Property Service, see [Section 67.3.4.1, "Create Property Set Definition."](#)

### 67.2.7 Creating a Property Set Within a Namespace Using the Property Service

For the request and response for creating a property set within a namespace using the Property Service, see [Section 67.3.5.1, "Create Property Set."](#)

### 67.2.8 Viewing a Property Set Within a Namespace Using the Property Service

For the request and response for viewing a property set within a namespace using the Property Service, see [Section 67.3.5.5, "Retrieve all Property Sets."](#)

### 67.2.9 Accessing the Conductor ResourceIndex

Note that in the example below the link templates and ResourceIndex will be modified to comply with best practice guidelines.

**Request URI:**

```
GET http://localhost:8891/wcps/api/conductor/resourceIndex
```

**Response:**

```
<resourceIndex resourceType="urn:oracle:wcps:conductor:resourceIndex">
  <links>
    <link resourceType="urn:oracle:wcps:conductor:namespaces"
      rel="urn:oracle:wcps:conductor:namespaces"
      href="http://localhost:8891/wcps/api/conductor/namespaces"
      capabilities="urn:oracle:restframework:read urn:oracle:restframework:create"/>
    <link
      template="http://localhost:8891/wcps/api/conductor/namespaces/{namespace}"
      resourceType="urn:oracle:wcps:conductor:namespace"
      rel="urn:oracle:wcps:conductor:namespace"
      capabilities="urn:oracle:restframework:read"/>
    <link
      template="http://localhost:8891/wcps/api/conductor/namespaces/{namespace}/scenarios?tag={tag}&projection={projection}&startIndex={startIndex}&itemsPerPage={itemsPerPage}"
      resourceType="urn:oracle:wcps:conductor:scenarioMetadatas"
```

```

rel="urn:oracle:wcps:conductor:scenarioMetadatas"
capabilities="urn:oracle:restframework:read"/>

## 67.2.11 Creating a Scenario Within a Namespace Using the Conductor

### Request URI:

```
POST http://localhost:8891/wcps/api/conductor/namespaces/FeatureReview_
Namespace/scenarios
```

### Request Body:

```

<scenarioMetadata>
<scenario xmlns:ns2="http://xmlns.oracle.com/webcenter/conductor/common/1.0.0"
xmlns:ns3="http://xmlns.oracle.com/webcenter/conductor/scenarios/1.0.0">
  <body>
    <assign-variable>
      <variable>var1</variable>

    <expression>${ScenarioContext.scenarioRequest.parameters['param1']}</expression>
    </assign-variable>
    <assign-variable>
      <variable>var2</variable>
      <expression>${var1}</expression>
    </assign-variable>
    <return>
      <expression>${var2}</expression>
    </return>
  </body>
  <name>FeatureCompleteScenario</name>
  <comments>FeatureCompleteScenario comments</comments>
  <tags>
    <tag>FeatureScenario</tag>
    <tag>ScenarioExample</tag>
    <tag>Simple</tag>
  </tags>
</scenario>
</scenarioMetadata>

```

### Response:

```

<scenarioMetadata xmlns:ns2="http://xmlns.oracle.com/wcps/conductor/common/1.0.0"
xmlns:ns3="http://xmlns.oracle.com/wcps/conductor/scenarios/1.0.0">
  <links>
    <link
template="http://localhost:8891/wcps/api/conductor/namespaces/FeatureReview_

### 67.2.13 Executing a Scenario Using the Conductor

**Request URI:**

```
POST http://localhost:8891/wcps/api/conductor/namespaces/FeatureReview_
Namespace/scenarios/FeatureCompleteScenario
```

**Request Body:**

```

<parameters>
  <parameter>
    <name>param1</name>
    <value>param1Value</value>
  </parameter>
  <parameter>
    <name>param2</name>
    <value>param2Value</value>
  </parameter>
</parameters>

```

**Response:**

```

<conductorExecutionResults resourceType="urn:oracle:wcps:conductor:genericType">
  <type>java.lang.String</type>
  <results xsi:type="xs:string"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xs="http://www.w3.org/2001/XMLSchema">param1Value</results>
</conductorExecutionResults>

```

### 67.2.14 Viewing Data Providers Within a Namespace Using the Conductor

Three IDataProvider implementations are provided out-of-the-box and are accessible in every namespace: ActivityGraphProvider; CMISDataProvider; PropertiesProvider.

**Request URI:**

```
http://localhost:8891/wcps/api/conductor/namespaces/FeatureReview_
Namespace/dataProviders
```

**Response:**

```
<dataProviders resourceType="urn:oracle:wcps:conductor:provider:dataProviders">
  <links>
    <link
      template="http://localhost:8891/wcps/api/conductor/namespaces/FeatureReview_

```

### 67.3.7 JSON Payload

The property value in JSON format indicates the value type using `concreteType` field names. The following table maps the property definition type and Java data type to the values of `concreteType`.

**Table 67–2 concreteType Values**

Property Definition Type	Java Data Type	concreteType Value
INT	java.lang.Integer	urn:oracle:wcps:property:internal:jaxrs:model:integer-value
NUMBER	java.lang.Double	urn:oracle:wcps:property:internal:jaxrs:model:double-value
STRING	java.lang.String	urn:oracle:wcps:property:internal:jaxrs:model:string-value
BOOLEAN	java.lang.Boolean	urn:oracle:wcps:property:internal:jaxrs:model:boolean-value
BLOB	oracle.wcps.property.BlobData	urn:oracle:wcps:property:blob-data
CLOB	oracle.wcps.property.ClobData	urn:oracle:wcps:property:clob-data
DATETIME	oracle.wcps.property.DateTime	urn:oracle:wcps:property:date-time

### 67.3.8 Exceptions

- If optimistic concurrency is disabled on the property server, the "If-Match" request header is not required. If enabled, the value of the "If-Match" header should be the value sent for the response header "ETag".
- Not sending the request header X-Oracle-RF-Token results in a 403 response status. The value of the token should be the one sent in response of the `/resourceIndex` request.
- Attempting to delete an "in use" Namespace, Property Definition, or Property Set Definition results in a 412 response status.

### 67.3.9 Query Parameters

Table 67–3 shows the supported query parameters and their default values.

**Table 67–3 Query Parameters**

Query Parameter Name	Description	Default Value	Other Special Values
q	the value for it is a search expression	none	none
startIndex	Represents the index of the first element in a page	0	none
itemsPerPage	Represents the number of items to be included in a page	10	none
dataFields	Represents a list of attributes of a property service entities for which data is returned	empty list = (Return zero attributes)	* = (all attributes)

### 67.3.10 Search Expressions

This section contains the following subsections:

- [Section 67.3.10.1, "Format"](#)
- [Section 67.3.10.2, "Supported Operators"](#)
- [Section 67.3.10.3, "Supported Attribute Names"](#)

#### 67.3.10.1 Format

The value for the 'q' query parameter is a search expression. The search expression format is:

```
single_expression = attribute_name:operator_name:value
expression = single_expression[;single_expression]
```

#### 67.3.10.2 Supported Operators

- Relational Operator
  - :equals: ==> Equals
  - :contains: ==> Contains
  - :like: ==> SQL Like, applies only to string type property values
  - :gt: ==> Greater than
  - :gte: ==> Greater than or equals to
  - :lt: ==> Less than
  - :lte: ==> Less than or equals to
- Logical Operation
  - ; ==> and

#### 67.3.10.3 Supported Attribute Names

[Table 67–4](#), [Table 67–5](#), [Table 67–6](#), and [Table 67–7](#) show the supported attribute names that can be used in a search expressions to search for property service entities.

## Namespace Attributes

**Table 67–4 Namespace Attributes**

Attribute Name	Description
ns-name	A namespace's name
ns-property-locator-class-name	A namespace's property locator class name
ns-definition-locator-class-name	A namespace's definition locator class name
ns-created-on	A namespace's created on date time
ns-updated-on	A namespace's updated on date time

### Examples:

```
/wcps/api/property/namespaces?q=ns-name:like:Oracle_%25
```

```
/wcps/api/property/namespaces?q=ns-definition-locator-class-name:like:%25Locator%25;ns-name:like:Oracle_%25
```

## Property Definition Attributes

**Table 67–5 Property Definition Attributes**

Attribute Name	Description
pd-name	A property definition's name
pd-description	A property definition's description
pd-type	A property definition's type
pd-restricted	A property definition's restricted attribute
pd-validator-class-name	A property definition's validator class name
pd-created-on	A property definition's created on date time
pd-updated-on	A property definition's updated on date time

### Example:

```
/wcps/api/property/namespaces/Oracle/propertydefinitions?q=pd-name:like:%25D%25;pd-description:contains:4th;pd-restricted:contains:true
```

## Property Set Definition Attributes

**Table 67–6 Property Set Definition Attributes**

Attribute Name	Description
psd-name	A property set definition's name
psd-description	A property set definition's description
psd-pd-name	A property definition name referred by a property set definition
psd-property-locator-class-name	A property locator class name associated with a property set definition
psd-created-on	A property set definition's created on date time
psd-updated-on	A property set definition's updated on date time

**Example:**

```
wcps/api/property/namespaces/Oracle/propertysetdefinitions?q=psd-created-on:gt:1980-01-01T00:00:00.000-0700;psd-name:like:%25%25
```

**Property Set Attributes****Table 67-7 Property Set Attributes**

Attribute Name	Description
ps-name	A property set's name
ps-description	A property set's description
psd-created-on	A property set's created on date time
psd-updated-on	A property set's updated on date time
a property's name	A property's name attribute (for example, firstName, zipCode, etc.)

**Example:**

```
/wcps/api/property/namespaces/Oracle/propertysetdefinitions/partners_info/propertysets?q=ps-created-on:gt:1980-01-01T00:00:00.000-0700
```

## 67.4 Using the Conductor REST APIs

This section provides examples of how you can use the Conductor's REST APIs to programmatically carry out basic Personalization tasks, such as:

- Get information about data providers
- Get information about function providers
- Create, retrieve, or delete a namespace
- Create, retrieve, execute, or delete a scenario

You can use the Conductor REST APIs from within application code, or using Personalization ELs to call them from within your WebCenter Portal: Framework application or WebCenter Portal: Spaces.

This section contains the following subsections:

- [Section 67.4.1, "Using the Data Provider Management APIs"](#)
- [Section 67.4.2, "Using the Function Provider Management APIs"](#)
- [Section 67.4.3, "Using the Namespace Management APIs"](#)
- [Section 67.4.4, "Using the Scenario Management APIs"](#)

### 67.4.1 Using the Data Provider Management APIs

This section provides examples of using the Conductor's data provider management APIs, and contains the following subsections:

- [Section 67.4.1.1, "Getting a Collection of Data Providers \(GET\)"](#)
- [Section 67.4.1.2, "Getting a Single Data Provider's Metadata \(GET\)"](#)
- [Section 67.4.1.3, "Getting Information About a Data Provider Connection \(GET\)"](#)

- Section 67.4.1.4, "Getting Information about an Executable Resource for a Data Provider and Connection (GET)"
- Section 67.4.1.5, "Getting Method Information for an Executable Resource for a Data Provider and Connection (GET)"
- Section 67.4.1.6, "Getting Entire Data Provider Information with Details Projection (GET)"

### 67.4.1.1 Getting a Collection of Data Providers (GET)

#### XML

##### Request :

```
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/dataProviders?projection=summary
accept-language: en
content-type: application/xml
accept: application/xml
```

##### Response :

```
