## 67.4.2 Using the Function Provider Management APIs

This section provides examples of using the Conductor's function provider APIs, and contains the following subsections:

- [Section 67.4.2.1, "Getting a Collection of Function Providers \(GET\)"](#)
- [Section 67.4.2.2, "Getting Metadata for a Single Function Provider \(GET\)"](#)

### 67.4.2.1 Getting a Collection of Function Providers (GET)

#### XML

##### Request :

```
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/functionProviders?projection=summary
accept-language: en
content-type: application/xml
accept: application/xml
```

##### Response :

```
Status Code:200

### 67.4.3 Using the Namespace Management APIs

This section provides examples of using the Conductor's namespace management APIs, and contains the following subsections:

- [Section 67.4.3.1, "Getting a Collection of Namespaces \(GET\)"](#)
- [Section 67.4.3.2, "Retrieving a Single Namespace \(GET\)"](#)
- [Section 67.4.3.3, "Creating a Namespace \(POST\)"](#)
- [Section 67.4.3.4, "Deleting a Namespace \(DELETE\)"](#)

#### 67.4.3.1 Getting a Collection of Namespaces (GET)

##### XML

###### Request:

```

GET
http://localhost:7001/wcps/api/conductor/namespaces?startIndex=0&itemsPerPage=10
accept-language: en
content-type: application/xml
accept: application/xml

```

###### Response:

```

Status Code:200
X-Powered-By: Servlet/2.5 JSP/2.1
Set-Cookie:

## 67.4.4 Using the Scenario Management APIs

This section provides examples of using the Conductor's scenario management APIs, and contains the following subsections:

- [Section 67.4.4.1, "Getting a Collection of Scenarios \(GET\)"](#)
- [Section 67.4.4.2, "Retrieving a Single Scenario \(GET\)"](#)
- [Section 67.4.4.3, "Creating a Scenario \(POST\)"](#)
- [Section 67.4.4.4, "Updating a Scenario \(PUT\)"](#)
- [Section 67.4.4.5, "Deleting a Scenario \(DELETE\)"](#)
- [Section 67.4.4.6, "Execute a Scenario \(POST\)"](#)

### 67.4.4.1 Getting a Collection of Scenarios (GET)

#### XML

**Request:**

```
GET
http://localhost:7001/wcps/api/conductor/namespaces/Oracle/scenarios?projection=summary&startIndex=0&itemsPerPage=10
accept-language: en
content-type: application/xml
accept: application/xml
```

**Response:**

```
Status Code:200

## 67.5 Calling Personalization Client Services Using ELs

Using Expression Language (EL) expressions, you can call Personalization services from remote clients such as web pages and Java Server Faces environments. You can, for example, use ELs to apply Personalization scenarios to pages in WebCenter Portal: Spaces. For more information about Personalization ELs, see also [Section F.9, "ELs Related to the Personalization Service."](#)

This section contains the following subsections:

- [Section 67.5.1, "Calling Personalization Client Services from JSF Pages"](#)
- [Section 67.5.2, "Calling Personalization Client Services from JSP Pages"](#)
- [Section 67.5.3, "Personalization Context Object Method Reference"](#)
- [Section 67.5.4, "Enabling Single Sign-on"](#)

### 67.5.1 Calling Personalization Client Services from JSF Pages

The Personalization Context is a session-scoped managed bean that is automatically declared and instantiated by the Java Server Faces context, and there for use with the following EL:

```
#{p13nContext}
```

#### Accessing the Conductor context

Access to remote Conductor services can be accessed in the following way:

```
#{p13nContext.conductor["<UrlOrConnectionName>"]}
```

where **UrlOrConnectionName** is a URL to the conductor resource index (for example, `http://localhost:7001/wcps/api/conductor/resourceIndex`), or a connection name specified in `connections.xml` (available only within JDeveloper or WebCenter environments).

If the connection name "default" is specified, the first connection name that starts with "Conductor" is retrieved. For example:

```
#{p13nContext.conductor['default'].namespaces['myNamespace'].scenario['myScenario'].results}
```

#### Accessing the Properties service context

Access to remote Properties Service services can be accessed in the following way:

```
#{p13nContext.properties["<UrlOrConnectionName>"]}
```

where ***UrlOrConnectionName*** is a URL to the Properties Service resource index (for example `http://localhost:7001/wcps/api/property/resourceIndex`), or a connection name specified in `connections.xml` (available only within JDeveloper or WebCenter environments).

If the connection name "default" is specified, the first connection name that starts with "Properties" is retrieved. For example:

```
#{p13nContext.properties['default'].namespaces['myNamespace'].setDefinitions['MyPropertySetDefinition'].sets['MyPropertySet'].results['MyPropertyName']}
```

### Configuring the client services for request scope

You may sometimes need to have the Personalization services client use request scope rather than session scope. To do this, configure a custom managed bean in your application's `faces-config` as shown in the example below:

```
<managed-bean>
  <managed-bean-name>myP13nContext</managed-bean-name>
  <managed-bean-class>oracle.wcps.client.PersonalizationContext
</managed-bean-class>
  <managed-bean-scope>request</managed-bean-scope>
</managed-bean>
```

## 67.5.2 Calling Personalization Client Services from JSP Pages

The Personalization client can be used with

JSP pages similarly to the way it is used in Java Server Faces pages (see [Section 67.5.1, "Calling Personalization Client Services from JSF Pages"](#)). You must, however, register the bean using `<jsp:useBean>` as shown in the following example:

```
<jsp:useBean id="p13nContext" class="oracle.wcps.client.PersonalizationContext"
scope="session"/>
<c:out
value="\#{p13nContext.conductor['http://weblogic:weblogic@localhost:7001/wcps/api/c
onductor'].namespaces['default'].scenario['my_scenario_
name'].withInput['question=Does JSP work?'].results}"/>
```

If you want to clear the bean's state, you can invoke it using scriptlet code by placing it after the `<jsp:useBean>` statement:

```
<jsp:scriptlet>((oracle.wcps.client.PersonalizationContext)session.getAttribute("p
13nContext")).reset();</jsp:scriptlet>
```

## 67.5.3 Personalization Context Object Method Reference

[Table 67-8](#) shows the Personalization context object methods.

**Table 67–8 Personalization Context Object Method Reference**

Method Name	Description	Example
reset	Clears the state of the context object in which it is invoked.	<pre>#{p13nContext.reset} #{p13nContext.conductor['ConductorConnection'].reset} #{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset} #{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}</pre>
update	<p>Updates the property set with new values if bound to a form. This method only applies to the PropertySetContext.</p> <p><b>Note:</b> This method can only be called as part of a form-based action.</p>	<pre>#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}</pre>
results	<p>Retrieves the results of the context object.</p> <p>For PropertySetContext, it retrieves the property set by name and property set definitions, if they exist.</p> <p>For ScenarioExecutionContext and ParameterizedScenarioExecutionContext, the scenario results are retrieved.</p>	<pre>#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results} #{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results} #{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=value1;input2=value2;input3=value3'].results}</pre>
withInput	<p>Executes a scenario by name with input parameters. Input parameters must be in the format:</p> <pre>&lt;paramOne&gt;=&lt;valueOne&gt;;&lt;paramTwo&gt;=&lt;valueTwo&gt;;&lt;paramThree&gt;=&lt;valueThree&gt;</pre> <p>where each parameter name and value is separated by semicolon. This method only applies to ScenarioExecutionContext.</p>	<pre>#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=value1;input2=value2;input3=value3'].results}</pre>
isError	Determines if an error has occurred in the current context object. Only applies to PropertySetContext and ~ScenarioExecutionContext.	<pre>#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError} #{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}</pre>
errorMessage	Returns the error message if an error has occurred in the current context object. Only applies to PropertySetContext and ~ScenarioExecutionContext.	<pre>#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].errorMessage} #{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}</pre>

## 67.5.4 Enabling Single Sign-on

To enable single sign-on, access to the `HttpServletRequest` must be available for both JSF and JSP environments. An implementation of `javax.servlet.Filter` (`PersonalizationFilter`) puts the `HttpServletRequest` on `ThreadLocal` for access within the client as shown in the example below:

```
<filter>
  <description>Personalization Filter for staging client-side
objects.</description>
  <filter-name>PersonalizationFilter</filter-name>
  <filter-class>oracle.wcps.client.PersonalizationFilter</filter-class>
</filter>

<filter-mapping>
  <filter-name>PersonalizationFilter</filter-name>
  <url-pattern>/*</url-pattern>
  <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

This filter is automatically configured in the `wcps-services-client-web-lib`.

# Part XII

---

## Completing Your WebCenter Portal Application

Part XII contains the following chapters:

- [Chapter 68, "Securing Your WebCenter Portal: Framework Application"](#)
- [Chapter 69, "Deploying and Testing Your WebCenter Portal: Framework Application"](#)
- [Chapter 70, "Building Multilanguage Portals"](#)

---

---

## Securing Your WebCenter Portal: Framework Application

This chapter describes the security mechanisms and features provided in a WebCenter Portal: Framework application, and how you can use Oracle ADF Security to handle authentication and authorization.

This chapter includes the following sections:

- Section 68.1, "Introduction to WebCenter Portal: Framework Application Security"
- Section 68.2, "Creating an Application Role"
- Section 68.3, "Configuring ADF Security"
- Section 68.4, "Using the Role Manager Task Flow"
- Section 68.5, "Using the Enterprise Role Member Task Flows"
- Section 68.6, "Using the Page Hierarchy Security Editor"
- Section 68.7, "Creating Login Pages and a Login Component"
- Section 68.8, "Creating a Login Portlet"
- Section 68.9, "Adding Portlets to a Login Page"
- Section 68.10, "Creating a Self-Registration Page"
- Section 68.11, "Creating a Reset Password Page"
- Section 68.12, "Configuring Basic Authentication for Testing Portlet Personalization"
- Section 68.13, "Working with External Applications"
- Section 68.14, "Registering Custom Certificates with the Keystore"
- Section 68.15, "Overriding Inherited Security on Portlets and Customizable Components"
- Section 68.16, "Identity Propagation Mechanisms"
- Section 68.17, "Securing Identity Propagation Through WSRP Producers with WS-Security"
- Section 68.18, "Implementing PDK-Java Portlet Security"
- Section 68.19, "Troubleshooting Security Issues"

## 68.1 Introduction to WebCenter Portal: Framework Application Security

WebCenter Portal: Framework applications are dynamic and often involve input from users in the form of customizations and preferences, and consequently require a flexible security model. The WebCenter security model is based on the ADF security model rather than the more traditional J2EE security model. For more information on ADF security, the section on "Enabling ADF Security in a Fusion Web Application" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

By default, a Framework application is configured with ADF security. A default username and password (weblogic/weblogic1) are created automatically for you, and you can use this username/password combination for testing purposes immediately. For more information about configuring ADF security, see [Section 68.3, "Configuring ADF Security."](#)

Default login and logout pages are also provided with the Framework application template.

Framework applications can also use two out-of-the-box security tools: the *Role Manager* task flow, and *Page Hierarchy* security editor. The Role Manager task flow provides pre-defined runtime security administration functionality to define roles and permissions for users. Using the Page Hierarchy security editor provides a quick way to apply inherited and/or delegated security to application pages. These two security tools are described in [Section 68.4, "Using the Role Manager Task Flow,"](#) and [Section 68.6, "Using the Page Hierarchy Security Editor."](#)

## 68.2 Creating an Application Role

There are three roles available out-of-the box:

- **Administrator** - the default member for the application Administrator role is the enterprise Administrator role, whose default member is `weblogic`
- **AppConnectionManager** - the default member for the AppConnectionManager role is the application Administrator role
- **AppConnectionViewer** - the default member for the AppConnectionViewer role is the authenticated-role

The Administrator role is provided so that you can set up navigation and security for your application, and delegate permissions to other users.

The AppConnectionManager and AppConnectionViewer are roles that are defined for managing and viewing application connections respectively. Typically, application connections are configured and managed using Fusion Middleware Control or WLST commands. However, connections for portlet producers and external applications can be configured through the application's runtime Administration page (or the Role Manager task flow if implemented separately). To manage or view these connections, you must be part of one of these roles. For more information about the default roles, see "Default Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

You can add members at runtime for these roles using the Administrator page (or the Role Manager task flow if implemented separately), and in JDeveloper using the JAZN Editor. Out-of-the-box, an administrator will be able to configure external application and portlet producer connections, and any other authenticated user will only be able to view these connections. Similarly, you can add users to the application by selecting the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

To create an application role:

1. Access the ADF Security Policy editor using any of the following methods:
  - Navigate to the **jazn-data.xml** file in the Application Resources Panel, under the META-INF folder. Right-click **jazn-data.xml** and select **Open** from the context menu. Open the Application Roles tab.
  - Right-click the application name, select **Secure** and then **Application Roles**.
  - From the Application menu, select **Secure** and then **Application Roles**.
2. In the Application Roles editor, click the Add (+) icon and select **New Role**.
3. Enter a name, a display name, and description for the new role.
4. Save the file.

Similarly, you can add users to the application by opening the Users tab in the ADF Security Policy editor, clicking the Add (+) icon, and specifying a username and password.

## 68.3 Configuring ADF Security

ADF security is configured by default if you created your application using the **Framework application** template. This section describes the Configure ADF security wizard, which you can use to override the default settings for a **Framework application**, or if your application does not use the **Framework application** template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application). This section also describes the grants that are generated when you create a **Framework application**, and when services are consumed.

This section contains the following subsections:

- [Section 68.3.1, "Configuring ADF Security Settings"](#)
- [Section 68.3.2, "Automated Security Grants for WebCenter Portal Services"](#)

### 68.3.1 Configuring ADF Security Settings

This section describes the Configure ADF security wizard, which you can use to override the default settings for a **Framework application**, or if your application does not use the **Framework application** template (i.e., you did not select the "Configure the application with standard portal features" checkbox when you created your application).

To configure the ADF security settings:

1. Open your portal application.
2. Access the Configure ADF Security Wizard using one of the following methods:
  - From the **Application** menu, select **Secure** and then **Configure ADF Security**.
  - Right-click the application name, select **Secure** and then **Configure ADF Security**.
3. On the Enable ADF Security page, select **ADF Authentication and Authorization**, which is the typical choice for **Framework applications**.

**Figure 68–1 ADF Security Page of the ADF Security Wizard**

4. Click **Next**.
5. Notice that form-based authentication is selected by default.

To make the process of securing your application easy, select **Form-Based Authentication** and then the **Generate Default Pages** option, as shown in [Figure 68–2](#).

---

**Note:** Framework applications provide default login and error pages. You should only select the **Generate Default Pages** option for applications not built using the Framework application template.

---

Alternatively, if you do not select Generate Default Pages, you can create custom login and error pages. For information about creating custom login pages, see [Section 68.7, "Creating Login Pages and a Login Component."](#)

**Figure 68–2 Authentication Page of ADF Security Wizard**

6. Click Next.
7. On the Enable automatic policy grants page, shown in [Figure 68–3](#), select whether to make ADF resources public without requiring application developers to first define ADF policy grants. For a standard security implementation, you can select the **No Automatic Grant** option.

However, in this case, you must individually grant permissions on each page in the application.

**Figure 68–3 Automatic Policy Grants Page**

When you enable automatic policy grants, a *View* grant for all ADF resources is made to the `test-all` application role, whose default member is the `public` role. This option provides a convenient way to run and test application resources without the restricted access that ADF authorization enforces. You can also disable automatic policy grants to secure all ADF resources by default.

Select **No Automatic Grant** when you want to explicitly configure a policy store to grant access to ADF resources. No automatic grants to the `test-all` application role are granted. However when WebCenter Portal services task flows are consumed in an application, the WebCenter extension automatically adds appropriate grants for these task flows, giving *View* access to the role `authenticated-role`. For more information about the specific grants provided through task flows, see [Section 68.3.2, "Automated Security Grants for WebCenter Portal Services."](#)

---

**Note:** By default, `anonymous-user` is granted permission to access services task flows. Anonymous access is also provided to the `resourceViewer` task flow that allows resources to be visible when looking at data through Activity Stream or Search. If you have no public or anonymous access to your functionality, all the grants that are currently given to `anonymous-role`, should be moved to `authenticated-role`. Also, grants made to `authenticated-role` are visible in the source view of the `jazn-data.xml` file.

If the default grants to `anonymous-role` or `authenticated-role` are not appropriate to the application, you can change them by opening the source view of the application's `jazn-data.xml` file and cutting and pasting the permissions to the appropriate role.

---

Select **Grant to Existing Objects Only** when you want JDeveloper to grant *View* privileges to the `test-all` (public) application role and you want this policy to apply to all your application's existing ADF task flows and web pages in the user interface project.

Select **Grant to All Objects** when you want JDeveloper to grant *View* privileges to the `test-all` application role and you want this policy to apply to all ADF task flows and web pages that developers create in the user interface project. Note that the **Grant to All Objects** option appears when you run the wizard for the first time. Subsequently, the **Grant to New Objects** option appears each time you run the wizard.

8. Click **Next**.
9. Optionally, if you want to display a specific welcome page upon authentication, then select the **Redirect Upon Successful Authentication** option as shown in [Figure 68-4](#).

You can either create a custom welcome page or let the wizard create a default one. To keep the process simple, select **Generate Default**.

**Figure 68–4 Specify an Authenticated Welcome Page**

10. The Summary page opens, as shown in [Figure 68–5](#).

**Figure 68–5 Summary Page**

11. Click **Finish**.

It may take several moments for the wizard to complete.

12. On the Security Infrastructure Created dialog, click **OK**.

## 68.3.2 Automated Security Grants for WebCenter Portal Services

Table 68–1 lists the security grants that are given automatically in a Framework application, configured with standard Portal features.

**Note:** If you do not have public or anonymous access to your application, grants that are currently given to anonymous-role can be removed using the following WLST command:

```
revokePermission(appStripe="papp1#V2.0",principalClass="oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl",
principalName="anonymous-role",
permClass="oracle.adf.controller.security.TaskFlowPermission",
permActions="view", permTarget="/oracle/webcenter/.*)"
```

**Table 68–1 Automated Security Grants for Framework applications**

Administrator	HierarchicalResourcePermission	Create, Delete, Grant, Manage, Personalize, Update, View	serviceID=oracle.webcenter.page,scopeID=s8bba98ff_4cbb_40b8_beee_296c916a23ed,resourceID=s8bba98ff_4cbb_40b8_beee_296c916a23ed
	WebCenterResourcePermission	Manag	oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_contentpresenter_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_datacontrol_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_navigation_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_pagestyle_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_catalog_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_pagetemplate_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_skin_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_taskflow_.* oracle_webcenter_siteresource_s8bba98ff_4cbb_40b8_beee_296c916a23ed_taskflowstyle_.*

Table 68–2 lists the grants that are given when a service is consumed. A service is consumed whenever a component (from the Component Palette) or a task flow (from the Resource Palette) belonging to that service is added to a page.

Grants are added automatically to the `jazn-data.xml` file. They can be viewed and edited through the ADF Security Policy Editor. For more information, see [Section 68.3.1, "Configuring ADF Security Settings."](#)

**Note:** When a WebCenter Portal: Framework application is created, the following element:

```
<name>resource=MyApplicationName</name>
```

(where *MyApplicationName* is the name of the application you created) is added to the `jazn-data.xml` file. If you modify the `jazn-data.xml` file, be sure that the application name matches the application name under the `jazn-data.xml` file's `<policy-store>` element. If these two application names do not match, any functionality that relies on WS-security identity propagation will not work.

If ADF security has not been configured for the application, then these grants are not added; however, if security is later configured, grants are added for all services that have been consumed in the application. Common grants are granted whenever any Oracle WebCenter Portal service is consumed.

**Table 68–2 Automated Security Grants for WebCenter Portal Services**

## 68.4 Using the Role Manager Task Flow

The Role Manager task flow lets administrators manage application roles, its memberships, and associate service permissions for the role. The Role Manager task flow is available out-of-the-box from the runtime Administration page's Security tab for applications built using the Framework application template. For information on how to use the Role Manager runtime to manage and configure users and application roles, see "Managing Users and Application Roles" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To prevent customizations from being overwritten during updates, the source for the Administration page should not be customized. You can, however, choose to write your own administration page if the default administration page is not sufficient, in which case you can use the Role Manager task flow as part of your application's runtime security administration. Follow the steps below to add it a JSF or JSP page and include it in your application.

To add the Role Manager task flow to your Framework application:

1. Create a new application choosing **Framework application** as the application type.
2. Create the application adding any project technology libraries that the application may require. Do not uncheck the **Configure the application with standard Portal features** check box.
3. Create a new JSF or JSP page.
4. From the Resource Palette, expand WebCenter Portal - Services Catalog, and from the list of Task Flows, select the *Security - Role Manager* task flow.

**Figure 68–6** Resource Palette - WebCenter Portal - Services Catalog

5. Drag the Role Manager task flow onto the page you created as a region.

**Figure 68–7 Role Manager Task Flow**

6. Build the application, log in as an administrator, and navigate to the page containing the role Manager task flow.

## 68.5 Using the Enterprise Role Member Task Flows

The Enterprise Role Member task flows provide additional task flows to the Role Manager task flow that you can add to a page to monitor enterprise users and roles. The members shown are both roles and users, with the result shown in a tree structure. Roles can be further expanded to see their members.

To add the task flows, follow the same steps as for the Role Manager task flow (see [Section 68.4, "Using the Role Manager Task Flow"](#)), substituting one of the task flows described below. Note that all of the Enterprise Role Members task flows take a single mandatory parameter which is the enterprise role name.

- **Security - Enterprise Role Members**  
This task flow shows a list of the members for a specified role.
- **Security - Enterprise Role - Members Search**  
This task flow does a nested search of members using a pattern for the specified role and shows the list of members.
- **Security - Enterprise Role - Members Viewer**  
This task flow shows the Members and Search tabs that are shown for the Enterprise Role Members and Members Search task flows in a single page.

## 68.6 Using the Page Hierarchy Security Editor

This section describes how to use page hierarchy security to provide inherited and delegated security for WebCenter Portal: Framework application pages. It includes the following sections:

- [Section 68.6.1, "Introduction to Page Hierarchy Security"](#)
- [Section 68.6.2, "Building a Page Hierarchy"](#)

### 68.6.1 Introduction to Page Hierarchy Security

This section describes the page hierarchy model and how page hierarchy security works within a WebCenter Portal: Framework application.

This section includes the following subsections:

- [Section 68.6.1.1, "Page Hierarchy Model"](#)
- [Section 68.6.1.2, "Page-level and Page Hierarchy Security"](#)
- [Section 68.6.1.3, "Inherited and Delegated Security"](#)

### 68.6.1.1 Page Hierarchy Model

A page hierarchy has a default security policy that is set at the root of the hierarchy. Unless explicitly overridden, this policy applies to all pages underneath. At any page in the hierarchy, it is possible to override the inherited policy with a new overriding policy, allowing for delegated administration and modifying the policy at the subordinate pages. Once the policy is overridden for a particular page, the children of that page, by default, will inherit the new policy. The policy established at any node is a list of grants indicating what permissions each of the grantees has on that page and its children, if any.

When you create a WebCenter Portal: Framework Application, a default navigation model is created for you that also contains the root node of a page hierarchy. These two structures work independently and collectively to provide the navigation flow and secured access to pages for your application. [Figure 68–8](#) shows the default navigation model (`default-navigation-model.xml`), which includes a node for the default page hierarchy (`pages.xml`).

**Figure 68–8** Default Navigation Model

You can add additional navigation models to, for example, provide different navigation views for specific user groups. For each navigation you can also add one or more page hierarchy nodes to provide a more granular navigation and security model. For more information about creating new navigation models, see [Section 10.2, "Creating a Navigation Model."](#) For more information about adding page hierarchies to a navigation, see [Section 10.3.5, "How to Add a Page Hierarchy to a Navigation Model."](#)

Although there is only a single page hierarchy within your application, any node within that hierarchy can be used as the root node in a navigation model. For example, you might have a page hierarchy that contains top level nodes for Human Resources, Support, Sales, Administration, and so forth. Each of these nodes can be added to the navigation model separately to create navigation only to that section of the page hierarchy.

**Figure 68–9 Page Hierarchy Root Node Permissions**

authenticated-role	<input type="checkbox"/>				
Administrator	<input checked="" type="checkbox"/>				
anonymous-role	<input type="checkbox"/>				

Figure 68–9 shows the page hierarchy root node and the associated permissions. From the root node you can start building your page hierarchy by adding or dragging pages into it. Note that the "Manage" permission appears only on the root node, and only for the administrator. This allows the administrator to delegate security and have full access to all pages within the hierarchy regardless of any security overrides downstream. In short, a user with "manage" permission on the root node is a "super admin" and has all access to all pages in the entire hierarchy.

### 68.6.1.2 Page-level and Page Hierarchy Security

A page hierarchy provides an alternative security mechanism to page-level security for your Framework application. Although you can add pages to your application and provide security for them without making them a part of a page hierarchy, a page hierarchy provides a convenient and more manageable way to secure the content for large sites. By simply adding a hierarchy node to the hierarchy root or home node and dragging and dropping pages into it, you can very quickly provide basic security for them.

---

**Note:** Although page-level security can co-exist with page hierarchy security, you cannot apply both page-level and page hierarchy security to the same page. Note also that if you add a page to a hierarchy node, all previous page-level permissions are purged.

---

### 68.6.1.3 Inherited and Delegated Security

The page hierarchy model uses a node structure that provides cascaded, role-based security where each child node inherits its parent's security permissions. By adding pages to a node you can quickly configure security for your application pages.

To be able to perform any action at a particular node, you need to have the required permission at the node or its immediate parent that delegates (overrides) security. However in order to view a page, you need to have view access for all pages up the hierarchy right till the root page.

As well as providing basic security inherited from a node's parent, you can also apply delegated security to child nodes to limit or override the security that would otherwise

have been inherited. These aspects of page hierarchy security are described in [Section 68.6.2, "Building a Page Hierarchy."](#)

---

---

**Note:** Inherited security is cascaded through a root node that can initially only be populated by an administrator. For other users to be able to create and delegate permissions the administrator must first delegate those permissions. In all cases, permissions are only cascaded down in the tree (that is, a user cannot change settings for a parent node). A user can also only delegate the rights they have themselves or a subset of those rights to another user.

---

---

## 68.6.2 Building a Page Hierarchy

This section explains how to use page hierarchy security to automatically cascade a parent page's role-based security settings to its child pages, and how to "delegate" security for individual page nodes.

This section contains the following subsections:

- [Section 68.6.2.1, "Adding a Page Hierarchy to a Navigation"](#)
- [Section 68.6.2.2, "Adding Pages to a Page Hierarchy"](#)
- [Section 68.6.2.3, "Delegating Security"](#)

### 68.6.2.1 Adding a Page Hierarchy to a Navigation

In addition to the default page hierarchy in the default navigation model, you can add page hierarchy nodes from the default page hierarchy to the navigations within your application as root nodes. For more information about adding a page hierarchy to a navigation, see [Section 10.3.5, "How to Add a Page Hierarchy to a Navigation Model."](#)

### 68.6.2.2 Adding Pages to a Page Hierarchy

This section describes how to add JSF or JSP pages to a page hierarchy.

---

---

**Note:** To avoid issues with conflicting inherited security models, a page can only appear once in the page hierarchy.

---

---

To add a JSF or JSP page to a page hierarchy:

1. Open the page hierarchy editor in JDeveloper:
  - Right-click the `/oracle/webcenter/portalapp/pagehierarchy` folder  
or
  - Right-click any `.jspx` page under `/oracle/webcenter/portalapp` and select **Edit Page Hierarchy** from the context menu
2. Select the node to which you want to add pages, and either:
  - Click the **Add page** icon and use the browser to locate and add the page  
or
  - Drag and drop the page from the Navigator under the appropriate node
3. Continue by adding additional pages as required, or use the **Remove Page** icon to delete any unwanted pages.

### 68.6.2.3 Delegating Security

This section describes how to override inherited security by delegating permissions for a node and its child pages. You can also delegate security for pages using the runtime Administration page. For more information about delegating security using the runtime Administration page, see "Managing Application Roles and Permissions" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To override inherited security with delegated security:

1. Open the page hierarchy (`pages.xml`) in JDeveloper.
2. Select the node at which to begin overriding inherited security.
3. Check or uncheck the **Visible** checkbox to specify whether the page or resource is displayed. Check the checkbox if you want the resource to be displayed to all users at all times. Uncheck the checkbox to hide the resource from all users at all times.
4. Select **Delegate Security**.

The Security options for delegating security displays (see [Figure 68–10](#)).

**Figure 68–10 Page Hierarchy - Delegate Security**

The screenshot shows the 'Page Hierarchy' editor with a tree view on the left and a configuration panel on the right. The tree view shows a hierarchy: Root > Home > MyPage1 > MyPage2. The configuration panel for 'MyPage1' includes fields for Id, Title, and Path, and a 'Visible' checkbox which is checked. Under the 'Security' section, the 'Delegate Security' radio button is selected. Below this is a table of permissions for various roles.

Role	Grant	Create	Delete	Update	Personalize	View
anonymous-role	<input type="checkbox"/>	<input checked="" type="checkbox"/>				
authenticated-role	<input checked="" type="checkbox"/>					
Administrator	<input checked="" type="checkbox"/>					

5. Check or uncheck permissions for the roles for this page and its child pages.
6. To specify permissions for another available user role, click the **Add** icon (+) and select the desired role. A new row will be created in the table for this role. To remove the permissions for an existing role, select the corresponding row in the table and click the **Delete** (X) icon.

---

**Note:** The role names in the Add list correspond to the application roles that have been defined in the policy store for the application. Delegating security is limited to only application roles at design time. You can, however, add user and enterprise roles at runtime using the runtime Administration page, as described in "Managing Application Roles and Permissions" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

## 68.7 Creating Login Pages and a Login Component

You can add login and logout links to your public welcome page or other page using a login backing bean (`LoginBackingBean`) so that users can explicitly log in and out while they are in the application. The bean provides methods that can be used by the user to log in and log out.

To use the bean, create a simple page and bind it to the bean to do the login and logout as described in the following steps:

1. Create a JSF page.
2. Add the `LoginBackingBean` to the `faces-config.xml` or `taskflow.xml` file.
3. Create a page with user name, password, login and logout links.
4. Bind the user name and password to the bean's user name and password.
5. Map the login and logout links to the `doLogin` and `doLogout` method respectively as shown in the example below:

```
<af:subform id="pt_sf1" defaultCommand="pt_logincb"
    rendered="#{attrs.showLogin and
!securityContext.authenticated}">
    <af:panelFormLayout id="pt_pf11">
        <af:panelLabelAndMessage id="pt_plam1" label="User Name"
            styleClass="NoLabelWrap"
            labelStyle="font-size:small;color:white;">
            <af:inputText id="pt_it1" simple="true"
                value="#{o_w_s_l_LoginBackingBean.userName}"
                columns="15"/>
        </af:panelLabelAndMessage>
        <af:panelLabelAndMessage id="pt_plam2" label="Password"
            styleClass="NoLabelWrap"
            labelStyle="font-size:small;color:white;">
            <af:inputText id="pt_it2" simple="true"
                value="#{o_w_s_l_LoginBackingBean.password}"
                columns="15" secret="true"/>
        </af:panelLabelAndMessage>
    </af:panelFormLayout>
    <af:spacer width="3" height="3" id="pt_s2"/>
    <af:panelGroupLayout id="pt_pg114" layout="horizontal"
        valign="top">
        <af:commandLink id="pt_logincb" text="Login"
            action="#{o_w_s_l_LoginBackingBean.doLogin}"
            inlineStyle="font-size:small;color:white;"/>
        <af:spacer id="pt_s3" width="5px"/>
    </af:panelGroupLayout>
</af:subform>
```

The login and logout methods return values that can be mapped to actions and used in the navigation rules of `faces-config.xml` after a successful login and logout. The following entry in `faces-config.xml` is seeded by default in a Framework application:

```
<navigation-rule>
    <from-view-id*></from-view-id>
    <navigation-case>
        <from-outcome>login_success</from-outcome>
```

```

        <to-view-id>/pages_home</to-view-id>
        <redirect/>
    </navigation-case>
    <navigation-case>
        <from-outcome>logout_success</from-outcome>
        <to-view-id>/pages_home</to-view-id>
        <redirect/>
    </navigation-case>
</navigation-rule>

```

This defines where to go to after a successful login and logout (in this case, for both login and logout the user is returned to the home page). If you want to alter that behavior, you can edit these rules in `faces-config.xml` to, for example, redirect the user to a different page.

For reference information about other configuration elements you can use in the `faces-config.xml` file, see "ADF Faces Configuration" in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

## 68.8 Creating a Login Portlet

Refer to the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for information about creating a login portlet for your application.

## 68.9 Adding Portlets to a Login Page

The *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* describes how you can create an ADF Faces-based login page for your application. In this section, you will add some portlets to such a login page so that the login page becomes indistinguishable from the other pages in your WebCenter Portal: Framework application.

Make sure your portlet producers have been registered before proceeding. See [Chapter 62, "Consuming Portlets"](#) for details.

To add portlets to the login page, perform the following steps:

1. Drag a **PanelCustomizable** onto the `h:form` tag that is inside the first `cust:panelCustomizable` tag you added to the login page.
2. From the Component Palette, select **RichTextPortlet Producer**, then select the Rich Text portlet from the list and drag it onto the `PanelCustomizable` component.
3. From the Component Palette, select **ADF Faces Core** and drag an **ObjectSeparator** below the Rich Text portlet on the `PanelCustomizable` component.
4. From the Component Palette, select **OmniPortlet Producer**, then select the `OmniPortlet` from the list and drag it onto the `PanelCustomizable` component.
5. Save the page.

Because the login page is called from the container as part of the login process, the request must be forwarded to the ADF binding filter to establish the appropriate portlet and security context. To do this, you must configure a mapping for the ADF Binding filter in the `web.xml` file. To do this, perform the following steps:

1. In the Applications Navigator, expand the WEB-INF node, right-click `web.xml` and select **properties** to open the property palette.

2. Select **Filter Mappings** in the left panel and click **add** to define a new mapping for the `adfBindings` Filter. This displays the Create Web Application Filter Mapping dialog box.
3. Specify **adfBindings** for the filter name and click the Servlet Name option and specify **Faces Servlet** as the servlet name. Ensure that the Forward and Include dispatcher types are selected as shown in [Figure 68–11](#).

**Figure 68–11 Create Web Application Filter Mapping Dialog Box**

4. Click **OK**.

Follow the steps in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* to complete the creation of the login page.

## 68.10 Creating a Self-Registration Page

You can create a self-registration page using the WebCenter Portal: Spaces self-registration task flow, or build a custom self-registration page based on a provided sample that shows how to use the user and role APIs provided in `CreateUserHelper`. This type of self-registration provides a way for public users to create their own login and password for your application.

You can also invite users who may, for example, be outside your organization to self-register using the Spaces public invitation task flow. For more information about these two types of self-registration pages and their runtime behavior, see the chapter on "Enabling Self-Registration" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

This section contains the following subsections:

- [Section 68.10.1, "Integrating the Spaces Self-Registration Task Flow"](#)
- [Section 68.10.2, "Building a Custom Self-Registration Page"](#)

### 68.10.1 Integrating the Spaces Self-Registration Task Flow

You can integrate the self-registration page provided in Spaces in a **Framework application** as described below. For information about the runtime behavior of the task flow, see "Enabling Anyone to Self-Register" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To consume the Spaces self-registration task flow:

1. Open or create a Framework application in JDeveloper.
2. Create a JSPX page.
3. From the Resource Palette, expand the task flows and drag and drop the self-registration task flow onto the page.

4. Create a mail connection and an external application with public credentials and connect the external application to the mail connection. Make this the mail default connection. For information on how to set up a mail connection, see "Managing the Mail Service" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.
5. Run the page with the self-registration task flow to see the runtime self-registration page.

## 68.10.2 Building a Custom Self-Registration Page

The example self-registration page described below provides a simple page that accepts the user's `firstname`, `lastname`, `mailid`, `login name` and `password`. Use the sample files as a starting point for use within your local environment, or build your own self-registration page and logic using the user and role APIs provided in `CreateUserHelper`. You can use the property set of the user profile attributes provided in the sample and add more attributes to the user as required.

To create the sample self-registration page:

1. Unzip the security samples files in `security-samples.zip` found in the `webcenter/customportal` directory in the WebCenter extension bundle.
2. Copy the `CreateUserBean.java` and `CreateUserHelper.java` files into the application sources folder for your Framework application.
3. Copy the `TestCreateUserPage.jspx` file into the `public-html` folder.
4. Edit the `TestCreateUserPage.jspx` file to suit the local environment and local requirements.
5. Run the `TestCreateUserPage.jspx` page to view the self-registration page.

## 68.10.3 Creating a Self-Registration Invitation Page

You can create a public invitation to self-register page in your Framework application using the Spaces public invitation task flow. For information about the runtime behavior of the task flow, see "Enabling Self-Registration by Invitation Only" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

To consume the self-registration invitation task flow:

1. Open or create a Framework application in JDeveloper.
2. Create a JSPX page.
3. From the Resource Palette, expand the task flows and drag and drop the self-registration invitation task flow onto the page.
4. Grant the following `CredentialAccessPermission` in `jazn-data.xml` to `oracle.webcenter.framework.view/-`

The `jazn-data.xml` file should like like the following:

```
<permission>
<class>oracle.security.jps.service.credstore.CredentialAccessPermission</class>
<name>context=SYSTEM,mapName=o.webcenter.security.selfreg,keyName=o.webcenter.s
ecurity.selfreg.hmackey</name>
<actions>read,write</actions>
</permission>
```

5. Run the page with the self-registration task flow to see the runtime self-registration invitation page.

## 68.11 Creating a Reset Password Page

The following example provides a simple reset password page that accepts a username and new password. Use the sample files as a starting point for use within your local environment, or build your own reset password page and logic using the user and role APIs provided in `ResetPasswordHelper` to change the password.

To create the sample reset password page:

1. Unzip the security samples files in `security-samples.zip` found in the `webcenter/customportal` directory in the WebCenter extension bundle.
2. Copy the `ResetPasswordBean.java` and `ResetPasswordHelper.java` files into the application sources folder for your Framework application.
3. Copy the `TestResetPasswordPage.jspx` file into the `public-html` folder.
4. Edit the `TestResetPasswordPage.jspx` file to suit the local environment and local requirements.
5. Run the `TestResetPasswordPage.jspx` page to view the reset password page.

## 68.12 Configuring Basic Authentication for Testing Portlet Personalization

Portlet personalizations are tied to particular, authenticated users. Hence, when running a portlet that has an Edit mode, the Personalize option in the portlet's dropdown menu only appears to authenticated users of the application. Anonymous or public users will not have the option to personalize the portlet. If you are a developer creating portlets and pages, then you may want to quickly test the Edit mode of your portlet without creating a complete security model for your application. To perform this sort of testing, you can easily configure some very basic authentication for your application and then remove it when you have finished testing:

---

---

**Note:** This procedure is useful for any portlet that has an Edit mode (OmniPortlet, Web Clipping, JSR 286, and PDK-Java).

---

---

1. Create a user `sking` and the role `manager`. See the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for information about creating users and roles.
2. Secure your application using the ADF Security Wizard. See the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework* for the steps to be performed. On the Login page of the wizard, select **HTTP Basic Authentication (RFC 2617)**. This specifies that the application will use basic authentication.
3. Run the page in the integrated WLS and log in as a valid user and test your portlet's edit mode.

When you are done testing your portlet's Edit mode, you can quickly remove this test security by do the following:

1. In the Applications Navigator, click the project that contains a page with the portlet you want to test.
2. From the **Tools** menu, choose **ADF Security Wizard**.
3. If the Welcome page appears, then click **Next**.

4. Choose **Remove All ADF Security Settings**.
5. Click **Next** until you come to the Finish page of the wizard. Click **Finish**. The security is removed. If you want to ensure that the security has been removed, then exit your browser and rerun the application. When you access the page, you are not prompted to login and the personalize option no longer available from the portlet's dropdown menu.

## 68.13 Working with External Applications

Oracle WebCenter Framework defines an external application as any application that implements its own authentication process. That is, an application that does not take part in the WebCenter Framework application's single sign-on process. In some cases, the identity management solution may be the same, but the authentication process can be different.

When WebCenter Framework Service interacts with an application that handles its own authentication, you can associate that service with an external application to allow for credential provisioning. Therefore, the use of an external application definition provides a means of accessing content from these independently authenticated applications.

To replicate a single sign-on experience from the end user's perspective, the external application service captures the username and password, and any other credentials for the external application, and supplies it to the WebCenter service requiring it. The WebCenter service then uses this and logs in on behalf of the end user. This username and password combination is securely stored in a credential store configured for the WebLogic domain where the application is deployed.

The user provides login credentials when prompted, and these credentials are mapped to the Framework application user and stored in the credential store configured for the domain. The credential store subsequently supplies that information during authentication to the external application. Unless the external application's credentials change, the user supplies the credentials only once as the mapped information is read from the credential store for future requests.

---

---

**Note:** When logging in to an external application, if you clear the **Remember My Login Information** checkbox, then the credentials provisioned for that user session are lost if there is a failover in a high availability (HA) environment. You are prompted to specify the credentials again if you try to access the external application content in the same user session.

---

---

The external applications that are to be used by the WebCenter Portal: Framework application can be specified before deployment through a wizard in Oracle JDeveloper, or post-deployment through the application server management interfaces (WebLogic Scripting Tool and Oracle Enterprise Manager). See *Oracle Application Server Administrator's Guide* for more information.

This section contains the following:

- [Section 68.13.1, "Using External Applications"](#)
- [Section 68.13.2, "Supplying User Credentials"](#)
- [Section 68.13.3, "Managing External Applications"](#)

## 68.13.1 Using External Applications

The WebCenter External Application Service provides a way for mapped user identities to be passed to a web application that requires its own authentication. The support for external applications and credential mapping provided by the WebCenter External Application Service can be used to set up a secured service connection and to provide a seamless automated single sign-on experience for the user.

This is described in the following sections:

- [Section 68.13.1.1, "Secured Service Connections"](#)
- [Section 68.13.1.2, "Automated Single Sign-On"](#)

### 68.13.1.1 Secured Service Connections

To use an external application definition with a secured service (such as a mail server or portlet producer) you associate the named external application with the connection configuration to the required service. For example, the connection to a mail server requires the user to supply a valid username and password to see their mail. Therefore, by associating an external application to the IMAP server connection definition, the user's credentials are automatically passed as part of the mail request as shown in [Figure 68-12](#).

---

---

**Note:** The following WebCenter Portal services must be configured with external applications for credential mapping support to be available:

- Instant Messaging and Presence (IMP)
- Mail
- Documents
- RSS

For more information about the identity propagation mechanisms used by WebCenter Portal services, see [Section 68.16, "Identity Propagation Mechanisms"](#).

---

---

**Figure 68–12 Configure a New Mail Connection Page**

When a portlet producer depends on an application that handles its own authentication, you can associate the producer with an external application so that when you register the producer it is a simple task to select the appropriate external definition that maps to the application that is exposed within the portlet, as shown in [Figure 68–13](#).

**Figure 68–13 External Application URL**

At run time, the producer uses the information associated with the external application to authenticate the user to the application, and consequently consume its portlets. The producer code is responsible for actually performing the authentication interaction with the external application. The external application support provided

with WebCenter Framework simply provides the information needed for authentication to the portlet producer. The use of external applications is supported for both Oracle PDK-Java as well as WSRP producers.

For example, a producer provides a stock portfolio portlet from a portlet-producing application that has its own authentication mechanism. In this case the developer:

- Defines the external application. This can be done through the Oracle JDeveloper wizard or through Oracle Enterprise Manager.
- Associates the external application with the portlet producer.

### 68.13.1.2 Automated Single Sign-On

With automated single sign-on, the user directly links to the application and is automatically authenticated to the secured web application, as their credentials are retrieved from the credential store. This provides the end user with a seamless single sign-on experience.

---

**Note:** Automated login is not supported for:

- External applications using BASIC authentication.
  - External applications configured for SSO.
  - External applications with a customized login form (built using ADF Faces) that does not implement the J2EE security container login method `j_security_check` for authentication.
  - External sites that do not support UTF8 encoding
- 

Rather than using a URL directly to the web application, links to the application are proxied through the external application's automated login servlet (`adfextapplogin`). If the user is not authenticated to the external application and they have not previously stored their credentials in the credential store, they will be challenged for their password through the credential provisioning page discussed below. If, however, the user has previously defined credentials, they will be returned from the credential store and the user will automatically be logged on to the application.

The proxy URL references the external application in question and redirects to the URL that is specified in the external application definition.

```
/adfextapplogin?extappid=<extappid>
```

For example, if you had a WebCenter Portal: Framework application in which you defined an external application that represented the myoracle.com Web site (external application identifier is "myoracle"), the proxy URL would look like this:

```
/adfextapplogin?extappid=myoracle
```

The link's `target` attribute should also be set appropriately. For example, if you use `<a href=>`, then set the `target` attribute appropriately in addition to specifying the target in the `href`. The target attribute specified for the servlet will determine how the Cancel button functions as described below.

```
/adfextapplogin?extappid=<extappid> [target= _self | _blank]
```

If you specify `target=_blank` the link opens in new window. If you specify `target=_self` the link opens in current window. If the `target` parameter is not specified the link opens in current window.

This parameter also affects how the **Cancel** button on the credential provisioning page works. If `_blank` is specified, the new window is closed when **Cancel** is clicked; if `_self` is specified (or the `target` parameter is not used), the user is returned to the calling page.

---

---

**Note:** Automated login for external sites is not supported for sites that do not support UTF8 encoding.

---

---

## 68.13.2 Supplying User Credentials

How you allow an end user to define their credentials for an external application depends on the use of the external application. For most services, the credential provisioning screen is incorporated into the task flow that the service exposes and for these no further configuration steps are required. You can, however, add the `External Application - Change Password` task flow component to applications using these services thereby allowing the end user to preemptively set the appropriate user name and password for each of the external applications that is registered with your WebCenter Portal: Framework application.

The `External Application - Change Password` task flow displays all external applications defined in the application that do not specify shared credentials (for more information about shared credentials, see [Section 68.13.3, "Managing External Applications"](#)). Note that the user must to be authenticated to view this task flow.

For the Instant Messaging and Presence service, however, you must explicitly add the `External Application - Change Password` task flow component to your application from the Resource Palette or Component Palette. For step-by-step instructions on how to configure security for the Instant Messaging and Presence service using the `External Application - Change Password` task flow component, see [Section 34.2.2, "Adding the IMP Service at Design Time"](#).

At run time, the credential provisioning screen displays login data fields composed of the data fields specified through external application registration. Users fill in the data fields with their login information for the specified external application and that login information is passed to the external application or service. Entering the credentials in the provisioning screen also results in the credentials being persisted in the credential store configured for the WebLogic domain.

By default, the login information the user entered is preserved in a credential store, which handles logins for future sessions. The user does not have to enter login information again (unless the user's credentials change). However, the end user can choose to use the information for the current session by deselecting the **Remember my Login Information** checkbox on the credential provisioning page.

## 68.13.3 Managing External Applications

This section provides information about registering external applications. Additionally, it describes the process of editing and deleting registration details. It contains the following subsections:

- [Section 68.13.3.1, "Adding External Application Task Flows"](#)
- [Section 68.13.3.2, "Working with External Applications in Oracle JDeveloper"](#)
- [Section 68.13.3.3, "Working with External Applications in Enterprise Manager"](#)
- [Section 68.13.3.4, "Working with External Applications Using WLST"](#)

### 68.13.3.1 Adding External Application Task Flows

The External Application task flow enables users to manage external application connections at runtime. This task flow provides an interface for users to update their credentials for all external applications as and when these credentials are changed at the back end. That is, users do not need to update credentials through the runtime Administration Console's Services tab if they use this task flow.

The external application task flows that you can add using Oracle JDeveloper are:

- **External Application:** This task flow enables users to register, modify, and delete connections at runtime.
- **External Application - Change Password:** This task flow enables users to change external application passwords at runtime.

For applications created using the Framework application template, both these task flows are available out-of-the-box through Framework application Administration page (Services tab). For details, see the section "Managing Services, Portlet Producers, and External Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

In addition, just like other task flows, you can add external application task flows to your application pages. This may be especially useful if you are not using the Framework application template and the Administration pages are therefore not part of your project.

Special permissions are required to manage or view external application connections through these task flows:

- **AppConnectionManager** - Users with this role can register, modify, and delete external application connections at runtime.
- **AppConnectionViewer** - Users with this role can view external application connections at runtime. By default, any user who is logged in (that is, has the authenticated-role) is granted this role.

By default, users with the Administrator role can manage external applications. If you want other users to manage connection through these task flows you must grant them the AppConnectionManager role.

To add the external application task flows:

1. Create or open a JSF page in your application where you want the task flow to be added (see [Section 5.3, "Adding Pages to a Portal"](#)).
2. In the Resource Palette, expand **My Catalogs, WebCenter Portal - Services Catalog, and Task Flows**.
3. Drag **External Application** from the Resource Palette and drop it onto the page inside of the `af:form begin` and `end` tags.
4. Drag **External Application - Change Password** from the Resource Palette and drop it onto the page inside of the `af:form begin` and `end` tags after the **External Application** task flow (`af:region - # {bindings.extapp1.regionModel}`).
5. Grant the AppConnectionManager role to one or more test users, if required:
  - Add the test user `TEST_EXTAPP`.
  - Grant the AppConnectionManager role.

For information about how to add a user and grant this role, see the section "Creating Test Users" in *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

6. Save and run your page. Login as an administrator or the TEST\_EXTAPP user defined in the previous step. The screen shown in [Figure 68-14](#) appears.

**Figure 68-14 External Application Task Flow in a Browser**

---

**Note:** At runtime, application administrators can grant users the AppConnectionManager and AppConnectionViewer roles through WebCenter Portal administration (see the section "Adding Members to Application Roles" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*). Alternatively, system administrators can grant AppConnectionManager and AppConnectionViewer roles through Fusion Middleware Control (see, "Granting Application Roles Using Fusion Middleware Control" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*).

---

### 68.13.3.2 Working with External Applications in Oracle JDeveloper

This section provides information about registering external applications and editing and deleting registration details in Oracle JDeveloper. It contains the following subsections:

- [Section 68.13.3.2.1, "Registering an External Application in Oracle JDeveloper"](#)
- [Section 68.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper"](#)
- [Section 68.13.3.2.3, "Deleting External Application Registration Details in Oracle JDeveloper"](#)

#### 68.13.3.2.1 Registering an External Application in Oracle JDeveloper

Use the Register External Application Wizard to identify and store information about the type of data required to authenticate to an external application, such as the names of login fields.

To register an external application in Oracle JDeveloper:

1. In the Applications Navigator, right-click a WebCenter Portal: Framework application or project and select **New** from the context menu.
2. In the New Gallery, select **External Applications** under the **General** node.
3. In the right pane, select **External Application**, and click **OK**.

This displays the Register External Application Wizard.

4. On the **Name** page, use the **Create external application in** option to specify whether the external application can be reused in other **Framework applications**. Select **Application Resources** to make the external application available only in the **Framework application** in which it is registered, or select **Resource Palette** to make the external application available from the Resource Palette to any new **Framework applications** you create in Oracle JDeveloper.

If you choose **Resource Palette**, then the external application connection will be visible under IDE connections in the Resource Palette. If you want to use it in an application, you can right click the external application from resource palette and click **Add to Application**.

5. In the **Name** field enter a unique name to identify the application.

This name must be unique within the WebCenter Portal: Framework application, and among other connections as well. Note that you cannot edit this field afterward.

6. In the **Display Name** field enter a name for the application that end users will see in the credential provisioning screens.

You can modify the Display Name at any time as described in [Section 68.13.3.2.2, "Editing External Application Registration Details in Oracle JDeveloper"](#). If you leave the field blank the display name is set to the value of the Name field by default.

7. Click **Next**.

8. On the General page, in the **Login URL** field enter the URL to which the HTML login page is submitted.

View the HTML source of the application's login form to retrieve this URL.

---

---

**Note:** The fields on the General pane are only required if the external application being defined participates in click-through login as described in [Section 68.13.2, "Supplying User Credentials"](#).

---

---

9. In the **User Name/ID FieldName** field, enter the label that the application uses for the user name field, for example, `User Name`.

10. In the **Password FieldName** field, enter the label that the application uses for the password field, for example `Password`.

11. From the **Authentication Method** list, select the application's login method.

Choose from the following:

- **GET**

Presents a page request to a server. Submits the login credentials as part of the login URL.

- **POST**

Submits login credentials within the body of a form.

12. Click **Next**.

13. On the Additional Fields page, enter the names and values of any additional fields that are submitted with the external application's login form:

Click the **Add Field** button to create an input field:

- **Field Name**

Enter a unique name for any additional field that requires user input on the external application HTML login form.

- **Field Value**

Enter a default value for the corresponding field name.

- **Display to User**

Select to display the field on the external application login screen. If the field is not displayed (unchecked), then a default value must be specified, which will be used to login into the external application for all users. If the value is user-specific, then the field must be displayed to the user provisioning page.

---

---

**Note:** The Delete Field option can be used to delete selected rows.

---

---

14. Click **Next**.

15. On the Shared Credentials page, select the **Specify Shared Credentials** check box and specify a **Username** and **Password** if you want all authenticated users to access the external application using this credential. Authenticated users will not be challenged to provide their credentials when they access the external application.

16. Click **Next**.

17. On the Public Credentials page, select the **Specify Public Credentials** check box and specify a **Username** and **Password** to be used for all unauthenticated (public) users accessing the external application. This is required when the external application content is accessed through one of the WebCenter Portal services (such as Document Library, or Instant Messaging and Presence), and the task flow is placed on a public page.

18. Click **Finish** to register the external application.

After registering your external application, you must configure the application to allow the end user to define the username and password. You can do this by dropping an `External Application - Change Password` task flow component into your application. This allows the end user to preemptively set the appropriate username and password for each of the external applications that is registered with your WebCenter Portal: Framework application.

To configure the application to allow the end user to define the username and password, perform the following steps:

1. Open a JSF Page in your ViewController project.
2. From the Resource Palette, under My Catalogs, WebCenter Portal - Services Catalog, expand **Task Flows**.
3. Drag an `External Application - Change Password` task flow component onto your page.
4. When prompted, choose **Region** as the way to create the task flow.
5. Secure the page as this task flow is accessible only to authenticated users

**68.13.3.2 Editing External Application Registration Details in Oracle JDeveloper** Use the Edit External Application Registration Information Wizard to revise the registration details provided for an external application.

To edit external application registration details:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Properties** from the context menu.
2. In the Edit External Application Wizard, click a link to show a page and revise its values.

Choose from the following:

- **Name**
- **General**
- **Additional Fields**
- **Shared Credentials**
- **Public Credentials**

For more information, see [Section 68.13.3.2.1, "Registering an External Application in Oracle JDeveloper"](#).

3. Click **OK** to save your changes and exit the wizard, or click **Cancel** to exit the wizard without saving.

**68.13.3.2.3 Deleting External Application Registration Details in Oracle JDeveloper** To delete external application registration information, perform the following steps:

1. In the Application Navigator, from the Application Resources pane under the Connections node, right-click an external application and select **Delete** from the context menu.

Alternatively, you can select an external application in the Applications Navigator and from the Edit menu, select **Delete**.

2. In the External Application Delete dialog box, select **Yes**.

Oracle recommends that you remove any references to services, such as a portlet producer, with which the external application is associated. Failing to do so will likely result in runtime errors, because the components will attempt to communicate with the external application.

### 68.13.3.3 Working with External Applications in Enterprise Manager

Just as you can create, edit, and delete external application registration details in Oracle JDeveloper, you can also do this in Enterprise Manager. See the section "Managing External Applications" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 68.13.3.4 Working with External Applications Using WLST

As well as Oracle JDeveloper and Enterprise Manager, you can also use WebLogic Scripting Tool (WLST) commands to create, edit, and delete external application registration details. See the section "Managing External Applications" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*.

## 68.14 Registering Custom Certificates with the Keystore

Secure Sockets Layer (SSL) Communication requires the use of trusted certificates issued by a certificate authority, which vouches for the authenticity of the certificates that it issues or signs. Widely accepted certificate authorities are listed in the keystore,

the `cacerts` file, available in the `<JDEV_HOME>\jdk\jre\lib\security` directory. If a portlet producer uses a security certificate issued by a non-widely accepted certificate authority and you try to access portlets from this producer, a security alert is displayed informing you that the security certificate was issued from a certificate authority you do not trust. This means the certificate is not available in the keystore. To avoid being prompted each time you access such portlets, you must register this certificate with the keystore.

To register a certificate with the keystore, perform the following steps:

1. Navigate to `JDEV_HOME\jdk\jre\lib\security`.
2. Back up the `cacerts` file.
3. Access the producer URL in Internet Explorer to get the certificate.

---

**Note:** Recent versions of FireFox do not provide a means to export certificates.

---

4. In the Security Alert dialog box, shown in [Figure 68–15](#), click **View Certificate**.

**Figure 68–15 Security Alert Dialog Box**

5. In the Certificate dialog box, click the **Certification Path** tab.
6. The dummy child certificate is selected by default as shown in [Figure 68–16](#). Select the root certificate and click **View Certificate**.

**Figure 68–16 Certificate Dialog Box**

7. Click the **Details** tab, and click **Copy to File**.
8. In the Certificate Export Wizard, accept the default settings and click **Next** until you reach the File to Export screen, shown in [Figure 68–17](#).

**Figure 68–17 File to Export Screen of the Certificate Export Wizard**

9. In the File Name field, enter `<JDEV_`  
`HOME>\jdk\jre\lib\security\root.cer` and click **Next**.
10. Click **Finish**.
11. In the command prompt, set your default directory to `<JDEV_`  
`HOME>\jdk\jre\lib\security` and run the following command:  

```
keytool -import -file root.cer -keystore cacerts -storepass changeit
```

  
By running this command, the `root.cer` certificate is imported into the keystore.

12. Enter `y` at the prompt to confirm that you trust this certificate.
13. Verify that the `cacerts` file is updated with the certificate.

## 68.15 Overriding Inherited Security on Portlets and Customizable Components

Individual actions on portlets and customizable components are not secured by default. Rather, the ability to customize a portlet or customizable component as a whole is inherited from the page permissions. If you want to grant more granular activities within a portlet or customizable component, then you can override the page-level security inheritance and define security directly on the required actions.

The ability of a user to perform actions on portlets and customizable components is inherited from the page security based on the value of the application-wide switch, `enableSecurity`, in the `adf-config.xml` file. If you selected the **WebCenter Portal: Framework application** template while creating your application, then the `adf-config.xml` file is located in the `<APPLICATION_NAME>/ .adf/META-INF` directory. The `enableSecurity` element is not available by default in `adf-config.xml`. To override or extend the page-level security inheritance for portlets and customizable components, you must add the portlets security and customizable components security sections in the `adf-config.xml` file, as shown in the examples below and set the `enableSecurity` element in those sections to `true`.

### ***enableSecurity Element in the Portlet Security Section in adf-config.xml***

```

<!--
=====
PORTLETS ACTIONS SECURITY
=====
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
  <adfp:actionsCategory>
    .....
</adfp:adf-config-child>

```

### ***enableSecurity Element in the Customizable Components Security Section in adf-config.xml***

```

<!--
=====
CUSTOMIZABLE COMPONENTS ACTIONS SECURITY
=====
-->
<cust:customizableComponentsSecurity
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>
  <cust:actionsCategory>
    .....
</cust:customizableComponentsSecurity>

```

Security for actions on portlets and customizable components can be implemented at the following levels:

- Page level: You can define security for portlets and customizable components such that page-level privileges are inherited by these components. This is the default behavior.

By default, portlets and customizable components inherit allowable actions from the defined page-level permissions such as `personalize` or `customize`. That is, a user who has `customize` privileges on the page has permission on the `customize` action for the components on that page. The `enableSecurity` element enables you to override the security inheritance behavior and can take either of the following values:

- `true`: If set to `true` (the default), then the ability for a user to modify a component will first be determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If a user has `customize` permission, then the actions that constitute the `customize` category (`move`, `customize`, and so on) are available to the user, but they will be overridden by the actions that are defined in the `adf-config.xml` file. For example, a page designer wants to allow the end user to be able to customize portlets, but not customize the page layout. By setting `enableSecurity` to `true`, the page designer enforces that users must first have `customize` permission on the page. Setting `customizeActionsCategory` to `false` for customizable components will prevent the customization of the page layout, yet still allowing portlet customization. (As the default for `customizeActionsCategory` is `true`, it does not need to be set explicitly for portlets.)
- `false`: If set to `false`, then all the actions are available to users. The user's page permissions and actions configured in `adf-config.xml` are ignored.
- Actions category level: You can define security on all actions for portlets or customizable components that belong to a named category.

You can add an `actionsCategory` element in the `adf-config.xml` file to define security on multiple actions simultaneously. Depending on the `actionCategory` attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

- Actions level: You can define security on individual actions for portlets or customizable components.

You can use the `actions` element in the `adf-config.xml` file to enable or disable individual actions. Depending on the `actions` attributes that you enable, appropriate privileges are provided on the portlets or customizable components.

---

---

**Notes:**

- Privileges can be inherited from the parent only. Inheritance from a component in any other position in the hierarchy is not supported
  - Although the security override implementation for portlets and customizable components is similar, they are independent from each other. Therefore, if you place a portlet inside a customizable component (for example, in a `PanelCustomizable` component), the portlet will not inherit override settings from the customizable component. Instead it will use the security override settings that are defined for portlets.
  - Settings made at the actions category level or actions level are applicable for all component instances in the application. These settings cannot be made for a single instance of a portlet or customizable component.
- 
-

[Section 68.15.1, "Portlets Security"](#) describes how you can implement security on portlets at the actions category level and actions level. For information on how to define security for actions on customizable components at the application level, see [Section 23.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."](#)

## 68.15.1 Portlets Security

You can define portlet security if actions on portlets are inherited from the page at the application level by setting `enableSecurity` to `true` in the portlets security section of the `adf-config.xml` file. A value of `true` implies that the user's permissions are determined from the page permission and then augmented according to the `actionsCategory` and `actions` elements specified. By defining actions categories and individual actions, you can control the exposure of the individual actions available within the given page permissions.

To implement security for actions on portlets at various levels as described earlier, you must define security settings at the following sections:

- [Defining Security at the Actions Category Level](#)
- [Defining Security at the Actions Level](#)

### 68.15.1.1 Defining Security at the Actions Category Level

You can add an `actionsCategory` element in the portlets security section in the `adf-config.xml` file to define the group of actions that are exposed on the portlets within the application. Depending on the `actionsCategory` attributes that you enable, appropriate privileges are provided on the portlets. [Table 68-3](#) describes the different `actionsCategory` attributes and the portlet actions they support by default.

**Table 68-3** *actionsCategory Attributes and Portlets Actions Mapping*

Attribute Value	Actions Supported
<code>viewActionsCategory</code>	Render isHelpModeAvailable isNormalModeAvailable isAboutModeAvailable isPreviewModeAvailable isDetailModeAvailable isLinkModeAvailable isPrintModeAvailable
<code>customizeActionsCategory</code>	showMoveAction showRemoveAction isCustomizeModeAvailable showMinimizeAction showMaximizeAction isConfigModeAvailable
<code>personalizeActionsCategory</code>	isPersonalizeModeAvailable

[Example 68-1](#) shows the `actionsCategory` entry that you can add to the portlets security section in the `adf-config.xml` file. In this example, `customizeActionsCategory` is set to `false` to prevent customization. You can use Expression Language (EL) for the values of these elements.

**Example 68-1 actionsCategory Element in the Portlets Security Section**

```
<!--
=====
PORTLETS ACTIONS SECURITY
=====
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
  <adfp:actionsCategory>
    <adfp:actionCategory name="viewActionsCategory" value="true"/>
    <adfp:actionCategory name="customizeActionsCategory" value="false"/>
    <adfp:actionCategory name="personalizeActionsCategory" value="true"/>
  </adfp:actionsCategory>

  <adfp:actions>
  .....
  </adfp:actions>

</adfp:adf-config-child>
```

### 68.15.1.2 Defining Security at the Actions Level

You can use the `actions` element in the portlets security section of the `adf-config.xml` file to enable or disable individual portlet actions. Depending on the `action` attributes that you enable, appropriate privileges are provided on the portlets.

[Example 68-2](#) shows an example of an `actions` entry that you can add to the portlets security section in the `adf-config.xml` file. You can use EL for the values of these elements. In this case you prevent customization by setting `isCustomizeModeAvailable` to `false`.

**Example 68-2 actions Element in the Portlets Security Section**

```
<!--
=====
PORTLETS ACTIONS SECURITY
=====
-->
<adfp:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>
  <adfp:actionsCategory>
  .....
  </adfp:actionsCategory>

  <adfp:actions>
    <adfp:action name="Render" value="true"/>
    <adfp:action name="showMoveAction" value="true"/>
    <adfp:action name="isCustomizeModeAvailable" value="false"/>
    <adfp:action name="isPersonalizeModeAvailable" value="true"/>
  </adfp:actions>

</adfp:adf-config-child>
```

### Using EL to Prevent Customization of Portlets Outside of Business Hours

An example to show when you may need to override inherited portlet security is an application that is configured to disable portlet customization outside of standard business hours. For this, you must first create a managed bean (for example, a managed bean called `appBusinessRules`), containing the method shown in [Example 68-3](#).

#### **Example 68-3** *InsideBizHours Method Defined in appBusinessRules Managed Bean*

```
public boolean isInsideBizHours()
{
    Calendar rightNow = Calendar.getInstance();
    int    currentHr = rightNow.get(rightNow.HOUR_OF_DAY);

    // Do not allow customize operation outside of standard business hours

    if ((currentHr > 9) && (currentHr < 17))
        return true;
    else
        return false;
}
```

You can then reference this managed bean from the `actionsCategory` element in the portlet security section of the `adf-config.xml` file, as shown in [Example 68-4](#).

#### **Example 68-4** *InsideBizHours Method Referenced in the adf-config.xml File*

```
<adf:adf-config-child xmlns:adfp="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

  <adfp:actionsCategory>
    <adfp:actionCategory name="customizeActionsCategory"
      value="#{appBusinessRules.InsideBizHours?'true':'false'}/>
  </adfp:actionsCategory>

</adf:adf-config-child>
```

In this example, the `customizeActionsCategory` will be set to `true` only if the application is run within business hours. Outside of these hours, the portlet cannot be customized even if the user had that permission granted on the page. All other categories that are not explicitly defined, will be inherited from the page.

### Using EL to Prevent Personalization and Customization of Portlets Outside the Corporate Network

In this example the managed bean checks the IP address of the request to determine whether the user has accessed the application through the corporate proxy server or from within the corporate network. In this simple example, assume that if the request has the proxy server's IP address, then it is coming from outside the corporate network. In general it is not advised to base security strictly on IP addresses, because these can be compromised. For this, you must add the method shown in [Example 68-5](#) to the managed bean:

#### **Example 68-5** *InsideCorpNetwork Method Defined in appBusinessRules Managed Bean*

```
public boolean isInsideCorpNetwork()
{
    // Do not allow personalize and customize operations
    // for requests that go through the corporate proxy
}
```

```

FacesContext      ctx = FacesContext.getCurrentInstance();
ExternalContext  ectx = ctx.getExternalContext();
HttpServletRequest myrequest = (HttpServletRequest) ectx.getRequest();
String           currentIP = myrequest.getRemoteAddr();

if (currentIP.equals(getProxyServerIP()))
    return false;
else
    return true;
}

```

You can then reference this managed bean from the `actionsCategory` element in the portlet security section of the `adf-config.xml` file, as shown in [Example 68–6](#).

**Example 68–6 InsideCorpNetwork Method Referenced in the adf-config.xml File**

```

<adfp:adf-config-child xmlns="http://xmlns.oracle.com/adfp/portlet">
  <adfp:enableSecurity value="true"/>

  <adfp:actionsCategory>
    <adfp:actionCategory name="customizeActionsCategory"
      value="{appBusinessRules.InsideCorpNetwork?"true":"false"}/>
    <adfp:actionCategory name="personalizeActionsCategory"
      value="{appBusinessRules.InsideCorpNetwork?"true":"false"}/>
  </adfp:actionsCategory>
</adfp:adf-config-child>

```

In this example, the `customizeActionsCategory` and the `personalizeActionsCategory` will be set to `true` only if the IP address of the request for the application does not match that of the corporate proxy. The assumption is that the internal requests would have a valid client IP address. All other categories that are not explicitly defined, will be inherited from the page.

## 68.16 Identity Propagation Mechanisms

The following table lists the identity propagation mechanisms employed by WebCenter Services for propagating the end-user's identity to the various information sources from which content is being integrated into the Framework application.

Whenever possible, WS-Security is the preferred means of identity propagation. Where WS-Security cannot be used due to legacy restrictions or pre-defined store-specific standards or specifications, the primary mechanism used is the credential mapping capability provided by the External Applications service to obtain the user's credentials for a remote application using a distinct security provider. For more information about WS-Security, see the *Oracle Application Server Web Services Security Guide*. For more information about External Applications, see [Section 68.13, "Working with External Applications"](#).

**Table 68–4 Identity Propagation Mechanisms**

Service	Connection Type	Identity Propagation Mechanism
Discussions	Jive	Oracle WS-Security
Announcements	see Discussion Forum	

**Table 68–4 (Cont.) Identity Propagation Mechanisms**

<b>Service</b>	<b>Connection Type</b>	<b>Identity Propagation Mechanism</b>
<b>Documents</b>	Content Server	Proprietary ID propagation mechanism through socket connection. Can use SSL with mutual authentication, or clear socket with IP authorization (or use External Application option)
	File System	N/A
	Portal 10g/11g	JSR-170 (External Application)
	Day Adapters	JSR-170 (External Application)
<b>E-Mail</b>	E-Mail Connection	External Application
	LDAP Connection	External Application
<b>Events - Personal</b>	Exchange Server Connection	External Application
<b>External Application</b>	HTTP Request from Browser	External Application
<b>IMP</b>	Microsoft Live Communication Server (LCS)	SOAP, Web Services calls. External Application
	<b>Portlet Producers</b>	WSRP Producer (Secure)
	WSRP Producer (Non-Secure)	WSRP userContext in SOAP message (WSRP Specification)
	JPDK Producer (External App)	External Application JPDK payload includes the user information and is conveyed to the producer in the ProviderUser. The information also includes a mapped username and password. (Proprietary, Legacy)
	JPDK Producer (Non-Secure)	Username in render request (Proprietary, Legacy)
<b>Search</b>	Secure Enterprise Search (SES)	Web Service Call
<b>Wiki</b>	Browser Connection	SSO mechanisms - OSSO/OAM or other WLS supported SSO mechanism
<b>Worklist Service</b>	BPEL Connection	Web Service call Oracle WS-Security

## 68.17 Securing Identity Propagation Through WSRP Producers with WS-Security

The Web Services for Remote Portlets (WSRP) specification indicates that Web Services Security (WS-Security) can be leveraged for providing secure identity propagation between the consumer and the portlet producer. However, WSRP in and of itself does not provide secure identity propagation of the end user's identity to the portlet producer. The WSRP specification explicitly defers to other security standards for secure identity propagation and does not go into the specific WS-Security profiles or

options that may be employed. In the absence of a secure mechanism, WSRP defines the concept of *user categories*, which can be mapped to security roles like the ones used by the JSR168 portlets. By using a combination of WSRP and WS-Security, you can ensure end-to-end security.

This section covers the following:

- [Identity Propagation Without WS-Security](#)
- [Identity Propagation with WS-Security](#)
- [Configuring Security for WSRP Portlets](#)

### 68.17.1 Identity Propagation Without WS-Security

When using WSRP without WS-Security, the `userContext` structure within the SOAP message contains user profile information and user category information. This information is not considered secure and should only be used for personalization and customization functionality. It should not be used for authorization of sensitive resources. This information is also exposed in the JSR168 APIs, `isUserInRole(role)` and `getUserPrincipal`. The code in [Example 68-7](#) shows how a sample portlet's markup rendering code uses the `isUserInRole` API to decide what content to display.

#### **Example 68-7** `isUserInRole(role)` API

```
private void doViewHtml(RenderRequest
request, RenderResponse response)
throws PortletException, IOException
{
    // To do: markup the required content.
    PrintWriter out = response.getWriter();
    out.print("<p>Welcome");
    out.println("</p>");
    if (request.isUserInRole("moderator"))
        {out.println("<p>MODERATOR</p>" );}
    else
        {out.println("<p>not moderator</p>" );}
    if (request.isUserInRole("participant"))
        {out.println("<p>PARTICIPANT</p>" );}
    else
        {out.println("<p>not participant</p>" );}
    if (request.isUserInRole("viewer"))
        {out.println("<p>VIEWER</p>" );}
    else
        {out.println("<p>not viewer</p>" );}
}
```

### 68.17.2 Identity Propagation with WS-Security

When WS-Security is leveraged with WSRP, the user's identity is propagated outside of the SOAP message body in the WS-Security header. This is a user assertion, using the Username Token format, and is digitally signed to authenticate the consumer and to ensure the integrity of the assertion.

When this mechanism is used, the JSR 168 APIs `isUserInRole` and `getUserPrincipal` are established based on the security context resulting from the WS-Security authentication, rather than the information in the SOAP message's `userContext`.

Also, when an Anonymous (i.e., PUBLIC) client is mapped to a default user using the producer's Default User connection parameter, the WSRP producer must be configured with `strict-authentication` and a grant must be added to the Policy store. For more information, see "Adding a Grant to the Policy Store for a Mapped User Identity" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

The use of WS-Security adds some complexity to the configuration and management of the WebCenter Portal: Framework application and the set of producers it consumes. However, when the situation warrants its use, it becomes an important ingredient of the SOA architecture that ensures the security of the information being published by the WebCenter Portal: Framework application.

Oracle WebCenter Framework supports the following token profiles (to digitally sign the security token and message body to ensure authenticity and integrity):

- Username token without password
- Username token with password
- SAML token (uses the *sender vouches* method that the producer uses to confirm the subject assertion)

Digitally signing the security token and the SOAP message body accomplishes the following objectives:

- [Consumer Authentication](#)
- [Assertion and Message Integrity](#)
- [Supported Producers](#)
- [Security Domain Implication](#)

### **Consumer Authentication**

When a portlet producer is generating sensitive information, for example paystub information, it is imperative that it only responds to requests to show the information from a legitimate consumer.

By using WS-Security, and having the consumer digitally sign the security token and the message body, the producer can verify the signature using the public key of the legitimate consumer. If the signature cannot be verified, then it means that the request may have come from a fraudulent consumer. By requiring the verification of the digital signature, the sensitive information will only be sent to the legitimate consumer.

### **Assertion and Message Integrity**

In addition to verifying the identity of the consumer making the Web Service requests, digitally signing the security token and the message body also ensures that the token and the message have not been tampered with. This prevents such problems as man-in-the-middle attacks where a legitimate request might be intercepted and the user name in the security token replaced with another user name to see the paystub information coming back for the other user. By digitally signing the token, it cannot be tampered with. Any modification to the token would result in the inability to verify the signature on the producer end, and would result in a SOAP fault to be returned instead of the requested paystub information.

### **Supported Producers**

WS-Security implementation is supported by the Oracle WebCenter Suite WSRP container. Other WSRP vendors may also be able to support the WS-Security

configuration of Username Token without password, with XML digital signature on the Username Token and the SOAP Message body.

### Security Domain Implication

When using secure identity propagation as described in this section, the user name of the user authenticated to the consumer (WebCenter Portal: Framework application) is propagated to the producer without any remapping or providing any credentials. There is an inherent assumption that the producer understands this user name and can locate this user in its associated security domain. Consequently, it is highly desirable to ensure that the consumer and producer share the same security provider (identity store) to simplify the management of this configuration.

Figure 68–18 summarizes the overall WSRP portlet security architecture.

**Figure 68–18 WSRP Portlet Security Architecture**

### 68.17.3 Configuring Security for WSRP Portlets

Before you configure the producer for WS-Security, you must first deploy your standards-compliant portlet producer to the Oracle WebCenter Suite WSRP Container by performing the steps described in [Chapter 61, "Deploying Portlet Producers."](#)

After you have deployed the producer, configure the producer for WS-Security by performing the following steps:

- Attaching a policy to the producer endpoint
- Creating the keystores
- Configuring the producer

- Configuring the consumer

These steps are described in "Configuring Security for Portlet Producers" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 68.18 Implementing PDK-Java Portlet Security

This section describes the available security services for your PDK-Java portlet.

For more detailed information about the PDK classes referred to in this section, see the JavaDoc on OTN by clicking **Java Doc API** on the Portlet Development page available at

[http://www.oracle.com/technology/products/ias/portal/portlet\\_development\\_10g1014.html](http://www.oracle.com/technology/products/ias/portal/portlet_development_10g1014.html)

### 68.18.1 Assumptions

The following assumptions are made to perform the tasks in this section:

1. You have followed through and understood [Section 60.2.1, "How to Create a PDK-Java Portlet"](#).
2. You built a portlet using the wizard and successfully added it to a page.

### 68.18.2 Introduction to PDK-Java Portlet Security Features

This section introduces the major features that are available to secure your PDK-Java portlet producers.

#### 68.18.2.1 Identity Propagation

When a user first logs in, they must enter their password to verify their identity and obtain access.

Once the user is authenticated, the producer code has access to the authenticated user's identity from the `PortletRenderRequest` that is available from the `HttpServletRequest` object as follows:

```
PortletRenderRequest pr = (PortletRenderRequest)request.getAttribute
    (HttpCommonConstants.PORTLET_RENDER_REQUEST);
String userName = pr.getUser().getName();
```

When using this user identity for sensitive operations, it is important to ensure that you have configured this producer to use basic message authentication to secure the integrity of the identity assertion.

#### 68.18.2.2 Authorization

Authorization determines if a particular user may view or interact with a portlet. For information about how to restrict access to portlets, see [Section 68.18.4, "Portlet Security Managers."](#)

#### 68.18.2.3 Message-level Security

To this point, user authentication and authorization are covered, which do not check the authenticity of messages received by a producer. To completely secure your producers, you should also secure the communication with a producer. If the communication is not secured, then it is possible for someone to imitate an application

instance and fool the producer into returning sensitive information. There are three types of communication security:

- **Server Authentication** restricts access to a producer to a small number of recognized computers. This method compares the IP address or the host name of an incoming HTTP message with a list of trusted hosts. If the IP address or host name is in the list, then the message is passed to the producer. If not, it is rejected before reaching the producer.
- **Message Authentication** provides consumer authentication and message integrity. It uses a shared key known to the client (Framework application) and the producer to digitally sign messages. See [Section 68.18.5, "Message Authentication"](#) for more information.
- **Message Encryption** relies on the use of the HTTPS protocol for communication between applications and producers. Messages are strongly encrypted to protect the data therein. Encryption provides a high level of security, but it incurs a performance penalty due to the additional processing required for each message.
- **User Input Escape** causes the application to escape any user input strings and treat them as text only to protect against XSS attacks, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title parameter entry. For this reason, the default behavior is to escape user input and thus disable any incoming scripts. See [Section 68.18.6, "User Input Escape"](#) for more information.

### 68.18.3 Single Sign-On

Portlets may act as windows into an application. They display summary information and provide a way to access the full functionality of the application. Portlets display some portions of the application in the **WebCenter Portal: Framework application** and typically enable the user to perform some application tasks.

An application may need to authenticate the user accessing the application through the portlet. The following are the possible application authentication methods:

- **External Application.** In this case, the Oracle Portal (Oracle Portal) user is different from the application user, but the application user name and password are managed by the Oracle Portal user.
- **No Application Authentication.** In this case, the communication between producer and consumer is not protected at all.

#### 68.18.3.1 External Application

An external application uses a different authentication server than the **WebCenter Portal: Framework application**. This means that when a user is logged into the **WebCenter Portal: Framework application**, you want to also log them into the external application without having to type in their user name or password.

Applications that manage the authentication of users can be loosely integrated with the WebCenter Framework if the administrator registers them as external applications. When a user who was previously authenticated by the WebCenter Framework accesses an external application for the first time, WebCenter Framework attempts to authenticate the user with the external application. The authentication process submits an HTTP request that combines the registration information and the user's user name and password for the application. If the user has not yet registered their user name and password for the external application, then the user is prompted for the required information before making the authentication request. When a user supplies a user

name and password for an external application, WebCenter Framework maps the new user name and password to the WebCenter Portal: Framework application user name and stores them. They will be used the next time the user needs authentication with the external application.

The advantages of an external application implementation are as follows:

- Provides a single sign-on experience for users. However, users still must maintain different user names and passwords. In addition, the external application user name mapping must be maintained.
- Allows integration with multiple portals independent of their user repositories and Oracle Single Sign-On.
- Avoids the requirement of having access to the application source code.

The disadvantages of an external application implementation are as follows:

- Does not share the same user repository as the portal, which requires additional maintenance of user information by the end user.
- Transmits the user name and password to the producer in plain text, unless you implement Secure Sockets Layer (SSL).

### 68.18.3.2 No Application Authentication

The producer trusts the WebCenter Portal: Framework application instance sending the request completely. The producer can determine if the user is logged in and the portal user name, but the application has not authenticated the user.

The advantages of no application authentication are as follows:

- Provides the easiest form of integration and the fastest to implement.

The disadvantages of no application authentication are as follows:

- Provides the least security.
- Provides the weakest integration with the WebCenter Portal: Framework application.

## 68.18.4 Portlet Security Managers

Portlet security managers may be implemented within a producer to restrict access to portlets depending on the user details. When a user views a page with a portlet instance on it, security managers determine whether the user has the appropriate privileges to see the portlet. Implementing access control methods in the producer restricts the retrieval of content from a portlet (that is, hides the portlet) from users without the appropriate privileges. Only if the specified characteristics, such as user details and preferences, pass the authorization logic will the content be retrieved for the user. If no portlet security methods are implemented in the producer, then any user name may be passed in, even fictitious, unauthenticated ones.

`AuthLevelSecurityManager` has access to the following information about authorization level:

- Strongly authenticated.  
The user has signed into the Framework application, and requested the portlet in the context of that session.
- Public or not authenticated.

The user has not logged in within the context of the current session, and does not have a persistent cookie to indicate that such a state previously existed.

To incorporate these security services into your Java portlet, you must update `provider.xml` and set the security level to strong, weak, or public. Place the following XML right before the `</portlet>` tag in `provider.xml`:

```
<securityManager class="oracle.portal.provider.v2.security.AuthLevelSecurityManager">
  <securityLevel>strong</securityLevel>
</securityManager>
```

After you make this change to `provider.xml`, refresh the producer.

For more information about the syntax of `provider.xml`, see the producer JavaDoc on OTN:

[http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml\\_tag\\_reference\\_v2.html](http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml_tag_reference_v2.html)

#### 68.18.4.1 Implementing Your Own Security Manager

If your portlet requires special security arrangements which are not provided by the implementations shipped with the PDK, then you must supply your own custom `PortletSecurityManager` controller class. To do this, extend the `oracle.portal.provider.v2.security.PortletSecurityManager` class and supply implementations for the two methods specified by the interface. Then replace the class attribute of the `securityManager` controller element in the XML producer definition with your new class name and configure child elements appropriately.

### 68.18.5 Message Authentication

Message authentication uses a digital signature. The signature is generated using a Hashed Message Authentication Code (HMAC) algorithm and is based on user information, the shared key, and a UTC (Universal Time, Coordinated) timestamp. The producer authenticates the message using its own copy of the shared key. This technique can be used in Secure Sockets Layer (SSL) communication with a producer instead of client certificates.

For caching purposes, show request signatures are calculated each time a session is set up so producers using message authentication must always have Producer Sessions enabled. This also means that there is a trade-off between performance and security. Shorter session timeouts mean less chance of a message being re-sent illegally, but there is a performance overhead associated with reestablishing a provider session.

A single producer instance cannot support multiple shared keys because it could cause security and administration problems. For instance, if one copy of the shared key is compromised in some way, then the producer administrator has to create a key and distribute it to all of the application clients, who then must update their producer definitions. The way around this problem is to deploy different producer services, specifying a unique shared key for each service. Each producer service has its own deployment properties file so that each service is configured independently of the others. The overhead of deploying multiple producer services within the same producer adapter is relatively small.

While the signature element provides protection against interception and resending of messages, it does nothing to prevent interception and reading of message contents. Messages are still transmitted in plain text. If you are concerned about the content of messages being read by unauthorized people, then this must be used in conjunction with SSL to encrypt the message.

The advantage of message authentication is as follows:

- Ensures that the message received by a producer comes from a legitimate WebCenter Portal: Framework application instance.

The disadvantages of message authentication are as follows:

- Causes administration problems if a producer serves multiple portals.
- Entails performance implications if made very secure by having a short session timeout.

## 68.18.6 User Input Escape

By accepting user input without escaping it to text, you run the risk of an XSS attack, where an attacker attempts to pass in malicious scripts through user input forms. For example, if a portlet title is customizable, then an attacker might attempt to pass scripts or commands to the portlet through the title string. PDK-Java provides the following features to ensure that you can protect your portlets from such attacks:

- [Default Container Encoding](#)
- [Escape Methods](#)

### 68.18.6.1 Default Container Encoding

To prevent any script inside a portlet title from being executed, the framework default container renderer class encodes any script characters. This default behavior is controlled through a JNDI variable, `escapeStrings`. When set to `true`, the markup tags in portlet titles are rendered as visible tag characters. For example, a title customization of `<i>title</i>` will be rendered as `<i>title</i>` not *title*. This mode is secure, but, if it is not the desired behavior, then you can set `escapeStrings` to `false` for that producer.

`escapeStrings` applies to all logical producers within a producer. You can set the value of `escapeStrings` from the Fusion Middleware Control Console as you would any other JNDI variable. See [Section 60.3.5.2, "Setting JNDI Variable Values"](#) for more information.

### 68.18.6.2 Escape Methods

If you have code that renders customized values, then you must ensure that you escape those input values appropriately to avoid XSS attacks. This requirement applies to code for rendering pages in any mode. PDK-Java supplies two new static methods for this purpose. They are in the Java class

`oracle.portal.provider.v2.url.UrlUtils`, and can be described as follows:

- `public static escapeString(string_text)` escapes any script characters in a given string. For example, less than `<` becomes `&lt;`. This method is unaffected by the `escapeStrings` JNDI variable and is the secure, recommended method to use.
- `public static escapeStringByFlag(string_text)` escapes any script characters in a given string. This method is controlled by the `escapeStrings` JNDI variable and is therefore less secure and not the recommended method to use.

For example:

```
title = UrlUtils.escapeString(data.getPortletTitle());
```

## 68.19 Troubleshooting Security Issues

This section provides troubleshooting information to help diagnose security related issues for Framework applications.

This section includes the following troubleshooting notes:

- [Section 68.19.1, "Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed"](#)

### 68.19.1 Error Message Appears When Running a Page with a Content Repository Data Control Method Being Consumed

#### Problem

When you run a page containing a content repository data control method, the following error message appears:

"Unable to locate the credential for key extapp in JPS credential store."

#### Cause

Credentials need to be provisioned explicitly using the change password task flow before you access the page that uses the data control method.

#### Solution

Since the data control is only a model and cannot do anything at the user interface level to allow credential provisioning, you must write an error handler that takes care of the redirection in the user interface. For information about writing an error handler, see the "Customizing Error Handling" section in the Oracle Application Development Framework Developer's Guide.

The following is a sample error handler:

```
public class ErrorHandler
    extends DCErrorHandlerImpl
{
    public ErrorHandler(boolean b)
    {
        super(b);
    }

    public ErrorHandler()
    {
        super(true);
    }

    @Override
    public void reportException(DCBindingContainer formBnd, Exception ex)
    {
        if (ex instanceof AdapterException)
        {
            AdapterException ae = (AdapterException) ex;
            if (ae.getCause() != null &&
                ae.getCause() instanceof ExtAppLoginException)
            {
                ExtAppLoginException eale = (ExtAppLoginException) ae.getCause();
                Throwable t = eale.getCause();
                if (t != null &&
                    (t instanceof ExtAppCredentialNotFoundExcepion) ||
```

```
        (t instanceof ExtAppInvalidUserCredential))
    {
        String extAppId = eale.getExternalAppId();
        showCredentialsProvisioningDialog(extAppId);
        return;
    }
}
super.reportException(formBnd, ex);
}

private void showCredentialsProvisioningDialog(String extAppId)
{
    FacesContext context = FacesContext.getCurrentInstance();
    // Create the dialog UIViewRoot
    ViewHandler viewHandler = context.getApplication().getViewHandler();
    UIViewRoot dialog =
        viewHandler.createView(context,
            "/oracle/adfinternal/extapp/view/pages/CredentialProvisionerDialog.jspx");

    HashMap<String, Object> properties = new HashMap<String, Object>();
    properties.put("width", new Integer(500));
    properties.put("height", new Integer(350));

    HashMap<String, Object> parameters = new HashMap<String, Object>();
    parameters.put("oracle.extapp.id", extAppId);

    RequestContext reqContext = RequestContext.getCurrentInstance();
    //launched from the button, need to specify this for the return listener
    //to be called.
    reqContext.launchDialog(dialog, parameters, null, true, properties);
}
}
```

---

---

# Deploying and Testing Your WebCenter Portal: Framework Application

This chapter describes how to deploy and test WebCenter Portal: Framework applications using the Integrated WebLogic Server (Integrated WLS) that comes packaged with Oracle JDeveloper and is configured as the default server (DefaultServer). This chapter also describes how to use JDeveloper to deploy applications to an Oracle WebLogic Managed Server configured to test application deployment or host applications for production.

For information about deploying WebCenter Portal: Framework applications through other mechanisms, such as Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Administration Console, and WebLogic Scripting Tool (WLST) commands, see the chapter, "Deploying WebCenter Portal: Framework Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This chapter includes the following sections:

- [Section 69.1, "Introduction to Oracle WebLogic Servers"](#)
- [Section 69.2, "Deploying a Framework Application to the Integrated WebLogic Server"](#)
- [Section 69.3, "Deploying a Framework Application to a WebLogic Managed Server"](#)
- [Section 69.4, "Transporting Customizations Between Environments"](#)

## 69.1 Introduction to Oracle WebLogic Servers

This section provides an overview of the Integrated WebLogic Server (or Integrated WLS) and Oracle WebLogic Managed Servers. Using Oracle JDeveloper, you can test your applications on the Integrated WLS and deploy applications to an Oracle WebLogic Managed Server that resides outside Oracle JDeveloper for staging and further testing or, if you have the required permissions, to an actual production environment.

### Integrated WebLogic Server

The Integrated WebLogic Server (IntegratedWebLogicServer) comes packaged with Oracle JDeveloper. The Integrated WebLogic Server connection appears as IntegratedWebLogicServer in the Resource Palette under **IDE Connections > Application Server**. With the Integrated WLS, you can quickly and easily test your application at design time without needing to package the application and create and configure a WebLogic Managed Server.

When you run an application, an Integrated WLS instance for that application automatically starts. You can also start the Integrated WLS manually by choosing the **Run > Start Server Instance** menu option in JDeveloper. Doing so creates a single server instance for all applications; any applications you run will then use this server instance.

Testing WebCenter Portal: Framework applications on the Integrated WLS helps to improve design-time tasks by:

- **Optimizing deployment:** the requirement to archive and copy files to a separate server for design time testing is eliminated.
- **Instantly refreshing changes to the application:** you can directly run most files from project directories, which enables you to make selected changes and refresh these changes while the application is running. For example, you can modify a task flow on a JSPX page, then refresh the page in the browser to view your changes without redeploying the application.
- **Removing the requirement to undeploy applications after testing and debugging.** If you stop the Integrated WLS, however, applications running on it are automatically undeployed.

To learn more about testing a WebCenter Portal: Framework application on the Integrated WLS, refer to [Section 69.2, "Deploying a Framework Application to the Integrated WebLogic Server."](#)

### **WebLogic Managed Server**

An Oracle WebLogic Managed Server resides outside of Oracle JDeveloper as part of a domain, and is managed by an Administration server within that domain. A WebLogic Managed Server hosts applications, along with the libraries and other resources needed by those applications. A domain, which is a logically related group of Oracle WebLogic Server resources, can have any number of Managed Servers. Managed Servers can be configured to run applications in a test environment, a production environment, or both.

To learn more about deploying a WebCenter Portal: Framework application to an Oracle WebLogic Managed Server, see [Section 69.3, "Deploying a Framework Application to a WebLogic Managed Server."](#)

## **69.2 Deploying a Framework Application to the Integrated WebLogic Server**

The Integrated WLS is preconfigured so that you can run applications within Oracle JDeveloper without needing to create deployment profiles.

However, when the Integrated WLS instance stops, the application is undeployed and therefore becomes unavailable. For a more persistent testing scenario, you can also deploy your application to the Integrated WLS. These two options are described in the following subsections:

- [Section 69.2.1, "Running a Framework Application in the Integrated WebLogic Server"](#)
- [Section 69.2.2, "Deploying a Framework Application to the Integrated WebLogic Server"](#)

## 69.2.1 Running a Framework Application in the Integrated WebLogic Server

To run a WebCenter Portal: Framework application, you can right-click the `.jspx` page in the project folder in the Application Navigator and choose **Run**, or select **Run** from the Run menu or click the **Run** icon from the toolbar to run the current project.

When you run an application in JDeveloper, a server instance named after the application is automatically created. While the application is running, you can switch back and forth between JDeveloper and your browser to make changes at design time in your application, save the changes and then refresh your JSPX page in your browser to view those changes. While in JDeveloper, you can also watch the progress of your applications, as well as stop the server instance (and thus stop the application).

When you run the application page or project, it triggers the packaging and deployment of your WebCenter Portal: Framework application on an Integrated WLS instance named after the application. You can stop instances of the Integrated WLS by using the Run Manager panel (shown in Figure 69–1). To stop an instance, just select **DefaultServer** and click the red Stop icon on the Run Manager tab.

**Figure 69–1** Run Manager

Use the DefaultServer Log window (shown in Figure 69–2) to view how the activity is progressing.

**Figure 69–2** DefaultServer Log Window

---

**Note:** Secure attributes and credentials are migrated by default when running a WebCenter Portal: Framework application on the Integrated WLS.

---

## 69.2.2 Deploying a Framework Application to the Integrated WebLogic Server

When the Integrated WLS instance stops, the application is undeployed, and therefore, becomes unavailable. For a more persistent testing scenario, you can deploy your application to the Integrated WLS by right-clicking the application and then selecting **Deploy**. This deploys the application to the Default Server instance and it will always be available while the Default Server is running. If you choose this method, then you must first create deployment profiles, as described in [Section 69.3.2.2, "Creating Deployment Profiles."](#) If you deploy your application to the Integrated WLS, then the Deployment Configuration dialog displays to let you configure and customize deployment settings. The file system MDS repository pre-created by JDeveloper displays in the **Repository Name** field.

To deploy and run an application in the Integrated WLS:

1. Open your application in JDeveloper.
2. Create the local data source for WebCenter Portal.  
For more information about how to create a local data source, see [Section 7.2.2, "Setting Up a Database Connection."](#)
3. If you're using Analytics task flows, create a local data source for Activities.
  - a. From the File menu, select **New**.
  - b. From the Connections category, select **Database Connection** and click **OK**.
  - c. Enter the connection details for the connection to the Activities schema and click **OK**.
  - d. Associate the connection with the ActivitiesDS data source as shown in [Figure 69-3](#) and click **OK**.

**Figure 69-3 Associate to Data Source Dialog - Activities Schema**

4. From the Run menu, select **Run xxxx.jpr** (where xxxx is the name of your project) to deploy and run your application.

## 69.3 Deploying a Framework Application to a WebLogic Managed Server

When you're ready to test your Framework application using an external test or staging site, you can deploy your applications directly from JDeveloper to an Oracle WebLogic Managed Server.

For information about deploying Framework applications using Fusion Middleware Control, Oracle WebLogic Administration Console, and WLST commands, see the chapter, "Deploying WebCenter Portal: Framework Applications" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section includes the following:

- [Section 69.3.1, "Deployment Roadmap"](#)

- Section 69.3.2, "Packaging a Framework Application"
- Section 69.3.3, "Preparing the Target Environment for Deployment"
- Section 69.3.4, "Deploying a Framework application to a Managed Server"

### 69.3.1 Deployment Roadmap

The flow chart and table in this section provide an overview of the prerequisites and tasks required to deploy a Framework application to an Oracle WebLogic Managed Server. Figure 69-4 shows the steps to deploy a Framework application, and the roles that will carry them out.

**Figure 69-4 Deploying a Framework Application to a Managed Server**

Table 69-1 shows the tasks, sub-tasks and who will need to carry them out to deploy a Framework application from JDeveloper.

**Table 69–1 Deploying a Framework Application to a Managed Server**

Actor	Task	Sub-task	Notes
Developer	1. Package the Application	1.a Select the data source type (package database connections)	<p>You can use either a global data source or an application-level data source.</p> <p>If using a global data source, then you need to create the data source in the WLS Administration Console before deploying.</p> <p>If using an application-level data source, then you may need to add credential mappings using the WLS Administration Console after deploying (see the note below).</p> <p><b>Note:</b> There are two options for deploying from JDeveloper.</p> <p>You can deploy directly to the Managed Server, or you can deploy to an EAR file and then deploy the EAR file using either Fusion Middleware Control, WLST or the WLS Admin Console.</p> <p>If you deploy directly from JDeveloper the credential mapping step is not required as JDeveloper automatically handles the credential mapping. However, if you deploy the EAR file outside of JDeveloper, then this step is required.</p>
		1.b Package application security data	This sub-task consists of packaging the credentials, identity data, and application policies.
		1.c Create deployment profiles	This sub-task consists of creating the WAR and EAR files.
Administrator	2. Prepare the Target Environment	<p>2.a Create and provision the Managed Server</p> <p>2.b Create and register the MDS repository</p> <p>2.c Configure the target environment</p> <p>2.d Create the server connection</p>	
Developer	3. Deploy the Application to a Managed Server from JDeveloper		The final step is to deploy the application to the Managed Server from JDeveloper.

### 69.3.2 Packaging a Framework Application

When you deploy WebCenter Portal: Framework applications, you may also need to migrate your database connections and the related security for connecting to the databases. You will also need to create a set of project-level and application-level deployment profiles that indicate how a WebCenter Portal: Framework application and its associated files should be packaged so that the application can be deployed to an Oracle WebLogic Managed Server.

This section includes the following:

- [Section 69.3.2.1, "Packaging Database Connections and Application Security"](#)
- [Section 69.3.2.2, "Creating Deployment Profiles"](#)

### 69.3.2.1 Packaging Database Connections and Application Security

When you deploy WebCenter Portal: Framework applications, you'll also need to package your database connections and the related security for connecting to the databases. This section describes how to package a WebCenter Portal: Framework application that uses one of the two database connection types: JDBC data source and JDBC URL. This section also describes security migration for applications that use database connections that specify passwords, or external applications that specify shared or public credentials.

Based on the policy defined by your administrator (if, for example, your administrator does not allow any application-level data sources), you may need to migrate the database connections and respective credentials to the target server. The packaging options described below allow you to choose how the database connections should be treated.

This section includes the following sub-sections:

- [Section 69.3.2.1.1, "Packaging the Database Connections"](#)
- [Section 69.3.2.1.2, "Packaging Application Security Data"](#)

#### 69.3.2.1.1 Packaging the Database Connections

If your WebCenter Portal: Framework application contains JDBC database connections, you'll need to choose how JDeveloper will migrate those database connections to the Oracle WebLogic Managed Server. You can choose from:

- *Global data source:*

Oracle recommends that you choose this type of data source if you plan to deploy an application EAR file to a Managed Server running in production mode using Fusion Middleware Control, the Oracle WebLogic Administration Console, or using a WLST (`wldeployer`) command.

To choose a global data source, deselect the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** checkbox when you create the EAR file so that JDeveloper does not create an application-level data source with password indirection. Instead, create the global data source using Oracle WebLogic Administration Console prior to or after deploying the application to a Managed Server in production mode using the default WebCenter Portal and Activities schemas. For more information on creating global data sources, see the section "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and Managing JDBC Data Sources for Oracle WebLogic Server*.

- *Application-level data source with password indirection:*

JDeveloper generates an application-level data source with password indirection by default when you run an application on the Integrated WLS. That is, when the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** checkbox is selected in the Application Properties dialog, as shown in [Figure 69–5](#).

**Figure 69–5 Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment Checkbox**

To generate an application-level indirection data source, JDeveloper does the following:

- Generates a `<connection>-jdbc.xml` file (such as `WC-jdbc.xml`) for each connection in the Application Resource.
- Sets the indirect password attribute in the `<connection>-jdbc.xml` file:

```
<jdbc-driver-params>
<use-password-indirection>true</use-password-indirection>
</jdbc-driver-params>
```

- Updates `weblogic-application.xml` to add each `<connection>-jdbc.xml` file as a module. For example:

```
<module>
<name>WC</name>
<type>JDBC</type>
<path>META-INF/WC-jdbc.xml</path>
</module>
```

- Adds a resource reference to each JDBC JNDI name in the `web.xml` file, if this file exists. For example:

```
<resource-ref>
<description>WC-Connection</description>
<res-ref-name>jdbc/WCDS</res-ref-name>
<res-type>javax.sql.DataSource</res-type>
<res-auth>Container</res-auth>
</resource-ref>
```

If you choose to generate an application data source with password indirection, then you must add credential mappings using the Oracle WebLogic Administration Console to be able to activate the application. For more information on adding credential mappings, see the section "Creating a JDBC Data

Source" in *Oracle Fusion Middleware Configuring and Managing JDBC Data Sources for Oracle WebLogic Server*.

---

**Note:** Do not use WLST commands to deploy applications that use application-level data sources with password indirection, as WLST cannot set password indirection credential mappings on the server.

---

### 69.3.2.1.2 Packaging Application Security Data

The following is applicable only if you have configured security in your application using the Configure ADF Security wizard, or the application contains connections with secure attributes such as a database connection password or external applications with shared or public credentials:

- [Packaging Credentials](#)
- [Packaging Identity Data](#)
- [Packaging Application Policies](#)

#### Packaging Credentials

If you do not intend to migrate credentials, then deselect the **Credentials** checkbox in the **Security Deployment Options** section in the Application Properties dialog (see [Figure 69–6](#)).

**Figure 69–6 Security Deployment Options**

If you retain the default selection in the Security Deployment Options section, then the credential migration will behave as follows, depending on whether the WebLogic domain is in development or production mode:

- When you deploy a WebCenter Portal: Framework application to a Managed Server running in production mode, secure attributes of the connections packaged within your application and any shared or public credentials specified for external

applications are not migrated to the domain-level credential store. This is because secure properties are likely to be different between development and production environments. Therefore, you must reconfigure secure attributes of connections and shared or public credentials for external applications using WLST commands or Fusion Middleware Control, as described in the security-related sections in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

For more information on credential migration behavior, see the section "Configuring the Credential Store" in *Oracle Containers for J2EE Security Guide*.

- When you deploy a Framework application in development mode, you must first enable credential migration. To enable credential migration for an application to be deployed in development mode, start the Managed Server with `-Djps.app.credential.override.allowed=true`, by adding the following option to the `setDomainEnv.cmd` or `setDomainEnv.sh` file located in `domain\bin`:

```
set EXTRA_JAVA_PROPERTIES=-Djps.app.credential.override.allowed=true %EXTRA_JAVA_PROPERTIES%
```

### Packaging Identity Data

In [Figure 69–6](#), in the Security Deployment Options section, the Users and Groups checkbox is selected by default. This indicates that the users and groups defined in the application's `jazn-data.xml` file will be migrated to the identity store configured for the WebLogic Managed Server, if the authenticator configured in the domain allows creation of users and groups. When migrating the identity store, you should deselect this option as users and groups defined in the identity store configured for the Managed Server should be used to access the application.

### Packaging Application Policies

When the **Application Policies** checkbox is selected, then the `jps.policystore.migration` parameter in the `weblogic-application.xml` file is set to `OVERWRITE`. This means that during application deployment and redeployment, the application policies packaged with the application will be overwritten on the domain-level policy store for the domain to which the application is being deployed.

If the **Application Policies** checkbox is not selected, then the `jps.policystore.migration` parameter is set to `MERGE`. This means that the application policies will be migrated during application deployment but not during redeployment, and the existing application policies will not be overwritten.

#### 69.3.2.2 Creating Deployment Profiles

Deploying your application to a Managed Server that resides outside JDeveloper using Fusion Middleware Control or the WLS Administration Console can only be done using a deployment profile, or Enterprise Archive (EAR) file. The EAR file packages (or archives) a WebCenter Portal: Framework application and its associated files so that the application can be deployed to an Oracle WebLogic Managed Server (this is typically done by a system administrator when the target is a production server).

---

**Note:** You can deploy Oracle ADF applications, such as WebCenter Portal: Framework applications, only as EAR files.

---

The EAR file contains application artifacts such as `adf-config.xml`, `connections.xml`, `weblogic-application.xml`, `jazn-data.xml`, `metadata`

archive (MAR) files, and all project-related WAR files. For WebCenter Portal: Framework applications containing MDS metadata or portlets, a metadata archive file (with the extension .MAR) is automatically generated and included in the EAR file. This file contains all MDS metadata and portlet customization data.

For Framework applications, both the WAR (project-level) and EAR-level deployment profiles are created for you as you build your application. These are named:

```
<application name>_webapp1
<application name>_application1
```

respectively, where *<application name>* is the name given to the application at creation time. Note that this only applies to Framework applications created based on the WebCenter Portal template.

If your application, however, was not created using the WebCenter Portal template, then you will need to create a deployment profile file for your application. You may also want to create your own EAR file if you want to give it a specific name or change what's included in the EAR file through the Application Assembly section.

To create an EAR file:

1. In JDeveloper, in the Application Navigator, right-click the application and select **New**.
2. In the New Gallery, expand **General**, select **Deployment Profile**, then **EAR File**, and click **OK**.
3. In the Create Deployment Profile – EAR File dialog, enter a name for your deployment profile and click **OK**.
4. In the Edit EAR Deployment Profile Properties dialog, select **Application Assembly**, then select the project WAR you want to make available in the project file and click **OK**.
5. In the Application Properties dialog, select the deployment options to use and click **OK**.

For a description of the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** option, see [Section 69.3.2.1.1, "Packaging the Database Connections."](#) For a description of the Deployment Security Options, see [Section 69.3.2.1.2, "Packaging Application Security Data."](#)

6. In the Application Navigator, right-click the application name, choose **Deploy**, *deployment profile name*, **to**, and then choose **to EAR file**. This creates the EAR file in the **deploy** folder located in *JDEV\_HOME\mywork\application\_name\deploy\*, as shown in [Figure 69-7](#).

**Figure 69–7 EAR Status in Deployment - Log**

```

Deployment - Log
1:38:37 PM] Running dependency analysis...
1:38:37 PM] Building...
1:39:07 PM] Deploying 3 profiles...
1:39:08 PM] Exporting portlet metadata and customizations.
1:39:18 PM] Wrote MAR file to D:\oracle\jdeveloper\mywork\Application1\deploy\AutoGeneratedMar.mar
1:39:20 PM] Wrote Web Application Module to D:\oracle\jdeveloper\mywork\Application1\ViewController\deploy\myWCapp.war
1:39:21 PM] Info: Namespace '/oracle/adf/share/prefs' is mapped to deploy-target metadata-store-usage 'WebCenterFileMet
1:39:21 PM] Info: Namespace '/oracle/webcenter/lifecycle' is mapped to deploy-target metadata-store-usage 'WebCenterFileMet
1:39:21 PM] Info: Namespace '/oracle/webcenter/lock' is mapped to deploy-target metadata-store-usage 'WebCenterFileMet
1:39:21 PM] Info: Namespace '/oracle/webcenter/rc' is mapped to deploy-target metadata-store-usage 'WebCenterFileMet
1:39:21 PM] Info: Namespace '/persdef' is mapped to deploy-target metadata-store-usage 'WebCenterFileMetadataStore'
1:39:21 PM] removed bundleresolver.jar from APP-INF because it cannot be part of an EJB deployment
1:39:22 PM] Wrote Enterprise Application Module to D:\oracle\jdeveloper\mywork\Application1\deploy\myWCapp.ear
1:39:22 PM] Elapsed time for deployment: 44 seconds
1:39:22 PM] ---- Deployment finished. ----

```

### 69.3.3 Preparing the Target Environment for Deployment

This section describes how to create and provision a WebLogic Managed Server instance prior to deploying your Framework application.

This section includes the following sub-sections:

- [Section 69.3.3.1, "Creating and Provisioning an Oracle WebLogic Managed Server Instance"](#)
- [Section 69.3.3.2, "Creating and Registering the Metadata Service Repository"](#)
- [Section 69.3.3.3, "Configuring the Target Environment"](#)
- [Section 69.3.3.4, "Creating a WebLogic Managed Server Connection"](#)

#### 69.3.3.1 Creating and Provisioning an Oracle WebLogic Managed Server Instance

Before deploying a WebCenter Portal: Framework application, you must create a WebLogic Managed Server based on the "Oracle WebCenter Custom Portal" template that contains all the required shared libraries and a MDS Repository. For instructions on how to create a new managed server, see "Extending an Existing Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*. For instructions on how to create a new domain, see "Creating a New Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter Portal*.

---

**Note:** Oracle does not recommend deploying Framework applications to any of the three pre-configured Managed Servers created during the installation, or to a domain Administration Server.

---

#### 69.3.3.2 Creating and Registering the Metadata Service Repository

After creating and provisioning the WebLogic Managed Server instance, you must create and register a Metadata Service Repository (MDS) schema for the application on the WebLogic Domain's Administration Server instance, as described in the section "Creating and Registering the Metadata Service (MDS) Repository" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

#### 69.3.3.3 Configuring the Target Environment

After creating the Managed Server and creating and registering the MDS repository, continue by configuring the data sources, and the connections to the Identity Store, and the Policy and Credential Store. For information on configuring data sources, see the section "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and*

*Managing JDBC Data Sources for Oracle WebLogic Server, or How to Create a JDBC Data Source for Oracle WebLogic Server.* Note that when setting up the data source, you must provide a password or the connection may not be created when the application is deployed.

#### 69.3.3.4 Creating a WebLogic Managed Server Connection

Before you can deploy your applications using JDeveloper to an Oracle WebLogic Managed Server instance that reside outside JDeveloper, you must create a connection to the Managed Server instance where you will deploy the application. Before you create a connection to an Oracle WebLogic Managed Server instance, ensure that the target Managed Server instance is up and running, and has the required libraries.

To create a connection to an Oracle WebLogic Managed Server:

1. In JDeveloper, from the File menu, select **New**.
2. In the New Gallery, expand General, select **Connections**, and then **Application Server Connection**.
3. Click **OK**.
4. In the Create Application Server Connection wizard, for Step 1, enter a name for the new connection (for example, `WC_CustomPortal`), and then click **Next**.
5. At Step 2, specify the user name and password for authentication, and then click **Next**.
6. At Step 3, enter the host name of the WebLogic Managed Server (for example, `webcenter.myserver.example.com`) and the port number (for example, 7888).
7. In the WLS Domain field, specify the name of the domain in which the WebLogic Managed Server instance is created (for example, `wc_server`), and then click **Next**.
8. At Step 4, click **Test Connection**.  
If the test is successful, you now have a connection to the target WebLogic Managed Server.
9. Click **Finish**.

### 69.3.4 Deploying a Framework application to a Managed Server

You can deploy a Framework application to a Managed Server using either local application or global data sources. Local application data sources can only be accessed by the deployed application. However, it's an easy way to deploy in that it needs no other data source configuration in order to work if deployed directly from JDeveloper.

Global data sources benefit from being able to be shared by other applications on the server where database connection config updates can be more easily maintained and picked up by all users of the global data source. For more information about data sources, see the section "Choosing the Data Source" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

This section contains the following subsections:

- [Section 69.3.4.1, "Deploying to a Managed Server Using Local Data Sources"](#)
- [Section 69.3.4.2, "Deploying to a Managed Server Using Global Data Sources"](#)

### 69.3.4.1 Deploying to a Managed Server Using Local Data Sources

When you deploy to a Managed Server, the application EAR file is generated. The EAR file packages the metadata archive (MAR file), which includes the metadata content to be deployed to an MDS repository. Additionally, the `adf-config.xml` file is reconfigured with a modified `mds-config` for the target deployment environment. Application-wide features, security, caching, and change persistence remain unchanged. Properties for other Oracle components, if any, are also configured in this file. Similarly, JSF and JSTL shared libraries are added in the `weblogic.xml` file during packaging.

To deploy a WebCenter Portal: Framework application to a Managed Server using local data sources:

1. In JDeveloper, in the Application Navigator, open the application to be deployed.
2. Create the local data source for WebCenter Portal (if required).
  - a. From the File menu, select **New**.

The New Gallery appears (see [Figure 69-8](#)).

**Figure 69-8** New Gallery

- b. From the Connections category, select **Database Connection** and click **OK**.  
The Create Database Connection Dialog displays (see [Figure 69-9](#)).

**Figure 69–9 Create Database Connection**

- c. Enter the connection details for the connection to the WebCenter Portal schema and click **OK**.

---

**Note:** When deploying directly from JDeveloper to a WLS Managed Server the local data source will only be created if the password is saved in the connection (that is, the **Save Password** option is checked), and the database is accessible at deployment time. If there is no saved password, or if the credentials are not able to access a database, the data source will not be created, the application will fail to deploy, and an error will be generated.

When deploying indirectly using Fusion Middleware Control or WLS Administration Console, however, the data sources are created and can be configured subsequent to deployment.

---

The Associate to Data Source dialog displays (see [Figure 69–10](#)).

**Figure 69–10 Associate to Data Source Dialog**

- d. If there are multiple projects select the project, associate the connection with the WebCenterDS data source and click **OK**.

Note that the Associate to Data Source dialog can also be invoked from the context menu for a database connection (right-click on a database connection and select **Associate to Data Source**). This is useful if you change your mind

and want to associate the database connection to a different data source, or disassociate it (by selecting **Neither**).

3. If you're using Analytics task flows, create a local data source for Activities.
  - a. From the File menu, select **New**.
  - b. From the Connections category, select **Database Connection** and click **OK**.
  - c. Enter the connection details for the connection to the Activities schema and click **OK**.
  - d. Associate the connection with the ActivitiesDS data source as shown in [Figure 69-11](#) and click **OK**.

Note that the Associate to Data Source dialog can also be invoked from the context menu for a database connection (right-click on a database connection and select **Associate to Data Source**). This is useful if you change your mind and want to associate the database connection to a different data source, or disassociate it (by selecting **Neither**).

**Figure 69-11 Associate to Data Source Dialog - Activities Schema**

4. Right-click the Application menu and select **Application Properties...**  
The Application Properties dialog displays (see [Figure 69-12](#)).

**Figure 69-12 Application Properties Dialog**

5. Choose **Deployment** from the navigation panel to display the Deployment options.
6. Make sure that the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** option is selected and click **OK**.
7. Right-click on the Application menu, select **Deploy** and then the application name.  
The Deployment Action dialog displays (see [Figure 69–13](#)).

**Figure 69–13** *Deployment Action Dialog*

8. Select **Deploy to Application Server** and click **Next**.  
The Select Server dialog displays (see [Figure 69–14](#)).

**Figure 69–14 Select Server Dialog**

9. Select the connection name of the Managed Server (for example, `WC_CustomPortal`), and click **Next**. If the server to which you want to deploy is not listed, click the Add icon (+) and complete the connection details to add the application server to the list.

The Deployment WebLogic Options dialog displays (see [Figure 69–15](#)).

**Figure 69–15 Deployment WebLogic Options dialog**

10. Select **Deploy to selected instance in the domain**, select the managed server from the list (for example, `WC_CustomPortal`), and click **Next**.

In most cases you will want to deselect **Deploy to all server instances in the domain** and select the specific servers and clusters to deploy to using the Server

Instances dialog. Refer to the online help for more information about using the Select Server dialog options.

The Deployment Configuration dialog displays (see [Figure 69–16](#)).

**Figure 69–16** *Deployment Configuration Dialog*

11. Select the Repository Name (for example, `mds-CustomPortalDS`), enter a Partition Name (if the partition doesn't already exist then it will be created during the deployment), and click **Deploy**.
12. On the Deployment Summary dialog (see [Figure 69–17](#)), check that all of the deployment options are correct and click **Finish** to start the deployment.

**Figure 69–17 Deployment Summary Dialog**

13. Continue by doing any post-deployment security or data source connection configurations that may be required as described in the section on "Post-Deployment Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

### 69.3.4.2 Deploying to a Managed Server Using Global Data Sources

Deploying to a Managed Server using global data sources is recommended when the application is not intended to run on a Managed Server created with the WebCenter Custom Portal template, or is intended to run against custom data sources not named WebCenterDS or ActivitiesDS.

Oracle recommends using the default data source names, but if you use non-default pre-seeded data sources, then you must name your data sources accordingly and follow the pre- or post-deployment global data source creation steps to create data sources that map to the names you have chosen. For more information, see the section "Choosing the Data Source" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

To deploy to a Managed Server using global data sources:

1. Open the application to be deployed in JDeveloper.
2. Determine the JNDI names your application will be using for the data-sources.

The JNDI names will depend on whether you've created a database connection for your application in JDeveloper or are using the defaults. The following table shows the default JNDI names:

Data Source	JDeveloper JNDI Name	Default JNDI Name
WebCenterDS	jdbc/ <i>WebCenterConnectionName</i> DS (where <i>WebCenterConnectionName</i> is the name of the WebCenter Portal database connection)	jdbc/webcenter/CustomPortalDS

Data Source	JDeveloper JNDI Name	Default JNDI Name
ActivitiesDS	jdbc/ <i>ActivitiesConnectionName</i> DS (where <i>ActivitiesConnectionName</i> is the name of the Activities database connection)	jdbc/activities/CustomPortalDS

3. Choose **Deployment** from the navigation panel to display the Deployment options.
4. Deselect the Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment option if selected and click **OK**.
5. Right-click on the Application menu, select **Deploy** and then the application name.

The Deployment Action dialog displays (see [Figure 69–13](#)).

**Figure 69–18** Deployment Action Dialog

6. Select **Deploy to Application Server** and click **Next**.  
The Select Server dialog displays (see [Figure 69–14](#)).

**Figure 69–19 Select Server Dialog**

7. Select the connection name of the Managed Server (for example, WC\_CustomPortal), and click **Next**. If the server to which you want to deploy is not listed, click the Add icon (+) and complete the connection details to add the application server to the list.

The Deployment WebLogic Options dialog displays (see Figure 69–15).

**Figure 69–20 Deployment WebLogic Options dialog**

8. Select **Deploy to selected instance in the domain**, select the managed server from the list (for example, WC\_CustomPortal), and click **Next**.

In most cases you will want to deselect **Deploy to all server instances in the domain** and select the specific servers and clusters to deploy to using the Server

Instances dialog. Refer to the online help for more information about using the Select Server dialog options.

The Deployment Configuration dialog displays (see [Figure 69–16](#)).

**Figure 69–21** *Deployment Configuration Dialog*

9. Select the Repository Name (for example, `mds-CustomPortalDS`), enter a Partition Name (if the partition doesn't already exist then it will be created during the deployment), and click **Deploy**.
10. On the Deployment Summary dialog (see [Figure 69–17](#)), check that all of the deployment options are correct and click **Finish** to start the deployment.

**Figure 69–22 Deployment Summary Dialog**

11. Continue by doing any post-deployment security or data source connection configurations that may be required as described in the section on "Post-Deployment Configuration" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## 69.4 Transporting Customizations Between Environments

When migrating a deployed application to a new environment, post-deployment customizations made to pages, WebCenter Portal service, and portlets (PDK-Java and WSRP version 2 producers) must be migrated too. Export and import utilities are available to assist with this process. For more information, see the chapter, "Managing Backup, Recovery, Export, and Import of WebCenter Portal" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

---

---

## Building Multilanguage Portals

When your application will be viewed by users in multiple countries, you can configure your JSF page or application to use different locales so that it displays the correct language for the language setting of a user's browser. For example, if you know your page will be viewed in Italy, you can localize your page so that when a user's browser is set to use the Italian language, text strings in the browser page appear in Italian.

Additionally, locale selection applies special formatting considerations applicable to the selected locale. For example, whether information is typically viewed from left to right or right to left, how numbers are depicted (such as monetary information), and the like.

When you develop a multi-language portal:

- Make use of the inherent multi-language support in Oracle WebCenter Portal: Services. For more information, see [Section 70.1, "Language Support in ADF Faces Components."](#)
- Put all resources in resource bundles, provide alternate-language resource bundles, and code your application to respond to users' language selection. For more information, see [Section 70.2, "Using Resource Bundles to Support Multiple Languages."](#)
- Make sure your database character set supports all required languages.  
For more information, see "Choosing a Character Set" in the *Oracle Database Globalization Support Guide*.
- Use number, date, and time formatting that supports all required locales.  
For more information, see "Setting Up a Globalization Support Environment" in the *Oracle Database Globalization Support Guide*.
- Use linguistic sort parameters to get the correct sort ordering for locale.  
For example, the same characters have different sort ordering in French and Canadian-French.  
For more information, see "Linguistic Sorting and String Searching" in the *Oracle Database Globalization Support Guide*.
- Write web pages that correctly render left to right or right to left (for example, if Arabic languages must be supported).

For more guidelines on globalization, see "Internationalizing and Localizing Pages" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework* or the *Oracle Database Globalization Support Guide*.

## 70.1 Language Support in ADF Faces Components

Some ADF Faces components include text that is part of the component, for example the `af:table` component uses the resource string `af_table.LABEL_FETCHING` for the message text that is displayed in the browser while the table is fetching data during the initial load of data or while the table is being scrolled. Oracle JDeveloper provides translations of these text resources into 28 languages. Therefore, when using the supplied components, you do not need to perform additional steps to translate the text in the components.

## 70.2 Using Resource Bundles to Support Multiple Languages

For any text you add to a component, for example if you define the label of an `af:commandButton` component by setting the text attribute, you must provide a resource bundle that holds the actual text, create a version of the resource bundle for each locale, and add a `<locale-config>` element to define default and support locales in the application's `faces-config.xml` file. You must also add a `<resource-bundle>` element to your application's `faces-config.xml` file to make the resource bundles available to all the pages in your application. Once you have configured and registered a resource bundle, the Expression Language (EL) editor displays the key from the bundle, making it easier to reference the bundle in application pages.

To simplify the process of creating text resources for text you add to ADF components, JDeveloper supports automatic resource bundle synchronization for any translatable string in the visual editor. When you edit components directly in the visual editor or in the Property Inspector, text resources are automatically created in the base resource bundle.

For more information on automatic resource bundles, see "Using Automatic Resource Bundle Integration in JDeveloper" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

For more information on manually defining resource bundles, see "Manually Defining Resource Bundles and Locales" in the *Oracle Fusion Middleware Web User Interface Developer's Guide for Oracle Application Development Framework*.

# Part XIII

---

## Appendixes

Part XIII contains the following appendixes:

- [Appendix A, "Files for WebCenter Portal: Framework Applications"](#)
- [Appendix B, "Composer Component Properties and Files"](#)
- [Appendix C, "Resource Catalog Properties and Files"](#)
- [Appendix D, "Guidelines for Creating Task Flows to Be Used in Composer-Enabled Pages"](#)
- [Appendix E, "Reuse of Oracle Portal Components"](#)
- [Appendix F, "Expression Language Expressions"](#)
- [Appendix G, "WebCenter Portal Analytics Database Schema,"](#)

---

---

# Files for WebCenter Portal: Framework Applications

This appendix provides reference information about the files that are created and modified as you build up your WebCenter Portal: Framework application. This appendix includes the following sections:

- [Section A.1, "About Files"](#)
- [Section A.2, "Files Overview"](#)
- [Section A.3, "Files Related to WebCenter Portal: Framework Applications"](#)
- [Section A.4, "Files Related to JSR 286 Portlets"](#)
- [Section A.5, "Files Related to PDK-Java Portlets"](#)
- [Section A.6, "System Files"](#)
- [Section A.7, "Files Related to Security"](#)
- [Section A.8, "Oracle JDeveloper Files"](#)
- [Section A.9, "Files Related to Oracle WebCenter Portal Services"](#)

For a complete reference for the Oracle Application Development Framework (Oracle ADF) metadata files that you create in your data model and user interface projects, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

To learn more how files are affected by major actions, see [Section 4.2.2, "Developer Actions Affecting Metadata Files."](#)

## A.1 About Files

When you use Oracle WebCenter Framework to build applications and components, several files are created as you perform such actions as building and consuming portlets. As you work with your application, you may find it useful to know a little bit about each of these files and how they relate to your application. You can group the files affected by the Oracle WebCenter Framework into two broad categories as follows:

- Files that are common to any Oracle ADF application, such as `web.xml`. For these files, it is useful to know what specific additions and changes are made for Framework applications. Those modifications are described in this appendix, but for more complete descriptions of these common files, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

- Files that are unique to Framework applications, such as `portlet.xml`. For these files, it is useful to know what the file is for and what it contains. These files are described completely in this appendix.

## A.2 Files Overview

The files that are created and modified are closely associated with the objects that you create as part of your Framework application. Hence, the easiest way to discuss these files is by object as follows:

- [Files Related to JSR 286 Portlets](#)
- [Files Related to PDK-Java Portlets](#)
- [System Files](#)
- [Files Related to Security](#)
- [Oracle JDeveloper Files](#)
- [Files Related to Oracle WebCenter Portal Services](#)

## A.3 Files Related to WebCenter Portal: Framework Applications

This section includes the following subsections that describe the files that are created for you when you create an application using WebCenter Portal's Framework application template:

- [Section A.3.1, "catalog-registry.xml"](#)
- [Section A.3.2, "default-catalog.xml"](#)
- [Section A.3.3, "default-navigation-model.xml"](#)
- [Section A.3.4, "index.html"](#)
- [Section A.3.5, "navigation-registry.xml"](#)
- [Section A.3.6, "pages.xml"](#)
- [Section A.3.7, "error.jspx"](#)
- [Section A.3.8, "home.jspx"](#)
- [Section A.3.9, "login.jspx"](#)
- [Section A.3.11, "pageTemplate\\_globe.jspx"](#)
- [Section A.3.12, "pageTemplate\\_swooshy.jspx"](#)

There are also image files created that are used in the application.

### A.3.1 catalog-registry.xml

`catalog-registry.xml` is a catalog registry file. It is used by the Resource Manager when a user creates or edits a resource catalog. The registry defines the superset of all items that are available to be included in a catalog that you create or edit. You can create multiple catalogs for an application, but an application can only have one catalog registry file.

### A.3.2 default-catalog.xml

`default-catalog.xml` is a default resource catalog. When a user edits pages at runtime using Composer, the default catalog file specifies all of the items that are available to be added to a page.

### A.3.3 default-navigation-model.xml

`default-navigation-model.xml` is the navigation model file, which incorporates navigation structures in portal site. For more information, see [Chapter 10, "Building a Navigation Model for Your Portal"](#) and [Section 8.5.3, "Understanding the Navigation Model and the Navigation Registry."](#)

### A.3.4 index.html

`index.html` contains a redirect statement that refers to the portal navigation model, including an URL element, `pages_home`, which refers to the "home" page specified in the page hierarchy. For more information, see [Section 8.13, "Changing the Default Home Page and Login/Logout Target Pages"](#)

### A.3.5 navigation-registry.xml

`navigation-registry.xml` is used by the Resource Manager when a user creates or edits a navigation model. The registry defines the superset of all items that are available to be included in a model that you create or edit. You can create multiple navigation models for an application, but an application can only have one navigation registry file. For more information, see [Chapter 10, "Building a Navigation Model for Your Portal."](#)

### A.3.6 pages.xml

`pages.xml`, or the "page hierarchy" file, organizes pages into a tree structure, with a parent-child relationship between pages. This hierarchical structure allows the convenient propagation or inheritance of security settings from pages to sub pages. For more information, see [Section 8.5.1, "Understanding Pages, Page Templates, and the Portal Page Hierarchy."](#)

### A.3.7 error.jspx

`error.jspx` is the default error page displayed to users when WebCenter Portal encounters an error.

### A.3.8 home.jspx

`home.jspx` is the default Home page, providing users access to features such as the Documents service, Links service, Tags service, and Discussion service.

### A.3.9 login.jspx

`login.jspx` is the default login page that provides login/logout functionality to users. For information on customizing the login page, see [Section 68.9, "Adding Portlets to a Login Page."](#)

### A.3.10 navigation-renderer.jspx

`navigation-renderer.jspx` is responsible for rendering non-page resources that appear in a navigation, such as portlets, content, and task flows. For more information, see [Section 10.5, "Editing the Navigation Renderer."](#)

### A.3.11 pageTemplate\_globe.jspx

`pageTemplate_globe.jspx` is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as `pageTemplate_swooshy.jspx` but with different graphics. For more information, see [Section 11.2, "Working with Page Templates."](#)

### A.3.12 pageTemplate\_swooshy.jspx

`pageTemplate_swooshy.jspx` is one of two seeded page templates created when you select the **Configure the application with standard Portal features** option when creating an application. This template offers essentially the same functionality as `pageTemplate_globe.jspx` but with different graphics. For more information, see [Section 11.2, "Working with Page Templates."](#)

## A.4 Files Related to JSR 286 Portlets

This section includes the following subsections that describe the files that are created for you when you build a JSR 286 portlet:

- [Section A.4.1, "portlet.xml"](#)
- [Section A.4.2, "oracle-portlet-tags.jar"](#)
- [Section A.4.3, "portlet\\_mode.jsp"](#)
- [Section A.4.4, "portlet\\_name.java"](#)
- [Section A.4.5, "portlet\\_nameBundle.jar"](#)
- [Section A.4.6, "web.xml"](#)

### A.4.1 portlet.xml

`portlet.xml` defines the characteristics of your JSR 286 portlet. For complete details on `portlet.xml`, you should see the Java Portlet Specification available at:

<http://jcp.org/en/jsr/detail?id=168>

[Example A-1](#) provides a sample fragment from a `portlet.xml` file. Note that this example does not include all of the available elements of `portlet.xml`.

#### **Example A-1** *portlet.xml Sample*

```
<portlet>
  <description xml:lang="en">JSR 286 map portlet </description>
  <portlet-name>portlet1</portlet-name>
  <display-name xml:lang="en">Map Portlet</display-name>
  <portlet-class>jsrportlet.MapPortlet</portlet-class>
  <expiration-cache>0</expiration-cache>
  <supports>
    <mime-type>text/html</mime-type>
    <portlet-mode>edit</portlet-mode>
    <portlet-mode>help</portlet-mode>
```

```

    <portlet-mode>about</portlet-mode>
</supports>
<supported-locale>en</supported-locale>
<resource-bundle>jsrportlet.resource.MapPortletBundle</resource-bundle>
<portlet-info>
  <title>Map Portlet</title>
  <short-title>Map</short-title>
  <keywords/>
</portlet-preferences>
  <preference>
    <name>portletTitle</name>
  </preference>
</portlet-preferences>
<security-role-ref>
  <role-name>viewer</role-name>
</security-role-ref>
</portlet>

```

For JSR 286 portlets, the `portlet.xml` file contains all information related to portlets and their settings. Note that not all of these settings are used in the previous sample.

- `<description>` describes the portlet, providing details to the end user.
- `<portlet-name>` uniquely identifies the portlet within the Portlet Producer application.
- `<display-name>` is used when presenting a list of available portlets to the user.
- `<portlet-class>` contains the fully qualified class name of the class implementing the `javax.portlet.Portlet` interface or extending the `GenericPortlet` abstract class that becomes the entry point for the portlet logic. The portlet container uses this class when it invokes the portlet life cycle methods. For JSF portlets created using the Oracle JSF Portlet Bridge, this is `oracle.portlet.bridge.adf.application.ADFBridgePortlet`.
- `<expiration-cache>` the default duration (in seconds) of the expiration cache.
- `<init-param>` defines initialization parameters for configuring the behavior of the portlet. The Oracle JSF Portlet Bridge uses initialization parameters to identify the entry points for the different portlet modes supported by the portlet, for example, for View mode:

```

<init-param>
  <name>javax.portlet.faces.defaultViewId.view</name>
  <value>/myPage.jsp</value>
</init-param>

```

Initialization parameters for other WebCenter Portal-supported modes are:

- Edit mode: `javax.portlet.faces.defaultViewId.edit`
- Help mode: `javax.portlet.faces.defaultViewId.help`
- About mode: `javax.portlet.faces.defaultViewId.about`
- Config mode: `javax.portlet.faces.defaultViewId.config`
- Edit Defaults mode: `javax.portlet.faces.defaultViewId.edit_defaults`
- Preview mode: `javax.portlet.faces.defaultViewId.preview`
- Print mode: `javax.portlet.faces.defaultViewId.print`

---

---

**Note:** The value for the `defaultViewId` is relative to the application context root and must always start with a `/`. In the example provided, the value for `defaultViewId.view` is `/myPage.jspx`.

If you add a `defaultViewId` for other portlet modes, then you must also add the mode to the `<supports>` tag. For example, `<portlet-mode>HELP</portlet-mode>`.

---

---

- `<supports>` provides information about the portlet modes supported for each content type. Portlet modes supported by WebCenter Portal include: `edit`, `help`, `about`, `config`, `edit_defaults`, `preview`, and `print`.
- `<supported-locale>` lists the locales supported by the portlet at runtime.
- `<resource-bundle>` is the fully qualified class name of the resource bundle used to provide language specific portlet information, such as title and keywords.
- `<title>` is the static title of the portlet, usually displayed in the portlet decoration on the portlet window.
- `<short-title>` is the title that is used on devices (such as mobile phones) that have limited display capabilities.
- `<keywords>` are used by applications that offer search capabilities for their users.
- `<portlet-preferences>` are preference attribute definitions.
- `<supported-processing-event>` are events that the portlet can receive.
- `<supported-publishing-event>` are events that the portlet raises.
- `<supported-public-render-parameter>` is a public render parameter supported by the portlet.
- `<container-runtime-option>` an option for defining additional runtime behavior.
- `<security-role-ref>` maps a role name to a security role in `web.xml`. The list of roles in `web.xml` that the `<security-role-ref>` maps to is published to the consumer as the producer's user categories. In `web.xml`, `<security-role>` appears similar to the following:

```
<security-role>
  <description>Viewer role</description>
  <role-name>viewer</role-name>
</security-role>
```

## A.4.2 oracle-portlet-tags.jar

`oracle-portlet-tags.jar` is the Oracle implementation of the JSP tag library defined by the Java Portlet Specification.

## A.4.3 portlet\_mode.jsp

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your `portlet_name\html` directory to define that mode. For example, if you choose to have View and Edit modes for your portlet, then you need `view.jsp` and `edit.jsp` in your `portlet_name\html` directory. For JSR 286 portlets, you can have the following JSP files for your portlet modes:

- `about.jsp`
- `config.jsp`
- `edit_defaults.jsp`
- `edit.jsp`
- `help.jsp`
- `preview.jsp`
- `print.jsp`
- `view.jsp`

For further explanation of portlet modes, see [Section 57.4.1, "Portlet Modes."](#)

#### A.4.4 `portlet_name.java`

`portlet_name.java` is the class that acts as the entry point for the portlet logic. This class must implement the `javax.portlet.Portlet` interface or extend the `GenericPortlet` abstract class. The portlet container uses this class when it invokes the portlet lifecycle methods.

#### A.4.5 `portlet_nameBundle.jar`

`portlet_nameBundle.jar` is a resource bundle class, containing translation of the strings used by the portlet.

#### A.4.6 `web.xml`

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### A.5 Files Related to PDK-Java Portlets

This section includes the following subsections that describe the files that are created for you when you build a PDK-Java portlet:

- [Section A.5.2, "\\_default.properties"](#)
- [Section A.5.3, "index.jsp"](#)
- [Section A.5.4, "portlet\\_name\\_modePage.jsp"](#)
- [Section A.5.1, "producer\\_name.properties"](#)
- [Section A.5.5, "provider.xml"](#)
- [Section A.5.6, "web.xml"](#)

#### A.5.1 `producer_name.properties`

`producer_name.properties` specifies deployment details about the producer, such as the location of the `provider.xml` file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

```
http://host:port/jpdk/provider/samples
```

or:

`http://host:port/jpdk/provider`

where the service ID field contains `samples`. See also [Section A.5.2, "\\_default.properties"](#).

## A.5.2 `_default.properties`

`_default.properties` specifies deployment details about the producer, such as the location of the `provider.xml` file. For example, this file is used if the registration URL to the PDK-Java samples is of the form:

`http://host:port/jpdk/provider`

Note that the producer name is not supplied here so it has to default. See also [Section A.5.1, "producer\\_name.properties"](#).

## A.5.3 `index.jsp`

`index.jsp` serves as a convenient starting point when testing PDK-Java producers from Oracle JDeveloper. This file lists all of the producers available in the application.

## A.5.4 `portlet_name_modePage.jsp`

Depending on the implementation style of the portlet mode that you choose to create for your portlet, a corresponding JSP file is created in your `\htdocs\portlet_name` directory to define that mode. For example, if you choose to have View and Edit modes for a portlet named `portletOne`, then you need `portletOneShowPage.jsp` and `PortletOneEditPage.jsp` in your `\htdocs\portletOne` directory. For PDK-Java portlets, you can have the following JSP files for your portlet modes:

- `portlet_nameAboutPage.jsp`
- `portlet_nameEditDefaultsPage.jsp`
- `portlet_nameEditPage.jsp`
- `portlet_nameHelpPage.jsp`
- `portlet_nameShowDetailsPage.jsp`
- `portlet_nameShowPage.jsp`

For further explanation of portlet modes, see [Section 57.4.1, "Portlet Modes"](#).

## A.5.5 `provider.xml`

`provider.xml` is the definition file for your PDK-Java producer.

---

---

**Note:** PDK-Java producers were formerly referred to as providers.

---

---

This section includes the following subsections:

- [Section A.5.5.1, "provider.xml Syntax"](#)
- [Section A.5.5.2, "provider.xml Sample"](#)

### A.5.5.1 provider.xml Syntax

For more information about the elements and syntax of `provider.xml`, see the Provider Definition Extensible Markup Language (XML) Tag Reference v2 on the Oracle Technology Network.

[http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml\\_tag\\_reference\\_v2.html](http://www.oracle.com/technology/products/ias/portal/html/javadoc/xml_tag_reference_v2.html)

### A.5.5.2 provider.xml Sample

Example A-2 provides a sample `provider.xml` file.

#### Example A-2 provider.xml Sample

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<?providerDefinition version="3.1"?>
<provider class="oracle.portal.provider.v2.DefaultProviderDefinition">
  <localePersonalizationLevel>none</localePersonalizationLevel>
  <session>true</session>
  <defaultLocale>en</defaultLocale>
  <preferenceStore
    class="oracle.portal.provider.v2.preference.FilePreferenceStore">
    <name>prefStore1</name>
    <useHashing>true</useHashing>
  </preferenceStore>
  <portlet class="oracle.portal.provider.v2.DefaultPortletDefinition">
    <id>1</id>
    <name>SampleRenderer</name>
    <title>SampleRenderer example</title>
    <shortTitle>SampleRenderer</shortTitle>
    <description>Example portlet rendered using the SampleRenderer</description>
    <timeout>40</timeout>
    <timeoutMessage>SampleRenderer example timed out</timeoutMessage>
    <acceptContentType>text/html</acceptContentType>
    <showEdit>true</showEdit>
    <showEditToPublic>false</showEditToPublic>
    <showEditDefault>true</showEditDefault>
    <showPreview>true</showPreview>
    <showDetails>true</showDetails>
    <hasHelp>true</hasHelp>
    <hasAbout>true</hasAbout>
    <renderer
      class="oracle.portal.sample.v2.devguide.samplerenderer.SampleRenderer"/>
    <personalizationManager
      class="oracle.portal.provider.v2.personalize.PrefStorePersonalizationManager">
      <dataClass>oracle.portal.provider.v2.personalize.
        NameValuePersonalizationObject
      </dataClass>
    </personalizationManager>
  </portlet>
</provider>
```

## A.5.6 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

## A.6 System Files

This section includes the following subsections that describe the files that are created or modified when you create or modify pages, deploy your application, or consume JSR 268 portlets:

- Created at page design time:
  - [Section A.6.1, "adf-config.xml"](#)
  - [Section A.6.2, "DataBindings.cpx"](#)
  - [Section A.6.3, "faces-config.xml"](#)
  - [Section A.6.4, "page\\_name.jspx"](#)
  - [Section A.6.5, "PageDef.xml"](#)
  - [Section A.6.6, "trinidad-config.xml"](#)
  - [Section A.6.7, "web.xml"](#)
  - [Section A.6.8, "weblogic-application.xml"](#)
- Created at application deployment time:
  - [Section A.6.9, "mds Subdirectory"](#)
- Created upon consumption of JSR 286 portlets
  - [Section A.6.10, "wsdl Subdirectory"](#)

### A.6.1 adf-config.xml

The `adf-config.xml` file is an extensible configuration file used by any ADF component. This file is used by the various WebCenter Portal services, including pages, portlets, and all the services such as search, worklist, forums, and so on, to set configuration information. This file, with `connections.xml`, contains the configuration information required for most of the services to function.

For more information, see:

- [Section 14.10.1, "adf-config.xml"](#) (for information on Skins settings)
- [Section 20.2.1.3, "Registering Add-Ons in adf-config.xml"](#)
- [Section 21.11.2.2, "Adding Relevant Entries to the adf-config.xml File"](#) (for information on configuring change persistence)
- [Section 22.2.1.1, "Updating Your Application's adf-config.xml File"](#) (for information on configuring sandbox creation)
- [Section 23.5.1, "How to Add an enableSecurity Section to adf-config.xml"](#)
- [Section B.2.2, "adf-config.xml"](#) (for information on Composer-specific settings)

[Table A–1](#) describes the child elements of `<adf-portlet-config>`. The `init-param` names in the first column correspond to the names of the servlet `init-params` used when the portlet client is accessed through the Web adapter.

**Table A–1** Child Elements of `adf-portlet-config`

Element (init-param)	Description	Default Value
<code>parallelPoolSize</code> ( <code>parallel.pool.size</code> )	The number of threads to use for parallel execution of tasks.	10

**Table A-1 (Cont.) Child Elements of `adf-portlet-config`**

Element (init-param)	Description	Default Value
<code>parallelQueueSize</code> ( <code>parallel.queue.size</code> )	The size of the queue of tasks waiting for parallel execution. Tasks are rejected when the queue size is exceeded.	20
<code>defaultTimeout</code> ( <code>default.timeout</code> )	The default timeout period in seconds for requests made to producers. This value is used when a timeout is not defined at the portlet or producer level.	10
<code>minimumTimeout</code> ( <code>minimum.timeout</code> )	The minimum timeout period in seconds for requests made to producers. This value is used to impose a lower limit on timeout periods specified by portlets or producers.	0.1
<code>maximumTimeout</code> ( <code>maximum.timeout</code> )	The maximum timeout period in seconds for requests made to producers. This value is used to impose an upper limit on timeout periods specified by portlets or producers.	300
<code>resourceProxyPath</code> ( <code>resource.proxy.path</code> )	The base path of the resource proxy servlet, relative to the context root of the application. Used to construct links to the resource servlet within portlet markup.	<code>/resourceproxy</code>
<code>supportedLocales</code> ( <code>supported.locales</code> )	The set of supported locales defined using strings of the form: <code>language[_country[_variant]]</code>	Commented out by default. You should uncomment it if you have multiple locales. See <a href="#">Example A-3</a> .
<code>portletTechnologies</code> ( <code>portlet.technologies</code> )	The set of portlet technologies supported by the client defined by the fully qualified names of classes that implement the <code>PortletTechnologyConfig</code> interface.	{ <code>o.p.c.ci.web.WebPortletTechnologyConfig</code> , <code>o.p.c.ci.wsrp.WSRPPortletTechnologyConfig</code> }
<code>cacheSettings</code> ( <code>cache.*</code> )	Cache configuration information. Used to enable or disable the cache, define its maximum size and impose limits on the amount of space available for different users and subscribers.	The cache is enabled and no size restrictions are imposed.

**Table A-1 (Cont.) Child Elements of `adf-portlet-config`**

Element (init-param)	Description	Default Value
<code>maximumResourceUrlLength</code> ( <code>maximum.resource.url.length</code> )	The maximum length allowed for resource URLs. This prevents the URL from becoming too long if the portlet passes a lot of contextual information in a resource request. Resource URLs longer than 2048 characters may cause problems in some browsers.  If the information encoded in a resource URL exceeds this value, the portlet client stores the information in the session and encodes a key to the session attribute in the URL instead. The key is calculated in a deterministic way to avoid adversely affecting browser caching.	2048

**<adf-portlet-config> element Sample**

[Example A-3](#) illustrates the usage of the `<adf-portlet-config>` element.

**Example A-3 <adf-portlet-config> element Sample**

```
<adf-portlet-config xmlns="http://xmlns.oracle.com/adf/portlet/config">
  <supportedLocales>
    <value>en</value>
    <value>fr</value>
    <value>de</value>
    <value>es</value>
  </supportedLocales>
  <portletTechnologies>
    <value>oracle.portlet.client.containerimpl.web.
      WebPortletTechnologyConfig</value>
    <value>oracle.portlet.client.containerimpl.wsrp.
      WSRPPortletTechnologyConfig</value>
  </portletTechnologies>
  <defaultTimeout>20</defaultTimeout>
  <minimumTimeout>1</minimumTimeout>
  <maximumTimeout>300</maximumTimeout>
  <resourceProxyPath>/portletresource</resourceProxyPath>
  <cacheSettings>
    <maxSize>10000000</maxSize>
    <subscriber default="true">
      <systemLevel>
        <maxSize>5000000</maxSize>
      </systemLevel>
      <userLevel>
        <maxSize>8000000</maxSize>
      </userLevel>
    </subscriber>
  </cacheSettings>
</adf-portlet-config>
```

## A.6.2 DataBindings.cpx

`DataBindings.cpx` is a file common to Web applications. For more information about `DataBindings.cpx`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

## A.6.3 faces-config.xml

`faces-config.xml` is a file common to JSF applications. It describes the page flow of your application. For more information about `faces-config.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

## A.6.4 page\_name.jspx

`page_name.jspx` is the JSP file for your page. Whenever you add or remove components, such as portlets or data controls from the page, this file is updated.

## A.6.5 PageDef.xml

`PageDef.xml` is a file common to Oracle ADF applications. This file holds information about portlet bindings. Also, portlet parameters can be tied to page variables in this file.

For more information about `PageDef.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### PageDef.xml Sample

[Example A-4](#) provides a sample `PageDef.xml` file.

#### Example A-4 PageDef.xml Sample

```
<?xml version="1.0" encoding="UTF-8" ?>
<pageDefinition xmlns="http://xmlns.oracle.com/adfm/uimodel"
  version="10.1.3.37.97" id="app_SRFeedbackPageDef"
  Package="oracle.srdemo.view.pageDefs">
  <parameters/>
  <executables>
    <methodIterator id="findAllServiceRequestIter"
      Binds="findAllServiceRequest.result"
      DataControl="SRPublicFacade" RangeSize="4"
      BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
    <variableIterator id="variables">
      <variable Name="portlet1_Param1" Type="java.lang.Object"
        DefaultValue="
        ${bindings.findAllServiceRequestIter.currentRow.dataProvider['svrId']}" />
      <variable Name="portlet1_Param2" Type="java.lang.Object" />
      <variable Name="portlet1_Param3" Type="java.lang.Object" />
      <variable Name="portlet1_Param4" Type="java.lang.Object" />
      <variable Name="portlet1_Param5" Type="java.lang.Object" />
    </variableIterator>
    <methodIterator id="findServiceRequestByIdIter"
      Binds="findServiceRequestById.result"
      DataControl="SRPublicFacade" RangeSize="10"
      BeanClass="oracle.srdemo.model.entities.ServiceRequest"/>
  <portlet id="portlet1"
    portletInstance="/oracle/adf/portlet/OmniProducer_1150310748178/
    applicationPortlets/Portlet100_eebc7f18_010b_1000_8001_82235f640cea"
    class="oracle.adf.model.portlet.binding.PortletBinding">
```

```

        xmlns="http://xmlns.oracle.com/portlet/bindings">
    <parameters>
        <parameter name="Param1" pageVariable="portlet1_Param1"/>
        <parameter name="Param2" pageVariable="portlet1_Param2"/>
        <parameter name="Param3" pageVariable="portlet1_Param3"/>
        <parameter name="Param4" pageVariable="portlet1_Param4"/>
        <parameter name="Param5" pageVariable="portlet1_Param5"/>
    </parameters>
</portlet>
</executables>
<bindings>
    <methodAction id="findAllServiceRequest"
        InstanceName="SRPublicFacade.dataProvider"
        DataControl="SRPublicFacade"
        MethodName="findAllServiceRequest" RequiresUpdateModel="true"
        Action="999" IsViewObjectMethod="false"
        ReturnName="SRPublicFacade.methodResults.
            SRPublicFacade_dataProvider_findAllServiceRequest_result"/>
    <table id="findAllServiceRequest1" IterBinding="findAllServiceRequestIter">
        <AttrNames>
            <Item Value="assignedDate"/>
            <Item Value="problemDescription"/>
            <Item Value="requestDate"/>
            <Item Value="status"/>
            <Item Value="svrId"/>
            <Item Value="custComment"/>
            <Item Value="custCommentDate"/>
            <Item Value="custCommentContactBy"/>
            <Item Value="mgrNotes"/>
            <Item Value="mgrNotesDate"/>
        </AttrNames>
    </table>
    <methodAction id="findServiceRequestById"
        InstanceName="SRPublicFacade.dataProvider"
        DataControl="SRPublicFacade"
        MethodName="findServiceRequestById" RequiresUpdateModel="true"
        Action="999" IsViewObjectMethod="false"
        ReturnName="SRPublicFacade.methodResults.
            SRPublicFacade_dataProvider_findServiceRequestById_result">
        <NamedData NDName="svrIdParam"
            NDValue=
                "${bindings.findAllServiceRequestIter.currentRow.dataProvider['svrId']}"
            NDType="java.lang.Integer"/>
    </methodAction>
    <attributeValues id="svrId" IterBinding="findServiceRequestByIdIter">
        <AttrNames>
            <Item Value="svrId"/>
        </AttrNames>
    </attributeValues>
    <attributeValues id="custComment" IterBinding="findServiceRequestByIdIter">
        <AttrNames>

```

## A.6.6 trinidad-config.xml

`trinidad-config.xml` contains information about the application skin family. Additionally, it can contain information about the level of page accessibility support, page animation, time zone, enhanced debugging output, and the URL for Oracle Help for the Web (OHW). For more information, see [Section 1.10.3, "The Framework Application Template Default trinidad-config.xml File"](#)

## A.6.7 web.xml

`web.xml` is a Java EE standard descriptor that contains details about Web applications. For more information about `web.xml`, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

## A.6.8 weblogic-application.xml

`weblogic-application.xml` is a deployment descriptor (a server configuration file that defines the application configuration) for Oracle WebLogic Server deployment.

## A.6.9 mds Subdirectory

When you deploy a WebCenter Portal: Framework application, an `mds` subdirectory is created in your project directory. This subdirectory contains other subdirectories and metadata files, such as portlet customizations and personalizations.

## A.6.10 wsdl Subdirectory

When you consume JSR 286 portlets in an application, a `wsdl` subdirectory is created in the `WEB-INF` directory. The files in this subdirectory are internal files created for portlets from a WSRP producer.

## A.7 Files Related to Security

This section includes the following subsections that describe the files that are created or modified when you implement or modify security:

- [Section A.7.1, "connections.xml"](#)
- [Section A.7.2, "jazn-data.xml"](#)
- [Section A.7.3, "cwallet.sso"](#)
- [Section A.7.4, "jps-config.xml"](#)
- [Section A.7.5, "adf-config.xml"](#)

### A.7.1 connections.xml

`connections.xml` contains portlet producer connection information. [Example A-5](#) shows a sample `connections.xml` file.

#### **Example A-5** *connections.xml*

```
<?xml version = '1.0' encoding = 'UTF-8'?>

## A.7.2 jazn-data.xml

When you implement or modify security for your application, the `jazn-data.xml` file is created or modified.

The `jazn-data.xml` file is used to facilitate the deployment of realm and policy information for your application. In your development environment (JDeveloper), `jazn-data.xml` is located in your application's `workspacedir/src/META-INF` directory. After deployment, the contents of this file are merged in domain-level identity or policy stores. This file contains the policies that are created at design time, and is merged at deployment by `JpsApplicationLifecycleListener` into the `system-jazn-data.xml` file (or appropriately configured policy store) for the deployment target.

When you migrate security information with `JpsApplicationLifecycleListener`, the `jazn-data.xml` file can be used as the source file for the migration. For more information about migrating roles, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### jazn-data.xml Sample

[Example A-6](#) provides a sample `jazn-data.xml` file.

#### Example A-6 jazn-data.xml Sample

```

<?xml version = '1.0' encoding = 'UTF-8'?>
<jazn-data>
    <jazn-realm>
        <realm>
            <name>jazn.com</name>
        </realm>
    </jazn-realm>
    <policy-store>
        <applications>
            <application>

```

```

        <name>mdsapp-secure</name>
    <app-roles>
        <app-role>
            <name>unauthenticated-role</name>
            <display-name>anonymous-role</display-name>

<class>oracle.security.jps.service.policystore.ApplicationRole</class>
        </app-role>
        <app-role>
            <name>authenticated-role</name>
            <display-name>authenticated-users</display-name>

<class>oracle.security.jps.service.policystore.ApplicationRole</class>
        </app-role>
        <app-role>
            <name>approle</name>
            <display-name>approle</display-name>
            <description>approle</description>
            <guid/>

<class>oracle.security.jps.service.policystore.ApplicationRole</class>
            <members>
                <member>

<class>oracle.security.jps.internal.core.principals.JpsXmlUserImpl</class>
                    <name>orcladmin</name>
                </member>
            </members>

        </app-role>
    </app-roles>
</jazn-policy>

<grant>
<grantee>
    <principals>
        <principal>
<class>oracle.security.jps.internal.core.principals.JpsAuthenticatedRoleImpl</class>
s>
<name>authenticated-role</name>
        </principal>
    </principals>
</grantee>
<permissions>
    <permission>
<class>oracle.adf.share.security.authorization.RegionPermission</class>
<name>project1.pageDefs.securePageDef</name>
<actions>view</actions>
        </permission>
    </permissions>
</grant>
<grant>
<grantee>
    <principals>
        <principal>
<class>oracle.security.jps.internal.core.principals.JpsAnonymousRoleImpl</class>
        <name>anonymous-role</name>
    </principal>
    </principals>
</grantee>
<permissions>

```

```
<permission>
<class>oracle.adf.share.security.authorization.RegionPermission</class>
<name>project1.pageDefs.publicPageDef</name>
<actions>view</actions>
</permission>
</permissions>
</grant>
    </jazn-policy>
  </application>
</applications>
</policy-store>
<jazn-policy/>
</jazn-data>
```

### A.7.3 cwallet.sso

`cwallet.sso` contains external application credentials, if any, and the connection's secure data such as database password. The `cwallet.sso` file is located in the `workspaceroot/src/META-INF` directory.

### A.7.4 jps-config.xml

`jps-config.xml` is located at `workspaceroot/src/META-INF`. The `jps-config.xml` file packaged with the application is used only at design time. At runtime, the configurations stored in the domain-level `jps-config.xml` file become functional.

`jps-config.xml` configures OPSS services. For more information on the element hierarchy and attributes of `jps-config.xml`, see the appendix "OPSS Configuration File Reference" in the *Oracle Containers for J2EE Security Guide*.

The recommendation for migration is to create a new `jps-config.xml` file with the source and destination contexts defined as required by the migration commands. For details on migrating identities, see the section "Migrating Identities Manually" in the *Oracle Containers for J2EE Security Guide*.

The policy store is migrated in the following ways: entire policy store, application-specific policies, and global policies. For details, see the section "Migrating Policies Manually" in the *Oracle Containers for J2EE Security Guide*.

The credential store is migrated in the following ways: entire credential store or application-specific credentials. When migrating application-specific credentials, ensure that `srcFolder` and `targetFolder` are the same. `srcFolder` and `targetFolder` can be determined from `appUID` in the `adf-config.xml` file, see [Example A-7](#). For details, see the section "Migrating Credentials Manually" in the *Oracle Containers for J2EE Security Guide*.

#### **Example A-7** *appUID in the adf-config.xml file*

```
<adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
  <adf-property name="adfAppUID" value="Application1-1167"/>
</adf:adf-properties-child>
```

### A.7.5 adf-config.xml

Security configurations are stored in `adf-config.xml`. This file is located at `workspaceroot/.adf/META-INF/adf-config.xml`. See [Example A-8](#).

**Example A–8** *adf-config.xml*

```

<adf-security-child xmlns="http://xmlns.oracle.com/adf/security/config">
  <JaasSecurityContext
initialContextFactoryClass="oracle.adf.share.security.JAASInitialContextFactory"
jaasProviderClass="oracle.adf.share.security.providers.jps.JpsSecurityContext"
    authorizationEnforce="true"
    authenticationRequire="true"/>
  <CredentialStoreContext
credentialStoreClass="oracle.adf.share.security.providers.jps.CSFCredentialStore"
    credentialStoreLocation="../../src/META-INF/jps-config.xml"/>
</adf-security-child>

```

---

**Note:** The credentialStoreLocation entry in the sample is valid at design time only.

---

## A.8 Oracle JDeveloper Files

This section includes the following subsection that describes the file that is created or modified when you create a page template:

- [Section A.8.1, "pagetemplate-metadata.xml"](#)

### A.8.1 pagetemplate-metadata.xml

pagetemplate-metadata.xml keeps track of all the page templates you create in a project.

## A.9 Files Related to Oracle WebCenter Portal Services

This section includes sample connections.xml and adf-config.xml files for some WebCenter Portal services.

[Example A–9](#) shows the minimum required configuration for the SES Web service connection.

**Example A–9** *SES Web Service Sample Connection*

```

<Reference name="GenericSesConnection"
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionReferen
ceable"
credentialStoreKey="GenericSesConnection" xmlns="">
  <Factory
className="oracle.adf.mbean.share.connection.webcenter.search.SesConnectionFactory"
  />
  <RefAddresses>
    <XmlRefAddr addrType="SesConfig">
      <Contents>
        <SesConfig>
          <AttributeMap>
            <Attribute name="date">

## Composer Component Properties and Files

This appendix provides reference information about Composer-specific tags, configuration files, and style properties. This information is useful while performing the tasks described in [Chapter 19, "Enabling Runtime Editing of Pages Using Composer"](#) and [Chapter 20, "Extending Runtime Editing Capabilities Using Composer."](#)

This appendix contains the following sections:

- [Section B.1, "Composer Component Properties"](#)
- [Section B.2, "Composer-Specific Files and Configurations"](#)
- [Section B.3, "Composer Default Add-Ons and Property Panels"](#)
- [Section B.4, "Composer Components Style-Specific Properties"](#)
- [Section B.5, "Customizable Components \(HTML\) Properties"](#)

### B.1 Composer Component Properties

This section is a quick reference for all Composer tags. When you add Composer components to a page, default values are assigned to certain attributes. You can change these default values and define values for the remaining attributes in JDeveloper.

For information about adding these components to the page, see [Section 19.1, "Designing Editable Pages Using Composer Components."](#)

---

---

**Note:** The Property Inspector in JDeveloper displays certain extended metadata attributes under the Customization Attributes category. You can use these properties to provide additional metadata information. For more information, see the section "Extended Metadata Properties" in *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

---

---

This section contains the following subsections:

- [Section B.1.1, "Page Customizable"](#)
- [Section B.1.2, "Change Mode Link and Change Mode Button"](#)
- [Section B.1.3, "Layout Customizable Component"](#)
- [Section B.1.4, "Panel Customizable Component"](#)
- [Section B.1.5, "Show Detail Frame Component"](#)
- [Section B.1.6, "Custom Action"](#)

- [Section B.1.7, "Show Property"](#)

## B.1.1 Page Customizable

Use the `Page Customizable` component to enable page editing at runtime. The `Page Customizable` component denotes the customizable part of a page and shows the Composer toolbar in Edit mode at runtime. When you enclose components within a `Page Customizable` component, Composer is enabled in the application page at run time, allowing the user to customize and edit the components.

In large applications, where you want to enable runtime page editing on multiple pages, you can include the `Page Customizable` component in the page template, somewhere in the top of the hierarchy. This way, all pages created using the template are editable at runtime.

### Geometry Management

**View mode:** The `Page Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. If the `Page Customizable` component is stretched, it in turn stretches its child component to fill the space available to it. However, if the `Page Customizable` component is not stretched, its size is determined by the child component.

**Edit mode:** The `Page Customizable` component stretches its child component to fill the space available to it.

### Attributes

[Table B-1](#) describes the attributes of a `Page Customizable` component.

**Table B-1** Attributes of a `Page Customizable` Component

Attribute	Type	Supports EL	Description
<b>Common Attributes</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>■ Must not be a zero-length String.</li> <li>■ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p>

**Table B-1 (Cont.) Attributes of a Page Customizable Component**

Attribute	Type	Supports EL	Description
<b>Appearance Attributes</b>			
sourceViewPosition	String	Yes	<p>The position of the Source view pane displaying components in a tree structure. Valid values are <code>bottom</code>, <code>end</code>, <code>start</code>, and <code>top</code>. Default value is <code>top</code>.</p> <p>Alternatively, the Source Position submenu on the View menu on the Composer toolbar provides options to set this attribute at runtime. For more information, see the section, <a href="#">Section 17.5, "Editing Capabilities in Source View in Page Edit Mode."</a></p>
sourceViewSize	String	Yes	<p>The height or width of the Source view pane in pixels.</p> <p>Use this to specify height if the <code>sourceViewPosition</code> is set to <code>top</code> or <code>bottom</code>, or to specify width if <code>sourceViewPosition</code> is set to <code>start</code> or <code>end</code>.</p> <p>Since the default for <code>sourceViewPosition</code> is <code>top</code>, the pane has a default height of 200 pixels.</p> <p>Alternatively, the resize handler on the edge of the Source view pane enables users to alter the height or width of the pane at runtime.</p>
toolbarLayout	String	Yes	<p>The elements to be displayed on the Composer toolbar. This attribute can take a space-separated list of elements.</p> <p>The built in strings the component recognizes are <code>message</code>, <code>stretch</code>, <code>statusindicator</code>, <code>newline</code>, <code>menu</code>, <code>addonpanels</code>, <code>stretch</code>, <code>help</code>, and <code>button</code>.</p> <p>For more information about using this attribute, see <a href="#">Section 20.10, "Customizing the Composer Toolbar."</a></p>
view	String	Yes	<p>The default view in which to open a page in Composer.</p> <p>Available options are <code>design</code> and <code>source</code>. Default value is <code>design</code>.</p> <p>For more information, see <a href="#">Section 21.7, "Configuring an Application Page to Display in Source View by Default."</a></p>
designViews	String	No	<p>The views available to the user in Composer Design view. This attribute can take a space-separated list of elements.</p> <p>Available options are <code>select</code>, <code>add-content</code> and <code>all</code>. Default value is <code>add-content</code>.</p> <p>This setting overrides the global setting <code>&lt;pe:enable-design-views&gt;</code> in <code>adf-config.xml</code>.</p> <p>For more information see <a href="#">Section 20.11, "Enabling Direct Select in Design View."</a></p>

**Table B-1 (Cont.) Attributes of a Page Customizable Component**

Attribute	Type	Supports EL	Description
<b>Style Attributes</b>			
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The <code>inlineStyle</code> is a set of CSS styles that are applied to the root DOM element of the component. If the <code>inlineStyle</code> 's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like <code>::label</code> or <code>::icon-style</code> .
<b>Advanced Attributes</b>			
binding	<code>oracle.adf.view.page.editor.component.PageCustomizable</code>	Supports only EL	An EL reference that stores the component instance on a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
sourceViewNodeAction	String	Yes	The name of the JSPX file to be called if you want to display custom actions against task flows in the component navigator in Composer Source view.  The <code>sourceViewNodeAction</code> attribute can take the name of a JSPX file or an EL value that evaluates to a JSPX file name.  For information about using this attribute, see <a href="#">Section 21.4, "Enabling Custom Actions that Display on Task Flows in the Component Navigator."</a>
allowLabel	Boolean	Yes	Specifies whether label creation must be enabled in the Customization Manager. When <code>allowLabel</code> is set to <code>true</code> , a Save and Label button is displayed on the Composer toolbar. For more information, see <a href="#">Section 17.4.14, "Manage Application Customizations."</a>  This attribute is relevant only if you have configured sandbox support in your application.
catalog	String	Yes	The Resource Catalog to be used as the default one for the application page. Provide the catalog definition file name.  For more information about using multiple Resource Catalogs, see <a href="#">Chapter 15, "Creating and Managing Resource Catalogs."</a>

**Table B–1 (Cont.) Attributes of a Page Customizable Component**

Attribute	Type	Supports EL	Description
allowEL	Boolean	No	<p>Specifies whether or not EL can be run in application pages. Default is true.</p> <p>This setting overrides the <code>&lt;pe:allow-el&gt;</code> setting in <code>adf-config.xml</code>.</p> <p>For more information, see <a href="#">Section 20.4.2, "How to Protect Expression Language."</a></p>
protectEL	Boolean	No	<p>Specifies whether or not EL in form elements is read-only. Default is false.</p> <p>This setting overrides the <code>&lt;pe:protect-el&gt;</code> setting in <code>adf-config.xml</code>.</p> <p>For more information, see <a href="#">Section 20.4.2, "How to Protect Expression Language."</a></p>

**Supported Facets**

The `Page Customizable` component provides an `editor` facet, which is prepopulated with a `Page Editor Panel` component. To ensure that `Composer` works properly, the `editor` facet must contain the `Page Editor Panel` component.

**B.1.2 Change Mode Link and Change Mode Button**

Use the `Change Mode Button` or `Change Mode Link` to enable switching to `Edit` mode of the page at runtime.

The `Change Mode Link` and `Change Mode Button` components share a common set of attributes. [Table B–2](#) describes the attributes of a `Change Mode Link` or `Change Mode Button` component.

**Table B-2 Attributes of a Change Mode Link or Change Mode Button Component**

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
id	String	Yes	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>■ Must not be a zero-length String.</li> <li>■ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
rendered	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>In a secured application, to enable the Edit link or button only for selected users based on specific criteria, you can specify an EL value for the <code>rendered</code> attribute.</p> <p><b>Note:</b> In a secured application, it is recommended that you check all users' privileges and enable the Edit link or button only for privileged users. Unauthenticated users who stumble into page Edit mode can change component properties.</p>
<b>Behavior Attributes</b>			

**Table B–2 (Cont.) Attributes of a Change Mode Link or Change Mode Button Component**

Attribute	Type	Supports EL?	Description
immediate	Boolean	Yes	Specifies whether data validation - client-side or server-side - must be skipped when events are generated by this component. When <code>immediate</code> is true, the command's action and ActionListeners, including the default ActionListener provided by the JavaServer Faces implementation, is executed during the Apply Request Values phase of the request processing lifecycle, rather than waiting until the Invoke Application phase. Because validation runs during Process Validators (after Apply Request Values, but before Invoke Application), setting <code>immediate</code> to true skips validation.
<b>Advanced Attributes</b>			
binding	<code>oracle.adf.view.pagemode.editor.component.ChangeModeLink</code> or <code>oracle.adf.view.pagemode.editor.component.ChangeModeButton</code>	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

If you do not want to use the `Change Mode Link` or `Change Mode Button` component, you can add your own button or link component and use the `ChangeModeLink` or `ChangeModeButton` API to enable the switching of the page mode.

### Disabling Runtime Editing in Your Application Pages

To disable runtime editing of pages, you can revoke Edit privileges for users, or delete the `Change Mode Link` or `Change Mode Button` component from the page so that the user cannot navigate to the Edit mode of the page.

## B.1.3 Layout Customizable Component

The `Layout Customizable` component applies a predefined layout to its child components. It is a container component that enables end users to lay out its child components in several predefined ways. Use the `Layout Customizable` component only to enable changing of the page layout at runtime. If you just want container components in which to layout components, but do not want to enable runtime layout changes, then it is recommended that you use ADF Faces layout components like `Panel Stretch Layout` and `Panel Group Layout`. It is recommended that you have just one `Layout Customizable` on the page.

A `Layout Customizable` component contains a direct child `Panel Customizable` component and two facets with `Panel Customizable` components by default to enable users to add content inside them at runtime. However, you can add any components inside the `Layout Customizable` component and its facets. The content in the three `Panel Customizable` components can be placed in different ways using predefined layouts. For more information, see the section, "[Predefined Layout Types](#)".

Table B-3 describes the attributes of a `Layout Customizable` component.

**Table B-3 Attributes of the Layout Customizable Component**

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>The rendering of a component can also be defined at runtime using the <code>Show Component</code> and <code>Hide Component</code> options.</p>
<code>type</code>	String	Yes	<p>Specifies the layout to be used for the page. You can choose from a list of eight predefined layouts. For more information, see <a href="#">Table B-5</a>.</p> <p>Default value is <code>threeColumn</code>.</p> <p>You can define customization restrictions on a <code>Layout Customizable</code> component. Specifically, if you place a restriction on the <code>type</code> attribute, then layout changer options are shown as disabled and users cannot use them to change the page layout. For more information, see <a href="#">Chapter 23, "Modifying Default Security Behavior of Composer Components."</a></p>
<b>Appearance Attributes</b>			
<code>text</code>	String	Yes	<p>Specifies the text to be displayed for the Change Layout menu.</p> <p>Use the <code>text</code> attribute to provide a descriptive label for the <code>Layout Customizable</code> component so that the component is clearly visible on the page at runtime.</p> <p>For example:</p> <pre>text="Change Layout"</pre>

**Table B-3 (Cont.) Attributes of the Layout Customizable Component**

Attribute	Type	Supports EL?	Description
accessKey	Char	Yes	<p>A character used to gain quick access to this button. For accessibility reasons, this functionality is not supported in screen reader mode.</p> <p>If the same access key appears in multiple input fields in the same page of output, the rendering user agent cycles among the elements accessed by the similar keys. Note that user agents are inconsistent about dealing with two links having same access key, and so the cycling behavior is dependent on what the user agent provides.</p> <p>This attribute is sometimes referred to as the "mnemonic".</p> <p>The character specified by this attribute must exist in the <code>Text</code> attribute of this button instance. If it does not, the user receives no visual indication of the existence of the <code>accessKey</code>. The easiest, and most convenient way to specify both the text and the mnemonic together is to use <code>textAndAccessKey</code>.</p> <p>Note that the <code>accessKey</code> is triggered by browser-specific and platform-specific modifier keys. It even has browser-specific meaning. For example, Internet Explorer 7.0 sets focus when you press <code>Alt+&lt;accessKey&gt;</code>. Firefox 2.0 on some operating systems sets focus when you press <code>Alt+Shift+&lt;accessKey&gt;</code>. Firefox 2.0 on other operating systems set focus when you press <code>Control+&lt;accessKey&gt;</code>. Refer to your browser's documentation for how it treats <code>accessKey</code>.</p>
showIcon	Boolean	Yes	<p>Specifies whether the default <b>Change Layout</b> icon is visible or not.</p> <p>The default value is <code>true</code>.</p>
showLayoutChanger	Boolean	Yes	<p>Specifies whether the <b>Change Layout</b> icon or text must be displayed.</p> <p>The default value is <code>true</code>.</p> <p>When set to <code>true</code>, the runtime behavior of the layout changer is as follows:</p> <ul style="list-style-type: none"> <li>■ Displayed in View mode.</li> <li>■ Displayed in Edit mode.</li> </ul> <p>It is always displayed in Edit mode, even if the value of the <code>showLayoutChanger</code> attribute is <code>false</code>.</p> <ul style="list-style-type: none"> <li>■ If there is a security or MDS restriction on the Layout Customizable component, then the layout changer is not displayed in View or Edit modes.</li> </ul>

**Table B-3 (Cont.) Attributes of the Layout Customizable Component**

Attribute	Type	Supports EL?	Description
showTypes	String	Yes	Specifies the names of predefined layouts that must be displayed in the layout changer. Use this attribute to control the layout options displayed to users. You can provide a space-separated list of layout types. By default, all eight layouts are displayed when a user clicks the Change Layout icon or link.
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the shortDesc is displayed in a note window.
<b>Style Attributes</b>			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The inlineStyle is a set of CSS styles that are applied to the root DOM element of the component. If the inlineStyle's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like ::label or ::icon-style.
<b>Behavior Attributes</b>			
binding	oracle.adf.view.page.editor.component.LayoutCustomizable	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.  For example:  binding="#{yourManagedBean.Binding}"

**Supported Facets**

Table B-4 describes the facets provided for a `Layout Customizable` component.

**Table B-4 Facets of the Layout Customizable Component**

Name	Description
contentA	Prepopulated with a <code>Panel Customizable</code> component. This <code>Panel Customizable</code> contains content to be rendered in area A in the layouts shown in Table B-5.
contentB	Prepopulated with a <code>Panel Customizable</code> component. This <code>Panel Customizable</code> contains content to be rendered in area B in the layouts shown in Table B-5.
facetSeparator	Content to be rendered once between each facet.
separator	Content to be rendered once between each of the other children.

## Predefined Layout Types

When you add a `Layout Customizable` component to the page, three child `Panel Customizable` components are added by default; one direct child and two `Panel Customizable`s in the two facets. However, you can replace the child `Panel Customizable` components with any container components of your choice. When you select the layout type, the components in these `Panel Customizable`s are arranged according to the layout type chosen.

[Table B-5](#) describes the eight layouts that you can apply to your page or an area of the page at design time. To easily describe how components are laid out, let us assume the following:

- The child `Panel Customizable` of `contentA` facet is called **A**.
- The child `Panel Customizable` of `contentB` facet is called **B**.
- The primary `Panel Customizable`, which is a direct child of the `Layout Customizable`, is called **C**.

**Table B-5** Values for Type Attribute of Layout Customizable

Layout Type	Image Showing Content Arrangement
oneColumn	 <p><b>Note:</b> In a <code>oneColumn</code> layout, A and B are rendered only if they contain child components.</p>
threeColumn	
threeColumnNarrow	
twoColumn	
twoColumnBottom	
twoColumnNarrowLeft	
twoColumnNarrowRight	
twoColumnTop	

## B.1.4 Panel Customizable Component

Use the `Panel Customizable` component as a container for page content that can be customized at runtime. You can add content inside a `Panel Customizable` component at runtime using the Resource Catalog. When you add child `Show Detail Frame` components inside a `Panel Customizable`, the `Show Detail`

Frame components provide runtime customization options for arranging or deleting components on the page.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

### Geometry Management

The `Panel Customizable` component can be stretched by a parent layout component that stretches its children, for example, a `Panel Stretch Layout` or `Panel Splitter` component. By setting the `layout` attribute on the `Panel Customizable` component to `stretch`, the child component can be stretched to the size of the `Panel Customizable`.

[Table B-6](#) describes the attributes of a `Panel Customizable` component.

**Table B-6** Attributes of a `Panel Customizable` Component

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>The rendering of a component can also be defined at runtime using the <code>Show Component</code> and <code>Hide Component</code> options.</p>
<code>halign</code>	String	Yes	<p>Specifies the horizontal alignment of child components.</p> <p>You can set horizontal alignment on child components only if the <code>Panel Customizable</code> component has a horizontal or vertical layout.</p> <p>Available values are <code>center</code>, <code>end</code>, <code>left</code>, <code>right</code>, and <code>start</code>. Default value is <code>start</code>.</p>

**Table B-6 (Cont.) Attributes of a Panel Customizable Component**

<b>Attribute</b>	<b>Type</b>	<b>Supports EL?</b>	<b>Description</b>
valign	String	Yes	<p>Specifies the vertical alignment of child components.</p> <p>You can set vertical alignment on child components only if the Panel Customizable component has a horizontal layout.</p> <p>Available values are baseline, bottom, middle, and top. Default value is top.</p>
shortDesc	String	Yes	<p>Specifies a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent. For example, Firefox 2 truncates long tooltips.</p>

**Table B-6 (Cont.) Attributes of a Panel Customizable Component**

Attribute	Type	Supports EL?	Description
layout	String	Yes	<p>Specifies how the children of the <code>Panel Customizable</code> must be laid out.</p> <p>Available options are <code>horizontal</code>, <code>vertical</code>, <code>scroll</code>, <code>stretch</code>, and <code>auto</code>. The default value is <code>vertical</code>.</p> <p>Depending on the value of the <code>layout</code> attribute, child components are laid out as follows:</p> <ul style="list-style-type: none"> <li>■ If you select <code>vertical</code>, then the child components are displayed one below the other and can be moved either up or down within the layout.</li> <li>■ If you select <code>horizontal</code>, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout.</li> <li>■ If you select <code>scroll</code>, then the child components are displayed one below the other, with scroll bars displayed if content overflows.</li> <li>■ If you select <code>stretch</code>, then the first child component is stretched to fill up available space in the <code>Panel Customizable</code> component. Subsequent child components are ignored. However, they are not removed from the page. <ul style="list-style-type: none"> <li>The Add icons for adding new <code>Panel Customizable</code> components adjacent to the selected one are not enabled if you set <code>layout</code> to <code>stretch</code>.</li> </ul> </li> <li>■ If you select <code>auto</code>, the child component is stretched only if the <code>Panel Customizable</code> is stretched by its parent. If not, the content scrolls.</li> </ul>
<b>Style Attributes</b>			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.

**Table B-6 (Cont.) Attributes of a Panel Customizable Component**

Attribute	Type	Supports EL?	Description
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The <code>inlineStyle</code> is a set of CSS styles that are applied to the root DOM element of the component. If the <code>inlineStyle</code> attribute's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like <code>::label</code> or <code>::icon-style</code> .
<b>Behavior Attributes</b>			
allowAction	Boolean	Yes	Determines whether this component allows addition of child components, dragging and dropping <code>Show Detail</code> <code>Frame</code> components inside and from it, and rearranging child components at runtime. It also determines whether the <code>Add Box</code> icons (that enable users to add <code>Box</code> components adjacent to the component) must be rendered on the component.  Available values are <code>none</code> and <code>all</code> . The default value is <code>all</code> .  <b>Note:</b> You can also set this attribute while defining component security in the application's <code>adf-config.xml</code> file. For more information, see <a href="#">Section 23.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."</a>
showEditAction	Boolean	Yes	While in Edit mode, in Design view, renders an <b>Edit</b> icon on the <code>Panel Customizable</code> header that enables users to edit component properties at runtime. Available values are <code>true</code> and <code>false</code> . Default value is <code>true</code> .  This is relevant only in a Composer-enabled page, that is, if the <code>Panel Customizable</code> component is nested within a <code>Page Customizable</code> component.

**Table B-6 (Cont.) Attributes of a Panel Customizable Component**

Attribute	Type	Supports EL?	Description
showSplitAction	Boolean	Yes	<p>In Design view of a page in Edit mode, renders the Add Box icons on the Panel Customizable header that enable users to add Box components above, below, to the left, or right of the selected component. Available values are true and false. Default value is true.</p> <p>This is relevant only in a Composer-enabled page, that is, if the Panel Customizable component is nested within a Page Customizable component. However, the Add Box icons are not displayed on the root Panel Customizable component.</p> <p>Although the default value for this attribute is true, the Add Box icons are not displayed on a component that is stretched.</p>
showTabAction	Boolean	Yes	<p>In Design view of a page in Edit mode, renders the Add a Tab Set or a Tab icon on the Panel Customizable header that enables users to add a tabs to the page. Available values are true and false. Default value is false.</p> <p>This is relevant only in a Composer-enabled page, that is, if the Panel Customizable component is nested within a Page Customizable component.</p>
<b>Advanced Attributes</b>			
binding	oracle.adf.view.page.editor.component.PanelCustomizable	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.

### Supported Facets

The Panel Customizable component supports a separator facet, which can be used to render content once between each of its child components.

### Disabling the Edit Option on a Panel Customizable Component

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all Panel Customizable or Box components that can be edited. To disable property editing on a specific Panel Customizable or Box component in Design view, you must set the showEditAction attribute on the component to false at design time. The **Edit** icon is no longer displayed on the

component in Design view. However, users can still select such a component in Source view and edit its properties.

## B.1.5 Show Detail Frame Component

Add `Show Detail Frame` components inside `Panel Customizable` components to enable runtime customizations like move, minimize, restore, and delete of child components. You can move `Show Detail Frame` components only if they are added inside a `Panel Customizable` component.

### Geometry Management

A `Show Detail Frame` component can be stretched by a parent layout component that stretches its children, for example, `Panel Customizable`.

A `Show Detail Frame` component stretches its child component to fill the height and width available to it. It is recommended that you add only one child component inside a `Show Detail Frame` component. However, if you have more than one child component, the first child component is stretched to the height and width of the `Show Detail Frame`'s content area and subsequent child components are ignored.

The resize handler at the lower right corner of a `Show Detail Frame` enables you to resize the component vertically. From then on, the `Show Detail Frame` cannot be stretched by its parent.

[Table B-7](#) describes the attributes of a `Show Detail Frame` component.

**Table B-7** Attributes of a Show Detail Frame Component

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>The rendering of a component can also be defined at runtime using the <code>Show Component</code> and <code>Hide Component</code> options.</p>

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
text	String	Yes	<p>A title for the Show Detail Frame component.</p> <p>You can change the style of this text using the <code>headerStyle</code> attribute.</p>
icon	String	Yes	<p>If you decide to add an icon on the header of the Show Detail Frame component, then this specifies the URI for the image to be used.</p> <p>For example:</p> <pre>icon="http://source-pc/images/accessability.gif"</pre> <p><b>Note:</b> An image that is stored at the document root does not require a full path. For example:</p> <pre>icon="detail.gif"</pre>
<b>Appearance Attributes</b>			
shortDesc	String	Yes	<p>The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the <code>shortDesc</code> is displayed in a note window.</p>
background	String	Yes	<p>Working with the skin CSS, provides a means of applying a different look and feel for this Show Detail Frame instance.</p> <p>Available values are <code>light</code>, <code>medium</code>, <code>dark</code>, and <code>coreDefault</code>. The default value is <code>medium</code>.</p> <p>The <code>coreDefault</code> value is similar to <code>medium</code>, but additionally it provides a rounded border for the container and renders a shadow. The background in this case would be similar to that of an ADF Faces <code>panelBox</code> component.</p>

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
displayHeader	Boolean	Yes	<p>Indicates whether the header of the Show Detail Frame is displayed.</p> <p>The default value is <code>true</code>.</p> <p>If you choose to set <code>displayHeader</code> to <code>false</code> and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar displays only in Edit mode, if there are actions available on the component.</p>
displayShadow	Boolean	Yes	<p>Specifies whether a shadow is cast by the Show Detail Frame component.</p> <p>The default value is <code>false</code>.</p>
expansionMode	String	Yes	<p>The default state of the Show Detail Frame.</p> <p>Available values are <code>minimized</code> and <code>normal</code>. The default display mode is <code>normal</code>.</p>
<b>Actions Attributes</b>			
displayActions	String	Yes	<p>Specifies when seeded interactions are displayed.</p> <p>Available options are <code>onHover</code> and <code>always</code>. The default is <code>always</code>.</p>
inheritGlobalActions	Boolean	Yes	<p>This attribute is of significance if you add child custom action components, and the attribute specifies whether the global action value of a custom action must override the local value.</p> <p>The default value is <code>false</code>.</p> <p>For information about global custom actions, see <a href="#">Section 21.3.2.2, "Defining Custom Actions at the Global Level."</a></p>

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
showMoveAction	String	Yes	<p>Specifies whether the Move action is available for the component.</p> <p>Available values are:</p> <ul style="list-style-type: none"> <li>▪ menu—Move action is displayed in the Actions menu</li> <li>▪ none—User can move the component by clicking the header and using drag and drop</li> <li>▪ disabled—Component cannot be moved</li> </ul> <p>The default value is menu.</p> <p><b>Note:</b> The disabled option is applicable only in View mode.</p>
showRemoveAction	String	Yes	<p>Renders a <b>Remove</b> icon on the Show Detail Frame header. Clicking this icon removes the component from the page.</p> <p>Available values are chrome and none. The default value is none.</p> <p><b>Note:</b> In page Edit mode, the Remove icon appears regardless of this setting, provided other restrictions have not been applied.</p>
showResizer	String	Yes	<p>Specifies whether a resize handle is displayed on the lower right corner of the Show Detail Frame. You can alter only the height of a Show Detail Frame while resizing it.</p> <p>Available values are never and always. The default value is always.</p>
showMinimizeAction	String	Yes	<p>Specifies whether the minimize action is displayed on the header.</p> <p>Available values are chrome and none. The default is chrome.</p>
showEditAction	Boolean	Yes	<p>While in Edit mode, in Design view, renders an <b>Edit</b> icon on the Show Detail Frame header that enables you to edit component properties at runtime. Default value is true.</p> <p>This is relevant only in a Composer-enabled page, that is, if the Show Detail Frame component is nested within a Page Customizable component.</p>
<b>Style Attributes</b>			

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
contentStyle	String	Yes	<p>The CSS style to apply to the Show Detail Frame content area. Manually enter any style in compliance with CSS version 2.0 or later.</p> <p>The CSS styles in this attribute are commonly used to define the height and background color of the Show Detail Frame. For example, <code>height:200px;</code> <code>background-color:green;</code></p> <p><b>Note:</b> If the Show Detail Frame component is nested inside a Panel Customizable component with a horizontal layout, you must specify a width for the Show Detail Frame component to ensure that it is rendered in page View mode.</p>
styleClass	String	Yes	The CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The <code>inlineStyle</code> is a set of CSS styles that are applied to the root DOM element of the component. If the <code>inlineStyle</code> 's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like <code>::label</code> or <code>::icon-style</code> .
headerStyle	String	Yes	<p>The CSS style to apply to the Show Detail Frame title that is displayed on the header. Manually enter any style in compliance with CSS version 2.0 or later.</p> <p>The CSS styles in this attribute are commonly used to define the font, size, and color of the title text.</p>

**Behavior Attributes**

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

<b>Attribute</b>	<b>Type</b>	<b>Supports EL?</b>	<b>Description</b>
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - ":" pop out of the component's naming container (or itself if the component is a naming container) and begin the search from there, ":::" pop out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	<code>javax.el.MethodExpression</code>	Yes	A method reference to a disclosure listener.  A disclosure event is fired when the user expands or collapses the Show Detail Frame component.

**Table B-7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
stretchContent	String	Yes	<p>Specifies whether the Show Detail Frame stretches its child component.</p> <p>Available options are <code>true</code>, <code>false</code>, and <code>auto</code>. The default value is <code>true</code>.</p> <p>You can use the <code>stretchContent</code> attribute to stretch a child component that supports being stretched. For example, container components like <code>Panel Form Layout</code>, <code>Panel Customizable</code>, and <code>Show Detail Item</code> provide the capability to be stretched.</p> <p>If you select <code>true</code>, then the child component is stretched to the height and width of the Show Detail Frame's content area.</p> <p>The default height of the Show Detail Frame is 200px. The height of the Show Detail Frame is defined using the <code>ContentStyle</code> attribute.</p> <p>If you select <code>auto</code>, the child component is stretched only if the Show Detail Frame is wrapped inside a component that stretches it. If not, <code>stretchContent</code> is set to <code>false</code>.</p>
<b>Advanced Attributes</b>			
binding	<code>oracle.adf.view.page.editor.component.ShowDetailFrame</code>	Supports only EL	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
attributeChangeListener	<code>javax.el.MethodExpression</code>	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change event might include the width of a column that supported client-side resizing.

**Table B–7 (Cont.) Attributes of a Show Detail Frame Component**

Attribute	Type	Supports EL?	Description
selectChild	String	Yes	<p>Specifies whether runtime selection and customization are enabled on child components. This is relevant only in a Composer-enabled page, that is, if the Show Detail Frame component is nested within a Page Customizable component.</p> <p>Default value is <i>yes</i>. However, when you add a task flow as a child of the Show Detail Frame component, this attribute defaults to <i>no</i>.</p> <p>If you select <i>yes</i>, then child components can be selected and customized at runtime.</p>
<b>Other Attributes</b>			
helpTopicID	String	Yes	<p>Specifies a Help topic ID that is used to link to a custom Help topic from the component.</p> <p>To link to a Help topic from your Show Detail Frame component instance, you can either link to an HTML file that is stored directly in your application directory, or to a Help topic that is part of a JAR file.</p>

### Supported Facets

Table B–8 describes the facets available on a Show Detail Frame component.

**Table B–8 Show Detail Frame Facets**

Name	Description
titleBarAction	Used if an action is to be associated with title of the Show Detail Frame component. The component specified by the facet is rendered in place of the Show Detail Frame's <i>text</i> attribute.
additionalActions	Used if some additional actions are to be added to the Actions menu available on the Show Detail Frame header. To ensure that the additional actions appear similar to other actions on the menu, use <i>Command Menu Item</i> components or a <i>Group</i> component with nested <i>Command Menu Item</i> components inside this facet.

### Displaying Child Component Properties Along with Show Detail Frame Properties

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all Show Detail Frame components that can be edited. Clicking this icon invokes the Component Properties dialog in which users can edit the Show Detail Frame's properties. If you want the Component Properties dialog to display the Show Detail Frame's properties and its child component's properties, then you can use the custom attribute, *sdf\_selection\_rule*.

In JDeveloper, right-click the Show Detail Frame component and select **Insert inside cust:showDetailFrame, JSF core**, and then **Attribute**. In the Insert Attribute

dialog, specify `sdf_selection_rule` as the name and `sdf_for_edit_mode_only` as the value. In Source mode, this attribute appears as shown in the following example:

```
<cust:showDetailFrame text="showDetailFrame 1" id="sdf1">
  <f:attribute name="sdf_selection_rule" value="sdf_for_edit_mode_only"/>
</cust:showDetailFrame>
```

### Disabling the Edit Option on a Show Detail Frame Component

When you switch to the Edit mode of a page at runtime, in Design view you will notice an **Edit** icon on all Show Detail Frame components that can be edited. To disable property editing on a specific Show Detail Frame or Movable Box component in Design view, then you can do this by setting the `showEditAction` attribute on the component to `false` at design time. The **Edit** icon is no longer displayed on the component when you enter the Edit mode of the page at runtime. However, users can still select such a component in Source view and edit its properties.

## B.1.6 Custom Action

Use Custom Action components to trigger navigational flow in a task flow when a region is included inside a Show Detail Frame component. You can define custom actions corresponding to the ADFc outcomes of the task flows. At runtime, these custom actions are displayed on the Show Detail Frame header as icons, menu options, or both. A Custom Action must always be defined as a child component of a Show Detail Frame and is useful only when the Show Detail Frame also contains a task flow as its child component.

You can add as many Custom Action components as there are ADFc outcomes in the task flow. If you add a Custom Action attribute without a corresponding ADFc outcome, or if the `action` attribute value does not match an ADFc outcome defined on the view that is currently being displayed by the task flow, then that action is not displayed at runtime.

---

---

**Note:** You can also define custom actions for Show Detail Frame components at the global level. For more information, see [Section 21.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."](#)

---

---

Table B-9 describes the attributes of a Custom Action component.

**Table B–9 Attributes of a Custom Action Component**

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
id	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>■ Must not be a zero-length String.</li> <li>■ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>■ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
action	String	Yes	<p>Specifies the action outcome defined for the task flow. The value of this attribute must match the relevant ADFc outcome in the task flow definition file.</p>
rendered	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>The rendering of a component can also be defined at runtime using the Show Component and Hide Component options.</p>
text	String	Yes	<p>Represents the text of the menu item link.</p> <p>This is applicable for a custom action rendered as a menu item link.</p>
<b>Appearance Attributes</b>			

**Table B-9 (Cont.) Attributes of a Custom Action Component**

Attribute	Type	Supports EL?	Description
icon	String	Yes	<p>For a custom action rendered as a toolbar link, specifies the icon to be rendered on the chrome. For a custom action rendered as a menu item link, this represents the icon to be displayed against the menu item text. This attribute supports these various types of URIs:</p> <ul style="list-style-type: none"> <li>■ absolute - an absolute path to the image, like "http://oracleimg.com/admin/images/ocom/hp/oralogo_small.gif"</li> <li>■ relative - a path located relatively to the source page, like "bullet.jpg"</li> <li>■ context relative - a path relatively based on the web application's context root, like "/images/error.png"</li> <li>■ server relative - a path relatively based on the web server by application name, like "//adf-richclient-demo-context-root/images/error.png"</li> </ul> <p>As icon does not allow alternative text to be provided for the image, in order to create an accessible product an icon must only be used when its use is purely decorative.</p>
shortDesc	String	Yes	<p>Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the shortDesc is displayed in a note window.</p> <p>This is applicable only for a custom action rendered as a toolbar icon.</p>
location	String	Yes	<p>Determines whether the custom action is rendered as a toolbar icon or a menu item link.</p> <p>Available values are chrome, menu, or both. Default value is chrome.</p>
<b>Other Attributes</b>			
actionComponent	String	Yes	<p>Specifies the ID of the command component that must be queued for the action event. When the actionComponent attribute is specified, the Show Detail Frame component queues the action event on this component.</p> <p>For more information, see <a href="#">Section 21.3.2.3, "Configuring Custom Actions that Display Task Flow Views in a Separate Browser Window."</a></p>

## B.1.7 Show Property

Use the `Show Property` component to display an attribute or parameter in a custom property panel at runtime. Use one `Show Property` component for each attribute or parameter that you want to display to users at runtime.

For more information about the `Show Property` component, see [Section 20.3.6, "How to Display Properties and Parameters in a Custom Property Panel."](#)

[Table B–10](#) describes the new attributes of a `Show Property` component.

**Table B–10 Attributes of a Show Property Component**

Attribute	Type	Supports EL?	Description
<b>Common Attributes:</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p> <p>The rendering of a component can also be defined at runtime using the <code>Show Component</code> and <code>Hide Component</code> options.</p>
<code>attributeType</code>	String	Yes	Specifies the property type. Supported values are <code>text</code> , <code>cbox</code> , <code>date</code> , <code>lov</code> .
<code>value</code>	String	Yes	Specifies the current value of the property. If the EL binding for the "value" points to a bean property with a getter but no setter, and this is an editable component, the component will be rendered in read-only mode.
<code>label</code>	String	Yes	Specifies the label of the component. If you want the label to appear above the control, use a <code>panelFormLayout</code> .
<b>Data Attributes:</b>			
<code>selectItem</code>			Specifies the list of values to be displayed if <code>attributeType</code> was set to <code>lov</code> . This attribute takes an EL value that returns the list of values dynamically.
<b>Appearance Attributes:</b>			

**Table B-10 (Cont.) Attributes of a Show Property Component**

Attribute	Type	Supports EL?	Description
columns	Int	Yes	Specifies the size of the text control specified by the number of characters shown. The number of columns is estimated based on the default font size of the browser.
rows	Int	Yes	Specifies the height of the text control specified by the number of characters shown. The default value is 1, which generates a one-row input field. The number of rows is estimated based on the default font size of the browser.
shortDesc	String	Yes	Provides a short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the <code>shortDesc</code> is displayed in a note window.  This is applicable only for a custom action rendered as a toolbar icon.
simple	Boolean	Yes	A boolean value that controls whether the component provides label support; when set to "true", the component will not display the label (these may be ignored: <code>label</code> , <code>labelAndAccessKey</code> , <code>accessKey</code> , <code>showRequired</code> , <code>help facet</code> ) and may use simpler layout primitives. One of the use cases can be when the component is used in repeatable elements like in <code>table</code> , <code>for-each</code> etc., where label is not required.
unselectedLabel			Specifies the label for the option that represents a value of null, meaning nothing is selected. If <code>unselectedLabel</code> is not set and if the component does not have a selected value, then an option with an empty string as the label and value is rendered as the first option in the choice box (if there isn't an empty option already defined). Once an option has been successfully selected, and if <code>unselectedLabel</code> is not set, then the empty option will not be rendered.
<b>Behavior Attributes:</b>			
required	Boolean	Yes	Specifies whether a non-null, non-empty value must be entered. If <code>false</code> , validators will not be executed when the value is null or empty.
autoSubmit	Boolean	Yes	Specifies an attribute which if set to <code>TRUE</code> on a form element, the component will automatically submit when an appropriate action takes place (a click, text change, etc.). Since <code>autoSubmit</code> is a partial submit, also submitted and re-rendered are any other components with <code>partialTriggers</code> pointing to this component.

**Table B-10 (Cont.) Attributes of a Show Property Component**

Attribute	Type	Supports EL?	Description
disabled	Boolean	Yes	Specifies whether the property should be shown as disabled. This is useful if the <code>Show Property</code> component is inside an iterator whose model specifies that the property must be shown as disabled, for example, if an MDS restriction has been applied on the property.
valueChangeListener	<code>javax.faces.el.MethodBinding</code>	EL only	Specifies a method reference to a value change listener.
<b>Advanced Attributes:</b>			
binding	<code>oracle.adf.view.rich.component.fragment.UIXDeclarativeComponent</code>	Supports only EL	Specifies an EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.
clientComponent	Boolean	Yes	Specifies whether a client-side component will be generated. A component may be generated whether or not this flag is set, but if client Javascript requires the component object, this must be set to true to guarantee the component's presence. Client component objects that are generated today by default may not be present in the future; setting this flag is the only way to guarantee a component's presence, and clients cannot rely on implicit behavior. However, there is a performance cost to setting this flag, so clients should avoid turning on client components unless absolutely necessary.
componentId			If you use the <code>Show Property</code> tag in Composer's property panel, <code>componentId</code> specifies the ID of the component for which the property must be rendered.
showELBuilder	Boolean	Yes	Specifies whether to display the EL builder for the property.
showResourceEditor	Boolean	Yes	Specifies whether to display the resource string editor for the property. However, this option is enabled only if you have configured resource string editing in the application and the property is of type <code>String</code> . For more information, see <a href="#">Section 21.12, "Configuring Runtime Resource String Editing."</a>
taskFlowId	String	Yes	If <code>Show Property</code> is used to display task flow parameters, <code>taskFlowId</code> specifies the ID of the task flow.
taskFlowParam	String	Yes	If <code>Show Property</code> is used to display task flow parameters, <code>taskflowParam</code> specifies the task flow parameter that the input field must display.
validator	String	Yes	Specifies a method reference to a validator method.

### Supported Facets

The `Show Property` component supports a `customLink` facet, which can be used to include a `Command Menu Item`. The `Command Menu Item` specified in this facet appears as a custom link in the dropdown next to the property field, along with Resource String editor and EL Builder.

## B.2 Composer-Specific Files and Configurations

This section describes the various files that you can modify to extend Composer capabilities. While some files, for example the Composer extension file, `pe_ext.xml`, are entirely relevant to Composer only, others are ADF configuration files that can take entries for Composer-specific configurations.

This section includes the following topics:

- [Section B.2.1, "pe\\_ext.xml"](#)
- [Section B.2.2, "adf-config.xml"](#)
- [Section B.2.3, "adf-settings.xml"](#)
- [Section B.2.4, "web.xml"](#)

### B.2.1 pe\_ext.xml

You can create a `pe_ext.xml` file and add elements in it to register new Composer add-ons and custom property panels, selectively render panels, register event handlers, and define property filters. This file is not available by default when you add Oracle Components to a page. You can create this file in the `META-INF` directory in your `Portal` project; for example, in the `APPLICATION_HOME\Portal\src\META-INF` directory. This section describes the different elements of the Composer extension file schema and explain when you may want to use the schema elements.

---

---

**Note:** In applications that use shared libraries with their own `pe_ext.xml` file, use the **sequence** element within the `pe-extension` tag to define the order of execution. Use `sequence="first"` to lay down default settings, and `sequence="last"` to load the file last and override settings defined by files loaded previously.

---

---

This section contains the following subsections:

- [Section B.2.1.1, "addon-config"](#)
- [Section B.2.1.2, "property-panels"](#)
- [Section B.2.1.3, "lov-config"](#)
- [Section B.2.1.4, "event-handlers"](#)
- [Section B.2.1.5, "drop-handlers"](#)
- [Section B.2.1.6, "filter-config"](#)
- [Section B.2.1.7, "elbuilder-config"](#)
- [Section B.2.1.8, "selection-config"](#)
- [Section B.2.1.9, "Sample pe\\_ext.xml File"](#)

### B.2.1.1 `addon-config`

Use the `addon-config` element to include entries for new Composer add-ons and custom property panels. For example, to add a new **About** button to your page that invokes a panel displaying information about your application, you must first create a task flow containing the information and then register this task flow in the `pe_ext.xml` file. Composer add-ons declared inside the `addon-config` element are configured in the `adf-config.xml` file, whereas custom property panels declared within the `addon-config` element are configured within the `property-panels` element in the extension file itself.

For information about configuring add-ons in `adf-config.xml`, see [Section B.2.2.2, "addon-panels."](#) For information about configuring custom property panels using the `property-panels` element, see [Section B.2.1.2, "property-panels."](#)

Insert the `addon-config` element within the `pe-extension` tag. You can add only one `addon-config` element in the XML file. Within the `addon-config` element you can have a `panels` element to define add-ons.

#### `panels`

Use the `panels` element to register new add-ons or property panels in Composer. Add the `panels` element within the `addon-config` element. You can have only one `panels` element in an extension file, and all custom panels must be defined inside this element.

#### `panel`

Use `panel` elements to define individual add-ons and property panels to display to users. Within the `panels` element you can insert any number of individual `panel` elements that define the add-ons or property panels to be displayed in Composer. You must have one `panel` element for every add-on or property panel you want to display.

[Table B-11](#) describes the attributes of the `panel` element.

**Table B-11** *panel Element Attributes*

Attribute	Description
<code>name</code>	An identifier that is used while referencing the new add-on in <code>adf-config.xml</code> , or a property panel in the <code>property-panels</code> section. This must be unique in the application.
<code>title</code>	The title to display on the button used to invoke the task flow in Composer. You can use EL for this property to show a localized title. For custom property panels, the title to display on the new tab for that panel.
<code>icon</code>	The icon that appears next to the title on the button. This is optional.
<code>taskflow-id</code>	The ID of the task flow that defines the add-on or property panel.
<code>help-topic-id</code>	A help topic ID that links to a custom help topic from the add-on or property panel. This is optional.

When a `panel` element is deleted from the file, that add-on or property panel is not displayed on the page.

The following example shows how to use the `addon-config`, `panels`, and `panel` elements:

```
<addon-config>
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
          icon="adf/webcenter/images/about.gif"
          taskflow-id="/WEB-INF/about-fod.xml#about-fod"
        />
  </panels>
</addon-config>
```

For more information about add-ons, see [Section 20.2, "Creating Composer Add-Ons."](#)

Optionally, to register an event handler for a specific add-on panel, you can also add an `event-handlers` element inside a `panel` element, as shown in the following example:

```
<event-handlers>
  <event-handler event="close">
    oracle.fod.custom.TaskFlowEventHandler
  </event-handler>
</event-handlers>
```

The XML code is the same as for any generic event handler. For more information, see [Section B.2.1.4, "event-handlers."](#)

### B.2.1.2 property-panels

Use the `property-panels` element to register custom property panels. Add the `property-panels` element within the `addon-config` element. For information about custom property panels, see [Section 20.3, "Creating Custom Property Panels."](#) You can have only one `property-panels` element in an extension file.

#### property-panel

Use the `property-panel` element to define a custom property panel to display for a particular component in Composer. Within the `property-panels` element you can insert any number of individual `property-panel` elements to define custom property panels to display as tabs in the Component Properties dialog. To specify the component or task flow for which you want to register a custom property panel, you must add a `component` or `taskflow-id` element respectively within the `property-panel`.

[Table B-12](#) describes the `property-panel` element attributes.

**Table B-12** *property-panel Element Attributes*

Attribute	Description
name	An identifier for the custom property panel you want to display in the Component Properties dialog.
rendered	Whether this panel is displayed to users in the Component Properties dialog. This can take an EL value.

#### component

Use the `component` element to specify the fully qualified class name of the component for which you are registering the custom property panel. You can have only one `component` inside a `property-panel` element.

**taskflow-id**

Use the `taskflow-id` element to specify the name of the task flow for which you are registering the custom property panel. You can have only one `taskflow-id` inside a `property-panel` element.

**panel**

Use the `panel` element to specify a custom property panel to display as a tab in the Component Properties or Page Properties dialog for the component. Within a `property-panel` element, you can have any number of `panel` elements. [Table B-13](#) describes the attributes of a `panel` element.

**Table B-13** *panel Element Attributes*

Attribute	Description
<code>name</code>	Name with which you declared the panel in the <code>addon-config</code> section.
<code>rendered</code>	Whether the custom property panel must be rendered or not.
<code>parameter</code>	Parameters to be passed to the implementing task flow. Takes an EL only and must return a <code>Map&lt;String, String&gt;</code> .

When a `panel` element is deleted from the file, that property panel is no longer displayed in the Component Properties dialog.

The following example shows how to register a custom property panel for a `Command Button` component:

```
<property-panels>
  <property-panel name="cmdbtn">
    <component>oracle.rich.CommandButton</component>
    <panel name="prop.panel.cmdbtn"/>
  </property-panel>
</property-panels>
```

The following example shows how to register a custom property panel for a task flow:

```
<property-panels>
  <property-panel name="dashboard">
    <taskflow-id>/WEB-INF/dashboard-taskflow#prop-panel</taskflow-id>
    <panel name="dashboard.prop-panel" />
  </property-panel>
</property-panels>
```

**B.2.1.3 lov-config**

Use the `lov-config` element to register a custom List of Values or picker for a task flow parameter. Add the `lov-config` element directly under the `pe-extension` tag. You can have only one `lov-config` element in an extension file. Within this element, you can add a `task-flow-definition` element for each task flow that you want to register for LOV usage. Add an `input-parameter-definition` for each parameter that provides an LOV. Use `enumeration` elements to list the LOV options for a parameter, as shown in the following example:

```
<lov-config>
  <task-flow-definition
taskflow-id="/WEB-INF/employee-details.xml#employee-details">
    <input-parameter-definition>
      <name>Designation</name>
      <enumeration>
```

```

    <item>
      <name>Accounts Manager</name>
      <value>Accounts Manager</value>
      <description>Accounts Manager</description>
    </item>
    <item>
      <name>Accounts Assistant</name>
      <value>Accounts Assistant</value>
      <description>Accounts Assistant</description>
    </item>
    <item>
      <name>Payroll Executive</name>
      <value>Payroll Executive</value>
      <description>Payroll Executive</description>
    </item>
    <item>
      <name>Senior Manager</name>
      <value>Senior Manager</value>
      <description>Senior Manager</description>
    </item>
  </enumeration>
</input-parameter-definition>
</task-flow-definition>
</lov-config>

```

For more information, see [Section 20.5, "Configuring Custom LOVs or Pickers for Task Flow Parameters."](#)

#### B.2.1.4 event-handlers

Use the `event-handlers` element to register handlers for events generated by Composer. Add the `event-handlers` element directly under the `pe-extension` tag. You can have only one `event-handlers` element under `pe-extension`.

Alternatively, to register an event handler for a specific Composer add-on panel, you can also add an `event-handlers` element inside a `panel` element under the `addon-config` section. For more information, see [Section B.2.1.1, "addon-config."](#)

##### event-handler

Use the `event-handler` element to register an event handler in Composer. Within `event-handlers` you can have any number of `event-handler` elements to register handlers for save, close, deletion, addition, and selection events. For example, if you have implemented the `processSave` method in a Java class called `SaveHandler` to perform a specific action when a Save event is invoked, then you can register that implementation in Composer by adding an `event-handler` entry in the `pe_ext.xml` file as follows:

```

<event-handlers>
  <event-handler event="save">view.SaveHandler</event-handler>
</event-handlers>

```

For information about configuring event handlers, see [Section 20.6, "Configuring Event Handlers for Composer UI Events."](#)

#### B.2.1.5 drop-handlers

Use the `drop-handlers` element to register drop handlers to handle addition of components to the page from the Resource Catalog. Add the `drop-handlers`

element directly under the `pe-extension` tag. You can have only one `drop-handlers` element in an extension file.

### drop-handler

Use the `drop-handler` element to register a drop handler in Composer. Within `drop-handlers` you can have any number of `drop-handler` elements to register drop handlers that you created in the application. For example, if you created a drop handler called `TestDropHandler` to handle addition of XML components on the page, then you can register that implementation in Composer by adding a `drop-handler` entry in the `pe_ext.xml` file as follows:

```
<drop-handlers>
  <drop-handler>test.TestDropHandler</drop-handler>
</drop-handlers>
```

For more information, see [Section 20.7, "Configuring Drop Handlers in the Resource Catalog."](#)

### B.2.1.6 filter-config

Use the `filter-config` element to define property filters for components that can be edited at runtime. For a selected component, the Component Properties dialog displays properties that can be edited. If you do not want to expose all properties for editing, you can filter specific properties so that they are not displayed in the Component Properties dialog. You can specify global-level filters to filter common attributes across all components, or you can define tag-level filters to filter properties for a particular component only.

Add the `filter-config` element directly under the `pe-extension` tag. You can have only one `filter-config` element in an extension file.

For information about property filters, see [Section 20.8, "Defining Property Filters."](#)

### global-attribute-filter

Use the `global-attribute-filter` element to filter specific properties across all components. You can have only one `global-attribute-filter` element in the extension file. Within this element you can include any number of `attribute` elements to define property filters for components from different libraries.

### taglib-filter

Use the `taglib-filter` element to define property filters for components within a particular library. You can include multiple `taglib-filter` elements to filter properties for components in different libraries. Within this element you can include `tag` elements for every component belonging to the library.

[Table B-14](#) describes the attribute the `taglib-filter` element can take.

**Table B-14** tag Element Attribute

Attribute	Description
<code>namespace</code>	Namespace of the tag library containing the component whose properties you want to filter.

### tag

Use the `tag` element to specify a component whose properties you want to filter. You can include multiple `tag` elements within a `taglib-filter` element. Within this element you can include `attribute` elements for all properties you want to filter.

Table B–15 describes the attribute the `tag` element can take.

**Table B–15 tag Element Attribute**

Attribute	Description
<code>name</code>	Name of the component whose properties you want to filter, for example, <code>commandButton</code> , <code>portlet</code> .

### attribute

Use the `attribute` element to specify a property to filter either across all components or for the specified component only. To define global-level filters, you must include `attribute` elements inside the `global-attribute-filter`. To define property filters for a particular component, you must include `attribute` elements inside the `taglib-filter` element.

Table B–16 describes the attributes the `attribute` element can take.

**Table B–16 attribute Element Attributes**

Attribute	Description
<code>name</code>	Name of the property you want to filter.
<code>filtered</code>	Whether the property must be filtered or not. Takes a value of <code>true</code> or <code>false</code> . To filter the property in a specific view, use the <code>view</code> attribute.
<code>label</code>	The label for the property in the UI. To retrieve localized strings or show a different label depending on the view, use EL.
<code>view</code>	(Optional) The view in which to show/hide this property. Takes a value of <code>design</code> or <code>source</code> .

The following example shows how you can define global and component-level property filters:

```
<filter-config>
  <global-attribute-filter>
    <attribute name="readOnly" filtered="false" label="Read Only" />
    <attribute name="required" filtered="false" label="Mandatory" />
    <attribute name="shortDesc" filtered="false" label="#{composerBundle.PNL_TB_
SHORTDESC}" />
  </global-attribute-filter>

  <taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
    <tag name="goLink">
      <attribute name="accessKey" view="design" />
      <attribute name="targetFrame" filtered="false" view="source" />
      <attribute name="destination" filtered="false"
label="#{pageEditorPanelBean.layoutView ? 'Where do you want to surf?' :
'Destination'}" />
    </tag>
    <tag name="inputText">
      <attribute name="all" view="design" />
      <attribute name="label" label="Field Name" filtered="false" />
      <attribute name="readOnly" filtered="false" />
      <attribute name="required" filtered="false" />
      <attribute name="rendered" filtered="false" />
      <attribute name="wrap" filtered="false" />
    </tag>
  </taglib-filter>
```

```
</filter-config>
```

### B.2.1.7 elbuilder-config

Use the `elbuilder-config` element to configure custom values for the expression builder. The expression builder invoked from Composer's Component Properties dialog enables users to specify EL values for component properties. Users can either select for a set of predefined values or enter an EL value in the text box. You can customize the expression builder to provide more options to users. For more information, see [Section 20.4, "Extending the Expression Builder."](#)

Add the `elbuilder-config` element directly under the `pe-extension` tag. You can have only one `elbuilder-config` element in an extension file.

#### selector

Use `selector` elements to define and include custom options, as shown in the following example:

```
<elbuilder-config>
  <!-- define selector -->
  <selector id="CustomELParameter">
    view.CustomELParameter
  </selector>

  <!-- include selector -->
  <selectors>
    <selector id="CustomELParameter"/>
  </selectors>
</elbuilder-config>
```

You can include many `selector` elements inside a `selectors` element.

### B.2.1.8 selection-config

Use the `selection-config` element to enable or disable direct select for specific components and define associated operations. To make a component selectable, you must define operations within this tag. For more information, see [Section 20.11, "Enabling Direct Select in Design View."](#)

Within the `<selection-config>` tag, you can configure selection globally using `<global-filter>` and by namespace and tag using `<selection-taglib-filter>`.

#### selection

The `selection` tag is used to enable or disable the associated direct select operations for a specific view. In the current release, direct select options can only be enabled/disabled for the Design view.

#### operation

Available operations are defined within `<operation>` tags under each specific component. The following elements are used to define operations:

- `name`: Defines the operation to be executed. (Use standard or custom operations.)
- `label` (optional): Overrides the operation name as the tab label in the popup window.
- `filtered`: Set to `false` to include the operation in the popup window.

```
<selection-config>
```

```

<global-filter>
  <selection view="design" enabled="false"/>
</global-filter>

<selection-taglib-filter
  namespace="http://xmlns.oracle.com/adf/faces/customizable">
  <tag name="showDetailFrame">
    <selection view="design" enabled="true"/>
    <operation name="oracle.adf.pageeditor.pane.sdfprop"
      label="SDF Change Property"
      filtered="false"/>
  </tag>
</selection-taglib-filter>
</selection-config>

```

### B.2.1.9 Sample pe\_ext.xml File

[Example B-1](#) shows a sample `pe_ext.xml` file with different elements used to extend Composer capabilities.

#### **Example B-1** Sample `pe_ext.xml` File

```

<pe-extension xmlns="http://xmlns.oracle.com/adf/pageeditor/extension">

<addon-config>
<!-- Composer add-on panels configuration -->
  <panels>
    <panel name="oracle.fod.custom.panel" title="About FOD"
      icon="adf/webcenter/images/about.gif"
      taskflow-id="/WEB-INF/about-fod.xml#about-fod"/>
  </panels>

<!-- Composer property panels configuration -->
  <property-panels>
    <property-panel name="cmdbtn">
      <component>oracle.rich.CommandButton</component>
      <panel name="prop.panel.cmdbtn" />
    </property-panel>
  </property-panels>
</addon-config>

<Save event handler configuration -->
  <event-handlers>
    <event-handler event="save">view.SaveHandler</event-handler>
  </event-handlers>

<!-- Test drop handler configuration -->
  <drop-handlers>
    <drop-handler>test.TestDropHandler</drop-handler>
  </drop-handlers>

<!-- Property filter configuration. Properties defined here are not displayed in
Composer. -->
  <filter-config>
    <global-attribute-filter>
      <attribute name="accessKey" />
      <attribute name="attributeChangeListener" />
      <attribute name="autoSubmit" />
      <attribute name="binding" />
    </global-attribute-filter>

```

```
<taglib-filter namespace="http://xmlns.oracle.com/adf/faces/rich">
  <tag name="commandButton">
    <attribute name="text" />
    <attribute name="icon" />
  </tag>
</filter-config>
</pe-extension>
```

## B.2.2 adf-config.xml

The `adf-config.xml` file specifies application-level settings that are usually determined at deployment and are often changed at runtime. This file is created when you create your application and is located in the ADF META-INF folder under Descriptors in the Application Resources panel. The following example shows the minimal `adf-config.xml` file created when you create a Framework application:

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="Application4-2138" />
  </adf:adf-properties-child>
</adf-config>
```

When you add the Page Customizable component to a page, certain required configurations are added to the `adf-config.xml` file.

You must update the `adf-config.xml` file when you perform tasks such as registering new add-ons and custom property panels, selectively rendering add-ons, creating customization layers, enabling and disabling the Composer sandbox, creating custom Resource Catalogs, and disabling Source view. The following sections describe the various `adf-config.xml` elements used for Composer-specific configurations.

This section contains the following subsections:

- [Section B.2.2.1, "page-editor-config"](#)
- [Section B.2.2.2, "addon-panels"](#)
- [Section B.2.2.3, "sandbox-namespaces"](#)
- [Section B.2.2.4, "session-options-factory"](#)
- [Section B.2.2.5, "enable-design-views"](#)
- [Section B.2.2.6, "allow-el and protect-el"](#)
- [Section B.2.2.7, "rcv-config"](#)
- [Section B.2.2.8, "customizableComponentsSecurity"](#)
- [Section B.2.2.9, "mds-config"](#)
- [Section B.2.2.10, "resource-string-editor"](#)
- [Section B.2.2.11, "enable-source-view"](#)
- [Section B.2.2.12, "enable-zoom"](#)
- [Section B.2.2.13, "persistent-change-manager"](#)
- [Section B.2.2.14, "taglib-config"](#)
- [Section B.2.2.15, "security-config"](#)
- [Section B.2.2.16, "Sample adf-config.xml File"](#)

### B.2.2.1 page-editor-config

Use the `<pe:page-editor-config>` element to include Composer-specific configurations such as add-on panel registration, sandbox configuration, resource string editor configuration, and so on. Add the `<pe:page-editor-config>` element within the `adf-config` tag as shown in the following example:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
            xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
            xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
  </pe:page-editor-config>
</adf-config>
```

### B.2.2.2 addon-panels

Use the `<pe:addon-panels>` element to register custom add-ons and property panels in Composer. Insert the `<pe:addon-panels>` element within `<pe:page-editor-config>`. You can have only one `<pe:addon-panels>` element in the file, however, within `<pe:addon-panels>` you can have any number of `<pe:addon-panel>` elements to register custom panels. For more information about Composer add-ons and property panels, see [Section 20.2, "Creating Composer Add-Ons"](#) and [Section 20.3, "Creating Custom Property Panels."](#)

#### addon-panel

Use a `<pe:addon-panel>` element to register an add-on in the `adf-config.xml` file. A `<pe:addon-panel>` element must only be included inside the `<pe:addon-panels>` element. You can have any number of `<pe:addon-panel>` elements to register custom panels. The following example shows how you can register a new add-on using these elements:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  <pe:addon-panels>
    <!-- Page Properties add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-settings" />

    <!-- Page Reset add-on -->
    <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-reset" />

    <pe:addon-panel name="oracle.fod.custom.panel" />

  </pe:addon-panels>
  . . .
</pe:page-editor-config>
```

The `<pe:addon-panel>` element also supports the `rendered` attribute. This attribute can take an EL value and specifies whether the panel must be rendered in Composer or not.

When registering custom add-ons, you must also include entries for the default add-ons. If the default add-ons are not registered, then only your custom add-on is available in Composer.

The `<pe:addon-panel>` element supports the following parameters:

- **rendered:** Use to specify whether the add-on must be rendered or not. The `rendered` attribute can take `true`, `false`, or an EL value. Use this attribute to display an add-on conditionally based on specific criteria.

- **parameters:** Use to declaratively pass parameters to the add-on task flow. The `parameters` attribute takes an EL value as shown in the following example:

```
<pe:addon-panels>
  <pe:addon-panel
    name="oracle.adf.pageeditor.addonpanels.customization-manager"
    parameters="#{AppUtilBean.customizationManagerParams}"/>
    . . .
</pe:addon-panels>
```

where `AppUtilBean` provides the logic to pass parameters to the add-on task flow.

### B.2.2.3 sandbox-namespaces

Use the `<pe:sandbox-namespaces>` element to register namespaces for all metadata for which you want to enable sandbox creation at runtime. For more information about enabling sandbox creation, see [Section 22.2.1, "How to Enable Composer Sandbox Creation."](#)

Insert the `<pe:sandbox-namespaces>` element within the `<pe:page-editor-config>` element. The following example shows how to use the `sandbox-namespaces` element:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:sandbox-namespaces>
    <pe:namespace path="/pages"/>
    <pe:namespace path="/pageDefs"/>
  </pe:sandbox-namespaces>
</pe:page-editor-config>
```

### B.2.2.4 session-options-factory

When creating customization layers in your application, use the `<pe:session-options-factory>` element to register the `ComposerSessionOptionsFactory` implementation with Composer. This class contains the logic to save customizations in different layers based on the specified criteria. For more information, see [Section 22.3, "Adding Customization Layers to View and Edit Modes: Example."](#)

The following example shows how to register a class named `AppsSessionOptionsFactoryImpl`:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .

  <pe:session-options-factory>view.AppsSessionOptionsFactoryImpl</pe:session-options-factory>
</pe:page-editor-config>
```

### B.2.2.5 enable-design-views

To enable Composer direct select, you must first enable the select view. For more information on direct select functionality, see [Section 20.11, "Enabling Direct Select in Design View."](#) Add the `<pe:enable-design-views>` tag inside the `<pe:page-editor-config>` tag to define the available views. The possible values are:

- `select`: Makes the direct select view the only view.
- `add-content` (default): Makes the legacy view the only view.

- `all`: Displays a toggle button to switch between views.

By default the hot key to switch between views is Ctrl-Shift-S. To change or disable the hot key, add a `<pe:component-view-switch-key>` tag inside the `<pe:page-editor-config>` tag. For example:

```
<pe:component-view-switch-key>
  <pe:enabled>true</pe:enabled>
  <pe:key-sequence>ctrl shift l</pe:key-sequence>
</pe:component-view-switch-key>
```

### B.2.2.6 allow-el and protect-el

You can configure Composer to disable EL or protect existing EL from overwrite. Use `<pe:allow-el>` to define whether or not EL can be run in application pages. The default is true. Use `<pe:protect-el>` to define whether or not EL in form elements can be edited. The default is false. For more information, see [Section 20.4.2, "How to Protect Expression Language."](#)

The following example disables EL:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
  . . .
  <pe:allow-el>false</pe:allow-el>
</pe:page-editor-config>
```

### B.2.2.7 rcv-config

Use the `<rcv-config>` element to register custom Resource Catalogs with Composer and to register the `ResourceCatalogSelector` implementation when using multiple Resource Catalogs.

If you want to display a custom Resource Catalog to users in place of the default one, you must first create a catalog definition file with the required content and then register this catalog definition in the Composer extension file and `adf-config.xml` file. The custom Resource Catalog is then displayed when a user clicks an Add Content button on the page. For more information, see [Section 15.2, "Creating a Custom Resource Catalog."](#)

Insert the `<rcv-config>` element within the `adf-config` tag. The following example shows how you can use the `<rcv-config>` element to register a custom catalog called `users-catalog`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
    <default-catalog catalog-name="users-catalog"/>
  </rcv-config>
</adf-config>
```

You can also configure multiple Resource Catalogs with Composer so that different catalogs are displayed to different users depending on the specified criteria. When configuring multiple Resource Catalogs, use the `<rcv-config>` element with a `<catalog-selector>` element to register the `ResourceCatalogSelector` implementation, which contains the logic for selecting a Resource Catalog.

The following example shows how you can use the `<rcv-config>` element to register a `ResourceCatalogSelector` implementation called `CatalogSelector`:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
```

```

xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
. . .
<rcv-config xmlns="http://xmlns.oracle.com/adf/rcs/viewer/adf-config">
  <catalog-selector class-name="webcenter.CatalogSelector"/>
  <default-catalog catalog-name="default-catalog"/>
</rcv-config>
</adf-config>

```

### B.2.2.8 customizableComponentsSecurity

Use the `<customizableComponentsSecurity>` element to apply restrictions on Show Detail Frame actions. Insert the `<customizableComponentsSecurity>` element within the `adf-config` tag.

Within the `<customizableComponentsSecurity>` element, you can specify the `<enableSecurity>`, `<actionsCategory>`, `<actions>`, and `<custom-actions>` elements.

#### enableSecurity

Use the `<enableSecurity>` element to override the security inheritance behavior on Show Detail Frame actions. This element can take a value of `true` or `false`. If set to `true`, then the ability for a user to modify a component is first determined from the page permissions and then adjusted according to the current set of actions defined for that type of permission. If set to `false`, then all actions are available to users. A user's page permissions and actions configured in `adf-config.xml` are ignored.

#### actionsCategory

Use the `<actionsCategory>` element to apply restrictions on a group of Show Detail Frame actions simultaneously. Within the `<actionsCategory>` element, you can have `<actionCategory>` elements for the supported categories. For more information about action categories, see [Section 23.5.2, "Defining Security at the Actions Category Level."](#)

The following example shows how `actionsCategory` can be used:

```

<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
. . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>

  <cust:actionsCategory>
    <cust:actionCategory name="personalizeActionsCategory" value="false"/>
    <cust:actionCategory name="editActionsCategory" value="true"/>
  </cust:actionsCategory>

  <cust:actions>
    . . .
  </cust:actions>

  </cust:customizableComponentsSecurity>
</adf-config>

```

**actions**

Use the `<actions>` element to apply restrictions on individual actions. Within each actions element, you can have `<action>` elements for all supported actions.

The following example shows how `<actions>` can be used:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  . . .
  <cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>

  <cust:actionsCategory>
  . . .
  </cust:actionsCategory>

  <cust:actions>
  <cust:action name="showMinimizeAction" value="true"/>
  <cust:action name="showMoveAction" value="false"/>
  </cust:actions>

  </cust:customizableComponentsSecurity>
</adf-config>
```

For more information about applying action-level restrictions, see [Section 23.5, "Applying Action-Level Restrictions on Panel Customizable and Show Detail Component Actions."](#)

**custom-actions**

Use the `<custom-actions>` element to define custom actions to display along with the other Show Detail Frame actions. You must add only one `<custom-actions>` element inside the `customizableComponentsSecurity` section. Within this you can add any number of `<custom-action>` elements to define individual custom actions.

---

---

**Note:** Alternatively, you can add a `<custom-actions>` element inside an `<adf-config-child>` element instead of inside the `<customizableComponentsSecurity>` section.

---

---

For more information about custom actions, see [Section 21.3.2, "How to Enable Custom Actions on a Show Detail Frame Enclosing a Task Flow."](#)

**B.2.2.9 mds-config**

When defining type-level application customization restrictions on components, use the `<mds-config>` element to register a standalone XML file describing the restrictions to be applied on specific components. For information about applying type-level restrictions, see [Section 23.1.1, "How to Define Type-Level Customization Policies."](#)

Insert the `<mds-config>` element within the `<adf-config>` tag. You can add the `<mds-config>` element as follows:

```
<mds-config xmlns="http://xmlns.oracle.com/mds/config">
  <type-config>
  <standalone-definitions>
```

```
        <file>Directory_Name/standalone.xml</file>
    </standalone-definitions>
</type-config>
</mds-config>
```

### B.2.2.10 resource-string-editor

Use a `<pe:resource-string-editor>` element to enable resource string editing in your application. Insert the `<pe:resource-string-editor>` element within the `<pe:page-editor-config>` section, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
    <pe:resource-string-editor>
        <pe:enabled>true</pe:enabled>
    </pe:resource-string-editor>
</pe:page-editor-config>
```

For more information, see [Section 21.12, "Configuring Runtime Resource String Editing."](#)

### B.2.2.11 enable-source-view

Use the `<pe:enable-source-view>` element to enable or disable Source view in Composer. Insert the `<pe:enable-source-view>` element within the `<pe:page-editor-config>` section. Source view is enabled by default in Composer. You can disable it by setting `<pe:enable-source-view>` to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
    <pe:enable-source-view>>false</pe:enable-source-view>
</pe:page-editor-config>
```

For more information, see [Section 21.8, "Disabling the Source View Menu for an Application."](#)

### B.2.2.12 enable-zoom

Use the `<pe:enable-zoom>` element to enable or disable the capability to zoom into task flows in Composer. Insert the `<pe:enable-zoom>` element within a `<pe:source-view>` tag in the `<pe:page-editor-config>` section. Task flow zoom is enabled by default in Composer. You can disable it by setting `<pe:enable-zoom>` to false, as shown in the following example:

```
<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">
    . . .
    <pe:source-view>
        <pe:enable-zoom>>false</pe:enable-zoom>
    </pe:source-view>
</pe:page-editor-config>
```

For more information, see [Section 21.9, "Disabling Task Flow Zoom Capability."](#)

### B.2.2.13 persistent-change-manager

Use this to configure the change manager to be used for persisting changes made in Composer. Insert the `<persistent-change-manager>` element within the `<adf-faces-config>` section. You must set `<persistent-change-manager>` to

MDSDocumentChangeManager as follows if you want to persist application customizations to MDS:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
  <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMan
ger</persistent-change-manager-class>
  </persistent-change-manager>
. . .
</adf-faces-config>
```

For more information about change persistence in Composer, see [Section 21.11, "Configuring the Persistence Change Manager."](#)

For more information about the `<persistent-change-manager>` element, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

### B.2.2.14 taglib-config

Use the `<taglib-config>` element to specify the component tags that must be persisted by default. This element is relevant only when you define change persistence using `<persistent-change-manager>` in your `adf-config.xml` file.

When you add Composer components to the page, the `adf-config.xml` file is populated with the `<taglib-config>` element containing a list of tags and attributes that must be persisted. You can add more elements and attributes to the default list.

For more information about this element, see *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

Insert the `<taglib-config>` element within the `<adf-faces-config>` section. The `<taglib-config>` element appears as shown in the following example:

```
<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">
. . .
  <taglib-config>
    <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
      <tag name="showDetailFrame">
        <persist-operations>all</persist-operations>
        <attribute name="expansionMode">
          <persist-changes>true</persist-changes>
        </attribute>
        <attribute name="contentStyle">
          <persist-changes>true</persist-changes>
        </attribute>
      </tag>
      <tag name="panelCustomizable">
        <persist-operations>all</persist-operations>
      </tag>
    </taglib>
  </taglib-config>
</adf-faces-config>
```

For more information, see [Section 21.11, "Configuring the Persistence Change Manager."](#)

### B.2.2.15 security-config

Use this to override Composer-specific security configurations, specifically if you want to override the default security policies with application-level checks. Insert the

<pe:security-config> element inside the <pe:page-editor-config> section. Within the security-config element, you can define <pe:security-policies>, <pe:security-policy>, <pe:policy-class>, and <pe:task-flow-security> elements.

### security-policies

Use this to encompass all the security policies and policy overrides for Composer. You can have only one <pe:security-policies> element under the <pe:page-editor-config> section.

### security-policy

Use this to override an existing policy. Add one <pe:security-policy> element for each policy that you want to override.

The <pe:security-policy> element supports the name and override attributes, where name is used to specify a name with which to register the custom policy and override is used to specify the name of the default policy that you want to override.

### policy-class

Use this to specify the name of the custom security policy.

### task-flow-security

Use this element, along with the check-permission attribute, to enable Composer to check for a task flow's permissions so that only users with appropriate privileges are allowed to edit or customize the task flow at runtime.

For more information, see [Section 23.6, "Implementing Task Flow Security."](#)

## B.2.2.16 Sample adf-config.xml File

[Example B-2](#) shows a sample adf-config.xml file with Composer-specific configurations.

### Example B-2 Sample adf-config.xml File with Composer-Specific Configurations

```
<?xml version="1.0" encoding="windows-1252" ?>
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:adf="http://xmlns.oracle.com/adf/config/properties"
  xmlns:mdsC="http://xmlns.oracle.com/adf/mds/config">
  <adf:adf-properties-child xmlns="http://xmlns.oracle.com/adf/config/properties">
    <adf-property name="adfAppUID" value="configfilesapp-7198"/>
  </adf:adf-properties-child>

  <mdsC:adf-mds-config version="11.1.1.000">
    <mds-config xmlns="http://xmlns.oracle.com/mds/config">
      <persistence-config>
        <metadata-namespaces>
          <namespace path="/oracle/adf/rc/metadata"
            metadata-store-usage="WebCenterFileMetadataStore"/>
          <namespace path="/persdef/"
            metadata-store-usage="WebCenterFileMetadataStore"/>

          <!-- Namespace definitions for Composer sandbox -->
          <!-- Your jspc customizations alone go here -->
          <namespace path="/pages"
            metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
          </namespace>
        </metadata-namespaces>
      </persistence-config>
    </mds-config>
  </adf-mds-config>
</adf-config>
```

```

        <!-- Your pagedef customizations alone go here -->
        <namespace path="/pageDefs"
metadata-store-usage="WebCenterFileMetadataStore">
            <namespace-restriction type="CUSTOMIZATIONS"/>
        </namespace>
    </metadata-namespaces>
    <metadata-store-usages>
        <metadata-store-usage id="WebCenterFileMetadataStore"
                                default-cust-store="true">
            <metadata-store
class-name="oracle.mds.dt.persistence.stores.file.SrcControlFileMetadataStore">
                <property name="metadata-path" value="../../mds"/>
            </metadata-store>
        </metadata-store-usage>
    </metadata-store-usages>
</persistence-config>
<cust-config>
    <match>
        <customization-class name="oracle.adf.share.config.SiteCC"/>
    </match>
</cust-config>
<cache-config>
    <max-size-kb>100000</max-size-kb>
</cache-config>

    <!-- Registration of a standalone XML file used for type-level customization
policies -->
    <type-config>
        <standalone-definitions>
            <file>Directory_Name/standalone.xml</file>
        </standalone-definitions>
    </type-config>
</mds-config>
</mdsC:adf-mds-config>

<pe:page-editor-config xmlns="http://xmlns.oracle.com/adf/pageeditor/config">

    <!-- Composer add-on panel configuration -->
    <pe:addon-panels>
        <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-settings" />
        <pe:addon-panel name="oracle.adf.pageeditor.addonpanels.page-reset" />
        <pe:addon-panel name="oracle.fod.custom.panel" />
    </pe:addon-panels>

    <!-- Composer sandbox configuration -->
    <pe:sandbox-namespaces>
        <pe:namespace path="/pages"/>
        <pe:namespace path="/pageDefs"/>
    </pe:sandbox-namespaces>

    <!-- ComposerSessionOptionsFactory class registration for implementing
customization layers -->

    <pe:session-options-factory>view.AppsSessionOptionsFactoryImpl</pe:session-options

  <default-catalog catalog-name="users-catalog"/>
</rcv-config>

<!-- Composer and WebCenter Portal Customizable Components actions security
configuration -->
<cust:customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
  <cust:enableSecurity value="true"/>
  <cust:actionsCategory>
    <cust:actionCategory name="personalizeActionsCategory" value="false"/>
    <cust:actionCategory name="editActionsCategory" value="true"/>
  </cust:actionsCategory>
  <cust:actions>
    <cust:action name="showMinimizeAction" value="true"/>
    <cust:action name="showMoveAction" value="false"/>
  </cust:actions>
</cust:customizableComponentsSecurity>

<adf-faces-config xmlns="http://xmlns.oracle.com/adf/faces/config">

  <!-- Composer persistence change manager configuration -->
  <persistent-change-manager>

<persistent-change-manager-class>oracle.adf.view.rich.change.MDSDocumentChangeMana
ger</persistent-change-manager-class>
  </persistent-change-manager>

  <!-- Composer default persistence configuration -->
  <taglib-config>
    <taglib uri="http://xmlns.oracle.com/adf/faces/customizable">
      <tag name="showDetailFrame">
        <persist-operations>all</persist-operations>
        <attribute name="expansionMode">
          <persist-changes>true</persist-changes>
        </attribute>
        <attribute name="contentStyle">
          <persist-changes>true</persist-changes>
        </attribute>
      </tag>
      <tag name="panelCustomizable">
        <persist-operations>all</persist-operations>
      </tag>
    </taglib>
  </taglib-config>
</adf-faces-config>
</adf-config>
```

## B.2.3 adf-settings.xml

The `adf-settings.xml` file, in addition to holding generic project- and library-level settings, can also be used to define custom actions on task flows. This section describes the `adf-settings.xml` configurations specific to Composer.

### B.2.3.1 custComps-config

Use the `custComps-config` element to define custom actions on task flows consumed in the application. At runtime, the custom actions configurations in the application's `adf-config.xml` and `adf-settings.xml` files are picked up and appropriate actions are displayed on the `Show Detail Frame` component surrounding a task flow. For more information, see [Section 21.3, "Enabling Custom Actions on a Task Flow."](#)

Insert the `custComps-config` element within the `adf-settings` tag. Within the `custComps-config` element, you can specify the `customActions` element.

#### customActions

Use the `customActions` element in the `adf-settings.xml` file to define actions that you want to display on task flows. The custom actions defined here will be displayed along with the other actions on the surrounding `Show Detail Frame` component. You must add only one `customActions` element inside the `custComps-config` section. Within the `customActions` element you can add any number of `customAction` elements to define individual custom actions, as shown in the following example:

```
<customActions>
  <customAction action="next" location="chrome"
    rendered="true"
    icon="/adf/webcenter/editheader_ena.png"
    text="Next"

taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
  shortDesc="next"/>
  <customAction action="prev" location="chrome"
    rendered="true"
    icon="/adf/webcenter/editheader_ena.png"
    text="Previous"
taskFlowId="/WEB-INF/task-flow-definition.xml#task-flow-definition"
  shortDesc="prev"/>
</customActions>
```

## B.2.4 web.xml

The `web.xml` file is a Java EE standard descriptor that contains details about web applications. When you add a `Page Customizable` component to your page, the `web.xml` file available in the `Application_Root\Project_Name\public_html\WEB-INF` directory is updated to enable change persistence among other settings.

You must update `web.xml` further when creating an application that uses multiple customization layers and when enabling Composer sandbox. The following sections describe the `web.xml` configurations specific to Composer.

### B.2.4.1 CHANGE\_PERSISTENCE Context Parameter

The `CHANGE_PERSISTENCE` context parameter in the application's `web.xml` file specifies how application customizations are persisted. To enable changes in a

Composer-enabled page to be persisted in MDS, you must ensure that the `CHANGE_PERSISTENCE` context parameter is set to `ComposerChangeManager`, as shown in the following example:

```
<context-param>
  <param-name>org.apache.myfaces.trinidad.CHANGE_PERSISTENCE</param-name>

  <param-value>oracle.adf.view.page.editor.change.ComposerChangeManager</param-value
  >
</context-param>
```

This context parameter registers the `ChangeManager` class to be used to ensure persistence to MDS. This configuration happens automatically when you add a `Page Customizable` component to a page in a new Framework application. However, in an existing ADF application, this context parameter may be set to some other value, for example `session` or `oracle.adf.view.rich.change.FilteredPersistenceChangeManager`. Therefore, when you add Composer components to such an application, you must ensure that the `CHANGE_PERSISTENCE` parameter is set to `ComposerChangeManager`.

For more information, see [Section 21.11, "Configuring the Persistence Change Manager."](#)

#### B.2.4.2 WebCenterComposerFilter

Use `WebCenterComposerFilter` in the `web.xml` file to register Composer's `ComposerSessionOptionsFactory` with Oracle ADF for every HTTP request. The request is then handled depending on your implementation of `ComposerSessionOptionsFactory`. This filter can be defined as shown in the following example:

```
<filter-mapping>
<filter-name>WebCenterComposerFilter</filter-name>
  <url-pattern>/faces/*</url-pattern>
  <dispatcher>FORWARD</dispatcher>
  <dispatcher>REQUEST</dispatcher>
</filter-mapping>
```

You must use `WebCenterComposerFilter` if you are performing the following tasks:

- Creating customization layers. For information, see [Section 22.3, "Adding Customization Layers to View and Edit Modes: Example."](#)
- Enabling sandbox creation in Composer. For more information, see [Section 22.2.1, "How to Enable Composer Sandbox Creation."](#)

## B.3 Composer Default Add-Ons and Property Panels

This section lists the add-ons and property panels available by default in Composer.

### B.3.1 Default Add-Ons

This section lists the add-ons available in Composer and provides the names with which these add-ons are registered in the `adf-config.xml` file. It is useful to know these names as you will need them to enable or disable the display of the add-ons in your application.

- **Page Properties**

Used to edit page properties and create page parameters.

This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.page-settings` in the `adf-config.xml` file.

- **Reset Page**

Used to reset page customizations.

This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.page-reset` in the `adf-config.xml` file.

- **Customization Manager**

Used to manage customizations made to pages and task flows.

This add-on is registered with the name `oracle.adf.pageeditor.addonpanels.customization-manager` in the `adf-config.xml` file.

The Page Properties and Reset Page add-ons are rendered by default. If you create custom add-ons in your application, while registering those add-ons in `adf-config.xml`, you must also include the entries for the default add-ons. Without these, the default add-ons are not displayed in Composer. For information about add-ons, see [Section 20.2, "Creating Composer Add-Ons."](#)

## B.3.2 Default Property Panels

This section lists the property panels available by default in the Component Properties and Page Properties dialogs and provides the names with which these panels are registered in the `pe_ext.xml` file. These names are useful if you choose to override the default panels with custom property panels, or hide some or all of the default panels. You can also enable specific panels for display in Composer Design view; for details, see [Section 20.11, "Enabling Direct Select in Design View."](#)

For information about creating property panels, see [Section 20.3, "Creating Custom Property Panels."](#)

- **Display Options**

Used to define display-related behavior of a component. This panel is displayed in the Component Properties dialog for all components.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.generic-property-inspector`.

- **Display Options (Show Detail Frame)**

Used to define display-related behavior of a Show Detail Frame component. This panel is displayed in the Component Properties dialog for a Show Detail Frame component only.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.sdfprop`.

- **Tabs**

Used to define the display properties and order of tabs on a `Panel Customizable` or `Box` component. This panel is displayed in the Component Properties dialog for a `Panel Tabbed` or `Panel Customizable` component. The panel is displayed for a `Panel Customizable` component only if the component has tabs on it.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.panel-tabbed`.

- **Style**

Used to define the appearance of the component instance. This panel is displayed in the Component Properties dialog for all components.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.inline-style-editor`.

- **Content Style**

Used to define the appearance of content inside a component instance. This panel is displayed in the Component Properties dialog for all components.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.content-style-editor`.

- **Events**

Used to wire a contextual event to an action handler to enable the passing of values from a producer component to a consumer component when the event is triggered on the producer. This panel displays in the Component Properties dialog for all components.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.events`.

- **Region Parameters**

Used to define parameters for the task flow region. This panel displays in the Component Properties dialog only for task flow regions.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.region-param`.

- **Portlet Parameters**

Used to define portlet parameters. This panel displays in the Component Properties dialog only for portlets.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.portlet-param`.

- **Layout Customizable**

Used to define the layout for page components by selecting from a set of predefined layouts. This panel displays in the Component Properties dialog only for `Layout Customizable` components.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.layout-cust-prop`.

- **Child Components**

Used to rearrange and show or hide child components inside a `Panel Customizable` component. This panel displays only for `Panel Customizable` components

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.adf.pageeditor.pane.child-navigator`.

- **Page Parameters**

Used to define the page parameters that can be wired to components on the page. This panel displays in the Page Properties dialog.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-param`.

- **Page Security**

Used to define page permissions. This panel displays in the Page Properties dialog for secured application pages.

In the `pe_ext.xml` file, this panel is referenced with the name `oracle.webcenter.page.pane.page-sec`.

## B.4 Composer Components Style-Specific Properties

This section includes a series of tables that describe the style selectors associated with Composer components. Additionally, it describes how to use the `background` property to choose one of three skin-defined looks for these components.

This section contains the following subsections:

- [Section B.4.1, "Style Selectors for Composer Components"](#)
- [Section B.4.2, "Style Attributes"](#)

### B.4.1 Style Selectors for Composer Components

Use a style selector to describe an element's appearance by identifying the element and defining styles for it.

This section contains the following subsections:

- [Global Style Selectors](#)
- [Composer Status Indicator Style Selectors](#)
- [Page Customizable Style Selectors](#)
- [Layout Customizable Style Selectors](#)
- [Panel Customizable Style Selectors](#)
- [Show Detail Frame Style Selectors](#)

#### B.4.1.1 Global Style Selectors

Use global style selectors to define styles for multiple components within the application. [Table B-17](#) lists and describes the global style selectors relevant to Composer components.

**Table B-17 Global Style Selectors**

Style Selector	Description
<code>.ComposerDark:alias</code>	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of <i>dark</i> .
<code>.ComposerLight:alias</code>	Specifies the default color for toolbars, headers, and so on in Composer, with a color scheme of <i>light</i> .
<code>.ComposerBackground</code>	Specifies the color scheme for Composer dialogs, such as the Component Properties and Page Properties dialogs.

**Table B-17 (Cont.) Global Style Selectors**

Style Selector	Description
.ComposerBorder	Specifies the border, width, and so on for Composer dialogs, such as the Component Properties and Page Properties dialogs.
.PEClickableImageAnchor:alias	An alias for rendering a clickable icon in a table cell.  Specifies the CSS properties needed to display an image which is clickable and which has inline-mode display. For example, you can specify this as a common property for all action icons on a Show Detail Frame header. By default, this alias is included in style selectors that use 16x16 images and have to display inline background-images for both IE and Firefox. To customize, you can include this alias in your selector and override its properties. For example, you can change font-size and padding-right for an image with different height and width, or you can set "display: block" with height, width attributes to display in block mode.
.ChildPanelFacetWarning	Specifies the style for the warning message displayed in the child navigator in the Component Properties dialog.

#### B.4.1.2 Composer Status Indicator Style Selectors

Use the style selectors in [Table B-18](#) to skin the status indicator component in the Composer toolbar.

**Table B-18 Status Indicator Style Selectors**

Style Selector	Description
af statusIndicator.ComposerStatus	Specifies the style for the status indicator component. You can use this to specify a fixed height for the status indicator.
af statusIndicator.ComposerStatus::idle-icon	Specifies the icon that represents the idle state. This icon is generally a non-animated icon that indicates communication is NOT occurring with the server.
af statusIndicator.ComposerStatus::processing-icon	Specifies the icon that represents the processing state. This icon is generally an animated icon that indicates communication IS occurring with the server.
af statusIndicator.ComposerStatus::connecting-icon	Specifies the icon that displays when the Active Data Service is in the process of connecting. This icon is generally an animated icon.
af statusIndicator.ComposerStatus::connected-icon	Specifies the icon that displays when the Active Data Service is in the connected state. This icon is generally a non-animated icon and may be the same as the idle state icon.
af statusIndicator.ComposerStatus::reconnecting-icon	Specifies the icon that displays when the Active Data Service has lost connection and is attempting to reconnect. This icon is generally an animated icon.
af statusIndicator.ComposerStatus::disconnected-icon	Specifies the icon that displays when the Active Data Service is in the disconnected state. This icon is generally a non-animated icon used to indicate that no further reconnection attempts will be made without user interaction.

#### B.4.1.3 Page Customizable Style Selectors

Use the style selectors in [Table B-19](#) to skin Page Customizable components.

**Table B–19 Page Customizable Style Selectors**

Style Selector	Description
<code>af pageCustomizable</code>	Specifies the default size of a Page Customizable component when not being stretched by its parent container.
<code>af pageCustomizable af toolbox.ComposerToolbox</code>	Specifies the style for the main dark gray toolbar displayed in Edit mode. This toolbar contains a message about the page being edited and the various buttons.
<code>af pageCustomizable af toolbox.ComposerToolbox af panelGroupLayout.ComposerConcurrency</code>	Specifies the style for the concurrency toolbar that appears below the main Composer toolbar when two or more users are editing a page at the same time in the same customization layer.
<code>af pageCustomizable af toolbox.ComposerToolbox af toolbar</code> <code>af pageCustomizable af toolbox.ComposerToolbox af toolbar::separator</code> <code>af pageCustomizable af toolbox.ComposerToolbox af toolbox::body</code> <code>af pageCustomizable af toolbox.ComposerToolbox af toolbox::body af toolbox::row</code> <code>af pageCustomizable af toolbox.ComposerToolbox af toolbox::body af toolbox::last-row</code> <code>af pageCustomizable af toolbox.ComposerToolbox af toolbox::body af toolbox::row</code> <code>af toolbox::leading-cell</code>	Specifies the styles for the different areas in the toolbar.
<code>af pageCustomizable af toolbox.ComposerToolbox af commandToolbarButton::text</code> <code>af pageCustomizable af toolbox.ComposerToolbox af commandToolbarButton: hover</code> <code>af pageCustomizable af toolbox.ComposerToolbox af commandToolbarButton: depressed</code>	Specify the styles for the Composer toolbar buttons such as Page Properties and Reset Page.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar::body</code> <code>af pageCustomizable af toolbox.ComposerToolbox af menuBar::body: rtl</code>	Specifies the style for the body of the View menu on the toolbar.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu::bar-item-text</code>	Specifies the style for the text on the View menu.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu::bar-item: highlighted</code>	Specifies the style for the View menu when the mouse hovers over it.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu::bar-item: depressed</code>	Specifies the style for the View menu when it is clicked.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu::bar-item-open-icon-style</code>	Specifies the style for the dropdown icon appearing on the View menu.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu: depressed</code> <code>af menu::bar-item-open-icon-style</code>	Specifies the style for the dropdown icon when it is clicked on the View menu.
<code>af pageCustomizable af toolbox.ComposerToolbox af menuBar af menu: highlighted</code> <code>af menu::bar-item-open-icon-style</code>	Specifies the style for the dropdown icon when the mouse hovers over it.
<code>af pageCustomizable af toolbar.SourceView</code>	Specifies the style for the toolbar in Composer Source view.

**Table B–19 (Cont.) Page Customizable Style Selectors**

Style Selector	Description
<code>af pageCustomizable af toolbar.SourceView af menuBar</code>	Specifies the style for the menubar in Source view.
<code>af dialog.ComposerDialog::content-start</code> <code>af dialog.ComposerDialog::content-start:rtl</code> <code>af dialog.ComposerDialog::content</code> <code>af dialog.ComposerDialog::content:rtl</code> <code>af dialog.ComposerDialog::content-end</code>	Specify the styles for the dialogs invoked using Composer toolbar buttons. Available alias is <code>:rtl</code> , which can be used when the component must be rendered right-to-left.
<code>af pageCustomizable</code> <code>af breadCrumbs.ComposerBreadcrumbs</code> <code>af pageCustomizable</code> <code>af breadCrumbs.ComposerBreadcrumbsHidden:step</code>	Specify the styles for Composer breadcrumbs.
<code>af pageCustomizable:edit</code> <code>af panelGroupLayout.ComposerSplitHorz</code> <code>af pageCustomizable:edit</code> <code>af panelGroupLayout.ComposerSplitVert</code>	Specifies the style for Panel Customizable components that are split horizontally or vertically. Typically, these selectors are used to specify the height in case of a horizontal split, or width in case of a vertical split.
<code>af pageCustomizable:edit,</code> <code>af pageCustomizable:stretched</code>	Specifies the style for the Page Customizable component in Edit mode.  This selector ensures that in Edit mode, a Page Customizable always stretches. In View mode, it will flow if being flowed, or stretch if being stretched.
<code>af pageCustomizable:printable</code>	Specifies the style for the Page Customizable in printable mode. It suppresses the height and width of the Page Customizable.
<code>af pageCustomizable</code> <code>af panelGroupLayout.ComposerCutComp</code> <code>af tree::node-stamp-text</code>	Specifies the style for the dotted line border around components that are cut.

#### B.4.1.4 Layout Customizable Style Selectors

Use the style selectors in [Table B–20](#) to skin Layout Customizable components.

**Table B–20 Layout Customizable Style Selectors**

Style Selector	Description
<code>af layoutCustomizable::menu:edit</code>	Specifies the style for the <b>Change Layout</b> button in Edit mode.
<code>af layoutCustomizable::menu:edit</code> <code>af commandImageLink::text</code> <code>af layoutCustomizable::menu:edit</code> <code>af commandImageLink::text:hover</code>	Specify the styles for the text on the <b>Change Layout</b> button in Edit mode.
<code>af layoutCustomizable.AFStretchWidth</code>	Specifies the width to which the component can stretch horizontally.

#### B.4.1.5 Panel Customizable Style Selectors

Use the style selectors listed in [Table B–21](#) to skin Panel Customizable components.

---

**Note:** Some style selectors in [Table B-21](#) have three color-scheme selections: *light*, *medium*, and *dark*. Using these you can define three distinct looks in your CSS and specify which one to use through the background property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's background property, the skin applies the relevant style.

---

**Table B-21 Panel Customizable Style Selectors**

Style Selector	Description
af panelCustomizable	Specifies the style for the root element of the component.
af panelCustomizable.PEStretched	Specifies the style for the component, when it is stretched.
af panelCustomizable:edit	Specifies the style for the container in Edit mode.
af panelCustomizable:edit:drop-target	Specifies the style for this component when you drag another component on the page and hover over this component to drop it in.
af panelCustomizable::edit-mode-content-style	Specifies the style for the area containing the Edit and Delete icons.
af panelCustomizable::add-icon-style af panelCustomizable::add-icon-style:active af panelCustomizable::add-icon-style:hover af panelCustomizable::add-icon-style:rtl	Specify the styles for the Add Content button on the component.
af panelCustomizable::edit-icon-style af panelCustomizable::edit-icon-style:active af panelCustomizable::edit-icon-style:hover	Specify the styles for the Edit icon on the component.
af panelCustomizable::delete-icon-style af panelCustomizable::delete-icon-style:active af panelCustomizable::delete-icon-style:hover	Specify the styles for the Delete icon on the component.
.PanelCustomizableDropProxy	Specifies the style for the placeholder area inside this component when you drag another component on the page and hover over this component to drop it in.
af panelCustomizable:edit:inline-selected .p_AFActiveInlineEditableContainer af panelCustomizable:edit:hover-target	Specifies the styles for the components in the inline editable subtree in the Panel Customizable component.
af panelCustomizable::add-icon-link af panelCustomizable::add-icon-link:active af panelCustomizable::add-icon-link:hover	Specify the styles for the Add icon in the Panel Customizable component.

**Table B–21 (Cont.) Panel Customizable Style Selectors**

Style Selector	Description	
af panelCustomizable::addtab-icon-style	Specify the styles for the Add Tab icon in the Panel Customizable component.	
af panelCustomizable::addtab-icon-style:active		
af panelCustomizable::addtab-icon-style:hover		
af panelCustomizable::split-up-icon-style	Specify styles for the icons available on a Panel Customizable component to split it horizontally and vertically.	
af panelCustomizable::split-up-icon-style:active		
af panelCustomizable::split-up-icon-style:hover		
af panelCustomizable::split-down-icon-style		
af panelCustomizable::split-down-icon-style:active		
af panelCustomizable::split-down-icon-style:hover		
af panelCustomizable::split-left-icon-style		
af panelCustomizable::split-left-icon-style:active		
af panelCustomizable::split-left-icon-style:hover		
af panelCustomizable::split-right-icon-style		
af panelCustomizable::split-right-icon-style:active		
af panelCustomizable::split-right-icon-style:hover		
.PanelCustomizableDropProxy		Specifies the style for a component being dragged and dropped inside a Panel Customizable component.

#### B.4.1.6 Show Detail Frame Style Selectors

Use the style selectors listed in [Table B–22](#) to skin portlets and Show Detail Frame components.

In Framework applications, each portlet is rendered with portlet *chrome* (for more information, see [Section 57.2, "Portlet Anatomy"](#)). The portlet chrome shares the same chrome rendering mechanism as a Show Detail Frame component. Thus, the style and icon selectors that apply to Show Detail Frame also apply to the portlet chrome. In other words, in addition to defining styles for Show Detail Frame components, use Show Detail Frame style and icon selectors to define styles for portlets.

---

**Note:** Some Show Detail Frame style selectors in [Table B–22](#) have *light*, *medium*, *dark*, and *core:default* color scheme options. Using these you can define four distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

---

**Table B-22 Show Detail Frame Style Selectors**

Style Selector	Description
af showDetailFrame	Specifies the style for the root element of the component.
af showDetailFrame::container:light af showDetailFrame::container:medium af showDetailFrame::container:dark af showDetailFrame::container:core:default	Specify the styles for the element containing the contents within the component.
af showDetailFrame.p_AFStretched	Specifies the style for the root element when the component is stretched.
af showDetailFrame::content af showDetailFrame::content:light af showDetailFrame::content:medium af showDetailFrame::content:dark af showDetailFrame::content:core:default	Specify the styles to render for the content region of the component.
af showDetailFrame::header af showDetailFrame::header:light af showDetailFrame::header:medium af showDetailFrame::header:dark af showDetailFrame::header:core:default	Specify the styles for the header element. This element surrounds the header text, icon, and actions regions.
af showDetailFrame::header-center af showDetailFrame::header-center:light af showDetailFrame::header-center:medium af showDetailFrame::header-center:dark af showDetailFrame::header-center:core:default	Specify the styles for the region on the component header containing the icons, title, and actions menu.
af showDetailFrame::header-start af showDetailFrame::header-start:rtl af showDetailFrame::header-start:light af showDetailFrame::header-start:light:rtl af showDetailFrame::header-start:medium af showDetailFrame::header-start:medium:rtl af showDetailFrame::header-start:dark af showDetailFrame::header-start:dark:rtl af showDetailFrame::header-start:core:default af showDetailFrame::header-start:core:default:rtl	Specify the styles for the small cap-like area at the start of the header. Available alias is :rtl, which can be used when the component must be rendered right-to-left.
af showDetailFrame::header-end af showDetailFrame::header-end:rtl af showDetailFrame::header-end:light af showDetailFrame::header-end:light:rtl af showDetailFrame::header-end:medium af showDetailFrame::header-end:medium:rtl af showDetailFrame::header-end:dark af showDetailFrame::header-end:dark:rtl af showDetailFrame::header-end:core:default af showDetailFrame::header-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the header. Available alias is :rtl, which can be used when the component must be rendered right-to-left.

**Table B-22 (Cont.) Show Detail Frame Style Selectors**

Style Selector	Description
af showDetailFrame::footer-start af showDetailFrame::footer-start:rtl af showDetailFrame::footer-start:light af showDetailFrame::footer-start:light:rtl af showDetailFrame::footer-start:medium af showDetailFrame::footer-start:medium:rtl af showDetailFrame::footer-start:dark af showDetailFrame::footer-start:dark:rtl af showDetailFrame::footer-start:core:default af showDetailFrame::footer-start:core:default:rtl	Specify the styles for the small cap-like area at the start of the footer. Available alias is :rtl, which can be used when the component must be rendered right-to-left.
af showDetailFrame::footer-center af showDetailFrame::footer-center:light af showDetailFrame::footer-center:medium af showDetailFrame::footer-center:dark af showDetailFrame::footer-center:core:default	Specify the styles for the central region of the Show Detail Frame component's footer element.
af showDetailFrame::footer-end af showDetailFrame::footer-end:rtl af showDetailFrame::footer-end:light af showDetailFrame::footer-end:light:rtl af showDetailFrame::footer-end:medium af showDetailFrame::footer-end:medium:rtl af showDetailFrame::footer-end:dark af showDetailFrame::footer-end:dark:rtl af showDetailFrame::footer-end:core:default af showDetailFrame::footer-end:core:default:rtl	Specify the styles for the small cap-like area at the end of the footer. Available alias is :rtl, which can be used when the component must be rendered right-to-left.
af showDetailFrame::shadowbox af showDetailFrame::shadowbox:rtl af showDetailFrame::shadowbox_div1 af showDetailFrame::shadowbox_div1:rtl af showDetailFrame::shadowbox_div2 af showDetailFrame::shadowbox_div2:rtl	Specify styles for the shadow cast by the Show Detail Frame component.
af showDetailFrame::toolbar af showDetailFrame::toolbar:rtl	Specifies the styles for a floating toolbar on the Show Detail Frame component.
af showDetailFrame::icon-style	Specifies the style for the icon on the Show Detail Frame header, if the icon attribute is set on the component.
af showDetailFrame::header-text af showDetailFrame::header-text:rtl	Specifies the style for the title available on the component header. Available alias is :rtl, which can be used when the component must be rendered right-to-left.
af showDetailFrame::header-actions	Specifies the style for icons such as delete and the actions menu on the component header.
af showDetailFrame::toolbar-container af showDetailFrame::toolbar-container:light af showDetailFrame::toolbar-container:medium af showDetailFrame::toolbar-container:dark af showDetailFrame::toolbar-container:core:default	Specify styles for the container element of the floating toolbar. Available aliases are :light, :medium, and :dark.

**Table B–22 (Cont.) Show Detail Frame Style Selectors**

Style Selector	Description
af showDetailFrame::collapse-icon-style af showDetailFrame::collapse-icon-style:active af showDetailFrame::collapse-icon-style:hover af showDetailFrame::collapse-icon-style.PEDisplayNone	Specify styles for the Collapse icon on the component header. Available aliases are :active and :hover that you can use to specify styles for the Collapse icon when clicked or when the mouse hovers over it.  You can use PEDisplayNone to hide the Collapse icon.
af showDetailFrame::disclose-icon-style af showDetailFrame::disclose-icon-style:active af showDetailFrame::disclose-icon-style:hover af showDetailFrame::disclose-icon-style.PEDisplayNone	Specify the styles for the Disclose icon on the component header.  You can use PEDisplayNone to hide the Disclose icon.
af showDetailFrame::actionmenu-icon-style af showDetailFrame::actionmenu-icon-style:active af showDetailFrame::actionmenu-icon-style:hover	Specify the styles for the action menu icon. This style has a background-image that you can override.
af showDetailFrame::remove-icon-style af showDetailFrame::remove-icon-style:active af showDetailFrame::remove-icon-style:hover	Specify the styles for the Delete icon.
af showDetailFrame::edit-icon-style af showDetailFrame::edit-icon-style:active af showDetailFrame::edit-icon-style:hover	Specify the styles for the Edit icon.
af showDetailFrame::preview-icon-style af showDetailFrame::preview-icon-style:active af showDetailFrame::preview-icon-style:hover	Specify styles for the Preview icon.
af showDetailFrame::edit-mode-content-style af showDetailFrame::edit-mode-content-style:light	Specify the styles for the area that contains the edit and remove icons.
af showDetailFrame::edit-mode-edit-icon-style af showDetailFrame::edit-mode-edit-icon-style:active af showDetailFrame::edit-mode-edit-icon-style:hover	Specify the styles for the Edit icon on the component header in Edit mode.
af showDetailFrame::edit-mode-remove-icon-style af showDetailFrame::edit-mode-remove-icon-style:active af showDetailFrame::edit-mode-remove-icon-style:hover	Specify the styles for the Delete icon on the component header in Edit mode.
af showDetailFrame::edit-text-link af showDetailFrame::edit-text-link:rtl af showDetailFrame::edit-text-link:hover	Specify the styles for the Edit Text link in Edit mode when the component includes a Rich Text Editor component as a child.
af showDetailFrame::resize af showDetailFrame::resize:rtl	Specifies the style for the resize handler on the component. Available alias is :rtl, which can be used when component must be rendered right-to-left.

**Table B–22 (Cont.) Show Detail Frame Style Selectors**

Style Selector	Description
af showDetailFrame::content.PEWrapsRTE > af richTextEditor af toolbox > af toolbox::body, af showDetailFrame::content.PEWrapsRTE > af richTextEditor af toolbox > af toolbox::body > af toolbox::row, af showDetailFrame::content.PEWrapsRTE > af richTextEditor af toolbox > af toolbox::body > af toolbox::last-row, af showDetailFrame::content.PEWrapsRTE > af richTextEditor af richTextEditor::content-input-container af showDetailFrame::content.PEWrapsRTE > af richTextEditor af richTextEditor::content-input, af showDetailFrame::content.PEWrapsRTE > af richTextEditor af richTextEditor::content-input-container af showDetailFrame::content:medium.PEWrapsRTE af showDetailFrame::content:light.PEWrapsRTE af showDetailFrame::content.PEWrapsRTE > af richTextEditor af toolbox	Specify styles for the areas surrounding and inside a nested Rich Text Editor component. For example, to ensure that the background color of the Rich Text Editor component is transparent in Edit mode, or to provide borders around the component.
af showDetailFrame::content.PEStretched	Specifies the height when the Show Detail Frame component stretches its content.
af showDetailFrame::content.PEStretched:printable	Ensures that the Show Detail Frame does not restrict the height of its content in printable mode.
af showDetailFrame::dynamic-help-icon-container af showDetailFrame::dynamic-help-icon-container:rtl	Specifies the styles for the help icon container on the component header.
af showDetailFrame::dynamic-help-icon-style af showDetailFrame::dynamic-help-icon-style:active af showDetailFrame::dynamic-help-icon-style:hover	Specify the styles for the help icon on the component header.
.PEShowDetailFrameAnimIcon	Specifies the animation icon to be used to show busy status on the component, for example, when you expand it.
.PEIconAndTextInHeading:alias .PEIconAndTextInHeading:alias:rtl	Specify the styles for rendering an icon with text in the component header.

## B.4.2 Style Attributes

Table B–23 provides a quick reference for the style attributes available for WebCenter Portal Customizable Components and Composer components through the JDeveloper Property Inspector. Note that portlets also use these style attributes.

For detailed information about style properties, see the CSS Specifications page at:

<http://www.w3.org/TR/CSS21/>

**Table B-23 Style Attributes of Composer and WebCenter Portal Customizable Components**

Attribute	Description
<code>background-color</code>	The background color of the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
<code>background-image</code>	The image that is displayed in the component background. Select to inherit from a parent component or to display no image, or click the Edit icon to select an image.
<code>background-repeat</code>	Specify whether and how the background image should repeat. Choose from: <ul style="list-style-type: none"> <li>▪ <code>&lt;none&gt;</code>: Forgo repeating the image.</li> <li>▪ <code>no-repeat</code>: Forgo repeating the image.</li> <li>▪ <code>repeat</code>: Repeat the image to fill the container.</li> <li>▪ <code>repeat-x</code>: Repeat the image horizontally but not vertically.</li> <li>▪ <code>repeat-y</code>: Repeat the image vertically but not horizontally.</li> <li>▪ <code>inherit</code>: Inherit this setting from a parent component.</li> </ul>
<code>border-color</code>	The color of the border that surrounds the component. Choose from a list of colors, or click the Edit icon to select from a color palette.
<code>border-style</code>	The style of border to draw around the component. Choose from: <ul style="list-style-type: none"> <li>▪ <code>&lt;none&gt;</code>: Apply no style to the border.</li> <li>▪ <code>none</code>: Do not display a border (use <code>border-style:none</code> on the <code>ContentStyle</code> property to turn off portlet borders. Using this attribute with <code>InlineStyle</code> does not turn off portlet borders.)</li> <li>▪ <code>hidden</code>: Hide the border.</li> <li>▪ <code>dotted</code>: Display the border as a line of dots.</li> <li>▪ <code>double</code>: Display the border as a double line.</li> <li>▪ <code>groove</code>: Display the border as a grooved line.</li> <li>▪ <code>ridge</code>: Display the border as a ridged line.</li> <li>▪ <code>inset</code>: Display the border as a concave line.</li> <li>▪ <code>outset</code>: Display the border as a convex line.</li> <li>▪ <code>dashed</code>: Display the border as a line of dashes.</li> <li>▪ <code>solid</code>: Display the border as a solid line.</li> <li>▪ <code>inherit</code>: Inherit the border style from a parent component.</li> </ul>
<code>border-width</code>	The thickness of the component border. Select <code>thick</code> , <code>medium</code> , <code>thin</code> , or <code>inherit</code> to determine the thickness of the border or inherit border width from a parent component. Alternatively, click the Edit icon and define a thickness in your preferred unit of measurement.
<code>color</code>	The color of the component text. Select from a list, or click the Edit icon to select from a color palette.
<code>font-family</code>	The font family (such as Arial, Helvetica, or sans-serif) for the component text. Enter this value manually.

**Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components**

Attribute	Description
<code>font-size</code>	<p>The size of component text. Choose from:</p> <ul style="list-style-type: none"> <li>■ <code>Length</code>: Specify an absolute value for the <code>font-size</code> in your preferred unit of measurement.</li> <li>■ <code>Percentage</code>: Specify font size as a percentage of the normal text size defined for the browser.</li> <li>■ <code>inherit</code>: Inherit font size from a parent component.</li> <li>■ <code>large</code>: Select the next size larger than the font associated with the parent component.</li> <li>■ <code>larger</code>: Increase the font size to larger than the font associated with the parent component (<code>larger</code> is larger than <code>large</code>).</li> <li>■ <code>medium</code>: Set the font size to the default font size of the parent component.</li> <li>■ <code>small</code>: Set the font size to smaller than the default font size of the parent component.</li> <li>■ <code>smaller</code>: Set the font size to smaller than the default font size of the parent component (<code>smaller</code> is smaller than <code>small</code>).</li> </ul>
<code>font-style</code>	<p>The font style of the component text. Choose from:</p> <ul style="list-style-type: none"> <li>■ <code>&lt;none&gt;</code>: Apply no style to the font.</li> <li>■ <code>normal</code>: The font is not italic.</li> <li>■ <code>italic</code>: The font is italic.</li> <li>■ <code>oblique</code>: The font is slanted to look italic, though the font family may not have a formal italic member.</li> <li>■ <code>inherit</code>: Inherit font style from a parent component.</li> </ul>
<code>font-weight</code>	<p>The thickness of the component text. Choose from:</p> <ul style="list-style-type: none"> <li>■ <code>&lt;none&gt;</code>: Specify no weight for the component text.</li> <li>■ <code>normal</code>: Apply same weight as the parent component's default font weight.</li> <li>■ <code>bold</code>: Set component text in bold.</li> <li>■ <code>bolder</code>: Set component text darker than bold.</li> <li>■ <code>light</code>: Set component text lighter than normal.</li> <li>■ <code>lighter</code>: Set component text lighter than light.</li> <li>■ <code>100–900</code>: Specify a value for text darkness—100 is lightest and 900 is darkest—400 is normal weight; 700 is bold.</li> <li>■ <code>inherit</code>: Inherit font weight from a parent component.</li> </ul>
<code>height</code>	<p>The spacing to apply between lines of continuous text (also known as <i>leading</i>). Specify a height by choosing from:</p> <ul style="list-style-type: none"> <li>■ <code>Length</code>: Specify an absolute value in your preferred unit of measurement.</li> <li>■ <code>Percentage</code>: Specify a value as a percentage of the value set for a parent component.</li> <li>■ <code>auto</code>: Set line height automatically, usually about 2 points larger than font size.</li> <li>■ <code>inherit</code>: Inherit line height from the parent component.</li> </ul>
<code>list-style-image</code>	<p>An image to use as an indicator of a list item. Specify an image instead of defining a <code>list-style-type</code>. Choose from:</p> <ul style="list-style-type: none"> <li>■ <code>inherit</code>: Inherit a list style image from a parent component.</li> <li>■ <code>none</code>: Use no image as an indicator of a list item.</li> </ul> <p>Or click the Edit icon and select an image.</p>

**Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components**

Attribute	Description
list-style-type	<p>The type of indicator to use for items on a list. Use this instead of specifying a image through list-style-image.</p> <p>Select from among many styles offered on the list, including &lt;none&gt;, which means the browser's default style is used, and inherit, which means the list-style-type is inherited from a parent component.</p>
margin	<p>The border of space surrounding the component content. Choose from:</p> <ul style="list-style-type: none"> <li>▪ Choose Length: Specify an absolute value for all margins.</li> <li>▪ Choose Percentage: Set a value as a percentage of the margin of a parent component.</li> <li>▪ inherit: Inherit margin value from a parent component.</li> <li>▪ auto: Set the value automatically according to browser defaults.</li> </ul>
padding	<p>The amount of space between the component and its margin or, if there is a border, between the component and its border. Choose from:</p> <ul style="list-style-type: none"> <li>▪ Choose Length: Specify an absolute value in your preferred unit of measurement.</li> <li>▪ Choose Percentage: Specify the value as a percentage of the padding set for a parent component.</li> <li>▪ inherit: Inherit the value from a parent component.</li> </ul>
text-align	<p>The horizontal alignment of the component text. Choose from:</p> <ul style="list-style-type: none"> <li>▪ &lt;none&gt;: Use browser default.</li> <li>▪ left</li> <li>▪ right</li> <li>▪ center</li> <li>▪ justify: Align text so that all lines start and end at the same point left and right.</li> <li>▪ auto: Apply a value automatically, either left or right.</li> <li>▪ inherit: Inherit alignment from a parent component.</li> </ul>

**Table B–23 (Cont.) Style Attributes of Composer and WebCenter Portal Customizable Components**

Attribute	Description
text-decoration	<p>The decorative value to apply to component text. Choose from:</p> <ul style="list-style-type: none"> <li>■ &lt;none&gt;: Use the browser default for hyperlinks; otherwise, no text decoration.</li> <li>■ none: No text decoration, including no underscore for hyperlinks.</li> <li>■ underline: Draw a line under all component text.</li> <li>■ overline: Draw a line over all component text.</li> <li>■ line-through: Draw a line through the middle of all component text.</li> <li>■ blink: Make component text blink.</li> <li>■ inherit: Inherit text decoration from a parent component.</li> </ul>
vertical-align	<p>The vertical alignment of component text. Choose from:</p> <ul style="list-style-type: none"> <li>■ Choose Length: Specify an absolute value in your preferred unit of measurement.</li> <li>■ Choose Percentage: Specify a value as a percentage of the value set for a parent component.</li> <li>■ inherit: Inherit the value from a parent component.</li> <li>■ baseline: Set the text on the baseline of the text row.</li> <li>■ middle: Set the text in the middle of the text row.</li> <li>■ text-bottom: Set the text on the bottom of the text row, lower than the baseline.</li> <li>■ text-top: Set the text at the top of the text row, above the baseline.</li> <li>■ sub: Set the text as subscript.</li> <li>■ super: Set the text as superscript.</li> </ul>
width	<p>The spacing between text. Specify a width by choosing from:</p> <ul style="list-style-type: none"> <li>■ Choose Length: Specify an absolute value in your preferred unit of measurement.</li> <li>■ Choose Percentage: Specify a value as a percentage of the value set for a parent component.</li> <li>■ auto: Set line height automatically, usually about 2 points larger than font size.</li> <li>■ inherit: Inherit line height from the parent component.</li> </ul>

## B.5 Customizable Components (HTML) Properties

Customizable Components (HTML) are similar in function to customizable components from the 10.1.3.2.0 release and can be used to add more customizable components to your migrated 10.1.3.2.0 application page. These customizable components are available from the Customizable Components (HTML) tag library in JDeveloper. When you add customizable components to the page, default values are assigned to certain attributes and you can define values for the remaining attributes as required.

Customizable components enable users to minimize or maximize, hide or show, or move any component on the page at runtime.

---

**Note:** The Customizable Components (HTML) library is available only to support applications created in release 10.1.3.2.0. Adding these components to new applications is not supported.

It is recommended that you replace Customizable Components (HTML) in existing applications with their rich counterparts (from the Composer tag library) whenever possible.

---

### B.5.1 Panel Customizable (HTML) Component

Use the `Panel Customizable (HTML)` component as a container for page content that can be customized at runtime. Components added inside a `Panel Customizable (HTML)` can be maximized, minimized, or rearranged.

Use this component only to perform runtime customizations on child components. If you just want a container to arrange components at design time, then it is recommended that you use an ADF Faces container like `Panel Group Layout`.

[Table B-24](#) describes the attributes of a `Panel Customizable (HTML)` component.

**Table B-24** Attributes of a `Panel Customizable (HTML)` Component

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
<code>id</code>	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
<code>rendered</code>	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p>

**Table B–24 (Cont.) Attributes of a Panel Customizable (HTML) Component**

Attribute	Type	Supports EL?	Description
layout	List of values horizontal/vertical	Yes	<p>Specifies how the children of the Panel Customizable (HTML) are laid out.</p> <p>The default value is <code>vertical</code>.</p> <p>Depending on the value of the layout attribute, child components are laid out as follows:</p> <p>If you select <code>vertical</code>, then the child components are displayed one below the other and can be moved either up or down within the layout.</p> <p>If you select <code>horizontal</code>, then the child components are displayed adjacent to each other and can be moved either to the left or right within the layout.</p>
<b>Style Attributes</b>			
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The <code>inlineStyle</code> is a set of CSS styles that are applied to the root DOM element of the component. If the <code>inlineStyle</code> 's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like <code>::label</code> or <code>::icon-style</code> .
<b>Advanced Attributes</b>			
binding	String	Yes	<p>An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.</p> <p>For example:</p> <pre>binding="#{yourManagedBean. Binding}"</pre>

## B.5.2 Show Detail Frame (HTML) Component

Add Show Detail Frame (HTML) components inside Panel Customizable (HTML) components to enable user customizations like maximizing, moving, minimizing, restoring, and deleting child components. You can perform these customizations only if you add Show Detail Frame (HTML) components inside Panel Customizable (HTML) components.

Table B-25 describes the attributes of a Show Detail Frame (HTML) component.

**Table B-25** Attributes of a Show Detail Frame (HTML) Component

Attribute	Type	Supports EL?	Description
<b>Common Attributes</b>			
id	String	No	<p>The identifier for the component. The identifier must follow a subset of the syntax allowed in HTML:</p> <ul style="list-style-type: none"> <li>▪ Must not be a zero-length String.</li> <li>▪ First character must be an ASCII letter (A-Za-z) or an underscore ('_').</li> <li>▪ Subsequent characters must be an ASCII letter or digit (A-Za-z0-9), an underscore ('_'), or a dash ('-').</li> </ul>
rendered	Boolean	Yes	<p>Specifies whether the component is rendered. When set to <code>false</code>, no output is delivered for this component (the component is not in any way rendered, and cannot be made visible on the client).</p> <p>The default value is <code>true</code>.</p>
text	String	Yes	A title for the Show Detail Frame (HTML) component.
icon	String	Yes	<p>If you want to add an icon on the header of the Show Detail Frame component, then this specifies the URI for the image to be used.</p> <p>For example:</p> <pre>icon="http://source-pc/images/accessability.gif"</pre> <p><b>Note:</b> An image that is stored at the document root does not require a full path. For example:</p> <pre>icon="detail.gif"</pre>
<b>Appearance Attributes</b>			

**Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component**

Attribute	Type	Supports EL?	Description
shortDesc	String	Yes	The short description of the component. This text is commonly used by user agents to display tooltip help text, in which case the behavior for the tooltip is controlled by the user agent, for example, Firefox 2 truncates long tooltips. For form components, the shortDesc is displayed in a note window.
background	List of values light/medium/dark	Yes	Working with the skin CSS, provides a means of applying a different look and feel for this Show Detail Frame (HTML) instance.  The default value is medium.
displayHeader	Boolean	Yes	Indicates whether the header of the Show Detail Frame (HTML) is displayed.  The default value is true.  If you set displayHeader to false and if you have exposed some actions on the component, then a toolbar is displayed when you move the mouse over the component area. The toolbar contains a drop down icon, which displays a menu of available options. This toolbar is rendered only if there are actions available on the component.  The toolbar display is also affected by the isSeededInteractionAvailable attribute. As the default value for isSeededInteractionAvailable is false, the toolbar is not displayed. It can be displayed by setting isSeededInteractionAvailable to true.
expansionMode	List of values maximized/minimized/normal	Yes	The default state of the Show Detail Frame (HTML).  The default display mode is normal.
<b>Actions Attributes</b>			
showMoveAction	List of values menu/none	Yes	Specifies whether the Move action is displayed in the Actions menu.  The default value is menu.
showMinimizeAction	List of values chrome/none	Yes	Specifies whether the minimize action is displayed on the header.  The default is chrome.

**Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component**

Attribute	Type	Supports EL?	Description
showMaximizeAction	List of values menu/none	Yes	Specifies whether the minimize action is displayed on the header. The default value is menu.
<b>Style Attributes</b>			
contentStyle	String	Yes	The CSS style to apply to the Show Detail Frame (HTML) content area. Manually enter any style in compliance with CSS version 2.0 or later.
styleClass	String	Yes	A CSS style class to use for this component. The style class can be defined in your JSPX page or in a skinning CSS file, for example.
inlineStyle	String	Yes	The CSS styles to use for this component. This is intended for basic style changes. The <code>inlineStyle</code> is a set of CSS styles that are applied to the root DOM element of the component. If the <code>inlineStyle</code> 's CSS properties do not affect the DOM element you want affected, then you must create a skin and use the skinning keys which are meant to target particular DOM elements, like <code>::label</code> or <code>::icon-style</code> .
<b>Behavior Attributes</b>			
partialTriggers	String	Yes	The IDs of the components that should trigger a partial update. This component listens on the trigger components. If a trigger component receives an event that causes it to update in some way, this component requests to be updated too. Identifiers are relative to the source component (this component), and must account for NamingContainers. If your component is inside of a naming container, you can use a single colon to start the search from the root of the page, or multiple colons to move up through the NamingContainers - <code>:"</code> pops out of the component's naming container (or itself if the component is a naming container) and begin the search from there, <code>:"</code> pops out of two naming containers (including itself if the component is a naming container) and begin the search from there.
disclosureListener	<code>javax.el.MethodExpression</code>	Yes	A method reference to a disclosure listener. A disclosure event is fired when the disclosure state changes.

**Table B–25 (Cont.) Attributes of a Show Detail Frame (HTML) Component**

Attribute	Type	Supports EL?	Description
<b>Advanced Attributes</b>			
binding	String	Yes	An EL reference that stores the component instance in a bean. This can be used to give programmatic access to a component from a backing bean, or to move creation of the component to a backing bean.  For example:  <code>binding="#{yourManagedBean.Binding}"</code>
attributeChangeListener	javax.el.MethodExpression	Yes	A method reference to an attribute change listener. Attribute change events are not delivered for any programmatic change to a property. They are only delivered when a renderer changes a property without the application's specific request. An example of an attribute change events might include the width of a column that supported client-side resizing.

The **Expression Builder** option available when setting these attributes enables you to bind the component instance to a managed bean property.

**Show Detail Frame Facets**

You can use the `Show Detail Frame (HTML)` facets to define and display custom actions on `Show Detail Frame (HTML)` components. [Table B–26](#) describes the facets that enable you to display custom actions supported by the `Show Detail Frame (HTML)` component.

**Table B–26 Show Detail Frame (HTML) Facets**

Facet	Description
titleBarAction	Used if an action is to be associated with title of the <code>Show Detail Frame (HTML)</code> component.
additionalActions	Used if some additional actions are to be added to the list of actions available on the <code>Show Detail Frame (HTML)</code> header.

JDeveloper displays all facets available to the `Show Detail Frame (HTML)` component in the Structure window. However, only those that contain UI components appear activated.

**B.5.3 Customizable Components (HTML) Style Selectors**

The tables in this section describe the style selectors that you can use to skin WebCenter Portal Customizable Components.

This section contains the following subsections:

- [Panel Customizable \(HTML\) Style Selectors](#)

- [Show Detail Frame \(HTML\) Style Selectors](#)
- [Property Keys](#)
- [Icon Selectors](#)

### B.5.3.1 Panel Customizable (HTML) Style Selectors

Use the style selectors listed in [Table B–27](#) to skin `Panel Customizable (HTML)` components. For icon selectors relevant to the `Panel Customizable` component, see [Section B.5.3.4, "Icon Selectors."](#)

**Table B–27** *Panel Customizable (HTML) Style Selectors*

Style Selector	Description
<code>afh panelCustomizable::no-header-content</code>	Specifies the style to render for all four component borders when the component header is turned off.

### B.5.3.2 Show Detail Frame (HTML) Style Selectors

Use the style selectors listed in [Table B–28](#) to skin the `Show Detail Frame (HTML)` components.

---

---

**Note:** In addition to defining styles for `Show Detail Frame` components, the `Show Detail Frame` style and icon selectors define styles for portlets.

---

---

**Table B–28** *Show Detail Frame (HTML) Style Selectors*

Style Selector	Description
<code>afh showDetailFrame::header-top-border-light</code> <code>afh showDetailFrame::header-top-border-medium</code> <code>afh showDetailFrame::header-top-border-dark</code>	Specifies the style for the top and bottom border of a component header and, also the header background color.
<code>afh showDetailFrame::container</code>	Specifies the style for the component's container.
<code>afh showDetailFrame::header-light</code> <code>afh showDetailFrame::header-medium</code> <code>afh showDetailFrame::header-dark</code>	Specifies the style for text in the component's header. The header is usually a banner of color that contains a title and links to menus and other types of actions.  Define the header background color with the <code>afh showDetailFrame::header-top-border-[light, medium, dark]</code> style element. Use icon selectors to specify the icons to use in the component header and, also the shape of the header's left and right sides.
<code>afh showDetailFrame::content-light</code> <code>afh showDetailFrame::content-medium</code> <code>afh showDetailFrame::content-dar</code>	Specifies the style for the component's left, right, and bottom borders.
<code>afh showDetailFrame::main-menu-container</code>	Specifies the style for the component's main menu container.
<code>afh showDetailFrame::sub-menu-container</code>	Specifies the style for the component's submenu container.
<code>afh showDetailFrame::menu-item</code>	Specifies the style for an individual item on the component's main menu.
<code>afh showDetailFrame::menu-item:hover</code>	Specifies the style to render when the mouse hovers over a component main menu item.
<code>afh showDetailFrame::sub-menu-item</code>	Specifies the style for an individual item on the component's submenu.

**Table B–28 (Cont.) Show Detail Frame (HTML) Style Selectors**

Style Selector	Description
<code>afh showDetailFrame::sub-menu-item:hover</code>	Specifies the style to render when the mouse hovers over a component submenu item.
<code>afh showDetailFrame::actions-image-separator</code>	Specifies the amount of padding to provide around the component's Actions, Minimize, and Restore icons.  For more information, see also <a href="#">Section B.5.3.4, "Icon Selectors"</a> .
<code>afh showDetailFrame::menu-item-separator</code>	Specifies the style for the line that separates a command or groups of commands on the component's Actions menu.  In the default case, a separator appears to be a single thick line. This is achieved using <code>border-top</code> and <code>border-bottom</code> elements to style the separator. A user who creates a custom skin can style the separator differently. For example, a user can create a separator that displays as a rectangular bar with a colorful background.
<code>A.afh showDetailFrame::title-clickable</code>	Specifies the style to render for the component's title when the title is a link.
<code>afh showDetailFrame::no-header-content</code> <code>afh showDetailFrame::no-header-content-light</code> <code>afh showDetailFrame::no-header-content-medium</code> <code>afh showDetailFrame::no-header-content-dark</code>	Specifies the style to render for all four component borders when the component header is turned off.

### B.5.3.3 Property Keys

Use property keys to control the display of custom menu items and component action icons. Though you include property keys in your custom skin, they are not represented in the generated CSS that results from the skin.

To explain, skins go through a process that results in a generated CSS. In turn, the generated CSS is consumed by the application. Most style selectors for `Panel Customizable` and `Show Detail Frame` components are represented in the generated CSS. Property keys are the exception. Although they affect the application as much as any other component style selector, they are not represented in the final generated CSS.

[Table B–29](#) lists and describes property keys relevant to `Panel Customizable` and `Show Detail Frame` components.

**Table B–29** Property Keys of Panel Customizable and Show Detail Frame Components

Property Key	Description
showDetailFrame {-ora-additional-actions-position-last:true}	Positions additional actions relative to seeded actions on the component's Actions menu.  Set to <code>false</code> to position additional actions before seeded actions. By default, additional actions are positioned after seeded actions.  The default value is <code>true</code> .
showDetailFrame {-ora-menu-icon-display:false}	Controls the display of icons next to their related commands on a Show Detail Frame Actions menu.  Set to <code>true</code> to display icons to the left of each action on the Actions menu. By default, no icons are displayed to the left of individual actions.  The default value is <code>false</code> .  For information about specifying the icons to use when this property key is set to <code>true</code> , see <a href="#">Section B.5.3.4, "Icon Selectors."</a>

### B.5.3.4 Icon Selectors

Icons are either displayed or not displayed depending on whether the component's `ora-menu-icon-display` property key is set to `true` or `false`. Property keys are described in [Section B.5.3.3, "Property Keys."](#)

Each icon selector has a *light*, *medium*, and *dark* scheme. Using these you can define three distinct looks in your CSS and specify which one to use through the `background` property in the JDeveloper Property Inspector. Depending on which value is specified for a component instance's `background` property, the skin applies the relevant style.

For easy, error-free portability, store all application icons under the Framework application's root folder.

The selectors described in [Table B–30](#) apply to the icons used with Panel Customizable (HTML) and Show Detail Frame (HTML) components.

**Table B–30 Icon Selectors for WebCenter Portal Customizable Components**

Selector	Description
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-ActionsIcon:alias  showDetailFrame::medium-ActionsIcon:alias  showDetailFrame::dark-ActionsIcon:alias</p>	<p>This icon represents the Actions menu. The Actions menu lists the actions a user can perform on the component.</p> <p>In a Framework application, the Actions icon is rendered on the right corner of the component header.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-ActionsIcon:alias  panelCustomizable::medium-ActionsIcon:alias  panelCustomizable::dark-ActionsIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MinimizeIcon:alias  showDetailFrame::medium-MinimizeIcon:alias  showDetailFrame::dark-MinimizeIcon:alias</p>	<p>This icon represents the Minimize option. Minimize collapses the view of the component like a window shade.</p> <p>In a Framework application, the Minimize icon is rendered on the left side of the component header.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MinimizeIcon:alias  panelCustomizable::medium-MinimizeIcon:alias  panelCustomizable::dark-MinimizeIcon:alias</p>	<p>See also,  showDetailFrame::light-ExpandIcon:alias.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MaximizeIcon:alias  showDetailFrame::medium-MaximizeIcon:alias  showDetailFrame::dark-MaximizeIcon:alias</p>	<p>This is applicable only for the Show Detail Frame (HTML) component. The rich variant of this component does not support the maximize action.</p> <p>This icon represents the Maximize option, which expands the Show Detail Frame (HTML) component to the dimensions of the Panel Customizable (HTML) component that contains it. Where multiple Show Detail Frame (HTML) components display in the same container, these are displaced while the maximized Show Detail Frame (HTML) remains maximized.</p> <p>In a Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MaximizeIcon:alias  panelCustomizable::medium-MaximizeIcon:alias  panelCustomizable::dark-MaximizeIcon:alias</p>	<p>This is applicable only for the Panel Customizable (HTML) component. The rich variant of this component does not provide any actions.</p> <p>This icon represents the Maximize option, which expands component display to the dimensions of the container. Where multiple components display in the same container, these are displaced by the maximized component.</p> <p>In a Framework application, the Maximize icon is displayed to the left of the Maximize command on the component's Actions menu.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-RestoreIcon:alias  showDetailFrame::medium-RestoreIcon:alias  showDetailFrame::dark-RestoreIcon:alias</p>	<p>This icon represents the Restore option, which restores maximized views to their default display modes.</p> <p>In a Framework application, the Restore icon is rendered to the left of the Restore command on the component's Actions menu.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-RestoreIcon:alias  panelCustomizable::medium-RestoreIcon:alias  panelCustomizable::dark-RestoreIcon:alias</p>	

**Table B-30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components**

Selector	Description
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-ExpandIcon:alias  showDetailFrame::medium-ExpandIcon:alias  showDetailFrame::dark-ExpandIcon:alias</p>	<p>The Expand icon represents the action that expands a component that has been minimized. The Expand icon toggles with the Minimize icon. That is, when the component is minimized, the Expand icon is displayed; when the component is expanded, the Minimize icon is displayed.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-ExpandIcon:alias  panelCustomizable::medium-ExpandIcon:alias  panelCustomizable::dark-ExpandIcon:alias</p>	<p>In a Framework application, the Expand icon is displayed on the left side of the component header.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MoveIcon:alias  showDetailFrame::medium-MoveIcon:alias  showDetailFrame::dark-MoveIcon:alias</p>	<p>This icon represents the Move option, which enables rearrangement of a component's location in relation to the other components on the page.</p> <p>In a Framework application, the Move icon is displayed to the left of the Move command on the component's Actions menu.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MoveIcon:alias  panelCustomizable::medium-MoveIcon:alias  panelCustomizable::dark-MoveIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MoveLeftIcon:alias  showDetailFrame::medium-MoveLeftIcon:alias  showDetailFrame::dark-MoveLeftIcon:alias</p>	<p>This icon represents the Move Left option on the component submenu. Move Left rearranges the component horizontally, one position closer to the left boundary of the page. For example, imagine three horizontally arranged components. You select Move Left on the right-most component. It becomes the middle component.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MoveLeftIcon:alias  panelCustomizable::medium-MoveLeftIcon:alias  panelCustomizable::dark-MoveLeftIcon:alias</p>	<p>In a Framework application, the Move Left icon is displayed to the left of the Move Left submenu item on the component's Actions menu.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MoveRightIcon:alias  showDetailFrame::medium-MoveRightIcon:alias  showDetailFrame::dark-MoveRightIcon:alias</p>	<p>This icon represents the Move Right option on the component submenu. Move Right rearranges the component horizontally, one position closer to the right boundary of the page. For example, imagine three horizontally arranged components. You select Move Right on the left-most component. It becomes the middle component.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MoveRightIcon:alias  panelCustomizable::medium-MoveRightIcon:alias  panelCustomizable::dark-MoveRightIcon:alias</p>	<p>In a Framework application, the Move Right icon is displayed to the left of the Move Right submenu item on the component's Actions menu.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MoveUpIcon:alias  showDetailFrame::medium-MoveUpIcon:alias  showDetailFrame::dark-MoveUpIcon:alias</p>	<p>This icon represents the Move Up option on the component submenu. Move Up rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Up on the middle component. It becomes the topmost component.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MoveUpIcon:alias  panelCustomizable::medium-MoveUpIcon:alias  panelCustomizable::dark-MoveUpIcon:alias</p>	<p>In a Framework application, the Move Up icon is displayed to the left of the Move Up submenu item on the component's Actions menu.</p>

**Table B-30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components**

Selector	Description
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-MoveDownIcon:alias  showDetailFrame::medium-MoveDownIcon:alias  showDetailFrame::dark-MoveDownIcon:alias</p>	<p>This icon represents the Move Down option on the component submenu. Move Down rearranges the component vertically in relation to the other components on the page. For example, imagine three vertically arranged components. You select Move Down on the middle component. It becomes the bottommost component.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-MoveDownIcon:alias  panelCustomizable::medium-MoveDownIcon:alias  panelCustomizable::dark-MoveDownIcon:alias</p>	<p>In a Framework application, the Move Down icon is displayed to the left of the Move Down submenu item on the component's Actions menu.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-HeaderLeftIcon:alias  showDetailFrame::medium-HeaderLeftIcon:alias  showDetailFrame::dark-HeaderLeftIcon:alias</p>	<p>This icon provides an image for the top-left corner of the component header.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-HeaderLeftIcon:alias  panelCustomizable::medium-HeaderLeftIcon:alias  panelCustomizable::dark-HeaderLeftIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-HeaderRightIcon:alias  showDetailFrame::medium-HeaderRightIcon:alias  showDetailFrame::dark-HeaderRightIcon:alias</p>	<p>This icon provides the image for the top-right corner of the component header.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-HeaderRightIcon:alias  panelCustomizable::medium-HeaderRightIcon:alias  panelCustomizable::dark-HeaderRightIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-ToolbarLeftIcon:alias  showDetailFrame::medium-ToolbarLeftIcon:alias  showDetailFrame::dark-ToolbarLeftIcon:alias</p>	<p>This icon provides the left portion of the component's FadeIn-FadeOut toolbar.</p> <p>The FadeIn-FadeOut toolbar comes into play when the <code>adfp:portlet</code> tag attribute <code>isSeededInteractionAvailable</code> is set to <code>true</code> and <code>displayHeader</code> is set to <code>false</code>.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-ToolbarLeftIcon:alias  panelCustomizable::medium-ToolbarLeftIcon:alias  panelCustomizable::dark-ToolbarLeftIcon:alias</p>	<p>The toolbar contains the Actions menu that would otherwise be displayed on the header. To invoke the toolbar, users move their mouse over the component content area.</p>
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-ToolbarRightIcon:alias  showDetailFrame::medium-ToolbarRightIcon:alias  showDetailFrame::dark-ToolbarRightIcon:alias</p>	<p>If the page design is very simple, then the FadeIn-FadeOut toolbar may not display, even when <code>displayHeader</code> is set to <code>false</code> and <code>isSeededInteractionAvailable</code> is set to <code>true</code>.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-ToolbarRightIcon:alias  panelCustomizable::medium-ToolbarRightIcon:alias  panelCustomizable::dark-ToolbarRightIcon:alias</p>	<p>This icon provides the right portion of the component's FadeIn-FadeOut toolbar.</p> <p>See the description for <code>showDetailFrame::light-ToolbarLeftIcon:alias</code> for an explanation of the FadeIn-FadeOut toolbar.</p>

**Table B-30 (Cont.) Icon Selectors for WebCenter Portal Customizable Components**

Selector	Description
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-ToolbarCenterIcon:alias  showDetailFrame::medium-ToolbarCenterIcon:alias  showDetailFrame::dark-ToolbarCenterIcon:alias</p>	<p>This icon provides the center portion of the component's FadeIn-FadeOut toolbar.</p> <p>See the description for showDetailFrame::light-ToolbarLeftIcon:alias for an explanation of the FadeIn-FadeOut toolbar.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-ToolbarCenterIcon:alias  panelCustomizable::medium-ToolbarCenterIcon:alias  panelCustomizable::dark-ToolbarCenterIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-EditIcon:alias  showDetailFrame::medium-EditIcon:alias  showDetailFrame::dark-EditIcon:alias</p>	<p>This icon represents the Edit option on the component menu. In a Framework application, the Edit icon is displayed to the left of the Edit menu item on the component's Actions menu.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-EditIcon:alias  panelCustomizable::medium-EditIcon:alias  panelCustomizable::dark-EditIcon:alias</p>	
<p><b>showDetailFrame</b></p> <p>showDetailFrame::light-HelpIcon:alias  showDetailFrame::medium-HelpIcon:alias  showDetailFrame::dark-HelpIcon:alias</p>	<p>This icon represents the Help option on the component menu. In a Framework application, the Help icon is displayed to the left of the Help menu item on the component's Actions menu.</p>
<p><b>panelCustomizable</b></p> <p>panelCustomizable::light-HelpIcon:alias  panelCustomizable::medium-HelpIcon:alias  panelCustomizable::dark-HelpIcon:alias</p>	

---

## Resource Catalog Properties and Files

This appendix provides reference information about the configuration, location, and attributes of the default catalog definition file. This information is useful while performing the tasks described in [Part III, "Customizing Your Application and Extending Customization Options"](#).

For detailed information about Resource Catalogs, see [Chapter 15, "Creating and Managing Resource Catalogs."](#)

This appendix includes the following sections:

- [Section C.1, "Configuration and Location of Catalog Definitions"](#)
- [Section C.2, "XML Schema"](#)
- [Section C.3, "Catalog Definition Attributes"](#)
- [Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog"](#)

### C.1 Configuration and Location of Catalog Definitions

The `rcv-config` section of your `adf-config.xml` file defines the name of the default catalog. The `rcv-config` element is not available by default in your application's `adf-config.xml` file. You must add it if you want to change the name of the default catalog or, if you have chosen to implement multiple catalogs, specify a catalog selector class.

```
<rcv:rcv-config>
  <rcv:catalog-selector class-name="" />
  <rcv:default-catalog
catalog-name="/oracle/webcenter/portalapp/catalogs/default-catalog.xml" />
</rcv:rcv-config>
```

The Resource Catalog service stores catalog definition files in MDS at the `resource-catalog-root` directory. The `resource-catalog-root` is defined as an MDS namespace, hence the exact location depends on your MDS configuration. The default `resource-catalog-root` is defined by the `default-scope` attribute in the `adf-rcs-config` element in your `adf-config.xml`. This attribute is set to `"/` implying that a catalog ID is expressed as fully the qualified MDS path:

```
<rcs:adf-rcs-config>
  <rcs:rcs-config>
    <rcs:catalog-config default-scope="/"
default-registry="/oracle/webcenter/portalapp/catalogs/catalog-registry.xml" />
  . . .
```

```

    <rcs:security-manager
class-name="oracle.webcenter.portalframework.genericssiteresources.internal.securit
y.CatalogSecurityManager"/>
  </rcs:rcs-config>

```

The security-manager element defines the security manager implementation.

## C.2 XML Schema

[Example C-1](#) provides the catalog definition XML schema for your reference.

### **Example C-1 XML Schema for Catalog Definition**

```

<xsd:schema elementFormDefault="qualified"
targetNamespace="http://xmlns.oracle.com/adf/rcs/catalog"
xmlns:rcs="http://xmlns.oracle.com/adf/rcs/catalog"
xmlns:md="http://xmlns.oracle.com/bali/xml/metadata"
xmlns:mds="http://xmlns.oracle.com/mds"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"

## C.3 Catalog Definition Attributes

The catalog definition schema provides a rich set of elements through which you can specify the structure and content of your Resource Catalogs.

This section contains the following subsections:

- [Section C.3.1, "catalogDefinition"](#)
- [Section C.3.2, "folder"](#)
- [Section C.3.3, "url"](#)
- [Section C.3.4, "includeCatalog"](#)
- [Section C.3.5, "component"](#)
- [Section C.3.6, "customFolder"](#)
- [Section C.3.7, "customContent"](#)
- [Section C.3.8, "attributes"](#)
- [Section C.3.9, "attribute"](#)
- [Section C.3.10, "parameters"](#)
- [Section C.3.11, "schema"](#)
- [Section C.3.12, "resource"](#)

For an example of creating a custom catalog definition file, see [Section 15.2, "Creating a Custom Resource Catalog."](#)

### C.3.1 catalogDefinition

The `catalogDefinition` element defines the overall characteristics of the catalog, such as the location of translated strings.

[Example C-2](#) illustrates the use of `catalogDefinition`.

**Example C–2 Example of catalogDefinition**

```
<catalogDefinition id="DefaultCatalog" visible="#{true}"
  resourceBundle="portal.catalog.DefaultCatalogBundle"
  definitionFilter="portal.catalog.DefaultCatalogFilter"
  xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
```

Table C–1 describes the keywords of the `catalogDefinition` element. For information about including attributes for elements, see [Section C.3.8, "attributes."](#)

**Table C–1 catalogDefinition Keywords**

Keyword	Description
<code>xmlns</code>	<code>http://xmlns.oracle.com/adf/rcs/catalog</code>
<code>id</code>	The identifier used when referring to this catalog definition.
<code>visible</code>	Whether the Resource Catalog must be available for selection at runtime. This attribute takes an EL value and can be used to conditionally display the catalog to specific users or groups. The default value is <code>#{true}</code> , which means that the catalog is displayed at all times.
<code>resourceBundle</code>	The name of the resource bundle to be used for obtaining translated attribute values, where <code>&lt;attribute... isKey="true"/&gt;</code> . The <code>resourceBundle</code> attribute can also be used at lower levels in the document, such as on individual attributes elements. Refer to the XSD for further details.
<code>definitionFilter</code>	The fully qualified name of a Java class that implements the <code>oracle.adf.rc.spi.plugin.catalog.CatalogDefinitionFilter</code> . You can use a definition filter to dynamically exclude entries from a catalog at runtime. One common use of a definition filter is to provide different views of the same catalog to users with different roles. For example, WebCenter Portal: Spaces uses a definition filter to hide entries for services that the administrator has disabled.

A catalog can have attributes, such as title, subject, and description. For information about including attributes, see [Section C.3.8, "attributes."](#)

**C.3.2 folder**

The `folder` element defines a catalog folder, used to organize content in the catalog. Folders can contain any number of entries including other folders. You can mix different types of catalog elements in the same folder.

Folders can have attributes just like any other entry. For information about including attributes for elements, see [Section C.3.8, "attributes."](#)

[Example C–3](#) illustrates the use of the `folder` element.

**Example C–3 Example of folder**

```
<folder visible="#{true}" id="webDevFolder">
  <attributes>
    <attribute value="WEB_DEV_FOLDER.TITLE" attributeId="Title"
      isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.DESCRPTION" attributeId="Description"
      isKey="true"/>
    <attribute value="WEB_DEV_FOLDER.KEYWORDS" attributeId="Subject"
      isKey="true"/>
    <attribute value="/adf/webcenter/folderlayout_qualifier.png">
```

```

        isKey="false" attributeId="IconURI" />
    </attributes>
    <contents/>
</folder>

```

Table C–2 describes the keywords of the `folder` element.

**Table C–2** *folder Keywords*

Keyword	Description
id	The unique identifier used when referring to this folder.
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is <code>#{true}</code> , which means that the resource is displayed in the catalog at all times.

Rather than adding the code to the catalog definition source, you may find it easier to add a folder in Design view of the catalog definition file. For more information, see [Section 15.2.3.1, "Adding a Folder."](#)

### C.3.3 url

The `url` element is used to define the following types of links in a catalog:

- **Task Flow:** Link to a WebCenter Portal service task flow or a custom task flow created in Oracle JDeveloper.
- **Portlet:** Link to any registered portlet producer.
- **Content:** Link to a file or directory from an existing Content Repository connection.
- **Other:** Link to a custom component that you create by providing the XML code for that component.

[Example C–4](#) illustrates the use of the `url` element.

**Example C–4** *Example of a url Resource*

```

<url visible="#{true}"

factoryClass="oracle.webcenter.portalframework.sitestructure.rc.TaskFlowResourceFactory"
    id="tagCloud"

url="taskflow://oracle/webcenter/tagging/controller/taskflows/tag-selection.xml#tag-selection">
    <attributes>
        <attribute value="TAG_CLOUD.TITLE" attributeId="Title" isKey="true"/>
        <attribute value="TAG_CLOUD.DESCRPTION" attributeId="Description"
            isKey="true"/>
        <attribute value="TAG_CLOUD.KEYWORDS" attributeId="Subject"
            isKey="true"/>
        <attribute value="oracle.webcenter.tagging"
            attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
        <attribute value="/adf/webcenter/label_qualifier.png"
            attributeId="IconURI"/>
        <attribute value="height:211px" attributeId="attr.contentStyle"
            isKey="false"/>
    </attributes>

```

```

</attributes>
<contents/>
</url>

```

Table C-3 describes the keywords for the `url` element.

**Table C-3** *url Keywords*

Keyword	Description
<code>id</code>	The unique identifier used when referring to this folder.
<code>visible</code>	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is <code>#{true}</code> , which means that the resource is displayed in the catalog at all times.
<code>factoryClass</code>	<p>If you are adding a custom component, then specify the factory class of the component. For all other resource types, the <code>Factory Class</code> value is populated as soon as you select the type in Design mode.</p> <p>The factory classes for the available resource types are as follows:</p> <ul style="list-style-type: none"> <li>■ Task flow: <code>oracle.webcenter.portalframework.sitestru cture.rc.TaskFlowResourceFactory</code></li> <li>■ Portlet: <code>oracle.webcenter.portalframework.sitestru cture.rc.PortletResourceFactory</code></li> <li>■ Content: <code>oracle.webcenter.content.model.rc.ContentUr lResourceFactory</code></li> <li>■ Data control: <code>oracle.webcenter.datacomposer.internal.adapt er.datacontrol.DataControlContextFactory</code></li> </ul>
<code>URL</code>	The URL to access the resource. Different link types support different URL formats. For more information, see <a href="#">Table 15-1, "URL Format for the Different Resource Types"</a> .

Resource links can have attributes, such as title, subject, and description, and parameters. For more information, see [Section C.3.8, "attributes"](#) and [Section C.3.10, "parameters."](#)

Rather than adding the code to the catalog definition source, you may find it easier to add a link in Design view of the catalog definition file. For more information, see [Section 15.2.3.2, "Adding a Link."](#)

### C.3.4 includeCatalog

The `includeCatalog` element is used to include a reference to another catalog definition file.

[Example C-5](#) illustrates the use of the `includeCatalog` element.

**Example C-5** *Example of a Nested Resource Catalog*

```

<includeCatalog visible="#{true}" scope="/" id="users-catalog"
catalogId="/oracle/webcenter/portalapp/catalogs/users-catalog.xml">
<attributes>

```

```

    <attribute value="catalog" isKey="false" attributeId="Title"/>
  </attributes>
</includeCatalog>

```

The `includeCatalog` element supports the same keywords as the `catalogDefinition` element. See [Table C-1](#) for the keywords on the `includeCatalog` element.

A catalog can have `attributes`, such as title, subject, and description. For information about including `attributes` for elements, see [Section C.3.8, "attributes."](#)

Rather than adding the code to the catalog definition source, you may find it easier to add a catalog in Design view of the catalog definition file. For more information, see [Section 15.2.3.3, "Adding a Resource Catalog."](#)

### C.3.5 component

The `component` element is used to include a custom XML resource, such as a simple ADF Faces component or raw HTML, in the catalog. The `component` element must be located within the `contents` section. You can add multiple `component` in a catalog definition file.

The `component` element must contain a `parameters` element with a nested `parameter` element. Set the `id` for the `parameter` element to `xml`. Include the XML fragment inside this `parameter` element. To generate an ADF Faces ID for the component at runtime, set the ID on the component to `#` (hash symbol).

[Example C-6](#) shows the code to add a `Box` component to the Resource Catalog.

#### **Example C-6 Panel Customizable Component in the Catalog Definition File**

```

<component id="pc" visible="#{true}"
  factoryClass="oracle.adf.rc.component.XmlComponentFactory">
  <attributes>
    <attribute attributeId="Title" value="BOX" isKey="true"/>
    <attribute attributeId="Description" value="BOX.DESCRPTION"
      isKey="true"/>
    <attribute attributeId="Subject" value="BOX.KEYWORDS" isKey="true"/>
    <attribute attributeId="IconURI"
      value="/adf/webcenter/panelcustomizable_qualifier.png"/>
  </attributes>
  <parameters>
    <parameter id="xml">&lt;cust:panelCustomizable id="#"
  xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
    </parameter>
  </parameters>
</component>

```

[Table C-4](#) describes the keywords of the `component` element. For information about including `attributes` for elements, see [Section C.3.8, "attributes."](#)

**Table C-4 component Keywords**

Keyword	Description
<code>id</code>	The unique identifier for the component in the catalog definition.

**Table C-4 (Cont.) component Keywords**

Keyword	Description
visible	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is <code>#{true}</code> , which means that the resource is displayed in the catalog at all times
factoryClass	The name of a Java class that implements the <code>oracle.adf.rc.component.ComponentFactory</code> interface and generates a Resource Catalog item based on a set of parameters. Each <code>ComponentFactory</code> implementation defines the set of parameters it requires. For example, <code>XmlComponentFactory</code> requires a single parameter named <code>xml</code> and the value of the parameter is a block of XML representing a component or components that can be inserted into a page.

A custom component can have attributes, such as title, subject, and description, and parameters. For more information, see [Section C.3.8, "attributes"](#) and [Section C.3.10, "parameters."](#)

You may find it easier to add a custom component in Design view of the catalog definition file. For more information, see [Section 15.2.3.4, "Adding a Component."](#)

### C.3.6 customFolder

The `customFolder` element defines content generated using Resource Catalog adapters. This element renders a folder that is populated with content dynamically at runtime. The catalog displays the folder even if there are no resources inside it.

[Example C-7](#) illustrates the use of the `customFolder` element to render task flows from the Analytics service.

#### **Example C-7 Example of a customFolder Resource**

```
<customFolder
factoryClass="oracle.webcenter.analytics.view.rc.ASServiceContextFactory"
id="analyticsServiceFolder" visible="#{true}">
  <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle">
    <attribute attributeId="Description" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.DESCRPTION"/>
    <attribute attributeId="IconURI" isKey="false"
value="/adf/webcenter/folderanalytics_qualifier.png"/>
    <attribute attributeId="Subject" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.KEYWORDS"/>
    <attribute attributeId="WEBCENTER_SERVICE_ID" isKey="false"
value="oracle.webcenter.analytics"/>
    <attribute attributeId="attr.text" isKey="false" value="#{uib_o_w_s_r_
DefaultGroupSpaceCatalog['ANALYTICS_FOLDER.TITLE']}/>
    <attribute attributeId="Title" isKey="true"
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"
value="ANALYTICS_FOLDER.TITLE"/>
  </attributes>
</parameters/>
</customFolder>
```

[Table C-5](#) describes the keywords for the `customFolder` element.

**Table C-5** *customFolder Keywords*

Keyword	Description
<code>id</code>	The unique identifier used when referring to this folder.
<code>visible</code>	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is <code>#{true}</code> , which means that the resource is displayed in the catalog at all times.
<code>factoryClass</code>	The factory class of the service. See <a href="#">Section C.4, "Factory Classes Available for Adding Dynamic Resources to the Catalog"</a> for information about the supported factory classes.

A custom folder can have attributes, such as `title`, `subject`, and `description`, and parameters. For more information, see [Section C.3.8, "attributes"](#) and [Section C.3.10, "parameters."](#)

Rather than adding the code to the catalog definition source, you may find it easier to add a custom folder in Design view of the catalog definition file. For more information, see [Section 15.2.3.5, "Adding a Custom Folder."](#)

### C.3.7 customContent

The `customContent` element defines content generated using Resource Catalog adapters. This element renders a folder that contains resources that are generated dynamically at runtime. Unlike the `customFolder` element, the `customContent` element renders a folder in the catalog only if the folder contains resources.

[Example C-8](#) illustrates the use of the `customContent` element.

**Example C-8** *Example of a customContent Resource*

```
<customContent
contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
    id="ensembleContentProvider" visible="true">
    <attributes
resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

[Table C-3](#) describes the keywords for the `customContent` element.

**Table C-6** *customContent Keywords*

Keyword	Description
<code>id</code>	The unique identifier used when referring to this folder.
<code>visible</code>	Whether the resource must be rendered in the catalog. This attribute takes an EL value and can be used to conditionally display the resource to specific users or groups. The default value is <code>#{true}</code> , which means that the resource is displayed in the catalog at all times.
<code>contentProviderClass</code>	The fully qualified name of a class that implements the interface <code>oracle.adf.rc.spi.plugin.catalog.CustomContentProviderV2</code> .

A custom content provider can have attributes, such as title, subject, and description, and parameters. For more information, see [Section C.3.8, "attributes"](#) and [Section C.3.10, "parameters."](#)

Rather than adding the code to the catalog definition source, you may find it easier to add a custom content folder in Design view of the catalog definition file. For more information, see [Section 15.2.3.6, "Adding a Custom Content Provider."](#)

## C.3.8 attributes

Entries in a Resource Catalog have associated attributes that describe the entry. Values for some attributes can be obtained directly from the resources or from the name and description attributes on each XML element in the catalog definition. However, these values may not always be appropriate for displaying to end users, and often they are not available in different languages. Attributes defined using the `attributes` element in the catalog definition let you override those available from other sources. In addition, these attributes can be defined in terms of a key to a resource bundle so the actual values displayed reflect the current user's locale.

Within the `attributes` element you can insert any number of individual `attribute` elements that define the attributes you want to apply to a Resource Catalog entry.

[Example C-9](#) illustrates the use of the `attributes` element.

### **Example C-9 Example of attributes and attribute Elements**

```
<attributes>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
    isKey="true"/>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESRIPTION" attributeId="Description"
    isKey="true"/>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
    isKey="true"/>
  <attribute value="oracle.webcenter.collab.announcement"
    attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

[Table C-7](#) describes the keywords of the `attributes` element.

**Table C-7 attributes Keywords**

Keyword	Description
resourceBundle	The name of the resource bundle to be used for obtaining translated attribute values.

## C.3.9 attribute

The `attribute` element defines an attribute for a Resource Catalog entry that corresponds to a descriptor in the `schema` element. For information about attributes, see [Section C.3.8, "attributes."](#) Composer uses the following attributes:

- Title
- Description
- Subject
- IconURI
- ToolTip

You should include at least a `Title` and `Description` attribute for each catalog entry. A `Subject` attribute is also highly recommended to facilitate keyword searching of the Resource Catalog. The `Title` attribute overrides the name attribute on the parent element and is used to declare a display name that is translated through a resource bundle. Similarly, the `Description` attribute overrides the `description` attribute on the parent element and is used to declare a description that is translated through a resource bundle.

You can declare your own attributes by including them in the `schema` element. For more information, see [Section C.3.11, "schema."](#)

[Example C-10](#) illustrates the use of the `attribute` element.

**Example C-10 Example of attributes and attribute Elements**

```
<attributes>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.TITLE" attributeId="Title"
    isKey="true"/>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.DESRIPTION" attributeId="Description"
    isKey="true"/>
  <attribute value="ANNOUNCEMENTS_MAIN_VIEW.KEYWORDS" attributeId="Subject"
    isKey="true"/>
  <attribute value="oracle.webcenter.collab.announcement"
    attributeId="WEBCENTER_SERVICE_ID" isKey="false"/>
</attributes>
```

[Table C-8](#) describes the keywords of the `attribute` element.

**Table C-8 attribute Keywords**

Keyword	Description
<code>attributeId</code>	The identifier of the attribute as declared in the <code>schema</code> element.
<code>value</code>	The value of the attribute.
<code>isKey</code>	A flag indicating whether the value is a literal value ( <code>false</code> ) or a key to a resource bundle ( <code>true</code> ). In most cases, attributes should be resource bundle keys and the values translated through a resource bundle. The resource bundle can be declared at the catalog level or on various lower level elements such as <code>attributes</code> .
<code>resourceBundle</code>	The name of the resource bundle to be used for obtaining translated attribute values.

For task flows included in your Resource Catalog, you can use the `attribute` element to pass task flow parameters and attributes of the enclosing `Show Detail Frame` component. You can do this by prefixing the `attributeId` values for the task flow parameters and `Show Detail Frame` attributes with **`parameter.`** and **`attr.`** respectively as shown in the following example:

```
<attributes>
  <attribute value="dark" attributeId="attr.background"
    isKey="false"/>
  <attribute value="{myBean.myParam1}" attributeId="parameter.myParam1"
    isKey="false"/>
</attributes>
```

For more information, see [Section 15.2.9, "How to Define Task Flow Parameters and Attributes of the Enclosing Show Detail Frames for Task Flows."](#)

### C.3.10 parameters

A few of the Resource Catalog components, such as links, custom components, and custom folders, support parameters. Parameters are used to provide the XML code for a custom component or bind the resource to other artifacts in the application. You can use the `parameters` element to define parameters on a resource. The `parameters` element must be included inside the tag for the resource. Each `parameters` element can have multiple `parameter` tags. You must provide an ID and a value for each parameter that you define.

When you define a parameter for a custom XML component, you must specify the parameter ID to be `xml` and the value is the code for the custom component. In the code, the component's ID must be `#` so that it is generated at runtime. In addition, you must specify the namespace for the component.

[Example C–11](#) illustrates the use of the `parameters` element in a custom XML component definition.

**Example C–11 Example of parameters and parameter Elements**

```
<parameters>
  <parameter id="xml">&lt;cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/&gt;
  </parameter>
</parameters>
```

### C.3.11 schema

The `schema` element contains one or more `descriptor` elements. The `descriptor` elements provide the Resource Catalog service with information about the attributes used within the catalog, such as whether they are searchable. Out-of-the-box, the attributes `Title`, `Description`, `Subject`, `ToolTip`, and `IconURI` are supported for a resource. You can add other custom attributes that you want to expose on the resource.

[Example C–12](#) illustrates the use of the `schema` element.

**Example C–12 Example of schema**

```
<schema resourceBundle="oracle.adf.rc.attribute.nls.AttributeBundle"
  xmlns="http://xmlns.oracle.com/adf/rcs/catalog">
  <descriptor labelKey="TITLE.PROMPT_KEY" endUserVisible="true"
    multivalue="false" searchable="true" attributeId="Title"
    shortLabelKey="TITLE.SHORT_PROMPT_KEY"
    xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
  <descriptor labelKey="DESCRIPTION.PROMPT_KEY" endUserVisible="true"
    multivalue="false" searchable="true" attributeId="Description"
    shortLabelKey="DESCRIPTION.SHORT_PROMPT_KEY"
    xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
  <descriptor labelKey="SUBJECT.PROMPT_KEY" endUserVisible="true"
    multivalue="false" searchable="true" attributeId="Subject"
    shortLabelKey="SUBJECT.SHORT_PROMPT_KEY"
    xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
  <descriptor labelKey="TOOL_TIP.PROMPT_KEY" endUserVisible="true"
    multivalue="false" searchable="false" attributeId="ToolTip"
    shortLabelKey="TOOL_TIP.SHORT_PROMPT_KEY"
    xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
  <descriptor labelKey="ICON_URI.PROMPT_KEY" endUserVisible="false"
    multivalue="false" searchable="false" attributeId="IconURI"
    shortLabelKey="ICON_URI.SHORT_PROMPT_KEY"
```

```
xmlns="http://xmlns.oracle.com/adf/rcs/catalog"/>
</schema>
```

[Table C-9](#) describes the keywords of the `descriptor` element.

**Table C-9** *descriptor Keywords*

Keyword	Description
<code>attributeId</code>	The identifier of the attribute being described.
<code>searchable</code>	Indicates whether the attribute is included in Resource Catalog searches ( <code>true</code> ) or not ( <code>false</code> ).
<code>multivalue</code>	Indicates whether the attribute can have multiple values ( <code>true</code> ) or not ( <code>false</code> ).
<code>endUserVisible</code>	Indicates whether the attribute should be exposed to end users ( <code>true</code> ) or not ( <code>false</code> ).
<code>resourceBundle</code>	The name of the resource bundle used to translate the label keys.
<code>labelKey</code>	The resource bundle key for the attribute's label.
<code>shortLabelKey</code>	The resource bundle key for the attribute's short label.

### C.3.12 resource

The `resource` element is used to declare an individual resource, such as a task flow, in the catalog. You would need to use this element if you are using a standalone version of Composer (that is, Composer without WebCenter Portal: Framework).

---

---

**Note:** The `url` element, discussed in [Section C.3.3, "url,"](#) also enables you to declare a resource in the catalog. However, `url` is available only if you have installed WebCenter Portal: Framework and have the associated shared libraries.

---

---

[Example C-13](#) illustrates the use of the `resource` element.

**Example C-13** *Example of resource*

```
<resource id="weatherTF"
  repository="application.classpath"
  path="TaskFlow.jar/ADF_
TaskFlow/oracle+composer+internal+test+weather-tfdefn.xml#weather_tf_defn"
  visible="#{true}">
  <attributes>
    <attribute value="/images/bulbgauge_ena.png" attributeId="IconURI"/>
    <attribute value="never" attributeId="attr.showResizer"/>
    <attribute value="Weather in Bangalore is rainy"
      attributeId="parameter.message"/>
    <attribute value="WeatherBee" isKey="false" attributeId="Title"/>
    <attribute value="Displays the weather of your city" isKey="false"
      attributeId="Description"/>
    <attribute value="Weather widget" isKey="false" attributeId="ToolTip"/>
  </attributes>
  <parameters/>
</resource>
```

[Table C-10](#) describes the keywords of the `resource` element. For information about including `attributes` for elements, see [Section C.3.8, "attributes."](#)

**Table C-10** *resource Keywords*

Keyword	Description
id	The identifier for the element in the catalog. Identifiers are required and must be unique at the folder level.
repository	The path to access ADF libraries included in your classpath.
path	<p>The path to the resource. For a task flow in an ADF Library, the path is of the following form:</p> <pre>path_to_jar/ADF_TaskFlow/task_flow_path</pre> <p>To obtain the <code>task_flow_path</code>, create a file system connection in Application Connections and navigate to the task flow in your ADF Library. The tooltip for the task flow shows the fully qualified ID of the task flow. Take this value and replace all occurrences of "/" with "+".</p> <p>For example:</p> <p>If the tooltip is:</p> <pre>oracle/webcenter/collab/announcement/view/taskflows/main-view-definition.xml#announcement-main-view</pre> <p>then <code>task_flow_path</code> would be:</p> <pre>oracle+webcenter+collab+announcement+view+taskflows+main-view-definition.xml#announcement-main-view</pre>

## C.4 Factory Classes Available for Adding Dynamic Resources to the Catalog

Resource Catalog adapters are used to add resources to a catalog dynamically, for example, a folder to display all available content repository connections to users. As the content of such a folder cannot be determined when you create the catalog, the adapter ensures that the folder is populated dynamically.

To use an adapter, you must specify the factory class as part of the resource definition while adding the resource. This section describes the supported factory classes. It includes the following sections:

- [Section C.4.1, "XMLComponentFactory"](#)
- [Section C.4.2, "ContentUrlResourceFactory"](#)
- [Section C.4.3, "CustomFolderContextFactory"](#)
- [Section C.4.4, "DefaultFolderContextFactory"](#)
- [Section C.4.5, "ContentListFactory"](#)
- [Section C.4.6, "EnsembleContentProvider"](#)

### C.4.1 XMLComponentFactory

Use the `oracle.adf.rc.component.XmlComponentFactory` class inside a `<component>` construct to include an XML component in the catalog. The `XmlComponentFactory` class requires a single parameter named `xml` and the value of the parameter is a block of XML representing one or more components that can be added to a page. The following example shows the code to add a Panel Customizable component to the Resource Catalog:

```
<component id="pc" factoryClass="oracle.adf.rc.component.XmlComponentFactory">
```

```
<attributes>
  <attribute attributeId="Title" value="Box"/>
  <attribute attributeId="Description" value="Container for other objects"/>
  <attribute attributeId="IconURI" value="/adf/webcenter/panelcustomizable_
qualifier.png"/>
</attributes>
<parameters>
  <parameter id="xml">
    <cust:panelCustomizable id="#"
xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable"/>
  </parameter>
</parameters>
</component>
```

For the detailed steps, see [Section 15.2.3.4, "Adding a Component."](#)

## C.4.2 ContentUrlResourceFactory

The `ContentUrlResourceFactory` class is used to include portal framework content from UCM connections. It is used when you add a URL resource of type `Content` to the catalog. The following example shows how the `ContentUrlResourceFactory` class can be used:

```
<url id="contentItem"
  factoryClass="oracle.webcenter.content.model.rc.ContentUrlResourceFactory"
  url="content://UCM/PersonalSpaces/weblogic/content.xml">
<attributes>
  <attribute value="Personal Document" isKey="false" attributeId="Title"/>
</attributes>
<parameters>
  <parameter id="templateView">SpaceTemplate</parameter>
</parameters>
</url>
```

where `id` is the unique identifier for the resource, and `url` is the URL to access the resource. The URL must begin with `content:` if you use `ContentUrlResourceFactory`. In addition, you can add a `templateView` parameter to specify the Content Presenter display template to be used.

For more information, see [Section 15.2.3.2, "Adding a Link."](#)

## C.4.3 CustomFolderContextFactory

The `CustomFolderContextFactory` class is used to list all the Content Repository connections available to the application. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="AllConnections"

factoryClass="oracle.webcenter.content.model.rc.CustomFolderContextFactory" />
```

For more information about custom folders, see [Section 15.2.3.5, "Adding a Custom Folder."](#)

## C.4.4 DefaultFolderContextFactory

In the WebCenter Portal: Spaces context, the `DefaultFolderContextFactory` class is used to render the folder for the current space. If the user is in the Home space, then

the user's personal folder is rendered. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="GroupDocuments"
  factoryClass="oracle.webcenter.doclib.model.rc.DefaultFolderContextFactory" />
```

For more information about custom folders, see [Section 15.2.3.5, "Adding a Custom Folder."](#)

## C.4.5 ContentListFactory

The `ContentListFactory` class is used to add a dynamic list of folders to the catalog. You can add a `customFolder` resource to the catalog and specify this factory class, as shown in the following example:

```
<customFolder id="customFolder-folder" visible="#{true}" path=""
  factoryClass="oracle.webcenter.content.model.rc.ContentListFactory">
  <attributes>
    <attribute attributeId="Title" value="Folders List" isKey="false"/>
  </attributes>
  <parameters>
    <parameter id="datasource">UCM#dCollectionID:60</parameter>
    <parameter id="datasourceType">dsTypeFolderContents</parameter>
  </parameters>
</customFolder>
```

The `ContentListFactory` class supports the following parameters:

- `datasource`: The data source of the content. The value depends on the value of `datasourceType`.
- `datasourceType`: The data source type of the content. Valid values are `dsTypeSingleNode`, `dsTypeFolderContents`, `dsTypeQueryExpression`, `dsTypeMultiNode`, and `dsTypeScenarioResults`.
- `templateView`: To specify the Content Presenter display template to be used.

For more information about using Content Presenter, see [Chapter 30, "Adding Content Task Flows and Document Components to a Portal Page."](#)

## C.4.6 EnsembleContentProvider

The `EnsembleContentProvider` class is used to display a dynamic list of all registered pagelet producers. You can add a `customContent` resource to the catalog and specify this factory class, as shown in the following example:

```
<customContent
  contentProviderClass="com.oracle.ensemble.interop.adf.EnsembleContentProvider"
  id="ensembleContentProvider" visible="true">
  <attributes
    resourceBundle="oracle.webcenter.spaces.resource.DefaultGroupSpaceCatalogBundle"/>
</customContent>
```

For more information about custom content providers, see [Section 15.2.3.6, "Adding a Custom Content Provider."](#)

---

---

## Guidelines for Creating Task Flows to Be Used in Composer-Enabled Pages

Task flows are reusable building blocks in Oracle ADF. Oracle WebCenter Portal provides task flows for you, or you can build your own task flows and add them to your Framework application pages. When you add task flows to customizable pages (that is, Composer-enabled pages), users can personalize, customize, and edit these task flows at runtime. It is imperative that you design your task flows according to the rules set forth in Oracle WebCenter Portal publications. Failure to do so can result in problems when the task flows are consumed in portal pages, such as too much white space, too many scroll bars, or slow, jerky, and unpredictable responses when displaying large data sets.

To prevent these issues and provide a consistent user experience in terms of look and feel, layout design, and interaction, follow the instructions in this document for:

- Creating highly performant, cost-effective task flows
- Consuming these task flows effectively in your application by implementing task flow parameters and customization and personalization options

This appendix contains the following topics:

- [Section D.1, "Guidelines for Effective Geometry Management and Pagination"](#)
- [Section D.2, "Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options"](#)
- [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines"](#)
- [Section D.4, "Conclusion"](#)

### D.1 Guidelines for Effective Geometry Management and Pagination

Effective geometry management results in efficient sizing and placement of task flows on the page. If the task flows are not designed properly, you end up with pages that have a slow response time or lots of unnecessary scroll bars or white spaces between components. For example, if you include a task flow containing very little data inside a container that stretches it (for example, a `Show Detail Frame` component), there is a lot of white space below the data in the task flow. Poor design can also cause scrolling to be slow and unpredictable in a task flow with a table displaying a large amount of data. To avoid such issues, be sure to design your task flows so that they flow and use a conventional pagination model when displaying large data sets.

Follow the guidelines in this section when designing new task flows for Framework applications. Also, be sure to adhere to these guidelines when you edit existing Framework application task flows.

### D.1.1 Guideline 1: Create Task Flows that Flow

To avoid unnecessary white spaces in your task flows, you must ensure that the task flow content flows and is not stretched by the task flow container. A *stretching* task flow is one that is stretched to the height of the container, whereas a *flowing* task flow is one whose height is determined by its content, rather than by a stretching container or by itself having a fixed height. A flowing task flow with a small amount of data is shorter than one with large amounts of data, as shown in [Figure D-1](#).

**Figure D-1** Difference Between a Task Flow that Stretches and One that Flows

To design a flowing task flow, you must ensure that:

- The child component of the task flow does not have a fixed height.
- The Show Detail Frame component surrounding the task flow region does not have a fixed height (specified using its `contentStyle` attribute).

The following two examples illustrate how you might include flowing components inside task flows.

#### D.1.1.1 Example 1: Oracle ADF Faces Table Component with Its `autoHeightRows` Attribute Set to a Specific Value

Add an Oracle ADF Faces `Table` component within the task flow and set the `autoHeightRows` attribute on the `Table` to a specific value. By defining this attribute, the table height is adjusted according to the content (flow behavior), rather than the table having a fixed height or being stretched into a container (stretch behavior). The `autoHeightRows` attribute setting results in table data being displayed as follows:

- If you provide a value `H` for `autoHeightRows`, the table grows to a maximum of `H` rows.
- If the number of records returned from the data source is less than `H`, the table height wraps to that number.
- If the number of records is more than `H`, the table displays `H` rows and provides a scrollbar to view the remaining rows.

- If the `autoHeightRows` attribute is not used, the table displays at a fixed default height irrespective of the amount of data displayed.

Instead of specifying a fixed value for the `autoHeightRows` attribute, you can also provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

[Example D–1](#) shows the attributes of a sample ADF Faces `table` component that is included inside a task flow called `recent-pages-task-flow-definition`. The `autoHeightRows` attribute is set to an EL expression that references a Java bean, `recentPagesBean`. This bean contains the logic to populate this attribute with a value provided by the end user (either as a personalization or a customization).

#### **Example D–1 The autoHeightRows Attribute on a Sample ADF Faces Table**

```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
  var="row" rowBandingInterval="0" id="t1"
  rowSelection="none" columnBandingInterval="0"
  width="100%" inlineStyle="border:none;width:100%;"
  columnStretching="last" horizontalGridVisible="true"
  verticalGridVisible="false"
  autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_show_
at_a_time}"
  contentDelivery="immediate"
  fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}">
  .
  .
  .
</af:table>
```

For a detailed description of the sample task flow displaying personalization and customization options for specifying the `autoHeightRows` value, see [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."](#)

To learn more about the `autoHeightRows` attribute, including requirements such as setting the `contentDelivery` attribute to `immediate`, see the tag documentation for `<af:table>` in the *Oracle Fusion Middleware Tag Reference for Oracle ADF Faces*.

#### **D.1.1.2 Example 2: Oracle ADF Faces Iterator Component Inside a Panel Group Layout with a Scrolling Layout**

Add a `Panel Group Layout` component within the task flow and set its `layout` attribute to `scroll`. Then add an `Iterator` inside the `Panel Group Layout`. Add your content inside the `Iterator`. The content from the `Iterator` flows inside the `Panel Group Layout`.

Since the height of the `Panel Group Layout` depends on the content from the `Iterator`, specify a minimum and maximum height for the component by using `min-height` and `max-height` in the `Panel Group Layout`'s `inlineStyle` attribute.

### **D.1.2 Guideline 2: Limit the Number of Records Displayed in a Task Flow**

To avoid a slow and jerky response when scrolling large data sets in your task flow, you must limit the number of records to be fetched from the data source at a time. For example, if you have included an ADF faces `Table` component inside your task flow,

limit the number of records to be displayed in the table. Use the `fetchSize` attribute on the `Table` to specify the number of records to be fetched from the data source in a single query. If you specify a fetch size of `N`, only `N` records are sent to the client from the data source.

The `fetchSize` and `autoHeightRows` attributes together control the number of rows displayed in the table. The relationship between these attributes is as follows:

- If `fetchSize` equals `autoHeightRows`, all records are displayed in the table.
- If `fetchSize` is less than `autoHeightRows`, the table is cropped at the `fetchSize` value.
- If `fetchSize` is greater than `autoHeightRows`, you can decide whether to display only as many records as the `autoHeightRows` value or provide pagination controls to display the remaining records. For example, you might include a `More` link at the bottom of the task flow or include pagination using `Previous` and `Next` links. For more information, see [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."](#)

Figure D–2 shows the difference between two task flows containing tables with equal `autoHeightRows` and `fetchSize` values of 10 and 5. The task flows wrap to the number of records displayed.

**Figure D–2** Difference Between Task Flows with Different Fetch Size Values

Instead of specifying a fixed value for `fetchSize`, you can provide an EL value so that the attribute is populated based on some logic you specify. You can enable customization and personalization on the task flow and provide an option for users to specify a value for this attribute. A value specified using the personalization option overrides a value specified using the customization option.

The following example shows the attributes of a sample ADF Faces `Table` component that is included inside a task flow called `recent-pages-task-flow-definition`. The `fetchSize` attribute is set to an EL expression that references a Java bean, `recentPagesBean`. This bean contains the logic to populate this attribute with a customization value provided by the end user.

```
<af:table value="#{pageFlowScope.recentPagesBean.pages}"
  var="row" rowBandingInterval="0" id="t1"
  rowSelection="none" columnBandingInterval="0"
  width="100%" inlineStyle="border:none;width:100%;"
  columnStretching="last" horizontalGridVisible="true"
  verticalGridVisible="false"
```

```

        autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_items_to_
show_at_a_time}"
        contentDelivery="immediate"
        fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_to_query}"
        .
        .
        .
</af:table>

```

For a detailed description of the sample task flow displaying a customization option for specifying the `fetchSize` value, see [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."](#)

To learn more about the `fetchSize` attribute, see the tag documentation for `<af:table>` in the *Oracle Fusion Middleware Tag Reference for Oracle ADF Faces*.

### D.1.3 Guideline 3: Specify a Minimum Height for the Task Flow

You can ensure that the task flow wraps to the height of the content by adhering to the first guideline, described in [Section D.1.1, "Guideline 1: Create Task Flows that Flow."](#)

To prevent the task flow from collapsing completely when there are no records, or seeming too short when there are only one or two records, specify a minimum height for the content.

For example, if your task flow contains a table with an `autoHeightRows` value specified, you can specify a `min-height` value using the table's `inlineStyle` attribute.

[Figure D-3](#) shows a task flow displayed with a reasonable height even though it has only two rows.

**Figure D-3 Task Flow with a Minimum Height Specified**

### D.1.4 Guideline 4: Include UI for Accessing Data Beyond the Display Limit

If a task flow is showing ten records, but the data source contains 100 records, you can design the task flow to do one of the following depending on the nature of data in the task flow:

- Display only ten records.

For example, a Popular Discussion Topics task flow may use this first option if it is considered sufficient to show the ten most popular topics and not necessary to let users see even the eleventh most popular topic.

- Show a More link at the bottom of the task flow that opens a view with the ability to show more records.

For example, the People Connections task flow on a Spaces page displays a More link at the bottom.

- Show a pagination control with Previous and Next links.

For example, a Watched Discussion Topics task flow may display pagination controls, as users typically want to see all of their watched topics. Pagination is a common choice for task flows in which the data is not inherently ranked in order of importance or can be sorted in different ways, and where it is important to be able to access any record in the data set. The pagination control can be placed either above or below the content, depending on the nature of the content.

Figure D–4 shows the Watched Topics and Popular Topics task flows containing tables having a `fetchSize` of 5 but both having more than five records in the data source. The Watched Topics task flow displays five records with pagination at the bottom, but the Popular Topics task flow displays only five records with no UI option to view other records.

**Figure D–4 Task Flows With and Without Pagination Controls**

### Pagination Specifics

Here are a few simple recommendations for creating a pagination control:

- Add a pagination message in the format 1 to N of M [prev] [next].
- Align the pagination elements to the right so that the Previous and Next links do not move as you navigate pages.
- Ensure that the Next or Previous option is grayed out when it is not required.

For an example of how to use pagination controls, see [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."](#)

You can customize pagination controls using the following parameters:

- Position of Previous and Next links
- Labels for Previous and Next links, for example, Newer and Older
- Icons used with Previous and Next links
- The words or symbols used to represent to and of, for example, 1-5 of 100
- Options for permitting random access, for example, Prev 1 2 3 ... Next Last

## D.2 Guidelines for Efficient Use of Task Flow Parameters and Customization and Personalization Options

While creating a task flow, you can create parameters and provide options for users to customize and personalize the task flow. You can enable privileged users to customize the task flow for all users (customization) and edit the task flow's properties and parameters in Composer. You can enable all users viewing the page to customize their view of the page (personalization). This section provides guidelines for implementing task flow parameters and the customization and personalization options.

[Table D-1](#) provides an overview of the various task flow editing options available to users.

**Table D-1 Options Used to Define Task Flow Appearance and Behavior**

Option	Description	When to Use	Who can See It
Parameters	A small set of ideally scalar values, used to program a task flow or set its context. Each parameter must have a good display name and description (which must include possible values and examples).	<p>Use for a context like the city or pin code so that you can add multiple instances of the task flow, each showing different information or programmed to show information based on receiving a value from the page, programmatically or using the URL.</p> <p>In Spaces, you can use a parameter for a context like space name.</p> <p>Precedence: 3</p> <p>This value overrides built-in values in the task flow.</p>	<p>Power users (or users with Edit or Customize permission) can see parameters in Composer's Component Properties dialog while editing a page.</p> <p>In Spaces, moderators can see and edit task flow parameters.</p> <p>When a WebCenter Portal service task flow is exposed as a portlet in Oracle Portal, page designers can see these parameters while setting up the portlet.</p>

**Table D-1 (Cont.) Options Used to Define Task Flow Appearance and Behavior**

Option	Description	When to Use	Who can See It
Customization/Preferences	<p>These two are synonymous. Customizations are typically considered changes a business user makes to the task flow. These changes are available to all viewers of the page and are used to specify values for options defined in the task flow. For example, users can decide whether to display the author name or revision date for a document.</p> <p>Preferences are referred to as a definition of the content in the task. For example, a query definition in the Document Viewer task flow, or a query in OmniPortlet.</p>	<p>Use these when the task flow must provide a user interface that assists the user in defining the task flow behavior. That is, when Lists of Values or specific UI components such as images or radio buttons guide the user better, or when the task flow setup is a multiple step wizard-style interface.</p> <p>Such assistance cannot be provided through parameters because they are strictly scalar values, with no assistance other than a description.</p> <p>Precedence: 2</p> <p>If there is an identical parameter value (for example, space name), customization overrides that value.</p>	<p>Business users (or users with Edit or Customize permission) editing a page in Composer can see the customization or preferences options.</p> <p>Typically, customization or preferences options are available on the chrome surrounding the task flow in Edit mode. However, users with Edit or Customize permission can also see these options on the chrome in View mode of the page.</p> <p>When a WebCenter Portal task flow is exposed as a portlet in Oracle Portal, the page designer sees these as Edit Defaults options while setting up the portlet.</p>
Personalization	<p>A subset of the customization and preferences options. You cannot have personalization options that are not also customization options.</p>	<p>Use these to allow all viewers of the page to tweak and tune the visual aspects of the task flow or the amount of data shown to them. For example, to set the number of items to display.</p> <p>Precedence: 1</p> <p>If there is an identical customization value (for example, number of items), personalization overrides that value.</p>	<p>All end users with View permission can see these options.</p> <p>Personalization options are available on the chrome surrounding the task flow. When WebCenter Portal task flows are exposed as portlets in Oracle Portal, the Personalization options allow end users to tweak the same visual aspects.</p>
Implicit Personalization	<p>Options that are persisted for end users from session to session. Implicit personalization options are not available on the chrome surrounding the task flow, but are actions that can be performed directly in the body of the task flow. For example, sorting and column resizing are implicit personalization options.</p>	<p>Use these options sparingly and only for options that are frequently changing. Options like column resizing and sorting are available for free from Oracle ADF.</p>	<p>All end users with View permission on the page can perform personalizations.</p>

To improve application performance, follow the guidelines in this section while implementing parameters and customization and personalization options in task flows.

## D.2.1 Guidelines for Implementing Task Flow Parameters

At design time (in JDeveloper), you can create parameters by defining them in the task flow definition XML file. At runtime, users with Edit or Customize permission can edit task flow parameters in the Component Properties dialog in Composer. To provide a good user experience, you must adhere to the following guidelines when creating parameters:

- Provide a display name that is meaningful.
- Provide a description for each parameter, along with examples and the possible values it can take.

The following example shows the code to define a parameter called `layoutStyle` in the task flow definition file:

```
<input-parameter-definition>
  <name>layoutStyle</name>
  <description> Used to control whether the documents must display as a list, with
  icons, or with document details.
  Allowed values are list, icon, and detail.</description>
  <display-name>Layout Style</display-name>
</input-parameter-definition>
```

## D.2.2 Guidelines for Implementing Customization

Users with Edit or Customize permission can access customization options from the chrome surrounding the task flow.

You must adhere to the following guidelines while implementing customization in your task flow:

- Customization options must be a subset of the task flow's parameters.
- Implement a view fragment within the task flow and expose an outcome to open this view in a separate dialog. For example, the control flow rule to invoke a view called `advancedEditPopupView` in a dialog is as follows:

```
<control-flow-case>
  <from-outcome>dialog:advancedEditPopup</from-outcome>
  <to-activity-id>advancedEditPopupView</to-activity-id>
</control-flow-case>
```

Adhering to this guideline is mandatory for new task flows.

- Implement a view fragment within the task flow and expose an outcome to transition inline to this view. For example, the control flow rule to invoke a view called `advancedEditView` within the same screen is as follows:

```
<control-flow-case>
  <from-outcome>advancedEdit</from-outcome>
  <to-activity-id>advancedEditView</to-activity-id>
</control-flow-case>
```

Although you can implement a task flow in this way, it is recommended that you expose an outcome to open the view in a dialog.

- Ensure that customizations are saved in the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, customizations are saved in the Metadata Storage (MDS). If you do not explicitly specify the MDS layer to be used to save task flow customizations, customization metadata and the consuming application metadata may get stored in different layers.

To ensure that customizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring customization. For an example of how this is implemented, see [Section D.3, "Example of a Framework Application Containing a Task Flow Created By Following the Guidelines."](#)

### D.2.3 Guidelines for Implementing Personalization

All users viewing the page can access personalization options from the chrome surrounding the task flow in View mode of the page.

You must adhere to the following guidelines while implementing personalization in your task flow:

- Ensure that personalization options are a subset of the customization options you define on the task flow.
- If a key aspect of the task flow is to show objects—for example, documents, users, or requests—then you must include a personalization option for users to set the maximum number of objects to display.
- Implement a view fragment within the task flow, and expose an outcome to open this view in a dialog. For example, the control flow rule to invoke a view called `simpleEditPopupView` in a dialog is as follows:

```
<control-flow-case>
  <from-outcome>dialog:simpleEditPopup</from-outcome>
  <to-activity-id>simpleEditPopupView</to-activity-id>
</control-flow-case>
```

Adhering to this guideline is mandatory for new task flows.

- Implement a view fragment within the task flow and expose an outcome to transition inline to the view. For example, the control flow rule to invoke a view called `simpleEditView` within the same screen is as follows:

```
<control-flow-case>
  <from-outcome>simpleEdit</from-outcome>
  <to-activity-id>simpleEditView</to-activity-id>
</control-flow-case>
```

Although you can implement a task flow in this way, it is recommended that you make a transition to bring this view up as a dialog.

- Ensure that personalizations are written to the MDS level set up by the application. Unlike task flow parameters, which are stored in the task flow definition itself, personalizations are saved in MDS. If you do not explicitly specify the MDS layer to be used to save personalizations, personalization metadata and application metadata may get stored in different layers.

To ensure that personalizations are saved to the same layer as application metadata, you must clone the application's MDS session in the task flow's preference file and reference that while configuring personalization. For an example of how this is implemented, see ["Example of a Framework Application Containing a Task Flow Created By Following the Guidelines"](#)

### D.2.4 Guidelines for Implementing Implicit Personalization

Users perform implicit personalizations while using the task flow itself, by way of resizing, sorting table columns, and so on. Personalization options in this case are not

invoked using dialogs and users may not even be aware that they are actually personalizing a page.

Adhere to the following guidelines while implementing implicit personalization:

- Do not overload the task flow with implicit personalization attributes. Select a few key, frequently used attributes to expose as implicit. Infrequently used or complex attributes can be handled with explicit personalization.
- Do not implement implicit personalization such that a dialog is invoked. Implicit personalization must be performed in the body of the task flow itself.

## D.3 Example of a Framework Application Containing a Task Flow Created By Following the Guidelines

As a companion to this document, a sample application was developed using Oracle WebCenter Portal: Framework. This sample application, called `RecentPages`, is used as an example to illustrate how you can build a near-perfect task flow by adhering to the guidelines in this document. The `RecentPages` application contains a customizable page, `Welcome.jspx`, which contains a task flow named `recent-pages-taskflow-definition` created by following all the required guidelines.

This section only provides a high-level description of how the task flow was implemented. For detailed information about using task flows and Composer, see the following guides:

- *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*, for information about creating task flows.
- *Oracle Fusion Middleware User's Guide for Oracle WebCenter Portal: Spaces*, for information about editing, customizing, and personalizing task flows in Composer.

The `RecentPages` sample application is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

<http://webcenter.oracle.com>

The `RecentPages` application contains the following projects:

- A Model project
- A Portal project named `RecentPagesTaskFlow` that contains the `recent-pages-task-flow-definition` task flow
- Another Portal project named `WebPages` that contains the JSPX page in which the task flow is consumed

### D.3.1 The `RecentPagesTaskFlow` Project

This project contains the task flow created by following the guidelines. The files of significance in this project are as follows:

- The `recent-pages-task-flow-definition.xml` file
- The `mainView.jsff` fragment
- The `simpleEditPopupView.jspx` page
- The `advancedEditPopupView.jspx` page
- The `recentPagesBean` Java bean

- The Preference Java bean

### D.3.1.1 The recent-pages-task-flow-definition.xml File

This is an Oracle ADF task flow definition containing three views: `mainView`, `simpleEditPopupView`, and `advancedEditPopupView`. The task flow is designed such that `mainView` displays a list of recently created pages in the application, `simpleEditPopupView` displays a personalization option to all users, and `advancedEditPopupView` displays customization options to users with Edit or Customize permission.

The following table breaks down the code in `recent-pages-task-flow-definition.xml` and explains each snippet.

The outcomes from `mainView` to `simpleEditPopupView` and `advancedEditPopupView` are called `dialog:simpleEditPopupview` and `dialog:advancedEditPopupView` respectively. This is to ensure that the views open in separate dialogs, not inline. In addition, this task flow provides Refresh, Previous, and Next outcomes on `mainView`. The `simpleEditPopupView` and `advancedEditPopupView` views provide Save and Cancel outcomes.

The following table describes significant sections of code in the `recent-pages-task-flow-definition.xml` file.

**Table D–2 Sections Of Code in the Task Flow Definition File**

Code	Description
<code>&lt;default-activity&gt;mainView&lt;/default-activity&gt;</code>	Defining the default view for the task flow: <code>mainView</code>
<code>&lt;managed-bean&gt;   &lt;managed-bean-name&gt;recentPagesBean&lt;/managed-bean-name&gt;   &lt;managed-bean-class&gt;view.RecentPangesBean&lt;/managed-bean-class&gt;   &lt;managed-bean-scope&gt;pageFlow&lt;/managed-bean-scope&gt; &lt;/managed-bean&gt;</code>	Referencing the <code>recentPagesBean</code> Java bean that is associated with the task flow definition. This bean was created as part of the <code>view</code> package.
<code>&lt;view id="mainView"&gt;   &lt;page&gt;/mainView.jsff&lt;/page&gt; &lt;/view&gt;   &lt;view id="simpleEditPopupView"&gt;     &lt;page&gt;/simpleEditPopupView.jsp&lt;/page&gt;   &lt;/view&gt;   &lt;view id="advancedEditPopupView"&gt;     &lt;page&gt;/advancedEditPopupView.jsp&lt;/page&gt; &lt;/view&gt;</code>	Mapping task flow views to pages or page fragments. For example, <code>mainView</code> is associated with <code>mainView.jsff</code> .

**Table D-2 (Cont.) Sections Of Code in the Task Flow Definition File**

Code	Description
<pre> &lt;control-flow-rule&gt;   &lt;from-activity-id&gt;mainView&lt;/from-activity-id&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;refresh&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;dialog:simpleEditPoup&lt;/from-outcome&gt;     &lt;to-activity-id&gt;simpleEditPopupView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;next&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;previous&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;dialog:advancedEditPopup&lt;/from-outcome&gt;     &lt;to-activity-id&gt;advancedEditPopupView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt; &lt;/control-flow-rule&gt; </pre>	<p>Control flow rules from mainView. Each control flow case defines an outcome and a corresponding target view.</p>
<pre> &lt;control-flow-rule&gt;   &lt;from-activity-id&gt;simpleEditPopupView&lt;/from-activity-id&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;save&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;cancel&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt; &lt;/control-flow-rule&gt; </pre>	<p>Control flow rules from simpleEditPopupView. Each control flow case defines an outcome and a corresponding target view.</p>
<pre> &lt;control-flow-rule&gt;   &lt;from-activity-id&gt;advancedEditPopupView&lt;/from-activity-id&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;save&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt;   &lt;control-flow-case&gt;     &lt;from-outcome&gt;cancel&lt;/from-outcome&gt;     &lt;to-activity-id&gt;mainView&lt;/to-activity-id&gt;   &lt;/control-flow-case&gt; &lt;/control-flow-rule&gt; </pre>	<p>Control flow rules from advancedEditPopupView. Each control flow case defines an outcome and a corresponding target view.</p>

### D.3.1.2 The mainView.jsff Fragment

Figure D-5 displays a list of recently created pages in the application. At runtime, the list looks like this:

**Figure D–5** The mainView Fragment in the Task Flow

The design features of this view fragment are as follows:

- The `autoHeightRows` attribute is defined on the table to control the number of items displayed in the table. The task flow then wraps to the height of the items displayed.
- The `fetchSize` attribute is defined to control the number of items to be fetched from the data source and displayed in the table.
- Pagination controls are included to display a message in the format "Items 1-4 of 25" along with previous and next icons.

[Table D–3](#) describes significant sections of code in the `mainView.jsff` fragment.

**Table D-3** *The mainView Fragment Code*

Code	Description
<pre>&lt;af:panelGroupLayout id="pgl1" layout="vertical"&gt;   &lt;af:outputText value="Shows recent pages in the application" id="ot1"/&gt;</pre>	<p>A single top-level component-Panel Group Layout. This component is designed to ensure that the task flow content flows vertically and always stretches horizontally. This allows geometry management.</p>

**Table D-3 (Cont.) The mainView Fragment Code**

Code	Description
<pre> &lt;af:table value="#{pageFlowScope.recentPagesBean.pages}" var="row"   rowBandingInterval="0" id="t1" rowSelection="none"   columnBandingInterval="0" width="100%"   inlineStyle="border:none;width:100%;" columnStretching="last"   horizontalGridVisible="true" verticalGridVisible="false" <b>autoHeightRows="#{pageFlowScope.recentPagesBean.number_of_ items_to_show_at_a_time}"</b>   contentDelivery="immediate" <b>fetchSize="#{pageFlowScope.recentPagesBean.number_of_items_ to_query}"</b>&gt; </pre>	<p>A table component that is a child of the Panel Group Layout.</p> <p>Table attributes:</p> <ul style="list-style-type: none"> <li>■ <b>autoHeightRows (N):</b> The number of items to display in the table at one time. ### D.3.1.3 The simpleEditPopupView.jspx Page

Figure D–6 displays an option to select the number of items to be displayed in the task flow. All users viewing the page can personalize the task flow using this option. The value specified by a user is applicable only for that user's view of the page.

**Figure D–6** The `simpleEditPopupView` Page

The following table describes significant sections of code in the `simpleEditPopupView.jspx` page.

**Table D–4** Code in the Personalization Page

Code	Description
<pre> &lt;af:panelStretchLayout id="psl1"&gt;   &lt;f:facet name="center"&gt;     &lt;af:group id="group1"&gt;       &lt;af:panelFormLayout id="pf11"&gt;         &lt;af:inputText label="Number of Items to show at a time"           id="it1"           value="#{pageFlowScope.recentPagesBean.number_ of_items_to_show_at_a_time}"           columns="3"/&gt;       &lt;/af:panelFormLayout&gt;       &lt;af:panelGroupLayout id="pgl2"         layout="horizontal"         halign="right"         inlineStyle="width:500px;"&gt;         &lt;af:commandButton text="Save" id="cb1"           action="#{pageFlowScope.recentPagesBean.saveSetting s}"/&gt;         &lt;af:commandButton text="Cancel" id="cb2"           action="cancel"           actionListener="#{pageFlowScope.recentPagesBean.can cel}"/&gt;       &lt;/af:panelGroupLayout&gt;     &lt;/af:group&gt;   &lt;/f:facet&gt; &lt;/af:panelStretchLayout&gt; </pre>	<p>A single top-level Panel Stretch Layout component with a Group component in its center facet. Within this group are a Panel Form Layout and a Panel Group Layout.</p> <p>The Panel Form Layout contains an Input Text component, which is populated with a value returned by <code>recentPagesBean</code>.</p> <p>The Panel Group Layout contains two Command Button components called Save and Close, which are wired to events defined in <code>recentPagesBean</code>.</p>

### D.3.1.4 The `advancedEditPopupView.jspx` Page

This page displays customization options to users with Edit or Customize permission. At runtime, this page opens in a separate dialog and displays options to select the

number of items to be displayed and number of items to be queried, and a check box to show or hide pagination controls.

The following table describes significant sections of code in the `advancedPopupView.jspx` page.

**Table D-5 Code in the Customization Page**

Code	Description
<pre> &lt;af:panelStretchLayout id="psl1"&gt;   &lt;f:facet name="center"&gt;     &lt;af:group id="group1"&gt;       &lt;af:panelFormLayout id="pfl1"&gt;         &lt;af:inputText label="Number of Items to show at a time"                     id="it1"                     value="#{pageFlowScope.recentPagesBean.number_of_ items_to_show_at_a_time}"                     columns="3"/&gt;         &lt;af:inputText label="Number of Items to Query" id="it2"                     value="#{pageFlowScope.recentPagesBean.number_of_ items_to_query}"                     columns="3"/&gt;         &lt;af:selectBooleanCheckbox label="Show Page Control"                                 id="sbc1"                                 value="#{pageFlowScope.recentPagesBean.showPageContro l}"/&gt;       &lt;/af:panelFormLayout&gt;       &lt;af:panelGroupLayout id="pgl2"                           layout="horizontal"                           halign="right"                           inlineStyle="width:500px;"&gt;         &lt;af:commandButton text="Save" id="cb1"                           action="#{pageFlowScope.recentPagesBean.saveSettings} "/&gt;         &lt;af:commandButton text="Cancel" id="cb2"                           action="cancel"                           actionListener="#{pageFlowScope.recentPagesBean.cance l}"/&gt;       &lt;/af:panelGroupLayout&gt;     &lt;/af:group&gt;   &lt;/f:facet&gt; &lt;/af:panelStretchLayout&gt; </pre>	<p>A single top-level Panel Stretch Layout component with a group component in its center facet. Within this group are a Panel Form Layout and a Panel Group Layout.</p> <p>The Panel Form Layout contains two Input Text components and a Select Boolean Checkbox. These components are populated with values returned by recentPagesBean.</p> <p>The Panel Group Layout contains two Command Button components called Save and Close, which are wired to events defined in recentPagesBean.</p>

### D.3.1.5 The recentPagesBean Java Bean

This Java bean contains the logic for the following:

- Displaying a specific number of items in the table based on user input.
- Handling the Save and Cancel events triggered from the simpleEditPopupView and advancedEditPopupView pages.
- Rendering Previous and Next icons while implementing pagination.
- Displaying the pagination message after retrieving the total number of pages.
- Referencing the Preference bean that defines where customizations and personalizations must be saved.

You can find the code for this bean in the `RecentPages` application that is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

<http://webcenter.oracle.com>

The following table describes significant sections of code in the `recentPagesBean.java` file.

**Table D-6 The recentPagesBean Java Bean Code**

Code	Description
<pre>private String _getPreferenceFileName() {     String taskflowId =  ControllerContextFwk.getInstanceFwk().getCurrentVi ewPortFwk().getClientId();     if (taskflowId == null)     {         taskflowId =  ControllerContextFwk.getInstanceFwk().getCurrentVi ewPortFwk().getParentViewPort().getClientId();     }     String preferenceFileName =         PREFERENCE_BASE + taskflowId.replace(".", "_ ") + ".xml";     return preferenceFileName; }  private static PageServiceBean getPageServiceBean() {     String beanName = "pageServiceBean";     Object bean = null;     FacesContext ftx = FacesContext.getCurrentInstance();     bean = ftx.getExternalContext().getRequestMap().get(beanN ame);     if (bean == null)     {         ELContext elContext = ftx.getELContext();         ExpressionFactory exFactory =  ftx.getApplication().getExpressionFactory();         ValueExpression expr =             exFactory.createValueExpression(elContext, "#{" + beanName + "}", PageServiceBean.class);         bean = expr.getValue(elContext);     }     return (PageServiceBean) bean; }</pre>	<p>Logic for identifying the task flow and retrieving the instance-level preference file for the currently running task flow.</p>

**Table D-6 (Cont.) The recentPagesBean Java Bean Code**

Code	Description
<pre> public String saveSettings() throws Exception {     if (number_of_items_to_query != null &amp;&amp;         !number_of_items_to_query.isEmpty())     {         Preference.setNumberOfItemsToQuery(_ getPreferenceFileName(),  Integer.parseInt(number_of_items_to_query));     }     if (this.number_of_items_to_show_at_a_time != null &amp;&amp;         !this.number_of_items_to_show_at_a_ time.isEmpty())     {         Preference.setNumberOfItemsToShow(_ getPreferenceFileName(),  Integer.parseInt(number_of_items_to_show_at_a_ time));     }     if (_showPageControl != null)     {         Preference.setShowPageControl(_ getPreferenceFileName(),_showPageControl);     }  AdfFacesContext.getCurrentInstance().returnFromDia log(null, null);     return "save"; } </pre>	<p>Logic to define behavior of Save button in the personalization or customization dialog. Settings are saved in the task flow preference file.</p>
<pre> public void setNumber_of_items_to_show_at_a_ time(String number_of_items_to_show_at_a_time) {     this.number_of_items_to_show_at_a_time = number_of_items_to_show_at_a_time; } public String getNumber_of_items_to_show_at_a_ time() {     String query =  Integer.toString(Preference.getNumberOfItemsToShow (_getPreferenceFileName()));     return query; } </pre>	<p>Logic to populate the Number of Items to show at a time field in the personalization or customization dialog.</p>

**Table D-6 (Cont.) The recentPagesBean Java Bean Code**

Code	Description
<pre> public void setNumber_of_items_to_query(String number_of_items_to_query) {     this.number_of_items_to_query = number_of_ items_to_query; } public String getNumber_of_items_to_query() {     String query =  Integer.toString(Preference.getNumberOfItemsToQuer y(_getPreferenceFileName()));     return query; } </pre>	<p>Logic to populate the Number of Items to Query field in the customization dialog.</p>

**Table D-6 (Cont.) The recentPagesBean Java Bean Code**

Code	Description
<pre>public void previous(ActionEvent actionEvent) {     int page_num = getPageNumber();     page_num--;     if (page_num &lt;= 0)     {         page_num = 1;     }      RequestContext.getCurrentInstance().getPageFlowScope().put("page_num", page_num); }</pre>	<p>Logic to define behavior of Previous action in the task flow's pagination control.</p>
<pre>public void next(ActionEvent actionEvent) {     int page_num = getPageNumber();     page_num++;     String items_to_query = this.getNumber_of_items_to_query();     int offset = Integer.parseInt(items_to_query);     int total_page_num = getTotalPageNumber();     if (page_num &gt; total_page_num)     {         page_num = this.getTableSize() / offset;     }      RequestContext.getCurrentInstance().getPageFlowScope().put("page_num", page_num); }</pre>	<p>Logic to define behavior of Next action in the task flow's pagination control.</p>
<pre>public boolean isShowPrevious() {     int page_num = getPageNumber();     if (page_num &lt;= 1)     {         return false;     }     else     {         return true;     } }</pre>	<p>Logic to render Previous icon</p>
<pre>public boolean isShowNext() {     int page_num = getPageNumber();     if (page_num &gt;= getTotalPageNumber())     {         return false;     }     else     {         return true;     } }</pre>	<p>Logic to render Next icon.</p>

**Table D-6 (Cont.) The recentPagesBean Java Bean Code**

Code	Description
<pre>public int getTotalPageNumber() {     String items_to_query =         this.getNumber_of_items_to_query();     int offset = Integer.parseInt(items_to_query);     int total_page_num = this.getTableSize()         / offset;     if (getTableSize() % offset &gt; 0)     {         total_page_num++;     }     return total_page_num; }</pre>	Logic to return the total number of pages.
<pre>public String getFooterText() {     return "Items " + (this.getStart() + 1) + "-" + this.getEnd() + " of " + " " + this.getTableSize() + " "; }</pre>	Logic for returning pagination text in the format Items 1-4 of 25.

### D.3.1.6 The Preference Bean

This Java bean is a wrapper that provides APIs to get and set attributes in the task flow preference file. It contains the logic for saving personalizations and customizations on this task flow instance in the same MDS layer as that used by the application. In this sample application, site-level customizations are stored in the `mds/mdssys/cust/site/site` directory. Therefore, the code in the Preference bean ensures that the application's MDS session is cloned and the task flow personalizations and customizations are stored in the same directory.

You can find the code for this bean in the `RecentPages` application that is available for download from the Oracle WebCenter Portal 11g Demonstrations and Samples page on OTN at:

<http://webcenter.oracle.com>

The following table describes significant sections of code in the `Preference.java` file.

**Table D-7 The Preference Java Bean Code**

Code	Description
<pre>private static MDSsession _getClonedMDSsession() {     MDSInstance instance = (MDSInstance) ADFContext.getCurrent().getMDSInstanceAsObject();     MDSsession mdsSession = (MDSsession) ADFContext.getCurrent().getMDSsessionAsObject();     mdsSession = instance.createSession(mdsSession.getSessionOptions(), mdsSession.getUserStateHandler());     return mdsSession; }</pre>	Logic to clone the application's MDS session.

**Table D-7 (Cont.) The Preference Java Bean Code**

Code	Description
<pre> private static MetadataObject _ readPreference(MDSsession mdsSession, String preferenceFileName) {     MetadataObject mo = null;     try     {         mo =  mdsSession.getMutableMO(MOREference.create(preferenceFi leName));     }     catch (MetadataNotFoundException mnfe)     {         _LOG.warning("Creating a new preference file " + preferenceFileName);     }     catch (ReferenceException re)     {         _LOG.warning("Creating a new preference file " + preferenceFileName);     }     catch (Exception e)     {         throw new RuntimeException(e);     }     // preference file is not available create a new one     if (mo == null)     {         try         {             DocumentBuilderFactory builderFactory =             DocumentBuilderFactory.newInstance();             builderFactory.setNamespaceAware(true);             builderFactory.setValidating(false);             DocumentBuilder builder =             builderFactory.newDocumentBuilder();             Document document =             builder.parse(new ByteArrayInputStream(CONTENTS.getBytes()));             mo =             mdsSession.createMetadataObject(preferenceFileName, document);             mdsSession.flushChanges();             mo =  mdsSession.getMutableMO(MOREference.create(preferenceFi leName));         }         catch (Exception e)         {             throw new RuntimeException(e);         }     }     return mo; } </pre>	<p>Logic to read the preference file in the MDS session or create one, if required.</p>

**Table D-7 (Cont.) The Preference Java Bean Code**

Code	Description
<pre> public static void setNumberOfItemsToShow(String preferenceFileName, int numberOfItemsToShow) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);  mo.getDocument().getDocumentElement().setAttribute("num berOfItemsToShow", Integer.toString(numberOfItemsToShow));     _flushChanges(session); } public static int getNumberOfItemsToShow(String preferenceFileName) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);     String show =  mo.getDocument().getDocumentElement().getAttribute("num berOfItemsToShow");     return Integer.parseInt(show); } </pre>	<p>Logic to get and set the number of items to show in the table at a time.</p>
<pre> public static void setNumberOfItemsToQuery(String preferenceFileName, int _numberOfItemsToQuery) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);  mo.getDocument().getDocumentElement().setAttribute("num berOfItemsToQuery", Integer.toString(_numberOfItemsToQuery));     _flushChanges(session); } public static int getNumberOfItemsToQuery(String preferenceFileName) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);     String query =  mo.getDocument().getDocumentElement().getAttribute("num berOfItemsToQuery");     return Integer.parseInt(query); } </pre>	<p>Logic to get and set the number of items to query from the data source.</p>

**Table D-7 (Cont.) The Preference Java Bean Code**

Code	Description
<pre>public static void setShowPageControl(String preferenceFileName, boolean showPageControl) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);  mo.getDocument().getDocumentElement().setAttribute("sho wPageControl", Boolean.toString(showPageControl));     _flushChanges(session); } public static boolean getShowPageControl(String preferenceFileName) {     MDSsession session = _getClonedMDSsession();     MetadataObject mo = _readPreference(session, preferenceFileName);     String pageControl =  mo.getDocument().getDocumentElement().getAttribute("sho wPageControl");     return Boolean.parseBoolean(pageControl); }</pre>	<p>Logic to get and set whether to show page control on the task flow.</p>
<pre>private static void _flushChanges(MDSsession session) {     try     {         session.flushChanges();     }     catch (Exception e)     {         throw new RuntimeException(e);     } }</pre>	<p>Logic to save changes made to the task flow into the MDS session. If a sand box is set up in the MDS session, the changes are saved to the sand box. Else, they are permanently written to MDS.</p>
<pre>private static final String CONTENTS = "&lt;preference numberOfItemsToShow='5'     numberOfItemsToQuery='10'     showPageControl='true' xmlns='http://xmlns.oracle.com/apps/preference' /&gt;"; }</pre>	<p>Logic to display defaults in the Number of Items to show at a time and Number of Items to query fields and the Show Page Control check box. When a user first accesses an instance of the RecentPages task flow, a new preference file is created with this content.</p>

The RecentPages project containing all these files is deployed to Oracle ADF and the task flow is then consumed in the customizable Welcome.jspx page in the WebPages project.

### D.3.2 The WebPages Project

This project contains the Welcome.jspx page in which the recent-pages-task-flow-definition task flow is consumed.

### D.3.2.1 The Welcome.jspx File

Welcome.jspx is a customizable page containing a Panel Stretch Layout component. The top facet of the Panel Stretch Layout contains a Change Mode Link and a Page Create task flow. The center facet contains a Page Customizable with a child Panel Customizable, which in turn contains a Show Detail Frame component with the recent-pages-task-flow-definition task flow.

The stretchContent and showResizer attributes on the Show Detail Frame are set to false and never respectively to ensure that this component does not stretch its child task flow.

Also, the refresh attribute is set to ifNeeded in the task flow binding. This is to ensure that customizations made to the page at runtime are reflected when users perform a refresh.

The Welcome.jspx page contains the following code:

```
<?xml version='1.0' encoding='US-ASCII'?>
<jsp:root xmlns:jsp="http://java.sun.com/JSP/Page" version="2.1"
  xmlns:f="http://java.sun.com/jsf/core"
  xmlns:h="http://java.sun.com/jsf/html"
  xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
  xmlns:pe="http://xmlns.oracle.com/adf/pageeditor"
  xmlns:cust="http://xmlns.oracle.com/adf/faces/customizable">
<jsp:directive.page contentType="text/html;charset=US-ASCII"/>
<f:view>
  <af:document id="d1">
    <af:form id="f1">
      <af:panelStretchLayout id="ps11">
        <f:facet name="top">
          <af:panelGroupLayout layout="horizontal"
            xmlns:af="http://xmlns.oracle.com/adf/faces/rich"
            id="pg12">
            <pe:changeModeLink id="cml1"/>
            <af:spacer width="10" height="10" id="s2"/>
            <af:region value="#{bindings.pagecreatepagel.regionModel}"
              id="r1"/>
            <af:panelGroupLayout id="pg11"/>
          </af:panelGroupLayout>
        </f:facet>
        <f:facet name="center">
          <pe:pageCustomizable id="pageCustomizable1">
            <cust:panelCustomizable id="panelCustomizable1" layout="scroll">
              <cust:showDetailFrame text="Recent Pages" id="sdf1"
                stretchContent="never" showResizer="never">
                <af:region
                  value="#{bindings.recentpagestaskflowdefinition1.regionModel}"
                  id="r2"/>
              </cust:showDetailFrame>
            </cust:panelCustomizable>
            <f:facet name="editor">
              <pe:pageEditorPanel id="pep1"/>
            </f:facet>
          </pe:pageCustomizable>
        </f:facet>
        <f:facet name="start"/>
        <f:facet name="end"/>
      </af:panelStretchLayout>
    </af:form>
  </af:document>
</f:view>
```

```
</jsp:root>
```

At runtime, the page appears as shown in [Figure D-7](#).

**Figure D-7** The *Welcome.jspx* Page

### D.3.2.2 The *adf-config.xml* File

You can add a task flow inside a `Show Detail Frame` component and display the task flow's outcomes as actions on the chrome of the parent `Show Detail Frame` component. This is possible by defining custom actions on the parent `Show Detail Frame` component. You can define custom actions at the instance level where `Custom Action` components are added as child components of the `Show Detail Frame`, or at the global level where `Custom Action` elements are defined in the application's *adf-config.xml* file. Global custom actions are enabled on all `Show Detail Frame` instances in the application, but are displayed only when a `Show Detail Frame` instance contains the task flow as its child.

In this application, custom actions corresponding to the task flow's outcomes, `dialog:simpleEditPopupView` and `dialog:advancedEditPopupView`, are defined globally in the *adf-config.xml* file as follows:

```
<customizableComponentsSecurity
xmlns="http://xmlns.oracle.com/adf/faces/customizable/config">
  <enableSecurity value="true"/>
  <customActions>
    <customAction action="refresh" text="Refresh"
      shortDesc="Refresh"
      location="menu" rendered="true"
      icon="/adf/pe/images/refresh_ena.png"/>
    <customAction action="dialog:simpleEditPoup"
      text="Simple Edit"
      shortDesc="Simple Edit"
      location="menu"
      rendered="#{!changeModeBean.inEditMode}"
      icon="/adf/pe/images/editproperties_ena.png"/>
    <customAction action="dialog:advancedEditPopup"
      text="Advanced Edit"
      shortDesc="Advanced Edit" location="menu"
      rendered="#{changeModeBean.inEditMode}"
      icon="/adf/pe/images/editproperties_ena.png"/>
  </customActions>
</customizableComponentsSecurity>
```

### D.3.3 Runtime Behavior

This configuration results in the following behavior at runtime:

- All users see a Simple Edit action on the chrome surrounding the task flow while viewing the page.

Clicking this action displays the personalization option in a separate dialog.

- Users with Edit or Customize permission see an Advanced Edit action on the chrome surrounding the task flow while editing the page.

Clicking this action displays customization options in a separate dialog.

## D.4 Conclusion

In Framework application pages containing task flows, task flow design can have a significant impact on application performance. Also, slow response time and inconsistent UI can lead to an unpleasant experience for application users. To ensure better performance and a good user experience for Framework application users, follow the guidelines in this document while implementing task flows to be consumed in the application.

---

---

## Reuse of Oracle Portal Components

This appendix describes how to reuse components from your existing Oracle Portal application in an application built with Oracle WebCenter Portal: Framework.

This appendix includes the following sections:

- [Section E.1, "Introduction to Oracle Portal Components"](#)
- [Section E.2, "Reusing Portlets"](#)
- [Section E.3, "Reusing Items"](#)

### E.1 Introduction to Oracle Portal Components

The two most basic building blocks of Oracle Portal are as follows:

- Portlets are the fundamental building blocks of a portal page. Portlets can be deployed to Oracle Portal through three producer (known in Oracle Portal as provider) types:
  - **Web (or Oracle PDK-Java) producers** use open standards, such as XML, SOAP, HTTP, or J2EE for deployment, definition, and communication with applications. The Oracle PDK-Java provides a framework that simplifies the task of building Web producers.
  - **WSRP producers** serve as the containers for standards-based portlets.
  - **Database producers** own one or more database portlets. Examples of database portlets include, portlets built using the Oracle PDK-PL/SQL, Portlet Builder portlets (charts, forms, reports, and so on), and Oracle Portal page portlets).

In WebCenter Portal: Framework, you can make Web and WSRP portlets available by registering their producers with the application. For more information, see [Section E.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets."](#)

You can also make database portlets available to Framework applications by using the Federated Portal Adapter. For more information, see [Section E.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."](#)

- Items are individual pieces of content (text, hyperlink, image, and so on) that reside on a page in an item region. Users with an appropriate privilege level can add items to a page. Item content and metadata are stored in the Oracle Portal schema of the Metadata Repository. Items are rendered on the page according to the layout, style, and attribute display defined for the item region.

Because items are stored in a content repository, you can retrieve them with Java Content Repository (JCR) data controls. A default adapter for the Oracle Portal

content repository is provided with WebCenter Portal: Framework. For more information, see [Section E.3, "Reusing Items."](#)

Given the technical differences between Oracle Portal and WebCenter Portal, there is no direct upgrade available across the platform. However, key components of your portal can be exposed within WebCenter Portal.

## E.2 Reusing Portlets

You can make the portlets used in your portal available to your Framework applications.

This section includes the following subsections:

- [Section E.2.1, "How to Reuse JSR 286 and Oracle PDK-Java Portlets"](#)
- [Section E.2.2, "What You May Need to Know About Events"](#)
- [Section E.2.3, "What You May Need to Know About Mobile Portlets"](#)
- [Section E.2.4, "What You May Need to Know About the Portlet Chrome"](#)
- [Section E.2.5, "What You May Need to Know About Personalizations and Customizations"](#)
- [Section E.2.6, "What You May Need to Know About Oracle Portal System Resources"](#)
- [Section E.2.7, "What You May Need to Know About Partner and External Applications"](#)
- [Section E.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets"](#)
- [Section E.2.9, "What You May Need to Know About Troubleshooting the Federated Portal Adapter"](#)
- [Section E.2.10, "What You May Need to Know About Limitations of the Federated Portal Adapter"](#)
- [Section E.2.11, "How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions"](#)

### E.2.1 How to Reuse JSR 286 and Oracle PDK-Java Portlets

To reuse JSR 286 and Oracle PDK-Java portlets in your Framework application, simply register the producers in the same way as any other producer.

#### **To reuse JSR 286 and Oracle PDK-Java portlets:**

1. In Oracle JDeveloper, access the WSRP or Oracle PDK-Java Producer Registration wizard.
2. Step through the wizard providing information about the producer, including the URL endpoint.
3. Open the page to which you to add the portlet.
4. Drag the portlet from the registered producer to the appropriate part of the page.

For more detailed information about consuming portlets in a Framework application, see [Chapter 62, "Consuming Portlets."](#)

## E.2.2 What You May Need to Know About Events

Oracle PDK-Java events are not supported in WebCenter Portal: Framework. If you have Oracle PDK-Java portlets that use events and you deploy them in an WebCenter Portal: Framework environment, then the events are ignored.

## E.2.3 What You May Need to Know About Mobile Portlets

Mobile portlets are not supported in WebCenter Portal: Framework. If you have Oracle PDK-Java mobile portlets, then they do not work in a WebCenter Portal: Framework environment.

## E.2.4 What You May Need to Know About the Portlet Chrome

In WebCenter Portal: Framework, the portlet does not provide the chrome. The consuming application provides the chrome. This behavior conforms to the WSRP convention, but it is a change from Oracle Portal, where Oracle PDK-Java provided the chrome for portlets. Hence, the Oracle PDK-Java portlet header is filtered out in the WebCenter Portal: Framework environment.

As part of this filtering process, WebCenter Portal: Framework parses the title area of PDK-Java portlets to preserve the title and add the necessary portlet mode links. The filtering algorithm is as follows:

- If the portlet has multiple tables, then the title area is considered to be the first table. If the portlet has only one table, then the title area is considered to be the first row in that table.
- The first text in the title area is considered to be the title. If the portlet has no tables or a discernible title, then the title is taken from the `adfp:portlet` component.
- Any link that contains the fragment `_mode= parameter` is considered to be a portlet mode link. These links are moved into the portlet menu by WebCenter Portal: Framework.

If you want to bypass the rendition of the header section of your portlet chrome and reuse its original, Oracle PDK-Java header, then you can set the `displayHeader` attribute of the `adfp:portlet` tag to `false` and `retainPortletHeader` as `true` in the associated portlet bindings of the page definition XML. Setting `retainPortletHeader=true` in the page definition portlet binding retains the portlet header in the portlet response. Setting `displayHeader=false` in the `adfp:portlet` tag suppresses the application's header for the portlet chrome, and hides the icons and links normally displayed in the header.

## E.2.5 What You May Need to Know About Personalizations and Customizations

Portlet customizations and personalizations that you or your users applied to your portlets in Oracle Portal are not carried over to your Framework application. In a Framework application, your Oracle Portal portlets are treated as new instances. Hence, previous personalizations and customizations are not available.

## E.2.6 What You May Need to Know About Oracle Portal System Resources

Portlets built with a target consumer of Oracle Portal in mind tend to make invalid assumptions about the runtime environment. For example, the portlet might assume the presence of Oracle Portal resources, such as images or JavaScript functions. In WebCenter Portal: Framework, these resources are not available. Hence, you must bundle the resources the portlet needs with the producer to ensure that the portlet runs properly in the WebCenter Portal: Framework environment.

Another common issue with portlets designed for Oracle Portal consumption is the portlet assuming the Oracle Portal URL format and the presence of Oracle Portal parameters. The page URL of an Oracle ADF application is different from that of Oracle Portal. Therefore, portlet developers cannot make assumptions about the page URL and must prepare their Oracle PDK-Java portlets for execution in the WebCenter Portal: Framework environment by using the proper portlet APIs.

## E.2.7 What You May Need to Know About Partner and External Applications

Partner applications are not supported. External applications are supported. Automatic login is supported through an external application automated login servlet, which is automatically configured in your application when you register a producer.

## E.2.8 How to Use the Federated Portal Adapter to Reuse Database Portlets

The Federated Portal Adapter is a component of Oracle Portal that enables Oracle Portal instances to share their database portlets through the Web portlet interface. The Federated Portal Adapter receives the SOAP messages for a Web producer, parses the SOAP and then dispatches the messages to a database producer as PL/SQL procedure calls. In effect, the Federated Portal Adapter makes a database producer behave in the same way as a Web producer. You can make Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets, available for use in your Framework applications.

---

---

**Note:** You can also expose Oracle Portal pages in WebCenter Portal through the Federated Portal Adapter by publishing them as portlets in Oracle Portal.

---

---

Implementing the Federated Portal Adapter for your portal exposes the Oracle Portal portlets through the Oracle PDK-Java Web producer protocol making it possible to register them as PDK-Java producers. Registering the producer with a Framework application causes the portlets to appear in the Component Palette, and you can then drag and drop them onto pages in the same way as any other portlet. Without the Federated Portal Adapter, you cannot access these producers from a Framework application.

For more information about the Federated Portal Adapter, see the chapter "Using the Federated Portal Adapter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.

### To register a Federated Portal Adapter producer with WebCenter Portal:

1. Set up the Oracle Portal environment for the Federated Portal Adapter. For more information, see the section "Setting Up the Environment to Use the Federated Portal Adapter" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.
2. To register an instance of Oracle Portal through the Federated Portal Adapter, the portal must have a user named "PORTAL" in Oracle Internet Directory. To create this user:
  - a. Log in to the Oracle Portal instance as the portal administrator user.
  - b. In the **User** portlet, click **Create New Users**.

By default, the **User** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.

- c. In the **Last Name** field, enter `PORTAL`.
  - d. In the **User ID** field, enter `PORTAL`.
  - e. In the **Password** and **Confirm Password** fields, enter an appropriate password.
  - f. In the **Email Address** field, enter an appropriate email address.
  - g. Click **Submit**, then **Done**.
  - h. In the **Portal User Profile** portlet, enter `PORTAL` in the **Name** field, and click **Edit**.
 

By default, the **Portal User Profile** portlet is on the **Administer** tab of the **Portal Builder** page, on the **Portal** subtab.
  - i. In the **Default Group** field, enter `PORTLET_PUBLISHERS`.
  - j. Click **OK**.
3. If you want to display Oracle Portal pages in your Framework applications, you must first publish each of those pages as portlets. To display Oracle Portal pages, edit the page properties and select **Publish As Portlet** on the **Optional** tab. For more information, see the section "Placing One Page Onto Another" in the *Oracle Fusion Middleware User's Guide for Oracle Portal*.
  4. Confirm that the users of the Framework application have appropriate privileges on the portlets and pages exposed through the Federated Portal Adapter, and that they map to the users of the Oracle Portal instance. The user name for a person on the Framework application should map to the user name of the same person in Oracle Portal. For example, `JSMITH` should represent the same person in both the Framework application and Oracle Portal.
  5. In Oracle JDeveloper, register the producer as an Oracle PDK-Java producer using the Federated Portal Adapter URL and Service ID:

```
http://host:port/adapter/dad/schema
```

To verify the URL, enter it in a browser. If the URL is correct you should see the following message:

```
Congratulations - you got to the adapter test page
```

If you are logged in you should see a list of producers, their service IDs, and the portlets each provides. If you are logged in as an Oracle Portal administrator, you should also see additional details about page portlets and Oracle Portal HMAC registrations.

When you register the producer, ensure that you select the **Establish Producer Sessions** checkbox on the Specify Connection Details page of the wizard. This is so that the WebCenter Portal user information is correctly propagated to Oracle Portal.

For more information, see [Chapter 62, "Consuming Portlets."](#)

6. You can drag and drop the producer's portlets onto a page.
7. To secure communication between the Oracle Portal instance and WebCenter Portal, provide a shared key using Hash Message Authentication Code (HMAC):
  - a. Go to `SQL*Plus` and log in as the portal schema owner.
  - b. Run:

```
@www/proadssr.sql http://www.oracle.com/adapter/portal
```

Note that, for Framework applications, the adapter URL is always the same:

`http://www.oracle.com/adapter/portal`

- c. Enter a shared key code.
- d. In Oracle JDeveloper, enter this shared key code into the **Shared Key** field on the Specify Additional Registration Details step of the Create/Edit Oracle PDK-Java Portlet Producer wizard or dialog.

---

---

**Note:** To remove the shared key from the Oracle Portal instance use:

`@wwc/proadsdr.sql`

---

---

8. Certain portlets built in Oracle Portal, such as page portlets and several sample database portlets, assume that the set of images shipped in the portal middle tier are available in the path `/images` in the Web server of the portal page. These images are not available by default for your Framework applications. For these images to display correctly:
  - a. Download the following zip file:  
<http://download.oracle.com/otndocs/tech/portal/files/portal-images.zip>
  - b. Extract the contents of the zip file and mount the contents under the URL `/images`.
9. You can now run the page that contains the portlet.

## E.2.9 What You May Need to Know About Troubleshooting the Federated Portal Adapter

The following information may help when trying to resolve issues with the Federated Portal Adapter in WebCenter Portal.

This section includes the following subsections:

- [Section E.2.9.1, "On Registration"](#)
- [Section E.2.9.2, "During Runtime"](#)

### E.2.9.1 On Registration

#### **Error occurred trying to register producer**

The shared key has not been set up in the Oracle Portal instance or it does not match that given in Oracle JDeveloper, or the service ID has not been entered.

#### **Could not Contact Producer**

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal instance could not be contacted (for example, it is behind a firewall or is not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.

- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

### E.2.9.2 During Runtime

#### Could not Contact Producer

Either the portal registration URL is not correct, the service ID given in Oracle JDeveloper does not match a provider in the Oracle Portal instance, the Oracle Portal could not be contacted (for example, if it is behind a firewall or not available), or the users in Oracle JDeveloper do not match those in Oracle Portal. The details of the message should give further information about the cause:

- 404 Not Found: The Oracle Portal instance could not be contacted or has timed out. Try increasing the time out period.
- 406 Not Acceptable: The provider with the given service ID could not be found in this Oracle Portal instance or HMAC authentication has either failed or been incorrectly configured.
- 503 Service Unavailable: the PORTAL user could not be found in Oracle Internet Directory. The Oracle Portal administrator may not have added the PORTAL user to Oracle Internet Directory.

#### Portlet does not render properly

- If images are missing or appear as links, see the instructions for downloading the images zip file provided in [Section E.2.8, "How to Use the Federated Portal Adapter to Reuse Database Portlets."](#)
- If navigation does not work properly, try editing the page and setting `RenderPortletInIframe` to `true`. Some portlets work better in their own inline frame (IFRAME).
- If the portlet responds with the following message, try putting the portlet in an IFRAME, by setting `RenderPortletInIframe` to `true`:  

```
The portlet attempted to issue a redirect in response to a render request.
```
- If popups, lists of values, and so on do not work in the portlet, it may be because JavaScript exceptions are raised in an attempt to avoid XSS attacks. The popup must have the same server URL as the Framework application.
- If a portlet renders a blank screen for Customize or Personalize, it may be that the user does not have permission to edit the portlet. Check the Portal log files.

## E.2.10 What You May Need to Know About Limitations of the Federated Portal Adapter

The following limitations apply when using the Federated Portal Adapter with WebCenter Portal:

- Deep linking may not work. In some cases, putting the portlet in an IFRAME helps (setting `RenderPortletInIframe` to `true`).
- Links rendered by the portlet must be absolute URLs.
- If a page portlet displays a page with tabs it should be placed into an IFRAME.

- Refresh, Collapse, and Remove portlet links do not work in portlets displayed in page portlets.
- Not all objects are returned by the Federated Portal Adapter, and thus are not visible in WebCenter Portal. For a full list, see "Oracle Portal - Limitations" in *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter Portal*.

## E.2.11 How to Reuse Oracle PDK-Java Producers from Earlier Oracle Application Server Versions

If you have a producer that you designed and deployed on Oracle Application Server Release 2 (10.1.2) or earlier, then you can reuse it in either one of two ways:

- You can consume a portlet from a producer running on an Oracle Application Server Release 2 (10.1.2.0.2) middle tier. In this case, the producer's code is running on Release 2 (10.1.2.0.2) while the application consuming the producer is running on Release 11.
- You can redeploy the producer application as an EAR file on Oracle WebLogic Server and consume its portlets in other Framework applications. In this case, both the producer's code and the consuming application run on Release 11.

In either of these cases, you must take some additional steps to get the producer's portlets to operate correctly. Portlets built for Oracle Portal expect certain boilerplate images to be present on the page assembly servlet and they break if those images are not available. These images were included in the middle-tier servlet by default in Oracle Application Server Release 2 (10.1.2.0.2), but for WebCenter Portal: Framework you must manually ensure that the images can be found by portlets.

This section includes the following subsections:

- [Section E.2.11.1, "Consuming a Portlet from Oracle Portal"](#)
- [Section E.2.11.2, "Redeploying PDK-Java Producers from Oracle Portal"](#)

### E.2.11.1 Consuming a Portlet from Oracle Portal

In WebCenter Portal, to consume a portlet running on a page in an Oracle Portal instance, you can do either of the following:

- Obtain the Oracle Portal images zip file from the Oracle Technology Network and unzip it inside the ADFP servlet.
- Properly configure the resource servlet as follows:
  1. Add an initialization parameter to the Web servlet as shown in [Example E-1](#).

#### **Example E-1 Web Servlet Initialization Parameters**

```
<servlet>
  <servlet-name>SOAPServlet</servlet-name>
  <display-name>SOAPServlet</display-name>
  <description>Extended Portal SOAP Server</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
  ...
  <init-param>
    <param-name>resourceServletMapping</param-name>
    <param-value>/pdkresource</param-value>
  </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in [Example E-2](#).

**Example E-2 Servlet Definition for Resource Servlet**

```
<servlet>
  <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as shown in [Example E-3](#).

**Example E-3 Servlet Mapping for Resource Servlet**

```
<servlet-mapping>
  <servlet-name>ResourceServlet</servlet-name>
  <url-pattern>/pdkresource/*</url-pattern>
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

**E.2.11.2 Redeploying PDK-Java Producers from Oracle Portal**

If you choose to take a PDK-Java producer built for Oracle Portal and redeployed on Oracle WebLogic Server, then you must enable the resource servlet as follows:

1. Add an initialization parameter to the Web servlet as shown in [Example E-4](#).

**Example E-4 Web Servlet Initialization Parameter**

```
<servlet>
  <servlet-name>SOAPServlet</servlet-name>
  <display-name>SOAPServlet</display-name>
  <description>Extended Portal SOAP Server</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.SOAPServlet</servlet-class>
  ...
  <init-param>
    <param-name>resourceServletMapping</param-name>
    <param-value>/pdkresource</param-value>
  </init-param>
</servlet>
```

2. Add a servlet definition for the resource servlet as shown in [Example E-5](#).

**Example E-5 Servlet Definition for Resource Servlet**

```
<servlet>
  <servlet-name>ResourceServlet</servlet-name>
  <display-name>ResourceServlet</display-name>
  <description>Image resource servlet</description>
  <servlet-class>oracle.webdb.provider.v2.adapter.ResourceServlet</servlet-class>
</servlet>
```

3. Add a servlet mapping for the resource servlet as [Example E-6](#).

**Example E-6 Servlet Mapping for Resource Servlet**

```
<servlet-mapping>
  <servlet-name>ResourceServlet</servlet-name>
```

```
<url-pattern>/pdkresource/*</url-pattern>  
</servlet-mapping>
```

4. Now you can register this PDK-Java producer in the same way as any other PDK-Java producer. For more information about registering PDK-Java producers, see [Section 62.3, "Registering an Oracle PDK-Java Portlet Producer with a WebCenter Portal: Framework Application."](#)

## E.3 Reusing Items

Items from Oracle Portal have no equivalent in WebCenter Portal: Framework. As such, creating, maintaining, and publishing items is not supported in WebCenter Portal: Framework. To replicate the behavior of items with WebCenter Portal: Framework, you can use JCR data controls to include content from Oracle Portal. Oracle Portal is a content repository that WebCenter Portal: Framework supports out of the box in the Create a Content Repository Data Control dialog in JDeveloper. For more information about integrating content from Oracle Portal, see [Chapter 26, "Managing Content Repository Connections."](#)

---

---

## Expression Language Expressions

This appendix catalogs the Expression Language expressions (ELs) available for use with the custom portals and applications you create using Oracle WebCenter Portal: Framework. Some of these expressions can be used in both Framework applications and the Spaces application.

This appendix includes the following sections:

- [Section F.1, "ELs Related to Applications"](#)
- [Section F.2, "ELs Related to Security"](#)
- [Section F.3, "ELs Related to General Settings"](#)
- [Section F.4, "ELs Related to Application Resources"](#)
- [Section F.5, "ELs Related to Navigation"](#)
- [Section F.6, "ELs Related to WebCenter Portal Services"](#)
- [Section F.7, "ELs Related to the Documents Service"](#)
- [Section F.8, "ELs Related to the People Connections Service"](#)
- [Section F.9, "ELs Related to the Personalization Service"](#)

**See Also:** For additional information about EL APIs, see *Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal*.

### F.1 ELs Related to Applications

[Table F-1](#) lists an EL expression relevant to an application and describes the type of functionality it provides. The listed EL applies to both Framework applications and the Spaces application.

**Table F-1** *EL Expression Relevant to an Application*

Expression	Function
<code>#{requestContext.skinFamily}</code>	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on.  Returns the same value as <code>#{adfFacesContext.skinFamily}</code> .

## F.2 ELs Related to Security

Table F.2 lists EL expressions relevant to application security and describes the types of functionality they provide. Some of these expressions can be used in both Framework applications and the Spaces application. The **Context** column indicates whether the EL is exclusive to WebCenter Portal: Framework (WCF) or can be used with both (Both).

**Table F–2 EL Expressions Relevant to Security**

Expression	Function	Context
<code>{security.authenticated}</code>	Returns <code>true</code> when the current user is authenticated in the context in which the EL is being invoked, otherwise <code>false</code> .	Both
<code>{securityContext.userName}</code>	Returns the user name of the currently logged in user. If the current user is not logged in, this expression returns no value.	Both
<code>{WCSecurityContext.currentUser['userName']}</code>	Returns the value <code>true</code> if the current user is the specified user, otherwise <code>false</code> .	Both
<code>{WCSecurityContext.userInAppRole['role']}</code>	Returns the value <code>true</code> if the current user is assigned the specified OPSS application role. This expression is useful in Framework applications that are scope unaware (that is, that do not support spaces).  Example: <code>{WCSecurityContext.userInAppRole['AppConnectionManager']}</code>	WCF
<code>{WCSecurityContext.userInGroup['group']}</code>	Returns the value <code>true</code> if the current user is assigned the specified group, for example:  <code>{WCSecurityContext.userInGroup['Administrators']}</code>	Both

## F.3 ELs Related to General Settings

Table F.3 lists EL expressions relevant to general application settings and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

**Table F–3 EL Expressions Relevant to General Settings**

Expression	Function
<code>{generalSettings.userTimeZone}</code>	Returns the time zone the current user has selected in application preferences.
<code>{generalSettings.preferredDateStyle}</code>	Returns the date format the current user has selected in application preferences.
<code>{generalSettings.preferredDatePattern}</code>	Returns the current user's preferred date format pattern if it has been set, else, returns <code>null</code> .  Note that <code>date + pattern</code> is applicable only to Framework applications, where they take precedence over <code>date + style</code> if they are set.
<code>{generalSettings.preferredTimeStyle}</code>	Returns the time format the current user has selected in application preferences.
<code>{generalSettings.preferredTimePattern}</code>	Returns the current user's preferred time format pattern if it has been set, else, returns <code>null</code> .

**Table F-3 (Cont.) EL Expressions Relevant to General Settings**

Expression	Function
<code>{generalSettings.preferredDateTimePattern}</code>	Returns the current user's preferred date and time format pattern if it has been set, else, returns null.
<code>{generalSettings.preferredAccessibilityMode}</code>	Returns the current user's preferred accessibility mode (either default, inaccessible, or screenReader)
<code>{generalSettings.preferredSkinName}</code>	The current user's preferred skin name if one is specified, otherwise the default value.
<code>{generalSettings.formattedCurrentDate}</code>	Returns the current date in the current user's selected locale.
<code>{generalSettings.formattedCurrentTime}</code>	Returns the current time in the current user's selected locale.
<code>{generalSettings.formattedCurrentDateTime}</code>	Returns the current date and time in the current user's selected locale.
<code>{requestContext.skinFamily}</code>	Returns the name of the ADF Faces skin family being used for the current web request, depending on factors such as what has been configured at the application level, the current user's preference setting, and so on.

## F.4 ELs Related to Application Resources

Use the expressions in this section to query for resources. Querying for a resource through an EL expression is similar to querying for it through an API call. That is, you must set query parameters in the format `.property[ 'value' ]`, where *property* is the name of the property, for example, *id*, *resourceScope*, and the like, and *value* is the search value for the attribute.

A query can result in single or multiple results. The query designer must decide what is wanted. The query designer determines whether to return one or multiple results by encountering one of the following values in the expression:

- `singleResult`—Returns a single resource. When no matching resource is found, null is returned.
- `resultList`—Returns a list of resources. When no matching resources are found, an empty list is returned.

---

**Note:** Occurrences of `singleResult` or `resultList` in the expression are used internally as the query end point, and, after this, the query is executed immediately. Anything set after the end point can result in unexpected behavior.

---

The following example returns the first template resource found with a display name that contains `myPage`:

```
{srmContext.resourceType['siteTemplate'].displayName['myPage'].singleResult}
```

The following example returns a list of template resources residing in the directory `resourceDir`, with a description that contains `sampleDesc`:

```
{srmContext.resourceType['siteTemplate'].description['sampleDesc'].contentDirectory['resourceDir'].resultList}
```

A property of this class includes any attribute of this class. Example properties include: `Id`, `DisplayName`, `iconURI`, `contentDirectory`, and the like.

The property value can be an explicit value or an EL expression that returns that type of value. For example, the following two queries return the same result:

```
#{srmContext.id['resourceId'].singleResult}

#{srmContext.id['spacesContext.currentSpace.uiMetadata.siteTemplateId'].singleResult}
```

You can use any property of this class in an EL-based query in the format `property['value']` and in any order. For example, the following two queries return the same result:

```
#{srmContext.resourceScope['scopeName'].id['resourceId'].singleResult}

#{srmContext.id['resourceId'].resourceScope['scopeName'].singleResult}
```

**Table F-4** lists EL expressions relevant to portal resources and describes the types of functionality each provides. You can use all resource EL expressions in both Spaces and Framework applications built with Oracle JDeveloper.

Many of the expressions in **Table F-4** are building blocks for narrowing down the resource or resources you want returned. That is, they are not necessarily meant to be used by themselves, but rather in an assembly of ELs to form the desired query.

For example, the following expression uses three resource-related ELs to form a single query that returns a particular space template. It retrieves the template `storesMasterTemplate` from the parent space `stores`:

```
#{srmContext.resourceScope['stores'].resourceType['siteTemplate'].displayName['storesMasterTemplate'].singleResult}
```

**Table F-4 ELs Relevant to Portal Resources**

EL	Function
<code>#{srmContext.id['resourceGUID']}</code>	Returns the resource with the specified ID
<code>#{srmContext.displayName['resourceDisplayName']}</code>	Returns any resources with the specified display name
<code>#{srmContext.displayNameKey['displayNameKey']}</code>	Returns any resources with the specified display name key
<code>#{srmContext.description['resourceDescription'].singleResult}</code>	Returns one result of a resource that contains the specified value in its description  To get multiple results, use <code>resultList</code> in lieu of <code>singleResult</code> .
<code>#{srmContext.descriptionKey[descriptionKey].singleResult}</code>	Returns one result of a resource with the specified description key  The description key is the key in the <code>xsrvt</code> file for the resource description.  To get multiple results, use <code>resultList</code> in lieu of <code>singleResult</code> .
<code>#{srmContext.createdDate['resourceCreationDate']}</code>	Returns any resource with the specified creation date
<code>#{srmContext.modifiedBy['resourceLastModifiedBy']}</code>	Returns any resource that was last modified by the user with the specified user name

**Table F-4 (Cont.) ELs Relevant to Portal Resources**

<b>EL</b>	<b>Function</b>
<code>{srmContext.modifiedDate['resourceLastModifiedDate']}</code>	Returns any resource that was last modified by the specified date
<code>{srmContext.resourceScope['resourceScope']}</code>	Returns any resource that falls within the specified scope
<code>{srmContext.category['categoryName']}</code>	Returns any resource that falls within the specified category For example: <code>{srmContext.category['siteTemplates']}</code>
<code>{srmContext.contentDirectory['contentDirectory']}</code>	Returns any resource that is stored within the specified directory
<code>{srmContext.metadataFile['metadataFileLocation']}</code>	Returns resource metadata from the specified metadata file For example, the following expression returns resource metadata from the following file <code>/home/metadata/data.xml</code> : <code>{srmContext.metadataFile['/home/metadata/data.xml']}</code>
<code>{srmContext.jspx['jspxFileLocation']}</code>	Returns any jsp file in the specified location For example, the following expression returns the <code>page.jsp</code> file: <code>{srmContext.jspx['/home/web/page.jsp']}</code>
<code>{srmContext.pageDef['pageDefinition']}</code>	Returns any jsp file with the specified page definition
<code>{srmContext.iconURI['iconURI']}</code>	Returns the icon at the specified icon URI
<code>{srmContext.excludeFrom['excludeFromScopes']}</code>	In a larger expression, returns all specified resources except those available in the excluded scopes
<code>{srmContext.usesCustomSecurity['usesCustomSecurity']}</code>	In a larger expression, returns any resource the either does or does not use custom security Set <code>usesCustomSecurity</code> to TRUE or FALSE. For example: <code>{srmContext.usesCustomSecurity['TRUE']}</code>
<code>{srmContext.seeded['seeded']}</code>	In a larger expression, returns any resource that is or is not seeded, depending on the provided value Set <code>seeded</code> to TRUE or FALSE. For example: <code>{srmContext.seeded['TRUE']}</code>

**Table F-4 (Cont.) ELs Relevant to Portal Resources**

EL	Function
<code>#{srmContext.visibleType['visibleType']}</code>	<p>In a larger expression, returns any resource that is of the specified type of visibility</p> <p>Set <i>visibleType</i> to <code>TRUE</code>, <code>FALSE</code>, or <code>NEVER</code> to indicate that the resource is never shown. For example, the following expression returns resources that are visible, that is, resources that are set to <b>Show</b>:</p> <pre>#{srmContext.visibleType['TRUE']}</pre>
<code>#{srmContext.visible['visible']}</code>	<p>In a larger expression, returns one or multiple resources with visibility set to either <code>TRUE</code> or <code>FALSE</code></p>
<code>#{srmContext.createdBy['resourceCreator']}</code>	<p>In a larger expression, returns any resource created by the specified user</p>
<code>#{srmContext.resourceType['resourceType']}</code>	<p>In a larger expression, returns one or multiple resources of the specified type</p> <p>For example, the following expression searches for a resource of the type <code>SITE_TEMPLATE</code>:</p> <pre>#{srmContext.resourceType['SITE_TEMPLATE']}</pre> <p>Note that all resource types are listed in <i>Oracle Fusion Middleware Java API Reference for Oracle WebCenter Portal</i>, in the <code>GenericSiteResourceTypes</code> class.</p>
<code>#{srmContext.version['version']}</code>	<p>In a larger expression, returns one or multiple resources available in the application of the specified version</p>
<code>#{srmContext.resourceScope['scopeName']}</code>	<p>In a larger expression, returns one or multiple resources available in the specified scope</p> <p>For example, the following expression searches for resources in the scope (in this instance, the space) <code>MySpace</code>:</p> <pre>#{srmContext.resourceScope['MySpace']}</pre> <p>To search in the default scope, that is, the application scope, use <code>defaultScope</code>.</p>
<code>#{srmContext.searchType['searchType']}</code>	<p>In a larger expression, returns one or multiple resources that contain or equal the values set by other included expressions</p> <p>Set <i>searchType</i> to <code>CONTAINS</code> or <code>EQUALS</code>.</p>

## F.5 ELs Related to Navigation

[Table F.5](#) lists EL expressions relevant to application navigation and describes the types of functionality they provide. All listed navigation ELs apply to both Framework applications and the Spaces application.

**Table F-5 EL Expressions Relevant to Navigation**

Expression	Function
<b>Navigation Context Expressions</b>	
<code>#{navigationContext.defaultNavigationModel}</code>	<p>Returns default navigation model. It gets the value from the preference bean. The preference bean gets the value based on the preference setting in <code>adf-config.xml</code>, <code>static</code> value.</p> <p>The following example returns the specified default tree model:</p> <pre>#{navigationContext.defaultNavigationModel.defaultTreeModel}</pre> <p>You can also use <code>defaultMenuModel</code> and <code>defaultListModel</code> (see next listing).</p>
<code>#{navigationContext.currentNavigationModel}</code>	<p>Returns the navigation model used to navigate to the current view (that is, the current page)</p> <p>There may be a number of navigation models on the page. Only the one used to navigate to the page is the current navigation model.</p> <p>The current navigation model is set only when the <code>processAction</code> is called.</p> <p>The following example returns the default tree model for the current navigation model:</p> <pre>#{navigationContext.currentNavigationModel.defaultTreeModel}</pre> <p>You can also use <code>defaultMenuModel</code> and <code>defaultListModel</code>.</p> <p><b>See Also:</b> <code>#{navigationContext.processAction}</code>.</p>
<code>#{navigationContext.navigationModel['model_path']}</code>	<p>Returns the navigation model specified by path.</p> <p><b>Example:</b></p> <pre>#{navigationContext.navigationModel['/oracle/webcenter/portalapp/navigations/default-navigation-model']}</pre> <p>User can simply enter the path in the square bracket without having to remember the parameter name. For backward compatibility, comma-separated parameters are also supported. Available parameters (with examples) are:</p> <ul style="list-style-type: none"> <li>▪ <code>modelPath=/oracle/webcenter/portalapp/navigations/default-navigation-model</code></li> <li>▪ <code>modelScope=/oracle/webcenter/portalapp/navigation</code></li> <li>▪ <code>modelId=default-navigation-model</code></li> </ul> <p><b>Note:</b> <code>modelScope</code> and <code>modelId</code> are used together, for example:</p> <pre>#{navigationContext.navigationModel['modelScope=/oracle/webcenter/portalapp/navigations,modelId=default-navigation-model']}</pre>

**Table F-5 (Cont.) EL Expressions Relevant to Navigation**

Expression	Function
<code>#{navigationContext.processAction}</code>	<p>Returns the default navigation method for binding to UI component's <code>actionListener</code> attribute. This assumes that the target resource to navigate to is passed in through the action UI component's <code>node</code> or <code>path</code> attribute.</p> <p>The <code>node</code> attribute is typically used for the iterative case; while the <code>path</code> attribute is typically used to create a static link. If both are specified, the <code>node</code> attribute is used. Note that when using the <code>path</code> attribute, you must also specify the <code>model</code> attribute to pass in the navigation model object. If the <code>model</code> attribute is not specified, the current navigation model is used.</p> <p>Example using the <code>node</code> attribute:</p> <pre data-bbox="695 596 1365 1024"> &lt;af:forEach var="node" varStatus="vs"   items="#{navigationContext.defaultNavigationModel.rootNode.children}"&gt;   &lt;af:subform id="pt_sfm1"&gt;     &lt;af:commandLink id="pt_cl1"       text="#{node.title}"       inlineStyle="font-size:small;color:White;"       actionListener="#{navigationContext.processAction}"       action="pprnav"&gt;       &lt;f:attribute name="node" value="#{node}"/&gt;       &lt;af:showPopupBehavior popupId="menuPopup"         align="afterStart"         triggerType="mouseOver"/&gt;     &lt;/af:commandLink&gt; </pre> <p>Example using the <code>path</code> attribute:</p> <pre data-bbox="695 1108 1365 1360"> &lt;af:commandLink id="pt_cl1" text="Prescriptions"   inlineStyle="font-size:small; color:White;"   actionListener="#{navigationContext.processAction}"   action="pprnav"&gt;   &lt;f:attribute name="path" value="/prescriptions"/&gt;   &lt;f:attribute name="model"     value="#{navigationContext.defaultNavigationModel}"   /&gt; &lt;/af:commandLink&gt; </pre>
<p><b>Navigation Model Expressions</b></p>	
<p><code>#{navigationContext.defaultNavigationModel.defaultTreeModel}</code></p> <p><code>#{navigationContext.defaultNavigationModel.defaultMenuModel}</code></p> <p><code>#{navigationContext.defaultNavigationModel.defaultListModel}</code></p> <p><code>#{navigationContext.defaultNavigationModel.defaultSiteMap}</code></p>	<p>Returns a tree/menu/list model based on the default settings</p> <p>The default values for the settings are specified in the next row. For example, the default value for <code>depth</code> is 0.</p> <p>For <code>defaultSiteMap</code>, it returns the XML for the site map of the navigation based on the default settings.</p> <p>This expression returns a model of type:</p> <ul style="list-style-type: none"> <li>■ <code>ChildPropertyTreeModel</code>—used in <code>&lt;af:tree&gt;</code> component</li> <li>■ <code>ChildPropertyMenuModel</code>—used in <code>&lt;af:breadcrumbs&gt;</code> or <code>&lt;af:menu&gt;</code> component</li> <li>■ <code>ListNavigationResource</code>—used in <code>&lt;af:foreach&gt;</code></li> </ul>

**Table F-5 (Cont.) EL Expressions Relevant to Navigation**

Expression	Function
<pre>#{navigationContext.defaultNavigationModel.treeModel['parameters']}</pre> <pre>#{navigationContext.defaultNavigationModel.menuModel['parameters']}</pre> <pre>#{navigationContext.defaultNavigationModel.listModel['parameters']}</pre> <pre>#{navigationContext.defaultNavigationModel.siteMap['parameters']}</pre>	<p>Returns tree/menu/list model based on the specified comma-separated parameters. Available parameters (with default values as examples) are:</p> <ul style="list-style-type: none"> <li>■ <code>startNode=/<code>—</code>specify the starting node of the model (do not need <code>"/</code> prefix unless requesting the root node, for example, <code>home</code>).</code></li> <li>■ <code>includeStartNode=true</code>—specify <code>true</code> if you want to include the starting node (for example, the root node above) or <code>false</code> to start from its children.</li> <li>■ <code>depth=0</code>—defines the initial depth of fetching. <code>"0"</code> means fetch the entire tree, which may take a long time. In which case, use <code>"1"</code> to fetch on demand (when users click the <b>Expand</b> icon).</li> <li>■ <code>prefetchOnly=false</code>—by default (<code>true</code>), it returns nodes up to the depth level requested initially; deeper level nodes are returned on demand. Use <code>false</code> if you want only the initial sets of nodes. In which case, it does not return deeper nodes later on when requested, even when there are deeper nodes.</li> </ul> <p>For <code>siteMap</code>, the available parameters are <code>startNode</code> and <code>includeStartNode</code>.</p> <p>Example:</p> <pre>#{navigationContext.defaultNavigationModel.treeModel['startNode=home,includeStartNode=false,depth=2']}</pre>
<pre>#{navigationContext.defaultNavigationModel.rootNode}</pre>	<p>Returns a root node (of type <code>NavigationResource</code>) of the navigation model.</p> <p>Example:</p> <pre>&lt;af:commandLink id="pt_cl1" text="Prescriptions"   inlineStyle="font-size:small; color:White;"   actionListener="#{navigationContext.processAction}"   action="pprnav"&gt;   &lt;f:attribute name="node"     value="#{navigationContext.defaultNavigationModel.rootNode.children[2]"/&gt; &lt;/af:commandLink&gt;</pre>
<pre>#{navigationContext.defaultNavigationModel.node['path']}</pre>	<p>Returns a node (of type <code>NavigationResource</code>) based on the path specified (you do not need <code>"/</code> prefix unless you are requesting the root node, for example, <code>' / '</code>)</p> <p>Example:</p> <pre>#{navigationContext.defaultNavigationModel.node['home/page1']}</pre>
<pre>#{navigationContext.defaultNavigationModel.currentSelection}</pre>	<p>Returns currently selected navigation resource.</p>

**Table F-5 (Cont.) EL Expressions Relevant to Navigation**

Expression	Function
<code>{navigationContext.defaultNavigationModel.newCurrentSelection['path']}</code>	<p>Sets the current selection to a node specified by the given path (you do not need "/" prefix unless you are requesting the root node, for example, '/'). If successful, returns the newly selected node of type <code>NavigationResource</code>.</p> <p>The user must have the ability to explicitly set the current selection without having to actually navigate to a node.</p> <p>This can be used where the user enters a page directly, and no selection is set. It provides a mechanism for the user to control what is the default when there is no current selection.</p> <p>Example:</p> <pre>&lt;c:set   value="{navigationContext.defaultNavigationModel.newCurrentSelection['home/page1']}"   var="currSel" scope="session"/&gt; &lt;c:if test="{currSel!=null}"&gt;   &lt;af:forEach items="{currSel.children}"     var="cnode" varStatus="cnodestatus"&gt;     ...   &lt;/c:if&gt;</pre>
<code>{navigationContext.defaultNavigationModel.attributes.Description}</code>	Returns the value of the specified attribute of the navigation model.
<code>{navigationContext.defaultNavigationModel.attributes['Description']}</code>	
<code>{navigationContext.defaultNavigationModel.properties['propertyName']}</code>	Returns the value of the specified property of the navigation model, where <code>propertyName</code> is either <code>rootNode</code> or <code>currentSelection</code> .
<b>Navigation Resource Expressions</b>	
<code>{node.attributes.Description}</code> <code>{node.attributes['Description']}</code>	Returns the value of the specified attribute of the navigation resource.
<code>{node.parameters.StockSymbol}</code> <code>{node.parameters['StockSymbol']}</code>	Returns the value of the specified parameter of the navigation resource.
<code>{node.parametersRaw.StockSymbol}</code> <code>{node.parametersRaw['StockSymbol']}</code>	Returns the raw value of the specified parameter of the navigation resource (before it is evaluated).
<code>{node.title}</code>	Returns the title of the navigation resource.
<code>{node.path}</code>	Returns the path to the navigation resource.
<code>{node.externalURL}</code>	Returns the URL for the navigation resource of type <code>External Link</code> .
<code>{node.prettyUrl}</code>	Returns the identifying path for this navigation resource.
<code>{node.prettyUrlPath}</code> <code>{node.prettyUrlPath[N]}</code>	<p>Returns a collection of identifying paths by depth to enable its use as a starting path to drive another navigation view.</p> <p>For example, assuming the <code>currentSelection</code> is <code>home/company/products/applications</code>, the following EL returns <code>home/company/products</code>:</p> <pre>{node.prettyUrlPath[3]}</pre>

**Table F-5 (Cont.) EL Expressions Relevant to Navigation**

Expression	Function
<code>#{node.goLinkPrettyUrl}</code>	Returns the identifying path for this navigation resource suitable for <code>goLink</code> destination  <pre>&lt;af:goLink id="pt_gl2" text="#{node.title}"   destination="#{node.goLinkPrettyUrl}"   targetFrame="#{node.attributes['Target']}"   inlineStyle="font-size:small;#{node.selected ?   'font-weight:bold;' : ''}"/&gt;</pre>
<code>#{node.separator ? ... : ...}</code>	Returns whether this resource is a separator item.
<code>#{node.navigable ? ... : ...}</code>	Returns whether it is possible to navigate to this resource.
<code>#{node.selected ? ... : ...}</code>	Returns whether this resource is currently selected.
<code>#{node.currentlySelected ? ... : ...}</code>	Returns whether the resource is the currently selected resource and the model is the currently selected model.
<code>#{node.onSelectedPath ? ... : ...}</code>	Returns whether this node lies on the selected path. This is useful for highlighting the selected tab, for example.  For example, assuming the currently selected node is <code>home/company/products/applications</code> , the following EL highlights the home tab.  <pre>&lt;c:set   value="\${navigationContext.defaultNavigationModel.node['home']}"   var="home" scope="session"/&gt; &lt;af:commandImageLink id="cill1"   icon="#{(home.onSelectedPath ?   '/images/caremark/nav/HomeSelected.png' :   '/images/caremark/nav/HomeIcon.png')}"   actionListener="#{navigationContext.processAction}"   action="pprnav"&gt;   &lt;f:attribute name="node" value="#{home}"/&gt; &lt;/af:commandImageLink&gt;</pre>
<code>#{node.leaf ? ... : ...}</code>	Returns whether this resource is a leaf node.
<code>#{node.parent}</code>	Returns the parent node (of type <code>NavigationResource</code> ) of this node. For the root node, <code>null</code> is returned.
<code>#{node.ancestors}</code>	Returns the hierarchy list of ancestors of this node (of type <code>NavigationResource</code> ) starting with the root node.  For example, assuming the current node is <code>home/company/products/applications</code> , the following ELs return the following values: <ul style="list-style-type: none"> <li>■ <code>#{node.ancestors[1]}</code> returns the node for <code>home</code></li> <li>■ <code>#{node.ancestors[3]}</code> returns the node for <code>home/company/products</code></li> </ul>
<code>#{node.depth}</code>	Returns the depth of this node from the root node. Root node has a depth of zero.
<code>#{node.siblings}</code>	Returns the list of siblings (of type <code>NavigationResource</code> ) of this node (inclusive).

**Table F–5 (Cont.) EL Expressions Relevant to Navigation**

Expression	Function
<code>#{node.nextSibling}</code>	Returns the next sibling in the list (of type <code>NavigationResource</code> ) of this node.  For example, the following code ensures that you do not output two separators in a row:  <pre>&lt;c:if test="\${(node.separator) &amp;&amp; (!node.nextSibling.separator)}"&gt;   &lt;af:separator id="s166"/&gt; &lt;/c:if&gt;</pre>
<code>#{node.previousSibling}</code>	Returns the previous sibling in the list (of type <code>NavigationResource</code> ) of this node.
<code>#{node.index}</code>	Returns the zero-relative index of this node relative to its siblings.
<code>#{node.children}</code> <code>#{node.children[N].title}</code> <code>#{node.children[N].children[N].title}</code>	Returns a collection of child resources.
<code>#{node.childCount}</code>	Returns the number of children of this node.
<code>#{node.childByIndex['index']}</code>	Returns the child node (of type <code>NavigationResource</code> ) specified by the zero-relative index.  If not found, this returns <code>null</code> .
<code>#{node.childByPath['admin']}</code>	Returns the child node (of type <code>NavigationResource</code> ) specified by the path relative to this node.  The path can be deeper than one level and does not need the <code>'/'</code> prefix. If not found, this returns <code>null</code> .
<code>#{node.properties['propertyName']}</code>	Returns the value of the specified property of the navigation resource, where <code>propertyName</code> is one of the following: <code>separator</code> , <code>title</code> , <code>prettyUrl</code> , <code>prettyUrlPath</code> , <code>depth</code> , <code>leaf</code> , <code>childCount</code> , <code>navigable</code> , <code>selected</code> , or <code>currentlySelected</code> .

## F.6 ELs Related to WebCenter Portal Services

[Table F.6](#) lists EL expressions relevant to WebCenter Portal services and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

**Table F-6 EL Expressions Relevant to WebCenter Portal Services**

Expression	Function
<code>#{webcenterService['serviceId']}</code>	An <code>oracle.webcenter.framework.service.Service</code> object representing the WebCenter Portal service with the service ID <code>serviceId</code> . For example, the following EL returns <i>Documents Service</i> :  <code>#{webcenterService['oracle.webcenter.doclib']}</code>  For service IDs, see <a href="#">Table F-7</a> .
<code>#{webcenterService['serviceId'].configured}</code>	Returns a Boolean value that indicates whether the WebCenter Portal service with the service ID <code>serviceId</code> is configured for use in the current Framework application. For example, the following EL returns <code>true</code> if Discussions service can be used in the application, <code>false</code> otherwise:  <code>#{webcenterService['oracle.webcenter.collab.forum'].configured}</code>  For service IDs, see <a href="#">Table F-7</a> .
<code>#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['spaceName'].forumId}</code>	Returns the forum ID of the specified space discussion forum. Enter the space name in lieu of <code>spaceName</code> .
<code>#{sessionContext['oracle.webcenter.collab.forum'].groupInfo['spaceName'].categoryId}</code>	Returns the category ID of the specified space discussion forums. Enter the space name in lieu of <code>spaceName</code> .

[Table F-7](#) lists service IDs associated with WebCenter Portal services.

**Table F-7 Service IDs**

Service	ID
Announcements	<code>oracle.webcenter.collab.announcement</code>
Discussions	<code>oracle.webcenter.collab.forum</code>
Documents and Wikis	<code>oracle.webcenter.doclib</code>
Events	<code>oracle.webcenter.collab.calendar.community</code>
Instant Messaging and Presence (IMP)	<code>oracle.webcenter.collab.rtc</code>
Links	<code>oracle.webcenter.relationship</code>
Lists	<code>oracle.webcenter.list</code>
Mail	<code>oracle.webcenter.collab.mail</code>
Notifications	<code>oracle.webcenter.notification</code>
Page	<code>oracle.webcenter.page</code>
People Connections: Activity Stream	<code>oracle.webcenter.activitystreaming</code>
People Connections: Connections	<code>oracle.webcenter.peopleconnections.connections</code>
People Connections: Feedback	<code>oracle.webcenter.peopleconnections.kudos</code>
People Connections: Message Board	<code>oracle.webcenter.peopleconnections.wall</code>
People Connections: Profile	<code>oracle.webcenter.peopleconnections.profile</code>
Polls	<code>oracle.webcenter.collab.survey</code>

**Table F-7 (Cont.) Service IDs**

Service	ID
Recent Activities	oracle.webcenter.recentactivity
Activity Graph	oracle.webcenter.activitygraph
RSS	oracle.webcenter.rss
Search	oracle.webcenter.search
Tags	oracle.webcenter.tagging
Blogs	oracle.webcenter.blog
Worklist	oracle.webcenter.worklist

## F.7 ELs Related to the Documents Service

[Table F-8](#) lists EL expressions relevant to the Documents service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

**Table F-8 EL Expressions Relevant to the Documents Service**

Expression	Function
<code>#{documentsService.defaultConnectionName}</code>	Gets the default content repository connection name. Returns <code>null</code> if no connection name is defined.
<code>#{documentsService.configured}</code>	Checks whether the Documents service is configured. Returns <code>true</code> if the Documents service is configured, otherwise <code>false</code> .

## F.8 ELs Related to the People Connections Service

[Table F-9](#) lists EL expressions relevant to the Profile feature of the People Connections service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application..

---

**Note:** The entry `securityContext.userName`, included in every Profile expression, returns the name of the current user. Note also that information is returned only if it is present in the user's profile. If the information is not included in the profile, a null value is returned.

---

**Table F-9 EL Expressions Relevant to the People Connections Service (Profile)**

Expression	Function
<code>{WebCenterProfile[userName].ManagerDisplayName}</code> <code>{WebCenterProfile[securityContext.userName].ManagerDisplayName}</code>	The display name of the specified user's manager if the current user is allowed to know it.
<code>{WebCenterProfile[userName].employeeNumber}</code> <code>{WebCenterProfile[securityContext.userName].employeeNumber}</code>	The specified user's employee number if the current user is allowed to know it.
<code>{WebCenterProfile[userName].businessPOBox}</code> <code>{WebCenterProfile[securityContext.userName].businessPOBox}</code>	The post office box number associated with the specified user if the current user is allowed to know it.
<code>{WebCenterProfile[userName].timeZone}</code> <code>{WebCenterProfile[securityContext.userName].timeZone}</code>	The time zone in which the specified user's home office is located if the current user is allowed to know it.
<code>{WebCenterProfile[userName].description}</code> <code>{WebCenterProfile[securityContext.userName].description}</code>	A description of the specified user (from Profile "About Me") if the current user is allowed to know it.
<code>{WebCenterProfile[userName].department}</code> <code>{WebCenterProfile[securityContext.userName].department}</code>	The department to which the specified user belongs if the current user is allowed to know it.
<code>{WebCenterProfile[userName].businessPager}</code> <code>{WebCenterProfile[securityContext.userName].businessPager}</code>	The specified user's business pager number if the current user is allowed to know it.
<code>{WebCenterProfile[userName].businessCity}</code> <code>{WebCenterProfile[securityContext.userName].businessCity}</code>	The city in which the specified user is located if the current user is allowed to know it.
<code>{WebCenterProfile[userName].maidenName}</code> <code>{WebCenterProfile[securityContext.userName].maidenName}</code>	The specified user's surname or last name before marriage if the current user is allowed to know it.
<code>{WebCenterProfile[userName].businessFax}</code> <code>{WebCenterProfile[securityContext.userName].businessFax}</code>	The specified user's business fax number if the current user is allowed to know it.
<code>{WebCenterProfile[userName].dateofHire}</code> <code>{WebCenterProfile[securityContext.userName].dateofHire}</code>	The specified user's date of hire if the current user is allowed to know it.
<code>{WebCenterProfile[userName].nameSuffix}</code> <code>{WebCenterProfile[securityContext.userName].nameSuffix}</code>	Additional information appended to the user's name, such as Esq., Jr., and so on if the current user is allowed to know it.
<code>{WebCenterProfile[userName].middleName}</code> <code>{WebCenterProfile[securityContext.userName].middleName}</code>	The specified user's middle name if the current user is allowed to know it.

**Table F-9 (Cont.) EL Expressions Relevant to the People Connections Service (Profile)**

<b>Expression</b>	<b>Function</b>
#{WebCenterProfile[userName].homePhone} #{WebCenterProfile[securityContext.userName].homePhone}	The specified user's home phone number if the current user is allowed to know it.
#{WebCenterProfile[userName].employeeType} #{WebCenterProfile[securityContext.userName].employeeType}	The specified user's employee type classification, for example, IC4 if the current user is allowed to know it.
#{WebCenterProfile[userName].lastName} #{WebCenterProfile[securityContext.userName].lastName}	The specified user's surname or last name if the current user is allowed to know it.
#{WebCenterProfile[userName].dateOfBirth} #{WebCenterProfile[securityContext.userName].dateOfBirth}	The specified user's birthday if the current user is allowed to know it.
#{WebCenterProfile[userName].businessState} #{WebCenterProfile[securityContext.userName].businessState}	The state in which the specified user's home office is located if the current user is allowed to know it.
#{WebCenterProfile[userName].homeAddress} #{WebCenterProfile[securityContext.userName].homeAddress}	The specified user's home street address if the current user is allowed to know it.
#{WebCenterProfile[userName].businessStreet} #{WebCenterProfile[securityContext.userName].businessStreet}	The street on which the specified user's home office is located if the current user is allowed to know it.
#{WebCenterProfile[userName].businessPostalCode} #{WebCenterProfile[securityContext.userName].businessPostalCode}	The specified user's postal or ZIP code if the current user is allowed to know it.
#{WebCenterProfile[userName].initials} #{WebCenterProfile[securityContext.userName].initials}	The specified user's initials if the current user is allowed to know it.
#{WebCenterProfile[userName].firstName} #{WebCenterProfile[securityContext.userName].firstName}	The specified user's first name if the current user is allowed to know it.
#{WebCenterProfile[userName].organizationalUnit} #{WebCenterProfile[securityContext.userName].organizationalUnit}	The organizational unit to which the specified user belongs, for example, D10, if the current user is allowed to know it.
#{WebCenterProfile[userName].wirelessAcctNumber} #{WebCenterProfile[securityContext.userName].wirelessAcctNumber}	The specified user's wireless account number if the current user is allowed to know it.
#{WebCenterProfile[userName].businessPhone} #{WebCenterProfile[securityContext.userName].businessPhone}	The specified user's business telephone number if the current user is allowed to know it.

**Table F-9 (Cont.) EL Expressions Relevant to the People Connections Service (Profile)**

Expression	Function
<code>#{WebCenterProfile[userName].businessCountry}</code> <code>#{WebCenterProfile[securityContext.userName].businessCountry}</code>	The country in to which the specified user is assigned if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].preferredLanguage}</code> <code>#{WebCenterProfile[securityContext.userName].preferredLanguage}</code>	The specified user's preferred language if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].displayName}</code> <code>#{WebCenterProfile[securityContext.userName].displayName}</code>	The specified user's display name if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].userName}</code> <code>#{WebCenterProfile[securityContext.userName].userName}</code>	The specified user's actual name if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].title}</code> <code>#{WebCenterProfile[securityContext.userName].title}</code>	The specified user's job title if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].businessEmail}</code> <code>#{WebCenterProfile[securityContext.userName].businessEmail}</code>	The specified user's business email address if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].organization}</code> <code>#{WebCenterProfile[securityContext.userName].organization}</code>	The organization to which the specified user belongs, for example, <i>Sales</i> , if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].businessMobile}</code> <code>#{WebCenterProfile[securityContext.userName].businessMobile}</code>	The specified user's cell or mobile phone number if the current user is allowed to know it.
<code>#{WebCenterProfile[userName].expertise}</code> <code>#{WebCenterProfile[securityContext.userName].expertise}</code>	The specified user's business expertise if the current user is allowed to know it.

## F.9 ELs Related to the Personalization Service

Table F-10 lists EL expressions relevant to the Personalization+ service and describes the types of functionality they provide. All listed ELs apply to both Framework applications and the Spaces application.

**Table F–10 EL Expressions Relevant to the Personalization Service**

Expression	Function
<code>{p13nContext.reset}</code>	<p>Clears the state of the context object in which it is invoked.</p> <p>Other examples:</p> <pre data-bbox="773 380 1365 432"><code>{p13nContext.conductor['ConductorConnection'].reset}</code></pre> <pre data-bbox="773 470 1365 522"><code>{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].reset}</code></pre> <pre data-bbox="773 560 1365 638"><code>{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].reset}</code></pre>
<code>{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].update}</code>	<p>Updates the property set with new values if bound to a form.</p> <p>The update method applies only to the context <code>PropertySetContext</code>, and can be called only as part of a form-based action.</p>
<code>{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].results}</code>	<p>Retrieves the results of the context object. In the case of <code>PropertySetContext</code>, it retrieves the property set by name and property set definition, if they exist.</p> <p>In the case of <code>ScenarioExecutionContext</code> and <code>ParameterizedScenarioExecutionContext</code>, the scenario results are retrieved.</p> <p>Other examples:</p> <pre data-bbox="773 1077 1365 1150"><code>{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}</code></pre> <pre data-bbox="773 1188 1365 1308"><code>{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}</code></pre>
<code>{p13nContext.conductor['PropertiesConnection'].namespaces['MyNamespace'].scenario['MyScenario'].results}</code>	Executes a scenario by name.

**Table F-10 (Cont.) EL Expressions Relevant to the Personalization Service**

Expression	Function
<pre>#{p13nContext.conductor['ConductorConnection'].namespaces['MyNamespace'].scenario['MyScenario'].withInput['input1=val1;input2=value2;input3=value3'].results}</pre>	<p>Executes a scenario by name with input parameters. Input parameters must be in the following format:</p> <pre>&lt;paramOne&gt;=&lt;valueOne&gt;;&lt;paramTwo&gt;=&lt;valueTwo&gt;;&lt;paramThree&gt;=&lt;valueThree&gt;</pre> <p>Where each parameter name and value is separated by semicolon.</p> <p>The withInput method applies only to the context ScenarioExecutionContext.</p>
<pre>#{p13nContext.conductor['ConductorConnection'].namespaces[myManagedBean.namespace].scenario[myManagedBean.scenario].isError}</pre>	<p>Determines if an error has occurred in the current context object.</p> <p>The isError method applies only to PropertySetContext and ~ScenarioExecutionContext.</p> <p>Other examples:</p> <pre>#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].isError}</pre>
<pre>#{p13nContext.conductor['ConductorConnection'].namespaces['myManagedBean.namespace'].scenario['myManagedBean.scenario'].errorMessage}</pre>	<p>Returns the error message if an error has occurred in the current context object.</p> <p>The errorMessage method applies only to PropertySetContext and ~ScenarioExecutionContext.</p> <p>Other examples:</p> <pre>#{p13nContext.properties['PropertiesConnection'].namespaces['MyNamespace'].setDefinitions['MyPropertySetDefinition'].set['MyPropertySet'].errorMessage}</pre>

---

# WebCenter Portal Analytics Database Schema

This appendix describes the underlying database design for Oracle WebCenter Portal's Analytics. This information is useful to developers building *custom* analytics data queries, as described in [Section 46.3, "Building Analytics Reports."](#)

This appendix contains the following topics:

- [Section G.1, "Analytics Database Schema Overview"](#)
- [Section G.2, "Analytics Fact Table Descriptions"](#)
- [Section G.3, "Analytics Dimension Table Descriptions"](#)
- [Section G.4, "Analytics System Table Descriptions"](#)
- [Section G.5, "Analytics User Properties"](#)
- [Section G.6, "Analytics Event and Dimension Data Types"](#)

## G.1 Analytics Database Schema Overview

This section contains the following topics:

- [Section G.1.1, "Analytics Database Model Overview"](#)
- [Section G.1.2, "Analytics Database Table Overview"](#)

### G.1.1 Analytics Database Model Overview

Oracle WebCenter Portal's Analytics database schema is modeled as a star-schema to optimize performance and provide fast response times.

Analytics data is stored in fact and dimension fact tables:

- **Analytics Fact Tables** are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, space views, document uploads, blog views, wiki edits, and so on. Columns in these fact tables mostly contain integer IDs that reference descriptive data stored in dimension tables.

[Table G–1, "Analytics Facts Tables \(Prefixed ASFACT\\_WC\)"](#) lists types of analytics events that can be collected and stored, and the associated tables.

- **Analytics Dimension Tables** are also created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is

added. Typical analytics dimension data includes: page name, browser name, document name, space name, and so on.

Table G-2, "Analytics Dimension Tables (Prefixed ASDIM\_WC)" lists the different types of analytics dimensions that can be collected and stored, and the associated table names.

The Analytics database schema also contains a few application tables that store information such as system configuration parameters. Application tables are created during installation.

Figure G-1 shows the relationship between predefined fact, dimension, and application tables in the analytics database schema.

**Figure G-1 Analytics Database Model**

Tables shown in Figure G-1 store the following analytics data:

- Application configuration
- Event metadata
- Report metadata

**Application Configuration**

Figure G-2 shows which entities are used to store system parameters for the Analytics service.

**Figure G-2 Application Configuration Entities**

**Event Metadata**

Figure G-3 shows which entities are used to store event data. The Users and Times entities are mainly dimensions that provide user/time oriented views of the event data.

Event metadata records which events are collected, the tables where events are stored, as well as dimensions that are saved each time an event occurs.

**Figure G-3 Event Metadata Entities**

**Report Metadata**

Figure G-4 shows which entities represent out-of-the-box analytics reports. Metadata in these tables are the primary source for information such as report metrics, report structure, and columns listed.

Report metadata stores out-of-the-box report configurations for WebCenter Portal's Analytics. Each report contains many columns to display in the report and which filters to apply. Some reports are composed from other reports.

**Figure G-4 Report Metadata Entities**

**G.1.2 Analytics Database Table Overview**

This section lists and describes database tables in the analytics schema:

- Table G-1, " Analytics Facts Tables (Prefixed ASFACT\_WC)"
- Table G-2, " Analytics Dimension Tables (Prefixed ASDIM\_WC)"
- Table G-3, " Analytics System Tables (Prefixed ASSYS)"

**Note:** Table names for analytics event and dimension tables are automatically generated based on analytics event and dimension names. The mapping between analytics event and dimension names and their corresponding table names is defined in the [ASSYS\\_EVENTS](#) and [ASSYS\\_EVENTDIMENSIONS](#) tables.

Some table names include **double underscores**, for example, `ASFACT_WC_DOCLIB__0`. This is because all the table names include a component value that is 7 characters long, and in some cases one of those characters is an underscore (for example, `DOCLIB_`).

For an example of how to use a query to return the table names associated with a specific event, see [Section G.1.2.1, "Sample SQL Query: Finding Table Names Associated with Specific Events"](#).

**Table G-1 Analytics Facts Tables (Prefixed ASFACT\_WC)**

Event Object	Table Name	Event Table Description
Pages	<a href="#">ASFACT_WC_PAGECRE_0</a>	Stores event information captured by the Analytics service when a page is created.
	<a href="#">ASFACT_WC_PAGEDEL_0</a>	Stores event information captured by the Analytics service when a page is deleted.
	<a href="#">ASFACT_WC_PAGEEDI_0</a>	Stores event information captured by the Analytics service when a page is edited.
	<a href="#">ASFACT_WC_PAGETAG_0</a>	Stores event information captured by the Analytics service when a page is tagged.
	<a href="#">ASFACT_WC_PAGEVIE_0</a>	Stores event information captured by the Analytics service when a page is viewed.
Discussions	<a href="#">ASFACT_WC_DISCUSS_0</a>	Stores event information captured by the Analytics service when a discussion topic is viewed.
	<a href="#">ASFACT_WC_DISCUSS_1</a>	Stores event information captured by the Analytics service when an announcement is viewed.
	<a href="#">ASFACT_WC_DISCUSS_2</a>	Stores event information captured by the Analytics service when a discussion forum is created.
	<a href="#">ASFACT_WC_DISCUSS_3</a>	Stores event information captured by the Analytics service when a discussion forum is deleted.
	<a href="#">ASFACT_WC_DISCUSS_4</a>	Stores event information captured by the Analytics service when a discussion topic is created.
	<a href="#">ASFACT_WC_DISCUSS_5</a>	Stores event information captured by the Analytics service when a discussion topic is edited.
	<a href="#">ASFACT_WC_DISCUSS_6</a>	Stores event information captured by the Analytics service when a discussion topic is deleted.
	<a href="#">ASFACT_WC_DISCUSS_7</a>	Stores event information captured by the Analytics service when a discussion topic is tagged.
	<a href="#">ASFACT_WC_DISCUSS_8</a>	Stores event information captured by the Analytics service when someone replies to a discussion topic message.
	<a href="#">ASFACT_WC_DISCUSS_9</a>	Stores event information captured by the Analytics service when a discussion topic message is liked.
	<a href="#">ASFACT_WC_DISCUSS_A</a>	Stores event information captured by the Analytics service when an announcement is created.

**Table G–1 (Cont.) Analytics Facts Tables (Prefixed ASFACT\_WC)**

<b>Event Object</b>	<b>Table Name</b>	<b>Event Table Description</b>
	<a href="#">ASFACT_WC_DISCUSS_B</a>	Stores event information captured by the Analytics service when an announcement is edited.
	<a href="#">ASFACT_WC_DISCUSS_C</a>	Stores event information captured by the Analytics service when an announcement is deleted.
<b>Documents - Blog - Wikis</b>	<a href="#">ASFACT_WC_DOCLIB_0</a>	Stores event information captured by the Analytics service when a document is viewed.
	<a href="#">ASFACT_WC_DOCLIB_1</a>	Stores event information captured by the Analytics service when a document is downloaded.
	<a href="#">ASFACT_WC_DOCLIB_2</a>	Stores event information captured by the Analytics service when a document is created.
	<a href="#">ASFACT_WC_DOCLIB_3</a>	Stores event information captured by the Analytics service when a document is edited.
	<a href="#">ASFACT_WC_DOCLIB_4</a>	Stores event information captured by the Analytics service when a document is tagged.
	<a href="#">ASFACT_WC_DOCLIB_5</a>	Stores event information captured by the Analytics service when a document is liked.
	<a href="#">ASFACT_WC_DOCLIB_6</a>	Stores event information captured by the Analytics service when a document is commented.
	<a href="#">ASFACT_WC_DOCLIB_7</a>	Stores event information captured by the Analytics service when a document is deleted.
<b>Space Events</b>	<a href="#">ASFACT_WC_EVENT_C_0</a>	Stores event information captured by the Analytics service when a space event is created.
	<a href="#">ASFACT_WC_EVENT_D_0</a>	Stores event information captured by the Analytics service when a space event is deleted.
	<a href="#">ASFACT_WC_EVENT_E_0</a>	Stores event information captured by the Analytics service when a space event is edited.
<b>Spaces</b>	<a href="#">ASFACT_WC_GROUPSP_0</a>	Stores event information captured by the Analytics service when a space is viewed.
	<a href="#">ASFACT_WC_GROUPSP_1</a>	Stores event information captured by the Analytics service when a space is created.
	<a href="#">ASFACT_WC_GROUPSP_2</a>	Stores event information captured by the Analytics service when someone joins a space.
	<a href="#">ASFACT_WC_GROUPSP_3</a>	Stores event information captured by the Analytics service when a space is deleted.
<b>Lists</b>	<a href="#">ASFACT_WC_LIST_CR_0</a>	Stores event information captured by the Analytics service when a list is created.
	<a href="#">ASFACT_WC_LIST_DE_0</a>	Stores event information captured by the Analytics service when a list is deleted.
	<a href="#">ASFACT_WC_LIST_ED_0</a>	Stores event information captured by the Analytics service when a list is edited.
<b>Logins</b>	<a href="#">ASFACT_WC_LOGINS_0</a>	Stores event information captured by the Analytics service when a user logs in to the site.
<b>People</b>	<a href="#">ASFACT_WC_PEOPLEC_0</a>	Stores event information captured by the Analytics service when someone adds a connection.
	<a href="#">ASFACT_WC_PEOPLEC_1</a>	Stores event information captured by the Analytics service when someone posts on a wall.

**Table G-1 (Cont.) Analytics Facts Tables (Prefixed ASFACT\_WC)**

Event Object	Table Name	Event Table Description
	<a href="#">ASFACT_WC_PEOPLEC_2</a>	Stores event information captured by the Analytics service when someone edits a profile.
	<a href="#">ASFACT_WC_PEOPLEC_3</a>	Stores event information captured by the Analytics service when someone edits status information.
Portlets	<a href="#">ASFACT_WC_PORTLET_0</a>	Stores event information captured by the Analytics service when a portlet is viewed.
Searches	<a href="#">ASFACT_WC_SEARCHE_0</a>	Stores event information captured by the Analytics service when a search is performed.

**Table G-2 Analytics Dimension Tables (Prefixed ASDIM\_WC)**

Dimension Name	Table Name	Dimension Table Description
Applications	<a href="#">ASDIM_WC_APPLICA_0</a>	Stores names of WebCenter Portal applications accessing analytics data.
IP Clients	<a href="#">ASDIM_WC_CLIENT_0</a>	Stores client IP addresses received in analytics events.
Discussion Topics	<a href="#">ASDIM_WC_DISCUSS_0</a>	Stores discussion topic details received in analytics events.
Discussion Forums	<a href="#">ASDIM_WC_DISCUSS_1</a>	Stores discussion forum details received in analytics events.
Discussion Messages	<a href="#">ASDIM_WC_DISCUSS_2</a>	Stores discussion message details received in analytics events.
Announcements	<a href="#">ASDIM_WC_DISCUSS_3</a>	Stores announcement details received in analytics events.
Documents	<a href="#">ASDIM_WC_DOCUMENT_0</a>	Stores document details received in analytics events.
Lists	<a href="#">ASDIM_WC_LISTS_0</a>	Stores list details received in analytics events.
Pages	<a href="#">ASDIM_WC_PAGES_0</a>	Stores WebCenter Portal page details received in analytics events.
Portlets	<a href="#">ASDIM_WC_PORTLET_0</a>	Stores portlet information received in analytics events.
Portlet Instances	<a href="#">ASDIM_WC_PORTLET_1</a>	Stores portlet instance information received in analytics events.
Portlet Producers	<a href="#">ASDIM_WC_PRODUCER_0</a>	Stores producers associated with portlet.
Referrers	<a href="#">ASDIM_WC_REFERER_0</a>	Stores referred URLs where analytics events come from.
Searches	<a href="#">ASDIM_WC_SEARCHE_0</a>	Stores search phrases received in analytics events.
Space Events	<a href="#">ASDIM_WC_EVENTS_0</a>	Stores space event details, received in analytics events.
Spaces	<a href="#">ASDIM_WC_GROUPS_0</a>	Stores space information received in analytics events.
Tags	<a href="#">ASDIM_WC_TAGS_0</a>	Stores tags received in analytics events.
Browsers	<a href="#">ASDIM_WC_USER_AG_0</a>	Stores information about which browsers are used to access analytics.
Times	<a href="#">ASDIM_TIME</a>	Stores times used to group analytics reports.

**Table G-2 (Cont.) Analytics Dimension Tables (Prefixed ASDIM\_WC)**

Dimension Name	Table Name	Dimension Table Description
Users	<a href="#">ASDIM_USERS</a>	Stores user details received in analytics events.
User Properties	<a href="#">ASDIM_USERPROPERTIES</a>	Stores user properties.
User Property Values	<a href="#">ASDIM_USERPROPERTYVALUES</a>	Stores user property values.

**Table G-3 Analytics System Tables (Prefixed ASSYS)**

Entity Name	Table Name	Table Description
Configuration	<a href="#">ASSYS_CONFIG</a>	Stores system configuration details.
Dimension Properties	<a href="#">ASSYS_DIMENSIONPROPS</a>	Stores configuration details for each dimension.
Event Dimensions	<a href="#">ASSYS_EVENTDIMENSIONS</a>	Stores dimensions associated with each event.
Event Facts	<a href="#">ASSYS_EVENTFACTS</a>	Stores facts associated with each event.
Events	<a href="#">ASSYS_EVENTS</a>	Stores the different types of analytics events that are collected by the Analytics service. An analytics event represents a single user action, such as document view, user login, and so on.
Namespaces	<a href="#">ASSYS_NAMESPACES</a>	Stores the namespace in which analytics events are registered.
Report Composition	<a href="#">ASSYS_REPORTCOMPOSITION</a>	Stores out-of-the-box composite analytics reports.
Report Group	<a href="#">ASSYS_REPORTGROUP</a>	Stores out-of-the-box analytics report groups, such as portlets, services, and so on.
Report Items	<a href="#">ASSYS_REPORTITEMS</a>	Stores items included in each analytics report.
Report Item Values	<a href="#">ASSYS_REPORTITEMVALUES</a>	Stores values associated with each item in an analytics report.
Reports	<a href="#">ASSYS_REPORTS</a>	Stores out-of-the-box analytics reports.

### G.1.2.1 Sample SQL Query: Finding Table Names Associated with Specific Events

This section provides a sample SQL query to return the names of tables associated with a specific event. This query uses a filter to return tables associated with the Documents service.

```
SELECT tablename "Table Name",
       displayname "Event Display Name"
FROM   assys_events
WHERE  tablename like 'ASFACT_WC_DOCLIB%'
ORDER BY 1;
```

#### Sample Report Output

Table Name	Event Display Name
ASFACT_WC_DOCLIB__0	{HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTVIEWS
ASFACT_WC_DOCLIB__1	{HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTDOWNLOADS
ASFACT_WC_DOCLIB__2	{HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTCREATE
ASFACT_WC_DOCLIB__3	{HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB_DOCUMENTEDIT

ASFACT\_WC\_DOCLIB\_\_4 {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB\_DOCUMENTTAG  
ASFACT\_WC\_DOCLIB\_\_5 {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB\_DOCUMENTLIKE  
ASFACT\_WC\_DOCLIB\_\_6 {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB\_DOCUMENTCOMMENT  
ASFACT\_WC\_DOCLIB\_\_7 {HTTP://WWW.ORACLE.COM/ANALYTICS/WC}DOCLIB\_DOCUMENTDELETES

## G.2 Analytics Fact Table Descriptions

Analytics fact tables are created when the Analytics Collector runs for the first time. Each fact table stores a specific event type, for example, page views, space views, document uploads, blog views, wiki edits, and so on. Columns in these fact table mostly contain integer IDs that reference descriptive data stored in dimension tables.

This section describes each of the tables listed in [Table G-1, "Analytics Facts Tables \(Prefixed ASFACT\\_WC\)"](#).

### G.2.1 ASFACT\_WC\_PAGECRE\_0

Fact table that stores event information captured by the Analytics service when someone creates a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.2 ASFACT\_WC\_PAGEDEL\_0

Fact table that stores event information captured by the Analytics service when someone deletes a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time the dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.3 ASFACT\_WC\_PAGEEDI\_0

Fact table that stores event information captured by the Analytics service when someone edits a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>

### G.2.4 ASFACT\_WC\_PAGETAG\_0

Fact table that stores event information captured by the Analytics service when someone tags a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
TAG_	NULL	NUMBER(38)	Tag ID dimension.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

## G.2.5 ASFACT\_WC\_PAGEVIE\_0

Fact table that stores event information captured by the Analytics service when someone views a page.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
RESPONSE_TIME_	NULL	NUMBER(16)	Response time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERER_0.ID</a>
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

## G.2.6 ASFACT\_WC\_DISCUSS\_0

Fact table that stores event information captured by the Analytics service when someone views a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
FORUM_	NULL	NUMBER(38)	Discussion forum associated with the event.	<a href="#">ASDIM_WC_DISCUSS_1.ID</a>
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
TOPIC_	NULL	NUMBER(38)	Discussion topic associated with the event.	<a href="#">ASDIM_WC_DISCUSS_0.ID</a>
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERER_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.7 ASFACT\_WC\_DISCUSS\_1

Fact table that stores event information captured by the Analytics service when someone views an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERER_0.ID</a>
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement associated with the event.	<a href="#">ASDIM_WC_DISCUSS_3.ID</a>

### G.2.8 ASFACT\_WC\_DISCUSS\_2

Fact table that stores event information captured by the Analytics service when someone creates a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
DISCUSSION_FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	<a href="#">ASDIM_WC_DISCUSS_0.ID</a>

### G.2.9 ASFACT\_WC\_DISCUSS\_3

Fact table that stores event information captured by the Analytics service when someone deletes a discussion forum.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
DISCUSSION_FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	<a href="#">ASDIM_WC_DISCUSS_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

### G.2.10 ASFACT\_WC\_DISCUSS\_4

Fact table that stores event information captured by the Analytics service when someone creates a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_0.ID</a>
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_2.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_ APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_ GROUPSP_0.ID</a>

### G.2.11 ASFACT\_WC\_DISCUSS\_5

Fact table that stores event information captured by the Analytics service when someone edits a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_ USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_ EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_ APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_ GROUPSP_0.ID</a>
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_0.ID</a>

### G.2.12 ASFACT\_WC\_DISCUSS\_6

Fact table that stores event information captured by the Analytics service when someone deletes a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_ EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_ GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_ APPLICA_0.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_0.ID</a>

### G.2.13 ASFACT\_WC\_DISCUSS\_7

Fact table that stores event information captured by the Analytics service when someone tags a discussion topic.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_ EVENTFACTS.ID</a>
TAG_	NULL	NUMBER(38)	Tag ID dimension.	<a href="#">ASDIM_WC_ TAGS_0.ID</a>
APPLICATION _	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_ APPLICA_0.ID</a>
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_ GROUPSP_0.ID</a>

### G.2.14 ASFACT\_WC\_DISCUSS\_8

Fact table that stores event information captured by the Analytics service when someone replies to a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_ EVENTFACTS.ID</a>
DISCUSSION_ MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_2.ID</a>
DISCUSSION_ TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_ DISCUSS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_ GROUPSP_0.ID</a>
APPLICATION_ _	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_ APPLICA_0.ID</a>

### G.2.15 ASFACT\_WC\_DISCUSS\_9

Fact table that stores event information captured by the Analytics service when someone likes a discussion topic message.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
DISCUSSION_MESSAGE_	NULL	NUMBER(38)	Discussion message ID dimension.	<a href="#">ASDIM_WC_DISCUSS_2.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
DISCUSSION_TOPIC_	NULL	NUMBER(38)	Discussion topic ID dimension.	<a href="#">ASDIM_WC_DISCUSS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.16 ASFACT\_WC\_DISCUSS\_A

Fact table that stores event information captured by the Analytics service when someone creates an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
DISCUSSION_ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement ID dimension.	<a href="#">ASDIM_WC_DISCUSS_3.ID</a>

### G.2.17 ASFACT\_WC\_DISCUSS\_B

Fact table that stores event information captured by the Analytics service when someone edits an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
DISCUSSION_ANNOUNCEMENT_	NULL	NUMBER(38)	Announcement ID dimension.	<a href="#">ASDIM_WC_DISCUSS_3.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

### G.2.18 ASFACT\_WC\_DISCUSS\_C

Fact table that stores event information captured by the Analytics service when someone deletes an announcement.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
DISCUSSION_FORUM_	NULL	NUMBER(38)	Discussion forum ID dimension.	<a href="#">ASDIM_WC_DISCUSS_1.ID</a>

### G.2.19 ASFACT\_WC\_DOCLIB\_0

Fact table that stores event information captured by the Analytics service when someone views a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
RESPONSE_ TIME_	NULL	NUMBER(16)	Response Time (ms).	
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
GROUPSPACE	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
REFERRER	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_ DOCUMENT_ 0.ID
USER_AGENT	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID
APPLICATION	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

## G.2.20 ASFACT\_WC\_DOCLIB\_1

Fact table that stores event information captured by the Analytics service when someone downloads a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_ EVENTFACTS.ID
DOCUMENT	NULL	NUMBER(38)	Document ID dimension.	ASDIM_WC_ DOCUMENT_0.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_ REFERRE_0.ID
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_ CLIENT_0.ID
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_ GROUPSP_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_ USER_AG_0.ID
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_ APPLICA_0.ID

**G.2.21 ASFACT\_WC\_DOCLIB\_2**

Fact table that stores event information captured by the Analytics service when someone creates document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	DATE	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

**G.2.22 ASFACT\_WC\_DOCLIB\_3**

Fact table that stores event information captured by the Analytics service when someone edits a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

**G.2.23 ASFACT\_WC\_DOCLIB\_4**

Fact table that stores event information captured by the Analytics service when someone tags a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
TAGS	NULL	NUMBER(38)	Tag added to the document.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.24 ASFACT\_WC\_DOCLIB\_5

Fact table that stores event information captured by the Analytics service when someone "likes" a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

### G.2.25 ASFACT\_WC\_DOCLIB\_6

Fact table that stores event information captured by the Analytics service when someone comments on a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.26 ASFACT\_WC\_DOCLIB\_7

Fact table that stores event information captured by the Analytics service when someone deletes a document.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
WEBCENTER_RESOURCE_	NULL	NUMBER(38)	WebCenter Portal resource ID.	

### G.2.27 ASFACT\_WC\_EVENT\_C\_0

Fact table that stores event information captured by the Analytics service when someone creates an event in a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
EVENT_	NULL	NUMBER(38)	Event Identifier.	<a href="#">ASDIM_WC_EVENTS_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.28 ASFACT\_WC\_EVENT\_D\_0

Fact table that stores event information captured by the Analytics service when someone deletes an event from a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
EVENT_	NULL	NUMBER(38)	Event Identifier.	<a href="#">ASDIM_WC_EVENTS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.29 ASFACT\_WC\_EVENT\_E\_0

Fact table that stores event information captured by the Analytics service when someone edits and event in a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
EVENT_	NULL	NUMBER(38)	Event Identifier.	<a href="#">ASDIM_WC_EVENTS_0.ID</a>

**G.2.30 ASFACT\_WC\_GROUPSP\_0**

Fact table that stores event information captured by the Analytics service when someone views a space.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
RESPONSE_TIME_	NULL	NUMBER(16)	Response time (ms).	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERER_0.ID</a>
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

**G.2.31 ASFACT\_WC\_GROUPSP\_1**

Fact table that stores event information captured by the Analytics service when someone creates a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

### G.2.32 ASFACT\_WC\_GROUPSP\_2

Fact table that stores event information captured by the Analytics service when someone joins a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>

### G.2.33 ASFACT\_WC\_GROUPSP\_3

Fact table that stores event information captured by the Analytics service when someone deletes a space in the Spaces application.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.34 ASFACT\_WC\_LIST\_CR\_0

Fact table that stores event information captured by the Analytics service when someone creates a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
LIST_	NULL	NUMBER(38)	List ID.	<a href="#">ASDIM_WC_LISTS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

### G.2.35 ASFACT\_WC\_LIST\_DE\_0

Fact table that stores event information captured by the Analytics service when someone deletes a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
LIST_	NULL	NUMBER(38)	List ID.	<a href="#">ASDIM_WC_LISTS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.36 ASFACT\_WC\_LIST\_ED\_0

Fact table that stores event information captured by the Analytics service when someone edits a list.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LIST_	NULL	NUMBER(38)	List ID.	<a href="#">ASDIM_WC_LISTS_0.ID</a>
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.2.37 ASFACT\_WC\_LOGINS\_0

Fact table that stores login event information captured by the Analytics service with related data for each event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICATION_0.ID</a>
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID	
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERER_0.ID</a>
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>

### G.2.38 ASFACT\_WC\_PEOPLEC\_0

Fact table that stores event information captured by the Analytics service when someone adds a people connection.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
TARGET_USER	NULL	NUMBER(38)	User ID	

### G.2.39 ASFACT\_WC\_PEOPLEC\_1

Fact table that stores event information captured by the Analytics service when someone posts on a wall.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>
TARGET_USER	NULL	NUMBER(38)	User ID.	

### G.2.40 ASFACT\_WC\_PEOPLEC\_2

Fact table that stores event information captured by the Analytics service when someone edits a profile.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>

### G.2.41 ASFACT\_WC\_PEOPLEC\_3

Fact table that stores event information captured by the Analytics service when someone edits status information.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	<a href="#">ASDIM_TIME.ID</a>
USERID	NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASSYS_EVENTFACTS.ID</a>

### G.2.42 ASFACT\_WC\_PORTLET\_0

Fact table that stores information captured by the Analytics service when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID
CACHED_	NULL	NUMBER(5)	Indicates whether the portlet was displayed from the cache.	
PORTLET_	NULL	NUMBER(38)	Portlet.	ASDIM_WC_PORTLET_1.ID
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	ASDIM_WC_REFERER_0.ID
PRODUCER_	NULL	NUMBER(38)	Portlet producer.	ASDIM_WC_PRODUCER_0.ID
PAGE_	NULL	NUMBER(38)	Page ID dimension.	ASDIM_WC_PAGES_0.ID
SESSION_ID_	NULL	NVARCHAR2 (254)	Session ID.	
CLIENT_IP	NULL	NUMBER(38)	Client IP ID dimension.	ASDIM_WC_CLIENT_0.ID
PORTLET_INSTANCE_	NULL	NUMBER(38)	Portlet instance.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	ASDIM_WC_GROUPSP_0.ID
RESPONSE_TIME_	NULL	NUMBER(16)	Response time (ms).	
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	ASDIM_WC_APPLICATION_0.ID
USER_AGENT_	NULL	NUMBER(38)	User agent.	ASDIM_WC_USER_AG_0.ID

### G.2.43 ASFACT\_WC\_SEARCHE\_0

Fact table that stores event information captured by the Analytics service when someone performs a search.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
OCURRED	NOT NULL	DATE	Date event occurred.	
TIMEID	NOT NULL	NUMBER(38)	Time dimension event occurred. This column is used for partitioning.	ASDIM_TIME.ID
USERID	NULL	NUMBER(38)	User ID dimension.	ASDIM_USERS.ID
EVENTID	NULL	NUMBER(38)	Event ID dimension.	ASSYS_EVENTFACTS.ID

Column Name	NOT NULL?	Data Type	Description	Foreign Key
PAGE_	NULL	NUMBER(38)	Page ID dimension.	<a href="#">ASDIM_WC_PAGES_0.ID</a>
USER_AGENT_	NULL	NUMBER(38)	User agent.	<a href="#">ASDIM_WC_USER_AG_0.ID</a>
CLIENT_IP_	NULL	NUMBER(38)	Client IP ID dimension.	<a href="#">ASDIM_WC_CLIENT_0.ID</a>
APPLICATION_	NULL	NUMBER(38)	Application ID dimension.	<a href="#">ASDIM_WC_APPLICA_0.ID</a>
SESSION_ID_	NULL	NVARCHAR2(254)	Session ID.	
REFERRER_	NULL	NUMBER(38)	Referrer ID dimension.	<a href="#">ASDIM_WC_REFERERRE_0.ID</a>
SEARCHED_PHRASE	NULL	NUMBER(38)	Search phrase.	
GROUPSPACE_	NULL	NUMBER(38)	Space ID dimension.	<a href="#">ASDIM_WC_GROUPSP_0.ID</a>

### G.3 Analytics Dimension Table Descriptions

Analytics dimension tables are created when the Analytics Collector runs for the first time. Dimension tables store redundant descriptive data associated with analytics events. When a value is not found in these tables, a new record is added. Typical analytics dimension data includes: page name, browser name, document name, space name, and so on.

This section describes each of the tables listed in [Table G-2, "Analytics Dimension Tables \(Prefixed ASDIM\\_WC\)"](#).

#### G.3.1 ASDIM\_WC\_APPLICA\_0

Dimension table that stores the names of WebCenter Portal applications accessing analytics data, for example `webcenter` (Spaces application).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NOT NULL	NVARCHAR2(254)	Application name.	

#### G.3.2 ASDIM\_WC\_CLIENT\_0

Dimension table that stores client IP address details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
IP	NOT NULL	NVARCHAR2(15)	Client IP address	

### G.3.3 ASDIM\_WC\_DISCUSS\_0

Dimension table that stores discussion topic details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
NAME_	NULL	NVARCHAR2(254)	Discussion topic name.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion topic description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

### G.3.4 ASDIM\_WC\_DISCUSS\_1

Dimension table that stores discussion forum details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion forum description.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion forum.	

### G.3.5 ASDIM\_WC\_DISCUSS\_2

Dimension table that stores discussion message details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date records last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the discussion message.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Discussion message description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	

### G.3.6 ASDIM\_WC\_DISCUSS\_3

Dimension table that stores announcement details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Announcement description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, name of the announcement.	

### G.3.7 ASDIM\_WC\_DOCUMENT\_0

Dimension table that stores information captured by the Analytics service when documents are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
CONTENTTYPE_	NULL	NVARCHAR2(254)	Document content type.	
CONTEXT	NULL	NVARCHAR2(512)	Document prefix (for identification purposes): <ul style="list-style-type: none"> <li>▪ Document prefix - Folder URL for parent space</li> <li>▪ Blog prefix - Blog title name</li> <li>▪ Wiki prefix - Wiki title name</li> </ul>	
NAME_	NULL	NVARCHAR2(254)	Document name.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
DESCRIPTION_	NULL	NVARCHAR2(254)	Document description.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
PATH_	NULL	NVARCHAR2(512)	Document path.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
OBJECTTYPE_	NULL	NVARCHAR2(254)	Object type.	

### G.3.8 ASDIM\_WC\_EVENTS\_0

Dimension table that stores information about space events captured by the Analytics service when a user creates an event in his or her calendar.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the space event.	

### G.3.9 ASDIM\_WC\_GROUPSP\_0

Dimension table that stores information captured by the Analytics service when a space is accessed by an end user (Spaces application only).

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
ICONURL_	NULL	NVARCHAR2(254)	Icon URL	
DESCRIPTION_	NULL	NVARCHAR2(254)	Description.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the space is the Home space (0) or a group space (1).	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Name of the space.	

### G.3.10 ASDIM\_WC\_LISTS\_0

Dimension table that stores list details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME_	NULL	NVARCHAR2(254)	WebCenter Portal resource name, that is, the name of the list.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.	

### G.3.11 ASDIM\_WC\_PAGES\_0

Dimension table that stores information captured by the Analytics service when pages are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERSONAL_	NULL	NUMBER(5)	Indicates whether the page is a personal page (in the Home space) or belongs to a group space.	
RESOURCEID_	NOT NULL	NVARCHAR2(254)	WebCenter Portal resource ID.  The full page path, for example, /oracle/webcenter/page/sda2547 65_f950/Home.jspx	
NAME_	NULL	NVARCHAR2(254)	Name of the page.	

### G.3.12 ASDIM\_WC\_PORTLET\_0

Dimension table that stores information captured by the Analytics service when portlets are accessed by end users.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
DEFAULT_TITLE_	NULL	NVARCHAR2(254)	Default portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

### G.3.13 ASDIM\_WC\_PORTLET\_1

Dimension table that stores portlet instance information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
TITLE_	NULL	NVARCHAR2(254)	Portlet title.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	

**G.3.14 ASDIM\_WC\_PRODUCE\_0**

Dimension table that stores portlet producer information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record modified.	
RESOURCEID_	NOT NULL	NVARCHAR2(512)	WebCenter Portal resource ID.	
NAME_	NULL	NVARCHAR2(254)	Producer name.	

**G.3.15 ASDIM\_WC\_REFERERE\_0**

Dimension table that stores information captured by the Analytics service related to the location (URL) to which the user was navigating when the analytics event was captured.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
URL	NOT NULL	NVARCHAR2(2000)	Referred URL	

**G.3.16 ASDIM\_WC\_SEARCHE\_0**

Dimension table that stores search phrases captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PHRASE	NOT NULL	NVARCHAR2(254)	Search phrase.	

**G.3.17 ASDIM\_WC\_TAGS\_0**

Dimension table that stores tag information captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
VALUE	NOT NULL	NVARCHAR2(254)	Tag value.	

### G.3.18 ASDIM\_WC\_USER\_AG\_0

Dimension table that stores information about which browsers are used to access analytics data.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
OS	NULL	NVARCHAR2(100)	Operating system.	
AGENT	NOT NULL	NVARCHAR2(512)	User agent ID.	
BROWSER	NULL	NVARCHAR2(255)	Name of the browser.	
BROWSER_VERSION	NULL	NVARCHAR2(30)	Browser version.	

### G.3.19 ASDIM\_TIME

Dimension table that stores times used to group analytics reports. An entry is created every hour. analytics reports use this table to group data within a specific time frame.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PERIODSTART	NULL	DATE	Current period start.	
PERIODEND	NULL	DATE	Current period end.	
HOUROFDAY	NULL	NUMBER(5)	Hour corresponding to this time period.	
DAYOFMONTH	NOT NULL	NUMBER(5)	Current day of the month.	
DAYOFYEAR	NULL	NUMBER(5)	Current day of the year.	
WEEKOFYEARSUNDAY	NULL	NUMBER(5)	Week number of Sunday year.	
WEEKOFYEARMONDAY	NULL	NUMBER(5)	Week number of Monday year.	
WEEKOFYEARSATURDAY	NULL	NUMBER(5)	Week number of Saturday year.	
MONTHOFYEAR	NOT NULL	NUMBER(5)	Month corresponding to the period's year.	
YEAR	NOT NULL	NUMBER(5)	Current year.	

### G.3.20 ASDIM\_USERS

Dimension table that stores user details captured by the Analytics service when an analytics event is received.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
USERID	NOT NULL	NVARCHAR2(255)	User ID. For example: <code>weblogic</code>	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	

### G.3.21 ASDIM\_USERPROPERTIES

Dimension table that stores user properties, such as Title, Department, and so on.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(255)	Property name.	

### G.3.22 ASDIM\_USERPROPERTYVALUES

Dimension table that stores values for user properties.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
USERID	NOT NULL	NUMBER(38)	User ID dimension.	<a href="#">ASDIM_USERS.ID</a>
PROPERTYID	NOT NULL	NUMBER(38)	Property ID.	<a href="#">ASDIM_USERPROPERTIES.ID</a>
VALUE	NULL	NVARCHAR2(255)	Property ID value.	
TYPE	NULL	NUMBER(38)	Property type.	

## G.4 Analytics System Table Descriptions

System tables are created during installation to store application information such as system configuration parameters. Each table is described in this section.

### G.4.1 ASSYS\_CONFIG

System table that stores system configuration information. Each row contains value pairs—configuration type/value.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NULL	NVARCHAR2(510)	Name of configuration parameter, for example, collector_port.	
CONFIGTYPEID	NOT NULL	NUMBER(38)	Configuration type ID.	
INTVAL	NULL	NUMBER(38)	Integer value associated with the configuration.	
STRVAL	NULL	NVARCHAR2(2000)	String value associated with the configuration.	

### G.4.2 ASSYS\_DIMENSIONPROPS

System table that stores dimension configuration information. Each row represents property values for a dimension.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DIMENSIONID	NOT NULL	NUMBER(38)	Dimension ID.	<a href="#">ASSYS_EVENTDIMENSIONS.ID</a>
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension property display name.	
COLUMNNAME	NOT NULL	NVARCHAR2(510)	Column name.	
COLUMNNTYPE	NULL	NUMBER(38)	Column type.	
COLUMNLENGT H	NULL	NUMBER(38)	Column length.	
ISKEY	NULL	NUMBER(38)	Indicates whether this is a key dimension property.	

### G.4.3 ASSYS\_EVENTDIMENSIONS

System table that stores dimensions associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Dimension event display name.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name associated with the dimension.	
ISUNIQUE	NULL	NUMBER(38)	Deprecated.	
IDENTIFYINGUSER	NOT NULL	NUMBER(38)	User ID.	<a href="#">ASDIM_USERS.ID</a>

#### G.4.4 ASSYS\_EVENTFACTS

System table that stores facts associated with each analytics event.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
EVENTID	NULL	NUMBER(38)	Event ID dimension.	<a href="#">ASDIM_WC_EVENTS_0.ID</a>
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
COLUMNNAME	NOT NULL	NVARCHAR2(510)	Event fact column name.	
COLUMNTYPEID	NULL	NUMBER(38)	Indicates the data type of the event fact: INTEGER (1), STRING (2), DATE (3), FLOAT (4), BOOLEAN (5)  If the event fact is a dimension, COLUMNTYPEID is -1.	
COLUMNLENGTH	NULL	NUMBER(38)	User ID.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	<a href="#">ASSYS_EVENTDIMENSIONS.ID</a>

#### G.4.5 ASSYS\_EVENTS

System table that stores the different analytics events representing *one* user action that is captured. Both out-of-the-box analytics events and custom (user-defined) analytics events are stored. Each row represents the event captured with its associated data such as active status, and table name where data is stored.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
DISPAYNAME	NOT NULL	NVARCHAR2(510)	Event fact display name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Event description.	
TABLENAME	NOT NULL	NVARCHAR2(510)	Table name.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ISCUSTOM	NOT NULL	NUMBER(38)	Indicates whether or not the event is a custom event. (0/1)	
ISACTIVE	NOT NULL	NUMBER(38)	Deprecated.	
ISPERSISTENT	NOT NULL	NUMBER(38)	Indicates whether or not to create a fact table for the event. (0/1)	
ISACTION	NOT NULL	NUMBER(38)	Not used.	

#### G.4.6 ASSYS\_NAMESPACES

System table that stores the different namespaces in which analytics events are registered.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PREFIX	NOT NULL	NVARCHAR2(510)	Namespace prefix.	
URI	NOT NULL	NVARCHAR2(510)	Universal resource identifier for the namespace.	

#### G.4.7 ASSYS\_REPORTCOMPOSITION

System table that stores the composition for reports provided by the Analytics service.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
PARENTREPORTID	NOT NULL	NUMBER(38)	Reference to parent report ID.	<a href="#">ASSYS_REPORTS.ID</a>
CHILDREPORTID	NOT NULL	NUMBER(38)	Reference to child report ID.	<a href="#">ASSYS_REPORTS.ID</a>
SEQUENCE	NULL	NUMBER(10)	Sequence of report composition.	
NAME	NOT NULL	NVARCHAR2(510)	Name of report composition.	
DESCRIPTION	NULL	NVARCHAR2(510)	Description of report composition.	

#### G.4.8 ASSYS\_REPORTGROUP

System table that stores the report groups included for the Analytics service. Report groups enable end users to display analytics data in a specific way.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
LASTMODIFIED	NOT NULL	DATE	Date record was last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report group name.	
DESCRIPTION	NULL	NVARCHAR2(510)	Report group description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	

### G.4.9 ASSYS\_REPORTITEMS

System table that stores item information in each report. Each row represents a specific item belonging to one report.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTID	NOT NULL	NUMBER(38)	Report ID.	<a href="#">ASSYS_REPORTS.ID</a>
ITEMTYPE	NOT NULL	VARCHAR2(30)	Item type.	
ITEMDESCRIPTION	NULL	NVARCHAR2(510)	Item description.	
ITEMVALUE	NULL	NUMBER(5)	Item value.	
EVENTDIMENSIONID	NULL	NUMBER(38)	Dimension ID.	<a href="#">ASSYS_EVENTDIMENSIONS.ID</a>
EVENTDIMENSIONNAME	NULL	NVARCHAR2(510)	Dimension name.	
EVENTFACTID	NULL	NUMBER(38)	Event fact ID.	<a href="#">ASSYS_EVENTFACTS.ID</a>
EVENTFACTNAME	NULL	NVARCHAR2(510)	Event fact name.	
PROPERTYNAME	NULL	NVARCHAR2(510)	The name of the column in the dimension table to be selected in the query performed, for example, name or ID.	
AGGREGATEFUNCTION	NULL	VARCHAR2(60)	SQL function for grouping purposes (AVG, MIN, MAX, COUNT, COUNT DISTINCT).	
DISPLAYFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to display the item in the report. (0/1)	
IDENTIFIERFLAG	NOT NULL	NUMBER(5)	Indicates whether or not to use this item as an identifier (SQL: whether or not to group by this column). (0/1)	

### G.4.10 ASSYS\_REPORTITEMVALUES

System table that stores the values associated to each item in a report. Each row represents a specific value (char, float or date) for one report item instance.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
REPORTITEMID	NOT NULL	NUMBER	Report item ID.	<a href="#">ASSYS_REPORTITEMS.ID</a>
VALUETYPE	NOT NULL	VARCHAR2(30)	Value type: CVALUE, NVALUE or DVALUE.	
CVALUE	NULL	NVARCHAR2(510)	Char value.*	
NVALUE	NULL	NUMBER	Numeric value.*	
DVALUE	NULL	DATE	Date value.*	

\*Only one of CVALUE, NVALUE or DVALUE has a value.

### G.4.11 ASSYS\_REPORTS

System table that stores the different out-of-the-box reports to be provided by the Analytics service. Each row represents a single report and the report's configuration.

Column Name	NOT NULL?	Data Type	Description	Foreign Key
ID	NOT NULL	NUMBER(38)	Internal table ID.	
CREATED	NOT NULL	DATE	Date record created.	
LASTMODIFIED	NOT NULL	DATE	Date record last modified.	
NAME	NOT NULL	NVARCHAR2(510)	Report item ID.	
DESCRIPTION	NULL	NVARCHAR2(255)	Report description.	
SEQUENCE	NULL	NUMBER(10)	Sequence.	
GROUPID	NULL	NUMBER (38)	Group ID for the report.	<a href="#">ASSYS_REPORTGROUP.ID</a>
EVENTTYPEID	NULL	NUMBER(38)	Associated event ID.	<a href="#">ASSYS_EVENTS.ID</a>
EVENTDISPLAYNAME	NULL	NVARCHAR2(510)	Denormalized. Display name of associated event.	
GROUPSPACEFILTERENABLED	NOT NULL	VARCHAR2(1)	Indicates whether users can filter the report 'by space'. If set to true (1), the report displays the space selector UI.	
DEFAULTCHARTSTYLE	NULL	NVARCHAR2(255)	Default chart style for the report.	
DEFAULTCHARTTYPE	NULL	NUMBER(2)	Default chart type.	
DEFAULTDISPLAYCOUNT	NULL	NUMBER(2)	Default display count.	
DEFAULTTIMEFRAME	NULL	NUMBER(2)	Default time frame.	

Column Name	NOT NULL?	Data Type	Description	Foreign Key
DEFAULTGROUPBYTIMEINTERVAL	NULL	NUMBER(2)	Default group time interval.	
DEFAULTGROUPBYUSERPROPERTY	NULL	NUMBER(38)	Default "group by user" property.	
SHOWMETRICSELECTOR	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display selector UI for this metric. (Y/N)	
SHOWCHARTTYPEOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display chart type options in the UI. (Y/N)	
SHOWDISPLAYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not the field to select display options will be shown in the UI. (Y/N) (The field is a drop-down list to select between: Top n, Bottom n, All records, or List of specific records.)	
SHOWDISPLAYTOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Top n" option. (Y/N) If N, the "Top n" option will not be available in the combo box.	
SHOWDISPLAYBOTTOMOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "Bottom n" option. (Y/N) If N, the "Bottom n" option will not be available in the combo box.	
SHOWDISPLAYALLOPTION	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select the "All records" option. (Y/N) If N, the "All records" option will not be available in the combo box, and users will only be able to select from Top n, Bottom n or a list of specific records.	
SHOWOBJECTPICKER	NOT NULL	NVARCHAR2(1)	Indicates whether or not users will be able to select a list of specific records option. (Y/N) If N, the "Select ..." option will not be available in the combo box. If Y the "Select ..." option will be available and a picker dialog will be displayed to select the list of objects to be included in the report.	
SHOWTIMEFRAMEFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display time frame filter. (Y/N)	
SHOWUSERPROPERTYFILTER	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display user property filter (Y/N).	
SHOWGROUPBYOPTIONS	NOT NULL	NVARCHAR2(1)	Indicates whether or not to display "group by" options. (Y/N)	
COMPOSEDREPORT	NOT NULL	NVARCHAR2(1)	Indicates whether this is a composed report.	
PORTLETTYPEID	NULL	NUMBER(38)	Portlet type ID.	

## G.5 Analytics User Properties

The Analytics service uses several tables to store information about users who are triggering analytics events in WebCenter Portal applications. This section contains the following topics:

- [Section G.5.1, "User Property Tables - Overview"](#)
- [Section G.5.2, "User Property Dimension Tables"](#)
- [Section G.5.3, "Out-of-the-Box User Properties for WebCenter Portal"](#)

For sample queries related to user properties, see [Section 46.3.3, "Sample Queries for User Metrics"](#) in [Chapter 46, "Integrating the Analytics Service."](#)

### G.5.1 User Property Tables - Overview

[Figure G–5](#) shows the database model used by the Analytics service to store information about users. The user dimension table has a single property column (USERID). In addition, there are two other tables (ASDIM\_USERPROPERTIES and ASDIM\_USERPROPERTYVALUES) that store user properties as key-value data. This model enables additional user properties to be added without changing the user dimension definition.

**Figure G–5 User Property Dimensions for Analytics**

The ASDIM\_USERPROPERTIES table stores the names of user properties received by the Analytics service. User properties (attributes of the user including name, position, email, address, etc) are captured by the Analytics service as an event when a user logs in to Spaces, not when the properties are modified. If a user changes a property, the value of the property will be updated in analytics the next time the user logs in.

The ASDIM\_PROPERTYVALUES table stores one row per property, per user, where each row corresponds to a value for a property associated with a specific user.

### G.5.2 User Property Dimension Tables

User property dimension tables are described in the following topics:

- [Section G.5.2.1, "ASDIM\\_USERPROPERTIES"](#)
- [Section G.5.2.2, "ASDIM\\_USERPROPERTYVALUES"](#)

#### G.5.2.1 ASDIM\_USERPROPERTIES

Dimension table that stores the names of user properties received by the Analytics service.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
NAME	VARCHAR(255)	Name of the user property. Names are converted to uppercase and whitespace characters are removed.

### G.5.2.2 ASDIM\_USERPROPERTYVALUES

Dimension table that stores one row per property per user, where each row corresponds to a value for a property associated with a specific user.

Column Name	Data Type	Description
ID	NUMBER(38,0)	Table primary key. Value obtained from the sequence.
USERID	NUMBER(38,0)	Foreign key to the <a href="#">ASDIM_USERS</a> table.
PROPERTYID	NUMBER(38,0)	Foreign key to the <a href="#">ASDIM_USERPROPERTIES</a> table.
VALUE	VARCHAR(255)	The value of a particular property (identified by the PROPERTYID column) for a particular user (identified by the USERID column). For example, if the property is "CITY" and the user "weblfig", this column will be storing the city name where that user works (for example "San Francisco").
TYPE	NUMBER(38,0)	User property value type. (Property values are always stored as strings.)

### G.5.3 Out-of-the-Box User Properties for WebCenter Portal

WebCenter Portal applications send a specific set of user properties to the Analytics service, as shown in [Table G-4](#).

**Note:** WebCenter Portal applications can only send properties that are set by the user or available in the user directory. If a property value is blank, no row is created for it in the [ASDIM\\_USERPROPERTYVALUES](#) table for that user.

**Table G-4** Out-of-the-Box User Properties for WebCenter Portal

Property Name	Property Label (displayed in reports)	Example Value
IMUSER	IM User	dfrabott
DISPLAYNAME	Display	Diego Frabotta
PHONE	Phone	+5411-2222-1234
TITLE	Title	Software Engineer
DEPARTMENT	Department	Analytics
MANAGER	Manager	uid=dsabaris,cn=users,dc=us,dc=myco,dc=com
COMPANY	Company	MyCo
STREET*	Street	Parque Austral, Edificio Insignia M3
ZIPCODE	ZIP Code	12345

**Table G-4 (Cont.) Out-of-the-Box User Properties for WebCenter Portal**

Property Name	Property Label (displayed in reports)	Example Value
STATEORPROVINCE	State or Province	Buenos Aires
COUNTRY	Country	Argentina
EMPLOYEEID	Employee Id	55555
CITY	City	Pilar

\* STREET stores the user's home address street.

## G.6 Analytics Event and Dimension Data Types

Table G-5 shows how analytics event and dimension data types map to data types in Oracle, Microsoft SQL Server, and IBM DB2 databases.

**Table G-5 Analytics Event and Dimension Data Types**

Analytics Event and Dimension Type	Oracle	Microsoft SQL Server	IBM DB2
INTEGER	NUMBER	BIGINT	INTEGER
STRING	NVARCHAR	NVARCHAR	VARGRAPHIC
DATE	DATE	DATETIME	TIMESTAMP
FLOAT	FLOAT	FLOAT	DECFLOAT
BOOLEAN	NUMBER(5)	TINYINT	SMALLINT

---

---

# Glossary

## About mode

A **portlet mode** that typically displays information such as copyright, version, and author of the portlet.

## Activity Stream

In the **People Connections service**, a feature for viewing the application activities tracked for you and other users.

## Activity Graph

A WebCenter Portal service that provides suggestions of people, items, and spaces that users may be interested in interacting with.

The engine used by the Activity Graph service to provide a central repository for actions that are collected by enterprise applications. The data stored in the activity graph is analyzed to calculate ranks for nodes, predict new actions, and make recommendations.

## Activity Rank

Determines the relevance of a search result.

## administrator

In the Spaces application there are two types of administrator:

- Fusion Middleware administrator: Also referred to as systems administrator. A user with complete administrative capabilities. This administrator can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks.
- Spaces administrator: A user responsible for customizing Spaces out of the box, managing and granting application roles, and maintaining the application when it is in use.

## Ajax

A combination of asynchronous JavaScript, dynamic HTML (DHTML), XML, and XMLHttpRequest communication channel that enables requests to be made to the server without fully re-rendering the page. Ajax enables rich client-like applications to use standard internet technologies.

## Analytics service

A WebCenter Portal service offers real-time usage and activity reporting for your portal. In the Spaces application, users can track and analyze Spaces traffic and usage.

### **Announcements service**

A WebCenter Portal service that offers a quick, convenient way to create and widely distribute messages instantly or at a specific time.

### **API**

Application Programming Interface. A set of exposed data structures and functions that an application can use to invoke services on an application object, such as a [portlet](#).

### **application customization**

Performed by an administrator, all users see the change. These are static changes to an application that affect a site or sites that do not involve changes to the application's code or schema.

See also [user customization](#) and [personalization](#)

### **Application Development Framework**

See [Oracle ADF](#).

### **Application Programming Interface**

See [API](#).

### **application role**

Roles that are specific to a particular application and are stored in an application-specific stripe of the policy store.

### **application skin**

Specifies the application background color, screen fonts, and, with some skins, the shapes and images used for application buttons and icons. In the Spaces application, the administrator chooses the default application skin and Spaces users may change the application skin on the General tab of the Preferences dialog.

### **application templates**

WebCenter Portal provides templates for creating two kinds of applications: Framework applications and Portlet Producer applications. Templates ensure that the right technology scopes are set, tag libraries added, and required Java classes are added to the class path. Once you do this, relevant components are included to the Component Palette and relevant context menus become available in JDeveloper.

See also [Framework application template](#) and [Portlet Producer Application template](#).

### **authenticated user**

A user who is logged into a WebCenter Portal application. Credentials of this user are verified against the identity store. By default, an authenticated user can access public information. To access secured information, such as pages and [portlets](#), this user must be authorized through the policy and credential store.

Contrast with [public users](#), who are not logged in, and can access public content only.

### **authentication**

Identification of a user through an identity management system. You can require ADF authentication to enforce credentials for users to access the Framework application only (all ADF resources in the application remain accessible), or authentication *and*

authorization to enforce credentials for users to access the Framework application and any ADF resources that have been secured in the application.

**authorization**

The policies that define the access rights of an individual or group to a secured resource. This resource may be a page or component within a page.

**authorized user**

An individual who has access to a secured resource. For non-public resources, this individual is also an [authenticated user](#).

**AviTrust Portal Demonstration for WebCenter Portal**

An enterprise banking application built using Oracle Fusion Middleware, including Oracle WebCenter Portal: Framework and WebCenter Portal: Spaces, used to provide examples of WebCenter Portal functionality.

**blog page**

A page that provides a personal record of an individual user's experience and opinions. There are two kinds of blog: personal blogs are written by an individual; group blogs are written by several users.

**Box layout component**

A layout component available through [Composer](#). A container that enables the placement of content on a page created in the [Spaces application](#). In [Composer](#), a Box is rendered as a rectangle comprised of dashed lines. In a [Framework application](#), this is the runtime equivalent of a Panel Customizable component.

**BPEL**

Business Process Execution Language. An XML-based markup language for composing a set of discrete web services into an end-to-end process flow.

**business role page**

A page, created by the administrators in the [Spaces application](#), specifically provided for a given role in an organization. Business role pages provide a targeted environment for users of a particular role by delivering information that is timely and relevant to individual roles without the noise of irrelevant information from other lines of business. Business role pages appear in the Home space of users classified under the specified role.

**caching**

The act of storing frequently accessed information, typically web pages, in a location where it can be accessed quickly to avoid frequent content generation.

See also [expiry-based caching](#) and [validation-based caching](#).

**calendar overlay**

The ability to display multiple calendars in a single Events task flow.

**Change Mode Button component**

In the [Composer](#) tag library that enables users to change from page View mode to page Edit mode.

### **Change Mode Link component**

A component provided in the [Composer](#) tag library that enables users to change from page View mode to page Edit mode.

### **check out/check in**

A mechanism that enables a user to lock information, by checking it out, so that other users cannot modify that same piece of information. This prevents users from overwriting each other's changes. After making modifications, the user releases it by checking it back in, making it available again for other users to modify.

### **Child Components**

The components contained within a parent component. For example, the task flows contained within a Box layout component are the child components of the Box.

See also [Box layout component](#) and [parent component](#).

### **chrome**

Visual elements surrounding a portlet or task flow that provide an access point for actions, such as those on the Actions menu and those embedded in the chrome itself, such as the minimize icon or resize handles.

### **CMIS**

Content Management Interoperability Services (CMIS) standard defines a domain model and Web services and Restful AtomPub bindings that can be used by applications to work with one or more Content Management repositories or systems.

### **component**

An individual piece of an application, for example, a task flow, portlet, page, or layout element such as a box or image.

### **Component Catalog**

A dialog, accessed from [Composer](#), that provides access to all the content you can add to a WebCenter Portal application page.

### **component developer**

The developer who builds components (such as portlets, [JavaServer Faces](#) components, and web services).

### **Component Properties**

A dialog, accessed from [Composer](#), that provides access to a component's parameters, display options, child components, style settings, and associated events.

### **Composer**

A seamlessly integrated environment for populating, revising, and configuring portal pages. Composer enables users to easily build or revise page layout and content. It also provides the means of adding different components, such as task flows, portlets, content, and other objects, onto a page and then linking those components for a more relevant or personalized view of the information.

### **Connections**

In the [People Connections service](#), a feature for establishing a social network with other application users.

**container**

An application program or subsystem in which the program building block, known as a **component**, is run.

**container runtime option**

A JSR 286 feature that provides a way to customize the behavior of the portlet container and therefore customize the runtime environment.

**content integration services**

Services provided by **Oracle WebCenter Portal** to enable developers to display content from a **content repository**, such as by creating **data controls**.

**Content Presenter**

A feature of the **Documents service** that enables end users to select and search content items and then display those items using available display templates. Oracle WebCenter Portal provides out-of-the-box templates for displaying single and multiple content items on your pages. You can also define custom templates for the content that you want to display in your **Framework application**, or for selection by end users at runtime.

**content repository**

A specialized storage and management mechanism that provides such features as author-based versioning, full text searching, and content categorization and attribution. A content repository is optimized for storing unstructured information, which differentiates it from a data repository.

**content repository data control**

A **data control** sourced through a content repository. In a **Framework application**, you can create content repository data controls for the following content repositories: **Oracle Portal**, **Oracle WebCenter Content**, third-party repositories that support the Java Content Repository (JCR) standard, and your local file system.

**credential provisioning page**

A **JSF** (\* .jspx) page used for authenticating to an **external application**. At runtime, the Credential Provisioning page displays login data fields consisting of the data fields specified through external application registration. Login information is passed to the producer, which in turn passes the login values to the external application. The application provides the producer with the requested portlets.

After authentication, the user's login credentials are preserved in a **credential store**, which subsequently supplies that information at future sessions. Unless his information changes, the user supplies his credentials only one time.

**credential store**

Provides storage for login credentials for its associated domain. It also preserves the login credentials that a user provides for authentication to an **external application**. Credential store is usually combined with the policy store as a single logical store.

Although the credentials stored in the credential store are used during subsequent logins for authentication, the main function of this store is to provide authorization for those accounts.

**CSS**

Cascading Style Sheet. A simple mechanism for ensuring a consistent look and feel or adding style, such as fonts, colors, and spacing, to web documents.

**custom action**

Icons or menu items rendered on the header or the Actions menu of a Show Detail Frame component surrounding a task flow. Custom actions can represent actions that were defined in the task flow when it was created. For example, at design time a developer can build a task flow with custom personalization settings. At runtime, users can access these settings through icons or Actions menu items provided in the task flow's surrounding chrome (or Show Detail Frame).

**custom attribute**

In the Spaces application, custom attributes specify information in addition to that provided by the built-in attributes. Custom attributes can be used to determine the content of the components in a space based on the parameter passed in. For example, a component can display data for a specific customer by passing in the customer ID. A custom attribute is simply a name value pair, for example `customerId=400`, `orderId=11`, `userName=Smith`, and so on. Custom attributes are stored within the space template.

**custom page**

Any page created by a user rather than one provided out of the box.

**custom display template**

A Content Presenter display template is a JSFF file (JSF page fragment) that defines how Content Presenter renders content items on a Framework application page. WebCenter Portal provides several out-of-the-box display templates to get you started, or, you can create your own templates.

**custom resource catalog**

A resource catalog that has been customized to control the components that are visible to specific users.

Contrast with [default resource catalog](#).

**custom role**

A user role created by an administrator or a space moderator to meet a specific Home space or space requirement.

**Customize mode**

A [portlet mode](#) that enables users to set the default values for portlet preferences for all users.

**customizable component**

A WebCenter Portal component that can be added to a page at runtime to enable end users to perform personalizations such as move, minimize, restore, or remove on content within those components. Customizable components are the [Panel Customizable component](#) and the [Show Detail Frame component](#).

**data control**

A mechanism that provides an abstraction of the business service's data model. The ADF data controls provide a consistent mechanism for clients and web application controllers to access data objects, collections, methods, and operations.

**default language (application-level)**

A display language specified by the Spaces administrator that is used when users log in to the Spaces application. The Spaces administrator sets the application-level default

language on the **General** tab of the **Administration** page. Individual users can set their own user-level default language on the General tab of the Preferences dialog.

#### **default language (user preference)**

A user-specified display language that is rendered when the user logs in to the Spaces application. This language selection lasts until the user specifies a different default language. It can be overridden by a session language, but returns as the default when the session cookie is purged or expires. This value is set on the **General** tab of the Preferences dialog.

#### **default resource catalog**

The resource catalog that is provided by default for an application. It contains all of the Oracle ADF components and portlets available to the application.

Contrast with [custom resource catalog](#).

#### **Default Server**

See [Integrated WLS](#).

#### **delegated administration**

Provides a mechanism for securing portal resources based on user roles. You apply delegated administration to a page hierarchy, and the specific security assignments are automatically propagated down through the hierarchy through pages and sub pages.

#### **deployment profile**

A file used in application deployment that specifies the following types of information:

- The source files, deployment descriptors, and other auxiliary files that are packages
- The type and name of the archive file to be created
- Dependency information
- Platform-specific instructions
- Other information

[Oracle WebCenter Portal: Services](#) provides a special deployment profile, the [Framework application](#) WAR deployment profile, that includes an option to export project metadata.

#### **Design view (JDeveloper)**

A view, in [Oracle JDeveloper](#), that provides a WYSIWYG representation of a file.

See also [Source view \(JDeveloper\)](#).

#### **Design view (Spaces)**

A view, in [Composer](#), that provides a WYSIWYG representation of a page and its components.

See also [Source view \(Spaces\)](#).

#### **discoverable space**

A space that can be found by anyone logged into the Spaces application, for example through a search. Any **Public** or **Private** space is discoverable. Discoverable spaces are listed on the **Spaces** page when **All Spaces** is selected from the **Show** list. Users

wishing to join the space can request membership through self-service (if enabled) or by contacting the space moderator.

### **Discussions service**

A WebCenter Portal service that provides a means of creating and participating in discussion forums.

### **display language**

Controls the language in which application user interface elements, such as buttons, field labels, and screen text, are rendered in the browser. The order of precedence for Framework application display language settings from weakest to strongest is: browser setting, application setting, user preference setting, session setting, space setting.

### **Documents page**

A predefined page provided in every Spaces group and Home space that includes the Document Manager task flow for managing content.

### **Documents service**

A WebCenter Portal service that provides several task flows that offer a variety of formats to display folders and files on a page. You can choose the task flows appropriate for your application to provide features for accessing, adding, and managing folders and files; configuring and viewing file and folder properties; and searching file and folder content in the connected content repositories.

### **domain**

Any tree or subtree within the Domain Name System (DNS) namespace. Domain most commonly refers to a group of computers whose host names share a common suffix: the domain name.

### **dynamically-generated page**

A page that displays as the result of a user action, such as a search or a click on a tag. As the name suggests, dynamically-generated pages are not stored, but rather are created as and when needed.

### **EAR**

Enterprise Archive file. A **Java EE** archive file that is used in deploying applications on a **Java EE** application server. **Framework applications** are deployed using both a generic EAR file, which contains the application and the respective runtime customization, and a targeted EAR file, which contains only the application for deployment to the application server. EAR files simplify application deployment by reducing the possibility of errors when moving an application from development to test, and test to production.

See also [WAR](#).

### **ECMA-262 specification**

A standardization of scripting programming languages, such as [ECMAScript](#) and JavaScript.

### **ECMAScript**

A scripting programming language, standardized by Ecma International according to the [ECMA-262 specification](#). Frequently referred to as JavaScript or JScript, which are both extensions of the ECMA-262 specification.

**Edit Defaults mode**

(JSR 286 portlets only.) A **portlet mode** that enables personalization of a JSR 286 portlet. Edit Defaults mode is a display mode for the JSR 286 portlet's properties. In a **Framework application**, the Edit Defaults mode displays on the portlet's Actions menu as the Customize command.

See also **Edit mode**.

**Edit mode**

A **portlet mode** that enables personalization of the portlet for each user, for each instance.

See also **Edit Defaults mode**.

**edit mode**

A view mode that enables users to modify the content, style, and layout of a page. Access edit mode by choosing Edit Page from the Page Actions menu.

**EL**

Expression Language. Provides a shorthand way of working with web application data by providing operators for retrieving and manipulating application data residing in a **Java EE** web container. In a **Framework application**, EL expressions are encapsulated in the characters "{" and "}" and typically come in the form `#{object.data}` where *object* represents any Java object or **Oracle ADF** component placed in the **Java EE** web container's page, request, session, or application's scope.

**Enterprise Archive file**

See **EAR**.

**enterprise mashup**

An application that enables users to bring all sorts of content and services together in a single place.

**Events service**

A WebCenter Portal service that provides calendars for scheduling meetings, appointments, and so on. In the Spaces application, it provides calendars to record events relevant to the specific space. You can also integrate the Events service with Microsoft Exchange Server to enable individual users to access their personal calendars in their Home space. Personal calendars are also available in Framework application.

**expiry-based caching**

A **caching** method that uses a retention period to specify how long the item is valid in the cache before a refresh is required. When there is a request for the item beyond the retention period, it is refreshed in the cache.

See also **validation-based caching**.

**Expression Language**

See **EL**.

**external application**

Applications that do not delegate authentication to the single sign-on server. Instead, they display HTML login forms that ask for application user names and passwords. At

the first login, users can choose to have the single sign-on server retrieve these credentials for them. Thereafter, they are logged in to these applications transparently.

**farm**

A collection of components managed by Fusion Middleware Control. A farm can contain a Managed Server domain and other Oracle Fusion Middleware system components that are installed, configured, and running on the domain.

**favorites**

A personal list of links to favorite pages in the Spaces application and external web sites.

**Federated Portal Adapter**

See [FPA](#).

**Feedback**

In the [People Connections service](#), a feature for posting informal appraisals for and receiving informal appraisals from other application users.

**FPA**

Federated Portal Adapter. A component of [Oracle Portal](#) that enables Oracle Portal instances to share their database portlets through the web portlet interface. Using the FPA, Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets can be made available for use in Framework applications.

**Framework application**

A Framework application is built on top of the ADF using the [WebCenter Portal's Extension for Oracle JDeveloper](#). This application combines web content, portlets, content integration, and collaborative services for the end user. Developers and administrators can create a Framework application based on their roles and skill levels in the organization.

A portal also includes page hierarchies, navigation models, and delegated administration.

**Framework application administrator**

The administrator responsible for maintaining the [Framework application](#). For example, in Spaces, the administrator performs tasks such as implementing the branding for the Framework application, making new content available, modifying pages, and granting and revoking privileges.

Contrast with systems administrator who has administrative rights for entire Fusion Middleware functions. The Fusion Middleware administrator is also responsible for deploying, setting up, and configuring the Framework application, and performing on-going administrative tasks for the Framework application and other WebCenter Portal components through Fusion Middleware Control.

**Framework application developer**

The developer who plans, builds, and maintains a [Framework application](#) using the Oracle Application Development Framework, [Oracle JDeveloper](#), and [Oracle WebCenter Portal](#).

**Framework application end user**

The runtime user of the [Framework application](#), who accesses pages, portlets, and content, and personalizes portlets (assuming the appropriate privileges).

### **Framework application life cycle**

The process of creating and testing a Framework application in a design time environment, deploying it to a production system, and then performing routine maintenance, such as monitoring performance and migrating customization data. The life cycle of an application also includes performing further enhancements, restaging, and then redeploying the application to the production system.

### **Framework application template**

A JDeveloper template which includes WebCenter Portal: Framework features like site navigation, page hierarchies, delegated administration, and page templates.

See also [application templates](#) and [Portlet Producer Application template](#).

### **Full Screen Mode (Spaces)**

A view mode that opens the space to occupy the entire screen, thus maximizing the display space. The Sidebar is not displayed in Full Screen Mode.

### **Full Screen mode (Portlets)**

(**PDK-Java** portlets only.) A [portlet mode](#) that provides more content than can be shown in the portlet when it is sharing a page with other portlets.

### **Fusion Middleware Control**

A browser-based management application that is deployed when you install Oracle WebCenter Portal. From Fusion Middleware Control, you can monitor and administer a [farm](#) (such as Oracle WebCenter Portal).

### **Fusion Order Demo (FOD)**

See [AviTrust Portal Demonstration for WebCenter Portal](#).

### **HA**

High Availability. A collection of solutions to ensure that your applications meet the required availability to achieve your business goals, eliminating single points of failure with no or minimal outage in service.

### **Help mode**

A [portlet mode](#) that displays usage information about the functionality of the portlet.

### **High Availability**

See [HA](#).

### **Home space**

A work area within Spaces that provides individual users with a private space for storing personal content, keeping notes, viewing and responding to assignments, maintaining a list of online buddies, and performing many other tasks relevant to their unique working day. Users can also extend this environment by creating additional personal pages and custom content.

### **HTML Markup layout component**

A layout component available through [Composer](#). A simple HTML component that renders raw HTML and JavaScript mark-up inline on the page.

### **Hyperlink layout component**

A layout component available through [Composer](#). A link to an internal or external web page. For designers of Framework applications, this is the runtime equivalent of a Go Link component.

### **IDE**

Integrated Development Environment. A visual application development tool containing editors, debuggers, screen painters, object browsers, and the like. [Oracle JDeveloper](#) is an example of an IDE.

### **Identity Propagation**

For a Framework application and associated content repositories, selecting this option allows propagation of current user's identity across the application and processes. The propagated identity is verified on the receiver's side, and then it is used to make decisions such as assigning role based access control.

### **Image layout component**

A layout component available through [Composer](#). An illustration that can include a hyper link. For designers of Framework applications, this is the runtime equivalent of an Image Link component.

### **IMP service**

See [Instant Messaging and Presence service](#).

### **initialization parameters**

The parameters initialized upon the start-up of a standard JSR 286 portlet. Initialization parameters provide an alternative to JNDI (Java Naming and Directory Interface) variables. Use initialization parameters instead of JNDI to configure the behavior of all of the different components of the portlet—for example, servlets and other portlets—in a compatible way. In [Oracle WebCenter Portal](#), initialization parameters are entered into the `portlet.xml` file.

### **Instant Messaging and Presence service**

A WebCenter Portal service that enables users to observe the presence status of other authenticated users and provides instant access to interaction options, such as instant messages and emails.

### **Integrated Development Environment**

See [IDE](#).

### **Integrated WLS**

Integrated WebLogic Server. A WLS instance used as a platform for pretesting Framework application deployments on a local computer. Integrated WLS also contains preconfigured portlet producers and several useful prebuilt portlets.

### **Iterative development**

Iterative development lets you make changes to your Framework application while it is running on the Integrated WebLogic Server and immediately see the effect of those changes simply by refreshing the current page in your browser. The iterative development feature works by disabling certain optimization features. Iterative development allows developers to work more quickly and efficiently when building a Framework application.

## JAAS

Java Authentication and Authorization Service (JAAS) is a Java package that enables applications to authenticate and enforce access controls upon users. JAAS is designed to complement Java 2 security and implements a Java version of the standard Pluggable Authentication Module (PAM) framework. This enables an application to remain independent from the authentication service, and supports the use of custom authentication modules.

JAAS extends the access control architecture of the Java 2 Security Model to support subject-based authorization. It also supports declarative security settings in deployment descriptors instead of being limited to code-based security settings.

### Java Authentication and Authorization Service

See [JAAS](#).

### Java Content Repository

See [JCR 1.0](#).

## Java EE

Also known as Java EE 5. Java Enterprise Edition 5 Platform. A platform that enables application developers to develop, deploy, and manage multitier, server-centric, enterprise-level applications. The Java EE platform offers a multitiered distributed application model, integrated XML-based data interchange, a unified security model, and flexible transaction control. You can build your own Java EE portlets and expose them through web producers.

### Java Enterprise Edition 5 Platform

See [Java EE](#).

### Java Portlet Specification

Standardizes how components for portal servers are to be developed. This specification defines a common portlet [API](#) and infrastructure that provides facilities for personalization, presentation, and security. Portlets using this [API](#) and adhering to the specification are product-agnostic, and can be deployed to any portal product that conforms to the specification. See also [JSR 286](#).

### Java Specification Request

See [JSR 286](#).

### JavaServer Faces

See [JSF](#).

### JavaServer Page

See [JSP](#).

## JCR 1.0

Java Content Repository 1.0. Also known as JSR 170. It proposes a standard access and interaction [API](#) for content repositories, much like JDBC does for databases.

## JDeveloper

See [Oracle JDeveloper](#).

**JSF**

JavaServer Faces. A standard Java framework for building web applications. It simplifies development by providing a component-centric approach to developing Java web user interfaces. JSF offers rich and robust **APIs** that provide programming flexibility and ensures that applications are well designed with greater maintainability by integrating the Model-View-Controller (**MVC**) design pattern into its architecture. As JSF is a Java standard developed through Java Community Process, development tools like **Oracle JDeveloper** are fully empowered to provide easy to use, visual, and productive development environments for JSF.

**JSF JSP**

JavaServer Faces JavaServer Page. JSF JSPs differ from plain JSPs through their support of **Oracle ADF Faces** components for the user interface and JSF technology for page navigation. JSF JSP pages leverage the advantages of the Oracle **Application Development Framework** (Oracle ADF) by using the ADF Model binding capabilities for the components in the pages.

**JSP**

JavaServer Page. An extension to servlet functionality that provides a simple programmatic interface to web pages. JSPs are HTML pages with special tags and embedded Java code that is executed on the web or application server. JSPs provide dynamic functionality to HTML pages. They are actually compiled into servlets when first requested and run in the servlet container.

See also **JSP tags**.

**JSP tags**

Tags that can be embedded in **JSPs** to enclose Java code. These tags use the `<jsp:` syntax and enclose action elements in the JSP with `begin` and `end` tags similar to XML elements.

**JSR 286**

Java Specification Request (JSR) 286. Defines a set of **APIs** for building standards-based portlets using Java. Portlets built to this specification can be rendered to a portal locally or deployed to a WSRP container for rendering portlets remotely. For more information, see <http://jcp.org/en/jsr/detail?id=286>.

**JSR 170**

See **JCR 1.0**

**JSR 329**

See **Oracle JSF Portlet Bridge**.

**keystore**

A file that provides information about available public and private keys that are used for authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the keystore.

**layout box**

A container that enables placement of content on a page created in the Spaces application.

**layout component**

An object for enhancing the usefulness and appearance of a given page. Layout components include layout boxes, a rich text editor, images, hyperlinks, and so on.

**Layout Customizable component**

A component provided in the [Composer](#) tag library that enables users to select from a set of predefined layouts (for example, two column, three column, two row, and so on) and apply it to the page. Users can apply these layouts to a particular area of the page or to the entire page.

**LDAP**

Lightweight Directory Access Protocol. A standard, extensible directory access protocol. It is a common language that LDAP clients and servers use to communicate. The framework of design conventions supporting industry-standard directory products, such as the Oracle Internet Directory.

**life cycle**

See [Framework application life cycle](#).

**Lightweight Directory Access Protocol (LDAP)**

See [LDAP](#).

**Links service**

A WebCenter Portal service that provides a means of creating a bidirectional association between two objects, thus setting up easy access between those objects.

**Lists service**

A WebCenter Portal service that provides a means of creating lists and exposing them for placement on application pages at runtime. At design time, you can make the Lists task flow available in your runtime Resource Catalog. At runtime, users can add the task flow from the Catalog to a page and use the task flow to create lists.

**Lists page**

A predefined page that displays the space's current lists.

**Look and feel**

A look and feel file determines the appearance of your application, from the placement and behavior of elements on a portal page to the colors used in the portlet title bars. The look and feel is determined by skins, navigations, page templates, layouts, content display templates, and other similar components.

**Mail service**

A WebCenter Portal service for exposing familiar email functionality in applications.

**Managed Server**

In a production environment, a Managed Server hosts applications and the resources needed by those applications. A domain, which is a logically related group of Oracle WebLogic Server resources, can have any number of Managed Servers. An Administration Server manages these servers.

**mashup**

A web application that enables end users to pull information from different sources to create a personalized application that exactly meets their individual requirements.

See also [enterprise mashup](#).

### **MBean Browser**

In Fusion Middleware Control, MBean browsers enable the administrator to perform specific monitoring and configuration tasks and browse MBeans for an Oracle WebLogic Server or a selected application.

### **MDS**

Oracle Metadata Services. A core technology of the [Application Development Framework](#). MDS provides a unified architecture for defining and using metadata in an extensible and customizable manner.

### **MDS repository**

An application server and Oracle relational database that keep metadata in these areas: a file-based repository, dictionary tables accessed by build-in functions, and a metadata registry. One of the primary uses of MDS is to store customizations and persisted personalization for Oracle applications.

### **Message Board**

In the [People Connections service](#), a feature for posting messages to and receiving messages from other application users.

### **metadata**

Information about a content item, such as title, author, or security group. Metadata is used to describe, find, and group content items. Also referred to as content information.

### **Model-View-Controller**

See [MVC](#).

### **moderator**

A Spaces user who is responsible for managing a particular space. A space moderator can add and remove members, invite new members, enable self registration, provide and update space metadata, and manage the services available to the space.

### **Movable Box layout component**

A layout component available through [Composer](#). A container that enables the placement of content on a page created in the Spaces application. Movable Boxes, along with their content, can be moved around on the page. For designers of Framework applications, this is the runtime equivalent of Show Detail Frame component.

### **MVC**

Model-View-Controller. A classic design pattern often used by applications that need the ability to maintain multiple views of the same data. The MVC pattern hinges on a clean separation of objects into one of three categories: models for maintaining data, views for displaying all or a portion of the data, and controllers for handling events that affect the model or views. Because of this separation, multiple views and controllers can interface with the same model. Even new types of views and controllers that never existed before, such as portlets, can interface with a model without forcing a change in the model design.

**My Spaces page**

A predefined page that displays a list of all the spaces available to the currently logged in user. The user can select from the **Show** menu to display **All Spaces**, only spaces of which the user is a member (**Joined by Me**), or only spaces of which the user is the moderator (**Moderated by Me**).

**navigation**

WebCenter Portal provides three navigation components to create portal navigation. These components are: Breadcrumb navigation, menu navigation, and tree navigation.

**navigation model**

Navigation models provide data to the navigation user interface and enable navigation to resources in your application, such as pages, page hierarchies, task flows, external sites, portlets, and other entities. You can configure navigation models at both design time and runtime.

**Notes service**

A WebCenter Portal service that provides useful features for writing personal notes and reminders. This service is available only in Spaces, and not in Framework applications.

**Notifications service**

A WebCenter Portal service that provides an automated means of triggering notices across different messaging channels, such as phone, mail, Worklist, and so on. Messages are triggered when the spaces and application objects to which you have subscribed change.

**Oracle ADF**

Oracle Application Development Framework. A range of technologies aimed at making **Java EE** application development faster and simpler for developers while at the same time taking advantage of proven software patterns to ensure that the developed application is scalable, performant, and the like.

**OAM**

See [Oracle Access Manager \(OAM\)](#).

**OHS**

See [Oracle HTTP Server \(OHS\)](#).

**OmniPortlet**

A component of [Oracle WebCenter Portal](#) that enables you to inject portal-like capabilities, such as portlets, content integration, and customization, into your [Oracle ADF Faces](#) applications.

**Oracle Access Manager (OAM)**

Part of Oracle's enterprise class suite of products for identity management and security, Oracle Access Manager provides a wide range of identity administration and security functions, including several single sign-on options for Spaces and Framework applications. OAM is the recommended single sign-on solution for Oracle WebCenter Portal 11g installations.

**Oracle ADF Faces**

Oracle [Oracle ADF Faces](#) is a rich set of user interface components based on the new [JavaServer Faces JSR \(JSR 127\)](#). Oracle ADF Faces provide various user interface components with built-in functionality, such as data tables, hierarchical tables, and color and date pickers, that can be customized and reused in an application.

**Oracle WebCenter Content: Content Server**

A content repository for building secure business libraries with check in and check out, revision control, and automated publishing in web-ready formats. Current information is available to authorized users anytime, anywhere.

Oracle WebCenter: Content Server is a component of Oracle WebCenter Content.

**Oracle WebCenter Portal's Discussions Server**

Backend discussions server for the Discussions and Announcements services.

**Oracle Enterprise Manager**

A component that enables administrators to manage Oracle Fusion Middleware services through a single environment. The Fusion Middleware administrator uses Enterprise Manager to configure, manage, and monitor Framework applications.

**Oracle HTTP Server (OHS)**

Software that processes web transactions that use the Hypertext Transfer Protocol (HTTP). Oracle uses HTTP software developed by the Apache Group.

**Oracle Internet Directory**

Oracle's LDAP V3 compliant LDAP server. It is used as a repository for provisioning users and groups. By default, the [Oracle Single Sign-On \(OSSO\)](#) authenticates user credentials against Oracle Internet Directory information about dispersed users and network resources. Oracle Internet Directory combines LDAP version 3 with the high performance, scalability, robustness, and availability of the Oracle database.

**Oracle JDeveloper**

Oracle JDeveloper is an integrated development environment (**IDE**) for building applications and web services using the latest industry standards for Java, XML, and SQL. Developers can use Oracle JDeveloper to create Java portlets.

**Oracle JSF Portlet Bridge**

Based on and conforming to JSR 329, the Oracle JSF Portlet Bridge enables application developers to expose a JSF application or task flow as a JSR 286 portlet for consumption in another application.

**Oracle Metadata Services**

See [MDS](#).

**Oracle Portal**

A component used for the development, deployment, administration, and configuration of enterprise class [portals](#). Oracle Portal incorporates a portal building framework with self-service publishing features to enable you to create and manage information accessed within your portal.

See also [Oracle WebLogic Portal](#).

**Oracle Secure Enterprise Search (SES)**

Provides easy-to-use search for public and secure data, with unified ranking results. With Framework applications, Oracle SES is set as the default and preferred search platform.

With Spaces applications, WebCenter Portal's internal live search adapters are set as the default search platform; however, large-scale implementations should be configured to use Oracle SES for best performance.

**Oracle Single Sign-On (OSSO)**

A component that enables users to log in to all features of the Oracle Fusion Middleware product suite, and to other web applications, using a single user name and password.

**Oracle WebCenter Content's Site Studio**

A powerful, flexible web development application suite that offers a comprehensive approach to designing, building, and maintaining enterprise-scale web sites. Site Studio uses Oracle WebCenter Content: Content Server as the main repository for a web site.

In WebCenter, Content Presenter integrates with Site Studio to allow you to create, access, edit, and display Site Studio contributor data files in either a Site Studio region template or a custom Content Presenter display template.

**Oracle SOA Suite**

A middleware component of Oracle Fusion Middleware. Oracle SOA Suite enables services to be created, managed, and orchestrated into SOA composite applications. Composites enable you to easily assemble multiple technology components into one SOA composite application. Oracle SOA Suite plugs into heterogeneous infrastructures and enables enterprises to incrementally adopt SOA.

**Oracle Technology Network**

See [OTN](#).

**Oracle WebCenter Content**

Provides a flexible, secure, centralized, web-based repository that manages all phases of the content life cycle: from creation and approval to publishing, searching, expiration, and archival or disposition. It enables contributors to easily contribute content from native desktop applications, efficiently manage business content through rich library services, and securely access that content anywhere using a web browser. All content, regardless of content type, is stored in the web repository or database for management, reuse and access.

**Oracle WebCenter Portal**

A suite of services that enables you to build Oracle WebCenter Portal applications. Oracle WebCenter Portal reduces the front-end labor historically required to bring necessary business components to the user by capitalizing on the notion of Service Oriented Architecture (SOA). The suite includes a wide range of plug-and-play products, tools, and services that make it easy to build the applications your users need.

**Oracle WebCenter Portal: Framework**

A set of features provided by [Oracle WebCenter Portal](#) that augments the Java Server Faces (JSF) environment by providing additional integration and runtime customization options. It integrates capabilities historically included in portal

products, such as site navigation, page hierarchies, portlets, customization, personalization, and integration, directly into the fabric of the JSF environment. This eliminates artificial barriers for the user and provides the foundation for developing context-rich applications. You can selectively add only desired Oracle WebCenter Portal components or services to your framework application.

### **Oracle WebCenter Portal's Pagelet Producer**

Provides a collection of useful tools and features that facilitate dynamic pagelet development.

### **Oracle WebCenter Portal: Services**

A collection of Web 2.0 services that expose social networking and personal productivity features through various services.

- [Activity Graph](#)
- [Announcements service](#)
- [Analytics service](#)
- [Discussions service](#)
- [Documents service](#)
- [Events service](#)
- [Instant Messaging and Presence service](#)
- [Links service](#)
- [Lists service](#)
- [Mail service](#)
- [Notes service](#)
- [Notifications service](#)
- [People Connections service](#)
- [Personalization for WebCenter Portal](#)
- [Polls service](#)
- [Recent Activities service](#)
- [RSS service](#)
- [Search service](#)
- [Tags service](#)
- [Worklist service](#)

### **Oracle WebCenter Portal: Spaces**

A WebCenter Portal application built using JSF, Oracle ADF, WebCenter Portal: Framework, WebCenter Portal: Services, and Composer. In the production documentation, it is commonly referred as [Spaces application \(Spaces\)](#).

### **Oracle WebLogic Server Administration Console**

A browser-based, graphical user interface to manage a WebLogic Server domain. Use to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters

- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy your applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

### **OTN**

Oracle Technology Network. The online Oracle technical community that provides a variety of technical resources for building Oracle-based applications. You can access OTN at <http://www.oracle.com/technetwork>.

### **Oracle WebLogic Portal**

WebLogic Portal enables you to provide a user interface to integrate your applications. WebLogic Portal lets you surface application data and functionality from heterogeneous environments into an integrated, dynamic, and customizable web-based portal user interface that can simultaneously support multiple devices. In addition to a powerful portal framework and its J2EE security foundation, WebLogic Portal provides many business services, such as content management, communities, personalization, search, and user management. WebLogic Portal provides a virtual content repository that lets you federate external content management systems into a single management interface. You can then build portals using content in those external resource. WebLogic Portal also provides a WLP content repository for creating and managing content.

### **Page Composer**

See [Composer](#).

### **Page Customizable component**

A component provided in the [Composer](#) tag library that defines the editable area of a page at runtime. Within this area, users can edit properties for a component, add content to the page, arrange content, and so on.

### **page hierarchy**

A model that associates pages in a parent-child relationship, where any page can have one or more sub pages. This parent-child model not only helps define the overall structure of the portal, but also allows child pages to inherit the security policies from their parent.

### **page parameter**

A parameter associated with a page that can be used to store values that can then be passed to the components on the page. It also enables your page to take values through its URL. Page parameters are defined using the `<parameter>` tag at the top of your `PageDef.xml`. You can bind page parameters to your [page variables](#).

### **Page Properties**

A dialog, accessed from [Composer](#), that provides access to a page's display options, security settings, and parameters.

### **page scheme**

Determines the background image used in the page. The Spaces application provides several default page schemes and an option for specifying a custom page scheme.

### **page style**

Determines the initial page structure, for example one column or two column. Some default page styles also include the task flows, components, and page properties useful for a particular purpose. For example, a page created using the Text page style includes a Text layout component.

### **page template**

Lets you specify view elements that you intend to be common to all of your pages. A page template file is a JSPX file that includes ADF layout components and other elements. Typically, page templates define a page layout, with headers, footers, and content areas. In addition, the page template usually specifies the positioning and style of the navigation UI for your pages.

### **page variable**

A variable that binds your public portlet parameter to the page. Page variables are defined within the `<variableIterator>` of your `PageDef.xml`. One page variable can be bound to multiple public portlet parameters.

### **pagelet**

A [portlet](#) that can be used in any web page (not just within a portal).

### **Panel Customizable component**

A component provided in the [Composer](#) tag library that provides a container region for a group of Oracle ADF components and portlets that are customizable at runtime. Any Show Detail Frame components and portlets added as child components to a Panel Customizable component can be moved or maximized with the Panel Customizable component.

### **parameter**

A variable that controls the default behavior of task flow content and facilitates the wiring of a task flow to page parameters and page definition variables.

### **parent component**

A component that contains other components, such as a Box layout component that contains task flows. The Box is the parent component of the task flows. In contrast, the task flows are the Box's child components.

See also [Child Components](#).

### **participant**

A Spaces user who can manipulate the content of a space. A participant can upload and share documents, initiate and take part in chats with other members, create discussion topics, create new or view existing lists.

### **PDK-Java**

Java Portlet Developer Kit. The development framework used to build and integrate web content and applications with [Oracle WebCenter Portal](#). It includes toolkits, samples, and technical articles that help make portal development simple. You can take existing Java [servlets](#), [JSPs](#), URL-accessible content and web services and turn

---

them into [portlets](#). It is typically used by external developers and vendors to create portlets and services.

### **People Connections service**

A WebCenter Portal service that provides social networking tools for creating, interacting with, and tracking the activities of one's enterprise connections.

See also, [Activity Stream](#), [Connections](#), [Feedback](#), [Message Board](#), and [Profile](#).

### **personalization**

Dynamic changes to an application's behavior based on user context, facilitated by Personalization for WebCenter Portal.

See also [application customization](#) and [user customization](#)

### **Personalization for WebCenter Portal**

A WebCenter Portal service that enables you to deliver content within your application to targeted application users based on selected criteria. Personalization for WebCenter Portal also provides a declarative means for specifying dynamic application flow.

### **personal page**

A page created by a user in his or her Home space. Personal pages are viewable by other users only if specifically granted access by the user who created the page.

### **personal profile**

A page that displays a user's personal information such as email address, phone number, office location, department, manager, direct reports, and so on.

See also, [Profile](#).

### **Polls service**

A WebCenter Portal service that enables you to create, edit, and take online polls on your application pages. Polls let you survey your audience (such as their opinions and their experience level) and check whether they can recall important information, and gather feedback on the efficacy of presentations.

### **portal**

A common interface (that is, a web page) that provides a personalized, single point of interaction with web-based applications and information relevant to individual users or class of users.

### **portal application template**

See [application templates](#).

### **Portal Developer Kit**

See [PDK-Java](#).

### **portlet**

A reusable web component that can draw content from many different sources. Portlets can display excerpts of other web sites, generate summaries of key information, perform searches, and access assembled collections of information from a variety of data sources. Because different portlets can be placed on a common page, the user receives a single-source experience, even though the content may be derived from multiple sources. Portlet resources include the many prebuilt portlets available

out of the box and programmatic portlets built through WebCenter's JSR 286, PDK-Java Portlet wizards, and other portlet building tools.

**portlet event**

A JSR 286 feature that allows portlets to react to actions or state changes not directly related to an interaction of the user with the portlet.

**portlet filter**

A JSR 286 feature that allows on-the-fly transformations of information in both the request to and the responses from a portlet. A portlet filter is a reusable piece of code that can transform the content of portlet requests and portlet responses.

**portlet mode**

The ways by which a [portlet](#) can be called to display information. These methods include:

- [Shared Screen mode](#) or [View mode](#)
- [Edit mode](#) or [Edit Defaults mode](#)
- [Customize mode](#)
- [Help mode](#)
- [About mode](#)
- [Full Screen mode \(Portlets\)](#) or [Show Details Page mode](#)

**Portlet Producer Application template**

An application template, provided by JDeveloper, for creating an application with the recommended projects and technology scopes required for developing portlets. The Portlet Producer Application template consists of a single project scoped for portlet creation (Portlets).

See also [Framework application template](#) and [producer](#).

**predefined page**

A page created by the Spaces application to perform a specific function. Examples of predefined pages include, Welcome pages, Search pages, and Documents pages.

**Predeployment Tool**

A utility for [Framework applications](#) that assists you in configuring your target system with the new producer registrations you have added to your application in Oracle JDeveloper. You must run this utility before deploying your application. You can also use this utility after deployment to migrate metadata from stage to production, for example, to export and import your customizations. This tool also enables you to define the [MDS](#) repository location to allow run-time customizations to be migrated.

**pretty URL**

A shortened version of a page's URL that hides the complexity of the real web address.

**private parameter**

A portlet parameter that is known only to the portlet itself and has no connection to the page on which the portlet resides.

Contrast with [public parameter](#).

**producer**

A communication link between portlet consumers (such as a **Framework application** or a **portal**). When a consumer application renders a portlet, it calls the producer of that portlet, which in turn executes the portlet and returns the results in the form of portlet content. A producer can contain one or more portlets. A portlet can be contained by only one producer.

**Oracle WebCenter Portal** supports two types of producers:

- Oracle **PDK-Java** producers: Deployed to a **Java EE** application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP.
- **Web Services for Remote Portlets (WSRP)**: A web services standard that enables the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as **JSR 286**, .NET, Perl) and any WSRP portal. A portlet (regardless of language) deployed to a WSRP-enabled container can be rendered in any application that supports this standard.

**Profile**

In the **People Connections service**, a feature for viewing and managing information about yourself, such as your contact information, manager, and direct reports, and for viewing this information about other application users.

**programmatic portlets**

Portlets constructed in a non-declarative manner using **APIs**. Also referred to as *hand-* or *manually-coded* portlets.

**public render parameters**

A JSR 286 feature that enables portlets to share parameter values, allowing a form of interportlet communication.

**public space**

A space that is available to all users, even those who are not logged in to the Spaces application.

**public page**

A page within the Spaces application that is available to all users, even those who are not logged in to the application.

**public parameter**

A portlet parameter that is known to the page and bound to it by way of a page variable.

Contrast with **private parameter**.

**public user**

A user who can access, but is not logged into, a WebCenter Portal application. A public user can view any page that has been marked as public, but cannot personalize or edit any content, or view pages that have any form of access control.

Contrast with **authenticated user**.

### **Recent Activities service**

A WebCenter Portal service that provides a means of tracking recent activities in a Framework application.

### **recipe**

A weighted list of similarity calculations. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

### **resize handle**

A user interface element in a task flow chrome increasing or decreasing the height of the task flow.

### **resource**

Items users can manage through the Resource Manager, like page templates, skins, task flows, navigations, and so on. Spaces categorizes resources under the following categories: Structure, Look and Layout, and Mashups.

### **Resource Action Handling framework**

Enables services that expose custom resources to be viewed, searched, and tagged.

### **Resource Catalog**

A catalog that provides a federated view of one or more otherwise unrelated repositories in a unified search and browse user interface. Resources are created and published in their source repository and are then exposed to the developer in JDeveloper's Resource Palette and to the end user in the Resource Catalog Viewer. Resource catalogs can contain layout components, Oracle ADF components, portlets, service task flows, and documents.

### **Resource Index**

The starting point for accessing WebCenter Portal REST APIs. Sending a GET request to the Resource Index URI returns a list of links to entry points for all available services.

### **Resource Manager**

Enables users with the appropriate privileges to continue developing the portal after the application has been deployed. Using the Resource Manager users can also download runtime portal resources (from Framework applications and Spaces) and import them into Oracle JDeveloper for further development. These resources can then be exported from JDeveloper and uploaded back into the deployed application.

### **resource type**

Defines the type of resource that a WebCenter Portal REST API link identifies. Use resource types to determine the response bodies for GET requests and allowable request bodies for POST and PUT. Also use `resourceType` attributes on entities to uniquely identify their type.

### **REST APIs**

Oracle WebCenter Portal provides a set of web-based REST (REpresentational State Transfer) APIs for retrieving and modifying server data dynamically from the client. REST APIs are available for [Discussions service](#), [People Connections service](#), and [Spaces application \(Spaces\)](#).

**Reverse Proxy Server**

A server process that hides the physical location of internal servers by exposing the servers as a single public site. Requests to the public site are routed to the appropriate internal server.

**Round-trip development**

Round-trip development refers to features and techniques that allow you to retrieve resources from a deployed, runtime portal back to JDeveloper for maintenance or enhancement. After modifying a resource in JDeveloper, you can use the Resource Manager to upload the resource back to the deployed portal. WebCenter Portal's round-trip development features provide a simple, convenient way to modify portal resources without redeploying the entire application.

**RSS reader**

An RSS reader provided with the Spaces application that incorporates public news feeds from external sources onto application pages. This RSS reader is available only in Spaces, and not in Framework applications.

**RSS service**

A WebCenter Portal service that provides a means of publishing content from other services as news feeds. The RSS service supports both RSS 2.0 and Atom 1.0 formats.

**Search service**

A WebCenter Portal service that enables the discovery of information and people in an application, returning only the results users are authorized to see

**Secure Enterprise Search**

See [Oracle Secure Enterprise Search \(SES\)](#).

**secured application page**

A page created by a user that has not been made available to public users.

**Self-Registration page**

A predefined page where users can register with the Spaces application, thus creating themselves an identity store login account. Administrators can customize certain aspects of this page.

**Self-Subscription page**

A predefined page where users can register to become members of a space. Moderators can customize certain aspects of this page.

**service ID**

In Expression Language, the string that identifies a particular service. For example, the string `oracle.webcenter.collab.announcement` is the service ID for the Announcements service.

A PDK-Java producer's unique identifier. PDK-Java enables you to deploy multiple producers under a single adapter servlet. Different producers are identified by their unique service IDs. A service ID is required only when a service ID/producer name is not appended to the URL endpoint.

**Service Oriented Architecture**

See [SOA](#).

**servlet**

A Java program that usually runs on a [Web server](#), extending the web server's functionality. HTTP servlets take client HTTP requests, generate dynamic content (such as through querying a database), and provide an HTTP response.

**session language**

A display language specified by the user that remains in effect for the life of the session cookie (from log on to log off). If the user clears browser cookies, the display language reverts to the user-level default language, if specified, then to the application-level default language set by the Spaces administrator. Set the session language in the Change Language pop-up, accessible from the Welcome page.

**Shared Screen mode**

A [portlet mode](#) that renders the body of the portlet and enables you to display a portlet on a page that can contain other portlets. Every portlet must have at least a Shared Screen mode.

See also [View mode](#).

**Show Detail Frame component**

A component provided in the [Composer](#) tag library that renders a border or chrome around the child component. It provides a header with an Actions menu and thereby provides user interface (UI) controls to customize the display of the child component. However, to customize the display of the child component, the Show Detail Frame component must be included inside a Panel Customizable component.

**Show Details Page mode**

A [portlet mode](#) that provides full-browser display of the portlet. For example, a portlet in [Show Page mode](#) could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with [Show Page mode](#).

**show modes**

Types of [portlet modes](#) encompassing [Show Page mode](#) and [Show Details Page mode](#).

**Show Page mode**

A [portlet mode](#) that provides a smaller portlet display to allow space for additional portlets and other objects in the browser window. For example, a portlet in Show Page mode could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with [Show Details Page mode](#).

**similarity calculation**

Used by the Activity Graph service to provide a similarity score (a number between zero and one) that designates how similar two objects are to each other given a specific criterion. The weighting of each calculation determines its significance in deciding the overall recommendation score. Recommendations are ordered by their total recommendation score.

**skin**

A style sheet based on the CSS 3.0 syntax specified in one place for an entire application. Instead of providing a style sheet for each component, or inserting a style sheet on each page, you can create one skin for the entire application.

**SOA**

Service Oriented Architecture. A design methodology aimed at maximizing the reuse of application services.

**Source view (JDeveloper)**

A view, in [Oracle JDeveloper](#), that provides a way to directly edit the source code of a file.

**Source view (Spaces)**

A view, in [Composer](#), that provides a selectable structural representation of a page and its components.

See also [Design view \(Spaces\)](#).

**space**

A work area within Spaces that supports a group of people of any size that is organized around an area of interest or a common goal.

**Spaces application (Spaces)**

A web-based application that offers the very latest technology for social networking, communication, collaboration, and personal productivity. Spaces uses services and applications to bring everything together that users require to exchange ideas with others, keep track of personal and work-related tasks, interact with critical applications, and zero in on projects and interests; all within a single integrated environment.

**space icon**

An image displayed alongside space names on the Spaces page in My Spaces to help other users with identification and location.

**space logo**

An image displayed on the Home space page to provide a visual identity for the space. The Home space logos also display alongside the space name at the top of the page in Full Screen Mode.

**space member**

A user who is participating in a space. Members can be added or invited to a space, or they can subscribe to a space themselves if self-registration is enabled.

**space owner**

A user who initially created a space. The space owner is automatically also a moderator of the space.

**space template**

A starting point for creating a new space. Spaces includes several out-of-the-box templates to get you started, and you can create custom space templates using existing spaces as the basis.

### **space Unavailable page**

A predefined page that displays when a space member tries to open a space that is temporarily offline. Moderators can customize this page.

### **Spaces application administrator**

See [administrator](#).

### **Spaces Switcher**

A menu showing three areas: **Recent Spaces** lists up to ten recently accessed spaces, followed by spaces to which current user most recently gained access. **My Spaces** lists all spaces to which the current user has access, in alphabetical order. A list of links provides direct access from the menu to the Home space, the Spaces browser page, and the Create a Space dialog.

### **struts**

A development framework for Java servlet applications based upon the [MVC](#) design paradigm.

### **style properties**

Used to override the style information from the skin CSS to set specific instances of component display.

### **Tags service**

A WebCenter Portal service that enables users to apply their own terms to application objects, making it possible to search for those objects using personally meaningful terms.

### **task flow**

A set of ADF Controller activities, control flow rules, and managed beans that interact to allow a user to complete a task. Task flows provide a modular approach for defining control flow in an application. Instead of representing an application as a single JSF page flow, developers can break it up into a collection of reusable task flows.

### **task flow header**

An area at the top of a task flow that displays the task flow name and various tools for interacting with the task flow.

### **template**

See [space template](#), [application templates](#), and [custom display template](#).

### **Text layout component**

A layout component available through [Composer](#). A rich text editor for providing static page text. For designers of Framework applications, this is the runtime equivalent of a Rich Text Editor component.

### **Unauthorized Access page**

A predefined page that is shown when someone without access permission tries to open a page.

### **URL parameter**

See [private parameter](#).

**user customization**

Changes that affects only a user's own work space.

See also [application customization](#) and [personalization](#)

**validation-based caching**

A [caching](#) method that uses a validation check to determine if the cached item is still valid.

Contrast with [expiry-based caching](#).

**Virtual Content Repository**

Virtual Content Repository (VCR) enables you to plug in multiple, heterogeneous content repositories.

**viewer**

Spaces users who can look at the information in a space but cannot contribute any of their own.

**View mode**

([JSR 286](#) portlets only.) A [portlet mode](#) that enables you to display a JSR 286 portlet on a page that can contain other portlets. It is the only required mode for JSR 286 portlets.

See also [Shared Screen mode](#).

**WAR**

Web application archive file. This file is used in deploying applications on a [Java EE](#) application server. WAR files encapsulate in a single module all of the components necessary to run an application. WAR files typically contain an application's [servlet](#), [JSP](#), and [JSF JSP](#) components.

See also [EAR](#).

**Web 2.0**

Technologies, such as wiki, RSS, and blogs, that enable the construction of highly interactive web applications.

See also [Oracle WebCenter Portal: Services](#).

**Web Application Archive file**

See [WAR](#).

**Web Clipping portlet**

A browser-based declarative tool that enables you to integrate any web application with your [Framework application](#). It is designed to give you quick integration by leveraging the web application's existing user interface. You can drag and drop Web Clipping portlets onto a \*.jspx page.

**Web Page layout component**

A layout component available through [Composer](#). A means of embedding another web site, wiki, or blog within the context of a page which is created in the Spaces application. For designers of Framework applications, this is the equivalent of an Inline Frame component.

**Web server**

A program that delivers web pages.

### **Web Services for Remote Portlets**

See [WSRP](#).

### **WebCenter Portal Application**

A WebCenter Portal application based on [Oracle WebCenter Portal: Framework](#) or [Oracle WebCenter Portal: Spaces](#).

### **WebCenter Portal's Extension for Oracle JDeveloper**

An extension available through the Oracle JDeveloper Update Wizard that installs the necessary libraries, templates, wizards, and dialogs needed to build and deploy [Framework applications](#) in [Oracle JDeveloper](#).

### **WebCenter Portal: Framework**

See [Oracle WebCenter Portal: Framework](#).

### **WebCenter Portal systems administrator**

See [administrator](#).

### **WebLogic Server**

See [WLS](#).

### **Welcome page**

There are two types of Welcome page:

- Public Welcome page: A predefined page that users encounter before logging in to the Spaces application.
- Personal Welcome page: A predefined page that introduces users to their Home space.

### **wiki page**

A page that provides in-place editing using HTML or a simple mark-up language. Any user with sufficient privileges can add, revise, and remove wiki content.

### **WLS**

WebLogic Server. A scalable, enterprise-ready Java Platform, Enterprise Edition (Java EE) application server. The WebLogic Server infrastructure supports the deployment of many types of distributed applications and is an ideal foundation for building applications based on Service Oriented Architectures (SOA).

See also [Integrated WLS](#)

### **WLST**

WebLogic Scripting Tool. A command line tool for managing Oracle Fusion Middleware components, such as Oracle WebCenter Portal.

### **Worklist service**

A WebCenter Portal service that provides access to notifications, alerts, and BPEL tasks assigned to the current user.

### **WSRP**

Web Services for Remote Portlets (WSRP) is a web services standard that allows the plug-and-play of visual, user-facing web services with portals or other intermediary web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as [JSR 286](#), .NET,

Perl) and any WSRP portal. A portlet (regardless of language) deployed to a WSRP-enabled container can be rendered on any portal that supports this standard.

**XSL**

Extensible Stylesheet Language (XSL) is the language used within style sheets to transform or render XML documents.
