## About This Guide

**Topics:**

## Introduction

This guide describes how to use the Tekelec Platform Configuration utility to configure Camiant Management, as are described in their respective manuals.

## Conventions

Your view of the product may vary from the figures used as examples in this guide; the pages, tabs, fields, and functions that you see depend on your configuration or application.

The MPE device is the Camiant policy server. The terms *policy server* and *MPE device* are synonymous.

The following conventions are used throughout this guide to emphasize certain information, such as user input, page options and output, and menu selections.

*Italics* -Indicates book titles and user input variables.

`Monospace` - Indicates program output.

**`Monospace bold`** - Indicates user input.

`Monospace italics` - Indicates variables in commands.

# How This Guide is Organized

The information in this guide is presented in the following order:

- *About This Guide* contains general information about this guide, the organization of this guide, and how to get technical assistance.
- *Accessing and Using the Platform Configuration Utility* describes how to access the Platform Configuration (Platcfg) utility, how to use the utility interface in a policy environment, and troubleshooting.
- *Performing Initial Server Configuration* describes how to access the Platform Configuration (Platcfg) utility and configure your applications initial configuration, and then how to verify the configuration.
- *Managing Certificates* describes how to access the Platform Configuration (Platcfg) utility to manage SSL security certificates, which allow two systems to interact with a high level of security.
- *Synchronizing Files* describes how and when to synchronize files in clusters.
- *Performing System and Server Backups and Restores* describes how to perform system and server backups and restores.
- Glossary

# Intended Audience

This guide is intended for the following trained and qualified service personnel who are responsible for operating policy servers and related support equipment:

- System operators
- System administrators

## Related Publications

The Policy Management product set includes the following publications, which provide information for the configuration and use of Policy Management products in the following environments:

**Cable**

- *Feature Notice*
- *Cable Release Notice*
- *Roadmap to Hardware Documentation*
- *CMP Cable User Guide*

# Documentation Admonishments

Admonishments are icons and text throughout this manual that alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

**Table 1: Admonishments**

| | |
|---|---|
| | **DANGER**: <br><br> (This icon and text indicate the possibility of *personal injury*.) |
| | **WARNING**: <br><br> (This icon and text indicate the possibility of *equipment damage*.) |
| | **CAUTION**: <br><br> (This icon and text indicate the possibility of *service interruption*.) |

# Customer Care Center

The Tekelec Customer Care Center is your initial point of contact for all product support needs. A representative takes your call or email, creates a Customer Service Request (CSR) and directs your requests to the Tekelec Technical Assistance Center (TAC). Each CSR includes an individual tracking number. Together with TAC Engineers, the representative will help you resolve your request.

The Customer Care Center is available 24 hours a day, 7 days a week, 365 days a year, and is linked to TAC Engineers around the globe.

Tekelec TAC Engineers are available to provide solutions to your technical questions and issues 7 days a week, 24 hours a day. After a CSR is issued, the TAC Engineer determines the classification of the trouble. If a critical problem exists, emergency procedures are initiated. If the problem is not critical, normal support procedures apply. A primary Technical Engineer is assigned to work on the CSR and provide a solution to the problem. The CSR is closed when the problem is resolved.

Tekelec Technical Assistance Centers are located around the globe in the following locations:

**Tekelec - Global**

Email (All Regions): support@tekelec.com

- **USA and Canada**

  Phone:

  1-888-FOR-TKLC or 1-888-367-8552 (toll-free, within continental USA and Canada)

  1-919-460-2150 (outside continental USA and Canada)

TAC Regional Support Office Hours:

8:00 a.m. through 5:00 p.m. (GMT minus 5 hours), Monday through Friday, excluding holidays

- **Caribbean and Latin America (CALA)**

Phone:

+1-919-460-2150

TAC Regional Support Office Hours (except Brazil):

10:00 a.m. through 7:00 p.m. (GMT minus 6 hours), Monday through Friday, excluding holidays

- **Argentina**

  Phone:

  0-800-555-5246 (toll-free)

- **Brazil**

  Phone:

  0-800-891-4341 (toll-free)

  TAC Regional Support Office Hours:

  8:00 a.m. through 5:48 p.m. (GMT minus 3 hours), Monday through Friday, excluding holidays

- **Chile**

  Phone:

  1230-020-555-5468

    TAC Regional Support Office Hours:

    9:00 a.m. through 6:00 p.m. (GMT plus 8 hours), Monday through Friday, excluding holidays

# Emergency Response

In the event of a critical service situation, emergency response is offered by the Tekelec Customer Care Center 24 hours a day, 7 days a week. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem with the installed equipment that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical situations affect service and/or system operation resulting in one or several of these situations:

- A total system failure that results in loss of all transaction processing capability
- Significant reduction in system capacity or traffic handling capability
- Loss of the system's ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions

- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity/traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with the Tekelec Customer Care Center.

## Locate Product Documentation on the Customer Support Site

Access to Tekelec's Customer Support site is restricted to current Tekelec customers only. This section describes how to log into the Tekelec Customer Support site and locate a document. Viewing the document requires Adobe Acrobat Reader, which can be downloaded at www.adobe.com.

1. Log into the *Tekelec Customer Support* site.

   **Note:** If you have not registered for this new site, click the **Register Here** link. Have your customer number available. The response time for registration requests is 24 to 48 hours.

2. Click the **Product Support** tab.
3. Use the Search field to locate a document by its part number, release number, document name, or document type. The Search field accepts both full and partial entries.
4. Click a subject folder to browse through a list of related files.
5. To download a file to your location, right-click the file name and select **Save Target As**.

# Accessing and Using the Platform Configuration Utility

**Topics:**

This chapter describes how to access the Platform Configuration (Platcfg) utility and use the utility interface in the Policy Management environment.

# Accessing the Platcfg Utility

To access the Platcfg utility, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

```
# su - platcfg
```

**Note:** The dash (-) is required in the su - service command to ensure proper permissions.

The following screen is displayed.

```
                      ┤ Main Menu ├

     Maintenance
     Diagnostics
     Server Configuration
     Remote Consoles
     Network Configuration
     NetBackup Configuration
     Camiant Configuration
     Exit
```
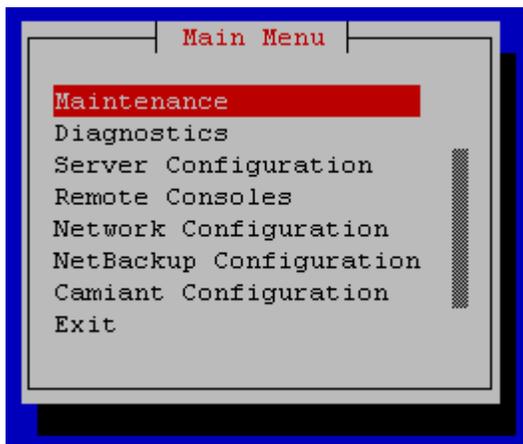

# Using the Platcfg Utility

To move and enter information within the Platcfg utility, use the following:

- Up and down arrows - moves the action up or down.
- Left and right arrows - moves the action sideways.
- Enter key - enters the desired information and moves to the next menu item or feature.
- First letter - Select the first letter of a menu item to move to that item.

# Troubleshooting Using the Camiant Configuration Menu

If a system failure occurs, use the Save Platform Debug Logs menu option on the Camiant Configuration Menu to help debug the issue.

## Saving Platform Debug Logs

The Save Platform Debug Logs option is used to troubleshoot a system failure. This option varies from the standard Platcfg save debug log option by providing two settings that allow you to limit the size of the Save Log files.

Information saved in the logs includes the current state of all logs, all the configuration files, all the system proc entries, and several miscellaneous files. Output from this process is a single tar/gzip file.

To access this utility, complete the following:

1.  Log in to your system as root.

2.  At the root prompt, enter the following command:

    ```
    # su - platcfg
    ```

3.  Select the **Camiant Configuration Menu** and press **Enter**.

4.  Select **Save Platform Debug Logs** and press **Enter**.

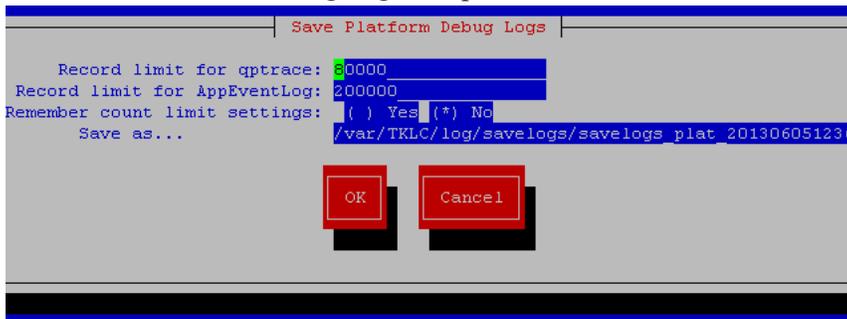

5.  Edit variables as needed:

    *   *Record limit for qptrace*: Specifies the maximum number of qptrace messages to save. Do not change this setting when generating a Save Log to debug a problem; only reduce the default number messages when instructed to do so by Tekelec Customer Support.
    *   *Record limit for AppEventLog*: Specifies the maximum number of AppEventLog records to save. Do not change this setting when generating a Save Log to debug a problem; only reduce the default number records when instructed to do so by Tekelec Customer Support.
    *   *Remember count limit settings:* Specifies whether or not to retain limit setting from previous log.
    *   *Save as:* Lists the path and filename of the file being saved.

6.  Select **OK** and press **Enter** to save variable changes and generate the tar/gzip file.
    The file is generated and saved in the specified location.

**Chapter**

# 3

# Performing Initial Server Configuration

**Topics:**

This chapter describes how to access the Platform Configuration (Platcfg) utility and configure your Policy Management initial configuration, and then how to verify the configuration. Specifically described:

- Initial Platcfg configuration
- Verifying the configuration
- Verifying the cluster status
- Restarting the application

# Initial Configuration

This section describes how to perform the initial configuration on the Configuration Management Platform (CMP), Multimedia Policy Engine (MPE), and Multi-Protocol Routing Agent (MRA).

To perform your system initial configuration, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

```
# su - platcfg
```

3. Select the **Camiant Configuration Menu** and press **Enter**. The following menu is displayed.

```
┤ Camiant Configuration Menu ├

Perform Initial Configuration
Restart Application
Verify Initial Configuration
Verify Server Status
Verify Cluster Status
Exchange SSH Key with Mate
SSL Key Configuration
Save Platform Debug Logs
Cluster File Sync
Routing Config
Firewall
Backup and Restore
Exit
```
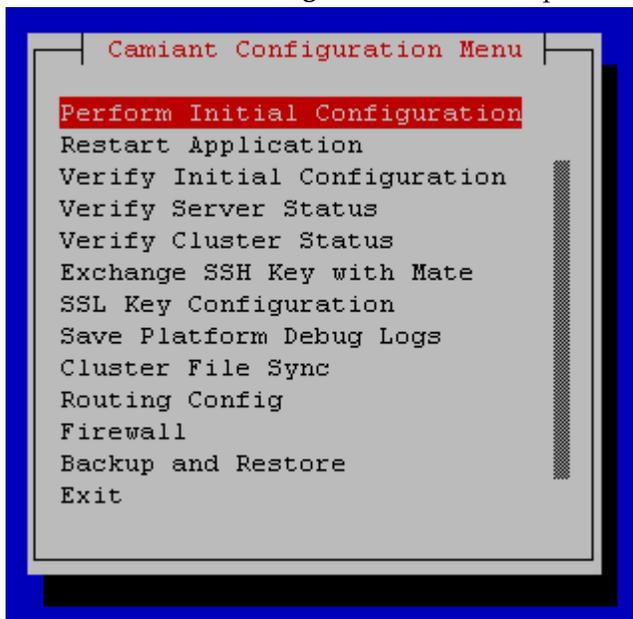

4. Select **Perform Initial Configuration** and press **Enter**. The initial Configuration screen is displayed. For example:

Where (all of the following fields are required, with the exception of the DNS Server and DNS Search which are optional but recommended):

• HostName - the unique hostname for the device being configured.

• OAM Real IP Address - the IP address that is permanently assigned to this device.

• OAM Default Route - the default route of the OAM network. Note the MPE and MRA will move the default route to the signaling A interface, once the topology configuration is complete. The default route remains on the OAM interface for the CMP.

• NTP Server (required) - a reachable NTP server on the OAM network.

• DNS Server A (optional) - a reachable DNS server on the OAM network.

• DNS Server B (optional) - a second reachable DNS server on the OAM network.

• DNS Search - is a directive to a DNS resolver (client) to append the specified domain name (suffix) before sending out a DNS query.

• Device - the bond interface of the OAM device. Note that the default value should be used, as changing this value is not supported.

• OAM VLAN Id - the OAM network VLAN Id (only applies to c-Class blades; field is ignored otherwise).

• SIG A VLAN Id - the Signaling-A network VLAN Id (only applies to c-Class blades; field is ignored otherwise).

• SIG B VLAN Id - the Signaling-B network VLAN Id (only applies to c-Class blades; field is ignored otherwise).

5. Enter the configuration and then select **OK**.

**NOTE:** If you have the optional Ethernet Mezzanine card installed, you will prompted to enable traffic segregation at this point. Selecting yes, enabling traffic segregation will segregate the SIG-A and SIG-B interfaces onto the optional second pair of 6120XG enclosure switches.

6. When finished, select **OK** to save and apply the configuration. At this point the screen pauses for around a minute. This is normal behavior, while the configuration updates.

## Verifying the Initial Configuration

Once you have made your initial configuration settings, from the Camiant Configuration Menu, select **Verify Initial Configuration** and press **Enter**. Your initial configuration settings are displayed. For example:

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP-A
                         Index Table of Contents
Date/Time: 05/11/2011 13:12:00
Hardware Type: ProLiantBL460cG6
HostName="jeffCMP-A"
SIGBVLAN="280"
ServIpAddr="10.15.26.103/23"
DefaultGw="10.15.26.1"
NtpServIpAddr="10.15.26.11"
DNSServer="10.15.29.59"
DNSSearch="qa.ma.tekelec.com ma.tekelec.com tekelec.com"
Device="bond0"
OAMVLAN="260"
SIGAVLAN="240"
NTP Status:
     remote           refid      st t when poll reach   delay   offset  jitter
===============================================================================

       [ Forward ]   [ Backward ]   [ Top ]   [ Bottom ]   [ Exit ]

  Use arrow keys to move between options |   <Enter> selects
```

**Note:** Use the Forward and Backward buttons to page up and down through the list.

## Verifying the Server Status

To view the Server Role and Policy Process Management Status, once you have made your initial configuration settings, from the Camiant Configuration Menu, select **Verify Server Status** and press **Enter**. Once fully configured, a server will show the server role as Active or Standby, based on whether it is the active server in the cluster. It is valid for it to be Unknown during initial configuration, as the cluster hasn't been formed yet. Policy Process Management Status should always be running. For example:

```
                      Index Table of Contents
Policy Process Management Status: Running
Server Role: Active

                   Forward    Backward    Top    Bottom    Exit
```
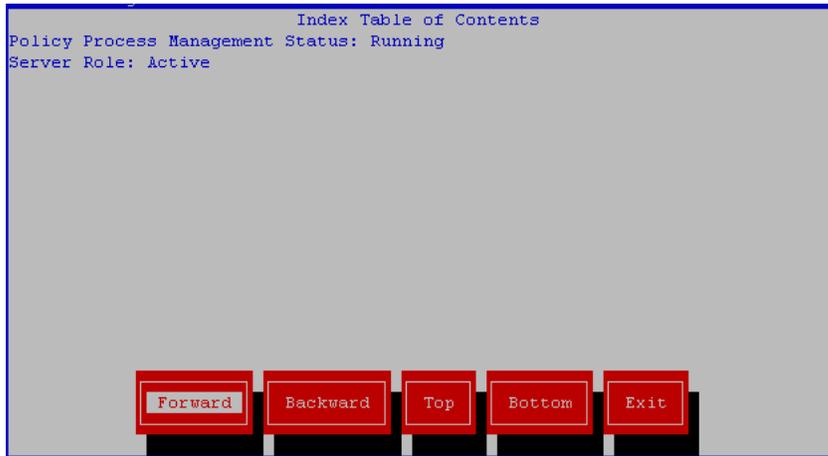

## Verifying the Cluster Status

Once you have configured your application topology and created the systems clustering, use the Check Cluster Status menu item of the Platform Configuration utility. To do this, complete the following:

1. From within the Camiant Configuration Menu screen, select the **Check Cluster Status** menu item and press **Enter**. A screen similar to the following is displayed:

```
                      Check Cluster Status
Topology Configuration: synchronized
Running topology unknown
comcol topology unknown
Key Exchange Status: Exchanged with 10.15.246.143
Unknown
MySQL Status: unknown
OAM VIP: 10.15.247.132
SIGA VIP:
SIGB VIP:

                   Forward    Backward    Top    Bottom    Exit
```
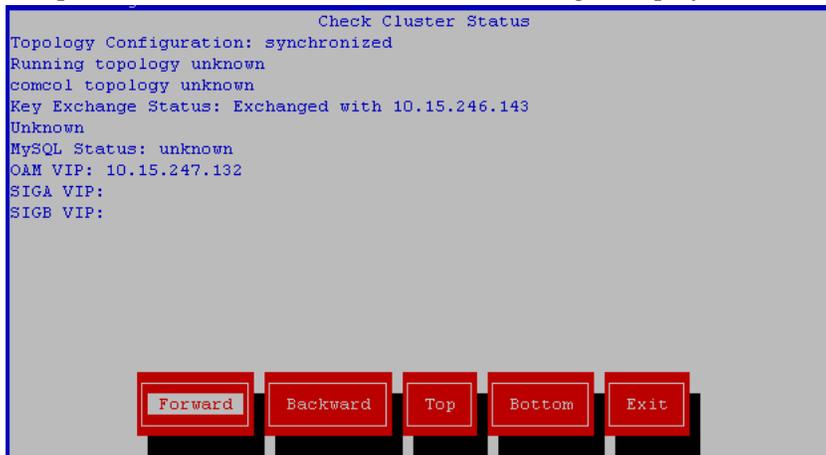

2. If the Key Exchange Status does not say **Exchanged with** *mate's IP* , you must run **Exchange SSH Key with Mate**. This is typically done after both servers in the cluster have been initially configured.

3. If the Topology Configuration or Running Configuration is not synchronized, check the configuration on your application device.

## Exchanging SSH Key with Mate

Use this option to allow two servers in a cluster to SSH to each other without entering a password. This simplifies back-end operations that rely on SSH. This step is required in the initial configuration

of a cluster, but must be done after the topology is defined in the CMP GUI. Note that the SSH keys exchange must be within the cluster (executed from one blade only). To perform the exchange, complete the following:

1. From within the Camiant Configuration Menu screen, select the **Exchange SSH Key with Mate** menu item and press **Enter**. A screen similar to the following is displayed:
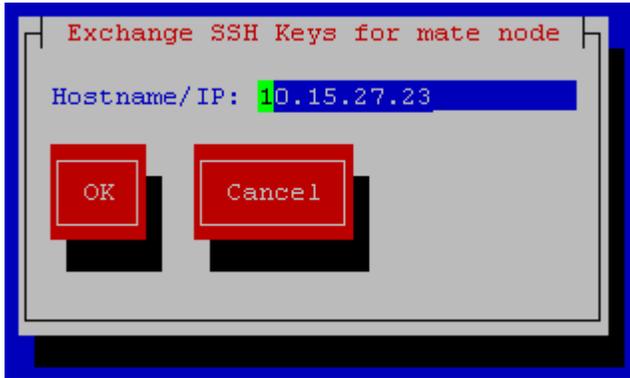

2. Enter the hostname or IP address of the server's mate and select **OK**.
   SSH keys are exchanged between the two servers.

# Configuring Routing on Your Server

This section describes how to configure routes on your server.

**Note:** When creating routes for an interface that does not have an active IP address, such as the SIG-A interface on the standby blade, you will receive a warning stating that the route cannot be applied at this time but it will be saved. These routes will show as INACT on the display routes section.

## Configuring Routing

To configure routing, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:
   ```
   # su – platcfg
   ```

3. Select the **Camiant Configuration Menu** , **Routing Config**, and press **Enter**.
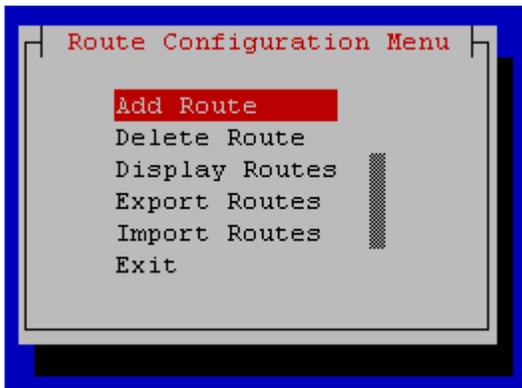

4.  Select **Add Route** and press **Enter**. The initial Add Route configuration screen is displayed. For example:

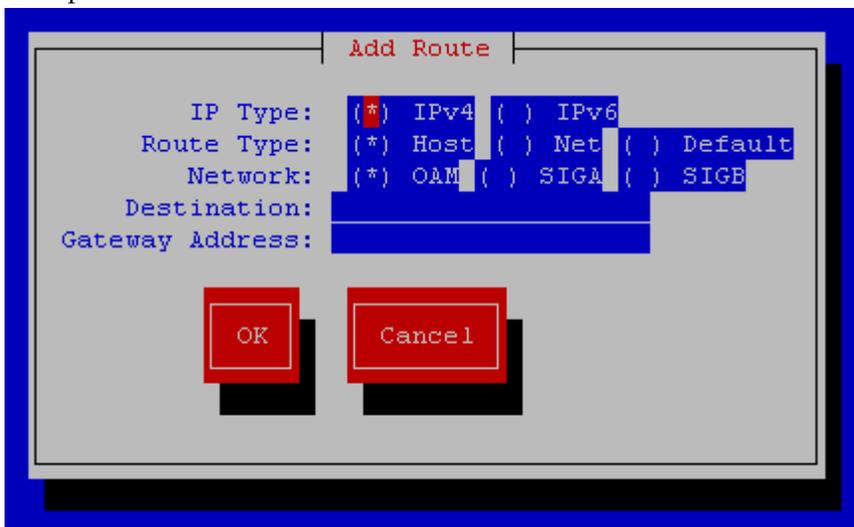

Where:

-   **IP Type** - Defines whether this will be an IPv4 or IPv6 route.

-   **Route Type** - Defines whether this route will be for a specific destination (Host), a specific network segment (Net), or a default route. Note that this option is provided to allow the default route to be moved to a different interface; only one default route per address family (IPv4 or IPv6) should exist on a system at one time.

-   **Network** - whether this route will be created on the OAM, SIGA, or SIGB interface. Note that the BKUP network is only available on CMP servers with the optional mezzanine card installed.

-   **Destination** - the destination IP address.

-   **Gateway Address** - the gateway address.

5.  Enter the desired information, and when you have finished select **OK** and press **Enter**. You are prompted to continue, press **Enter** again to save changes.

## Deleting a Route

To delete an existing route, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:
   ```
   # su – platcfg
   ```
3. From the Camiant Configuration Menu, select **Routing Config** and press **Enter**.
4. Select **Delete Route** and press **Enter**. The main routing page is displayed. For example:

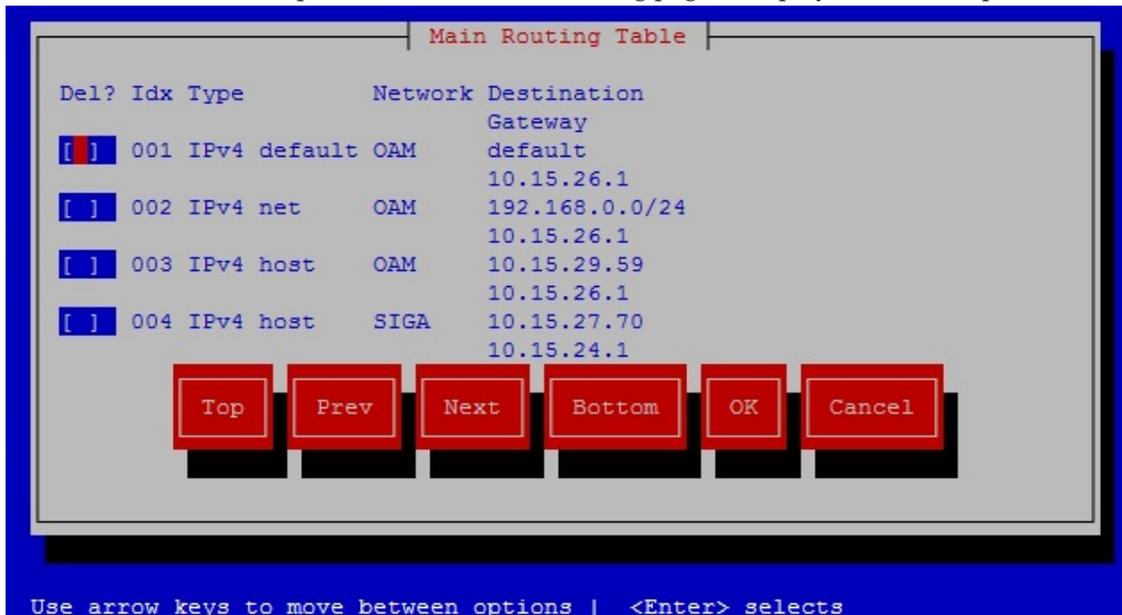

5. Select the route to be deleted by pressing the space bar, then select **OK** and press **Enter**. More than one route can be deleted at a time. Use the **Top**, **Bottom**, **Prev**, and **Next** buttons to scroll through the list if needed. **Note:** The route is deleted without warning.

## Displaying Configure Routes

To display the configured routes, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:
   ```
   # su – platcfg
   ```
3. From the Camiant Configuration Menu, select **Routing Config** and press **Enter**.
4. Select **Display Routes** and press **Enter**. The configured routes are displayed. For example:
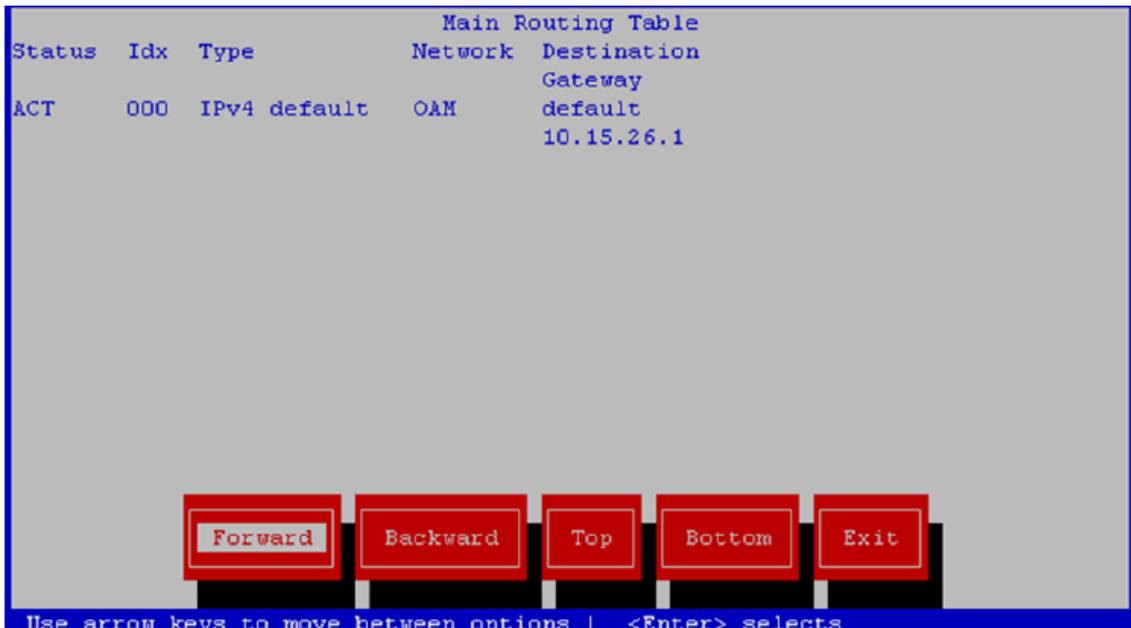

## Exporting a Route

To export all existing routes, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

```
# su - platcfg
```

3. From the Camiant Configuration Menu, select **Routing Config** and press **Enter**.
4. Select **Export Route** and press **Enter**. The export routing page is displayed. For example:

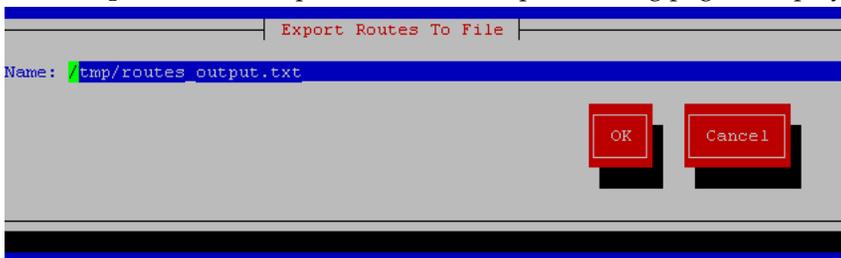

5. Specify the location and filename to which routes are to be exported, then select **OK** and press **Enter**.
   Routes are exported to the specified directory and filename.

## Importing a Route

To import existing routes into the routing configuration, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su - platcfg
   ```

3. From the Camiant Configuration Menu, select **Routing Config** and press **Enter**.

4. Select **Import Routes** and press **Enter**. The import routes page is displayed. For example:

   ```
   ┤ Import Routes From File ├
   ation: /tmp/routes_output.txt

                                    OK        Cancel
   ```
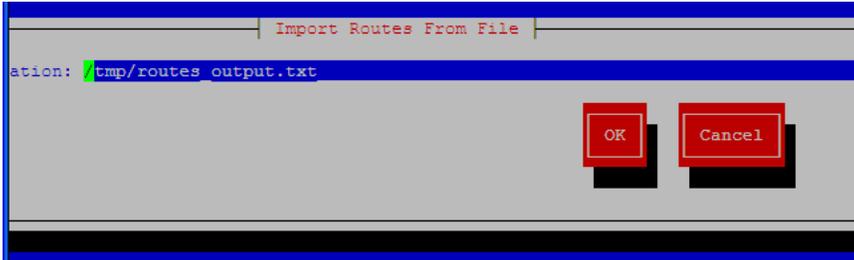

5. Specify the directory and filename from which routes are to be imported, then select **OK** and press **Enter**.
   Routes are imported into the routing configuration from the specified directory and filename.

## Restarting the Application

To restart your application, from the Camiant Configuration Menu:

1. Select **Restart Application** and press **Enter**. You are prompted to continue. For example:

   ```
   ┤ Restart qp_procmgr ├

     You are going to restart qp_procmgr.
     Continue?

                              Yes        No
   ```
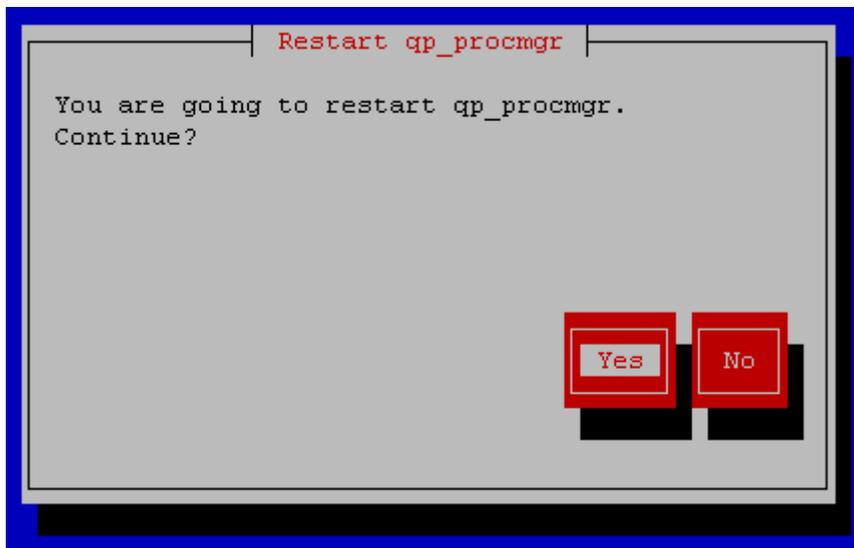

This action restarts qp_procmgr, which controls all Policy Management specific processes, and the entire application is restarted. It does *not* restart HA or database software, although the failure of the application will trigger an HA failover.

## Configuring Firewall Settings

**Note:** When configuring firewall settings, be sure to use the menu item **Save and Apply Configuration**, as it is the only way changes will be saved. The "Save and Apply" action takes your edits, commits them to the firewall config files, and restarts the firewall. If you leave this menu before initiating "Save and Apply" your changes will be lost.

To configure firewall settings on the server, that restrict access to non-standard ports, complete the following.

**Note:** In the following process, the term "all" indicates open access to any interface (For example: OAM, SIG-A, and SIG-B).

1. Log in to your system as root.
2. At the root prompt, enter the following command:
   ```
   # su – platcfg
   ```

3. Select the **Camiant Configuration Menu**, **Firewall**, and press **Enter**.
4. Select **Customize Firewall** and press **Enter**.

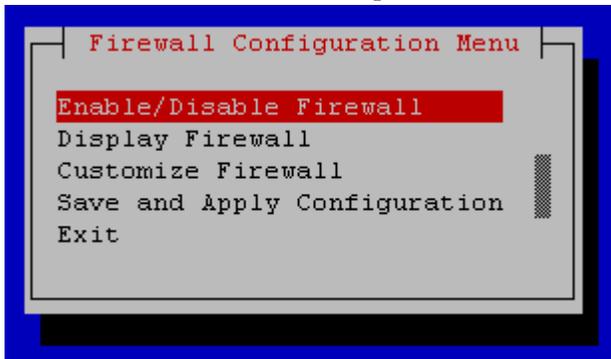

5. Select **Edit** and press **Enter**.
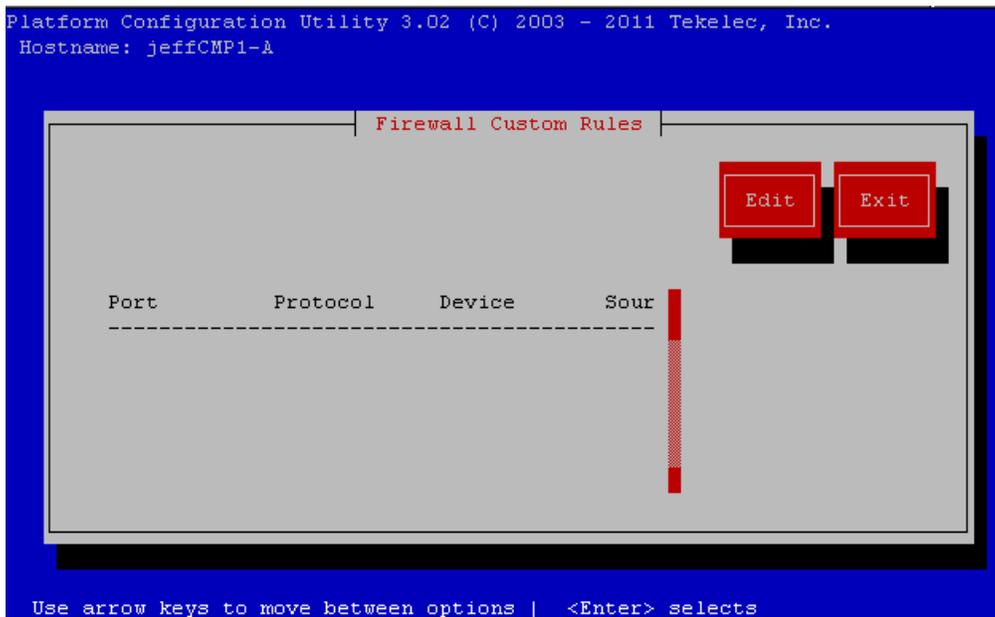

6. Select **Add** or **Edit** (if the rule already exists) and press **Enter**.

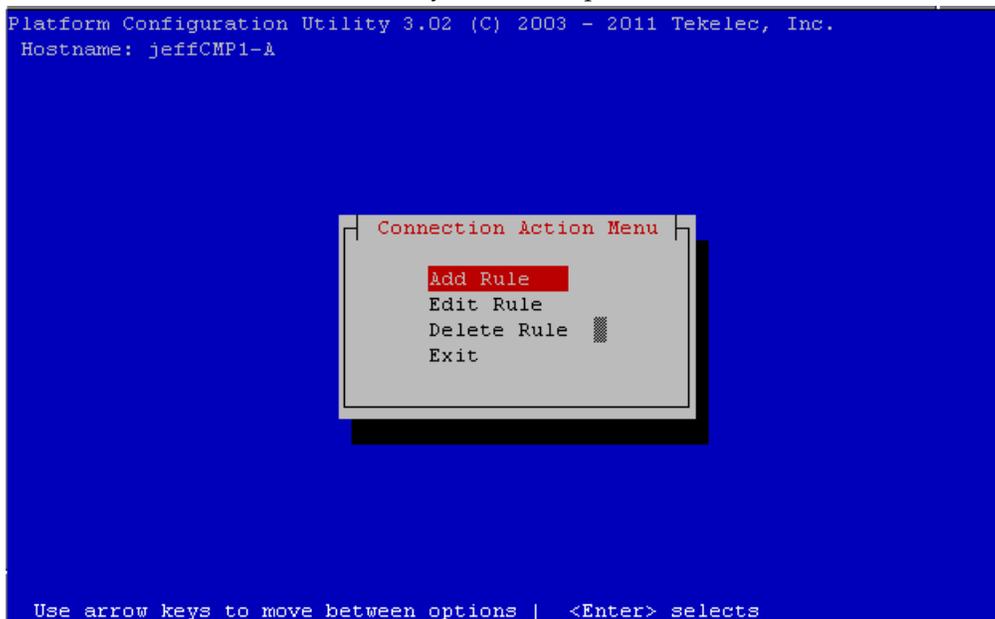

7. Enter the desired information, when finished, select **OK** and press **Enter**.
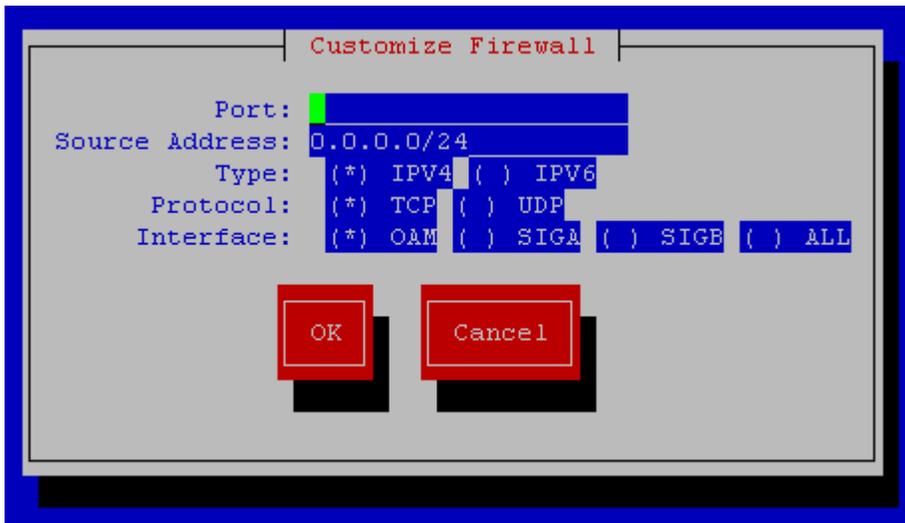

8. NOTE: If configuring a CMP with the optional Ethernet mezzanine card, an additional interface will appear called **BKUP**. This interface is used as a dedicated interface for performing remote archive activities for CMP backup operations. The BKUP will be included if **ALL** is selected.

9. Return to the **Firewall Configuration Menu**, select **Enable/Disable Firewall** and press **Enter**. Be sure to select **Save and Apply Configuration** to save this change.

10. Select **Edit** to define which IPv4 and IPv6 firewalls to enable or disable and press **Enter**.

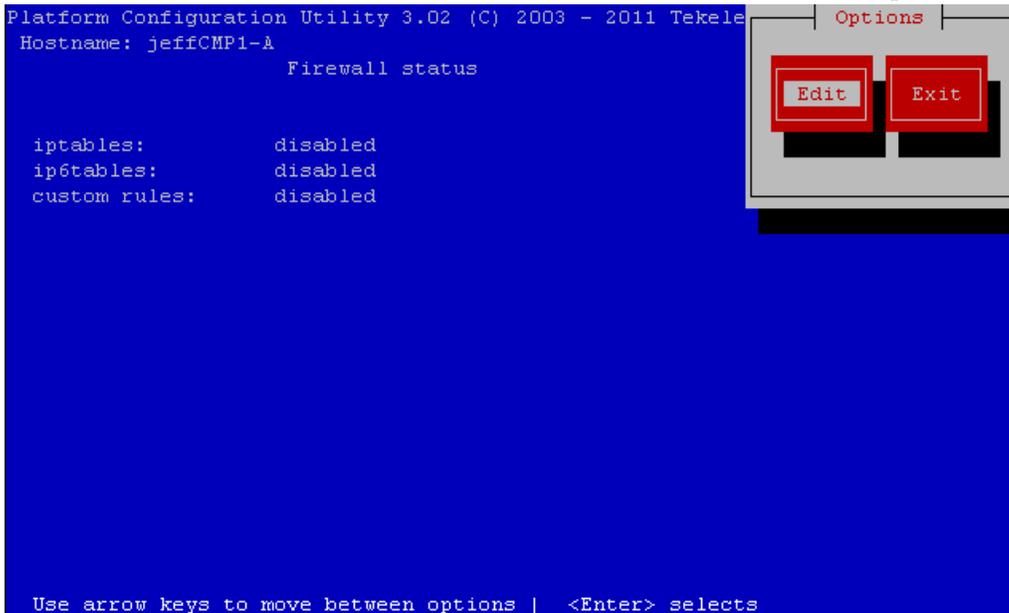

11. Select the desired interfaces and press **Enter**. The firewall is disabled by default. By enabling iptables or ip6tables, you are turning on the firewall with a default set of rules (don't forget to save and apply!). These default rules are enough to allow the product to function as needed, however it may be considered desirable to open up additional ports. To do this you must enable the Custom rules. When you add or remove a firewall rule, you are making changes to this custom rule set (the default firewall rules cannot be changed).
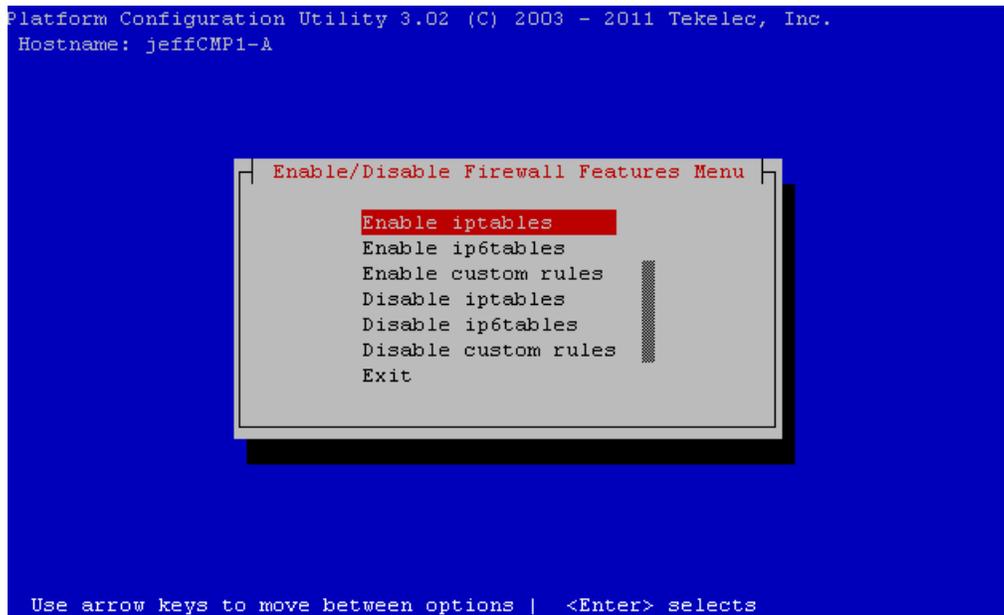

12. You are prompted to continue, select **Yes** and press **Enter**. Be sure to select **Save and Apply Configuration** to save this change.

## Displaying Firewall Settings

To display current firewall settings, complete the following:

- From the **Camiant Configuration Menu**, select **Firewall** and press **Enter**.
- Select **Display Firewall** and press **Enter**.

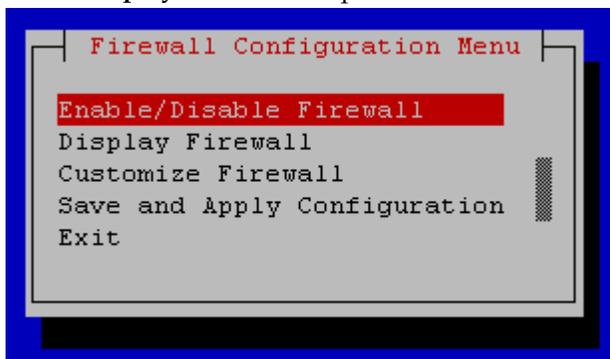

- Select the desired Firewall feature and press **Enter**.

```
┌─┤ Display Firewall Menu ├─┐

  Display Firewall Status
  Display Factory Rules
  Display Custom Rules        ▓
  Exit
```

This is an example of the Display Firewall Status screen:

```
                    Display Firewall Status
iptables:       enabled
ip6tables:      disabled
custom rules:   enabled

              [ Forward ]  [ Backward ]  [ Top ]  [ Bottom ]  [ Exit ]
```
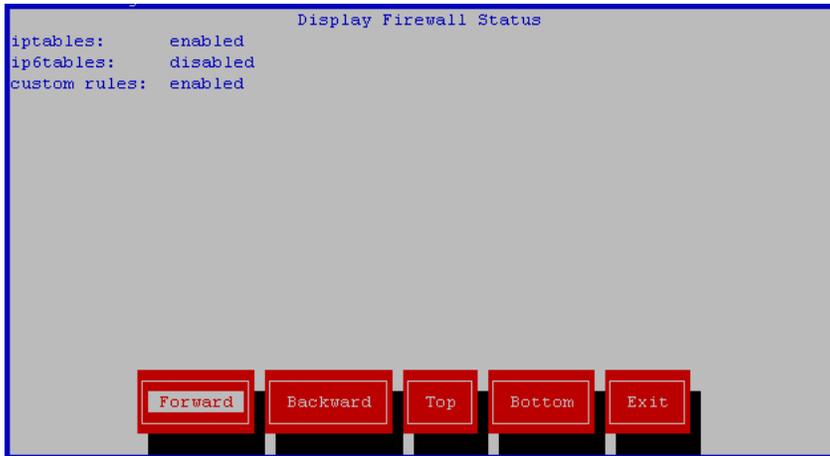

This is an example of the Display Factory Rules screen:

```
                        Display Factory Rules
Port            Protocol        Device          Source
mysql           IPV4 tcp        OAM             all
http            IPV4 tcp        ALL             all
webcache        IPV4 tcp        ALL             all
https           IPV4 tcp        ALL             all
pcsync-https    IPV4 tcp        ALL             all
http            IPV6 tcp        ALL             all
webcache        IPV6 tcp        ALL             all
https           IPV6 tcp        ALL             all
pcsync-https    IPV6 tcp        ALL             all
9663            IPV4 udp        OAM             all
ssh             IPV4 tcp        ALL             all
ntp             IPV4 udp        OAM             all
16810           IPV4 tcp        OAM             all
16426           IPV4 tcp        OAM             all

              [ Forward ]  [ Backward ]  [ Top ]  [ Bottom ]  [ Exit ]
```

And this is an example of the Display Custom Rules screen:
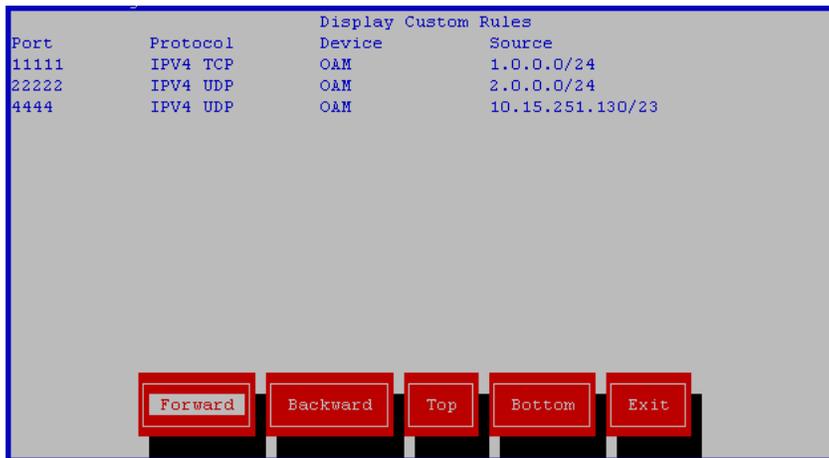

```
                              Display Custom Rules
   Port          Protocol        Device          Source
   11111         IPV4 TCP        OAM             1.0.0.0/24
   22222         IPV4 UDP        OAM             2.0.0.0/24

         Forward     Backward     Top     Bottom     Exit
```

## Configuring DSCP

Use the options on the DSCP (Differentiated Services Code Point) Configuration menu to manage DSCP configurations. These configurations allow you to operate DSCP on network interfaces (SIG A, SIG B) for a Policy Management device. The configurations are persistent during system power off, reboot, and upgrade. Configurations can also sync to other blades within a cluster.

Menu options include:

- Add a DSCP configuration
- View existing DSCP configurations
- Edit a DSCP configuration
- Delete a DSCP configuration
- Sync a configuration to other blades in cluster

### Adding a DSCP Configuration

Use the **Add New DSCP Configuration** to add a new DSCP configuration on the network interface and begin DSCP marking of specified packets. Each DSCP configuration is saved to the configuration file in the order in which it is added.

To add a new DSCP configuration, complete the following:

1. From the **Camiant Configuration Menu**, select **DSCP Config** and press **Enter**.
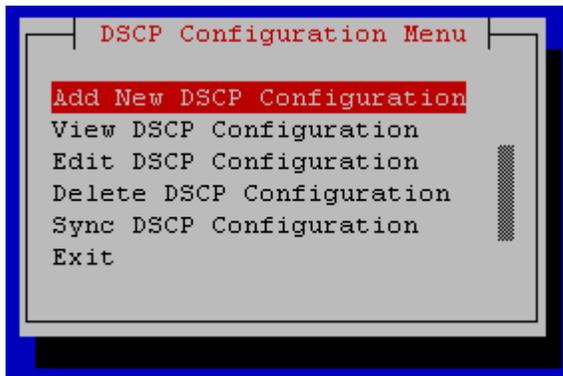

2. Select **Add New DSCP Configuration** and press **Enter**.

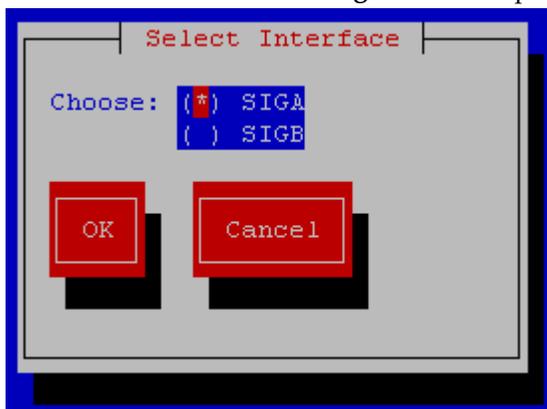

3. Select the desired interface for the new configuration, then select **OK** and press **Enter**. In the Policy Management architecture, network interfaces are segregated into SIG A, SIG B, and OAM. The interface SIG A is used to connect to the customer signaling A network; SIG B is used to connect to the customer signaling B network; and OAM is used to connect to the customer management network and for internal connection between the cluster and site. The Configuration includes interface SIG A and SIG B, but does not include OAM. Select either SIG A or SIG B for the current DSCP configuration.

If more than one DSCP configuration is added on the same network interface (for example, SIG A), the output packets sent from this interface are from the latest DSCP configuration added. The new DSCP configuration (with the same or greater scope in output packets of this network interface) takes precedence over any previous DSCP configurations. **Please note that if one interface has both VIP and blade IP and associates DSCP only with VIP, the packets sent from this interface may not be marked with DSCP as expected because the application may send packets from the blade IP instead of the VIP.**

```
┌──────┤ Input Source IP and Destination IP ├──────┐
│                                                   │
│    IP Protocol Version:  (*) ALL ( ) IPv4 ( ) IPv6│
│       Source IP Address:                          │
│  Destination IP Address:                          │
│                                                   │
│        ┌────────┐      ┌────────────┐             │

              ( ) AF13 - 001110
              ( ) AF12 - 001100
              ( ) AF11 - 001010
              ( ) CS1 - 001000
              ( ) NULL - 000000
              ( ) Customize DSCP

   ┌──────┐   ┌────────────┐
   │  OK  │   │   Cancel   │
   └──────┘   └────────────┘
```
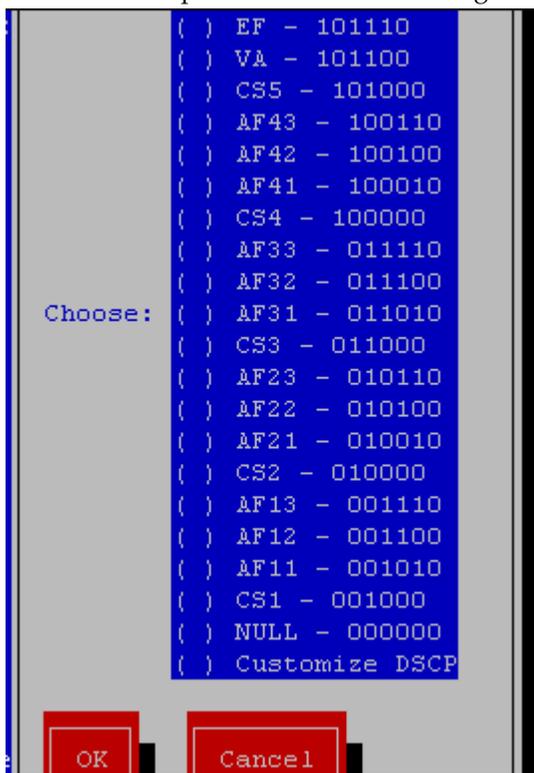

6. Select the **Code Point** to use with this configuration, then select **OK** and press **Enter**.
   Once **OK** is selected, the configuration is saved and DSCP marking commences on the specified packets.

## Viewing DSCP Configurations

To display existing DSCP configurations, complete the following:

1. From the **Camiant Configuration Menu**, select **DSCP Config** and press **Enter**.
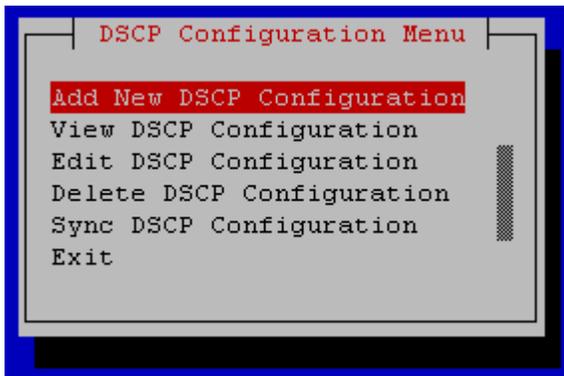

2. Select **View DSCP Configuration** and press **Enter**.

   All existing DSCP configurations are displayed.

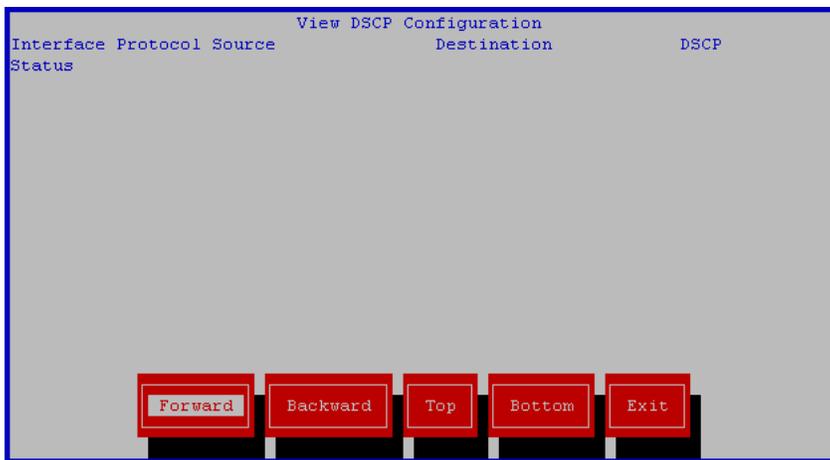

## Editing a DSCP Configuration

To edit an existing DSCP configuration, complete the following:

1. From the **Camiant Configuration Menu**, select **DSCP Config** and press **Enter**.

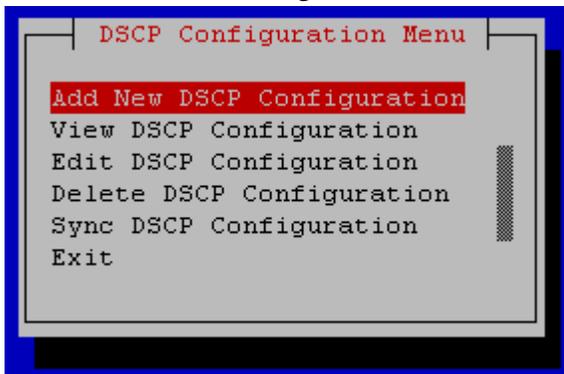

2. Select **Edit DSCP Configuration** and press **Enter**.

   All existing DSCP configurations are displayed.

```
                    ┤ Edit DSCP Configuration Menu ├
SIGA        IPv4     ALL            ALL              AF43 - 100110
SIGB        IPv6     ALL            ALL              AF42 - 100100
Exit
```

**3.** Select the configuration to change and press **Enter**.

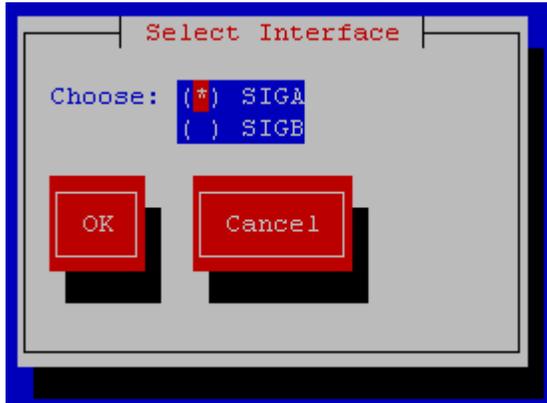

```
            ┤ Select  Interface ├

    Choose:  (*)  SIGA
             ( )  SIGB

        OK            Cancel
```

**4.** Select the interface to use for the configuration, then select **OK** and press **Enter**.

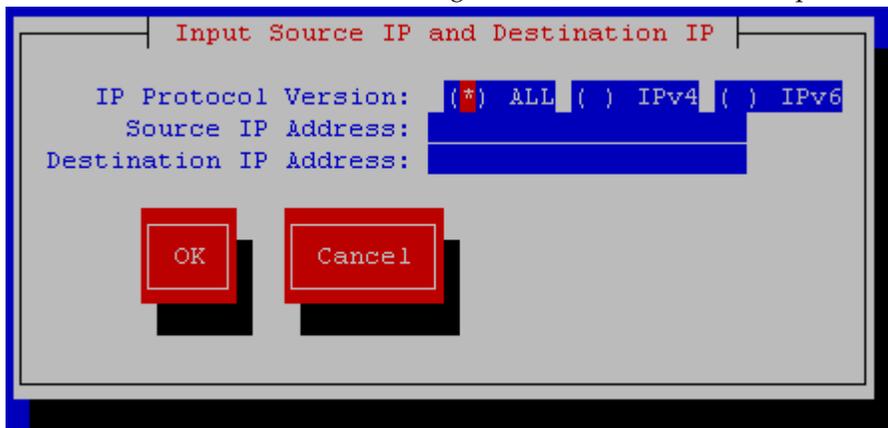

```
        ┤ Input Source IP and Destination IP ├

    IP Protocol Version:  (*) ALL ( )  IPv4 ( )  IPv6
      Source IP Address:
 Destination IP Address:

          OK          Cancel
```

**5.** Specify the **IP Protocol Version**, **Source IP Address**, and **Destination IP Address** to associate with the configuration, if desired. If no settings are specified here, the previous settings are used.

**6.** Select **OK** and press **Enter** to save setting selections and continue to Code Point selection.
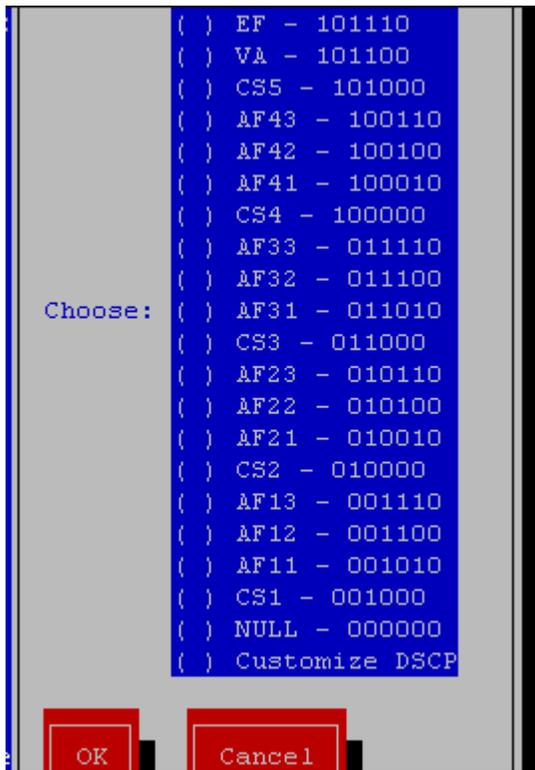

7. Select the **Code Point** to use with this configuration, then select **OK** and press **Enter**.
   Once **OK** is selected, the changes are saved for the configuration, and DSCP marking commences on the specified packets.

## Deleting a DSCP Configuration

To delete an existing DSCP configuration, complete the following:

1. From the **Camiant Configuration Menu**, select **DSCP Config** and press **Enter**.

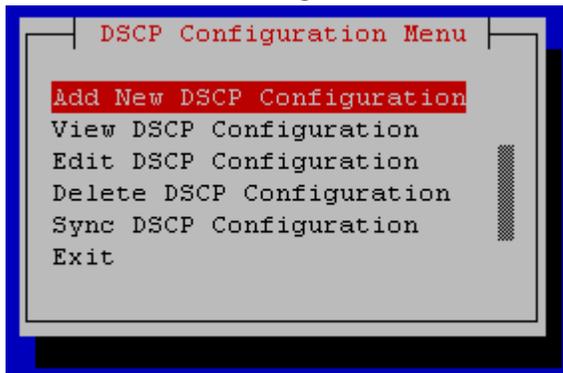

2. Select **Delete DSCP Configuration** and press **Enter**.

   All existing DSCP configurations are displayed.
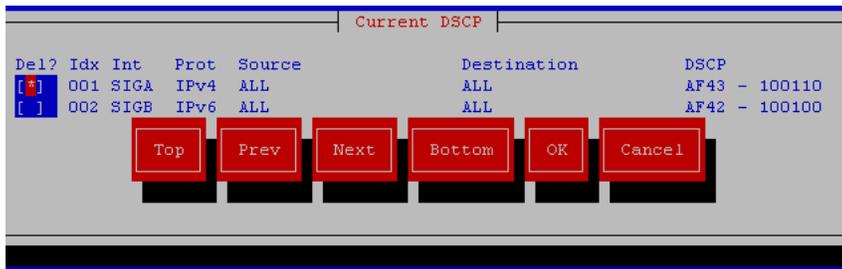

3. Select the configuration to delete by pressing the space bar; more than one configuration can be deleted at a time.

4. Select **OK**, and press **Enter**.
   The configuration/s are deleted.

   **Note:** When a configuration is deleted for a network interface that has more than one configuration defined, priority is given to the most current remaining DSCP configuration regarding output packet processing.

## Syncing DSCP Configurations

DSCP configurations on one server can be synced with other blades in the same cluster. It is recommended the sync be performed from the active blade to all other blades (standby or standby and spare) in a one site or two site cluster.

To sync existing DSCP configurations, complete the following:

1. From the **Camiant Configuration Menu**, select **DSCP Config** and press **Enter**.

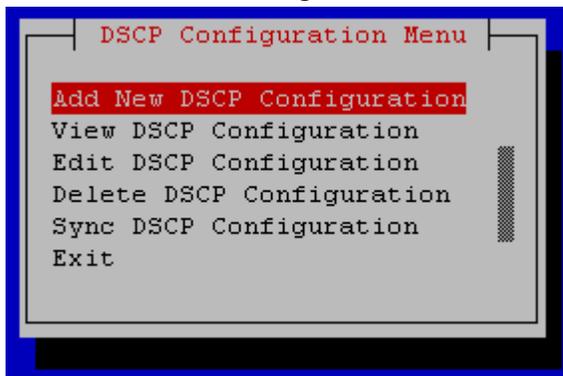

2. Select **Sync DSCP Configuration** and press **Enter**.

   If the sync is performed from a server that is not the Active blade, a warning message appears, giving you the option to abort the sync process.

   If you select **Yes** to continue, the sync process begins. Once it's complete, the following message is displayed:
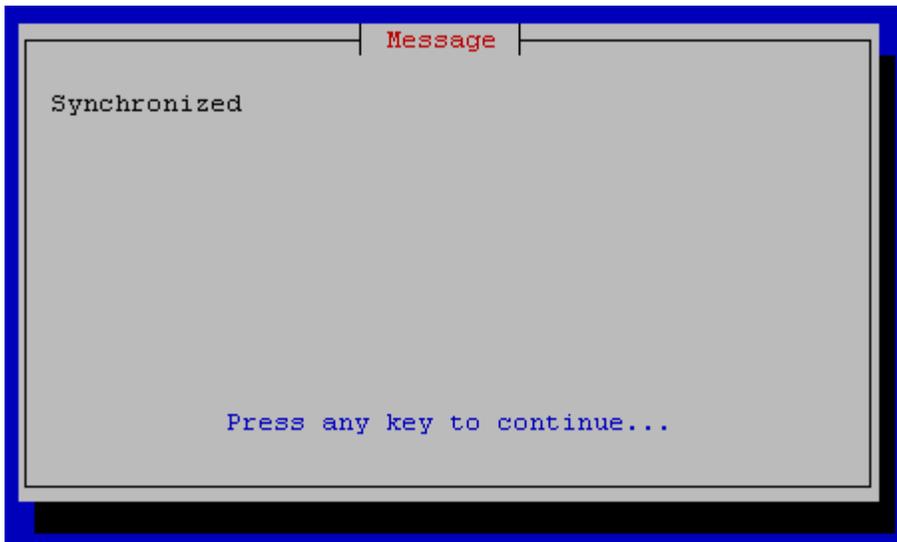

The configurations are copied to the other blades and take effect. The sync status is displayed for each remote blade.

# Chapter

# 4

# Managing Certificates

Normal web traffic is sent unencrypted over the Internet, which allows anyone with access to the right tools to snoop and view all of that traffic and data. This can lead to problems, especially where security and privacy is necessary. To combat this, the Secure Socket Layer (SSL) is used to encrypt the data stream between the web server and the web client (the browser).

Each SSL Certificate consists of a public key and a private key. The public key is shared with other SSL clients and is used to set up secure sessions, while the private key never leaves the server. When a Web browser points to a secured domain, an SSL handshake authenticates the server and the client.

This chapter describes how to access the Platform Configuration (platcfg) utility to manage SSL security certificates, which allow two systems to interact with a high level of security.

Within this chapter, the following terms are used:

* Local certificate - The certificate created on the local system and then exported to the peer system.
* Peer certificate - The certificate created on the peer system that is imported by the local system.
* Private/Public Key - As previously stated, the public key is used to encrypt information and the private key is used to decipher it.

The information and configuration steps that are provided in this chapter are primarily implemented within the platcfg utility. However, Secure Connections must be enabled within the CMP Graphical User Interface (GUI) for the MPE and MRA devices used in the certificate exchange.

# Managing SSL Security Certificates

## Creating a Self-Signed Certificate

Certificate creation is performed on the local server, and depending on your implementation, on the remote server, as well. This local certificate acts as a Private key for the local server.

To create a self-signed key, using the default value of "tomcat" or another value, complete the following:

1. Log in to your server as root.
2. At the root prompt, enter the following command:
   ```
   # su - platcfg
   ```

3. Select the **Camiant Configuration Menu, SSL Key Configuration** and press **Enter**.
4. Select **SSL Key Configure** and press **Enter**.

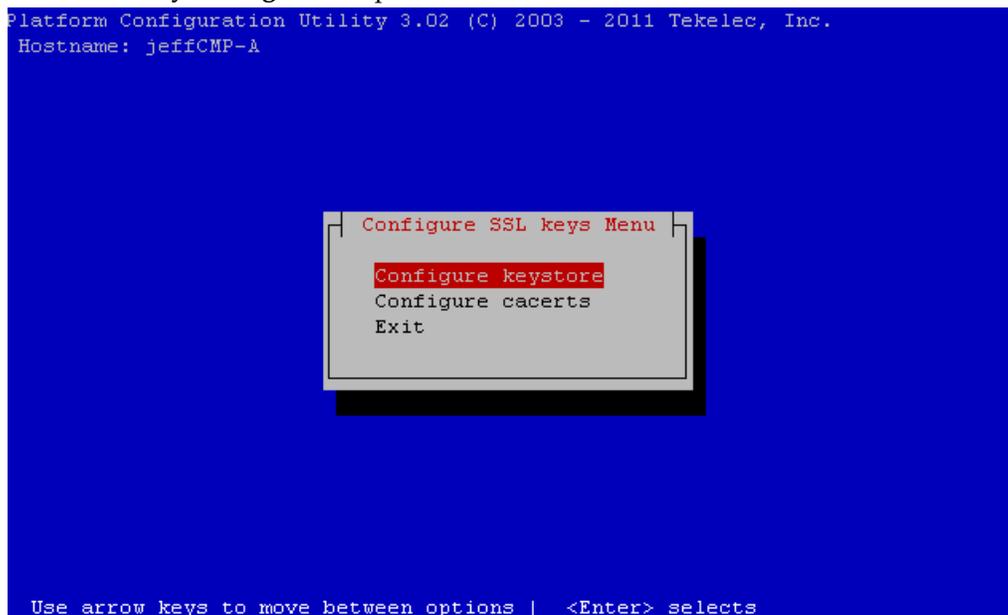

5. Select **Create Self-Signed Key** and press **Enter**.
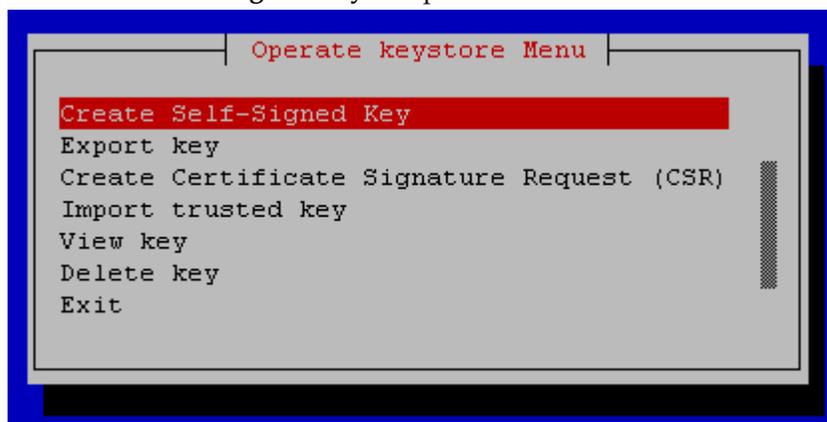

6. Enter the desired keystore information and then click OK. If you desire to change this alias name, the default alias "tomcat" will need to be deleted to ensure that the correct SSL certificate is used.

   **Note:** When creating the certificate, to avoid confusion, Tekelec recommends that the default alias "tomcat" be used. Also, the default password of 'changeit' must be used throughout the creation process or the certificate will not work.

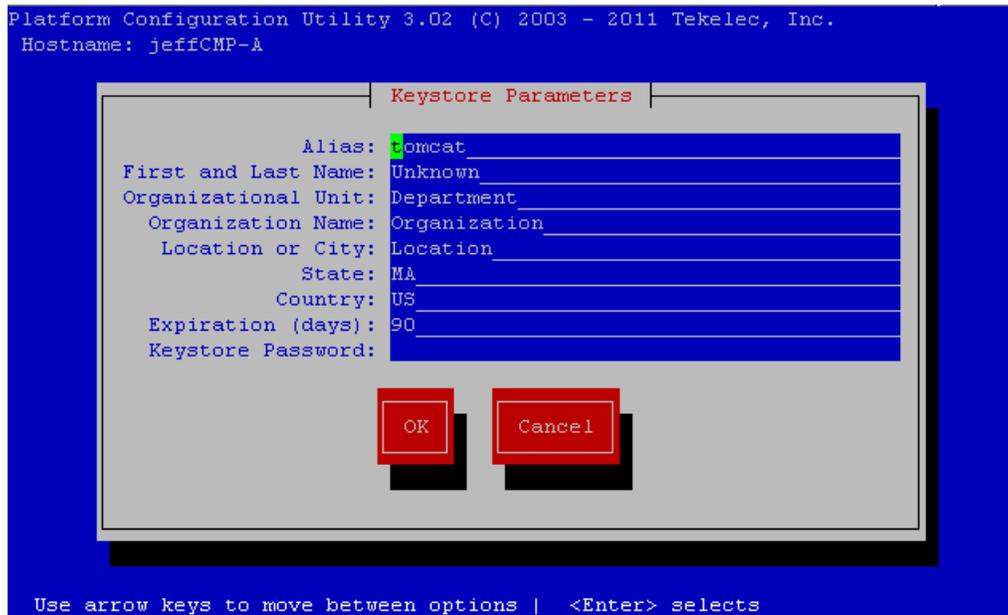

7. When you have finished, select **OK** and press **Enter**.

## Verifying the Generated Certificate

Once the SSL certificate has been created Tekelec recommends that you verify the certificate's attributes before attempting to import or export the certificate and create your secure connection. If the certificate on the host is not the same after being imported into its peer, the secure connection will not be allowed.

To verify the SSL Certificate's attributes, complete the following:

1. From the **Camiant Configuration Menu, SSL Key Configuration** and press **Enter**.
2. Select **Configure Keystore** and press **Enter**.
3. Select **OK** to accept the keystore destination, and press **Enter**.
4. Select **View key** and press **Enter**.
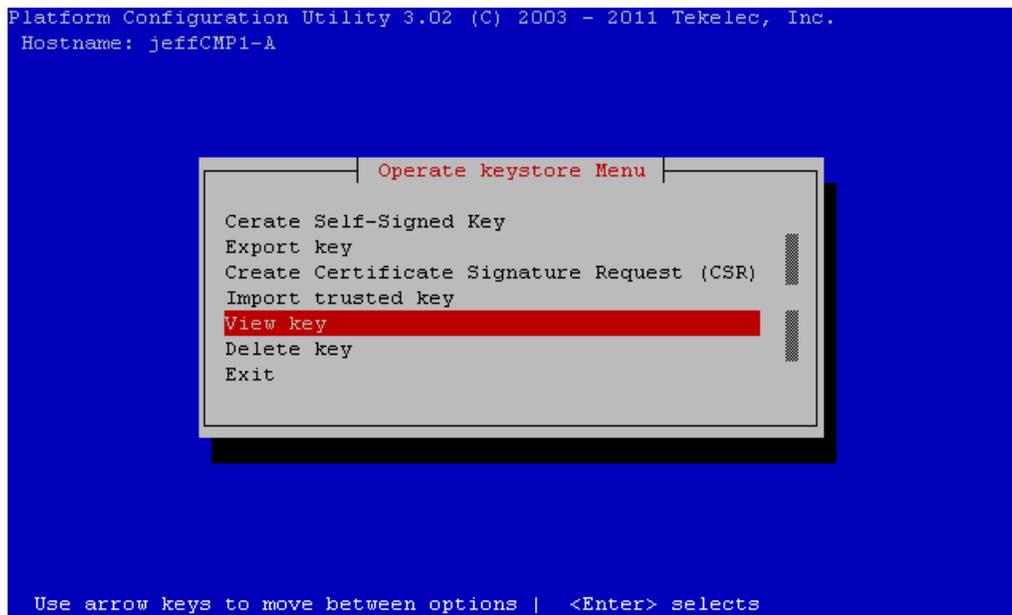

5. Enter the password (changeit), select **OK** and press **Enter**.

6. Select the desired certificate and press **Enter**.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.

        Version: 3

           ┌────────┐  ┌─────────┐  ┌─────┐  ┌────────┐  ┌──────┐
           │Forward │  │Backward │  │ Top │  │ Bottom │  │ Exit │
           └────────┘  └─────────┘  └─────┘  └────────┘  └──────┘

  Use arrow keys to move between options |   <Enter> selects
```

From the previous display, the key portions of the certificate are the Alias name, Owner, and issuer, as these attributes are exported and imported to the other server to establish the secure HTTP session.

## Using a Local Certificate to Establish a Secure HTTP (https) Web-Browser Session

To ensure a safe and secure TCP connection between an end-user (PC Web-browser) and the CMP system, an https session can be created between the two by passing a predefined certificate to the end-user. Once the end-user accepts the certificate, the https session is created.

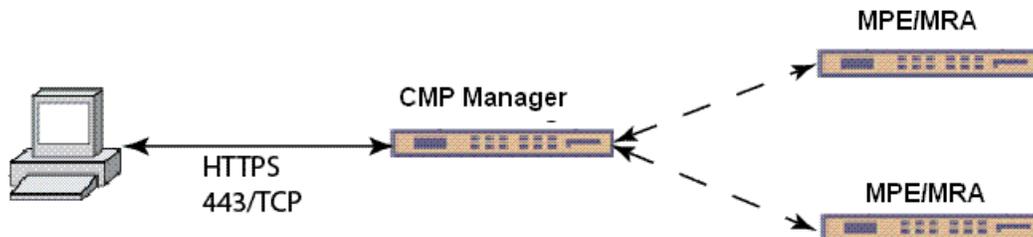

Also, Web browsers may behave differently, based on their configuration. Be sure to understand your browser settings before using SSL certificates.

To force end-users to establish an https session with the CMP system, complete the following steps:

1. Create the local certificate as described in *Creating a Self-Signed Certificate*.
2. Clear firewall settings.
3. Once the local certificate has been created, the end-user will need to accept the certificate before access to the MPE/MRA is granted.

## Establishing a Secure Connection Between a CMP System and an MPE/MRA Device

**Note:** Procedures used in this chapter may require the rebooting of one or more blades. Subsequently, for HA to operate correctly in a clustered system, the active blade of the cluster must not be rebooted unless the cluster is in the "online" state. Before rebooting any blade, check cluster status using the CMP Manager Graphical User Interface. If a cluster is labeled Degraded, but the blade detail does not show any failed or disconnected equipment, the blade is performing a database synchronization operation and until the synchronization process has completed, the standby blade cannot perform as the active blade.

Also, when a new certificate is configured, the synchronization will cause HA on the standby blade to restart.

It should be noted that SSL certificates are created on a per-cluster basis, and to ensure that the cluster has the same certificate installed, you should force a system synchronization.

To establish a secure connection between a CMP system and an MPE/MRA server, both the CMP system and the MPE/MRA server must exchange certificates. The following figure provides an example of this:

Within this figure, the SSL Certificate is shared within the cluster, with the following certificate exchange occurring:

1. The CMP system creates a local certificate and exports the certificate to the MPE/MRA server.
2. The MPE/MRA server imports the peer certificate (local certificate created by the CMP system) into its trust store.
3. The MPE/MRA server creates a local certificate and exports the certificate to the CMP system.
4. The CMP system imports the peer certificate (local certificate created by the MPE/MRA server) into its trust store.

## Exporting the Local Certificate to the MPE/MRA Servers

To establish a secure connection between the CMP system and an MPE/MRA server, complete the following:

1. Create the local certificate on each server or cluster, as described in *Creating a Self-Signed Certificate*.
2. From within the Platcfg utility, complete the following:
   a) From the **Camiant Configuration Menu**, select **SSL Key Configuration** and press **Enter**.
   b) Select **Configure Keystore** and press **Enter**.
   c) Select **OK** to accept the keystore destination, and press **Enter**.
   d) Select **Export key** and press **Enter**.
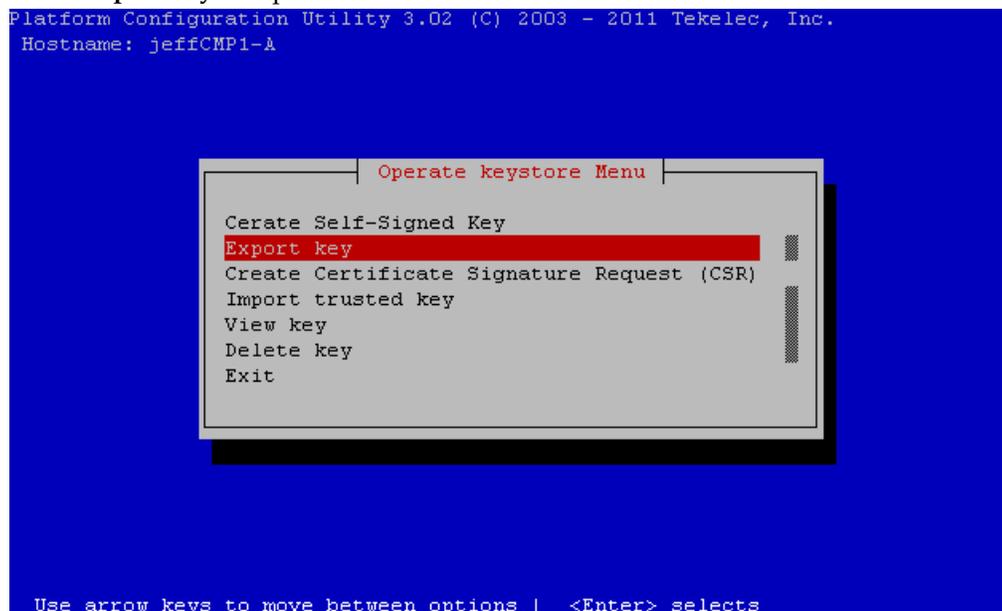

e) Enter the Keystore Password (changeit), select **OK** and press **Enter**.

f) Press **Enter** to accept the alias "tomcat" or enter the alias previously created for the certificate and press Enter. You are prompted to create a binary or ascii certificate.

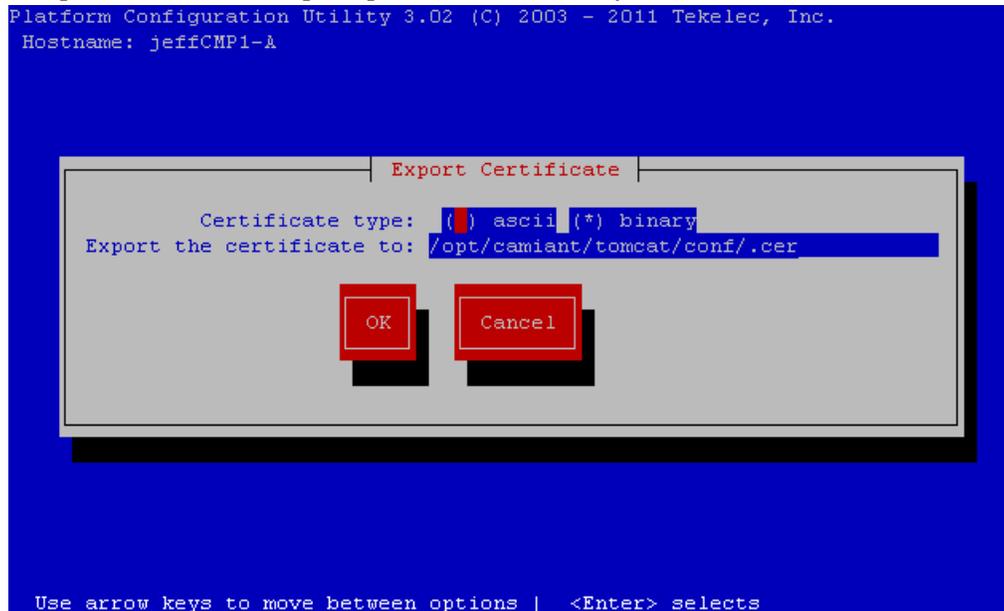

g) Select **OK** and press **Enter** to accept the default value of "binary". The certificate is exported.

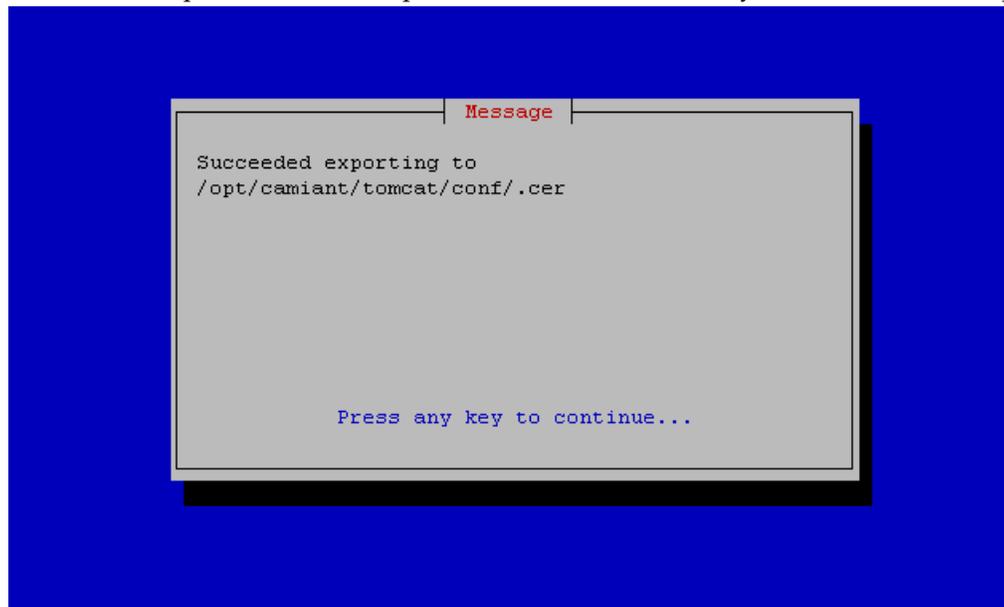

## Importing the Peer Certificate

Once you have exported the local certificate, return to the Operate Keystore Menu item of the platcfg utility and import the peer certificate (this is the certificate that was exported from the other system).

**Note:** The process that follows is used to import a certificate to the peer machine. This includes certificates generated by other Tekelec servers including certificates signed by a third party or similar.

1. From within the Operate Keystore Menu, select **Import trusted key** and press **Enter**.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP1-A

                    ┤ Operate keystore Menu ├

         Cerate Self-Signed Key
         Export key
         Create Certificate Signature Request (CSR)
         Import trusted key
         View key
         Delete key
         Exit

   Use arrow keys to move between options |  <Enter> selects
```
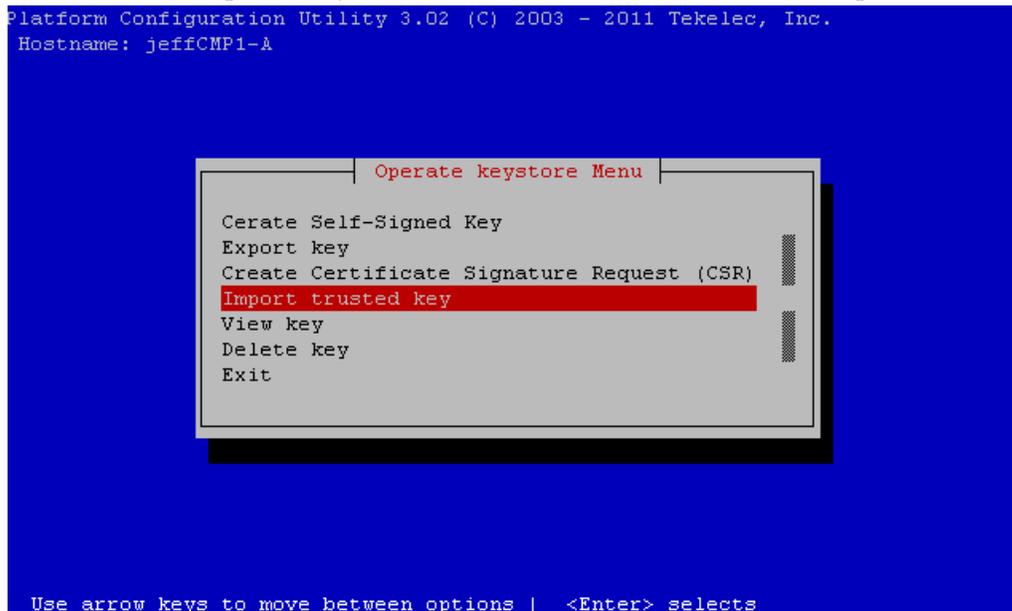

2. Enter the **Keystore Password** (changeit), select **OK** and press **Enter**.

3. You are prompted for the location and alias for the certificate.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP1-A

                      ┤ Import Certificate ├

     Import Certificate From: /opt/camiant/tomcat/conf/.cer
                       Alias: tomcat

                  OK          Cancel

   Use arrow keys to move between options |  <Enter> selects
```
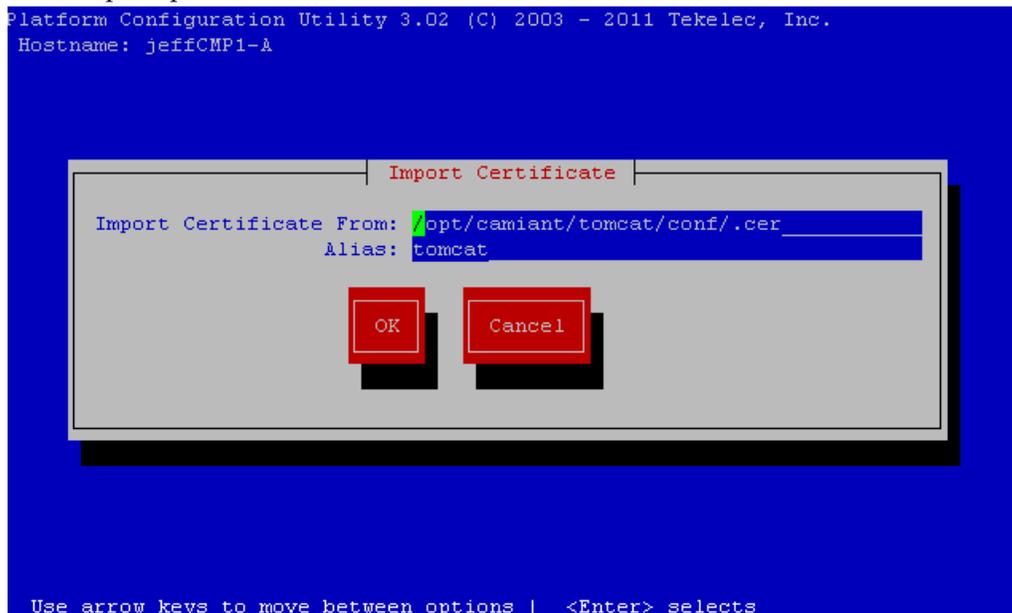

4. Enter the **Alias** for certificate (tomcat), select **OK** and press **Enter**. You are then presented with the certificate data for verification. To avoid confusion, though they may be different, ensure that the "Owner" and "Issuer" names used for the certificate match that of the certificate it is being created on.

5. If the certificate data is correct, select **OK** and press **Enter**.

6. Log in to the CMP system, enter the desired Policy Server, and click on the **Secure Connections** checkbox, located under the Policy Server System tab. Refer to the *CMP User Guide* to do this.

# Creating a Third-party CA Signed Certificate

**Note:** This section assumes that no SSL certificates have previously been generated on or imported into the servers. If there are any other pre-existing certificates on the system (besides the default tomcat certificate), please consult with Tekelec Technical Support to determine its use and importance. Also, Tekelec recommends that this method be read in its entirety before starting the operations presented herein.

Third-party certificates are implemented as follows:

- Remove pre-existing local certificate
- Generate local certificate, export for signing, and re-import
- Import the third-party peer certificate
- Synchronize and reboot Policy Management cluster

## Remove the Pre-existing Local Certificate

Typically on most MPE/MRA installations, there is a pre-existing certificate in the store that has an alias name of "tomcat". This certificate needs to be removed before continuing with any of the other required certificate generation, or import/export functions. To do this:

1. From the **Camiant Configuration Menu**, select **SSL Key Configuration** and press **Enter**.
2. Select **Configure Keystore** and press **Enter**.
3. Select **OK** to accept the keystore destination, and press **Enter**.

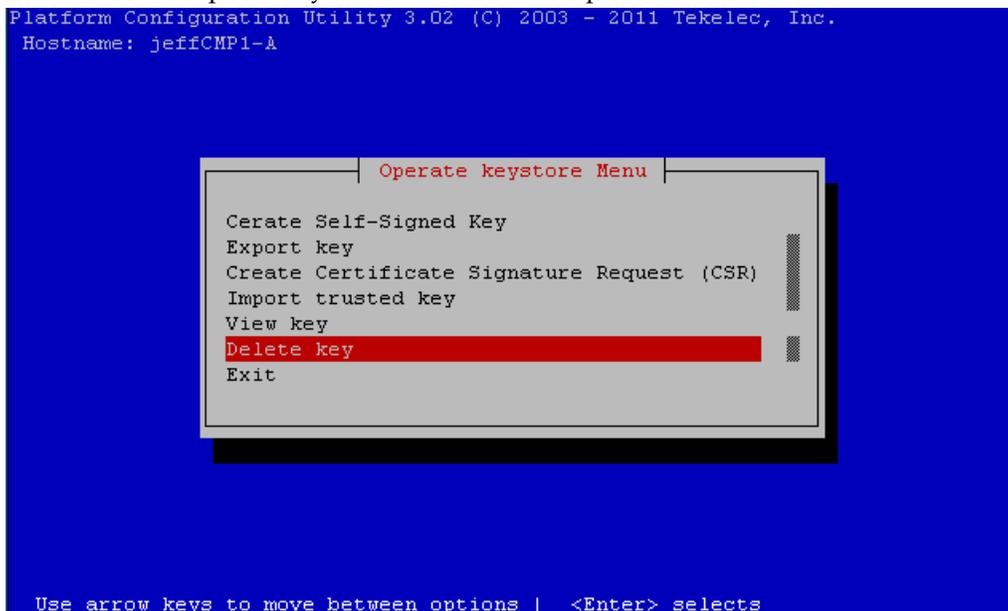

4. Select **Delete key** and press **Enter**.
5. Enter the Keystore Password (changeit), select **OK** and press **Enter.**
6. Select the desired certificate (tomcat1 in this example) and press **Enter**.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP1-A

              ┤ Delete existing certificate ├

              Are you sure you want to delete tomcat1?

                                     Yes      No

 Use arrow keys to move between options |  <Enter> selects
```
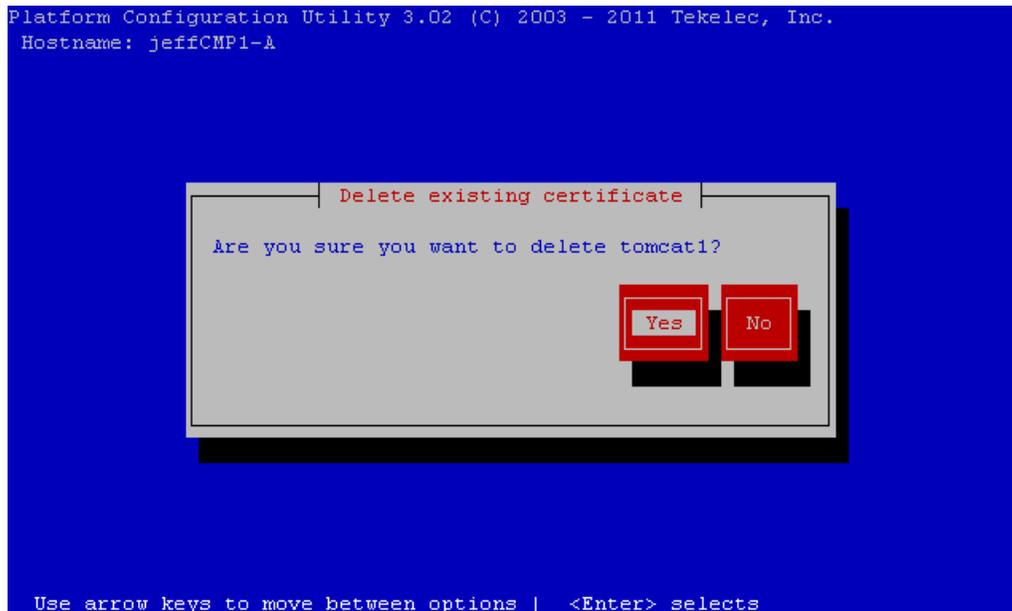

7. You are prompted to delete the selected certificate. Select **Yes** to delete the certificate or **No** to leave it as is, and then press **Enter**.

You are now ready to generate the local certificate, export it for signing, and then re-import it.

## Generating a Local Certificate, Exporting for Signing, and Re-importing

To generate the third-party signed local certificate you need to complete the following:

- Generate a certificate signature request
- Export certificate from the system
- Re-import the third-party signed certificates
- Verify that the certificates are stored

### Generate a Certificate Signature Request

To do this:

1. From the Camiant Configuration Menu, select **SSL Key Configuration** and press **Enter**.
2. Select **Configure Keystore** and press **Enter**.
3. Select **OK** to accept the keystore destination, and press **Enter**.
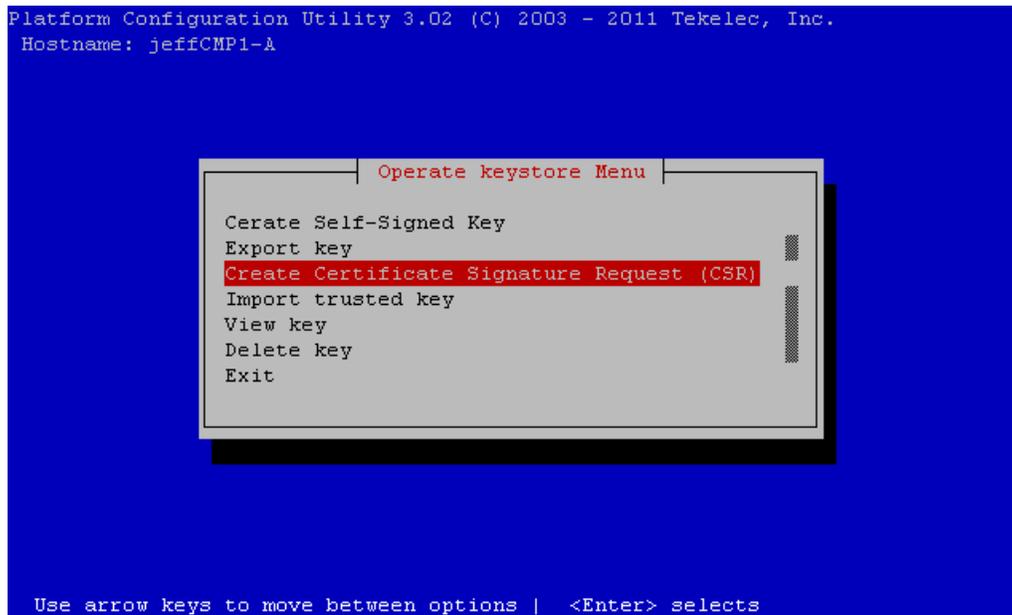

4. Select **Create Certificate Signature Request (CSR)** and press **Enter**.

5. Enter the Keystore Password (changeit), select **OK** and press **Enter**.

6. Select the desired certificate (tomcat, in this example) to export for signature and press Enter.

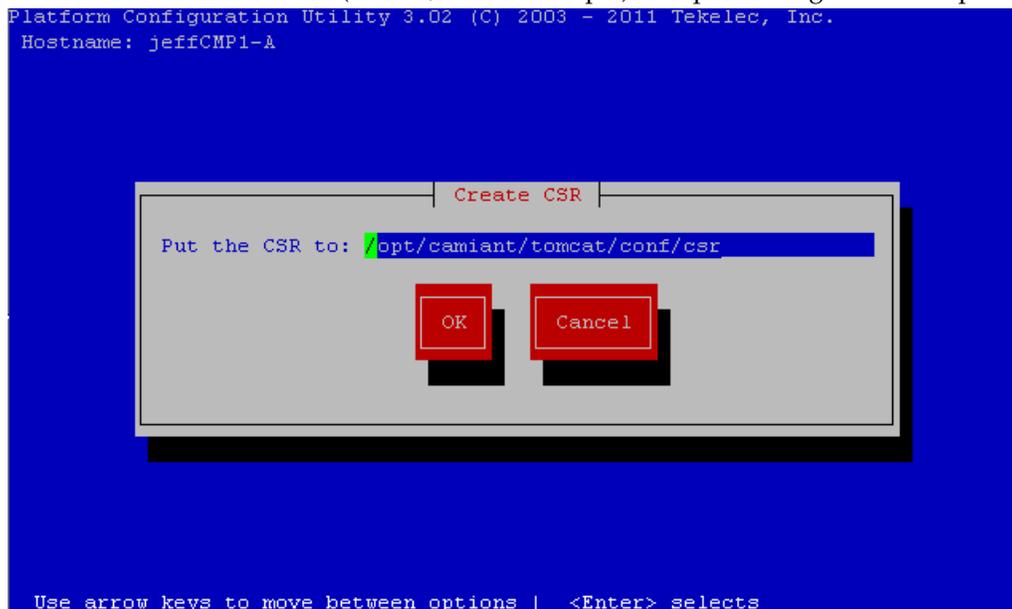

**Note:** The alias (certificate) value will be used later for re-importing the certificate after signing by a third party. Tekelec recommends using a name that allows the certificate to be identified with a specific system. Also of importance is the Expiration attribute, which should be set to a sufficiently large value so as not to expire before any peer certificates. A value preventing expiration before 2019 would be advisable.

7. Select **OK** to accept the keystore destination, and press **Enter**.
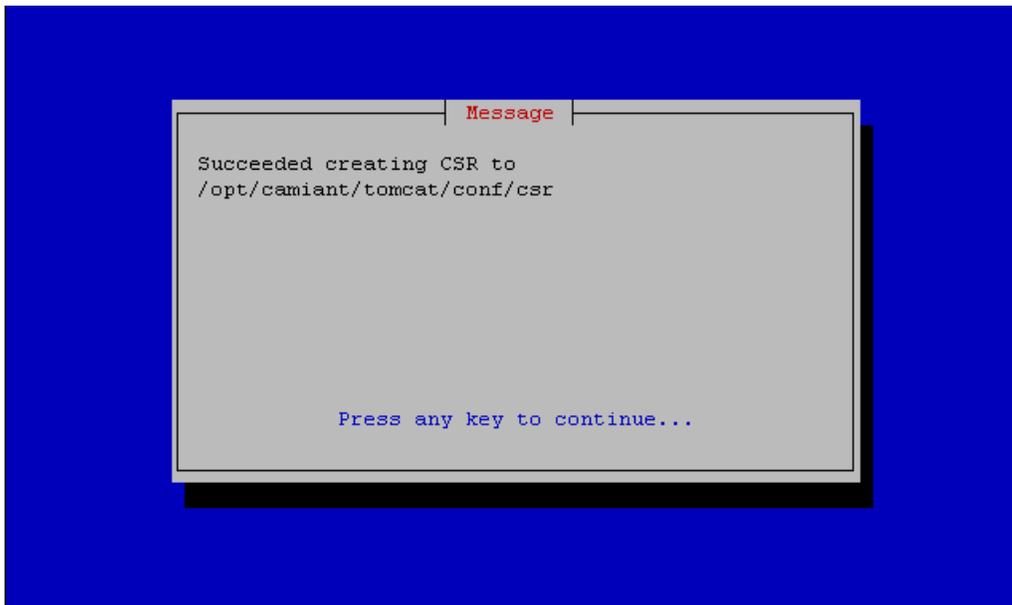

## Export the Certificate Signature Request from the System

To export a locally generated certificate signature request:

1. From the Camiant Configuration Menu, select **SSL Key Configuration** and press **Enter**.
2. Select **Configure Keystore** and press **Enter**.
3. Select **OK** to accept the keystore destination, and press **Enter**.
4. Select **Export key** and press **Enter**.
5. Enter the Keystore Password (changeit), select **OK** and press **Enter**.
6. Select the desired certificate (tomcat, in this example) to export for signature and press **Enter**. You are prompted to export a binary or ascii certificate.
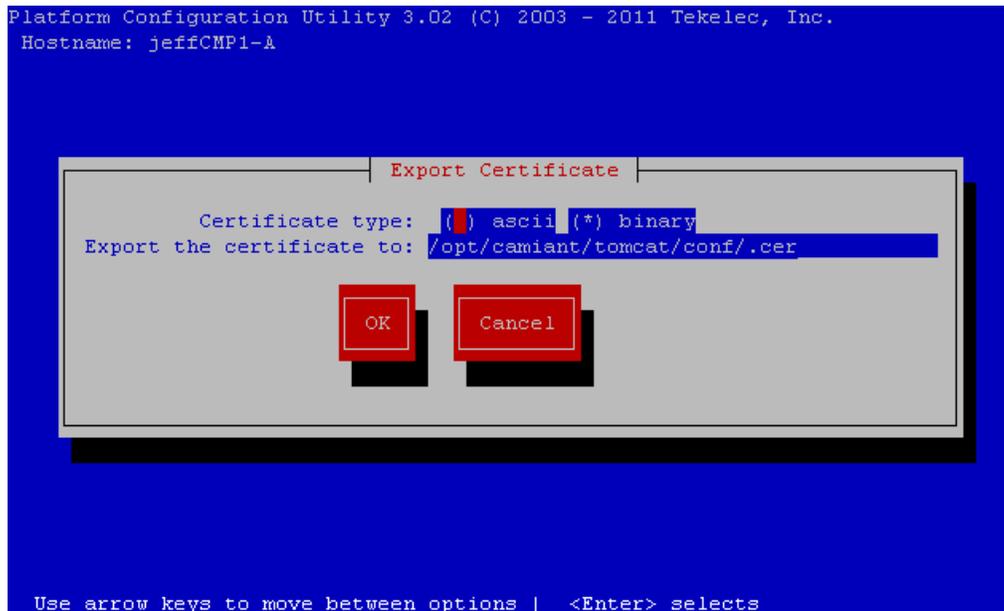

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP1-A

                          ┤ Export Certificate ├
              Certificate type:  ( ) ascii (*) binary
        Export the certificate to: /opt/camiant/tomcat/conf/.cer

                       OK          Cancel

 Use arrow keys to move between options |  <Enter> selects
```

7. Select **OK** and press **Enter** to accept the default value of "binary". The certificate is exported.

```
                          ┤ Message ├
         Succeeded exporting to
         /opt/camiant/tomcat/conf/.cer

                  Press any key to continue...
```
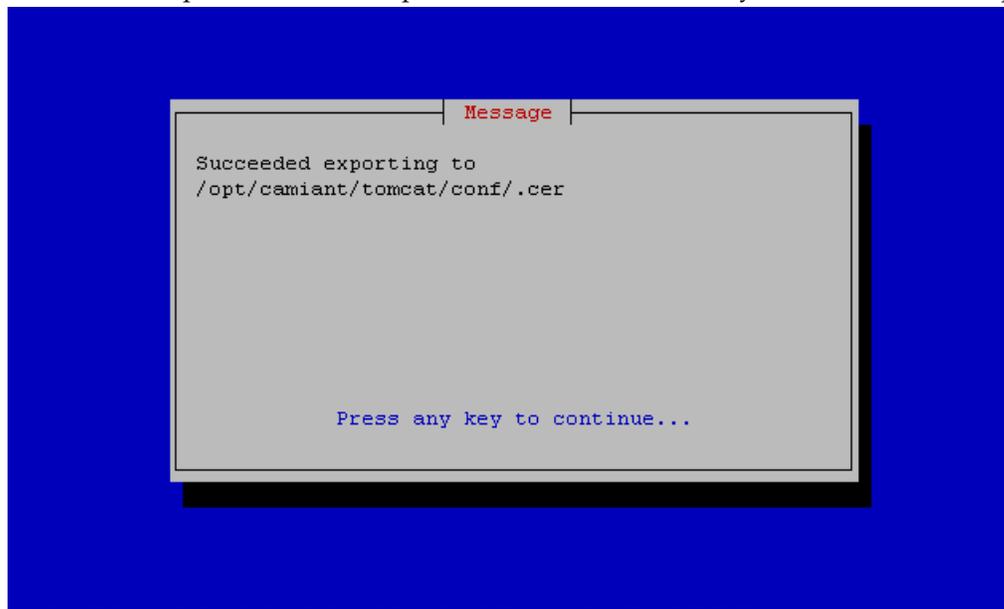

After the certificate file is exported, provide it to the third party who will be signing and returning the certificate request.

## Re-import the Third-party Signed Certificates

Once the certificate has been signed by the third party, two certificate files should be returned by them for importing into the MPE/MRA system. One of these files will be a signed, local client certificate, and the other a certificate authority (CA), peer certificate. Both of these need to be imported into the system for proper SSL communication.

**Note:** It may be necessary to edit the returned files to remove extraneous debugging-type information in the certificate. This must be accomplished using Linux-based editor to preserve line termination style. The only contents that should be in the files, are the blocks of data headlined by "-----BEGIN CERTIFICATE-----" and concluded by "-----END CERTIFICATE-----". All other text above or below these blocks should be removed.

In addition, to remove extra text in the certificate files, a further modification needs to be made to the signed local client certificate. In order for the MPE/MRA to be able to import this local certificate successfully, the CA certificate needs to be merged into this file as well. To do this, the BEGIN/END certificate text block from the CA cert needs to be copied and then pasted into the local client certificate _below_ its BEGIN/END certificate text block. The final result will be the original local client certificate text block immediately followed by the certificate text block of the CA cert that was provided by the third-party signer. An example of what this should look like is as follows:

```
-----BEGIN CERTIFICATE-----
MIIC7zCCAligAwIBAgIBBTANBgkqhkiG9w0BAQUFADCBjDELMAkGA1UEBhMCVVMx
<text removed>
gJeTRnZwMJEXv71V85NGobVGqb1uR94kIQazFP5HC2b2C0Q=
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIDjTCCAvagAwIBAgIJAJCKgXrXbhQ/MA0GCSqGSIb3DQEBBQUAMIGMMQswCQYD
<text removed>
YVPOATiFnrt1B9Qb1P8kW8lwPmG88Gg6nqttolhAnIi/lWBcp+QZfJMxPBcMkH2k7A==
-----END CERTIFICATE-----
```

Either copy these certificate files to the MPE/MRA in advance, or store them somewhere on the network accessible via SCP. They can now be imported back into the system for use in securing the communication channel with the third-party system. To do this:

1. From the **Camiant Configuration Menu**, select **SSL Key Configuration** and press **Enter**.
2. Select **Configure Keystore** and press **Enter**.
3. Select **OK** to accept the keystore destination, and press **Enter**.
4. Select **Import trusted key** and press **Enter**.
5. Enter the Keystore Password (changeit), select OK and press Enter. You are prompted for the location of the certificate to be imported.
6. Select or enter the location where the certificate is located and the certificate alias name, select **OK** and press **Enter**.

   **Note:** The alias entered here MUST match the alias originally used to create the certificate.

   You are then presented with the certificate data for verification. To avoid confusion, though they may be different, ensure that the "Owner" and "Issuer" names used for the certificate matches the hostname of the server the certificate is being created on. If all certificate information is correct, the next operation is to import the CA certificate as a peer certificate.

## Import the Third-party Peer Certificates

In addition to the certificates that were imported in the previous section, it is also necessary to import a pair of peer certificates from the third party to connect to and communicate with their server (versus their client communicating with the CMP/MPE/MRA servers).

The third party will provide a set of new client and CA certificate files, both of which will be imported to the CMP/MPE/MRA system as peer certificates. This process will be almost identical to that which was followed previously.

**Note:** It may be necessary to edit the returned files to remove extraneous debugging-type information in the certificate. The only contents that should be in the files, are the blocks of data headlined by "-----BEGIN CERTIFICATE-----" and concluded by "-----END CERTIFICATE-----". All other text above or below these blocks should be removed.

To import the peer certificates, either copy these certificate files to the CMP/MPE/MRA in advance, or store them somewhere on the network accessible via SCP. To import the certificate:

1. From the Camiant Configuration Menu, select **SSL Key Configuration** and press **Enter**.
2. Select **Configure cacerts** and press **Enter**.
3. Select **OK** to accept the keystore destination and press **Enter**.
4. Select **Import trusted key** and press **Enter**.
5. Enter the Keystore Password (changeit), select **OK** and press **Enter**. You are prompted for the location of the certificate to be imported.
6. Select or enter the location where the certificate is located and the certificate alias name, select **OK** and press **Enter**.

   **Note:** The alias entered here MUST match the alias originally used to create the certificate.

## Synchronize and Reboot the Cluster

In order for the new certificates to take effect, all blades of the cluster must be synchronized so they have the set of certificates necessary, and then also rebooted for the certificates to take effect on the MPE/MRA system. To do this, refer to the *CMP User Guide*.

# Chapter

# 5

# Synchronizing Files

**Topics:**

This chapter describes how and when to synchronize files in clusters.

Files should be synchronized using Cluster File Sync after any of the following are configured:

* Routes (Routing Config)
* Firewall (Firewall)

Functionality described includes:

* Cluster Sync Config
* Show Sync Config
* Show Sync Destination
* Show Sync Status
* Start Synchronizing

# Managing Cluster Sync Configurations

Use the Cluster Sync Config menu to manage cluster sync configurations. Functionality available on this menu includes:

- Read destination from COMCOL
- Add Sync File
- Delete Sync File

## Reading Destination from COMCOL

Select this option to read the cluster sync destination from COMCOL. To perform this step, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

   ```
   # su - platcfg
   ```

3. **Select the Camiant Configuration Menu**, and press **Enter**.
4. Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.

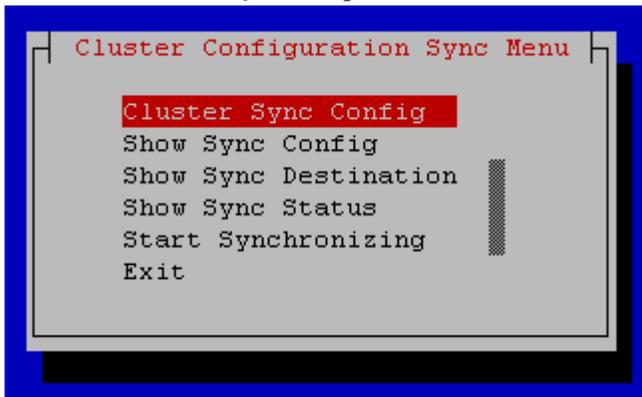

5. Select **Cluster Sync Config** and press **Enter**.

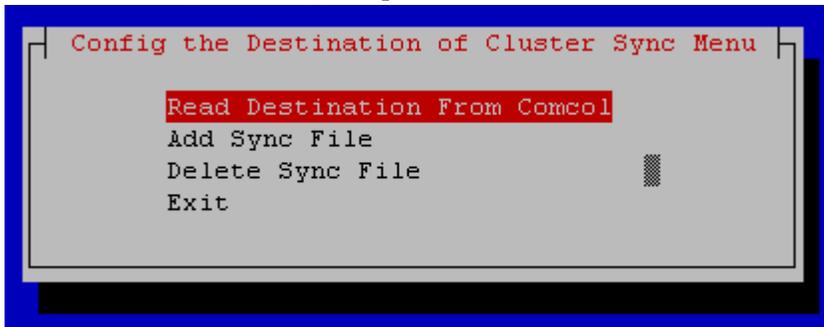

The Config Destination of Cluster Sync menu is displayed.

6. Select **Read Destination from Comcol** and press **Enter**.

The destination of the cluster sync file is read from COMCOL.

## Adding a Sync File

To create a new cluster sync configuration file, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

```
# su - platcfg
```

3. **Select the Camiant Configuration Menu**, and press **Enter**.
4. Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.

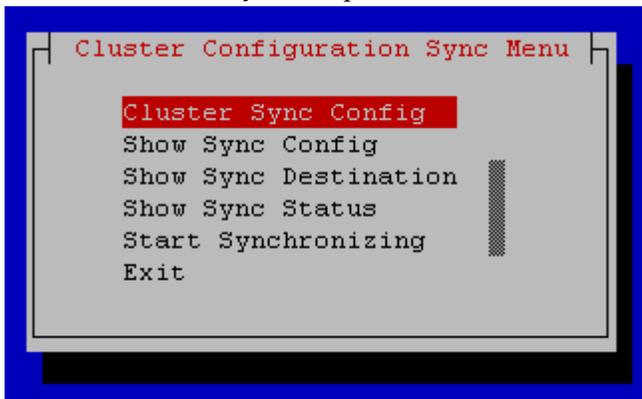

5. Select **Cluster Sync Config** and press **Enter**.

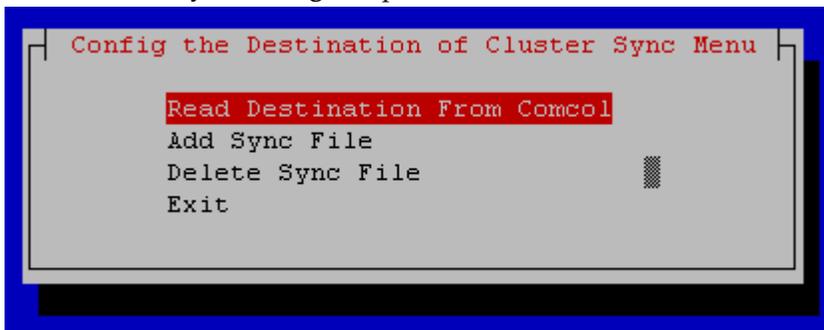

The Config Destination of Cluster Sync menu is displayed.

6. Select **Add Sync File** and press **Enter**.
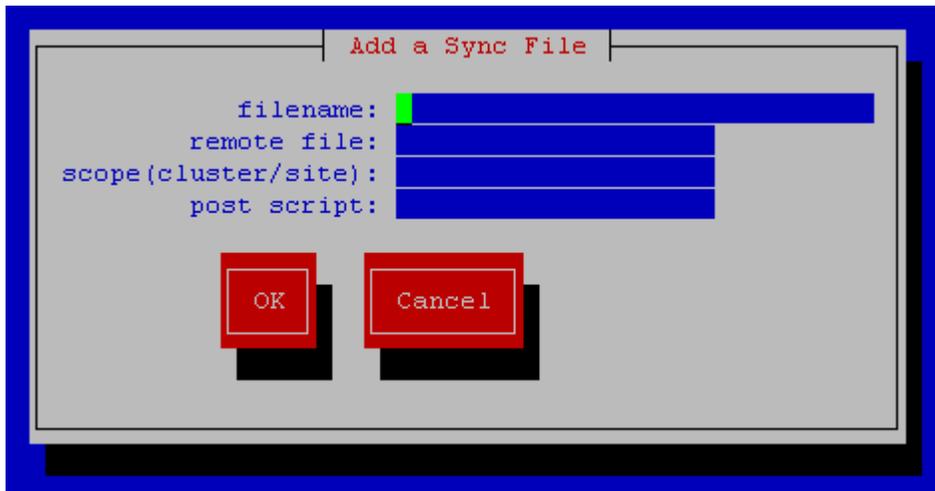

The Add a Sync File screen is displayed.

7. Enter data into the fields, as needed.

   1. **Filename** -
   2. **Remote file** -
   3. **Scope (cluster/site)** - Scope lists where each file is being synced: Site indicates just to servers at the local site, Cluster indicates to all servers at all sites. Files that need to be in sync at all sites (like certificates) should be listed as Cluster; IP-related files that may not be valid at other sites (like firewall and static routes) should be listed as Site.
   4. **Post script -**

8. Select **OK** and press **Enter**
   The new cluster sync configuration is saved.

## Deleting a Sync File

To delete an existing cluster sync configuration file, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

   ```
   # su – platcfg
   ```

3. **Select the Camiant Configuration Menu**, and press **Enter**.
4. Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.
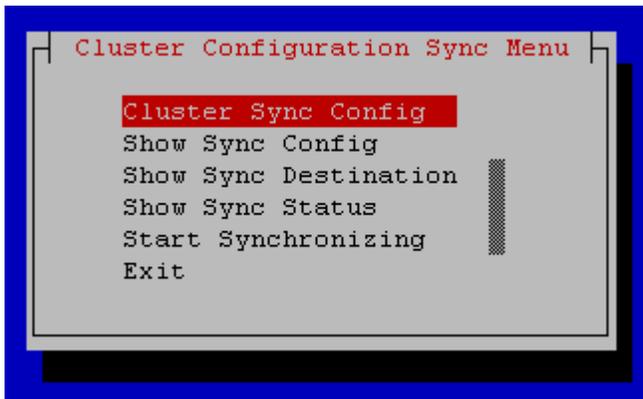

**5.** Select **Cluster Sync Config** and press **Enter**.

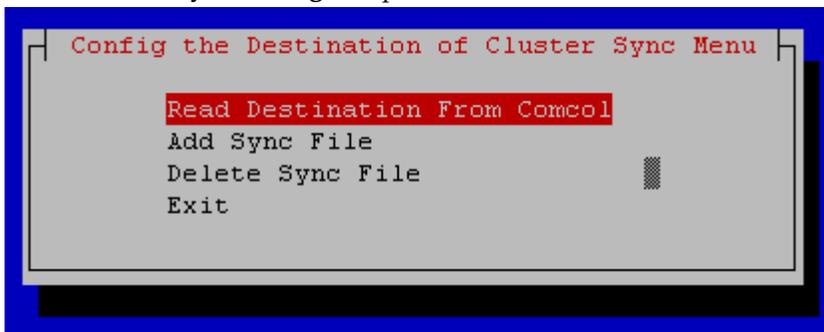

The Config Destination of Cluster Sync menu is displayed.

**6.** Select **Delete Sync File** and press **Enter**.

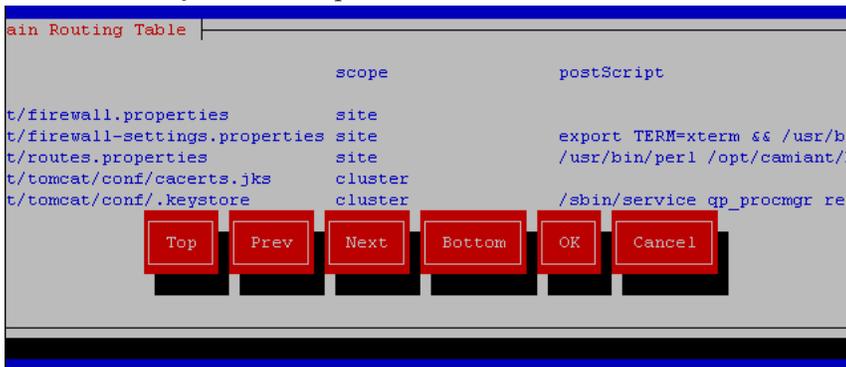

The Main Routing Table screen is displayed.

**7.** Select the cluster sync configuration file to delete from the list, select **OK**, and press **Enter**.
The selected cluster sync configuration is deleted.

# Showing Sync Configuration

Use this option to view where files are synced; this is useful when georedundancy is implemented.
The Scope column lists where each file is being synced: Site indicates just to servers at the local site,

Cluster indicates to all servers at all sites. Files that need to be in sync at all sites (like certificates) are listed as Cluster; IP-related files that may not be valid at other sites (like firewall and static routes) are listed as Site.

To display cluster sync filenames and their scope, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

```
# su - platcfg
```

3. **Select the Camiant Configuration Menu**, and press **Enter**.

4. Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.

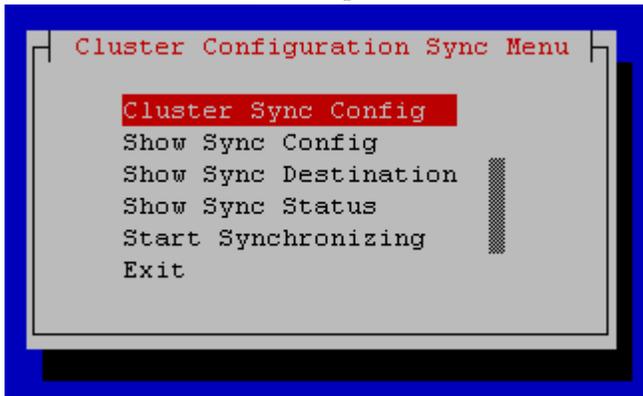

5. Select **Show Sync Config** and press **Enter**.

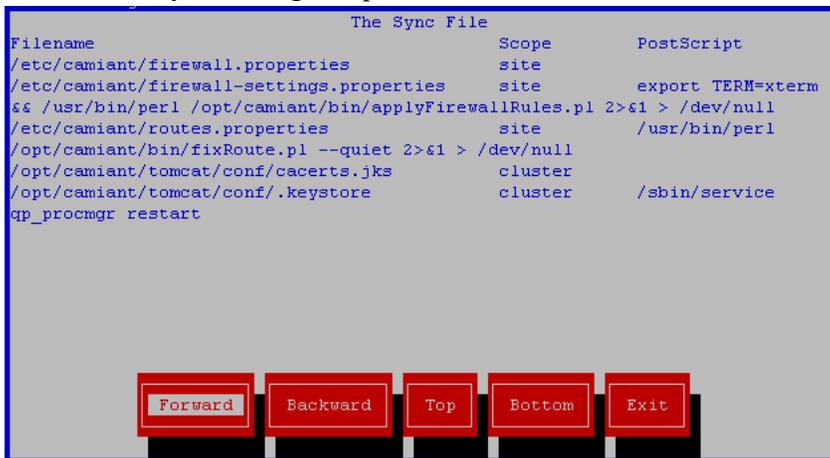

The Sync File screen is displayed.

## Showing Sync Destination

To display cluster sync destinations (hostname, IP address, and Location), complete the following:

1. Log in to your system as root.

**2.** At the root prompt, enter the following command:

```
# su - platcfg
```

**3.** **Select the Camiant Configuration Menu**, and press **Enter**.

**4.** Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.

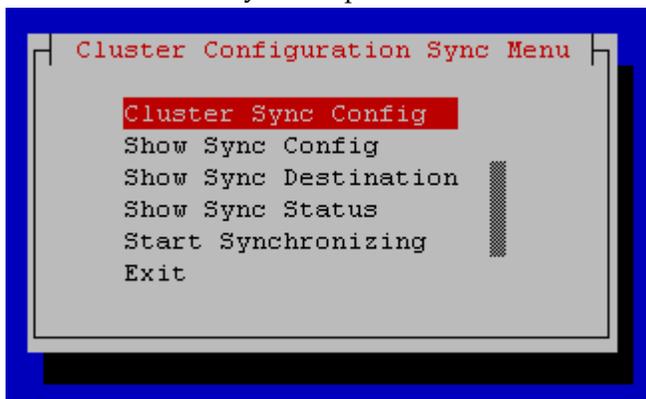

**5.** Select **Show Sync Destination** and press **Enter**.

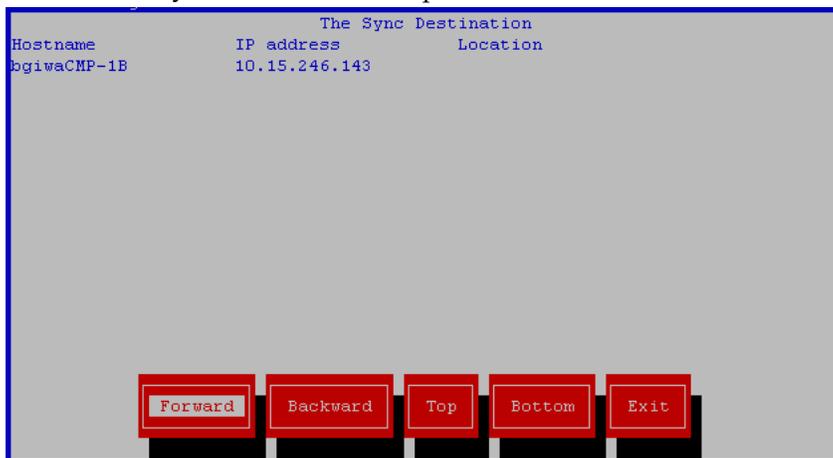

The Sync Destination screen is displayed.

## Showing Sync Status

To display cluster sync status, complete the following:

**1.** Log in to your system as root.

**2.** At the root prompt, enter the following command:

```
# su - platcfg
```

**3.** **Select the Camiant Configuration Menu**, and press **Enter**.

**4.** Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.
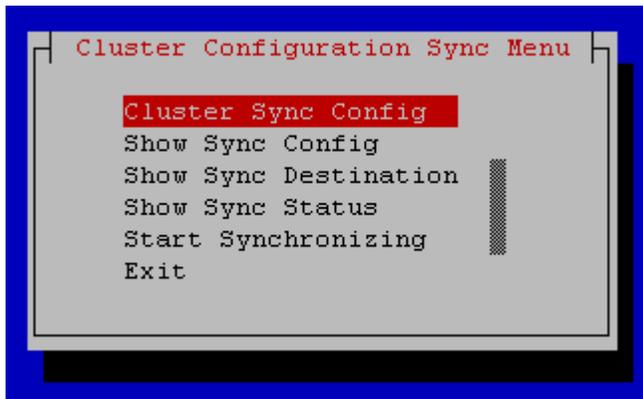

5. Select **Show Sync Status** and press **Enter**.

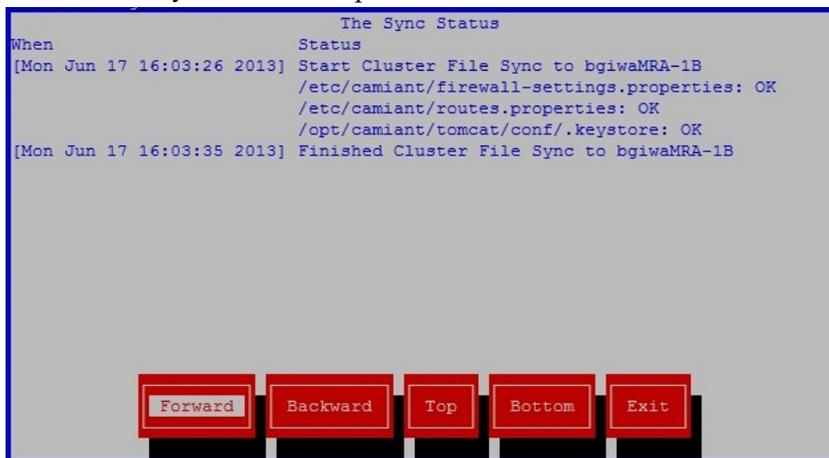

The Sync Status screen is displayed.

## Performing File Synchronization

File synchronization (or cluster sync) copies configuration files from the target server to the remaining servers in the cluster. Performing a cluster sync restarts qp_procmgr on the target blade(s), so this action should only be performed from the Active server, otherwise a failover will occur. A warning displays on the screen before continuing with the sync, to help prevent this issue from occurring. Note that the cluster file sync doesn't currently handle DSCP configurations; there is a separate DSCP-specific sync operation for this.

To perform the cluster sync, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:

```
# su - platcfg
```

3. **Select the Camiant Configuration Menu** and press **Enter**.
4. Select **Cluster File Sync** and press **Enter**. The Cluster Configuration Sync Menu is displayed.

```
┌─ Cluster Configuration Sync Menu ─┐
│                                   │
│    Cluster Sync Config            │
│    Show Sync Config               │
│    Show Sync Destination       ▓  │
│    Show Sync Status            ▓  │
│    Start Synchronizing            │
│    Exit                           │
│                                   │
└───────────────────────────────────┘
```
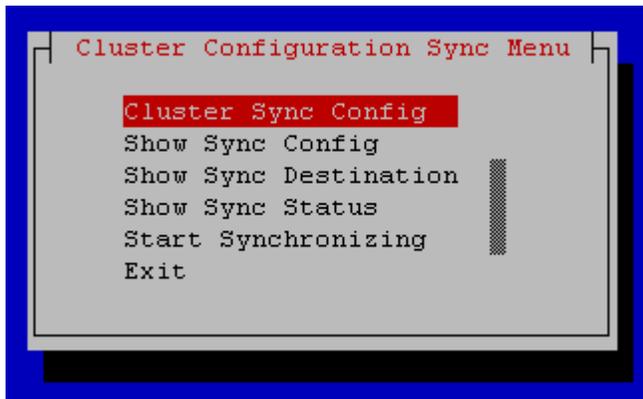

**5.** Select **Start Synchronizing** and press **Enter**.

A warning message is displayed, warning that a cluster sync restarts qp_procmgr on the target blade(s). This action should only be performed from the Active server, otherwise a failover will occur.

**6.** Select **OK** to continue.
Configuration files are synced to the other servers in the cluster, and qp_procmgr is restarted on the target blade(s).

**Chapter**

# 6

## Performing System and Server Backups and Restores

**Topics:**

This chapter describes how to perform system and server backups and restores.

# Performing a Server Backup

The server backup contains OS-level information such as IP, NTP, and DNS information, basically what gets configured in Platcfg. This type of backup is therefore unique to a server and should be created for each server within a cluster.

To back up your server settings, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su - platcfg
   ```

3. **Select the Camiant Configuration Menu** and press **Enter**.

4. Select **Backup and Restore** and press **Enter**. The Backup and Restore Menu is displayed. Note that System Backup and System Restore are only allowed on the CMP system, so these options don't appear on the menu for non-CMP blades.

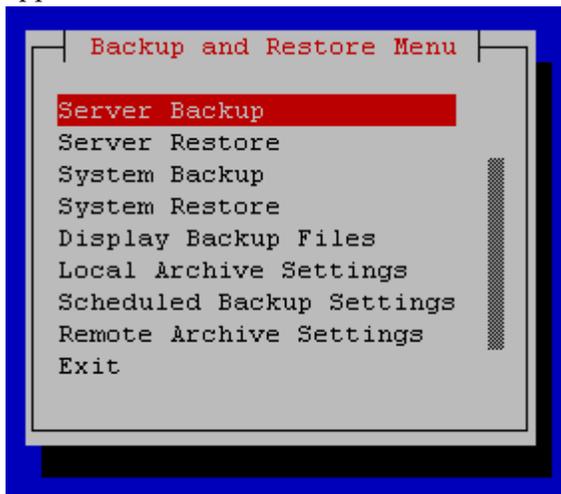

5. Select **Server Backup** and press **Enter**. You are prompted for the ISO path to save the backup file. For example:
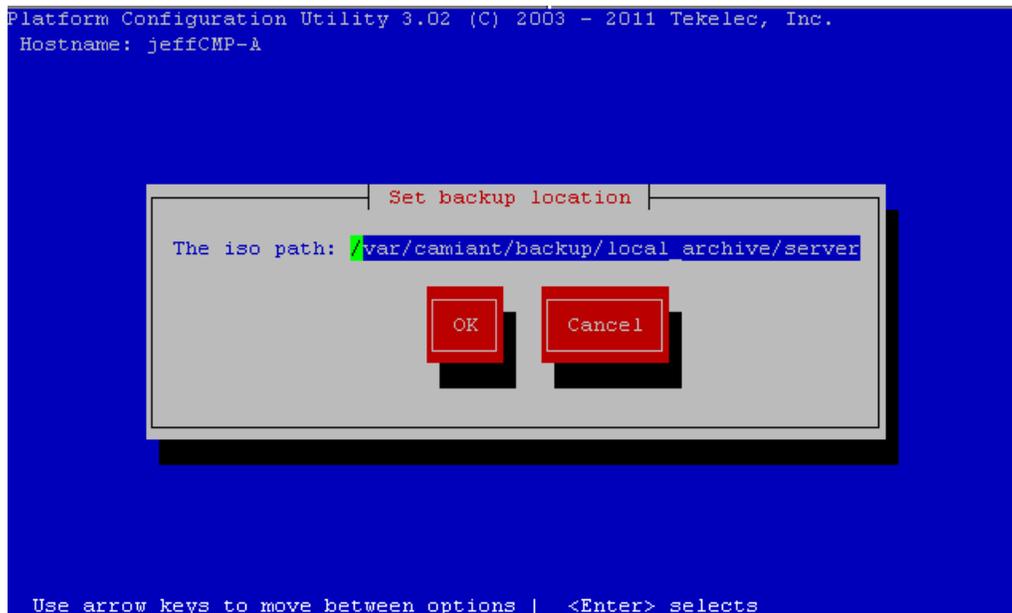

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
  Hostname: jeffCMP-A

                  ┌──────────┤ Set backup location ├──────────┐
                  │                                           │
                  │   The iso path: /var/camiant/backup/local_archive/server│
                  │                                           │
                  │              ┌──────┐    ┌────────┐        │
                  │              │  OK  │    │ Cancel │        │
                  │              └──────┘    └────────┘        │
                  │                                           │
                  └───────────────────────────────────────────┘

   Use arrow keys to move between options |   <Enter> selects
```

Accept the default backup directory or enter a desired directory. The file naming convention used for the backup file is:

`<hostname>-camiant-<release>-serverbackup-<datetime>.iso`

6. When you are done, select **OK** and press **Enter**. The backup is created.

```
Creating backup archive... OK
Removing oldest archives... OK
Rsync copying local archive to remote archive... OK

PRESS ANY KEY TO RETURN TO THE PLATCFG MENU.
```

# Performing a System Backup

The system backup contains application-level information such as Topology, Network Element, and PCRF configurations, almost anything that is configured in the CMP GUI. This type of backup will save information for an entire deployment and should be created on the active blade of the Primary CMP cluster only.

When the backup file is created it contains a specific name and is located in a specific directory. Tekelec recommends that this backup be transferred to an FTP server and/or to the PMAC server.

To back up your server settings, complete the following:

1. Log in to your server as root

2. At the root prompt, enter the following command:

   `# su - platcfg`

3. Select the **Camiant Configuration Menu** and press **Enter**.

4. Select **Backup and Restore** and press **Enter**.

5. Select **System Backup** and press **Enter**. You are prompted for the ISO path to save the backup file. For example:

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP-A

                              Set backup location

           The tarball path: /var/camiant/backup/local_archive/system

                              OK          Cancel

      Use arrow keys to move between options |   <Enter> selects
```
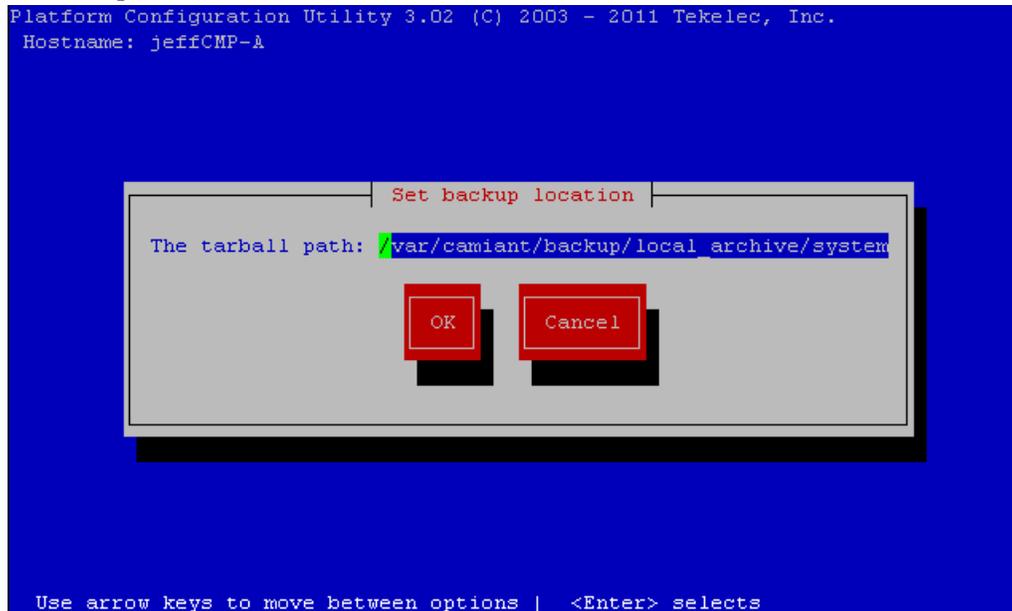

6. Accept the default backup directory or enter a desired directory. The file naming convention used for the backup file is:

   `<hostname>-camiant-<release>-systembackup-<datetime>.tar.gz`

7. When you are done, select **OK** and press **Enter**. The backup is created.

# Displaying Backup Files

To display current backup files, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   `# su - platcfg`

3. Select the **Camiant Configuration Menu** and press **Enter**.

4. Select **Display Backup Files** and press **Enter**.

5. You are prompted for Local or Remote backup archive.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP-A

                    ┌─ Display Backup Files Menu ─┐
                    │                             │
                    │  Display Local Archive      │
                    │  Display Remote Archive     │
                    │  Exit                       │
                    │                             │
                    └─────────────────────────────┘

   Use arrow keys to move between options |  <Enter> selects
```
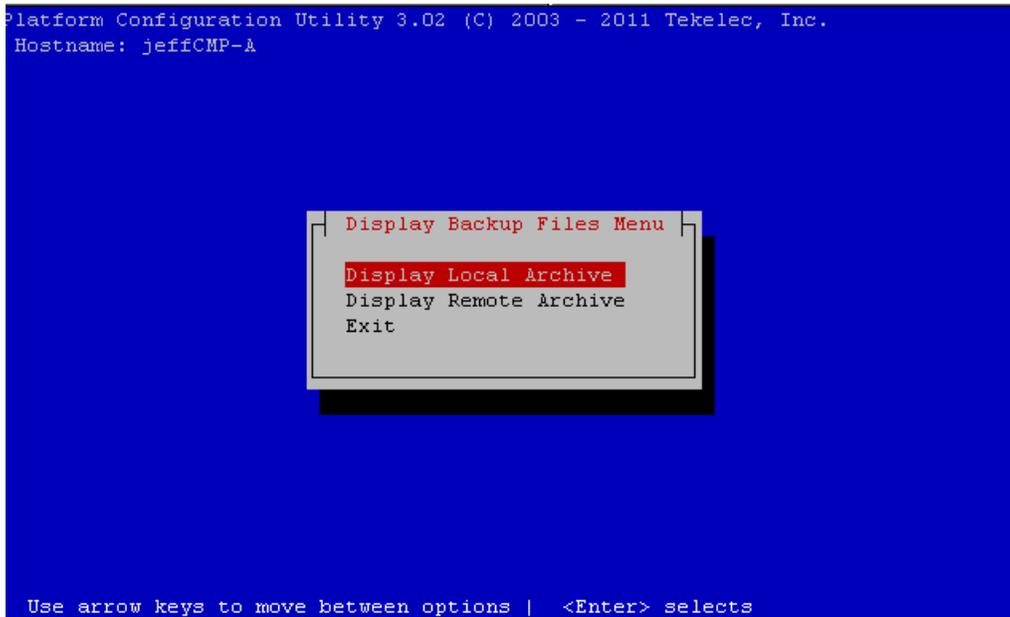

6. Select the desired archive and press **Enter**. The archive is displayed. For example:

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP-A
                      Local Archives
serverbackup/jeffCMP-A-cmp_7.5.0_5.7.0-serverbackup-201105111355.iso

       ┌─────────┐  ┌──────────┐  ┌─────┐  ┌────────┐  ┌──────┐
       │ Forward │  │ Backward │  │ Top │  │ Bottom │  │ Exit │
       └─────────┘  └──────────┘  └─────┘  └────────┘  └──────┘

   Use arrow keys to move between options |  <Enter> selects
```
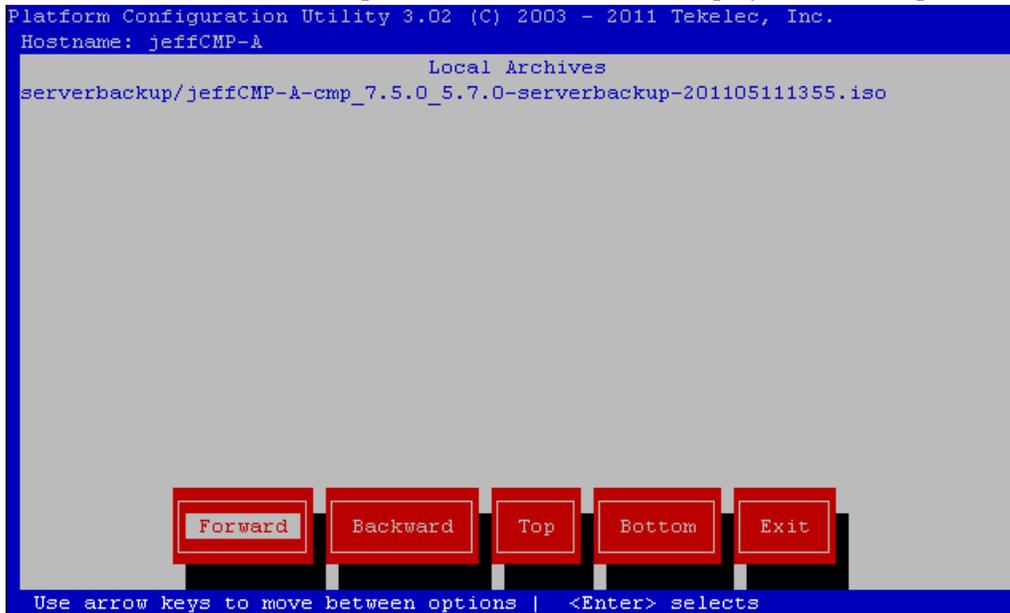

# Configuring Local Archive Settings

You can store up to three archives for both the server and system backup files. To configure this setting, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su - platcfg
   ```

3. Select the **Camiant Configuration Menu** and press **Enter**.

4. Select **Local Archive Settings** and press **Enter**.

5. You are prompted for the desired number of archives for both the server and system backups. Note that the following example shows both the number of Server Backups and System Backups to keep; the Server Backup line will only appear on a CMP system.

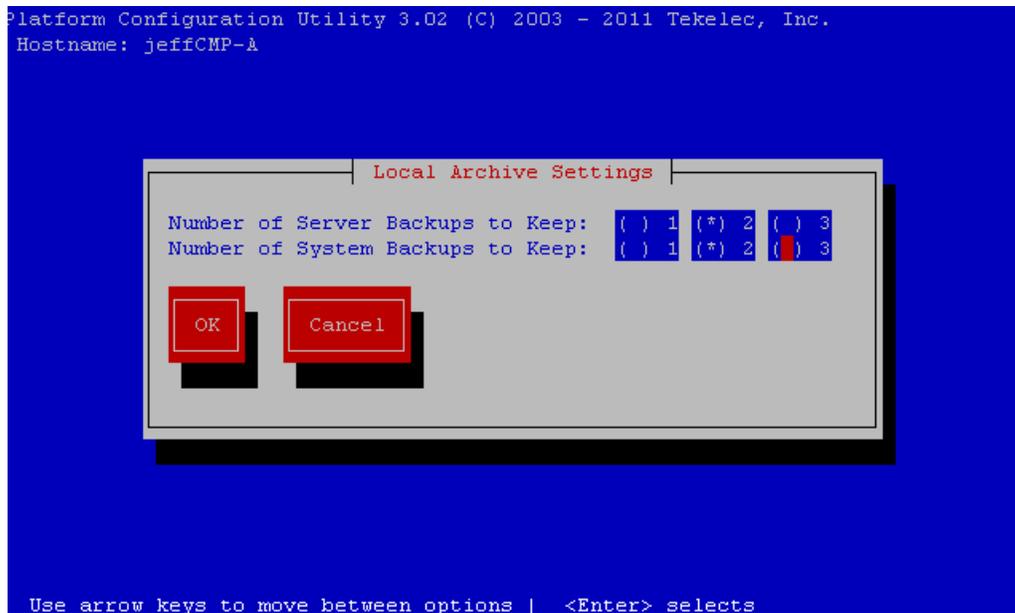

6. Select the desired number for each archive and when you are done, select **OK** and press **Enter**.

# Configuring Remote Archive Settings

You can store system and server archives remotely. These archives have separate directories for each host. This section describes how to configure, edit, and delete system or server remote archives.

## Configuring a Remote Archive

To configure this setting, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su - platcfg
   ```

3. Select the **Camiant Configuration Menu** and press **Enter**.

4. Select **Remote Archive Settings** and press **Enter**.

5. You are prompted for the desired archive type (server or system). Note that the Server Backups option only appears on a CMP system. Select the desired archive type and press **Enter**.

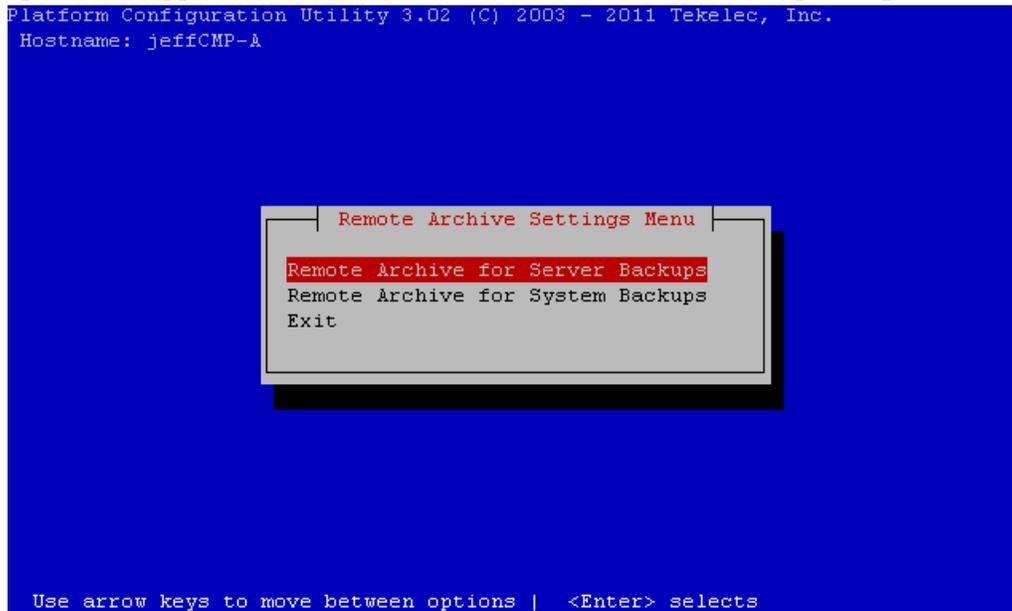

The **Add Remote Archive** screen displays.

6. Enter all remote access information:

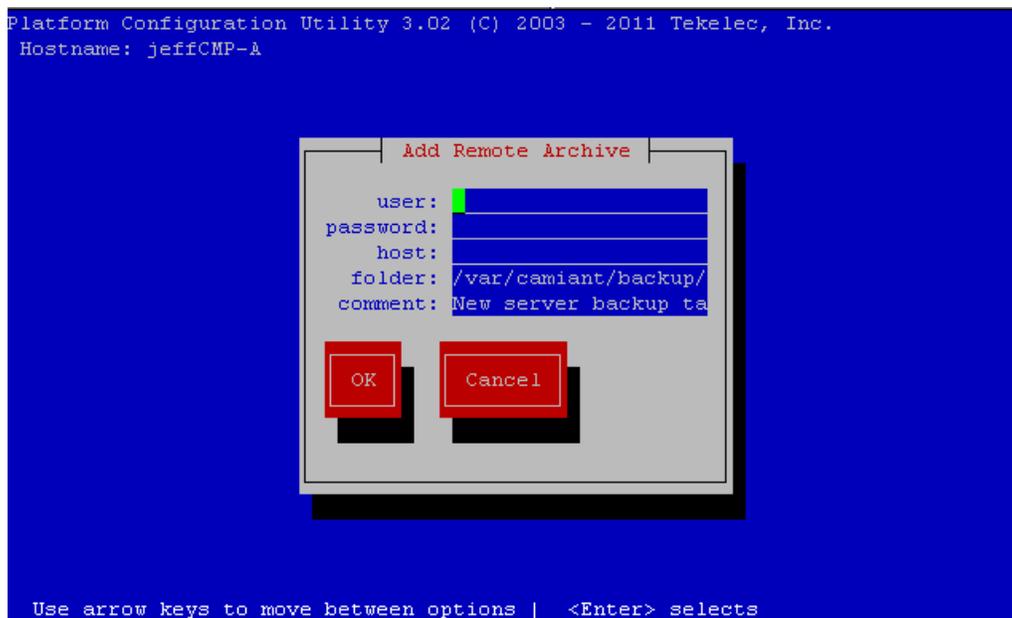

a) **user** and **password**: must be valid SSH login credentials for the target server.

b) **host**: must be either a reachable IP address or a resolvable hostname.

c) **folder**: must be a directory on the target server where the Policy Management server will attempt to copy backups to. The directory must already exist; it will not be created on demand.

d) **comment**: is just the name of the remote archive when viewed in Platcfg.

7. When you are done, select **OK** and press **Enter**.

### Editing a Remote Archive Configuration

To edit an archive configuration, complete the following:

1. From the Camiant Configuration Menu, select **Remote Archive Settings** and press **Enter**.
2. Select the desired archive type and press **Enter**.
3. Select **Edit Remote Archive** and press **Enter**.
4. Enter all remote access information and when you are done, select **OK** and press **Enter**.

### Deleting an Archive Configuration

To delete an archive configuration, complete the following:

1. From the Camiant Configuration Menu, select **Remote Archive Settings**, and press **Enter**.
2. Select the desired archive type and press **Enter**.
3. Select **Delete Remote Archive** and press **Enter**.
4. Select the desired archive to delete and press **Enter**. The archive is removed from the system.

## Scheduling Backups

You can configure your system or server to conduct backups on a scheduled basis. This section describes how to schedule, edit, delete, and view scheduled backups.

**Note:** When "Daily" is selected, the Days of the month field is ignored, and when "Monthly" is selected, the Days of the week field is ignored.

### Scheduling a Backup

To schedule a backup, complete the following:

1. Log in to your system as root.
2. At the root prompt, enter the following command:
   ```
   # su - platcfg
   ```
3. Select the **Camiant Configuration Menu**, and press **Enter**.
4. Select **Backup and Restore** and press **Enter**.
5. You are prompted for the desired backup type (server or system). Select the desired backup type and press **Enter**. For example:
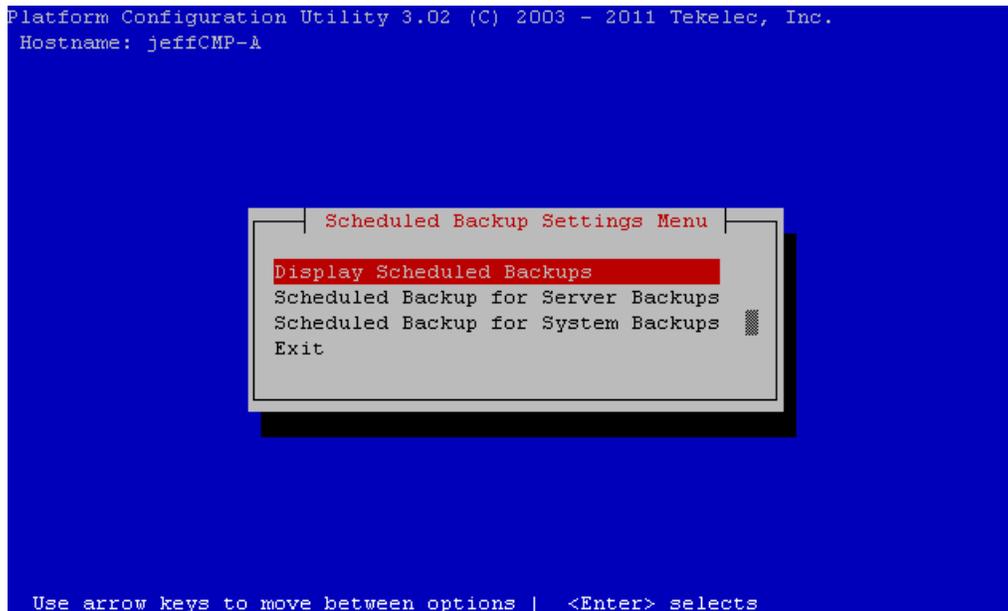

6. Select **Add Schedule** and press **Enter**.

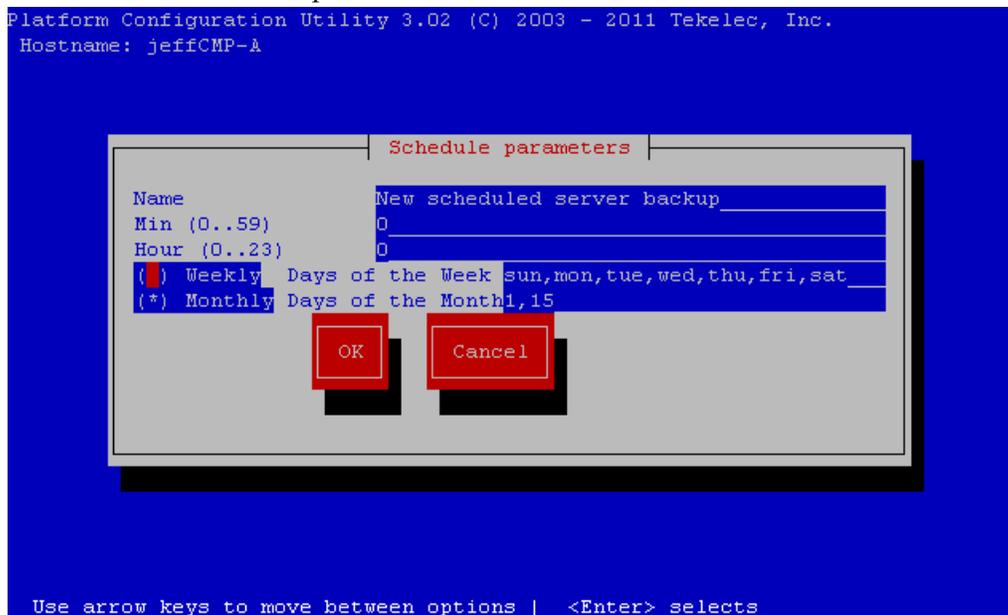

7. Enter the following information:

- Name - a unique name identifiying the scheduled backup.
- Min - minute to perform backup. Valid values are 0 to 59, with a default of 0.
- Hour - hour to perform backup. Valid values are 0 to 23, with a default of 0.
- Weekly - select to have the backup performed weekly. When Weekly is selected, the Days of the Month value is ignored. The default backup is performed weekly.
- Days of Week - day to perform backup. Valid values include the days of the week and All.
- Monthly - select to have the backup performed monthly. When Monthly is selected, the Days of the Week value is ignored.

- Days of the Month - day to perform backup. Valid values include 1 through 31.

8. When you have finished, select **OK** and press **Enter**.

## Editing a Scheduled Backup

To edit an existing scheduled backup, complete the following:

1. From the Camiant Configuration Menu, select **Backup and Restore** and press **Enter**.
2. You are prompted for the desired backup type (server or system). Select the desired backup type and press **Enter**.
3. Select **Edit Schedule** and press **Enter**.
4. Edit the following Information, as desired.

   - Name - a unique name identifiying the scheduled backup.
   - Min - minute to perform backup. Valid values are 0 to 59, with a default of 0.
   - Hour - hour to perform backup. Valid values are 0 to 23, with a default of 0.
   - Weekly - select to have the backup performed weekly. The default backup is performed weekly.
   - Days of Week - day to perform backup. Valid values include the days of the week and All.
   - Monthly - select to have the backup performed monthly.
   - Days of the Month - day to perform backup. Valid values include 1 through 31.

5. When you have finished, select **OK** and press **Enter**.

## Deleting a Scheduled Backup

To delete an existing scheduled backup, complete the following:

1. From the Camiant Configuration Menu, select **Backup and Restore** and press **Enter**.
2. You are prompted for the desired backup type (server or system). Select the desired backup type and press **Enter**.
3. Select **Delete Schedule** and press **Enter**.
4. When you have finished, select **OK** and press **Enter**.

## Displaying Scheduled Backups

To display the scheduled backups, complete the following:

1. From the Camiant Configuration Menu, select **Backup and Restore** and press **Enter**.
2. Select Display Scheduled Backups and press **Enter**. The scheduled backups are displayed.

# Performing a System Restore

The system restore restores the PCRF information that is unique to this system. Information such as: topology, policies, and feature configuration.

To perform a system restore, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su – platcfg
   ```

3. Select the **Camiant Configuration Menu** and press **Enter**.

4. Select **System Restore** and press **Enter**.

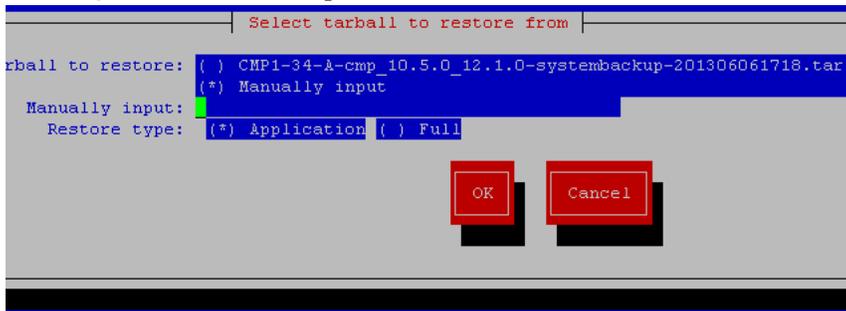

5. Enter the path of the location that contains the backup, select Application, and select whether this is a full restore. When you are finished, select **OK** and press **Enter**. The system restores to the backup version specified.

## Performing a Server Restore

The server restore restores the OS information unique to the server. This operation applies the data from a previously saved server configuration backup file.

To perform a server restore, complete the following:

1. Log in to your system as root.

2. At the root prompt, enter the following command:

   ```
   # su – platcfg
   ```

3. Select the **Camiant Configuration Menu**, press **Enter**.

4. Select **Server Restore** and press **Enter**.

```
Platform Configuration Utility 3.02 (C) 2003 - 2011 Tekelec, Inc.
 Hostname: jeffCMP1-A

                   ┤ Select iso to restore from ├

          Manually input: █

                         ┌──────┐  ┌────────┐
                         │  OK  │  │ Cancel │
                         └──────┘  └────────┘

   Use arrow keys to move between options |  <Enter> selects
```
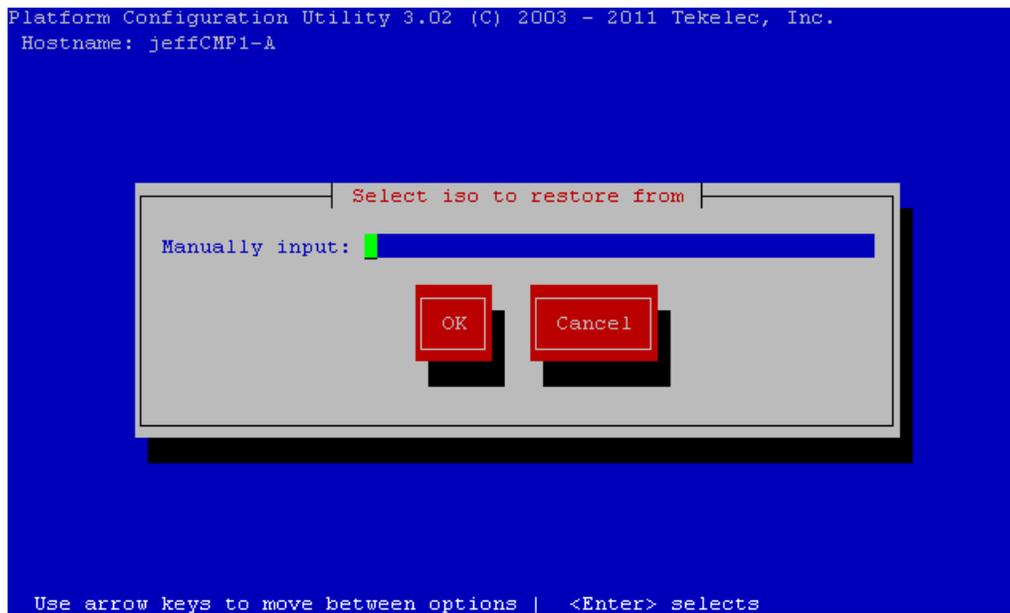

**5.** Enter the path of the location that contains the backup, select OK, and press Enter. The system restores to the backup version specified.

# Glossary

## C

CA
:   Conditioning Action

    NPP CAs indicate what digit conditioning actions to execute when processing a digit string.

CMP
:   Configuration Management Platform

    A centralized management interface to create policies, maintain policy libraries, configure, provision, and manage multiple distributed MPE policy server devices, and deploy policy rules to MPE devices. The CMP has a web-based interface.

## D

DNS
:   Domain Name System

    A system for converting Internet host and domain names into IP addresses.

DSCP
:   Differentiated Service Code Point

    Differentiated Services Code Point: Provides a framework and building blocks to enable deployment of scalable service discrimination in the internet. The differentiated services are realized by mapping the code point contained in a field in the IP packet header to a particular forwarding treatment or per-hop behavior (PHB). Differentiated services or DiffServ is a computer networking architecture that specifies a simple, scalable and coarse-grained mechanism for classifying and managing network traffic and providing quality of service (QoS) on modern IP networks.

**G**

GUI

Graphical User Interface

The term given to that set of items and facilities which provide the user with a graphic means for manipulating screen data rather than being limited to character based commands.

**I**

IP

Internet Protocol

IP specifies the format of packets, also called datagrams, and the addressing scheme. The network layer for the TCP/IP protocol suite widely used on Ethernet networks, defined in STD 5, RFC 791. IP is a connectionless, best-effort packet switching protocol. It provides packet routing, fragmentation and re-assembly through the data link layer.

ISO

International Standards Organization

**M**

MPE

Multimedia Policy Engine

A high-performance, high-availability platform for operators to deliver and manage differentiated services over high-speed data networks. The MPE includes a protocol-independent policy rules engine that provides authorization for services based on policy conditions such as subscriber information, application information, time of day, and edge resource utilization.

MRA

Multi-Protocol Routing Agent

Scales the Policy Management infrastructure by distributing the

**M**

PCRF load across multiple Policy
Server devices.

**N**

NTP                 Network Time Protocol

**P**

PCRF                Policy and Charging Rules Function

The ability to dynamically control
access, services, network capacity,
and charges in a network.

PMAC                Platform Management &
Configuration (also referred to as
PM&C)

Provides hardware and platform
management capabilities at the site
level for Tekelec platforms. The
PMAC application manages and
monitors the platform and installs
the TPD operating system from a
single interface.

**V**

VLAN                Virtual Local Area Network

A logically independent network. A
VLAN consists of a network of
computers that function as though
they were connected to the same
wire when in fact they may be
physically connected to different
segments of a LAN. VLANs are
configured through software rather
than hardware. Several VLANs can
co-exist on a single physical switch.
