This guide provides an end-to-end example for how to use Oracle Enterprise Manager Ops Center.

**Introduction**

A virtualization host, such as Oracle VM Server for SPARC, Oracle VM Server for x86, or Oracle Solaris Zones, relies on its associated storage library to store the metadata for itself and its virtual hosts, as well as the data that is the output of operations. The metadata and data is stored on LUNs that are managed by the SAN that are managed by the SAN storage libraries.

SAN LUNs are associated with Fibre Channel or iSCSI target groups. Fibre Channel targets use a dedicated optical network and iSCSI targets use the IP network, but in both protocols, the targets in a target group expose one or more LUNs as a storage resource for the target's initiators.

For both protocols, Oracle Enterprise Manager Ops Center acts as the initiator. To allow the target group and Oracle Enterprise Manager Ops Center to identify each other as eligible initiators and targets, each one’s Fibre Channel World Wide Number (WWN) or iSCSI IQN must be registered with the other one. Oracle Enterprise Manager Ops Center recognizes the targets because the WWNs or IQNs of the storage server are recorded when the storage server is discovered. Any LUNs that have been assigned to that WWN or IQN are eligible to be used in a storage library.

For LUNs backed by Fibre Channel disks, the block storage is static. From the user interface of Oracle Enterprise Manager Ops Center, you cannot change the size of the LUNs, delete them, or create new LUNs. However, you can add more LUNs to the library or remove LUNs if they are not in use. The number of LUNs in the storage library determines the number of virtual hosts that the library can support.

This document describes how to set up a static block storage library for an existing server pool, backed by Fibre Channel LUNs.

See [Related Articles and Resources](#) for links to information about storage management.

**What You Will Need**

You will need the following to set up and use a block storage library:

- LUNs backed by a managed SAN server using the Fibre Channel protocol
- A server pool
- The role of Storage Admin
If you must create LUNs on the storage server, you must have the user account and password to log into the storage server and create the LUNs as targets.

**Configure the Storage Server**

These instructions use the LUNs available in an existing server pool, but if you need to create LUNs and make them available to Oracle Enterprise Manager Ops Center, see the storage server’s documentation for instructions in how to perform the following:

- **Configure the initiator and the targets.** The initiator (Oracle Enterprise Manager Ops Center) must be able to recognize the targets (LUNs) and the targets must be able to recognize the initiator. Oracle Enterprise Manager Ops Center recognizes the targets because the WWNs of the storage server are recorded when the storage server is discovered. Any LUNs that have been assigned to that WWN are eligible to be used in a storage library. On the storage server, you must specify Oracle Enterprise Manager Ops Center’s WWN as an initiator and assign LUNs to that initiator.

- **Enable multipathing on the Fibre Channel ports.** Multipathing is enabled by default on Oracle Solaris x86-based systems, but is disabled by default on Oracle Solaris SPARC-based systems. Use the `stmsboot -e` command to enable multipathing.

- **Create new LUNs.** It can take several hours for a new LUN to be displayed in Oracle Enterprise Manager Ops Center’s user interface. To verify iSCSI LUNs are available to the virtualization host, use the following command:

  ```
  # prtconf -vc /devices/scsi_hci | grep dev_link.*s2
  ```

**Create a Static Block Storage SAN Library**

To specify the LUNs in a storage library, you specify the server pool that will use the storage library and then select LUNs from among the LUNs available to the server pool.

2. Click New SAN Storage Library in the Actions pane.

3. Enter the name and description of the library. Click Next.
4. In this example, we are creating a storage library for an existing server pool so we can make the association between the server pool and the new library at this time. Click the **Associate the new library with the selected items** option.

5. The Identify Library Associations window is populated with existing server pools and virtualization hosts.

Select at least one server pool. The LUNs that are available to the virtualization hosts in the server pool will be available for selection in the next step.

If you select more than one server pool or virtualization host, the LUNs that are common to all selections will be available for selection in the next step.

6. You have the option to enable multipathed storage for guests of Oracle VM Servers. When you click the **LUNs sharing to LDOMs** option, each logical domain can get access to its storage through any of the domains in the server pool. If you do not enable multipath storage, the logical domain gets access to storage through its primary domain. Click **Next**.

7. In the Identify LUNs step, select at least one LUN from the list of available LUNs. Because this is a static block storage library, the number of LUNs you select determines the number of virtual hosts that the library can support. For example, if you select eight LUNs, eight virtual hosts can use the storage library. Click **Next**.
8. Review the details of the storage library in the Summary pane.

9. Click Finish to submit the job.

When the job is completed, the new storage library is displayed in the Libraries section of the Navigation pane in the Static Block Storage section. The center pane shows the library’s Summary tab.
What's Next

The new storage library is ready to be used by the members of the server pool you selected.
