Oracle® Fusion Applications
Enterprise Deployment Guide for Customer Relationship Management
11g Release 7 (11.1.7)
E16684-21

October 2013
Documentation for system administrators who are installing and configuring Oracle Fusion Applications components in an enterprise deployment for Oracle Fusion Customer Relationship Management.
# Preface

- Audience ................................................................. xi
- Documentation Accessibility ....................................... xi
- Related Documents ...................................................... xi
- Conventions ............................................................... xii

# What's New in This Guide

- Significant Changes in this Document for 11g Release 11.1.7 ............................... xiii
- Significant Changes in this Document for 11g Release 11.1.6 ................................ xiv

# Enterprise Deployment Overview

1.1 What is an Enterprise Deployment? .......................................................... 1-1
1.2 About Oracle Fusion Applications ............................................................ 1-2
1.3 Benefits of Oracle Recommendations ...................................................... 1-2
  1.3.1 Built-in Security ............................................................................. 1-3
  1.3.2 High Availability .......................................................................... 1-3
1.4 Terminology ......................................................................................... 1-3

# Introduction to the Enterprise Deployment Reference Topologies

2.1 Overview of Reference Enterprise Deployment Topologies .......................... 2-1
2.1.1 Overall Reference Enterprise Deployment Topology ................................ 2-1
2.1.2 Reference Topologies Documented in the Guide .................................... 2-3
  2.1.2.1 Oracle Fusion Customer Relationship Management Domain ............. 2-3
  2.1.2.2 Oracle Fusion Common Domain .................................................... 2-4
  2.1.2.3 Oracle Fusion Human Capital Management Domain ....................... 2-5
  2.1.2.4 Oracle Fusion Supply Chain Management Domain ........................ 2-5
  2.1.2.5 Oracle Fusion Financials Domain .................................................. 2-6
  2.1.2.6 Oracle Fusion Incentive Compensation Domain ................................ 2-7
  2.1.2.7 Oracle Business Intelligence Domain ........................................... 2-8
2.1.3 About the Web Tier Nodes .................................................................... 2-9
  2.1.3.1 Load Balancer Requirements ....................................................... 2-10
2.1.4 About the Application Tier .................................................................. 2-11
  2.1.5 About the Data Tier ........................................................................ 2-11
2.2 Hardware Requirements ........................................................................... 2-11
2.3 Installation Prerequisite ......................................................................... 2-12
2.4 Implementing the Topology ........................................................................................................ 2-12

3 Preparing the Network for an Enterprise Deployment

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>

9 Scaling Out the Oracle Fusion Common Domain

9.1 Overview of the Oracle Fusion Common Domain ........................................................... 9-1
9.2 Prerequisites for Scaling Out the Oracle Fusion Common Domain .................................. 9-2
9.2.1 Starting Node Manager in SSL Mode ........................................................................ 9-2
9.2.2 Removing Oracle Coherence Startup Properties from wlc_server1 ............................ 9-2
9.2.3 Configuring Shared Content Folders for UCM_server1 ............................................ 9-3
9.3 Adding a New Machine in the Oracle WebLogic Server Console ............................... 9-4
9.4 Packing and Unpacking the Managed Server Domain Home ......................................... 9-4
9.5 Cloning Managed Servers and Assigning Them to CRMHOST2 .................................. 9-4
9.6 Configuring the Oracle WebCenter Portal wc_spaces and wc_spaces2 Servers .......... 9-8
9.6.1 Verifying the Location of FusionAppsContentRepository ....................................... 9-8
9.7 Scaling Out the Oracle WebCenter Content Inbound Refinery Server ......................... 9-9
9.8 Oracle HTTP Server Configuration ................................................................................ 9-10
9.9 Configuring Server Migration for the Managed Servers .............................................. 9-11
9.10 Validating the System .................................................................................................... 9-12

10 Scaling Out the Oracle Fusion Human Capital Management Domain

10.1 Overview of the Oracle Fusion Human Capital Management Domain ....................... 10-1
10.2 Prerequisites for Scaling Out the Oracle Fusion Human Capital Management Domain . 10-1
10.3 Adding a New Machine in the Oracle WebLogic Server Console ......................... 10-2
10.4 Packing and Unpacking the Managed Server Domain Home ...................................... 10-2
10.5 Cloning Managed Servers and Assigning Them to CRMHOST2 ............................. 10-2
10.6 Oracle HTTP Server Configuration ................................................................................ 10-5
10.7 Configuring Server Migration for the Managed Servers .............................................. 10-6
10.8 Validating the System .................................................................................................... 10-6

11 Scaling Out the Oracle Fusion Supply Chain Management Domain

11.1 Overview of the Oracle Fusion Supply Chain Management Domain ...................... 11-1
11.2 Prerequisites for Scaling Out the Oracle Fusion Supply Chain Management Domain .. 11-1
11.3 Adding a New Machine in the Oracle WebLogic Server Console ......................... 11-1
11.4 Packing and Unpacking the Managed Server Domain Home ...................................... 11-2
11.5 Cloning Managed Servers and Assigning Them to CRMHOST2 ............................. 11-2
11.6 Oracle HTTP Server Configuration ................................................................................ 11-5
11.7 Configuring Server Migration for the Managed Servers .............................................. 11-6
11.8 Validating the System .................................................................................................... 11-6

12 Scaling Out the Oracle Fusion Financials Domain

12.1 Overview of the Oracle Fusion Financials Domain ...................................................... 12-1
12.2 Prerequisites for Scaling Out the Oracle Fusion Financials Domain ....................... 12-1
12.3 Adding a New Machine in the Oracle WebLogic Server Console ......................... 12-1
12.4 Packing and Unpacking the Managed Server Domain Home ...................................... 12-2
12.5 Cloning Managed Servers and Assigning Them to CRMHOST2 ............................. 12-2
12.6 Oracle HTTP Server Configuration ................................................................................ 12-5
12.7 Configuring Server Migration for the Managed Servers .............................................. 12-6
12.8 Validating the System .................................................................................................... 12-6
14.7 Validating the System

15 Additional Configuration Procedures for Scaling Out Oracle SOA Suite Server

15.1 Enabling Virtual IPs on CRMHOST1 and CRMHOST2 ........................................... 15-2
15.2 Setting the Listen Address for soa_server1 ............................................................. 15-3
15.3 Setting the Listen Address for soa_server2 ............................................................. 15-3
15.4 Updating the FusionVirtualHostcrm.conf Configuration File .................................... 15-4
15.5 Configuring UMSJMServer_auto_1 and UMSJMServer_2 ........................................ 15-4
15.6 Configuring JMS Servers with JDBC Store Persistence ........................................... 15-6
15.7 Configuring Oracle Coherence for Deploying Composites ....................................... 15-7
15.8 Configuring a JDBC Transaction Log Store for Transaction Recovery .......................... 15-9
15.9 Disabling Host Name Verification for the soa_server Managed Servers ...................... 15-11
15.10 Restarting Node Manager on CRMHOST1 ............................................................. 15-11
15.11 Starting and Validating soa_server on CRMHOST1 ................................................. 15-12
15.12 Restarting Node Manager on CRMHOST2 ............................................................. 15-12
15.13 Starting and Validating soa_server on CRMHOST2 ................................................. 15-12

16 Configuring Administration Server High Availability

16.1 Enabling Administration Server High Availability ................................................... 16-1
16.1.1 Enabling an Administrative Virtual Host on CRMHOST1 .................................... 16-2
16.1.2 Adding a New Machine in the Oracle WebLogic Server Console ......................... 16-3
16.1.3 Enabling the Administration Server to Listen on the Virtual IP Address .................. 16-3
16.2 Oracle HTTP Server Configuration .......................................................................... 16-4
16.3 Validating the Administration Server ......................................................................... 16-5
16.4 Manually Failing Over the Administration Server to CRMHOST2 ............................ 16-6
16.4.1 Prerequisites .......................................................................................................... 16-6
16.4.2 Performing the Failover ......................................................................................... 16-7
16.5 Failing the Administration Server Back to CRMHOST1 .......................................... 16-8

17 Setting Up Server Migration for an Enterprise Deployment

17.1 Prerequisite .............................................................................................................. 17-1
17.2 Migrating Oracle Fusion Applications Domains ....................................................... 17-1
17.2.1 About Configuring Server Migration ...................................................................... 17-1
17.2.2 Setting up a User and Tablespace for the Server Migration Leasing Table ............. 17-2
17.2.3 Creating a Multi-Data Source Using the Oracle WebLogic Server Administration Console ......................................................................................................................... 17-3
17.2.4 Editing Node Manager's Properties File ................................................................. 17-4
17.2.5 Setting Environment and Superuser Privileges for the wlsifconfig.sh Script ........ 17-5
17.2.6 Configuring Server Migration Targets ................................................................. 17-6
17.2.7 Testing the Server Migration .................................................................................. 17-7

18 Configuring Oracle Business Intelligence Applications

18.1 Introduction to Oracle BI Applications for Oracle Fusion Customer Relationship Management .......................................................................................................................... 18-1
18.1.1 Topology ................................................................................................................ 18-2
19 Managing the Topology

19.1 Scaling the Topology for Additional Nodes ......................................................... 19-1

19.1.1 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle ADF Server ............................................................. 19-2

19.1.1.1 Prerequisites for Scaling Out the Topology for Oracle ADF Server ............... 19-2

19.1.1.2 Adding a New Machine in the Oracle WebLogic Server Console .............. 19-2

19.1.1.3 Packing and Unpacking the Managed Server Domain Home .................. 19-3

19.1.1.4 Cloning Managed Servers and Assigning Them to CRMHOST3 ............... 19-3

19.1.1.5 Validating the System .............................................................................. 19-6

19.1.2 Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle ADF Server ............................................................. 19-6

19.1.2.1 Cloning Managed Servers and Assigning Them to CRMHOST3 ............... 19-6

19.1.2.2 Validating the System .............................................................................. 19-8

19.1.3 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle SOA Suite Server ............................................................. 19-8

19.1.3.1 Prerequisites for Scaling Out the Topology for Oracle SOA Suite Server .... 19-8

19.1.3.2 Adding a New Machine in the Oracle WebLogic Server Console .............. 19-9

19.1.3.3 Packing and Unpacking the Managed Server Domain Home .................. 19-9

19.1.3.4 Cloning Managed Servers and Assigning Them to CRMHOST3 ............... 19-9

19.1.3.5 Validating the System .............................................................................. 19-12

19.1.3.6 Additional Configuration Procedures for Scaling Out Oracle SOA Suite Server ....................................................................................... 19-13

19.1.4 Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle SOA Suite Server ............................................................. 19-13

19.1.4.1 Cloning Managed Servers and Assigning Them to CRMHOST3 ............... 19-18

19.1.4.2 Validating the System .............................................................................. 19-18

19.1.5 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle Business Intelligence .......................................................... 19-19

19.1.5.1 Prerequisites for Scaling Out the Topology for Oracle Business Intelligence 19-20

19.1.5.2 Scale-Out Procedure for Oracle Business Intelligence ............................ 19-20

19.1.6 Scaling Up the Topology for Oracle Business Intelligence ............................ 19-22

19.1.6.1 Scale-Up Procedure for Oracle Business Intelligence ............................ 19-22

19.2 Performing Backups and Recoveries ................................................................. 19-23

19.3 Monitoring the Topology .................................................................................... 19-24

19.4 Configuring Log File Rotation ............................................................................ 19-24
19.4.1 Specifying Log File Rotation Using Oracle Enterprise Manager ........................................ 19-24
19.4.2 Specifying Log File Rotation Using WLST ................................................................. 19-25
19.5 Patching the Topology ...................................................................................................... 19-26
19.6 Auditing ............................................................................................................................. 19-26
19.7 Troubleshooting ................................................................................................................. 19-28
19.7.1 Page Not Found When Accessing soa-infra Application Through Load Balancer 19-28
19.7.2 soa-infra Application Fails to Start Due to Deployment Framework Issues (Coherence) ................................................................. 19-29
19.7.3 Incomplete Policy Migration After Failed Restart of Oracle SOA Suite Server .... 19-29
19.7.4 Oracle SOA Suite Server Fails to Start Due to Maximum Number of Processes Available in Database ........................................ 19-30
19.7.5 Administration Server Fails to Start After a Manual Failover ...................................... 19-31
19.7.6 Error While Activating Changes in Administration Console ........................................ 19-31
19.7.7 Oracle SOA Suite Server Not Failed Over After Server Migration ............................. 19-31
19.7.8 Oracle SOA Suite Server Not Reachable From Browser After Server Migration ...... 19-31
19.7.9 Oracle Access Manager Configuration Tool Does Not Remove URLs ..................... 19-32
19.7.10 Redirecting of Users to Login Screen After Activating Changes in Administration Console ........................................................................... 19-32
19.7.11 Redirecting of Users to Administration Console's Home Page After Activating Changes to OAM ................................................................. 19-32
19.7.12 Configured JOC Port Already in Use ........................................................................... 19-33
19.7.13 Out-of-Memory Issues on Managed Servers ............................................................... 19-33
19.7.14 JDBC Connection Reset Appears When on OEL 5.4 .................................................. 19-33
19.7.15 Missing JMS Instances on Oracle BI Publisher Scheduler Diagnostics Page .......... 19-34
19.7.16 Oracle BI Publisher Jobs in Inconsistent State After Managed Server Shutdown ...... 19-34
19.7.17 JMS Instance Fails in an Oracle BI Publisher Cluster ................................................. 19-34
19.7.18 Administration Console Redirects from Internal URL to Container URL after Activation ........................................................................................................ 19-34
19.7.19 Oracle Essbase Clustering Fails After Clicking Activate Changes ............................. 19-34

A Protected Domain URIs
A.1 Protected CRM Domain URIs .............................................................................................. A-1
A.2 Protected BI Domain URIs .................................................................................................... A-3

B Worksheets for Oracle Fusion CRM Topology
B.1 Hosts and Virtual IP Addresses for Oracle Fusion CRM .................................................. B-1
B.2 Directory Mapping ............................................................................................................... B-2
B.3 Port Mapping ........................................................................................................................ B-4
B.4 LDAP Directory Details ....................................................................................................... B-5
B.5 Database Details ................................................................................................................... B-5
B.6 Web Tier Details ................................................................................................................... B-6
B.7 Application Tier Details ....................................................................................................... B-6
B.8 User and Group Mapping ................................................................................................... B-9
Preface

This preface describes the audience, contents and conventions used in the Oracle Fusion Applications Customer Relationship Management Enterprise Deployment Guide.

Audience

This guide is intended for system administrators who are responsible for installing and configuring Oracle Fusion Applications enterprise deployments for Oracle Fusion Customer Relationship Management.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th><strong>Convention</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><strong>italic</strong></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New in This Guide

The preface describes the significant changes made to the Oracle Fusion Applications Customer Relationship Management Enterprise Deployment Guide 11g Release 7 (11.1.7), and provides pointers to additional information.

Significant Changes in this Document for 11g Release 11.1.7

For 11g Release 7 (11.1.7), this guide has been updated in several ways. Following are the sections that have been added or changed.

- Reference enterprise topology diagrams have been updated to reflect the changes made in this release. See Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies".
- Screen shots have been updated to reflect changes made in this release. See Section 5.3.2, "Creating a New Provisioning Response File."
- Section has been revised to include the following:
  - Additional prerequisites
  - Instructions for performing a manual backup
  - Instructions for cleaning up and restoring from manual backups after a configure failure
  See Section 5.3.3, "Running the Provisioning Commands to Install Components."
- Screen shots have been updated to reflect changes made in this release. See Chapter 6, "Scaling Out Oracle HTTP Server."
- New section has been added describing how to configure Oracle Coherence for Oracle Data Integrator servers. See Section 8.3, "Configuring Oracle Coherence for the odi_server Managed Server."
- New section has been added describing how to configure Oracle Coherence for Oracle Data Integrator servers. See Section 13.3, "Configuring Oracle Coherence for the odi_server Managed Server."
- New section has been added describing how to verify the location of the FusionAppsContentRepository content repository. See Section 9.6.1, "Verifying the Location of FusionAppsContentRepository".
- Section heading has changed and associated content has been revised. See Section 14.4.1, "Configuring JMS Persistence File Stores on CRMHOST1".
- Section title has changed and some content has been removed. See Section 14.6, "Configuring and Validating Oracle Essbase Clustering."
Section heading has changed and associated content has been revised. Information about a new Java Message Service server, PS6SOAJMSServer, has been added. See Section 15.5, "Configuring UMSJMSServer_auto_1 and UMSJMSServer_2."

New section has been added. See Section 15.6, "Configuring JMS Servers with JDBC Store Persistence."

Section has been revised to include steps for configuring a cluster-based migration. See Section 17.2.6, "Configuring Server Migration Targets."

Section "Migrating from a Test Environment to a Production Environment" has been removed. See Chapter 19, "Managing the Topology."

Worksheets have been updated to reflect changes made in this release. See Appendix B, “Worksheets for Oracle Fusion CRM Topology.”

**Significant Changes in this Document for 11g Release 11.1.6**

For 11g Release 6 (11.1.6), this guide has been updated in several ways. Following are the sections that have been added or changed.

- Screen shots have been updated to reflect changes made in this release. See Section 5.3.2, "Creating a New Provisioning Response File."

- New section has been added. See Section 9.6, "Configuring the Oracle WebCenter Portal wc_spaces and wc_spaces2 Servers."

- The section "Redefining the Essbase Cluster Name After Essbase Scale Out" has been updated to reflect Essbase cluster component output for this release.

- New section has been added. See Section 19.7.19, "Oracle Essbase Clustering Fails After Clicking Activate Changes."

- A new worksheets appendix has been added to help you keep track of machine names, IP addresses, directories, and other important data. See Appendix B, "Worksheets for Oracle Fusion CRM Topology."
This chapter provides an overview of the enterprise topology for Oracle Fusion Customer Relationship Management.

This chapter includes the following topics:

- Section 1.1, "What is an Enterprise Deployment?"
- Section 1.2, "About Oracle Fusion Applications"
- Section 1.3, "Benefits of Oracle Recommendations"
- Section 1.4, "Terminology"

1.1 What is an Enterprise Deployment?

An enterprise deployment is an Oracle guidelines blueprint based on proven Oracle high-availability and security technologies and recommendations for Oracle Fusion Applications. The guidelines described in these blueprints span all Oracle products across the entire technology stack: Oracle Database, Oracle Fusion Middleware, Oracle Fusion Applications, and Fusion Middleware Control.

An Oracle Fusion Applications enterprise deployment:

- considers various business Service Level Agreements (SLA) to make high-availability guidelines as widely applicable as possible
- leverages database grid servers and storage grid with low-cost storage to provide highly resilient, lower cost infrastructure
- uses results from extensive performance impact studies for different configurations to ensure that the high-availability architecture is optimally configured to perform and scale to business needs
- enables control over the length of time to recover from an outage and the amount of acceptable data loss from a natural disaster
- uses Oracle guidelines and recommended architecture, which are independent of hardware and operating systems.

---

**Note:** This document focuses on enterprise deployments in Linux environments. Enterprise deployments can also be implemented in UNIX and Windows environments.
1.2 About Oracle Fusion Applications

Oracle Fusion Applications are a unified suite of business applications designed to unify personal and enterprise processes. It unifies transactional Oracle SOA Suite and business processes, business intelligence, and collaborative technologies in a seamless user experience. Oracle Fusion Applications can be easily integrated into a service-oriented architecture and made available as software as a service.

Oracle Fusion Applications offer a strong functional value by providing:

- Installed based demand (for example, unified global payroll module)
- Competitive differentiation (for example, Distributed Order Orchestration)
- Revenue generation (for example, sales territory management)

Oracle Fusion Applications are standards-based, making them highly adaptable. This standards-based technology allows you to respond effectively to change with flexible, modular, user-driven business software that is powered by best-in-class business capabilities built on open standards. Its technology framework includes the following products:

- Oracle WebCenter Portal provides design time and runtime tools for building enterprise portals, transactional websites, and social networking sites.
- Oracle Business Intelligence 11g provides a full range of business intelligence capabilities that allow you to collect, present, and deliver organizational data.
- Hyperion extends Oracle’s business intelligence capabilities to offer the most comprehensive system for enterprise performance management.
- Oracle WebCenter Content enables you to leverage document management, Web content management, digital asset management, and records retention functionality to build and complement your business applications.
- Oracle SOA Suite provides an enterprise architecture that supports building connected enterprise applications to provide solutions to business problems.
- Oracle WebLogic Server is a scalable, enterprise-ready Java Platform, Enterprise Edition (Java EE) application server.
- Oracle JDeveloper is an integrated development environment with end-to-end support for modeling, developing, debugging, optimizing, and deploying Java applications and Web services.
- Oracle Enterprise Manager Fusion Middleware Control offers business-driven applications management, integrated application to disk management, and integrated systems management and support experience.
- Oracle Identity Management enables organizations to manage the end-to-end life cycle of user identities and to secure access to enterprise resources and assets.

For more information, see the Oracle Fusion Applications Concepts Guide.

1.3 Benefits of Oracle Recommendations

The Oracle Fusion Applications configurations discussed in this guide are designed to ensure security of all invocations, maximize hardware resources, and provide a
reliable, standards-compliant system for enterprise computing with a variety of applications.

- Built-in Security
- High Availability

The security and high-availability benefits of the Oracle Fusion Applications configurations are realized through isolation in firewall zones and replication of software components.

### 1.3.1 Built-in Security

The enterprise deployment architectures are secure because every functional group of software components is isolated in its own demilitarized zone (DMZ), and all traffic is restricted by protocol and port. The following characteristics ensure security at all needed levels, as well as a high level of standards compliance:

- Configure external load balancers to redirect all external communication received on port 80 to port 443.

**Note:** The Oracle Technology Network ([http://www.oracle.com/technetwork/index.html](http://www.oracle.com/technetwork/index.html)) provides a list of validated load balancers.

- Communication from external clients does not go beyond the Load Balancing Router (LBR) level.
- Components are separated in different protection zones: the Oracle Web Tier, application tier, and the data tier. Moreover, Oracle Identity Management (IDM) has its own protection zones like Oracle Web Tier, Applications tier and Data tier
- No direct communication from the Load Balancing Router to the data tier is allowed.
- Direct communication between two firewalls at any one time is prohibited.
- If a communication begins in one firewall zone, it must end in the next firewall zone.
- Oracle Internet Directory (OID) is isolated in the data tier.
- All communication between components across protection zones is restricted by port and protocol, according to firewall rules.

### 1.3.2 High Availability

The enterprise deployment architectures are highly available, because each component or functional group of software components is replicated on a different computer, and configured for component-level high availability.

### 1.4 Terminology

The following terminology is used in this enterprise deployment guide:

- **Oracle home**: An Oracle home contains installed files necessary to host a specific product. For example, the SOA Oracle home contains a directory that contains binary and library files for Oracle SOA Suite. An Oracle home resides within the
directory structure of the Middleware home. Each Oracle home can be associated with multiple Oracle instances or Oracle WebLogic Server domains.

- **ORACLE_BASE**: An alternate way of specifying the path `/u01/oracle`. Stores binaries, configuration, and Oracle Inventory.

- **WebLogic Server home**: A WebLogic Server home contains installed files necessary to host a WebLogic Server. The WebLogic Server home directory is a peer of Oracle home directories and resides within the directory structure of the Middleware home.

- **Middleware home**: A Middleware home consists of the Oracle WebLogic Server home, and, optionally, one or more Oracle homes. A Middleware home can reside on a local file system or on a remote shared disk that is accessible through NFS.

- **Oracle instance**: An Oracle instance contains one or more active middleware system components, for example Oracle Web Cache, Oracle HTTP Server or Oracle Internet Directory. You determine which components are part of an instance, either at install time or by creating and configuring an instance at a later time. An Oracle instance contains files that can be updated, such as configuration files, log files, temporary files.

- **Domain**: The basic administrative unit of Oracle WebLogic Server.

- **Managed Server**: Hosts business applications, application components, Web services, and their associated resources. To optimize performance, Managed Servers maintain a read-only copy of the domain's configuration document. When a Managed Server starts, it connects to the domain's Administration Server to synchronize its configuration document with the document that the Administration Server maintains.

- **failover**: When a member of a high availability system fails unexpectedly (unplanned downtime), the system undergoes a failover operation to continue offering services to its consumers. If the system is an active-passive system, the passive member is activated during the failover operation and consumers are directed to it instead of the failed member. The failover process can be performed manually, or it can be automated by setting up hardware cluster services to detect failures and move cluster resources from the failed node to the standby node. If the system is an active-active system, the failover is performed by the load balancer entity serving requests to the active members. If an active member fails, the load balancer detects the failure and automatically redirects requests for the failed member to the surviving active members. See *Oracle Fusion Middleware High Availability Guide* for information on active-active and active-passive systems.

- **failback**: After a system undergoes a successful failover operation, the original failed member can be repaired over time and be re-introduced into the system as a standby member. If desired, a failback process can be initiated to activate this member and deactivate the other. This process reverts the system back to its pre-failure configuration.

- **hardware cluster**: A hardware cluster is a collection of computers that provides a single view of network services (for example: an IP address) or application services (for example: databases, Web servers) to clients of these services. Each node in a hardware cluster is a standalone server that runs its own processes. These processes can communicate with one another to form what looks like a single system that cooperatively provides applications, system resources, and data to users.

  A hardware cluster achieves high availability and scalability using specialized hardware (cluster interconnect, shared storage) and software (health monitors,
resource monitors). The cluster interconnect is a private link used by the hardware cluster for heartbeat information to detect node death. Due to the need for specialized hardware and software, hardware clusters are commonly provided by hardware vendors such as HP, IBM, and Dell. While the number of nodes that can be configured in a hardware cluster is vendor dependent, only two nodes are required for Oracle Fusion Applications high availability. Hence, this document assumes a two-node hardware cluster for high availability solutions employing a hardware cluster.

- **cluster agent**: The software that runs on a node member of a hardware cluster that coordinates availability and performance operations with other nodes. Clusterware provides resource grouping, monitoring, and the ability to move services. A cluster agent can automate the service failover.

- **clusterware**: Software that manages the operations of the members of a cluster as a system. It allows one to define a set of resources and services to monitor via a heartbeat mechanism between cluster members and to move these resources and services to a different member in the cluster as efficiently and transparently as possible.

- **shared storage**: Shared storage is the storage subsystem that is accessible by all the computers in the enterprise deployment domain. Among other things, the following is located on the shared disk:
  - Middleware Home software
  - AdminServer Domain Home
  - Java Message Service (JMS)
  - Tlogs (where applicable)

Managed server homes can also be optionally located in the shared disk. The shared storage can be a Network Attached Storage (NAS), a Storage Area Network (SAN) or any other storage system that multiple nodes can access simultaneously and can read/write.

- **primary node**: The node that is actively running an Oracle Fusion Applications instance at any given time and has been configured to have a backup/secondary node. If the primary node fails, Oracle Fusion Applications instance is failed over to the secondary node. This failover can be manual or automated using the Clusterware for Administration Server. For a server migration based scenario, WebLogic Whole Server Migration is used for automated failover.

- **secondary node**: The node that is the backup node for an Oracle Fusion Applications instance. This is where the active instance fails over when the primary node is no longer available. See the definition for primary node in this section.

- **network host name**: Network host name is a name assigned to an IP address either through the `/etc/hosts` file or through DNS resolution. This name is visible in the network that the computer to which it refers to is connected. Often, the network host name and physical host name are identical. However, each computer has only one physical host name but may have multiple network host names. Thus, a computer’s network host name may not always be its physical host name.

- **physical host name**: This guide differentiates between the terms physical host name and network host name. This guide uses physical host name to refer to the "internal name" of the current computer. On UNIX, this is the name returned by the `hostname` command.
Physical host name is used by Oracle Fusion Middleware to reference the local host. During installation, the installer automatically retrieves the physical host name from the current computer and stores it in the Oracle Fusion Middleware configuration metadata on disk.

- **physical IP**: Physical IP refers to the IP address of a computer on the network. In most cases, it is normally associated with the physical host name of the computer (see the definition of the physical host name). In contrast to a virtual IP, it is always associated with the same computer when on a network.

- **switchover**: During normal operation, active members of a system may require maintenance or upgrading. A switchover process can be initiated to allow a substitute member to take over the workload performed by the member that requires maintenance or upgrading, which undergoes planned downtime. The switchover operation ensures continued service to consumers of the system.

- **switchback**: When a switchover operation is performed, a member of the system is deactivated for maintenance or upgrading. When the maintenance or upgrading is completed, the system can undergo a switchback operation to activate the upgraded member and bring the system back to the pre-switchover configuration.

- **virtual host name**: Virtual host name is a network addressable host name that maps to one or more physical computers via a load balancer or a hardware cluster. For load balancers, the name “virtual server name” is used interchangeably with virtual host name in this book. A load balancer can hold a virtual host name on behalf of a set of servers, and clients communicate indirectly with the computers using the virtual host name. A virtual host name in a hardware cluster is a network host name assigned to a cluster virtual IP. Because the cluster virtual IP is not permanently attached to any particular node of a cluster, the virtual host name is not permanently attached to any particular node either.

---

**Note:** Whenever the term “virtual host name” is used in this document, it is assumed to be associated with a virtual IP address. In cases where just the IP address is needed or used, it will be explicitly stated.

---

- **virtual IP**: (Cluster virtual IP, load balancer virtual IP.) Generally, a virtual IP can be assigned to a hardware cluster or load balancer. To present a single system view of a cluster to network clients, a virtual IP serves as an entry point IP address to the group of servers which are members of the cluster. A virtual IP can be assigned to a server load balancer or a hardware cluster.

A hardware cluster uses a cluster virtual IP to present to the outside world the entry point into the cluster (it can also be set up on a standalone computer). The hardware cluster's software manages the movement of this IP address between the two physical nodes of the cluster while clients connect to this IP address without the need to know which physical node this IP address is currently active on. In a typical two-node hardware cluster configuration, each computer has its own physical IP address and physical host name, while there could be several cluster IP addresses. These cluster IP addresses float or migrate between the two nodes. The node with current ownership of a cluster IP address is active for that address.

A load balancer also uses a virtual IP as the entry point to a set of servers. These servers tend to be active at the same time. This virtual IP address is not assigned to any individual server but to the load balancer which acts as a proxy between servers and their clients.
This chapter describes and illustrates the Oracle Fusion Customer Relationship Management enterprise deployment reference topologies described in this guide. The road map for installation and configuration directs you to the appropriate chapters for the tasks you need to perform. Use this chapter to help you plan your Oracle Fusion Customer Relationship Management enterprise deployment.

This chapter includes the following topics:

- Section 2.1, "Overview of Reference Enterprise Deployment Topologies"
- Section 2.2, "Hardware Requirements"
- Section 2.3, "Installation Prerequisite"
- Section 2.4, "Implementing the Topology"

2.1 Overview of Reference Enterprise Deployment Topologies

This section describes diagrams used in an Oracle Fusion Customer Relationship Management enterprise deployment. Use this section to plan your enterprise deployment topology.

This section includes the following topics:

- Section 2.1.1, "Overall Reference Enterprise Deployment Topology"
- Section 2.1.2, "Reference Topologies Documented in the Guide"
- Section 2.1.3, "About the Web Tier Nodes"
- Section 2.1.4, "About the Application Tier"
- Section 2.1.5, "About the Data Tier"

2.1.1 Overall Reference Enterprise Deployment Topology

Figure 2–1 shows the overall Oracle Fusion Customer Relationship Management reference enterprise deployment topology, to which variations may be applied. The graphic illustrates how all components are deployed together.

In the topology, the primary node (also known as a host, and is \texttt{CRMHOST1} in the diagram) is actively running the Oracle Fusion Applications instance. The secondary node (\texttt{CRMHOST2}) is the redundant (HA) node for the Oracle Fusion Applications instance. The primary node consists of an Administration Server and applications that have been deployed to Managed Servers. Managed Servers can be grouped together in
clusters to provide scalability and high availability for applications. Together, the primary and secondary nodes form a domain.

Figure 2–1 Oracle Fusion CRM Reference Enterprise Deployment Topology

As shown in Figure 2–1, the overall Oracle Fusion Applications reference enterprise deployment topology comprises several domains:

- Oracle Fusion Customer Relationship Management Domain
- Oracle Fusion Common Domain
- Oracle Fusion Human Capital Management Domain
- Oracle Fusion Supply Chain Management Domain
- Oracle Fusion Financials Domain
- Oracle Fusion Incentive Compensation Domain
- Oracle Business Intelligence Domain

Figure 2–2 shows each of the domains in detail.
Figure 2–2  Domain Details

The scale out of these domains is described in the chapters that follow.

For information about installing the Oracle Identity Management stack for Oracle Fusion Applications, see Section 5.2, "Prerequisites for Using the Provisioning Process."

2.1.2 Reference Topologies Documented in the Guide

This section describes the references topologies used in an Oracle Fusion Customer Relationship Management enterprise deployment.

2.1.2.1 Oracle Fusion Customer Relationship Management Domain

Figure 2–3 shows the Oracle Fusion Customer Relationship Management domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.
2.1.2.2 Oracle Fusion Common Domain

Figure 2–4 shows the Oracle Fusion Common domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.
2.1.2.3 Oracle Fusion Human Capital Management Domain

Figure 2–5 shows the Oracle Fusion Human Capital Management domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.

Figure 2–5 Reference Topology for the Oracle Fusion Human Capital Management Domain

2.1.2.4 Oracle Fusion Supply Chain Management Domain

Figure 2–6 shows the Oracle Fusion Supply Chain Management domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.

Introduction to the Enterprise Deployment Reference Topologies 2-5
2.1.2.5 Oracle Fusion Financials Domain

Figure 2–7 shows the Oracle Fusion Financials domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.
2.1.2.6 Oracle Fusion Incentive Compensation Domain

Figure 2–8 shows the Oracle Fusion Incentive Compensation domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.
Figure 2–8  Reference Topology for Oracle Fusion Incentive Compensation

2.1.2.7 Oracle Business Intelligence Domain

Figure 2–9 shows the Oracle Business Intelligence domain within the overall reference enterprise deployment topology for Oracle Fusion Applications.
2.1.3 About the Web Tier Nodes

Nodes in the Oracle Web Tier are located in the demilitarized zone (DMZ) public zone. In this tier, two nodes WEBHOST1 and WEBHOST2 run Oracle HTTP Server configured with WebGate and FusionVirtualHost_domain.conf.

Through FusionVirtualHost_domain.conf, which allows requests to be proxied from Oracle HTTP Server to WebLogic Server, Oracle HTTP Server forwards the requests to WebLogic Server running in the application tier.

WebGate (which is an Oracle Access Manager component) in Oracle HTTP Server uses Oracle Access Protocol (OAP) to communicate with Oracle Access Manager running...
on **OAMHOST1** and **OAMHOST2**, in the Identity Management DMZ. WebGate and Oracle Access Manager are used to perform operations such as user authentication.

The Oracle Web Tier also includes a load balancer router to handle external requests. External requests are sent to the virtual host names configured on the load balancer. The load balancer then forwards the requests to Oracle HTTP Server.

The WebGate module in Oracle HTTP Server uses Oracle Access Protocol (OAP) to communicate with Oracle Access Manager to perform operations such as querying user groups.

On the firewall protecting the Oracle Web Tier, only the HTTP ports are open: 443 for HTTPS and 80 for HTTP.

### 2.1.3.1 Load Balancer Requirements

This enterprise topology uses an external load balancer. This external load balancer should have the following features:

- **Ability to load-balance traffic to a pool of real servers through a virtual host name:** Clients access services using the virtual host name (instead of using actual host names). The load balancer can then load-balance requests to the servers in the pool.

- **Port translation configuration:** Port translation configuration should be possible so that incoming requests on the virtual host name and port are directed to a different port on the back-end servers.

- **Monitoring of ports on the servers in the pool to determine availability of a service.**

- **Virtual servers and port configuration:** Ability to configure virtual server names and ports on your external load balancer, and the virtual server names and ports must meet the following requirements:
  - The load balancer should allow configuration of multiple virtual servers. For each virtual server, the load balancer should allow configuration of traffic management on more than one port. For example, for Oracle HTTP Server in the Oracle Web Tier, the load balancer must be configured with a virtual server and ports for HTTP and HTTPS traffic.
  - The virtual server names must be associated with IP addresses and be part of your DNS. Clients must be able to access the external load balancer through the virtual server names.

- **Ability to detect node failures and immediately stop routing traffic to the failed node.**

- **Fault-tolerant mode:** It is highly recommended that you configure the load balancer to be in fault-tolerant mode.

- **It is highly recommended that you configure the load balancer virtual server to return immediately to the calling client when the back-end services to which it forwards traffic are unavailable.** This is preferred over the client disconnecting on its own after a timeout based on the TCP/IP settings on the client computer.

- **Sticky routing capability:** Ability to maintain sticky connections to components. Examples of this include cookie-based persistence, IP-based persistence, and so on.

- **The load balancer should be able to terminate SSL requests at the load balancer and forward traffic to the back-end real servers using the equivalent non-SSL protocol (for example, HTTPS to HTTP).** Typically, this feature is called SSL acceleration and it is required for this enterprise deployment.
2.1.4 About the Application Tier

Nodes in the application tier are located in the DMZ secure zone.

CRMHOST1 and CRMHOST2 run all the managed servers in the Oracle Fusion Customer Relationship Management, Oracle Business Intelligence, Oracle Incentive Compensation, Oracle Fusion Financials, Oracle Fusion Supply Chain Management, and Oracle Fusion Human Capital Management domains.

CRMHOST1 and CRMHOST2 run the managed and C/C++ servers from different domains in an active-active or active-passive implementation. C/C++ components are managed by Oracle Process Manager and Notification Server (OPMN), and all the managed servers are managed by Administration Server within the domain.

CRMHOST1 and CRMHOST2 also run the Oracle WebLogic Server Administration Console and Oracle Enterprise Manager Fusion Middleware Control, but in an active-passive configuration. You also can fail over the Administration Server manually. Alternatively, you can configure the Oracle WebLogic Server Administration Console with CFC/CRS to fail over automatically on a separate hardware cluster.

Except for the Oracle Business Intelligence domain, Oracle Web Services Manager (Oracle WSM) provides a policy framework to manage and secure Web services in the enterprise deployment topology. WSM Policy Manager also runs in active-active configuration in every Fusion domain where Web Services are hosted.

On the firewall protecting the application tier, the HTTP ports, OAP port, and proxy port are open. The OAP port is for the WebGate module running in Oracle HTTP Server in the Oracle Web Tier to communicate with Oracle Access Manager. Applications requiring external HTTP access use Oracle HTTP Server as the proxy. (The proxy on the Oracle HTTP Server must be enabled to allow this access.)

2.1.5 About the Data Tier

Nodes in the data tier are located in the most secured network zone (the intranet).

In this tier, an Oracle RAC database runs on the nodes FUSIONDBHOST1 and FUSIONDBHOST2. The database contains the schemas needed by the Oracle Fusion Applications components. The components running in the application tier access this database.

On the firewall protecting the data tier, the database listener port (typically, 1521) is required to be open. The LDAP ports (typically, 389 and 636) are also required to be open for the traffic accessing the LDAP storage in the IDM enterprise deployment.

2.2 Hardware Requirements

This section provides recommended hardware for the Oracle Fusion Applications reference enterprise deployment topology on Linux operating systems.

The recommended hardware for the Oracle Fusion Applications reference enterprise deployment topology consists of six 128 GB Intel Westmere, six dual-core CPU servers (excluding Oracle HTTP Server and Oracle Database servers). Table 2–1 describes the typical hardware requirements.
2.3 Installation Prerequisite

The Oracle Identity Management stack for Oracle Fusion Applications should already be installed before starting a deployment. Note, however, that the provisioning process described in Chapter 5, "Using the Provisioning Process to Install Components for an Enterprise Deployment," cannot proceed without it. Follow the instructions in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Identity Management (Oracle Fusion Applications Edition) to install and configure these components.

2.4 Implementing the Topology

Oracle recommends the following approach when implementing the Oracle Fusion Applications topology outlined in Section 2.1, "Overview of Reference Enterprise Deployment Topologies":

1. Preparing the Network for an Enterprise Deployment
2. Preparing the Database for an Enterprise Deployment
3. Using the Provisioning Process to Install Components for an Enterprise Deployment
4. Scaling Out Oracle HTTP Server
5. Setting Up Node Manager for an Enterprise Deployment
6. Scaling Out the Oracle Fusion Customer Relationship Management Domain
7. Scaling Out the Oracle Fusion Common Domain
8. Scaling Out the Oracle Fusion Human Capital Management Domain
9. Scaling Out the Oracle Fusion Supply Chain Management Domain
10. Scaling Out the Oracle Fusion Financials Domain
11. Scaling Out the Oracle Fusion Incentive Compensation Domain
12. Scaling Out the Oracle Business Intelligence Domain
14. Configuring Administration Server High Availability
15. Setting Up Server Migration for an Enterprise Deployment
16. Configuring Oracle Business Intelligence Applications
17. Managing the Topology

### Table 2–1 Example Hardware Requirements - 200 Concurrent Users

18. Protected Domain URIs

Oracle recommends this modular approach to facilitate the verification of individual components one by one. This building block approach simplifies the troubleshooting during the setup process and facilitates the configuration in smaller steps.
Preparing the Network for an Enterprise Deployment

This chapter describes the network environment configuration required by the Oracle Fusion Applications reference enterprise deployment topology, as well as recommendations for shared storage and directory structure.

This chapter includes the following topics:

- Section 3.1, "External Virtual Server Names"
- Section 3.2, "Internal Virtual IPs"
- Section 3.3, "Load Balancer Configuration"
- Section 3.4, "Reference Enterprise Deployment Directory Structure"
- Section 3.5, "Shared Storage"
- Section 3.6, "IPs and Virtual IPs"
- Section 3.7, "Firewalls and Ports"
- Section 3.8, "Clock Synchronization"

3.1 External Virtual Server Names

The Oracle Fusion Applications enterprise deployment topology uses the following externally accessible load balancer virtual IPs that are created on the Load Balancer:

- crmexternal.mycompany.com
- finexternal.mycompany.com
- hcmexternal.mycompany.com
- scmexternal.mycompany.com
- biexternal.mycompany.com
- commonexternal.mycompany.com
- icexternal.mycompany.com

These virtual server names act as the access point for all HTTP traffic to the runtime components for Oracle Fusion Customer Relationship Management. The HTTP traffic from client browser to LBR is always in SSL.

These VIPs receive all the requests externally (from the intranet or internet) on port 443 in SSL mode. These requests are forwarded to one of Oracle HTTP Server’s “external virtual hosts specific to each domain” on WEBHOST1 or WEBHOST2.
3.2 Internal Virtual IPs

The following Oracle Fusion Customer Relationship Management deployment topology also requires separate secure network address translations (NATs) internal VIPs for each domain. These VIPs are used for transactional and administrative access.

- CRMInternal.mycompany.com
- FinInternal.mycompany.com
- HcmInternal.mycompany.com
- ScmInternal.mycompany.com
- BiInternal.mycompany.com
- CommonInternal.mycompany.com
- IcInternal.mycompany.com

The above virtual URLs (VIPs) are defined on the load balancer and are used for internal invocations of services within the data center. The URLs are not exposed to the internet or intranet, and are only accessible within the data center.

The VIPs receive all the requests internally on port 7777 in non-SSL mode. All the internal services/clients access these VIPs using the above virtual addresses, and the requests are then forwarded to one of Oracle HTTP Server's "internal virtual hosts specific to each domain" on WEBHOST1 or WEBHOST2.

For additional Oracle WebLogic Server security, you can configure the internal VIPs listed above with a load-balancing router rule that accepts requests only from well-known hosts like CRMHOST1, CRMHOST2, or from the system administrator host, and rejects all other requests.

Note that an additional VIP, COMMONUCMLBRVH.mycompany.com:6300 – for Transmission Control Protocol (TCP) socket connection traffic, not Hypertext Transfer Protocol (HTTP) – is used to load balance the traffic to the UCM_server instances.

Note: Use TCP, and not HTTP, in the LBR setup. Also note that the port number in the LBR URL is 6300, not 7777 (which is used internally for HTTP non-SSL mode).

3.3 Load Balancer Configuration

The Oracle Fusion Applications enterprise topology requires an external load balancer with SSL acceleration. To configure the load balancer with above VIPs listed above, refer to vendor-specific load balancer configuration instructions.

Note: The Oracle Technology Network (http://otn.oracle.com) provides a list of validated load balancers and their configurations.
3.4 Reference Enterprise Deployment Directory Structure

This section describes the directory structure specifically used by the Oracle Fusion Applications reference enterprise deployment topology. It includes the following topics:

- Section 3.4.1, "Directory Structure"
- Section 3.4.2, "Binary Directory Structure"
- Section 3.4.3, "Domain Configuration Directory Structure"

For general information about Oracle Fusion Applications architecture and concepts, see "Introduction to Oracle Fusion Applications for System Administrators" in Oracle Fusion Applications Administrator’s Guide.

3.4.1 Directory Structure

Figure 3–1 shows the enterprise deployment directory structure and its dependencies.
### 3.4.2 Binary Directory Structure

The binaries in the Oracle Fusion Applications reference enterprise deployment topology (the Oracle Fusion Middleware home and Oracle home) are on a shared disk. To avoid disk corruption, you may choose to maintain snapshots.

The file system for the binaries should be mounted on all the nodes with the exact mount point and path. For example, `/u01/oracle`. 

---

**Figure 3–1 Enterprise Deployment Directory Structure for Oracle Fusion Applications**

Directory Structure for Binaris and Domain Directories on Shared Disk

Directory Structure for Binaris and Domain Directories on Local Disk
3.4.3 Domain Configuration Directory Structure

The domain configuration directory structure is created on a shared disk, and its mount point should be visible from all nodes. This path will be used by the components that require shared resources and also administration servers to start active-passive processes. For example, /u01/oracle.

3.5 Shared Storage

For binaries: the file system is optimized for read operations.

For config: the file system should be optimized for read/write operations. For example, AdminServer Domain directory and Oracle Business Intelligence shared folders like Oracle Business Intelligence WebCat, RPD cache, Essbase ARBORPATH, and Oracle Business Intelligence config.

---

**Note:** The minimum amount of shared storage is 500 GB.

The following steps show how to create and mount shared storage locations for binaries and config so that CRMHOST1 and CRMHOST2 can see the same location.

"nasfiler" is the shared storage filer.

**From CRMHOST1:**

```bash
CRMHOST1> mount nasfiler:/vol/vol1/u01/oracle /u01/oracle -t nfs
```

**From CRMHOST2:**

```bash
CRMHOST2> mount nasfiler:/vol/vol1/u01/oracle /u01/oracle -t nfs
```

---

**Note:** The shared storage can be a NAS or SAN device. The following illustrates an example of creating storage for a NAS device from CRMHOST1. The options may differ.

```bash
mount nasfiler:/vol/vol1/u01/oracle /u01/oracle -t nfs -o rw,bg,hard,nointr,tcp,vers=3,timeo=300,rsize=32768,wsize=32768
```

Contact your storage vendor and computer administrator for the correct options for your environment.

3.5.1 Shared Storage for Oracle Business Intelligence

For general information, see “Shared Storage and Recommended Directory Structure” in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Business Intelligence.

**Shared Storage Locations**

In addition, Oracle Business Intelligence has two specific shared-storage locations.

- Location for Data Warehouse Console Configuration folder:

  `ORACLE_BASE/config/BIShared/dac`
- Mounted from: All nodes containing the instance of DAC in the cluster or where DAC can be migrated to must mount this location (all nodes must have read/write access)

- Location for shared Essbase ARBORPATH:
  
  `ORACLE_BASE/config/BiShared/Essbase`

- Mounted from: All nodes containing the instance of Essbase in the cluster must mount this location (all nodes must have read/write access)

---

**Note:** `ORACLE_BASE` is `/u01/oracle`.

### 3.6 IPs and Virtual IPs

Configure the Administration Server and the Managed Servers to listen on different virtual IPs and physical IPs.

The following VIPs are required to configure specific components:

- Virtual IPs for AdminServer are needed for every domain to configure AdminServer in active-passive mode. These VIPs are shared across `CRMHOST1` and `CRMHOST2`, depending on where the Administration Server is running.

- Virtual IPs for all Oracle SOA Suite servers in every domain, and Oracle Business Intelligence servers in the Oracle Business Intelligence domain are needed to support server migration. These components are implemented in active-active mode, so these VIPs are needed for `CRMHOST1` and `CRMHOST2`.

- When requesting VIPs, ensure that they are in the same subnet as `CRMHOST1` and `CRMHOST2` with netmask.

Table 3–1 provides descriptions of the various virtual hosts.

<table>
<thead>
<tr>
<th>Virtual IP</th>
<th>VIP Maps to...</th>
<th>Description</th>

3.7 Firewalls and Ports

Many Oracle Fusion Middleware components and services use ports. As an administrator, you must know the port numbers used by these services, and to ensure that the same port number is not used by two services on a host.

Most port numbers are assigned during installation.

Table 3–2 lists the ports used in the Oracle Fusion Customer Relationship Management topology, including the ports that you must open on the firewalls in the topology.

Firewall notation:

- FW1 refers to the outermost firewall
- FW2 refers to the firewall between the Oracle Web Tier and the application tier
- FW3 refers to the firewall between the application tier and the data tier
- dst refers to destination
<table>

</tbody>
</table>
3.8 Clock Synchronization

The clocks of all servers participating in the cluster must be synchronized to within one second difference. To accomplish this, use a single network time server and then point each server to that network time server.

The procedure for pointing to the network time server is different on different operating systems. Refer to your operating system documentation for more information.

Note: The firewall ports depend on the definition of TCP/IP ports.
Preparing the Database for an Enterprise Deployment

This chapter provides information about how the database tier is implemented in an enterprise deployment topology.

This chapter includes the following topics:
- Section 4.1, "Understanding the Database in the Enterprise Deployment Topology"
- Section 4.2, "Setting Up the Database"
- Section 4.3, "Creating and Starting the Database Services"
- Section 4.4, "Loading the Oracle Fusion Applications Repository into the Oracle RAC Database"
- Section 4.5, "Backing Up the Database"

4.1 Understanding the Database in the Enterprise Deployment Topology

The Oracle Fusion Applications reference enterprise deployment topology uses a single database for the following components:
- Oracle Fusion Applications metadata
- Oracle Fusion Applications transactional data
- Oracle Transactional Business Intelligence data
- Technology stack data, such as Oracle SOA Suite, Oracle Enterprise Manager Fusion Middleware Control, Oracle WebCenter Portal, and Oracle Essbase.
- Oracle Secure Enterprise Search data

Implementing Oracle Business Intelligence Data Warehouse requires a separate database for following components:
- Data Warehouse Administration Console (DAC)
- Informatica
- a Data Warehouse

For the enterprise topology, Oracle Real Application Clusters (Oracle RAC) databases are highly recommended. You must set up these databases before you can install and configure the Oracle Fusion Applications components. You install the Oracle Fusion Applications and Oracle Fusion Middleware metadata repositories into existing databases using the Fusion Applications Repository Creation Utility (Fusion Applications RCU).
4.2 Setting Up the Database

Before loading the metadata repository into your database, check that the database meets the requirements described in these sections:

- Database Host Requirements
- Supported Database Versions
- Minimum Database Configuration Parameters

---

Note: When creating the database, ensure that the length of the Oracle System ID (SID) does not exceed eight (8) characters.

For example:

- \textit{SID: abc12345} is invalid
- \textit{SID: abc123} is valid

---

4.2.1 Database Host Requirements

Note the following requirements for the hosts \texttt{FUSIONDBHOST1} and \texttt{FUSIONDBHOST2} in the data tier:

- \textbf{Oracle Clusterware}
  
  For Oracle Database 11g Release 2 (11.2.0.3) for Linux, refer to the \textit{Oracle Database Installation Guide}.

- \textbf{Oracle Real Application Clusters}
  
  For Oracle RAC 11g Release 2 (11.2.0.3) for Linux, refer to the \textit{Oracle Database Installation Guide}.

- \textbf{Oracle Automatic Storage Management (optional)}
  
  Oracle ASM gets installed for the node as a whole. It is recommended that you install it in a separate Oracle Home from the Database Oracle Home. This option comes in at runInstaller. In the Select Configuration page, select the \textbf{Configure Automatic Storage Management} option to create a separate Oracle ASM home.

4.2.2 Supported Database Versions

Oracle Fusion Applications requires the presence of a supported database and schemas. To check if your database is certified or to see all certified databases, refer to the supported platforms documentation for Oracle Fusion Applications.

To check the release of your database, you can query the \texttt{PRODUCT\_COMPONENT\_VERSION} view as follows:

```
SQL> SELECT VERSION FROM SYS.PRODUCT\_COMPONENT\_VERSION WHERE PRODUCT LIKE 'Oracle%';
```
You enable Oracle Label Security in the Select Database Edition screen, shown in Figure 4–1, using Oracle Universal Installer.

Figure 4–1 Oracle Label Security

![Oracle Label Security](image)

4.2.3 Minimum Database Configuration Parameters

Table 4–1 shows the recommended minimum init.ora parameters for an Oracle database. The database shipped with the Oracle Fusion Applications software contains this configuration. When you run the Fusion Applications RCU, its prerequisite check feature checks to see that the database meets these minimum requirements.

Table 4–1 Minimum Requirements for Database Configuration

<table>
<thead>
<tr>
<th>INST_ID Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>_b_tree_bitmap_plans</td>
<td>FALSE</td>
</tr>
<tr>
<td>audit_trail</td>
<td>NONE</td>
</tr>
<tr>
<td>compatible</td>
<td>11.2.0</td>
</tr>
<tr>
<td>db_files</td>
<td>1024</td>
</tr>
</tbody>
</table>
Setting Up the Database

For example, to use the SHOW PARAMETER command using SQL*Plus to check the value of the initialization parameter:

1. As the SYS user, enter the SHOW PARAMETER command:
   
   ```sql
   SQL> SHOW PARAMETER processes
   ```

2. Set the initialization parameter using the following commands:
   
   ```sql
   SQL> ALTER SYSTEM SET processes=5000 SCOPE=SPFILE;
   SQL> ALTER SYSTEM SET open_cursors=500 SCOPE=SPFILE;
   ```

3. Restart the database.

**Note:** The method that you use to change a parameter's value depends on whether the parameter is static or dynamic, and on whether your database uses a parameter file or a server parameter file. See the *Oracle Database Administrator’s Guide* for details on parameter files, server parameter files, and how to change parameter values.

---

4-4  Enterprise Deployment Guide for Customer Relationship Management
4.3 Creating and Starting the Database Services

Oracle recommends using the Oracle Enterprise Manager Fusion Middleware Control Cluster Managed Services screen or SQL*Plus to create database services that client applications will use to connect to the database.

To configure this using SQL*Plus:

1. Use the CREATE_SERVICE subprogram to create the database service.

Log in to SQL*Plus as the sysdba user and run the following command:

```sql
SQL> EXECUTE DBMS_SERVICE.CREATE_SERVICE
(SERVICE_NAME => 'crm.mycompany.com',
NETWORK_NAME => 'crm.mycompany.com')
```

2. Add the service to the database and assign it to the instances using srvctl:

```
prompt> srvctl add service -d FADB -s crm.mycompany.com -r FADB1,FADB2
```

3. Start the service using srvctl:

```
prompt> srvctl start service -d FADB -s crm.mycompany.com
```

4. Verify that the crm service is running on instance(s) FADB1 and FADB2:

```
prompt> srvctl status service -d FADB
```

Note: For more information about the srvctl command, see the Oracle Real Application Clusters Administration and Deployment Guide.

Oracle recommends that a specific database service be used for a product suite even when they share the same database. It is also recommended that the database service used is different than the default database service. For example, for Oracle Fusion Customer Relationship Management the database would be fadb.mycompany.com and the default service is one with the same name. The Oracle Fusion Customer Relationship Management install is configured to use the service crm.mycompany.com.

4.3.1 Updating the Kernel Parameters

This section describes how to update the kernel parameters for Linux before the database is installed.

To update the parameters:

1. Log in as root and add or edit the following values in the /etc/sysctl.conf file:

   ```
   fs.file-max = 6815744
   kernel.shmall = 2097152
   kernel.shmmax = 2147483648
   kernel.shmmni = 4096
   kernel.sem = 250 32000 100 128
   net.core.rmem_default = 4194304
   net.core.rmem_max = 4194304
   net.core.wmem_default = 262144
   net.core.wmem_max = 1048576
   net.ipv4.ip_forward = 0
   net.ipv4.conf.default.rp_filter = 1
   tcp.ipv4.tcp_wmem = 262144 262144 262144
   ```
tcp.ipv4.tcp_rmem = 4194304 4194304 4194304
fs.aio-max-nr = 1048576
net.ipv4.ip_local_port_range = 9000 65000

2. Execute the following command to activate the changes:
   `/sbin/sysctl -p`

### 4.3.2 Adding a Database Patch

To add a patch to the database, set the path to Opatch in the database installation directory and run the following command:

```
./opatch napply ORACLE_BASE/repository/installers/database/patch -skip_duplicate
```

For the location of the repository (ORACLE_BASE/repository), see Section 5.3.1,
"Creating the Installation Environment" in Chapter 5, "Using the Provisioning Process to Install Components for an Enterprise Deployment."

### 4.4 Loading the Oracle Fusion Applications Repository into the Oracle RAC Database

The Fusion Applications RCU components are included in the zipped Fusion Applications RCU file delivered in the provisioning framework. (The location of the file is REPOSITORY_LOCATION/installers/apps_rcu/linux/rcuHome_fusionapps_linux.zip.) Unzip the file to the RCU_HOME location on the FUSIONDBHOST1 machine. For example, ORACLE_BASE/rcu.

After you have the Fusion Applications RCU installed, do the following:

1. Copy all the required dump files locally on FUSIONDBHOST1 (for example, to /tmp):
   ```
   FUSIONDBHOST1> cd RCU_HOME/rcu/integration/fusionapps
   FUSIONDBHOST1> cp export_fusionapps_dbinstall.zip /tmp
   FUSIONDBHOST1> cd RCU_HOME/rcu/integration/biapps/schema
   FUSIONDBHOST1> cp otbi.dmp /tmp
   FUSIONDBHOST1> cd /tmp
   FUSIONDBHOST1> unzip export_fusionapps_dbinstall.zip
   ```

   **Note:** When running Fusion Applications RCU for Oracle RAC, you must copy the export_fusionapps_dbinstall.zip file as well as otbi.dmp to all the nodes of the Oracle RAC.

2. Create the `incident_logs` directory on FUSIONDBHOST1:
   ```
   FUSIONDBHOST1> cd ORACLE_HOME
   FUSIONDBHOST1> mkdir incident_logs
   ```

3. To stop the gathering of database statistics, do the following:
   a. In the RCU_HOME/rcu/integration/fusionapps/sql/fusionapps_postverify.sql file, find the following SQL command:
      ```sql
      DBMS_STATS.GATHER_DATABASE_STATS;
      --dbms_output.put_line('Gathered database stats');
      ```
b. Change the command to:

```
--DBMS_STATS.GATHER_DATABASE_STATS;
dbms_output.put_line('Not Gathering database stats');
```

4. Start Fusion Applications RCU from the `/bin` directory in the Fusion Applications RCU home directory:

```
cd RCU_HOME/bin
./rcu
```

5. In the Welcome screen (if displayed), click Next.

6. In the Create Repository screen, shown in Figure 4–2, select Create to load component schemas into a database. Click Next.

![Figure 4–2  Create Repository Screen](image)

7. In the Database Connection Details screen, shown in Figure 4–3, enter connect information for your database:

- **Database Type**: Select Oracle Database
- **Host Name**: Specify the name of the node on which the database resides. For the Oracle RAC database, specify the VIP name or one of the node names as the host name: `FUSIONDBHOST1-VIP`
- **Port**: Specify the listen port number for the database; for example 1521
- **Service Name**: Specify the service name of the database (`crm.mycompany.com`)
- **Username**: Specify the name of the user with DBA or SYSDBA privileges: `SYS`
- **Password**: Enter the password for the SYS user
Role: Select the database user’s role from the list: SYSDBA (required by the SYS user)

Click Next.

Figure 4–3  Database Connection Details Screen

8. The Repository Creation Utility selects the required components automatically, as shown in Figure 4–4.
Click **Next**. The Repository Creation Utility checks the prerequisites, as shown in Figure 4–5.
Click OK.

9. In the Schema Passwords screen, shown in Figure 4–6, enter passwords for the main and additional (auxiliary) schema users, and click Next.

Note: For increased security, do the following:

- Specify different schema passwords for all schemas
- Ensure that all passwords are more than eight (8) characters in length.
10. In the Custom Variables screen, shown in Figure 4–7, enter the required values.

Fusion Applications

- **FUSIONAPPS_DBINSTALL_DP_DIR**: The directory on the database server where you unzipped `export_fusionapps_dbinstall.zip` and copied the `otbi.dmp` file. For example, `/tmp`.
- **APPLCP_FILE_DIR**: Used by Oracle Enterprise Scheduler to store the log and output files. For example, `ORACLE_HOME/incident_logs`.
- **APPLLOG_DIR**: Location of the PL/SQL log file from Oracle Fusion Applications PL/SQL procedures, on the database server. For example, `ORACLE_HOME/incident_logs`.
- **OBIEE Backup Directory**: Location of the Oracle Business Intelligence Enterprise Edition dump files.

**Note**: When specifying an Oracle Business Intelligence Enterprise Edition (OBIEE) backup directory, set it to be a shared directory with read/write permissions for both FUSIONDB hosts.

Secure Enterprise Search

- Do you have Advanced Compression Option (ACO) License? Yes (Y) or No (N): Default is No.
- Do you have Oracle Partitioning option License? Yes (Y) or No (N): Default is No.

Master and Work Repository
Note: The default values are the only valid values. If you change any of these values, the ODI-related provisioning process will not work.

- **Master Repository ID**: Default = 501
- **Supervisor Password**: Enter and confirm your ODI supervisor password.
- **Work Repository Type**: (D) Development or (R). Default = D
- **Work Repository ID**: Default = 501
- **Work Repository Name**: Default = FUSIONAPPS_WREP
- **Work Repository Password**: Default = None. Enter and confirm your ODI supervisor password.

**Oracle Transactional BI**

- Directory on the database server where Oracle Transactional Business Intelligence import and export files are stored. For example, /tmp.

**Note**: For an Oracle RAC database, replace /tmp with a directory that can be accessed by the two Oracle RAC nodes.

**Activity Graph and Analytics**

- **Install Analytics with Partitioning (Y/N)**: Default is N.

Click Next to continue.

**Figure 4–7 Custom Variables Screen**

11. In the Map Tablespaces screen, click Next.

12. In the Summary screen, click Create.
13. In the Completion Summary screen, click Close.

---

**Note:** If you encounter any issues while using the Repository Creation Utility, check the logs at `RCU_HOME/rcu/log`.

---

4.5 Backing Up the Database

After you have loaded the metadata repository in your database, you should make a backup.

Backing up the database is for the explicit purpose of quick recovery from any issue that may occur in the further steps. You can choose to use your backup strategy for the database for this purpose or simply make a backup using operating system tools or RMAN for this purpose. It is recommended that you use Oracle Recovery Manager for the database, particularly if the database was created using Oracle ASM. If possible, a cold backup using operating system tools such as tar can also be performed.
This chapter describes the provisioning process that is used to install and configure components specifically required for an enterprise deployment.

For general information about provisioning and installation, see the “Overview” chapter in the *Oracle Fusion Applications Installation Guide*.

This chapter includes the following topics:

- Section 5.1, "Understanding Provisioning"
- Section 5.2, "Prerequisites for Using the Provisioning Process"
- Section 5.3, "Installing Components"
- Section 5.4, "Configuring Components"
- Section 5.5, "Performing Post-Provisioning Tasks"
- Section 5.6, "Starting and Stopping the Provisioned Environment"

### 5.1 Understanding Provisioning

**Provisioning** is the entire set of operations required to install, configure, and deploy applications product offerings from a system point of view. It performs these operations:

- **Install** - operations related to laying down all the component needed to create an Oracle Fusion Applications environment.
- **Configure** - the tailoring of components based on the applications topology, the creating of Managed Server instances and cluster members, and the updating of endpoints and virtual hosts.
- **Deploy** - process that starts the Managed Servers and clusters and facilitates the actual use of product offerings.

---

**Note:** Provisioning does not supply users, tenants, or hardware.

For more information about Oracle Fusion Applications architecture, see "Key Oracle Fusion Applications Concepts" in the *Oracle Fusion Applications Administrator’s Guide*. 

---

Using the Provisioning Process to Install Components for an Enterprise Deployment  5-1
5.2 Prerequisites for Using the Provisioning Process

Before starting the provisioning process, you must do the following:

- Make sure you first install the Oracle Identity Management stack for Oracle Fusion Applications. Follow the instructions in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Identity Management (Oracle Fusion Applications Edition) to install and configure these components.

  Keep a record of the configuration details. You must supply them to the Oracle Fusion Applications Provisioning Wizard when you create your provisioning response file. For more information, see Section 5.3.2.16, "Identity Management Configuration Screen."

- Make sure you obtain the certificates file from the Oracle Identity Management installation. The installation contains all the Oracle Identity Management certificates.

  The following information from the Oracle Identity Management setup is used as input for provisioning and is required. (Note that this information is provided at the plan-generation stage in Figure 5–11 to Figure 5–15):
  - Superuser of the Oracle Identity Management setup
  - Identity Store host and port
  - Identity Store user name and password
  - Identity Store read-only user name and password
  - Oracle Identity Management Administration Server host, port, user name, and password
  - Oracle Identity Management Managed Server hostname and port
  - Oracle Identity Management HTTP internal endpoint URL
  - Oracle Identity Management HTTP(s) external endpoint URL
  - Oracle Access Manager Administration Server host name, port, user name, and password
  - Oracle Access Manager AAA server host name, port, access-server port, access-server identifier 1 and access-server identifier 2
  - Oracle Platform Security Services Policy Store host name, port, read-only user name, and password
  - Oracle Platform Security Services Policy Store JPS root node
  - Oracle Identity Management database system user login, Oracle Identity Management/Oracle Metadata Services schema password

- Make sure all the virtual IPs shown in Table 3–1 in Chapter 3, "Preparing the Network for an Enterprise Deployment" have been created before you start the provisioning process. Ping the VIPs to ensure that they are live, and that the /etc/hosts entries are correct. (The VIPs are required for the scale-out chapters that follow, and not for provisioning.)

- Make sure the SMTP server is preinstalled, and that its host name and port value are available. Also ensure that the /etc/hosts file has proper entries. To verify, ping the server with the fully qualified name of the machine.

- Make sure the default system time zones defined are the same on the database servers, Oracle Fusion Applications servers, and web servers. If the default time...
zones on these servers are different, you will encounter taxonomy errors during the provisioning postconfigure phase.

- Set the TZ environment variable on Linux to have a valid time zone ID.
- Check the time zone setting using the command: echo $TZ. The tzselect tool may be handy if you need to change the setting.
- Oracle WebLogic Server and Oracle Database will then derive JVM and database time zones from their host systems, respectively. JVMs and the database need to be running in the same time zone.

Make sure the following 32-bit libraries are available on the Linux 64-bit operating system before provisioning a new environment. Otherwise, you will encounter an error during installation:

- glibc-devel-32bit-2.9-13.2
- libgcc43-4.3.3_20081022
- libstdc++43-4.3.3_20081022-11.18
- gcc-32bit-4.3
- libaio-32bit-0.3.104
- libaio-devel-32bit-0.3.104
- libstdc++43-32bit-4.3.3_20081022
- libstdc++43-devel-32bit-4.3.3_20081022

Define your local port range to ensure that it does not overlap with the ports used by JVMs and other servers. This action avoids port conflicts during server startup.

- To view: $cat /proc/sys/net/ipv4/ip_local_port_range
- To modify: $echo "32768 61000" > /proc/sys/net/ipv4/ip_local_port_range
- To make the local port range permanent after server restart, add (or update) the following line in the /etc/sysctl.conf file: net.ipv4.ip_local_port_range = 32768 61000

Make sure the hosts have enough entropy values in the provisioning hosts. If this value is less than 1000, increase it to a value to a greater value using the rngd command from root account.

- To check the entropy value:
  $cat /proc/sys/kernel/random/entropy_avail
- To increase the entropy value:
  $rngd -r /dev/urandom -o /dev/random

Make sure you use the sh, ksh or bash shell for provisioning and scale-out shell scripts executed from the command line. Since shell scripts for Oracle Fusion Applications and Oracle Fusion Middleware products are written using the Bourne shell (.sh file extension), these scripts can run from any of these three shells.

Some helpful commands:

- To display the shell you currently are using:
  $ ps -p $$
5.3 Installing Components

This section covers the following topics:

- Section 5.3.1, "Creating the Installation Environment"
- Section 5.3.2, "Creating a New Provisioning Response File"
- Section 5.3.3, "Running the Provisioning Commands to Install Components"

5.3.1 Creating the Installation Environment

Oracle Fusion provisioning repositories consist of multiple installers from Oracle Fusion Middleware and Oracle Fusion Applications. To run the Fusion provisioning process, these installers must be in a predefined directory structure.

This section includes the following topics:

- Downloading the Provisioning Repository
- Installing the Provisioning Framework Bits

5.3.1.1 Downloading the Provisioning Repository

A zipped provisioning repository is included in the Oracle Fusion Applications Product Media Pack. See "Obtaining the Software" in Oracle Fusion Applications Installation Guide for instructions on how to get it.

Extract the contents of all the zipped files to the same target directory (ORACLE_BASE/repository) that is on a shared/network drive. By default, the installers are located in REPOSITORY_LOCATION/installers.

5.3.1.2 Installing the Provisioning Framework Bits

The provisioning framework supplies the components needed to orchestrate the provisioning process. After the framework is set up, it retrieves the components and installers silently when they are required.

5.3.1.2.1 Running the Provisioning Installer Run the installer from the directory where you created the provisioning repository. For example: REPOSITORY_LOCATION/installers/faprov/Disk1.

**Note:** If you are running a fresh install or are re-running the installer after cleaning up previously installed products, ensure that no /etc/oraInst.loc file exists.

To run the installer:

CRMHOST1> ./runInstaller
When prompted, enter the following JRE/JDK location:

```
REPOSITORY_LOCATION/jdk6
```

Use the screen information in Table 5–1 as a guide when running the installer.

---

**Note:** In the case of a clean host, that is, one where the /etc/oraInst.loc file does not exist:

- The oraInventory creation panels will display before the Oracle Fusion Applications Provisioning Wizard starts
- A confirmation dialog asking you to execute `oracleRoot.sh` will display at the end of the installation
- On the Specify Inventory Directory screen, specify the location as `ORACLE_BASE/oraInventory`

---

**Table 5–1 Provisioning Installer Screens**

<table>
<thead>
<tr>
<th>Screen Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>The standard Welcome screen is read-only and appears each time you start the provisioning framework installer. No action is required. Click <strong>Next</strong> to continue.</td>
</tr>
<tr>
<td>Prerequisite Checks</td>
<td>Analyzes the host computer to ensure that specific operating system prerequisites have been met. If any prerequisite check fails, the screen displays a short error message at the bottom. Fix the error and click <strong>Retry</strong>. If you want to ignore the error or warning message, click <strong>Continue</strong>. Click <strong>Abort</strong> to stop the prerequisite check process for all components. Click <strong>Next</strong> to continue.</td>
</tr>
<tr>
<td>Specify Installation Location</td>
<td>Specify a location where you want to install the provisioning framework (ORACLE_BASE/repository). This is the location where the Oracle Fusion Applications Provisioning Wizard and the start commands for provisioning (runProvisioning) are installed. The Oracle Fusion Applications Provisioning framework must be installed on a shared disk in a location that is accessible to all hosts to be provisioned. Click <strong>Next</strong> to continue.</td>
</tr>
<tr>
<td>Installation Summary</td>
<td>Summarizes the selections you have made during this installation session. To change this configuration before installing, select one of the screens from the left navigation pane. Click <strong>Save</strong> to create a text file (response file) to use if you choose to perform the same installation at a later date. Click <strong>Install</strong> to continue installing this configuration.</td>
</tr>
<tr>
<td>Installation Progress</td>
<td>The progress indicator shows the percentage of the installation that is complete and indicates the location of the installation log file. Click <strong>Next</strong> when the progress indicator shows 100 percent.</td>
</tr>
<tr>
<td>Installation Complete</td>
<td>Summarizes the installation just completed. If you want to save the details to a text file, click <strong>Save</strong> and indicate a directory where you want to save the file. Click <strong>Finish</strong> to dismiss the screen and exit the installer.</td>
</tr>
</tbody>
</table>
/provisioning Directory Structure:

After installing the provisioning framework, the directories in ORACLE_BASE/repository/provisioning should be the following:

ant  bin  labelInfo.txt  lib  provisioning-build  provisioning-plan  template  util

---

Note: Installation logs are located in the ORACLE_BASE/oraInventory directory.

---

5.3.2 Creating a New Provisioning Response File

Before provisioning the Oracle Fusion Applications enterprise deployment environment, you must generate the provisioning response file, which will serve as the input for the actual provisioning process. You generate the provisioning response file by completing several Oracle Fusion Applications Provisioning Wizard interview screens to collect the configuration details for your provisioning response file and save the file in a location that is accessible to the provisioning installers. Be sure to make a note of the provisioning response file name and location, as you must supply these when you run the physical installation.

Before launching the Oracle Fusion Applications Provisioning Wizard, set JAVA_HOME and PATH. For example:

CRMHOST1> export JAVA_HOME=ORACLE_BASE/repository/jdk6
CRMHOST1> export PATH=$JAVA_HOME/bin:$PATH

Launch the wizard from any host in the enterprise deployment environment:

CRMHOST1> cd ORACLE_BASE/repository/provisioning/bin
CRMHOST1> ./provisioningWizard.sh

The wizard is launched and the Welcome screen displays. The screen is read-only and displays each time you start the Wizard.

Click Next.

---

Note: When using the wizard, you must enter the full path when asked to provide any path file (such as Applications Base, Application Configuration Directory, and so on). Using a symbolic link path will cause provisioning to fail in a later phase.

---

5.3.2.1 Installation Options Screen

In this screen, shown in Figure 5–1, select only the following task from the list of options:

Create a New Applications Environment Provisioning Response File - create a provisioning response file for a new Oracle Fusion Applications environment.
Figure 5–1 Installation Options Screen

Click Next to continue.

5.3.2.2 Specify Security Updates Screen
In this screen, you can set up a notification preference for security-related updates and installation-related information from Oracle Support.

- **Email** - specify your email address to have updates sent by this method.

- **I wish to receive security updates via My Oracle Support** - specify your My Oracle Support Password to have updates posted to your account.

Click Next to continue.

5.3.2.3 Provisioning Configurations Screen
This screen, shown in Figure 5–2, enables you to select the Oracle Fusion Customer Relationship Management options to configure.

Select only the options shown in Figure 5–2:

- **Oracle Fusion Customer Relationship Management**
  When selected, the Marketing and Sales options are automatically selected.

- **Oracle Fusion Incentive Compensation**

  The information in the message pane displays a cumulative estimate of the number of Managed Servers made available based on the offerings you selected. Click Details to see a breakdown of servers by domain.
Figure 5–2  Provisioning Configurations Screen

Figure: Screenshot of the Provisioning Configurations screen. The screen shows checkboxes for different components, such as Marketing, Sales, Financials, and others. The selections include Oracle Fusion Customer Relationship Management, Oracle Fusion Accounting Hub, and Oracle Fusion Human Capital Management.

5.3.2.4 Response File Description Screen

This optional screen lets you enter descriptive information to identify this response file, or create another version. This information becomes part of the summary document, and is listed under the Global settings on the Summary screen. It does not affect the content of your response file.

Update the response file name and click Next to continue.

5.3.2.5 Installation Location Screen

In this screen, shown in Figure 5–3, specify credentials for the node manager and supply the location of the various directories required for installation and configuration actions.

Use the values shown in the screen for your installation.

- **Node Manager Credentials** options - Add the values for the Node Manager credentials, which are used by Node Manager to start the Managed Server.

**Note:** Although the actual number of Oracle Fusion Middleware Managed Servers is 21, the `soa_server1` Managed Server is not needed for the FinancialDomain. This Managed Server is created in the FinancialDomain solely for the purpose of using the Oracle SOA Suite libraries, and is neither started up nor counted. Subsequently, the number of Oracle Fusion Middleware Managed Servers is 20.

Click Next to continue.
- **Installers Directory Location** - Specify the location of the repository you created. For example, `ORACLE_BASE/repository`.

- **Applications Base** - The root directory of all Oracle Fusion Applications and Oracle Fusion Middleware products. Typically, this location is on a shared disk, `ORACLE_BASE/products`.

- **Applications Configuration Directory** - Specify the path of the root directory where you want to write and manage the configuration files for all the domains, and from where the Administration Servers are started. Typically, this location is on a shared disk, `ORACLE_BASE/config`. (Note that `ORACLE_BASE/config` should be empty.)

- **Enable Local Applications Configuration** - Enable this option. When enabled, all the Managed Servers will run locally; only the Administration Server will run from the shared disk. Provisioning will run pack and unpack, and will create local domain directories.

- **Local Applications Configuration** - Specify a local-drive location, for example, `/u02/local/oracle/config`. This field is required if you selected **Enable Local Applications Configuration**.

- **Font Directory** - Enter the directory where the TrueType fonts are installed. The location varies on different operating systems, but is typically found at `/usr/share/X11/fonts/TTF`.

- **Oracle Business Intelligence Repository Password** options - Specify and confirm a password to allow access to the metadata repository (RPD) for both Oracle Business Intelligence Applications and Oracle Transactional Business Intelligence.

*Figure 5–3 Installation Location Screen*
Click **Next** to continue.

### 5.3.2.6 System Port Allocation Screen

In this screen, shown in Figure 5–4, accept the **Applications Base Port** value or enter a custom value. If you change the base port default, you must reset the domain port ranges accordingly when setting up firewall port ranges. (The default port range used for Oracle Fusion Applications is from 7000 to 11500.)

The **Other Ports** section contains the default values for the Node Manager and Informatica Identity Resolution License Server ports.

![Figure 5–4 System Port Allocation Screen](image)

Click **Next** to continue.

### 5.3.2.7 Database Configuration Screen

In this screen, shown in Figure 5–5, select **Real Application Clusters Database** and then click **Add** to create a line in the table for each instance in the Oracle RAC database. Select a row and click **Remove** if you need to revise the table. Specify the following information for each instance:

- **User Name (SYSDBA Role)** - the user name of the *sysdba* role. This user name is used to upgrade schemas during the configuration phase. Note that the *sysdba* fields are not validated, so ensure that you enter the correct values.
- **Password** - the password of the *sysdba* role.
- **Host Name** - the name of the Oracle RAC virtual host for each instance.
- **Port** - listening port of the database.
- **Instance Name** - the Oracle RAC database instance name
Service Name - the global database name for the transaction database that you
installed. Used to distinguish this database instance from other instances of Oracle
Database running on the same host.

Figure 5–5 Database Configuration Screen

Click Next to continue.

5.3.2.8 Schema Passwords Screen

In this screen, enter the same password for all the accounts if a single password was
used during Oracle Fusion Middleware Metadata Repository Creation Utility seeding.
However, if different passwords for each account were used during Repository
Creation Utility seeding, select Use a different password for each account and enter
the passwords.

Note: It is recommended to use a separate password for each
account in the production deployment.

Click Next to continue.

5.3.2.9 ODI Password Configuration Screen

In this screen, enter the Oracle Data Integrator Supervisor Password that was used
when the Oracle Fusion Middleware Metadata Repository was loaded into the Oracle
RAC database (see Figure 4–7 in Section 4.4, "Loading the Oracle Fusion Applications
Repository into the Oracle RAC Database").

Click Next to continue.
5.3.2.10 Domain Topology Configuration Screen

In this screen, determine the flow for the remaining wizard interview screens.

- **One host for all domains** - select this option to specify a **Host Name** if there is only one host and the ports are not changing.

- **One host per domain** - select this option if the domains are to be split among several machines. Use the dropdown list to select a **Host Name** for each application domain to be created.

- **One host per application and middleware component** - select this option when there are different hosts and ports to be modified.

Click Next to continue.

5.3.2.11 Web Tier Configuration Screen

This screen, shown in Figure 5–6, allows you to create virtual hosts on a single Oracle Web Tier that are either port-based or name-based for each product family domain that is created during installation. Specify an internal and an external port. The values assigned during installation are derived from the default HTTP port you name on this screen.

**Web Tier**

- **Install Web Tier in DMZ** - select this option if you set up a separate host for web tier installation. This host is set up as a demilitarized zone (DMZ), which does not have access to the shared file system. It cannot be used for any other host deployed, regardless of domain.

- **Host** - enter the name of the host where the Oracle HTTP Server will be installed and configured.

- **Virtual Host Mode** - select **IP-based** to create new DNS entries to use as virtual hosts. For example, **crm.mycompany.com**.

- **Domain Name** - Specify a domain name. **This is a mandatory field**. For example, **mycompany.com**.

- **HTTP Port** - default port for the Web Tier. Should not require operating system administrator privileges. Use the default values.

- **HTTPS (SSL) Port** - secure port for the Web Tier. Should not require operating system administrator privileges. Use the default values.

**SMTP Server**

- **Host** - the pre-installed SMTP server host name.

- **Port** - the port that the SMTP server is listening to
5.3.2.12 Virtual Hosts Configuration Screen

This screen, shown in Figure 5–7, contains the configuration details for the domains on the virtual hosts.

Specify the following information for each application domain listed:

- **Internal Name** - the host name or IP address where the Webtier listens on the internal virtual host for this domain.
- **Internal Port** - port for this internal virtual host. Should be visible only from inside the firewall.
- **External Name** - the host name or IP address for the external virtual host for this product family or middleware dependency. The host:port should be visible from outside the firewall.
- **External Port** - port to be used for this external virtual host. The host:port should be visible from outside the firewall.

If you selected **Name-based** on the Web Tier Configuration screen, specify the following information for each domain listed:

- **Internal.Name** - the DNS name for this internal virtual host. For example, for Financials, the name might be `fin-internal`.
- **External.Name** - the DNS name for this external virtual host. For example, for Financials, the name might be `fin`.

If you selected **Port-based** on the Web Tier Configuration screen, specify the following information for each domain listed:
- **Internal Port** - the port that is visible only from inside the firewall for this domain.
- **External Port** - the port that is visible from outside the firewall for this domain.

**Figure 5–7 Virtual Hosts Configuration Screen**

Click **Next** to continue.

### 5.3.2.13 Load Balancer Configuration Screen

This screen, shown in Figure 5–8, enables you to distribute workload evenly across two or more hosts, network links, CPUs, hard drives, or other resources. Check **Load Balancing Enabled** to take advantage of this feature, and specify:

- **Internal Load Balancer Configuration** - the host and port for the internal Virtual IP (VIP).
- **External Load Balancer Configuration** - the host and port for external Virtual IP (VIP). It must have a publicly available address to be usable.

If you want to stop creating this response file and resume at a later date, click **Save**. This action creates a partial response file. A partial response file cannot be used to provision an environment.
Figure 5–8 Load Balancer Configuration Screen

Click Next to continue.

5.3.2.14 Web Proxy Configuration Screen

This screen, shown in Figure 5–9, allows you to create Proxy Settings to enable users who want to use a proxy server to connect to the Internet.
Click Next to continue.

5.3.2.15 IDM Properties File Screen

In this screen, shown in Figure 5–10, select Load IDM Configuration from IDM Properties file.

When you are creating a response file or updating an incomplete response file without updates to this screen, shown in Figure 5–10, you will be able to select the IDM properties file to load IDM configuration data. After you select the file, you can review the content and decide if you want to proceed with this file.

- **Do not load IDM Configuration from IDM Properties file** - select this option if you want to manually enter the values on the Identity Management Configuration screens (shown in Figure 5–11 and Figure 5–12) and the Access and Policy Management Configuration screens (shown in Figure 5–13 and Figure 5–14.)

- **Load IDM Configuration from IDM Properties file** - select this option if you want the values on the Identity Management Configuration and Access and Policy Management Configuration screens to default to the values in the IDM properties file (for example, idmsetup.properties).

- **IDM Properties file** - enter the location of the file (for example, idmsetup.properties) on CRMHOST1: ORACLE_BASE/repository/provisioning/bin/idmsetup.properties.

---

**Note:** You must copy the idmsetup.properties file located at IDM_ ORACLE_HOME/idmtop/config/fa from IDMHOST to CRMHOST1 at ORACLE_ BASE/repository/provisioning/bin/idmsetup.properties.
- **IDM Properties file contents** - If you have selected a valid IDM properties file, the contents will be displayed. This field is read-only and cannot be modified.

**Note:** Even though you loaded the IDM properties file, you still must enter passwords manually in the Identity Management Configuration and the Access and Policy Management Configuration screens (for obvious security reasons). Passwords are not stored in the IDM properties file.

Click **Next** and then click **Continue** on the warning window that displays.

**Note:** The warning window tells you that you will not be able to change any IDM properties file options once you click **Continue** and move to the next screen. Subsequently, the only way to change these options is to exit/abandon the partially completed create-response-file process and start the process again, from the beginning (Section 5.3.2, "Creating a New Provisioning Response File").

**Figure 5–10  IDM Properties File Screen**

5.3.2.16 **Identity Management Configuration Screen**

In these screens, shown in Figure 5–11 and Figure 5–12, enter the **Identity Management Configuration** parameters for the identity management infrastructure associated with this environment.

- **Super User Name** - enter the name of an existing user that should be granted administrator and functional setup privileges.
- **Create Administrators Group** - check this box to create an "Administrators" group, whose members have specialized privileges for all Oracle Fusion Middleware components.

- **Create Monitors Group** - check this box to create a "Monitors" group, whose members have read-only administrative privileges to Oracle WebLogic domains.

- **Create Operators Group** - check this box to create an "Operators" group, whose members have Monitors privileges to Oracle WebLogic domains.

---

**Note:** The Administrators, Monitors, and Operators LDAP groups are mandatory. If you do not create the Administrators group, the pre-verify target will fail. If you do not create the Operators and Monitors groups, the pre-configure target will fail.

---

- **Identity Store Server Type** - select "Oracle Virtual Directory" from the dropdown list to indicate the type of identity store you set up.

---

**Important Notes:**

- **If the Oracle Identity Manager being used in the form of an Oracle Identity Manager enterprise deployment, select the "Oracle Virtual Directory" option.**

- **If a single-node Oracle Identity Manager is used or if, for any reason, Oracle Identity Manager did not configure Oracle Virtual Directory, use the default "Oracle Internet Directory" option.**

---

- **Use SSL to communicate with Identity Store** - this feature is currently not enabled.

- **Identity Store Host** - enter the host or DNS name for your identity store LDAP service. (The value can be the Load Balancer host of the Oracle Identity Management enterprise deployment setup.)

- **Identity Store Port** - port assigned to the identity store.

- **Identity Store Secure Port** - the SSL port for the identity store. (This option is currently not available.)

- **Identity Store User DN** - enter the Distinguished Name of the user you set up with read-write access to the LDAP.

- **Identity Store Password** - enter the password you set up for the user with read-write access to the LDAP.

- **Identity Store Read-Only User DN** - the Distinguished Name of the user with read-only access to the Identity Store LDAP.

- **Identity Store Read-Only Password** - enter the password you set up for the identity store read-only user.

- **Identity Store User Name Attribute** - the type of user name attribute you configured in the identity store. Valid values are: user ID (uid), common name (CN), or email address.
- **Identity Store User Base DN** - enter the root Distinguished Name assigned to the upload of applications user data. This is the root for all the user data in your identity store.

- **Identity Store Group Base DN** - enter the root Distinguished Name for all the group data in your identity store.

- **OIM Admin Server Host** - enter the name of the host where the OIM Administration Server is installed. (This value can be either the host name or the VIP name of host.)

- **OIM Admin Server Port** - the port where the OIM Administration Server listens.

- **OIM Administrator User Name** - enter the OIM (Oracle Identity Manager domain) Oracle WebLogic Server Administration user name.

  **Note:** This user is different from the “XELSYSADMIN” OIM product administrator user name. The correct OIM (Oracle Identity Manager domain) Oracle WebLogic Server Administration user name is found in the WLSADMIN property in the idmsetup.properties file.

- **OIM Administrator Password** - enter the password you set up for the OIM (Oracle Identity Manager domain) Oracle WebLogic Server Administration user.

- **OIM Managed Server Host** - enter the virtual or real host name of the Oracle Identity Manager Managed Server where SPML callback and other OIM services are running. (This value can be either the host name or the VIP name of the host, based on the listen address where the OIM Managed Server is listening.)

- **OIM Managed Server Port** - enter the virtual or real port where the Oracle Identity Manager Managed Server listens.

- **OIM HTTP Internal Endpoint URL** - the access point on the Oracle HTTP Server for Oracle Identity Manager services in an Oracle Identity Management enterprise deployment, or the Oracle Identity Manager Managed Server access point for a non-enterprise deployment. This URL is used for deployment.

  Enter the http termination address of Oracle Access Manager. Terminates at either a load balancer or the Oracle HTTP Server.

- **OIM HTTP(S) External Endpoint URL** - the access point to use for taxonomy. This is not used for deployment. Note that a non-secure connection is used unless you provide an https URL.

  **Note:** In a single-node Oracle Identity Manager environment, the IDM properties file does not load any value into this field because secure URL setup is not performed. Subsequently, you will need to copy the non-secure URL from the OIM HTTP Internal Endpoint URL field to the OIM HTTP(S) External Endpoint URL field.
Click **Next** to continue.
5.3.2.17 Access and Policy Management Configuration Screen

Access and Policy Management Configuration provides identity administration and security functions such as Single Sign-On and policy management. In these screens, shown in Figure 5–13 and Figure 5–14, supply the following parameters to integrate with your existing Oracle Identity Management environment:

- **OAM Admin Server Host** - enter the name of the host where the Oracle Access Manager Administration Server is installed.
- **OAM Admin Server Port** - the port where the Oracle Access Manager Administration Server listens.
- **OAM Administrator User Name** - enter the name you assigned this user when you installed Oracle Access Manager.
- **OAM Administrator Password** - enter the password you assigned this user when you installed Oracle Access Manager.
- **OAM AAA Server Host** - enter the name of the proxy host where Oracle Access Manager is installed. (This value can be either the host name or the VIP name of host.)
- **OAM AAA Server Port** - the port number for the Oracle Access Manager listener on the OAM proxy host.
- **Access Server Identifier** - name used to identify the Oracle Access Server.
- **Enable Second Primary Oracle Access Manager** - select this check box to name a second Primary Oracle Access Manager for high availability.
- **Second Access Server Identifier** - enter the name of the second Primary Oracle Access Manager Server.

---

**Notes:** After connecting to the primary access server, provisioning is able to get the second access server connection information.

However, if you have a second access server in Oracle Identity Manager and you select the option to load the properties from the Oracle Identity Manager setup properties file, you must enter the server name manually. This is necessary because the Oracle Identity Manager setup properties file does not have a property entry that will get the name of the second access server automatically.

---

- **Webgate Password/Confirm Password** - specify a password for the Resource WebGate. It must contain at least eight alphanumeric characters and at least one digit or punctuation mark. Re-type to Confirm the password. If seeding of security data is disabled, the password must be the existing WebGate password.
- **Default to Identity Store** - the default values of this section depend on whether this field is enabled. If the checkbox is unchecked, which is the default, the OPSS Policy Store Host, OPSS Policy Store Read-Write User Name and OPSS Policy Store Password fields are empty by default and do not inherit values from your identity store.
- **Use SSL to communicate with OPSS Policy Store** - this option is currently not available.
- **OPSS Policy Store Host** - enter the host name for OID where Oracle Platform Security Services (OPSS) policies are to be seeded. (The value can be the Load Balancer host of the Oracle Identity Management enterprise deployment setup.)
- **OPSS Policy Store Port** - number of the OID port for OPSS policy store.
- **OPSS Policy Store Secure Port** - the secure port for OID.
- **OPSS Policy Store Read-Write User Name** - enter the Distinguished Name of the user that you set up with write privileges to the OPSS policy store.
- **OPSS Policy Store Password** - enter the password that you set up for the OPSS policy store user with read-write privileges.
- **OPSS Policy Store JPS Root Node** - enter the Distinguished Name of the node to be used as the OPSS policy root for Oracle Fusion Applications. The field is read-only and the default value is set as `cn=FAPolicies`.
- **Create OPSS Policy Store JPS Root Node** - selecting this option creates the OPSS JPS Root Node; since the node was created during the Oracle Identity Management provisioning process, there is no need to select the option here.
- **IDM Keystore File** - enter the location of the JKS keystore containing the certificates for the Oracle Identity Management components. (This option is currently not available.)
- **IDM Keystore Password** - enter the password that you set up for the IDM Keystore File. (This option is currently not available.)

*Figure 5–13  Access and Policy Management Configuration Screen (1)*
Click Next to continue.

5.3.2.18 IDM Database Configuration Screen

In this screen, shown in Figure 5–15, enter the configuration details you specified when you installed the database for the Oracle Identity Management.

Select Real Application Clusters Database if you have installed an Oracle Identity Management database based on Oracle Real Application Clusters (Oracle RAC). Specify the Service Name.

To identify the Oracle RAC instances, click Add to create a new row in the table. To delete a row, select it and click Remove. Enter the following information for each instance:

- **Host Name** - the name of the Oracle RAC host virtual host for each instance of an Oracle Identity Management database.
- **Port** - listening port of the RDBMS.
- **Instance Name** - the Oracle RAC database instance name
- **Service Name** - the global database name for the transaction database that you installed. Used to distinguish this database instance from other instances of Oracle Database running on the same host.

Specify the database schema and password used to store the Metadata Service (MDS) Repository data for Oracle Web Services Policy Manager.

- **Schema Owner** - the MDS schema in the Oracle Identity Management database that is used by Oracle Web Services Policy Manager.
- **Schema Owner Password** - the password for the MDS schema.
Click Next to continue.

5.3.2.19 Summary Screen

Review the information on this screen. If it is not what you expected or intended, click Back to return to the interview flow screen that must be changed, or click the name of the screen in the left navigation pane.

Descriptive information for this response file (if any) and database connection details are displayed under Global Settings. Each product family Domain to be created is listed along with the configuration details you have previously entered.

If you are satisfied with the information as displayed, specify the following information:

- **Provisioning Response File Name** - the executable file that contains the configuration details of this provisioning response file.
- **Provisioning Summary** - a text document that summarizes the details of this provisioning response file. You cannot use this file to execute the response file.
- **Directory** - the directory path to the location where you save the response file and the summary document.

Make a note of the name and location where you saved the executable file. You must supply this information to the Installation Wizard for other options.

Click Finish to save the file_name.rsp and provisioning.summary files to ORACLE_BASE/repository/provisioning/bin.

5.3.3 Running the Provisioning Commands to Install Components

The provisioning commands that install components perform the following tasks:
- Set up WEBHOST1
- Run the pre-verify phase
- Run the installation phase

Prerequisites for running the provisioning commands
Before running the provisioning commands that run the ant targets (preverify, install, and so on), do the following:

- Check the latest Oracle Fusion Applications release notes for any known workarounds.
- Ensure that the preverify target is passed before you move on to other targets.
- Ensure that all commands with ant targets say "Build Successful" when they pass.
- Set the JAVA_HOME variable to ORACLE_BASE/repository/jdk6.
- On CRMHOST1 and WEBHOST1, create the /etc/oraInst.loc file with the following entries:
  inventory_loc=ORACLE_BASE/oraInventory
  inst_group=usergroup
- For commands that fail, use the following location to debug:
  ORACLE_BASE/products/logs/provisioning/CRMHOST1/runProvisioning-targetname.log

Notes:
- In the provisioning commands that follow in these sections, the -override parameter takes the option override.properties. The override.properties file contains the changes that are required for responseFile values.
- The override.properties file can be an empty file. The values it contains exist only to overwrite the responseFile values.
- If for any reason you need to run any target again, run the following:
  ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target cleanup-targetname
  ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target restore-targetname
  Then run the target again.

- Using Oracle Recovery Manager (RMAN), manually back up both the Oracle Identity Manager file system and database before starting "Run the pre-verify phase". You can use the file-system and database manual backups to rebuild the Oracle Identity Manager environment if you need to repeat the Oracle Fusion Applications provisioning configure phases from the beginning ("Run the pre-verify phase").
- Using RMAN, manually back up the Oracle Fusion Applications file systems on both CRMHOST1 and WEBHOST1, and the Oracle Fusion Applications database after completing "Run the installation phase" in this section, and "Run the
pre-configure phase” through "Run the post-configure phase" in Section 5.4, "Configuring Components." Also, ensure that the manual backup .tar files are stored in your own separate restart folder (restart_mb).

---

**Note:** The provisioning process performs automatic incremental backups of Oracle Fusion Applications file systems on CRMHOST1 and WEBHOST1 after completing each provisioning target. The provisioning process then uses these automatic backups to run the current provisioning phase cleanup in order to restore the end of the previous provisioning phase file system. For more information, see "Running Cleanup and Restore" in Oracle Fusion Applications Installation Guide.

The provisioning process does not perform automatic database backups. Instead, it runs the available database undo script for the current provisioning phase from the code repository to restore the Oracle Fusion Applications database to the end of previous provisioning phase.

However, these automatic file-system backups are useful only if restoring to one immediate provisioning phase. (For example, if you notice some problem in post-configure and you want to repeat all provisioning targets from pre-configure to post-configure, these automatic file-system backups will not work.) In addition, ready-made database undo scripts are not available in the code repository to restore more than one previous provisioning phase. Consequently, it is recommended that you perform manual backups of file systems and the Oracle Fusion Applications database.

These manual backups can also be used to restore a previous provisioning target if an automatic backup should fail.

---

**Performing a manual backup**

Run the following commands for each provisioning target, "Run the installation phase" through "Run the post-configure phase", and for each host in the environment.

```
tar -C ORACLE_BASE/config -cf ORACLE_BASE/products/restart_mb/backup_target_name/shared_config.tar .

tar -C ORACLE_BASE/products/provisioning -cf ORACLE_BASE/products/restart_mb/backup_target_name/provisioning.tar .

tar -C /u02/local/oracle/config -cf ORACLE_BASE/products/restart_mb/backup_target_name/local_config.tar .
```

For more information see "Performing a Manual Backup" in Oracle Fusion Applications Installation Guide.

**Cleaning up and restoring from manual backups to repeat multiple configure targets after a configure failure**

Do the following:

1. Find any Oracle Fusion Applications or Oracle WebLogic Server configure processes (except Node Manager processes) running from the ORACLE_BASE location to be killed:

```
ps -ef | grep /u01/oracle
```
2. Run the following commands to restore the file system:

```bash
rm -Rf ORACLE_BASE/config
rm -Rf ORACLE_BASE/products/provisioning
rm -Rf /u02/local/oracle/config
mkdir ORACLE_BASE/config
mkdir ORACLE_BASE/products/provisioning
mkdir /u02/local/oracle/config

tar -xfv ORACLE_BASE/products/restart_mb/backup_target_name/shared_config.tar .
   -C ORACLE_BASE/config

tar -xfv ORACLE_BASE/products/restart_mb/backup_target_name/provisioning.tar .
   -C ORACLE_BASE/products/provisioning

tar -xfv ORACLE_BASE/products/restart_mb/backup_target_name/local_config.tar .
   -C /u02/local/oracle/config
```

3. Recover the Oracle Fusion Applications database from the RMAN backup that was done at the end of "Run the installation phase".

4. Repeat the provisioning of targets from "Run the pre-configure phase" through the end of the provisioning process.

Task 1 Set up WEBHOST1

For this task, WEBHOST1 is the host you configured in Figure 5–6, and WEBHOST1 and CRMHOST1 do not have a common shared storage. From CRMHOST1, copy ORACLE_BASE/repository to ORACLE_BASE on WEBHOST1.

Be sure to maintain the same directory structure on WEBHOST1.

Task 2 Run the pre-verify phase

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

- On CRMHOST1: `./runProvisioning.sh -responseFile ./file_name.rsp
   -override ./overrides.properties -target preverify`

- On WEBHOST1: `./runProvisioning.sh -responseFile ./file_name.rsp
   -override ./overrides.properties -target preverify`

Task 3 Run the installation phase

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

- On CRMHOST1: `./runProvisioning.sh -responseFile ./file_name.rsp
   -override ./overrides.properties -target install`

- On WEBHOST1: `./runProvisioning.sh -responseFile ./file_name.rsp
   -override ./overrides.properties -target install`

**Note:** If the relative path for the response file (`./file_name.rsp`) and override properties (`./overrides.properties`) does not work, give a fully qualified path instead.

5.4 Configuring Components

The provisioning commands that configure components perform the following tasks:

- Run the pre-configure phase
- Run the configure phase
- Run the configure secondary phase
- Run the post-configure phase
- Run the start-up phase
- Run the validate phase
- Configure email servers

**Note:** If any target fails and you have to run the configure stage again, you only need to cleanup/restore the target on that host and then run the target again.

To run cleanup/restore:

```
./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target cleanup-configure

./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target restore-configure
```

When the cleanup and restore builds are successful, you can run the configure target again.

This applies to all tasks related to configuring components.

**Note:** If the relative path for the response file (.file_name.rsp) and override properties (.overrides.properties) does not work, give a fully qualified path instead.

---

**Task 1 Run the pre-configure phase**

Before running the pre-configure phase, copy the ORACLE_BASE/products/webtier_dmz_artifacts.zip file from the CRMHOST1 non-DMZ computers to WEBHOST1 ORACLE_BASE/products. The webtier_dmz_artifacts.zip file contains all the required files for the DMZ setup.

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

- **On CRMHOST1:** ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target preconfigure
- **On WEBHOST1:** ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target preconfigure

**Task 2 Run the configure phase**

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

- **On CRMHOST1:** ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target configure
- **On WEBHOST1:** ./runProvisioning.sh -responseFile ./file_name.rsp -override ./overrides.properties -target configure

**Task 3 Run the configure secondary phase**

Run the following commands from ORACLE_BASE/repository/provisioning/bin:
Performing Post-Provisioning Tasks

On CRMHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target configure-secondary

On WEBHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target configure-secondary

Task 4 Run the post-configure phase

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

On CRMHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target postconfigure

On WEBHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target postconfigure

Task 5 Run the start-up phase

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

On CRMHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target startup

On WEBHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target startup

Task 6 Run the validate phase

Run the following commands from ORACLE_BASE/repository/provisioning/bin:

On CRMHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target validate

On WEBHOST1: ./runProvisioning.sh -responseFile ./_filename.rsp -override ./overrides.properties -target validate

When all the scripts have run successfully, Oracle Fusion Customer Relationship Management provisioning is complete. For information about the resulting directory structure, see Section 3.4.1, "Directory Structure."

For information about the tasks these scripts perform, see Oracle Fusion Applications Installation Guide.

Task 7 Configure email servers

To configure an email server as a delivery channel to be used with Oracle Business Intelligence Publisher, see "Adding an E-mail Server" in the chapter "Setting Up Delivery Destinations" in Oracle Fusion Middleware Administrator's Guide for Oracle Business Intelligence Publisher (Oracle Fusion Applications Edition).

5.5 Performing Post-Provisioning Tasks

After provisioning, there are several tasks you must perform.

5.5.1 Validation

After provisioning, access the following URLs, ensuring that the Administration console is visible:

- http://fininternal.mycompany.com:7777/console
- http://crminternal.mycompany.com:7777/console
- http://hcminternal.mycompany.com:7777/console
Starting and Stopping the Provisioned Environment

- http://commoninternal.mycompany.com:7777/console

For the following URLs, ensure that the Oracle Fusion Applications login screen is visible.

- https://crmexternal.mycompany.com/crmPerformance/faces/TerritoriesMain
- https://crmexternal.mycompany.com/marketing/faces/LeadsDashboard
- https://crmexternal.mycompany.com/orderCapture/faces/SalesCatalogAdmin
- https://biexternal.mycompany.com/analytics

5.5.2 Other Tasks

Other post-installation tasks include the following:

- Applying patches to your new environment
- Creating upgradeLDAPUsersForSSO.props
- Adding privileges to IDStore and Policy Store entities
- Reconciling users and roles from the IDStore into Oracle Identity Manager
- Deleting Oracle Business Intelligence restart files

For information about performing these tasks, see "Postinstallation Tasks" in Oracle Fusion Applications Installation Guide.

5.6 Starting and Stopping the Provisioned Environment

The fastartstop.sh script offers a wide range of options to start and stop the servers in the provisioned Oracle Fusion Applications environment. The script resides in the following location:

ORACLE_BASE/products/fusionapps/applications/lcm/ad/bin/fastartstop.sh

For example:

./fastartstop.sh -Start|-Stop|-Bounce|-StartBIPS|-StopBIPS
-all|-domains domain_name, domain_nameN, domain_nameN|-BIPSerServerComponents
-all|-domains "domain_name(server:all,server:managed_server_name|AdminServer),domain_name(server:all,server:managed_server_name|AdminServer)"|-BIPSerServerComponents
[-componentType OHS |-componentDomain component_domain_name] [iasInstance=instance_id][iasComponent=component_id][-processType=component_type]
[-clusterType soa]
-username user_name
-appbase FA_ORACLE_HOME
[-loglevel log_level]
[-timeout timeout_period]
[--help]
For more information, see "Starting and Stopping" in the Oracle Fusion Applications Administrator’s Guide.
Scaling Out Oracle HTTP Server

The first Oracle HTTP Server was configured during the provisioning process (see Chapter 5). This chapter describes how to scale out Oracle HTTP Server for additional hosts.

This chapter includes the following topics:

- Section 6.1, "Performing the Scaleout"
- Section 6.2, "Performing WebGate Post-Installation Steps"
- Section 6.3, "Installing WebGate Patches"
- Section 6.4, "Wiring Oracle HTTP Server with Load Balancer"
- Section 6.5, "Validating Oracle HTTP Server on WEBHOST2"

6.1 Performing the Scaleout

To scale out Oracle HTTP Server:

1. Reboot WEBHOST2 to start the scaleout from a clean machine.

   Note: WEBHOST2 and WEBHOST1 should be identical machines.

2. Create the directory ORACLE_BASE/repository/installers with the same user that installed Oracle HTTP Server on WEBHOST1.

3. Copy or ftp the installers and jdk6 from WEBHOST1 to WEBHOST2:

   WEBHOST1> ORACLE_BASE/repository/installers/webgate

   to

   WEBHOST2> ORACLE_BASE/repository/installers

   WEBHOST1> ORACLE_BASE/repository/installers/webtier

   to

   WEBHOST2> ORACLE_BASE/repository/installers

   WEBHOST1> ORACLE_BASE/repository/jdk6

   to

   WEBHOST2> ORACLE_BASE/repository/jdk6
4. Run the following command to install Oracle Web Tier on WEBHOST2 (oraInventory should be located in ORACLE_BASE/oraInventory):

   ORACLE_BASE/repository/installers/webtier/Disk1/runInstaller

   The Oracle Fusion Middleware 11g Oracle Web Tier Utilities Configuration Welcome screen opens.
   Click Next. The Install Software Updates screen opens.

5. Select the appropriate options, and then click Next to start the installation.
   The Select Installation Type screen, shown in Figure 6–1, opens.

   **Figure 6–1 Select Installation Type Screen**

6. Select Install Software - Do Not Configure and click Next.
   The Prerequisite Checks screen, shown in Figure 6–2, opens.
Performing the Scaleout

Scaling Out Oracle HTTP Server

Figure 6–2  Prerequisite Checks Screen

Click Next. The Specify Installation Location screen, shown in Figure 6–3, opens.

Figure 6–3  Specify Installation Location Screen

Select the path to Oracle Middleware Home and enter a name for the home directory. For example, /u01/oracle/products/webtier_mwhome/. Click Next.

7. In the Specify Security Updates screen, shown in Figure 6–4, do the following:
- Enter an email address
- Indicate that you wish to receive security updates from My Oracle Support
- Enter your My Oracle Support password

**Figure 6–4 Specify Security Updates Screen**

![Specify Security Updates Screen]

Click **Next**. The Installation Summary screen, shown in **Figure 6–5**, opens.
8. Click **Install**. The Installation Progress screen, shown in **Figure 6–6**, opens.

**Figure 6–6  Installation Progress Screen**

Click **Next** when the installation has finished. The Installation Complete screen, shown in **Figure 6–7**, opens.

**Figure 6–7  Installation Complete Screen**
Click **Finish**.

9. View the directory structure that has been created:

```
cd ORACLE_BASE/products/webtier_mwhome
```

10. Install the Oracle Web Tier patches:

**Note:** If any directory under `ORACLE_BASE/repository/installers/webtier/patch` exists, perform Steps a and b, listed below. If no directory exists, skip these steps and continue to Step 11.

**a.** Add `ORACLE_BASE/products/webtier_mwhome/webtier/OPatch` to the `$PATH` environment variable. Then set or change `$ORACLE_HOME` to `ORACLE_BASE/products/webtier_mwhome/webtier`, as shown in the following example:

```
export PATH=ORACLE_BASE/products/webtier_mwhome/webtier/OPatch:$PATH
export ORACLE_HOME=ORACLE_BASE/products/webtier_mwhome/webtier
```

**Note:** Running the `$ which opatch` command will give you the path specified above.

**b.** To install a patch, first change directory to the folder that corresponds to each existing patch number, and run the following command:

```
opatch apply
```

11. Begin configuring the Oracle Web Tier components:
Performing the Scaleout

Performing the Scaleout

```
cd ORACLE_BASE/products/webtier_mwhome/webtier/bin
run ./config.sh
```

The Oracle Fusion Middleware 11g Oracle Web Tier Utilities Configuration Welcome screen opens.

Click Next. The Configure Components screen, shown in Figure 6–8, opens.

**Figure 6–8 Configure Components Screen**

![Configure Components Screen](image)

12. Select **Oracle HTTP Server** and **Associate Selected Components with WebLogic Domain**.

13. Click Next. The Specify WebLogic Domain screen, shown in Figure 6–9, opens.
14. Enter the following:
   - a domain host name; for example, CRMHOST1
   - a domain port number; for example, COMMONDOMAIN ADMIN PORT
   - your CommonDomain Administration Server user name
   - your CommonDomain Administration Server password

   **Note:** Associate Oracle HTTP Server with the CommonDomain that Provisioning installed in Chapter 5.

15. Click **Next**. The Specify Component Details screen, shown in Figure 6–10, opens.
16. Do the following:
   - Select the instance home location; for example, /u01/oracle/config/CommonDomain_webtier1
   - Enter the instance name; for example, CommonDomain_webtier1
   - Enter the Oracle HTTP Server component name; for example ohs2

17. Click Next. The Configure Ports screen, shown in Figure 6–11, opens.
18. Select **Specify Ports using Configuration file** and click **View/Edit**.

In the text field that displays, shown in **Figure 6–12**, enter **OHS port = 7777**.

**Note:** Copy the `staticports.ini` file from `repository/installers/webtier/Disk1/stage/Response` to `ORACLE_BASE/staticports.ini`. 
Figure 6–12 Configure Ports Screen (2)

Click *Save* and then click *Next*.

The Specify Security Updates screen, shown in Figure 6–13, opens.

Figure 6–13 Specify Security Updates

19. Do the following:
   - Enter an email address
- Indicate that you wish to receive security updates from My Oracle Support
- Enter your My Oracle Support password

20. Click Next. The Installation Summary screen, shown in Figure 6–14, opens.

*Figure 6–14  Installation Summary Screen*

21. Click Configure to install the configuration. The Configuration Progress screen, shown in Figure 6–15, opens.
22. Click Next.

When the installation completes, the Installation Complete screen, shown in Figure 6–16, opens.

23. Click Finish.
24. Copy or ftp the FusionVirtualHost files from WEBHOST1 to WEBHOST2:

WEBHOST1> ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf
to
WEBHOST2> ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf/

**Note:** If you get an error message saying that the FusionSSL.conf file is missing, copy the file from ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1 on WEBHOST1 to the ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2 folder on WEBHOST2.

25. After the copy, change all WEBHOST1 entries in the .conf files to WEBHOST2.

26. Restart the Oracle HTTP Server instance:

WEBHOST2> cd ORACLE_BASE/config/CommonDomain_webtier1/bin
WEBHOST2> ./opmnctl stopall
WEBHOST2> ./opmnctl startall

27. From ORACLE_BASE/repository/installers/webgate/Disk1, start the WebGate installation:

./runInstaller

28. When prompted, specify the path to the JDK:

ORACLE_BASE/repository/jdk6

29. When the Welcome screen opens, click Next. The Prerequisite Checks screen, shown in Figure 6–17, opens.

*Figure 6–17 Prerequisite Checks Screen*
30. When the checking process completes, click Next. The Installation Location screen, shown in Figure 6–18, opens.

**Figure 6–18 Installation Location Screen**

![Installation Location Screen](image)

31. Enter an Oracle Middleware Home location Oracle Home Directory, ORACLE_BASE/products/webtier_mwhome, and click Next. The Installation Summary screen, shown in Figure 6–19, opens.
Performing the Scaleout

**Figure 6–19  Installation Summary Screen**

32. Click **Save** if you wish to save the response file. Click **Install** to start the installation. Following an interim screen, the one shown in Figure 6–20 opens. During installation, a progress screen, shown in Figure 6–20, opens.

**Figure 6–20  Installation Progress Screen**

33. When the installation finishes, click **Next**. The Installation Complete screen opens.
34. Click **Save** if you wish to save the installation details. Click **Finish** to complete the WebGate installation.

### 6.2 Performing WebGate Post-Installation Steps

After installing WebGate, do the following:

1. Append environment variable `LD_LIBRARY_PATH` with the Web Tier library path
   `ORACLE_BASE/products/webtier_mwhome/webtier/lib`:

   ```
   WEBHOST2> export LD_LIBRARY_PATH=ORACLE_BASE/products/webtier_mwhome/webtier/lib:$LD_LIBRARY_PATH
   ```

2. Run the following commands:

   ```
   # Usage: deployWebGateInstance.sh -w <WebGate_instancedir> -oh WebGate_Oracle_Home
   $ cd ORACLE_BASE/products/webtier_mwhome/webgate/webgate/ohs/tools/deployWebGate
   $ ./deployWebGateInstance.sh -w ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs1 -oh ORACLE_BASE/products/webtier_mwhome/webgate
   $ cd ORACLE_BASE/products/webtier_mwhome/webgate/webgate/ohs/tools/setup/InstallTools
   $$ ./EditHttpConf -w ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2 -oh ORACLE_BASE/products/webtier_mwhome/webgate -o webgate.conf
   ```

3. Do the following on **WEBHOST1**:
   a. From `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/webgate/config`, copy the following to `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs2/webgate/config` on **WEBHOST2**:
      ```
      "ObAccessClient.xml","cwallet.sso","password.xml"
      ```
   b. From `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/webgate/config/simple`, copy the following to `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs2/webgate/config/simple` on **WEBHOST2**:
      ```
      "aaa_key.pem","aaa_cert.pem"
      ```

### 6.3 Installing WebGate Patches

If the `ORACLE_BASE/repository/installers/webgate` location has a patch directory, perform the steps in this section.

**Note:** Ensure that you install all the patches that are located in`ORACLE_BASE/repository/installers/webgate/patch/`.

To install WebGate patches, do the following:

1. Change directory to `ORACLE_BASE/repository/installers/webgate/patch/`. 

2. If any directory under patch exists, perform Steps a and b, listed below. If no directory exists, skip these steps and continue to Section 6.4, "Wiring Oracle HTTP Server with Load Balancer."

a. Add \texttt{ORACLE\_BASE/products/webtier\_mwhome/webgate/OPatch} to the \texttt{\$PATH} environment variable. Then set or change \texttt{\$ORACLE\_HOME} to \texttt{ORACLE\_BASE/products/webtier\_mwhome/webgate/}, as shown in the following example:

   \begin{verbatim}
   export PATH=ORACLE_BASE/products/webtier_mwhome/webgate/OPatch:$PATH
   export ORACLE_HOME=ORACLE_BASE/products/webtier_mwhome/webgate
   \end{verbatim}

   \textbf{Note:} Running the \texttt{\$ which opatch} command will give you the path specified above.

b. To install a patch, first change directory to the folder that corresponds to each existing patch number, and run the following command:

   \begin{verbatim}
   opatch apply
   \end{verbatim}

   After you install the patches, restart the web server. Oracle HTTP Server scaleout is complete, and WEBHOST1 and WEBHOST2 should behave identically.

6.4 Wiring Oracle HTTP Server with Load Balancer

Configure your load balancer to route all HTTP requests to the hosts running Oracle HTTP Server, that is, WEBHOST1 and WEBHOST2.

To prevent repeat authorization from occurring, enable sticky session (insert cookie) on the load balancer when Oracle HTTP Server is the front end to Oracle WebLogic Server.

You also must set Monitors for HTTP.

6.5 Validating Oracle HTTP Server on WEBHOST2

To validate after the installation is complete:

1. Check that it is possible to access the Oracle HTTP Server home page using the following URLs:

   - \texttt{http://webhost1.mycompany.com:10601}
   - \texttt{http://webhost2.mycompany.com:7777}

2. Stop WEBHOST1:

   \texttt{WEBHOST1> cd ORACLE\_BASE/config/CommonDomain_webtier/bin
   WEBHOST1> ./opmnctl stopall}

3. Access the following URLs to ensure that the Administration console is visible:

   - \texttt{http://crminternal.mycompany.com:7777console}
   - \texttt{http://hcminternal.mycompany.com:7777/console}
   - \texttt{http://scminternal.mycompany.com:7777/console}
   - \texttt{http://commoninternal.mycompany.com:7777/console}
4. Access the following URLs to ensure that the Oracle Fusion Applications login screen is visible:
   - https://crmexternal.mycompany.com/crmPerformance/faces/TerritoriesMain

5. Run the following commands:

```
WEBHOST1> cd ORACLE_BASE/config/CommonDomain_webtier/bin
WEBHOST1> ./opmnctl startall
```
This chapter describes how to configure Node Manager in accordance with enterprise deployment recommendations.

This chapter includes the following topics:

- Section 7.1, "Prerequisites for Setting Up Node Manager"
- Section 7.2, "Setting Up Node Manager for CRMHOST2"
- Section 7.3, "Creating the Identity Keystore on CRMHOST2"

### 7.1 Prerequisites for Setting Up Node Manager

Before setting up Node Manager, ensure the following:

- You are starting with a clean machine, if it is the first time it is being setup
- The /etc/hosts file has proper entries. To verify, ping this machine with the fully qualified name of the machine.
- The user created on CRMHOST2 should be the same as the user on CRMHOST1
- The directory structure /u01/oracle (ORACLE_BASE) is mounted to same shared file system as CRMHOST1
- The directory structure /u02/local/oracle/config on CRMHOST2 has been created
- The initial Oracle Fusion Customer Relationship Management deployment on CRMHOST1 has already been done and verified by provisioning

### 7.2 Setting Up Node Manager for CRMHOST2

Do the following:

1. Run the following command:
   
   CRHOST2> cd ORACLE_BASE/config/nodemanager

2. In the nodemanager directory, copy the content of the node-specific directory to CRMHOST2. In this case, CRMHOST1 is the node-specific directory.
   
   CRHOST2> cp -r CRMHOST1 CRMHOST2

3. Change directory to CRMHOST2. You should see the following files:

   nm_data.properties  nodemanager.log  startNodeManagerWrapper.sh
   nodemanager.domains  nodemanager.properties
4. In the nodemanager.domains file, edit all the domain paths that are local to CRMHOST2. For example, CRMDomain=/u02/local/oracle/config/domains/CRMHOST2/CRMDomain.

Note: Because BIDomain is a bit different, an example path would be BIDomain=/u02/local/oracle/config/domains/CRMHOST1/BIDomain.

5. In the startNodeManagerWrapper.sh file, change NM_HOME to ORACLE_BASE/config/nodemanager/CRMHOST2.

6. In the nodemanager.properties file:
   - Add or modify the following lines:
     ```
     KeyStores=CustomIdentityAndCustomTrust
     CustomIdentityKeyStoreFileName=ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks
     CustomIdentityPrivateKeyPassPhrase=keypassword
     CustomIdentityAlias=CRMHOST2_fusion
     ```

   Note: keypassword is the password given in the ORACLE_BASE/products/provisioning/plan/provisioning.plan file.

   Since the passwords in the response and plan files are encrypted, take note of or save the Node Manager password you enter when creating the provisioning response file. For more information, see Section 5.3.2.5, “Installation Location Screen.”

   - Ensure that the path to the local machine /u02/local/oracle/nodemanager/ exists, and that the LogFile value is pointing to /u02/local/oracle/nodemanager/CRMHOST2.log.
   - Ensure that the path for DomainsFile and NodeManagerHome are correct for CRMHOST2.

7.3 Creating the Identity Keystore on CRMHOST2

Provisioning has created the identity keystore CRMHOST1_fusion_identity.jks for CRMHOST1. Subsequently, the identity keystore CRMHOST2_fusion_identity.jks must be created for CRMHOST2.

Do the following to create the keystore:

1. Change directory to ORACLE_BASE/config/keystores.
   - Ensure the CRMHOST1_fusion_identity.jks and fusion_trust.jks files are present.

2. Back up fusion_trust.jks to fusion_trust.jks.org.

3. Run the following command to set the CLASSPATH:
   ```
   CRMHOST2> source ORACLE_BASE/products/fusionapps/wlserver_10.3/server/bin/setWLSEnv.sh
   ```
Ensure that the CLASSPATH has been set:

```bash
CRMHOST2> which keytool
```

The output should point to the `ORACLE_BASE/products/fusionapps/jdk6/jre/bin/keytool`.

4. Run the following command to create the keypair for `CRMHOST2_fusion_identity.jks`:

```bash
CRMHOST2> keytool -genkeypair -keyalg RSA -alias CRMHOST2_fusion -keypass keypassword -keystore CRMHOST2_fusion_identity.jks -storepass keystorepassword -validity 180 -dname 'CN=CRMHOST2, OU=defaultOrganizationUnit, O=defaultOrganization, C=US'
```

where

- `keystorepassword` is the password given in the `ORACLE_BASE/products/provisioning/plan/provisioning.plan` file
- `keypassword` is the password given in the `ORACLE_BASE/products/provisioning/plan/provisioning.plan` file

5. Run the following command to export the certs:

```bash
CRMHOST2> keytool -exportcert -alias CRMHOST2_fusion -keystore CRMHOST2_fusion_identity.jks -storepass keystorepassword -rfc -file /tmp/appIdentityKeyStore.jks
```

6. Run the following command to import the certs:

```bash
CRMHOST2> keytool -importcert -noprompt -alias CRMHOST2_fusion -file /tmp/appIdentityKeyStore.jks -keystore fusion_trust.jks -storepass keystorepassword
```

7. Verify that the file `CRMHOST2_fusion_identity.jks` has been created in the directory `ORACLE_BASE/config/keystores` directory.

Notes:

- It is recommended to keep the commands in a file and then execute it.
- Since the passwords in the response and plan files are encrypted, take note of or save the Node Manager password you enter when creating the provisioning response file. For more information, see Section 5.3.2.5, "Installation Location Screen."

- If the alias `CRMHOST2_fusion` exists, run this command to delete it:

```bash
keytool -delete -alias CRMHOST2_fusion -keystore fusion_trust.jks -storepass keystorepassword
```

The following command will display the certificates in the trust keystore:

```bash
keytool -list -keystore fusion_trust.jks -storepass keystorepassword
```

Setting Up Node Manager for an Enterprise Deployment 7-3
8. Start Node Manager on CRHOST2 by running the following command:

```
ORACLE_BASE/config/nodemanager/CRHOST2/startNodeManagerWrapper.sh &
```
This chapter describes how to scale out the Oracle Fusion Customer Relationship Management domain.

This chapter includes the following topics:

- Section 8.1, "Overview of the Oracle Fusion Customer Relationship Management Domain"
- Section 8.2, "Prerequisites for Scaling Out the Oracle Fusion Customer Relationship Management Domain"
- Section 8.3, "Configuring Oracle Coherence for the odi_server Managed Server"
- Section 8.4, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 8.5, "Packing and Unpacking the Managed Server Domain Home"
- Section 8.6, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 8.7, "Configuring Data Quality for Scale Out"
- Section 8.8, "Oracle HTTP Server Configuration"
- Section 8.9, "Configuring Server Migration for the Managed Servers"
- Section 8.10, "Validating the System"

8.1 Overview of the Oracle Fusion Customer Relationship Management Domain

The Oracle Fusion Customer Relationship Management application is a very distributed and modularized one. Applications within Oracle Fusion Customer Relationship Management, which are deployed on the domain, are the following:

- Marketing
- Sales
- Territory Management
- Customer Management
- Order Capture
- Email Marketing
- OutLook/Mobile
- CRM Common
In addition to the applications, the Oracle Fusion Customer Relationship Management domain also contains Oracle Fusion Customer Relationship Management Analytics, which is the Oracle BI Enterprise Edition broker application that interfaces with Oracle Application Development Framework, Oracle BI Enterprise Edition, and Oracle Data Integrator agent for data import flow.

Figure 2-3 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Customer Relationship Management domain within the overall reference enterprise deployment topology.

### 8.2 Prerequisites for Scaling Out the Oracle Fusion Customer Relationship Management Domain

Before you begin, ensure that Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

### 8.3 Configuring Oracle Coherence for the odi_server Managed Server

Oracle recommends using unicast communication in odi_server enterprise deployments, unless use of multicast is a must. Consider using multicast communication for large Oracle Data Integrator clusters with approximately 20 or more Oracle Data Integrator Managed Servers.

**Note:** An incorrect configuration of the Oracle Coherence framework that is used for deployment may prevent the odi_server Managed Server from starting. Oracle recommends the configuration described in this section.

Unicast communication does not enable nodes to discover other cluster members automatically when a new Oracle Data Integrator server is added to a cluster. Consequently, you must specify the nodes that belong to the cluster. You do not need to specify all of the nodes of a cluster, however. You need only specify enough nodes so that a new node added to the cluster can discover one of the existing nodes. Consequently, when a new node has joined the cluster, it is able to discover all of the other nodes in the cluster. Additionally, in configurations such as Oracle Data Integrator enterprise deployments, where multiple IPs are available in the same box, you must configure Oracle Coherence to use a specific host name to create the Oracle Coherence cluster.

**Tip:** To guarantee high availability during deployments of odi_server Managed Servers, specify enough nodes so that at least one of them is running at any given time.

Specify the nodes using the `–Doracle.odi.coherence.wka n` system property, where `n` is the number for each Oracle HTTP Server. The numbering starts at 1. This numbering must be sequential and must not contain gaps. In addition, specify the host name used by Oracle Coherence to create a cluster through the `tangosol.coherence.localhost` system property. Set this property by adding the `-Dtangosol.coherence.localhost` parameters to the Arguments field of the Oracle WebLogic Server Administration Console's **Server Start** tab.

To add the virtual-host names to Oracle Coherence:

2. In the Domain Structure window, expand the Environment node.

3. Click Servers.
   The Summary of Servers page appears.

4. Select odi_server1 (represented as a hyperlink) from the column of the table.
   The Settings page appears.

5. Click Lock & Edit.

6. Click the Server Start tab.

7. Change the existing properties if necessary, and enter new properties into the Arguments field:

   -Dtangosol.coherence.localport=9066
   -Dtangosol.coherence.localhost=CRMHOST1
   -Doracle.odi.coherence.wka1=CRMHOST1
   -Doracle.odi.coherence.wka1.port=9066
   -Doracle.odi.coherence.wka2=CRMHOST2
   -Doracle.odi.coherence.wka2.port=9066
   -DJDBCProgramName=DS/CRMDomain/odi_server1
   -Dserver.group=ODICluster

8. Click Save and Activate Changes.

9. Navigate to CRMDomain > Environment > Servers and select the Control tab.

10. Select the odi_server1 Managed Server in the table, click Shutdown, and then select the Force Shutdown Now option from dropdown list.

11. Start the odi_server1 Managed Server.

8.4 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

1. Log in to the Administration Server:

2. Navigate to CRMDomain > Environment > Machines.
   LocalMachine is located in the right-hand pane.

3. In the left-hand pane, click Lock & Edit.

4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST2
   - Machine operating system - Unix
5. Click Next.

6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>

   **Note:** The "localhost" default value here is wrong.

   - Listen port - 5556

7. Click Finish and activate the changes.

---

**8.5 Packing and Unpacking the Managed Server Domain Home**

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both the pack and unpack commands can be executed from CRMHOST2.

To pack and unpack the Managed Server domain home:

1. Change directory to `ORACLE_BASE/products/fusionapps/oracle_common/common/bin`.

2. Run the pack command:

   ```
   CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMDomain1/CRMDomain -template=ORACLE_BASE/user_templates/CRMDomain_managed.jar -template_name="CRM_Managed_Server_Domain"
   ```

3. Ensure that `/u02/local/oracle/config/domains/CRMHOST2/CRMDomain` is empty, and then run the unpack command:

   ```
   CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/CRMDomain -template=ORACLE_BASE/user_templates/CRMDomain_managed.jar
   ```

   Here, `ORACLE_BASE` is shared, and `/u02/local` is local to CRMHOST2.

---

**8.6 Cloning Managed Servers and Assigning Them to CRMHOST2**

To add a Managed Server and assign it to CRMHOST2:

1. Log in to the Administration Server:

2. Navigate to CRMDomain > Environment > Servers.

3. Switch to Lock & Edit mode.

4. Select the Managed Server checkbox (for example, SalesServer_1) and then click Clone.

5. Specify the following server identity attributes:
   - Server Name - SalesServer_2
Cloning Managed Servers and Assigning Them to CRMHOST2

Note: To ensure consistency in naming, copy the name of the server shown in Server Identity and paste it into the Server Name field. Then change the number to "_2".

- Server Listen Address - <CRMHOST2>
- Server Listen Port - leave "as is"

6. Click OK.

You now should see the newly cloned sales server, SalesServer_2.

7. Click SalesServer_2 and change the following attributes:
   - Machine - <CRMHOST2>
   - Cluster Name - accept the default, SalesCluster

    Note: Ensure that this cluster name is the same as the cluster name of the original Managed Server.

8. Click Save and then Activate Changes.

10. From the Name column, click the SalesServer_2 scaled-out server link.

11. Click Lock & Edit, and then select the Configuration tab.

12. Select the Keystores tab, and ensure that the keystores value is Custom Identity and Custom Trust.

13. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/config/keystores/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   h. Re-enter the Custom Trust Keystore Passphrase.
   i. Click Save.

14. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to Keystores.
   b. Change the Private Key Alias to CRMHOST2_fusion.
c. Change the Private Key Passphrase to the `<keypassword>`, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

d. Re-enter the `<keypassword>` from Step c for the Confirm Private Key Passphrase.

e. Click Save.

15. Select the **Server Start** tab and do the following:

a. Change the Arguments to reflect the name of your cloned managed server and make sure the server group is the correct cluster name. For example, you should see the following:

   ```
   -DJDBCProgramName=DS/CRMDomain/SalesServer_2
   -Dserver.group=SalesCluster
   ```

b. When cloning the `odi_server2` Managed Server only, ensure that the local coherence host and the coherence well known address (wka) properties are changed to the following:

   ```
   -Dtangosol.coherence.localport=9066
   -Dtangosol.coherence.localhost=CRMHOST2
   -Doracle.odi.coherence.wka1=CRMHOST2
   -Doracle.odi.coherence.wka1.port=9066
   -Doracle.odi.coherence.wka2=CRMHOST1
   -Doracle.odi.coherence.wka2.port=9066
   -DJDBCProgramName=DS/CRMDomain/odi_server2
   -Dserver.group=ODICluster
   ```

c. Click Save.

16. Select the **Logging** tab, and then select the **HTTP** tab.

17. Do the following:

a. Change the Log file name to `logs/access.log.%yyyyMMdd%`.

b. Change the rotation type to **By Time**.

c. Leave the **Limit number of retained files** option unchecked.

d. Leave the **Rotate log file on startup** option unchecked.

e. Click Save.

f. Expand **Advanced**.

g. Change the format to **Extended**.

h. Change the extended logging format fields to the following:

   ```
   date time time-taken cs-method cs-uri
   sc-status sc(X-ORACLE-DMS-ECID)
   cs(ECID-Context) cs(Proxy-Remote-User)
   cs(Proxy-Client-IP)
   ```

i. Click Save.

18. Click **Activate Changes**.

19. Repeat Steps 2 to 18 for all the Managed Servers on this domain.

20. Stop the domain’s Administration Server:

   ```
   CRMHOST1> ORACLE_BASE/config/domains/CRMHOST1/CRMDomain/bin/stopWebLogic.sh
   ```
21. Set the following environment variable on CRHOST2:

   ```
   export WLST_PROPERTIES="-Dweblogic.security.SSL.trustedCAKeyStore=${ORACLE_BASE}/config/keystores/fusion_trust.jks"
   ```

22. Start the domain’s Administration Server:

   ```
   CRHOST2> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
   ```

   ```
   CRHOST2> nmConnect(username='username', password='password',
   domainName='CRMDomain', host='CRMHOST1', port='5556',
   nmType='ssl', domainDir='${ORACLE_BASE}/config/domains/CRMHOST1/CRMDomain')
   ```

   ```
   CRHOST2> nmStart('AdminServer')
   ```

   ```
   CRHOST2> exit()
   ```

   **Note:** The *username* and *password* used in the `nmConnect` are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

23. Run the newly created Managed Servers:

   a. Log in to the Administration Server:
      
      `http://crminternal.mycompany.com:7777/console`
   
   b. Navigate to **CRMDomain > Environment > Servers > Control**.
   
   c. Select the newly created Managed Servers and click **Start**.
   
   d. Navigate to **CRMDomain > Environment > Servers** and check the **State** to verify that the newly created Managed Servers are running.

## 8.7 Configuring Data Quality for Scale Out

Data Quality is an Informatica tool that provides the following:

- A *matching* function, which allows you to search, match, and identify duplicate customer records based on key customer attributes such as name, address, date of birth, Social Security Number, or tax ID number. It also includes data quality connector, a generalized interface that can make real-time and batch requests to an external data-cleansing engine.

- An *address-cleansing* feature, which corrects and validates address data based on postal requirements.

Implementing Data Quality requires four steps:

1. Obtaining postal reference data and license keys.
2. Setting up the Data Quality Engine, also known as Informatica Identity Resolution (IIR).
3. Configuring Data Quality Connector and IIR in Oracle Fusion Functional Setup Manager.
8.7.1 Obtaining Postal Reference Data and License Keys

Before configuring data quality for scale out, you must obtain postal reference data and license key files from AddressDoctor. For information about how to obtain these, see the licensing documentation.

8.7.2 Setting Up the Data Quality Engine

To set up the data quality engine:

1. On CRMHOST1, change directory to ORACLE_BASE/products/InformaticaIR/bin.
2. Run the following commands:
   ```
   CRMHOST1> ./setfusionEnv.sh
   CRMHOST1> ./liup
   CRMHOST1> ./idsup
   ```
3. Start the following:
   ```
   ./idsconc -a
   ```
4. On the launched console, select Rulebase Type=SSA and Alias=rtunitrb and click OK. Then click Yes to create a new rulebase.
5. In the IIR console, navigate to System > New > Create a system from SDF.
6. Enter the following system information:
   - **System Name** - FusionDQRealtime
   - **System Definition File** - ORACLE_BASE/products/InformaticaIR/ssaas/ad5/ad/db/FusionDQRealtime.sdf
   - **DB Type** - SSA
   - **Alias** - fusion_s01
7. Click OK, and then click Close to dismiss the Create/System window.
8. Navigate to System menu > Select > System Name: FusionDQRealtime and click OK.
9. Navigate to System menu > Load IDT to start loading the individual IDT tables, one by one, until the following IDTs are completed:
   ```
   load_location
   load_organization
   load_org_address
   load_person
   load_per_address
   load_per_phone
   ```
10. Close the IIR Console started in Step 2 and run the following commands to stop the IIR server:
    ```
    CRMHOST1> ORACLE_BASE/products/InformaticaIR/bin/idsdown
    CRMHOST1> ORACLE_BASE/products/InformaticaIR/bin/lidown
    ```
11. Assuming you have received the postal reference data and license key files from AddressDoctor (that you requested in Section 8.7.1), run the following commands:
    ```
    CRMHOST1> cd ORACLE_BASE/products/InformaticaIR/ssaas/ad5/ad/db
    CRMHOST1> cp mylocation/key .
    CRMHOST1> cp mylocation/* .MD
    ```
mylocation is the directory where you copied the license key and the postal reference data.

*.MD is the postal data reference file. key is a text file that contains the AddressDoctor license.

AddressDoctor supports 248 countries. Each *.MD file is per country or a group of countries. Each of these files should be copied to the *.MD directory.

12. Run the following commands to start the IIR server:

CRMHOST1> ORACLE_BASE/products/InformaticaIR/bin/liup
CRMHOST1> ORACLE_BASE/products/InformaticaIR/bin/idsup

13. From the IIR Console, do the following to start the UPD Synchronizer:

a. Run the following command:

    CRMHOST1> ORACLE_BASE/products/InformaticaIR/bin/idsconc -a

b. On the launched console, select Rulebase Type=SSA and Alias=rtunitrb, and click OK to go the RuleBase.

c. In the IIR console, go to System > Select and select FusionDQRealtime.

d. Go to Tools > Synchronizer > Run Synchronizer and click OK to accept all the defaults shown in the Update Synchronizer popup window.

Note: Ensure that the IDT Name=(all) option is selected.

8.7.3 Configuring the Data Quality Connector and IIR

To configure the data quality connector and IIR:

1. Log in to Oracle Fusion Functional Setup Manager as an administrator. For example,

2. Click Navigator > Setup and Maintenance.

3. Select the All tasks tab.

4. Select Input Name= manage server and then click Search.
   The Manage Server Configurations task displays.

5. Click Go to Task to open the Manage Data Quality Server Configurations page, and then click Search to find all existing configurations.

6. Select Realtime and Batch Basic Server and do the following:

   a. Click Edit.

   b. Enter the server IP address and port of the IIR search server you set up as the IIR matching server.
c. Select **Enable Matching**.

d. Click **Save and Close**.

7. From the Manage Data Quality Server Configurations page, select **Realtime Cleanse Server** and do the following:

   a. Click **Edit**.

   b. Enter the server IP address and port of the IIR search server you set up as the IIR matching server.

   **Note:** For the server IP address, enter the **CRMHOST1** IP address. Enter the default port number, **1666**. Since the port number can be different than the default port number, run the following command to confirm that you are using the correct one:

   ```
grep SSA_SEPORT= ORACLE_BASE/products/InformaticaIR/env/iss
```

   c. Select **Enable Cleansing**.

   d. Click **Save and Close**.

8. From the Manage Data Quality Server Configurations page, select **Batch Cleanse Server** and repeat Steps a through d from Step 7.

9. Search for the task "Manage Data Synchronization" and click **Go to Task**.

10. From **Actions** dropdown list, select **Refresh Identity Table Information** to refresh the IDT repository information.

11. Select **Enable for Sync** for each IDT and click **Save**.

12. Click **Schedule Synchronization Process** and then **Advanced**.

13. Select **Using a schedule**.

14. Select **Hourly/Minute** from the **Frequency** dropdown list. (This frequency should be determined by the business requirement.)

15. Enter "every 5 minutes" for this example. (This "every 5 minutes" sample should be determined by the business requirement.)

16. Select a "next few days" end date from the calendar. (This "few days" sample should be determined by the business requirement.)

17. Click **Submit** to schedule the Sync ESS job.

---

8.7.4 Creating a Second Data Quality Server on CRMHOST2

To create a second data quality server:

1. Run the following command:

   ```
   CRMHOST2> cd ORACLE_BASE/repository/installers/iir/fusion_iir
   ```
2. **Edit the install.props file to include the following values:**

```ini
# USE ABSOLUTE PATHS FOR ALL
##############################################
# These environment variables are required to be set for
# IIR to be able to use the ORACLE DB CLIENT
##############################################
ORACLE_HOME=ORACLE_BASE/products/dbclient
TNS_ADMIN=ORACLE_BASE/products/dbclient/network/admin
LD_LIBRARY_PATH=ORACLE_BASE/products/dbclient/lib
##############################################
# These properties are required to be set for
# IIR to be installed in the right directory
##############################################
FUSION_STAGE_DIR=ORACLE_BASE/repository/installers/iir
IIR_STAGE_DIR=ORACLE_BASE/repository/installers/iir
IIR_VERSION=IIR_901spl_linux_amd64
IIR_TOP=ORACLE_BASE/products/IIR2
##############################################
# These properties are required to be set for IIR to be
# able to connect to the Oracle DB to install Schema Objects
##############################################

##############################################
SSALI_MZXPQRS=STANISLAUS
```

3. **Run the following command:**

```
./runInstaller.sh install.props > test_console
```
The installation is now complete.

4. Configure the data quality connector and IIR:
   a. Perform Steps 1 through 6 in Section 8.7.3, "Configuring the Data Quality Connector and IIR."
   b. Update the SecondaryServer1Address and SecondaryServer1Port values respectively for the host name and port of the Secondary Server CRMHOST2. These parameters can be found in the Server Parameter Values section.
   c. Select Enable High Availability for each server configuration.
   d. Click Save and Close.

5. Restart IIR on CRMHOST1 and CRMHOST2.

On CRMHOST1:

   CRMHOST1> cd ORACLE_BASE/products/InformaticaIR/bin
   CRMHOST1> ./setfusionEnv.sh
   CRMHOST1> ../../../env/isss
   CRMHOST1> ./idsdown
   CRMHOST1> ./idsup

On CRMHOST2:

   CRMHOST2> cd ORACLE_BASE/products/IIR2/InformaticaIR/bin
   CRMHOST2> ./setfusionEnv.sh
   CRMHOST2> ../../../env/isss
   CRMHOST2> ./idsdown
   CRMHOST2> ./idsup

The following is sample output of the idsdown command:

bash-3.2$ ./idsdown

6. Restart the Oracle Fusion Applications instances (which require DQ) so that the DQ Connector can do load balancing and failover.

For more information about data quality and IIR, see the following sections in the "Customer Relationship Management" chapter in the Oracle Fusion Applications Post-Installation Guide:

- "Setting Up Informatica Identity Resolution"
- "Informatica Identity Resolution Setup: Procedures"

### 8.8 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:

   - On WEBHOST1, change directory to ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf
Validating the System

- On WEBHOST2, change directory to ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf

2. Copy FusionVirtualHost.crm.conf to FusionVirtualHost.crm.conf.org.

3. Edit the FusionVirtualHost.crm.conf file, adding the scaled-out host and port to all the WebLogic Application Clusters. Add this to both the Internal and External part of the FusionVirtualHost.crm.conf file. Example 8–1 shows sample code for SalesServer.

---

Notes:

- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.

- If the Managed Servers are running on VIPs, replace CRMHOST1 and CRMHOST2 with the VIP addresses in Example 8–1.

---

Example 8–1 Sample “SalesServer” Code

```
<Location /sales>
    SetHandler weblogic-handler
    WebLogicCluster <CRMHOST1:port>,<CRMHOST2:port>
</Location>
```

4. Repeat Step 3 for all applications.

5. Do the following to restart Oracle HTTP Server:

On WEBHOST1:

- Change directory to ORACLE_BASE/config/CommonDomain_webtier/bin
- Enter the following:
  
  WEBHOST1> ./opmnctl stopall
  WEBHOST1> ./opmnctl startall

On WEBHOST2:

- Change directory to ORACLE_BASE/config/CommonDomain_webtier1/bin
- Enter the following:
  
  WEBHOST2> ./opmnctl stopall
  WEBHOST2> ./opmnctl startall

8.9 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, “Setting Up Server Migration for an Enterprise Deployment.”

8.10 Validating the System

You should verify URLs to ensure that the appropriate routing and failover is working from Oracle HTTP Server to the SalesCluster.

To verify the URLs:

Notes:

- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.

- If the Managed Servers are running on VIPs, replace CRMHOST1 and CRMHOST2 with the VIP addresses in Example 8–1.
1. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST1 while the Managed Servers on CRMHOST2 are running.

2. Access the following URLs to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)
   - https://crmexternal.mycompany.com/crmPerformance/faces/TerritoriesMain
   - https://crmexternal.mycompany.com/marketing/faces/LeadsDashboard
   - https://crmexternal.mycompany.com/orderCapture/faces/SalesCatalogAdmin

3. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST2.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
Chapter 9: Scaling Out the Oracle Fusion Common Domain

This chapter describes how to scale out the Oracle Fusion Common domain. This chapter includes the following topics:

- Section 9.1, "Overview of the Oracle Fusion Common Domain"
- Section 9.2, "Prerequisites for Scaling Out the Oracle Fusion Common Domain"
- Section 9.3, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 9.4, "Packing and Unpacking the Managed Server Domain Home"
- Section 9.5, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 9.6, "Configuring the Oracle WebCenter Portal wc_spaces and wc_spaces2 Servers"
- Section 9.7, "Scaling Out the Oracle WebCenter Content Inbound Refinery Server"
- Section 9.8, "Oracle HTTP Server Configuration"
- Section 9.9, "Configuring Server Migration for the Managed Servers"
- Section 9.10, "Validating the System"

9.1 Overview of the Oracle Fusion Common Domain

The Oracle Fusion Common domain is shared by all Oracle Fusion Applications product families. Oracle Fusion Customer Relationship Management implementation is dependent on the Oracle Fusion Common domain for the following components:

- Oracle Fusion Functional Setup Manager, for all setup task flows
- Help Portal, for centralized help
- Home page application, which has the Oracle Fusion Customer Relationship Management home page and launch pad
- Oracle WebCenter Content, to store all marketing collateral as well as all attachments. Import flow also uses WebCenter Content to stage the CSV files that the user uploads
- Oracle Secure Enterprise Search
- Oracle WebCenter Community Space and forums
- Oracle WebLogic Communication Services (OWLCS) and Oracle WebLogic SIP Server
Figure 2–4 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Common domain within the overall reference enterprise deployment topology.

9.2 Prerequisites for Scaling Out the Oracle Fusion Common Domain

Before scaling out the Oracle Fusion Common domain, ensure that you do the following:

- Start Node Manager in the Secure Sockets Layer (SSL) mode
- Remove Oracle Coherence startup properties
- Configure Oracle WebCenter Content Server

9.2.1 Starting Node Manager in SSL Mode

To start Node Manager in the Secure Sockets Layer (SSL) mode, follow the instructions in Chapter 7, “Setting Up Node Manager for an Enterprise Deployment.”

9.2.2 Removing Oracle Coherence Startup Properties from wlcs_server1

You must remove Oracle Coherence startup properties from the `wlcs_server1` Managed Server's `Startup` tab before scaling out the `wlcs_server2` Managed Server.

To remove the startup properties:

2. In the Domain Structure window, expand the `Environment` node.
3. Click `Servers`.
   
   The Summary of Servers page appears.
4. Select `wlcs_server1` (represented as a hyperlink) from the column of the table.
   
   The Settings page appears.
5. Click `Lock & Edit`.
6. Click the `Server Start` tab.
7. Remove the following Oracle Coherence properties from the Arguments field:
   
   -DUCS.coherence.localhost=CRMHOST1
   -DUCS.coherence.localport=7061
   -DUCS.coherence.wka1.port=7061
   -DUCS.coherence.wka1=CRMHOST1

8. Click `Save` and `Activate Changes`.
9. Navigate to `CommonDomain > Environment > Servers` and select the `Control` tab.
10. Select the \texttt{wlcs\_server1} Managed Server in the table, click \texttt{Shutdown}, and then select the \texttt{Force Shutdown Now} option from dropdown list.

11. Start the \texttt{wlcs\_server1} Managed Server.

9.2.3 Configuring Shared Content Folders for \texttt{UCM\_server1}

To configure shared content folders for the \texttt{UCM\_server1} server, do the following:

1. Create a \texttt{COMMONUCM\_LBR\_VH} Transmission Control Protocol (TCP) VIP with port 6300 on the load-balancing router (LBR) with \texttt{CRMHOST1:7034} and \texttt{CRMHOST2:7034} as its members.

\textbf{Note:} Because Oracle WebCenter Content failover works only with TCP connections, ensure that you use TCP, and not Hypertext Transfer Protocol (HTTP), in the LBR setup.

2. Shut down the \texttt{UCM\_server1} Managed Server:
   b. In the Domain Structure window, first navigate to Environment > Servers, and then click Control.
   c. Select \texttt{UCM\_server1}.
   d. Click Shutdown and then Force Shutdown Now.

3. In the 
   /u02/local/oracle/config/domains/CRMHOST1/CommonDomain/ucm/cs/bin/intradoc.cfg file on \texttt{CRMHOST1}, create the variables IntradocDir, vaultDir, and weblayoutDir if they do not already exist, and point them to the shared location: \texttt{ORACLE\_BASE/config/domains/CRMHOST1/CommonDomain/ucm/cs}.

4. Copy the 
   CRMHOST1/u02/local/oracle/config/domains/CRMHOST1/CommonDomain/ucm/cs directory from the local to the shared location, \texttt{ORACLE\_BASE/config/domains/CRMHOST1/CommonDomain/ucm/cs}.

5. Do the following in the config file on \texttt{CRMHOST1 (ORACLE\_BASE/config/domains/CRMHOST1/CommonDomain/ucm/cs/config/config.cfg)}:
   a. Edit two existing properties with the following:
      * SocketHostAddressSecurityFilter=127.0.0.1|CRMHOST1 IP Address|CRMHOST2 IP Address|COMMONUCM\_LBR\_VH IP Address|0:0:0:0:0:0:0:1
      * IdcCommandServerHost=127.0.0.1
   b. Add a new property:
      * AlwaysReverseLookupForHost=Yes

6. Start the \texttt{UCM\_server1} Managed Server.

7. Ensure that the \texttt{UCM\_server1} Managed Server is functioning properly. You should be able to access and log in to the following:

8. \texttt{http://CRMHOST1:7012/cs}
   \texttt{http://CRMHOST1:7012/ibr}
9.3 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

1. Log in to the Administration Server:

2. Navigate to CommonDomain > Environment > Machines.
   LocalMachine is located in the right-hand pane.

3. In the left-hand pane, click Lock & Edit.

4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST2
   - Machine operating system - Unix

5. Click Next.

6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>

   **Note:** The "localhost" default value here is wrong.

   - Listen port - 5556

7. Click Finish and activate the changes.

9.4 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both the pack and unpack commands can be executed from CRMHOST2.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command:

   CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMHOST1/CommonDomain -template=ORACLE_BASE/user_templates/CommonDomain_managed.jar -template_name="Common_Managed_Server_Domain"

3. Ensure that /u02/local/oracle/config/domains/CRMHOST2/CommonDomain is empty, and then run the unpack command:

   CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/CommonDomain -template=ORACLE_BASE/user_templates/CommonDomain_managed.jar

   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST2.

9.5 Cloning Managed Servers and Assigning Them to CRMHOST2

To add a Managed Server and assign it to CRMHOST2:
1. Log in to the Administration Server:
3. Switch to Lock & Edit mode.
4. Select the Managed_Server checkbox (for example, HomePageServer_1) and then click Clone.
5. Specify the following Server Identity attributes:
   - Server Name - HomePageServer_2
     Note: To ensure consistency in naming, copy the name of the server shown in Server Identity and paste it into the Server Name field. Then change the number to "_2".
   - Server Listen Address - <CRMHOST2>
   - Server Listen Port - leave "as is"
6. Click OK.
   You now should see the newly cloned sales server, HomePageServer_2.
7. Click HomePageServer_2 and change the following attributes:
   - Machine - <CRMHOST2>
   - Cluster Name - accept the default, HomePageCluster
     Note: Ensure that this cluster name is the same as the cluster name of the original Managed Server.
8. Click Save and then Activate Changes.
10. From the Name column, click the HomepageServer_2 scaled-out server link.
11. Click Lock & Edit, and then select the Configuration tab.
12. Select the Keystores tab, and then ensure that the keystores value is Custom Identity and Custom Trust.
13. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/config/keystores/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the `keystorepassword` field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

h. Re-enter the Custom Trust Keystore Passphrase.

i. Click Save.

14. Select the SSL tab.

a. Make sure that Identity and Trust Locations is set to Keystores.

b. Change the Private Key Alias to `CRMHOST2_fusion`.

c. Change the Private Key Passphrase to the `keypassword`, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

d. Re-enter the `keypassword` from Step c for the Confirm Private Key Passphrase.

e. Click Save.

15. Select the Server Start tab and do the following:

a. Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:

```bash
-DJDBCProgramName=DS/CommonDomain/HomePageServer_2
-Dserver.group=HomePageCluster
```

b. Click Save.

16. Select the Logging tab, and then select the HTTP tab.

17. Do the following:

a. Change the Log file name to `logs/access.log.%yyyyMMdd%`.

b. Change the rotation type to By Time.

c. Leave the Limit number of retained files option unchecked.

d. Leave the Rotate log file on startup option unchecked.

e. Click Save.

f. Expand Advanced.

g. Change the format to Extended.

h. Change the extended logging format fields to the following:

```plaintext
date time time-taken cs-method cs-uri
sc-status sc(X-ORACLE-DMS-ECID)
cs(ECID-Context) cs(Proxy-Remote-User)
cs(Proxy-Client-IP)
```

i. Click Save.

18. Click Activate Changes.

19. Repeat Steps 2 to 18 for all the Managed Servers on this domain.
20. Stop the domain’s Administration Server:

```
CRMHOST1> ORACLE_BASE/config/domains/CRMHOST1/CommonDomain/bin/stopWebLogic.sh
```

21. Set the following environment variable on CRMHOST2:

```
export WLST_PROPERTIES=-Dweblogic.security.SSL.trustedCAKeyStore=
```

```
ORACLE_BASE/config/keystores/fusion_trust.jks
```

22. Start the domain’s Administration Server:

```
CRMHOST2> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
```

```
CRMHOST2> nmConnect(username='<username>', password='<password>',
```

```
domainName='CommonDomain', host='CRMHOST1', port='5556',
```

```
nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/CommonDomain')
```

```
CRMHOST2> nmStart('AdminServer')
CRMHOST2> exit()
```

**Note:** The *username* and *password* used in the *nmConnect* are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

23. For the *wlcs_sipstate2* scaled-out server only, do the following:

   a. Change directory to:

   ```
   ORACLE_BASE/config/domains/CRMHOST1/CommonDomain/config/custom
   ```

   b. In the *datatier.xml* file, after the following line:

   ```
   <server-name>wlcs_sipstate1</server-name>
   ```

   add

   ```
   <server-name>wlcs_sipstate2</server-name>
   ```

24. Run the newly created Managed Servers:

   a. Log in to the Administration Server:

   ```
   ```

   b. Navigate to **CommonDomain > Environment > Servers > Control**.

   c. Select the newly created Managed Server and click **Start**.

   d. Navigate to **CommonDomain > Environment > Servers** and check the **State**
   to verify that the newly created Managed Servers are running.

25. Do the following:
9.6 Configuring the Oracle WebCenter Portal wc_spaces and wc_spaces2 Servers

After scaling out the Oracle WebCenter Portal Managed Server, do the following:

   Click Content Repository.

3. Highlight FusionAppsContentRepository and click Edit.

4. Select Socket and enter COMMONUCMLBRVH as the host and the LBR port for the server.

5. If updating the first instance of wc_spaces did not automatically update the second instance, repeat Step 2 through Step 4 for wc_spaces2.

9.6.1 Verifying the Location of FusionAppsContentRepository

When configuring Oracle WebCenter Content Server, the FusionAppsContentRepository content repository should move from the file system to the Fusion database. To verify the move of the repository to the database, upload the /etc/hosts file on CRMHOST1 to WebCenter Content Server by running the following commands, in order:

$ export RIDC_JAR=/u01/oracle/products/fusionapps/ecm/ucm/Distribution/RIDC/oracle.ucm.ridc-11.1.1.jar

$ export UCMSCRIPT_JAR=/u01/oracle/products/fusionapps/ecm/ucm/Distribution/FAProv/ucmscript.jar

$ java -cp $UCMSCRIPT_JAR:$RIDC_JAR oracle.ucm.client.UploadTool
   --url=idc://CRMHOST1:7034 --username=sysadmin
   --uploadFile=/etc/hosts --dSecurityGroup=public --dDocTitle=hosts --quiet
9.7 Scaling Out the Oracle WebCenter Content Inbound Refinery Server

You also must scale out the Oracle WebCenter Content Inbound Refinery server.

Note:

/u02/local/oracle/config/domains/CRMHOST1/CommonDomain/ucm/ibr on CRMHOST1 must already be on the local disk.

1. Edit the
   /u02/local/oracle/config/domains/CRMHOST1/CommonDomain/ucm/ibr/config/config.cfg file on CRMHOST1 with the following:
   - IDC_Name=CRMHOST1myexamplecom7012 (In this instance, CRMHOST1 is not the fully qualified name.)
   - InstanceMenuLabel=CRMHOST1myexamplecom7012
   - SocketHostAddressSecurityFilter=127.0.0.1|CRMHOST1 IP Address|CRMHOST2 IP Address|0:0:0:0:0:0:0:1
   - AlwaysReverseLookupForHost=Yes
   - HttpServerAddress=CRMHOST1:7012 (CRMHOST1's server address instead of load balancer, as it is a singleton node.)

2. Restart the ucm_server1 server.

3. Navigate to http://CRMHOST2:7012/ibr (CRMHOST2's ibr) and log in when prompted.
The post-installation configuration page displays, as it is not a clustered node.

4. On the post-installation configuration page:
   a. Set the server socket port to 7035.
   b. Ensure the port has a unique server instance name and unique local paths on CRMHOST2.
   c. Set the Incoming Socket Connection Address Security Filter:
      
      SocketHostAddressSecurityFilter=127.0.0.1|CRMHOST1 IP Address|CRMHOST2 IP Address|0:0:0:0:0:0:0:1
      
   d. Click Submit.
   e. Restart the ucm_server2 server.

   ibrprovider is already defined in this list.

6. Add a new outgoing provider:
   a. Click Add.
   b. Set the values to match the values of ibrprovider.

   Note: The value for the new outgoing ibrprovider must differ from the value of the default ibrprovider.

   c. Assign the following unique values: to Provider Name, Provider Description, Server Host Name, Server Port, Instance Name, and Relative Web Root.
      - Provider Name: ibr_provider2
      - Provider Description: ibrprovider for second server
      - Server Host Name: the second host address's CRMHOST2 IP address
      - Server Port: 7035
      - Instance Name: CRMHOST2myexamplecom7012
      - Relative Web Root: /cs

8. Select Conversion Settings and update the primary web rendition.

9. Navigate to Third-Party Applications Settings > General OutsideIn Filter Options > Options and set the following path to the fonts: /usr/share/X11/fonts/TTF.

   Note: The font location can be specific to the operating system.

10. Restart the UCM_server1 and UCM_server2 Managed Servers.

### 9.8 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:
9.9 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."
9.10 Validating the System

You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:

1. Log in to the CommonDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST1 while the Managed Servers on CRMHOST2 are running.

2. Access the following URLs to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)

3. Log in to the CommonDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST2.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
10

Scaling Out the Oracle Fusion Human Capital Management Domain

This chapter describes how to scale out the Oracle Fusion Human Capital Management domain.

This chapter includes the following topics:

- Section 10.1, "Overview of the Oracle Fusion Human Capital Management Domain"
- Section 10.2, "Prerequisites for Scaling Out the Oracle Fusion Human Capital Management Domain"
- Section 10.3, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 10.4, "Packing and Unpacking the Managed Server Domain Home"
- Section 10.5, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 10.6, "Oracle HTTP Server Configuration"
- Section 10.7, "Configuring Server Migration for the Managed Servers"
- Section 10.8, "Validating the System"

10.1 Overview of the Oracle Fusion Human Capital Management Domain

The Oracle Fusion Human Capital Management domain provides the user-management flow needed to create a user, which is executed via Oracle Fusion Human Capital Management/Oracle Identity Management integration. The flow is available as part of Customer Data Management.

Figure 2-5 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Human Capital Management domain within the overall reference enterprise deployment topology.

10.2 Prerequisites for Scaling Out the Oracle Fusion Human Capital Management Domain

Before you begin, ensure that Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."
10.3 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

1. Log in to the Administration Server:

2. Navigate to HCMDomain > Environment > Machines.
   LocalMachine is located in the right-hand pane.

3. In the left-hand pane, click Lock & Edit.

4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST2
   - Machine operating system - Unix

5. Click Next.

6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>

   **Note:** The "localhost" default value here is wrong.

   - Listen port - 5556

7. Click Finish and activate the changes.

10.4 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both pack and unpack commands can be executed from CRMHOST2.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command:

   ```
   CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMHOST1/HCMDomain -template=ORACLE_BASE/user_templates/HCMDomain_managed.jar -template_name="HCM_Managed_Server_Domain"
   ```

3. Ensure that /u02/local/oracle/config/domains/CRMHOST2/HCMDomain is empty, and then run the CRMHOST2 command:

   ```
   CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/HCMDomain -template=ORACLE_BASE/user_templates/HCMDomain_managed.jar
   ```

   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST2.

10.5 Cloning Managed Servers and Assigning Them to CRMHOST2

To add a Managed Server and assign it to CRMHOST2:

Note: The "localhost" default value here is wrong.
1. Log in to the Administration Server:
   http://hcminternal.mycompany.com:7777/console
2. Navigate to HCMDomain > Environment > Servers.
3. Switch to Lock & Edit mode.
4. Select the Managed_Server checkbox (for example, CoreSetupServer_1) and then click Clone.
5. Specify the following Server Identity attributes:
   ■ Server Name - CoreSetupServer_2
   ■ Server Listen Address - <CRMHOST2>
   ■ Server Listen Port - leave "as is"
6. Click OK.
   You now should see the newly cloned sales server, CoreSetupServer_2.
7. Click CoreSetupServer_2 and change the following attributes:
   ■ Machine - <CRMHOST2>
   ■ Cluster Name - accept the default, CoreSetupCluster
   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.
8. Click Save and then Activate Changes.
10. From the Name column, click the CoreSetupServer_2 scaled-out server link.
11. Click Lock & Edit, and then select the Configuration tab.
12. Select the Keystores tab, and then ensure that the keystores value is Custom Identity and Custom Trust.
13. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/config/keystores/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

h. Re-enter the Custom Trust Keystore Passphrase.
i. Click Save.

14. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to Keystores.
   b. Change the Private Key Alias to CRMHOST2_fusion.
   c. Change the Private Key Passphrase to the keypassword, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the keypassword from Step c for the Confirm Private Key Passphrase.
   e. Click Save.

15. Select the Server Start tab.

Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:

-DJDBCProgramName=DS/HCMDomain/CoreSetupServer_2
-Dserver.group=CoreSetupCluster

Click Save.

16. Select the Logging tab, and then select the HTTP tab.

17. Do the following:
   a. Change the Log file name to logs/access.log.%yyyyMMdd%.
   b. Change the rotation type to By Time.
   c. Leave the Limit number of retained files option unchecked.
   d. Leave the Rotate log file on startup option unchecked.
   e. Click Save.
   f. Expand Advanced.
   g. Change the format to Extended.
   h. Change the extended logging format fields to the following:

```
date time time-taken cs-method cs-uri
sc-status sc(X-ORACLE-DMS-ECID)
cs(ECID-Context) cs(Proxy-Remote-User)
cs(Proxy-Client-IP)
```
   i. Click Save.

18. Click Activate Changes.

19. Repeat Steps 2 to 18 for all the Managed Servers on this domain.

20. Stop the domain's Administration Server:

   `CRMHOST1`> ORACLE_BASE/config/domains/CRMHOST1/HCMDomain/bin/stopWebLogic.sh

21. Set the following environment variable on CRMHOST2:
export WLST_PROPERTIES=-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks

22. Start the domain’s Administration Server:

```
CRMHOST2> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh

CRMHOST2> nmConnect(username='<username>', password='<password>',
domainName='HCMDomain', host='CRMHOST1', port='5556',
nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/HCMDomain')

CRMHOST2> nmStart('AdminServer')
CRMHOST2> exit()
```

**Note:** The *username* and *password* used in the `nmConnect` are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5-3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

23. Run the newly created Managed Servers:

a. Log in to the Administration Server:
   `http://hcminternal.mycompany.com:7777/console`

b. Navigate to *HCMDomain > Environment > Servers > Control*.

c. Select the newly created Managed Servers and click *Start*.

d. Navigate to *HCMDomain > Environment > Servers* and check the *State* to verify that the newly created Managed Servers are running.

### 10.6 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:
   - On `WEBHOST1`, change directory to `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf`
   - On `WEBHOST2`, change directory to `ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf`

2. Copy `FusionVirtualHost_hcm.conf` to `FusionVirtualHost_hcm.conf.org`.

3. Edit the `FusionVirtualHost_hcm.conf` file, adding the scaled-out host and port to all the WebLogic Application Clusters. Add this to both the Internal and External part of the `FusionVirtualHost_hcm.conf` file. *Example 10–1* shows sample code for `CoreSetupServer`. 
10.7 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."

10.8 Validating the System

You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:

1. Log in to the HCMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST1 while the Managed Servers on CRMHOST2 are running.

2. Access the following URL to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)
   - https://hcmexternal.mycompany.com/hcmCoreSetup/faces/HcmWSIntWA

Example 10–1 Sample "CoreSetupServer" Code

```xml
<Location /hcmCoreSetup>
  SetHandler weblogic-handler
  WebLogicCluster <CRMHOST1:port>,<CRMHOST2:port>
</Location>
```

4. Repeat Step 3 for all applications.

5. Do the following to restart Oracle HTTP Server:

On WEBHOST1:

- Change directory to ORACLE_BASE/config/CommonDomain_webtier/bin
- Enter the following:
  ```
  WEBHOST1> ./opmnctl stopall
  WEBHOST1> ./opmnctl startall
  ```

On WEBHOST2:

- Change directory to ORACLE_BASE/config/CommonDomain_webtier1/bin
- Enter the following:
  ```
  WEBHOST2> ./opmnctl stopall
  WEBHOST2> ./opmnctl startall
  ```

Notes:

- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.
- If the Managed Servers are running on VIPs, replace CRMHOST1 and CRMHOST2 with the VIP addresses in Example 10–1.
3. Log in to the HCMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST2.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
This chapter describes how to scale out the Oracle Fusion Supply Chain Management domain.

This chapter includes the following topics:

- Section 11.1, "Overview of the Oracle Fusion Supply Chain Management Domain"
- Section 11.2, "Prerequisites for Scaling Out the Oracle Fusion Supply Chain Management Domain"
- Section 11.3, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 11.4, "Packing and Unpacking the Managed Server Domain Home"
- Section 11.5, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 11.6, "Oracle HTTP Server Configuration"
- Section 11.7, "Configuring ServerMigration for the Managed Servers"
- Section 11.8, "Validating the System"

11.1 Overview of the Oracle Fusion Supply Chain Management Domain

Oracle Fusion Customer Relationship Management uses Oracle Fusion Supply Chain Management for products and product groups. The Oracle Fusion Supply Chain Management domain provides the flows to import any existing customer product and product catalog into Oracle Fusion Customer Relationship Management.

Figure 2–6 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Supply Chain Management domain within the overall reference enterprise deployment topology.

11.2 Prerequisites for Scaling Out the Oracle Fusion Supply Chain Management Domain

Before you begin, ensure that Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

11.3 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:
1. Log in to the Administration Server:

2. Navigate to SCMDomain > Environment > Machines.
   Local Machine is located in the right-hand pane.

3. In the left-hand pane, click Lock & Edit.

4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST2
   - Machine operating system - Unix

5. Click Next.

6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>

   **Note:** The "localhost" default value here is wrong.

   - Listen port - 5556

7. Click Finish and activate the changes.

### 11.4 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both pack and unpack commands can be executed from CRMHOST2.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command:
   
   ```
   CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/SCMDomain -template=ORACLE_BASE/user_templates/SCMDomain_managed.jar -template_name="SCM_Managed_Server_Domain"
   ```

3. Ensure that /u02/local/oracle/config/domains/CRMHOST2/SCMDomain is empty, and then run the unpack command:
   
   ```
   CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/SCMDomain -template=ORACLE_BASE/user_templates/SCMDomain_managed.jar
   ```

   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST2.

### 11.5 Cloning Managed Servers and Assigning Them to CRMHOST2

To add a Managed Server and assign it to CRMHOST2:

1. Log in to the Administration Server:

2. Navigate to SCMDomain > Environment > Servers.
3. Switch to **Lock & Edit** mode.

4. Select the **Managed Server** checkbox (for example, **ProductManagementServer_1**) and then click **Clone**.

5. Specify the following Server Identity attributes:
   - **Server Name** - **ProductManagementServer_2**

   ---
   **Note:** To ensure consistency in naming, copy the name of the server shown in **Server Identity** and paste it into the **Server Name** field. Then change the number to "_2".
   ---

   - **Server Listen Address** - `<CRMHOST2>`
   - **Server Listen Port** - leave "as is"

6. Click **OK**.

   You now should see the newly cloned sales server, **ProductManagementServer_2**.

7. Click **ProductManagementServer_2** and change the following attributes:
   - **Machine** - `<CRMHOST2>`
   - **Cluster Name** - accept the default, **ProductManagementCluster**

   ---
   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.
   ---

8. Click **Save** and then **Activate Changes**.

9. Navigate to **SCMDomain > Environment > Servers**.

10. From the **Name** column, click the **ProductManagementServer_2** scaled-out server link.

11. Click **Lock & Edit**, and then select the **Configuration** tab.

12. Select the **Keystores** tab, and ensure that the keystores value is **Custom Identity and Custom Trust**.

13. Do the following:
   a. Change the Custom Identity Keystore path to point to the `ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks` file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the `keystorepassword` field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the `ORACLE_BASE/config/keystores/fusion_trust.jks` file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the `keystorepassword` field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
h. Re-enter the Custom Trust Keystore Passphrase.

i. Click Save.

14. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to Keystores.
   b. Change the Private Key Alias to \texttt{CRMHOST2}_fusion.
   c. Change the Private Key Passphrase to the keypassword, as described in the second bullet in Step 4 in Section 7.3, “Creating the Identity Keystore on CRMHOST2.”
   d. Re-enter the keypassword from Step c for the Confirm Private Key Passphrase.
   e. Click Save.

15. Select the Server Start tab.
   Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:

   \texttt{-DJDBCProgramName=DS/SCMDomain/ProductManagementServer}_2
   \texttt{-Dserver.group=ProductManagementCluster}

   Click Save.

16. Select the Logging tab, and then select the HTTP tab.

17. Do the following:
   a. Change the Log file name to logs/access.log.%yyyyMMdd%.
   b. Change the rotation type to By Time.
   c. Leave the Limit number of retained files option unchecked.
   d. Leave the Rotate log file on startup option unchecked.
   e. Click Save.
   f. Expand Advanced.
   g. Change the format to Extended.
   h. Change the extended logging format fields to the following:

   \begin{verbatim}
   date time time-taken cs-method cs-uri
   sc-status sc(X-ORACLE-DMS-ECID)
   cs(ECID-Context) cs(Proxy-Remote-User)
   cs(Proxy-Client-IP)
   \end{verbatim}

   i. Click Save.

18. Click Activate Changes.

19. Repeat Steps 2 to 18 for all the Managed Servers on this domain.

20. Stop the domain's Administration Server:

   \texttt{CRMHOST1> ORACLE_BASE/config/domains/CRMHOST1/SCMDomain/bin/stopWebLogic.sh}

21. Set the following environment variable on \texttt{CRMHOST2}:

   \texttt{export WLST_PROPERTIES=-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks}
22. Start the domain’s Administration Server:

```bash
CRMHOST2> ORACLE_BASE/products/fusionapps/wls/server_10.3/common/bin/wlst.sh
CRMHOST2> nmConnect(username='<username>', password='<password>',
domainName='SCMDomain', host='CRMHOST1', port='5556',
nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/SCMDomain')
CRMHOST2> nmStart('AdminServer')
CRMHOST2> exit()
```

**Note:** The *username* and *password* used in the `nmConnect` are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

23. Run the newly created Managed Servers:

a. Log in to the Administration Server:

   ```
   ```

b. Navigate to **SCMDomain > Environment > Servers > Control**.

c. Select the newly created Managed Servers and click **Start**.

d. Navigate to **SCMDomain > Environment > Servers** and check the **State** to verify that the newly created Managed Servers are running.

### 11.6 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:
   - On **WEBHOST1**, change directory to `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf`
   - On **WEBHOST2**, change directory to `ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf`

2. Copy `FusionVirtualHost_scm.conf` to `FusionVirtualHost_scm.conf.org`.

3. Edit the `FusionVirtualHost_scm.conf` file, adding the scaled-out host and port to all the WebLogic Application Clusters. Add this to both the Internal and External part of the `FusionVirtualHost_scm.conf` file. **Example 11–1** shows sample code for `ProductManagementServer`.

**Notes:**

- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.

- If the Managed Servers are running on VIPs, replace `CRMHOST1` and `CRMHOST2` with the VIP addresses in **Example 11–1**.
Example 11–1 Sample "ProductManagementServer" Code

<Location /productManagement>
    SetHandler weblogic-handler
    WebLogicCluster <CRMHOST1:port>,<CRMHOST2:port>
</Location>

4. Repeat Step 3 for all applications.

5. Do the following to restart Oracle HTTP Server:

   On WEBHOST1:
   - Change directory to ORACLE_BASE/config/CommonDomain_webtier/bin
   - Enter the following:
     WEBHOST1> ./opmnctl stopall
     WEBHOST1> ./opmnctl startall

   On WEBHOST2:
   - Change directory to ORACLE_BASE/config/CommonDomain_webtier1/bin
   - Enter the following:
     WEBHOST2> ./opmnctl stopall
     WEBHOST2> ./opmnctl startall

11.7 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."

11.8 Validating the System

You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:

1. Log in to the SCMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST1 while the Managed Servers on CRMHOST2 are running.

2. Access the following URL to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)

3. Log in to the SCMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST2.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
This chapter describes how to scale out the Oracle Fusion Financials domain.

This chapter includes the following topics:

- Section 12.1, "Overview of the Oracle Fusion Financials Domain"
- Section 12.2, "Prerequisites for Scaling Out the Oracle Fusion Financials Domain"
- Section 12.3, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 12.4, "Packing and Unpacking the Managed Server Domain Home"
- Section 12.5, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 12.6, "Oracle HTTP Server Configuration"
- Section 12.7, "Configuring Server Migration for the Managed Servers"
- Section 12.8, "Validating the System"

12.1 Overview of the Oracle Fusion Financials Domain

The Oracle Fusion Financials domain provides Oracle Fusion Customer Relationship Management with Currency, Calendar, and other functionality. The Oracle Fusion Financials domain exposes setup portlets that the Oracle Fusion Customer Relationship Management implementation manager can use via Functional Setup Manager.

Figure 2–7 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Financials domain within the overall reference enterprise deployment topology.

12.2 Prerequisites for Scaling Out the Oracle Fusion Financials Domain

Before you begin, ensure that Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

12.3 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

2. Navigate to FinancialDomain > Environment > Machines. LocalMachine is located in the right-hand pane.
3. In the left-hand pane, click Lock & Edit.
4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST2
   - Machine operating system - Unix
5. Click Next.
6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>
   - Listen port - 5556
7. Click Finish and activate the changes.

12.4 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both pack and unpack commands can be executed from CRMHOST2.

To pack and unpack the Managed Server domain home:
1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.
2. Run the pack command:
   ```bash
   CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMHOST1/FinancialDomain -template=ORACLE_BASE/user_templates/FinancialDomain_managed.jar -template_name="Financial_Managed_Server_Domain"
   ```
3. Ensure that /u02/local/oracle/config/domains/CRMHOST2/FinancialDomain is empty, and then run the unpack command:
   ```bash
   CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/FinancialDomain -template=ORACLE_BASE/user_templates/FinancialDomain_managed.jar
   ```
   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST2.

12.5 Cloning Managed Servers and Assigning Them to CRMHOST2

To add a Managed Server and assign it to CRMHOST2:
3. Switch to Lock & Edit mode.
4. Select the Managed_Servers checkbox (for example, GeneralLedgerServer_1) and then click Clone.

5. Specify the following Server Identity attributes:
   - Server Name - GeneralLedgerServer_2
   - Server Listen Address - <CRMHOST2>
   - Server Listen Port - leave "as is"

6. Click OK.
   You now should see the newly cloned server, GeneralLedgerServer_2.

7. Click GeneralLedgerServer_2 and change the following attributes:
   - Machine - <CRMHOST2>
   - Cluster Name - accept the default, GeneralLedgerCluster

   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.

8. Click Save and then Activate Changes.

10. From the Name column, click the GeneralLedgerServer_2 scaled-out server link.

11. Click Lock & Edit, and then select the Configuration tab.

12. Select the Keystores tab, and ensure that the keystores value is Custom Identity and Custom Trust.

13. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/config/keystores/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   h. Re-enter the Custom Trust Keystore Passphrase.
   i. Click Save.
14. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to **Keystores**.
   b. Change the Private Key Alias to **CRMHOST2_fusion**.
   c. Change the Private Key Passphrase to the **keypassword**, as described in the second bullet in Step 4 in **Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the **keypassword** from Step c for the Confirm Private Key Passphrase.
   e. Click Save.

15. Select the **Server Start** tab.
    Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:
    
    ```
    -DJDBCProgramName=DS/FinancialDomain/GeneralLedger_2
    -Dserver.group=GeneralLedgerCluster
    ```
    
    Click Save.

16. Select the **Logging** tab, and then select the **HTTP** tab.

17. Do the following:
   a. Change the Log file name to **logs/access.log.%yyyyMMdd%**.
   b. Change the rotation type to **By Time**.
   c. Leave the **Limit number of retained files** option unchecked.
   d. Leave the **Rotate log file on startup** option unchecked.
   e. Click Save.
   f. Expand **Advanced**.
   g. Change the format to **Extended**.
   h. Change the extended logging format fields to the following:

   ```
   date time time-taken cs-method cs-uri
   sc-status sc(X-ORACLE-DMS-ECID)
   cs(ECID-Context) cs(Proxy-Remote-User)
   cs(Proxy-Client-IP)
   ```
   i. Click Save.

18. Click **Activate Changes**.

19. Repeat Steps 2 to 18 for all the Managed Servers on this domain except the **soa_server1** Managed Server.

**Note:** Since only the Oracle SOA Suite libraries are needed in the FinancialDomain at this time, do not start the **soa_server1** Managed Server.

20. Stop the domain's Administration Server:
    
    ```
    CRMHOST1> ORACLE_BASE/config/domains/CRMHOST1/
    FinancialDomain/bin/stopWebLogic.sh
    ```
21. Set the following environment variable on `CRMHOST2`:

   ```bash
   export WLST_PROPERTIES=":Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks"
   ```

22. Start the domain's Administration Server:

   ```bash
   CRMHOST2> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
   CRMHOST2> nmConnect(username='<username>', password='<password>',
                        domainName='FinancialDomain', host='CRMHOST1', port='5556',
                        nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/FinancialDomain')
   CRMHOST2> nmStart('AdminServer')
   CRMHOST2> exit ()
   ```

   **Note:** The `username` and `password` used in the `nmConnect` are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

23. Run the newly created Managed Servers:

   a. Log in to the Administration Server:
      ```bash
      ```
   b. Navigate to `FinancialDomain > Environment > Servers > Control`.
   c. Select the newly created Managed Servers and click `Start`.
   d. Navigate to `FinancialDomain > Environment > Servers` and check the `State` to verify that the newly created Managed Servers are running.

### 12.6 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:

   - On `WEBHOST1`, change directory to `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf`
   - On `WEBHOST2`, change directory to `ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf`

2. Copy `FusionVirtualHost_fin.conf` to `FusionVirtualHost_fin.conf.org`.

3. Edit the `FusionVirtualHost_fin.conf` file, adding the scaled-out host and port to all the WebLogic Application Clusters. Add this to both the Internal and External part of the `FusionVirtualHost_fin.conf` file. Example 12–1 shows sample code for GeneralLedgerServer.
4. Repeat Step 3 for all applications.
5. Do the following to restart Oracle HTTP Server:
   On **WEBHOST1**:
   - Change directory to **ORACLE_BASE/config/CommonDomain_webtier/bin**
   - Enter the following:
     ```bash
     WEBHOST1> ./opmnctl stopall
     WEBHOST1> ./opmnctl startall
     ```
   On **WEBHOST2**:
   - Change directory to **ORACLE_BASE/config/CommonDomain_webtier1/bin**
   - Enter the following:
     ```bash
     WEBHOST2> ./opmnctl stopall
     WEBHOST2> ./opmnctl startall
     ```

## 12.7 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the **CRMHOST1** and **CRMHOST2** nodes. For more information, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."

## 12.8 Validating the System

You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:
1. Log in to the **FinancialDomain** Oracle WebLogic Server Administration Console and stop all the Managed Servers on **CRMHOST1** while the Managed Servers on **CRMHOST2** are running.
2. Access the following URL to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)

Notes:
- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.
- If the Managed Servers are running on VIPs, replace **CRMHOST1** and **CRMHOST2** with the VIP addresses in Example 12–1.
3. Log in to the FinancialDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST2.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
Scaling Out the Oracle Fusion Incentive Compensation Domain

This chapter describes how to scale out the Oracle Fusion Incentive Compensation domain.

This chapter includes the following topics:

- Section 13.1, "Overview of the Oracle Fusion Incentive Compensation Domain"
- Section 13.2, "Prerequisites for Scaling Out the Oracle Fusion Incentive Compensation Domain"
- Section 13.3, "Configuring Oracle Coherence for the odi_server Managed Server"
- Section 13.4, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 13.5, "Packing and Unpacking the Managed Server Domain Home"
- Section 13.6, "Cloning Managed Servers and Assigning Them to CRMHOST2"
- Section 13.7, "Oracle HTTP Server Configuration"
- Section 13.8, "Configuring Server Migration for the Managed Servers"
- Section 13.9, "Validating the System"

13.1 Overview of the Oracle Fusion Incentive Compensation Domain

The Oracle Fusion Incentive Compensation domain provides Oracle Fusion Customer Relationship Management with a comprehensive solution that integrates with Quota Management to ensure consistent and accurate incentive compensation plan goals and enables organizations to measure and pay for performance that aligns with organizational strategies. Embedded participant and manager dashboards support sales performance management by enable salespeople to easily track their performance achievements against objectives and allowing them to focus on customers instead of shadow accounting.

Figure 2–8 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Fusion Incentive Compensation domain within the overall reference enterprise deployment topology.
13.2 Prerequisites for Scaling Out the Oracle Fusion Incentive Compensation Domain

Before you begin, ensure that Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

13.3 Configuring Oracle Coherence for the odi_server Managed Server

Oracle recommends using unicast communication in odi_server enterprise deployments, unless use of multicast is a must. Consider using multicast communication for large Oracle Data Integrator clusters with approximately 20 or more Oracle Data Integrator Managed Servers.

Note: An incorrect configuration of the Oracle Coherence framework that is used for deployment may prevent the odi_server Managed Server from starting. Oracle recommends the configuration described in this section.

Unicast communication does not enable nodes to discover other cluster members automatically when a new Oracle Data Integrator server is added to a cluster. Consequently, you must specify the nodes that belong to the cluster. You do not need to specify all of the nodes of a cluster, however. You need only specify enough nodes so that a new node added to the cluster can discover one of the existing nodes. Consequently, when a new node has joined the cluster, it is able to discover all of the other nodes in the cluster. Additionally, in configurations such as Oracle Data Integrator enterprise deployments, where multiple IPs are available in the same box, you must configure Oracle Coherence to use a specific host name to create the Oracle Coherence cluster.

Tip: To guarantee high availability during deployments of odi_server Managed Servers, specify enough nodes so that at least one of them is running at any given time.

Specify the nodes using the -Doracle.odi.coherence.wka n system property, where n is the number for each Oracle HTTP Server. The numbering starts at 1. This numbering must be sequential and must not contain gaps. In addition, specify the host name used by Oracle Coherence to create a cluster through the tangosol.coherence.localhost system property. Set this property by adding the -Dtangosol.coherence.localhost parameters to the Arguments field of the Oracle WebLogic Server Administration Console’s Server Start tab.

To add the host name used by Oracle Coherence:

2. In the Domain Structure window, expand the Environment node.
3. Click Servers.
   The Summary of Servers page appears.
4. Select odi_server1 (represented as a hyperlink) from the column of the table.
   The Settings page appears.
5. Click **Lock & Edit**.
6. Click the **Server Start** tab.
7. Change the existing properties if necessary, and enter new properties into the Arguments field:
   -Dtangosol.coherence.localport=9839
   -Dtangosol.coherence.localhost=CRMHOST1
   -Doracle.odi.coherence.wka1=localhost
   -Doracle.odi.coherence.wka1.port=9839
   -Doracle.odi.coherence.wka2=localhost
   -Doracle.odi.coherence.wka2.port=9839
   -DJDBCProgramName=DS/ICDomain/odi_server1
   -Dserver.group=ODICluster

   **Note:** There should be no breaks in lines between the different -D parameters. Do not copy or paste the code from above to your Administration Console's Arguments text field. This may result in HTML tags being inserted in the Java arguments. The code should not contain other characters than those included in the example above.

8. Click **Save** and **Activate Changes**.
9. Navigate to **ICDomain > Environment > Servers** and select the **Control** tab.
10. Select the odi_server1 Managed Server in the table, click **Shutdown**, and then select the **Force Shutdown Now** option from dropdown list.
11. Restart the odi_server1 Managed Server.

### 13.4 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

1. Log in to the Administration Server:

2. Navigate to **ICDomain > Environment > Machines**.

   LocalMachine is located in the right-hand pane.

3. In the left-hand pane, click **Lock & Edit**.
4. In the right-hand pane, first click **New** to add the remote machine, and then specify the following:
   - Name - enter **CRMHOST2**
   - Machine operating system - Unix
5. Click **Next**.
6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - <CRMHOST2>

   **Note:** The "localhost" default value here is wrong.
- Listen port - 5556

7. Click Finish and activate the changes.

13.5 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST2, both the pack and unpack commands can be executed from the CRMHOST2.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command:

```
CRMHOST2> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMHOST1/ICDomain -template=ORACLE_BASE/user_templates/ICDomain_managed.jar -template_name="IC_Managed_Server_Domain"
```

3. Ensure that /u02/local/oracle/config/domains/CRMHOST2/ICDomain is empty, and then run the unpack command:

```
CRMHOST2> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST2/ICDomain -template=ORACLE_BASE/user_templates/ICDomainManaged.jar
```

Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST2.

13.6 Cloning Managed Servers and Assigning Them to CRMHOST2

To add a managed server and assign it to CRMHOST2:

2. Navigate to ICDomain > Environment > Servers.

3. Switch to Lock & Edit mode.

4. Select the Managed_Server checkbox (for example, IncentiveCompensationServer_1) and then click Clone.

5. Specify the following Server Identity attributes:

   - Server Name - IncentiveCompensationServer_2
   - Server Listen Address - <CRMHOST2>
   - Server Listen Port - leave "as is"

6. Click OK.

You now should see the newly cloned server, IncentiveCompensationServer_2.

7. Click IncentiveCompensationServer_2 and change the following attributes:

   - Machine - <CRMHOST2>
Cloning Managed Servers and Assigning Them to CRMHOST2

- Cluster Name - accept the default, IncentiveCompensationCluster

Note: Ensure that this cluster name is the same as the cluster name of the original managed server.

8. Click Save and then Activate Changes.
10. From the Name column, click the IncentiveCompensationServer_2 scaled-out server link.
11. Click Lock & Edit, and then select the Configuration tab.
12. Select the Keystores tab, and ensure that the keystores value is Custom Identity and Custom Trust.
13. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/config/keystores/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   h. Re-enter the Custom Trust Keystore Passphrase.
   i. Click Save.
14. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to Keystores.
   b. Change the Private Key Alias to CRMHOST2_fusion.
   c. Change the Private Key Passphrase to the keypassword, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the keypassword from Step c for the Confirm Private Key Passphrase.
   e. Click Save.
15. Select the Server Start tab and do the following:
   a. Change the Arguments to reflect the name of your cloned managed server and make sure the server group is the correct cluster name. For example, you should see the following:
      
      -DJDBCProgramName=DS/ICDomain/IncentiveCompensationServer_2
      -Dserver.group=IncentiveCompensationCluster
b. When cloning the odi_server2 Managed Server only, ensure that the local coherence host and the coherence well known address (wka) properties are changed to the following:

-Dtangosol.coherence.localport=9839
-Dtangosol.coherence.localhost=CRMHOST2
-Doracle.odi.coherence.wkal=CRMHOST2
-Doracle.odi.coherence.wka1=CRMHOST2
-Doracle.odi.coherence.wka2=CRMHOST1
-Doracle.odi.coherence.wka2.port=9839
-DJDBCProgramName=DS/ICDomain/odi_server2
-Dserver.group=ODICluster

c. Click Save.

16. Select the Logging tab, and then select the HTTP tab.

17. Do the following:
   a. Change the Log file name to logs/access.log.%yyyyMMdd%.
   b. Change the rotation type to By Time.
   c. Leave the Limit number of retained files option unchecked.
   d. Leave the Rotate log file on startup option unchecked.
   e. Click Save.
   f. Expand Advanced.
   g. Change the format to Extended.
   h. Change the extended logging format fields to the following:

   date time time-taken cs-method cs-uri
   sc-status sc(X-ORACLE-DMS-ECID)
   cs(ECID-Context) cs(Proxy-Remote-User)
   cs(Proxy-Client-IP)

   i. Click Save.

18. Click Activate Changes.

19. Repeat Steps 2 to 18 for all the managed servers on this domain.

20. Stop the domain's Administration Server:

   CRMHOST1> ORACLE_BASE/config/domains/CRMHOST1/ICDomain/bin/stopWebLogic.sh

21. Set the following environment variable on CRMHOST2:

   export WLST_PROPERTIES="-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks"

22. Start the domain's Administration Server:

   CRMHOST2> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh

   CRMHOST2> nmConnect(username='<username>', password='<password>',
   domainName='ICDomain', host='CRMHOST1', port='5556',
   nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/ICDomain')

   CRMHOST2> nmStart('AdminServer')
   CRMHOST2> exit ()
23. Run the newly created managed servers:
   b. Navigate to ICDomain > Environment > Servers > Control.
   c. Select the newly created managed servers and click Start.
   d. Navigate to ICDomain > Environment > Servers and check the State to verify that the newly created managed servers are running.

13.7 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. Do the following:
   a. On WEBHOST1, change directory to ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf
   b. On WEBHOST2, change directory to ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs2/moduleconf

2. Copy FusionVirtualHost_ic.conf to FusionVirtualHost_ic.conf.org.

3. Edit the FusionVirtualHost_ic.conf file, adding the scaled-out host and port to all the WebLogic Application Clusters. Add this to both the Internal and External part of the FusionVirtualHost_ic.conf file. Example 13–1 shows sample code for IncentiveCompensationServer.

```
Example 13–1 Sample "IncentiveCompensationServer" Code

<Location /IncentiveCompensation >
  SetHandler weblogic-handler
  WebLogicCluster <CRMHOST1:port>,<CRMHOST2:port>
</Location>
```

4. Repeat Step 3 for all applications.

5. Do the following to restart Oracle HTTP Server:
   a. On WEBHOST1:
      i. Change directory to ORACLE_BASE/config/CommonDomain_webtier/bin

Notes:
- Do not add these values for Oracle Enterprise Manager, Oracle WebLogic Server Administration Console, or Oracle Authorization Policy Manager.
- If the Managed Servers are running on VIPs, replace CRMHOST1 and CRMHOST2 with the VIP addresses in Example 13–1.
13.8 Configuring Server Migration for the Managed Servers

Server migration is required for proper failover of Oracle Fusion Customer Relationship Management components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."

13.9 Validating the System

You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:

1. Log in to the ICDomain Oracle WebLogic Server Administration Console and stop all the managed servers on the CRMHOST1 while the managed servers on CRMHOST2 are running.

2. Access the following URL to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)
   - https://icexternal.mycompany.com/incentiveCompensation/faces/IcCnCompPlanWorkarea

3. Log in to the ICDomain Oracle WebLogic Server Administration Console and stop all the managed servers on CRMHOST2.

4. Start the managed servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)

6. Start all the managed servers on CRMHOST2 and verify that they are running on CRMHOST1 and CRMHOST2.
This chapter describes how to scale out the Oracle Business Intelligence domain. This chapter includes the following topics:

- Section 14.1, "Overview of the Oracle Business Intelligence Domain"
- Section 14.2, "Prerequisites for Scaling Out the Oracle Business Intelligence Domain"
- Section 14.3, "Starting the Default Node Manager"
- Section 14.4, "Prerequisites for Scaling Out Oracle Business Intelligence on CRMHOST2"
- Section 14.5, "Scaling Out Oracle Business Intelligence Components"
- Section 14.6, "Configuring and Validating Oracle Essbase Clustering"
- Section 14.7, "Validating the System"

### 14.1 Overview of the Oracle Business Intelligence Domain

Oracle Fusion Customer Relationship Management Sales and Marketing offerings use following Oracle Business Intelligence components from the Oracle Business Intelligence domain:

- Oracle Business Intelligence Analytics
- Essbase
- Oracle Real-Time Decisions
- Oracle Business Intelligence Publisher

Key components of Oracle Fusion Customer Relationship Management, such as Territory (which is the core component of Oracle Fusion Customer Relationship Management), rely on Oracle Business Intelligence Analytics as the source data for planning and optimization.

Oracle Business Intelligence Analytics is the mandatory underlying component for Territory Management, Sales Predictor Engine, and Opportunity Landscape, as they are analytic-centric applications.

Figure 2–9 in Chapter 2, "Introduction to the Enterprise Deployment Reference Topologies," shows the topology for the Oracle Business Intelligence domain within the overall reference enterprise deployment topology.
14.2 Prerequisites for Scaling Out the Oracle Business Intelligence Domain

Before you begin, ensure the following:

- Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

- The Administration Console’s Follow Configuration Changes feature has been disabled (to eliminate redirections):
  1. Log into the Administration Console (http://biinternal.mycompany.com:7777/console) and go to Preferences > Shared Preferences.
  2. Deselect Follow Configuration Changes and click Save.

14.3 Starting the Default Node Manager

To start the default Node Manager:

1. Stop any Node Manager running on CRMHOST2 using one of the following methods:
   - Use Ctrl+C in the shell where it was started.
   - Use the standard process-identification and kill commands in the operating system appropriate to Oracle Fusion Customer Relationship Management and the Oracle Fusion Applications enterprise deployment.

2. Change directory to ORACLE_BASE/products/fusionapps/wlserver_10.3/common/nodemanager and edit the nodemanager.properties file with the following:
   
   SecureListener=false

3. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin and run the following script:
   
   ./setNMProps.sh

4. Change directory to ORACLE_BASE/products/fusionapps/wlserver_10.3/server/bin and run the following script:
   
   ./startNodeManager.sh

Node Manager starts on CRMHOST2.

**Note:** Steps 2 through 4 will enable Node Manager on CRMHOST2 and the Administrator Console to communicate on Plain Socket.

14.4 Prerequisites for Scaling Out Oracle Business Intelligence on CRMHOST2

Prerequisites include the following:

- Configuring JMS Persistence File Stores on CRMHOST1
- Setting the Listen Address for bi_server1 Managed Server
14.4.1 Configuring JMS Persistence File Stores on CRMHOST1

You must configure the location for all persistence stores to a directory visible from both nodes. Change all persistent stores to use this shared base directory.

2. In the Domain Structure window, expand the Services node.
3. In the Change Center, click Lock & Edit.
4. Click the Persistent Stores node.
   The Summary of Persistent Stores page displays.
5. Click BipJmsStore and enter a directory that is located in the shared storage. This shared storage is accessible from both CRMHOST1 and CRMHOST2:
   
   ORACLE_BASE/config/domains/CRMHOST1/BIDomain/BipJmsStore

6. Click Save.
7. Repeat Steps 4 through 6 for the JRFWSAsyncFileStore persistence file store with the shared location ORACLE_BASE/config/domains/CRMHOST1/BIDomain/JRFWSAsyncFileStore.
8. Click Activate Changes.
   The changes will not take effect until the Managed Server is restarted.
9. Do the following:
   a. Ensure that Node Manager is up and running.
   b. On the Summary of Servers page, select the Control tab.
   c. Select bi_server1 in the table and then click Shutdown.
   d. After the server has shut down, select bi_server1 in the table and then click Start.
10. Run the following commands on CRMHOST1 to restart the Oracle Business Intelligence system components:

    $ cd /u02/local/oracle/config/BIInstance/bin
    $ ./opmnctl stopall
    $ ./opmnctl startall

14.4.2 Setting the Listen Address for bi_server1 Managed Server

Make sure that you have performed the steps described in Section 15.1, "Enabling Virtual IPs on CRMHOST1 and CRMHOST2" before setting the bi_server1 listen address.

To set the listen address for the Managed Server:
2. In the Change Center, click Lock & Edit.
3. Expand the Environment node in the Domain Structure window.
4. Click Servers. The Summary of Servers page is displayed.
5. Select bi_server1 in the table. The Settings page for bi_server1 is displayed.
6. Set the Listen Address to BIVH1.

Note: Both BIVH1 and BIVH2 are pingable.

7. Click Save.

8. Click Activate Changes.

9. The changes will not take effect until the bi_server1 Managed Server is restarted (ensure that Node Manager is up and running):
   a. On the Summary of Servers page, select the Control tab.
   b. Select bi_server1 in the table and then click Shutdown.
   c. After the server has shut down, select bi_server1 in the table and then click Start.

10. Restart the Oracle Business Intelligence system components on CRMHOST1:

    $ cd /u02/local/oracle/config/BIInstance/bin
    $ ./opmnctl stopall
    $ ./opmnctl startll

14.4.3 Updating the FusionVirtualHost_bi.conf Configuration File

To enable Oracle HTTP Server to route to bi_cluster, which contains the bi_server Managed Servers, you must set the WebLogicCluster parameter to the list of nodes in the cluster:

1. Update the WebLogicCluster parameter in the FusionVirtualHost_bi.conf file to contain a cluster list of virtual host:port entries. (On WEBHOST1: ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf/FusionVirtualHost_bi.conf. On WEBHOST2: ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf/FusionVirtualHost_bi.conf.)

Note: You must update the FusionVirtualHost_bi.conf file in two locations:
- Under the internal virtual host for Oracle Business Intelligence
- Under the external virtual host for Oracle Business Intelligence

For example, for the internal virtual host:

<LocationMatch ^/analytics/>
SetHandler weblogic-handler
WebLogicCluster BIVH1:10217,BIVH2:10217
</LocationMatch>

For the external virtual host:

<LocationMatch ^/analytics/>
SetHandler weblogic-handler
WebLogicCluster BIVH1:10217,BIVH2:10217
WLProxySSL ON
WLProxySSLPassThrough ON
RewriteEngine ON
RewriteOptions inherit
2. Restart Oracle HTTP Server on both \texttt{WEBHOST1} and \texttt{WEBHOST2}:

\texttt{WEBHOST1}: \texttt{ORACLE\_BASE/config/CommonDomain\_webtier/bin/opmnctl restartproc ias-component=ohs1}

\texttt{WEBHOST2}: \texttt{ORACLE\_BASE/config/CommonDomain\_webtier1/bin/opmnctl restartproc ias-component=ohs1}

The servers specified in the WebLogicCluster parameters are only important at startup time for the plug-in. The list must provide at least one running cluster member for the plug-in to discover other members in the cluster. The listed cluster member must be running when Oracle HTTP Server is started. Oracle WebLogic Server and the plug-in work together to update the server list automatically with new, failed, and recovered cluster members.

Sample scenarios include:

- **Example 1**: If you have a two-node cluster and then add a third member, you do not need to update the configuration to add the third member. The third member will be discovered dynamically at run time.

- **Example 2**: You have a three-node cluster, but only two nodes are listed in the configuration. However, if both listed nodes are down when you start Oracle HTTP Server, then the plug-in would fail to route to the cluster. You must ensure that at least one of the listed nodes is running when you start Oracle HTTP Server.

If you list all the members of the cluster, then you guarantee you can route to the cluster, assuming at least one member is running when Oracle HTTP Server is started. For more information on configuring the Oracle WebLogic Server plug-in, see \textit{Oracle Fusion Middleware Using Web Server 1.1 Plug-Ins with Oracle WebLogic Server}.

### 14.5 Scaling Out Oracle Business Intelligence Components

This section describes how to scale out the Oracle Business Intelligence system using the Configuration Assistant. It is assumed that an Oracle Business Intelligence \texttt{ORACLE\_BASE} (binaries) has already been installed and is available from \texttt{CRMHOST1} and \texttt{CRMHOST2}, and that a domain with an Administration Server has been created. This is the domain that will be extended in this chapter to support Oracle Business Intelligence components.

\textbf{Important:} Oracle strongly recommends that you read the Oracle Fusion Middleware release notes for any additional installation and deployment considerations before starting the setup process.

This section includes the following topics:

- Section 14.5.1, “Scaling Out the Oracle Business Intelligence System on \texttt{CRMHOST2}”
- Section 14.5.2, “Starting Node Manager in SSL Mode”
- Section 14.5.3, “Scaling Out the System Components”
14.5.1 Scaling Out the Oracle Business Intelligence System on CRMHOST2

To scale out the Oracle Business Intelligence system:

1. Ensure that the bi_server1 server is running.
2. Change directory to the location of the Configuration Assistant:
   
   CRMHOST2> ORACLE_BASE/products/fusionapps/bi/bin

3. Start the Oracle Business Intelligence Configuration Assistant:

   CRMHOST2> ./config.sh

4. In the Welcome screen, click Next.
5. In the Prerequisite Checks screen, verify that all checks complete successfully, and then click Next.
6. In the Create, Scale Out or Extend BI System screen, select Scale Out BI System and enter the following:
   
   - **Host Name:** CRMHOST1
   - **Port:** 10201
   - **User name:** WLS_Administrator
   - **User Password:** WLS_Administrator_password

   Click Next.
7. In the Scale Out BI System Details screen, enter the following:
   
   - **Middleware Home:** ORACLE_BASE/products/fusionapps (dimmed)
   - **Oracle Home:** ORACLE_BASE/products/fusionapps/bi (dimmed)
   - **WebLogic Server Home:** ORACLE_BASE/products/fusionapps/wlserver_10.3 (dimmed)
   - **Domain Home:** /u02/local/oracle/config/domains/CRMHOST1/BIDomain
   - **Applications Home:** /u02/local/oracle/config/applications/CRMHOST1/BIDomain
   - **Instance Home:** Defaults to /u02/local/oracle/config/BIIInstance1
   - **Instance Name:** BIIInstance1 (dimmed)
Click Next.

8. In the Configure Ports screen, select “Specify Ports using Configuration File.”
   Use the bi_staticports.ini file from the ORACLE_BASE/products/ports directory.
   Click Next.

9. In the Specify Security Updates screen, choose whether you want to receive security updates from Oracle support and if you do, enter your e-mail address.
   Click Next.

10. In the Summary screen, click Configure.

11. In the Configuration Progress screen, verify that all the Configuration Tools have completed successfully and click Next.

12. In the Complete screen, click Finish.

14.5.2 Starting Node Manager in SSL Mode

To start Node Manager in SSL mode:

1. Stop the default Node Manager running on CRMHOST2 using one of the following methods:
   ■ Use CTRL+C in the shell where it was started
   ■ Use the standard process-identification and kill commands in the operating system appropriate to Oracle Fusion Customer Relationship Management and the Oracle Fusion Applications enterprise deployment.

2. Start Node Manager in SSL mode on CRMHOST2:

```
CRMHOST2> cd ORACLE_BASE/config/nodemanager/CRMHOST2
CRMHOST2> ./startNodeManagerWrapper.sh &
```

3. Update the Node Manager for the CRMHOST2 machine using the Oracle WebLogic Server Console by doing the following:

   a. Log in to the Administration Server:
   b. Navigate to BIDomain > Environment > Machines.
   c. In the left-hand pane, click Lock & Edit.
   d. In the right-hand pane, click CRMHOST2.
   e. In the window that opens, click the Node Manager tab and set the following attributes:
      – Type - SSL
      – Listen Address - <CRMHOST2>
      – Listen Port - 5556

4. Click Save and then Activate Changes.
   The changes will not take effect until the bi_server2 Managed Server is restarted.

5. Do the following:
   a. Stop the Administration Server:
b. Connect to the Administration Server through nmConnect and start the Administration Server using nmstart:

- Set the following environment variable:
  ```
  export WLST_PROPERTIES="-Dweblogic.security.SSL.trustedCAKeyStore=
  ORACLE_BASE/config/keystores/fusion_trust.jks"
  ```
- Start the Administration Server:
  ```
  CRMHOST1> cd ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin
  CRMHOST1> ./wlst.sh
  ```
- In the WLST shell, execute the following command:
  ```
  wls:/offline> nmConnect (username='Admin_User',password='Admin_Password',host='CRMHOST1',port='5556', nmType='ssl', domainDir=
  ORACLE_BASE/config/domains/CRMHOST1/BIDomain')
  ```
  ```
  wls:/nm/domain_name> nmStart ('AdminServer')
  wls:/nm/domain_name> exit()
  ```

**Note:** The username and password used in nmConnect are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–2 in Chapter 5, "Using the Provisioning Process to Install Components for an Enterprise Deployment."

c. Restart the bi_server2 Managed Server:

- On the Summary of Servers page, select the Control tab.
- Select bi_server2 in the table and then click Shutdown.
- After the server has shut down, select bi_server2 in the table and then click Start.

### 14.5.3 Scaling Out the System Components

To scale out the system components, do the following in Oracle Enterprise Manager Fusion Middleware Control:

2. Expand the Business Intelligence node in the Farm_BIDomain window.
3. Click coreapplication.
4. Click Capacity Management, then click Scalability.
5. Click Lock and Edit Configuration.
6. For the CRMHOST2 BIInstance1 Oracle instance, increment the Oracle Business Intelligence components by 1:
   - BI Servers
   - Presentation Servers
7. Change the **Port Range From** and **Port Range To** to be the same as the `CRMHOST1 BIInstance Oracle` instance.

8. Click **Apply**.

9. Click **Activate Changes**.

You do not need to restart at this point, because you will perform a restart after completing the steps in Section 14.5.4, "Configuring Secondary Instances of Singleton System Components."

### 14.5.4 Configuring Secondary Instances of Singleton System Components

Oracle Business Intelligence Scheduler and Oracle Business Intelligence Cluster Controller are singleton components that operate in active/passive mode. Configure a secondary instance of these components so that they are distributed for high availability.

To configure secondary instances, do the following in Fusion Middleware Control:

1. Log in to Fusion Middleware Control
2. Expand the **Business Intelligence** node in the Farm_BIDomain window.
3. Click **coreapplication**.
4. Click **Availability**, then click **Failover**.
5. Click **Lock and Edit Configuration** to activate the Primary/Secondary Configuration section of the Availability tab.
7. Click **Apply**.
8. Click **Activate Changes**.
9. Click **Restart to apply recent changes**.
10. From **Manage System**, click **Restart**.
11. Click **Yes** when prompted to confirm that you want to restart all Business Intelligence components.

**Note:** Under Potential Single Points of Failure, no problem should be reported for BI Scheduler and BI Cluster Controller.

### 14.5.5 Configuring the bi_server2 Managed Server

This section explains how to configure the bi_server2 Managed Server, and contains the following topics:

- **Section 14.5.5.1, "Setting the Listen Address for the bi_server2 Managed Server"**
- **Section 14.5.5.2, "Configuring Custom Identity and Custom Trust for the bi_server2 Managed Server"**
- **Section 14.5.5.3, "Disabling Host Name Verification for the bi_server2 Managed Server"**
- **Section 14.5.5.4, "Adding bi_server2 System Properties to the Server Start Tab"**
14.5.5.1 Setting the Listen Address for the bi_server2 Managed Server

Make sure that you have performed the steps described in Section 15.1, "Enabling Virtual IPs on CRMHOST1 and CRMHOST2" before setting the bi_server2 listen address.

To set the listen address for the Managed Server:

2. In the Change Center, click Lock & Edit.

3. Expand the Environment node in the Domain Structure window.

4. Click Servers. The Summary of Servers page is displayed.

5. Select bi_server2 in the table. The settings page for bi_server2 is displayed.

6. Set the Listen Address to BIVH2.

7. Click Save.

8. Click Activate Changes.

   The changes will not take effect until the Managed Server is restarted.

9. Do the following:
   a. Ensure that Node Manager is up and running.
   b. On the Summary of Servers page, select the Control tab.
   c. Select bi_server2 in the table and then click Shutdown.
   d. After the server has shut down, select bi_server2 in the table and then click Start.

14.5.5.2 Configuring Custom Identity and Custom Trust for the bi_server2 Managed Server

To configure custom identity and custom trust:

2. In the Change Center, click Lock & Edit.

3. Expand the Environment node in the Domain Structure window.

4. Click Servers.

   The Summary of Servers page displays.

5. Select bi_server2 in the table. The Settings page for bi_server2 displays.

6. Click Keystores, and then do the following:
   a. Click Change next to Demo Identity and Demo Trust.
   b. Select Custom Identity and Custom Trust from the Keystores dropdown list and click Save.
   c. Under Identity, do the following:
      – Change the Custom Identity Keystore entry to point to the ORACLE_BASE/config/keystores/CRMHOST2_fusion_identity.jks file.
– Enter and confirm the Custom Identity Keystore Passphrase. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

d. Under Trust, do the following:

– Change the Custom Identity Keystore entry to point to the ORACLE_BASE/config/keystores/fusion_trust.jks file.

– Enter and confirm the Custom Trust Keystore Passphrase. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

– Click Save.

7. Click SSL, and then do the following:

a. Ensure that Identity and Trust Locations is set to Keystores.

b. Under Identity, do the following:

– Change the Private Key Alias to CRMHOST2_fusion.

– Enter and confirm the Private Key Passphrase to the keypassword, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."

– Click Save.

8. Click Activate Changes.

9. Set the following property in ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh:

   WLST_PROPERTIES=" -Dweblogic.wlstHome='${WLST_HOME}'
   -Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks ${WLST_PROPERTIES}"

14.5.5.3 Disabling Host Name Verification for the bi_server2 Managed Server

This step is required if you have not set up the appropriate certificates to authenticate the different nodes with the Administration Server (see Chapter 7, "Setting Up Node Manager for an Enterprise Deployment"). If you have not configured the server certificates, you will receive errors when managing the different WebLogic servers. To avoid these errors, disable host name verification while setting up and validating the topology, and enable it again after the enterprise deployment topology configuration is complete as described in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment."

To disable host name verification:

2. Click Lock & Edit.

3. Expand the Environment node in the Domain Structure window.

4. Click Servers. The Summary of Servers page is displayed.

5. Select bi_server2 in the table. The settings page for the server is displayed.

6. Click the SSL tab.

7. Expand the Advanced section of the page.

8. Set Host Name Verification to None.
9. Click **Save**.

10. Click **Activate Changes**.

11. The change will not take effect until the **bi_server2** Managed Server is restarted (make sure that Node Manager is up and running):
   a. In the Summary of Servers screen, select the **Control** tab.
   b. Select **bi_server2** in the table and then click **Shutdown**.
   c. Select **bi_server2** in the table and then click **Start**.

12. Restart the Oracle Business Intelligence system components on **CRMHOST2**:
   
   ```
   $ cd /u02/local/oracle/config/BIInstance1/bin
   $ ./opmnctl stopall
   $ ./opmnctl startall
   ```

14.5.5.4 Adding **bi_server2** System Properties to the Server Start Tab

After scaling out the **bi_server2** Managed Server, you must add a new system property to the **Server Start** tab of this Managed Server.

2. Click **Lock & Edit**.

3. Expand the **Environment** node in the Domain Structure window.

4. Click **Servers**.
   The Summary of Servers page displays.

5. Select **bi_server2** in the table.
   The settings page for the server displays.

6. Click **Server Start**.

7. Add the following property to the arguments:
   ```
   -DJDBCProgramName=DS/BIDomain/bi_server2
   ```

8. Click **Save** and then **Activate Changes**.

9. Restart the **bi_server2** Managed Server (ensure sure that Node Manager is up and running):
   a. In the Summary of Servers screen, select the **Control** tab.
   b. Select **bi_server2** in the table and then click **Shutdown**.
   c. Select **bi_server2** in the table and then click **Start**.

10. Restart the BI System Components on **CRMHOST2**:

    ```
    $ cd /u02/local/oracle/config/BIInstance1/bin
    $ ./opmnctl stopall
    $ ./opmnctl startall
    ```

14.5.6 Performing Additional Configuration for Oracle Business Intelligence High Availability

This section describes additional high availability configuration tasks for Oracle BI Enterprise Edition, Oracle Real-Time Decisions, Oracle BI Publisher, and Oracle Financial Reports. It includes the following topics:
14.5.6.1 Additional Configuration Tasks for Oracle BI Scheduler

If you use server-side scripts with Oracle BI Scheduler, it is recommended that you configure a shared directory for the scripts so that they can be shared by all Oracle BI Scheduler components in a cluster.

Perform these steps only if you are using server-side scripts.

To share Oracle BI Scheduler scripts:

1. Create an `ORACLE_BASE/config/BIShared/OracleBISchedulerComponent/coreapplication_obisch1` directory.

2. From `CRMHOST1`, copy the default Oracle BI Scheduler scripts (for example, `/u02/local/oracle/config/BIInstance/bifoundation/OracleBISchedulerComponent/coreapplication_obisch1/scripts/common`) and custom Oracle BI Scheduler scripts (for example, `/u02/local/oracle/config/BIInstance/bifoundation/OracleBISchedulerComponent/coreapplication_obisch1/scripts/scheduler`) to the following location:
   
   `ORACLE_BASE/config/BIShared/OracleBISchedulerComponent/coreapplication_obisch1`

3. Update the `SchedulerScriptPath` and `DefaultScriptPath` elements of the Oracle BI Scheduler instanceconfig.xml file, as follows:

   - **SchedulerScriptPath**: Refers to the path where Oracle BI Scheduler-created job scripts are stored. Change this to the path of the shared BI Scheduler scripts location.
   
   - **DefaultScriptPath**: Specifies the path where user-created job scripts (not agents) are stored. Change this to the path of the shared BI Scheduler scripts location.

   The instanceconfig.xml files for Oracle BI Scheduler are in the following locations:

   **On CRMHOST1:**
   
   `/u02/local/oracle/config/BIInstance/config/OracleBISchedulerComponent/coreapplication_obisch1`

   **On CRMHOST2:**
   
   `/u02/local/oracle/config/BIInstance1/config/OracleBISchedulerComponent/coreapplication_obisch1`

   You must update these files for each Oracle BI Scheduler component in the deployment.

4. Restart the Oracle BI Scheduler component.

   **On CRMHOST1:**
   
   `$ cd /u02/local/oracle/config/BIInstance/bin`
14.5.6.2 Additional Configuration Tasks for Oracle Real-Time Decisions
This sections contains the following topics:

- Section 14.5.6.2.1, "Configuring Oracle Real-Time Decisions Clustering Properties"
- Section 14.5.6.2.2, "Adding Oracle RTD System Properties to the Server Start Tab"

14.5.6.2.1 Configuring Oracle Real-Time Decisions Clustering Properties
Perform these steps in Fusion Middleware Control to set up cluster-specific configuration properties for Oracle Real-Time Decisions (Oracle RTD). You only need to perform the steps on one of the nodes in your deployment. You do not need to set cluster-specific configuration properties for Oracle RTD for subsequent nodes.

2. Expand the Application Deployments node in the Farm_BIDomain window.
4. Click any node under it. For example, OracleRTD(11.1.1)(bi_server1).
5. In the right pane, click Application Deployment, and then select System MBean Browser.
6. In the System MBean Browser pane, expand Application Defined MBeans.
7. For any one of the servers under OracleRTD, navigate to the MBean and set the attribute, as shown in Table 14–1. Other servers automatically get updated with the value you set.

<table>
<thead>
<tr>
<th>MBean</th>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Misc</td>
<td>DecisionServiceAddress</td>
<td><a href="http://biinternal.mycompany.com:7777">http://biinternal.mycompany.com:7777</a></td>
</tr>
</tbody>
</table>

8. Click Apply.

14.5.6.2.2 Adding Oracle RTD System Properties to the Server Start Tab
After scaling out Oracle RTD, use the Administration Console to add three system properties to the Server Start tab of each Managed Server.

2. Click Lock & Edit.
3. Expand the Environment node in the Domain Structure window.
4. Click Servers.
   The Summary of Servers page displays.

5. Select bi_server<1,2> in the table.
   The settings page for the server displays.

6. Click Server Start.

7. Add the following property to the arguments:
   -Drtd.clusterRegistryJobIntervalMs=12000
   -Drtd.clusterDepartureThresholdMs=50000
   -Drtd.clusterDepartureThreshold2Ms=50000

8. Click Save and then Activate Changes.

9. Restart the bi_server<1,2> Managed Server (ensure sure that Node Manager is
    up and running):
   a. In the Summary of Servers screen, select the Control tab.
   b. Select bi_server<1,2> in the table and then click Shutdown.
   c. Select bi_server<1,2> in the table and then click Start.

10. Restart the BI System Components on CRMHOST1 and CRMHOST2:
    $ cd /u02/local/oracle/config/BIInstance1/bin
    $ ./opmnctl stopall
    $ ./opmnctl startall

Performing this task enables an instance of Oracle RTD to be migrated successfully
from one host to another in the event of a failure of a Managed Server.

Even after these changes, if the server migration finishes in less than 50 seconds, the
Oracle RTD batch framework will be in an inconsistent state.

If the enterprise has deployed any RTD Inline Services that host Batch Job
implementations, and if after a server migration the batch console command,"batch-names",
or its brief name, "bn", shows no registered batch jobs, then the Oracle
RTD Batch Manager service must be stopped and restarted. To do this, perform these
steps:

1. In Fusion Middleware Control, expand the WebLogic Domain node in the left
   pane. Then, right-click BIDomain and select System MBean Browser.

2. Locate SDPropertyManager > Misc MBean under Application Defined MBeans
   > OracleRTD > Server:bi_servern.
   Be sure to select the Misc MBean that corresponds to the local node where you are
   making the change. For example, if you are connecting to APPHOST1, then make
   sure to update the attribute associated with bi_server1.

3. Set the BatchManagerEnabled attribute to false and click Apply.

4. Set the BatchManagerEnabled attribute back to true and click Apply. Performing
   this task causes the Batch Manager to stop and be restarted.
   When it restarts, it will be running on either the same server as before, or on a
   different server.

5. After restarting Batch Manager, note that the corresponding MBean does not
   always immediately get refreshed on the server where Batch Manager comes back
Scaling Out Oracle Business Intelligence Components

14.5.6.3 Additional Configuration Tasks for Oracle BI Publisher

Perform the steps in this section on each machine where Oracle BI Publisher is configured.

This section includes the following topics:

- Section 14.5.6.3.1, "Configuring Integration with Oracle BI Presentation Services"
- Section 14.5.6.3.2, "Setting the Oracle BI EE Data Source"
- Section 14.5.6.3.3, "Configuring JMS for BI Publisher"

14.5.6.3.1 Configuring Integration with Oracle BI Presentation Services

To configure Oracle BI Publisher integration with Oracle BI Presentation Services:

1. Log in to Oracle BI Publisher
   
   (http://biinternal.mycompany.com:7777/xmlpserver) with Administrator credentials and select the Administration tab.

2. Under Integration, select Oracle BI Presentation Services.

3. Verify and update the following:

   - **Server Protocol:** http
   - **Server:** biinternal.mycompany.com
   - **Port:** 7777
4. Click Apply.

5. Under System Maintenance, select **Server Configuration**.
   In the Catalog section, change the BI Publisher Repository value to the shared location for the Configuration Folder. For example:
   \texttt{ORACLE\_BASE/config/BIShared/BIPublisher/repository}
   
   6. Click Apply.

7. Restart your Oracle BI Publisher application:
   b. Click **Deployments** in the Domain Structure window.
   c. Select **bipublisher(11.1.1)**.
   d. Click **Stop**, and then select **When Work Completes** or **Force Stop Now**.
   e. After the application has stopped, click **Start** and then **Start Servicing All requests**.

14.5.6.3.2 **Setting the Oracle BI EE Data Source**

The Oracle BI EE Data Source must point to the clustered Oracle BI Servers through the Cluster Controllers. Perform this task in Oracle BI Publisher.

To set the Oracle BI EE data source in Oracle BI Publisher:

1. Log in to Oracle BI Publisher (http://biinternal.mycompany.com:7777/xmlpserver) with Administrator credentials and select the **Administration** tab.

2. Under **Data Sources**, select **JDBC Connection**.

3. Update the Oracle BI EE data source setting by changing the **Connection String** parameter to the following:

   \texttt{jdbc:oraclebi://primary\_cluster\_controller\_host:primary\_cluster\_controller\_port/PrimaryCCS=primary\_cluster\_controller\_host;PrimaryCCSPort=primary\_cluster\_controller\_port;SecondaryCCS=secondary\_cluster\_controller\_host;SecondaryCCSPort=secondary\_cluster\_controller\_port;}

   For example:

   \texttt{jdbc:oraclebi://CRMHOST1:10212/PrimaryCCS=CRMHOST1;PrimaryCCSPort=10212;SecondaryCCS=CRMHOST2;SecondaryCCSPort=10212;}

---

**Note:** Since the Cluster Controller Port may be different between CRMHOST1 and CRMHOST2, you can use the following procedure to check the port being used:

2. Expand **Farm_Domain > Business Intelligence > coreapplication**.
3. Navigate to **Availability**.
4. Check the port number used by the Cluster Controller on CRMHOST1 and CRMHOST2.
4. Do one of the following:
   - Select Use System User.
   - Deselect Use System User and specify BIImpersonateUser credentials.

   For more information, see "Credentials for Connecting to the Oracle BI Presentation Catalog" in Oracle Fusion Middleware Developer’s Guide for Oracle Business Intelligence Enterprise Edition.

5. Click Test Connection. You should receive a "Connection established successfully" message.

6. Click Apply.

14.5.6.3.3 Configuring JMS for BI Publisher You must configure the location for all persistence stores to a directory visible from both nodes. Change all persistent stores to use this shared base directory.

   On CRMHOST2:

2. In the Domain Structure window, expand the Services node and then click the Persistence Stores node. The Summary of Persistence Stores page is displayed.

3. Click Lock & Edit.

4. Click New, and then Create File Store.

5. Enter a name (for example, BipJmsStore2) and target (for example, bi_server2). Enter a directory that is located in shared storage so that it is accessible from both CRMHOST1 and CRMHOST2:

   ORACLE_BASE/config/domains/CRMHOST1/BIDomain/BipJmsStore

6. Click OK and then Activate Changes.

7. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Servers node. The Summary of JMS Servers page is displayed.

8. Click Lock & Edit.

9. Click New.

10. Enter a name (for example, BipJmsServer2) and in the Persistence Store drop-down list, select BipJmsStore2 and click Next.

11. Select bi_server2 as the target.

12. Click Finish and Activate Changes.

13. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Modules node. The JMS Modules page is displayed.

15. Click BipJmsResource and then click the Subdeployments tab.

16. Select BipJmsSubDeployment under Subdeployments.

17. Add the new Oracle BI Publisher JMS Server (BipJmsServer2) as an additional target for the subdeployment.

18. Click Save and then Activate Changes.

To validate, do the following:
1. Log in to each Oracle BI Publisher URL.

2. Navigate to Administration > System Maintenance > Scheduler Diagnostics.
   All statuses should be in a Passed state and both instances should be visible.

---

14.5.6.4 Additional Configuration Tasks for Oracle BI for Microsoft Office

This section includes the following topics:

- Section 14.5.6.4.1, "Configuring Oracle BI for Microsoft Office Properties"
- Section 14.5.6.4.2, "Validating Oracle BI for Microsoft Office"

14.5.6.4.1 Configuring Oracle BI for Microsoft Office Properties

To perform additional configuration tasks for Oracle BI for Microsoft Office:

   The About Oracle BI EE Office Server page displays.

2. Go to the Oracle BI Enterprise Edition Office Server directory. For example:
   /u02/local/oracle/config/domains/CRMHOST1/BIDomain/servers/bi_server1/tmp/_WL_user/bioffice_11.1.1/cvsibb/war/WEB-INF

   If you are not sure how to locate the Oracle BI Enterprise Edition Office Server directory, check the LogDir parameter on the About Oracle BI EE Office Server page. The Oracle BI Enterprise Edition Office Server directory is the parent directory of the log directory.

   **Note:** You can determine the exact location for CRMHOSTn by using the following URL: http://BIVHn:10217/bioffice/about.jsp.

3. On both CRMHOST1 and CRMHOST2, open bioffice.xml for editing and modify the BI Office properties shown in Table 14–2.

   **Table 14–2 BI Office Properties in bioffice.xml**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Valid Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SawBaseURL</td>
<td><a href="http://biinternal.mycompany.com:7777/analytics/saw.dll">http://biinternal.mycompany.com:7777/analytics/saw.dll</a> or <a href="http://biinternal.mycompany.com:7777/analytics-ws/saw.dll">http://biinternal.mycompany.com:7777/analytics-ws/saw.dll</a></td>
<td>Load Balancer Virtual Server Name URL for Oracle BI Presentation Services. Important: If SSO is enabled, then enter the URL for the protected analytics servlet that you deployed when configuring BI Office to integrate with the SSO-enabled Oracle BI Server. The URL that is specified for this property is used for Web services requests between the BI Office Server and Presentation Services.</td>
</tr>
<tr>
<td>SawUseSSO</td>
<td>0 = No (Default)</td>
<td>Set this property to 1 if the Oracle Business Intelligence implementation is enabled for SSO.</td>
</tr>
<tr>
<td></td>
<td>1 = Yes</td>
<td></td>
</tr>
</tbody>
</table>
4. Restart the BI Office application:
   b. Click Deployments in the Domain Structure window.
   c. Select bioffice(11.1.1).
   d. Click Stop.
   e. After the application has stopped, click Start.
5. Validate that the SawBaseURL parameter has been updated on the About Oracle BI EE Office Server page.

The changes you made to the About Oracle BI EE Office Server page in the preceding steps are shown in Figure 14–1.

---

**Table 14–2 (Cont.) BI Office Properties in bioffice.xml**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Valid Value</th>
<th>Description</th>
</tr>
</thead>

<td><a href="http://biinternal.mycompany.com:7777/analytics/saw.dll">http://biinternal.mycompany.com:7777/analytics/saw.dll</a></td>
<td>When SSO is enabled, use this property to enter the public URL that allows external users to access Oracle Business Intelligence using SSO from the Oracle BI Add-in for Microsoft Office.</td>
</tr>
</tbody>
</table>

---

*Figure 14–1 About Oracle BI EE Office Server Page*

![Table 14–2 BI Office Properties in bioffice.xml](image-url)
14.5.6.4.2 Validating Oracle BI for Microsoft Office  
To validate configuration for Oracle BI for Microsoft Office:

1. Log in to Oracle BI Presentation Services at:
   
   http://biinternal.mycompany.com:7777/analytics

2. In the lower left pane, under the Get Started heading, select Download BI Desktop Tools and then select Oracle BI for MS Office.

3. Install Oracle BI for Microsoft by running the Oracle BI Office InstallShield Wizard.

4. Open Microsoft Excel or Microsoft PowerPoint.

5. From the Oracle BI menu, select Preferences.

6. In the Connections tab, select New.

7. Enter values for the following fields:
   - **Server Name:** Provide a name for the connection.
   - **BI Office Server:** Provide the URL for the Oracle BI Office Server.
   - **Application Name:** Enter the Application Name that you defined for the Oracle BI Office Server when you deployed the Oracle BI Office Server application to WLS. The default name is bioffice.
   - **Port:** Enter the Oracle BI Office Server port number.

   Figure 14–2 shows the New Connection dialog.

![Figure 14–2 New Connection Dialog for Oracle BI Office](image)

8. Click **Test Connection** to test the connection between the add-in and the Oracle BI Office Server.

   Successful connections receive a "Test connection successful" message, as shown in Figure 14–3.
9. Log in as an Administrator (for example, weblogic) and validate that you can access the Oracle BI Task Pane, as shown in Figure 14–4.

14.5.6.5 Additional Configuration Tasks for Oracle Financial Reporting

There are additional configuration tasks to perform for Oracle Financial Reporting. Do the following on CRMHOST1 and CRMHOST2:

1. Update the VARIABLE_VALUE_LIMIT from 4096 to 3072000 in the NQSConfig.INI file. For example,

   VARIABLE_VALUE_LIMIT = 3072000;

   On CRMHOST1, this file is located in

   /u02/local/oracle/config/BIInstance/config/OracleBIServerComponent/core
   application_obis1.
On **CRMHOST2**, this file is located in
/u02/local/oracle/config/BIInstance1/config/OracleBIServerComponent/coreapplication_obis1.

2. Run the following commands to restart the Oracle Business Intelligence system components on **CRMHOST1** and **CRMHOST2**:
   
   $ cd /u02/local/oracle/config/BIInstance
   $ ./opmnctl stopall
   $ ./opmnctl startall

### 14.5.7 Configuring a Default Persistence Store for Transaction Recovery

Each server has a transaction log that stores information about committed transactions that are coordinated by the server that may not have been completed. The WebLogic Server uses this transaction log for recovery from system crashes or network failures. To leverage the migration capability of the Transaction Recovery Service for the servers within a cluster, store the transaction log in a location accessible to a server and its backup servers.

---

**Note:** Preferably, this location should be a dual-ported SCSI disk or on a Storage Area Network (SAN).

---

To set the location for the default persistence store:

2. In the Change Center, click **Lock & Edit**.
3. In the Domain Structure window, expand the **Environment** node and then click the **Servers** node. The Summary of Servers page is displayed.
4. Click **bi_server1** in the table. The Settings page for the selected server is displayed, and defaults to the Configuration tab.
5. Navigate to **Configuration > Services**.
6. Create a **tlogs** directory on **CRMHOST1**:
   
   **CRMHOST1**> mkdir ORACLE_BASE/config/domains/CRMHOST1/BIDomain/tlogs

7. Enter the newly created **tlogs** path in the Directory section of the Default Store. For example:
   
   **CRMHOST1**> ORACLE_BASE/config/domains/CRMHOST1/BIDomain/tlogs

8. Click **Save**.
9. Repeat Steps 1 through 8 for the **bi_server2** Managed Server.
10. Click **Activate Changes**.
11. Start the Managed Servers to activate the changes (ensure that Node Manager is up and running):
   b. In the Summary of Servers screen, select the **Control** tab.
   c. Select **bi_server1** and **bi_server2** in the table and then click **Shutdown**.
d. Start the bi_server1 and bi_server2 servers.

e. Restart the Oracle Business Intelligence system components on CRMHOST1 and CRMHOST2:

```bash
$ cd /u02/local/oracle/config/BIInstance
$ ./opmnctl stopall
$ ./opmnctl startall
```

**Note:** To enable migration of the Transaction Recovery service, specify a location on a persistent storage solution that is available to other servers in the cluster. Both bi_server1 and bi_server2 must be able to access this directory.

### 14.5.8 Starting and Validating Oracle Business Intelligence on CRMHOST2

This section includes the following topics:

- Section 14.5.8.1, "Starting the bi_server2 Managed Server"
- Section 14.5.8.2, "Starting the Oracle Business Intelligence System Components"
- Section 14.5.8.3, "Validating Oracle Business Intelligence URLs"

#### 14.5.8.1 Starting the bi_server2 Managed Server

To start the bi_server2 Managed Server:

1. Start the bi_server2 Managed Server using the Oracle WebLogic Server Administration Console, as follows:
   
   
b. Expand the Environment node in the Domain Structure window.
   
c. Select Servers. The Summary of Servers page is displayed.
   
d. Click the Control tab.
   
e. Select bi_server2 and then click Start.

2. Verify that the server status is reported as "Running" in the Administration Console. If the server is shown as "Starting" or "Resuming," wait for the server status to change to "Started." If another status is reported (such as "Admin" or "Failed"), check the server output log files for errors.

#### 14.5.8.2 Starting the Oracle Business Intelligence System Components

You can control Oracle Business Intelligence system components using opmnctl commands.

To start the Oracle Business Intelligence system components using the opmnctl command-line tool:

1. Go to the directory that contains the Oracle Process Manager and Notification Server command-line tool, located in /u02/local/oracle/config/BIInstance1/bin.

2. Run the opmnctl command to start the Oracle Business Intelligence system components:
   
   ```bash
   ./opmnctl startall: Starts Oracle Process Manager and Notification Server and all Oracle Business Intelligence system components
   ```
3. Check the status of the Oracle Business Intelligence system components:

   ./opmnctl status

14.5.8.3 Validating Oracle Business Intelligence URLs

Access the following URLs:

- Access http://BIVH2:10217/wsm-pm to verify the status of Web Services Manager. Click Validate Policy Manager. A list of policies and assertion templates available in the data is displayed.

  **Note:** The configuration is incorrect if no policies or assertion templates appear.
- Access http://BIVH2:10217/xmlpserver to verify the status of the Oracle BI Publisher application.
- Access http://BIVH2:10217/mapviewer to verify the status of the map view functionality in Oracle BI EE.
- Access http://BIVH2:10217/aps/Test to verify APS.

14.5.9 Validating Access Through Oracle HTTP Server

You should verify URLs to ensure that the appropriate routing and failover is working from Oracle HTTP Server to bi_cluster. Perform these steps to verify the URLs:

1. While bi_server2 is running, stop bi_server1 using the Oracle WebLogic Server Administration Console.

2. Access the following URLs to verify that routing and failover is functioning properly:
   - http://WEBHOST1:10621/analytics
   - http://WEBHOST1:10621/xmlpserver
   - http://WEBHOST1:10621/ui (access only available on Microsoft Internet Explorer 7 or 8)
   - http://WEBHOST1:10621/hr
   - http://WEBHOST1:10621/aps/Test
   - http://WEBHOST1:10621/workspace
3. Start bi_server1 from the Oracle WebLogic Server Administration Console.

4. Stop bi_server2 from the Oracle WebLogic Server Administration Console.

5. Access the following URLs to verify that routing and failover is functioning properly:
   - http://WEBHOST1:10621/analytics
   - http://WEBHOST1:10621/xmlpserver
   - http://WEBHOST1:10621/ui (access only available on Microsoft Internet Explorer 7 or 8)
   - http://WEBHOST1:10621/hr
   - http://WEBHOST1:10621/aps/Test
   - http://WEBHOST1:10621/workspace

6. Start bi_server2 from the Oracle WebLogic Server Administration Console.

14.5.10 Configuring Node Manager for the Managed Servers

Oracle recommends using host name verification for the communication between Node Manager and the servers in the domain. This requires the use of certificates for the different addresses communicating with the Administration Server and other servers. See Chapter 7, “Setting Up Node Manager for an Enterprise Deployment” for further details. The procedures in that chapter must be performed twice using the information provided in Table 14–3.

**Table 14-3 Details for Host Name Verification for Node Manager and Servers**

<table>
<thead>
<tr>
<th>Run</th>
<th>Host Name (Host)</th>
<th>Server Name (WLS_SERVER)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run1:</td>
<td>CRMHOST1</td>
<td>bi_server1</td>
</tr>
<tr>
<td>Run2:</td>
<td>CRMHOST2</td>
<td>bi_server2</td>
</tr>
</tbody>
</table>

**Note:** If you configured Node Manager for the Managed Servers earlier, you do not need to configure it again.

14.5.11 Configuring Server Migration for the Managed Servers

Server Migration is required for proper failover of the Oracle BI Publisher components in the event of failure in any of the CRMHOST1 and CRMHOST2 nodes. For more information, see Chapter 17, “Setting Up Server Migration for an Enterprise Deployment.”

14.6 Configuring and Validating Oracle Essbase Clustering

This section describes how to configure and validate secondary instances of Oracle Essbase Agent so that they are distributed for high availability.
Perform the following steps in Fusion Middleware Control to scale out the secondary Oracle Essbase Agent:

2. Expand the Business Intelligence node in the Farm_BIDomain window.
3. Click coreapplication.
4. Click Availability, then click Failover.
5. Click Lock and Edit Configuration to activate the Primary/Secondary Configuration section of the Availability tab.
7. Ensure the Shared Folder Path is set to ORACLE_BASE/config/BIShared/Essbase/essbaseserver1 and click Apply.
8. Click Activate Changes.
10. Click Yes in the confirmation dialog.

To validate Essbase clustering:
1. Check the APS (Hyperion Provider Services) test URL:
   The message "Hyperion Provider Services: Hello!" should display.
2. Run the following command on CRMHOST1:
   /u02/local/oracle/config/BIInstance/bin/opmnctl stopproc ias-component=essbaseserver1
3. Ensure that Essbase starts on CRMHOST2:
   /u02/local/oracle/config/BIInstance1/bin/opmnctl status
   The status should be init then Alive.
4. Check the APS test URL again:

14.7 Validating the System

You should verify URLs to ensure that the appropriate routing and failover is working from Oracle HTTP Server to bi_cluster. Perform these steps to verify the URLs:

Note: In Oracle Fusion Applications, Oracle Essbase can only connect to and work with the primary server instance of an Oracle Real Application Clusters (Oracle RAC) database. If, for any reason, there is an Oracle RAC database failover to a secondary server instance, Oracle Essbase will not work.

Note: Under Potential Single Points of Failure, no problems should be reported for Essbase Agent.
1. While bi_server2 is running, stop bi_server1 using the Oracle WebLogic Server Administration Console.

2. Access the following URLs to verify that routing and failover is functioning properly:
   - http://WEBHOST1:10621/analytics
   - http://WEBHOST1:10621/xmlpserver
   - http://WEBHOST1:10621/ui (access only available on Microsoft Internet Explorer 7 or 8)
   - http://WEBHOST1:10621/hr
   - http://WEBHOST1:10621/workspace
   - http://WEBHOST1:10621/aps/Test

3. Start bi_server1 from the Oracle WebLogic Server Administration Console.

4. Stop bi_server2 from the Oracle WebLogic Server Administration Console.

5. Access the following URLs to verify that routing and failover is functioning properly:
   - http://WEBHOST1:10621/analytics
   - http://WEBHOST1:10621/xmlpserver
   - http://WEBHOST1:10621/ui (access only available on Microsoft Internet Explorer 7 or 8)
   - http://WEBHOST1:10621/hr
   - http://WEBHOST1:10621/workspace
   - http://WEBHOST1:10621/aps/Test

6. Start bi_server1 from the Oracle WebLogic Server Administration Console.
This chapter describes the additional scaleout steps required for the soa_server1 and soa_server2 servers on CRMHOST1 and CRMHOST2.

**Notes:**

- The Oracle SOA Suite server uses the Java Message Service (JMS) server. JMS requires a shared file system for its file store and transactional log. Each Oracle SOA Suite Managed Server in a cluster uses a separate file on the shared folder. During a node failure, the Oracle SOA Suite server must be moved to a targeted node to run the same server using the exact JMS file store and transaction log. To enable this server migration, each Oracle SOA Suite server must be configured with its own virtual IP, which can be floated on any server where the Oracle SOA Suite server is migrated.

- For Java Database Connectivity (JDBC), each Oracle SOA Suite Managed Server in a cluster uses a dedicated table per server on a database using the shared data source connection. During a node failure, the Oracle SOA Suite server must be moved to a targeted node to run the same server using the exact JDBC store and transaction log.

The procedures in this chapter use the Oracle SOA Suite server in the Oracle Fusion Customer Relationship Management domain as an example. You must perform the same procedures for the Oracle SOA Suite servers in all other domains except the BIDomain and FinancialDomain, which have no Oracle SOA Suite servers.

**Note:** For Oracle Fusion Customer Relationship Management, the Oracle SOA Suite virtual IPs for CRMHOST1 and CRMHOST2 are called CRMSOAVH1 and CRMSOAVH2. For all other domains, replace the first three characters with domain-specific syntax. For HCMSOAVH1, SCMSOAVH1, ICSoAVH1, and so on.

This chapter includes the following topics:

- Section 15.1, "Enabling Virtual IPs on CRMHOST1 and CRMHOST2"
- Section 15.2, "Setting the Listen Address for soa_server1"
To enable the virtual IP on Linux:

1. **On CRMHOST1:**
   a. **Run the ifconfig command as root:**
      ```
      /sbin/ifconfig interface:index IPAddress netmask netmask
      ```
      For example:
      ```
      /sbin/ifconfig ethX:Y 100.200.140.206 netmask 255.255.255.0
      ```
   
   b. **Enable your network to register the new location of the virtual IP:**
      ```
      /sbin/arping -q -U -c 3 -I interface IPAddress
      ```
      For example:
      ```
      /sbin/arping -q -U -c 3 -I ethX 100.200.140.206
      ```
   
   c. **Validate that the address is available by pinging it from another node.**
      For example:
      ```
      /bin/ping 100.200.140.206
      ```

2. **Repeat Steps a through c on CRMHOST2.**
15.2 Setting the Listen Address for soa_server1

Ensure that you have performed the steps described in Section 15.1, and the scale-out steps described in Section 8.4, Section 8.5, and Section 8.6 before setting the soa_server1 listen address.

To set the listen address for the Managed Server:
1. Log in to the Administration Console.
2. In the Change Center, click Lock & Edit.
3. Expand the Environment node in the Domain Structure window.
4. Click Servers. The Summary of Servers page is displayed.
5. Select soa_server1 in the table. The Setting page for soa_server1 is displayed.
6. Set the Listen Address to CRMSOAVH1.
7. Click Save.
8. Click Activate Changes.
9. The changes will not take effect until the soa_server1 Managed Server is restarted (ensure that Node Manager is up and running):
   a. On the Summary of Servers page, select the Control tab.
   b. Select soa_server1 in the table and then click Shutdown.
   c. After the server has shut down, select soa_server1 in the table and then click Start.

15.3 Setting the Listen Address for soa_server2

Ensure that you have performed the steps described in Section 15.1 before setting the soa_server2 listen address.

Perform these steps to set the listen address for the Managed Server:
1. Log in to the Administration Console.
2. In the Change Center, click Lock & Edit.
3. Expand the Environment node in the Domain Structure window.
4. Click Servers. The Summary of Servers page is displayed.
5. Select soa_server2 in the column of the table. The Settings page for soa_server2 is displayed.
6. Set the Listen Address to CRMSOAVH2.
7. Click Save.
8. Click Activate Changes.
9. The changes will not take effect until the soa_server2 Managed Server is restarted (ensure that Node Manager is up and running):
   a. On the Summary of Servers page, select the Control tab.
   b. Select soa_server2 in the table and then click Shutdown.
   c. After the server has shut down, select soa_server2 in the table and then click Start.
15.4 Updating the FusionVirtualHost.crm.conf Configuration File

To enable Oracle HTTP Server to route to soa_cluster, which contains the soa_server Managed Servers, you must set the WebLogicCluster parameter to the list of nodes in the cluster.

To set the parameter:

1. Update the WebLogicCluster parameter in the FusionVirtualHost.crm.conf file to contain a cluster list of virtual host:port entries. (On WEBHOST1: ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf/FusionVirtualHost.crm.conf. On WEBHOST2: ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf/FusionVirtualHost.crm.conf.) For example:

   `<Location /soa-infra>
    SetHandler weblogic-handler
    WebLogicCluster CRMSOAVH1:9024,CRMSOAVH2:9024
   </Location>`

2. Restart Oracle HTTP Server on both WEBHOST1 and WEBHOST2:

   `WEBHOST1> ORACLE_BASE/config/CommonDomain_webtier/bin/opmnctl restartproc ias-component=ohs1`

   `WEBHOST2> ORACLE_BASE/config/CommonDomain_webtier1/bin/opmnctl restartproc ias-component=ohs2`

The servers specified in the WebLogicCluster parameters are only important at startup time for the plug-in. The list must provide at least one running cluster member for the plug-in to discover other members in the cluster. The listed cluster member must be running when Oracle HTTP Server is started. Oracle WebLogic Server and the plug-in work together to update the server list automatically with new, failed, and recovered cluster members.

Sample scenarios include the following:

- **Example 1:** If you have a two-node cluster and then add a third member, you do not need to update the configuration to add the third member. The third member will be discovered dynamically at runtime.

- **Example 2:** You have a three-node cluster, but only two nodes are listed in the configuration. However, if both listed nodes are down when you start Oracle HTTP Server, then the plug-in would fail to route to the cluster. You must ensure that at least one of the listed nodes is running when you start Oracle HTTP Server.

If you list all the members of the cluster, then you guarantee you can route to the cluster, assuming at least one member is running when Oracle HTTP Server is started.

For more information on configuring the Oracle WebLogic Server plug-in, see Oracle Fusion Middleware Using Web Server 1.1 Plug-Ins with Oracle WebLogic Server.

15.5 Configuring UMSJMSServer_auto_1 and UMSJMSServer_2

After CRMHOST1 has been provisioned, the UMSJMSServer_auto_1 server is set up and configured for CRMHOST1, and the file store is created for CRMHOST1. You now must configure the file store for CRMHOST1, and create and configure the UMSJMSServer_2 server and file store for CRMHOST2. Configure the location for the persistence store file to a directory visible from both nodes.
To configure the file store for CRMHOST1:
1. Log in to the Oracle WebLogic Server Administration Console.
2. Click Lock & Edit.
3. In the Domain Structure window, expand the Services node and then click the Persistence Stores node.
   The Summary of Persistence Stores page appears.
4. Click a persistence-store name. For example, UMSJMSFileStore_auto_1.
5. In the Directory field, enter ORACLE_BASE/config/domains/CRMHOST1/CRMDomain/UMSJMSFileStore_auto_1.
6. Click Save and then click Activate Changes.

To create and configure the JMS servers and file store for CRMHOST2:
1. Log in to the Oracle WebLogic Server Administration Console.
2. Click Lock & Edit.
3. In the Domain Structure window, expand the Services node and then click the Persistence Stores node.
   The Summary of Persistence Stores page appears.
4. Click New, and then Create File Store.
5. In the file store fields, enter the following:
   ■ Name: for example, UMSJMSFileStore_2
   ■ Target: soa_server2
   ■ Directory:
     ORACLE_BASE/config/domains/CRMHOST1/CRMDomain/UMSJMSFileStore_auto_1
   
   Note: The same shared-directory path is used for file stores 1 and 2.

6. Click OK and then click Activate Changes.
7. Click Lock & Edit.
8. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Servers node.
   The Summary of Summary of JMS Servers page appears.
9. Click New.
10. Enter a name (for example, UMSJMSFileStore_2), then select UMSJMSFileStore_2 in the Persistence Store dropdown list.
11. Click Next.
12. Select soa_server2 as the target.
13. Click Finish and then click Activate Changes.
14. Click Lock & Edit.
15. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Modules node.
The Summary of JMS Modules page appears.

16. Click UMSJMSSystemResource and then click the Subdeployments tab.
17. Click UMSJMSServerxxxxx under Subdeployments.
18. Add the new UMSJMSServer_2 server as an additional target for the subdeployment.
19. Click Save and then click Activate Changes.

15.6 Configuring JMS Servers with JDBC Store Persistence

After CRMHOST1 has been provisioned, the Java Message Service (JMS) servers are set up and configured and Java Database Connectivity (JDBC) stores are created and fully configured for CRMHOST1. You now must create and configure the JMS servers and JDBC stores for CRMHOST2.

To create and configure the JMS servers and JDBC stores for CRMHOST2:
1. Log in to the Oracle WebLogic Server Administration Console.
2. Click Lock & Edit.
3. In the Domain Structure window, expand the Services node and then click the Persistence Stores node.
   The Summary of Persistence Stores page appears.
4. Click New, and then Create JDBC Store.
5. In the file store fields, enter the following:
   ■ Name: for example, SOAJMSJDBCStore_2
   ■ Target: soa_server2
   ■ Data Source: SOALocalTxDataSource
   ■ Prefix Name: CRM_FUSION_SOAINFRA.SOAJMS_2_. (Do not forget to include the ending ".")
6. Click OK.
7. Repeat Steps 3 through 6 for the remaining three remaining JDBC stores, using the same target and data-source field values:
   ■ AGJMSJDBCStore_2
   ■ BPMJMSJDBCStore_2
   ■ PS6SOAJMSJDBCStore_2
8. Click Activate Changes.
9. Click Lock & Edit.
10. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Servers node.
    The Summary of Summary of JMS Servers page appears.
11. Click New.
12. Enter a name (for example, SOAJMSServer_2), then select SSOAJMSJDBCStore_2 in the Persistence Store dropdown list.
13. Click Next.
14. Select soa_server2 as the target.
15. Click Finish.
16. Repeat Steps 10 through 15 for the remaining JMS servers:
   ■ AGJMSServer_2
   ■ BPMJMSServer_2
   ■ PS6SOAJMSServer_2
17. Click Activate Changes.
18. Click Lock & Edit.
19. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Modules node.
   The JMS Modules page appears.
20. Click SOAJMSModule and then click the Subdeployments tab.
21. Click SOAJMSServerxxxxx under Subdeployments.
22. Add the new SOAJMSServer_2 server as an additional target for the subdeployment.
23. Click Save.
24. Repeat Steps 19 through 23 for the BPMJMSModule JMS module.
25. Click Activate Changes.

15.7 Configuring Oracle Coherence for Deploying Composites

Although deploying composites uses multicast communication by default, Oracle recommends using unicast communication instead in SOA enterprise deployments. Use unicast if you disable multicast communication for security reasons.

---

**Note:** Do not make any changes to these JMS modules:

- ADSJMSAQMNode
- JRFWSAsyncJmsModuleAQ
- AGJMSModule
- PS6SOAJMSModule

---

**Note:** An incorrect configuration of the Oracle Coherence framework that is used for deployment may prevent the SOA system from starting. The deployment framework must be properly customized for the network environment on which the SOA system runs. Oracle recommends the configuration described in this section.

---

Multicast communication enables Oracle Fusion Middleware SOA to discover all of the members of a cluster to which it deploys composites dynamically. However, unicast communication does not enable nodes to discover other cluster members in this way. Consequently, you must specify the nodes that belong to the cluster. You do not need to specify all of the nodes of a cluster, however. You need only specify
Configuring Oracle Coherence for Deploying Composites

enough nodes so that a new node added to the cluster can discover one of the existing nodes. Consequently, when a new node has joined the cluster, it is able to discover all of the other nodes in the cluster. Additionally, in configurations such as SOA enterprise deployments, where multiple IPs are available in the same box, you must configure Oracle Coherence to use a specific host name to create the Oracle Coherence cluster.

**Tip:** To guarantee high availability during deployments of SOA composites, specify enough nodes so that at least one of them is running at any given time.

Specify the nodes using the \texttt{tangosol.coherence.wka n} system property, where \texttt{n} is the number for each Oracle HTTP Server. The numbering starts at 1. This numbering must be sequential and must not contain gaps. In addition, specify the host name used by Oracle Coherence to create a cluster through the \texttt{tangosol.coherence.localhost} system property. This local host name should be the virtual host name used by the SOA server as the listener addresses (\texttt{CRMSOAVH1} and \texttt{CRMSOAVH2}). Set this property by adding the \texttt{-Dtangosol.coherence.localhost} parameters to the Arguments field of the Oracle WebLogic Server Administration Console’s Server Start tab.

![Tip: To guarantee high availability during deployments of SOA composites, specify enough nodes so that at least one of them is running at any given time.]

Specify the nodes using the \texttt{tangosol.coherence.wka n} system property, where \texttt{n} is the number for each Oracle HTTP Server. The numbering starts at 1. This numbering must be sequential and must not contain gaps. In addition, specify the host name used by Oracle Coherence to create a cluster through the \texttt{tangosol.coherence.localhost} system property. This local host name should be the virtual host name used by the SOA server as the listener addresses (\texttt{CRMSOAVH1} and \texttt{CRMSOAVH2}). Set this property by adding the \texttt{-Dtangosol.coherence.localhost} parameters to the Arguments field of the Oracle WebLogic Server Administration Console’s Server Start tab.

**Note:** \texttt{CRMSOAVH1} is the virtual host name that maps to the virtual IP where \texttt{soa_server1} is listening (in \texttt{CRMHOST1}). \texttt{CRMSOAVH2} is the virtual host name that maps to the virtual IP where \texttt{soa_server2} is listening (in \texttt{CRMHOST2}).

To add the host name used by Oracle Coherence:

1. Log in to the Oracle WebLogic Server Administration Console.
2. In the Domain Structure window, expand the Environment node.
3. Click Servers.
4. The Summary of Servers page appears.
5. The Settings page appears.
6. Click Lock & Edit.
7. Click the Server Start tab.
8. Append the following for \texttt{soa_server1} and \texttt{soa_server2} to the Arguments field.

For \texttt{soa_server1}:

- \texttt{-Dtangosol.coherence.wka1=CRMSOAVH1}
- \texttt{-Dtangosol.coherence.wka2=CRMSOAVH2}
- \texttt{-Dtangosol.coherence.localhost=CRMSOAVH1}
- \texttt{-Dtangosol.coherence.localport=8089}
- \texttt{-Dtangosol.coherence.wka1.port=8089}
- \texttt{-Dtangosol.coherence.wka2.port=8089}

For \texttt{soa_server2}:

- \texttt{-Dtangosol.coherence.wka1=CRMSOAVH2}
- \texttt{-Dtangosol.coherence.wka2=CRMSOAVH1}
- \texttt{-Dtangosol.coherence.localhost=CRMSOAVH2}
- \texttt{-Dtangosol.coherence.localport=8089}
- \texttt{-Dtangosol.coherence.wka1.port=8089}
- \texttt{-Dtangosol.coherence.wka2.port=8089}
15.8 Configuring a JDBC Transaction Log Store for Transaction Recovery

Each server has a transaction log that stores information about committed transactions that are coordinated by the server that may not have been completed. Oracle WebLogic Server uses this transaction log for recovery from system crashes or network failures. To leverage the migration capability of the Transaction Recovery Service for the servers within a cluster, store the transaction log in a location accessible to a server and its backup servers.

To set the location for the transaction log store:

2. In the Change Center, click Lock & Edit.
3. In the Domain Structure window, expand the Environment node and then click the Servers node.
   The Summary of Servers page appears.
4. Click the server name `soa_server2` (represented as a hyperlink) in the table. The Settings page for the selected server appears, and defaults to the Configuration tab.

5. In the Configuration tab, click the Services tab.

6. In the Transaction Log Store section of the page, do the following:
   a. For the type, change the dropdown list selection from Default Store to JDBC.
   b. For the data store, select `SOALocalTxDataSource` from dropdown list.
   c. For prefix name, enter `CRM_FUSION_SOAINFRA.TLOG_soa_server2_.` (Do not forget to include the ending "._").

---

**Note:** The prefix name is specific for each domain.

- Oracle Fusion Customer Relationship Management domain: `CRM_FUSION_SOAINFRA.TLOG_soa_server2_`
- Oracle Fusion Common domain: `SETUP_FUSION_SOAINFRA.TLOG_soa_server2_`
- Oracle Fusion Incentive Compensation domain: `OIC_FUSION_SOAINFRA.TLOG_soa_server2_`
- Oracle Fusion Human Capital Management domain: `HCM_FUSION_SOAINFRA.TLOG_soa_server2_`
- Oracle Fusion Supply Chain Management domain: `SCM_FUSION_SOAINFRA.TLOG_soa_server2_`

---

**Note:** When the JDBC transaction log store configuration is complete, and after bouncing the `soa_server2` server, do the following:

- Append the table name in the prefix name with WLStore. For example, `TLOG_soa_server2_WLStore`.
- Verify that the new table, `TLOG_soa_server2_WLStore`, has been created in `CRM_FUSION_SOAINFRA`.

---

7. Click Save and then click Activate Changes.

8. Restart the Managed Server to activate the changes (ensure that Node Manager is up and running):
   b. In the Summary of Servers screen, select the Control tab.
   c. Select `soa_server2` in the table and then click Shutdown.
   d. Start the `soa_server2` server.
### 15.9 Disabling Host Name Verification for the soa_servern Managed Servers

This step is required if you have not set up the appropriate certificates to authenticate the different nodes with the Administration Server. By default, Host Name Verification should be set to *None*. If it is not, follow the steps below.

If you have not configured the server certificates, you will receive errors when managing the different WebLogic servers. To avoid these errors, disable host name verification while setting up and validating the topology, and enable it again after the enterprise deployment topology configuration is complete.

To disable Host Name Verification:

2. Click **Lock & Edit**.
3. Expand the **Environment** node in the Domain Structure window.
4. Click **Servers**.
   - The Summary of Servers page appears.
5. Select **soa_server1** (represented as a hyperlink) in the table.
6. Select the **SSL** tab.
7. Expand the **Advanced** section of the page.
8. Set **Hostname Verification** to **None**.
9. Click **Save**.
10. Repeat Steps 1 through 9 for the **soa_server2** Managed Server.
11. Save and activate the changes.

### 15.10 Restarting Node Manager on CRMHOST1

To restart Node Manager on **CRMHOST1**:

1. Stop Node Manager by stopping the process associated with it:
   a. If it is running in the foreground in a shell, simply use CTRL+C.
   b. If it is running in the background in the shell, find the associated process and use the `kill` command to stop it. For example:

   ```bash
   CRMHOST1> ps -ef | grep NodeManager
   orcl 9139 9120 0 Mar03 pts/6 00:00:00/bin/sh ./startNodeManager.sh
   CRMHOST1>kill -9 9139
   ```
   c. Run the following command:

   ```bash
   CRMHOST1> ORACLE_BASE/config/nodemanager/CRMHOST1/startNodeManagerWrapper.sh
   ```
15.11 Starting and Validating soa_server1 on CRMHOST1

To start the soa_server1 Managed Server on CRMHOST1:

2. Click Servers.
3. Open the Control tab.
4. Select soa_server1.
5. Click Start.

To validate the soa_server1 Managed Server on CRMHOST1:

1. Verify that the server status is reported as "Running" in the Administration Console. If the server is shown as "Starting" or "Resuming," wait for the server status to change to "Started." If another status is reported (such as "Admin" or "Failed"), check the server output log files for errors.

Note: Although the soa_server1 server may be up, some applications may be in a failed state. Therefore, Oracle recommends verifying the above URLs and watching for errors pertaining each individual application in the server's output file.

15.12 Restarting Node Manager on CRMHOST2

To restart Node Manager on CRMHOST2, follow the steps in Section 15.10, "Restarting Node Manager on CRMHOST1."

15.13 Starting and Validating soa_server2 on CRMHOST2

To start the soa_server2 Managed Server on CRMHOST2 and ensure that it is configured correctly:

1. From the Administration Console, start the soa_server2 Managed Server.
2. Verify that the server status is reported as "Running" in the Administration Console. If the server is shown as "Starting" or "Resuming," wait for the server status to change to "Started." If another status is reported (such as "Admin" or "Failed"), check the server output log files for errors.

Note: Although soa_server2 server may be up, some applications may be in a failed state. Therefore, Oracle recommends verifying the above URLs and watching for errors pertaining each individual application in the server's output file.
This chapter describes how to configure and validate the Oracle WebLogic Server Administration Server for high availability.

This chapter includes the following topics:

- Section 16.1, "Enabling Administration Server High Availability"
- Section 16.2, "Oracle HTTP Server Configuration"
- Section 16.3, "Validating the Administration Server"
- Section 16.4, "Manually Failing Over the Administration Server to CRMHOST2"
- Section 16.5, "Failing the Administration Server Back to CRMHOST1"

### 16.1 Enabling Administration Server High Availability

The Administration Server is a singleton application, so it cannot be deployed in an active-active configuration. By default, the Administration Server is only available on the first installed node. If this node becomes unavailable, then the Administration Console and Fusion Middleware Control also become unavailable. To avoid this scenario, the Administration Server and the applications deployed to it must be enabled for failover. The enterprise deployment architecture in this guide calls for the deploying the Administration Server on a disk shared between the primary node and the secondary node.

The following domains are deployed as part of the Oracle Fusion Customer Relationship Management enterprise deployment implementation:

- Oracle Fusion Customer Relationship Management Domain
- Oracle Fusion Common Domain
- Oracle Fusion Financials Domain
- Oracle Fusion Human Capital Management Domain
- Oracle Fusion Supply Chain Management Domain
- Oracle Fusion Incentive Compensation Domain
- Oracle Business Intelligence Domain

The process described in this guide initially deploys each domain-specific Administration Server in shared storage (/u01/oracle) mounted on CRMHOST1, and Managed Servers in the local disk (/u02/local/oracle).
This section contains the following topics:

- Section 16.1.1, "Enabling an Administrative Virtual Host on CRMHOST1"
- Section 16.1.2, "Adding a New Machine in the Oracle WebLogic Server Console"
- Section 16.1.3, "Enabling the Administration Server to Listen on the Virtual IP Address"

16.1.1 Enabling an Administrative Virtual Host on CRMHOST1

**Note:** CRADMINVH is used as a generic name in this chapter. For domain-specific administrative virtual host names, see Table 3–1 in Section 3.6, "IPs and Virtual IPs."

The Administration Server must be configured to listen on a virtual IP Address to enable it to seamlessly failover from one host to another. In a failure, the Administration Server, along with the virtual IP Address, can be migrated from one host to another.

However, before the Administration Server can be configured to listen on a virtual IP Address, one of the network interface cards on the host running the Administration Server must be configured to listen on this virtual IP Address. The steps to enable a virtual IP Address are completely dependent on the operating system.

To enable a virtual IP Address on CRMHOST1:

**Note:** In a UNIX environment, the command must be run as the root user.

1. On CRMHOST1, run the `ifconfig` command to get the value of the netmask. In a UNIX environment, run this command as the root user. For example:

   ```bash
   [root@CRMHOST1 ~] # /sbin/ifconfig
   eth0    Link encap:Ethernet  HWaddr 00:11:43:D7:5B:06
           inet addr:139.185.140.51  Bcast:139.185.140.255  Mask:255.255.255.0
           inet6 addr: fe80::211:43ff:fed7:5b06/64 Scope:Link
           UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
           RX packets:10626133  errors:0  dropped:0  overruns:0  frame:0
           TX packets:10951629  errors:0  dropped:0  overruns:0  carrier:0
           collisions:0  txqueuelen:1000
           RX bytes:4036851474 (3.7 GiB)  TX bytes:2770209798 (2.5 GiB)
           Base address:0xecc0  Memory:dfae0000-dfb00000
   ``

2. On CRMHOST1, bind the virtual IP Address to the network interface card using `ifconfig`. In a UNIX environment, run this command as the root user. Use a netmask value that was obtained in Step 1.

   The syntax and usage for the `ifconfig` command is as follows:

   `/sbin/ifconfig networkCardInterface Virtual_IP_Address netmask netMask`

   For example:

   `/sbin/ifconfig eth0:1 100.200.140.206 netmask 255.255.255.0`
3. Update the routing table using `arping`. In a UNIX environment, run this command as the root user.

   `/sbin/arping -q -U -c 3 -I networkCardInterface Virtual_IP_Address`

   For example:

   `/sbin/arping -q -U -c 3 -I eth0 100.200.140.206`

4. Validate that the address is available by pinging it from another node. For example:

   `/bin/ping 100.200.140.206`

### 16.1.2 Adding a New Machine in the Oracle WebLogic Server Console

Create a new machine and assign the Administration Server to the new machine using the Administration Console:

1. Log in to the Administration Console.
2. In the Change Center, click **Lock & Edit**.
3. In the Environment section of the Home page, click **Machines**.
4. On the Summary of Machines page, select the machine that is associated with the Administration Server from under the **Machines** table and click **Clone**. For example: *CRMHOST1.MYCOMPANY.COM*.
5. On the Clone a Machine page, enter the name of the machine under the Machine Identity section and click **OK**. For example, enter *ADMINHOST* as the machine name.
6. On the Summary of Machines page, click the newly created machine link.
7. On the Settings page for the *ADMINHOST* machine, click **Servers**.
8. Click **Add** under the **Servers** table.
9. On the Add a Server to Machine page, select **Select an existing server, and associate it with this machine**.
10. Choose the AdminServer from the dropdown list.
11. Click **Finish** to associate the Administration Server with the machine.
12. On the Settings page for the *ADMINHOST* machine, click **Node Manager**.
13. Set the listen address to *CRMADMINVH*.

**Note:** Ensure that you have performed the steps described in Section 16.1.1, "Enabling an Administrative Virtual Host on CRMHOST1" before setting the Node Manager listen address.

14. Click **Save**.
15. In the Change Center, click **Activate Changes**.

### 16.1.3 Enabling the Administration Server to Listen on the Virtual IP Address

Ensure that you have performed the steps described in Section 16.1.1, "Enabling an Administrative Virtual Host on CRMHOST1" before setting the Administration Server listen address.
To set the Administration Server listen address:

1. Log in to the Administration Console.
2. In the Change Center, click **Lock & Edit**.
3. Expand the **Environment** node in the Domain Structure window.
4. Click **Servers**. The Summary of Servers page is displayed.
5. Select **AdminServer(admin)** in the table. The Settings page for AdminServer(admin) is displayed.
6. Set the listen address to **CRMADMINVH** (domain-specific administrative virtual host).
7. Click **Save**.
8. Click **Activate Changes**.
9. The changes will not take effect until the Administration Server is restarted.
   Follow these steps to restart the Administration Server:
   a. In the Summary of Servers page, select the **Control** tab.
   b. Select **AdminServer(admin)** in the table and then click **Shutdown**.
10. Set the following environment variable:
    
    ```
    WLST_PROPERTIES="-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks"
    ```
11. Start the Administration Server again from the command line. Use the `nmconnect` username and password you specified in the **Installation Location Screen** in Chapter 5.
    ```
    CRMHOST1> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
    CRMHOST1> nmConnect(username='username', password='password',
    domainName='domain_name', host='CRMADMINVH', port='5556', nmType='ssl',
    domainDir='ORACLE_BASE/config/domains/CRMHOST1/domain_name')
    CRMHOST1> nmStart('AdminServer')
    CRMHOST1> exit ()
    ```

### 16.2 Oracle HTTP Server Configuration

To configure Oracle HTTP Server:

1. On **WEBHOST1**:
   a. cd **ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf**.
   b. Edit the domain-specific virtual host `config` file. For example:
      ```
      cp FusionVirtualHost_crm.conf FusionVirtualHost_crm.conf.org
      ```
2. Edit the `FusionVirtualHost_crm.conf` file, adding the Administrative virtual host and port. Example 16–1 shows sample code.

**Note:** Replace **CRMADMINVH** and port with domain-specific Administrative virtual host and port number.
Example 16–1  Add AdministrativeVirtual Host and Port

## Context roots for application em
<Location /em>
  SetHandler weblogic-handler
  WebLogicCluster CRMADMINVH:port
</Location>

## Context roots for application console
<Location /console >
  SetHandler weblogic-handler
  WebLogicCluster CRMADMINVH:port
</Location>

3. Restart Oracle HTTP Server: cd to ORACLE_BASE/config/CommonDomain_webtier/bin and enter the following:
   WEBHOST1> ./opmnctl stopall
   WEBHOST1> ./opmnctl startall

4. Repeat Steps 1 through 3 on WEBHOST2.

16.3 Validating the Administration Server

Perform these steps to ensure that the Administration Server and Oracle Enterprise Manager Fusion Middleware Control are properly configured:

1. Ensure that you can access the domain-specific Oracle WebLogic Server Administration Console and Oracle Enterprise Manager Fusion Middleware Control. For example, for the Oracle Fusion Customer Relationship Management domain:
   http://crminternal.mycompany.com:7777/console
   http://crminternal.mycompany.com:7777/em

2. After completing the steps in Section 16.1 and Section 16.2 for other domains, repeat Step 1 for other domains by replacing the domain-specific URL.

3. Do the following:
   a. Log into Oracle Fusion Functional Setup Manager as a super user. The user should have the Oracle WebLogic Server Administrator role, for example, "FAadmin". Functional Setup Manager is located here:
      https://commonexternal.mycompany.com/setup/faces/TaskListManagerTop
   b. Select Register Domains in the left-hand task pane.
   c. On the Register Domains page, select the domain to be updated and click Edit.
   d. Do the following:
      – Replace ADMIN_HOST (the default value) with CRMADMINVH wherever it appears.
      – Update the value of Enterprise Manager Protocol to ssl.
      – Ensure the value of Enterprise Manager Port is 5556.
   e. Click Save and Close.
   f. Repeat Step a through Step e for all domains.
4. Replace the value of **TAXONOMY_URL** in the `fusion_env.properties`, `fusion_prov.properties`, and `atgpf_env.properties` files located in `ORACLE_BASE/config/fapatch` with `CRMADMINVH` if the Administration Server's listen address is updated with the virtual IP (VIP) for CommonDomain.

5. The changes will not take effect until the Administration Server is restarted. Follow these steps to restart the Administration Server:
   a. In the Summary of Servers page, select the **Control** tab.
   b. Select **AdminServer(admin)** in the table and then click **Shutdown**.

6. Set the following environment variable:
   
   ```
   WLST_PROPERTIES=-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/config/keystores/fusion_trust.jks
   ```

7. Start the Administration Server again from the command line. Use the `nmconnect` username and password you specified in the Installation Location Screen in Chapter 5.
   
   ```
   CRMHOST1> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
   CRMHOST1> nmConnect(username='username', password='password',
   domainName='domain_name', host='CRMADMINVH', port='5556', nmType='ssl',
   domainDir='ORACLE_BASE/config/domains/CRMHOST1/directory')
   CRMHOST1> nmStart('AdminServer')
   CRMHOST1> exit ()
   ```

8. Restart the Managed Servers:
   b. Navigate to **CRMDomain > Environment > Servers > Control**.
   c. Select all the Managed Servers and click **Stop**.
   d. After all the servers have shut down, select all the servers in the table and then click **Start**.

**16.4 Manually Failing Over the Administration Server to CRMHOST2**

In case a node fails, you can fail over the Administration Server to another node. This section describes how to fail over the Administration Server from **CRMHOST1** to **CRMHOST2**.

**16.4.1 Prerequisites**

Ensure the following:

- The Administration Server is configured to listen on a domain-specific administrative virtual host, and not on any address
- When failover happens, the Administration Server is failed over from **CRMHOST1** to **CRMHOST2** and the two nodes have the following IPs:
  - **CRMHOST1**: 100.200.140.165
  - **CRMHOST2**: 100.200.140.205
- **CRMADMINVH**: 100.200.140.206. This is the VIP where the domain-specific Administration Server is running, assigned to ethX:Y, available in CRMHOST1 to and CRMHOST2.

- The domain directory where the Administration Server is running on CRMHOST1 to is on shared storage and is mounted from CRMHOST2

### 16.4.2 Performing the Failover

The following procedure explains how to fail over the Administration Server to a different node (CRMHOST2) with the Administration Server still using the same Oracle WebLogic Server machine. (This machine is a logical machine, not a physical one.)

To fail over the Administration Server:

1. Stop the Administration Server.
2. Migrate the IP to the second node:
   a. Run the following command as root on CRMHOST1 to (where X:Y is the current interface used by CRMADMINVH):

   ```
   CRMHOST1> /sbin/ifconfig ethX:Y down
   ```

   b. Run the following command as root on CRMHOST2:

   ```
   CRMHOST2> /sbin/ifconfig interface:index IP_Address netmask netmask
   ```

   For example:

   ```
   /sbin/ifconfig eth0:1 100.200.140.206 netmask 255.255.255.0
   ```

   **Note:** Ensure that the netmask and interface to be used to match the available network configuration in CRMHOST2.

3. Update the routing tables with arping. For example, run the following command as root:

   ```
   CRMHOST2> /sbin/arping -q -U -c 3 -I eth0 100.200.140.206
   ```

4. Validate that the address is available by pinging it from another node. For example:

   ```
   /bin/ping 100.200.140.206
   ```

5. Start the Administration Server on CRMHOST2 using the procedure in Section 16.1.3.

6. Test access to the Administration Server on CRMHOST2:
   a. Ensure that you can access the domain-specific Oracle WebLogic Server Administration Console and Oracle Enterprise Manager Fusion Middleware Control. For example, for the Oracle Fusion Customer Relationship Management domain, use these URLs:

   - http://crminternal.mycompany.com:7777/console
   - http://crminternal.mycompany.com:7777/em

   b. Repeat Step a for other domain by replacing the domain-specific URL.
16.5 Failing the Administration Server Back to CRMHOST1

You also must ensure that you can fail back the Oracle WebLogic Server Administration Server, that is, stop it on CRMHOST2 and run it on CRMHOST1. To do this, migrate CRADMINVH back to CRMHOST1 node.

To migrate CRADMINVH:

1. Stop the Administration Server on CRMHOST2.

2. Run the following command as root from CRMHOST2 to shut down the network stack virtual interface:

   CRMHOST2> /sbin/ifconfig ethX:Y down

3. Run the following command as root from CRMHOST1 to restart the virtual interface:

   CRMHOST1> /sbin/ifconfig ethX:Y 100.200.140.206 netmask 255.255.255.0

   **Note:** Ensure that the netmask and interface to be used match the available network configuration in CRMHOST1.

4. Run the following command from CRMHOST1 to update the routing tables through arping:

   CRMHOST1> /sbin/arping -q -U -c 3 -I eth0 100.200.140.206

5. Validate that the address is available by pinging it from another node. For example:

   /bin/ping 100.200.140.206

6. Start the Administration Server again on CRMHOST1 using the procedure in Step 3 in Section 16.1.3.

7. Test access to the Administration Server on CRMHOST1:

   a. Ensure that you can access the domain-specific Oracle WebLogic Server Administration Console and Oracle Enterprise Manager Fusion Middleware Control. For example, for the Oracle Fusion Customer Relationship Management domain, use these URLs:

      - http://crminternal.mycompany.com:7777/console
      - http://crminternal.mycompany.com:7777/em

   b. Repeat Step a for other domain by replacing the domain-specific URL.

---

**Note:** The Administration Server does not use Node Manager for failing over. After a manual failover, the machine name that appears in the Current Machine field in the Administration Console for the server is CRMHOST1, and not the failover machine, CRMHOST2. Since Node Manager does not monitor the Administration Server, the machine name that appears in the Current Machine field, is not relevant and you can ignore it.
This chapter describes how to configure server migration according to enterprise deployment recommendations.

This chapter includes the following topic:

- Section 17.1, "Prerequisite"
- Section 17.2, "Migrating Oracle Fusion Applications Domains"

### 17.1 Prerequisite

Before migrating Oracle Fusion Applications domains, ensure you have completed the steps in Section 15.1, "Enabling Virtual IPs on CRMHOST1 and CRMHOST2," Section 15.2, "Setting the Listen Address for soa_server1," and Section 15.3, "Setting the Listen Address for soa_server2" for all Managed Servers needing to be migrated.

**Note:** This prerequisite does not apply to the Oracle Business Intelligence domain.

### 17.2 Migrating Oracle Fusion Applications Domains

The procedures in this section apply to these domains and applications:

- Oracle SOA Suite in the Oracle Fusion Customer Relationship Management domain
- Oracle SOA Suite in the Oracle Fusion Financials domain
- Oracle SOA Suite in the Oracle Fusion Common domain
- Oracle SOA Suite in the Oracle Business Intelligence domain
- Oracle SOA Suite in the Oracle Fusion Human Capital Management domain
- Oracle SOA Suite in the Oracle Fusion Supply Chain Management domain
- Oracle SOA Suite in the Oracle Incentive Compensation domain

### 17.2.1 About Configuring Server Migration

The procedures described in this chapter must be performed for various components of the enterprise deployment topology outlined in Section 2.1, "Overview of Reference
Variables are used in this chapter to distinguish between component-specific items:

- `WLS_SERVER1` and `WLS_SERVER2` refer to the managed WebLogic servers for the enterprise deployment component
- `CRMHOST1` and `CRMHOST2` refer to the host machines for the enterprise deployment component
- `CLUSTER` refers to the cluster associated with the enterprise deployment component.

The values to be used to these variables are provided in the component-specific chapters in this guide.

In this enterprise topology, you must configure server migration for the `WLS_SERVER1` and `WLS_SERVER2` Managed Servers. The `WLS_SERVER1` Managed Server is configured to restart on `CRMHOST2` should a failure occur. The `WLS_SERVER2` Managed Server is configured to restart on `CRMHOST1` should a failure occur. For this configuration, the `WLS_SERVER1` and `WLS_SERVER2` servers listen on specific floating IP addresses that are failed over by WebLogic Server migration. Configuring server migration for the WLS Managed Servers consists of the following steps:

- Step 1: Setting Up a User and Tablespace for the Server Migration Leasing Table
- Step 2: Creating a Multi-Data Source Using the Oracle WebLogic Server Administration Console
- Step 3: Editing Node Manager’s Properties File
- Step 4: Setting Environment and Superuser Privileges for the wlsifconfig.sh Script
- Step 5: Configuring Server Migration Targets
- Step 6: Testing the Server Migration

### 17.2.2 Setting Up a User and Tablespace for the Server Migration Leasing Table

The first step is to set up a user and tablespace for the server migration leasing table.

#### Note:
If other servers in the same domain have already been configured with server migration, the same tablespace and data sources can be used. In that case, the data sources and multi-data source for database leasing do not need to be re-created, but they will have to be retargeted to the cluster being configured with server migration.

To set up a user and tablespace:

1. Create a tablespace called 'leasing'. For example, log on to SQL*Plus as the sysdba user and run the following command:

   ```sql
   SQL> create tablespace leasing logging datafile
   'DB_HOME/oradata/orcl/leasing.dbf'
   size 32m autoextend on next 32m maxsize 2048m extent management local;
   ```

2. Create a user named 'leasing' and assign to it the leasing tablespace:

   ```sql
   SQL> create user leasing identified by password;
   SQL> grant create table to leasing;
   SQL> grant create session to leasing;
   SQL> alter user leasing default tablespace leasing;
   ```
3. Create the leasing table using the leasing.ddl script:
   a. Copy the leasing.ddl file located in either the ORACLE_BASE/products/fusionapps/wlserver_10.3/server/db/oracle/817 or the ORACLE_BASE/products/fusionapps/wlserver_10.3/server/db/oracle/920 directory to your database node.
   b. Connect to the database as the leasing user.
   c. Run the leasing.ddl script in SQL*Plus:
      SQL> @Copy_Location/leasing.ddl;

17.2.3 Creating a Multi-Data Source Using the Oracle WebLogic Server Administration Console

The second step is to create a multi-data source for the leasing table from the Oracle WebLogic Server Administration Console. You create a data source to each of the Oracle RAC database instances during the process of setting up the multi-data source, both for these data sources and the global leasing multi-data source.

Please note the following considerations when creating a data source:

- Make sure that this is a non-XA data source.
- The names of the multi-data sources are in the format of <MultiDS>-rac0, <MultiDS>-rac1, and so on.
- Use Oracle's Driver (Thin) Version 9.0.1, 9.2.0, 10, 11.
- Use Supports Global Transactions, One-Phase Commit, and specify a service name for your database.
- Target these data sources to the cluster assigned to the enterprise deployment component (CLUSTER; see the component-specific chapters in this guide).

Creating a Multi-Data Source
To create a multi-data source:

1. In the Domain Structure window in the Oracle WebLogic Server Administration Console, click the Data Sources link.
2. Click Lock & Edit.
3. Select Multi Data Source from the New dropdown menu.
   The Create a New JDBC Multi Data Source page is displayed.
4. Enter leasing as the name.
5. Enter jdbc/leasing as the JNDI name.
6. Select Failover as algorithm (default).
7. Click Next.
8. Select the cluster that must be migrated. In this case, SOA cluster.
9. Click Next.
10. Select non-XA driver (the default).
11. Click Next.
12. Click Create a New Data Source.

13. Enter leasing-rac0 as the name. Enter jdbc/leasing-rac0 as the JNDI name. Enter oracle as the database type. For the driver type, select Oracle Driver (Thin) for Oracle RAC Service-Instance connections, Versions 10 and later.

---

**Note:** When creating the multi-data sources for the leasing table, enter names in the format of <MultiDS>-rac0, <MultiDS>-rac1, and so on.

---

14. Click Next.

15. Deselect Supports Global Transactions.

16. Click Next.

17. Enter the following for your leasing schema:

- **Service Name:** The service name of the database.
- **Database Name:** The Instance Name for the first instance of the Oracle RAC database.
- **Host Name:** The name of the node that is running the database. For the Oracle RAC database, specify the first instance’s VIP name or the node name as the host name.
- **Port:** The port number for the database (1521).
- **Database User Name:** Enter leasing.
- **Password:** The leasing password.

18. Click Next.

19. Click Test Configuration and verify that the connection works.

20. Click Next.

21. Target the data source to the cluster assigned to the enterprise deployment component (CLUSTER).

22. Click Finish.

23. Click Create a New Data Source for the second instance of your Oracle RAC database, target it to the cluster assigned to the enterprise deployment component (CLUSTER), repeating the steps for the second instance of your Oracle RAC database.

24. Add leasing-rac0 and leasing-rac1 to your multi-data source.

25. Make sure the initial connection pool capacity of the data sources is set to 0 (zero). In the Datasources screen do the following:

   a. Select Services, then select Datasources.
   b. Click Datasource Name, then click the Connection Pool tab.
   c. Enter 0 (zero) in the Initial Capacity field.

26. Click Save, then click Activate Changes.

### 17.2.4 Editing Node Manager’s Properties File

The third step is to edit Node Manager’s properties file, which is located at:
This must be done for the node managers in both nodes where server migration is being configured. For example:

```
Interface=eth0
NetMask=255.255.255.0
UseMACBroadcast=true
```

- **Interface**: This property specifies the interface name for the floating IP (for example, eth0).

  Do not specify the sub-interface, such as eth0:1 or eth0:2. This interface is to be used without :0 or :1. Node Manager's scripts traverse the different :X-enabled IPs to determine which to add or remove. For example, the valid values in Linux environments are eth0, eth1, eth2, eth3, ethn, depending on the number of interfaces configured.

- **NetMask**: This property specifies the net mask for the interface for the floating IP. The net mask should the same as the net mask on the interface; 255.255.255.0 is used as an example in this document.

- **UseMACBroadcast**: This property specifies whether to use a node's MAC address when sending ARP packets, that is, whether to use the -b flag in the arping command.

Verify in Node Manager's output (shell where Node Manager is started) that these properties are being used, or problems may arise during migration. You should see something like this in Node Manager's output:

```
...  
StateCheckInterval=500
Interface=eth0
NetMask=255.255.255.0
...  
```

---

**Note**: The steps below are not required if the server properties (start properties) have been properly set and Node Manager can start the servers remotely.

---

1. Set the following property in the nodemanager.properties file:

   - **StartScriptEnabled**: Set this property to 'true'. This is required for Node Manager to start the Managed Servers using start scripts.

2. Restart Node Manager on CRMHOST1 and CRMHOST2 by running the `startNodeManagerWrapper.sh` script, which is located in the ORACLE_BASE/config/nodemanager/CRMHOST1 and ORACLE_BASE/config/nodemanager/CRMHOST2 directories.

### 17.2.5 Setting Environment and Superuser Privileges for the wlsifconfig.sh Script

The fourth step is to set environment and superuser privileges for the `wlsifconfig.sh` script:
1. Ensure that your PATH is set with the environment variables in the terminal from where Node Manager is started, and that it includes these files:

<table>
<thead>
<tr>
<th>File</th>
<th>Located in this directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlsifconfig.sh</td>
<td>/u02/local/oracle/config/domains/CrmHOSTn/ManagedServer_</td>
</tr>
<tr>
<td></td>
<td>_Domain/bin/server_migration</td>
</tr>
<tr>
<td>wlscontrol.sh</td>
<td>ORACLE_BASE/products/fusionapps/wlservice_10.3/common/bin</td>
</tr>
<tr>
<td>nodemanager.domains</td>
<td>ORACLE_BASE/config/nodemanager/CrmHOSTn</td>
</tr>
</tbody>
</table>

2. Grant sudo configuration for the wlsifconfig.sh script.
   - Configure sudo to work without a password prompt.
   - For security reasons, sudo should be restricted to the subset of commands required to run the wlsifconfig.sh script. For example, perform these steps to set the environment and superuser privileges for the wlsifconfig.sh script:
     a. Grant sudo privilege to the WebLogic user ('oracle') with no password restriction, and grant execute privilege on the /sbin/ifconfig and /sbin/arping binaries.
     b. Make sure the script is executable by the WebLogic user ('oracle'). The following is an example of an entry inside /etc/sudoers granting sudo execution privilege for oracle and also over ifconfig and arping:
        ```
        oracle ALL=NOPASSWD: /sbin/ifconfig,/sbin/arping
        ```
        
        **Note:** Ask the system administrator for the sudo and system rights as appropriate to this step.

### 17.2.6 Configuring Server Migration Targets

The fifth step is to configure server migration targets. You first assign all the available nodes for the cluster's members and then specify candidate machines (in order of preference) for each server that is configured with server migration.

Enterprise deployment recommends using cluster-based migration. Perform the following steps, including a step to enable automatic server migration (Step 10), to configure cluster-based migration for all Managed Servers in a cluster:

1. Log in to the Oracle WebLogic Server Administration Console. For example, For example, http://crminternal.mycompany.com:7777/console.
2. In the Domain Structure window, expand Environment and select Clusters. The Summary of Clusters page is displayed.
3. Click the cluster for which you want to configure migration (CLUSTER) in the Name column of the table.
4. Click the Migration tab.
5. Click Lock & Edit.
6. In the Available field, select the machine to which to allow migration and click the right arrow. In this case, select CRMHOST1 and CRMHOST2.
7. Select the data source to be used for automatic migration. In this case, select the leasing data source.

8. Click Save.

9. Click Activate Changes.

10. Enable automatic server migration for all Managed Servers in the cluster. (You must perform this task for all of the Managed Servers.)

   **Note:** Although you are using cluster-based migration for the Managed Servers, you must perform this step (from the Migration tab) to enable automatic server migration for all the Managed Servers in the selected cluster.

   **Tip:** Click Customize this table in the Summary of Servers page and move Current Machine from the Available window to the Chosen window to view the machine on which the server is running. This will be different from the configuration if the server gets migrated automatically.

   b. Select the server for which you want to configure cluster-based migration.

   c. Click the Migration tab, and then click Lock & Edit.

   d. Select Automatic Server Migration Enabled. This enables Node Manager to start a failed server on the target node automatically.

   e. Click Save.

   f. Click Activate Changes.

   g. Restart the administration server, node managers, and the servers for which server migration has been configured.

### 17.2.7 Testing the Server Migration

The sixth and final step is to test the server migration. Perform these steps to verify that server migration is working properly:

**From CRMHOST1:**

1. Stop the WLS_SERVER1 Managed Server. To do this, run this command:

   ```
   CRMHOST1> kill -9 pid
   ```

   where `pid` specifies the process ID of the Managed Server. You can identify the pid in the node by running this command:

   ```
   CRMHOST1> ps -ef | grep WLS_SERVER1 | grep DomainName_SOACluster
   ```
2. Watch the Node Manager console. You should see a message indicating that WLS_SERVER1’s floating IP has been disabled.

3. Wait for Node Manager to try a second restart of WLS_SERVER1. It waits for a fence period of 10 seconds before trying this restart.

4. After Node Manager restarts the server, stop it few times. Node Manager should now log a message indicating that the server will not be restarted again locally.

From CRMHOST2:
1. Watch the local Node Manager console. Ten (10) seconds after the last try to restart WLS_SERVER1 on CRMHOST1, Node Manager on CRMHOST2 should prompt that the floating IP for WLS_SERVER1 is being brought up and that the server is being restarted in this node.

2. As an example, for Oracle SOA Suite Managed Servers, access the soa-infra console in the same IP.

Verification from the Administration Console
Migration can also be verified in the Administration Console:

1. Log in to the Administration Console.
2. Click Domain on the left console.
3. Click the Monitoring tab and then the Migration subtab.

The Migration Status table, shown in Figure 17–1, provides information on the status of the migration.

Figure 17–1  Migration Status Screen in the Administration Console

---

**Note:** To complete server migration in a cluster, perform the same steps on the second, third, and so on, managed servers.
Configuration of Oracle Business Intelligence Applications is an extension of the existing Oracle Business Intelligence domain. This chapter describes how the different components of Oracle BI Applications can be installed and configured for high availability.

This chapter includes the following topics:

- Section 18.1, "Introduction to Oracle BI Applications for Oracle Fusion Customer Relationship Management"
- Section 18.2, "Roadmap for Installing Oracle BI Applications"
- Section 18.3, "Creating Databases for Oracle Business Intelligence Applications Components"
- Section 18.4, "Running Oracle BI Applications RCU to Create the Oracle BI Applications Schemas for the Data Warehouse"
- Section 18.5, "Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional Setup Manager, and DAC"
- Section 18.6, "Configuring Oracle HTTP Server for the Managed Server"
- Section 18.7, "Performing Additional Data Warehouse Administration Console Tasks"
- Section 18.8, "Validating Oracle BI Applications Components URLs"

**18.1 Introduction to Oracle BI Applications for Oracle Fusion Customer Relationship Management**

Oracle Fusion Customer Relationship Management is seamlessly integrated with Oracle Business Intelligence Suite to address the full range of analytical requirements. The suite consists of two products, Oracle Transactional Business Intelligence and Oracle Business Intelligence Applications (Oracle BI Applications).

Oracle Transactional Business Intelligence delivers up-to-the minute analysis of a wide range of Oracle Fusion Customer Relationship Management subject areas, whereas Oracle BI Applications provides a more comprehensive historical perspective for Oracle Fusion Customer Relationship Management that is suited to deeper analytical assessments. The product suite is meant to work together to provide customers with the ability to adapt to the rapidly changing and diverse analytical needs required by the business. For example, a customer could use the Transactional Business
Intelligence CRM Sales analysis area to view up to the minute pipeline analysis near key forecasting time periods; the projected forecast could then be further validated leveraging the CRM analysis area in Oracle BI Applications to see how this compares vs. previous time periods, sales people, customers, industries, etc. enabling sales management to make adjustments that deliver a more accurate overall forecast.

Oracle Transactional Business Intelligence is an integrated product of Oracle Fusion Applications. Oracle BI Applications is an optional product that you may choose to deploy. The ETL tier of Oracle BI Applications consists of the following components:

- a Data Warehouse database
- Informatica ETL suite
- Data Warehouse Administration Console (DAC)

The following sections provide more details about implementing these components of Oracle BI Applications for Oracle Fusion Applications.

18.1.1 Topology

Figure 18-1 shows the topology that represents Oracle BI Applications implementation in the Oracle Fusion Applications environment.
18.2 Roadmap for Installing Oracle BI Applications

This section describes the high-level tasks that are required to install Oracle BI Applications.

Some of these tasks are specific to an enterprise deployment, while others are more generalized Oracle BI Applications installation procedures. You will find detailed information about the enterprise-deployment tasks in this chapter. For those tasks that are related to an Oracle BI Applications installation, you will be directed to view the...

1. Create the Oracle Business Analytics, DAC Repository, Informatica Domain, and Informatica Repository databases. See *Section 18.3, 'Creating Databases for Oracle Business Intelligence Applications Components.'*

2. Run the Repository Creation Utility (RCU) to create the Oracle BI Applications schemas for the Data Warehouse. See *Section 18.4, 'Running Oracle BI Applications RCU to Create the Oracle BI Applications Schemas for the Data Warehouse.'*

5. Install and configure the database connectivity software. See "Setup Step: Install and Configure Database Connectivity Software" in *Oracle Fusion Middleware Installation and Configuration Guide for Oracle Business Intelligence Applications*.

8. Install and configure Informatica PowerCenter Services. Perform all steps in the following sections, including their subsections, in *Oracle Fusion Middleware Installation and Configuration Guide for Oracle Business Intelligence Applications*:
   - "Install and Set Up Informatica PowerCenter Services Manually"
   - "Setup Step: Creating the Informatica Repository Service"
   - "Setup Step: Creating the Informatica Integration Service"
   - "Setup Step: Load the Prebuilt Informatica Repository"
   - "Setup Step: Copying Source Files to the Informatica PowerCenter Services Machine"
   - "Setup Step: Setting PowerCenter Integration Services Relaxed Code Page Validation"
   - "Setup Step: Setting PowerCenter Integration Services Custom Properties"

9. Extend the Oracle Business Intelligence domain. See *Section 18.5, 'Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional Setup Manager, and DAC.'*

10. Configure Oracle HTTP Server. See *Section 18.6, 'Configuring Oracle HTTP Server for the Managed Server.'*

11. Perform additional Data Warehouse Administration Console tasks. See *Section 18.7, 'Performing Additional Data Warehouse Administration Console Tasks.'*

12. Validate the Oracle BI Applications components URLs. See *Section 18.8, 'Validating Oracle BI Applications Components URLs.'*
13. Perform all the steps listed in the sections "Setup Step: Configure SSO and Portlet Provider for Oracle BI Applications Configuration Manager and Functional Setup Manager" through "Next Steps" in Oracle Fusion Middleware Installation and Configuration Guide for Oracle Business Intelligence Applications.

18.3 Creating Databases for Oracle Business Intelligence Applications Components

Before you install Oracle BI Applications, the Data Warehouse Administration Console (DAC), and Informatica PowerCenter, create an Oracle RAC database on BIDWHOST1 and BIDWHOST2 to hold the following:

- DAC Repository
- Informatica Domain Configuration Database
- Informatica Repository
- Oracle Business Analytics Warehouse

For information, see the following:

- Section 4.2, "Setting Up the Database" in Chapter 4, "Preparing the Database for an Enterprise Deployment."
- "Pre-installation and Pre-deployment Requirements for Oracle BI Applications" in Oracle Fusion Middleware Installation and Configuration Guide for Oracle Business Intelligence Applications.

18.4 Running Oracle BI Applications RCU to Create the Oracle BI Applications Schemas for the Data Warehouse

You must run the Oracle BI Applications Repository Creation Utility (RCU) to create the following Oracle BI Applications schemas:

- Oracle Data Warehouse Administration Console
- Oracle Business Analytics Warehouse

**Note:** Before running Oracle BI Applications RCU, you must copy the export dump files from the RCU_HOME/rcu/integration/biapps/schema directory to the BIDWHOST1 and BIDWHOST2 Oracle RAC database nodes. These dump files will be required when entering values in the Custom Variables screen (Figure 18–5). The directory should have read/write access since logs are written to it during the import.

For more information, see "Create the Oracle BI Applications Schemas Using RCU" in Oracle Fusion Middleware Installation and Configuration Guide for Oracle Business Intelligence Applications.

To run the Oracle BI Applications RCU:

1. Do the following:
   a. Create the Oracle Business Intelligence RCU home directory (BI_RCU_HOME):
      `ORACLE_BASE/bi_rcu` and then unzip the Oracle_
b. Start RCU from the bin directory in the Oracle Business Intelligence RCU home directory:

   cd BI_RCU_HOME/bin
   ./rcu

2. In the Welcome screen (if displayed), click Next.

3. In the Create Repository screen, shown in Figure 18–2, select Create to load component schemas into a database. Click Next.

   **Figure 18–2 Create Repository Screen**

   ![](image)

4. In the Database Connection Details screen, shown in Figure 18–3, enter connect information for your database:

   - **Database Type**: Select Oracle Database from the dropdown list
   - **Host Name**: Specify the name of the node on which the database resides. For the Oracle RAC database, specify the VIP name or one of the node names as the host name: BIDWHOST1-VIP
   - **Port**: Specify the listen port number for the database
   - **Service Name**: Specify the service name of the database (bidw.mycompany.com).
   - **Username**: Specify the name of the user with DBA or SYSDBA privileges: SYS.
   - **Password**: Enter the password for the SYS user.
   - **Role**: Select the database user’s role from the dropdown list: SYSDBA (required by the SYS user).

   Click Next.
5. In the Select Components screen, shown in Figure 18–4, do the following:

   a. Select **Create a new Prefix**, and enter a prefix to use for the database schemas, for example **DEV** or **PROD**. You can specify up to six characters as a prefix. Prefixes are used to create logical groupings of multiple repositories in a database. For more information, see *Oracle Fusion Middleware Repository Creation Utility User’s Guide*.

   **Tip:** Note the name of the schema because the upcoming steps require this information.

   b. Expand **Oracle Application Components** and then **Oracle BI Applications Schemas**. Then, select the following:

      - **Oracle Data Warehouse Administration Console**
      - **Oracle Business Analytics Warehouse**

   Click Next.
6. In the Schema Passwords screen, enter passwords for the main and additional (auxiliary) schema users, and click Next.

   **Tip:** Note the name of the schema because the upcoming steps require this information.

7. In the Custom Variables screen, shown in Figure 18–5, enter `BI_RCU_HOME/rcu/integration/biapps/schema` in both Value fields.
8. In the Map Tablespaces screen, choose the tablespaces for the selected components, and click Next.

9. In the Summary screen, click Create.

10. In the Completion Summary screen, click Close.

18.5 Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional Setup Manager, and DAC

This section includes the following topics:

- How to Configure DAC, Oracle BI Applications Configuration Manager, and Functional Setup Manager
- Configuring Data Warehouse Administration Console for High Availability

---

**Note:** The DAC, Oracle BI Applications Configuration Manager, and Oracle Fusion Functional Setup Manager, configurations are an extension of the existing Oracle Business Intelligence domain. These procedures assume that Oracle Business Intelligence has been installed and configured during the Oracle Fusion Applications Provisioning process.

---

18.5.1 How to Configure DAC, Oracle BI Applications Configuration Manager, and Functional Setup Manager

The DAC, Oracle BI Applications Configuration Manager, and Functional Setup Manager configuration is an extension of the existing Oracle Business Intelligence domain. In this extension, the Oracle BI Applications Configuration Manager, and Functional Setup Manager components are administration components and are targeted to the Administration Server. DAC will be targeted to the Oracle Business Intelligence Managed Server.

To extend the domain:

1. Run the WebLogic Scripting Tool (WLST) script, \`ORACLE_BASE/products/fusionapps/bi/dwtools/scripts/install_dwtools.py\` from \`CRMHOST1\`. A sample script is shown in Example 18–1.

**Example 18–1 Running the WLST Script**

```bash
ORACLE_BASE/products/fusionapps/bi/common/bin/wlst.sh install_dwtools.py
'DOMAIN_HOME'
'INFORMATICA_SERVER_HOME'
'INFORMATICA_DOMAIN_FILE'
'DW_DB_URL' 'DW_DB_SCHEMA'
'MDS_DB_URL' 'MDS_DB_SCHEMA'
'DAC_DB_URL' 'DAC_SCHEMA'
'DAC_TARGET'
```

where:

- `DOMAIN_HOME` is the path to the Administration Server Domain Home
- `INFORMATICA_SERVER_HOME` is the path to the Informatica Server Home
Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional

- **INFORMATICA DOMAIN FILE** is the path to the Informatica domains.infa file location

- **DW_DB_URL** is the string; for example,

  ```
  jdbc:oracle:thin:@(DESCRIPTION=
  (ADDRESS_LIST=(LOAD_BALANCE=on)
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=BIDWHOST1-VIP)(PORT=1521)) (ADDRESS=
  (PROTOCOL=TCP) (HOST=BIDWHOST2-VIP)
  (PORT=1521))) (CONNECT_DATA=
  (SERVICE_NAME=bidw.mycompany.com)))
  ```

- **DW_DB_SCHEMA** is the Data Warehouse schema; for example, **prefix_DW**

- **MDS_DB_URL** is the string; for example,

  ```
  jdbc:oracle:thin:@(DESCRIPTION=
  (ADDRESS_LIST=(LOAD_BALANCE=on)
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=FUSIONDBHOST1-VIP)(PORT=1521))
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=FUSIONDBHOST2-VIP)(PORT=1521)))
  (CONNECT_DATA=
  (SERVICE_NAME=crm.mycompany.com)))
  ```

- **MDS_DB_SCHEMA** is the MDS schema; for example, **prefix_MDS**

- **DAC_DB_URL** is the string; for example,

  ```
  jdbc:oracle:thin:@(DESCRIPTION=
  (ADDRESS_LIST=(LOAD_BALANCE=on)
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=BIDWHOST1-VIP)(PORT=1521)) (ADDRESS=
  (PROTOCOL=TCP) (HOST=BIDWHOST2-VIP)
  (PORT=1521))) (CONNECT_DATA=
  (SERVICE_NAME=bidw.mycompany.com)))
  ```

- **DAC_SCHEMA** is the DAC schema; for example, **prefix_DAC**

---

**Note:** When prompted, enter the password for each of the following schemas:

- **prefix_DW**
- **prefix_MDS**
- **prefix_DAC**

---

**Note:** DAC_TARGET should be set to the Managed Server name (bi_server1) for an enterprise deployment.

---

**Note:** You must restart the Administration Server for this configuration to take effect.

---

2. Run the following Oracle WebLogic Scripting Tool (WLST) script from **CRMHOST1**:

   `ORACLE_BASE/products/fusionapps/bi/dac/scripts/copyDACDomainFiles.py`

   For example:
Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional

ORACLE_BASE/products/fusionapps/bi/common/bin/wlst.sh copyDACDomainFiles.py
'ORACLE_HOME' 'DOMAIN_HOME'

where

- **ORACLE_HOME** is the path to Oracle home. For example, ORACLE_BASE/products/fusionapps/bi.
- **DOMAIN_HOME** is the path to the Managed Server domain home. For example, /u02/local/oracle/config/domains/CRMHOST1/BIDomain.

3. Restart the Administration Server and all Managed Servers.

4. Run the following WLST script on **CRMHOST1**:

ORACLE_BASE/products/fusionapps/bi/dwtools/scripts/configure_dwtools.py

For example:

ORACLE_BASE/products/fusionapps/bi/common/bin/wlst.sh configure_dwtools.py

'WEBLOGIC_ADMINISTRATOR'
'WEBLOGIC_ADMIN_SERVER_HOST'
'WEBLOGIC_ADMIN_SERVER_PORT'

Where

- **WEBLOGIC_ADMINISTRATOR** is the Oracle WebLogic Server Administrator
- **WEBLOGIC_ADMIN_SERVER_HOST** is the Oracle WebLogic Server Administration host. For example, CRMHOST1.mycompany.com.
- **WEBLOGIC_ADMIN_SERVER_PORT** is the Oracle WebLogic Server Administration Console Port. For example, 10201.

You will be prompted for the WebLogic Administrator password.

5. Run the following WLST script on **CRMHOST1**:

ORACLE_BASE/products/fusionapps/bi/dwtools/scripts/configure_rpd.py

For example:

$ cd ORACLE_BASE/products/fusionapps/bi/dwtools/scripts/
$ ORACLE_BASE/products/fusionapps/bi/common/bin/wlst.sh configure_rpd.py

'DOMAIN_HOME'
'DW_DB_URL'
'DW_DB_SCHEMA'
'MASTER_BI_INSTANCE_HOME'
'WEBLOGIC_ADMIN_SERVER_HOST'
'WEBLOGIC_ADMIN_SERVER_PORT'
'WEBLOGIC_ADMINISTRATOR'

where

- **DOMAIN_HOME** is the path to the Managed Server domain home. For example, /u02/local/oracle/config/domains/CRMHOST1/BIDomain.
- **DW_DB_URL** is the string. For example,

  jdbc:oracle:thin:@(DESCRIPTION=
  (ADDRESS_LIST=(LOAD_BALANCE=on)
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=BIDWHOST1-VIP) (PORT=1521))
  (ADDRESS=(PROTOCOL=TCP)
  (HOST=BIDWHOST2-VIP)
  (PORT=1521))
  (CONNECT_DATA=
  (SERVICE_NAME=bidw.mycompany.com)))
Extending the Oracle Business Intelligence Domain by Deploying Oracle BI Applications Configuration Manager, Functional

- **DW_DB_SCHEMA** is the Data Warehouse schema. For example, prefix_DW.

- **MASTER_BI_INSTANCE_HOME** is the path to the Master BI Server Instance home. For example, /u02/local/oracle/config/BIInstance.

- **WEBLOGIC_ADMIN_SERVER_HOST** is the Oracle WebLogic Server Administration host. For example, CRMHOST1.mycompany.com.

- **WEBLOGIC_ADMIN_SERVER_PORT** is the Oracle WebLogic Server Administration Console Port. For example, 10201.

- **WEBLOGIC_ADMINISTRATOR** is the Oracle WebLogic Server Administrator.

6. On all nodes where DAC Server can run, back up and update the `/u02/local/oracle/config/domains/CRMHOST1/BIDomain/bin/setDomainEnv.sh` script.
   a. Back up the script:
      ```
      $ cd /u02/local/oracle/config/domains/CRMHOST1/BIDomain/bin
      $ cp setDomainEnv.sh setDomainEnv.sh.sav
      ```
   b. Update the script to include the following:
      ```
      # Set Informatica Environment for DAC Server
      . ${DOMAIN_HOME}/config/dac/dac_env.sh
      ```

7. For the changes to take effect, restart the Managed Servers and the System Components:
   a. On the Summary of Servers page, select the Control tab.
   b. Select **bi_server1** and **bi_server2** in the table and then click Shutdown.
   c. After the servers have shut down, select **bi_server1** and **bi_server2** in the table and then click Start.
   d. Run the following commands to restart the Oracle Business Intelligence system components:
      ```
      $ cd /u02/local/oracle/config/BIInstance
      $ ./opmnctl stopall
      $ ./opmnctl startall
      ```

8. Validate the Oracle BI Applications components:
   a. Log in to the Administration Server console (http://biinternal.mycompany.com:7777/console) and check the health and status of the Data Warehouse Administration Console Server (DACServer).
   b. Validate the following DAC URL: http://BIVH1:10217/DACServer.
   c. Check to ensure that the following files have been created:
      ```
      ORACLE_BASE/config/domains/CRMHOST1/BIDomain/dac/conf-shared/server.properties
      ORACLE_BASE/config/domains/CRMHOST1/BIDomain/dac/conf-shared/security/repository/cwallet.sso
      ```
   d. Log in to the database with the DAC schema user name and password and type the following SQL query:
      ```
      SELECT * FROM W_ETL_REPOS WHERE ROW_WID='DACServerURL';
      ```
18.5.2 Configuring Data Warehouse Administration Console for High Availability

The Data Warehouse Administration Console (DAC) Server is a singleton: only one active Oracle DAC Server is used at any given time. The Oracle WebLogic Server Migration feature is used to protect Oracle DAC server from failures. The Oracle WebLogic Managed Server in which Oracle DAC server runs is listening on a virtual IP that gets migrated to another node when the failure occurs.

For more information on server-migration features, see Chapter 17, "Setting Up Server Migration for an Enterprise Deployment."

1. Run the following WLST script on the Administration Server (not on Managed Servers) to move the DAC configuration files to a new shared location:

   `ORACLE_BASE/products/fusionapps/bi/dac/scripts/moveDACConfigLocation.py`

   For example:

   `ORACLE_BASE/products/fusionapps/bi/common/bin/wlst.sh moveDACConfigLocation.py 'DOMAIN_HOME' 'DAC_SHARED_LOCATION'`

   where
   - `DOMAIN_HOME` is the path to the Administration Server domain home.
   - `DAC_SHARED_LOCATION` is the DAC shared location. For example, `ORACLE_BASE/config/BIShared/dac`.

2. Restart the Administration Server and Managed Servers (ensure that Node Manager is up and running):
   b. In the Summary of Servers screen, select the Control tab.
   c. Select AdminServer, bi_server1 and bi_server2 in the table and then click Shutdown.
   d. Restart the AdminServer, bi_server1, and bi_server2 Managed Servers.
   e. Restart the Oracle Business Intelligence system components:

      ```
      $ cd /u02/local/oracle/config/BIInstance
      $ ./opmnctl stopall
      $ ./opmnctl startall
      ```

18.6 Configuring Oracle HTTP Server for the Managed Server

To enable Oracle HTTP Server to route to the Data Warehouse Component Managed Server, you must set the WebLogicHost parameter.

To set the WebLogicHost parameter:

1. Add the following line to the FusionVirtualHost_bi.conf file. (On WEBHOST1, in `ORACLE_BASE/config/CommonDomain_webtier/config/OHS/ohs1/moduleconf`. On WEBHOST2, in `ORACLE_BASE/config/CommonDomain_webtier1/config/OHS/ohs2/moduleconf`.)

   ```
   e. Check the VALUE column of the result.
      The default value before configuration is http://localhost:9704/DACServer.
      The hostname and port will be updated in Step 1 in Section 18.7.
   ```
Performing Additional Data Warehouse Administration Console Tasks

RedirectMatch 301 ^/DACServer$ /DACServer/

RedirectMatch 301 ^/biacm$ /biacm/

# DAC Server
<LocationMatch ^/DACServer/>
SetHandler weblogic-handler
WebLogicHost BIVH1
WebLogicPort 10217
</LocationMatch>

## Context roots for application biacm
<LocationMatch ^/biacm/>
SetHandler weblogic-handler
WebLogicCluster BIADMINVH:10201
</LocationMatch>

## Context roots for application fsm
<LocationMatch /setup >
SetHandler weblogic-handler
WebLogicCluster BIADMINVH:10201
</LocationMatch>

2. Restart Oracle HTTP Server on both WEBHOST1 and WEBHOST2:

WEBHOST1> ORACLE_BASE/config/CommonDomain_webtier/bin/opmnctl restartproc
ias-component=ohs1
WEBHOST2> ORACLE_BASE/config/CommonDomain_webtier1/bin/opmnctl restartproc
ias-component=ohs2

18.7 Performing Additional Data Warehouse Administration Console Tasks

Perform the following additional tasks:

1. Set the correct DACServer URL in DAC Repository.

   The DACServerURL should be set to point to the load balancer virtual server. Log in to the database with the DAC schema, user name, and password, and then run the SQL commands shown in Example 18–2.

   **Example 18–2 Set the DACServer URL**

   ```sql
   SQL>
   UPDATE "prefix_DAc"."W_ETL_REPOS" SET VALUE = 'http://biinternal.mycompany.com:7777/DACServer'
   WHERE ROW_WID = 'DACServerURL';
   SQL>
   commit;
   ```

   2. From the ORACLE_BASE/config/domains/CRMHOST1/BIDomain/dac directory, start the DAC Client using startclient.sh and try to configure a new connection to validate the DAC Server setup. For more information, see "Logging into DAC for the First Time as an Administrator" in Oracle Fusion Middleware User’s Guide for Oracle Business Intelligence Data Warehouse Administration Console.

   **Note:** Specify the cwallet.sso file in DAC_SHARED_LOCATION. For example, ORACLE_BASE/config/BIShared/dac.
18.8 Validating Oracle BI Applications Components URLs

To validate, access the following URLs:

- http://biinternal.mycompany.com:7777/biacm to verify the status BI Applications Configuration Manager

- http://biinternal.mycompany.com:7777/setup/faces/TaskListManagerTop to verify the status of Oracle Fusion Functional Setup Manager

  Also, ensure that clicking on the "Perform Functional Configurations" link from Oracle BI Applications Configuration Manager launches Functional Setup Manager.

- http://biinternal.mycompany.com:7777/DACServer to verify the status of the DAC Server

Verify URLs to ensure that appropriate routing is working from the HTTP Server to the DAC Server.

To verify, access http://WEBHOST1:10621/DACServer and verify the appropriate functionality.
This chapter describes some operations that you can perform after you have set up the topology. These operations include monitoring, scaling, and backing up.

This chapter includes the following topics:

- Section 19.1, "Scaling the Topology for Additional Nodes"
- Section 19.2, "Performing Backups and Recoveries"
- Section 19.3, "Monitoring the Topology"
- Section 19.4, "Configuring Log File Rotation"
- Section 19.5, "Patching the Topology"
- Section 19.6, "Auditing"
- Section 19.7, "Troubleshooting"

19.1 Scaling the Topology for Additional Nodes

You can scale out and or scale up the enterprise topology. When you scale up the topology, you add new Managed Servers to nodes that are already running on one or more Managed Servers. When you scale out the topology, you add new Managed Servers to new nodes.

This section includes the topics:

- Section 19.1.1, "Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle ADF Server"
- Section 19.1.2, "Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle ADF Server"
- Section 19.1.3, "Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle SOA Suite Server"
- Section 19.1.4, "Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle SOA Suite Server"
- Section 19.1.5, "Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle Business Intelligence"
- Section 19.1.6, "Scaling Up the Topology for Oracle Business Intelligence"
19.1.1 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle ADF Server

When scaling out the topology, you add new Managed Servers configured to new nodes.

---

**Note:** The steps provided in this section also can be used to scale out additional hosts, such as CRMHOST4, CRMHOST5, and so on.

---

19.1.1.1 Prerequisites for Scaling Out the Topology for Oracle ADF Server

Before you begin, ensure the following:

- Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment"
- You are starting with a clean machine if it is the first time it is being used for a scale out
- The `/etc/hosts` file has proper entries. To verify, ping this machine with the fully qualified name of the machine
- The user created on CRMHOST3 should the same as the user on CRMHOST1
- The directory structure `/u01/oracle` is mounted to same shared file system as CRMHOST1
- The directory structure `/u02/local/oracle/config` on CRMHOST3 has been created
- The initial Oracle Fusion Customer Relationship Management deployment on CRMHOST1 has already been done and verified by provisioning

19.1.1.2 Adding a New Machine in the Oracle WebLogic Server Console

To add a new machine:

2. Navigate to CommonDomain > Environment > Machines. LocalMachine is located in the right-hand pane.
3. In the left-hand pane, click Lock & Edit.
4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   - Name - enter CRMHOST3
   - Machine operating system - Unix
5. Click Next.
6. In the window that opens, set the following attributes:
   - Type - SSL
   - Listen Address - `<CRMHOST3>`

---

**Note:** The "localhost" default value here is wrong.
 Scaling the Topology for Additional Nodes

7. Click Finish and activate the changes.

19.1.1.3 Packing and Unpacking the Managed Server Domain Home
Since the CRMHOST1 domain directory file system is also available from CRMHOST3, both the pack and unpack commands can be executed from the CRMHOST3.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command. For CommonDomain, for example:

   CRMHOST3> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMHOST1/CommonDomain -template=ORACLE_BASE/user_templates/CommonDomain_managed.jar -template_name="Common_Managed_Server_Domain"

3. Ensure that /u02/local/oracle/config/domains/CRMHOST3/CommonDomain is empty, and then run the unpack command:

   CRMHOST3> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMHOST3/CommonDomain -template=ORACLE_BASE/user_templates/CommonDomain_managed.jar

   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST3.

19.1.1.4 Cloning Managed Servers and Assigning Them to CRMHOST3
To add a Managed Server and assign it to CRMHOST3:

1. Log in to the Administration Server:

3. Switch to Lock & Edit mode.

4. Select the Managed_Server checkbox (for example, HomePageServer_1) and then click Clone.

5. Specify the following Server Identity attributes:

   ■ Server Name - HomePageServer_3

   Note: To ensure consistency in naming, copy the name of the server shown in Server Identity and paste it into the Server Name field. Then change the number to "_3"

   ■ Server Listen Address - <CRMHOST3>

   ■ Server Listen Port - leave "as is"

   Note: For Oracle SOA Suite server, add a port value that is different than the soa_server1 server value. This will help in server migration.

6. Click OK.

   You now should see the newly cloned server, HomePageServer_3.
7. Click **HomePageServer_3** and change the following attributes:
   - Machine - `<CRMHOST3>`
   - Cluster Name - accept the default, HomePageCluster

   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.

8. Click **Save** and then **Activate Changes**.
9. From the Name column, click the **HomePageServer_3** scaled-out server link.
10. Click **Lock & Edit**, and then select the **Configuration** tab.
11. Select the **Keystores** tab, and then ensure that the keystores value is **Custom Identity and Custom Trust**.
12. Do the following:
   a. Change the Custom Identity Keystore path to point to the `ORACLE_BASE/products/fusionapps/wlserver_10.3/server/lib/CRMHOST3_fusion_identity.jks` file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the `keystorepassword` field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the `ORACLE_BASE/products/fusionapps/wlserver_10.3/server/lib/fusion_trust.jks` file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the `keystorepassword` field described in the first bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   h. Re-enter the Custom Trust Keystore Passphrase.
   i. Click **Save**.
13. Select the **SSL** tab.
   a. Make sure that Identity and Trust Locations is set to **Keystores**.
   b. Change the Private Key Alias to `CRMHOST3_fusion`.
   c. Change the Private Key Passphrase to the `keypassword`, as described in the second bullet in Step 4 in Section 7.3, "Creating the Identity Keystore on CRMHOST2."
   d. Re-enter the `keypassword` from Step c for the Confirm Private Key Passphrase.
   e. Click **Save**.
14. Select the **Server Start** tab.
   Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:
Click Save.
15. Select the **Logging** tab, and then select the **HTTP** tab.

16. Do the following:
   a. Change the Log file name to `logs/access.log.%yyyyMMdd%`
   b. Change the rotation type to **By Time**.
   c. Leave the **Limit number of retained files** option unchecked.
   d. Leave the **Rotate log file on startup** option unchecked.
   e. Click **Save**.
   f. Expand **Advanced**.
   g. Change the format to **Extended**.
   h. Change the extended logging format fields to the following:
      
      ```
      date time time-taken cs-method cs-uri
      sc-status sc(X-ORACLE-DMS-ECID)
      cs(ECID-Context) cs(Proxy-Remote-User)
      cs(Proxy-Client-IP)
      ```
   i. Click **Save**.

17. Click **Activate Changes**.

18. Repeat Steps 2 to 17 for all the newly cloned Managed Servers on this domain.

19. Set the following environment variable on **CRMHOST3**:

   ```
   WLST_PROPERTIES=-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/products/fusionapps/wlserver_10.3/server/lib/fusion_trust.jks
   ```

20. Start the domain’s Administration Server on **CRMHOST3**:

   ```
   CRMHOST3> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh
   CRMHOST3> nmConnect(username='<username>', password='<password>',
   domainName='CommonDomain', host='CRMHOST1', port='5556',
   nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/CommonDomain')
   ```

   ```
   CRMHOST3> nmStart('AdminServer')
   ```

   **Note:** The **username** and **password** used in the `nmConnect` are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

21. Run the newly created Managed Servers:
   a. Log in to the Administration Server:
      ```
      http://commoninternal.mycompany.com:7777/console
      ```
   b. Navigate to **CommonDomain > Environment > Servers > Control**.
   c. Check the newly created Managed Servers and click **Start**.
d. Navigate to CommonDomain > Environment > Servers and check the State to verify that the newly created Managed Servers are running.

19.1.1.5 Validating the System
You should verify URLs to ensure that the appropriate routing and failover are working.

To verify the URLs:
1. Log in to the CommonDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on the CRMHOST1 while the Managed Servers on CRMHOST3 are running.
2. Access the following URL to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)
   https://commonexternal.mycompany.com/homePage/faces/AtkHomePageWelcome
3. Log in to the CommonDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST3.
4. Start the Managed Servers on CRMHOST1.
5. Repeat Step 2. (Ensure the log in prompt is visible.)
6. Start all the Managed Servers on CRMHOST3 and verify that they are running on CRMHOST1 and CRMHOST3.

19.1.2 Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle ADF Server

Before performing the procedures in this section, ensure that CommonDomain and its Managed Servers are running.

19.1.2.1 Cloning Managed Servers and Assigning Them to CRMHOST3
To add a Managed Server and assign it to CRMHOST3:
1. Log in to the Administration Server:
3. Switch to Lock & Edit mode.
4. Select the Managed_Server checkbox (for example, HomePageServer_1) and then click Clone.
5. Specify the following Server Identity attributes:
   ■ Server Name - HomePageServer_4
   ■ Server Listen Address - <CRMHOST3>
   ■ Server Listen Port - leave "Give an unused port on the machine CRMHOST3"

   Note: To ensure consistency in naming, copy the name of the server shown in Server Identity and paste it into the Server Name field. Then change the number to "4".
6. Click OK.

8. Click HomePageServer_4 and change the following attributes:
   - Machine - <CRMHOST3>
   - Cluster Name - accept the default, HomePageCluster

   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.

9. From HomePageServer_4, click Advanced and then select the WebLogic Plug-In Enabled checkbox.

10. Click Save.

11. Run the newly created Managed Server:
   b. From the Navigation pane on the Oracle WebLogic Server console, select Activate Changes.
   c. Navigate to CommonDomain > Environment > Servers > Control.
   d. Check the newly created Managed Server and click Start.
   e. Navigate to CommonDomain > Environment > Servers and check the State to verify that the newly created Managed Servers are running.

12. Log in to the Administration Server once again (http://commoninternal.mycompany.com:7777/console) and verify that all the Managed Servers, including scaled-up servers, are running.

13. Select the Server Start tab.
    Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:

    ```
    -DJDBCProgramName\=DS/CommonDmain/HomePageServer_4
    -Dserver.group\=HomePageCluster
    ```

    Click Save.

14. Select the Logging tab, and then select the HTTP tab.

15. Do the following:
   a. Change the Log file name to logs/access.log.%yyyyMMdd%.
   b. Change the rotation type to By Time.
   c. Leave the Limit number of retained files option unchecked.
   d. Leave the Rotate log file on startup option unchecked.
   e. Click Save.
   f. Expand Advanced.
   g. Change the format to Extended.
   h. Change the extended logging format fields to the following:
19-8 Enterprise Deployment Guide for Customer Relationship Management

Scalability

Scaling the Topology for Additional Nodes

... (content continues with relevant instructions and validation steps)

19.1.3 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle SOA Suite Server

When scaling out the topology, you add new Managed Servers configured to new nodes.

19.1.3.1 Prerequisites for Scaling Out the Topology for Oracle SOA Suite Server

Before you begin, ensure the following:

- Node Manager has been started in the Secure Sockets Layer (SSL) mode by following the instructions in Chapter 7, "Setting Up Node Manager for an Enterprise Deployment"
- You are starting with a clean machine if it is the first time it is being used for a scale out
- The /etc/hosts file has proper entries. To verify, ping this machine with the fully qualified name of the machine
- The user created on CRMHOST3 should be the same as the user on CRMHOST1
- The directory structure /u01/oracle is mounted to same shared file system as CRMHOST1
The directory structure /u02/local/oracle/config on CRMHOST3 has been created.

The initial Oracle Fusion Customer Relationship Management deployment on CRMHOST1 has already been done and verified by provisioning.

### 19.1.3.2 Adding a New Machine in the Oracle WebLogic Server Console

If you have not already added CRMHOST3, follow these steps:

1. Log in to the Administration Server:
   

2. Navigate to CRMDomain > Environment > Machines.
   
   LocalMachine is located in the right-hand pane.

3. In the left-hand pane, click Lock & Edit.

4. In the right-hand pane, first click New to add the remote machine, and then specify the following:
   
   - Name - enter CRMHOST3
   - Machine operating system - Unix

5. Click Next.

6. In the window that opens, set the following attributes:
   
   - Type - SSL
   - Listen Address - <CRMHOST3>

   **Note:** The "localhost" default value here is wrong.

   - Listen port - 5556

7. Click Finish and activate the changes.

### 19.1.3.3 Packing and Unpacking the Managed Server Domain Home

Since the CRMHOST1 domain directory file system is also available from CRMHOST3, both the pack and unpack commands can be executed from the CRMHOST3.

To pack and unpack the Managed Server domain home:

1. Change directory to ORACLE_BASE/products/fusionapps/oracle_common/common/bin.

2. Run the pack command. For example, for CRMDomain:

   CRMHOST3> ./pack.sh -managed=true -domain=ORACLE_BASE/config/domains/CRMDomain -template=ORACLE_BASE/user_templates/CRMDomain_managed.jar -template_name="CRM_Managed_Server_Domain"

3. Run the unpack command:

   CRMHOST3> ./unpack.sh -domain=/u02/local/oracle/config/domains/CRMDomain -template=ORACLE_BASE/user_templates/CRMDomain_managed.jar

   Here, ORACLE_BASE is shared, and /u02/local is local to CRMHOST3.

### 19.1.3.4 Cloning Managed Servers and Assigning Them to CRMHOST3

To add a Managed Server and assign it to CRMHOST3:

Note: The "localhost" default value here is wrong.
1. Log in to the Administration Server:
2. Navigate to CRMDomain > Environment > Servers.
3. Switch to Lock & Edit mode.
4. Select the Managed_Server checkbox (for example, soa_server1) and then click Clone.
5. Specify the following Server Identity attributes:
   - Server Name - soa_server3
   - Server Listen Address - <CRMHOST3>
   - Server Listen Port - leave "as is"

   **Note:** To ensure consistency in naming, copy the name of the server shown in Server Identity and paste it into the Server Name field. Then change the number to ":3".
   - Server Listen Address - <CRMHOST3>
   - Server Listen Port - leave "as is"

   **Note:** For Oracle SOA Suite server, add a port value that is different than the soa_server1 server value. This will help in server migration.

6. Click OK.
7. Navigate back to CRMDomain > Environment > Servers. You now should see the newly cloned sales server, soa_server3.
8. Click soa_server3 and change the following attributes:
   - Machine - <CRMHOST3>
   - Cluster Name - accept the default, SOACluster

   **Note:** Ensure that this cluster name is the same as the cluster name of the original Managed Server.

9. From soa_server3, click Advanced and then select the WebLogic Plug-In Enabled checkbox.
10. Run the newly created Managed Server:
    a. Navigate to CRMDomain > Environment.
    b. From the Navigation pane on the Oracle WebLogic Server console, select Activate Changes.
    c. Navigate to CRMDomain > Environment > Servers > Control.
    d. Check the newly created Managed Server and click Start.
    e. Navigate to CRMDomain > Environment > Servers and check the State to verify that the newly created Managed Servers are running.
11. From the Name column, select the scaled-out server, soa_server3.
12. Click Lock & Edit, and then select the Configuration tab.
13. Select the Keystores tab, and then ensure that the keystores value is Custom Identity and Custom Trust.

14. Do the following:
   a. Change the Custom Identity Keystore path to point to the ORACLE_BASE/products/fusionapps/wlsserver_10.3/server/lib/CRMHOST3_fusion_identity.jks file.
   b. Leave the Custom Identity Keystore type blank.
   c. Change the Custom Identity Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, “Creating the Identity Keystore on CRMHOST2.”
   d. Re-enter the Confirm Custom Identity Keystore Passphrase.
   e. Ensure that the Confirm Custom Trust Keystore path is pointing to the ORACLE_BASE/products/fusionapps/wlsserver_10.3/server/lib/fusion_trust.jks file.
   f. Leave the Custom Trust Keystore type blank.
   g. Change the Custom Trust Keystore Passphrase entry. This should be the same as the keystorepassword field described in the first bullet in Step 4 in Section 7.3, “Creating the Identity Keystore on CRMHOST2.”
   h. Re-enter the Custom Trust Keystore Passphrase.
   i. Click Save.

15. Select the SSL tab.
   a. Make sure that Identity and Trust Locations is set to Keystores.
   b. Change the Private Key Alias to CRMHOST3_fusion.
   c. Change the Private Key Passphrase to the keypassword, as described in the second bullet in Step 4 in Section 7.3, “Creating the Identity Keystore on CRMHOST2.”
   d. Re-enter the keypassword from Step c for the Confirm Private Key Passphrase.
   e. Click Save.

16. Select the Server Start tab.
    Change the Arguments to reflect the name of your cloned Managed Server and make sure the server group is the correct cluster name. For example, you should see the following:
    -DJDBCProgramName\=DS/CRMDomain/soa_server3
    -Dserver.group\=SOACLuster

    Click Save.

17. Select the Logging tab, and then select the HTTP tab.

18. Do the following:
   a. Change the Log file name to logs/access.log.%yyyyMMdd%.
   b. Change the rotation type to By Time.
   c. Leave the Limit number of retained files option unchecked.
   d. Leave the Rotate log file on startup option unchecked.
e. Click Save.
f. Expand Advanced.
g. Change the format to Extended.
h. Change the extended logging format fields to the following:
   date time time-taken cs-method cs-uri
   sc-status sc(X-ORACLE-DMS-ECID)
   cs(ECID-Context) cs(Proxy-Remote-User)
   cs(Proxy-Client-IP)
i. Click Save.

19. Click Activate Changes.

20. Set the following variable:

   WLST_PROPERTIES="-Dweblogic.security.SSL.trustedCAKeyStore=ORACLE_BASE/products/fusionapps/wlserver_10.3/server/lib/fusion_trust.jks"

21. Start the domain's Administration Server on CRMHOST3:

   CRMHOST3> ORACLE_BASE/products/fusionapps/wlserver_10.3/common/bin/wlst.sh

   CRMHOST3> nmConnect(username='username', password='password',
   domainName='CRMDomain', host='CRMHOST1', port='5556',
   nmType='ssl', domainDir='ORACLE_BASE/config/domains/CRMHOST1/CRMDomain')

   CRMHOST3> nmStart('AdminServer')

   **Note:** The *username* and *password* used in the nmConnect are the Node Manager credentials (username and password) specified when creating the provisioning response file. This is shown in Figure 5–3 in "Using the Provisioning Process to Install Components for an Enterprise Deployment".

19.1.3.5 Validating the System

You should verify URLs to ensure that the appropriate routing and failover is working from Oracle HTTP Server to the SalesCluster.

To verify the URLs:

1. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on the CRMHOST1 while the Managed Servers on CRMHOST3 are running.

2. Access the following URLs to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)

3. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop all the Managed Servers on CRMHOST3.

4. Start the Managed Servers on CRMHOST1.

5. Repeat Step 2. (Ensure the log in prompt is visible.)
6. Start all the Managed Servers on CRMHOST3 and verify that they are running on CRMHOST1 and CRMHOST3.

19.1.3.6 Additional Configuration Procedures for Scaling Out Oracle SOA Suite Server

At this point, soa_server1 and soa_server3 are running on CRMHOST1 and CRMHOST3.

This section includes the following topics:
- Enabling Virtual IPs on CRMHOST3
- Setting the Listen Address for soa_server3
- Configuring JMS for the Oracle SOA Suite Server
- Configuring Oracle Coherence for Deploying Composites
- Disabling Host Name Verification for the soa_servern Managed Servers
- Restarting Node Manager on CRMHOST3
- Starting and Validating soa_server3 on CRMHOST3

19.1.3.6.1 Enabling Virtual IPs on CRMHOST3

To enable the virtual IPs on Linux:

1. Run the `ifconfig` command as root:

   ```
   /sbin/ifconfig interface:index IPAddress netmask netmask
   ```

   For example:

   ```
   /sbin/ifconfig ethX:Y 100.200.140.206 netmask 255.255.255.0
   ```

2. Enable your network to register the new location of the virtual IP:

   ```
   /sbin/arping -q -U -c 3 -I interface IPAddress
   ```

   For example:

   ```
   /sbin/arping -q -U -c 3 -I ethX 100.200.140.206
   ```

3. Validate that the address is available by pinging it from another node.

   ```
   /bin/ping 100.200.140.206
   ```

19.1.3.6.2 Setting the Listen Address for soa_server3

Ensure that you have performed the steps described in Section 15.1 before setting the soa_server3 listen address.

To set the listen address for the Managed Server:
1. Log in to the Administration Console.
2. In the Change Center, click Lock & Edit.
3. Expand the Environment node in the Domain Structure window.
4. Click Servers. The Summary of Servers page is displayed.
5. Select soa_server3 in the table. The Settings page for soa_server3 is displayed.
6. Set the Listen Address to CRMSOAVH3.
7. Click Save.
8. Click Activate Changes.
9. The changes will not take effect until the soa_server3 Managed Server is restarted (ensure that Node Manager is up and running):
   a. On the Summary of Servers page, select the Control tab.
   b. Select soa_server3 in the table and then click Shutdown.
   c. After the server has shut down, select soa_server3 in the table and then click Start.

19.1.3.6.3 Updating the FusionVirtualHost.crm.conf Configuration File For information, see Section 15.4, "Updating the FusionVirtualHost.crm.conf Configuration File."

19.1.3.6.4 Configuring JMS for the Oracle SOA Suite Server After CRMHOST1 has been provisioned, the JMS server and file store are set up and configured for CRMHOST1. You now must configure the file store for CRMHOST3. Configure the location for all persistence stores to a directory visible from both nodes.

To configure the file store for CRMHOST3:
1. Log in to the Oracle WebLogic Server Administration Console.
2. In the Domain Structure window, expand the Services node and then click the Persistence Stores node.
   The Summary of Persistence Stores page appears.
3. Click Lock & Edit.
4. Click New, and then Create File Store.
5. Enter a name (for example, SOAJMSSFileStore_auto_3), and a target, soa_server3:

   ORACLE_BASE/config/domains/CRMHOST1/CRMDomain

6. Click OK and activate the changes.
7. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Servers node.
   The Summary of JMS Servers page appears.
8. Click Lock & Edit.
9. Click New.
10. Enter a name (for example, SOAJMSServer_3), then select SOAJMSSFileStore_auto_3 in the Persistence Store dropdown list.
11. Click Next.
12. Select soa_server3 as the target.
13. Click Finish and Activate Changes.

14. In the Domain Structure window, expand the Services node and then click the Messaging > JMS Modules node.
   The JMS Modules page appears.

15. In the Change Center, click Lock & Edit.

16. Click SOAJMSSModule and then click the Subdeployments tab.

17. Select SOAJMSServer under Subdeployments.

18. Add the new SOAJMSServer_3 as additional targets for the subdeployment.

19. Click Save and Activate Changes.

19.1.3.6.5 Configuring Oracle Coherence for Deploying Composites

Although deploying composites uses multicast communication by default, Oracle recommends using unicast communication instead in SOA enterprise deployments. Use unicast if you disable multicast communication for security reasons.

**Note:** An incorrect configuration of the Oracle Coherence framework that is used for deployment may prevent the SOA system from starting. The deployment framework must be properly customized for the network environment on which the SOA system runs. Oracle recommends the configuration described in this section.

Multicast communication enables Oracle Fusion Middleware SOA to discover all of the members of a cluster to which it deploys composites dynamically. However, unicast communication does not enable nodes to discover other cluster members in this way. Consequently, you must specify the nodes that belong to the cluster. You do not need to specify all of the nodes of a cluster, however. You need only specify enough nodes so that a new node added to the cluster can discover one of the existing nodes. Subsequently, when a new node has joined the cluster, it is able to discover all of the other nodes in the cluster. Additionally, in configurations such as SOA enterprise deployments, where multiple IPs are available in the same box, you must configure Oracle Coherence to use a specific host name to create the Oracle Coherence cluster.

**Tip:** To guarantee high availability during deployments of SOA composites, specify enough nodes so that at least one of them is running at any given time.

Specify the nodes using the `tangosol.coherence.wka n` system property, where `n` is the number for each Oracle HTTP Server. The numbering starts at 1. This numbering must be sequential and must not contain gaps. In addition, specify the host name used by Oracle Coherence to create a cluster through the `tangosol.coherence.localhost` system property. This local host name should be the virtual host name used by the SOA server as the listener addresses. Set this property by adding the `-Dtangosol.coherence.localhost` parameters to the Arguments field of the Oracle WebLogic Server Administration Console’s Server Start tab, shown in Figure 19–1.
To add the host name used by Oracle Coherence:

1. Log in to the Oracle WebLogic Server Administration Console.
2. In the Domain Structure window, expand the Environment node.
3. Click Servers.
   The Summary of Servers page appears.
4. Select soa_server1 (represented as a hyperlink) in the table.
   The Settings page appears.
5. Click Lock & Edit.
6. Click the Server Start tab (shown in Figure 19–1).
7. Enter the following for soa_server1 and soa_server3 into the Arguments field.

   For soa_server1, enter the following:
   -Dtangosol.coherence.wka1=CRMSOAVH1
   -Dtangosol.coherence.wka2=CRMSOAVH3
   -Dtangosol.coherence.localhost=CRMSOAVH1
   -Dtangosol.coherence.localport=8089
   -Dtangosol.coherence.wka1.port=8089
   -Dtangosol.coherence.wka2.port=8089

   For soa_server3, enter the following:
   -Dtangosol.coherence.wka1=CRMSOAVH3
   -Dtangosol.coherence.wka2=CRMSOAVH1
   -Dtangosol.coherence.localhost=CRMSOAVH3
   -Dtangosol.coherence.localport=8089
   -Dtangosol.coherence.wka1.port=8089
   -Dtangosol.coherence.wka2.port=8089

**Note:** CRMSOAVH1 is the virtual host name that maps to the virtual IP where soa_server1 is listening (in CRMHOST1). CRMSOAVH3 is the virtual host name that maps to the virtual IP where soa_server3 is listening (in CRMHOST3).
8. Click Save and Activate Changes.

Note: You must ensure that these variables are passed to the Managed Server correctly. (They should be reflected in the server’s output log.) Failure of the Oracle Coherence framework can prevent the soa-infra application from starting.

Note: The multicast and unicast addresses are different from the ones used by the Oracle WebLogic Server cluster for cluster communication. Oracle SOA Suite guarantees that composites are deployed to members of a single Oracle WebLogic Server cluster even though the communication protocol for the two entities (the Oracle WebLogic Server cluster and the groups to which composites are deployed) are different.

Note: The Oracle Coherence cluster used for deployment uses port 8088 by default. This port can be changed by specifying the -Dtangosol.coherence.wkaX.port startup parameter.

19.1.3.6.6 Disabling Host Name Verification for the soa_server Managed Servers This step is required if you have not set up the appropriate certificates to authenticate the different nodes with the Administration Server. By default, Host Name Verification should be set to None. If it is not, follow the steps below.

If you have not configured the server certificates, you will receive errors when managing the different WebLogic servers. To avoid these errors, disable host name verification while setting up and validating the topology, and enable it again after the enterprise deployment topology configuration is complete.

To disable Host Name Verification:

2. Click Lock & Edit.

3. Expand the Environment node in the Domain Structure window.

4. Click Servers.

The Summary of Servers page appears.

5. Select soa_server (represented as a hyperlink) in the table.

The Settings page appears.

6. Select the SSL tab.
7. Expand the **Advanced** section of the page.

8. Set **Hostname Verification** to **None**.

9. Click **Save** and activate the changes.

19.1.3.6.7 **Restarting Node Manager on CRMHOST3** To restart Node Manager on **CRMHOST3**, follow the steps in Section 15.10, "Restarting Node Manager on CRMHOST1."

19.1.3.6.8 **Starting and Validating soa_server3 on CRMHOST3** To start the soa_server3 Managed Server on **CRMHOST3** and ensure that it is configured correctly:

1. From the Administration Console, start the soa_server3 Managed Server.

2. Verify that the server status is reported as "Running" in the Administration Console. If the server is shown as "Starting" or "Resuming," wait for the server status to change to "Started." If another status is reported (such as "Admin" or "Failed"), check the server output log files for errors.

**19.1.4 Scaling Up the Topology (Adding Managed Servers to an Existing Node) for Oracle SOA Suite Server**

Before performing the procedures in this section, ensure that **CommonDomain** and its Managed Servers are running.

**19.1.4.1 Cloning Managed Servers and Assigning Them to CRMHOST3**

To add a Managed Server and assign it to **CRMHOST3**:

1. Log in to the Administration Server:

2. Navigate to **CRMDomain > Environment > Servers**.

3. Switch to **Lock & Edit** mode.

4. Select the **Managed_Servers** checkbox (for example, soa_server3) and then click **Clone**.

5. Specify the following Server Identity attributes:
   - **Server Name** - soa_server4

   **Note:** To ensure consistency in naming, copy the name of the server shown in **Server Identity** and paste it into the **Server Name** field. Then change the number to ".4".

   - **Server Listen Address** - <**CRMHOST3**>
   - **Server Listen Port** - leave "Give an unused port on the machine **CRMHOST3**"

6. Click **OK**.

7. Navigate back to **CRMDomain > Environment > Servers**. You now should see the newly cloned SOA server, soa_server4.

8. Click soa_server4 and change the following attributes:
   - **Machine** - <**CRMHOST3**>
9. From soa_server4, click Advanced and then select the WebLogic Plug-In Enabled checkbox.

10. Click Save.

11. Run the newly created Managed Servers:
   a. Navigate to CRMDomain > Environment.
   b. From the Navigation pane on the Oracle WebLogic Server console, select Activate Changes.
   c. Navigate to CRMDomain > Environment > Servers > Control.
   d. Check the newly created Managed Servers and click Start.
   e. Navigate to CRMDomain > Environment > Servers and check the State to verify that the newly created Managed Servers are running.

12. Log in to the Administration Server once again (http://crminternal.mycompany.com:7777/console) and verify that all the Managed Servers, including scaled-up servers, are running.

19.1.4.2 Validating the System
You should verify URLs to ensure that the appropriate routing and failover is working from Oracle HTTP Server to the SalesCluster.

To verify the URLs:

1. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop the soa_server1, soa_server2, and soa_server3 Managed Servers on CRMHOST1, CRMHOST2, and CRMHOST3.

2. Perform Step 3 in Section 8.8, "Oracle HTTP Server Configuration," for the scaled-up server.

3. Access the following URLs to verify that routing and failover are functioning properly. (Ensure the log in prompt is visible.)
   ■ http://crminternal.mycompany.com:7777/soa-infra

4. Log in to the CRMDomain Oracle WebLogic Server Administration Console and stop the soa_server4 Managed Server on CRMHOST3.

5. Start the Managed Servers on CRMHOST1.

6. Repeat Step 2. (Ensure the log in prompt is visible.)

7. Start all the Managed Servers on CRMHOST2 and verify that they are running on CRMHOST1.

19.1.5 Scaling Out the Topology (Adding Managed Servers to a New Node) for Oracle Business Intelligence
When scaling out the topology, you add a new Managed Server and set of system components to a new node in your topology (CRMHOST3). This procedure assumes that you already have an enterprise topology that includes two nodes, with a Managed Server and a full set of system components on each node.
19.1.5.1 Prerequisites for Scaling Out the Topology for Oracle Business Intelligence

Before performing the steps in this section, ensure that you meet these requirements:

- There must be existing nodes running Oracle Business Intelligence Managed Servers within the topology.
- The new node (CRMHOST3) can access the existing home directories for Oracle WebLogic Server and Oracle Business Intelligence.
- When an FA_MW_HOME or WL_HOME is shared by multiple servers in different nodes, it is recommended that you keep the Oracle Inventory and Middleware home list in those nodes updated for consistency in the installations and application of patches. To update the oraInventory in a node and "attach" an installation in a shared storage to it, use ORACLE_BASE/products/fusionapps/bi/oui/bin/attachHome.sh. To update the Middleware home list to add or remove a WL_HOME, edit the ORACLE_BASE/products/fusionapps/.home file. See the steps below.
- You must ensure that all shared storage directories are available on the new node. Ensure that all shared directories are available on all nodes, except for the ORACLE_INSTANCE directory and the domain directory for the scaled-out Managed Server. Also, if you are using shared storage for the identity keystore and trust keystore that hold your host name verification certificates, make sure that the shared storage directory is accessible from the scaled-out node (CRMHOST3). If you are using local directories for your keystores, follow the steps in Section 7.3, "Creating the Identity Keystore on CRMHOST2." to create and configure a local identity keystore for the scaled-out node.

For example, mount the following directories:
- Transaction Log directory
- JMS Persistence Store
- Global Cache
- BI Presentation Catalog
- BI Repository Publishing directory
- BI Publisher Catalog
- BI Publisher Configuration Keystore (certs)
- MW_HOME

19.1.5.2 Scale-Out Procedure for Oracle Business Intelligence

To scale out Oracle Business Intelligence on CRMHOST3:

1. On CRMHOST3, mount the existing Middleware home, which should include the Oracle Business Intelligence installation and (optionally, if the domain directory for Managed Servers in other nodes resides on shared storage) the domain directory, and ensure that the new node has access to this directory, just like the rest of the nodes in the domain.

2. Run the following command to attach ORACLE_BASE/products/fusionapps/oracle_common in shared storage to the local Oracle Inventory:

   CRMHOST3> cd ORACLE_BASE/products/fusionapps/oracle_common/oui/bin/
   CRMHOST3> ./attachHome.sh -jreLoc ORACLE_BASE/products/fusionapps/jdk6
To update the Middleware home list, create (or edit, if another WebLogic installation exists in the node) the `ORACLE_BASE/products/fusionapps/.home` file and add `ORACLE_BASE/products/fusionapps` to it.

3. Start Node Manager:
   a. Stop any Node Manager running on `CRMHOST3`.
   b. Change directory to `ORACLE_BASE/products/fusionapps/wlserver_10.3/common/nodemanager` and edit the `nodemanager.properties` file with the following:
      
      `SecureListener=false`
   c. Change directory to `ORACLE_BASE/products/fusionapps/oracle_common/common/bin` and run the following script:
      
      `./setNMProps.sh`
   d. Change directory to `ORACLE_BASE/products/fusionapps/wlserver_10.3/server/bin` and run the following script:
      
      `./startNodeManager.sh`

Node Manager starts on `CRMHOST3`.

---

**Note:** Steps b through d will enable Node Manager on `CRMHOST3` and the Administrator Console to communicate on Plain Socket.

---

4. Run the Configuration Assistant from one of the shared Oracle homes, using the steps in Section 14.5.1, "Scaling Out the Oracle Business Intelligence System on CRMHOST2" as a guide.

5. Scale out the system components on `CRMHOST3`, using the steps in Section 14.5.3, "Scaling Out the System Components" as a guide.

6. Configure the `bi_server3` Managed Server by setting the Listen Address and disabling host name verification, using the steps in Section 14.5.5, "Configuring the `bi_server2` Managed Server" as a guide.

7. Configure JMS for Oracle BI Publisher, as described in Section 14.5.6.3.3, "Configuring JMS for BI Publisher."

8. Configure Oracle BI for Microsoft Office on `CRMHOST3`, as described in Section 14.5.6.4, "Additional Configuration Tasks for Oracle BI for Microsoft Office."

9. Set the location of the default persistence store for `bi_server3`, as described in Section 14.5.7, "Configuring a Default Persistence Store for Transaction Recovery."

11. Start the `bi_server3` Managed Server and the system components running on `CRMHOST3`. See Section 14.5.8, "Starting and Validating Oracle Business Intelligence on CRMHOST2" for details.

12. Set up server migration for the new node, as described in the following sections:

   - Section 7.3, "Creating the Identity Keystore on CRMHOST2"
   - Section 17.2.4, "Editing Node Manager’s Properties File"
Scaling the Topology for Additional Nodes

- Section 17.2.5, "Setting Environment and Superuser Privileges for the wlsifconfig.sh Script"
- Section 17.2.6, "Configuring Server Migration Targets"
- Section 17.2.7, "Testing the Server Migration"

13. Access the following URLs to validate the configuration:

- http://BIVH3:10217/wsm-pm to verify the status of Web Services Manager. Click Validate Policy Manager. A list of policies and assertion templates available in the data is displayed.

Note: The configuration is incorrect if no policies or assertion templates appear.

- http://BIVH3:10217/xmlpserver to verify the status of the Oracle BI Publisher application.
- http://BIVH3:10217:/mapviewer to verify the status of the map view functionality in Oracle BI EE.
- http://BIVH3:10217/aps/Test to verify APS.
- http://BIVH3:10217/workspace to verify workspace

Oracle recommends using host name verification for the communication between Node Manager and the servers in the domain. This requires the use of certificates for the different addresses communicating with the Administration Server and other servers. See Chapter 7, "Setting Up Node Manager for an Enterprise Deployment" for further details.

19.1.6 Scaling Up the Topology for Oracle Business Intelligence

This procedure assumes that you already have an enterprise topology that includes two nodes, with a Managed Server and a full set of system components on each node. To scale up the topology, you increase the number of system components running on one of your existing nodes.

Note that it is not necessary to run multiple Managed Servers on a given node.

19.1.6.1 Scale-Up Procedure for Oracle Business Intelligence

To scale up Oracle Business Intelligence on CRMHOST3:

1. Log in to Fusion Middleware Control.
2. Expand the Business Intelligence node in the Farm_BIDomain window.
3. Click coreapplication.
4. Click Capacity Management, then click Scalability.
5. Click **Lock & Edit** and then change the number of BI Servers, Presentation Servers, or Java Hosts using the arrow keys.

**Note:** To avoid port conflicts for the system components being scaled within the given Oracle WebLogic Server instance, enter a different range of available ports in the **Port Range From** and **Port Range To** fields. For example, change **Port Range From** to 10221 and **Port Range To** to 10300.

6. Click **Apply**, then click **Activate Changes**.
7. Click **Restart** to apply recent changes.
8. Click **Restart** under **Manage System**.
9. Click **Yes** in the confirmation dialog.

### 19.2 Performing Backups and Recoveries

Table 19–1 lists the static artifacts to back up in the 11g Oracle Fusion Customer Relationship Management enterprise deployment.

**Table 19–1 Static Artifacts to Back Up in the 11g Enterprise Deployment**

<table>
<thead>
<tr>
<th>Type</th>
<th>Host</th>
<th>Location</th>
<th>Tier</th>

</tr>
</tbody>
</table>
For more information on backup and recovery of Oracle Fusion Middleware components, see Oracle Fusion Middleware Administrator’s Guide.

19.3 Monitoring the Topology

For information on monitoring the Oracle Fusion Customer Relationship Management topology, see the following documents:

- Oracle Fusion Middleware System Administrator’s Guide for Oracle Content Server
- Oracle Fusion Middleware Managing Oracle WebCenter Content
- Oracle Fusion Middleware Administering Oracle WebCenter Content

19.4 Configuring Log File Rotation

An ODL log is a set of log files that includes the current ODL log file and zero or more ODL Archives (segment files) that contain older messages. As the log file grows, new information is added to the end of the log file, server_name-diagnostic.log. When the log file reaches the rotation point, it is renamed and a new log file, server_name-diagnostic.log is created. You specify the rotation point, by specifying the maximum ODL segment size, or, for the log files of some components, the rotation time and rotation frequency.

Segment files are created when the ODL log file server_name-diagnostic.log reaches the rotation point. That is, the server_name-diagnostic.log is renamed to server_name-diagnostic-n.log, where n is an integer, and a new server_name-diagnostic.log file is created when the component generates new diagnostic messages.

To limit the size of the ODL log, you can specify:

- The maximum size of the logging directory. Whenever the sum of the sizes of all of the files in the directory reaches the maximum, the oldest archive is deleted to keep the total size under the specified limit.
  
  By default, the log files are rotated when they reach 10 MB. The maximum size of all log files for a particular component is 100 MB.
- The maximum size of the log file. You specify that a new log file be created when a specific time or frequency is reached.

Note: After you change the log file rotation, the configuration is reloaded dynamically. It may take 1 or 2 seconds to reload the configuration.

The following topics describe how to change the rotation:

- Section 19.4.1, "Specifying Log File Rotation Using Oracle Enterprise Manager"
- Section 19.4.2, "Specifying Log File Rotation Using WLST"

19.4.1 Specifying Log File Rotation Using Oracle Enterprise Manager

To configure log file rotation using Oracle Enterprise Manager for a component:

1. Log in to the component (for example, http://crminternal.mycompany.com/em).
2. From the navigation pane, select the component (for example, navigate to Farm_CommonDomain > WebLogic Domain > CommonDomain > ESSCluster > ess_server1).

4. From the WebLogic Server dropdown list, select Logs > Log Configuration, then select the Log Files tab.

5. In the table, select the logger and click Edit Configuration. The Edit Log File dialog box is displayed.

6. In the Rotation Policy section, you can select one of the following:
   - **Size Based:** If you select this, enter the following:
     - For Maximum Log File Size, enter the size in MB, for example, 15.
     - For Maximum Size of All Log Files, enter the size in MB, for example, 150.
   - **Time Based:** If you select this, enter the following:
     - For Start Time, enter the date when you want the rotation to start. For example, enter 10-SEP-2009.
     - For Frequency, you can select Minutes and enter the number of minutes, or you can select Hourly, Daily, or Weekly.
     - For Retention Period, you can specify how long the log files are kept. You can select Minutes and enter the number of minutes, or you can specify Day, Week, Month, or Year.
     Specifying a shorter period means that you use less disk space, but are not able to retrieve older information.

7. Click OK.

8. In the confirmation window, click Close.

### 19.4.2 Specifying Log File Rotation Using WLST

To specify log file rotation using WLST, use the `configureLogHandler` command. You can specify size-based rotation or time-based rotation.

For example, to specify that the log files rotate daily and that they are retained for a week, use the following command:

```python
configureLogHandler(name='odl-handler', rotationFrequency='daily', retentionPeriod='week')
```

To specify that the size of a log file does not exceed 5MB and rotates when it reaches that size, use the following command:

```python
configureLogHandler(name='odl-handler', maxFileSize='5M')
```
19.5 Patching the Topology

For information, see the Oracle Fusion Applications Patching Guide.

19.6 Auditing

Oracle Fusion Middleware Audit Framework is a new service in Oracle Fusion Middleware 11g, designed to provide a centralized audit framework for the middleware family of products. The framework provides audit service for platform components such as Oracle Platform Security Services (OPSS) and Oracle Web Services. It also provides a framework for JavaEE applications, starting with Oracle's own JavaEE components. JavaEE applications will be able to create application-specific audit events. For non-JavaEE Oracle components in the middleware, such as C or JavaSE components, the audit framework also provides an end-to-end structure similar to that for JavaEE applications.

Figure 19–2 is a high-level architectural diagram of the Oracle Fusion Middleware Audit Framework.

*Figure 19–2  Audit Event Flow*

The Oracle Fusion Middleware Audit Framework consists of the following key components:

- **Audit APIs**: These are APIs provided by the audit framework for any audit-aware components integrating with the Oracle Fusion Middleware Audit Framework. During run time, applications may call these APIs, where appropriate, to audit the
necessary information about a particular event happening in the application code. The interface allows applications to specify event details such as user name and other attributes needed to provide the context of the event being audited.

- **Audit Events and Configuration:** The Oracle Fusion Middleware Audit Framework provides a set of generic events for convenient mapping to application audit events. Some of these include common events such as authentication. The framework also allows applications to define application-specific events.

  These event definitions and configurations are implemented as part of the audit service in Oracle Platform Security Services. Configurations can be updated through Enterprise Manager (UI) and WebLogic Scripting Tool (WLST) command-line tool.

- **Audit Bus-stop:** Bus-stops are local files containing audit data before they are pushed to the audit repository. In the event where no database repository is configured, these bus-stop files can be used as a file-based audit repository. The bus-stop files are simple text files that can be queried easily to look up specific audit events. When a DB-based repository is in place, the bus-stop acts as an intermediary between the component and the audit repository. The local files are periodically uploaded to the audit repository based on a configurable time interval.

- **Audit Loader:** As the name implies, the audit loader loads the files from the audit bus-stop into the audit repository. In the case of platform and JavaEE application audit, the audit loader is started as part of the JavaEE container start-up. In the case of system components, the audit loader is a periodically spawned process.

- **Audit Repository:** The audit repository contains a predefined Oracle Fusion Middleware Audit Framework schema, created by Repository Creation Utility (RCU). When configured, all the audit loaders are aware of the repository and upload data to it periodically. The audit data in the audit repository is expected to be cumulative and will grow over time. Ideally, this should not be an operational database used by any other applications; rather, it should be a standalone RDBMS used for audit purposes only. In a highly available configuration, Oracle recommends that you use an Oracle Real Application Clusters (RAC) database as the audit data store.

- **Oracle Business Intelligence Publisher:** The data in the audit repository is exposed through predefined reports in Oracle Business Intelligence Publisher. The reports allow users to drill down the audit data based on various criteria. For example:
  - User name
  - Time range
  - Application type
  - Execution context identifier (ECID)

For more introductory information for the Oracle Fusion Middleware Audit Framework, see the "Introduction to Oracle Fusion Middleware Audit Framework" chapter in the Oracle Fusion Middleware Application Security Guide.

For information on how to configure the repository for Oracle Fusion Middleware Audit Framework, see the "Configuring and Managing Auditing" chapter in the Oracle Fusion Middleware Application Security Guide.

The enterprise deployment topology does not include Oracle Fusion Middleware Audit Framework configuration. The ability to generate audit data to the bus-stop files and the configuration of the audit loader will be available after the products are
installed. The main consideration is the audit database repository where the audit data is stored. Because of the volume and the historical nature of the audit data, it is strongly recommended that customers use a separate database from the operational store or stores being used for other middleware components.

19.7 Troubleshooting

This section covers the following topics:

- Section 19.7.1, "Page Not Found When Accessing soa-infra Application Through Load Balancer"
- Section 19.7.2, "soa-infra Application Fails to Start Due to Deployment Framework Issues (Coherence)"
- Section 19.7.3, "Incomplete Policy Migration After Failed Restart of Oracle SOA Suite Server"
- Section 19.7.4, "Oracle SOA Suite Server Fails to Start Due to Maximum Number of Processes Available in Database"
- Section 19.7.5, "Administration Server Fails to Start After a Manual Failover"
- Section 19.7.6, "Error While Activating Changes in Administration Console"
- Section 19.7.7, "Oracle SOA Suite Server Not Failed Over After Server Migration"
- Section 19.7.8, "Oracle SOA Suite Server Not Reachable From Browser After Server Migration"
- Section 19.7.9, "Oracle Access Manager Configuration Tool Does Not Remove URLs"
- Section 19.7.10, "Redirecting of Users to Login Screen After Activating Changes in Administration Console"
- Section 19.7.11, "Redirecting of Users to Administration Console's Home Page After Activating Changes to OAM"
- Section 19.7.12, "Configured JOC Port Already in Use"
- Section 19.7.13, "Out-of-Memory Issues on Managed Servers"
- Section 19.7.14, "JDBC Connection Reset Appears When on OEL 5.4"
- Section 19.7.15, "Missing JMS Instances on Oracle BI Publisher Scheduler Diagnostics Page"
- Section 19.7.16, "Oracle BI Publisher Jobs in Inconsistent State After Managed Server Shutdown"
- Section 19.7.17, "JMS Instance Fails in an Oracle BI Publisher Cluster"
- Section 19.7.18, "Administration Console Redirects from Internal URL to Container URL after Activation"
- Section 19.7.19, "Oracle Essbase Clustering Fails After Clicking Activate Changes"

19.7.1 Page Not Found When Accessing soa-infra Application Through Load Balancer

Problem: A 404 "page not found" message is displayed in the web browser when you try to access the soa-infra application using the load balancer address. The error is intermittent and Oracle SOA Suite servers appear as "Running" in the WLS Administration Console.
**Solution:** Even when the Oracle SOA Suite Managed Servers may be up and running, some of the applications contained in them may be in Admin, Prepared or other states different from Active. The soa-infra application may be unavailable while the Oracle SOA Suite server is running. Check the Deployments page in the Administration Console to verify the status of the soa-infra application. It should be in "Active" state. Check the Oracle SOA Suite server's output log for errors pertaining to the soa-infra application and try to start it from the Deployments page in the Administration Console.

19.7.2 soa-infra Application Fails to Start Due to Deployment Framework Issues (Coherence)

**Problem:** The soa-infra application fails to start after changes to the Coherence configuration for deployment have been applied. The Oracle SOA Suite server output log reports the following:

Cluster communication initialization failed. If you are using multicast, Please make sure multicast is enabled on your network and that there is no interference on the address in use. Please see the documentation for more details.

**Solutions:**

- When using multicast instead of unicast for cluster deployments of Oracle SOA Suite composites, a message similar to the above may appear if a multicast conflict arises when starting the soa-infra application (that is, starting the Managed Server on which Oracle SOA Suite runs). These messages, which occur when Oracle Coherence throws a run-time exception, also include the details of the exception itself. If such a message appears, check the multicast configuration in your network. Verify that you can ping multicast addresses. In addition, check for other clusters that may have the same multicast address but have a different cluster name in your network, as this may cause a conflict that prevents soa-infra from starting. If multicast is not enabled in your network, you can change the deployment framework to use unicast as described in Oracle Coherence Developer’s Guide.

- When entering well-known address list for unicast (in server start parameters), make sure that the node’s addresses entered for the localhost and clustered servers are correct. Error messages like the following are reported in the server’s output log if any of the addresses is not resolved correctly:

```
oracle.integration.platform.blocks.deploy.CompositeDeploymentCoordinatorMessage
s errorUnableToStartCoherence
```

19.7.3 Incomplete Policy Migration After Failed Restart of Oracle SOA Suite Server

**Problem:** The Oracle SOA Suite server fails to start through the administration console before setting Node Manager property startScriptEnabled=true. The server does not come up after the property is set either. The Oracle SOA Suite server output log reports the following:

```
SEVERE: <.> Unable to Encrypt data
Unable to Encrypt data.
Check installation/post-installation steps for errors. Check for errors during SOA server startup.

ORABPEL-35010
Unable to Encrypt data.
Unable to Encrypt data.
```

Check installation/post-installation steps for errors. Check for errors during SOA server startup.

```
at oracle.bpel.services.common.util.EncryptionService.encrypt(EncryptionService.java:56)
```

... 

**Solution:** Incomplete policy migration results from an unsuccessful start of the first SOA server in a cluster. To enable full migration, edit the `<jazn-policy>` element the system-jazn-data.xml file to grant permission to bpm-services.jar:

```
<grant>
  <grantee>
    <codesource>
      <url>file:${oracle.home}/soa/modules/oracle.soa.workflow_11.1.1/bpm-services.jar</url>
    </codesource>
  </grantee>
  <permissions>
    <permission>
      <class>java.security.AllPermission</class>
    </permission>
  </permissions>
</grant>
```

### 19.7.4 Oracle SOA Suite Server Fails to Start Due to Maximum Number of Processes Available in Database

**Problem:** A Oracle SOA Suite server fails to start. The domain has been extended for new types of Managed Server or the system has been scaled up (added new servers of the same type). The Oracle SOA Suite server output log reports the following:

```
<Warning> <JDBC> <BEA-001129> <Received exception while creating connection for pool "SOADataSource-rac0": Listener refused the connection with the following error:
ORA-12516, TNS:listener could not find available handler with matching protocol stack >
```

**Solution:** Verify the number of processes in the database and adjust accordingly. As the SYS user, issue the `SHOW PARAMETER` command:

```
SQL> SHOW PARAMETER processes
```

Set the initialization parameter using the following command:

```
SQL> ALTER SYSTEM SET processes=greater than 2500 SCOPE=SPFILE
```

Restart the database.

---

**Note:** The method that you use to change a parameter's value depends on whether the parameter is static or dynamic, and on whether your database uses a parameter file or a server parameter file. See the *Oracle Database Administrator’s Guide* for details on parameter files, server parameter files, and how to change parameter values.
19.7.5 Administration Server Fails to Start After a Manual Failover

**Problem:** Administration Server fails to start after the Administration Server node failed and manual failover to another nodes is performed. The Administration Server output log reports the following:

```
<Feb 19, 2009 3:43:05 AM PST> <Warning> <EmbeddedLDAP> <BEA-171520> <Could not obtain an exclusive lock for directory: ORACLE_BASE/admin/edg_domain/aserver/edg_domain/servers/AdminServer/data/ldap/ldapfiles. Waiting for 10 seconds and then retrying in case existing WebLogic Server is still shutting down.>
```

**Solution:** When restoring a node after a node crash and using shared storage for the domain directory, you may see this error in the log for the Administration Server due to unsuccessful lock cleanup. To resolve this error, remove the file `ORACLE_HOME/config/domains/CRMHOST1/DomainName/servers/AdminServer/data/ldap/ldapfiles/EmbeddedLDAP.lok`.

19.7.6 Error While Activating Changes in Administration Console

**Problem:** Activation of changes in Administration Console fails after changes to a server's start configuration have been performed. The Administration Console reports the following when clicking **Activate Changes**:

```
An error occurred during activation of changes, please see the log for details.
[Management:141190]The commit phase of the configuration update failed with an exception:
In production mode, it's not allowed to set a clear text value to the property: PasswordEncrypted of ServerStartMBean
```

**Solution:** This may happen when start parameters are changed for a server in the Administration Console. In this case, provide user name/password information in the server start configuration in the Administration Console for the specific server whose configuration was being changed.

19.7.7 Oracle SOA Suite Server Not Failed Over After Server Migration

**Problem:** After reaching the maximum restart attempts by local Node Manager, Node Manager in the failover node tries to restart it, but the server does not come up. The server seems to be failed over as reported by Node Manager's output information. The VIP used by the Oracle SOA Suite server is not enabled in the failover node after Node Manager tries to migrate it (if config in the failover node does not report the VIP in any interface). Executing the command `sudo ifconfig $INTERFACE $ADDRESS $NETMASK` does not enable the IP in the failover node.

**Solution:** The rights and configuration for `sudo` execution should not prompt for a password. Verify the configuration of `sudo` with your system administrator so that `sudo` works without a password prompt.

19.7.8 Oracle SOA Suite Server Not Reachable From Browser After Server Migration

**Problem:** Server migration is working (Oracle SOA Suite server is restarted in the failed over node), but the `Virtual_Hostname:8001/soa-infra` URL cannot be accessed in the web browser. The server has been "killed" in its original host and Node Manager in the failover node reports that the VIP has been migrated and the server started. The VIP used by the Oracle SOA Suite server cannot be pinged from the client's node (that is, the node where the browser is being used).

**Solution:** The `arping` command executed by Node Manager to update ARP caches did not broadcast the update properly. In this case, the node is not reachable to external
nodes. Either update the nodemanager.properties file to include the MACBroadcast or execute a manual arping:

```
/sbin/arping -b -q -c 3 -A -I INTERFACE ADDRESS > $NullDevice 2>&1
```

Where `INTERFACE` is the network interface where the virtual IP is enabled and `ADDRESS` is the virtual IP address.

### 19.7.9 Oracle Access Manager Configuration Tool Does Not Remove URLs

**Problem:** The Oracle Access Manager Configuration Tool has been used and a set of URLs was added to the policies in Oracle Access Manager. One of multiple URLs had a typo. Executing the Oracle Access Manager Configuration Tool again with the correct URLs completes successfully; however, when accessing Policy Manager, the incorrect URL is still there.

**Solution:** The Oracle Access Manager Configuration Tool only adds new URLs to existing policies when executed with the same `app_domain` name. To remove a URL, use the Policy Manager Console in Oracle Access Manager. Log on to the Access Administration site for Oracle Access Manager, click on My Policy Domains, click on the created policy domain (SOA_EDG), then on the Resources tab, and remove the incorrect URLs.

### 19.7.10 Redirecting of Users to Login Screen After Activating Changes in Administration Console

**Problem:** After configuring Oracle HTTP Server and LBR to access the Oracle WebLogic Administration Console, some activation changes cause the redirection to the login screen for the Administration Console.

**Solution:** This is the result of the console attempting to follow changes to port, channel, and security settings as a user makes these changes. For certain changes, the console may redirect to the Administration Server’s listen address. Activation is completed regardless of the redirection. It is not required to log in again; users can simply update the URL to `crm.mycompany.com/console/console.portal` and directly access the home page for the Administration Console.

**Note:** This problem will not occur if you have disabled tracking of the changes described in this section.

### 19.7.11 Redirecting of Users to Administration Console’s Home Page After Activating Changes to OAM

**Problem:** After configuring OAM, some activation changes cause the redirection to the Administration Console’s home page (instead of the context menu where the activation was performed).

**Solution:** This is expected when OAM SSO is configured and the Administration Console is set to follow configuration changes (redirections are performed by the Administration Server when activating some changes). Activations should complete regardless of this redirection. For successive changes not to redirect, access the Administration Console, select Preferences, then Shared Preferences, and deselect the "Follow Configuration Changes" check box.
19.7.12 Configured JOC Port Already in Use

Problem: Attempts to start a Managed Server that uses the Java Object Cache (JOC), such as OWSM Managed Servers, fail. The following errors appear in the logs:

- J2EE JOC-058 distributed cache initialization failure
- J2EE JOC-043 base exception:
- J2EE JOC-803 unexpected EOF during read.

Solution: Another process is using the same port that JOC is attempting to obtain. Either stop that process, or reconfigure JOC for this cluster to use another port in the recommended port range.

19.7.13 Out-of-Memory Issues on Managed Servers

Problem: You are experiencing out-of-memory issues on Managed Servers.

Solution: Increase the size of the memory heap allocated for the Java VM to at least one gigabyte:

1. Log in to the Oracle WebLogic Administration Console.
2. Click Environment, then Servers.
3. Click on a Managed Server name.
4. Open the Configuration tab.
5. Open the Server Start tab in the second row of tabs.
6. Include the memory parameters in the Arguments box, for example:

   -Xms3072m -Xmx1024m -XX:CompileThreshold=8000 -XX:PermSize=128m
   -XX:MaxPermSize=1024m

Note: Please note that the memory parameter requirements may differ between various Java Virtual Machines (Sun, JRockit, or others). See "Increasing the Java VM Heap Size for Managed Servers" in the *Oracle Fusion Middleware Installation Guide for Oracle Enterprise Content Management Suite* for further details.

7. Save the configuration changes.
8. Restart all running Managed Servers.

19.7.14 JDBC Connection Reset Appears When on OEL 5.4

Problem: When you are on Oracle Enterprise Linux (OEL) 5.4, a Java Database Connectivity (JDBC) connection reset appears.

Solutions:

- Upgrade to OEL 5.6.
- As root, do the following:
  1. Download and install the rngd tool.
  2. Execute the following commands (in order):

     ```
     rngd -r /dev/urandom -o /dev/random
     cat /proc/sys/kernel/random/entropy_avail
     ```
3. Ensure that entropy returns a number greater than 1000.

### 19.7.15 Missing JMS Instances on Oracle BI Publisher Scheduler Diagnostics Page

In some cases, only one JMS instance is visible on the Oracle BI Publisher Scheduler diagnostics page, rather than all instances in the cluster. This issue is most likely caused by clocks being out of sync. For more information on the importance of synchronizing clocks on all nodes in the cluster, see "Clock Synchronization" in the chapter "Database and Environment Preconfiguration" in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Business Intelligence.

### 19.7.16 Oracle BI Publisher Jobs in Inconsistent State After Managed Server Shutdown

Before shutting down the Managed Server on which Oracle BI Publisher is running, it is a best practice (but not mandatory) to wait for all running Oracle BI Publisher jobs to complete, or to cancel any unfinished jobs using the Report Job History page. Otherwise, the shutdown might cause some jobs to incorrectly stay in a running state.

### 19.7.17 JMS Instance Fails in an Oracle BI Publisher Cluster

On rare occasions, a JMS instance is missing from an Oracle BI Publisher Scheduler cluster. To resolve this issue, restart the Oracle BI Publisher application from the Oracle WebLogic Server Administration Console.

To restart Oracle BI Publisher:

1. Log in to the Administration Console.
2. Click **Deployments** in the Domain Structure window.
3. Select **bipublisher(11.1.1)**.
4. Click **Stop**.
5. After the application stops, click **Start**.

### 19.7.18 Administration Console Redirects from Internal URL to Container URL after Activation

Log in to the Administration Console and do the following:

1. Click **Preferences** in the top navigation bar.
2. Select the **Shared Preferences** tab.
3. De-select **Follow Configuration Changes**.
4. Click **Save**.

### 19.7.19 Oracle Essbase Clustering Fails After Clicking Activate Changes

**Problem:** During Essbase clustering, the process of activating changes was not successful because of errors made while editing the `EssFOConfig.properties` file.

**Solution:** Do the following:

1. Restart the Administration Server and the `bi_server1` and `bi_server2` Managed Servers.
2. Correct the contents of the 
   /u02/local/oracle/config/BIInstance/bin/essbase_ 
   ha/EssFOConfig.properties file on CRMHOST1.

3. Delete or rename the EssFOConfig.properties file in the Essbase shared folder 
   under ORACLE_BASE/config/BIShared/Essbase/essbaseserver1.

4. Retry the Essbase clustering.
This appendix provides a list of URIs that need to be protected for each domain. This appendix includes the following topics:

- Section A.1, "Protected CRM Domain URIs"
- Section A.2, "Protected BI Domain URIs"

### A.1 Protected CRM Domain URIs

The following is the list of protected Oracle Fusion Customer Relationship Management domain URIs:

- `/cdmFoundation/adfAuthentication`
- `/DateEffectivitySyncEssTest/adfAuthentication`
- `/DataQualityBatchEssTest/adfAuthentication`
- `/DataQualitySync/adfAuthentication`
- `/FoundationBulkImportEssTest/adfAuthentication`
- `/resourcemgr/ADFAuthentication`
- `/EssAppNew/ADFAuthentication`
- `/CommonComponentApps-SuperWeb-context-root/ADFAuthentication`
- `/commonComponents-SuperWeb-context-root/ADFAuthentication`
- `/WorkMgmtSubmitBatchAsgn/ADFAuthentication`
- `/CommonComponentsEss/ADFAuthentication`
- `/SalesPartiesEss/ADFAuthentication`
- `/SalesPartiesEssTest/ADFAuthentication`
- `/contractManagement-SuperWeb-context-root/ADFAuthentication`
- `/ContractManagementEss-ContractsWrkAreaAsgnOwnerPublicEssUiTest-context-root/ADFAuthentication`
- `/contractManagementEss-ContractsCoreStatusMgmtPublicEssUi-context-root/ADFAuthentication`
- `/contractManagementEss-ContractsTermsLibraryPublicEssUi-context-root/ADFAuthentication`
- `/workflow/ContractsCoreApprovalUI/ADFAuthentication`
Protected CRM Domain URIs

- /CrmAnalytics-AnalyticsWebapp-context-root/adfAuthentication
- /CustomerCenter-SuperWeb-context-root/adfAuthentication
- /customerDataHub/adfAuthentication
- /TestDispatcherWebApp/
- /crm-marketing/adfAuthentication
- /crm-leads/adfAuthentication
- /orderCapture/adfAuthentication
- /sales-SuperWeb-context-root/adfAuthentication
- /salesPredictionEngine-SuperWeb-context-root/adfAuthentication
- /SetTransform/adfAuthentication
- /territories/adfAuthentication
- /cdmFoundation
- /DateEffectivitySyncEssTest
- /DataQualityBatchEssTest
- /DataQualitySync
- /FoundationBulkImportEssTest
- /resourcemgr
- /EssAppNew
- /CommonComponentApps-SuperWeb-context-root
- /commonComponents-SuperWeb-context-root
- /WorkMgmtSubmitBatchAsgn
- /CommonComponentsEss
- /SalesPartiesEss
- /SalesPartiesEssTest
- /contractManagement-SuperWeb-context-root
- /ContractManagementEss-ContractsWrkAreaAsgnOwnerPublicEssUiTest-context-root
- /contractManagementEss-ContractsCoreStatusMgmtPublicEssUi-context-root
- /contractManagementEss-ContractsTermsLibraryPublicEssUi-context-root
- /workflow/ContractsCoreApprovalUI
- /CrmAnalytics-AnalyticsWebapp-context-root
- /CustomerCenter-SuperWeb-context-root
- /customerDataHub
- /TestDispatcherWebApp
- /crm-marketing
- /crm-leads
A.2 Protected BI Domain URIs

The following is the list of protected Oracle Business Intelligence domain URIs:

- /analytics/saw.dll
- /hr
- /aps
- /workspace
- /calcmgr
- /xmlpserver
- /ui
- /biooffice
Worksheets for Oracle Fusion CRM Topology

This appendix contains worksheets to help you keep track of machine names, IP addresses, directories, and other important data.

We recommend that you open the PDF version of this guide in a PDF reader and print out this appendix. Update these worksheets as you set up your enterprise deployment.

This chapter contains the following worksheets:

- Section B.1, "Hosts and Virtual IP Addresses for Oracle Fusion CRM"
- Section B.2, "Directory Mapping"
- Section B.3, "Port Mapping"
- Section B.4, "LDAP Directory Details"
- Section B.5, "Database Details"
- Section B.6, "Web Tier Details"
- Section B.7, "Application Tier Details"
- Section B.8, "User and Group Mapping"

B.1 Hosts and Virtual IP Addresses for Oracle Fusion CRM

Use this worksheet to record information about hosts and IP addresses.

Table B–1 Hosts and Virtual IP Addresses

<table>
<thead>
<tr>
<th>Documented Alias</th>
<th>Type</th>
<th>Your Host Name</th>
<th>IP Address</th>
<th>Operating System and Version</th>
</tr>
