Notice

Information in this documentation is subject to change without notice. Unauthorized use or copying of this documentation can result in civil or criminal penalties.

Any export of Tekelec products is subject to the export controls of the United States and the other countries where Tekelec has operations.

No part of this documentation may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying or recording, for any purpose without the express written permission of an authorized representative of Tekelec.

Other product names used herein are for identification purposes only, and may be trademarks of their respective companies.

RoHS 5/6 - As of July 1, 2006, all products that comprise new installations shipped to European Union member countries will comply with the EU Directive 2002/95/EC "RoHS" (Restriction of Hazardous Substances). The exemption for lead-based solder described in the Annex will be exercised. RoHS 5/6 compliant components will have unique part numbers as reflected in the associated hardware and installation manuals.

WEEE - All products shipped to European Union member countries comply with the EU Directive 2002/96/EC, Waste Electronic and Electrical Equipment. All components that are WEEE compliant will be appropriately marked. For more information regarding Tekelec's WEEE program, contact your sales representative.

Trademarks

The Tekelec logo, EAGLE, G-Flex, G-Port, IP⁷, IP⁷ Edge, IP⁷ Secure Gateway, and TALI are registered trademarks of Tekelec. TekServer and A-Port are trademarks of Tekelec. All other trademarks are the property of their respective owners.

Patents

This product is covered by one or more of the following U.S. and foreign patents:

U.S. Patent Numbers:

5,008,929; 5,953,404; 6,167,129; 6,324,183; 6,327,350; 6,456,845; 6,606,379; 6,639,981; 6,647,113; 6,662,017; 6,735,441; 6,745,041; 6,765,990; 6,795,546; 6,819,932; 6,836,477; 6,839,423; 6,885,872; 6,901,262; 6,914,973; 6,940,866; 6,944,184; 6,954,526; 6,954,794; 6,959,076; 6,965,592; 6,967,956; 6,968,048; 6,970,542

Overview

The *Commands Manual* provides a description of all commands used in the EAGLE 5 Integrated Signaling System (ISS) and LNP. The EAGLE 5 ISS includes the IP7 Secure Gateway and the IP7 Front End. The use of the term “the system” indicates that the information is common to all of the functions of the EAGLE 5 ISS. Differences are indicated for the specific product, as appropriate.

NOTE: The IP7 Front End configuration is a stand-alone single-shelf IP7 Secure Gateway. When using this manual, consider IP7 Front End and IP7 Secure Gateway as functional equivalents with the IP7 Front End limited to a single shelf configuration.

Commands are entered at a terminal to perform system operations such as displaying the system status, administering system security, and maintaining the database. Error messages are displayed to provide information about problems encountered when a command is entered.

Where to Find Information in This Manual

Table 1-1 shows how this manual is organized.

NOTE: Throughout this manual, reference to the OAP (Operation System Support Application Processor) applies also to the EOAP (Enhanced Operation System Support Application Process).

Table 1-1. Manual Organization

Chapter Number and Title	Description
Chapter 1, "Introduction"	The organization of this manual The audience References to other Tekelec documentation Customer assistance Documentation packaging, delivery, and updates Safety admonishments
Chapter 2, "Alphabetical List of Commands"	An alphabetical list of the system commands and the corresponding page number for each command description in this manual
Chapter 3, "Commands Listed by Class"	List of the system commands arranged by command class
Chapter 4, "Using Commands"	Descriptions of system terminals, printers, MASP cards, and MDAL cards Keyboard functions Command class administration Definitions of types of command output and messages Procedures for logging into and logging out of the system
Chapter 5, "Commands"	Descriptions of the commands used in the system
Chapter 6, "Debug Commands"	Descriptions of debug commands used in troubleshooting and debugging the system
Chapter 7, "Pass-Through Commands"	Descriptions of the command strings used within the pass command to gather card- and application-specific information
Appendix A, "Reference Information"	Information that is referred to in more than one command description (including signaling link ports, point code formats and

Table 1-1. Manual Organization

Chapter Number and Title	Description
	usage rules, device status, loopback testing, and ISUP Normalization Variants) How to convert an ITU national point code from the format specified by the chg-stpopts:npcfmti parameter into a single number so that it can be used by gateway screening. Summary of loopback testing functions
Appendix B, "Acronyms and Abbreviations"	List of acronyms and abbreviations used in the document
Index	Alphabetic listing of commands and other information, with page references.

Scope and Audience

This manual is intended for those who maintain and do database administration on the Tekelec Signaling Products and LNP. It is assumed that the user is familiar with the SS7 network and its associated protocols. The manual describes commands used in the system, and it contains a special section on debug commands and their descriptions.

Debug commands are a special group of commands used in troubleshooting and debugging the system. These commands are intended for Tekelec Technical Services personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to those personnel who have access to the “Debug” command class.

Related Publications

The *Commands Manual* is part of the EAGLE 5 ISS documentation set and may refer to one or more of the following manuals:

- The *Commands Error Recovery Manual* contains the procedures to resolve error message conditions generated by the commands in the Commands Manual. These error messages are presented in numerical order.
- The *Commands Pocket Guide* is an abridged version of the Commands Manual. It contains all commands and parameters, and it shows the command-parameter syntax.
- The *Commands Quick Reference Guide* contains an alphabetical listing of the commands and parameters. The guide is sized to fit a shirt-pocket.
- The *Database Administration Manual – Features* contains procedural information required to configure the EAGLE 5 ISS to implement these features: X.25 Gateway, STP LAN, Database Transport Access, GSM MAP Screening, and EAGLE 5 Integrated Monitoring Support.
- The *Database Administration Manual - Gateway Screening* contains a description of the Gateway Screening (GWS) feature and the procedures necessary to configure the EAGLE 5 ISS to implement this feature.

- The *Database Administration Manual – Global Title Translation* contains procedural information required to configure an EAGLE 5 ISS to implement these features: Global Title Translation, Enhanced Global Title Translation, Variable Length Global Title Translation, Interim Global Title Modification, Intermediate GTT Load Sharing, ANSI-ITU-China SCCP Conversion, Flexible GTT Load Sharing, Origin-Based SCCP Routing, Hex Digit Support for GTT, Weighted GTT Load Sharing, and Transaction-Based GTT Load Ssharing.
- The *Database Administration Manual - IP7 Secure Gateway* contains procedural information required to configure the EAGLE 5 ISS to implement the SS7-IP Gateway.
- The *Database Administration Manual – SEAS* contains the EAGLE 5 ISS configuration procedures that can be performed from the Signaling Engineering and Administration Center (SEAC) or a Signaling Network Control Center (SNCC). Each procedure includes a brief description of the procedure, a flowchart showing the steps required, a list of any EAGLE 5 ISS commands that may be required for the procedure but that are not supported by SEAS, and a reference to optional procedure-related information, which can be found in one of these manuals:
 - *Database Administration Manual – Gateway Screening*
 - *Database Administration Manual – Global Title Translation*
 - *Database Administration Manual – SS7*.
- The *Database Administration Manual – SS7* contains procedural information required to configure an EAGLE 5 ISS to implement the SS7 protocol.
- The *Database Administration Manual – System Management* contains procedural information required to manage the EAGLE 5 ISS database and GPLs, and to configure basic system requirements such as user names and passwords, system-wide security requirements, and terminal configurations.
- The *Dimensioning Guide for EPAP Advanced DB Features* is used to provide EPAP planning and dimensioning information. This manual is used by Tekelec personnel and EAGLE 5 ISS customers to aid in the sale, planning, implementation, deployment, and upgrade of EAGLE 5 ISS systems equipped with one of the EAGLE 5 ISS EPAP Advanced Database (EADB) Features.
- The *ELAP Administration Manual* defines the user interface to the EAGLE 5 ISS LNP Application Processor on the MPS/ELAP platform. The manual defines the methods for accessing the user interface, menus, screens available to the user and describes their impact. It provides the syntax and semantics of user input and defines the output the user receives, including information and error messages, alarms, and status.
- The *EPAP Administration Manual* describes how to administer the EAGLE 5 ISS Provisioning Application Processor on the MPS/EPAP platform. The manual defines the methods for accessing the user interface, menus, and screens available to the user and describes their impact. It provides the syntax and semantics of user input and defines the output the user receives, including messages, alarms, and status.
- The *Feature Manual - A-Port* provides an overview of a feature providing the capability for IS41 mobile subscribers to change service provider while retaining their original Mobile Directory Number (MDN). This manual gives the instructions and information on how to install, use, and maintain the A-Port feature on the Multi-Purpose Server (MPS) platform of the EAGLE 5 ISS.
- The *Feature Manual - ECAP* provides instructions and information on how to install, use, and maintain the Integrated Accounting Feature Application feature on the Eagle Collector Application Processor (ECAP). This feature collects raw MSU data from the EAGLE 5 ISS,

categorizes the data into groups, and feeds those groups to another system for accounting activities. Additional features will be added to this manual at a later date.

- The *Feature Manual - EIR* provides instructions and information on how to install, use, and maintain the EIR feature on the Multi-Purpose Server (MPS) platform of the EAGLE 5 ISS. The feature provides network operators with the capability to prevent stolen or disallowed GSM mobile handsets from accessing the network.
- The *Feature Manual - G-Flex C7 Relay* provides an overview of a feature supporting the efficient management of Home Location Registers in various networks. This manual gives the instructions and information on how to install, use, and maintain the G-Flex feature on the MPS/EPAP platform of the EAGLE 5 ISS.
- The *Feature Manual - G-Port* provides an overview of a feature providing the capability for mobile subscribers to change the GSM subscription network within a portability cluster while retaining their original MSISDNs. This manual gives the instructions and information on how to install, use, and maintain the G-Port feature on the Multi-Purpose Server (MPS) platform of the EAGLE 5 ISS.
- The *Feature Manual - INP/AINPQ* provides the user with information and instructions on how to implement, utilize, and maintain either the INAP-based Number Portability (INP) feature or the ANSI-41 INP Query (AINPQ) feature or both features on the Multi-Purpose Server (MPS) platform of the EAGLE 5 ISS.
- The *Feature Manual - Migration* provides an overview of a feature providing the capability for IS41 subscribers to migrate to a GSM network and GSM mobile subscribers to migrate to an IS41 network. This manual gives the instructions and information on how to install, use, and maintain the IS41 GSM Migration feature on the Multi-Purpose Server (MPS) platform of the EAGLE 5 ISS.
- The *FTP-Based Table Retrieve Application (FTRA) User Guide* describes how to set up and use a PC to serve as the offline application for the EAGLE 5 ISS FTP Retrieve and Replace feature.
- The *Hardware Manual - EAGLE 5 ISS* provides an overview of each system and its subsystems, details of standard and optional hardware components in each system, and basic site engineering. These include the EAGLE 5 ISS, OEM-based products such as the ASi 4000 Service Control Point (SCP), and the Netra-based Multi-Purpose Server (MPS).
- The *Hardware Manual - Tekelec 1000 Application Server* provides general specifications and a description of the Tekelec 1000 Applications Server (T1000 AS). This manual also includes site preparation, environmental and other requirements, procedures to physically install the T1000 AS, and troubleshooting and repair of Field Replaceable Units (FRUs).
- The *Hardware Manual - Tekelec 1100 Application Server* provides general specifications and a description of the Tekelec 1100 Applications Server (T1100 AS). This manual also includes site preparation, environmental and other requirements, procedures to physically install the T1100 AS, and troubleshooting and repair of Field Replaceable Units (FRUs).
- The *Installation Manual - EAGLE 5 ISS* contains cabling requirements, schematics, and procedures for installing the EAGLE 5 ISS along with LEDs, connectors, cables, and power cords to peripherals. Refer to this manual to install components or the complete systems.
- The *LNP Database Synchronization Manual - LSMS/EAGLE 5 ISS* describes how to keep the LNP databases at the LSMS and at the network element (the EAGLE 5 ISS is a network element) synchronized through the use of resynchronization, audits and reconciles, and bulk loads. This manual is contained in both the LSMS documentation set and in the EAGLE 5 ISS documentation set.

- The *LNP Feature Activation Guide* contains procedural information required to configure the EAGLE 5 ISS for the LNP feature and to implement these parts of the LNP feature on the EAGLE 5 ISS:
 - LNP services
 - LNP options
 - LNP subsystem application
 - Automatic call gapping
 - Triggerless LNP feature
 - Increasing the LRN and NPANXX Quantities on the EAGLE 5 ISS
 - Activating and Deactivating the LNP Short Message Service (SMS) feature
- The *Maintenance Manual* contains procedural information required for maintaining the EAGLE 5 ISS system. The *Maintenance Manual* provides preventive and corrective maintenance procedures used in maintaining the different systems.
- The *Maintenance Pocket Guide* is an abridged version of the *Maintenance Manual* and contains all the corrective maintenance procedures used in maintaining the EAGLE 5 ISS.
- The *Maintenance Emergency Recovery Pocket Guide* is an abridged version of the *Maintenance Manual* and contains the corrective maintenance procedures for critical and major alarms generated on the EAGLE 5 ISS.
- The *MPS Platform Software and Maintenance Manual - EAGLE 5 ISS with Tekelec 1000 Application Server* describes the platform software for the Multi-Purpose Server (MPS) based on the Tekelec 1000 Application Server (T1000 AS) and describes how to perform preventive and corrective maintenance for the T1000 AS-based MPS. This manual should be used with the EPAP-based applications (EIR, G-Port, G-Flex, A-Port, IS41 GSM Migration, AINPQ, and INP).
- The *MPS Platform Software and Maintenance Manual - EAGLE 5 ISS with Tekelec 1100 Application Server* describes the platform software for the Multi-Purpose Server (MPS) based on the Tekelec 1100 Application Server (T1100 AS) and describes how to perform preventive and corrective maintenance for the T1100 AS-based MPS. This manual should be used with the ELAP-based application (LNP).
- The *Previously Released Features Manual* summarizes the features of previous EAGLE, EAGLE 5 ISS, and IP7 Secure Gateway releases, and it identifies the release number of their introduction.
- The *Provisioning Database Interface Manual* defines the programming interface that populates the Provisioning Database (PDB) for the EAGLE 5 ISS features supported on the MPS/EPAP platform. The manual defines the provisioning messages, usage rules, and informational and error messages of the interface. The customer uses the PDBI interface information to write his own client application to communicate with the MPS/EPAP platform.
- The *Release Documentation* contains the following documents for a specific release of the system:
 - *Feature Notice* - Describes the features contained in the specified release; also provides the hardware baseline, describes the customer documentation set, provides information about customer training, and explains how to access the Customer Support website.

- *Master Glossary*- Contains an alphabetical listing of terms, acronyms, and abbreviations relevant to the system.
 - *Master Index* - Lists all index entries used throughout the documentation set.
 - *Release Notice* - Describes the changes made to the system during the lifecycle of a release. The Release Notice includes Generic Program Loads (GPLs), a list of PRs resolved in a build, and all known PRs.
 - The *Release Notice* is maintained solely on Tekelec's Customer Support site to provide you with instant access to the most up-to-date release information.
 - *System Overview* - Provides high-level information on SS7, EAGLE 5 ISS system architecture, LNP, and EOAP.
- The *SEAS Commands Error Messages Manual* lists the error messages generated by the EAGLE 5 ISS that are specific to the Signaling Engineering and Administration System (SEAS). It includes the SEAS commands that trigger the error messages, the equivalent system error messages and commands, and the explanatory text.
 - The *SS7-over-IP Networks Using SIGTRAN* manual examines the reasons for transitioning to an SS7-over-IP network, the considerations that go into planning and dimensioning, and helpful information for implementing the network using EAGLE 5 ISS.
 - The *System Manual – EOAP* describes the Embedded Operations Support System Application Processor (EOAP) and provides the user with procedures on how to implement the EOAP, replace EOAP-related hardware, device testing, and basic troubleshooting information.

Customer Assistance

The Customer Care Center offers a point of contact through which customers can receive support for problems that may be encountered during the use of Tekelec's products. The Customer Care Center is staffed with highly trained engineers to provide solutions to your technical questions and issues seven days a week, twenty-four hours a day. A variety of service programs are available through the Customer Care Center to maximize the performance of Tekelec products that meet and exceed customer's needs.

To receive technical assistance, call the Customer Care Center at one of the following locations:

- Tekelec, USA
 - Phone (US and Canada) +1 888-FOR-TKLC
 - Phone (international) +1 919-460-2150
 - Fax +1-919-460-0877
 - Email: support@tekelec.com
- Tekelec, Europe and UK
 - Phone +44 1784 467 804
 - Fax +44 1784 477 120
 - Email: ecsc@tekelec.com

Documentation Packaging, Delivery, and Updates

Customer documentation is provided with each system in accordance with the contract agreements. It is updated whenever significant changes that affect system operation or configuration are made. Updates may be issued as an addendum, or a reissue of the affected documentation.

The document part number appears on the title page along with the current revision of the document and the date of publication. The bottom of each page contains the document part number and date of publication.

Two types of releases are major software releases and maintenance releases. Maintenance releases are issued as addenda with a title page and change bars. On the changed pages, the date and document part number are changed. On any unchanged pages that accompany the changed pages, the date and document part number is unchanged.

When the software release has a minimum effect on documentation, we provide an addendum. The addendum provides an instruction page, a new title page, a change history page, and replacement chapters with the date of publication, the document part number, and change bars.

If a new release has a major impact on documentation, such as a new feature, the entire documentation set is reissued with a new part number and a new release number.

Documentation Admonishments

Admonishments are icons and text that may appear in this and other Tekelec manuals. Admonishments alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

The following admonishments, listed in descending order of priority, are used in Tekelec manuals.

TOPPLE

TOPPLE: This icon and text indicate the possibility of equipment damage and personal injury from toppling.

DANGER

DANGER: This icon and text indicate the possibility of *personal injury*.

WARNING

WARNING: This icon and text indicate the possibility of *equipment damage*.

CAUTION

CAUTION: This icon and text indicate the possibility of *service interruption*.

Alphabetical List of Commands

Introduction

This chapter contains an alphabetical list of the Tekelec Signaling Products (Eagle STP, IP⁷ Secure Gateway, and IP⁷ Front End) commands and the page number where each command is described in this manual.

Commands

act-alm-trns.....	5-1	canc-slk.....	5-51
act-cdl.....	5-2	canc-user.....	5-52

Commands Listed by Class

Introduction

This chapter provides lists of the available non-configurable command classes and an alphabetical list of the commands allowed in each class. The command class Basic is automatically given to all users and terminals as a default.

Basic

act-echo.....	5-4
act-user.....	5-28
canc-echo.....	5-47
canc-user.....	5-52
chg-pid.....	5-274
dact-cmd.....	5-442
dact-echo.....	5-444
dact-user.....	5-448
dlt-sccp-serv.....	5-527
lock.....	5-865
login.....	5-865
logout.....	5-866
rept-stat-user.....	5-1115
rtrv-cmd.....	5-1169
rtrv-cmdclass.....	5-1172
rtrv-is41opts.....	5-1306
rtrv-sccp-serv.....	5-1438
rtrv-user.....	5-1604
unlock.....	5-1645

Database Administration

act-ftp-trns.....	5-10

Using Commands

Introduction

This chapter provides the following information:

- A description of the system's Maintenance and Administration Subsystem Processors
- A description of the system's input and output devices
- A description of how to enter commands
- The procedures for logging into and out of the system

This chapter is intended to assist personnel responsible for the system.

Maintenance and Administration Subsystem Processors

The maintenance and administration subsystem contains two Maintenance and administration Subsystem Processors (MASP). The MASP is made up of two cards:

1. A GPSM-II card
2. A Terminal Disk Module (TDM).

The GPSM-II card contains the communications processor and applications processor and provides connections to the IMT bus. This processor controls the maintenance and database administration activity.

Each TDM is equipped with a fixed disk drive, the terminal processor for the 16 I/O ports, and interfaces to the Maintenance Disk and Alarm (MDAL) card. The fixed disk drive is used as either a permanent, temporary, or transient medium for data storage. The data stored on the disk can be used immediately or backed up and stored as permanent archives files.

See the *Installation Manual - EAGLE 5 ISS* for more information.

Removable Cartridge Disk Drives

The system is equipped with a removable cartridge drive located on the Maintenance Disk and Alarm (MDAL) card, located in the control shelf. Refer to the *Installation Manual - EAGLE 5 ISS* for more detailed information about the MDAL card.

The removable cartridge is used for installing new software; backing up the system software, application software, and the database; and downloading data for off-line processing.

Input/Output Devices

There are two types of Input/Output (I/O) devices: terminals and printers. All I/O devices are connected to the system through the control shelf backplane. Each I/O device is described in terms of its function and its connection to the system. Refer to the *Installation Manual - EAGLE 5 ISS* for backplane connection information.

Terminals and Printers

The EAGLE 5 ISS uses VT320 terminals for maintenance and database administration. The EAGLE 5 ISS also can be configured to communicate with the SEAS interface (OAP). The terminals enable you to enter information into or receive information from the system. The system is capable of communicating with terminals at data rates from 2400 to 19,200 baud, using the ASCII character set.

You must configure terminals to operate with the system. You also must set printers (and modems) for hardware flow control. To do this, enable Data Terminal Ready (DTR) through your terminal's configuration menu. A modem also must have DCD set on "high." If your terminal has the auto-wrap feature, ensure that it is disabled before using your terminal on the system.

For information on the setup values for printers and terminals on the system, see the **chg-trm** command.

Terminals provide the following capabilities:

- Command input and output
- Continuous alarm states
- Event/Error messages

You enter commands at the terminal to perform system operations such as displaying the system status, administering system security, and maintaining the database.

An example of a terminal screen is shown in Figure 4-1. Note that the alarm status area is labeled either Total Alarm Status or Active Alarm Status depending on how the VT320 terminal is configured. See the **chg-stpopts** command description for configuration information.

Alarms are displayed in the alarm status area of the terminal screen. The alarm levels are as follows:

- Critical – Indicates a severe, service-affecting condition has occurred and that immediate corrective action is needed, regardless of the time of day or the day of the week.
- Major – Indicates a serious disruption of service or the failure of important circuits is taking place. These troubles require attention and response to restore or maintain system capability.
- Minor – Indicates a trouble, but one that does not have a serious affect on service.

- Inhibited – Indicates a device in the system with an inhibited alarm. A temporarily or permanently inhibited alarm does not generate unsolicited output or cause alarm indicators to be turned on. See the **inh-alm** command description for information on inhibited alarms.

Figure 4-1. System Terminal User Display

Event/Error messages also are issued to terminals to report system conditions or events. If the condition or event affects service, an alarm is issued along with an Event/Error message. Event/Error messages are displayed in the scroll area of the terminal screen.

Use the command line region of the terminal display (Figure 4-1) to enter commands. The command line region consists of two lines. Each of these lines can hold up to 80 characters. If you enter a command of more than 80 characters in length, the command appears on both lines. When you press the Enter key, only the first 80 characters are displayed in the previous command line, followed by a message on the command response line showing the status of the command. The remaining characters have not been rejected; they are not displayed due to line length limitations. If you recall the command by pressing the Up arrow key or Down arrow key, all the characters in the command are displayed. For a description of the arrow key functions, see Table 4-2.

Terminal and Printer Connections

Terminals and printers are connected to the Terminal Disk Module (TDM), using the control shelf backplane. The TDM also provides Keyboard Send and Receive (KSR) function. See "KSR Function

on VT320 Terminal Devices" on page 4-5 for more information on the KSR function. A description of the TDM can be found in the *Installation Manual - EAGLE 5 ISS*.

KSR Function on VT320 Terminal Devices

The terminals can use the keyboard send and receive (KSR) mode of operation. KSR refers to a device or mode of operation that prints or displays all received data. The KSR mode of operation typically supports a teletype printer, but in the system, it also supports a video display unit and keyboard.

The KSR feature enables you to attach a dumb terminal device or teletype printer to the system's I/O ports or emulate KSR mode of operation on a VT320. KSR enhances the system's dial-up administration functions by allowing faster throughput, because the screen formatting characters associated with the VT320 mode of operation need not be transmitted.

KSR Configuration

This feature allows you to configure the operational characteristics of system's I/O serial ports to support KSR terminal devices. See Table 4-2 for a list of the keyboard functions used by the KSR feature. For information on configuring a serial I/O port for KSR operation, see the *Database Administration Manual - SS7*.

Changing the Mode Of Operation

Before you attempt to change the mode of operation of the terminal, you *must* follow the "Changing the Terminal Characteristics" procedure found in the *Database Administration Manual - SS7*. You must perform this procedure from another terminal.

You can change the mode of operation of the terminal by pressing the **F11** key. The **F11** key instructs the system to mimic a KSR. Command line editing operates exactly like the VT320.

The KSR emulation resembles a printer when in operation. The entire screen is used for output. Before you enter a command, press <Ctrl-A>. The command prompt (>) is displayed. Enter a carriage return to signify the end of command entry.

While in the KSR mode, all output to the video display unit is buffered. When any character is entered from the terminal, a one-minute timer is started and data reception from the system is stopped. The system responds to the command with the appropriate response, then resumes sending data where it left off.

If a carriage return is not received during command entry, a time-out occurs and the system resumes sending data to the terminal.

Requirements

The KSR function operates on any combination of terminal type assignments for the 16 available terminal ports.

Telnet Terminals

Telnet is a user command using the underlying TCP/IP protocol for accessing remote computers. Telnet provides a connection from a remote (client) to a host (server) computer; the client keyboard and monitor (or window) act as if physically attached to the host computer. Remote users log on as if they were local users with whatever privileges may have been granted to the specific applications

and data on the remote computer. Remote users, after they log in, can use the same services as a local user.

The IP User Interface feature permits any standard telnet client to act as an EAGLE 5 ISS terminal. This IP-based access provides a standard interface through which EAGLE 5 ISS commands are entered from a telnet session to the EAGLE 5 ISS. The EAGLE 5 ISS then provides command responses back to the remote telnet terminal.

Up to 3 IPSM cards in the EAGLE 5 ISS, with IP connectivity, enable telnet clients to connect from anywhere on the customer's IP LAN. The EAGLE 5 ISS must be on the customer's LAN or WAN. Each IPSM card provides 8 telnet terminal ports (IDs 17-24 for the first card installed, 25-32 for the second card installed, and 33-40 for the third card installed), which are automatically made available when the card is installed and provisioned. See the **chg-trm** command description in this manual for more information about configuring telnet terminals. Refer to the "Adding an IPSM" procedure in the Database Administration Manual for information on configuring the IPSM.

From the telnet client, the remote user connect to any one of the equipped IPSM cards available by entering the command **telnet** *<IP address>*. For example,

```
telnet 192.168.1.100
```

The remote user then selects a terminal number from a list of available terminals. If an incorrect terminal number (one not listed in the prompt) is selected, the prompt appears again. (After three incorrect tries, the session is closed.) After the session is accepted, an EAGLE 5 ISS welcome message appears. At this point, broadcast messages (if provisioned) will begin to appear. See Figure 4-2.

Figure 4-2. Telnet Terminal Selection and Login

```

After a connection is made, the remote user can log in using a pre-provisioned user ID and password. (The user ID and password must be provisioned from an existing serial terminal.) The **login** command can be typed directly, without typing <Ctrl-A> first.

An EAGLE 5 ISS serial terminal emulating a Keyboard Send/Receive (KSR) device is normally in *display mode* (where outgoing messages are displayed). In order to enter a command, the user must interrupt the display by holding down the Ctrl key and typing an “a” (the ATTENTION or Ctrl-A key sequence). When the terminal controller receives an ATTENTION, it enters a *command entry mode*. The output text is temporarily halted, and the prompt symbol “>” appears.

The telnet terminal enters *command entry mode* when any key is pressed; <Ctrl-A> is not needed.

After the login is accepted and the user presses a key to receive the standard EAGLE 5 ISS command line prompt, all EAGLE 5 ISS commands assigned to that user ID are now accessible.

The display of broadcast messages can be interrupted with any keystroke, and will resume after a command is entered or a set timeout expires. When in command entry mode, the telnet server holds

any outgoing messages in a buffer while a command is entered. A command entry is completed by pressing the Enter key.

The telnet server waits up to 60 seconds between keystrokes for the command text to be completed, before timing out and resuming the broadcast display. If the command entry times out, and output resumes, the incomplete command text might scroll off the screen. Even though the incomplete command was not executed, it is saved as an entry in the command buffer. This incomplete command will be displayed again when any key is pressed. The command string can be finished by continuing the typing where it was interrupted. Pressing the Enter key submits this command as usual.

Broadcast messages are held in a buffer from the time a key is pressed, until the command is complete (timed out, aborted, cancelled, or rejected). This is to allow command responses to be completely displayed. After the command completes, broadcast messages (if provisioned) will resume. The IPSM card buffer will hold up to 30 minutes of broadcast output before discarding the oldest messages.

When the user enters the **logout** command to end the telnet session, the user is logged off of the EAGLE 5 ISS, but the port remains assigned to the EAGLE 5 ISS telnet terminal. If the active port connection is lost for a reason such as hardware fault or system interruption, the telnet server resets affected ports, the session is closed, and the user ID is logged off.

The OA&M IP Security Enhancement feature provides secure connections to the EAGLE 5 ISS. Refer to Appendix B of the Database Administration Manual - System Management for information on using the PuTTY client to make a secure telnet connection.

Element Management System Alarm Monitor Terminals

Element Management System Alarm Monitor (EMSALM) terminals display UAM alarm set and clear messages and the UIM 1083 "system alive" messages only. No other messages (including reports and other UIMs) are displayed. EMSALM terminals are designed to display alarm messages only. EMSALM terminals are not restricted in any other way. They can accept login, and commands; however these operations may interfere with alarm monitoring and should be performed on an alternate terminal.

Serial port terminal IDs 1-16 can be assigned as EMSALM terminals. These EMSALM terminals are a refinement of the KSR terminal, and contain all the KSR terminal communication parameters.

Telnet terminal IDs 17-40 can be assigned as EMSALM terminals when the IP User Interface feature is enabled and turned on and up to 3 IPSM cards are equipped in the system (see "Telnet Terminals" on page 4-6). These EMSALM terminals have all of the functions of a telnet type terminal.

When the **chg-trm** command is entered to change a terminal to the EMSALM type, all output group parameter values for that terminal default to YES, even if they were set to NO before the change. Even though an output group is set to YES for an EMSALM terminal, no reports or UIMS other than UIM 1083 will appear for that output group. Individual output group values can be changed to NO by entering another **chg-trm** command for an EMSALM terminal (do this only with caution; it can cause loss of UAM alarm messages at the EMSALM terminal).

When the **chg-trm** command is entered to change a terminal from type EMSALM to another type, the output group values remain unchanged. A **chg-trm** command can be entered to change output group settings.

About Commands

Commands allow you to interact with the system to perform specific functions. Commands are available to perform the following functions:

- Obtain system status and operational status
- Modify system configuration
- Obtain measurement reports

The following sections describe how to enter commands through a system terminal. Command correction, keywords, parameters, and syntax are described.

Entering Commands

All commands are entered at the command prompt (>), located in the bottom window of the terminal display. After entering a command, you must press the **Enter** key. When the command has executed (an output message appears in the display to indicate execution), you can enter another command. The **F9** function key allows you to interrupt a running command; however, you cannot enter another command until the running command completes its operation.

Commands are not case sensitive; therefore, either uppercase or lowercase characters can be used. Intermixing (using both upper and lower case) characters does not create an error message, but you must use the correct command syntax.

Action Commands

Throughout this manual, the term “action command” is used in the description of some dependencies, as in the sentence “No other action command can be in progress when this command is entered.”

Action commands are used to effect changes to the state of entities within the system, such as cards and signaling links. For example, you use the **inh-card** command to change the state of the card to Out-of Service - Maintenance Disabled (OOS-MT-DSBLD).

Table 4-1 lists the action commands and shows which type of system entity they are associated with.

Table 4-1. Action Commands and Their Associated System Entity

Action Commands	System Entity
act-slk, alw-slk, canc-slk, dact-slk, inh-slk, unhb-slk, blk-slk, ublk-slk, tst-slk	Link Commands
act-alm-trns, canc-alm-trns, rls-alm	Alarm Commands
alw-trm, inh-trm	Terminal Commands
alw-card, inh-card, rmv-card, rst-card	Card Commands

Command Keywords and Parameters

Commands consist of two parts: keywords and parameters. Keywords identify the principal action to be performed by the system, and consist of one to three words. Most commands also require parameters to further define the command operation.

Parameters are entered after the keyword. Each parameter must be separated from the keyword or the previous parameter with a colon. If a parameter has multiple values, the values entered are discrete and must be separated with a hyphen or comma. The parameters can be entered in any order.

Some command parameters have built-in default values that are used if a value is not specified. To accept a default value, press **Enter** after the desired keyword and parameters have been entered.

Use the following delimiters when entering commands:

- : —separates parameters
- or , —separates multiple values within a parameter block
- = —use as delimiter between the parameter and input value

The following is an example of a command entry:

> **dact-slk:loc=1101:port=a**

The keyword in the above example is **dact-slk** (Deactivate Signaling Link). The first parameter for this command is **loc=1101** (the actual card location in the system for the link being cancelled, based on equipment location). The second parameter is **port=a**. This parameter signifies which signaling link port on the card in the designated location has the link that is to be cancelled.

If an error is made while typing commands, use the **Delete** key to make corrections, one character at a time.

NOTE: If the same parameter is entered more than once in a command, the system accepts the last parameter value that was entered. Any values for the parameter that were entered earlier in the command are ignored.

Keyboard Functions

Some keyboard functions used with commands are described in the previous section. Keyboard functions available for use with commands are listed in Table 4-2. Arrow key functions are further described following the table.

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
↑	↑	The Up arrow key recalls the previous commands entered at the prompt, one command at a time. The Up arrow key scrolls backwards through up to 10 commands for a KSR, VT320, or SCCS terminal, and up to 20 commands for an IP UI telnet terminal.

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
		See page 4-12 for a description of the Up arrow key functions.
←	←	The Left arrow key backspaces the underline cursor without erasing.
↓	↓	The Down arrow key recalls the previous command entered at the prompt, one parameter at a time. If the Up arrow key is pressed and more than one command has been entered in the session, pressing the Down arrow key displays one previously entered command at a time. The Down arrow key scrolls forward through up to 10 commands for KSR, VT320, and SCCS terminals and up to 20 commands for IP UI telnet terminals. See page 4-13 for a description of the down arrow key functions.
→	→	The Right arrow key recalls the last command entered at the prompt, one character at a time.
F6	F6	The F6 Function key refreshes the terminal screen, including any characters already input on the command line and the command response line.
F7	F7	The F7 Function key clears the scroll buffer. This enables a user to stop useless information from passing to the scroll region of the system terminal.
F8	F8	The F8 function key enables you to stop and restart the scrolling of information on the terminal screen.
F9	F9	The F9 Function key allows you to interrupt a running command so that you can enter another command. Output and processing of the interrupted command continue. Pressing F9 is the same as issuing the canc-cmd command with no parameters. The commands that can be interrupted by pressing F9 are listed in the description of the canc-cmd command. If the terminal is running one of the listed commands and you press F9 , output and processing are cancelled. This function works only on the same terminal that is running the command you want to cancel. To cancel a command from another terminal, use the canc-cmd:trm= command (see the canc-cmd command description).

Table 4-2. Keyboard Functions

VT320 Key Sequence	KSR Key Sequence	Description
F10	F10	The F10 Function key displays help information for the last command that was entered, including parameters, parameter formats, and the command class.
F11	F11	The F11 Function key allows you to toggle the terminal's mode of operation from VT320 to KSR and from KSR to VT320. This function key has no effect on IP UI telnet terminals.
Not Available	Control-A	Control-A allows you to enter a command in the KSR mode.
Control-S	Control-S	Used with the <i>sw</i> or <i>both</i> flow control (see the chg-trm command description for more information), this key sequence sends the XOFF character to temporarily stop sending data.
Control-Q	Control-Q	Used with the <i>sw</i> or <i>both</i> flow control (see the chg-trm command description for more information), this key sequence sends the XON character to resume sending data.
Ins	Ins	When Insert is toggled on, typed characters are inserted into the command line, moving existing characters to the right. When toggled off, typed characters overwrite existing characters.
Del	Del	Deletes one character at a time from the right; the cursor stays in position.
Backspace	Backspace	Deletes a character and moves the cursor one space to the left.

Arrow Key Operation

The arrow keys are used to move the cursor to a different position in a command, and to display part or all of a command that was previously entered.

On KSR, VT320, and SCCS terminals, you can scroll through the last 10 commands that were entered at the terminal during the session. On IP UI telnet terminals, you can scroll through the last 20 commands that were entered at the terminal during the session. Part or all of one command at a time is displayed. When you have scrolled through the complete list of up to 10 or 20 commands, the scrolling wraps back to the beginning of the list.

The list of previously entered commands is cleared when a terminal is inhibited and allowed (**inh-trm:trm=xx** and **alw-trm:trm=xx**) and when a file transfer is initialized with the **act-file-trns** command.

There are two modes of command recall for Up and Down arrow keys:

- **Edit Mode**
Edit Mode includes any key operation that changes the command at the prompt, such as the Delete key, the Back Space key, or an alphanumeric key. Pressing one of these keys to enter or change a command puts the terminal into Edit Mode. Pressing the Enter key (or carriage return) takes the terminal out of Edit Mode.
- **Non-edit Mode**
Pressing the Enter key (or carriage return) puts the terminal into Non-edit Mode. A terminal remains in Non-edit Mode when you press an arrow key, a Function key, or the Insert key, which do not change the command at the prompt. When you press a key that changes the command, the terminal goes into Edit Mode until you press the Enter key again.

Up Arrow Key

The Up arrow key is used to recall up to the last 10 commands (KSR, VT320, and SCCS terminals) or the last 20 commands (IP UI telnet terminals) entered at the prompt during the session.

In Edit Mode

- You enter 3 characters of a command at the prompt and press the Up arrow key. If the previous command was 6 characters long, then the last 3 characters of the previous command are recalled and displayed after the 3 characters that you entered at the prompt.
- You enter 10 characters of a command at the prompt and press the Up arrow key. If the previous command was 6 characters long, none of the previous command is displayed. The command that you entered remains as you entered it at the prompt.
- Entering part or all of a command at the prompt puts the terminal into Edit Mode. In Edit Mode, the last (or previous) command is recalled only if the command length of the last command is greater than the command at the prompt. For example,;

In Non-edit Mode

- When you have pressed the Enter key and there is no command at the prompt, or you have pressed the Insert key or a Function key, the terminal is in Non-edit Mode.
- When you press the Up arrow key in Non-edit Mode, and you have entered at least one previous command, the last command that you entered is displayed at the prompt. Pressing the Up arrow key again clears the command at the prompt (if any) and displays the next previous command that you entered (if any). By continuing to press the Up arrow key, you can scroll backwards through the last 10 commands (KSR, VT320, and SCCS terminals) or the last 20 commands (IP UI telnet terminals) that you entered at the terminal. The display wraps back to the most recent of the entered commands when all of the available commands have been recalled. The terminal remains in Non-edit Mode until you press a key that changes the displayed command.

Down Arrow Key

In Edit Mode, the Down arrow key recalls the last command that was entered at the terminal, one parameter at a time. The recalled parameter is displayed at the end of the entry that currently appears at the prompt.

In Non-edit Mode:

- If the Up arrow has not been pressed just before pressing the Down arrow key, the Down arrow key recalls the last command that was entered at the terminal, one parameter at a time.
- If the Up arrow key is the last key that was pressed before the Down arrow key is pressed, the Down arrow key scrolls forward through the last 10 commands (KSR, VT320, and SCCS terminals) or last 20 commands (IP UI telnet terminals), displaying one complete command each time the key is pressed. The scrolling wraps to the beginning of the list when all of the available commands have been displayed.

Right Arrow Key

Each time the Right arrow key is pressed, one character of the last command is recalled and the cursor moves one position to the right. When the last command is completely displayed, pressing the Right arrow key does not cause any cursor movement or character display.

Left Arrow Key

The Left arrow key moves the underline cursor one position to the left without erasing the character. The underline cursor can be moved until it reaches the first character at the left of the command. If the Left arrow key is pressed again after the cursor reaches the first character of the command, the bell sounds.

Command Output and Messages

Reports and outputs generated through retrieve or report status commands are followed by a semi-colon (;) to signify the end of the output (this is in compliance with TL1 standards).

The following types of output messages are used on the system:

- **Command Accepted—Processing:** The command has been accepted by the application's command handler as syntactically correct. This message is displayed in the command area of the terminal display.
- **Command Completed—**The command has been entered, and the system has completed processing. This message is displayed in the scroll area of the terminal display.
- **Command Executed—**The command has been entered, and the system has completed processing. This message is displayed in the command area of the terminal display.
- **Command Failed—**The command was executed but failed due to an external reason, such as the link is not equipped or a disk drive is unable to communicate. The reason for the failure is included in this message.
- **Command Rejected—**The command syntax could be incorrect, or a parameter value is incorrect (semantic error). This message is displayed in the command area of the terminal display. The reason for rejecting the command (command syntax or incorrect parameter value) is included in this message.

- **Command Aborted**—The command syntax and the parameter values are ok, but for some reason the command was aborted (for example, a disk drive is inaccessible). This message is displayed in the scroll area of the terminal display.
- **Command Response Messages**—A command is entered at the terminal, and the response to that command is echoed on that same terminal. These messages are displayed in the scroll area of the terminal display.
- **Unsolicited Messages**—An example of unsolicited messages are the messages delivered in response to alarm conditions. These messages are displayed in the scroll area of the terminal display.

The unsolicited messages can be directed to a specific terminal or printer by using the **chg-trm** command to assign one or more of the following groups of unsolicited output messages to the specified terminal or printer.

Application Server	Application Subsystem
Card	Clock
Debug	Global Title Translation
Gateway Screening	Measurements Maintenance
Monitor	MPS
SEAS Maintenance	SLAN Maintenance
System Maintenance	Security Administration
Traffic Measurements	Database Administration
Link Maintenance	Program Update
LNP Database Administration	LNP Subscription

To configure a terminal to receive unsolicited LNP database administration and LNP subscription messages, the LNP feature must be turned on (see the **enable-ctrl-feat** command).

Command Output Banners

When a command is executed in the system, one or more banner lines appear in the output that is displayed for the command.

page 4-14 shows the general format of an output banner.

Figure 4-3. Output Banner Format

The following fields appear in each output banner:

- **Host CLI code**—a maximum of one alphabetic character and ten alphanumeric characters. The CLI code uniquely identifies the system in terms of its physical location. The CLI code must be unique among all elements in the system.
The CLI code contains the following information:
 - City—4 characters
 - State— 2 characters
 - Building— 2 characters
 - Equipment type —3 characters
- Date—year-month-day
- Time—hour: minute: second time zone
- System Release Number— contains a product identifier and the version ID number.
The product identifier, which is shown as ‘Prod’ in Figure 4-3 and the output examples in this manual, can appear as “EAGLE” or “EAGLE5” depending on which product key is turned on in the system (see the **rtrv-ctrl-feat** output example). If one or more “EAGLE 5” features are enabled in the system, the EAGLE5 product key must also be turned on and EAGLE5 will appear in the banner. If there are no “EAGLE 5” features enabled in the system, the EAGLE product key will be turned on and EAGLE will appear in the banner. (If both the EAGLE5 and EAGLE product keys are enabled, the EAGLE5 product key should be turned on and appear in the banner).
The version ID number identifies the GPL set that is specific to the software release that is expected to be installed on the system as approved loads. The format of the version ID number is *maj.min.maint*, defined as follows:
 - *maj*—the major release ID
 - *min*—the minor release ID
 - *maint*—the maintenance release ID

System Security

User IDs and passwords protect the system from unauthorized entry into the system and enhance system security. To enter the system through a terminal, a user must enter a valid user ID and password at the system prompt, and the user ID and password must be authorized for use together. A user ID identifies a user to the system.

To maintain the security of the system, passwords should be changed periodically and user IDs should be deleted whenever there is a personnel change.

When prompted to enter a new password, a different password should be provided. This is the responsibility of the user, and is not enforced by the EAGLE 5 ISS.

Rules for User ID and Password Administration

The rules for administering User IDs and passwords are:

- The maximum number of user ID-password combinations is 100.
- The maximum length of the user ID is 16 characters.

- The maximum length of the password is 12 characters; the minimum length is site provisionable using the **chg-secu-dflt** command, and it can be from 1 – 12 characters long.
- User IDs and passwords may contain any printable characters except the characters used as command delimiters: colon (:), comma (,), hyphen (-), or equal sign (=).
- Each user ID must begin with an alpha character.
- A password must contain:
 - At least as many characters as specified on the **minlen** parameter of the **chg-secu-dflt** command
 - At least as many alphabetic characters as specified on the **alpha** parameter of the **chg-secu-dflt** command
 - At least as many numeric characters as specified on the **num** parameter of the **chg-secu-dflt** command
 - At least as many punctuation characters as specified on the **punc** parameter of the **chg-secu-dflt** command
- A password must not contain the associated user ID.

Command Classes

Each user ID and password combination is assigned to one or more command classes to control the set of commands that a user may enter.

There are 10 unique non-configurable command classes: Basic, Database Administration, Debug, Link Maintenance, Program Update, Security Administration, System Maintenance, LNP Basic, LNP Database Administration, and LNP Subscription. (The Basic command class is assigned to all users as a default.)

There are 32 available configurable command classes. See the **chg-cmd** command description and the **chg-cmdclass** command description for information about naming and assigning commands to configurable command classes.

See the **chg-user** command description or the **ent-user** command description for more information on configuring user IDs and passwords and assigning command classes.

Login Security Checks

To aid in system security, the system maintains a record of when a password was last changed and requires a user to change the password when it is older than the site-specified maximum password age. The system also keeps track of the elapsed time between successful logins. If the time between successful logins exceeds the site-specified maximum, a user is not allowed access to the system. The site systems administrator also has the ability to revoke a user ID.

When a user first logs into the system, the default unauthorized user warning is displayed as follows

NOTICE: This is a private computer system.

Unauthorized access or use may lead to prosecution.

Additional security is available for the system in that multiple logins using the same user ID are prohibited.

Intrusion Alert

To alert the system administrator to a possible attempt by an unauthorized person trying to log into the system, the system issues a scroll area message. When 5 or more consecutive attempts to log into the system have failed, the following scroll area message is sent to all terminal ports that can receive unsolicited Security Administration messages:

Info: xxxxxxxxxx successive LOGIN failures on port pp

Where:

xxxxxxx is the number of consecutive login failures on the port (1 – 4,294,967,295)

pp is the terminal port (1 – 40) on which the login attempts were made

When the attempt to log into the system is successful after a series of failed consecutive login attempts, or if the active MASP reboots, the count of failed consecutive login attempts for that port is reset to 0.

Attempts to log into the system that are not completed normally, are not considered login attempts and are not included in the count of failed consecutive login attempts. For example, while prompting for a password you might use the **F9** key to abort the command, or errors might occur when the system is looking up a user ID or password.

Login Procedure

The commands described in this manual are entered at a terminal connected to the system. Before you can enter most of the commands, you must enter the **login** command to log into the system and open a user session. You must enter the login command with a valid user ID and password combination. When the system accepts your user ID and password as valid, you can enter commands at the terminal in the user session.

The first procedure in this section explains how to log into the system using the **login** command.

The procedures that follow the login procedure explain how to handle common situations that can arise when you log into the system.

- You must change the password the first time that you log in with a new user ID and password.
- The user ID and password that you enter are not accepted as valid.
- Your password has expired and must be changed.
- Someone else has already logged on with your user ID and password; the system does not allow the same ID and password to be used on two terminals at the same time.

NOTE: You can enter the **act-user** command instead of the **login** command.

Procedure - Log into the System for a User Session

- 1 At the system prompt (>), enter the **login** command with your user ID.
 - 2 Press the **Enter** key.
-

The following message appears:

Enter Password:

-
- 3 At the system prompt, type your password.
For security reasons, the password is not displayed on the terminal screen.
-
- 4 Press the **Enter** key.
Follow the remaining steps to complete this procedure or to go to another procedure, depending on the system response to validation of your user ID and password.
-
- 5 If your user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session.

Command Accepted-Processing
Command Executed

This procedure is complete.

-
- 6 If your user ID and password combination are not accepted and the following message appears, go to "Procedure - Your User ID and Password were not Accepted" on page 4-18.

E2757 Cmd Rej: Invalid UserID/Password Combination

-
- 7 If you entered a new user ID and password combination for the first time, the following message appears, go to page 4-19 .

Enter new password (password must be changed) :

-
- 8 If you entered your user ID and password combination and your password has expired, the following message appears, go to page 4-20 .

Enter new password (password has expired and must be changed) :

-
- 9 If you entered your user ID and password combination and they are already being used at another terminal, the following message appears. Go to page 4-20 .

E2750 Cmd Rej: UserID already logged on (or is logging on) another port

Procedure - Your User ID and Password were not Accepted

- 1 This procedure outlines the steps to follow when you attempt to log into the system and your user ID and password combination are not accepted.
When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

E2757 Cmd Rej: Invalid UserID/Password Combination

When this message is displayed, the terminal also presents a message describing the login attempt and the time and date the attempt occurred.

- 2 Verify that you have the correct user ID and password.
Return to the login procedure, and log in again with the correct user ID and password.
If the problem occurs again, contact your System Administrator.
-

Procedure - You Must Change Your Password

- 1 This situation can occur when you first log in after the system administrator uses the **ent-user** command to enter a new user ID and password combination, or when you first log in after the **chg-user:pid=yes** command has been entered.
When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

Enter new password (password must be changed) :

Type a new password, following your site guidelines.

For security reasons, the password is not displayed on the terminal screen.

- 2 Press the **Enter** key.
The system checks the password to ensure that it meets your site's password complexity requirements.
-

- 3 If your password does not meet your site's password complexity requirements, the system displays a message based on the password violation (see page 4-21 for a list of possible messages).

The login process ends.

Decide on a new password, and start the login procedure again.

- 4 If your password meets the complexity requirements, the following message appears:

Verify Password:

Type the exact password again that you entered in Step 1

For security reasons, the password is not displayed on the terminal screen.

- 5 Press the **Enter** key.
-

- 6 If the user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session

Command Accepted-Processing
Command Executed

- 7 Record your new password in a secure location.
-

Procedure - Your Password has Expired

- 1 When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

Enter new password (password has expired and must be changed) :

Type a new password, following your site guidelines.

For security reasons, the password is not displayed on the terminal screen.

- 2 Press the **Enter** key.
The system checks the password to ensure that it adheres to your site's password complexity requirements.
-

- 3 If your password does not meet your site's password complexity requirements, the system displays a message based on the password violation (see page 4-21 for a list of possible messages).
The login process ends.
Decide on a new password, and start the login procedure again.
-

- 4 If your password meets the complexity requirements, the following message appears:

Verify Password:

Type the exact password again that you entered in Step 1

For security reasons, the password is not displayed on the terminal screen.

- 5 Press the **Enter** key.
-

- 6 If the user ID and password combination are accepted and the following messages appear in the terminal input/command response region, the terminal is available for a user session

Command Accepted-Processing
Command Executed

- 7 Record your new password in a secure location.
-

Procedure - Your User ID is Already Being Used

- 1 When you entered the **login** command with your user ID and entered your password at the system prompt, the following message appeared:

E2750 Cmd Rej: UserID already logged on (or is logging on) another port

The following information is displayed in the scroll area:

Info: UID is currently logged on (or is logging on) to port yy.

where yy is in the range of 1 - 40.

- 2 Find the terminal at port yy, and log off your user ID at that workstation.
See page 4-22 .

- 3 Return to your terminal and log into the system again.

Login Error Messages

- E2262 Cmd Rej: Password too long, 12 maximum
- E2263 Cmd Rej: Password does not contain enough characters
- E2264 Cmd Rej: Password verification failed
- E2750 Cmd Rej: UserID already logged on (or is logging on) another port
- E2751 Cmd Rej: UserID has been revoked
- E2752 Cmd Rej: UserID has become obsolete and cannot be used
- E2753 Cmd Rej: Password does not contain enough alphabetic characters
- E2754 Cmd Rej: Password does not contain enough numeric characters
- E2755 Cmd Rej: Password does not contain enough punctuation characters
- E2756 Cmd Rej: Failed reading the password table
- E2757 Cmd Rej: Invalid userID/password combination
- E2758 Cmd Rej: ALPHA+NUM+PUNC must not be greater than 12
- E2759 Cmd Rej: Revocation of security admin userID not allowed
- E2760 Cmd Rej: Failed reading the security defaults table
- E2761 Cmd Rej: Password cannot contain userID

See the **chg-secu-dflt** command description for information on different options the system administrator has for configuring the system for password requirements.

The following is an example of the information that might be displayed in the scroll area, depending on your site's configuration:

New password must contain

- from 8 to 12 characters
- at least 1 alphabetic character(s) (a – z)
- at least 1 numeric character(s) (0 – 9)
- at least 1 punctuation character(s) (for example, \$%#@#)

Logout Procedure

When a terminal session is completed, you perform the following logout procedure to log out of the system. The terminal returns to an input idle state.

NOTE: You can use the **dact-user** command instead of the **logout** command.

Procedure - Log Out Of the System

- 1** At the system prompt (>), enter the **logout** command.
- 2** Press the **Enter** key.
The following messages appear on the terminal screen to confirm command completion:

```
Command Accepted-Processing  
Command Executed
```

Commands

Introduction

This chapter contains commands that are not pass-through or debug commands. The commands are listed in alphabetical order starting on page 5-1 .

For each command listed in this chapter, the following information is given:

- A description of the command
- The command syntax
- A list of related commands
- The command class to which the command belongs
- A description of the command parameters
- An example of the command usage
- Rules, dependencies, and notes relevant to the command
- Sample command output

act-alm-trns

Activate Alarm Transfer

Use this command to transfer all alarm indications from the local office to the remote maintenance center.

Keyword: act-alm-trns

Related Commands: dact-alm-trns, rept-stat-clk, rept-stat-trbl, rtrv-obit, rtrv-trbl

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

act-alm-trns

Dependencies

No other action command can be in progress when this command is entered.

Notes

After this command is entered, use the **rept-stat-alm** command to verify the **act-alm-trns** action.

New alarms cause the local maintenance center audible alarms to sound for a short period.

Output**act-alm-trns**

```
rlghncxa03w 04-01-09:50:17 EST EAGLE 31.3.0
Alarms transferred to Remote Maintenance Center
Command Completed.
```

```
;
```

act-cdl**Activate Command Driven Loopback**

Use this command to initiate a command driven loopback for testing a signaling link.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receiver.

Keyword: act-cdl

Related Commands: act-lbp, dact-cdl, dact-lbp, rept-stat-cdl, tst-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling links. The SS7 signaling link to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid link parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:loopback= (optional)

Loopback test type.

Range: line, payload

The **payload** value is valid only on LIM-ATM and E1-ATM cards.

Default: line

Example

```
act-cdl:loc=1205:link=b
```

Dependencies

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

LFS must not be running on the specified signaling link when this command is entered. The LFS processing must be stopped or must be allowed to complete before this command can be entered.

The **loopback=payload** parameter is valid only for LIM-ATM and E1-ATM cards.

Command Driven Loopback testing is not available during upgrade.

A Command Driven Loopback test cannot be in progress on the specified link when this command is entered.

A **tst-slk** command cannot be in progress on the specified link when this command is entered. The **tst-slk** processing must be stopped or must be allowed to complete before this command can be entered.

The card location specified in the **loc** parameter must be in the In-Service-Normal (IS-NR) state.

The card location specified in the **loc** parameter must support Command Driven Loopback testing.

The signaling link specified in the **link** parameter must not be active.

The card location specified in the **loc** parameter cannot be reserved by the system.

Notes

None

Output

act-cdl:loc=1205:link=b

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Accepted: Command Driven Loopback message is sent.
```

;

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Completed.
```

;

act-dlk

Activate Data Link

Use this command to activate a TCP/IP data link and put that data link into service. The state of the TCP/IP data link is changed from out of service maintenance disabled (OOS-MT-DSBLD) to in service normal (IS-NR).

Keyword: act-dlk

Related Commands: canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

act-dlk:loc=1308

Dependencies

No other action command can be in progress when this command is entered.

The shelf and card must be equipped.

The card location must contain an ACM.

Notes

None

Output

```
act-dlk:loc=1308
rlghncxa03w 04-01-17:00:36 EST EAGLE 31.3.0
Activate Link message sent to card.
Command Completed.
;
```

act-echo

Activate Echo

Use this command to force responses from the scroll area of a terminal to be printed to a specified terminal or printer. The command supports one terminal echoing to many terminals or many terminals echoing to one terminal.

CAUTION

CAUTION: Exercise restraint in using this command, because excessive echoing can cause a loss of output at the receiving terminal.

Keyword: act-echo

Related Commands: chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: Basic

Parameters

:trm= (mandatory)
Serial port number.
Range: 1-16

Example

```
act-echo:trm=3
```

Dependencies

Terminal output cannot be echoed to a terminal that is out of service.

If a terminal is already echoing to a specified terminal, the **act-echo** command cannot be entered to echo the terminal's output to that same terminal.

Echo is not allowed to the terminal from which the command is issued.

Echo is not allowed to or from IP User Interface telnet ports (terminals 17-40).

Echo is not allowed to an OAP port.

Terminal output cannot be echoed to a terminal that is inhibited.

Terminal parameter must be specified.

Notes

This command can be used to echo only command output responses to a terminal. For alarm and network messages to be sent to a terminal, the **chg-trm** command must be used.

To echo output to a destination port, a user must be logged in at the destination port. The following warning message appears in the scroll area of the issuing terminal if echo is attempted to a terminal that has no user logged in:

No user logged in at Terminal X. No echo will occur until a user logs in.

where X is the **trm** parameter value specified in the **act-echo** command.

Output

act-echo:trm=2

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
act-echo:trm=2
Command entered at terminal #1.
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Scroll Area Output is echoed to terminal 2.
```

Caution: Loss of output may occur if too many terminals are echoed.

;

act-echo:trm=3

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
act-echo:trm=3
Command entered at terminal #1.
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Scroll Area Output is echoed to terminal 2.
Scroll Area Output is echoed to terminal 3.
```

Caution: Loss of output may occur if too many terminals are echoed.

;

act-file-trns

Activate File Transfer

This command starts a file transfer between the system and a remote computer.

Keyword: **act-file-trns**

Related Commands: **copy-fts, disp-fts-dir, dlt-fts**

Command Class: System Maintenance

Parameters

:loc= (optional)

The location of the fixed disk to or from which the file is to be uploaded or downloaded.

Range: **1114, 1116**

Active and standby TDM locations

Default: The active TDM location

:retries= (optional)

The number of times the system retries a packet before giving up.

Range: **1-20**

Default: **10**

:timeout= (optional)

The number of seconds the system waits for a packet before sending a negative acknowledgment or retransmitting the previous packet. This parameter also specifies the number of seconds to wait for a transfer initiation message from the remote computer.

Range: **1-120**

Default: **30**

Example

```
act-file-trns:loc=1113
```

Dependencies

The **loc** parameter must specify a TDM card.

Only one file transfer can be active at a time.

This command cannot be entered on a telnet terminal (IDs 17-40).

Notes

Output messages indicating transfer initiated and transfer terminated (whether successful or not) are sent to the output devices in the Security Administration output group.

LNP Measurements

When used to output LNP measurements, the **rept-meas** command sends data to the FTA. Extracting LNP measurements from the FTA requires:

- A computer with a VT320 or KSR connection to the system
- A communication program that both emulates VT terminals and supports Kermit file transfer
- A spreadsheet program that can import Comma Separated Value (CSV) text files

A PC running ProComm© for Windows and Microsoft Excel© can be used.

Use the following procedure to collect LNP measurements.

Procedure - Extracting LNP Measurements from the FTA

- 1 Enter the following command to display the contents of the FTA:
disp-fta-dir:loc=xxxx
 Where **xxxx** = the active TDM (**1114** or **1116**)

- 2 Enter the following command to delete any existing files from the FTA:
dlt-fta:loc=xxxx:all=yes
 Where **xxxx** = the active TDM (**1114** or **1116**)

- 3 Enter the command to send LNP daily measurements to the FTA. For example:
rept-meas:enttype=lnp:type=mtcd

- 4 Enter the following command to activate the file transfer:
act-file-trns:loc=xxxx
 Where **xxxx** = the active TDM (**1114** or **1116**)

- 5 Enter the following command to display a list of the files transferred to the FTA in step 4:
disp-fta-dir:loc=xxxx
 Where **xxxx** = the active TDM (**1114** or **1116**)

- 6 Use the **get** command from within the communications program configured to run Kermit in ASCII mode to transfer the desired files (with the .csv suffixes) to the PC. For example:
 > **get mday_lnp.csv**
 > **get mday_ssp.csv**
 > **get mday_lrn.csv**
 > **get mday_npa.csv**
 > **finish**

- 7 Run a spreadsheet program and open each of the collected files to view the LNP measurement data.
-
- 8 After all files are successfully transferred and confirmed, enter the following command to remove the files from the FTA:
dlt-fta:loc=xxxx:all=yes
 Where **xxxx** = the active TDM (**1114** or **1116**)
-

Output

Normal session output to non-Security Administration user's terminal.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:37:05 EST EAGLE 31.3.0
act-file-trns:loc=1114:timeout=20:retries=2
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 14:37:05 EST EAGLE 31.3.0
Awaiting File Transfer with remote.
Please initiate binary Kermit session on local computer
;
rlghncxa03w 04-01-05 14:38:33 EST EAGLE 31.3.0
File Transfer : 0 file(s) DOWNLOADED from location 1114 successfully
File Transfer : 1 file(s) UPLOADED to location 1114 successfully
File Transfer : Kermit Session terminated NORMALLY
```

Normal session output to Security Administration group terminals.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:40:42 EST EAGLE 31.3.0
File Transfer : INITIATED on terminal #1
;
rlghncxa03w 04-01-05 14:41:07 EST EAGLE 31.3.0
File Transfer: 511_byte.bin UPLOADED to location 1114 successfully.
;
rlghncxa03w 04-01-05 14:41:44 EST EAGLE 31.3.0
File Transfer : terminated NORMALLY on terminal #1
```

Normal session output to Security Administration user's terminal.

```
act-file-trns:loc=1114:timeout=20:retries=2
rlghncxa03w 04-01-05 14:42:51 EST EAGLE 31.3.0

File Transfer : INITIATED on terminal #1
;
rlghncxa03w 04-01-05 14:43:53 EST EAGLE 31.3.0
Awaiting File Transfer with remote.
Please initiate binary Kermit session on local computer

rlghncxa03w 04-01-05 14:44:19 EST EAGLE 31.3.0
File Transfer: 511_byte.bin UPLOADED to location 1114 successfully.
;
rlghncxa03w 04-01-05 14:44:52 EST EAGLE 31.3.0
File Transfer : 0 file(s) DOWNLOADED from location 1114 successfully
File Transfer : 1 file(s) UPLOADED to location 1114 successfully
File Transfer : Kermit Session terminated NORMALLY
;
rlghncxa03w 04-01-05 14:45:31 EST EAGLE 31.3.0
File Transfer : terminated NORMALLY on terminal #1
;
```

act-flash**Activate Flash**

Use this command to activate the trial FLASH GPL that is currently running on one target card or on a range of cards.

Keyword: act-flash

Related Commands: clr-imt-stats, flash-card, init-flash, init-imt-gpl, rept-imt-info, rept-imt-lvl1, rept-imt-lvl2, tst-imt

Command Class: System Maintenance

Parameters

:eloc= (optional)

End location. This parameter specifies the location of the last card of a range of cards to be activated.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:gpl= (optional)

Generic program load. This parameter specifies the flash GPL type that is running on the cards in the specified range of cards.

This parameter must be specified for cards that have more than one flash image (GPL).

Range: ayyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters.

Valid GPLs are: **blbios**, **blbepm**, **blbsmg**, **blcpld**, **bldiag**, **bldiag6**, **blvxw**, **blvxw6**, **bpdcn**, **bphcap**, **bphcapt**, **bphmux**, **bpmpl**, **bpmp1**, **hipr**, **imtpci**, and **p1dpmc1**.

:loc= (optional)

Location. This parameter specifies the location of a single target card.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:sloc= (optional)

Start location. This parameter specifies the location of the first card of a range of cards to be activated.

Range: 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:appl= (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

Example

act - flash : loc=1105

act - flash : sloc=1101 : eloc=1112 : gpl=bpmp1

Dependencies

The card, or cards, in the specified location or range of locations for this command must be actively running a FLASH GPL in *trial* mode.

The allowed cards are HCAP, HCAP-T, DCM, DSM, E1/T1 MIM, E5-ENET, HC-MIM, E5-E1T1, E5-SM4G, GPMSM-II, MPL, or MPL-T. Card locations xy09 and xy10 (x is the frame, y is the shelf) can be specified only for HMUX or HIPR cards.

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the target is HMUX or HIPR, both of the card locations specified in the **sloc** and **eloc** parameters must contain HMUX or HIPR cards on the same IMT bus. For HMUX or HIPR the bus is implicit based on the specified location. Location xy09 specifies HMUX or HIPR IMT-A Bus, and location xy10 specifies HMUX or HIPR IMT-B Bus. For example, **sloc=1109:eloc=6109** specifies all HMUX or HIPR cards on the IMT-A Bus only; **sloc=1110:eloc=6110** specifies all HMUX or HIPR cards on the IMT-B Bus only. HMUX or HIPR cards from both the IMT-A bus and IMT-B bus cannot be flash downloaded simultaneously.

The card must be running an inactive flash GPL when this command is executed.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

The **eloc** and **sloc** parameters must be specified together in the command; one parameter cannot be specified without the other parameter.

The **sloc** parameter value must be greater than the **eloc** parameter value.

The cards in the specified **sloc** and **eloc** card locations must be present and able to communicate over the IMT. The cards do not have to be provisioned in the database.

The **gpl** parameter must be specified if the **eloc** and **sloc** parameters are specified.

The **gpl** parameter must be specified for cards that have more than one flash image (GPL).

The cards in the locations specified in the **sloc** and **eloc** parameters must be running the specified general program load (**gpl**). Other cards in the range of card locations can be running other GPLs, but will not be activated. Only the cards within the range that are running the specified GPL will be activated.

A card that is the active MASP cannot be specified for the **loc**, **sloc**, or **eloc** parameter.

Notes

None

Output

```

act-flash:loc=1105

act-ftp-trns**Activate FTP Transfer**

Use this command to activate an FTP transfer to send database tables from the system to the customer's FTP server.

NOTE: This command is not for customer use. It is for Tekelec use only.

Keyword: act-ftp-trns

Related Commands:

Command Class: Database Administration

Parameters

:action= (mandatory)

This parameter specifies the operation that the command is to perform.

Range: **put**

:filetype= (mandatory)

This parameter specifies the EAGLE 5 ISS table type to be transferred.

Range: **mtp, gtt, gws, all**

mtp—Transfer all Message Transfer Part tables

gtt—Transfer all Global Title Translation tables

gws—Transfer all Gateway Screening tables

all—Transfer all of the types of tables

Example

act-ftp-trns:action=put:filetype=gtt

Dependencies

An **act-ftp-trns** command cannot be entered if another file transfer is already in progress.

Both the **action** and **filetype** parameters must be specified in the command.

The FTP Server table must contain at least one FTP server entry that specifies the **user** application

Notes

This command communicates with the **user** application, defined in the FTP Server table. The IP address and server details necessary for an FTP transfer are also stored in the FTP Server table. One such **user** application is the FTP-based Table Retrieve Application (FTRA). Refer to the *FTP-Based Table Retrieve Application (FTRA) User Guide* for the **user** application to configure an FTP Server table entry.

Output

The sections ending in "Copy-table COMPLETE" and "FTP file transfer SUCCESSFUL" appear for each table that is transferred. Each table name is shown as tablexxx.tbl, where xxx indicates the name of the specific table.

```
act-ftp-trns:action=put:filetype=gtt

act-gpl

Activate Generic Program Load

Use this command to change the status of the trial GPL from "trial" to "approved." The status of the previously approved GPL is changed to "trial."

Keyword: act-gpl

Related Commands: chg-gpl, copy-gpl, rept-stat-gpl, rtrv-gpl

Command Class: Program Update

Parameters

:gpl= (mandatory)

Generic program load. This parameter specifies the name of the GPL identifier to be moved from "trial" to "approved" status on the disk.

Range: ayyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

atmansi —The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

atmitu —The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

blbepm —A flash GPL containing the BIOS ROM image on E5-E1T1 cards and E5-ENET cards.

blbios —A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

blbsmg—A flash GPL containing the BIOS ROM image on E5-SM4G cards.

blcpld —A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag —A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag6—A flash GPL containing the diagnostic code on E5-E1T1 cards and E5-ENET cards.

blvxw —A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

blvxw6 —A flash GPL containing the VxWorks operating system on E5-E1T1 cards and E5-ENET cards.

bpdcn —This GPL is used in communications in the init-flash process.

bphcap —This GPL is used to support Board PROM for HCAP flash memory.

bphcap —This GPL is used to support Board PROM for HCAP-T flash memory.

bphmux —This GPL is used to support Board PROM for HMUX flash memory.

bpmpl —This GPL is used to support Board PROM for MPL flash memory.

bpmpit —This GPL is used to support Board PROM for E1/T1 flash memory and Board Prom for MPL-T flash memory.

ccs7itu —This GPL is used by the LIM cards for ITU-TSS MTP functionality.

cdu —This GPL is used in the card manufacturing process.

ebdablm —This GPL is used by the TSM card for enhanced bulk download.

ebdadcm —This GPL is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 ISS at high speed over an ethernet connection for enhanced bulk download.

eoam —This GPL is used by the GPSM-II card for enhanced OAM functions.

eroute —This GPL is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

erthc —This GPL is used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

gls —This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

hipr —The communication software used on the High Speed IMT Packet Router (HIPR) card.

imt —This GPL is the communication processor on the logical processing element (LPE).

imtpci —The communication software that operates the IMT bus on HC-MIM cards.

ipghc —This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

ipgwi —This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

iplhc —This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

iplim —This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi —This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

ips —This GPL is used by the IPSM card for the IP User Interface feature.

mcp —This GPL is used by the MCPM card for the Measurements Platform feature.

pldpmc1 —A flash GPL that is used on HC-MIM cards for E1 and T1 signaling links.

sccp —This GPL is used by the TSM cards for the global title translation application.

sccphc —This GPL is used by the E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card is present, then the **sccphc** GPL processes normal GTT traffic.

ss7ansi —This GPL is used by the LIM cards for the MTP functionality.

ss7epm —This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications. The **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

ss7gx25 —This GPL is used by the LIM cards to support X.25 functionality.

ss7hc —This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

ss7ipgw —This GPL is used by the system to support TCP/IP point-to-multipoint connectivity.

ss7ml —This GPL is used to support the functionality for the multi-port LIM (MPL or MPL-T) card and the E1/T1 MIM (Multi-Channel Interface Module) card. The MPL cards run only the **ss7ansi** application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the **ss7ml** GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. The MPL cards support only the DS0 interface. The E1/T1 MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7ml** GPL allows the card to support 8 signaling links for E1 and T1 functions. (The older E1 card supports 2 signaling links for E1 functions).

stplan —This GPL is used by the ACM card to support the STP LAN application.

utility —This GPL is used by the factory for testing, and when directed by your Customer Care Center.

vcdu —This GPL is used in the card manufacturing process.

vsccp —This GPL is used by the DSM card to support the GTT and ELAP-based and EPAP-based features. If no ELAP-based and EPAP-based features are turned on and a DSM card is present, the **vsccp** GPL processes normal GTT traffic.

vxwslan —This GPL is used by the SSEDCCM card to support the STP LAN application.

:ver= (mandatory)

Version. This parameter specifies the version number of the GPL to be activated, with subfields the format of *major-minor-fix* separated by dashes.

Range: *major-minor-fix*

Specify a value in the range 0–255 for each subfield of the GPL version number (*major-minor-fix*).

:appl= (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

Example

```
act-gpl:gpl=sccp:ver=101-6-0
act-gpl:gpl=bphcapt:ver=110-25-0
act-gpl:gpl=bpmlt:ver=112-18-0
act-gpl:gpl=mcp:ver=111-17-0
act-gpl:gpl=atmitu:ver=114-1-0
act-gpl:gpl=ips:ver=114-1-0
act-gpl:gpl=hipr:ver=118-20-0

act-gpl:gpl=blbios:ver=125-1-0
act-gpl:gpl=imtpci:ver=125-1-0
act-gpl:gpl=blbsmg:ver=128-1-0
act-gpl:gpl=slanhc:ver=128-2-0
act-gpl:gpl=erthc:ver=128-2-0
act-gpl:gpl=sccphc:ver=128-1-0
```

Dependencies

No other activate, change, copy, or retrieve GPL commands, nor a GPL audit, can be in progress when this command is entered.

Notes

Test the trial GPL by loading to a card before activating the GPL. Activating the GPL changes it from *trial* to *approved*.

The generic program load is committed on the active system and on the standby system.

Trial GPLs are downloaded to cards manually. Only approved GPLs can be downloaded to cards by the system.

Use the **rtrv-gpl** command to determine the version of the GPL.

Output

The output indicates that the specified GPL is activated on each TDM card.

act-gpl:gpl=ss7ansi:ver=101-014-000

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0

;

act-lbp**Activate Loopback Point Test**

Use this command to activate one or more loopback point tests for testing data signaling link elements in an SS7 transmission path. Use this command to:

- Activate a test for a specified loopback point that is defined in the LFS database table
- Activate a test for one loopback point that is not defined in the LFS database table
- Activate tests for all loopback points that have been defined in the LFS database table. See "Summary of Loopback Testing Commands and Functions" for information about loopback testing commands and functions.

The **ent-lbp** command can be used to define a maximum of 32 loopback points in the LFS database table.

Keyword: act-lbp

Related Commands: chg-lbp, dact-lbp, dlt-lbp, rept-stat-lfs, rtrv-lbp

Command Class: Database Administration

Parameters

To activate a test for a single loopback point that is defined in the LFS database table, specify the loopback point number in the **lbp** parameter and do not specify any of the **lfst**, **rle**, **rep**, and **cli** parameters in the command. Information from the LFS database is used to activate the test for the specified loopback point.

To activate a test for a single loopback point that is not defined in the LFS database table, specify one or more of the **lfst**, **rle**, **rep**, and **cli** parameters in the command. (If the **cli** parameter is not specified, the **cli** value is blank, a null string. If the **rep** parameter is not specified, the default value is 0.)

To activate tests for all loopback points that are defined in the LFS database, do not specify any of the **lbp**, **lfst**, **rle**, **rep**, and **cli** parameters in the command. Information from the LFS database table is used to activate tests for all defined loopback points.

:link= (mandatory)

SS7 signaling link. This parameter specifies the SS7 signaling link to be tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

Location. This parameter specifies the unique identifier of the card containing the signaling link to use for loopback point testing.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cli= (optional)

Common language location identifier. This parameter specifies the CILLI code or other mnemonic identifier, used to refer to the given loopback point.

Range: **ayyyyyyyyyy**

1 alphabetic character followed by up to 10 alphanumeric characters

Default: If the **rle**, **lfst**, or **rep** parameter is specified—null string (blank)

If the **rle**, **lfst**, or **rep** parameter is not specified—the value in the LFS database

:data= (optional)

This parameter specifies the data used with the *octet* or *alternate* patterns.

Range: **1-255**

Default: **255**

:force= (optional)

The **force=yes** parameter must be specified to start a test when there are 256 or more tests already running.

Range: **yes, no**

Default: **no**

:lbp= (optional)

Loopback point ID. This parameter specifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range: **1-32**

Default: If the **rle**, **cli**, **rep**, or **lfst** parameter is specified, the default is **1**.
If the **rle**, **cli**, **rep**, and **lfst** parameters are not specified, the default is all loopback points found in the LFS database (up to 32 loopback points), as shown in the **rtrv-lbp** command output.

:lfst= (optional)

Link fault sectionalization test. This parameter specifies the type of link fault sectionalization loopback test to be performed.

This parameter is mandatory if the **rle**, **cli**, or **rep** parameter is specified.

Range: **LLT**, **MLT**, **NLT**

LLT— latching loopback test; a software latch is set at the test point to reverse everything that is received and return it to the sender until the test is complete

MLT— manual latch loopback test; an external hardware latch has been set to reverse everything that is received and return it to the sender until the test is complete (for equipment that cannot set a software latch for the test)

NLT— nonlatching loopback test; no permanent latch is set. Loopback codes are alternated with test data until the test is complete.

Default: The value in the LFS database, as shown in the **rtrv-lbp** command output

:maxerr= (optional)

The bit error threshold. This parameter specifies the actual number of errors allowed for a specific time period during which loopback testing is being performed. If this threshold is exceeded, the *TEST STATUS* field in the output report indicates an error.

Range: **0-4838400**

Default: **56**

:pattern= (optional)

This parameter specifies the type of test pattern used to perform the LFS test.

Range: **b2047**, **b511**, **octet**, **alternate**

b2047— 047-bit Bert pattern sent until it is stopped by software

b511— 511-bit Bert pattern sent until it is stopped by software

octet— Data (from the **data** parameter) sent continuously until it is stopped by software

alternate— Alternately, a count of 100 octets of the specified data (from the **data** parameter) followed by 100 octets of **0**, sent until it is stopped by the software

The **octet** and **alternate** values are valid only when **lfst=llt** is specified.

Default: **b2047**

:rep= (optional)

Repetition count. This parameter specifies the number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: **0-31**

Default: If the **rle**, **cli**, **rep**, or **lfst** parameter is specified, the default is **0**.

If the **rle**, **cli**, **rep**, or **lfst** parameter is not specified, the default is the value in the LFS database, as shown in the **rtrv-lbp** command output.

:rle= (optional)

Remote link element. This parameter specifies the link element to be looped back for testing.

This parameter is mandatory if the **lfst**, **cli**, or **rep** parameter is specified.

Range: **ds0**, **ocu**, **csu**, **dsu**, **nei**

Default: The value from the LFS database, as shown in the **rtrv-lbp** command output

:time= (optional)

This parameter specifies the length of time the test must be run in order to determine success or failure. If the number of errors that actually occur during this time exceeds the threshold set by the **maxerr** parameter, the loopback test is identified as a failure.

Range: 1-240000
hhmmss—*hh*=hours (00-24), *mm*=minutes (00-59), *ss*=seconds (00-59)
 For example, **time=1** or **time=000001** is one second; **time=240000** is 24 hours;
time=200 or **time=000200** is 2 minutes

Default: 1 second

Example

Activate tests for all loopback points that are defined in the LFS database table:

```
act - lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=000200
```

Activate a test for a single loopback point that is not defined in the LFS database table:

```
act - lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:cli=r lghncxa05w
```

```
act -
```

```
lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:cli=r lghncxa05w:patte  
rn=octet:data=h'ff
```

```
act -
```

```
lbp:loc=1205:link=b:lbp=1:rle=ds0:lfst=llt:cli=r lghncxa05w:maxe  
r=40:time=12000
```

Activate a test for a single loopback point that is defined in the LFS database table:

```
act -
```

```
lbp:loc=1205:link=b:lbp=3:pattern=alternate:maxerr=10:time=000200
```

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

The **rle=ds0** or the **rle=nei** parameter cannot be specified if the **lfst=nlt** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If one or more of the **rle**, **rep**, **lfst**, or **cli** parameters are specified, the database is not used to look up their values; therefore, the **lfst** and **rle** parameters must be specified when the **rep** or **cli** parameter is specified.

The **data** parameter can be specified only if the **pattern=octet** parameter or **pattern=alternate** parameter is specified.

The **pattern=octet** and **pattern=alternate** parameters cannot be specified for non-latching tests (**rle=nlt**).

The card location (**loc** parameter) must contain a provisioned and equipped **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card in the **loc** parameter location must be in the In-Service-Normal state.

The signaling link that is used for LFS testing must be equipped, and must be deactivated before this command is entered.

The loopback points (LBPs) must have been previously defined in the database.

Only one LFS test can be active on a signaling link at a time.

This command cannot be entered for a signaling link LFS test when the maximum number of LFS tests are active for the card. At least one LFS test must complete before this command can be entered again.

On LIM-AINF, LIM-ILA, LIM-EILA, and MPL cards (type LIMDS0 cards), only one LFS test can be active on a card at a time.

On the following cards, up to 8 LFS tests can be active on a card at a time:

- E1/T1 MIM cards or HC-MIM cards used as T1 cards
- E1/T1 MIM cards used as LIMCH cards associated with a T1 card
- MPL-T cards (type LIMDS0)

This command cannot be entered when the maximum combined total number of LFS and link tests (1024) are in progress in the system. At least one test must complete before this command can be entered again.

The **force=yes** parameter must be specified to activate a test when there are 256 or more tests already running in the system.

The specified signaling link must not be running a **tst-slk** test when this command is entered. The **tst-slk** test must be stopped or allowed to complete before this command can be entered for the link.

The specified signaling link must not be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link.

This command cannot be entered for a link that is already blocked by another link diagnostic test. The test must be canceled or allowed to complete before this command can be entered for the link.

LFS testing is not available during upgrade.

The maximum number of loopback point entries allowed in the LFS table is 32.

Notes

The **act-lbp** command is not supported for **limatm** cards.

If an LFS test is aborted by a card reset, it can leave the remote far-end loopback condition active. Use the **dact-lbp** command to cancel LFS tests.

The E1/T1 MIM card and the HC-MIM card support this command on up to 8 T1 channels at a time; the command is not supported for E1.

The test can terminate with the status "ERROR, bit error exceeded threshold" for two reasons.

- The number of cumulative bit errors exceeds the specified **maxerr** parameter value.
- The number of bit errors for one second reaches or exceeds 255, without considering the **maxerr** parameter value.

Output

The LFS report is displayed when the LFS test completes.

The following example shows how the test failed because the bit error rate exceeded the threshold. Here the **maxerr=10** parameter is used for a test time of 2 minutes. Because more than 10 errors occurred within 2 minutes, the test is considered a failure and the **TEST STATUS** field displays the cause. The parameter values are applied to each loopback point. The **maxerr** value is per test, not cumulative for all tests.

act - lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=002000

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
LOC = 1205 Link = B LSN = ls11345678 Start time = 11:10:34
```

PATTERN = ALTERNATE DATA= FF MAXERR = 10 TIME = 00:02:00

TEST STATUS = ERROR, bit error exceeded threshold.

LBP	CLLI	RLE	REP	LFST	BIT_ERROR	ERRORED_SEC	DURATION
2	rlghncxa05w	DS0	0	LLT	0	0	00:02:00
3	-----	OCU	0	NLT	8	2	00:02:00
5	-----	NEI	0	LLT	15	1	00:01:20

;

In the following example, the test failed because the loopback could not be established.

act - lbp:loc=1205:link=b:pattern=alternate:maxerr=10:time=000200

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
LOC = 1205 Link = B LSN = ----- Start time = 11:10:34
```

PATTERN = ALTERNATE DATA= FF MAXERR = 10 TIME = 00:02:00

TEST STATUS = ERROR, loopback was not established.

LBP	CLLI	RLE	REP	LFST	BIT_ERROR	ERRORED_SEC	DURATION
1	rlghncxa05w	DS0	0	LLT	0	0	00:00:00

;

Legend

LOC—Card location that contains the signaling being tested.

LINK—Signaling link that is being tested on the card.

LSN—Name of the linkset that contains the link being tested.

START TIME—Time that the test started.

PATTERN—Type of test pattern used to perform the LFS test.

DATA—Data used with the **octet** or **alternate** patterns.

MAXERR—Bit error threshold; actual number of errors allowed for the specific time period during which loopback testing is being performed. If this threshold is exceeded in the specified time period, the **TEST STATUS** field in the output report indicates an error.

TIME—Specified length of time to run the test in order to determine success or failure. If the number of errors that actually occur during this time exceeds the threshold set by the **maxerr** parameter, the loopback test is identified as a failure.

TEST STATUS—Any one of the following **TEST STATUS** values can appear:

- PASS
- ERROR, LFS HARDWARE is not available.
- ERROR, loopback could not be established.

- ERROR, bit error exceeded threshold.
- ERROR, LFS test aborted.
- ERROR, LFS hardware failed.

LBP—Loopback point used to perform the LFS test.

CLLI—Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

RLE—Remote link element to be looped back for testing.

REP—Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

LFST—Type of link fault sectionalization loopback test to be performed.

BIT_ERROR—The number of bit errors observed during the test.

ERRORED_SEC—The number of seconds that contained bit errors during the test. (Bit errors are sampled once per second; each sample that contains bit errors adds one second to this count.)

DURATION—Length of time that the test actually ran for the loopback point. For successful test, the TIME and the DURATION should be the same. If a test ran for less than the specified amount of time, the DURATION will be less than the TIME.

act-lpo

Activate Local Processor Outage

Use this command to force a processor outage on the specified link. The system begins sending link status signal units (LSSUs) with a status of SIPO to the adjacent signaling point. Level 2 status remains in service, except when the link is an ATM high-speed signaling link.

NOTE: The signaling link's blocked status is not preserved across a LIM reboot.

Keyword: act-lpo

Related Commands: blk-slk, canc-lpo, rept-stat-slk, ublk-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

act-lpo:loc=1101:link=a

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- An E1/T1 MIM or HC MIM card running the **ss7ansi** or **ccs7itu** application

This command can be entered for IPLIMx signaling links only when they have an **ipliml2** parameter setting of **m2pa**.

The **act-lpo** command is not valid for DCM cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only for the following cards:

- A multi-port LIM
- An E1/T1 MIM
- An HC MIM

Notes

The function of this command is the same as the **blk-slk** command.

This command generates an alarm.

If the **act-lpo** command is followed by the **init-card** command, the local processor outage is not preserved after the **init-card** command completes.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
act - lpo: loc=1101: link=a
tekelecstp 05-01-21 17:00:36 EST  EAGLE5 33.0.0
Local processor outage being set.

tekelecstp 05-01-21 17:00:36 EST  EAGLE5 33.0.0
* 0014.0208 * SLK 1101,A nc00027 slk local blocked
```

act-oap-config

Activate OAP Configuration

Use this command to update the OAPs with the configuration data entered into the EAGLE 5 ISS database with the **chg-oap-config** command.

The **act-oap-config** command also sends the EAGLE 5 ISS Site ID to the OAPs. See the **chg-sid**, **ent-lnp-serv**, and **chg-lnp-serv** commands for more information.

CAUTION: Before the **act-oap-config** command can be entered, the EAGLE 5 ISS database must be provisioned with required data for the SEAS feature, depending on which of those features are turned on. If this information is left blank or incorrectly provisioned and the act-

oap-config command is entered, the OAP may lose SEAS or LSMS connectivity. The requirements are discussed in the Dependencies section for this command.

Keyword: act-oap-config

Related Commands: chg-lnp-serv, chg-oap-config, chg-sid, dlt-lnp-serv, ent-lnp-serv, rtrv-lnp-serv, rtrv-oap-config, rtrv-sid

Command Class: Database Administration

Parameters

:force= (optional)

Force the EAGLE 5 ISS to provision only one OAP in a dual OAP configuration.

Range: yes, no

Default: no

:oap= (optional)

The OAP being updated.

Range: a, b, all

Default: all

Example

act-oap-config:oap=a:force=yes

Dependencies

Table 5-1 shows the fields of the **rtrv-oap-config** command output that must be configured depending on which feature is on. Table 5-1 also shows the parameters of the **chg-oap-config** command that are used to configure the OAP configuration data.

If the required information for a feature has already been configured in the EAGLE 5 ISS database, you do not have to re-enter all the parameters for that feature when you make a change. It is mandatory, however, that the configuration data in the EAGLE 5 ISS and the OAP database match.

Table 5-1. Parameters That Must Be Provisioned Prior to Updating OAP

Feature	Fields Displayed	Required Entry before Configuration can be sent to the OAP	chg-oap-config Parameter
SEAS	SEAC CLI	An entry is required if the SEAS feature is on.	seaccli
	X25 Packet Size	An entry is required if the SEAS feature is on.	x25ps
	X25 Mode	An entry is required if the SEAS feature is on.	x25mode
LNP	Active LSMS	An entry is required if the LNP feature is on.	lsms
	Main LSMS NSAP	An entry is required if the lsms=main parameter is specified.	mnsap
	Main LSMS SSEL	An entry is required if the lsms=main parameter is specified.	mpsel

Table 5-1. Parameters That Must Be Provisioned Prior to Updating OAP

Feature	Fields Displayed	Required Entry before Configuration can be sent to the OAP	chg-oap-config Parameter
	Main LSMS PSEL	An entry is required if the lsms=main parameter is specified.	mssel
	Shadow LSMS NSAP	An entry is required if the lsms=shadow parameter is specified.	snsap
	Shadow LSMS SSEL	An entry is required if the lsms=shadow parameter is specified.	spsel
	Shadow LSMS PSEL	An entry is required if the lsms=shadow parameter is specified.	sssel
Either SEAS or LNP features	Hostname	An entry is required.	aname and bname
	IP Address	An entry is required if the LNP feature is on.	aipaddr and bipaddr
	IP Netmask	An entry may be required depending on the network configuration.	anmask and bnmask
	Default Router	An entry may be required depending on the network configuration.	arouter and brouter
	Config	An entry is required.	cfg

Table 5-2 shows other data not shown in the **rtrv-oap-config** command output that must be provisioned in the database before the OAP configuration can be updated.

Table 5-2. Other Data Required for Updating the OAP Configuration

Feature	Data Required Before an OAP can be Updated
Either SEAS or LNP features	EAGLE 5 ISS CLI - configured with the cli parameter of the chg-sid command
LNP	The LNP services class , liddb , cnam , and isvm configured with the serv parameter of either the ent-lnp-serv or chg-lnp-serv command

To keep OAP parameters in sync with the EAGLE 5 ISS, a checksum is created using all of the OAP configuration data stored on the EAGLE 5 ISS (shown in Table 5-1 and Table 5-2). The OAP also calculates this checksum based on the data it has. The OAP returns this checksum every 5 seconds. The EAGLE 5 ISS compares the checksums and generates the following alarm within 10 seconds of any mismatch.

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
```

```
* nnnn.0364 * OAP A Configuration data checksum mismatch
```

The alarm is cleared when a maintenance poll returns a checksum that matches the EAGLE 5 ISS' checksum, indicating that the databases are back in sync. The EAGLE 5 ISS clears the alarm within five seconds. The following UAM clears the alarm:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
```

```
nnnn.0365          OAP A      Configuration data checksum alarm cleared
```

If the **oap=a**, **oap=b**, or **oap=all** parameter is specified with the **act-oap-config** command, then the link from the EAGLE 5 ISS to the specified OAP must be in service.

If the **oap=a** or **oap=b** parameter is specified, the **force=yes** parameter must be specified.

Notes

To configure the OAP from the EAGLE 5 ISS, the procedure "Configuring the OAP from the EAGLE 5 ISS STP Terminal" in the *System Manual – EOAP* is recommended.

It is recommended that only one OAP be updated at a time. Although the **act-oap-config** command completes immediately on the EAGLE 5 ISS, processing on the OAP may take over 10 minutes depending on which parameters changed and which OAP hardware is installed. Also, whenever some parameters are changed, the OAP reboots to use the new data. The reboot interrupts the connection between that OAP and the SEAC or LSMS. By updating only one OAP at a time, the EAGLE 5 ISS and the SEAC or LSMS will not be isolated, as one OAP is always connected to the SEAC or LSMS.

Table 5-3 shows the fields of the **rtrv-oap-config** command output that must be configured depending on which feature is on. Table 5-3 also shows the parameters of the **chg-oap-config** command that are used to configure the OAP configuration data.

Table 5-3. Performance Impact of act-oap-config parameters

Configured Parameter Group	OAP Action					
	Restart Q3 Links	Restart Q3 and SEAS Links	Bring Down, Rebuild, Bring Up Q3 and SEAS Links:	Bring Down Q3 and SEAS Links; Reboot OAP	Bring Down and Rebuild Q3 and SEAS Links; Reboot OAP	Total Time Required (in seconds)
Group A mpsel/spsel mssel/sssel mnsap/snsap serv	X					≤ 65
Group B x25ps, x25mode		X				≤ 260
Group C clli, seaccli			X			≤ 320

Table 5-3. Performance Impact of **act-oap-config** parameters

Configured Parameter Group	OAP Action					
	Restart Q3 Links	Restart Q3 and SEAS Links	Bring Down, Rebuild, Bring Up Q3 and SEAS Links:	Bring Down Q3 and SEAS Links; Reboot OAP	Bring Down and Rebuild Q3 and SEAS Links; Reboot OAP	Total Time Required (in seconds)
Group D aname/bname aipaddr/bipaddr anmask, bnmask arouter/brouter				X		≤ 560
Group A and B		X				≤ 260
Group A and C			X			≤ 320
Group A and D				X		≤ 560
Group A, B, and C			X			≤ 320
Group A, B, and D				X		≤ 560
Group A, C, and D			X	X		≤ 620
Group B and C			X			≤ 320
Group B and D			X	X		≤ 620
Group B, C, and D			X	X		≤ 620
Group C and D					X	≤ 620

The OAP is named and addressed according to the terminal port number on the EAGLE 5 ISS control shelf backplane that the OAP is connected to. The terminal ports are numbered from MMI 0 to MMI 15. OAP A is connected to the lower numbered terminal port and OAP B is connected to the higher numbered terminal port. If the terminal port connections for the OAPs change, the names for OAPs A and B could be reversed. For example, OAP A is connected to MMI 3 and OAP B is connected to MMI 9. At some later time, OAP A is moved from MMI 3 to MMI 12. Because of this move, OAP A is now OAP B, and what was OAP B is now OAP A.

Output

```
act-oap-config:oap=a:force=yes
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  ACT-OAP-CONFIG: MASP A - COMPLTD
;
```

act-slk**Activate Signaling Link**

Use this command to change the link from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal).

NOTE: The signaling link's activated status is preserved across a card reboot.

Keyword: act-slk

Related Commands: blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

act-slk:loc=1301:link=a

Dependencies

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmsansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- A DCM or SSED CM or E5-ENET card running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application
- An E1/T1 MIM card or an HC MIM card running the **ss7ansi** or **ccs7itu** application

This command cannot be entered while the **tst-slk** command is in progress.

A card location that is defined in the database must be specified.

The card must contain signaling links.

No other action command can be in progress when this command is entered.

The specified signaling link must be provisioned in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

Notes

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
act-slk:loc=1301:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Activate Link message sent to card
;
```

act-user

Activate User

This command is an alternate to the **login** command. Use this command to log into the system. After this command is entered, the system requests a password. For security reasons the password is not echoed to the terminal.

Keyword: act-user

Related Commands: chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

:uid= (mandatory)

User ID. The system prompts you for a valid password after this ID is entered.

Range: azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters; the first character must be a letter.

Example

```
act-user:uid=john
```

Dependencies

The first character of the user ID must be a letter.

Notes

CAUTION: If the OA&P IP Security Enhancements feature is not turned on, a serial terminal (terminals 1-16) must be used to log in with a new Userid and password for the first time or to change an expired password. The OA&M IP Security Enhancements feature must be turned on before you can change the password at the prompt from an IP User Interface telnet terminal (IDs 17-40) when:

- It is the first time the user is logging in with the assigned Userid and password.
- The password has expired because of aging out.

The **login** command can be used instead of **act-user**. The command **act-user** has been provided in accordance with OTGR standards.

When a new system is shipped, the user ID and password are set to the system. Change these immediately to ensure system security.

The OAP is named and addressed according to the terminal port number on the EAGLE 5 ISS control shelf backplane that the OAP is connected to. The terminal ports are numbered from MMI 0 to MMI 15. OAP A is connected to the lower numbered terminal port and OAP B is connected to the higher numbered terminal port. If the terminal port connections for the OAPs change, the names for OAPs A and B could be reversed. For example, OAP A is connected to MMI 3 and OAP B is connected to MMI 9. At some later time, OAP A is moved from MMI 3 to MMI 12. Because of this move, OAP A is now OAP B, and what was OAP B is now OAP A.

Output

Not applicable.

alloc-mem

Allocate Memory

Use this command to create up to five additional LNP 4DIGIT database objects, each capable of containing up to 2 million ported telephone numbers. (The standard EAGLE 5 ISS contains a single LNP 4DIGIT database object.) If all five additional LNP 4DIGIT database objects are configured in the database, the database can contain 12 million ported numbers.

NOTE: This command is obsolete.

NOTE: The alloc-mem:num command cannot be entered to create an LNP 4DIGIT database object that, when added to the number of previously created LNP 4DIGIT database objects, would exceed the maximum number allowed.

Keyword: alloc-mem

Related Commands: rtrv-mem

Command Class: LNP Database

Parameters

:obj= (mandatory)

The type of database object to create.

Range: lnp4digit

:num= (optional)

The number of database objects to create.

Range: 1-5

Default: 1

Example

```
alloc-mem:obj=lnp4digit:num=1
```

Dependencies

An LNP ported TNs feature key of sufficient quantity must be on before the **alloc-mem** command can be executed (see the **enable-ctrl-feat** command and Table 5-4).

LNP 4DIGIT objects can be created with the **alloc-mem** command only if the capacity of the fixed disk drives on the TDMs (Terminal Disk Modules) and the amount of memory on the TSM (Translation Services Modules) memory is sufficient to support the number of ported telephone numbers allowed by the number of LNP 4DIGIT objects configured in the database (one plus the value of the **num** parameter). Table 5-4 shows the TSM and TDM requirements.

Table 5-4. TSM and TDM Memory Requirements

Number of LNP 4DIGIT Objects	Number of Ported Numbers Supported	TSM Memory Requirements	Fixed Disk Drive Capacity Requirements
1	2 Million	256 Mbytes	4 Gigabytes
2	4 Million	512 Mbytes	4 Gigabytes
3	6 Million	768 Mbytes	4 Gigabytes
4	8 Million	1024 Mbytes	4 Gigabytes
5	10 Million	1024 Mbytes	4 Gigabytes
6	12 Million	1024 Mbytes	4 Gigabytes

Notes

If an in-service TSM does not have sufficient memory to support the number of ported telephone numbers allowed by the number of LNP 4DIGIT objects configured in the database, the EAGLE 5 ISS is considered to be in degraded mode and the **alloc-mem** command is rejected. The **rept-stat-card:loc=<SCCP card location>;mode=full** command can be used to display the status and the amount of memory for the TSMs equipped in the database.

Output

```
alloc-mem:obj=lnp4digit:num=1
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Memory allocation complete.
;
```

alw-card**Allow Card**

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful.

Keyword: alw-card

Related Commands: dlt-card, ent-card, inh-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: System Maintenance

Parameters

:loc= (mandatory)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:code= (optional)

This parameter specifies the GPL type to be loaded.

CAUTION: Do not enter the **pktgen** or utility values for this parameter unless instructed to do so by Tekelec personnel.

Range: **appr**, **pktgen**, **trial**, **utility**

appr — Downloads the approved GPL

pktgen — Downloads the **pktgen** GPL for the appropriate hardware type. This GPL is to be used only for engineering test purposes and must not be used in customer installations without engineering oversight.

trial — Downloads the trial GPL

utility — Downloads the CDU or VCDU GPL for the appropriate hardware type. This GPL is used primarily by the factory for testing purposes.

After the **pktgen** GPL is initially downloaded to a card by the **alw-card** command, the **pktgen** GPL will continue to be downloaded to the card until another **alw-card** command is issued.

Default: **appr**

:data= (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP (see the **enable-ctrl-feat** command), G-Flex, G-Port, or INP feature is on. This parameter is applicable only to network cards containing the LNP database (SCCP, EBDABLM) or the MPS database (VSCCP).

NOTE: Various conditions in the system may prevent the persistence of the data on the cards.

Range: **refresh**, **persist**

refresh — Causes data to be reloaded to the specified card.

persist — Indicates that the database is not to be reloaded to the card. This parameter is used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place (for example, that the TSM/BLM card is present and ready and that the downloaded LNP database is coherent. The LNP database audit cannot be performed prior to the card reset.) During the card initialization and loading sequence, a warm restart is performed if the card meets the warm restart conditions, as described in the Notes section of this command.

Default: **refresh**

Example

alw-card:loc=2301:code=trial

alw-card:loc=1101:data=persist

Dependencies

The following card locations are not valid for this command: **1117**, **1118**, and all **xy 09** and **xy 10** locations (where *x* is the frame and *y* is the shelf).

The active and standby TDM card locations and the card location that is running the active OAM cannot be specified in the **loc** parameter.

The shelf and card must be equipped.

If the card is a LIM, a signaling link must be assigned to the card before the card can be allowed.

No other action command can be in progress when this command is entered.

An SCCP card cannot be reset when the system is in LNP degraded mode.

The LNP (see the **enable-ctrl-feat** command), G-Flex, G-Port, or INP feature must be turned on before the **data** parameter can be specified.

The **data** parameter is valid only for SCCP and EBDABLM card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

Notes

The function of this command is the same as the **rst-card** command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of the warm restart feature.

A number of reasons exist for not being able to warm restart. If none of these conditions exists, a warm restart is possible and will be attempted following a SCCP/EBDABLM or VSCCP card reset.

- The following conditions require a full data reload:
 - **AUDIT FAILED**—The checksum comparisons of the LNP database failed during card initialization. Data on the card is determined to be corrupted after the reset (was not yet detected by normal auditing).
 - **AUDIT TIMEOUT**—The LNP initialization audit timed out (software failure).
 - **DB LEVEL**—The database level is not supported, or the difference exceeds incremental loading capability. This condition is caused by the reset of OAMs or if the number of updates exceeds the incremental loading capability.
 - **DB STATUS**—The database status of the card is incoherent at the time of a reset. This condition can be caused by a failed network card update or a reset during a database update to the card.
 - **DB VERSION**—The LNP Database version has changed from the previous version. An online memory allocation (**alloc-mem**), import or bulk downloads (**chg-db**), or changes from release to release may alter the database version.
 - **HW ERROR**—The hardware error bit checks on the card failed during card initialization.
 - **NO AUDIT**—Unable to perform an LNP audit. The LNP audit is not on (for example, LNP options has **audit=off**). This condition can occur if the rate of LNP updates exceeds the ability of the LNP audit to compute checksums (excessive unknown checksums). This condition is more likely on a small database where there are fewer checksums. The percentage of known checksums must be 99% or more. The percentage is based on the number of checksums in use, which is smaller for small databases (such as two million TNs or fewer).
 - **POWER ON**—A power on reset (the card is pulled and reinserted).
 - **UNKNOWN/OTHER**—An unknown or other type of software failure.
 - **USER REQUEST**—A user-initiated **init-card** or **init-sys** command **reload type=cold**. The default restart type for these commands is a cold or full LNP data reload. The user must specify **data=persist** for a warm restart on command.
 - **XILINX VERSION**—The M256 Xilinx program version has changed from the previous version.
- The following conditions require an MCPM card cold restart:

- **DB STATUS**—The database status of the card is incoherent at the time of a reset. This condition can be caused by a failed network card update or a reset during a database update to the card.
- **MEAS DB**—A measurements database Init failure or corruption.
- **POWER ON**—A power on reset (card is pulled and reinserted).
- **UNKNOWN/OTHER**—An unknown or other type of software failure.
- **XILINX VERSION**—The D1G Xilinx program version has changed from previous version.

CAUTION **CAUTION: This command can be used to enable Measurements Platform measurements collection after the collection function has been disabled with the inh-card command for ALL MPCM cards in the system. To enable collection, at least 1 MPCM card must be allowed in the system. Disabling collection by inhibiting all MCPM cards CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS.**

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated

```

If a location for an E1/T1 MIM card (type **lime1**, **limt1**, or **limch**), HC-MIM card (type **lime1** or **limt1**), or E5-E1T1 card (type **lime1** or **limt1**) is specified, at least one signaling link must be provisioned for that card before it can be allowed.

Output

```
alw-card: loc=2301:code=trial
rlghncxa03w 06-06-01 11:11:28 EST EAGLE 35.0.0
Card has been allowed.
;
```

alw-imt**Allow IMT**

Use this command to change the state of the specified Interprocessor Message Transport (IMT) bus from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal), if the command is successful. If the command fails, the status is IS-ANR (In-Service-Abnormal). The IMT bus is comprised of two 125 Mbps counter-rotating serial busses. If one bus fails, the other immediately assumes control of all messages.

Keyword: **alw-imt**

Related Commands: **clr-imt-stats**, **conn-imt**, **disc-imt**, **inh-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**, **rst-imt**, **tst-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)

This parameter specifies the IMT bus whose status you want to change.

Range: **a, b**

Example

```
alw-imt:bus=a
```

Dependencies

This command cannot be entered during an IMT Fault Isolation Test.

Notes

This command returns an inhibited IMT bus to service.

The function of this command is the same as the **rst-imt** command.

See the **tst-imt** command to determine the location of faults on a failed or abnormal IMT bus.

Output

```
alw-imt:bus=a
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Allow IMT Bus A command issued.
```

```

```

alw-map-ss**Allow Mated Application Subsystem**

Use this command to activate a subsystem and bring it online. Currently, the LNPQS, INPQS, and Equipment Identity Register (EIR) subsystems can be allowed and inhibited.

Keyword: **alw-map-ss**

Related Commands: **inh-map-ss**, **rept-stat-lnp**, **rept-stat-sccp**

Command Class: System Maintenance

Parameters

:ssn= (mandatory)

Subsystem number. This parameter specifies the LNP, INP, or EIR subsystem number.

Range: **2-255**

Example

a lw-map-ss:ssn=10

Dependencies

No other action command can be in progress when this command is entered.

The EAGLE 5 ISS must be configured with at least one TSM card running the **sccp** application or one DSM card running the **vsccp** application.

The LNP feature (see the **enable-ctrl-feat** command) or the INP feature must be turned on, or the EIR feature must be enabled and turned on before this command can be entered.

The specified **ssn** parameter value must represent the LNPQS, INPQS, or EIR subsystem.

The LNPQS, INPQS, or EIR subsystem must be online in the database before this command can be entered.

The LNPQS, INPQS, or EIR subsystem must be out-of-service maintenance disabled (OOS-MT-DSBLD) for command action to occur. Otherwise, the command is accepted and no action occurs.

Notes

None

Output

```
a lw-map-ss:ssn=11
integrat40 00-05-24 10:37:22 EST EAGLE5 31.0.0
Allow map subsystem command sent to all SCCP cards.
Command Completed.
;
```

alw-slk**Allow Signaling Link**

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

NOTE: The signaling link's inhibited status is not preserved across a card reboot.

Keyword: alw-slk

Related Commands: act-slk, blk-slk, canc-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

This parameter specifies the signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,

4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

alw-slk:loc=1301:link=b

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

This command is not valid on TCP/IP point to multipoint links (DCM cards equipped with SS7IPGW links).

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only for the following cards:

- A multi-port LIM card
- An SSED CM card running the **iplim** or **iplimi** application that supports 8 points
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card

The card that contains the specified signaling link must be equipped in the specified card location.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HPR card, or the cards running the OAM application.

If the card in the specified card location is an SSED CM card running the **iplim** or **iplimi** application, the specified link must have an **ipliml2** parameter value of **m2pa** or **saaltali** (see the **ent-slk** command).

Notes

The function of this command is the same as the **unhb-slk** command.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
alw-slk:loc=1301:link=b
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Allow Link message sent to card
;
```

alw-trm

Allow Terminal

Use this command to return the specified serial port to the state IS-NR (in-service normal) from the state OOS-MT-DSBLD (out-of-service maintenance-disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (out-of-service maintenance).

Keyword: **alw-trm**

Related Commands: **act-echo**, **canc-echo**, **chg-trm**, **dact-echo**, **inh-trm**, **rept-stat-trm**, **rmv-trm**, **rst-trm**, **rtrv-trm**

Command Class: System Maintenance

Parameters**:trm=** (mandatory)

The ID of the serial port to be put into service.

Range: 1-40**Example****alw-trm:trm=5****alw-trm:trm=23****Dependencies**

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.The terminal specified by the **trm** parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

NotesThe function of this command is the same as the **rst-trm** command.

When you attempt to return to service a terminal that is already in service, a warning message is echoed to the scroll area but no action is taken.

Output**alw-trm:trm=12**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Allow message sent to terminal
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
```

;

aud-data**Audit Data**

Use this command to perform a data audit, which is used to determine the integrity of the database. The data audit is separate from the GPL audit, which determines if a specified GPL is at the correct version level.

Keyword: aud-data**Related Commands:** rept-stat-db, rtrv-gpl**Command Class:** System Maintenance**Parameters****:display=** (optional)

Indicates the scope of the display, whether it is a brief display or full display. The output includes the type and location of the card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

Range: all, brief, except**all**—Contains the actual checksum values (in hexadecimal) and details for each individual GPL and each subset of the current and backup database**brief**—Contains data collections for the current database, the backup database on the fixed disk and the approved and trial GPLs

except—Contains the same as **display=all**, except that only the GPLs or database subsets with problems are displayed

Default: **brief**

Example

aud-data:display=all

Dependencies

Only one **aud-data** command can be in progress at a time.

Notes

The standby OAM must be available when the **aud-data** command commences so that the standby OAM can receive the signal to begin auditing. If the standby OAM is not available when **aud-data** is issued, then the following messages are issued:

Extended Processing Time Required
Standby MASP is (or was) not available at audit start.

The above messages may also appear if the standby OAM is not available when the hourly periodic audit, which uses the **aud-data** command, automatically starts. Because the standby OAM is not performing any auditing, no audit results for the standby OAM are displayed in the audit report. Instead, the standby's audit results are as follows:

No information currently available

If an auditing cycle completes on either the active or standby OAM and does not produce the full set of expected results (i.e., checksums), the following message appears:

Audit results may be incomplete

The audit results may be missing some of the checksums that would normally be displayed (**:display=all** or **:display=except**). The results may also contain summary status information (**:display=brief**) that might have been calculated differently had some of the missing checksums been available. This condition can be caused if the audit results for the backup database are missing, probably because a backup database has not been created.

If the "Audit results may be incomplete" message appears in the audit report, perform the following procedure:

Procedure - Audit Data

- 1 Ensure that the standby OAM is online and ready.

- 2 Enter the following command to ensure that a backup database has been created:
rept-stat-db
If no backup has ever been created, the output shows the fixed disk backup (FD BKUP) database at level 1. There will be no information under the heading "Time Last Backup."

- 3 If necessary, create a backup on the fixed disk by entering the following command:
chg-db:action=backup:dest=fixed

- 4 Re-enter the **aud-data** command.

If the standby OAM does not run an audit cycle and no audit information is available, the following message appears:

Audit results are not available

This condition is probably caused by the standby OAM rebooting while an audit cycle is underway. If this message appears, ensure that the standby OAM is available and re-enter the **aud-data** command. Ensure that the standby OAM remains up (is not rebooted) for the duration of the audit cycle.

Output

The following example shows a full display. This example applies only to STP databases.

aud-data:display=all

```

;

Legend

CARD—The card type

DATA—The type of data being audited:

APPR—The approved GPL

BKUP—The database in the backup partition

CCS7ITU—The CCS7ITU GPL

CRNT—The database in the current partition

DBMM—The database management mechanism database

GLS—The GLS GPL

GTT—The global title translation database

GWS—The gateway screening database

MISC—The miscellaneous system configuration database
MTP—The message transfer part database (links, linksets, routing tables)
OAM—The OAM GPL
SCCP—The SCCP GPL
SS7ANSI—The SS7ANSI GPL
SS7GX25—The SS7GX25 GPL
SUBSET or GPL—Indicates whether the data is a part of the database or a generic program load.
TRI—The trial GPL

LOC—The location of the card
NEW CS—The new checksum value calculated by this command
OLD CS—The checksum value stored in the database or GPL
REF CS—The reference checksum value stored on the active MASP
STATUS—The status of the database or GPL, as one of the following conditions:

- **CORRUPTED**—The database or GPL has been changed by some abnormal process. The GPL cannot be used
- **DIFFERENT**—The database or GPL contains information that is not consistent with the reference database or GPL
- **OK**—The database or GPL is not corrupted and contains the same information as the reference database or GPL

blk-slk

Block Signaling Link

Use this command to force a local processor outage (LPO) on the specified link. The system begins sending link status signal units (LSSU) with status of processor outage (SIPO) to the adjacent signaling point.

CAUTION

CAUTION: Maintenance personnel should use this command only to block MSUs from being sent to the system. Level 2 status remains in service, except when the link is an ATM high-speed signaling link.

NOTE: The signaling link's blocked status is not preserved across a card reboot.

Keyword: blk-slk

Related Commands: blk-slk, canc-lpo, rept-stat-slk, ublk-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

This parameter specifies the signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

blk-slk:loc=2311:link=a

blk-slk:loc=2312:link=a

Dependencies

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

This command is not valid for DCM cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

The card that contains the specified signaling link must be equipped in the specified card location.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

If the card in the specified card location is an SSED CM card running the **iplim** application, the specified link must have an **ipliml2** parameter value of **m2pa** (see the **ent-slk** command).

If the card in the specified card location is an SSED CM card running the **iplimi** application, the specified link must have an **ipliml2** parameter value of **saaltali** (see the **ent-slk** command).

Notes

The function of this command is the same as the **act-lpo** command.

This command generates a minor alarm. Refer to the *Maintenance Manual* for information on MRNs 0201 and 0208.

If the **blk-slk** command is followed by the **init-card** command, the signaling link blockage is not preserved after the **init-card** command completes.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

```
blk-slk:loc=2311:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Local processor outage being set.
```

;

In the following example, no signaling link has been defined for link a.

```
blk-slk:loc=2312:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Link is UNEQUIPPED in the database.
Local processor outage being set.
```

;

In the following example, slot 55 in the card location is not valid.

```
blk-slk:loc=2355:link=a
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Rejected: Slot ID out of range
```

;

canc-alm-trns**Cancel Alarm Transfer**

Use this command to return all audible alarm indications to the local office.

Keyword: **canc-alm-trns**

Related Commands: **act-alm-trns**, **dact-alm-trns**, **rept-stat-cdt**, **rept-stat-clk**, **rept-stat-trbl**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
canc-alm-trns
```

Dependencies

None

Notes

No other action command can be in progress when this command is entered.

The function of this command is the same as the **dact-alm-trns** command.

After the **canc-alm-trns** command is entered, the **rept-stat-alm** command can be entered to verify the status of the alarms.

Output

```
canc-alm-trns
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Alarms returned to Local Maintenance Center
Command Completed.
```

;

canc-cmd**Cancel Command**

This command halts processing and output of the commands listed in Table 5-5.

Table 5-5. Commands for which **canc-cmd** Halts Processing and Output

Commands		
rept-imt-info	rtrv-as	rtrv-map
rept-stat-applsock	rtrv-assoc	rtrv-mrn
rept-stat-as	rtrv-asp	rtrv-obit (active OAM)
rept-stat-asp	rtrv-cmd	rtrv-rte

rept-stat-card	rtrv-dstn	rtrv-secu-user
rept-stat-clk	rtrv-gta	rtrv-slk
rept-stat-dstn	rtrv-gtt	rtrv-tbl-capacity
rept-stat-ls	rtrv-lbp	rtrv-trbltx
rept-stat-rte	rtrv-log	rtrv-uaps
rept-stat-slk	rtrv-ls	
rtrv-appl-rtkey		
rtrv-appl-sock		

When using the **canc-cmd** command without the **trm** parameter, enter the command on the same terminal that is currently running the command you want to cancel.

When using the **canc-cmd** command with the **trm** parameter, enter the command on a terminal other than the one that is currently running the command you want to cancel.

NOTE: The Basic command class allows use of this command without the **trm** parameter (**dact-cmd**); the Security Administration command class is required for use of this command when the **trm** parameter is specified (**dact-cmd:trm=x**).

Keyword: **canc-cmd**

Related Commands: **rept-imt-info**, **rept-stat-asp**, **rept-stat-assoc**, **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-rte**, **rept-stat-slk**, **rtrv-appl-rtkey**, **rtrv-appl-sock**, **rtrv-asp**, **rtrv-assoc**, **rtrv-dcmps**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-log**, **rtrv-ls**, **rtrv-map**, **rtrv-rte**, **rtrv-seculog**, **rtrv-slk**, **rtrv-trbltx**, **rtrv-uaps**

Command Class: Security Administration

Parameters

:trm= (optional)

The terminal on which the command is to be canceled.

Range: 1-40

Example

canc -cmd

canc -cmd :trm=3

Dependencies

The **trm** parameter cannot be specified in a **canc-cmd** command that is entered on the same terminal that is running the command that is to be cancelled. The terminal will return an error: system is busy.

The **canc-cmd:trm=** command requires the Security Administration command class for the terminal and for the user.

The **canc-cmd:trm** command requires a Security Administration command class for the terminal.

Notes

The **canc-cmd** command (without the **trm** parameter) must be entered on the same terminal that is running the command to be cancelled.

If the **canc-cmd** command is entered on a terminal that is not running a command, the **canc-cmd** command completes successfully without returning an error. Likewise, if the **canc-cmd:trm=** command is entered and there is no command running on the specified terminal, the **canc-cmd:trm=** command completes successfully without returning an error.

When the **canc-cmd** with no parameter is entered, a scroll area message appears to indicate that the command has been cancelled. For example:

```
Command aborted on terminal 2.
```

Some output can still appear after the above abort message if output accumulated in the output queue before the **canc-cmd** command was entered. When a command is cancelled, the cancellation should take no longer than 25 seconds to take effect.

The **F9** function key provides the same function as the **canc-cmd** command (without the **trm** parameter). On a terminal in KSR mode, pressing **<CTRL>I** also provides the same function.

The **canc-cmd** and the **F9** function key cannot be used for pure SEAS commands.

If **canc-cmd** is entered to cancel a command other than ones listed in Table 5-5, the terminal will accept another command, but output and processing of the current command continue.

When **canc-cmd** is entered, a command status code of **AB** (command aborted) is logged in the security log as follows:

- When the **canc-cmd** (without the **trm** parameter) is entered, no entry is logged.
- When the **canc-cmd:trm=** command is entered, an entry is logged.
- When the **canc-cmd** command (without the **trm** parameter) is entered as a SEAS flow-thru command, an entry is logged. The **canc-cmd:trm=** command is not allowed as a SEAS flow-thru command because the **canc-cmd:trm=** command belongs to the Security Administration Command Class.

For examples of the security log entries, see the **rtrv-seculog** command.

Output

canc-cmd

```
rlghncxa03w 04-07-27 17:00:36 EST  EAGLE 31.6.0
canc-cmd
Command entered at terminal #2.
```

```

Command aborted on terminal 2.
```

```
;
```

canc-cmd:trm=2

```
rlghncxa03w 04-07-27 17:00:36 EST  EAGLE 31.6.0
canc-cmd:trm=2
Command entered at terminal #3.
```

```
rlghncxa03w 04-07-27 17:00:36 EST  EAGLE 31.6.0
Command aborted on terminal 2.
```

```
;
```

canc-dlk**Cancel Data Link**

Use this command to remove a TCP/IP data link from service. The state of the TCP/IP data link is changed from in service normal (IS-NR) to out of service maintenance disabled (OOS-MT-DSBLD).

Keyword: **canc-dlk**

Related Commands: **act-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk**

Command Class: Link Maintenance

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

canc-dlk: loc=1308

Dependencies

No other action command can be in progress when this command is entered.

The shelf and card must be equipped.

The card location must contain an ACM card.

Notes

None

Output

canc-dlk: loc=1308

rlghncxa03w 04-01-27 17:00:36 EST EAGLE 31.3.0

Deactivate Link message sent to card.

Command Completed.

;

canc-echo**Cancel Echo**

Use this command to halt the echoing of command responses from the user's terminal to other terminals or printers.

Keyword: **canc-echo**

Related Commands: **act-echo, alw-trm, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm**

Command Class: Basic

Parameters

:trm= (optional)

The ID number of the terminal for which the echo is being canceled.

Range: **1-16**

Default: Cancels all active echoes

Example**canc-echo****canc-echo:trm=7****Dependencies**

The echo cannot be cancelled to the same terminal from which the **canc-echo** command is entered.

An **act-echo** command must be active at the specified terminal before this command can be entered to cancel the echo.

Notes

Only the echoing of command output responses can be halted by this command. To halt the printing of alarm and network messages, the **chg-trm** command must be used.

Output**canc-echo**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
canc-echo
Command entered at terminal #6.
Scroll Area Output echo disabled to all terminals.
```

;

canc-echo:trm=7

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
canc-echo:trm=7
Command entered at terminal #6
Scroll Area Output echo disabled for terminal 7.
```

;

canc-lnp-dpcer**Cancel LNP DPC Transaction Report**

Use this command to cancel a report previously invoked with the **rtrv-lnp-dpcer** command.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS.

Keyword: **canc-lnp-dpcer**

Related Commands: **rtrv-lnp-dpcer**

Command Class: LNP Basic

Parameters

This command has no parameters.

Example**canc-lnp-dpcer****Dependencies**

The LNP feature must be turned on before this command can be entered (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

Notes

If the **canc-lnp-dpcer** command is entered on the same EAGLE 5 ISS terminal at which the currently active **rtrv-lnp-dpcer** command was entered, you must press the F9 key before the command will be accepted. However, you can cancel the command from a different terminal without pressing the F9 key.

Output**canc - lnp - dpcer**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
CANC-LNP-DPCER: MASP A - COMPLTD
```

;

canc-lnp-tnrpt**Cancel LNP Subscription Version Report**

Use this command to cancel a report previously invoked with the **rtvr-lnp-tnrpt** command.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS.

Keyword: **canc-lnp-tnrpt**

Related Commands: **rtvr-lnp-tnrpt**

Command Class: LNP Basic

Parameters

This command has no parameters.

Example

```
canc - lnp - tnrpt
```

Dependencies

None

Notes

If the **canc-lnp-tnrpt** command is entered on the same EAGLE 5 ISS terminal at which the currently active **rtvr-lnp-dpcer** command was entered, you must press the **F9** key before the command will be accepted. However, you can cancel the command from a different terminal without pressing the **F9** key.

Output**canc - lnp - tnrpt**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
CANC-LNP-TNRPT: MASP A - COMPLTD
```

;

canc-lpo**Cancel Local Processor Outage**

Use this command to cancel a processor outage and restore the link to its previous state. LSSUs with status of processor outage are terminated, and the link begins sending MSUs.

NOTE: The signaling link's blocked status is not preserved across a card reboot.

Keyword: **canc-lpo**

Related Commands: **act-lpo, blk-slk, ublk-slk**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

The signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The address of the card containing the signaling link to be unblocked.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

canc-lpo:loc=2311:link=b

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- An SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- An E1/T1 MIM card or an HC MIM card running the **ss7ansi** or **ccs7itu** application

This command cannot be entered for IPLIMx signaling links that have an **ipliml2** parameter setting that is not **m2pa**.

The **canc-lpo** command is not valid for DCM cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only for the following cards:

- A multi-port LIM
- An E1/T1 MIM or an HC MIM

Notes

The function of this command is the same as the **ublk-slk** command.

Unblocking a signaling link removes a Level 2 failure resulting from a **blk-slk** of an ATM high-speed signaling link.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

Output

canc -lpo:loc=2311:link=a

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Local processor outage being cleared.
```

;

In the following example, card location 1113 is not valid:

canc -lpo:loc=1113:link=a

```
tekelecstp 05-01-21 17:00:36 EST EAGLE5 33.0.0
Command Rejected : Location is not valid for command
```

;

canc-slk**Cancel Signaling Link**

Use this command to change the state of the specified link to OOS-MT-DSBLD (Out-Of-Service Maintenance Disabled).

CAUTION: This command impacts network performance and should be used only during periods of low traffic.

Keyword: **canc-slk**

Related Commands: **act-slk, alw-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

Signaling link defined on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

canc -slk:loc=1301:link=a

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

The card that contains the specified signaling link must be equipped in the specified card location.

The card in the specified card location cannot be a TDM card, an MDAL card, an HMUX or HIPR card, or the cards running the OAM application.

Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual - EAGLE 5 ISS* provides an illustration of card locations.

After the **canc-slk** command is entered, the **rept-stat-slk** command can be entered to verify the cancellation.

Output

```
canc-slk:loc=1301:link=a
rlghncxa03w 05-02-07 11:11:28 EST EAGLE5 33.0.0
Deactivate Link message sent to card
;
```

canc-user

Cancel User

Use this command to end a user session. The **dact-echo** or **logout** command has the same affect as the **canc-user** command.

Keyword: **canc-user**

Related Commands: **act-user**, **chg-pid**, **chg-user**, **dact-user**, **dlt-user**, **ent-user**, **login**, **logout**, **rept-stat-user**, **rtrv-secu-user**, **rtrv-user**

Command Class: Basic

Parameters

This command has no parameters.

Example

```
canc-user
```

Dependencies

None

Notes

The **dact-echo** or **logout** commands can be used in place of **canc-user**.

Output

Not applicable.

chg-acg-mic**Change ACG Manually Initiated Control**

Use this command to change the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A particular control is selected to be changed by either specifying that it is the **type=all** control or specifying its service and digits.

Keyword: **chg-acg-mic**

Related Commands: **dlt-acg-mic**, **ent-acg-mic**, **rept-stat-lnp**, **rtrv-acg-mic**

Command Class: Database Administration

Parameters

:aintvl= (optional)

AIN interval index

Range: **1-15**

Default: The current value

:dgts= (optional)

Digits

Range: **000-999, 000000-9999999999**

Specify 3 digits or 6-10 digits.

:drtn= (optional)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node. Refer to the chapter on Automatic Call Gapping (AGC) configuration in the *LNP Feature Activation Guide* for a description of the use of the duration index.

Range: **1-13**

Default: The current value

:intvl= (optional)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the gap interval index.

Range: **0-15**

Default: Current value

:nd= (optional)

New number of digits

Range: **3, 6-10**

Default: The current value

:serv= (optional)

Query service

Range: **ain, in**

:type= (optional)

Type of control

Range: **all, sd**

Default: **sd**

Example

To change the type=all MIC to use 3 digits:

chg-acg-mic:type=all:nd=3

To change the MIC for AIN queries for 919-460-2132 to use an interval index of 15:

chg-acg-mic:serv=ain:dgts=9194602132:aintvl=15

To change the MIC for IN queries for 919-xxx-xxxx to use a duration index of 9 and an interval index of 5:

chg-acg-mic: serv=in: dgts=919: drtn=9: intvl=5

Dependencies

If the **type=all** parameter is specified, at least one optional parameter (**nd**, **drtn**, **intvl**, or **aintvl**) must be specified.

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** cannot be specified.

If the **type=sd** parameter is specified, optional parameters **serv** and **dgts** must be specified.

If the **type=sd** parameter is specified, optional parameter **nd** cannot be specified.

If the **serv=ain** parameter is specified, at least one optional parameter (**drtn** or **aintvl**) must be specified.

If the **serv=ain** parameter is specified, optional parameter **intvl** cannot be specified.

If the **serv=in** parameter is specified, at least one optional parameter (**drtn** or **intvl**) must be specified.

If the **serv=in** parameter is specified, optional parameter **aintvl** cannot be specified.

The **dgts** parameter value must be either 3 digits in the range **000-999** or 6-10 digits in the range **000000-9999999999**.

The **nd** parameter value must be **3** or **6-10** to indicate the number of new digits.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

If the **type=all** parameter is specified, a MIC with **type=all** must exist.

If the **type=sd** parameter is specified, a MIC with the same service and digits must exist.

Notes

None

Output

chg-acg-mic: type=all: nd=31

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
ACG MIC table is (11 of 256) 4% full of type SD
CHG-ACG-MIC: MASP A - COMPLTD
;
```

chg-acg-noc

Change ACG Node Overload Control

Use this command to change the definition of a node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the automatic call gappings (ACG) to be sent when at the specified level.

Keyword: **chg-acg-noc**

Related Commands: **dlt-acg-noc**, **ent-acg-noc**, **rept-stat-lnp**, **rtrv-acg-noc**

Command Class: Database Administration

Parameters

:lvl= (mandatory)
Overload level.

Range: **1-10**

:and= (optional)

AIN number of digits. The number of digits in the global title address of an AIN query.

Range: 6, 10

Default: The current value

:drtn= (optional)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node. Refer to the chapter on Automatic Call Gapping (ACG) configuration in the *LNP Feature Activation Guide* for a description of the use of the duration index.

Range: 1-13

Default: The current value

:ind= (optional)

IN number of digits. The number of digits in the global title address of an IN query.

Range: 6, 10

Default: The current value

:intvl= (optional)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the gap interval index.

Range: 0-15

Default: The current value

:qr= (optional)

Query rate. The number of LNP queries, which define a particular overload level, in a 30-second period.

Range: 1-2147483647

Default: The current value

Example

To change level 10's query rate and AIN number of digits:

chg-acg-noc:lvl=10:qr=900000:and=6

To change level 3's duration and interval indexes:

chg-acg-noc:lvl=3:drtn=7:intvl=3

Dependencies

At least one optional parameter must be specified.

The **and** parameter value must be either **6** or **10**.

The specified overload level must be defined.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The **ind** parameter value must be either **6** or **10**.

Notes

None

Output

chg-acg-noc:lvl=10:qr=900000:and=6

rlghncxa03w 03-02-28 08:50:12 EST EAGLE 28.1.0

CHG-ACG-NOC: MASP A - COMPLTD

;

chg-appl-rtkey**Change Static Routing Key Table Entries**

Use this command to change static entries in the Routing Key table. Only one attribute can be changed at a time.

Keyword: **chg-appl-rtkey**

Related Commands: **dlt-appl-rtkey**, **ent-appl-rtkey**, **rtrv-appl-rtkey**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cice= (optional)

The end range of circuit identification codes assigned to the routing key.

Specify the **cice** and **cics** parameters to identify the routing key to be changed. The **cice** parameter is mandatory and valid only if the **si** parameter has a value of **4**, **5**, or **13**.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The start range of circuit identification codes assigned to the routing key.

Specify the **cics** and **cice** parameters to identify the routing key to be changed. The **cics** parameter is mandatory and valid only if the **si** parameter has a value of **4**, **5**, or **13**.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **dpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:nasname= (optional)

This parameter is obsolete.

:ncice= (optional)

The new end range of circuit identification codes assigned to the routing key.

Specify the **ncice** and/or **ncics** parameter to change the range of the circuit identification codes assigned to the routing key. The **ncice** parameter is valid only if **si=4, 5, or 13** and is not valid if the **split** parameter is specified.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:ncics= (optional)

The new start range of circuit identification codes assigned to the routing key.

Specify the **ncics** and/or **ncice** parameter to change the range of the circuit identification codes assigned to the routing key. The **ncics** parameter is valid only if **si=4, 5, or 13** and is not valid with the **split** parameter.

Range: **0-4294967295**

See Table A-4 for valid CIC values for specified SI and MSU types.

:norm= (optional)

Normalization Enabled/Disabled. This parameter enables or disables the normalization process for MSUs using the routing key.

This parameter cannot be specified with the **ncics**, **ncice**, and **split** parameters.

Range: **yes, no**

If **norm=yes**, **pstncat** and **pstnid** must be set to values supported by the Secure Gateway.

Default: Current value in the database

:nrcontext= (optional)

This parameter modifies the routing context value assigned to this routing key.

- Routing context is mandatory for routing keys associated with SUA Application Servers.
- Routing context is optional for routing keys associated with M3UA Application Servers.
- Routing context is invalid for routing keys associated with TALI connections.

An AS can be associated with only 1 routing key with routing context. An AS can be associated with multiple routing keys that do not contain routing context. An AS cannot be simultaneously assigned to a routing key with routing contexts and to routing keys without routing contexts.

The **pstncat**, **pstnid**, and **norm** parameters cannot be specified when the **nrcontext** parameter is specified.

Range: 0-4294967295

:nsname= (optional)

This parameter is obsolete.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: opca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Valid only if **si**=4, 5, or 13 and required if **si**=4, 5, or 13.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-*

gc, m1-m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pstncat= (optional)

Public Switched Telephone Network (PSTN) Category assigned to the routing key.

This parameter cannot be specified with the **ncics**, **ncice**, or **split** parameters.

Range: **0-65535**

Default: Current value in the database

:pstnid= (optional)

Public Switched Telephone Network (PSTN) ID assigned to the routing key.

This parameter cannot be specified with the **ncics**, **ncice**, or **split** parameters.

Range: **0-65535**

Default: Current value in the database

:rcontext= (optional)

This parameter specifies a routing key by its routing context when a routing key needs to be changed as an optional alternative to entering the **dpc/si/ssn/opc/cics/cice/type** parameters.

The **pstncat**, **pstnid**, **norm** and **split** parameters cannot be specified if this parameter is specified. (Split operations are invalid for routing keys with routing context.)

Range: **0-4294967295**

:si= (optional)

The service indicator.

Range: **0-15**

0-15 or equivalent text values:

Number = Text—Description

0 = snm—Signaling network management messages

1 = regtest—Signaling network testing and maintenance regular

2 = spltest—Signaling network testing and maintenance special

3 = sccp—SCCP

4 = tup—Telephone user part

5 = isup—ISDN user part

13 = qbicc

See Table A-4 and Table 5-8 for valid **si** values in combination with other parameters.

:split= (optional)

The CIC value where the routing key with the specified CICS and CICE range will be split. The specified routing key is split into two entries with adjacent CIC ranges. The existing routing key retains the range of CICs that is lower than the **split** value. The value of **split** minus 1 is used as the end range for this entry. The range of CICs assigned to the original entry is the values of **cics** to **split** minus 1.

A new routing key entry is created with the high end of the original range. The **split** value is used as the start of the CIC range for this entry. The range of CICs assigned to the new entry is the values of **split** to **cice**.

This parameter is valid only if **si=4, 5, or 13** and is not valid with **ncics** or **ncice**. See Table A-4 and Table 5-8.

Range: 0-16363

:ssn= (optional)

Subsystem number. This parameter is mandatory and valid only if the **si=3** parameter is specified.

Range: 0-255

:type= (optional)

Type of routing key.

Range: full, partial, default

Default: full

Example

```
chg-appl-
rtkey:dpc=123-230-245:si=5:opc=123-230-244:cics=1:cice=100:split=
50
```

```
chg-appl-
rtkey:dpc=123-230-245:si=5:opc=123-230-244:cics=1:cice=50:ncice=1
00
```

```
chg-appl-
rtkey:dpcn24=10-100-10:si=5:opc24=10-100-11:cics=1:cice=100:ncic
e=200
```

```
chg-appl-rtkey:dpc=8-8-8:si=3:ssn=5:rcontext=500
```

```
chg-appl-
rtkey:dpci=s-3-11-1:si=5:opci=s-4-11-1:cics=1:cice=1000:ncice=500
```

```
chg-appl-rtkey:rcontext=5:ncice=100
```

```
chg-appl-rtkey:rcontext=1:nrcontext=2
```

Dependencies

Optional parameters that must be specified with the **chg-appl-rtkey** command depend on the type of routing key being changed. See Table 5-8 for valid parameter combinations.

The **srkq** parameter value in the **chg-sg-opts** command limits the maximum number of static routing keys that can be provisioned using the **ent-appl-rtkey** command.

- For **ss7ipgw** and **ipgwi** applications running on dual-slot DCM cards (870-1945-xx), there is a limit of 1000 routing keys in the system. The **chg-sg-opts** command will not allow the **srkq** parameter to be set to a value greater than 1000.
- For **ss7ipgw** and **ipgwi** applications running on SSED CM cards (870-2732-xx), there is a limit of 2500 routing keys in the system. See the **chg-sg-opts** command for parameter values that allow 2500 routing keys to be defined in the system.

The subsystem number is mandatory and valid only when the **si=3** (or **sccp**) parameter is specified; if the **si** parameter does not equal **3** (or **sccp**), the **ssn** parameter cannot be specified.

The **pstnid**, **pstncat**, and **norm** parameters are not valid for 24-bit ITU-N point codes.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

The value entered for the new starting circuit identification code (**ncics**) must be less than or equal to the value entered for the new ending circuit identification code (**ncice**).

A circuit identification code range (**cics** to **cice**) cannot be specified that overlaps an existing routing key.

When **si=4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**), the **opc**, **cics**, and **cice** parameters are required. The **opc**, **cics**, and **cice** parameters can be specified only if **si=4**, **5**, or **13**.

The value entered for the circuit identification code split range (**split**) must be greater than the value entered for the starting circuit identification code (**cics**) and less than or equal to the value entered for the ending circuit identification code (**cice**).

The value entered for the new starting circuit identification code (**ncics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**) when the new ending circuit identification code (**ncice**) is not specified.

The value entered for the new ending circuit identification code (**ncice**) must be greater than or equal to the value entered for the starting circuit identification code (**cics**) when the new starting circuit identification code (**ncics**) is not specified.

The **split**, **ncics**, and **ncice** parameters are not allowed with the **si** parameter unless the **si=4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**) parameter is specified.

TALI sockets cannot be specified for IPGWI cards when the Spare Point Code Support Feature (s-prefix) is enabled.

A DPC/SI routing key must be specified when the DPC is ANSI and the **si=4** parameter is specified (TUP is used only in an ITU network).

Table A-4 shows valid CIC values for SI types **4**, **5**, and **13**.

Partial point codes are not allowed; no asterisks can be specified in the point codes in the command.

Mixed point code types are not allowed; **opc** and **dpc** types must match.

When the **type=partial** or **type=default** parameters are specified, the **nsname** parameter or attributes must be specified.

When the **type=partial** or **type=default** parameters are specified, the **split** and **resize** parameters are not supported.

When the **type=full** parameter is specified, the **dpc** and **si** parameters must be specified.

When the **pstncat=0** parameter is specified, the **pstnid=0** parameter must be specified.

The parameter value **pstncat=1** requires ITU-I or ITU-N point code.

The following types of partial routing keys are supported:

- DPC-SI-OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC-SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

When a default routing key is specified, only the attributes parameters **pstnid**, **pstncat**, and **norm** are allowed.

The **split**, **ncics**, **ncice**, **pstncat**, **pstnid**, and **norm** parameters cannot be specified if the **rcontext** parameter is specified.

The **rcontext** parameter must be specified for routing keys that are associated with SUA Application Servers.

The specified **rcontext** parameter value must already exist in the database.

If specified, the service indicator parameter must be **si=3** for routing keys that are associated with SUA Application Servers.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing context. To assign an M3UA or SUA association to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS, and each AS must be assigned to a routing key with routing context.

The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type assigned to the AS.

Table 5-6. Valid Parameter Combinations for Routing Key Types using the **chg-appl-rtkey** command.

Action	dpc	si	ssn	opc	cics	cice	ncics	ncice	split	type
Split CIC Range	X	X		X	X	X			X	full
Re-size CIC Range	X	X		X	X	X	X	X		full
Socket Name Override (SI=ISUP or 5)	X	X		X	X	X				full
Socket Name Override (SI = SCCP or 3)	X	X	X							full
Socket Name Override (SI = not 3, 4, 5, or 13)	X	X								full
Socket Name Override (SI = 4, 5, or 13)	X	X		X						partial
Socket Name Override (SI = 3, 4, 5 or 13)	X	X								partial
Socket Name Override SI-only key		X								partial
Socket Name Override DPC-only key	X									partial
Socket Name Override Default key										default

The value of the **nrcontext** parameter cannot be changed for a routing key if the **rcontext** parameter has not been configured for that routing key.

The attributes that are required to change a routing key must be specified in the command.

Notes

A routing key entry associates a routing key with a socket name or Application Server (AS) name.

The parameters **dpc**, **si**, **ssn**, **opc**, **cics**, and **cice** are used to identify the routing key to be changed.

The parameters **split**, **ncics**, and **ncice** are used to specify new values for the routing key.

The **opc**, **cics**, and **cice** parameters are not required for partial routing keys.

The **cics**, **cice**, **ncice**, **ncice**, and **split** parameters are valid and required when **si=4** and ITU DPCs (**dpci**, **dpcn**) are specified. These parameters are not valid when an ANSI DPC (**dpc**, **dpca**) is specified and **si=4**.

The parameters **pstncat**, **pstnid**, and **norm** are routing key attributes. These attributes are not used to uniquely identify routing keys. The **pstncat** and **pstnid** parameter values convey PSTN format information to IP devices and are also used to control the normalization process when **norm=yes**. Table 5-7 describes the PSTN Category and ID combinations.

Table 5-7. PSTN Categories and Associated PSTN IDs

PSTN Category	PSTN Category Description	PSTN ID	PSTN ID Description
0	Unknown	0	Unknown
1	Defines PSTN formats for which the Tekelec EAGLE 5 ISS provides ISUP Normalization function	0	Unknown
		1	ITU Q.767
		2	ETSI V3
		3	UK PNO-ISC7
		4	GERMAN ISUP
2 - 4095	Reserved for future definition by Tekelec	None	None
4096-65535	Available for user definition	0-65535	User-defined PSTN IDs

The values **0** and **4096-65535** are always valid for the **pstncat** parameter when **norm=no**.

Use the **rtrv-pstn-pres** command to display allowed values for the **pstncat** and **pstnid** parameters.

The parameter value **pstncat=1** may be used only with keys that specify ITU-N or ITU-I point codes. PSTN IDs used with **pstncat=1** must meet specific **si** value criteria shown in Table 5-8.

The parameter value **norm=yes** can be entered if **pstncat=1** and the **pstnid** parameter value is indicated by “*” in Table 5-6.

Table 5-8. Routing Keys and Supported PSTN Categories and PSTN IDs for PSTN Category 1

Routing Key Entry Type	SI	PC Type	norm= yes is valid	pstnid for pstncat = 1			
				1=ITU Q.767	2=ETSI V3	3=UK PNO- ISC7	4= GERMAN ISUP
Full-CIC	5	ANSI					
and		ITU-I/N	*	*	*	*	*

Table 5-8. Routing Keys and Supported PSTN Categories and PSTN IDs for PSTN Category 1

Routing Key Entry Type	SI	PC Type	norm= yes is valid	pstnid for pstncat = 1			
				1=ITU Q.767	2=ETSI V3	3=UK PNO- ISC7	4= GERMAN ISUP
Partial DPC/ OPC/SI	4 or 13	ALL					
Full-SCCP	3		ALL				
Full-DPC/SI	All valid	ALL					
Partial DPC/ SI	5	ANSI					
		ITU-I/N	*	*	*	*	*
	Other than 5						
Partial DPC	N/A	ALL					
Partial SI	ALL	N/A					
Default	N/A	N/A					

The following changes can be made for routing keys. Only one of these changes is allowed per command.

- A routing key can be split into two entries with adjacent CIC ranges. The resulting entries retain the socket associations of the original entry.
- The range of CICs assigned to a routing key can be changed as long as it does not overlap another routing key. The new entry retains the socket associations of the original entry.
- Routing key attributes **pstncat**, **pstnid**, and **norm** can be changed. These values replace the current attribute values for the routing key.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

Routing context is a routing key parameter that uniquely identifies routing keys. Routing context is mandatory for routing keys associated with SUA Application Servers, optional for routing keys associated with M3UA Application Servers, and invalid for routing keys associated with TALI connections.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing contexts.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```

chg-appl-rtkey:dpc=123-230-245:si=3:ssn=250:nsname=socket5

```

chg-appl-sock**Change Application Socket**

Use this command for the IPLIM, IPLIMI, SS7IPGW, or IPGWI application to configure the Socket table which is used to associate the local host/local port to a remote host/remote port.

Keyword: **chg-appl-sock**

Related Commands: **dlt-appl-sock, ent-appl-sock, rtrv-appl-sock**

Command Class: Database Administration

Parameters

:sname= (mandatory)

Socket name. This parameter specifies the name of an individual socket. This name is used by the routing key table and maintenance commands.

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:alw= (optional)

This parameter specifies whether the connection manager should allow or disallow a socket to carry SS7 traffic.

Range: **yes, no**

yes — The connection manager is allowed to carry SS7 traffic.

no — The connection manager is to prohibit the socket from carrying SS7 traffic.

Default: No change to current value

:dcmps= (optional)

This parameter specifies the parameter set that will be used by this socket.

Range: **1-10**

Default: No change to current value

:lhost= (optional)

Local host name. This parameter specifies the logical name assigned to the local host device.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*

Any string of characters beginning with a letter and comprising up to 60 characters in length.

Valid characters are **a-z, A-Z, 0-9, - (dash), . (period)**

Default: Current value

:link= (optional)

This parameter specifies the signaling link associated with this socket.

Range: **a, b, a1, b1, a2, b2, a3, b3**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have signaling links.

Default: Current value

:lport= (optional)

Local port number. This parameter specifies the TCP port number for the local host.

Range: **1024-65535**

Default: Current value
System
Default: 0

:open= (optional)
Socket state. This parameter specifies whether the socket should be open/connected to far end.
Range: **yes, no**
yes— The connection manager is to open the socket if the socket is operational
no— The connection manager will not open the socket

:rexmit= (optional)
Retransmission Mode. This parameter specifies whether the connection should use the Standard Berkeley Sockets Distribution (BSD) Retransmission Policy, the FIXED Tekelec Aggressive Transmission Policy (a fixed interval between each retransmission), or a combination of the two (MOD—a fixed interval between each retransmission and the fixed interval is doubled after each third retry), if packet loss is detected on the socket.
Range: **bsd, fixed, mod**
Default: No change to current value
System
Default: **fixed**

:rhost= (optional)
Remote host name. This parameter specifies the logical name assigned to the remote host device.
Range: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
Any string of characters beginning with a letter and comprising up to 60 characters in length).
Valid characters are **a–z, A–Z, 0–9, -** (dash), **.** (period)
Default: Current value

:rport= (optional)
The TCP port number of the remote host.
Range: **1024-65535**
Default: Current value
System
Default: 0

:rtt= (optional)
Round Trip Time. This parameter tells the connection manager the expected time (in milliseconds) in which a message on this socket is sent to the remote host and an acknowledgment is received back at the local host. If the RTT is entered, the Retransmission Mode cannot be set to BSD.
Range: **1-750**
Default: No change to current value
System
Default: 60

:server= (optional)
This parameter specifies the role of the local socket in the client/server relationship.
Range: **yes, no**
yes— Local side is the server
no— Local side is the client
Default: No change to current value

Example

```
chg-app1-sock:sname=socket1:lhost=gw105.nc.tekelec.com:lport=1030:server=y
```

```
es : rhost=gw100.nc.tekelec.com:rport=1030:open=yes:alw=yes:dcmps=1
0
```

Dependencies

At least one optional parameter must be specified.

The **link** parameter is used to associate a socket with a signaling link.

- Only link **a** is valid on cards that execute the **ss7ipgw** or **ipgwi** application.
- Links **a** and **b** are valid on dual-slot DCM cards or SSEDCCM cards that execute the **iplim** or **iplimi** application and support 2 point-to-point links.
- Links **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** are valid only on SSEDCCM cards that execute the **iplim** or **iplimi** application and support 8 point-to-point links.

A maximum of 50 connections (association-to-AS assignments + sockets) can exist per Local Host on IPGWx cards. The total number of sockets and SCTP associations that can be provisioned for **iplim** and **iplimi** applications is limited to 2 on non-SSEDCCM cards and cards with SCTP associations provisioned.

To assign a socket on an IPLIMx card for a local host, the linkset associated with the signaling link must contain only links where the **ipliml2=saaltali** parameter has been specified for the **ent-slk** command.

The allowed maximum is 1 socket per signaling link on IPLIMx cards.

Each time an M3UA/SUA association is assigned to an AS, the SS7IPGW or IPGWI card that hosts the association must maintain a state (ASP-Down, ASP-Inactive, ASP-Active) for the association/AS combination. Each TALI socket on an SS7IPGW or IPGWI card requires the card to maintain a TALI state (NEx-FEx) as well. These states are referred to as adapter states. A single M3UA/SUA association may have multiple adapter states, 1 for each AS it resides in. There is a single adapter state for each TALI socket. The maximum number of adapter states for a single SS7IPW or IPGWI card is 50.

IPGWI sockets cannot be defined when the Spare Point Code Support feature is enabled.

The **sname** parameter value must exist in the IPAPSOCK table.

The specified local host name (**lhost**) must exist in the IP Link table.

The **open=no** parameter must be specified before the **server**, **lhost**, **lport**, **rhost**, **link**, **rexmit**, **rtt**, or **rport** parameters can be specified.

Socket connection parameters (**lhost**, **lport**, **rhost**, **rport**) must be unique for each socket name (**sname**).

To change the value of the **open=yes** parameter, the values must be specified for all parameters that are required to fully specify the connection (**server**, **lhost**, **lport**, **rhost**, and **rport**).

If the socket is a server and the **open=yes** parameter is specified, the socket's **lhost** / **lport** configuration must not match that of any other open client socket. If the socket is a client and the **open=yes** parameter is specified, the socket's **lhost** / **lport** configuration must not match that of any other open socket.

When the **rexmit=bsd** parameter is specified, the **rtt** parameter cannot be specified.

When the **rexmit=fixed** parameter or the **rexmit=mod** parameter is specified, the **rtt** parameter must be specified.

Before the **open=yes** parameter can be specified for a socket, the local host must have a signaling link assigned to its associated signaling link port. Before the local host IP address can be changed, the new local host must have a signaling link assigned to its associated signaling link port.

The local host cannot be assigned to the B interface.

A specified **lhost** or **rhost** name must be valid and must exist in the IP Host table. The name must begin with a letter and can contain the characters **a-z**, **A-Z**, **0-9**, **-** (dash), and **.** (period). The **lhost** must be defined as local to this EAGLE 5 ISS.

There are per card and per system limits on the maximum number of sockets supported.

- A maximum of 50 sockets per local host on SS7IPGW/IPGWI cards
- A maximum of 2 sockets per local host on DCM or SSED CM IPLIM/IPLIMI cards that support 2 point-to-point links
- A maximum of 8 sockets per local host on SSED CM IPLIM/IPLIMI cards that support 8 point-to-point links.
- A maximum of 1 socket per signaling link on IPLIM/IPLIMI cards
- A maximum of 4000 IP connections per system

This command cannot be used to change SCTP type IP connections. The **chg-assoc** command must be used for associations; this command is used for sockets.

This command can be entered only for DCM cards running IPGWx applications or DCM and SSED CM cards running IPLIMx applications.

The card for which this command is entered must be equipped.

Notes

The command input is limited to 150 characters.

The total number of sockets and SCTP associations provisioned for **iplim** and **iplimi** applications is limited to 2 on non-SSED CM cards, and when any SCTP associations are provisioned for the card.

Output

```
chg-appl-
sock: sname=socket1: lhost=gw105.nc.tekelec.com: lport=1030: server=y
es: rhost=gw100.nc.tekelec.com: rport=1030: open=yes: alw=yes: dcmps=1
0
    rlgncxa03w 04-01-07 15:35:05 EST EAGLE 31.3.0

;
```

chg-as

Change Application Server

Use this command to change the characteristics of an existing Application Server (AS).

Keyword: **chg-as**

Related Commands: **dlt-as**, **ent-as**, **rept-stat-as**, **rtrv-as**

Command Class: Database Administration

Parameters

:asname= (mandatory)

This parameter specifies the application Server (AS) name in the AS table.

Range: **aaaaaaaaaaaaa**

Up to 15 alphanumeric characters; the first character must be a letter.

:mode= (optional)

This parameter specifies the traffic mode assigned to this AS.

Range: **loadshare**, **override**

The **mode=override** parameter is not valid for SUA associations assigned to the AS.

Default: No change from current value in AS
System
Default: loadshare

:tr= (optional)

This parameter specifies the recovery timer value for this AS, in milliseconds.

Range: 10 - 2000

Default: No change from current value in AS

System

Default: 200

Example

chg-as:asname=asx:mode=override

Dependencies

The AS name (**asname**) must already exist in the AS table.

Association connection parameters must be unique.

The connection state for all associations assigned to the AS must be **open=no** before the **mode** parameter can be changed.

The override traffic mode is not supported for SUA associations.

Notes

By default the AS recovery timer value is set to 200 ms when an AS is entered. This value can be changed at any time using the **chg-as** command. The new timer value will be used the next time the AS enters the AS-Pending state.

Output

chg-as:asname=asx:mode=override

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
CHG-AS: MASP A - COMPLTD
```

;

chg-asp

Change Application Server Process

Use this command to change the UA parameter set that an Application Server Process (ASP) uses for various SNM message and notification response options. UA parameter sets are valid only for M3UA associations.

NOTE: This command is obsolete.

Keyword: chg-asp

Related Commands: dlt-asp, ent-asp, rtrv-asp

Command Class: Database Administration

Parameters

:asname= (mandatory)

Application Server Process (ASP) name.

Range: aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

:uaps= (mandatory)

UA parameter set.

Range: 1-10

Default: 10

Example

chg-asp:aspname=asp1:uaps=1

Dependencies

The ASP must already be defined.

For the associations assigned to the ASP, the association adapter layer type must be **m3ua**.

The associations assigned to the ASP must be set to **open=no** before the UAPS can be changed.

Notes

None

Output

```
chg-asp:aspname=asp1:uaps=1
rlghncxa03w 04-09-17 15:35:05 EST EAGLE 31.10.0
CHG-ASP: MASP A - COMPLTD
;
```

chg-assoc**Change Association**

Use this command to configure existing SCTP associations in the IPAPSOCK table.

Keyword: **chg-assoc**

Related Commands: **dlt-assoc, ent-assoc, rept-stat-assoc, rtrv-assoc**

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name assigned to this association (in IPAPSOCK table).

Range: *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:lhost= (mandatory)

Local host name. This parameter specifies the local host name as defined in the IP Host table.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*

Any string of characters beginning with a letter and comprising up to 60 characters in length.

Valid characters are **0-9, a-z, A-Z, -** (dash), **.** (period).

Default: No change in current value.

:adapter= (optional)

The adapter layer for this association.

Range: **m3ua, sua, m2pa**

Default: Current value

System

Default: **m3ua**

:alhost= (optional)

Alternate local host name. This parameter configures the SCTP association as a multi-homed endpoint.

Range: *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa*, **none**

Any string of characters beginning with a letter and comprising up to 60 characters in length

Valid characters are **a-z, A-Z, 0-9, -** (dash), **.** (period)

none—The alhost is not configured; the SCTP association is configured as a uni-homed endpoint.

:alw= (optional)

The parameter specifies whether the connection manager should allow or disallow the association to carry SS7 traffic.

Range: **yes, no**

yes— The connection manager is to allow the association to carry SS7 traffic.

no— The connection manager is to prohibit the association from carrying SS7 traffic.

Default: No change in current value

System

Default: **no**

:bufsize= (optional)

Association buffer size in Kilobytes.

Range: **8-400**

:cwmn= (optional)

Minimum congestion window. This parameter specifies the minimum and initial sizes, in bytes, of the association's congestion window.

Range: **1500-196608**

Default: No change in current value

System

Default: **3000**

:istrms= (optional)

SCTP Inbound Stream Value. A 16-bit unsigned integer that defines the number of streams the sender allows the peer end to create in this association.

Range: **1, 2**

Default: No change in current value

System

Default: **2**

:link= (optional)

The signaling link for this association.

Synonym: **port**

Range: **a, b, a1-a7, b1-b7**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: Current value.

:lport= (optional)

Local port. This parameter specifies the SCTP port number for the local host.

Range: **1024-65535**

Default: Current value.

:m2patset= (optional)

The M2PA timer set assigned to this association.

Range: **1-20**

Default: **1**

:open= (optional)

Connection state (open or closed) that the connection manager is to put the association in when the socket is operational.

Range: **yes, no**

yes — The connection manager is to open the association if the association is operational.

no — The connection manager will not open the association.

Default: No change in current value

System

Default: **no**

:ostrms= (optional)

SCTP Outbound Stream Value. This parameter specifies the 16-bit unsigned integer that defines the number of streams the sender wants to create in this association.

Range: **1, 2**

Default: No change in current value

System

Default: **2**

:rhost= (optional)

Remote host. This parameter specifies the name of the remote host as defined in the IP Host table.

Range: *xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx*

Any string of characters beginning with a letter and comprising up to 60 characters in length.

Valid characters are **a–z, A–Z, 0–9, -** (dash), **.** (period)

Default: Current value.

:rmax= (optional)

Maximum retransmission timeout. This parameter specifies the maximum value of the calculated retransmission timeout in milliseconds.

Range: **10-1000**

Default: No change in current value

System

Default: **800**

:rmin= (optional)

Minimum retransmission timeout. This parameter specifies the minimum value of the calculated retransmission timeout in milliseconds.

Range: **10-1000**

Default: No change in current value

System

Default: **120**

:rmode= (optional)

Retransmission mode. This parameter specifies the retransmission policy used when packet loss is detected.

Range: **lin, rfc**

lin — The Tekelec Linear Retransmission Policy where each retransmission timeout value is the same as the initial transmission timeout, and only the slow start algorithm is used for congestion control.

rfc — Standard RFC 2960 algorithm in the retransmission delay doubles after each retransmission. The RFC 2960 standard for congestion control is also used.

Default: No change in current value

System

Default: **lin**

:rport= (optional)

Remote port. This parameter specifies the SCTP port number for the remote host.

Range: 1024-65535
Default: Current value.

:rtimes= (optional)

Maximum retransmission retries. This parameter specifies the number of times a data retransmission will occur before closing the association.

Range: 3-12
Default: No change in current value.
System
Default: 10

:uaps= (optional)

User adapter parameter set. This parameter specifies the set used by the M3UA or SUA association for various SNM message and notification response options.

Range: 1-10

:ver= (optional)

Version. This parameter specifies the M2PA version supported by the association. The M2PA version is valid only for associations with the **adapter=m2pa** parameter specified.

Range: d6, rfc

:ver= (obsolete)

This parameter is obsolete. Only the RFC version is valid. Indicates that the association uses M3UA RFC version.

Range: RFC
Default: No change in current value.
System
Default: RFC

Example

```
chg-  
assoc:aname=a1:lhost=gw105.nc.tekelec.com:lport=1030 :rhost=gw100.  
nc.tekelec.com:rport=1030:open=yes:alw=yes:uaps=10  
chg-assoc:aname=ipl1303b6:bufsize=32
```

Dependencies

At least one optional parameter must be specified.

The association name (**aname**) must already exist in the IP Socket/Association (IPAPSOCK) table.

An association's connection parameters (**lhost**, **rhost**, **lport**, **rport**) must be unique.

The connection state must be **open=no** to change **lhost**, **rhost**, **lport**, **rport**, **port**, **alhost**, **adapter**, **m2patset**, **istrms**, **ostrms**, **rmode**, **rmin**, **rmax**, **rtimes**, **cwmin**, and **bufsize** parameters.

To specify the **open=yes** parameter, the values must be specified for all parameters that are required to fully specify the connection (**lhost**, **lport**, **rhost**, and **rport**). Specifying the **open=no** parameter requires only the **aname** parameter and at least one other optional parameter.

The value of the **uaps** parameter can be changed for an association if the **open=yes** parameter is specified.

The host name specified by the **lhost** parameter must exist in the IP Host table and must be provisioned as local to this EAGLE 5 ISS.

The hostnames specified in the **lhost** and **alhost** parameters must refer to different IP addresses.

The hostnames specified in the **lhost** and **alhost** parameters must refer to IP addresses on the same IP card.

An association with **adapter=sua** or **m3ua** cannot be specified for an **lhost** on a card running the **iplim** or **iplimi** application.

Before **open=yes** can be specified for an association, the local host must have a signaling link assigned to its associated signaling link port.

An association's **lhost** and **alhost** cannot be assigned to a card's Ethernet interface B.

The adapter layer cannot be changed for an association that is already associated with an Application Server (AS).

Before the local host can be changed, the new local host must have a signaling link assigned to its associated signaling link port.

Only **link=a** or **link=b** can be specified for the **link** parameter value if the card is a dual-slot DCM card running the **iplim** or **iplimi** application. Only **link=a** can be specified if the card is running the **ss7ipgw** or **ipgwi** application. The **link** parameter values **a**, **b**, **a1-a3**, and **b1-b3** can be specified only if the card is an SSEDCCM card running the **iplim** or **iplimi** application. The **link** parameter values **a**, **b**, **a1-a7**, and **b1-b7** can be specified only if the card is an E5-ENET card running the **iplim** or **iplimi** application.

The card location for the card associated with the **lhost** and **alhost** must exist in the IP Link table.

The allowed maximum is 1 association per signaling link on IPLIMx cards.

A maximum of 50 connections (association-to-AS assignments + sockets) can be specified per local host on IPGWx cards.

A maximum of 4000 connections (association-to-AS assignments + sockets) are allowed per system.

Table 5-9 shows the maximum IP connections per DCM Class card.

Table 5-9. Maximum IP Connections per Card

Type	Cards Per System	Links Per Card	IP Connections Per Link	Total Connections
IPLIMx	100	8	1	800
IPGWx	64	1	50	3200
E5-ENET	100	16	1	1600
System				5600

The **rmin** parameter value must be less than or equal to the **rmax** parameter value.

The **cwmin** parameter value must be less than or equal to the **bufsize** parameter value.

To assign an association on an IPLIMx card for a local host, the association must have an adapter parameter value that is the same as the **ipliml2** setting of its assigned signaling link. An association having an adapter value of **m2pa** must be assigned to an IPLIM signaling link having an **ipliml2** value of **m2pa**.

If the **m2patset** parameter is specified, the **adapter=m2pa** parameter must be specified.

The trade ratio states the quantity of associations to sockets that may be provisioned on a certain card, as follows:

Trade Ratio = a:s

Where: a=associations and s=sockets

The requested buffer size increase cannot exceed available buffer space on the card. Use the **rtrv-assoc** command with the **aname**, **lhost**, or **alhost** parameter to display used and total buffer space on the card.

The **ver** parameter can only be specified if the **adapter=m2pa** parameter is specified.

Notes

The command that is entered cannot exceed a total of 150 characters in length.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This fully specifies the connection.

If the **open=yes** parameter is specified, the association's **lhost** and **lport** configuration must not match that of any open association.

If the card's application is **iplim** or **iplimi**,

- The **adapter** parameter value must equal **m2pa**.
- The **ipliml2** value for the assigned signaling link must equal **m2pa**.

If the entered **lhost** or **alhost** corresponds to an IP address associated with the card's B Ethernet Interface hosted by a present non-EDCM card, an error will be generated. If the entered **lhost** or **alhost** corresponds to an IP address associated with the card's B Ethernet Interface hosted by a provisioned but not present DCM card, the card will be auto-inhibited upon card insertion.

An association with an **adapter** value of **m2pa** cannot be assigned to an SS7IPGW or IPGWI host.

The M2PA version is supported if the application is IPLIMx and the **adapter=m2pa** parameter is specified. When changing the association adapter type to **m2pa** and a version is not specified, the **m2pa=rfc** value is assigned by default.

Output

```

chg-atm-lps

Change ATM Link Parameter Set

Use this command to configure a link parameter set with timers and other parameters used by the system to provide level 2 functions for each ATM high-speed signaling link.

Use this command also to copy values from **lpset 20** and **30**, as well as any **lpset** to another. The **action=copy** and **srclpset=x** parameters provide this capability.

Keyword: **chg-atm-lps**

Related Commands: **ent-slk**, **rtrv-atm-lps**

Command Class: Database Administration

Parameters

NOTE: Unless specified, the system default values are meant for both ANSI (T1) and ITU (E1) standards.

:lpset= (mandatory)

The link parameter set being changed. Sets **1** through **19** and **21** through **29** can be configured by the user. Link parameter sets **20** and **30** are not configurable, but are used to contain the recommended default values for a set.

Range: **1-19, 21-29**

Default: **1** for ANSI
21 for ITU

:action= (optional)

This parameter copies a set of ATM signaling link parameters from one set to another.

Range: **copy**

Default: No change to the current value

:maxcc= (optional)

The maximum number of transmissions of BGN, END, ER, or RS PDU.

Range: **1-10**

Default: **4**

:maxnrp= (optional)

The maximum number of retransmitted PDUs during proving.

Range: **0-10**

Default: **1** for ANSI
0 for ITU

:maxpd= (optional)

The maximum number of SD PDUs that can be sent before a POLL is sent.

Range: **5-2120**

Default: **500**

:maxstat= (optional)

The maximum number of list elements in a STAT PDU.

Range: **3-67**

Default: **67**

:n1= (optional)

The number of PDUs sent during proving.

Range: **500-64552**

Default: **64552** for ANSI
1000 for ITU

:nblk= (optional)

The number of monitoring intervals per block.

Range: **1-10**

Default: **3**

:srclpset= (optional)

The source **lpset** for a **copy** action. This parameter can be specified only with the **action=copy** parameter.

Range: **1-30**

:tmrcc= (optional)

The timer, in milliseconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs.

Range: 100-2000

Default: 200

:tmrerm= (optional)

The error rate monitor interval, in milliseconds.

Range: 25-500

Default: 100

:tmridle= (optional)

The timer, in milliseconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase.

Range: 25-1000

Default: 100

:tmrkalive= (optional)

The timer, in milliseconds, used during the transient phase when no SD PDUs are being sent to keep connection up.

Range: 25-500

Default: 100

:tmrnocred= (optional)

The timer, in milliseconds, used when the no credit exists and PDUs are available to be sent.

Range: 1000-6000

Default: 1500

:tmrnorsp= (optional)

The timer, in milliseconds, used to check that STAT PDUs are arriving often enough.

Range: 500-2000

Default: 1500

:tmrpoll= (optional)

The timer, in milliseconds, used to guarantee that POLL PDUs are sent often enough.

Range: 25-500

Default: 100

:tmrprov= (optional)

The timer, in milliseconds, used to monitor the status of a link after it is placed into service.

Range: 60000-120000

Default: 60000

:tmrsrec= (optional)

The timer, in milliseconds, used to prohibit closely spaced SSCOP recoveries from occurring.

Range: 60000-10800000

Default: 3600000

:tmrt1= (optional)

The time, in milliseconds, between link release action and the next link reestablish action during alignment.

Range: 1000-15000

Default: 5000

:tmrt2= (optional)

The total time, in milliseconds, that SSCF will attempt alignment.

Range: 15000-180000
Default: 120000 for ANSI
 30000 for ITU (E1)

:tmrt3= (optional)
 The time, in microseconds, between proving PDUs.
Range: 450-23000
Default: 925

Example

```
chg-atm-lps:lpset=5:tmrprov=1000:tmridle=55
chg-atm-lps:lpset=3:srclpset=5:action=copy
```

Dependencies

The values in link parameter sets **20** and **30** are the system default values. They cannot be changed but can be copied to another link parameter set.

The values of the **lpset** and **srclpset** parameters cannot be the same.

The **action** and **srclpset** parameters must be specified together.

If **action=copy** is specified, only the **lpset** and **srclpset** parameters can be specified.

At least one optional parameter must be specified.

Notes

The **lpset** values **20** and **30** are non-configurable and contain the default values for ANSI and ITU ATM standards respectively. The **lpset** values **1** through **19** and **21** through **29** are configurable and initialized to the default values for ANSI and ITU standards respectively.

If no parameter value for **lpset** is included when the **ent-slk** command is entered, the system default value of **1** is assigned for ANSI links and the system default value of **21** is assigned for ITU links.

All timer values for link parameter sets are initialized to the system default values.

Output

```
chg-atm-lps:lpset=5:tmrprov=1000:tmridle=55

rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0

chg-attr-seculog

Change the Security Log Characteristics

Use this command to modify various attributes that affect the operation of the security logging feature. These attributes include:

- Enabling or disabling the raising of alarms when the log needs uploading
- Specifying the log percentage full threshold at which an *upload required* alarm is raised for the active security log.

Keyword: chg-attr-seculog

Related Commands: rtrv-attr-seculog

Command Class: Security Administration

Parameters**:upldalm=** (optional)

Enable or disable log alarms that pertain to uploading of the security log.

Range: **yes, no****yes**—Enables the log alarms pertaining to uploading of the log, as follows:

- Upload required

- Log overflowed

- Standby log contains greater than 0 un-uploaded entries

no—Prevents the log alarms from being raised when these conditions occur. Should the alarm already be raised when **no** is specified, the alarm is lowered.**Default:** No change to the current value**:upslg=** (optional)Percent full threshold. This parameter specifies the percent full threshold for the security logs. If the **upldalm=yes** parameter is configured, an alarm is raised for the security log when the %full field (as displayed using the **rept-stat-seculog** command) in the log, on the active OAM, reaches or exceeds the value specified for **upslg**. This alarm indicates that the administrator must upload the log.**Range:** **1-99****Default:** No change to the current value**Example****chg-attr-seculog:upslg=80:upldalm=yes****Dependencies**

At least one optional parameter must be specified.

Notes

None

Output**chg-attr-seculog:upslg=80:upldalm=yes**rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0

;

chg-cmd**Change Command Attributes**

Use this command to change the attributes of a command.

Keyword: **chg-cmd****Related Commands:** **rtrv-cmd****Command Class:** Security Administration**Parameters****:cmd=** (mandatory)

The command whose attributes are to be changed.

Range: **ZZZZZZZZZZZZZZZZZZZZ**

One alphabetic character followed by up to 19 additional alphanumeric characters.

:class1= (optional)Configurable command class name (ayy), and indicator (**-yes** or **-no**) to specify whether the command class is allowed.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

Default: No change to current value

:class2= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:class3= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:class4= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:class5= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:class6= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:class7= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:class8= (optional)

Configurable command class name (*ayy*), and indicator (**-yes** or **-no**) to specify whether the command class is allowed

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

Example

```
chg-cmd:cmd=ent-rte:class1=u11=yes
```

```
chg-cmd:cmd=rept-stat-slk:class7=dab-no
```

Dependencies

At least one optional parameter must be specified.

The Command Class Management feature must be enabled before this command can be entered.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before a command from the classes LNPBAS, LNPDB, and LNPSUB can be specified.

The **cmd** parameter value must be a valid system command.

The **class1** - **class8** parameter values must be valid default or provisioned configurable command class names.

The **login** command is available to all users and therefore cannot be assigned to a configurable class. If the **login** command is used as a parameter, it will be rejected.

Notes

Up to 8 configurable command class names can be specified in one command. More than 8 command classes can be updated by entering additional commands. To update all 32 available configurable command classes, you could enter 4 commands with 8 command classes specified in each command.

The following feature names are valid for this command:

- Prepaid IDP Query Relay
- IDP Screening for Prepaid.

:list= (optional)

The name of the Common Screening List that is associated with the feature.

NOTE: The list parameter must be specified when the feature uses more than one type of Common Screening List.

Range: **delpfx, gt, skbcm, ccnc, skts, insl**

delpfx—Delete Prefix List

gt—Global Title List

skbcm—SK+BCSM List

ccnc—CC+NC List

skts—SK+TS List

insl—In Network Subscriber List

The following screening lists are valid for the indicated features:

- **ccnc, delpfx, gt, skbcm**—Prepaid IDP Query Relay feature
- **skts, insl**—IDP Screening for Prepaid feature

:p1= (optional)

Parameter value 1. The parameter value is specific to the feature and list name that use this parameter.

Range: 1 digits

Valid digit values are:

0-1—For the Prepaid IDP Query Relay feature **delpfx** list, where: **0**=National, **1**=International

:p2= (optional)

Parameter 2. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:p3= (optional)

Parameter 3. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the **ds** parameter or the **pc** parameter must be specified for the command. Currently, no features use the **pc** parameter.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example.

NOTE: Either the *pn* parameter or the feature parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces.

The following part numbers are valid for this command:

- **893016001**—Prepaid IDP Query Relay feature
- **893015501**—IDP Screening for Prepaid

Example

```
chg-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=123456
chg-csl:feature="Prepaid IDP Query Relay":list=skbcsn:ds=4321
chg-csl:feature="Prepaid IDP Query
Relay":list=delpfx:ds=54321:p1=0
chg-csl:feature="IDP Screening for
Prepaid":list=insl:ds=123456789bcDEF
chg-csl:feature="IDP Screening for Prepaid":list=skts:ds=36ab
```

Dependencies

An enabled feature must be specified using either a valid part number (**pn**) or feature name (**feature**). The specified feature must use a Common Screening List.

The specified feature name must be for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output example. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The following features use a Common Screening List:

- IDP Screening for Prepaid
- Prepaid IDP Query Relay

The feature that is specified in the **feature** parameter must be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The **list** parameter value must be valid for the specified screening feature. The following **list** parameter values are valid for the indicated feature:

- **skts, insl**—IDP Screening for Prepaid
- **gt, ccnc, delpfx, skbcsn**—Prepaid IDP Query Relay

The specified screening list entry must exist in the screening list that is used by the feature.

The length of the digit string that is specified for the **ds** parameter must be valid for the screening feature and list type.

A valid **ds** parameter value is required for the specified feature and list type.

The following parameters are allowed with the indicated common screening list type:

- **list=gt**—**ds** parameter
- **list=ccnc**—**ds** parameter
- **list=delpfx**—**ds** and **p1** parameters
- **list=skbcsn**—**ds** parameter
- **list=skts**—**ds** parameter
- **list=insl**—**ds** parameter

The leading digit pattern in the specified digit string (**ds** parameter) must be unique in the specified screening list for the indicated feature:

- **skts** and **insl** lists—IDP Screening for Prepaid
- **gt** and **ccnc** lists—Prepaid IDP Query Relay

The specified **ds** parameter value must be valid for the specified screening list (**list** parameter).

The value that is specified for a common screening list parameter must be valid for the specified common screening list feature.

Notes

None

chg-ctrl-feat

Change Controlled Feature

Use this command for controlled features that have been purchased and enabled with the **enable-ctrl-feat** command. to:

- Turn on or turn off On/Off features
- Turn on Permanently On features (they cannot be turned off after they have been turned on)

Use this command when the system station shows an expired temporary key and the administrator wants to clear the CRITICAL system alarm without purchasing a permanent Feature Access Key.

Keyword: chg-ctrl-feat

Related Commands: enable-ctrl-feat, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

:partnum= (mandatory)

Part number. This parameter specifies the part number for the feature.

Range: 893000000 - 893999999

Do not include dashes in the 9-digit number.

:alarm= (optional)

Clears alarms when temporary feature keys have expired.

Range: clear

:status= (optional)

Changes the operational status of the feature.

Range: on, off

Default: No change in current status

Example

```
chg-ctrl-feat:partnum=893xxxxxx:status=on
```

```
chg-ctrl-feat:partnum=893xxxxxx:alarm=clear
```

Dependencies

The controlled feature specified by the **partnum** parameter must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

One of the optional parameters, but not both, must be specified in the command.

To use this command to turn off a feature, the Part Number specified in the command must be for one of the following On/Off features that is currently on. (A Permanently On feature is turned on with this command; after the feature has been turned on, it cannot be turned off with this command):

- 893006601 LNP Short Message Service (LNP SMS)
- 893006701 Prepaid SMS Intercept Phase 1 (PPSMS)
- 893006901 Intermediate GTT Load Sharing (IGTTLS)
- 893015401 Flexible GTT Load Sharing (FGTTLS)
- 893007001 MNP Circular Route Prevention
- 893005801 Command Class Management
- 893005701 IP User Interface (Telnet)
- 893009101 Network Security Enhancement
- 893009301 Portability Check for Mobile Originated SMS
- 893400001 EAGLE OA&M IP Security
- 893013501 MTP Map Screening
- 893018401 Large BICC MSU Support for IP Signaling
- 893000201 ISUP Normalization
- 893000301 German 1TR7 Normalization
- 893000401 UK PNO-ISC7 Normalization
- 893000501 ITU Q.767 Normalization
- 893000601 ITU Q.767 Normalization

Turning on a feature that is already on or turning off a feature that is already off has no effect.

Before the LNP ELAP Configuration feature can be turned on, all cards that are running the **sccp**, **ebdadcm**, and **ebdablm** applications must be deleted.

The GTT feature must be turned on (see the **chg-feat** command) before the Intermediate Global Title Translation Load-Sharing (IGTTLS) feature can be enabled or turned on.

All IPSM cards in the system must be inhibited before the IP User Interface (Telnet) feature can be turned on or off.

All IPSM cards in the system must be inhibited before the EAGLE OA&M IP Security Enhancements feature can be turned on or off.

The **mtplprst** option must be enabled (see the **chg-stpropts** command) before the Origin-based MTP Routing feature can be turned on.

The Origin-based MTP Routing feature can not be turned on if any of the following unsupported cards are equipped in the system:.

- LIMDS0 Part Number 870-1009-xx
- LIMOCU Part Number 870-1010-xx
- LIMV35 Part Number 870-1012-xx
- ILA Part Number 870-1484-xx
- EILA Part Number 870-2049-xx
- LIM-E1 Part Number 870-1379-01
- ASM (Obsolete)
- Dual-Slot DCM Part Numbers 870-1984-xx

Before the Intermediate Global Title Translation Load Sharing (IGTTLS) feature can be turned on, each SCCP card in the system must have at least a 586 processor.

Only one of the optional parameters, not both, can be specified in the command.

After a Permanently On feature is turned on, it cannot be turned off with this command. All controlled features with quantity feature access keys (like LNP ported TNs) and the following features are Permanently On features:

- LNP ELAP Configuration
- Equipment Identity Register (EIR)
- 15 Minute Measurements
- ANSI-ITU-China SCCP Conversion
- GSM MAP Screening (GMS)
- Enhanced GSM MAP Screening (EGMS)
- Spare Point Code Support
- ITUN-ANSI SMS Conversion
- GSM MAP SRI Redirect for Serving HLR
- ISUP NP with EPAP
- Origin-Based MTP Routing
- Origin-based SCCP Routing
- GSM Mobile Number Portability (G-Port)
- ANSI-41 Mobile Number Portability (A-Port)
- IS41 GSM Migration (IGM)
- MTP Msgs for Prepaid Apps (MTPR)
- Transaction-based GTT Loadsharing (TBGTTLS)
- Weighted GTT Loadsharing (WGTTLS)
- ANSI-41 INP Query
- INP
- Hex Digit Support for GTT
- E5-SM4G Throughput Capacity

Before the 15 Minute Measurements feature can be turned on,

- The Measurements Platform feature must be turned on (see the **chg-feat** command).
- The Measurements Platform collection option must be enabled (see the **chg-measopts** command).

Before the 15 Minute Measurements feature can be turned on, at least one MCPM card must be in the IS-NR state in the system.

The 15 Minute Measurements feature cannot be turned on when 30 minute measurements collection is in progress.

The Global Title Translation (GTT) feature must be turned on (using the **gtt=on** parameter for the **chg-feat** command) before the Intelligent Network Application Part (INAP) Number-based Portability (INP) feature or the ANSI-41 INP Query (AINPQ) feature can be turned on.

Each provisioned VSCCP card must have at least 4G memory before the AINPQ feature can be turned on.

The A-Port, G-Port, or IGM feature must be turned on before the MNP Circular Route Prevention feature can be turned on.

The G-Port feature requires a DSM card running the VSCCP application.

The GTT feature must be turned on before the G-Port feature can be turned on.

Notes

None.

Output

chg-ctrl-feat:partnum=893xxxxxx:status=on

```

Command entered at terminal #4.
CHG-CTRL-FEAT: MASP A - COMPLTD
```

chg-db

Change Database

Use this command to manipulate elements of the database.

CAUTION: When this command is entered, all other database operations are locked out while the command executes. The only chg-db actions that are not locked out are the LNP electronic bulk download operations (beginedl and canceledl).

CAUTION: The cards that run both the active and standby OAM reboot whenever the restore, import, or finishedl operations complete successfully. When a database is repaired successfully, the card with the standby OAM reboots. This action purges old database data from memory and reloads the MASPs with the new data. When the card with the active OAM reboots, all terminals reinitialize, automatically logging off all users. Depending on the new database, the terminals may be initialized to a different configuration, and user IDs and passwords may change.

Keyword: chg-db

Related Commands: copy-meas, rept-stat-db

Command Class: System Maintenance

Parameters

:action= (mandatory)

The database management action.

CAUTION: These parameter values (except beginedl, canceledl, or finishedl) can cause loss of synchronization of LNP databases unless you inhibit the OAP terminal ports before entering the chg-db command with these parameters. Refer to the *Database Administration Manual - System Management* for procedures using these command parameters.

Range: backup, repair, restore, import, beginedl, canceledl, finishedl

backup— Makes a copy of the database from the current data partitions to the backup partitions on both fixed disks or from the active fixed disk to the backup partition on the removable cartridge on the MDAL card

repair— Copies the current and backup databases from the active to the standby fixed disk.

restore— Copies the backup partitions to the current data partitions on both fixed disks, or copies the database on the removable cartridge on the MDAL card to the current partitions on both fixed disks.

CAUTION: The action=restore parameter initiates an emergency recovery procedure and requires the init-sys command to download the restored database to all the cards in the system.

import— Copies the LNP database from a removable cartridge created at the LSMS to current partitions on both fixed disks. The **import** parameter is used to manually load the LNP database from the LSMS when the LNP is first brought into service or when resynchronization of the LNP database with the LSMS database is needed.

CAUTION: The imported database must be loaded onto all TSMs in the system. The preferred method is to take each TSM out of service using the `rmv-card` command then put it back into service using the `rst-card` command until all the TSMs have been reloaded.

CAUTION: The following method of initialing cards should be used only in emergency situations: all the TSMs can be initialized at the same time using the `init-card:appl=sccp` command. This method not only loads the imported LNP database onto the TSMs at the same time, but takes all the TSMs out of service and the LNP subsystem offline.

beginedl — Signals that an electronic bulk download of the LNP database from the LSMS can proceed. The LSMS LNP data is downloaded to the RAM memory of the Bulk Load Module (BLM) card. The command performs various checks to ensure that the system is ready to receive the data from the LSMS.

canceledl — Signals that the LNP database resident in the BLM card should not be copied to the OAM fixed disks, but instead should be discarded. The command causes the BLM card to reboot in order to reload a fresh copy of current LNP database.

finishedl — Signals that an electronic bulk download of the LNP database from the LSMS is completed; specifically, that the LNP database currently resident in the BLM's memory should be copied to the OAM fixed disks, overwriting the current LNP database. The command performs various checks to ensure the BLM's LNP database is acceptable prior to copying it to fixed disk. During the execution of **finishedl**, LNP database provisioning is blocked.

:dest= (optional)

Destination drive. This parameter provides the option to back up the database to the fixed or removable drive.

Range: **remove, fixed**

Default: **fixed**

:force= (optional)

Force indicator. Specify **force=yes** with the **action=canceledl** parameter. This parameter prevents the inadvertent destruction of the downloaded LSMS LNP database currently resident in the BLM card.

Range: **yes, no**

Default: **no**

:src= (optional)

Source drive. This parameter provides the option to restore the database from the fixed or removable drive.

Range: **remove, fixed**

Default: **fixed**

Example

```
chg-db:action=backup:dest=fixed
chg-db:action=backup:dest=remove
chg-db:action=restore:src=fixed
chg-db:action=restore:src=remove
chg-db:action=repair
chg-db:action=import
chg-db:action=beginl
```

```
chg-db:action=finishedl
chg-db:action=canceledl:force=yes
```

Dependencies

NOTE: Before issuing a `chg-db:action=import` command, be sure to familiarize yourself with the information in Chapter 9 "Manual LSMS to STP Bulk Download" in the *LNP Database Synchronization Manual*.

NOTE: Before issuing the `chg-db:action=beginl/canceledl/finishedl` commands, be sure to familiarize yourself with the procedures in Chapter 3 "Preparing the Eagle for High-Speed Operations," in the *LNP Database Synchronization Manual*.

The **chg-db** command cannot be entered while the system is in upgrade mode.

When a removable disk is involved in the operation, the removable disk must meet the following criteria:

- Be accessible and ready in the drive.
- Be formatted as a system removable disk, not a measurement removable disk.

The **dest** parameter can be specified only when **action=backup**. If the **dest=fixed** parameter is specified, or the **dest** parameter is not specified, the database on the current partition of the fixed disk is copied to the backup partition of the fixed disk. This action is shown in Figure 5-1.

Figure 5-1. The `chg-db:action=backup:dest=fixed` Command

If the **dest=remove** parameter is specified, the database on the current partition of the active TDM fixed disk is copied to the removable cartridge in the MDAL. This action is shown in Figure 5-2.

Figure 5-2. The `chg-db:action=backup:dest=remove` Command

The current database partition of both fixed disks must be free of integrity violations (for example, incoherency, inconsistency, and data corruption) when **action=backup** is specified.

The **src** parameter can be used only when **action=restore**. To restore the database, if the **src=fixed** parameter is specified or the **src** parameter is not specified, the backup partition of each fixed disk is copied to the current partition of the fixed disk. This action is shown in Figure 5-3.

Figure 5-3. The **chg-db:action=restore:src=fixed** Command

The backup database partition of both fixed disks must be coherent when **chg-db:action=restore:src=fixed** is specified.

If the **src=remove** parameter is specified, the database on the removable cartridge is copied to the current partitions on both the active and standby fixed disks. This action is shown in Figure 5-4.

Figure 5-4. The **chg-db:action=restore:src=remove** Command

The database on the removable cartridge must be coherent when **action=restore:src=remove** is specified.

If the **action=repair** parameter is specified, the current and backup database partitions are copied from the active fixed disk to the standby fixed disk. This action is shown in Figure 5-5.

Figure 5-5. The **chg-db:action=repair** Command

The current and backup database partitions of the active fixed disk must be free of integrity violations (for example, incoherency and data corruption) when **action=repair** is specified.

If the **action=import** parameter is specified, an LNP database is copied from a removable created by the LSMS to the current partition of both fixed disks. Figure 5-6 illustrates this action.

Figure 5-6. The **chg-db:action=import** Command

The current database partitions of the active and standby fixed disks must be free of integrity violations (for example, incoherency and data corruption) when the **action=import** parameter is specified.

The LNP feature must be on for use with OAP before the **action=import**, **beginedl**, **finishedl**, or **canceledl** parameter can be specified. Verify that the LNP feature is on by entering the **rtrv-ctrl-feat** command. In the output:

- If the *LNP ported TNs* quantity is not listed, the LNP feature is not on.
- If the LNP ELAP Configuration controlled feature is not listed or is turned off, and the quantity for the *LNP ported TNs* entry is less than or equal to 12,000,000, the LNP feature is turned on for use with OAP.

- If the LNP ELAP Configuration controlled feature is turned on, the LNP feature is turned on for use with ELAP and not with OAP.

Refer to “Activating the LNP Feature” in Chapter 2 of the *LNP Feature Activation Guide*.

If the **chg-db:action=beginedl** command is entered, part or all of the LNP database is transmitted via an ethernet connection from the LSMS to the RAM memory of the system’s Bulk Load Module (BLM) card. After the electronic bulk download of the LNP data from the LSMS is completed and is resident in the BLM’s memory, the **chg-db:action=finishedl** command copies the database to the OAM fixed disks, overwriting the current LNP database. This process is shown in Figure 5-7.

Figure 5-7. The chg-db:action=beginedl/finishedl Command

To specify the **chg-db:action=beginedl** command, the following conditions must be met:

- The current database on the active and standby OAM fixed disks must be coherent.
- The BLM and DCM cards must be provisioned and their primary state (PST) must be IS-NR.
- The LNP database currently resident in the BLM card must be at the same level as the current database on the active OAM and must be coherent.
- A **chg-db:action=beginedl/finishedl/canceledl** command must not currently be in effect.

To specify the **chg-db:action=finishedl** command, the following conditions must be met:

- The BLM card must be provisioned and its primary state (PST) must be IS-NR.
- The download from the LSMS to the BLM card must have completed.
- The database in the BLM card must be coherent.
- There cannot be a measurement preparation operation in progress.

To specify the **chg-db:action=canceledl** command, a **chg-db:action=beginedl** command must currently be in effect.

The **force** parameter can be used only with the **chg-db:action=canceledl** command. The **force=yes** parameter must be specified whenever the **action=canceledl** operation is specified.

If the LNP ELAP Configuration controlled feature is turned on, the **beginedl**, **finishedl**, and **canceledl** parameter values are no longer available. All data from the LSMS is transmitted over an ethernet connection to the active ELAP (Eagle LNP Application Processor) rather than a BLM. The ELAP automatically distributes the changes to LNP databases or DSM cards in the EAGLE 5 ISS; it is not necessary to identify a beginning and end for high-speed transmissions. For more information, refer to the *LNP Database Synchronization Manual*.

Notes

When the **chg-db** command is entered with the **action=backup** parameter, the following message appears when an audit is in progress:

Command In Progress: waiting for database audit to complete

The command executes when the audit is finished.

Should the EAGLE 5 ISS LNP database become severely out of sync with the LSMS master LNP database (such as, a long-duration communications failure between the EAGLE 5 ISS and LSMS), then you can use one of the following methods to resynchronize the EAGLE 5 ISS from the master LSMS database:

- The **chg-db:action=import** command (cartridge-based method)
- The **chg-db:action=beginedl** and **chg-db:action=finishedl** command (ethernet-based method)

If the LNP ELAP Configuration controlled feature is turned on, the LSMS can accomplish the resynchronization with no action required at the EAGLE 5 ISS. For more information, refer to the *LNP Database Synchronization Manual*.

After an **action=import** or **action=finishedl** operation completes, the following alarm is raised for all operational SCCP cards:

* 5022.0429 * CARD xxxx SCCP LNP database is inconsistent

This alarm indicates that all SCCP cards must be reloaded to receive the newly imported LNP database.

The **action=import** or **action=finishedl** operations do not affect the database level. Therefore, these operations do not require that you reinitialize non-SCCP networking cards. Only SCCP cards must be reinitialized.

If the **chg-db:action=finishedl** command is entered, but no modifications have been made to the LNP database in the BLM card (that is, the LSMS did not apply any updates to the database), then the results are as follows:

- The database will not be uploaded from the BLM card to the OAM fixed disks.
- The following output message appears:

FINISHEDL : MASP A - LNP DB in BLM card not modified by LSMS.

No upload will occur.

When the LNP ELAP Configuration controlled feature is not turned on, the following components must be in place before the LNP database can be electronically downloaded from the LSMS:

- A single BLM card running the **ebdablm** GPL must be provisioned and must be operational (IS-NR). This card is populated with the current LNP database, and the download must have completed. The card does not go to the IS-NR state until the download is completed.

- A single DCM card running the **ebdadcm** GPL must be provisioned and must be operational (IS-NR).
- An ethernet connection between the LSMS and DCM must exist.
- The DCM card must be provisioned with the necessary TCP/IP configuration information so that the card can establish a data connection with the LSMS.

Performance

For **chg-db** command activities using the **backup**, **restore**, **repair**, and **import** parameter values, the performance time varies depending on the number of records allocated for the database, system activity, and system setup. These operations should typically take no longer than 30 minutes. If one of these operations exceeds one hour, contact Tekelec Technical Services for assistance at (888) FOR-TKLC.

The performance time required for enhanced bulk download activities varies depending on the number of records provisioned in the database and the quality of the transmission and connections. Table 5-10 lists the performance range for enhanced bulk download activities.

Table 5-10. Performance Range for Enhanced Bulk Download Activities

Activity	Typical Performance per Million Records	Maximum Time* per Million Records
Uploading a database from the BLM to the OAM fixed disks (active and standby).	10 minutes	15–20 minutes
Downloading a database from the LSMS to the BLM (includes extracting and formatting the entries on the LSMS, transmitting the data from the LSMS to the EAGLE 5 ISS and inserting the entries in the database).	75 minutes	90 minutes
*If an activity exceeds the maximum time, contact the Tekelec Customer Care Center ().		

Output

The output of the various actions of the **chg-db** command is shown in the following examples.

In addition to the output shown in the examples for the **action=beginedl** and **action=canceledl** actions, messages such as UIMs might appear at your terminal.

chg-db:action=backup

```
BACKUP (FIXED): MASP B - Backup starts on active MASP.
BACKUP (FIXED): MASP B - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP B - Backup starts on standby MASP.
BACKUP (FIXED): Backup on standby MASP to fixed disk complete.
```

chg-db:action=restore

```
RESTORE (FIXED): MASP A - Restore starts on active MASP.
RESTORE (FIXED):MASP A - Restore from fixed disk on active MASP complete.
RESTORE (FIXED): MASP A - Restore starts on standby MASP.
RESTORE (FIXED):MASP A - Restore from fixed disk on standby MASP complete.
RESTORE (FIXED): MASP A - MASP(s) will reboot to load data.
```

chg-db:action=backup:dest=remove

```
BACKUP (REMOVABLE) : MASP A - Backup starts on active MASP.
BACKUP (REMOVABLE) : MASP A - Backup to removable cartridge complete.
```

chg-db:action=backup:dest=fixed

```
BACKUP (FIXED) : MASP A - Backup starts on active MASP.
BACKUP (FIXED) : MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED) : MASP A - Backup starts on standby MASP.
BACKUP (FIXED) : MASP A - Backup on standby MASP to fixed disk complete.
```

chg-db:action=restore:src=remove

```
RESTORE (REMOVABLE) : MASP A - Restore starts on active MASP.
RESTORE (REMOVABLE) : MASP A - Restore starts on standby MASP.
RESTORE (REMOVABLE) : MASP A - MASP(s) will reboot to load data.
RESTORE (REMOVABLE) : MASP A - Restore from removable cartridge complete.
```

chg-db:action=restore:src=fixed

```
RESTORE (FIXED) : MASP A - Restore starts on active MASP.
RESTORE (FIXED) : MASP A - Restore from fixed disk on active MASP complete.
RESTORE (FIXED) : MASP A - Restore starts on standby MASP.
RESTORE (FIXED) : MASP A - MASP(s) will reboot to load data.
RESTORE (FIXED) : MASP A - Restore from fixed disk on stdby MASP complete.
```

chg-db:action=repair

```
REPAIR: MASP A - Repair starts on standby MASP.
REPAIR: MASP A - Standby MASP will reboot to load data.
REPAIR: MASP A - Repair from fixed disk complete.
```

chg-db:action=import

```
IMPORT : MASP A - Import (LNP) starts on active MASP.
IMPORT : MASP A - Import (LNP) on active MASP complete.
IMPORT : MASP A - Import (LNP) starts on standby MASP.
IMPORT : MASP A - Import (LNP) on standby MASP complete.
IMPORT : MASP A - MASP(s) will reboot to reload data.
```

chg-db:action=beginedl

```
BEGINEDL : MASP A - Electronic Bulk Download from LSMS may proceed.
Note: Issue CHG-DB:ACTION=FINISHEDL or CANCELEDL to resume.
```

chg-db:action=finishedl

```
FINISHEDL : MASP A - Upload (LNP) starts on active MASP.
FINISHEDL : MASP A - Upload (LNP) on active MASP complete.
FINISHEDL : MASP A - Upload (LNP) starts on standby MASP.
FINISHEDL : MASP A - Upload (LNP) on standby MASP complete.
FINISHEDL : MASP A - MASP(s) will reboot to load data.
```

chg-db:action=finishedl

FINISHEDL : MASP A - LNP DB in BLM card not modified by LSMS.
No upload will occur.

chg-db:action=canceledl

CANCELEDL : MASP A - LNP DB upload will not occur.
Note: BLM will now reboot to reload LNP DB.

chg-dcmps**Change Database Communication Module
Parameter Set**

Use this command to change the set of generic timers and parameters used by the system application.

Keyword: **chg-dcmps**

Related Commands: **rtrv-dcmps**

Command Class: Database Administration

Parameters

:set= (mandatory)

The set number.

Range: **1-9**

:parm= (optional)

The parameter number within the timer.

Range: **1-10**

parm=1 is used for the Type of Service (TOS) socket option.

parm=2 is used for the Nagle's Algorithm socket option.

parm=3 is used for the Default SORP flags socket option.

The remaining parameter values are unused.

Default: No change to current value

:pvalue= (optional)

The value to be set for this parameter if the **parm** parameter is specified.

Range: **0-4294967295**

Table 5-11 shows valid **pvalue** parameter values for each **parm** parameter value.

Table 5-11. Valid pvalue Values for chg-dcmps

parm	pvalue bits	Valid Range
1	0-7	0-255
2	0	0=Disabled 1=Enabled
3	0-31	0x0 – 0xFFFFFFFF

Default: No change to current value

:srcset= (optional)

The source set of the copy.

Range: **1-10**

Default: Empty

:timer= (optional)

The timer number within the set.

Range: 1-10

timer=1 is the time in milliseconds between sending of TEST messages by NE.

timer=2 is the time in milliseconds to wait for a response to a TEST message.

timer=3 is the time in milliseconds to continue processing received service messages after NE is prohibited.

timer=4 is the time in milliseconds between sending of MONI messages by NE.

The remaining timer numbers are unused.

Default: No change to current value

:tvalue= (optional)

The value the timer will be set to, in milliseconds.

Range: 0-4294967275

Default: No change to current value

Example

```
chg-dcmps:set=1:srcset=10
```

Dependencies

At least one of the following optional parameters must be specified: **timer**, **parm**, **srcset**.

If the **srcset** parameter is specified, no other optional parameters can be entered.

If the **timer** parameter is specified, the **tvalue** parameter must be specified.

If the **parm** parameter is specified, the **pvalue** parameter must be specified.

Notes

There are 10 IP parameter sets. Each IP parameter set has 10 timers.

IP parameter set number 10 contains parameter set default values. It cannot be changed.

Output

```
chg-dcmps:set=1:srcset=10
```

```
rlghncxa03w 03-02-05 15:35:05 EST EAGLE 28.1.0
```

```
CHG-DCMPS: MASP A - COMPLTD
```

```
;
```

chg-dstn

Change Destination

Use this command to change the characteristics of the point codes that are considered destinations from this signal transfer point (STP). A destination does not have to be an adjacent signaling point, but the system must be able to route traffic to this destination.

Keyword: chg-dstn

Related Commands: chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p**-

The asterisk value (*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:aliasa= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

:aliasa/aliasi/aliasn/aliasn24= (optional)

Alias point code.

:aliasi= (optional)

ITU international alias point code with subfields *zone-area-id*. This parameter is not valid if an ITU international (**dp ci**) point code is entered. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

:aliasn= (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

:aliasn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Enter **none** to delete the point code.

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether the STP broadcasts network management messages to adjacent signaling points. The network management messages contain information about the indicated cluster and any of that cluster's member signaling points that are on its exception list. The messages whose broadcast is determined by this parameter are:

- **TFP**—transfer prohibited
- **TCP**—transfer cluster prohibited

Range: **yes, no**

yes — Network management messages are not broadcast

no — Network management messages are broadcast

Default: No change to the current value

:cli= (optional)

The Common Language Location Identifier assigned to this destination.

Range: ayyyyyyyyyy

1 alphabetic character followed by 10 alphanumeric characters

Default: No change to the current value

:lei= (optional)

Exception-list exclusion indicator, for cluster destinations only. This parameter specifies whether the system *excludes* or *includes (maintains)* a dynamic status exception list (x-list) for each cluster route used to reach the member signaling points that make up the cluster.

Range: **yes, no**

yes — Do not maintain a dynamic status x-list

no — Maintain a dynamic status x-list

Default: No change to current value.

:ncai= (optional)

Nested cluster allowed indicator. Specifies whether the route to the cluster point code can be different for provisioned members of the cluster. A point code is a member of a cluster point code if it has the same network identifier (NI) and network cluster (NC) values as the cluster point code. This parameter can only be specified for cluster point codes. Nested cluster routing is allowed if this parameter is set to **yes** and the CRMD and NCR features are turned on.

Range: **yes, no**

yes — The cluster point code is a nested cluster point code. Point codes that are members of this cluster point code can be assigned to route sets that are different from the route set assigned to the cluster point code.

no — The cluster point code is not a nested cluster point code. Point codes that are members of this cluster point code must be assigned to the same route set assigned to the cluster point code.

Default: Current value.

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: spca**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: No change.**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

Default: No change.**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: No change.**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255
 ssa—000-255
 sp—000-255

Example

To change the clii of destination 111-222-111 to rlghncxa01a:

chg-dstn:dpc=111-222-111:clli=rlghncxa01a

To change the national alias of ANSI destination 111-222-111 to 321:

chg-dstn:dpca=111-222-111:aliasn=321

To change the exception-list exclusion indicator for cluster 20-2-* to yes:

chg-dstn:dpca=20-2-*:elei=yes

To change an existing destination to remove the SPC:

chg-dstn:dpc=20-2-2:spc=none

To change an existing destination to contain an SPC:

chg-dstn:dpc=20-2-2:spc=5-5-5

To change Nested Cluster Allowed Indicator for cluster 20-2-* to yes:

chg-dstn:dpc=20-2-*:ncai=yes

To change a network destination:

chg-dstn:dpc=25-*-*:clli=tklc

To change the bei parameter value of ITU national destination 8111-aa to yes:

chg-dstn:dpcn=8111-aa:bei=yes

To change the bei parameter value of 24-bit ITU-N destination 15-100-10 to yes:

chg-dstn:dpcn24=15-100-10:bei=yes

To change the International alias of 24-bit ITN-N destination 12-12-12 to 5-5-5:

chg-dstn:dpcn24=12-12-12:aliasi=5-5-5

To change the 24-bit ITN-N alias of International destination 1-6-1 to 9-9-9:

chg-dstn:dpci=1-6-1:aliasn24=9-9-9

To change an existing 24-bit ITN-N destination to contain a 24-bit ITN-N SPC:

chg-dstn:dpcn24=12-12-12:spcn24=25-25-25

To change ITU-I spare destination point code s-2-100-1:

chg-dstn:dpci=s-2-100-1:spci=s-2-129-9:aliasa=121-120-120:aliasn=s-129

To change ITU-N spare destination point code s-231:

chg-dstn:dpci=s-231:spcn=129:aliasa=120-120-122:aliasi=s-2-123-2

Dependencies

NOTE: A *full point code* contains numerical values for all three segments of the point code.

At least one optional parameter must be specified.

The specified destination point code value must already be defined in the Destination point code table.

The destination address must be a full point code, a network destination, or a cluster point code.

The ANSI self-ID destination point code for the STP must be defined before ANSI destinations can be changed.

The ITU-I self-ID destination point code for the STP must be defined before ITU-I destinations can be changed.

The ITU-N self-ID destination point code for the STP must be defined before ITU-N destinations can be changed.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N destination, secondary, or alias point code.

If the **dpcn** or **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

When the 7000 Routesets or 8000 Routesets feature quantity is enabled, the total number of provisioned aliases in the system cannot exceed 8000.

Alias point codes are allowed only for full point code destinations.

Alias point codes for destinations must be full point codes.

A specified alias cannot already be defined as a destination address.

Alias ANSI point codes cannot be members of a cluster or network destination.

The specified alias network type must be different from the destination point code network type.

A 24-bit ITU-N point code cannot have:

- A 14-bit ITU-N alias point code
- An ANSI alias point code

A 24-bit ITU-National point code can have an ITU-I point code alias. This allows conversion of 14-bit ITU-I routing label to 24-bit routing label and vice versa.

An ANSI or ITU-I point code can have either a 14-bit ITU-N alias or a 24-bit ITU-N alias, but not both.

A 14-bit ITU-N point code cannot have a 24-bit ITU-N alias point code.

An ANSI point code cannot have a 24-bit ITU-N alias point code.

If an ITU-I point code is specified, either the **aliasn** or the **aliasn24** parameter can be specified, but not both.

Cluster destinations are allowed only if the CRMD feature is turned on.

The **ncai** parameter can be specified only for cluster destinations.

The **elei** parameter can be specified only for cluster destinations (for example, **dpc=ni-nc-***).

The **bei** parameter can be specified only for cluster destinations.

The NCR (Nested Cluster Routing) feature must be turned on before the **ncai** parameter can be specified.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*-***).

If a provisioned nested cluster point code is being changed to a non-nested cluster point code (**ncai=no**), previously provisioned members of the cluster must have the same route set.

If a provisioned non-nested cluster point code is being changed to a nested cluster point code (**ncai=yes**), the maximum number of provisioned nested clusters must be no greater than 500.

If specified, the **spc** parameter value must be already be configured as a secondary point code in the Secondary Point Code table.

If specified, the **spc** parameter value must be a full point code (except when **spc=none**).

If the **spc** parameter is specified, the **domain=ss7** parameter must be specified.

If the **spc** parameter is specified (except when **spc=none**), the specified destination point code (**dpc**) must be a full point code.

If the **spc** parameter is specified (except when **spc=none**), its network type must match the network type for the destination point code (**dpc**).

If a new **cli** for the destination point code is specified, it cannot match the **cli** of the system.

If the corresponding destination for the specified destination point code is an adjacent signaling point (matched a Far End point code in its linkset entity set), the **cli** of the specified destination point code cannot be assigned to any other destination address.

Alias point codes are supported only for destinations in the SS7 domain (**domain=ss7**).

A reserved word cannot be specified for the destination identifier (**cli**).

If an ITU national destination is being changed and the ITUDUPPC feature is turned on, the following applies depending on whether the destination uses an SPC (secondary point code):

If the destination does *not* use an SPC, the group code of the destination must be the same as the group code of the ITU national true point code.

If the destination uses an SPC, then the group code of the destination must match the group code of the SPC.

For example, if the ITU national true point code has a group code of **ee**, then destinations with group codes of **ee** can be added without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

Notes

The **domain** parameter of a destination (see the **ent-dstn** command) cannot be changed with this command. To change the **domain** parameter, the destination must be removed with the **dlt-dstn** command and re-entered with the **ent-dstn** command.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

```
chg-dstn:dpca=111-222-111:aliasn=321

chg-e1

Change E1 Interface

Use this command to change an interface for an E1 card in the system:

- A 2-port E1 card
- An E1/T1 MIM card
- An HC-MIM card used as an E1 card or an SE-HSL card
- An E5-E1T1 card used as an E1 card or an SE-HSL card

The E1 port number on the card and the E1 card location in the system must be specified.

The CRC4, CAS, CCS, encoding, timing source, and NFAS signaling bit options can be set.

On HC-MIM and E5-E1T1 cards, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered E1 ports 2, 4, 6, and 8 (slave ports) to allow non-signaling data pass-through.

Keyword: **chg-e1**

Related Commands: **dlt-e1, ent-e1, rtrv-e1, tst-e1**

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card.

Range: **1- 8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cas= (optional)

CAS (**on**) or CCS (**off**) indicator.

Range: **on, off**

CAS cannot be specified for HC-MIM cards or E5-E1T1 cards.

Default: No change in current value

:chanbrdg= (optional)

Port bridging status. This parameter indicates whether an odd-numbered E1 port on either an HC-MIM card or an E5-E1T1 card is channel bridged with its adjacent even-numbered E1 port for non-signaling data pass through.

Range: **on, off**

Default: **off**

:crc4= (optional)

CRC4 enable or disable indicator.

Range: **on, off**

Default: No change in current value

:e1tsel= (optional)

Timing source. This parameter indicates a master (**external**) or slave (**line**) timing source, or a timing source recovered from the paired master port for channel bridged slave ports.

Range: **line, external, recovered**

Default: No change in current value

:encode= (optional)

Indicator for use of HDB3 or AMI encoding/decoding.

Range: **hdb3, ami**

AMI encoding is not supported for the 2-port E1 card. AMI encoding is supported for the E1/T1 MIM card, the HC MIM card, or the E5-E1T1 card used as an E1 card.

Default: No change in current value

:minsurate= (optional)

Minimum signal unit rate. This parameter indicates the minimum number of SUs present on a link that are uniformly distributed. This parameter is valid only when the **linkclass=unchan** parameter is specified in the E1 interface.

Range: **500-2000**

Default: No change in current value.

:si= (optional)

Value of two Spare International bits of NFAS data.

Range: **0-3**

Default: No change in current value

:sn= (optional)

Value of five Spare International bits of NFAS data.

Range: **0-31**

Default: No change in current value

Example

chg-

e1: loc=1205: e1port=1: crc4=off: cas=on: encode=hdb3: e1tsel=external: si=2: sn=12

chg-e1: loc=1205: e1port=2: cas=off: encode=ami

chg-e1: loc=1205: e1port=3: chanbrdg=on: e1tsel=recovered

chg-e1: loc=1205: e1port=1: minsurate=1000

Dependencies

At least one optional parameter must be specified.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **lime1** card type.

The port specified by the **e1port** parameter must already be equipped with an E1 interface.

All signaling links serviced by the specified E1 card must be deactivated before the values for the **crc4**, **cas**, **encode**, and **e1tsel** parameters can be changed.

The **cas=on** parameter cannot be specified when timeslot 16 on the E1 card is being used by a signaling link.

The **cas=on** parameter cannot be specified for HC-MIM or E5-E1T1 cards.

The **encode=ami** parameter is supported only for the E1/T1 MIM card, HC-MIM card, or E5-E1T1 card used as an E1 card. The parameter is not supported for the 2-port E1 card.

The **chanbrdg** parameter can be specified only for HC-MIM cards and E5-E1T1 cards used as E1 cards (not as SE-HSL cards).

The **chanbrdg=on** parameter cannot be specified for even-numbered E1 ports on the HC-MIM cards and E5-E1T1 cards.

The timing source parameter **e1tsel** must be specified if **chanbrdg=on** is specified.

The **e1tsel=line** parameter cannot be specified if the specified HC-MIM port or E5-E1T1 E1 port is in channel bridging mode.

The **e1tsel=recovered** parameter can be specified only if the specified HC-MIM port or E5-E1T1 E1 port is in channel bridging mode.

When provisioning an odd-numbered E1 port of an HC-MIM card or E5-E1T1 card to channel bridging mode, **force=yes** must be specified if the adjacent even-numbered port is already provisioned.

The **minsurate** parameter can be specified only when the **linkclass=unchan** parameter is specified.

The **chanbrdg=on** parameter cannot be specified when the **linkclass=unchan** parameter is specified.

The **cas=on** parameter cannot be specified when the **linkclass=unchan** parameter is specified.

Channelized and un-channelized E1 ports (mixed mode) are not allowed on a single HC-MIM card or E5-E1T1 card. A card cannot be used as an SE-HSL card and either an HC-MIM card or an E5-E1T1 card at the same time.

All signaling links assigned to their adjacent even numbered ports must be deleted before provisioning the port into channel bridging mode.

The specified port cannot be changed since it is bridged with its adjacent odd numbered port (master port). The master port should be changed instead.

Notes

When **e1tsel=external** is specified, a user-supplied BITS clock is required.

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

chg-eisopts

Change Eagle Support for Integrated Sentinel Options

Use this command to enable and disable the copy function associated with the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

Keyword: **chg-eisopts**

Related Commands: **rtrv-eisopts**

Command Class: Security Administration

Parameters

:eiscopy= (optional)

System-wide control for MSU, alarm, and event copy to the ESP.

Range: **on, off**

Default: **off**

Example

chg-eisopts:eiscopy=on

Dependencies

At least one parameter must be specified.

The Eagle 5 Support for Integrated Sentinel (E5IS) feature must be turned on before this command can be entered

Before the E5IS copy function can be enabled, at least 2 STC cards must be installed and in the IS-NR state in the system.

Notes

None

Output

chg-eisopts:eiscopy=on

```
rlghncxa03w 04-01-20 09:07:58 EST EAGLE 31.3.0
CHG-EISOPTS: MASP A - COMPLTD
;
```

chg-feat

Change Feature

Use this command to activate the optional features available on the system.

You must purchase a feature before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

CAUTION

CAUTION: The features are off when you install the system. After they are turned on with this command, you cannot turn them off.

Keyword: chg-feat

Related Commands: rtrv-feat

Command Class: Program Update

Parameters

:cnf= (optional)

This parameter turns on the Calling Name Conversion Facility (CNCF) feature.

Range: on

Default: No change in current value.

System

Default: off

:crmd= (optional)

This parameter turns on the Cluster Routing and Management Diversity (CRMD) feature.

Range: on

Default: No change in current value.

System

Default: off

:dstn5000= (optional)

This parameter turns on the 5000 Routes feature.

Range: on

Default: No change in current value.

System

Default: off

:dynrtk= (optional)

This parameter turns on the Dynamic Routing Key feature.

Range: on

Default: No change in current value.

System

Default: off

:e5is= (optional)

This parameter turns on the EAGLE 5 Integrated Monitoring Support (E5IS) feature. This feature cannot be turned on until the Time Slot Counter Synchronization (TSC) feature used with GPRS-II cards is turned on (**tscsync=on**). The **e5is** parameter and the **tscsync** parameter can be specified in the same **chg-feat** command to turn both features on at the same time.

Range: on

Default: No change in current value.

System

Default: off

:egtt= (optional)

This parameter turns on the Enhanced Global Title Translation (EGTT) feature.

Range: on

Default: No change in current value.

System

Default: off

:fan= (optional)

This parameter turns on the cooling fan feature.

Range: on

Default: No change in current value.

System

Default: off

:gflex= (optional)

This parameter turns on the GSM flexible numbering (G-Flex) feature.

Range: on

Default: No change in current value.

System

Default: off

:gtt= (optional)

This parameter turns on the Global Title Translation (GTT) feature.

Range: on

Default: No change in current value.

System

Default: off

:gws= (optional)

This parameter turns on the Gateway Screening (GWS) feature.

Range: on

Default: No change in current value.

System

Default: off

:ipisup= (optional)

This parameter turns on the ISUP Routing Over IP (IPISUP) feature.

Range: on

Default: No change in current value.

System

Default: off

:ituduppc= (optional)

This parameter turns on the ITU National Duplicate Point Code (ITUDUPPC) feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:itumtpsr= (optional)

This parameter turns on the ITU MTP Restart feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:lan= (optional)

This parameter turns on the STP LAN feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:lfs= (optional)

This parameter turns on the Link Fault Sectionalization (LFS) feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:measplat= (optional)

This parameter turns on the Measurements Platform feature. The **chg-measopts:platformenable=on** command must be entered to enable the Measurement Platform collection function (which cannot be disabled after it is enabled in the system).

Range: **on**

Default: No change in current value.

System

Default: **off**

:mgtt= (optional)

This parameter turns on the Modified Global Title Translation (MGTT) feature. The MGTT feature replaces the PRFXDLGT feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:mpc= (optional)

This parameter turns on the Multiple Point Code (MPC) feature.

Range: **on**

Default: No change in current value.

System

Default: **off**

:mtprs= (optional)

This parameter turns on the ANSI MTP Restart feature.

Range: **on**

Default: No change in current value.

System

Default: off

:ncr= (optional)

This parameter turns on the Nested Cluster Routing (NCR) feature.

Range: on

Default: No change in current value.

System

Default: off

:nrt= (optional)

This parameter turns on the Network Routing feature.

Range: on

CAUTION

CAUTION: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Default: No change in current value.

System

Default: off

:plnp= (optional)

This parameter turns on the PCS (Personal Communication Service) 1900 Number Portability feature.

Range: on

Default: No change in current value.

System

Default: off

:sccpcnv= (optional)

This parameter turns on the SCCP Conversion feature.

Range: on

Default: No change in current value.

System

Default: off

:seas= (optional)

This parameter turns on the Signaling Engineering Administration System (SEAS) feature.

Range: on

Default: No change in current value.

System

Default: off

:slsob= (optional)

This parameter turns on the Other CIC (Circuit Identification Code) Bit Used feature.

Range: on

Default: No change in current value.

System

Default: off

:tcapcnv= (optional)

This parameter turns on the TCAP Conversion feature.

Range: on

Default: No change in current value.

System**Default:** off**:tlnp=** (optional)

This parameter turns on the Triggerless Local Number Portability (TLNP) feature.

Range: on**Default:** No change in current value.**System****Default:** off**:tscsync=** (optional)This parameter turns on the Time Slot Counter Synchronization (TSC) feature that is used with GPSM-II cards. This feature is required, along with use of STC cards, for the EAGLE 5 Integrated Monitoring Support feature (**e5is=on**).**Range:** on**Default:** No change in current value.**System****Default:** off**:vgtt=** (optional)

This parameter turns on the Variable Length GTT (VGTT) feature.

Range: on**Default:** No change in current value.**System****Default:** off**:wnp=** (optional)

This parameter turns on the Wireless Number Portability (WNP) feature.

Range: on**Default:** No change in current value.**System****Default:** off**:x252000=** (optional)

This parameter turns on the 2000 X.25 Routes and Destinations feature.

Range: on**Default:** No change in current value.**System****Default:** off**:x25g=** (optional)

This parameter turns on the X.25/SS7 Gateway feature.

Range: on**Default:** No change in current value.**System****Default:** off**Example****chg-feat:gtt=on****chg-feat:gws=on:cncf=on****chg-feat:gtt=on:gws=on:crmd=on:x25g=on:lan=on:lfs=on****chg-feat:sccpcnv=on:tcapcnv=on****chg-feat:tscsync=on:e5is=on****chg-feat:mgtt=on**

Dependencies

NOTE: The "LNP feature" is turned on when the LNP ported TNs quantity appears in the `rtrv-ctrl-feat` command output. An LNP quantity feature access key has been enabled and turned on. See the `enable-ctrl-feat` and `chg-ctrl-feat` commands for more information about turning on the LNP feature.

At least one optional parameter must be specified.

The Gateway Screening feature must be turned on (**gws=on**) before the following features can be turned on:

- The STP LAN feature (**lan=on**)
- The CNCF feature (**cncf=on**)

The SCCP conversion feature must be on (**sccpcnv=on**) before the TCAP conversion feature can be turned on (**tcapcnv=on**).

The LNP feature must be turned on before the following features can be turned on:

- The Wireless Number Portability feature (**wnp=on**)
- The PCS 1900 LNP feature (**plnp=on**)

The LNP feature must be turned on and the Gateway Screening feature must be turned on (**gws=on**) before the Triggerless LNP feature can be turned on (**tlnp=on**).

The X.25/SS7 Gateway feature must be turned on (**x25g=on**) before the 2000 X.25 Routes and Destinations feature can be turned on (**x252000=on**).

The Cluster Routing and Management Diversity (CRMD) feature must be turned on (**crmd=on**) before the Nested Cluster Routing (NCR) feature can be turned on (**ncr=on**).

The Global Title Translation (GTT) feature must be turned on (**gtt=on**) before the Enhanced Global Title Translation (EGTT) feature (**egtt=on**) or the Modified Global Title Translation (MGTT) feature (**mgtt=on**) can be turned on. When the EGTT feature is turned on, three new command sets, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands, replace the following Translation Type and Global Title Translation commands: **ent/dlt/rtrv-tt**, and **ent/chg/dlt/rtrv-gtt**. All data previously provisioned with these commands is maintained.

The EGTT feature cannot be turned on while there is an SCCP card running on a 486 processor.

The Multiple Point Code (MPC) feature must be turned on (**mpc=on**) before the ITU National Duplicate Point Code (ITUDUPPC) feature can be turned on (**ituduppc=on**).

The Global Title Translation (GTT) feature must be turned on (**gtt=on**) or Enhanced Global Title Translation (EGTT) feature (**egtt=on**) must be turned on before the G-Flex feature can be turned on (**gflex=on**).

The Global Title Translation (GTT) feature must be turned on (**gtt=on**) before the Variable Length GTT (VGTT) feature (**vgtt=on**) can be turned on.

The G-Flex feature requires DSM cards in the system.

To turn on both the VGTT and LNP features requires that the system has all DSM cards. To turn on both the VGTT and EGTT features requires that the system has TSM or DSM cards. The VGTT feature requires TSM or DSM cards in the system.

The Global Title Translation (GTT) feature must be turned on (**gtt=on**) before the Modified Global Title Translation (MGTT) feature (**mgtt=on**) can be turned on.

The Modified Global Title Translation (MGTT) feature (**mgtt=on**) cannot be turned on if any SCCP card has less than a 586 processor.

Both cards that run the OAM must be GPSM-II cards before the Time Slot Counter Synchronization (TSC) feature (**tscsync** parameter) can be turned on.

CAUTION: Never install or initialize MCAP cards in card slots 1113 and 1115 after GPSM-II cards are provisioned in these slots. Attempting to initialize MCAP cards after GPSM-II cards have been provisioned in slots 1113 and 1115 will cause a system outage. Before replacing an existing GPSM-II card in slot 1113 or 1115, contact Tekelec Customer Service.

The Time Slot Counter Synchronization (TSC) feature (**tscsync** parameter) must be turned on before the EAGLE 5 Integrated Monitoring Support feature (**e5is** parameter) can be turned on. The two parameters can be specified in the same **chg-feat** command to turn them both on at the same time.

The SCCP and TCAP conversion features (SCCPCNV and TCAPCNV) cannot be turned on when the ANSI-ITU-China SCCP Conversion feature is enabled (see the **enable-ctrl-feat** command).

If any of the G-Flex, G-Port, INP, or EIR features are turned on in the system, the maximum number of DSM cards allowed in the system is 25. If the system is running only GTT, the maximum number of DSM cards allowed in the system is 32.

The EGTT feature requires TSM or DSM cards in the system.

If the LNP feature is turned on, the G-Flex feature bit cannot be turned on.

If the E5-SM4G Throughput Capacity feature is enabled, then the E5IS feature cannot be turned on.

Notes

This command is not allowed in upgrade mode.

After a feature bit is turned on, it cannot be turned off. Take care in turning on features that are not used in the network configuration.

The Calling Name Conversion Facility (CNCF) feature provides a conversion of ISUP IAM messages. The facility uses the following two versions of calling name identification presentation (CNIP) for calling name information delivery:

- The nonstandard, proprietary ISUP party information (PIP) parameter.
- The ANSI standard ISUP generic name (GN) parameter.

The conversion either replaces the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message. The user can set up GWS screens to apply the CNCF feature on a per-point-code or range-of-point-code basis.

The Cluster Routing and Management Diversity (CRMD) feature allows the system to configure one route set to an entire cluster of destinations, thus enabling the system to manage and switch traffic to more end nodes.

The Global Title Translation (GTT) feature allows the system to provide translation of the global title digits located in the called party address of an SCCP message. The translation consists of a point code and subsystem number. This feature requires TSMs or DSMs loaded with the SCCP application.

The Enhanced Global Title Translation (EGTT) feature provides enhancements to the way the system performs GTT for both ITU and ANSI messages. The feature allows the combination of domain (ANSI or ITU), global title indicator (GTI), translation type (TT), numbering plan (NP), and nature of address indicator (NAI) selectors to be used to select a translation table when the system receives a message requiring EGTT. The feature also allows inclusion of the translated subsystem number (SSN) in the called party address (CDPA) and inclusion of the originating point code (OPC) in the

calling party address (CGPA). The feature also provides deletion capability of the GT (global title) in the CDPA.

The Modified Global Title Translation (MGTT) feature allows customizing of the GTT information in the MSU (in addition to the Translation Type) to ensure correct routing. The Global Title information can be modified on outbound MSUs for some networks in order to be compatible with the network the MSU is going to. The MGTT feature replaces the Prefix Deletion of Global Title (PRFXDLGT) feature.

The Gateway Screening (GWS) feature allows the system to screen specific message types with selected parameters from entering the network through this STP. This feature requires TSM cards loaded with the GLS application.

The STP LAN feature allows selected SS7 messages to be copied and sent to a remote host over an ethernet LAN using the TCP/IP protocol. This feature also requires the gateway screening feature and application communication modules (ACMs).

The Triggerless LNP (TLNP) feature gives service providers a method to route calls to ported numbers without having to upgrade their signaling switch (end office or mobile switching center) software. This feature uses the gateway screening stop action TLNP to intercept through-switched ISUP messages on the LIM.

The Link Fault Sectionalization (LFS) feature allows the system to perform a series of far end loopback tests that identify faulty segments of an SS7 transmission path up to and including the remote network element.

The ANSI MTP Restart (MTPRS) feature provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent; Table 5-12 provides examples of some approximate times.

Table 5-12. Link Alignment Performance

System Size (No. of LIMs)	Link Alignment Delay (seconds)
Up to 64	62
64 to 127	97
128 to 191	132
More than 191	167

The ITU MTP Restart (ITUMTPRS) feature provides MTP restart support for ITU networks and extends the system's ANSI MTP restart support to mixed ITU and ANSI networks. The performance of ITU MTP Restart is comparable to the performance of ANSI MTP Restart.

SEAS interface support allows the system to interface with the Signaling Engineering and Administration System (SEAS).

The X.25/SS7 Gateway (X25G) feature allows cellular providers to connect their X.25 signaling networks to other providers SS7 network.

The SCCP and TCAP conversion features (SCCPCNV and TCAPCNV) allow the system to convert MTP-routed SCCP and TCAP messages from ANSI to ITU format and to convert ITU formatted messages to ANSI.

The PCS 1900 LNP (PLNP) feature provides for LNP query/response in a PCS wireless environment using the LRN method to support Service Provider Number Portability.

The Nested Cluster Routing (NCR) feature allows the system to support full point code entries on different routes within a cluster.

The Other CIC (Circuit Identification Code) Bit Used feature is one of two methods provided as ITU SLS enhancements for distributing the load across links in a combined and single linkset. The Other CIC Bit Used feature lets the system derive the LSB (Least Significant Bit) from bits 2 through 4 of the CIC to serve as the three lower bits of the SLS (Signaling Link Selection) and one other bit of the CIC to serve as the MSB (Most Significant Bit) of the SLS. The SLSOCB feature applies only to ITU-ISUP messages. The other method of distributing the load is rotation of the four bits of the SLS to change the LSB of the SLS. For additional information on bit rotation, see the **ent-ls** command.

The Network Routing (NR) feature allows provisioning of a single routeset to be used for all MSUs destined to members of that network.

The DSTN5000 (5000 Routes) feature provides the ability to administer up to 5000 routes on the system. If **dstn5000=on**, the values of the **mtpdpcq** (destination point code) and **mtpxlq** (exception list entries) parameters of the **chg-stpopts** command can total **5500**. Otherwise, the sum total for **mtpdpcq** and **mtpxlq** cannot exceed **2500**. The Cluster Routing and Management Diversity (CRMD) feature must be turned on before the **mtpxlq** parameter can be specified.

The MPC (Multiple Point Code) feature enables the user to use SPCs (secondary point codes) in addition to the true point codes that the EAGLE 5 ISS uses. The SPCs are used for provisioning and routing as if they were the true point code of the EAGLE 5 ISS. SPCs can be provisioned in any of the three domains (ANSI, ITU-N, and ITU-I). SPCs are supported for any type of link.

The ITUDUPPC (ITU National Duplicate Point Code) feature allows an EAGLE 5 ISS mated pair to route traffic for two or more countries that may have overlapping point code values.

The G-Flex (GSM Flexible Numbering) feature optimizes the use of subscriber numbers and number ranges by providing a logical link between any MSISDN (Mobile Station ISDN number), MDN (Mobile Dialed Number), or MIN (Mobile Identification Number) and any IMSI (International Mobile Station Identifier), between any IMSI and any HLR, and/or between any MSISDN/MDN/MIN and any HLR. This link allows subscribers to move from one HLR (Home Location Register) to another.

The VGTT (Variable Length GTT) feature provides the ability to provision global title entries of varying lengths to a single translation type or GTT set. Users are able to assign global title entries of up to 10 different lengths to a single translation type or GTT set.

The Time Slot Counter Synchronization (TSCSYNC) feature allows the system's A (Active) and B (Standby) internal clocks to be synchronized by the GPSP-II card that is running the standby OAM.

The EAGLE 5 Integrated Monitoring Support feature provides an Ethernet interface between the EAGLE 5 ISS and the Sentinel Extended Services Platform (ESP) or the Integrated Message Feeder (IMF), to eliminate the need for cabling between each SS7 link and the ESP or IMF to monitor SS7 traffic.

The Measurements Platform feature provides a dedicated processor for collecting and reporting STP, LNP, INP, G-Flex, and G-Port Measurements data, with support for EAGLE 5 ISS growth to more than 700 links.

chg-frm-pwr**chg-frm-pwr**

Use this command to change the power threshold value in the Frame Power Threshold table for a specified frame.

The entries in the Frame Power Threshold table contain a Frame ID and the corresponding power threshold value.

You can use the following commands to display the threshold and calculated maximum power consumption for the frames in the system.

- The **rtrv-frm-pwr** command displays the current provisioned frame power threshold for each provisioned frame.
- The **rtrv-stp:display=power** command displays the provisioned frame power threshold for each provisioned frame, and displays the maximum calculated power consumption for each frame, based on card population.
- The **rtrv-stp:display=power:frm=xxxx** command displays the provisioned frame power threshold for the specified frame, the maximum calculated power consumption for the frame based on card population, and the maximum power consumption for each card in the frame and for a fan assembly for each shelf.

NOTE: The frame-level power threshold value needs to be determined from the capacity in Amps of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the FAP capacity.

Keyword: chg-frm-pwr

Related Commands: dlt-frm-pwr, ent-frm-pwr, rtrv-frm-pwr, rtrv-stp

Command Class: Database Administration

Parameters

:frm= (mandatory)

Frame ID

Range: cf00, ef00, ef01, ef02, ef03, ef04

cf00 — Control frame

ef00 — First extension frame

ef01 — Second extension frame

ef02 — Third extension frame

ef03 — Fourth extension frame

ef04 — Fifth extension frame

:thrshld= (mandatory)

Threshold. This parameter specifies the frame-level power threshold, in Amps. This value is compared with the current calculated maximum power consumption for the frame (use the **rtrv-stp:display=power:frm=** command to obtain the maximum power consumption value), and the appropriate alarms are raised if that power consumption exceeds the threshold limit.

The value of the **thrshld** parameter needs to be determined from the capacity of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the frame FAP capacity.

Range: 30-65
Default: 30

Example

Change the frame power threshold value for the first extension frame.

chg-frm-pwr:frm=ef00:thrshld=58

Dependencies

A power threshold value must already be provisioned for the specified frame.

Notes

The maximum calculated power for a frame is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

Output

```
chg-frm-pwr:frm=ef00:thrshld=58
tekelecstp 06-06-01 15:18:41 EST EAGLE 35.0.0
FRAME POWER THRESHOLD table is (4 of 10) 40% full
CHG-FRM-PWR: MASP A - COMPLTD
;
```

chg-ftp-serv

Change FTP Server Entry

Use this command to change an entry for an FTP server in the FTP Server table.

NOTE: Though the user parameter value is available, it is not for customer use unless directed by Tekelec Technical Support. The FTP-based Table Retrieve Application (FTRA) sends the necessary FTP Server information to the system, and the system overwrites any entry that is already in the FTP Server table for that server.

Keyword: chg-ftp-serv

Related Commands: dlt-ftp-serv, ent-ftp-serv, rtrv-ftp-serv

Command Class: Database Administration

Parameters

:app= (mandatory)

The FTP Client application that interfaces with the FTP server.

Range: **meas**, **user**

meas—the Measurements Platform application

user—the FTP-based Table Retrieve Application (FTRA)

:ipaddr= (mandatory)

IP Address of the FTP Server.

Range: 4 numbers separated by dots, with each number in the range of 0-255.

:login= (optional)

FTP Server Username (A prompt for entering a password appears on a separate line.)

Range: zzzzzzzzzzzzzzzz

1 to 15 alphanumeric characters; mixed-case is allowed

:path= (optional)

FTP path used to locate the file that will be sent.

Range:	<i>XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX XXXXXXXXXXXX</i> Up to 100 characters; mixed-case string in double quotes with valid FTP path format
Default:	User's home directory

:prio= (optional)

Priority of this FTP server when there is more than one FTP Server for this application.

Range: 1 - 10

Example

```
chg-ftp-  
serv:app=meas:ipaddr=1.255.0.102:login=ftpmeas1:path=~meas:prio  
=1  
chg-ftp-serv:app=user:ipaddr=1.255.0.102:login=tekperson1:path=~  
\data:prio=1
```

Dependencies

At least one optional parameter must be specified.

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **path** parameter value must be in a valid FTP path format.

The **prio** parameter specifies a priority for use of an FTP server by an application when the application has more than one FTP server defined in the table. Each FTP server defined for use by the application must have a priority from 1 to 10 assigned. The available FTP server with the highest priority (smallest number) will be used first by the application.

If the **login** parameter is specified, a separate prompt appears for entry of the FTP server password. You must enter a password that is at least 1 and not more than 15 characters long. If an invalid password is entered or the Return key is pressed without entering a password, the entire command must be entered again to cause the password prompt to appear again. The password is not displayed as it is entered.

An entry for the specified application ID at the specified priority cannot already exist.

The FTP server entry to be changed with this command must already exist in the FTP Server table for the specified IP address and application.

Notes

The same FTP server can be defined more than once, but the specified application must be different for each entry.

Output

```
chg-ftp-serv:app=meas:ipaddr=1.255.0.102:path="-ftpmeas1"

chg-gpl**Change Generic Program Load**

Use this command to copy a generic program load from the system removable cartridge to the destination active and standby system disks as a "trial" version. The system release identification file is uploaded from the system removable cartridge to the active and standby fixed drives along with each GPL. This command also provides a parameter to turn GPL auditing "on" and "off".

Keyword: **chg-gpl**

Related Commands: **act-gpl, alw-card, copy-gpl, init-card, init-sys, rept-stat-gpl, rtrv-gpl**

Command Class: Program Update

Parameters

:gpl= (mandatory)

Generic program load. This parameter specifies the name of the GPL identifier to be moved from "trial" to "approved" status on cartridge to the disk.

Range: *ayyyyyy*

1 alphabetic character followed by up to 6 alphanumeric characters. Valid GPLs are:

atmansi—The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

atmitu—The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

blbepm—A flash GPL containing the BIOS ROM image on E5-E1T1 cards and E5-ENET cards.

blbios—A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

blbsmg—A flash GPL containing the BIOS ROM image on E5-SM4G cards.

blcpld—A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag—A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

bldiag6—A flash GPL containing the diagnostic code on E5-E1T1 cards and E5-ENET cards.

blvxw—A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

blvxw6—A flash GPL containing the VxWorks operating system on E5-E1T1 cards and E5-ENET cards.

bpdcm—This GPL is used in communications in the **init-flash** process.

bphcap—This GPL is used to support Board PROM for HCAP flash memory.

bphcapt—This GPL is used to support Board PROM for HCAP-T flash memory.

bphmux—This GPL is used to support Board PROM for HMUX flash memory.

bpmpl—This GPL is used to support Board PROM for MPL flash memory.

bpmplt—This GPL is used to support Board PROM for E1/T1 flash memory and Board Prom for MPL-T flash memory.

ccs7itu—This GPL is used by the LIM cards for ITU-TSS MTP functionality.

cdu—This GPL is used in the card manufacturing process.

ebdablm—This GPL is used by the TSM card for enhanced bulk download.

ebdadcm—This GPL is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 ISS at high speed over an ethernet connection for enhanced bulk download.

eoam—This GPL is used by the GPSM-II card for enhanced OAM functions.

eroute—This GPL is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

erthc—This GPL is used by the E5-ENET card when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions.

gls—This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

hipr—The communication software used on the High Speed IMT Packet Router (HIPR) card.

imt—This GPL is the communication processor on the logical processing element (LPE).

imtpci—The communication software that operates the IMT bus on HC-MIM cards.

ipghc—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

ipgwi—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

iplhc—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

iplim—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

ips—This GPL is used by the IPSM card for the IP User Interface feature.

mcp—This GPL is used by the MCPM card for the Measurements Platform feature.

pldpmc1—A flash GPL that is used on HC-MIM cards for E1 and T1 signaling links.

sccp—This GPL is used by the TSM cards for the global title translation application.

sccphc—This GPL is used by the E5-SM4G cards to support the EPAP-based features and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if an E5-SM4G card is present, the **sccphc** GPL processes normal GTT traffic.

ss7ansi—This GPL is used by the LIM cards for the MTP functionality.

ss7epm—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications. The **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

ss7gx25—This GPL is used by the LIM cards to support X.25 functionality.

ss7hc—This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

ss7ipgw—This GPL is used by the system to support TCP/IP point-to-multipoint connectivity.

ss7ml—This GPL is used to support the functionality for the multi-port LIM (MPL or MPL-T) card and the E1/T1 MIM (Multi-Channel Interface Module) card. The MPL cards run only the **ss7ansi** application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the **ss7ml** GPL allows the card to support 8

signaling links rather than the usual 2 links for LIM cards. The MPL cards support only the DS0 interface. The E1/T1 MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7ml** GPL allows the card to support 8 signaling links for E1 and T1 functions.

stplan—This GPL is used by the ACM card to support the STP LAN application.

utility—This GPL is used by the factory for testing, and when directed by your Customer Care Center.

vcdu—This GPL is used in the card manufacturing process.

vsccp—This GPL is used by DSM cards to support the EPAP-based and the LNP ELAP Configuration features. If no EPAP-based or LNP ELAP Configuration feature is turned on, and if a DSM card is present, then the **vsccp** GPL processes normal GTT traffic.

vxwslan—This GPL is used by the SSEDCCM card to support the STP LAN application.

:audit= (optional)

This parameter specifies whether the active MASP system release running version is to be audited every 90 seconds. The audit state is preserved through a system restart or power up.

NOTE: When audit is turned off, the system release audit process is stopped. The detection, marking, and reporting of corrupt GPLs is continuous and not affected by turning audit off.

Range: on, off

Default: on

:ver= (optional)

Version number of the GPL, in the form of *major-minor-fix*.

Range: *major-minor-fix*

Specify a valid value for each component of the version number, in the range **0-255**

:appl= (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

Example

```
chg-gpl:gpl=ss7ansi:ver=101-014-000
```

```
chg-gpl:audit=on
```

```
chg-gpl:gpl=vsccp:ver=101-014-000
```

```
chg-gpl:gpl=iplim:ver=101-014-000
```

```
chg-gpl:gpl=bpmp:ver=108-11-0
```

```
chg-gpl:gpl=ss7ml:ver=108-11-0
```

```
chg-gpl:gpl=bphmux:ver=105-21-0
```

```
chg-gpl:gpl=hipr:ver=105-21-0
```

```
chg-gpl:gpl=mcp:ver=111-17-0
```

```
chg-gpl:gpl=ipgwi:ver=111-17-0
```

```
chg-gpl:gpl=bphcapt:ver=111-17-0
```

```
chg-gpl:gpl=eoam:ver=111-17-0
```

```
chg-gpl:gpl=bpmp:ver=112-18-0
```

```
chg-gpl:gpl=atmitu:ver=114-1-0
```

```
chg-gpl:gpl=ss7hc:ver=125-1-0
```

```

chg-gpl:gpl=blvxw:ver=125-1-0
chg-gpl:gpl=blcpld=125-1-0
chg-gpl:gpl=plde1t1:ver=125-1-0
chg-gpl:gpl=pldpmc1:ver=125-1-0
chg-gpl:gpl=blbios:ver=125-1-0
chg-gpl:gpl=imtpci:ver=125-1-0
chg-gpl:gpl=bldiag:ver=125-1-0
chg-gpl:gpl=slanhc:ver=128-2-0
chg-gpl:gpl=erthc:ver=128-2-0
chg-gpl:gpl=blbsmg:ver=128-1-0
chg-gpl:gpl=sccphc:ver=128-1-0

```

Dependencies

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

If either the **ver** or the **gpl** parameter is specified, both parameters must be specified.

The **audit** parameter, or the **ver** and **gpl** parameters together, or the **audit**, **ver**, and **gpl** parameters together must be specified.

Notes

If there is a failure changing the active system, the operation is stopped. If there is a failure changing the standby system, the active system is still updated.

A cartridge must be inserted into the removable disk drive, the cartridge must be initialized, and it must be formatted as a system disk.

Use the **rtvr-gpl** command to determine the version number and audit state of a GPL.

The **ver** and **gpl** parameters are mandatory if a generic program load is being uploaded from a removable cartridge.

The **audit** parameter is required only when turning GPL auditing on or off and the **ver** and **gpl** parameters are optional.

Before the **gpl=oap** parameter can be specified, the OAPs must be provisioned and functional.

When the **audit** parameter is set to **off**, the system release audit process is stopped. The detection, marking, and reporting of corrupt GPLs is continuous and not affected by turning audit off.

Output

The output for a successful command execution is in the following format; the name of the uploaded GPL is shown for card locations 1114 and 1116.

```

chg-gpl:gpl=ss7hc:ver=125-1-0
rlghncxa03w 06-06-01 11:43:04 EST EAGLE 35.0.0
SS7HC upload to 1114 completed
SS7HC upload to 1116 completed
;

```

The following example shows an error in the upload.

```

chg-gpl:gpl=bphcap:ver=101-014-000
rlghncxa03w 06-06-01 11:43:04 EST EAGLE 35.0.0
BPHCAP corrupted on 1117 removable: mismatched checksums
;

```

chg-gsmmap-scrn**Change GSM MAP Screening Entry**

Use this command to change the attributes (**nforbid**, **npc/npca/npci/npcn/npcn24**, **nssn**, **ncgsr**, **ncdsr**, and **naction**) of GSM Map Screening CgPA and CdPA entries that are used to filter out or allow SCCP messages containing Map Op-Codes, CgPA GTA+NPV+NAIV, CdPA GTA+NPV+NAIV, and forbidden parameters.

Keyword: chg-gsmmap-scrn

Related Commands: dlt-gsmmap-scrn, ent-gsmmap-scrn, rtrv-gsmmap-scrn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cgsr= (mandatory)

CgPA Screening Reference.

Range: ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:opname= (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command. GSM MAP Screening is performed on the specified address or addresses for the referenced operation code.

Range: ayyyyyyy

Up to 8 alphanumeric characters

:cdsr= (optional)

CdPA Screening Reference.

Range: ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **npc/npca/npci/npcn** and **nssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: yes, no

Default: no

:naction= (optional)

The new screening action to take if a message is forbidden as defined by the **forbid** parameter.

Range: **atierr**, **discard**, **dupdisc**, **duplicate**, **forward**, **pass**, **route**

atierr — Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated to the originator. This value is valid only for ATI MAP operation codes.

discard — Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

dupdisc — Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

duplicate — Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward — Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass— Route the message as normal to the destination; a UIM will be issued. This is intended to be a test mode and is recommended when setting up GSM Map Screening during the initial phase to assure that no MSUs will be inadvertently thrown away.

route— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: No change to current value

:ncdsr= (optional)

The new CDPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:ncgsr= (optional)

The new CGPA Screening Reference.

Range: *ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

:nforbid= (optional)

The new forbidden parameter value. Indicates a forbidden parameter for the specified entry. If a forbidden parameter is detected, the message is handled with the action defined by the **action/naction** parameter.

Range: **all, none, state, location**

all—All parameters are forbidden. Take the specified screening action defined by the **naction** parameter for messages arriving at the system.

none—None of the parameters are forbidden. Route the message to its destination.

state—Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **state** as the forbidden parameter for the entered address/operation code combination. **Note:** The **state** parameter is valid only for GSM ATI messages.

location—Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **location** as the forbidden parameter for the entered address/operation code combination. **Note:** The **location** parameter is valid only for GSM ATI messages.

Default: No change to current value

:nmapset= (optional)

The new MAP set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

Default: No change to the MAP set value.

:npc= (optional)

New ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **npca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:npc/npc/npci/npci/npcn24= (optional)

New point code. The **npc/npc/npci/npci/npcn24** and **nssn** parameters are used when the new screening action (**naction**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

:npci= (optional)

New ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:npcn= (optional)

New ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:npcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:nssn= (optional)

New Subsystem Number. The **npc/npc/npci/npci/npcn24** and **nssn** parameters are used when the new screening action (**naction**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

Range: **002 - 255**

Example

```

chg-gsmmap-scrn:opname=xyz:cgsr=fela:naction=pass
chg-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall:naction=discard
chg-gsmmap-scrn:opname=test2:cgsr=pcn1:npcn=s-333:nssn=254
chg-gsmmap-
scrn:opname=test1:naction=forward:npc=2-2-2:nssn=20:nmapset=12
chg-gsmmap-
scrn:opname=test2:naction=duplicate:npc=1-1-2:nssn=20:cgsr=cg1:nm
apset=dflt

```

Dependencies

At least one optional parameter must be specified.

If the **cdsr** parameter is specified, at least one additional optional parameter must be specified.

If the **ncdsr** parameter is specified, then the **cdsr** parameter must be specified.

If the **cdsr** parameter is specified, then the **ncgsr** parameter cannot be specified.

The **ncgsr** parameter and the **ncdsr** parameter cannot be specified together in the same command.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The specified **ncgsr** parameter value cannot already exist in the database.

The specified **ncdsr** parameter value cannot already exist in the database.

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be turned on before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be turned on before the **cdsr**, **ncdsr**, **pc**, and **pca** parameters can be specified.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

A value of **state** or **location** cannot be specified for the **nforbid** parameter unless the operation code (**opcode**) referenced by the **opname** parameter is **71**. The **opcode=71** parameter signifies an ATI MAP operation code.

A value of **atierr** cannot be specified for the **naction** parameter unless the operation code (**opcode**) referenced by **opname** is **71**. The **atierr** option is valid only for ATI MAP operation codes; **opcode=71** signifies an ATI MAP operation code.

If specified, the **npc/npc/npci/npci/npcn24** parameter must be a full point code.

If the **naction** parameter is specified, and its value is **forward**, **duplicate**, or **dupdisc**, then the **npc/npc/npci/npci/npcn24** parameter and the **nssn** parameter must be specified.

The **force** parameter can be specified only if the **npc/npc/npci/npci/npcn24** parameter and the **nssn** parameter are specified.

If the **npc/npc/npci/npci/npcn24** parameter and the **nssn** parameter are specified, and the **force** parameter is not specified as **yes**, the PC-SSN must be populated in the SCCP Application entity set (Remote Point Code / Mated Application Table).

If specified, the **npc/npc/npci/npci/npcn24** parameter value must exist as a destination in the Ordered Route entity set (ANSI only), or must reside in a cluster that exists as a destination in the Ordered Route entity set (for global title routing).

The **npc/npc/npci/npci/npcn24** and **nssn** parameters can be specified only if the **naction** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

If the value of the **naction** parameter is **forward**, **duplicate**, or **dupdisc**, then the **nmapset** parameter must be specified.

The **npc/npcn/npci/npcn24** and **nssn** parameters can be specified only if the **naction** parameter is specified, and its value is **forward**, **duplicate**, or **dupdisc**. If the **naction** parameter is specified with a value of **forward**, **duplicate**, or **dupdisc**, then the **npc/npcn/npci/npcn24** parameter and the **nssn** parameter must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **nmapset** parameter can be specified.

The specified new MAP set must exist in the MAP table.

If the value of the **nmapset** parameter is not **dflt**, or if the **nmapset=dflt** parameter is specified, but the value of the **force** parameter is not **yes**, then the values for the **npc** and **nssn** parameters must exist in the new MAP set.

If the **nmapset** parameter is specified without specifying the **ndfltact** parameter, then the previously provisioned **dfltact** parameter must have a value of **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **nmapset** parameter is specified.

Notes

Unlike GTT (Global Title Translation) entries, the GSM MAP Screening commands do not support splits of ranges during deletion or changes of entries.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

chg-gsmmap-scrn:cgsr=fela:opname=xyz:naction=pass

```

chg-gsmopts

Change GSM System Options

Use this command to enter GSM (Global System for Mobile Telecommunications) system options in the database. This command updates the GSMOPTS Table.

Keyword: chg-gsmopts

Related Commands: rtrv-gsmopts

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ccnc= (optional)

E214 country code and network code.

The G-Flex feature must be turned on before this parameter can be specified.

This parameter is mandatory if the **mccmnc** parameter is specified.

Range: 2-8 digits

Default: No change to current value

:defmapvr= (optional)

Default MAP version. The G-Port feature or the IS41 GSM Migration feature must be enabled before this parameter can be specified.

Range: 1-3

Default: 1

:defmcc= (optional)

E212 default mobile country code.

The G-Flex feature must be turned on before this parameter can be specified.

Range: 3 digits, **none**

Valid digits are **0-9, A-F, a-f**.

none—Deletes the current value for the **defmcc** parameter.

Default: No change to current value

:defmnc= (optional)

E212 default mobile network code.

The G-Flex feature must be turned on before this parameter can be specified.

Range: 1-4 digits, **none**

Valid digits are **0-9, A-F, a-f**.

none—Deletes the current value for the **defmnc** parameter.

Default: No change to current value

:eirgrsp= (optional)

Equipment Identity Register (EIR) Global Response status. The EIR feature must be enabled and turned on before this parameter can be specified. When a value other than **off** is specified, EIR responds according to the specified value.

Range: **off, whitelst, graylst, blklst, unknown**

off—EIR Global Response is not used.

whitelst—Indicates that the IMEI is "valid" and registration should be allowed for this handset.

graylst—Indicates that the IMEI is "questionable." Registration should be allowed, but the event is logged in the EIR log and a special measurement peg is incremented.

blklst—Indicates that the IMEI is "invalid" and registration should not be allowed for this handset.

unknown—Indicates that the IMEI is not in the White list, the Gray list, or the Black list and registration should not be allowed for this handset.

Default: **off**

:eirimsichk= (optional)

Equipment Identity Register (EIR) IMSI Check status. This parameter is not valid for IMEI ranges.

Range: on, off

Default: off

:eirrsptype= (optional)

Equipment Identity Register (EIR) Response Type. The EIR feature must be turned on before this parameter can be specified.

Range: type1, type2, type3

Table 5-13 contains information to help you choose the value for this parameter.

Table 5-13. EIR Response Type (eirrsptype) Values

Presence in List			EIR Response Type		
White	Gray	Black	Type 1	Type 2	Type 3
X			in white list	in white list	in white list
X	X		in gray list	in gray list	in gray list
X	X	X	in black list	in black list	in black list
X		X	in black list	in black list	in black list
	X		in gray list	in gray list	unknown
	X	X	in black list	in black list	unknown
		X	in black list	in black list	unknown
			in white list*	unknown*	unknown*

* This entry in the table indicates that there has been no match found for the IMEI in an incoming message within the database.

Default: type1

:gsm2is41= (optional)

GSM to IS41 migration prefix. The IS41 GSM Migration (IGM) feature must be turned on before this parameter can be specified.

Range: 1-15 digits, none

none—Deletes the current value of the **gsm2is41** parameter.

Default: none

:is412gsm= (optional)

IS41 to GSM migration prefix. The IGM feature must be turned on before this parameter can be specified.

Range: 1-15 digits, none

Valid digits are **0-9, A-F, a-f**.

none—Deletes the current value of the **is412gsm** parameter.

Default: none

:mccmnc= (optional)

E212 mobile country code and mobile network code. The G-Flex feature must be turned on before this parameter can be specified.

This parameter is mandatory if the **ccnc** parameter is specified.

Range: 4-7 digits, **none**
Valid digits are **0-9, A-F, a-f**.
none—Deletes the current **mccmnc** and **ccnc** parameter combination entry.

Default: No change to current value

:msisdntrunc= (optional)

MS ISDN truncation digits. Specifies number of digits to delete from the beginning of the National MSISDN (MSISDN without Country Code) before formulating the MSRN parameter of the SRI-ack response. The G-Port or IGM feature must be enabled before this parameter can be specified.

Range: **0-5**
Default: No change to current value

:msrndig= (optional)

The routing number to be used as is or to be concatenated with the MSISDN. The G-Port or IGM feature must be enabled before this parameter can be specified.

Range: **rn, rdn, ccrdn**
rn—Routing number
rdn—Routing number prefix and the international DN (dialed/directory number)
ccrdn—Country code, routing number, and national directory number

Default: **rn**

:msrnnai= (optional)

The nature of address indicator value for the MSRN. The G-Port or IGM feature must be enabled before this parameter can be specified.

This parameter is mandatory if the **msrnp** parameter is specified.

Range: **0-7**
0—Unknown Nature of Address
1—International Number
2—National Significant Number
3—Network Specific Number
4—Subscriber Number
5—Reserved for national use
6—Abbreviated Number
7—Reserved for extension

Default: No change to current value

:msrnp= (optional)

The numbering plan value for the MSRN. The G-Port or IGM feature must be enabled before this parameter can be specified.

This parameter is mandatory if the **msrnnai** parameter is specified.

Range: **0-15**
Default: No change to current value

:multcc= (optional)

Multiple country code. The G-Port or IGM feature must be enabled before this parameter can be specified.

Range: 1-3 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to current value

:nmultcc= (optional)

New multiple country code. The specified **multcc** value is either changed to the specified **nmultcc** value, or deleted if **nmultcc=none** is specified. The G-Port feature must be turned on before this parameter can be specified.

Range: 1-3 digits, **none**
Valid digits are **0-9, A-F, a-f**.
none—Deletes the specified **multcc** value from the multiple country code list.

Default: No change to current value

:serverpfx= (optional)

Server SRI prefix. The G-Port or IGM feature must be enabled before this parameter can be specified.

Range: 1-4 digits, **none**
Valid digits are **0-9, A-F, a-f**.
none—No Server SRI prefix is provisioned

Default: No change to current value

System

Default: **none**

:srfaddr= (optional)

Entity address of the MNP_SRF node. The G-Port or IGM feature must be enabled before this parameter can be specified.

This parameter is mandatory if the **srfnai** and **srfnp** parameters are specified.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to current value

:srfnai= (optional)

The nature of address indicator value of the MNP_SRF. The G-Port or IGM feature must be enabled before this parameter can be specified.

This parameter is mandatory if the **srfaddr** and **srfnp** parameters are specified.

Range: **0-127**

Default: No change to current value

:srfnp= (optional)

The numbering plan value of the MNP_SRF. The G-Port or IGM feature must be enabled before this parameter can be specified.

This parameter is mandatory if the **srfnai** and **srfaddr** parameters are specified.

Range: **0-15**

Default: No change to current value

:sridn= (optional)

The Send Routing Information Dialed Number location. The G-Port or IGM feature must be enabled before this parameter can be specified.

Range: **tcap, sccp**

Default: No change to current value

Example

```
chg-gsmopts: defmcc=214: defmnc=34
chg-gsmopts: ccnc=33322123: mccmnc=21434
chg-gsmopts: ccnc=334: mccmnc=22435
chg-gsmopts: is412gsm=0123456789abcde
chg-gsmopts: eirimsichk=on: eirrsptype=type1
chg-gsmopts: eirimsichk=on: eirrsptype=type2: eirgrsp=blk1st
chg-gsmopts: multcc=011
chg-gsmopts: multcc=011: nmultcc=11
chg-gsmopts: msisdntrunc=1
```

The following example deletes a ccnc/mccmnc parameter combination. The value of the ccnc parameter specifies the ccnc/mccmnc parameter combination to delete:

chg-gsmopts:ccnc=334:mccmnc=none

chg-gsmopts:srfaddr=123456789abcdef:srfnai=0:srfnp=0

chg-gsmopts:msrndig=ccrndn

chg-gsmopts:msrnnai=1:msrnp=1

chg-gsmopts:serverpfx=0000

The following example shows the sridn parameter used with G-Port and the G-Port MNP Circular Route Prevention features.

chg-gsmopts:sridn=sccp

Dependencies

At least one parameter must be specified.

The G-Flex feature must be turned on before the following parameters can be specified: **defmcc**, **defmnc**, **ccnc**, **mccmnc**.

The G-Port feature must be turned on before the following parameters can be specified: **defmapvr**, **srfaddr**, **srfnai**, **srfnp**, **msrndig**, **msrnnai**, **msrnp**, **sridn**, **multcc**, **nmultcc**, **msisdtrunc**, **is412gsm**, **serverpfx**.

An **is412gsm** parameter value must exist in the database before the **serverpfx** parameter can be specified.

The **serverpfx** value must be set to **none** in the database before the **is412gsm** value can be set to **none**.

The EIR feature must be enabled and turned on before the following parameters can be specified: **eirgrsp**, **eirsptype**, **eirimsichk**.

The **ccnc** and **mccmnc** parameter values must be specified together in sets.

A maximum of 10 **ccnc** records can exist in the database.

The **ccnc** parameter value must not already exist in the database unless the **mccmnc=none** parameter is specified.

The **srfaddr**, **srfnai**, and **srfnp** parameters must be specified together.

The **msrnnai** and **msrnp** parameters must be specified together.

A value of **none** cannot be specified for the **ccnc** parameter.

A maximum of 10 entries can be defined in the multiple country code list (in addition to the STP options **defcc** value).

The value **none** cannot be specified for the **multcc** parameter.

A multiple country code cannot be entered when the STP options **defcc** value is none. A **defcc** value must first be defined before the first multiple country code can be entered. See the **chg-stpopts** command.

When the **multcc** parameter is specified to enter a new value in the multiple country list, the specified value cannot already exist in the list.

When the **nmultcc** parameter is specified, the **multcc** parameter must be specified.

When the **multcc** and **nmultcc** parameters are specified to change the specified **multcc** value to the specified **nmultcc** value, the specified **nmultcc** value cannot already exist in the multiple country code list.

When the **multcc** and **nmultcc** parameters are specified to change the specified **multcc** value to the specified **nmultcc** value, the specified **multcc** value must already exist in the multiple country code list.

The specified **multcc** and **nmultcc** values cannot already be defined as the STP options **defcc** parameter value.

The IGM feature must be enabled before the **is412gsm**, **gsm2is41**, or **serverpfx** parameter can be specified.

The G-Flex or EIR feature must be turned on, or the G-Port or IGM feature must be enabled before this command can be specified.

Notes

The **sridn** parameter can be used with G-Port only or with G-Port and G-Port MNP Circular Route Prevention. Refer to the *Feature Manual - G-Port* for more information.

Output

```
chg-gsmopts: defmcc=214: defmnc=34
rlghncxa03w 04-01-20 09:04:14 EST EAGLE 31.3.0
CHG-GSMOPTS: MASP A - COMPLTD
;
```

chg-gsms-opcode

Change GSM MAP Screening Operation Code

Use this command to change the attributes of the GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening operation codes. The command allows you to change the default screening action and the operation-code name for a specific operation code.

Keyword: chg-gsms-opcode

Related Commands: dlt-gsms-opcode, ent-gsms-opcode, rtrv-gsms-opcode

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:opname= (mandatory)

Operation code name. This parameter specifies the user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

Range: ayyyyyy
Up to 8 alphanumeric characters

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **npc/npcn/npci/npcn24** and **nssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: yes, no

Default: no

:ndfltact= (optional)

New default screening action.

Range: **pass, discard, atierr, route, forward, duplicate, dupdisc**

pass—Route the message as normal to the destination; a UIM will be issued. This is intended to be a test mode and is recommended when setting up GSM Map Screening during the initial phase to assure that no MSUs will be inadvertently thrown away.

discard—Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

atierr—Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated to the originator. This value is valid only for ATI MAP operation codes.

route—Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

forward—Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

duplicate—Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

dupdisc—Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

Default: No change to the existing value

:nmapset= (optional)

New MAP set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

:nopname= (optional)

This parameter specifies the new user-defined name for the operation code.

Range: **ayyyyyyy**

Up to 8 alphanumeric characters

Default: No change to current value

:npc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **npca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:npc/npca/npai/npcn/npcn24= (optional)

New point code. The **npc/npca/npai/npcn/npcn24** and **nssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

:npci= (optional)

New ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:npcn= (optional)

New ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:npcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:nssn= (optional)

New Subsystem Number. The **npc/npcn/npci/npcn/npcn24** and **nssn** parameters are used when the new default screening action (**ndfltact**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

Range: **002 - 255**

Example

chg-gsms-opcode:opname=ati:ndfltact=atierr

chg-gsms-

opcode:opname=ati:ndfltact=forward:npci=1-1-1:nssn=5:force=yes

chg-gsms-opcode:opname=xyz:npcn=9-9-9:nssn=3

chg-gsms-opcode:opname=test2:npci=s-1-1-1

```
chg-gsms-
opcode:opname=test2:ndfltact=dupdisc:npci=1-1-1:nssn=5:nmapset=8
chg-gsms-
opcode:opname=ts4:ndfltact=forward:npc=1-1-2:nssn=5:nmapset=dflt
```

Dependencies

At least one optional parameter must be specified.

If the **ndfltact** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**, the **npc**/**npca**/**npci**/**npcn**/**npcn24** and **nssn** parameters must be specified.

The reserved word **none** cannot be specified as a value for the **opname** parameter or **nopname** parameter.

If the **npc**/**npca**/**npci**/**npcn**/**npcn24** and **nssn** parameters are specified with the **ndfltact** parameter, the **ndfltact** parameter value must be **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **npc**/**npca**/**npci**/**npcn**/**npcn24** parameter and the **nssn** parameter are specified.

The value specified for the **opname** parameter must already exist in the GSM Map Op-Code table.

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be turned on before this command can be entered.

The EGMS feature must be enabled and turned on before the **npc** or **npca** parameters can be specified.

The **ndfltact=atierr** parameter cannot be specified unless the value of the operation code referenced by the **opcode** parameter is **71**. The **atierr** option is valid only for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If specified, the **npc**/**npca**/**npci**/**npcn**/**npcn24** parameter value must be a full point code.

If the **npc**/**npca**/**npci**/**npcn**/**npcn24** parameter and the **nssn** parameter are specified, and the **force** parameter is not specified as **yes**, the PC-SSN must be populated in the SCCP Application entity set (Remote Point Code / Mated Application Table).

If specified, the **npc**/**npca**/**npci**/**npcn**/**npcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The **nmapset** parameter must be specified if the value of the **ndfltact** parameter is **forward**, **duplicate**, or **dupdisc**.

If the **nmapset** and **ndfltact** parameters are specified, or if the **ndfltact** and **pc** or **ssn** parameters are specified, then the **ndfltact** parameter must have a value of **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **nmapset** parameter is specified.

The Flexible GTT Load Sharing feature must be enabled before the **nmapset** parameter can be specified.

The specified new MAP set must exist.

If the **nmapset=dflt** parameter is not specified, or the **nmapset=dflt** parameter is specified, but the **force=yes** parameter is not specified, then the new PC and new SSN must exist in the new MAP set.

If the **nmapset** parameter is specified without the **ndfltact** parameter, then the **dfltact** parameter must have a previously provisioned value of **forward**, **duplicate**, or **dupdisc**.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```

chg-gta**Change Global Title Address Information**

Use this command to change the global title address information (GTA) for applicable global title selectors required to specify a global title entry.

This command changes the routing objects for messages requiring global title translations. The specified point code, subsystem number, MRN set ID, and routing indicator overwrite the existing data values.

When the Intermediate GTT Load Sharing feature and the Flexible GTT Load Sharing feature are both on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN Set ID and the post-translation PC create a key that is used to perform a lookup in the MRN table. This lookup results in a set of alternate PCs from which a PC is selected, based on relative cost, to route the MSU in most cost-effective way.

Keyword: **chg-gta**

Related Commands: **dlt-gta, ent-gta, rtrv-gta**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *ayyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

:ccgt= (optional)

Cancel called global title indicator.

Range: **yes, no**

Default: No change to **ccgt** value

:cggtasn= (optional)

CgPA GTA GTT set name.

Range: *ayyyyyyy, none*

1 leading alphabetic and up to 8 following alphanumeric characters.

none—Set names do not point to the CgGTA set.

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **cgpca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmfi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgpcsn= (optional)

CgPA GTA GTT set name.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Set names do not point to the CgPA set.

:cgssn= (optional)

The subsystem number of the start CgPA.

Range: **0-255**

:cgssnsn= (optional)

CgPA SSN GTT set name.

Range: *ayyyyyyy*, **none**

1 leading alphabetic and up to 8 following alphanumeric characters.

none—Set names do not point to the CgSSN set.

:ecgssn= (optional)

Subsystem number of the end CgPA.

Range: **0-255**

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1-21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Same as the specified **gta** value

:force= (optional)

Check mated application override.

Range: **yes, no**

Default: **no**

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1-21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000 none, dflt**

dflt—Default MRN set

none—The GTA translation does not participate in any load sharing.

:ngti= (optional)

New GTI code. When the ANSI-ITU-China SCCP Conversion and MGTT features are on and the Translated Point Code is of a different network type, this parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: 2, 4

:nnai= (optional)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: 0-127

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of 0.

:nnp= (optional)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: 0-15

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of 0xFFFF.

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: 0-21

Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
If the **rmgtt=yes** parameter is specified, the value resets to a default of 0xFFFF.

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default: If **:rmgtt=no** is specified, no change to current value
If **:rmgtt=yes** is specified, resets to default value of no digits.

:nsdd= (optional)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21

Default: 0

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default: No digits

:ntt= (optional)

New translation type. The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: 000-255

Default: If the **xlat** parameter does not change from **dpcngt**—No change to the current value.
If the **xlat** parameter changes from **dpcngt**—The **ntt** parameter value is removed.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **opca**

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-*- is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:opc= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:opcsn= (optional)

The new OPC GTT set name.

Range: *ayyyyyyy*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**, **p-**, **ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: No change to current value.

:ri= (optional)

Routing indicator.

Range: **gt**, **ssn**

Default: No change to current value.

:rmgtt= (optional)

Reset MGTT. This parameter resets all MGTT fields to default values before applying values for other parameters in the command.

Range: **yes**, **no**

Default: **no**

:selid= (optional)

Selector ID.

Range: **0-65534 none**

:split= (optional)

Split or change an existing GTA range.

Range: **yes**, **no**

yes — Splits the existing GTA range.

no — Changes the existing GTA range.

Default: **yes**

:ssn= (optional)

Subsystem number.

Range: **002-255**

Default: If the **xlat** parameter is not changed to **dpcngt**—No change to current value.

If the **xlat** parameter is changed to **dpcngt** —The **ssn** parameter value is removed.

:xlat= (optional)

Translate indicator. This parameter is used to specify translation actions and routing actions.

Range: **dpc**, **dpcngt**, **dpcssn**, **udts**, **disc**

Default: No change to current value.

Example

```
chg-
gta:gttsn=lidb:gta=9195554321:xlat=dpcssn:ri:ssn:pc=001-255-252:s
sn=254
```

```
chg-
gta:gttsn=test:gta=100000:egta=199999:pca=1-1-1:xlat=dpcngt:ri=gt
:rmgtt=yes :nnp=3:nnai=120
```

```
chg-gta:gttsn=setnat003:gta=987658321198765432102:pcn=s-129
```

```
chg-gta:gttsn=itui1:gta=987658321198765432112:pci=s-1-210-1
```

```
chg-gta:gttsn=setnat003:gta=987658321198765432122:pcn=s-128-aa
```

The following examples require the Flexible GTT Load Sharing feature to be ON.

```
chg-
gta:gttsn=setmap:gta=2345678901:egta=3456789012:ri:ssn:PC=1-1-3:s
sn=225:mapset=2
```

```
chg-
gta:gttsn=setmap:gta=2345678911:egta=3456789022:ri:ssn:PC=2-2-2:s
sn=221:mapset=df1t
```

In the following example, the database contains a GTA range [5556000-5558000], but no part of the GTA range [5558001-5559000] exists. The command deletes the GTA range [5556000-5558000] from the database and adds two new GTA ranges [5556000-5556799] and [5556800-5559000].

```
chg-gta:gttsn=tst1:gta=5556800:egta=5559000:split=yes
```

The following command deletes the GTA range [5556000-5556799] from the database and adds a new GTA range [5556200-5556500] to the database. All the parameters for specified GTA range [5556200-5556500] have the same values as that of the deleted [5556000-5556799] GTA range, except the pc parameter that is assigned the specified value of 1-1-2.

```
chg-gta:gttsn=tst1:gta=5556200:egta=5556500:pc=1-1-2:split=no
```

The following command deletes the GTA range [5556200-5556500] from the database and adds two new GTA ranges [5556200-5556400] and [5556401-5556500] to the database.

```
chg-gta:gttsn=tst1:gta=5556401:egta=5556500
```

The following example specifies the default MRN set.

```
chg-gta:gttsn=setmrn:gta=1234567880:pc=1-1-2:mrnset=df1t
```

The following example specifies the mrnset=none parameter to remove the MRN set ID.

```
chg-
gta:gttsn=setmrn:gta=1234567890:egta=2234567890:pc=1-1-2:mrnset=n
one
```

The following example specifies MRN set ID 2.

```
chg-
gta:gttsn=setmrn:gta=2345678901:egta=3456789012:pc=1-1-3:mrnset=2
```

```
chg-
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:cggtasn=cggtas1:opcsn=opc1
```

```
chg-
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:selid=1024:opcsn=opc1
```

```

chg-
gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345
678901:cggtasn=none

chg-
gta:gttsn:setcggt:gta=323456789012345678901:egta=323456789012345
678901:cgssnsn=none

chg-gta:gttsn=setopc:opca=002-001-001:xlat=dpcssn:ri:ssn:
pca=001-001-001:ssn=20:cgssnsn=setcgssnsn

chg-gta:gttsn=setcgpc:cgpc=001-001-001:xlat=dpcssn:ri:ssn:
pca=001-001-001:ssn=20:cgssnsn=setcgssn

chg-gta:gttsn=setcgssn:cgssn=100:ecgssn=200:xlat=dpcssn:ri:ssn:
pca=001-001-001:ssn=20

chg-gta:gttsn=set1:gta=2543:egta=2943:xlat=disc

chg-gta:gttsn=set2:cgpc=1-2-*:xlat=udts

chg-gta:gttsn=set3:opcn=2543:xlat=udts

chg-gta:gttsn=set4:cgssn=25:ecgssn=29:xlat=disc

```

The following example specifies hexadecimal digits for the gta, egta, and npds parameters.

```
chg-gta:gttsn=set1:gta=abcd:egta=abce:npds=fab
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The MGTT feature must be turned on before the **rmgtt**, **nnp**, **nnai**, **ngti**, **nsdd**, **nsds**, **npdd**, and **npds** parameters can be specified.

The ANSI-ITU-China SCCP Conversion feature must be enabled and turned on before the **ngti** parameter can be specified.

The ANSI-ITU-China SCCP Conversion feature must be enabled and turned on before a translated point code that is of a different domain than the **gttsn** can be specified.

The **nsdd**, **nsds**, **npdd**, and **npds** parameters cannot be changed with this command. Use the **rmgtt** parameter to reset all MGTT entry values to their default values, and enter the command again to specify new MGTT parameter values.

At least one optional parameter must be specified.

The **ssn**, **ri**, **cgssn**, or **ecgssn** parameters cannot have an asterisk (*) as a value.

The **gttsn** parameter must be specified, cannot not have a value of **none**, and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24** parameter cannot be out of range and must be a full point code.

If the **egta** parameter is specified, the values of the **gta** and **egta** parameters must be the same length, and the value of the **egta** parameter must be greater than value of the **gta** parameter.

If the **ngti=4** parameter is specified, the **nnp** and **nnai** parameters must be specified.

If the **ngti=4** parameter is specified, the translated point code cannot be ANSI. For ANSI point codes, the GTI value must be 2.

If the **ngti=2** parameter is specified, the **nnp** and **nnai** parameters cannot be specified.

If the **ccgt** parameter is specified, the **ngti** parameter cannot be specified. If the **ngti** parameter is specified, the **ccgt** parameter cannot be specified.

If the ANSI-ITU-China SCCP Conversion feature is not on, and the specified GTT set is an ANSI set, then the **pc/pca** parameter must be a valid ANSI point code.

If the ANSI-ITU-China SCCP Conversion feature is not on, and the specified GTT set is an ITU set, the **pci/pcn/pcn24** parameter must be a valid ITU point code.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set (**gttsn**). If the VGTT (variable length GTT) feature is turned on, then there can be up to 10 GTA lengths per GTT set. When the **ent-gta** command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths. The global title address specified for the GTT set must have the same number of digits as an existing GTA.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, an overlap with another range cannot be specified. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, error message E2401 is generated displaying the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

```
START GTA END GTA
8005550000 8005551999
8005552000 8005553999
8005554000 8005555999
CHG-GTA: MASP A - Command Aborted
```

If the ANSI-ITU-China SCCP Conversion feature is not on, the **ntt** parameter can be specified only when the **xlat=dpcngt** parameter is specified.

If the ANSI-ITU-China SCCP Conversion feature is on, the **ntt** parameter can be specified only when the value of the **xlat** parameter is **dpc** or **dpcngt**.

If the ANSI-ITU-China SCCP Conversion feature is on, and the **ntt** parameter is specified, the **ri=gt** parameter must be specified.

The **ngti** parameter can be specified only when the translated point code and the translation type are in different domains, or are both in the ITU domain.

If the **xlat=dpcngt** parameter is specified, the **ntt** parameter must be specified.

If a new or existing **xlat=dpcngt** parameter is specified, a new or existing **ri=gt** parameter must be specified.

If the **ssn** parameter is specified, a new or existing **xlat=dpcssn** parameter must be specified.

If the **xlat=dpcssn** parameter is specified, the **ssn** parameter must be specified.

If the **pc/pca/pci/pcn/pcn24** parameter is specified, and the point code is the STP true point code, then the value of the new or existing **xlat** parameter must be **dpcssn**, and the new or existing value of the **ri** parameter must be **ssn**.

If the **pc/pca/pci/pcn/pcn24** parameter, **ssn** parameter, or both, are specified, and the point code is the STP true point code, the **ssn** value must exist in the SS-APPL table.

If the **pc/pca/pci/pcn** parameter is specified, then it must exist as a destination in the Route table or reside in a cluster that exists as a destination in the Route table (for global routing) unless the point code is the STP's true point code.

If new or existing **ri=ssn** and **xlat=dpc** parameters are specified, and the **pc/pca/pci/pcn/pcn24** parameter is not specified, then the existing PC must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

If new or existing **ri=ssn**, **xlat=dpc**, and **pc/pca/pci/pcn/pcn24** parameters are specified, the new point code must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

If a new or existing **ccgt=yes** parameter is specified, a new or existing **ri=ssn** parameter must be specified.

If a new or existing **ri=gt** parameter is specified, a new or existing **ccgt=no** parameter must be specified.

If the new or existing **pc/pca/pci/pcn/pcn24** parameter is an STP PC or CPC, the **ccgt=no** parameter must be specified.

If the **rmgtt** parameter is specified, the **nnp**, **nnai**, **ngti**, **nsdd**, **nsds**, **npdd**, and **npds** parameters cannot be specified.

If new or existing **ri=ssn** and **xlat=dpcssn** parameters are specified, a new or existing **xlat=dpcssn** parameter must exist in the Remote Point Code/MAP table, unless the **force=yes** parameter is specified.

The GTT table cannot be full.

If the **ri=gt** parameter is specified, the **mrnset** parameter must be specified. If the **ri=gt** parameter is not specified, the **mrnset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must exist in the MRN set.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the **ri=ssn** parameter is specified, the **mrnset** parameter cannot be specified.

The SEAS command can operate only on the default MRN set or the default MAP set.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

The specified or previously provisioned PC/SSN must exist in the specified or previously provisioned MAP set.

The SEAS command cannot operate on any MAP set other than the default MAP set.

If the **xlat=dpc** parameter is specified, and the value of the **force** parameter is not **yes**, then the point code and MAP set must exist in the MAP table.

The specified GTA must occur within an existing GTA range in the specified GTT Set.

Either the **gta**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24** or **cgssn** parameter must be specified.

If the **cgssnsn** parameter is specified, the **cggtasn**, **opcsn**, **cgpcsn**, and **selid** parameters cannot be specified.

If the **cgssn** parameter is specified, the **cggtasn**, **cgpcsn**, **cgssnsn**, **opcsn**, and **selid** parameters cannot be specified.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** and **opc/opca/opci/opcn/opcn24** parameters must have values within the valid range for each subfield.

If the **ecgssn** parameter is specified, its value must be greater than the value of the **cgssn** parameter.

If the **xlat** parameter has a value of **udts** or **disc**, the **gta/egta**, **cgpc**, **opc**, or **cgssn/ecgssn** parameters are the only other optional parameters that can be specified. If the **cgpc** or **opc** parameter is specified,

the **egta**, **ecgssn**, and **split** parameters cannot be specified. If the **cgssn** parameter is specified, the **egta** and **split** parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled before the **cggtasn**, **cgpcsn**, **cgssnsn**, **opcsn**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **(e)cgssn**, or **selid** parameters are specified or before the **xlat** parameter is specified with a value of **udts** or **discard**.

The **cgssnsn** parameter cannot be specified if the GTTSN set type has a value of **cdgta/cgssn**. The **cggtasn**, **cgpcsn**, or **opcsn** parameters cannot be specified if the GTTSN set type does not have a value of **cdgta**.

The **cggtasn**, **cgpcsn**, and **selid** parameters are mutually exclusive. A translation entry has only one valid value of the three at any given time. If one of the parameters has a valid value, and the entry is changed to set another one to a valid value, the first parameter must be changed to have a value of **none**.

The **gta** parameter must be specified if the GTTSN set type has a value of **cdga** or **cggtta**. The **gta** parameter cannot be specified for other set types.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter must be specified if the GTTSN set type has a value of **cgpc**. The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter cannot be specified for other set types.

The **opc/opca/opci/opcn/opcn24** parameter must be specified if the GTTSN set type has a value of **opc**. The **opc/opca/opci/opcn/opcn24** cannot be specified for other set types.

The **cgssn** parameter must be specified if the GTTSN set type is **cgssn**. The **cgssn** parameter cannot be specified for other set types.

The range specified by the **cgssn/ecgssn** parameters cannot overlap a currently existing range for the specified GTT set.

The value specified for the GTT set name (the **gttsn** parameter) must match the corresponding type in the GTTSET table. The following GTT set names and matching GTT set types may be specified:

- GTT set name specified by the **cgssnsn** parameter must be type **cgssn**
- GTT set name specified by the **cggtasn** parameter must be the type **cggtta**
- GTT set name specified by the **cgpcsn** parameter must be type **cgpc**
- GTT set name specified by the **opcsn** parameter must be type **opc**

If the specified GTT set is an ANSI set, the **cgpc/cgpca** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT set is an ITU set, the **cgpci/cgpcn/cgpcn24** and **opci/opcn/opcn24** parameters must be valid ITU point codes.

The set domain of the **cgpcsn** parameter must be the same as the set domain of the **gttsn** parameter. For example, if the set domain of the **gttsn** parameter is ANSI, then the set domain of the **cgpcsn** parameter must be ANSI. If the set domain of the **gttsn** parameter is ITU, then the set domain of the **cgpcsn** parameter must be ITU.

The set domain of the **opcsn** parameter must be the same as the set domain of the **gttsn** parameter. For example, if the set domain of the **gttsn** parameter is ANSI, then the set domain of the **opcsn** parameter must be ANSI. If the set domain of the **gttsn** parameter is ITU, then the set domain of the **opcsn** parameter must be ITU.

The set domain of the **cgssnsn** parameter must be the same as the set domain of the **gttsn** parameter. For example, if the set domain of the **gttsn** parameter is ANSI, then the set domain of the **cgssnsn** parameter must be ANSI. If the set domain of the **gttsn** parameter is ITU, then the set domain of the **cgssnsn** parameter must be ITU.

The set domain of the **cggtasn** parameter must be the same as the set domain of the **gttsn** parameter. For example, if the set domain of the **gttsn** parameter is ANSI, then the set domain of the **cggtasn**

parameter must be ANSI. If the set domain of the **gttsn** parameter is ITU, then the set domain of the **cggtasn** parameter must be ITU.

The range specified by the **cgssn/ecgssn** parameters must exist for the specified GTT set in the STP active data base. An exact match is not required.

If the value of the **xlat** parameter is changed from **udts** or **disc** to **dpc**, **dpcngt**, or **dpcssn**, the **gta/egta**, **cgpc**, **opc**, **cgssn/ecgssn**, **pc/pca/pci/pn/pcn24**, and **ri** parameters must be specified. If the value of the **xlat** parameter is **udts** or **disc**, changing the PC or other fields requires the **xlat** parameter value to be changed to a value other than **udts** or **disc**.

The **selid** parameter can be specified only if the GTTSN set type has a value of **cdgta**.

The point code specified by the **cgpc** or **opc** parameter must exist.

The **cgpc**, **cgssn**, **gta**, and **opc** parameters are mutually exclusive. Each of these parameters must be specified individually in separate commands.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta**, **egta**, **npds**, or **nsds** parameters.

Notes

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

If the EGTT feature is turned on, then the GTT Selector (**ent/chg/dlt/rtrv-gttssel**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

If a GTT is being deleted or changed and the point code (**dpc** or **rte**) is not found in the route table (unless the point code is the STP's true point code), then the following message is displayed in the terminal scroll area:

NOTICE: No DPC and/or RTE found for GTT being deleted or changed.

The above situation may occur for the following reasons:

- A database was upgraded from a release prior to EAGLE 5 ISS Release 27.1 or IP⁷ Secure Gateway Release 3.0 when GTT entries were not linked to the route table and the deletion of the **dpc** was permitted. The GTT referenced a **dpc/rte** that was deleted, and the enforce reference counts between the GTT and route tables were not updated.
- A serious problem occurred in which the reference count rules were not enforced and a **dpc** and/or **rte** were deleted while being referenced by a GTT entry. This indicates a software error; notify the Customer Care Center at (888) FOR-TKLC.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix **s-** and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The **mrnset** parameter and the post-translation PC create a key that is used to perform a lookup in the MRN table. This lookup results in a set of alternate PCs, from which a PC is selected, based on relative cost, to route the MSU in most cost-effective way.

When the Flexible GTT Load Sharing feature is turned on, multiple relationships can be defined among a set of PC/SSN pairs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the Origin-based SCCP Routing feature is enabled, the CdPA GTA entry can be provisioned in addition to the CgPA GTA, CgPA PC, CgPA SSN, and OPC entries. When provisioning, the Advanced CdPA GTA entry can associate with the CgPA GTA set or the CgPA PC set, the SELID and/or OPC set; the CgPA GTA, CgPA PC, or OPC can associate with the CgPA SSN set; the CgPA SSN cannot associate with any other GTT set. The Advanced CdPA GTA entry may contain the selector ID along with CgPA information present in the MSU to search the Selector table again for the CgPA GTA or CgPA PC Set.

Output

```

chg-gtcnv

Change Global Title Conversion

Use this command to change entries in the Default Global Title Conversion table. A table entry is identified by the direction and either the **tta** parameter, the **tti** parameter, or the **tti/np/nai** parameter combination. The Notes section for this command describes rules for changing entry information.

Keyword: chg-gtcnv

Related Commands: dlt-gtcnv, ent-gtcnv, rtrv-gtcnv

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: atoi, itoa, both

atoi—ANSI to ITU conversion

itoa—ITU to ANSI conversion

both—Conversion in both directions

:nai= (optional)

Nature of address indicator. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: 0-63 *

Default: No change to current value

:np= (optional)

Numbering plan. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: 0-15 *

Default: No change to current value

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the number of new prefix digits to be deleted. These digits will be replaced with the new prefix digits string (**npds**).

Range: 0-21

Default: No change to current value

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No change to current value

:nsdd= (optional)

New suffix digits to be deleted. This parameter specifies the number of new suffix digits to be deleted. These digits will be replaced with the new suffix digits string (**nsds**).

Range: **0-21**

Default: No change to current value

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No change to current value

:rdmod= (optional)

Reset digit modifiers (**npdd** and **npds** or **nsdd** and **nsds**) values to "no digit modification."

Range: **yes, no**

yes—Reset the **npdd** and **npds** parameter or **nsdd** and **nsds** parameter values.

no—Do not reset the **npdd** and **npds** parameter or **nsdd** and **nsds** parameter values.

Default: No change to current value

:tta= (optional)

ANSI translation type. This parameter is mandatory when **dir=atoi** or **dir=both** is specified.

Range: **0-255 ***

Default: No change to current value

:tti= (optional)

ITU translation type. This parameter is mandatory when **dir=atoi** is specified.

Range: **0-255 ***

Default: No change to current value

Example

The following example changes a **dir=atoi** entry's current **tta** value to 5.

chg-gtcnv:dir=atoi:tta=10:tti=5

The following example changes a **dir=atoi** entry's current **tta**, **nai**, and **np** values to 7, 8, and 6 respectively, and either changes or adds the **nsdd** and **nsds** values.

chg-gtcnv:dir=atoi:tta=11:tti=7:nai=8:np=6:nsdd=3:nsds=123

The following example changes a **dir=itoe** entry's current **tta** value to 11, and either changes or adds the **npdd** and **npds** values.

chg-gtcnv:dir=itoe:tta=11:tti=7:npdd=3:npds=123

The following example changes a **dir=itoe** entry's current **tta** value to 12, and either changes or adds the **nsdd** and **nsds** values.

chg-gtcnv:dir=itoe:tta=12:tti=7:nai=8:np=6:nsdd=5:nsds=45667

The following example adds or changes a dir=both entry's nsdd and nsds values.

chg-gtcnv:dir=both:tta=12:tti=33:nsdd=3:nsds=456

The following example changes a default dir=atoi entry's current tti value to 9, and either changes or adds the nsdd and NSDS values.

chg-gtcnv:dir=atoi:tta=*:tti=9:nsdd=1:nsds=9

The following example changes a default dir=atoi entry's current tti, nai, and np value to 4, 6, and 5 respectively.

chg-gtcnv:dir=atoi:tta=*:tti=4:nai=6:np=5

The following example changes a default dir=itoe entry's current tta value to 17, and either changes or adds the npdd and npds values.

chg-gtcnv:dir=itoe:tta=17:tti=*:nai=*:np=*:npdd=3:npds=123

The following example resets existing npdd/npds or nsdd/nsds values to "no digit modification."

chg-gtcnv:dir=both:tta=12:tti=11:rdmod=yes

The following example specifies hexadecimal digits for the nsds parameter.

chg-gtcnv:dir=atoi:tta=*:tti=4:npdd=3:npds=abc1234fed

Dependencies

The ANSI-ITU-China SCCP Conversion feature must be turned on before this command can be entered.

If the **dir=atoi** parameter is specified, the **tta** parameter must be specified.

If the **dir=both** parameter is specified, at least the **tta** and **tti** parameters must be specified.

If the **dir=both** parameter is specified, asterisk parameter values (*) cannot be specified.

If the **dir=atoi** parameter is specified, the asterisk parameter value (*) can be specified only for the **tta** parameter.

If the **dir=itoe** parameter is specified, the asterisk parameter value (*) must be specified for the **tti**, **np**, and **nai** parameters.

If the **dir=itoe** and **gtixlat=22** parameters are specified, asterisk parameter values (*) cannot be specified. The **gtixlat=24** parameter must be specified with asterisk parameter values when the **dir=itoe** parameter is specified.

The specified **dir**, **tta**, **tti**, **np**, and **nai** parameter combination cannot already exist in the database.

If the **nsdd** and **nsds** parameters are specified, the **npdd** and **npds** parameters cannot be specified.

The Default Global Title Conversion table can contain a maximum of 1000 entries.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **npds** and **nsds** parameters.

Notes

The use of asterisks (wildcards) is allowed only once for each direction of ANSI to ITU and ITU to ANSI. This provides a configurable default.

In the conversion direction of ANSI to ITU, an asterisk can be specified only for the ANSI **tta** parameter.

In the conversion direction of ITU to ANSI, the asterisk value must be specified for the **itu tti**, **np**, and **nai** parameters.

Asterisks are not allowed when conversion is in both directions (**dir=both**).

The suffix digit manipulation parameters **nsdd** and **nsds** cannot be specified in the same command with the prefix digit manipulation parameters **npdd** and **npds** parameters. The **npdd** and **nsdd** parameters specify how many digits to delete, if any, from the beginning or end respectively of the Global Title address digits. The **npds** and **nsds** parameters specify what digits, if any, to append to the beginning or end respectively of the Global Title address digits.

The **gtixlat** parameter is expressed in the form of the ANSI GTI and the ITU GTI. The **gtixlat** parameter is used to indicate the conversion of the Global Title Indicator between the ANSI and ITU standards. For example: A **gtixlat** value of **24** converts an incoming ANSI GTI2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI2.

Output

```
chg-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5

chg-gtt

Change Global Title Translation

Use this command to change the routing objects for messages requiring global title translation. The global title addresses remain unchanged.

If the EGTT (Enhanced Global Title Translation) feature is turned on, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gttset**)
- GTT Set commands (**ent/dlt/rtrv-gttset**)
- GTA commands (**ent/chg/dlt/rtrv-gta**).

See the "Notes" section in this command description for functions provided when various controlled features are turned on.

Keyword: **chg-gtt**

Related Commands: **dlt-gtt, ent-gtt, rtrv-gtt**

Command Class: Database Administration

Parameters

NOTE: At least one of these parameters must be specified: **pc/pca/pci/pcn/pcn24, ri, ssn, ttn, type/typea/typeei/typen/typen24, xlat**.

NOTE: "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (mandatory)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: **egta** same as **gta**

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000 dflt**
dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000 none, dflt**
dflt—Default MRN set
none—The GTT translation does not participate in any load sharing

:ngt= (optional)

New global title

Range: **000-255**
Default: If the value for the **xlat** parameter changes from **dpcngt**, the **ngt** parameter is removed.
 If the value for the **xlat** parameter does not change from **dpcngt**, there is no change to the **ngt** parameter value.

:ngti= (optional)

New GTI code. When the ANSI-ITU-China SCCP Conversion and MGTT features are on and the Translated Point Code is of a different network type, the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: **2, 4**

:nnai= (optional)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: **0-127**
Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
 If the **rmgtt=yes** parameter is specified, the value resets to a default of **0**.

:nnp= (optional)

New numbering plan. This parameter identifies the numbering plan that will replace the received numbering plan.

Range: **0-15**
Default: If the **rmgtt=no** parameter is specified, there is no change to the current value.
 If the **rmgtt=yes** parameter is specified, the value resets to a default of **0xFFFF**.

:npdd= (optional)

New prefix digits to be deleted. This parameter identifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: **0-21**
Default: If the **rmgtt=no** parameter is specified, no change to the current value.
 If the **rmgtt=yes** parameter is specified, the value resets to a default of **0xFFFF**.

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

- Range:** 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
- Default:** If the **rmgtt=no** parameter is specified, there is no change to the current value.
 If the **rmgtt=yes** parameter is specified, the value resets to a default of no digits.

:nsdd= (optional)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

- Range:** **0-21**
Default: **0**

:nsds= (optional)

New suffix digits string. This parameter specifies the new new suffix digits string that will replace the received suffix digits string

- Range:** 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
- Default:** No digits

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

- Range:** **p-, 000-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
 When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
 When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
 The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

- Range:** **s-, p-, ps-, 0-255**
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
 The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*. (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ri= (optional)

Routing Indicator. This parameter provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: **gt, ssn**

gt— Allow a called party address with a routing indicator value of **global title**.

ssn— Allow a called party address with a routing indicator value of **dpc/ssn**.

Default: No change in current value.

:rmgtt= (optional)

This parameter resets all MGTT fields to default values before applying values for other parameters in the command.

Range: **yes, no**

Default: **no**

:split= (optional)

Split or change an existing GTA range.

Range: **yes, no**

yes— Split the existing GTA range.

no— Change the existing GTA range.

Default: **yes**

:ssn= (optional)

Subsystem number.

Range: **002-255**

Default: If the **xlat=dpcngt** parameter is specified, there is no change to the current value.

If the **xlat=dpcngt** parameter is not specified, the **ssn** parameter is removed.

:ttn= (optional)

Translation type name.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24= (optional)

Translation type. This parameter identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **0-255**

Default: No translation type is specified

:xlat= (optional)

Translate indicator. This parameter specifies translation actions and routing actions.

Range: **dpc, dpcssn, dpcngt**

Default: No change in current value.

Example

chg-

gtt:type=5:gta=9195551212:egta=9195551999:xlat=dpcssn:ri:ssn:pc=255-002-001:ssn=255

**chg-
gtt:ttn=setmrn:gta=2345678901:egta=3456789012:pc=1-1-3:mrnset=2**

The following examples require the Flexible GTT Load Sharing feature to be ON.

**chg-
gtt:ttn=setmap:gta=2345678901:egta=3456789012:ri=ssn:pc=1-1-3:ssn=10:mapset=2**

**chg-
gtt:ttn=setmap:gta=2345678911:egta=3456789022:ri=ssn:pc=2-2-2:ssn=6:mapset=df1t**

The database contains a GTA range [5556000-5558000], but no part of the GTA range [5558001-5559000] exists. The following command deletes the GTA range [5556000-5558000] from the database and adds a new GTA range [5556800-5559000] to the database.

chg-gtt:ttn=tst1:gta=5556800:egta=5559000:split=no

The following command deletes the GTA range [5556800-5559000] from the database and adds three new GTA ranges [5556800-5556899], [5556900-5557000] and [5557001-5559000] to the database.

chg-gtt:ttn=tst1:gta=5556900:egta=5557000

The following example specifies hexadecimal digits for the gta, egta, and nsds parameters.

**chg-
gtt:type=1:xlata=dpcssn:ri=ssn:ssn=10:pc=1-1-1:gta=df3456789012345678906:egta=df345678901234567890a:nsds=EF012345DF012**

Dependencies

This command is not valid when the EGTT feature is turned on.

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the **ttn** parameter is specified, the name must correspond to a translation type entry.

If the translation type is specified, the translation type must already exist.

The network type (ANSI, ITU-I, ITU-N, or 24-bit ITU-N) of the translation type and the translated point code must be the same.

The ANSI-ITU-China SCCP Conversion feature must be on before a translated point code and a translation type in different network types can be specified.

The range of global title addresses to be changed, as specified by the start and end global title addresses, must match exactly an existing range in the global title translation data for the specified translation type.

If the new or existing value of the **xlata** parameter is **dpc**, the new or existing value of the **ri** parameter is **ssn**, and the **pc/pca/pci/pcn** parameter is specified, the new point code must exist in the Remote Point Code/MAP table.

If the new or existing **xlata** parameter value is **dpc**, the new or existing **ri** parameter value is **ssn**, and the **pc/pca/pci/pcn** parameter is not specified, a point code must exist in the Remote Point Code/MAP table.

If the **xlata** parameter value is changed from **dpcssn** to **dpc** or **dpcngt**, a new **ssn** parameter value cannot be specified, and the current **ssn** parameter value must be removed.

If the new **xlata** parameter value is **dpcssn**, and the current **ssn** parameter value has been removed, a new **ssn** parameter value must be specified.

The start **gta** length must equal the number of digits specified by the translation type. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA lengths per translation type are allowed.

When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

The **nnp**, **nnai**, **nsdd**, **nsds**, **npdd**, and **npds** parameters cannot be specified with the **rmgtt** parameter in the command.

The MGTT feature must be on before the **rmgtt**, **nnp**, **nnai**, **nsdd**, **nsds**, **npdd**, and **npds** parameters can be specified in the command.

If the **nsdd** and **nsds** parameters are specified, the **npdd** and **npds** parameters cannot be specified.

To change existing **nsdd**, **nsds**, **npdd**, and **npds** parameter values, enter the command with the **rmgtt** parameter to reset the MGTT values, and enter the command with new **nnp** and **nnai** or **npdd** and **npds** parameter values.

The **ngti** parameter can be specified only when the translated point code and the translation type are in different domains, or are both in the ITU domain.

If the **ngti=4** parameter is specified, the **nnp** and **nnai** parameters must be specified.

If the **ngti=4** parameter is specified, the translated point code cannot be ANSI. For ANSI point codes, the GTI value must be 2.

If the **ngti=2** parameter is specified, the **nnp** and **nnai** parameters cannot be specified.

If the **egta** parameter is specified, the length must equal the length of the start **gta**.

If the **egta** parameter is specified, the value must be greater than the value specified for the **gta** parameter.

The range of global title addresses to be changed, as specified by the start and end global title addresses, must match exactly or be contained within an existing range in the global title translation data for the specified translation type.

The new **gta-egta** range cannot include the **gta** or the **egta** of an existing range. However, the new global title address range can completely fall within an existing global title address range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

```
START GTA END GTA
8005550000 8005551999
8005552000 8005553999
8005554000 8005555999
CHG-GTT: MASP A - Command Aborted
```

If the range specified by the **gta** and **egta** parameters does not exactly match the existing range, the existing range is split. All addresses in the existing range that are outside the range specified by the **gta** and **egta** parameters retain the original **xlat**, **ri**, **pc**, **ssn**, and **ngt** parameters. A new range is created that is bounded by the **gta** and **egta** parameters. The new range contains new values for the **xlat**, **ri**, **pc**, **ssn** and **ngt** parameters parameters that are present in the command, while retaining parameter values from the previous range that do not have corresponding new values in the command.

When the ANSI-ITU-China SCCP Conversion feature is not on, the current value of the **xlat** parameter is **dpngt**, and a different value is specified for the **xlat** parameter, then a value for the **ngt** parameter must not be specified, and the current value of the **ngt** parameter is removed.

If the new **xlat** parameter value is **dpcngt**, and the current **ngt** parameter value has been removed, a new **ngt** parameter value must be specified.

If the ANSI-ITU-China SCCP Conversion feature is on, the **ngt** parameter can be specified only if the **xlat=dpc** parameter or the **xlat=dpcngt** parameter is specified.

If the ANSI-ITU-China SCCP Conversion feature is turned on, and the **ngt** parameter is specified, the **ri=gt** parameter must be specified.

A translation type cannot be specified that is already defined as an alias for another translation type.

Either the **type** parameter or the **ttn** parameter must be specified.

Point code entries must be full point codes. Partial point codes are not allowed.

Table 5-14 shows the valid combinations for the **xlat**, **ri**, **ssn**, and **ngt** parameters. All other combinations are rejected.

Table 5-14. Valid Parameter Combinations for the **chg-gtt** Routing Parameters

New or Existing XLAT Value	New or Existing RI Value	Routing Action	SSN Value	NGT Value
DPC	GT	Translate DPC only and route on GT	Cannot be specified. The current database entry is removed.	Cannot be specified unless ANSI-ITU-China SCCP Conversion is enabled. The current database entry is removed.
DPC	SSN	Translate DPC only and route on SSN	Cannot be specified. The current database entry is removed.	Cannot be specified. The current database entry is removed.
DPCSSN	GT	Translate DPC and SSN and route on GT	Must be specified.	Cannot be specified. The current database entry is removed.
DPCSSN	SSN	Translate DPC and SSN and route on SSN	Must be specified.	Cannot be specified. The current database entry is removed.
DPCNGT	GT	Translate DPC , new translation type (TT), and route on GT	Cannot be specified. The current database entry is removed.	Must be specified.

To enter this command, the Remote Point Code table cannot be full.

To enter this command, the subsystem table for primary remote point codes cannot be full.

If the **ri=ssn** parameter is specified, the **mrnset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the point code must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The Flexible GTT Load-Sharing feature must be enabled before the **mrnset** parameter can be specified.

The SEAS command is not allowed to operate on any other MRN set except the default MRN set.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is not enabled, the **mapset** parameter cannot be specified.

If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The specified or previously provisioned point code and subsystem number must exist in the specified or previously provisioned MAP set.

The SEAS command cannot operate on any MAP set other than the default MAP set.

The specified GTA must lie within an existing GTA range in the specified GTT Set.

The specified GTA range must not overlap with any other existing GTA range in the specified GTT Set.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must exist in the MRN set.

If the **ri=gt** parameter is specified, the **mrnset** parameter must be specified.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta**, **egta**, **npds**, or **nsds** parameters.

Notes

The specified DPC, SSN, relative cost, and routing indicator will overwrite the existing data values in the table.

In this command, only ITU-international and ITU-national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

When the Intermediate GTT Load Sharing feature and the Flexible GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the existing MRN table. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN Set and the post-translation PC formulate a key that is used for a lookup in the MRN table. The MRN table lookup results in a set of alternate PCs, one of which is selected (based on relative cost) to route the MSU in the most cost effective way.

When the Flexible GTT Load Sharing feature is turned on, multiple relationships among a set of PCs and SSNs in the existing MAP table are supported. The relationship used in a particular translation is based on the GTA digits used for translation. The MAP set ID and PC/SSN formulate a key that is used to perform lookup tasks in the MAP table. The lookup results in a set of alternate PC/SSNs, one of which is selected to route the MSU in the most cost effective way.

If the ANSI-ITU-China SCCP Conversion feature is turned on, then the Translated Point Code (**pc**, **pca**, **pci**, **pcn**, and **pcn24** parameters) can be of a different network type than the Translation Type (**type** parameter).

If the ANSI-ITU-China SCCP Conversion and MGTT features are turned on, and the Translated Point Code is of a different network type, then the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

If the MGTT feature is turned off, then the **ngti** parameter cannot be specified and the Default GT Conversion Table is used for conversion. If the ANSI-ITU-China SCCP Conversion feature is turned off, then mixed network types are not allowed.

Output

```

chg-gttset

Change GTT Selectors

Use this command to change the global title translation (GTT) set (**gttsn**) linked with an existing **gti**, **tt**, **np/npv**, and **nai/naiv** combination.

Keyword: chg-gttset

Related Commands: dlt-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin/gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry of **gtin=2** and **tt=4** cannot be entered.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii=2, 4** and **gtin/gtin24=2, 4**

:tt= (mandatory)

Translation type.

Range: 0-255

:cdgtasn= (optional)

CgPA GTA GTT set name.

Range: ayyyyyyyy, none
1 leading alphabetic character and up to 8 following alphanumeric characters.
none—Set names do not point to the CdGTA set.

:cggtasn= (optional)

CgPA GTA GTT set name.

Range: ayyyyyyyy, none
1 leading alphabetic character and up to 8 following alphanumeric characters.
none—Set names do not point to the CgGTA set.

:cgpcsn= (optional)

CgPA PC GTT set name.

Range: ayyyyyyyy, none
1 leading alphabetic character and up to 8 following alphanumeric characters.
none—Set names do not point to the CgPC set.

:cgssn= (optional)

CgPA subsystem number.

Range: 0-255

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned. The **gttsn** parameter can be specified only if the Origin-based SCCP Routing feature is off.

Range: *ayyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **sub, rsvd, natl, intl, dflt**

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **0-127**

:np= (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **e164, generic, x121, f69, e210, e212, e214, private, dflt**

:npv= (optional)

Numbering Plan value. The numbering plan indicator can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **0-15**

:selid= (optional)

Selector ID.

Range: **0-65534**

Example

chg-

gttsel:gtii=2:tt=40:cdgtasn=setcggtta:cgpcsn=none:cgssn=10:selid=12

chg-gtttsel:gtia=2:tt=253:gttsn=newansi

chg-gtttsel:gtin=4:tt=0:np=dflt:nai=dflt:gttsn=setint000

The following example would change the selectors (gtii=4, tt=5, npv=1, naiv=2) linked with GTTSN ansi1 so that the selectors are linked with ansi2 (assuming that ansi2 is an existing GTT set in the database):

chg-gtttsel:gtii=4:tt=5:npv=1:naiv=2:gttsn=ansi2

chg-

gttsel:gtin=4:tt=60:npv=5:naiv=5:cgpcsn=setcgpc:selid=100:cgssn=10

Dependencies

The EGTT feature must be turned on before this command can be entered.

At least one parameter value must be changed in the command.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The parameter values **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** cannot be specified.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np/npv** and **nai/naiv** parameter combinations cannot be specified.

When the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in any combination: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing **gttsn**.

If two set names are specified, one of the names can have a value of **none**, but not both. A GTT selector must contain at least one GTT set.

An entry must already exist that matches the **gti**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

An entry must already exist that matches the **gtii**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

An entry must already exist that matches the **gtin**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

The specified **gttsn** value must exist for the specified **gtin24**, **tt**, **np/npv/nai/naiv** parameter combination.

The network domain (ANSI or ITU) must match that of the existing GTT Set entry specified by the **gttsn** parameter.

A maximum of 5 **nai** entries per **tt-np** combination is allowed in the GTT Selector table.

At least one set name, as indicated by the **cdgtasn**, **cggtasn**, or **cgpcsn** parameter, must be specified.

If the **cgssn** parameter and/or the **selid** parameter is specified, the **cggtasn** parameter or the **cgpcsn** parameter must be specified.

The specified **cdgta** parameter must already exist for the specified GTT selector.

The **cdgtasn** parameter and the **cggtasn** or **cgpcsn** parameter cannot both have a value of **none**.

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

The network domain of the specified GTT selector must match that of the GTT set specified by the **cdgtasn** or **gttsn** parameter, unless the domain of the existing GTT set is **cross**.

The Origin-based SCCP Routing feature must be enabled when the **cggtasn**, **cgpcsn**, **cgssn**, or **selid** parameters are specified.

The values for the **cdgtasn**, **cgpcsn**, or **cggtasn** parameters do not match the corresponding entries in the GTT set table.

The specified **cgssn** parameter and/or the **selid** parameter must already exist in the SSNSELID table.

The GTT set specified by the **cggtasn** parameter or the **cgpcsn** parameter must already exist in the database before being assigned to a GTT selector.

The network domain of the CGGTASN or CGPCSN GTT set doesn't match the domain indicated by the **gti** parameter.

The set type specified by the **cggtasn** or **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggt**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The network domain (ANSI or ITU) of the specified GTT selector must match the domain of the new GTT set, specified by the **cdgtasn** parameter, unless the domain of the new GTT set has a value of **cross**.

The **cggtasn** and **cgpcsn** parameters cannot be specified in the same command.

A value of **none** cannot be specified for the **cggtasn** parameter or the **cgpcsn** parameter if the GTT Selector contains only one GTT set. A GTT selector must point to at least one GTT set.

A value of **none** cannot be specified for the **cdgtasn** parameter if the **gttsn** parameter specifies the only GTTSET associated with that selector.

The value specified for the **cdgtasn** or **gttsn** set type must match the set type of the corresponding entry specified in the GTTSET table. If the **cdgtasn** parameter is specified, the value specified for the GTTSET type must be **cdgta**.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

The entry that matches the specified parameter combination is assigned to the specified **gttsn**.

When the Origin-based SCCP Routing feature is enabled, two GTT sets, either the **cdgtasn/cggtasn** or the **cdgtasn/cgpcsn**, can be assigned to a GTT selector. The **cggtasn** and **cgpcsn** GTT sets are mutually exclusive and cannot be assigned to the same GTT selector.

When the value of the **cggtasn/cgpcsn** GTT set is specified as **none**, that combination (domain, **tti**, **gti**, **np/npi**, **na/ani**, **cgssn**, and **selid**) are deleted from the database. At any point of time, each provisioned selector must have at least one GTT set.

Output

```
chg-gttset:gti=2:tti=10:gttsn=t800
```

```
rlghncxa03w 04-01-18 08:50:12 EST EAGLE 31.3.0

chg-gttset

Change GTT Set

Use this command to specify the attributes to change for an existing set of global title translations.

Keyword: **chg-gttset**

Related Commands: **dlt-gttset**, **ent-gttset**, **rtrv-gttset**

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 8 alphanumeric characters.

:ndgt= (optional)

Number of digits. This parameter specifies the number of digits required for GTAs (global title addresses) associated with this GTT set. This parameter is not valid if the VGTT (Variable Length GTT) feature is turned on or if the value of the **settype** parameter is **cgpc**, **cgssn**, or **opc**.

Range: 1-21

:netdom= (optional)

Network domain. This command does not distinguish between ITU national or ITU international because the Enhanced Global Title Translation (EGTT) feature does not discriminate between the ITU-I and ITU-N translations.

NOTE: The netdom parameter refers to the incoming message network domain.

Range: cross

Example

```
chg-gttset:gttsn=lidb:netdom=cross
```

```
chg-gttset:gttsn=setxyz:netdom=cross:ndgt=10
```

Dependencies

The **gttsn=none** parameter cannot be specified.

The specified **netdom** parameter value must be **cross**. This command cannot be used to change the **netdom** setting from **cross** to **ansi** or **itu**.

The **ndgt** parameter cannot be specified if the value of the specified **settype** parameter is **cgssn**, **cgpc**, or **opc**.

The EGTT feature must be turned on prior to using this command.

The value specified for the **gttsn** parameter must match the name of an existing GTT Set.

If the VGTT feature is turned on, the **ndgt** parameter cannot be specified.

The ANSI-ITU-China SCCP Conversion feature must be turned on before the **netdom** parameter can be specified.

If GTAs are assigned to the GTT set, the **ndgt** parameter cannot be specified.

The **netdom=cross** parameter can be specified only if the **settype=cdgta** parameter is specified.

Output

```
chg-gttset:gttsn=lidb:netdom=cross
```

```
rlghncxa03w 06-06-01 08:50:12 EST EAGLE 35.0.0
CHG-GTTSET: MASP A - COMPLTD
```

chg-gtw-stp

Change Gateway Parameters

Use this command to modify the level 3 ANSI transfer control status (TFCSTAT) when converted from ITU to ANSI.

Keyword: chg-gtw-stp

Related Commands: rtrv-gtw-stp

Command Class: Database Administration

Parameters

:tfcstat= (mandatory)

This parameter identifies the desired level 3 control status on a TFC message received from an ITU node destined for an ANSI node.

Range: 1-3

Example**chg-gtw-stp:tfcstat=1****Dependencies**

None

Notes

None

Output**chg-gtw-stp:tfcstat=1**

```
rlghncxa03w 04-01-11 11:34:04 EST  EAGLE 31.3.0
CHG-GTW-STP: MASP A - COMPLTD
;
```

chg-gws-actset**Change Gateway Screening Stop Action Sets**

Use this command to configure the gateway screening stop action sets in the system database. Stop action sets are used to define the actions performed on the Message Sending Units (MSUs) that pass the gateway screening process. The gateway screening stop action table contains a maximum of 16 stop action sets, with each stop action set containing a maximum of 10 stop actions. The first three gateway screening stop action sets (**actid=1**, **actid=2**, and **actid=3**) are already defined with the existing gateway screening stop actions shown in Table 5-15.

Table 5-15. Gateway Screening Stop Action Definitions

Gateway Screening Stop Action ID	Gateway Screening Stop Action Set Name	Stop Action 1	Stop Action 2	Action Performed by the system
1	copy	copy	—	Copy the MSU for the STP LAN feature.
2	rdct	rdct	—	Redirect the MSU for the DTA feature.
3	cr	copy	rdct	Copy the MSU for the STP LAN feature and redirect the MSU for the DTA feature.

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on** in the **chg-ls** command, the gateway screening action in the stop action set *will* be performed at the end of the screening process.

Keyword: chg-gws-actset**Related Commands:** rtrv-gws-actset**Command Class:** Database Administration

Parameters

:actid= (mandatory)

The identification number of the gateway screening stop action set.

Range: 4-16

:act1= (optional)

Stop action 1.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act10= (optional)

Stop action 10.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act2= (optional)

Stop action 2.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act3= (optional)

Stop action 3.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act4= (optional)

Stop action 4.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act5= (optional)

Stop action 5.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act6= (optional)

Stop action 6.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act7= (optional)

Stop action 7.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act8= (optional)

Stop action 8.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:act9= (optional)

Stop action 9.

Range: **cncf, copy, none, rdct, tlnp**

Default: No change to the existing value.

:actname= (optional)

The name of the gateway screening stop action set.

This parameter is mandatory when you first enter an action set.

Range: *ayyyyy*

One alphabetic character followed by up to five alphanumeric characters.

Default: No change to the existing value.

:all= (optional)

The **all=none** parameter clears all of the actions in the specified stop action set, and deletes the stop action set.

Range: **none**

Default: Undefined

:force= (optional)

Use **force=yes** when changing the stop action of an existing stop action set.

Range: **yes, no**

Default: **no**

Example

chg-gws-actset:actid=4:actname=cncf:act1=cncf

Dependencies

At least one optional parameter must be specified.

If **all=none** is specified, no other optional parameters can be specified.

The reserved word *none* cannot be used for the **actname** parameter.

The **force=yes** parameter must be specified to change an existing stop action.

If **cncf** is specified for **act1** through **act10**, the Calling Name Conversion Feature (CNCF) must be on. Use the **rtrv-feat** command to determine whether CNCF is on or off. If off, CNCF can be turned on with the **chg-feat** command. Note also that Gateway Screening (GWS) must be on before CNCF can be turned on.

To provision a Gateway Screening TLNP stop action (**tlnp**), either the TLNP feature must be turned on or the ISUP NP with EPAP feature must be enabled.

If **tlnp** is specified for **act1** through **act10** for Triggerless LNP in the system,

- The Triggerless LNP feature (TLNP) must be on. Use the **rtrv-feat** command to determine whether TLNP is on or off. If TLNP is off, TLNP can be turned on with the **chg-feat** command. (Verify that TLNP has been purchased for your system before you turn it on.)
- The LNP (Local Number Portability) and GWS (Gateway Screening) features must be on before TLNP can be turned on. See the **enable-ctrl-feat** command and the **chg-feat** command.

If **tlnp** is specified for **act1** through **act10** with the ISUP NP with EPAP feature in the system,

- The ISUP NP with EPAP feature must be enabled. Use the **rtrv-ctrl-feat** command to determine whether the ISUP NP with EPAP feature is enabled. The feature is listed in the output if it is enabled. If the ISUP NP with EPAP feature does not appear in the output, you must purchase it and receive the feature access key before you can enable it with the **enable-ctrl-feat** command.
- The G-Port and GWS (Gateway Screening) features must be on before the ISUP NP with EPAP feature can be enabled. See the **chg-feat** command.

A specific gateway screening stop action (**cncf**, **copy**, **none**, **rdct**, **tlnp**) can be specified for one and only one gateway screening stop action parameter for each gateway screening stop action set.

If a value is entered for the **actname** parameter, the value must be unique. Note that the **actname** parameter is *mandatory* when you first enter a gateway screening stop action set in the database and *optional* thereafter.

If **copy** is specified for an action set, it must be specified in stop action 1 (**act1**). A parameter value of **copy** cannot be specified for **act2** through **act10**.

If the redirect gateway screening action (**rdct**) is specified with other gateway screening stop actions, it must be specified with the last gateway screening stop action parameter specified for the command.

The **tlnp** (Triggerless LNP) gateway screening stop action cannot be specified in the same action set with either the **cncf** (Calling Name Conversion Facility) or **rdct** (Redirect) gateway screening stop actions.

Notes

Gateway screening stop action 1 (**act1**) is the first stop action to be performed and gateway screening stop action 10 (**act10**) is the last stop action to be performed on the MSU. These parameters can have the following values:

- **cncf**—Convert the PIP parameter with the GN parameter or the GN parameter with the PIP parameter in the ISUP IAM message for the Calling Name Conversion Facility feature.
- **copy**—Copy the MSU for the STP LAN feature.
- **none**—No action is performed on the MSU.
- **rdct**—Redirect the MSU for the DTA feature
- **tlnp**—ISUP IAMs that pass gateway screening are intercepted by the Triggerless LNP equipped EAGLE 5 ISS and converted to include the LRN if the call is to a ported number. This gateway screening stop action applies only to the Triggerless LNP feature.

Output

```
chg-gws-actset:actid=4:actname=cncf:act1=cncf
rlghncxa03w 04-01-10 11:43:04 EST EAGLE 31.3.0
CAUTION: GWS action set may be referenced by one or more GWS rules
CHG-GWS-ACTSET: MASP A - COMPLTD
;
```

chg-gws-redirect

Change Gateway Screening Redirect

Use this command to change the provisioning data for the redirect function. The values that are specified for this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the **ri=gt** parameter is specified, the value **gt** is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Keyword: chg-gws-redirect

Related Commands: dlt-gws-redirect, ent-gws-redirect,

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (optional)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **dpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Default: Current value.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

Default: Current value.

:dpcn= (optional)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the **chg-stpopts:npcfmti** flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: **0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: Current value.

:dpcn24= (optional)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: Current value.

:enabled= (optional)

Specifies whether MSUs that have passed gateway screening are to be redirected (**enabled=on**) or routed as normal (**enabled=off**).

Range: on, off

Default: Current value.

:gta= (optional)

Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.

Range: 1-21 digits

:ri= (optional)

Specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected. Use the **gt** value to route by global title digits or use the **ssn** value to route by subsystem number.

Range: gt, ssn

Default: Current value

:ssn= (optional)

Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.

Range: 0-255

Default: Current value

:tt= (optional)

Identifies the type of the global title translation (GTT). It is the decimal representation of the 1-byte field used in SS7. This value is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.

Range: 0-255

Default: Current value

Example

```
chg-gws-redirect:dpc=111-222-111:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

```
chg-gws-redirect:dpc=111-222-111:ri=ssn:ssn=10:tt=1:gta=1800833:enabled=off
```

```
chg-gws-redirect:enabled=off
```

Dependencies

At least one optional parameter must be specified.

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must be defined in the Destination table or defined as the STP site point code.

If the **dpc/dpca/dpci/dpcn/dpcn24** parameter is defined as a destination, at least one route must be defined.

The redirect function data must exist in the database before it can be changed with this command.

Notes

None

Output

chg-gws-redirect:dpc=111-222-111:ri=gt:ssn=10:tt=1:gta=180833:enabled=on

```
rlghncxa03w 04-07-10 11:43:04 EST EAGLE 31.6.0
CHG-GWS-REDIRECT: MASP A - COMPLTD
```

;

chg-inpopts

Change INP Options Command

Use this command to provision INP-specific data. This command updates the INPOPTS table.

Keyword: **chg-inpopts**

Related Commands: **rtrv-inpopts**

Command Class: Database Administration

Parameters

:cdpnmai= (optional)

Called Party Number Nature of Address indicator.

Range: **0-127**

The following **cdpnmai** parameter values are valid for the indicated feature:

- **1** (Subscriber), **2** (Unknown), **3** (National), **4** (International) and **5** (Network)—INP feature
- **0** (National) and **1** (International)—ANSI-41 INP Query (AINPQ) feature

Default: Current value

:cdpnpx= (optional)

Called Party Number Prefix.

Range: 1-15 digits

Valid digits are **0-9**, **A-F**, **a-f**.

Default: Current value

:dltpfx= (optional)

Delete prefix.

Range: **yes**, **no**

Default: **no**

:dra= (optional)

The destination routing address.

Range: **rndn**, **rn**, **ccrndn**, **rnnecdn**

rndn—Supports RN + [CDPNPFX] + DN in the INP "CONNECT" or AINPQ "Return Result" response messages.

rn— Supports Routing Number in the INP "CONNECT" or AINPQ "Return Result" response messages.

ccrndn— Supports [CDPNPFX]+CC+RN+DN in the INP "CONNECT" or AINPQ "Return Result" response messages.

rnnecdn— Supports RN+[CDPNPFX]+NEC+DN in the INP "CONNECT" or AINPQ "Return Result" response messages.

Default: Current value

:dranai= (optional)

The Nature of Address indicator.

Range: sub, unknown, natl, intl, ntwk

NOTE: The nature of address indicator parameters (dranaiv or dranai) can be specified by supplying either a mnemonic or an explicit value. At no time may both the mnemonic and the explicit value be specified at the same time for the same parameter. Either the dranaiv or dranai parameter can be specified. Table 5-16 shows the mapping between the drnaiv and the drnai parameters.

Table 5-16. DRANAIV/DRANAI Mapping

dranaiv	dranai	Description
1	sub	Subscriber Number
2	unknown	Unknown
3	natl	National significant number
4	intl	International number
5	ntwk	Network
The mnemonic's list is different from the list for the Service Selector commands because the INAP destination routing address uses ISUP values instead of SCCP values.		

Default: Current value

:dranaiv= (optional)

The Nature of Address indicator value.

The nature of address indicator parameters (**dranaiv** or **dranai**) can be specified by supplying either a mnemonic or an explicit value. At no time may both the mnemonic and the explicit value be specified at the same time for the same parameter. Either the **dranaiv** or **dranai** parameter can be specified. Table 5-16 shows the mapping between the **drnaiv** and the **drnai** parameters.

Range: 0-127

:dranp= (optional)

The numbering plan.

NOTE: The nature of address indicator parameters (dranaiv or dranai) can be specified by supplying either a mnemonic or an explicit value. At no time may both the mnemonic and the explicit value be specified at the same time for the same parameter. Either the dranpv or dranp parameter can be specified. Table 5-17 shows the mapping between the dranpv and the dranp parameters.

Range: e164, x121, f69

Default: Current value

:dranpv= (optional)

The numbering plan value. See Table 5-17.

NOTE: The numbering plan parameters (dranpv or dranp) can be specified by supplying either a mnemonic or an explicit value. At no time may both the mnemonic and the explicit value be specified at the same time for the same parameter. Either the dranpv or dranp parameter can be specified. Table 5-17 shows the mapping between the dranpv and the dranp parameters

Table 5-17. DRANPV/DRANP Mapping

dranpv	dranp	Description
1	E164	ISDN/telephony numbering plan
3	X121	Data numbering plan
4	F69	Telex numbering plan
Several of the numbering plan mnemonics that apply to the Service Selector commands are not in this list because they do not apply to INAP destination routing addresses.		

Range: 1-7

Default: Current value

:ncdnpfx= (optional)

The New Called Party Number Prefix.

Range: 1-15 digits, **none**

Valid digits are **0-9, a-f, A-F**.

:nec= (optional)

National Escape Code.

Range: 1-5 digits, **none**

Valid digits are **0-9, A-F, a-f**.

Default: **None.**

:snai= (optional)

The Service Nature of Address indicator.

Range: **sub, natl, intl, none, unknown**

Default: Current value

:sprestype= (optional)

INP option that indicates the type of message the EAGLE 5 ISS is to send when an IDP message is received for INP service, the DN digits match, and the HLR ID is present.

Range: **connect, continue**

connect— The EAGLE 5 ISS sends a “Connect” message (for the INP feature) or a “Return Results with Digits” message (for an AINPQ feature).

continue— The EAGLE 5 ISS sends a “Continue” message (for the INP feature) or a “Return Results without Digits” message (for the AINPQ feature).

Default: **continue**

Example

chg-inpopts:dra=rn:dranp=e164:dranai=intl

chg-inpopts:dranp=f69:dranai=sub:dra=rndn

chg-inpopts:dra=rn:dranp=e164:dranai=intl:cdnpfx=fac:dltpfx=yes

```

chg-inpopts:dranp=f69:dranai=sub:dra=rndn:cdpnpx=200
chg-
inpopts:dranp=f69:dranai=sub:dra=rndn:cdpnpx=200:ncdpnpx=3abcde

chg-
inpopts:dra=rn:dranp=e164:dranai=intl:cdpnpx=fac:dltpx=no:cdpnnai=1:snai=none
chg-inpopts:sprestype=connect
chg-inpopts:dra=rnnecdn:nec=abcd1
chg-inpopts:dra=rnnecdn:nec=0

```

Dependencies

At least one optional parameter must be specified.

The **dranp** and **dranpv** parameters cannot be specified together in the command.

The **dranai** and **dranaiv** parameters cannot be specified together in the command.

If the **ncdpnpx** or **dltpx** parameter is specified, the **cdpnpx** parameter must be specified.

A value of **none** cannot be specified for the **cdpnpx** parameter.

If the **ncdpnpx=none** parameter is specified, then the **dltpx** parameter cannot be specified.

The specified Called Party Number Prefix (**cdpnpx** parameter) must exist in the INPOPTS table.

The specified New Called Party Number Prefix (**ncdpnpx** parameter) must not already exist in the INPOPTS table.

A maximum of 5 Called Party Number Nature of Address values is allowed.

The **cdpnnai** and **snai** parameters must be specified together in the command.

If this command is entered to delete a Called Party Number Nature of Address value from the INPOPTS table (for example, if the command is entered with **:cdpnnai=1:ssnai=none**), then the value for the **cdpnnai** parameter must exist in the INPOPTS table.

The National Escape Code (**nec** parameter) can contain between 1 and 5 digits. Otherwise the value is **none**.

The INP or AINPQ feature must be turned on before the **chg-inpopts** command can be entered.

A maximum of 40 Called Party Number Prefix values can be provisioned.

If the **nec=none** parameter is specified, the **dra=rnnecdn** parameter cannot be specified.

Notes

Table 5-18 provides examples of **dranp/dranpv**, **dranai/dranaiv**, **cdpnpx/ncdpnpx/dltpfx**, and **cdpnai/snai** parameter combinations.

Table 5-18. Examples of parameter combinations for the **chg-inpopts** command

Command	Comments
chg-inpopts:dranai=sub:dranaiv=1:dra=rn	dranai and dranaiv cannot be specified together.
chg-inpopts:dranp=e164:dranpv=1:dra=rndn	dranp and dranpv cannot be specified together.
chg-inpopts:dranp=e164:dranaiv=4:dranpv=1	dranp and dranpv cannot be specified together.
chg-inpopts:dranai=sub:dranaiv=1:dranpv=5	dranai and dranaiv cannot be specified together
chg-inpopts:dranp:=e164:dranai=sub:dranpv=1	dranp and dranpv cannot be specified together.
chg-inpopts:dranai=natl:dranaiv=3:dranp=e164	dranai and dranaiv cannot be specified together.
chg-inpopts:dranai=sub:dranp=f69:dra=rndn	Okay
chg-inpopts:dranp=e164:dranaiv=10:dra=rn	Okay
chg-inpopts:dranai=sub:dranpv=3	Okay
chg-inpopts:dranpv=4:dranaiv=20	Okay
chg-inpopts:dltpfx=yes	cdpnpx must be specified.
chg-inpopts:ncdpnpx=1:dltpfx=yes	cdpnpx must be specified.
chg-inpopts:cdpnpx=none:dltpfx=yes	cdpnpx=none is not valid.
chg-inpopts:cdpnpx=1:dltpfx=yes	Okay
chg-inpopts:cdpnpx=1:ncdpnpx=none:dltpfx=yes	dltpfx must be not be specified when ncdpnpx=none .

chg-ip-card**Change Internet Protocol Card**

Use this command to provision IP networking parameters for a given card.

Keyword: **chg-ip-card**

Related Commands: **rtrv-ip-card**

Command Class: Database Administration

Parameters

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:defrouter= (optional)

Default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the parameter value

System

Default: **0.0.0.0**

:dnسا= (optional)

The IP address for Domain Name Server A. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the parameter value.

System

Default: **0.0.0.0**

:dnسب= (optional)

The IP address for Domain Name Server B. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

A value of **0.0.0.0** will remove an IP address from this parameter.

Default: No change to the parameter value.

System

Default: **0.0.0.0**

:domain= (optional)

Domain name of the Domain server.

Range:
 ~~~~~  
 ~~~~~

Any string of characters beginning with a letter and comprising up to 120 characters in length.

Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), . (period).

Default: No change to the parameter value.

System

Default: Null

:rstdomain= (optional)

Reset Domain Name. This parameter is used to reset the Domain Name to a NULL value.

Range: **yes**, **no**
yes—reset Domain Name to a NULL value
no—Domain Name does not change

Default: **no**

:srchodr= (optional)

Host table search order.

Range: **local**, **svr**, **svronly**
local—Local host table is searched first.
svr—Domain Server is searched first.
svronly—Only the Domain Server is searched.

Default: No change to the parameter value

System

Default: No search

Example

```
chg-ip-
card: loc=1211:dnsc=150.1.1.1:domain=nc.tekelec.com:defrouter=150.
1.1.105
```

Dependencies

At least one optional parameter must be specified.

The **loc** parameter value must correspond to the location of a DCM or SSEDCCM card in the card table.

The DCM or SSEDCCM card associated with the **loc** parameter must be inhibited prior to command execution.

If the **domain** parameter is specified, the **rstdomain** parameter cannot be specified.

The **defrouter** IP address must be local to the Ethernet A network or Ethernet B network for the card. The B network can be used only on SSEDCCM cards.

Notes

The Domain Name has a 120 character limitation.

Output

```
chg-ip-
card: loc=1211:dnsc=150.1.1.1:domain=nc.tekelec.com:defrouter=150.
1.1.105
```

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
```

```
CHG-IP-CARD: MASP A - COMPLTD
```

```
;
```

chg-ip-lnk**Change Internet Protocol Link**

Use this command to provision the IP link table.

Keyword: **chg-ip-lnk**

Related Commands: **rtrv-ip-lnk**

Command Class: Database Administration

Parameters

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:port= (mandatory)

Ethernet interface Port ID.

Range: a, b

Port **b** is not valid for SS7IPGW and IPGWI applications with Application Sockets.

:auto= (optional)

Tells hardware whether to automatically determine duplex and speed.

Range: yes, no

yes — Automatically determines duplex and speed

no — Do not automatically determine duplex and speed
Default: No change to the parameter value
System
Default: **no**

:duplex= (optional)

This is the mode of operation of the interface.

Range: **half, full**
half — Half duplex
full — Full duplex
Default: No change to the parameter value
System
Default: **full**

:ipaddr= (optional)

The IP address for the specified port. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.
A value of **0.0.0.0** will remove an IP address from this parameter.
Default: No change to the parameter value.
System
Default: **0.0.0.0**

:mactype= (optional)

The Media Access Control Type of the interface.

Range: **802.3, DIX**
802.3 — The IEEE standard number 802.3
DIX — The Digital/Inter/Xerox *de facto* standard for ethernet
Default: No change to the parameter value
System
Default: **DIX**

:mcast= (optional)

Multicast Control. This parameter enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the DSM card to the MPS system.

Range: **yes, no**
yes — Multicasting is enabled on the interface and the sending and receiving of multicast frames is allowed.
no — All multicast frames are silently dropped.
System
Default: **no**

:speed= (optional)

The bandwidth for the interface in megabits per second

Range: **10, 100**
Default: No change to the parameter value
System
Default: **100**

:submask= (optional)

The subnet mask of the IP interface in the form of an IP address with a restricted range of values. This parameter is mandatory when the **ipaddr** parameter is specified.

Range: The value must be valid for the class of the entered IP address.

Table 5-19. Valid Subnet Mask Values

Valid for Class A Networks	Valid for Class A or B Networks	Valid for Class A, B, or C Networks
255.0.0.0	255.255.0.0	255.255.255.0
255.192.0.0	255.255.192.0	255.255.255.192
255.224.0.0	255.255.224.0	255.255.255.224
255.240.0.0	255.255.240.0	255.255.255.240
255.248.0.0	255.255.248.0	255.255.255.248
255.252.0.0	255.255.252.0	255.255.255.252
255.254.0.0	255.255.254.0	
255.255.128.0	255.255.255.128	

Default: If **ipaddr** is not specified, there is no change to the parameter value.
When a host's IP address is known, the default subnet mask should be chosen according to Table 5-20.

Table 5-20. Default Subnet Mask Values

Network Class	IP Network Address Range	Default Subnet Mask
A	1.0.0.0 to 127.0.0.0	255.0.0.0
B	128.0.0.0 to 191.255.0.0	255.255.0.0
C	192.0.0.0 to 223.255.255.0	255.255.255.0

System Default: 0.0.0.0

Example

chg-ip-lnk:loc=1211:port=A

Dependencies

The IP address must be entered in the IP Host table using the **ent-ip-host** command before it can be entered in the IP Link table using the **chg-ip-lnk** command.

Each IP address entered into the IP Link table must be unique.

At least one optional parameter must be specified.

If the **auto** parameter is entered, then the **duplex** and **speed** parameters are not allowed.

The **loc** parameter value must correspond to a DCM or SSEDCM card in the card table.

The card associated with the **loc** parameter must be inhibited before executing this command.

For SS7IPGW and IPGWI, Application Sockets on port **b** are not allowed.

The local **ipaddr** and **submask** values of either the A or B network cannot be changed to an address that represents a different network if a default router and/or other gateway routers are assigned to the current local network (display with **rtrv-ip-card** and **rtrv-ip-rte**).

The local IP address cannot be changed if the current or new local host has open sockets or associations (the **open** parameter set to **yes** with the **ent-assoc** or **chg-assoc** command).

The IP address of an existing IP link entry in the IP Link table cannot be changed if it exists in the IP Host table.

An IP link entry must be provisioned in the IP Link table before an IP host entry can be provisioned with a corresponding IP address in the IP Host table.

The IP host entry must be deleted from the IP Host table before an IP link entry can be deleted from the IP Link table.

An existing IP link entry in the IP Link table cannot be deleted (**ipaddr=0.0.0.0**) if it exists in the IP Host table.

The IP network address specified by the **ipaddr** and **submask** parameters must be different from the IP network address specified by the **pvn** and **pvnmask** parameters in the NETOPTS table.

Notes

None

Output

chg-ip-lnk:loc=1211:port=a

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
CHG-IP-LNK: MASP A - COMPLTD
;
```

chg-is41opts

Change IS41 Options

Use this command to change the values of one or more of the IS41 option indicators maintained in the IS41 Options (IS41OPTS) table.

Keyword: **chg-is41opts**

Related Commands: **rtrv-gsmopts, rtrv-is41opts, rtrv-srvsel**

Command Class: Database Administration

Parameters

:esnmfg= (optional)

ESN manufacturer code. This parameter specifies the value that will be encoded in the manufacturer code section of the **esn** parameter for a LOCREQ response message.

Range: **0-255**

Default: **0**

:esnsn= (optional)

ESN serial number. This parameter specifies the value that will be encoded in the serial number section of the **esn** parameter for a LOCREQ response message.

Range: **0-16777215**

Default: **0**

:iec= (optional)

International escape code. This parameter specifies the international escape code that a received LOCREQ message can contain and have lookup performed.

Range: **1-5 digits, none**

none—Removes the IEC from a received LOCREQ message before lookup.

Default: none

:locreqdn= (optional)

This parameter specifies whether to obtain the Called Party, used for database lookup, from the SCCP or TCAP layer of a received LOCREQ message.

Range: **tcap, sccp**

tcap — Obtains the Called Party from the TCAP layer.

sccp — Obtains the Called Party from the SCCP layer.

Default: **sccp**

:locreqrmhrn= (optional)

LOCREQ remove HomeRN. This parameter specifies whether to remove the HomeRN from the TCAP Outgoing Called Party for a relayed LOCREQ message.

Range: **yes, no**

yes — Remove HomeRN.

no — Do not remove HomeRN.

Default: **no**

:mscmktid= (optional)

MSCID market ID. This parameter specifies the value that will be encoded in the Market ID section of the **mscid** parameter for a response LOCREQ message.

Range: **0-65535**

Default: **0**

:mscswitch= (optional)

MSCID market ID switch. This parameter specifies the value that will be encoded in the Market ID Switch section of the **mscid** parameter for a response LOCREQ message.

Range: **0-255**

Default: **0**

:mtplocreqnai= (optional)

MTP-routed LOCREQ nature of address indicator. This parameter specifies how the Called Party from the TCAP layer of a received MTP-routed LOCREQ message will be interpreted.

Range: **ccrndn, frmsg, intl, natl, rnidn, rnndn, rnsdn, sub**

ccrndn — Country code, routing number, and national directory number

frmsg — Incoming message value.

intl — International number

natl — National number

rnidn — Routing number prefix and international dialed/directory number

rnndn — Routing number prefix and national dialed/directory number

rnsdn — Routing number prefix and subscriber dialed/directory number

sub — Subscriber number

Default: **frmsg**

:nec= (optional)

National escape code. This parameter specifies the national escape code that a received LOCREQ message can contain and have lookup performed.

Range: 1-5 digits, **none**

none — Removes the NEC from the received LOCREQ message before database lookup.

Default: **none**

:rspcdpapcp= (optional)

Response called party point code present. This parameter specifies the point code present bit that will encode the SCCP CdPA GTA of a LOCREQ response message.

Range: **off, on, frmsg**

off — The response will not contain a point code present bit.

on — The point code in the SCCP CgPA of the received LOCREQ message will be used. If no point code is present, the originating point code in the MTP Routing Label will be used.

frmsg — The point code present bit from the received message will be used. Override does not occur.

Default: **off**

:rspcdpari= (optional)

Response called party routing indicator. This parameter specifies the value of the routing indicator bit that will encode the SCCP CdPA GTA of a LOCREQ response message.

Range: **frmsg, gt, ssn**

frmsg — The received message routing indicator bit will be used. Override does not occur.

gt — The GTA digits in the SCCP CgPA GTA of the received message will be used. If no GTA digits are present in the SCCP CgPA GTA, override will occur according to the **cdpari=ssn** parameter.

ssn — The SCCP CgPA of the received message will be used.

Default: **frmsg**

:rspcgpanai= (optional)

Response calling party nature of address indicator. This parameter specifies the nature of address (NAI) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **0-127, none**

none — The NAI value in the SCCP CdPA of the received message will be used. Override does not occur.

Default: **none**

:rspcgpanp= (optional)

Response calling party numbering plan. This parameter specifies the numbering plan (NP) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **0-15 none**

none — The NP in SCCP CdPA of the received message will be used. Override does not occur.

Default: **none**

:rspcgpapcp= (optional)

Response calling party point code present. This parameter specifies the point code present bit that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **frmsg, on, off**

frmsg — The point code present bit from the received message will be used.

on — The point code in the SCCP CdPA of the incoming LOCREQ message will be used. If no point code is present, the destination point code in the MTP Routing Label will be used.

off — The response message will not contain a point code present bit.

Default: **frmsg**

:rspcgpari= (optional)

Response calling party routing indicator. This parameter specifies the routing indicator bit that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: **frmsg, gt, ssn**

frmsg — The value from the received message will be used. Override does not occur.

gt — The GTA digits in the SCCP CdPA GTA of the received message will be used. If no GTA digits are present, override occurs according to the **cgpari=ssn** parameter.

ssn — The SCCP CdPA of the received message will be used.

Default: frmsg

:rspcgpatt= (optional)

Response calling party translation type. This parameter specifies the translation type (TT) that will encode the SCCP CgPA GTA of a LOCREQ response message.

Range: 0-255 none

none—The TT in the SCCP CdPA of the received message will be used. Override does not occur.

Default: none

:rspdig= (optional)

Routing number. This parameter specifies the digit encoding format of the TCAP Outgoing Called Party parameter for a LOCREQ response message.

The routing number will be used as is or concatenated with the Called Party Number. The routing number format will be used on a per EAGLE 5 ISS node basis.

Range: ccrndn, hrnrndn, rn, rndn

ccrndn—Country Code + RN + DN

hrnrndn—HomeRN + RN + DN

rndn—RN + DN

Default: rn

:rspdigtype= (optional)

Response digit type. This parameter specifies the value that will encode the Digit Type field in the TCAP Outgoing Called Party parameter of a LOCREQ response message.

Range: 0-255

Default: 6

:rspmin= (optional)

Response LOCREQ MIN parameter encoding. This parameter specifies how the **min** parameter of a LOCREQ response message will be encoded.

Range: homern, nothomern, tendelhomern, tenhomern, tenzero

homern—The exact number of digits, with home RN prefix, as encoded in the Called Party of the received LOCREQ message.

nothomern—The exact number of digits, without home RN prefix, as encoded in the Called Party of the received LOCREQ message.

tendelhomern—The leading 10 digits of the Called Party of the received LOCREQ message after deleting the home RN prefix, if it exists.

tenhomern—The leading 10 digits the Called Party of the received LOCREQ message without deletion of the home RN prefix.

tenzero—10 digits filled with 0.

Default: homern

:rspnon= (optional)

MSRN nature of number. This parameter specifies the nature of number value that will encode the TCAP Outgoing Called Party parameter of a LOCREQ response message.

Range: 0-255 none

none—The NAI value in the Digits[Dialed] parameter of a received LOCREQ message is used.

Default: none

:rspnp= (optional)

MSRN numbering plan. This parameter specifies the numbering plan that will encode the TCAP Outgoing Called Party parameter of the LOCREQ response message.

Range: 0-15 none

2—Telephony Numbering

Default: 2

:rspparm= (optional)

Response parameter. This parameter specifies the TCAP parameter that will encode the RN and/or DN information for a LOCREQ response message.

This value encodes the DigitType field of the TerminationList, RoutingDigits, or Digits[Destination] on a per EAGLE 5 ISS node basis.

Range: **ddigit, rtdigit, tlist**
ddigit — Digits[Destination].
rtdigit — Routingdigits
tlist — Termination list (Default)

Default: **tlist**

:smsreqbypass= (optional)

This parameter specifies whether a received SMSREQ message that passes the MNP Service Selector (**serv=mnp** parameter in the **chg-sccp-serv** command) will undergo A-Port message processing.

Range: **yes, no**
yes — Bypass A-Port.
no — Do not bypass A-Port.

Default: **no**

:tcapsnai= (optional)

This parameter specifies how the Called Party from the TCAP layer of a received LOCREQ message will be interpreted.

Range: **ccrndn, frmsg, intl, natl, rnidn, rnrndn, rnsdn, sub**
ccrndn — Country code, routing number, and national directory number
frmsg — Incoming message value
intl — International number
natl — National number
rnidn — Routing number prefix and international dialed/directory number
rnrndn — Routing number prefix and national dialed/directory number
rnsdn — Routing number prefix and subscriber dialed/directory number
sub — Subscriber number

Default: **frmsg**

Dependencies

The A-Port or IS41 GSM Migration (IGM) feature must be enabled before this command can be entered.

Output**chg-is41opts:smsreqbypass=yes**

```
tekelecstp 06-09-11 15:13:20 EST EAGLE 36.0.0
Command entered at terminal #4.
CHG-IS41OPTS: MASP A - COMPLTD

chg-isupvar-attrb**Change ISUP Variant Attribute**

Use this command to change the attributes of ISUP Variant table entries.

Keyword: **chg-isupvar-attrb**

Related Commands: **copy-isupvar-attrb, rtrv-isupvar-attrb, rtrv-pstn-pres**

Command Class: Database Administration

Parameters

The following table lists valid combinations of required and optional parameters.

Table 5-21. Valid **chg-isupvar-attrb** command parameter combinations

These are the only permitted combinations of required and optional parameters for this command.											
msg code	parm code	attrib				min len	parmtyp		order	action	force
		defined	not defined	supp	not supp		opt	mf/ mv			
R		R								O	
R			R								R
	R	R				R					
	R		R								
R	R			R			R			O	
R	R			R				R	R	O	
R	R				R						
R = Required — O = Optional with the required parameter(s)											

:attrib= (mandatory)

The attribute being assigned to a message or parameter.

Range: **defined, notdefined, supp, notsupp**

defined—The message or parameter is defined in the Variant.

notdefined—The message or parameter is not defined in the Variant.

supp—the parameter is supported in the specified message in the Variant.

notsupp—The parameter is not supported in the specified message in the Variant.

:pstncat= (mandatory)

The Public Switched Telephone Network (PSTN) category assigned to the Variant.

Range: **0-65535**

:pstnid= (mandatory)

The Public Switched Telephone Network (PSTN) ID assigned to the Variant.

Range: **0-65535**

:action= (optional)

Specifies the message or parameter conversion action the software follows when a message is received with the specified **msgcode** or **msgcode:parmcode** combination.

Range: **none, convert, passthru**

none—The software will follow its normal conversion rules. No special conversions will occur.

convert—The software will invoke a special conversion routine that is available in the SG for the specified **msgcode** or **msgcode:parmcode** combination.

passthru—For **msgcode**, the specified **msgcode** should be passed through unconverted using the raw MTP3 transfer method.

For **msgcode:parmcode** combination, **parmcode**, when encountered in **msgcode**, should be passed through to the Normalized section of the message (ignoring the **defined** and **supp** attributes of the Normalized specification).

Valid only when included with the following combinations:

msgcode:attrib=defined

msgcode:parmcode:attrib=supp

Default: none

:force= (optional)

You must set **force=yes** when setting **msgcode:attr0b=notdefined**. This is to ensure the user understands that this action is destructive and will clear all the associated parameter data for that **msgcode**.

Range: no, yes

Default: no

:minlen= (optional)

Specified the minimum parameter length. This command is used for validating the length of the received parameter is at least **minlen** bytes long.

Range: 0-255

:msgcode= (optional)

The ISUP message type code entered is used to identify a specific ISUP message that is going to have its attributes changed.

Range: 0-255

Can be entered as **h'00-h'ff**.

:order= (optional)

Specifies the order the mandatory parameters appear in the message.

Range: 1-7

:parmcode= (optional)

The ISUP parameter code entered to identify a specific ISUP parameter that is going to have its attributes changed.

Range: 0-255

Can be entered as **h'00-h'ff**.

:parmtyp= (optional)

Specifies the type of ISUP parameter.

Range: opt, mf, mv

opt—The parameter may appear in the Optional part of the ISUP message.

mf—The parameter must appear in the Mandatory Fixed part of the ISUP message.

mv—The parameter must appear in the Mandatory Variable part of the ISUP message.

Default: opt

Example

chg-isupvar-attrib:pstncat=1:pstnid=5:msgcode=4:attrib=defined

chg-isupvar-

attrib:pstncat=1:pstnid=5:parmcode=10:attrib=defined:minlen=6

chg-isupvar-

attrib:pstncat=1:pstnid=5:msgcode=4:attrib=defined:action=convert

Dependencies

The combination of **pstncat=1** and **pstnid=2** values is invalid.

A controlled feature must exist for the specified **pstncat** and **pstnid** combination.

The **msgcode** and **parmcode** parameters cannot be specified together in the command.

When the **parmtyp** parameter is specified, the **attrib** parameter must be specified.

When the **parmtyp=mf/mv** parameter is specified, the **order** parameter must be specified.

When the **order** parameter is specified, the **parmtyp** parameter must be specified.

When a parameter is being **defined**, the **minlen** parameter must be specified.

The following parameter combinations are invalid:

- **attrib** is not allowed to be **defined** or **notdefined** if both **msgcode** and **parmcode** are specified.
- **attrib** is not allowed to be **supp** or **notsupp** unless both **msgcode** and **parmcode** are specified.
- **parmtyp** and **order** are not allowed unless both **msgcode** and **parmcode** are not specified.
- **order** is not allowed if **parmtyp=opt**.
- **minlen** is not allowed if **msgcode** is specified.
- **action** is not allowed if only **parmcode** is specified.
- **action** is not allowed to be **convert** or **passthru** if **msgcode:parmcode=0** is specified.

Only **parmcode=0** (EOP) can have **minlen=0**.

Required controlled features must be enabled:

- ISUP normalization controlled feature
- On/off controlled feature for *Tekelec-defined* Variant
- Quantity controlled feature for *user-defined* Variant.

The PSTN must have been previously defined with the **ent-pstn-pres** command.

The **mf** or **mv** parameters must be kept in an ordered list starting with 1.

The **force=yes** parameter is required and valid only if the **msgcode:attribnotdefined** combination is specified.

Notes

An ISUP Variant table entry exists for each Variant defined in the SG. Each entry contains ISUP message and parameter data specific to the ISUP protocol used by that Variant. A Variant is uniquely defined by its PSTN presentation value, consisting of a PSTN category and PSTN ID.

The **pstncat** and **pstnid** parameters identify the ISUP Variant table entry to be changed. Use the **rtrv-pstn-pres** command to display the only allowed values for the PSTN category and ID. This command can be used to change any *Tekelec-defined* or *user-defined* Variants that **rtrv-pstn-pres** displays. The *Tekelec-defined* Variants' associated ON/OFF control feature *must* be ENABLED.

The user can change the following aspects of the ISUP Variant table entries:

- All the ISUP messages for the Variant can be provisioned as **defined** or **notdefined**. All the ISUP messages default to **notdefined** until this command sets them to **defined**.
- All the ISUP parameters for the Variant can be provisioned as **defined** or **notdefined**. All the ISUP parameters default to **notdefined** until this command sets them to **defined**.
- Values **defined** and **notdefined** are valid only if either **msgcode** or **parmcode** is specified alone. When a parameter is being **defined**, **minlen** is required.

- Changing a **msgcode** to **notdefined** clears all the associated parameter data. In this case, **force=yes** is required.
- All the ISUP parameters for specified messages in the Variant can be provisioned as **supported** or **notsupported**. All the ISUP parameters default to **notsupported** until this command sets them to supported.
- Values **supp** and **notsupp** are valid only if the **msgcode:parmcode** parameter is specified.
- **parmcode** cannot be set to **notdefined** if it occurs in any message as **supp**.
- The minimum valid parameter length can be specified for each **defined** ISUP parameter.
- All the ISUP messages provisioned as **defined** can also have a message conversion action assigned.
- All the ISUP parameters provisioned as **supported** can also have a parameter conversion action assigned.
- All the ISUP parameters provisioned as **supported** can also be assigned as optional, mandatory-fixed (**mf**), or mandatory-variable (**mv**).
- If assigned as MF or MV, the numerical order the parameter appears in the message must be specified.
- The user cannot change the attributes for **pstncat=1**, **pstnID=2**.
- When specified with **msgcode**, **parmcode** identifies a parameter within the **msgcode** that is going to have its attributes changed. **parmcode** is required if **msgcode** is not specified.
- **minlen** is required and valid only if the **parmcode:attrib= defined** combination is specified.
- The **minlen=0** is valid only if **parmcode=0 (EOP)**. All other parameters have a range of **1-255**.
- **parmtyp** is valid only if the **msgcode:parmcode:attrib-supp** combination is specified.
- When **mf** or **mv** is specified, **order** must also be specified. The **parmtyp** can be changed as long as the change does not violate the **order** rules.
- The MF parameters must be specified in an order list starting with 1. The **mv** parameters must be specified in a different ordered list starting with 1. There can be no gaps in order number. A parameter cannot be deleted from a list, as when changing **parmtyp** or changing **attrib** to **notsupp**, unless all parameters with a higher **order** number are deleted first.
- **order** is required and valid only if the **msgcode:parmcode:attrib=supp:parmtyp=mf/mv** combination is specified.
- **action** is valid only when included with the **msgcode:attrib=defined** or **msgcode:parmcode:attrib= supp** combinations.
- When **parmcode =0**, **none** is the only valid **action**.
- The user can enter an **action** for *user-defined* Variants; however, the SG will ignore the **convert** value. There will be no supported conversion **action**.
- **force** is required and valid only if the **msgcode:attrib notdefined** combination is specified.

Output

The following example defines a message in a Variant.

```
chg-isupvar-attr:pstncat=1:pstnid=5:msgcode=4:attrib=defined
  rlgncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
  CHG-ISUPVAR-ATTRIB: MASP A - COMPLTD
;
```

chg-l2t**Change Level 2 Timers**

Use this command to change the values of the SS7 MTP level 2 timers. The SS7 MTP level 2 timers are organized in 30 timer sets of 8 timer values each. The 30 timer sets have been grouped and system default values have been initialized by specification (ANSI, ITU, High Speed for China, and High Speed for Q.703 Annex A). Each timer set is administered individually by this command. The **ent-slk** command associates links with timer sets. Each assigned link is associated with one of the 30 timer sets.

Keyword: chg-l2t

Related Commands: ent-slk, rtrv-l2t, rtrv-slk

Command Class: Database Administration

Parameters

:l2tset= (mandatory)

Level 2 timer set identifier, or timer set number. Up to 30 different timer sets can be defined. A signaling link may be assigned to any one of the 30 timer sets.

Range: 1-30

1-10 for ANSI links

11-20 for low-speed ITU links

21-25 for China high speed links

26-30 for Q.703 Annex A high speed links

:t1= (optional)

Timer 1—Aligned/ready

Range: 5000-350000

For ANSI timer sets 1-10—5000-20000 milliseconds

For ITU timer sets 11-20—40000-50000 milliseconds

For China timer sets 21-25—25000-350000 milliseconds

For Q.703 Annex A timer sets 26-30—25000-350000 milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1-10—13000 milliseconds

For ITU timer sets 11-20—40000 milliseconds

For China timer sets 21-25—150000 milliseconds

For Q.703 Annex A timer sets 26-30—300000 milliseconds

:t2= (optional)

Timer 2—Not aligned

Range: 5000-150000

For ANSI timer sets 1-10—5000-30000 milliseconds

For ITU timer sets 11-20—5000-150000 milliseconds

For China timer sets 21-25—5000-150000 milliseconds

For Q.703 Annex A timer sets 26-30—5000-150000 milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1-10—11500 milliseconds

For ITU timer sets 11–20—**30000** milliseconds
 For China timer sets 21–25—**130000** milliseconds
 For Q.703 Annex A timer sets 26–30—**130000** milliseconds

:t3= (optional)

Timer 3—Aligned

Range: **5000-20000**For ANSI timer sets 1–10—**5000-30000** millisecondsFor ITU timer sets 11–20—**1000-2000** millisecondsFor China timer sets 21–25—**1000-2000** millisecondsFor Q.703 Annex A timer sets 26–30—**1000-2000** milliseconds**Default:** No change to the current value**System****Default:** For ANSI timer sets 1–10—**11500** millisecondsFor ITU timer sets 11–20—**2000** millisecondsFor China timer sets 21–25—**1000** millisecondsFor Q.703 Annex A timer sets 26–30—**1000** milliseconds**:t4epp=** (optional)

Timer 4—Proving period Emergency

Range: **200-1000**For ANSI timer sets 1–10—**200-1000** millisecondsFor ITU timer sets 11–20—**400-600** millisecondsFor China timer sets 21–25—**400-600** millisecondsFor Q.703 Annex A timer sets 26–30—**400-600** milliseconds**Default:** No change to the current value**System****Default:** For ANSI timer sets 1–10—**600** millisecondsFor ITU timer sets 11–20—**500** millisecondsFor China timer sets 21–25—**500** millisecondsFor Q.703 Annex A timer sets 26–30—**500** milliseconds**:t4npp=** (optional)

Timer 4— Proving period normal

Range: **500-70000**For ANSI timer sets 1–10—**500-5000** millisecondsFor ITU timer sets 11–20—**7500-9500** millisecondsFor China timer sets 21–25—**3000-70000** millisecondsFor Q.703 Annex A timer sets 26–30—**3000-70000** milliseconds**Default:** No change to the current value**System****Default:** For ANSI timer sets 1–10—**2300** millisecondsFor ITU timer sets 11–20—**8200** millisecondsFor China timer sets 21–25—**30000** millisecondsFor Q.703 Annex A timer sets 26–30—**30000** milliseconds**:t5=** (optional)

Timer 5—Sending SIB

Range: **40-500**For ANSI timer sets 1–10—**40-500** millisecondsFor ITU timer sets 11–20—**80-120** millisecondsFor China timer sets 21–25—**80-120** millisecondsFor Q.703 Annex A timer sets 26–30—**80-120** milliseconds**Default:** No change to the current value

System

Default: For ANSI timer sets 1–10—**100** milliseconds
 For ITU timer sets 11–20—**100** milliseconds
 For China timer sets 21–25—**100** milliseconds
 For Q.703 Annex A timer sets 26–30—**100** milliseconds

:t6= (optional)

Timer 6—Remote congestion

Range: **1000-10000**
 For ANSI timer sets 1–10—**1000–10000** milliseconds
 For ITU timer sets 11–20—**3000–6000** milliseconds
 For China timer sets 21–25—**3000–6000** milliseconds
 For Q.703 Annex A timer sets 26–30—**3000–6000** milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—**4000** milliseconds
 For ITU timer sets 11–20—**4000** milliseconds
 For China timer sets 21–25—**5000** milliseconds
 For Q.703 Annex A timer sets 26–30—**5000** milliseconds

:t7= (optional)

Timer 7—Excessive delay of acknowledgment

Range: **200-3000**
 For ANSI timer sets 1–10—**200–3000** milliseconds
 For ITU timer sets 11–20—**500–2000** milliseconds
 For China timer sets 21–25—**500–2000** milliseconds
 For Q.703 Annex A timer sets 26–30—**500–2000** milliseconds

Default: No change to the current value

System

Default: For ANSI timer sets 1–10—**1500** milliseconds
 For ITU timer sets 11–20—**1500** milliseconds
 For China timer sets 21–25—**800** milliseconds
 For Q.703 Annex A timer sets 26–30—**800** milliseconds

Example

chg-l2t:l2tset=1:t1=5400

chg-l2t:l2tset=21:t4epp=600:t5=90:t6=3500:t7=1900

Dependencies

At least one optional parameter must be specified.

Notes

ANSI timer defaults are within the Telcordia recommended ranges.

ITU timer defaults are within ITU Q.703 white book recommended ranges.

Output

chg-l2t:l2tset=21:t4epp=600:t5=90:t6=3500:t7=1900

rlghncxa03w 05-02-07 11:11:28 EST EAGLE5 34.0.0

CHG-L2T: MASP A - COMPLTD

;

chg-l3t

Change Level 3 Timers

Use this command to change the SS7 MTP level 3 timers. The SS7 MTP level 3 timers are organized in a timer set of 21 values each. Only one timer set is administered by this command. Each linkset is associated with the SS7 MTP level 3 Timer set. The linkset and timer set association is assigned with the link administration commands.

Keyword: chg-l3t

Related Commands: chg-l2t, rtrv-l2t, rtrv-l3t

Command Class: Database Administration

Parameters

:l3tset= (mandatory)

Timer set table. Only one timer set table exists. All SS7 signaling links use the SS7 MTP level 3 timer set table.

Range: 1

:it18= (optional)

For ITU networks.

Timer 18—Timer within a signaling point whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set; in seconds.

Range: 19.0-50.0

Default: No change to the current value.

System

Default: 50.0

:it19= (optional)

For ITU networks.

Timer 19—Supervision timer during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages; in seconds.

Range: 67.0-69.0

Default: No change to the current value

System

Default: 67.0

:it20= (optional)

For ITU networks.

Timer 20—Overall MTP restart timer at the signaling point whose MTP restarts; in seconds.

Range: 59.0-61.0

Default: No change to the current value.

System

Default: 59.0

:it21= (optional)

For ITU networks.

Timer 21—Overall MTP restart timer at a signaling point adjacent to one whose MTP restarts; in seconds.

Range: 63.0-65.0

Default: No change to the current value.

System

Default: 63.0

:it22= (optional)

For ITU networks.

Timer 22—Waiting to repeat local inhibit test; in seconds.

Range: 180.0-360.0

Default: No change to the current value

System

Default: 90.0

:it23= (optional)

For ITU networks.

Timer 23—Waiting to repeat remote inhibit test; in seconds.

Range: 180.0-360.0

Default: No change to the current value

System

Default: 90.0

:t1= (optional)

For ANSI or ITU networks.

Timer 1—Changeover delay in seconds. Also used as isolation timer for ITU MTP Restart.

Range: 0.1-2.0

Default: No change to the current value

System

Default: 0.8

:t10= (optional)

For ANSI or ITU networks.

Timer 10—Wait to repeat signaling route set test (SRST) message; in seconds.

Range: 20.0-90.0

Default: No change to the current value

System

Default: 30.0

:t11= (optional)

For ANSI or ITU networks.

Timer 11—Transfer restricted; in seconds.

Range: 1.0-90.0

Default: No change to the current value System

System

Default: 30.0

:t12= (optional)

For ANSI or ITU networks.

Timer 12—Wait for uninhibit acknowledgment; in seconds.

Range: 0.1-2.0

Default: No change to the current value

System

Default: 0.8

:t13= (optional)

For ANSI or ITU networks.

Timer 13—Wait for force uninhibit; in seconds.

Range: 0.1-2.0
Default: No change to the current value.
System
Default: 0.8

:t14= (optional)

For ANSI or ITU networks.

Timer 14—Wait for inhibit acknowledgment; in seconds.

Range: 0.2-4.0
Default: No change to the current value
System
Default: 2.0

:t15= (optional)

For ANSI or ITU networks.

Timer 15—Wait for repeat route set congestion test (RSCT); in seconds.

Range: 0.2-4.0
Default: No change to the current value
System
Default: 3.0

:t16= (optional)

For ANSI or ITU networks.

Timer 16—Wait for route set congestion test (RSCT) update; in seconds.

Range: 0.2-3.0
Default: No change to the current value
System
Default: 1.4

:t17= (optional)

For ANSI or ITU networks.

Timer 17—Delay to avoid oscillation of initial alignment failure; in seconds.

Range: 0.5-2.0
Default: No change to the current value
System
Default: 0.8

:t18= (optional)

For ANSI networks.

Timer 18—Repeat transfer restricted (TFR) once by response method; in seconds.

Range: 2.0-20.0
Default: No change to the current value
System
Default: 10.0

:t19= (optional)

For ANSI networks.

Timer 19—Failed link craft referral timer; in seconds.

Range: 30.0-600.0
Default: No change to the current value.
System
Default: 480

:t2= (optional)

For ANSI or ITU networks.

Timer 2—Wait for changeover acknowledge (COA); in seconds.

Range: 0.1-3.0

Default: No change to the current value

System

Default: 1.4

:t20= (optional)

For ANSI networks.

Timer 20—Repeat local inhibit test; in seconds.

Range: 90.0-120.0

Default: No change to the current value

System

Default: 90.0

:t21= (optional)

For ANSI networks.

Timer 21—Repeat remote inhibit test; in seconds.

Range: 90.0-120.0

Default: No change to the current value

System

Default: 90.0

:t22= (optional)

For ANSI networks.

Timer 22—Timer at restarting STP, waiting for signaling links to become available; in seconds.

Range: 10.0-60.0

Default: No change to the current value.

System

Default: 10.0

:t23= (optional)

For ANSI networks.

Timer 23—Timer at restarting STP, started after T22, waiting to receive all TRA messages; in seconds.

Range: 9.0-100.0

Default: No change to the current value.

System

Default: 10.0

:t24= (optional)

For ANSI networks.

Timer 24—Timer at restarting STP with transfer function, started after T23, waiting to broadcast all TRA messages; in seconds.

Range: 9.0-60.0

Default: No change to the current value.

System

Default: 10.0

:t25= (optional)

For ANSI networks.

Timer 25—Timer at adjacent STP and restarting STP, waiting for TRA message; may be started at level 2; in seconds.

Range: 30.0-35.0

Default: No change to the current value

System

Default: 30.0

:t26= (optional)

For ANSI networks.

Timer 26—Timer at restarting STP, waiting to repeat TRW message; in seconds.

Range: 12.0-15.0

Default: No change to the current value.

System

Default: 12.0

:t28= (optional)

For ANSI networks.

Timer 28—Timer at STP adjacent to restarting STP, waiting for TRW message; in seconds.

Range: 3.0-35.0

Default: No change to the current value

System

Default: 3.0

:t29= (optional)

For ANSI networks.

Timer 29—Timer started when a TRA is sent in response to an unexpected TRA or TRW; also, started when traffic resumed without receipt of TRA; in seconds.

Range: 60.0-65.0

Default: No change to the current value

System

Default: 60.0

:t3= (optional)

For ANSI or ITU networks.

Timer 3—Time controlled diversion on changeback; in seconds.

Range: 0.1-2.0

Default: No change to the current value

System

Default: 0.8

:t30= (optional)

For ANSI networks.

Timer 30—Timer to limit sending of TFPs/TFRs in response to an unexpected TRA or TRW; in seconds.

Range: 30.0-35.0

Default: No change to the current value

System

Default: 30.0

:t31= (optional)

For ANSI networks.

Timer 31—False link congestion detection; in seconds.

Range: 10.0-120.0
Default: No change to the current value.
System
Default: 60.0

:t32= (optional)

For ANSI networks.

Timer 32—Link oscillation timer – Procedure A; in seconds.

Range: 60.0-120.0
Default: No change to the current value.
System
Default: 60.0

:t4= (optional)

For ANSI or ITU networks.

Timer 4—Wait for changeback acknowledge (CBA) #1; in seconds.

Range: 0.1-2.0
Default: No change to the current value
System
Default: 0.8

:t5= (optional)

For ANSI or ITU networks.

Timer 5—Wait for changeback acknowledge (CBA) #2; in seconds.

Range: 0.1-2.0
Default: No change to the current value
System
Default: 0.8

:t6= (optional)

For ANSI or ITU networks.

Timer 6—Controlled reroute; in seconds.

Range: 0.1-2.0
Default: No change to the current value
System
Default: 0.8

:t7= (optional)

For ANSI or ITU networks.

Timer 7—Signaling data link connection (SDLC) acknowledg; in seconds.

Range: 0.1-3.0
Default: No change to the current value.
System
Default: 1.0

:t8= (optional)

For ANSI or ITU networks.

Timer 8—Transfer prohibited (TFP) inhibit; in seconds.

Range: 0.5-2.0
Default: No change to the current value.
System
Default: 0.8

Example

```
chg-l3t:l3tset=1:t1=800
```

```
chg-l3t:l3tset=1:t5=800:t6=800:t32=70000
```

Dependencies

The minimum parameter requirement is the table number and at least one timer specified.

You can enter seconds or milliseconds for the timer values. If seconds are entered, the timer value must contain at least one decimal place, but it can contain up to three decimal places. If you do not use decimal places, the system accepts the value as milliseconds. Be aware that the **rtrv-l3t** command always displays the output in seconds, not milliseconds.

Do not specify the following pairs of timers together because one value overrides the other:

- T20 and IT22
- T21 and IT23

Notes

The command line allows 157 characters. Some SS7 MTP level 3 timer changes may exceed this limit. Multiple entries of this command may be required in such cases.

Timer 9 is not currently supported in the SS7 protocol, and has been omitted from this manual. The command will support this timer when it has been defined in the protocol.

The default values are within the Telcordia recommended ranges.

Output

```
chg-l3t:l3tset=1:t1=800
```

```
rlghncxa03w 04-01-07 08:40:50 EST EAGLE 31.3.0
CHG-L3T: MASP A - COMPLTD
;
```

chg-lbp**Change Loopback Point's Attribute Values**

Use this command to change a far-end loopback point's attribute values maintained in the link fault sectionalization table.

Keyword: **chg-lbp**

Related Commands: **act-lbp, dact-lbp, dlt-lbp, ent-lbp, rtrv-lbp**

Command Class: Database Administration

Parameters

:lbp= (mandatory)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to *and including* the target device).

Range: **1-32**

:link= (mandatory)

SS7 signaling links. The SS7 signaling link to be tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cli= (optional)

Common Language Location Identifier (CLLI) code. This parameter specifies the CLLI or other mnemonic identifier used to refer to the given loopback point.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 23 alphanumeric characters

Default: No change to the cli value

:lfst= (optional)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range: **llt, nlt**

llt—latching loopback test

nlt—nonlatching loopback test

:rep= (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: **0-31**

Default: No change unless:

0—The link element to be looped back for testing is NEI (**rle=nei** is specified)

0—The type of link fault sectionalization test is NLT (**lfst=nlt** is specified)

0—The type of link fault sectionalization test is NLT (**lfst=nlt** is specified)

0—The new remote link element is the first loopback point of the link to be tested

1-30—Next sequential number for subsequent loopback points of the link to be tested

:rle= (optional)

Remote link element. The link element to be looped back for testing.

Range: **ds0, ocu, csu, dsu, nei**

Default: No change to the rle value

Example

chg-lbp:loc=1101:link=a:lbp=1:rle=ds0:lfst=llt

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before using this command.

At least one optional parameter must be specified.

The card location specified in the **loc** parameter cannot be reserved by the system.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The CLLI cannot be a reserved word.

The **rep** parameter value that is specified for this loopback point (LBP) must be greater than the **rep** parameter value of any previously defined LBP and less than the **rep** parameter value of any subsequently defined LBP.

The **rep** parameter must be specified if the default value is a duplicate of the **rep** parameter value of any previously defined loopback point.

The LBP must have been previously defined.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rle=ds0** or the **rle=nei** parameter cannot be specified if the **lfst=nl** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

For each SS7 signaling link, you can define only one loopback point with **rle=nei** specified; and that loopback point must be the terminating SS7 signaling link component.

For each SS7 signaling link, the loopback point with **rle=nei** specified must be the terminating SS7 signaling link component.

The card location specified in the **loc** parameter must be equipped.

Notes

None

Output

```
chg-lbp:loc=1101:port=a:lbp=1:rle=ds0:lfst=llt
```

chg-lnp-lrn

Change LNP Location Routing Number

Use this command to change existing location routing number (LRN) specific information in the database. You can change existing message relay override services. This command updates the LNP LRN table. You can change a maximum of two overriding message relay global title translations at a time.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: chg-lnp-lrn

Related Commands: dlt-lnp-lrn, ent-lnp-lrn, rtrv-lnp-lrn

Command Class: LNP Database

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:lrn= (mandatory)

The location routing number.

Range: 10 digits

:nmrgt1= (optional)

New message relay global title entry 1.

Range: *tt-pc-ssn-xlat-ri-ngt-ngta*

tt—Translation type; valid range is 0-255

pc—ANSI destination point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

- When **chg-sid:pctype=ansi** is specified,

- *ni*— **001–255**
- *nc*— **001–255** (if *ni* = **001–005**)
- —**000–255** (if *ni* = **006–255**)
- *ncm*— **000–255**

- The point code **0-0-0** is not a valid point code.

ssn—Subsystem number; valid range is **0-255**

xlat—Translate; valid values are **dpc**, **dpcssn**, **dpcngt**

ri—Routing indicator; valid values are **gt**, **ssn**

ngt—New Global Title translation type; valid range is **0-255**

rgta—Replace global title address; valid values are **yes**, **no**

:nmrgt2= (optional)

New message relay global title entry 2.

Range: *tt-pc-ssn-xlat-ri-ngt-rgta*

tt—Translation type; valid range is **0-255**

pc—ANSI destination point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

- When **chg-sid:pctype=ansi** is specified,

- *ni*— **001–255**
- *nc*— **001–255** (if *ni* = **001–005**)
- —**000–255** (if *ni* = **006–255**)
- *ncm*— **000–255**

- The point code **0-0-0** is not a valid point code.

ssn—Subsystem number; valid range is **0-255**

xlat—Translate; valid values are **dpc**, **dpcssn**, **dpcngt**

ri—Routing indicator; valid values are **gt**, **ssn**

ngt—New Global Title translation type; valid range is **0-255**

rgta—Replace global title address; valid values are **yes**, **no**

Example

chg-lnp-lrn:lrn=1234567890

chg-lnp-lrn:lrn=1234567891:nmrgt1=16-233-233-233-20-dpcssn-ssn-0-yes

Dependencies

To enter this command, the LNP feature must be turned on (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

When **nmrgt1** or **nmrgt2** parameters are used, the constituent values must be entered in this order: **tt**, **pc**, **ssn**, **xlat**, **ri**, **ngt**, **rgta**

At least one optional parameter must be specified.

Translation type (**tt** parameter) values that are associated with AIN, IN, PCS, LNPQS, or WNP LNP queries cannot be specified.

The same **tt** value cannot be specified more than once.

When the **xlat=dpcssn** parameter is specified, the **ssn** parameter value must be non-zero.

When the **xlat** parameter is specified with a value other than **dpcssn**, a value of **0** must be specified for the **ssn** parameter.

When a value other than **dpngt** is specified for the **xlat** parameter, a value of **0** must be specified for the **ngt** parameter.

When the **xlat=dpngt** parameter is specified, the **ri=gt** parameter must be specified.

The point code must be an ANSI point code, and it must be a valid DPC (not **0-0-0**). The point code entry must be a full point code. Partial point codes are not allowed.

The subsystem number (**ssn** parameter) must be in the LNP database.

The service provider (SP) must be specified if an LRN was not assigned previously.

The LRN must exist.

The NMRGT# message relay translation type must be a reserved service for LNP, and it must already be assigned.

Notes

The LNP EAGLE 5 ISS stores the 10-digit override global title NGT (new global title) value on a per service, point code, and subsystem combination basis. This design allows a user to always modify the NGT field for all LRNs assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 10-digit override (LRN) global title translation entered.

When an NGT field is modified or assigned to a particular LNP 10-digit override global title translation (either via the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing LRN entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 10-digit override (LRN) global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Output

chg - lnp - lnr : lnr=1234567890

```
rlghncxa03w 04-01-18 08:50:12 EST  EAGLE 31.3.0

;
```

chg-lnp-npanxx

Change LNP NPANXX

Use this command to change an existing LNP NPANXX record, including a message relay default global title translation in the database. This command allows the replacement of a single message relay default global title translation in the database and the replacement of the message relay indicator. It does not add to or delete from the NPANXX a new message relay translation type. This command changes only the existing data. Translation type values associated with WNP, PCS, AIN, LNPQS, or IN LNP queries are not allowed to be administered as NPANXX default message relay global title translations.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: chg-lnp-npanxx

Related Commands: dlt-lnp-npanxx, ent-lnp-npanxx, rtrv-lnp-npanxx

Command Class: LNP Database

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:npanxx= (mandatory)

Numbering plan area.

Range: 6 digits

:ngt1= (optional)

New default global title entry 1.

Range: *tt, ni, ncm, ssn, xlat, ri, ngt*

tt—Translation type; valid range is **0-255**

ni—Network indicator; valid range is **0-255**

nc—Network cluster; valid range is **0-255**

ncm—Network cluster member; valid range is **0-255**

ssn—Subsystem number; valid range is **0-255**

xlat—Translate; valid values are **dpc, dpcssn, dpcngt**

ri—Routing indicator; valid values are **gt, ssn**

ngt—New Global Title translation type; valid range is **0-255**

:ngt2= (optional)

New default global title entry 2.

Range: *tt, pc, ssn, xlat, ri, ngt, rgta*

tt—Translation type; valid range is **0-255**

ni—Network indicator; valid range is **0-255**

nc—Network cluster; valid range is **0-255**

ncm—Network cluster member; valid range is **0-255**

ssn—Subsystem number; valid range is **0-255**

xlat—Translate; valid values are **dpc, dpcssn, dpcngt**

ri—Routing indicator; valid values are **gt, ssn**

ngt—New Global Title translation type; valid range is **0-255**

:nmr= (optional)

New message relay ported indication

Range: **yes, no**

Default: The current value

Example

chg-lnp-npanxx:npanxx=111111:nmr=no

chg-lnp-npanxx:npanxx=111111:nmr=yes:ngt1=16-255-255-255-0-dpcngt-gt-20

Dependencies

At least one optional parameter must be specified.

To enter the **chg-lnp-npanxx** command, the LNP feature must be turned **on** (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

The new message relay global title point code must exist in the route table.

The LNP query default global title point code must exist in the route table, or must be the EAGLE 5 ISS's true point code and LNP subsystem.

The **gt1** and **gt2** parameters translation type must already be assigned, and they must be a reserved service for the LNP.

The NPANXX must already exist.

Translation type (**tt** parameter) values associated with PCS, LNPQS, or WNP LNP queries cannot be specified.

The same translation type value cannot be specified more than once.

When the **xlat=dpcssn** parameter is specified, the **ssn** parameter value must be non-zero.

When the **xlat** parameter is specified with a value other than **dpcssn**, a value of **0** must be specified for the **ssn** parameter.

When a value other than **dpngt** is specified for the **xlat** parameter, a value of **0** for the **ngt** parameter must be specified.

When the **xlat=dpngt** parameter is specified, you must specify the **ri=gt** parameter must be specified.

The point code must be an ANSI point code, and it must be a valid DPC (not **0-0-0**). The point code must be a full point code entry.

The subsystem number (**ssn** parameter) must be in the LNP database.

The new GTT value must not match the old GTT value.

Notes

This command can be entered several times for the same NPANXX to change one or more default global title translations.

The LNP EAGLE 5 ISS stores the 6-digit default global title NGT (new global title) value on a per service, point code, and subsystem combination basis, not on an NPA-NXX basis. This design allows a user to always modify the NGT field for all NPA-NXXs assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 6-digit default (NPA-NXX) global title translation entered.

When an NGT field is modified or assigned to a particular LNP 6-digit global title translation (either via the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing NPA-NXX entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 6-digit default (NPA-NXX) global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Output

```
chg-lnp-npanxx:npanxx=111111:nmr=no
```

```
rlghncxa03w 04-01-18 08:50:12 EST EAGLE 31.3.0

chg-lnp-serv

Change LNP Service

Use this command to change an existing LNP service. You can specify a new translation type, digit validity indicator, and translation type name for the existing service. A new translation type name of **none** defaults the name back to the reserved service type name.

Keyword: **chg-lnp-serv**

Related Commands: **dlt-lnp-serv**, **ent-lnp-serv**, **rtrv-lnp-serv**

Command Class: Database Administration

Parameters

:ndv= (optional)

New digits valid.

Range: **sccp**, **tcap**

Default: The current value

:nserv= (optional)

New reserved service type name.

Range: **ain**, **in**, **pcs**, **wnp**, **class**, **lidb**, **cnam**, **isvm**, **lnpqs**, **wsmcsc**, **udf1**, **udf2**, **udf3**, **udf4**

Default: The current value

:ntt= (optional)

New translation type.

Range: **0-255**

Default: The current value

:nttn= (optional)

User defined TT name.

Range: **aaaaaaaa**, **none**
1 to 8 alphabetic characters, or **none**

Default: If **none** is specified, the default value is the reserved service type name (**serv** parameter).
If **none** is not specified, no change to current value.

:serv= (optional)

Reserved service type name.

Range: **ain**, **in**, **pcs**, **wnp**, **class**, **lidb**, **cnam**, **isvm**, **lnpqs**, **wsmcsc**, **udf1**, **udf2**, **udf3**, **udf4**

Default: The current value

:tt= (optional)

Translation type.

Range: **0-255**

Default: The current value

Example

```
chg-lnp-serv:serv=lidb:ntt=22, ndv=tcap:nttn=mr lidb
```

```
chg-lnp-serv:tt=11:nserv=lnpqs
```

Dependencies

The LNP feature must be turned on before this command can be entered (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

The LNP feature is "turned on" when a value for the LNP ported TNs quantity is shown in the **rtrv-ctrl-feat** command output.

The LNP SMS feature must be turned on before the **serv=wsmc** parameter can be specified.

The PCS 1900 LNP (PLNP) feature must be turned on before the **nserv=pcs** parameter can be specified.

The WNP feature must be turned on before the **nserv=wnp** parameter can be specified.

At least one optional parameter must be specified.

The new translation type (**ntt** parameter) must not already exist in the LNP database.

The new translation type name (**nttn** parameter) must not already exist in the LNP database.

The service type (**serv** parameter) must already exist in the LNP database.

The **serv** parameter and the **tt** parameter cannot be specified in the same command.

The **ntt** parameter and the **nserv** parameter cannot be specified in the same command.

The new digits valid indication (**dv** parameter) must not match the old digits valid indication.

An LNP alias cannot be specified as the value for the **ntt** parameter.

Before a service (**serv** parameter) can be changed, all LNP aliases for that service must be removed from the LNP database.

Translation type names must be unique for LNP services.

A reserved service type name can be specified for the **nttn** parameter only if the name matches the existing service (**serv** parameter).

Notes

When the LNP feature is on for up to 12 million TNs (see the **enable-ctrl-feat** command), the LNP services CLASS, CNAM, LIDB, and ISVM must be in the OAP configuration in the EAGLE 5 ISS database. You must update the OAP configuration (with the **act-oap-config** command) whenever you perform the following actions:

- Add LNP services to the database (with the **ent-lnp-serv** command).
- Remove services from the database (with the **dlt-lnp-serv** command).
- Change services (with the **chg-lnp-serv** command).

As a reminder, the following warning message is displayed:

CAUTION: LNP service TTs have changed, OAP configuration is required

A service cannot be changed if any alias translation type exists for that service. To modify the service based upon translation type, the **tt** parameter with the **nserv** parameter must be specified.

Output

```
chg-lnp-serv:serv=lidb:ntt=22:ndv=tcap:nttn=mr lidb
rlghncxa03w 02-11-18 08:50:12 EST EAGLE 30.0.0
CHG-LNP-SERV: MASP A - COMPLTD
;
```

chg-lnp-sub**Change LNP 10-Digit Subscription**

Use this command to change an existing LNP 10-digit telephone number (TN) subscription or pooled TN number existing in the database. All the LRN and message relay information must be specified. The messages relay global title point code is validated as a destination in the Route table.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: chg-lnp-sub

Related Commands: dlt-lnp-sub, ent-lnp-sub, rtrv-lnp-sub

Command Class: LNP Subscription

Parameters

:tn= (mandatory)

The telephone number.

Range: 10 digits
10 digits—To specify a single TN subscription
7 digits with 3 asterisks (***) appended—To pool a block of 1000 TNs

:nlrn= (optional)

The new location routing number.

Range: 10 digits

:nmrgt1= (optional)

The new message relay global title entry number 1. The arguments allow default global title translations to be incrementally changed by entering the **nmrgt1** and **nmrgt2** parameters several times. When **nmrgt1** or **nmrgt2** parameters are used, the argument values must *all* be entered and separated by a comma (,) or a dash (-) in the order *tt-ni-nc-ncm-ssn-xlat-ri-ngt-rgta*.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ngt, rgta*
tt—Translation type; valid range is **0-255**
ni—Network indicator; valid range is **0-255**
nc—Network cluster; valid range is **0-255**
ncm—Network cluster member; valid range is **0-255**
ssn—Subsystem number; valid range is **0-255**
xlat—Translate; valid values are **dpc, dpcssn, dpcngt**
ri—Routing indicator; valid values are **gt, ssn**
ngt—New Global Title translation type; valid range is **0-255**
rgta—Replace global title address (TN) with LRN; valid values are **yes, no**

:nmrgt2= (optional)

The new message relay global title entry number 2. The arguments allow default global title translations to be incrementally changed by entering the **nmrgt1** and **nmrgt2** parameters several times. When **nmrgt1** or **nmrgt2** parameters are used, the argument values must *all* be entered and separated by a comma (,) or a dash (-) in the order *tt-ni-nc-ncm-ssn-xlat-ri-ngt-rgta*.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ngt, rgta*
tt—Translation type; valid range is **0-255**
ni—Network indicator; valid range is **0-255**
nc—Network cluster; valid range is **0-255**

ncm—Network cluster member; valid range is **0-255**
ssn—Subsystem number; valid range is **0-255**
xlat—Translate; valid values are **dpc**, **dpcssn**, **dpcngt**
ri—Routing indicator; valid values are **gt**, **ssn**
ngt—New Global Title translation type; valid range is **0-255**
rgta—Replace global title address (TN) with LRN; valid values are **yes**, **no**

Example

```
chg-lnp-
sub:tn=1234567890:nsp=a123:nlrn=1234567890:nmrgt1=16,233-233-233,
0,dpc,gt,28,yes

chg-lnp-
sub:tn=1234567***:nsp=a123:nlrn=1234567890:nmrgt1=16,233-233-233,
0,dpc,gt,28,yes

chg-lnp-
sub:tn=1234567000:nsp=a123:nlrn=1234567890:nmrgt1=16,233-233-233,
0,dpc,gt,28,yes
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

When the **nmrgt1** or **nmrgt2** parameter is specified, the constituent values must be entered in this order: **tt**, **pc**, **ssn**, **xlat**, **ri**, **ngt**, **rgta**

Ranges across NPANXX boundaries cannot be specified.

Translation type values associated with AIN, IN, LNPQS, PCS, or WNP LNP queries are not allowed as message relay global title translations.

A maximum of two message relay global title translations can be changed at a time.

When the **xlat=dpcssn** parameter is specified, a non-zero value must be specified for the **ssn** parameter.

When a value other than **dpcssn** is specified for the **xlat** parameter, a value of **0** must be specified for the **ssn** parameter.

When the **xlat=dpcngt** parameter is specified, the **ri=gt** parameter must be specified.

When a value other than **dpcngt** is specified for the **xlat** parameter, a value of **0** must be specified for the **ngt** parameter.

When the **rgta=yes** parameter is specified, the **nlrn** parameter must be specified.

Either the **nlrn** parameter or the **ngt** parameter must be specified.

The point code must be a valid ANSI DPC that exists in the routing table. (The point code **0-0-0** is not a valid ANSI point code.) The point code entry must be a full point code. Partial point codes are not allowed.

The same **tt** parameter value cannot be specified more than once.

The **nmrgt# tt** must be already assigned and it must be a reserved service for LNP.

Notes

This command can be entered several times to change an existing LNP service for an existing **tn**.

The LNP EAGLE 5 ISS stores the 10-digit subscription global title NGT (new global title) value on a per service, point code, and subsystem combination basis. This design allows a user to always

modify the NGT field for all 10-digit subscriptions assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 10-digit subscription global title translation entered.

When an NGT field is modified or assigned to a particular LNP 10-digit global title translation (either through the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing subscription entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 10-digit subscription global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Pooled TNs are allocated on an even 1000-block boundary and cannot cross an NPANXX's boundary. Specific ported TNs can overlap a pooled block and contain different routing.

Pooled TNs cannot be changed to specific subscriptions, nor can specific subscriptions be changed to pooled TNs.

Output

chg-lnp-

sub:tn=1234567890:nsp=a123:nln=1234567890:nmrgt1=16,233-233-233,0,dpc,gt,28,yes

```

CHG-LNP-SUB: MASP A - COMPLTD
```

;

chg-lnp-ttmap

Change LNP Translation Type Mapping

Use this command to create, change, or disable the existing message relay global title (MRGT) LNP GT entry for a group of existing telephone numbers (TN) in the database. This command allows you to specify a translation type and global title address treatment of different service providers according to the DPC configured in the message relay (MR) global title translation (GTT) table.

Keyword: chg-lnp-ttmap

Related Commands: rtrv-lnp-ttmap

Command Class: LNP Database

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:tt= (mandatory)
Translation type.
Range: **0-255**

:nngt= (optional)
New new global title translation type.
Range: **0-255 none**
Default: No change to current value

:nrgta= (optional)
New replacement **gta** treatment.
Range: **yes, no**
Default: No change to current value

Example

chg -lnp -ttmap:tt=16:pc=233-233-233:nngt=28

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

At least one optional parameter must be specified.

The **tt** must be reserved for LNP.

The **tt** cannot be an LNP alias.

The point code (**pc/pca** parameter) must exist in the routing table.

The LNP MR table must not be full.

Notes

Entering this command one time affects all the NPANXXs and TNs that reference the specified DPC in their default MR GTT or MR GTT respectively.

If the **nngt** parameter is specified, the **xlat=dpcnngt** and **ri=gt** parameter values must be specified. If they are not specified, they are changed to those values.

The **nrgta** parameter assumes an associated LRN is specified. If no LRN is specified, the real-time database displays *not found* information.

If the **nrgta** or **ngt** parameter is specified, it performs a global database assignment of **ngt** or **rgta** to the specified translation type and point code combination in the database. Subsequent assignments of non-**ngt** parameters specified by **sub** or **npnxxx** commands, for the globally updated translation type and point code combination, retain the globally defined **ngt** or **rgta** value.

The EAGLE 5 ISS terminal-administered **npnxxx** or **sub** commands can also globally enable or disable **ngt** or **rgta** values.

Output

chg -lnp -ttmap:tt=16:pc=233-233-233:nngt=28

```
rlghncxa03w 04-01-05 16:40:40 EST  EAGLE 31.3.0
CHG-LNP-TTMAP: MASP A - COMPLTD
;
```

chg-lnpopts

Change LNP System Options

Use this command to enter LNP-specific system options in the database. This command updates the LNPOPTS table.

Keyword: chg-lnpopts

Related Commands: rtrv-lnpopts

Command Class: Database Administration

Parameters

:admhipri= (optional)

Give LNP database administration the highest administrative priority in the system.

Range: yes, no

Default: The current value.

:amactype= (optional)

AMA call type.

Range: 3 digits

Default: The current value.

:amafeatid= (optional)

AMA feature ID.

Range: 3 digits

Default: The current value.

:amaslpid= (optional)

AMA slip ID.

Range: 9 digits

Default: The current value.

:aud= (optional)

Audit indicator.

Range: on, off

Default: The current value.

:ccp= (optional)

Copy charge parameters. When this parameter is enabled (**ccp=yes**), the EAGLE 5 ISS copies the Charge Number and Charge Party Station type from an LNP AIN query (if present) to the LNP AIN Response message.

Range: yes, no

Default: The current value.

:cic= (optional)

Carrier identification code.

Range: 3-4 digits

Default: The current value.

:frcsmplx= (optional)

Allow simplex database updates.

Range: yes, no

Default: The current value.

:gtwystp= (optional)

Indicates that the LNP system is also configured as a Gateway STP.

Range: yes, no

Default: The current value.

:incslp= (optional)

Include AMA slip ID in the response.

Range: yes, no

Default: The current value.

:jipdigits= (optional)

The Jurisdictional Information Parameter value.

Range: 6 digits

Default: The current value.

:jipprv= (optional)

Determines whether a Jurisdictional Information Parameter value is to be added to the IAM.

Range: **yes, no**

Default: The current value.

:servport= (optional)

Service portability.

Range: **yes, no**

yes— This is a protocol setting that allows splitting services between TN and LRN override records. This setting lets the EAGLE LNP craftsperson update LRN overrides for message relay services that are to be supported in the network. The EAGLE 5 ISS then uses the TN gateway point code (NPAC subscription data) for message relay services the CLEC wants to provide.

no— If no LRN override services are provisioned, then the TN's gateway point codes (NPAC subscription data) are used to route queries out of the network. If one or more LRN override services are provisioned, the TN is considered to be ported into the network. In this case, if an LRN override service is requested and the LRN has other services administered, but the requested service is not provisioned, then a UDTS response for the service is provided.

Default: The current value

:sp= (optional)

Service provider ID.

Range: *xyyy*

4 alphanumeric characters

Default: The current value.

:wqredrct= (optional)

Wireless queries directed to default GTT.

Range: **on, off**

on— This setting allows the GTT functionality to treat any wireless LNP (WNP and PCS) queries that require GT as a normal GTT.

off— This setting routes all wireless LNP queries (WNP and PCS) that require GT directly to the local subsystem.

Default: the current value

:wsmsc10dig= (optional)

SCCP GTA digit length indicator for 10 or 11 digits.

Range: **yes, no**

yes— The system verifies that either 10 or 11 digits are present in the CDPA GTA. If 11 digits are present, the first digit is stripped to derive 10 digits for LNP SMS translation. If 10 digits are present, all 10 digits are used for LNP SMS translation.

no— The system verifies that 11 digits (plus a padded 0 digit) are present in the CDPA GTA. If 11 digits are present, the system strips the first digit and considers only 10 digits for LNP SMS translation.

Default: the current value

Example

chg-lnpopts:amaslpid=123456789

```

chg-lnpopts:amactype=003
chg-lnpopts:amafeatid=010
chg-lnpopts:incslp=yes
chg-lnpopts:cic=1369
chg-lnpopts:aud=on
chg-lnpopts:sp=1234
chg-lnpopts:jipdigits=919460
chg-lnpopts:jipprv=yes
chg-lnpopts:frcsmplx=yes
chg-lnpopts:admhipri=yes
chg-lnpopts:gtwystp=yes
chg-lnpopts:ccp=yes
chg-lnpopts:servport=yes
chg-lnpopts:wqredrct=off
chg-lnpopts:wsmc10dig=yes

```

Dependencies

At least one optional parameter must be specified.

The LNP feature (see the **enable-ctrl-feat** command) and the Triggerless LNP (TLNP) feature must be turned on before this command can be entered.

The **jipprv** and **jipdigits** parameters can be specified only if the Triggerless LNP feature is **on**.

The LNP SMS feature must be turned on before the **wsmc10dig** parameter can be specified.

Notes

The **frcsmplx** parameter is used to force the system in a forced simplex mode. In this mode, simplex updates are accepted by the active OAM if the standby OAM is in one of the following states: incoherent, diff level, or unstable.

If the **admhipri** parameter is set to **yes**, LNP database administration can starve out normal STP updates during LNP administration of 2 TNs per second. If the parameter is set to **no**, then STP and LNP updates receive the same priority. Depending on the system activity level, the performance of LNP updates may be reduced.

If the **gtwystp** parameter is set to **yes**, the LNP system is also configured as a gateway STP. The NPAC sends down capability point codes without routes. In this configuration, the system does not output a warning (UIM 1176) about capability point codes or true point codes without routes.

Output

```

chg-lnpopts:amaslpid=123456789

rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
CHG-LNPOPTS: MASP A - COMPLTD
;

```

chg-ls

Change Linkset

Use this command to change the attributes for a specified linkset in the system database. The new values overwrite the existing values.

Keyword: chg-ls

Related Commands: chg-slt, dlt-ls, rtrv-ls

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:lsn= (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

:action= (optional)

This parameter adds or deletes the SAPC or mate IPGWx linkset name.

Range: add, delete

Default: add

:apc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: apca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:apc/apca/apci/apcn/apcn24= (optional)

Adjacent point code.

:apci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:apcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:apcntype= (optional)

ITU-N Adjacent Point Code Type. This parameter specifies the format that will be used for changeover and changeover acknowledgement messages.

Range: **itun, itunchina**

itun — ITU National Adjacent Point Code type

itunchina — ITU National China Adjacent Point Code type

Default: **itun**

:asl8= (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSs.

Range: **yes, no**

Default: Current value

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range: **yes, no**

yes — TFPs are not broadcast.

no — TFPs are broadcast.

Default: Current value

:cli= (optional)

Far-end Common Language Location Identifier (CLLI). This parameter specifies the CLLI assigned to the linkset.

Range: *aaaaaaaaaa*

1 alphabetic character followed by up to 10 alphanumeric characters

Default: Current value

:gsmscrn= (optional)

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range: **on, off**

Default: Current value

:gttmode= (optional)

Global Title Translation Mode. This parameter specifies a GTT Mode hierarchy for each link set.

Range: **cd, cg, acdcd, acdcgcd, acdcdcg, cgacdcd, cgcd, cdcg, sysdflt**

Default: No change to current value.

:gwsa= (optional)

Gateway screening action. This parameter specifies whether gateway screening (GWS) is on or off for the specified linkset.

Range: **on, off**

Default: Current value

:gwsd= (optional)

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if **gwsd=on** is specified.

Range: **on, off**

Default: **off**

:gwsm= (optional)

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range: **on, off**

Default: Current value

:iptps= (optional)

IPGWx Linkset TPS. The value of this parameter is a user-defined portion of the total enabled system IP Signaling TPS shown in the **rtrv-ctrl-feat** command output. This parameter is allowed and required only for IPGWx linksets (when **ipgwapc=yes** is specified).

The maximum range value for the **iptps** parameter is **188000** for future expansion. However, the maximum system IPGWx Signaling TPS capacity currently available is 112000.

Range: **100-188000**

The specified value must be divisible by 10.

The sum of the **iptps** values assigned to all linksets in the system cannot exceed the enabled system IPGWs Signaling TPS value (see the **rtrv-ctrl-feat** command).

Default: No change to current value.

:itutfr= (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range: **on, off**

Default: No change to current value

:l3tset= (optional)

Link timer set. This parameter is defined with the **chg-l3t** command.

Range: **1**

Default: No change to current value

:lst= (optional)

Linkset type of the specified linkset. This parameter specifies whether the specified link is an access link, bridge link, cross link, diagonal link, or extended link, as defined in Telcordia GR-246-CORE, T1.111.5.

Range: **a, b, c, d, e**

a — Access links

b — Bridge links

c — Cross links

d — Diagonal links

e — Extended links

Default: No change to current value

:lsusealm= (optional)

IPTPS linkset alarm threshold percent. This parameter specifies the percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

Range: 10-100

Default: No change to current value

:matelsn= (optional)

Mate linkset name.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

Default: No change to current value

:mtprese= (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range: yes, no

yes — equipped

no — not equipped

Default: No change to current value

:multgc= (optional)

Multiple group codes. The parameter specifies whether multiple group codes can be specified.

Range: yes, no

:nis= (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range: on, off

Default: off

:nlsn= (optional)

New linkset name. This parameter specifies the name to be used when changing the linkset name specified in the **lsn** parameter.

Range: ayyyyyyyyy

Up to 8 alphanumeric characters; the first character must be a letter

Default: No change to current value

:randsls= (optional)

Random SLS (signaling link selection). This parameter is used to apply random SLS generation on a per linkset basis for ITU SCCP messages.

Specifying the **randsls** parameter in the **chg-ls** command enables random SLS generation on a per linkset basis only if the **randsls=perls** parameter has been specified in the **chg-stpopts** command.

Range: off, class0, all

off — Disables random SLS generation on a specified linkset.

class0 — Enables random SLS generation for Class0 SCCP traffic on a specified linkset.

all — Enables random SLS generation for Class0 and Class1 SCCP traffic on a specified linkset.

Default: off

:sapci= (optional)

ITU international secondary adjacent point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:sapci/sapcn/sapcn24= (optional)

Secondary adjacent point code.

:sapcn= (optional)

ITU national secondary adjacent point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:sapcn24= (optional)

24-bit ITU national secondary adjacent point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:scrn= (optional)

Gateway screening screen set. This parameter specifies the gateway screening screen set assigned to this linkset.

When using the **scrn** parameter to change Gateway Screening from an old screenset name with Gateway Screening Allowed Mode **gwsa=off** to a new screenset name with **gwsa=on**, the command must first be entered to assign the screenset name to NONE (**scrn=none**). This assignment will prevent any rules from the old screenset from being applied during the interim period that it takes for the new screenset to load.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters or none (deletes screen set association)

Default: No change to current value

:slkusealm= (optional)

IPTPS signaling link alarm threshold percent. This parameter specifies the percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

Range: **10-100**

Default: No change to current value

:slsci= (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range: **yes, no**
yes — enabled
no — disabled

Default: No change to current value.

:slsocbit= (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5– 16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (**slsocbit=9**). The new SLS is 0100:

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS							0				1	0	0		

Range: **5-16 none**

Default: No change to current value

:slsrsb= (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter specifies the bit (1–4) to rotate as the new SLS LSB (Least Significant Bit). The SLS is not modified in the outgoing message. Table 5-22 shows how the rotation affects the four bits of the SLS during linkset selection:

Table 5-22. SLS Bit Rotation

If This Bit Is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB.	

This parameter is used for ITU messages on a per-linkset basis.

Range: 1-4

Default: No change to current value.

:sltset= (optional)

SLTM record. This parameter specifies the SLTM record to be associated with the linkset.

Range: 1-20

Default: No change to current value.

:tfatcabmlq= (optional)

TFA/TCA broadcast minimum link quantity. This parameter specifies the minimum number of links in the given linkset, or in the combined linkset in which the linkset resides, that must be available to user-part messages traffic. This parameter value is used by the STP to consider the first-choice ordered routes using that linkset as Allowed rather than Restricted.

When the **tfatcabmlq** parameter provisioned or default value is **0**, the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be either **1** for linksets containing 3 or fewer links, or half of the number of links configured in the linkset for linksets containing more than 3 links.

When the **tfatcabmlq** parameter value is set to a specific value greater than **0**, the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The specified value is used.

If the **lsrestrict** option is **off** (see the **chg-ss7opts** command), the **tfatcabmlq** database value for C linksets cannot be changed to a value greater than **0**. If the **lsrestrict** option is **on** (see the **chg-ss7opts** command), the **tfatcabmlq** value for C linksets (**lst=c**) can be set to a value from **1** to **16**. If you change the **tfatcabmlq** value for one or more C linksets in the system, you cannot set the **lsrestrict** option from **on** to **off** until you set all of the changed C linkset **tfatcabmlq** values back to **0**.

NOTE: The `rtrv-ls` command output always shows the calculated value or the provisioned value for the `tfatcabmlq` parameter. See the `rtrv-ls` command description.

Range: 0, 1-16
Default: No change to current value.
System
Default: 0

Example

Changes link set wy644368 to use APC 144-202-5

chg-ls:lsn=wy644368:apc=144-202-005

Changes link set wy644368 to Link Set Type A

chg-ls:lsn=wy644368:lst=a

Changes link set wy644370 to use APCN24 10-100-15

chg-ls:lsn=wy644370:apcn24=10-100-15

Adds an SAPC to a linkset

chg-ls:lsn=linkset:sapcn=1234-fr:action=add

Deletes an SAPC from a linkset

chg-ls:lsn=linkset:sapcn=1234-fr:action=delete

Modifies an SAPC, sapc has to be deleted first and added again

chg-ls:lsn=nc001:apc=144-201-001

chg-ls:lsn=c002:gwsn=on: nis=on

chg-ls:lsn=nc002:gwsn=on

chg-ls:lsn=nc003:sltm=reg:lst=b

Adds a 24-bit ITU-N SAPC to a linkset

chg-ls:lsn=ls1:sapcn24=5-5-5

Deletes a 24-bit ITU-N SAPC from a linkset:

chg-ls:lsn=ls1:sapcn24=5-5-5:action=delete

Assigns a mate linkset to a linkset:

chg-ls:lsn=linkset:matelsn=matelinkset

chg-ls:lsn=linkset:matelsn=matelinkset:action=add

Removes a mate linkset assignment from a linkset:

chg-ls:lsn=linkset:matelsn=matelinkset:action=delete

Changes an ITUN24 linkset to an apcntype for China:

chg-ls:lsn=ls2:apcntype=itunchina

Changes an ITUN24 linkset to an apcntype for Q703.A:

chg-ls:lsn=ls2:apcntype=itun

Additional examples:

chg-ls:lsn=nc003:slsci=yes:tfatcabmlq=2

chg-ls:lsn=lsitu1:gmscrn=off

chg-ls:lsn=wy644370:apcn24=10-100-15

chg-ls:lsn=ls1:sapcn24=5-5-5

chg-ls:lsn=ls1:sapcn24=5-5-5:action=delete

```
chg-ls:apca=p-011-2-3:lsn=lsa1:lst=a
chg-ls:apci=s-1-2-3:lsn=lsn1:lst=c
chg-ls:apcn= ps-1-1-1-2047:lst=a
chg-ls:lsn=ls1:randsls=all
```

Dependencies

The **gwsa**, **gwsn**, and **gwsd** parameters can be specified only if the **scrn** parameter is specified.

The **gwsd=on** parameter can be specified only if the **gwsa=on** parameter is specified.

At least one optional parameter must be specified.

If the **lsrestrict** option is **off** (see the **chg-ss7opts** command), the **tfatcabmlq** database value for C linksets cannot be changed from the system default of **0**. If the **lsrestrict** option is **on** (see the **chg-ss7opts** command), the **tfatcabmlq** value for C linksets (**lst=c**) can be set to a value from **1** to **16**. If you change the **tfatcabmlq** value for one or more C linksets in the system, you cannot set the **lsrestrict** option from **on** to **off** until you set all of the changed C linkset **tfatcabmlq** values back to **0**. C linksets are never the primary route (except to reach the STP's mate).

The **tfatcabmlq** parameter value cannot exceed the total number of assigned links in the linkset.

The **tfatcabmlq=0** parameter specifies that the system broadcasts TFAs or TCAs only when half the links in the given linkset, or in the combined linkset in which it resides, become available.

The **slsci** parameter is valid only for ANSI linksets.

The linkset name must be in the database.

The screen set name specified by the **scrn** parameter must be valid and must be in the database.

Adjacent point codes must be full point codes.

The adjacent point code must be defined as a destination point code.

The adjacent point code cannot match the site point code.

If the adjacent point code is in the X.25 domain, the **bei=yes** parameter must be specified or the **bei** parameter must be omitted.

The domain of the new adjacent point code must be the same as the previous adjacent point code unless there are no links in the linkset.

The adjacent point code cannot be referenced by an X.25 route with the **lc2nm=yes** parameter specified.

Only one linkset can be defined for an adjacent point code.

An SAPC cannot be deleted when routes exist for its SS7 domain.

If the **gwsa=off** and **gwsn=off** parameters are specified, all MSUs are passed. If the **gwsa=off** and **gwsn=off** parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the **gwsa=off** and **gwsn=on** parameters are specified, all MSUs pass, but error messages are generated if an MSU matches a screening condition.

If the **gwsa=on** and **gwsn=off** parameters are specified, MSUs are screened but messages are not generated.

CAUTION

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

If the **gwsa=on**, **gwsn=on**, and **gwsd=off** parameters are specified, MSUs are screened and error messages are generated if an MSU is passed when it should have been screened. For example, an LIM was configured for gateway screening but was unable to load its screening data.

The **lc2nm** parameter in the X.25 route commands allows the system to apply network management procedures to X.25 logical channels. If an X.25 logical channel fails, network management reroutes messages to an alternate route.

The **mtpmse** parameter can be specified only if the MTP restart feature, MTPRS (for ANSI), or ITUMTPRS (for ITU), is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (MTPRS=YES or ITUMTPRS=YES in the output).

The **mtpmse=yes** parameter is not valid for IPGW Adjacent Point Code linksets (the **ipgwapc=yes** was specified when the linkset was entered in the database).

The **mtpmse=yes** parameter is not valid for IPLIMx M3UA signaling links.

A gateway linkset can be configured only from a SEAS terminal and not from a system terminal.

The **clli** parameter and the **apc/apca/apci/apcn/apcn24** parameter must be specified together in the command.

The **nis** parameter can be specified only for ANSI and ITU-N links.

If a DPC matching the far end point code exists, the system compares the far end CLLI for the given linkset to the destination identifier (DI) of that matching destination. If they are not identical, the system rejects the command.

If the **asl8=yes** parameter is specified with the **lst=a** parameter (a linkset containing access signaling links), this indicates that the originator of the MSUs is generating 8-bit SLSs. For other linkset types, the **asl8=yes** parameter indicates that the adjacent STP is converting 5-bit SLSs to 8-bit SLSs. The SLS in MSUs received by the system on a linkset that has the **asl8=yes** parameter assigned to it will not be converted. These MSUs are assumed to contain 8-bit SLSs.

The **asl8=yes** parameter can be assigned only to an SS7 linkset (a linkset containing an adjacent point code in the SS7 domain).

The **apcn** parameter format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

An SAPC parameter can be specified only for ITU-N and ITU-N24 linksets.

The **slsocbit** parameter is valid only for ITU linksets.

The **slsrbs** parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on before the **gmscrn** parameter can be specified (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

The Enhanced GSM Map Screening feature must be turned on before the **gmscrn=on** parameter can be specified for an ANSI linkset.

The **itutfr** parameter is valid only for ITU national linksets.

The group code of DPC(s) must match the group code of the APC/SAPC when the **multgc=no** parameter is specified. If the adjacent point code's group code is changed, the **multgc=yes** parameter must be specified, or there must be no routes using the linkset. The **multgc** parameter value can be changed to **no** only if there are no routes with group codes different from the adjacent point code's group code.

Only one ITU-N APC/SAPC is allowed with the **multgc=no** parameter.

Only one ITU-I or 24-bit ITU-N APC/SAPC is allowed per linkset

The **apcntype** parameter can be specified only for ITU-N and ITU-N24 linksets.

A linkset cannot have both a 14-bit ITU-N and a 24-bit ITU-N APC/SAPC unless it contains only IPGWI links or IPLIM M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic

simultaneously. A linkset with the **ipgwapc=no** parameter cannot have both a 14-bit ITU-N and a 24-bit ITU-NAPC/SAPC if no links are provisioned. The SAPC cannot be a 24-bit ITU-N point code if the linkset contains IPLIM SAALTALI or E1 ATM links, which do not support 24-bit ITU-N traffic.

Private (**p-**) and private and spare (**ps-**) point codes can be assigned only to IPGW linksets (the **ipgwapc=yes** parameter is specified).

The **iptps** parameter cannot be specified for linksets that are not IPGWx.

The specified **iptps** parameter value must be divisible by 10.

The total of the **iptps** parameter values for all linksets cannot exceed the IPGWx Signaling TPS feature quantity that is enabled in the system.

The **lsusealm** parameter cannot be specified for linksets that are not IPGWx.

The **slkusealm** parameter cannot be specified for linksets that are not IPGWx.

The specified linkset name (**lsn**) cannot be the same as the specified mate linkset name (**matelsn**).

If the **action=add** parameter is specified, the specified mate linkset cannot already be assigned as the mate of the specified linkset.

When the **action=add** parameter is specified, the specified mate linkset cannot already be the mate of another linkset.

The specified mate linkset must be an existing linkset in the database.

A mated linkset can have only one assigned link.

Mated linksets can contain only SS7IPGW or IPGWI links.

Mated linksets must have APCs of the same network type.

The card that has the link assigned to the specified linkset must be inhibited before the **action=add** parameter can be specified to assign the specified mate linkset to the specified linkset.

The card that has a link in the mate linkset must be inhibited before the **action=delete** parameter can be specified to delete the mate linkset assignment.

If the **action=delete** parameter is specified to delete a mate linkset assignment, the specified mate linkset must be the mate of the specified linkset in the database.

Either an SAPC or a mate linkset (**matelsn**), but not both, can be specified with the **action=delete** parameter.

The **mtprse** parameter can be specified only if the MTP restart feature ITUMTPRS (for ITU) is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (ITUMTPRS=YES in the output).

The **slsocbit** parameter is valid only if the SLSOCB feature is turned on.

The adjacent point code cannot match the capability point code.

An APC cannot be changed to a point code that has exception routes provisioned

An APC or SAPC cannot be assigned to an IPGWx linkset that is already assigned to a route involving another linkset.

The Origin-based SCCP Routing feature must be turned on before the **gttmode** parameter can have a value of **acdcdd**, **cgacdcdd**, **acdcgdd**, **acdcgdcg**, **cgcd**, **dcg**, or **cg**.

The APC/SAPC of an existing IPGW link set cannot be changed to an APC/SAPC that is already configured in a routing key.

All links assigned to the linkset must be removed before changing the **apcntype** parameter value from **apcn** to **apcn24** or from **apcn24** to **apcn**.

The **randsls** parameter is valid only for ITU linksets.

If one or more links in a specified linkset are in service, the **apc/apca/apci/apcn/apcn24** parameters cannot be specified.

The **lst** parameter must have a value of **b**, **c**, or **d** if a network or cluster route is configured through the linkset.

Notes

Any optional parameter that is not specified is not changed.

The links that directly connect the system with a distant node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standard) signaling links, depending on how the system attributes were defined when the network was created.

Signaling link test acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system-dependent. Table 5-23 provides examples of some approximate times.

Table 5-23. Link Alignment Performance

System Size (No. of LIMs)	Link Alignment Delay (seconds)
up to 64	62
64 to 127	97
128 to 191	132
more than 191	167

When two linksets are used as a combined linkset, each linkset should have the same **slsci** and **asl8** values. **This is not enforced in the system and there is no warning mechanism if the values of these parameters are not the same for each linkset.**

The **tfacabmlq** parameter is not supported for linksets that terminate in the X.25 domain.

The **slrsrb** parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field will still not be realized. The **slsocbit** parameter must also be used to provide an even distribution across all links within the linkset. If both parameters are used for a given linkset, the SLS field is processed in the following order.

1. The SLS is modified using the Other CIC Bit option.
2. The modified SLS is modified again using the Rotated SLS Bit option.
3. The modified SLS is used by the existing linkset and link selection algorithms to select a link.
4. The ISUP message is sent out of the link containing the original, unmodified SLS field.

To modify a secondary adjacent point code, **sapc** has to be first deleted, then added again.

A 24-bit ITU-N point code can be provisioned as an SAPC only if the APC is not already a 24-bit ITU-N point code.

Only one 24-bit ITU-N point code is allowed to be provisioned as an SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a 14-bit ITU-N point code, then a 24-bit ITU-N point code cannot be provisioned as an SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a 24-bit ITU-N point code, then a 14-bit ITU-N point code cannot be provisioned as a SAPC.

For a linkset containing either low speed CCS7ITU links or IPLIM M2PA links, if the APC is a ITU-I point code, then either a 24-bit ITU-N point code or a 14-bit ITU-N point code can be provisioned as an SAPC, but not both

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The **randsls** parameter value applies only to ITU-T SCCP messages and only when random SLS generation is set to occur on a per linkset basis (the **randsls=perls** parameter has been specified in the **chg-stpopts** command).

If the **randsls=perls** parameter is specified in the **chg-stpopts** command, it is recommended that the linksets in a combined linkset be provisioned with the same **randsls** value to avoid undesired SLS distribution.

Output

The following example displays output that results if the APC was changed.

```
chg- ls: lsn=nc002:gwsn=on
  rlghncxa03w 04-01-18 08:16:14 EST  EAGLE 31.3.0
  CAUTION: Linkset APC has changed - verify remote node's APC.
  Link set table is (114 of 1024) 1% full

chg-m2pa-tset

Change M2PA Timer Set

Use this command to change M2PA timers in an M2PA timer set. The **srcset** and **tset** parameters can be used to copy from one timer set to another.

NOTE: The M2PA RFC feature introduces 20 new timer sets. M2PA timer sets created prior to this feature become M2PA Draft 6 timer sets, which are used by the M2PA Draft 6 associations. M2PA RFC associations use the RFC timer sets.

Keyword: chg-m2pa-tset

Related Commands: rtrv-m2pa-tset

Command Class: Database Administration

Parameters

:tset= (mandatory)

Timer set. This parameter specifies the name of the M2PA timer set.

Range: 1-20

:srctset= (optional)

This parameter specifies which timer set is to be copied into the timer set specified by the **tset** parameter. If the **srctset** parameter is specified, no other timer values can be specified. The timer set specified by the **srctset** parameter cannot be the same timer set that is specified by the **tset** parameter.

Range: 1-20

:t1= (optional)

T1 timer. This parameter specifies the alignment timer in milliseconds. This timer marks the amount of time M2PA waits to receive a Link Status Alignment message from the peer.

Range: 1000-350000

Default: 10000 - D6
35000 - RFC

:t16= (optional)

T16 timer. This parameter specifies the proving rate timer in milliseconds. This timer marks the amount of time between sending Link Status Proving messages while T2N or T2E is running. The T16 value is given in microseconds.

Range: 100-500000

Default: 200000

:t17= (optional)

T17 timer. This parameter specifies the ready rate timer in milliseconds. This timer marks the amount of time between sending Link Status Ready messages while T3 is running.

Range: 100-500

Default: 250

:t18= (optional)

T18 timer. This parameter specifies the processor outage rate timer. This timer marks the amount of time between sending Link Status Processor Outage messages while the link is in service.

Range: 100-10000

Default: 1000

:t2= (optional)

T2 timer. This parameter specifies the M2PA RFC timer.

The T2 timer is not used in M2PA Draft 6 timer sets.

Range: 5000-150000

Default: 20000

:t3= (optional)

T3 timer. This parameter specifies the ready timer in milliseconds. This timer marks the amount of time after proving that M2PA waits to receive a Link Status Ready message from the peer.

Range: 1000-60000

Default: 10000 - D6
2000 - RFC

:t4e= (optional)

T4E timer. This parameter specifies the emergency proving timer in milliseconds. The emergency proving timer marks the amount of time M2PA generates Link Status Proving messages during emergency proving.

Range: 400-5000

Default: 500

:t4n= (optional)

T4N timer. This parameter specifies the normal proving timer in milliseconds. This timer marks the amount of time M2PA generates Link Status Proving messages during normal proving.

Range: 1000-70000

Default: 10000 - D6

30000 - RFC

:t5= (optional)

T5 timer. This parameter specifies the busy rate timer in milliseconds. This timer marks the amount of time between sending Link Status Busy messages while the link is in service.

Range: 80-10000

Default: 1000 - D6

100 - RFC

:t6= (optional)

T6 timer. This parameter specifies the remote congestion timer. This timer marks the amount of time that a congested link will remain in service.

Range: 1000-6000

Default: 3000

:t7= (optional)

T7 timer. This parameter specifies the excessive acknowledgement delay timer. This timer marks the maximum amount of time that can pass between transmission of a user data message and receipt of an acknowledgement for that message from the peer. If this timer expires, the link is taken out of service.

Range: 200-2000

Default: 1200

:ver= (optional)

Version. This parameter specifies the M2PA version used by the association.

Range: d6, rfc

Example

```
chg-m2pa-tset:tset=1:t1=20000
```

```
chg-m2pa-tset:tset=1:t1=20000:ver=d6
```

```
chg-m2pa-tset:srctset=1:tset=2:ver=rfc
```

Dependencies

At least one optional parameter must be specified.

The **srctset** parameter and the **tset** parameter cannot specify the same timer set name.

The specified timer is not supported for the Draft 6 version of M2PA.

Either a timer value or the **srctset** parameter must be specified.

Notes

None

Output

```
chg-m2pa-tset:tset=1:t1=20000:ver=d6
```

```
rlghncxa03w 06-01-18 08:16:14 EST EAGLE 34.3.0
```

chg-map**Change Mate Applications**

Use this command to add or modify an entry in the Mated Application Part (MAP) table. A MAP table entry consists of a mate PC/SSN and its attributes. A mate point code defines an adjacent signaling point, which is considered the mated signal transfer point (STP) to the system. See the *Notes* section for additional information on multiplicity modes.

Keyword: **chg-map**

Related Commands: **dlt-map, ent-map, rtrv-map**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Primary remote point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ssn= (mandatory)

Subsystem number.

Range: 2-255

:eswt= (optional)

Entity set weight. This parameter specifies the weight assigned to each PC/SSN in a weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified. This parameter cannot be specified when adding PC/SSNs to a weighted entity set or when modifying RC or weight values for an individual PC/SSN.

Range: 1-99 none

none—Changes a weighted entity set to a non-weighted entity set.

:force= (optional)

The **force=yes** parameter must be specified to modify the **rc** parameter and the **srn**, **mrc**, or **wt** parameter in the same command.

Modification of the **srn**, **mrc**, or **wt** parameter is dependent on the parameter's current multiplicity state, which is dependent on the RC value. Changing the **rc** parameter value can change the multiplicity state, which can then cause the **srn**, **mrc**, or **wt** parameter value to become invalid.

Range: yes

:grp= (optional)

Group. This parameter specifies the concerned point code broadcast list (CSPC) group name. The CSPC is a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE 5 ISS broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA.

Range: ayyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters or **none**

none—Disassociates a concerned point code broadcast list group from the given mate application

Default: Current value.

:grpwt= (optional)

Group weight. This parameter specifies the weight assigned to each PC/SSN in a weighted RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

This parameter cannot be specified when adding PC/SSNs to a weighted entity set or when modifying RC or weight values for an individual PC/SSN.

Range: 1-99

:mapset= (optional)

MAP set ID.

Range: 1-36000 **dflt**

dflt—Default MAP set

Default: **dflt** - If the Flexible GTT Load Sharing feature is not enabled

No change to current value—If the Flexible GTT Load Sharing feature is enabled

:materc= (optional)

Mate relative cost. This parameter specifies the RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE 5 ISS determines the multiplicity mode based on the RC values (the **rc** and **materc** parameters) of the subsystem.

Range: 0-99

Default: Current value.

:mpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **mpca**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

Default: 000-000-000

:mpc/mpca/mpci/mpcn/mpcn24= (optional)

Mate remote point code.

:mpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

Default: 000-000-000

:mpcn= (optional)

ITU national point code in the format of a 5-digit ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: 00000

:mpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: 000-000-000

:mrc= (optional)

Message routing under congestion. This parameter specifies whether Class 0 messages are routed during congestion conditions.

Range: yes, no

Default: Current value.

:mssn= (optional)

Mated subsystem number. This parameter specifies the SSN that acts as a backup if the SSN fails.

Range: 2-255

Default: Current value.

:mwt= (optional)

Mate point code weight. This parameter specifies the weight assigned to the PC/SSN that is being added to a weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:rc= (optional)

Relative cost. This parameter specifies the RC assigned to a specified PC/SSN. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the **rc** and **materc** parameters) of the subsystem.

Range: 0-99

Default: Current value.

:srm= (optional)

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

Range: yes, no

Default: Current value.

:sso= (optional)

Subsystem status option. This parameter specifies whether the PC/SSN will initiate a subsystem test when a RESUME is received for the PC.

Range: on, off

on—prohibited

Default: **off**—allowed
 Primary—no change
 Mate, if entered—**off**

:thr= (optional)

Threshold. This parameter specifies the in-service threshold assigned to each PC/SSN in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

This parameter cannot be specified when adding PC/SSNs to a weighted entity set or RC group or when modifying RC or weight values for an individual PC/SSN.

If the **thr** parameter is not specified, a value of **1%** is assigned to each weighted PC/SSN.

Range: **1-100**

:wt= (optional)

Weight. This parameter specifies the new weight assigned to the primary PC/SSN. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: **1-99**

Example

The following example enters 1-1-3/10 into the MAP table and adds it to the same group as 1-1-0/10. Because 1-1-0/10 already exists in the MAP table, the rc parameter is not used.

chg-map:pc=1-1-0:ssn=10:mpc=1-1-3:mssn=10:materc=40

The following example enters 1-1-2/10 into the MAP table, and adds it to the same group as 1-1-0/10 (see above example). Because 1-1-2/10 has a lower relative cost than 1-1-3/10, it is placed into the group in relative cost order.

chg-map:pc=1-1-0:ssn=10:mpc=1-1-2:mssn=10:materc=30

The following example changes the relative cost (rc) for the specified pc/ssn pair:

chg-map:pc=1-1-0:ssn=10:rc=20

The following example changes the concerned PC broadcast list group name (grp) for the specified pc/ssn pair:

chg-map:pc=1-1-0:ssn=10:grp=abc

The following example changes the ITU-I spare point code entry s-1-12-2 and adds the spare mate point code entry s-2-23-3 in the map table:

chg-map:pci=s-1-12-2:ssn=10:rc=10:mpci=s-2-23-3:mssn=20:materc=10

The following example turns ON the sso option for pc1-1-0 and ssn10.

chg-map:pc=1-1-0:ssn=10:sso=on

The following example turns OFF the sso option for pc1-1-0 and ssn10.

chg-map:pc=1-1-0:ssn=10:sso=off

The following example does not change the current value of the sso option for the primary or the mate.

chg-map:pc=1-1-0:ssn=10:rc=10

The following example turns ON the sso option for primary and mate.

chg-map:pc=1-1-0:ssn=10:mpc=3-3-3:mssn=2:sso=on

The following example turns OFF the sso option for primary and mate.

chg-map:pc=1-1-0:ssn=10:mpc=4-4-4:mssn=2:sso=off

The following example does not change the current value for the sso option for the primary. The sso option is turned OFF for the mate, because the mate is specified but the sso parameter is not specified (the default is OFF for the mate when the mate is specified).

chg-map:pc=1-1-0:ssn=10:mpc=5-5-5:mssn=2

The following example changes the ITU-I spare s-1-12-2 entry and adds the spare mate point code s-2-23-3 entry in the map table.

chg-map:pci=s-1-12-2:ssn=10:rc=10:mpci=s-2-23-3:mssn=20:materc=10

The following example adds a new PC/SSN 1-1-3/10 in the existing MAP set 362.

chg-map:pc=1-1-1:ssn=10:mpc=1-1-3:mssn=10:materc=40:mapset=362

The following example adds a new PC/SSN 1-1-3/15 to the same load-sharing group in the default MAP set to which 1-1-1/15 belongs.

chg-map:pc=1-1-1:ssn=15:mpc=1-1-3:mssn=15:materc=40:mapset=dlft

The following example changes the RC of 1-1-1/10 in existing MAP set 362 to 20.

chg-map:pc=1-1-1:ssn=10:rc=20:mapset=362

The following example changes a non-weighted shared or non-weighted combined entity set to a weighted shared or weighted combined entity set.

chg-map:pc=1-1-1:ssn=10:eswt=30

The following example changes a non-weighted shared or non-weighted combined entity set to a weighted shared or weighted combined entity set. This example also sets a threshold value and changes the weights of all of the PC/SSNs in the entity set.

chg-map:pc=1-1-1:ssn=10:eswt=30:thr=50

The following example changes a weighted shared or weighted combined entity set to a non-weighted shared or non-weighted combined entity set.

chg-map:pc=1-1-1:ssn=10:eswt=none

The following example assigns a weight value to each PC/SSN in an RC group within a weighted entity set.

chg-map:pc=1-1-1:ssn=10:grpwt=20

The following example assigns a threshold value to each PC/SSN in an RC group within a weighted entity set.

chg-map:pc=1-1-1:ssn=10:thr=70

The following example assigns weight and threshold values to each PC/SSN in an RC group within a weighted entity set.

chg-map:pc=1-1-1:ssn=10:grpwt=20:thr=70

The following example changes the weight of an existing PC/SSN in a weighted entity set.

chg-map:pc=1-1-1:ssn=10:wt=20

The following example changes the weight of PC/SSN 1-1-1/10 and adds PC/SSN 1-2-1/10 to an existing weighted entity set.

chg-map:pc=1-1-1:ssn=10:wt=50:mpc=1-2-1:mssn=10:materc=20:mwt=30

The following example adds PC/SSN 1-3-2/10 to an existing non-weighted entity set.

chg-map:pc=1-1-1:ssn=10:mpc=1-3-2:mssn=10:materc=20:mwt=10

The following example changes the RC value and turns on MRC of an existing PC/SSN in a weighted entity set.

chg-map:pc=1-1-1:ssn=10:rc=30:mrc=yes:force=yes

The following example changes the RC value and turns on SRM of an existing PC/SSN in a weighted entity set.

chg-map:pc=1-1-1:ssn=10:rc=30:srm=yes:force=yes

The following example changes the RC value and the weight of an existing PC/SSN in a weighted entity set.

chg-map:pc=1-1-1:ssn=10:rc=30:wt=20:force=yes

Dependencies

At least one optional parameter must be specified.

The specified remote PC must exist in the MAP table.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

The specified SSN must exist for the specified remote PC.

ITU-I, ITU-N, ITU-I spare, and ITU-N spare true PCs must be entered with the same SSN.

The mate PC/SSN cannot be the same as the primary PC/SSN.

If the PC value is an ITU type (**pci**, **pcn**, or **pcn24**), the **srm=yes** parameter cannot be specified.

The network type of the specified point code must match the network type of the specified mated point code.

To mix group and PC network types, the ANSI-ITU-China SCCP Conversion feature must be on.

The network type of the specified CSPC group must match the network type of the specified PC.

The mated PC/SSN must not already exist in the MAP table.

The DPCs of the primary subsystem and the mate subsystem must be full PCs.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before an EAGLE 5 ISS true PC and the LNP subsystem can be changed.

The format of the **pcn** or **mpcn** parameter must match the format assigned with the **npcfmti** parameter of the **chg-stpopts** command.

If the **mpc** parameter is specified, the **mssn** and **materc** parameters must be specified.

A maximum of 8 mated applications is allowed.

The **sso** parameter cannot be specified with a PC that is the system true PC.

A true PC can have only one mate.

A true PC cannot be routed to itself.

If the **mssn** or **materc** parameter is specified, the **mpc** parameter must be specified.

The PC must already exist in the CPC group.

The specified CSPC broadcast list group name must already exist.

If an MPC is specified, then an MSSN must be specified.

The number of MPC Subsystem entries must not exceed the table capacity.

A maximum of 1024 unique remote point codes are allowed.

If a remote MPC is specified, then the remote MPC must exist in the Routing table.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter must not be specified. If the Flexible GTT Load Sharing feature is enabled, then the **mapset** parameter must be specified.

The specified MAP set must exist in the database.

The specified PC/SSN/MAP set must already be provisioned in the MAP table.

The EAGLE 5 ISS true PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the **wt**, **mwt**, **eswt**, **grpwt**, or **thr** parameters can be specified.

If the **eswt**, **grpwt** or **thr** parameter is specified, the **mpc** parameter cannot be specified.

If the **eswt**, **grpwt** and **thr** parameters are specified, the **rc**, **wt**, **mrc**, **srn**, **ssn** or **grp** parameters cannot be specified.

The **eswt** and **grpwt** parameters cannot be specified together in the command.

If the **eswt=none** parameter is specified, the **thr** parameter cannot be specified.

If the **mwt** parameter is specified, the **mpc** parameter must be specified.

The **mpc** parameter value must be a full point code.

If the **mpc** parameter is specified for a weighted entity set, the **mwt** parameter must be specified.

If the **mpc** parameter is specified for a non-weighted entity set, the **mwt** parameter cannot be specified.

The **eswt=none** parameter cannot be specified for a non-weighted entity set.

The **grpwt** and **thr** parameters cannot be specified for a non-weighted entity set.

If the resulting multiplicity mode (MULT field) is SOL (Solitary) or SHR (Loadsharing), the **srn** parameter and the **mrc** parameter cannot be specified.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

The MAP table contains a maximum of 3000 entries.

The specified true point code must not already exist in the MAP table.

The INP or EIR feature must be turned on before the **mpcn** parameter value can be a true point code.

The EIR feature must be turned on before the **mpci** parameter value can be a true point code.

The true point code in the entity set must be the primary PC/SSN for that entity set. The **rc** parameter value for the specified point code cannot be changed, and a new point code cannot be added that causes the true point code to no longer be the primary PC/SSN.

If the **pc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the RC group.

If the **mpc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the RC group.

The **eswt**, **grpwt**, and **thr** parameters cannot be specified for solitary or dominant entity sets.

The **srn** and **mrc** parameters cannot be specified for a solitary or shared PC/SSN in an entity set.

The INP, AINPQ, or EIR feature must be turned on before a value that is a true point code can be specified for the **mpcn** parameter.

The **force=yes** parameter must be specified before the **rc** parameter can be specified in the same command with the **srn**, **mrc**, or **wt** parameter.

The **force** parameter can be used only to specify the **rc** parameter and the **srn**, **mrc**, or **wt** parameter in the same command.

Notes

When the ANSI-ITU-China SCCP Conversion feature is turned on, the Concerned Point Code (CSPC) Group's network type can be of a different network than the mated application's network type. For example, the mated application's network type could be ANSI and the CSPC Group could be ITU or mixed with ANSI, ITU, and ITUN concerned point codes.

For the **-map** commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined loadsharing /dominant mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

The **sso** parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE 5 ISS previously marked the subsystem status “allowed” (OFF) for each PC/SSN entry. The **sso** option marks the subsystem status “prohibited” for each entry that has **sso=on**. This causes the EAGLE 5 ISS to generate an SST to the remote PC when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is turned on, MAP Load-Sharing Sets are supported. Each MAP set is identified by a new **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN in a weighted entity set.

Output

```
chg-map:pc=1-1-0:ssn=10:mpc=1-1-3:mssn=10:materc=40:mapset=362

chg-meas

Change Measurements

Use this command to change both the report and collecting status of the measurement subsystem.

NOTE: After the Measurements Platform collection function has been enabled, the collect=on/off parameter controls only the output of reports to the UI. The parameter has no effect on enabling and disabling collection and report generation for the Measurements Platform. Measurements Platform collection can, but

should not, be enabled and disabled by allowing and inhibiting the MCPM cards. (See the `alw-card` and `inh-card` command descriptions.) Report generation for the Measurements Platform is controlled by the `rept-ftp-meas` and `chg-measopts` commands.

Keyword: `chg-meas`

Related Commands: `copy-meas`, `rept-ftp-meas`, `rept-meas`, `rtrv-meas-sched`

Command Class: Link Maintenance

Parameters

:collect= (optional)

Activates or deactivates the reporting of scheduled measurements to the UI. This parameter does not affect measurements collection and generation for the Measurements Platform.

Range: `on`, `off`

Default: No change to value

System

Default: `off` - `off`

:complink= (optional)

Activates or deactivates scheduled measurement report for links.

Range: `on`, `off`

Default: Current value

:complnkset= (optional)

Activates or deactivates scheduled measurement report for linksets.

Range: `on`, `off`

Default: Current value

:gtwylnkset= (optional)

Activates or deactivates the scheduled GTWY measurement report for the linkset.

Range: `on`, `off`

Default: Current value

:gtwylsfltr= (optional)

Filters the linksets included in the GTWY report.

Range: `both`, `stp`, `seas`, `none`

both—Only gateway linksets are included in the report to the terminal and SEAS.

stp—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.

seas—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.

none—All defined linksets are included in the report to the terminal and SEAS.

:gtwystp= (optional)

Activates or deactivates the scheduled GTWY measurement report for the STP.

Range: `on`, `off`

Default: Current value

:systotstp= (optional)

Activates or deactivates scheduled measurement report for STP system totals.

Range: `on`, `off`

Default: Current value

:systotstplan= (optional)

Activates or deactivates scheduled measurement report for the STPLAN feature system totals.

Range: `on`, `off`

Default: Current value

:systottt= (optional)

Activates or deactivates scheduled measurement report for translation type system totals.

Range: on, off

Default: Current value

Example

```
chg-meas:collect=on
```

```
chg-
```

```
meas:complink=on:complnkset=on:systottt=off:systotstp=off:collect=on
```

```
chg-meas:gtwylsfltr=both
```

Dependencies

At least one optional parameter must be specified.

If the 15 Minute Measurements collection option is turned on, the **collect=on** parameter cannot be specified in this command.

Notes

Activated scheduled reports print at serial ports configured for traffic-related unsolicited messages (the **traf=yes** parameter of the **chg-trm** command).

When the Measurements Platform is not enabled, the daily maintenance scheduled reports are always allowed and cannot be inhibited.

The *Maintenance Manual* provides detailed information on measurements and measurement reports.

Output

```
chg-
```

```
meas:complink=on:complnkset=on:systottt=off:systotstp=off:collect=on
```

```
rlghncxa03w 04-01-18 17:02:57 EST EAGLE 31.3.0

```

chg-measopts

Change Measurements Options

Use this command for the following functions:

- Enable the Measurements Platform collection function
- Turn on or turn off the 15 Minute Measurements collection function
- Enable or disable the automatic generation and FTP transfer of scheduled measurements reports to the FTP server
- Turn on or off the CLLI-based file name option for measurements reports files

NOTE: After the Measurements Platform collection function has been enabled with the **platformenable=on** parameter, it cannot be disabled with this command.

Keyword: chg-measopts

Related Commands: chg-ftp-serv, chg-meas, chg-netopts, dlt-ftp-serv, ent-ftp-serv, rept-ftp-meas, rept-meas, rept-stat-meas, rtrv-ftp-serv, rtrv-measopts, rtrv-netopts

Command Class: Link Maintenance

Parameters

:all= (optional)

Activates or deactivates the automatic generation and FTP transfer of all scheduled measurements reports.

NOTE: The all parameter does not change the setting of the platformenable parameter.

Range: on, off

Default: No change to the current value

:avldlink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily availability measurement report for links.

Range: on, off

Default: No change to the current value

:avllink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly availability measurement report for links.

Range: on, off

Default: No change to the current value

:avlstplan= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly availability measurement report for STPLAN.

Range: on, off

Default: No change to the current value

:cllibasedname= (optional)

Enable or disable CLLI-based measurements report file name option.

Range: on, off

Default: No change to the current value

:collect15min= (optional)

Turns on or off the 15 Minute Measurements collection function.

Range: on, off

Default: No change to the current value

:complink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for links.

Range: on, off

Default: No change to the current value

:complnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled component measurement report for linksets.

Range: on, off

Default: No change to the current value

:gtwylnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY measurement report for linksets.

Range: on, off

Default: No change to the current value

:gtwylsdestni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link set measurement report for destination NI

Range: on, off

Default: No change to the current value

:gtwylsonismt= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY linkset measurement report for ISUP message type per linkset per originating NI

Range: on, off

Default: No change to the current value

:gtwylsorigni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link set measurement report for originating NI

Range: on, off

Default: No change to the current value

:gtwyorigni= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI.

Range: on, off

Default: No change to the current value

:gtwyorigninc= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY link measurement report for originating NI and NC.

Range: on, off

Default: No change to the current value

:gtwystp= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled GTWY measurement report for STP.

Range: on, off

Default: No change to the current value

:mtcdeir= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for Equipment Identity Register (EIR).

Range: on, off

Default: No change to the current value

:mtcdlink= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for links.

Range: on, off

Default: No change to the current value

:mtcdlnkset= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for link sets.

Range: on, off

Default: No change to the current value

:mtcdlnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report per LNP.

Range: on, off

Default: No change to the current value

:mtcdmap= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report per GSM MAP Screening server entry.

Range: on, off

Default: No change to the current value

:mtcdnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled daily maintenance measurement report per NP.

Range: on, off

Default: No change to the current value

:mtcdstp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for STP.

Range: on, off

Default: No change to the current value

:mtcdstplan= (optional)

Activates or deactivates the automatic generation and FTP transfer of the daily maintenance measurement report for STPLAN.

Range: on, off

Default: No change to the current value

:mtcheir= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report for Equipment Identity Register (EIR).

Range: on, off

Default: No change to the current value

:mtchlnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report per LNP.

Range: on, off

Default: No change to the current value

:mtchmap= (optional)

Activates or deactivates the automatic generation and FTP transfer of scheduled hourly maintenance measurement report per GSM MAP Screening server entry.

Range: on, off

Default: No change to the current value

:mtchnp= (optional)

Activates or deactivates the automatic generation and FTP transfer of the scheduled hourly maintenance measurement report per NP.

Range: on, off

Default: No change to the current value

:nmllink= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled network management measurement report for links.

Range: on, off

Default: No change to the current value

:nmllnkset= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled network management measurement report for link sets.

Range: on, off

Default: No change to the current value

:nmstp= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled network management measurement report for STP.

Range: on, off

Default: No change to the current value

:platformenable= (optional)

Enables the Measurements Platform collection function.

Range: on

Default: No change to the current value

:systotstp= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled measurement report for STP system totals.

Range: on, off

Default: No change to the current value

:systotstplan= (optional)

Activates or deactivates automatic generation and FTP transfer of the scheduled measurement report for the STPLAN feature system totals.

Range: on, off

Default: No change to the current value

:systotstt= (optional)

Activates or deactivates automatic generation and FTP transfer of scheduled measurement report for translation type system totals.

Range: on, off

Default: No change to the current value

Example

chg-measopts:platformenable=on

chg-

measopts:platformenable=on:complink=on:complnkset=on:systotstt=off

:systotstp=off

Dependencies

The Measurements Platform feature must be on before this command can be entered.

An MCPM card must be in the IS-ANR Restrict state before the Measurements Platform collection option can be enabled.

The 15 Minute Measurements feature must be enabled and turned on before the 15 Minute Measurements collection option can be turned on.

The Measurements Platform collection option must be enabled (**platformenable=on**) before the CLLI-based name option can be turned on (**cllibasedname=on**).

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **mtchlnp=on** parameter or the **mtcdlnp=on** parameter can be specified.

The GSM Map Screening (GSMSCR) feature must be turned on before the **mtcdmap=on** parameter or the **mtchmap=on** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **mtcheir=on** parameter or the **mtcdeir=on** parameter can be specified.

This command is not allowed while in upgrade mode.

Half-hour collection and report processing cannot be in progress when **collect15min=on** is specified.

Quarter-hour collection and report processing cannot be in progress when **collect15min=off** is specified.

The G-Port, A-Port, IS41 GSM Migration, or Prepaid SMS Intercept Ph1 feature must be enabled, or the INP or AINPQ feature must be turned on before the **mtchnp=on** parameter or the **mtcdnp=on** parameter can be specified.

The G-Flex, G-Port, EIR, or IGM feature must be turned on before this command can be specified.

Notes

When **all=on** is specified, the **mtchnp**, **mtchlnp**, **mtchmap**, **mtcheir**, **mtcdnp**, **mtcdlnp**, **mtcdmap**, and **mtcdeir** report will be turned on if the corresponding feature is turned on.

Activated scheduled reports are generated and transferred to the customer's FTP server

The **rept-ftp-meas** command can be used to manually generate and transfer one report at a time as needed.

The primary application of the **set-time** command is for Daylight Savings Time changes, setting the time forward or backward 1 hour. To reduce effects of **set-time** changes on measurements, the time change should be done within the first 15 minutes of any hour.

The *Maintenance Manual* provides detailed information on measurements and measurement reports.

CLLI-Based Measurements Report File Name

When the CLLI-based file name option (**cllibasedname**) is turned on, the CLLI is added to the measurements report file name, and the year is removed from the file name to ensure that the file name is equal to or fewer than 39 characters.

15 Minute Measurements

When the SEAS feature is turned on and 15 Minute Measurements collection is turned from off to on with the **collect15min=on** parameter, the message "Disabling SEAS Measurements..." is displayed at the UI.

When the SEAS feature is turned on and 15 Minute Measurements collection is running (**collect15min=on**), EAGLE 5 ISS measurements output to the SEAS interface is disabled.

When the SEAS feature is turned on and 15 Minute Measurements collection is turned from on to off with the **collect15min=off** parameter, EAGLE 5 ISS measurements output to the SEAS interface is enabled again.

NOTE: If SEAS reporting is turned on, for the 24 hours after the 15 Minute Measurements option is turned from on to off, 30-minute demand SEAS reports for time periods prior to the option status change will contain only 15 minutes of data, and SEAS will not support reporting at the xx15 and xx45 times.

Some quarter-hour measurements data might not be available for 24 hours after turning 15 Minute Measurements collection on. This condition exists for quarter-hour intervals for which 15 Minute Measurements collection has not yet occurred. Data that was collected on a 30-minute basis is available for reporting for up to 24 hours after it is collected. After the 15 Minute Measurements collection option is turned on, this data remains available on a half-hour basis (xx00 and xx30) but is not available on a quarter-hour basis (xx15 and xx45) because no data was collected on the quarter hours. After the 15 Minute Measurements collection option has been turned on for 24 hours, all 15-minute measurements data is available on a quarter-hour basis (xx00, xx15, xx30, and xx45).

In addition, full 30-minute data coverage will not be available until 24 hours after turning off the 15 Minute Measurements collection option. Reports for specific periods will always contain the amount of data collected for that period.

The action of turning 15-minute measurements feature control status on using the **chg-ctrl-feat** command also has an impact on the generation of measurements reports for **period=active**. Specifically, if the feature control status of 15-minute measurements is turned on and a report is requested for the active interval prior to the next scheduled measurements collection (based on the current 15-minute measurements status), the starting time for the period shown in the report will be incorrect. As soon as the next scheduled collection occurs, active reports will show the correct starting time. For example, if 15-minute feature control status is turned on with the **chg-ctrl-feat** command at 13:03, and the 15-minute measurements collection option is turned on using the **chg-measopts** command at 13:05, and a comp-link report for **period=active** is requested at 13:10, that report will contain an incorrect interval start time. If the same report is requested at 13:20, the start time shown in the report will be correct, because a collection occurred at 13:15.

A similar limitation exists for **period=last**. If the feature control status of 15-minute measurements is turned on and a report is requested for the last interval prior to the next scheduled measurements collection (based on the current 15-minute measurements status), the start and end times for the period shown in the report will be incorrect. The data presented in the report will correspond to the start and end times. As soon as the next scheduled collection occurs, then **period=last** reports will show the correct start and end times and the corresponding data for that interval. To generate measurements from the last collected interval before the first collection with feature control status on, a **period=specific** report will need to be entered. In the example given in the previous paragraph, the first report requested at 13:10 would not give the last interval, but the data given would correspond to the interval shown in the report. The second report requested at 13:20 would show correct start and end times and the data would correspond to the interval.

If the 15 Minute Measurements collection option is turned from on to off in the first 15 minutes of a half-hour (xx00-xx15 or xx30-xx45) and a demand report is requested in the second 15 minutes of a half-hour (xx15-xx30 or xx45-xx60) for **period=last** or **period** not specified, the report that is displayed will be the last 15-minute interval (xx00-xx15 or xx30-xx45), not the last collected 15-minute interval (xx45-xx00 or xx15-xx30). Collection did not occur during this 15-minute period, and the message "Measurements data not current" will be displayed. To report the last collected 15-minute interval, **period=specific** must be specified in the command with the correct **qh/hh** value.

The time interval in each measurements report shows which collection option was on when the measurements were collected. (This might not be the option that is currently on if the option was changed in the last 24 hours).

Table 5-24 summarizes the impacts of turning on the 15 Minute Measurements collection option.

Table 5-24. Impacts on Data Collection of Turning On the 15 Minute Measurements Option

Time Window for Turning On the Option	Impact on Data Collection
xx00-xx15	None. 15 minutes of data will be collected for the quarter-hour xx15.
xx15-xx30	The xx15 interval will contain no data. The xx30 interval will contain 30 minutes of data
xx30-xx45	None. 15 minutes of data will be collected for the quarter-hour xx15.
xx45-xx00	The xx45 interval will contain no data. The xx00 interval will contain 30 minutes of data

chg-mrn**Change Mated Relay Node**

Use this command to add new point codes or modify exiting point codes and relative costs in the Mated Relay Node (MRN) table. The Intermediate GTT Load-Sharing (IGTTLS) feature must be on to enter this command.

If IGTTLS and the Flexible GTT Load Sharing feature (FGTTLS) are on, entries are added to or changed in existing MRN sets in the MRN table.

If only IGTTLS is on, the MRN table can contain a maximum of 3000 entries. With both IGTTLS and FGTTLS on, the MRN table can contain a maximum of 6000 entries.

**CAUTION**

CAUTION: If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Enter the `rtrv-sccp-serv` command output to see if entries exist in the SCCP-SERV table. See the Notes section for additional information on multiplicity modes.

Keyword: `chg-mrn`

Related Commands: `dlt-mrn`, `ent-mrn`, `rtrv-mrn`

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:eswt= (optional)

Entity set weight. This parameter specifies the weight assigned to each PC in a weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified. This parameter cannot be specified when adding PCs to a weighted entity set or when modifying RC or weight values for an individual PC.

Range: 1-99 none

none—Changes a weighted entity set to a non-weighted entity set.

:force= (optional)

The **force=yes** parameter must be specified to modify the **rc**, **rc1**, **rc2**, **rc3**, or **rc4** parameter and the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter in the same command.

Modification of the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameters is dependent on the parameter's current multiplicity state, which is dependent on the RC value. Changing the **rc** parameter value can change the multiplicity state, which can then cause any of the weight parameter values to become invalid.

Range: yes

:grpwt= (optional)

Group weight. This parameter specifies the weight assigned to each PC in a weighted RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

This parameter cannot be specified when adding PCs to a weighted entity set or when modifying RC or weight values for an individual PC.

Range: 1-99

:mrnset= (optional)

MRN set ID.

Range: 1-3000 dflt

dflt—Default MRN set.

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca1**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca2**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca3**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca4**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
zone—0-7
area—000-255
id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000–255

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000–255

ssa—000–255

sp—000–255

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:rc= (optional)

Relative cost. This parameter specifies the relative cost of the route for the primary PC.

Range: **0-99**

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for mate PC 1.

Range: **0-99**

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for mate PC 2.

Range: **0-99**

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for mate PC 3.

Range: 0-99

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for mate PC 4.

Range: 0-99

:thr= (optional)

Threshold. This parameter specifies the in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

This parameter cannot be specified when adding PCs to a weighted entity set or RC group or when modifying RC or weight values for an individual PC.

If the **thr** parameter is not specified, a value of 1% is assigned to each weighted PC.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the new weight assigned to the primary PC. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

This parameter cannot be specified when adding PCs to a weighted entity set.

Range: 1-99

:wt1= (optional)

Weight 1. This parameter specifies the weight assigned to the mate PC 1 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt2= (optional)

Weight 2. This parameter specifies the weight assigned to the mate PC 2 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt3= (optional)

Weight 3. This parameter specifies the weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt4= (optional)

Weight 4. This parameter specifies the weight assigned to the mate PC 4 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

Example

In the following example, the system searches the MRN table for a point code of 1-1-0. If the point code is found, its relative cost is set to 40.

chg-mrn:pc=1-1-0:rc=40

In the following example, the system searches the MRN table for point code 1-1-0. Having found it, the system then searches the entity set for 1-1-10. If 1-1-10 is not in the entity set, the command will add point code 1-1-10 to the entity set and assign it a relative cost of 30.

chg-mrn:pc=1-1-0:pc1=1-1-10:rc1=30

In the following example, the system searches the MRN table for a point code of 1-1-0. Having found it, the system then searches for each of the two specified associated point codes in the entity set. If neither of the associated point codes are found, the specified point codes and their relative costs are inserted into the entity set in the MRN table.

chg-mrn:pc=1-1-0:pc1=1-1-1: rc1=10:pc2=1-1-10:rc2=20

The following examples include spare point codes.

chg-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=s-1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3

chg-

mrn:pci=s-2-2-1:rc=20:pci1=s-2-2-2:rc1=21:pci2=s-2-100-1:rc2=22

chg-mrn:pc=1-1-1:rc=30:mrnset=df1t

chg-mrn:pc=1-1-1:rc=20:pc1=2-2-2:rc1=20:mrnset=111

chg-mrn:pc=1-1-1:pc1=3-3-3:rc1=30:mrnset=111

The following examples change a non-weighted entity set to a weighted entity set.

chg-mrn:pc=1-1-1:eswt=30

chg-mrn:pc=1-1-1:eswt=30:thr=50

The following example changes a weighted entity set to a non-weighted entity set.

chg-mrn:pc=1-1-1:eswt=none

The following example assigns a weight value to each PC in a weighted RC group within a weighted entity set.

chg-mrn:pc=1-1-1:grpwt=20

The following example assigns a threshold value to each PC in the RC group within a weighted entity set.

chg-mrn:pc=1-1-1:thr=70

The following example assigns a weight and threshold to each PC in an RC group within a weighted entity set.

chg-mrn:pc=1-1-1:grpwt=20:thr=70

The following example assigns PC 1-1-1 a weight of 30.

chg-mrn:pc=1-1-1:wt=30

The following example adds PC 1-1-10 to the weighted entity set containing PC 1-1-0 and assigns PC 1-1-10 an RC of 30 and a weight of 20.

chg-mrn:pc=1-1-0:pc1=1-1-10:rc1=30:wt1=20

The following example assigns specified PCs and their associated RCs and weights to the weighted entity set that contains the point code 1-1-0.

chg-mrn:pc=1-1-0:pc1=1-1-1:rc1=10:wt1=35:pc2=1-1-10:rc2=20:wt2=20

The following example modifies both RC values and weights for PCs in an existing weighted entity set.

chg-

mrn:pc=1-1-0:rc=30:wt=10:pc1=1-1-10:rc1=20:pc2=1-1-2:wt2=5:force=yes

The following example modifies only weights for PCs in an existing weighted entity set.

chg-mrn:pc=1-1-0:wt=10:pc1=1-1-10:wt1=20:pc2=1-1-2:wt2=5

Dependencies

The Intermediate Global Title Translation Load Sharing feature must be turned on before this command can be entered.

A point code must have the same network type as existing point codes.

When a new point code is specified, its relative cost (**rc**) must be specified; a new point code and its relative cost must be entered together in the command.

A new point code that is specified in the command must not already exist in the MRN table.

The point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

The MRN table can contain a maximum of 3000 point codes. Each point code group can contain a maximum of 8 point codes.

ITU-N point codes must be in the format set by the **npcfmti** parameter of the **chg-stpopts** command. (Use the **rtrv-stpopts** command to display the STP option settings).

Mate remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

To change the relative cost for a point code, the point code must already exist in the MRN table.

The Flexible GTT Loadsharing feature must be enabled before the **mrnset** parameter can be specified..

If the Flexible GTT Loadsharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

A maximum of 3000 point codes can be entered into the MRN table.

The Weighted GTT Loadsharing feature must be turned on before the **wt/wt1/wt2/wt3/wt4**, **eswt**, **grpwt**, or **thr** parameter can be specified.

If the **rc** parameter is not specified, the **wt** parameter cannot be specified.

The **eswt** and **grpwt** parameters cannot be specified together in the command.

If the **eswt=none** parameter is specified, the **thr** parameter cannot be specified.

If the **eswt**, **grpwt**, or **thr** parameters are specified, the **rc/rc1/rc2/rc3/rc4** and **wt/wt1/wt2/wt3/wt4** parameters cannot be specified.

If the Weighted GTT Loadsharing feature is enabled, and individual PCs are being modified, the **wt** or **rc** parameter must be specified for each PC.

Alternate point codes cannot be specified when modifying an entity set or RC group.

If the **pc1/pc2/pc3/pc4** parameter is specified for a weighted entity set, a corresponding **wt1/wt2/wt3/wt4** parameter must be specified.

If the **pc1/pc2/pc3/pc4** parameter is specified for a non-weighted entity set, the **wt1/wt2/wt3/wt4** parameter cannot be specified.

The **eswt=none** parameter cannot be specified for non-weighted entity sets.

The **grpwt** and **thr** parameters cannot be specified for non-weighted entity sets.

At least one additional point code must be specified.

If the **wt/wt1/wt2/wt3/wt4** parameter is specified, the corresponding **pc/pc1/pc2/pc3/pc4** parameter must be specified.

The **pc/pc1/pc2/pc3/pc4** parameter values must be full point codes.

At least one optional parameter must be specified.

If the Weighted GTT Loadsharing feature is not enabled, and individual PCs are being modified, the **rc** parameter must be specified for each PC.

The **eswt**, **grpwt**, and **thr** parameters cannot be specified for solitary or dominant entity sets.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

The **force=yes** parameter must be specified before the **rc**, **rc1**, **rc2**, **rc3**, or **rc4** parameter can be specified in the same command with the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter.

The **force** parameter can be used only to specify the **rc**, **rc1**, **rc2**, **rc3** or **rc4** parameter and the **wt**, **wt1**, **wt2**, **wt3**, or **wt4** parameter in the same command.

Notes

For the MRN commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

All of the point codes that are specified in one command must exist in the same point code group in the MRN table.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

The EAGLE 5 ISS supports the following multiplicity modes for nodes/subsystems.

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Output

chg-netopts

Change Network Options

Use this command to change the Private Virtual Network address and PVN subnet mask values for the IP networks used by the EAGLE 5 ISS.

Keyword: **chg-netopts**

Related Commands: **rtrv-netopts**

Command Class: Database Administration

Parameters**:pvn=** (optional)

Private Virtual Network (PVN) address for the EAGLE 5 ISS. The value must be valid for a Class B network IP address.

Range: 128.0.0.0-191.255.0.0

4 numbers separated by dots in the range 128.0.0.0 to 191.255.0.0

Default: 172.20.50.0**:pvnmask=** (optional)

Subnet mask for the EAGLE 5 ISS PVN. An IP address with a restricted range of values.

Range: The value must be valid for a Class B network IP address as shown in the following table.

Table 5-25. Valid PVN Subnet Mask Values

Valid for Class B Networks	
255.255.0.0	255.255.248.0
255.255.192.0	255.255.252.0
255.255.224.0	255.255.254.0
255.255.240.0	255.255.255.128

Default: 255.255.252.0**Example**

```
chg-netopts:pvn=172.20.51.0:pvnmask=255.255.255.0
```

Dependencies

Both optional parameters must be specified in the command.

The **pvn** and **pvnmask** IP addresses cannot have the same value.

The **pvn** and **pvnmask** parameters must be specified together in the command.

The IP network address specified by the **pvn** and **pvnmask** parameters must be different from the IP network addresses assigned to Ethernet interface A or B of the IPGWx and IPLIMx cards

The IP Network address specified by the **pvn** and **pvnmask** parameters must not have a route for it in the IP Route table.

Notes

None

Output

```
chg-netopts:pvn=172.20.51.0:pvnmask=255.255.255.0

CHG-NETOPTS: MASP A - COMPLTD
;
```

chg-oap-config**Change OAP Configuration**

Use this command to configure the EAGLE 5 ISS database with the OAP configuration information. This information is sent to the specified OAP with the **act-oap-config** command.

NOTE: This command enables you to configure the OAP from the EAGLE 5 ISS terminal.
You should no longer perform this function from a terminal connected to the OAP.

Keyword: chg-oap-config

Related Commands: chg-lnp-serv, chg-sid, dlt-lnp-serv, ent-lnp-serv, rtrv-lnp-serv, rtrv-oap-config, rtrv-sid

Command Class: Database Administration

Parameters

NOTE: You must provision the EAGLE 5 ISS database with valid information for the SEAS or LNP features if you have those features turned on (as shown by SEAS=on in the output of the rtrv-feat command or by an LNP ported TNs quantity less than or equal to 12000000 in the output of the rtrv-ctrl-feat command). The information must be provisioned to clear the checksum mismatch alarm (UAM 0364).

:aipaddr= (optional)

The IP address of OAP A. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are unsure of your IP address, check with your Information Services department. You can configure this parameter even if the LNP feature is turned off.

This parameter is mandatory for LNP.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:aname= (optional)

The name assigned to OAP A.

This parameter is mandatory for LNP and SEAS.

Range: xzzzzzzzzzzzz

1 alphabetic character followed by 1 to 13 alphanumeric characters.

The value must be enclosed in double quotation marks (" "); for example,

aname="tekelec-10".

:anmask= (optional)

The netmask for OAP A. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for LNP and SEAS.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

:arouter= (optional)

The IP address of the default router assigned to OAP A. This is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are not sure if your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for LNP and SEAS.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:bipaddr= (optional)

The IP address of OAP B. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are unsure of your IP address, check with your Information Services department. You can configure this parameter even if the LNP feature is turned off.

This parameter is mandatory for LNP.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:bname= (optional)

The name assigned to OAP B.

This parameter is mandatory for LNP and SEAS.

Range: *xzzzzzzzzzzzz*

1 alphabetic character followed by 1 to 13 alphanumeric characters.

The value must be enclosed in double quotation marks (" "), for example,

bname="tekelec-10" .

:bnmask= (optional)

The netmask for OAP B. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for LNP and SEAS.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:brouter= (optional)

The IP address of the default router assigned to OAP B. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number. If you are not sure that your network requires this configuration, check with your Information Services department.

Depending on your network configuration, this parameter may be mandatory for LNP and SEAS.

Range: 4 numbers separated by dots, with each number in the range of **0-255**.

:cfg= (optional)

The number of OAPs being configured.

This parameter is mandatory for LNP and SEAS.

Range: **sngl, dual**

sngl—OAP A

dual—OAP A and OAP B

:lsms= (optional)

The LSMS to be associated with the OAP.

This parameter is mandatory for LNP.

Range: **main, shadow**

:mnsap= (optional)

The network service access point of the main LSMS. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host

number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and 5 is the machine's host number.

This parameter is mandatory for LNP if **lsms=main**.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:mpsel= (optional)

The presentation selector of the main LSMS.

This parameter is mandatory for LNP if **lsms=main**.

Range: xyyy

1-4 alphanumeric characters.

The value must be enclosed in double quotation marks (" ").

:msel= (optional)

The session selector of the main LSMS.

This parameter is mandatory for LNP if **lsms=main**.

Range: xyyy

1-4 alphanumeric characters.

The value must be enclosed in double quotation marks (" ").

:seaccli= (optional)

The common language location identifier (CLLI) of the SEAC the OAP is connecting to.

This parameter is mandatory for SEAS.

Range: ayyyyyyyyyy

1 alphabetic character followed by 1 to 10 alphanumeric characters.

:snsap= (optional)

The network service access point of the shadow LSMS. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. A sample IP address is **192.126.100.5**, where **192.126.100** is the network number and 5 is the machine's host number.

This parameter is mandatory for LNP if **lsms=shadow**.

Range: 1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:spsel= (optional)

The presentation selector of the shadow LSMS. The value is enclosed in quotes (" ").

This parameter is mandatory for LNP if **lsms=shadow**.

Range: xyyy

1 to 4 alphanumeric characters.

:sssel= (optional)

The session selector of the shadow LSMS.

This parameter is mandatory for LNP if **lsms=shadow**.

Range: xyyy

1-4 alphanumeric characters.

The value must be enclosed in double quotation marks.

:x25mode= (optional)

The mode of the x.25 link to the SEAC.

This parameter is mandatory for SEAS.

Range: **dte, dce**

:x25ps= (optional)

The x.25 packet size for the link to the SEAC.

This parameter is mandatory for SEAS.

Range: **7, 8**

Example

```
chg-oap-config:aname="tekelec-xx":bname="tekelec-xx"
```

```
chg-oap-config:aipaddr=128.132.64.15:bipaddr=128.132.64.16
```

```
chg-oap-
```

```
config:mnsap=198.89.39.22:mssel="emss":mpsel="emsp":lsms=main
```

Dependencies

At least one parameter must be specified each time the **chg-oap-config** command is entered.

The **chg-oap-config** command allows one or several parameters to be specified at a time. If the required information for a feature has already been provisioned in the EAGLE 5 ISS database, all of the parameters for that feature do not need to be specified when you make a change. It is mandatory, however, that the configuration data in the EAGLE 5 ISS and the OAP database match. The EAGLE 5 ISS generates an alarm (UAM 0364) if the EAGLE 5 ISS database is not provisioned with the same information as the OAP.

To keep OAP parameters in sync with the EAGLE 5 ISS, a checksum is created using all of the OAP configuration data stored on the EAGLE 5 ISS. The OAP also calculates this checksum based on the data it has. The OAP returns this checksum every five seconds. The EAGLE 5 ISS compares the checksums, and generates the following alarm within ten seconds of any mismatch:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
```

```
* nnnn.0364 * OAP A Configuration data checksum mismatch
```

The alarm is cleared when a maintenance poll returns a checksum that matches the EAGLE 5 ISS' checksum, indicating that the databases are back in sync. The EAGLE 5 ISS clears the alarm within five seconds. The following UAM clears the alarm:

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
```

```
nnnn.0365 OAP A Configuration data checksum alarm cleared
```

All configured parameters are included in the data checksum with the following exceptions:

:mnsap, :mpsel, and :mssel if :lsms=shadow

:snsap, :spsel, and :sssel if :lsms=main

In addition to parameters configured with the **chg-oap-config** command, the EAGLE 5 ISS' Site ID (**:clli**) and LNP service information (**serv=class/lidb/ cnam/ isvm**) are also included in the checksum. See the **chg-sid** and **ent-lnp-serv** or **chg-lnp-serv** commands for more information.

The LNP feature must be turned on before the **mnsap** and **snsap** parameters can be specified.

The SEAS feature must be turned on before the **seaccli** parameter can be specified.

The SEAS feature must be turned on before the **x25ps** parameter can be specified.

The SEAS feature must be turned on before the **x25mode** parameter can be specified.

The LNP feature must be turned on before the **spsel** and **sssel** parameters can be specified.
 The LNP feature must be turned on before the **mpsel** and **spsel** parameters can be specified.
 The LNP feature must be turned on before the **lsms** parameter can be specified.

Notes

Before starting disaster recovery operations for the LSMS and before a switchover can occur, the shadow LSMS must be stable. The shadow LSMS should have no active alarms or hardware failures and cannot be in recovery mode with any number portability administration center (NPAC).

Output

```
chg-oap-config:aipaddr=128.132.64.15:bipaddr=128.132.64.16
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
CHG_OAP_CONFIG: MASP A - COMPLTD
;
```

chg-pid

Change Password ID

Use this command to change your password.

Keyword: **chg-pid**

Related Commands: **act-user**, **chg-secu-dflt**, **chg-user**, **dact-user**, **dlt-user**, **ent-user**, **login**, **logout**, **rept-stat-user**, **rtrv-secu-dflt**, **rtrv-secu-user**, **rtrv-user**

Command Class: Basic

Parameters

This command has no parameters.

Example

chg-pid

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

When this command is executed, you are prompted to enter your current password. This prevents anyone but you from changing your password.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified on the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified on the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

Notes

When a new system is shipped, both the user ID and password are set to the system. Change these immediately to ensure system security.

Output**chg-pid**

```
rlghncxa03w 04-01-07 09:10:41 EST EAGLE 31.3.0
CHG-PID: MASP A - COMPLTD
;
```

chg-ppsopts**Change Prepaid SMS Options**

Use this command to enter Prepaid Short Message Service options (PPSOPTS) in the database. This command updates the PPSOPTS Table with entries that correspond to Intelligent Network (IN) platforms.

NOTE: The Prepaid SMS Intercept Ph1 (PPSMS) feature must be turned on before this command can be specified.

Keyword: chg-ppsopts

Related Commands: rtrv-ppsopts

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

If the CgPA GTA matches the value of the **gta** parameter during message screening, then the message falls through to GTT instead of receiving PPSMS screening.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to current value

:gta1= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

If the CgPA GTA matches the value of the **gta1** parameter during message screening, then the message falls through to GTT instead of receiving PPSMS screening.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to current value.

:gta2= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

If the CgPA GTA matches the value of the **gta2** parameter during message screening, then the message falls through to GTT instead of receiving PPSMS screening.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.

Default: No change to current value.

:gta3= (optional)

Global title address. This parameter specifies the entity address for an IN platform and determines whether an incoming message receives PPSMS screening.

If the CgPA GTA matches the value of the **gta3** parameter during message screening, then the message falls through to GTT instead of receiving PPSMS screening.

Range: 1-15 digits
Valid digits are **0-9, A-F, a-f**.
Default: No change to current value.

:ngta= (optional)

New global title address. This parameter specifies an entity address that replaces an existing entity address for an IN platform.

Range: 1-15 digits, **none**
Valid digits are **0-9, A-F, a-f**.
none—Deletes the current value.
Default: No change to current value.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**
zone—**0-7**
area—**000-255**
id—**0-7**
Enter **none** to delete the point code.
The point code **0-000-0** is not a valid point code.
Default: No change to current value.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—**s-**
nnnnn—**0-16383**
gc—**aa-zz**
m1-m2-m3-m4—**0-14** for each member; values must sum to 14
Enter **none** to delete the point code.
Default: No change to current value.

:ppt= (optional)

Prepaid portability type. This parameter specifies the IN platform where the incoming message is sent.

This parameter is mandatory if the **pc**, **ri**, or **setid** parameter is specified.

Range: **1-32**

:ri= (optional)

Routing indicator. This parameter specifies the IN platform routing indicator.

Range: **gt, ssn**

gt— Routes on the GT value.

ssn— Routes on the SSN value.

Default: No change to current value.

:setid= (optional)

Set ID. This parameter specifies the MAP set ID (if the **ri=ssn** parameter is specified) or the MRN set ID (if the **ri=gt** parameter is specified) that is used by a loadsharing IN platform.

The Flexible GTT Load Sharing (FGTTLS) feature must be enabled before this parameter can be specified. If the FGTTLS feature is not enabled, lookup is performed in the default set of the MAP table or MRN table.

Range: **1 - 36000, none, dflt**

1 - 36000, none, dflt— MAP Table

1 - 3000—MRN table

none—Lookup is not performed. This value applies only to the MRN table.

dflt—Lookup is performed in the default MAP set or MRN set.

Default: No change to current value.

Example

The following command provisions a single GTA in the PPSOPTS table.

chg-ppsopts:gta=1234

The following command provisions four GTAs in the PPSOPTS table.

chg-ppsopts:gta=1101:gta1=1102:gta2=1103:gta3=1104

The following command replaces an existing GTA with a new GTA.

chg-ppsopts:gta=1101:ngta=4567

The following command deletes a specified GTA from the PPSOPTS table.

chg-ppsopts:gta=1102:ngta=none

The following command deletes the pc, ri, and setid values for a specified IN platform.

chg-ppsopts:ppt=1:pci=none

The following command provisions a loadsharing set for a specified IN platform.

chg-ppsopts:ppt=2:setid=2

The following example provisions point code, routing indicator, and set ID values for a specified IN platform and loadsharing set.

chg-ppsopts:ppt=1:pci=1-1-1:ri=gt:setid=1

Dependencies

At least one parameter must be specified.

The PPSMS feature must be turned on before this command can be entered.

If the **ngta** parameter is specified, then the **gta** parameter must be specified.

The **gta**, **gta1**, **gta2**, and **gta3** parameters cannot have a value of **none**.

If the **ngta** parameter is specified, the **gta** parameter value must already exist in the database.

The **ngta** parameter value cannot already exist in the database.

Values for the **pci** and **pcn** parameters cannot be the same as the STP True Point Code

Values for the **pci** and **pcn** parameters cannot be the same as the STP Capability Point Code.

If the **pc**, **ri**, or **setid** parameter is specified, then the **ppt** parameter must be specified.

If the **gta1**, **gta2**, or **gta3** parameter is specified, then the **ngta** parameter cannot be specified.

The Flexible GTT Load Sharing (FGTTLS) feature must be enabled before the **setid** parameter can be specified.

If the **ri=gt** parameter is specified, then the value of the **setid** parameter must not exceed the value of the maximum MRN set ID.

The **pci** or **pcn** parameter value must already exist in the Routing Indicator table.

The value of the **gta**, **gta1**, **gta2**, or **gta3** parameter cannot already exist in the database unless the **ngta** parameter is specified.

The **pci** or **pcn** parameter and the **ri** parameter must be entered together in the command unless the **pci** or **pcn** parameter has a value of **none**.

The **gta**, **gta1**, **gta2**, and **gta3** parameters cannot have the same value.

A maximum of 32 GTA values (for 32 IN platforms) can be defined in the database.

If the Flexible GTT Load Sharing (FGTTLS) feature is enabled and the **ri=ssn** parameter is specified, then the value of the **pci** or **pcn** parameter must exist in the MAP table in the MAP set specified by the **setid** parameter, or in the default MAP set if it is not specified.

If the **ri=gt** parameter is specified, then the value of the **pci** or **pcn** parameter must exist in the MRN table.

If the **ri=ssn** parameter is specified, then the **setid=none** parameter cannot be specified.

The **pci**, **pcn**, **ri**, or **setid** parameter must be specified before the **ppt** parameter can be specified.

The **setid** parameter can be specified only if the **pci** or **pcn** parameter has been provisioned for the Prepaid Type specified by the **ppt** parameter.

The **ri** or **setid** parameter cannot be specified if the **pci/pcn** parameter is entered as **none**.

If the Flexible GTT Load Sharing (FGTTLS) feature is not enabled and the **ri=ssn** parameter is specified, then the value of the **pci** or **pcn** parameter must exist in the default MAP set of the MAP table.

Notes

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes.

The GTA digits are used during message screening to determine whether an incoming message should receive PPSMS screening. If the CgPA GTA matches the value of any of the GTA parameters, then the message falls through to GTT instead of receiving PPSMS screening.

The point code and routing indicator values (the **pci**, **pcn**, and **ri** parameters) are used to route messages from prepaid subscribers to the correct IN for credit checking.

Output

```
chg-ppsopts:ppt=1:pci=1-1-1:ri=gt:setid=1
tekelecstp 06-06-25 09:04:14 EST EAGLE 37.0
CHG-PPSOPTS: MASP A - COMPLTD
;
```

chg-prefix

Change Prefix

Use this command to enter the name of a feature, the value of a prefix used by the feature, and a prefix number that is used to refer to the prefix from another table.

Keyword: **chg-prefix**

Related Commands: **dlt-prefix**, **rtrv-ctrl-feat**, **rtrv-prefix**

Command Class: Database Administration

Example

Define a prefix with prefix number 1 for the ISUP NP with EPAP feature.

chg-prefix:feature="isup np with epap":prefix=1004:prefixnum=1

Define a prefix with prefix number 2 and specify part of the GSM MAP SRI Redirect feature name.

chg-prefix:feature="GSM MAP SRI":prefix=104:prefixnum=2

Dependencies

The specified feature name value (**feature** parameter) must be enclosed in double quotation marks (" ").

The G-Port feature must be turned on before a prefix can be defined for the GSM MAP SRI Redirect feature.

The GSM MAP SRI Redirect feature must be enabled before a GSM MAP SRI Redirect prefix can be defined.

The ISUP NP with EPAP feature must be enabled before an ISUP NP with EPAP prefix can be defined.

The specified prefix value must contain a number of digits that is equal to or greater than the minimum number of digits required by the specified feature.

The specified prefix value must contain a number of digits that is equal to or less than the maximum number of digits required by the specified feature.

The prefix value **none** is not valid for GSM MAP SRI Redirect prefixes.

The specified prefix number (**prefixnum**) must be valid for the specified feature.

The maximum number of prefixes that can be defined is:

- 3 for the GSM MAP SRI Redirect feature
- 5 values, 1 Insertion Country Code, and 1 Deletion Condition for the ISUP NP with EPAP feature
- 4 for the Prepaid IDP Query Relay feature

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output; The specified feature must be one of the following features that are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

The FEATPFX table cannot be full when a new entry is added.

The Prepaid IDP Query Relay feature must be enabled before a prefix can be provisioned for the feature.

Notes

The Prefix table contains different groups of entries based on the features that are turned on. For the GSM MAP SRI Redirect for Serving HLR feature, the entries are referenced by the VendID table, based on a Vendor Number matching a Prefix Number. For the ISUP NP with EPAP feature, the entries are referenced by the SubnetID table, based on a Subnet Number matching a Prefix Number. The Prefix table for the ISUP NP with EPAP feature also reserves Prefix Number 6 for the Insertion

Country Code value, and reserves Prefix Number 7 for the Deletion Condition value. Figure 5-8 illustrates the references to the Prefix table.

Figure 5-8. Prefix Table References

* Reserved for the ISUP NP with EPAP feature Insertion Country Code value

** Reserved for the ISUP NP with EPAP feature Deletion Condition value

For the ISUP NP with EPAP feature:

- When the Insertion Country Code (prefix number 6) is defined, the following information message appears:
ISUP NP with EPAP, Insertion Country Code value is now defined
- When the Deletion Condition (prefix number 7) is defined, the following information message appears:
ISUP NP with EPAP, Deletion Condition value is now defined

Output

chg-prefix:feature="isup np with epap":prefix=1004:prefixnum=1

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0
CHG-PREFIX: MASP A - COMPLTD
```

;

chg-pstn-pres

Change PSTN Presentation

Use this command to change the description for a previously defined Public Switched Telephone Network (PSTN) presentation value.

Output

The following command changes the description for a previously assigned PSTN.

```
chg-pstn-pres:pstncat=5000:pstnid=1:pstndesc="new description text"
```

```
rlghncxa03w 04-01-07 09:10:41 EST EAGLE 31.3.0
```

```
CHG-PSTN-PRES: MASP A - COMPLTD
```

```
;
```

chg-rte**Change Route**

Use this command to change the “cost,” or priority of a route. The cost is based on whether this route is first choice, second choice, and so on. Prioritize routes in such a way that the most direct route (fewest intermediate signaling points) is highest priority.

Keyword: **chg-rte**

Related Commands: **chg-dstn, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rtrv-dstn, rtrv-rte**

Command Class: Database Administration

Parameters

NOTE: See **"Point Code Formats and Conversion"** for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset associated with the route. The linkset name must be unique.

Range: *ayyyyyyyyy*

1 alphabetic character followed by 9 alphanumeric characters

:nlsn= (optional)

New linkset name. This parameter specifies the new linkset name associated with the route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by 9 alphanumeric characters

Default: The current value

:rc= (optional)

The relative cost (priority) for this route. Zero (**0**) is the highest priority, **99** the lowest.

Range: **0-99**

Default: The current value

Example

chg-rte:lsn=rlgh03:rc=0:dpc=244-003-001

chg-rte:dpc=25-*-*:lsn=myls:rc=10

The following example changes route for dpcn 4085-aa using linkset e1m2itun to relative cost of 30:

chg-rte:dpcn=4085-aa:lsn=e1m2itun:rc=30

The following example changes route for dpcn2410-100-14 using linkset we123624 to a relative cost of 25:

chg-rte:dpcn24=10-100-14:lsn=we123624:rc=25

The following example changes route for private point code dpcp-1-1-1 using linkset we123642 to relative cost of 50:

chg-rte:dpc=p-1-1-1:lsn=we123642:rc=50

The following example changes route for spare point code dpcns-4085-aa using linkset e1m2itun to relative cost of 30:

chg-rte:dpc=s-4085-aa:lsn=e1m2itun:rc=30

The following example changes route for private point code dpcn24p-1-100-1 using linkset we123624 to relative cost of 25:

chg-rte:dpcn24=p-1-100-1:lsn=we123624:rc=25

The following example changes route for private and spare point code dpcips-1-104-1 using linkset e1m2itui to relative cost of 30:

chg-rte:dpci=ps-1-104-1:lsn=e1m2itui:rc=30

Dependencies

No more than two linksets can be assigned the same relative cost (**rc**) value.

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a specified cluster (*ni-nc-**), attributes of the ordered routes assigned to it cannot be changed.

Combined linksets are not allowed for X.25 destinations. Routes of equal cost destined for X.25 domains are not allowed.

If the identity of a route is being changed because of a change in the linkset name, the database must not already contain the new linkset name and destination address.

If the **nlsn** parameter is specified, the link set must already exist in the database and at least one link must be assigned to the link set.

If a new linkset name (the **nlsn** parameter) is specified for an existing destination network address (*ni-*-**), or destination network cluster address (*ni-nc-**), the linkset type used in the route (see the **chg-ls** command) must be either **b**, **c**, or **d**.

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether the attributes of the ordered routes assigned to the cluster can be changed is determined by the destination address's NCAI (Nested Cluster Allowed Indicator). The NCAI is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, the cluster point code is not a nested cluster point code and the attributes of the ordered routes assigned to the cluster cannot be changed.
- If the **ncai=yes** parameter is specified, the specified destination address is a member of a provisioned nested cluster where the attributes of the ordered routes assigned to the cluster can be changed.

If the specified destination address is a network cluster address (*ni-nc-**), how the attributes of the specified ordered route are changed is determined by the setting of the destination address's NCAI.

- If the **ncai=no** parameter is specified, the attributes of the specified ordered route are changed for each signaling point code having the same network identifier (*ni*) and network cluster (*nc*) codes.
- If the **ncai=yes** parameter is specified, the specified destination address is a nested cluster where changing the attributes of the ordered routes for the cluster does not affect the attributes of the ordered routes of the provisioned members.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

Only IPGW routes are allowed for private point codes.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

Network routing is valid only if the NRT feature is on. The NRT feature is turned on with the **chg-feat** command.

When using network routing, if the destination point code has a value of * in the *nc* field, the *ncm* field must also be * (for example, **dpc=21-*-***).

At least one of the following optional parameters must be specified: **nda**, **nz nlsn**, and **nrc**.

The current destination address must be a full or a cluster point code.

All linksets that are currently assigned to a route set must still be equipped.

The specified linkset must already be assigned to a route in the Route table.

If a new link set (**nlsn** parameter) is specified in the command, that link set name must exist in the active LINK SET entity.

The specified DPC must be in the database.

Only a single route is allowed to an APC or SAPC for an IPGWx linkset. The changed route must include the APC or SAPC's IPGWx linkset with the destination equal to the APC or SAPC.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
chg-rtx: lsn=r lgh03: rc=0: dpc=244-003-001
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-RTX: MASP A - COMPLTD

```

chg-rtx

Change Exception Route

Use this command to change an exception route entry in the Routing table.

Keyword: **chg-rtx**

Related Commands: **dlt-rtx**, **ent-rtx**, **rtrv-rtx**

Command Class: Database Administration

Parameters

At least one of the following optional parameters must be specified: **opc**, **ilsn**, **si**, or **cic**.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:dpci= (mandatory)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

Destination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUPUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

Destination Point Code. 24-bit ITU national point code with subfields *main signaling area-subsignaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset associated with the specified exception route.

Range: **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **1-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:force= (optional)

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **nl sn** parameter value.

Range: **yes**

:ilsn= (optional)

Incoming linkset name. This parameter specifies the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:nl sn= (optional)

New linkset name. This parameter specifies the linkset name that replaces the linkset name associated with the specified exception route.

Range: *ayyyyyyyyy*
1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.
When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.
The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—s-, p-, ps-
zone—0-7
area—000-255
id—0-7
The point code **0-000-0** is not a valid point code.

:opc n= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:np cfmti** flexible point code option. A group code must be specified when the ITUPUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national point code with subfields *main signaling area-subsignaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255

ssa—000-255

sp—000-255

:rc= (optional)

Relative cost. This parameter specifies the relative cost associated with the specified exception route.

Range: 0-99

:si= (optional)

Service indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: 3-15

Example

This example changes the relative cost of an existing exception route.

chg-rtx:dpca=1-1-1:opca=2-3-3:lsn=lset1:rc=30

This example changes the linkset associated with the exception route.

chg-rtx:dpca=1-2-1:si=3:lsn=lset2:nlsn=lset3

This example changes the linkset and relative cost of the exception route.

chg-rtx:dpca=1-3-1:ilsn=lset2:lsn=lset3:nlsn=lset4:rc=20

chg-rtx:dpci=2-100-1:ilsn=lset2:lsn=lset4:rc=10

chg-rtx:dpci=2-100-1:si=5:lsn=lset5:rc=50

Dependencies

Only one of the **opc**, **ilns**, **cic**, or **si** parameters can be specified for a exception route entry.

If the **ecic** parameter is specified, the **cic** parameter must be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be turned on before this command can be entered.

The specified combination of exception route parameter conditions must already exist.

The linkset name, as defined by the **ilsn**, **lsn**, or **nlsn** parameter, must exist.

For the **opc**, **ilns**, CIC range (**cic** and **ecic** parameter values are not identical), and **si** criteria, only one pair of identical exception route conditions, differing only in **lsn** assignment, can exist for a given

DPC. For exception route conditions with a single CIC, there can be only one exception route per CIC value per DPC per route cost.

The network domain of the APC in the linkset specified by the **lsn** parameter must be the same network domain of the specified DPC or its alias.

The linkset APC/SAPC type and group code in the linkset specified by the **lsn** parameter must match the **dpc** parameter.

The **nlsn** parameter value cannot be the same as the **lsn** parameter value.

Either the **nlsn** parameter, the **rc** parameter, or both parameters must be specified.

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **nlsn** parameter value.

Output

```
chg-rtx:dpc=1-1-1:opc=2-3-3:lsn=lset1:rc=30
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
CHG-RTX: MASP A - COMPLTD
```

chg-sccp-serv

Change SCCP Service

Use this command to:

- Change the state of G-Flex and G-Port services to online or offline. Taking a service offline shifts the processing load to designated nodes.
- Add PCs to an existing service group for service re-route assignment, or change the relative cost (RC) of existing point codes in a group.

Keyword: **chg-sccp-serv**

Related Commands: **dlt-sccp-serv**, **rtrv-sccp-serv**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:serv= (mandatory)

Service. This parameter specifies the name of the service.

Range: **gflex**, **gport**, **mnp**

gflex — G-Flex (GSM Flexible Numbering)

gport — G-Port (GSM Mobile Number Portability)

mnp — Mobile Number Portability

:gtt= (optional)

GTT option indicator. This parameter specifies whether to use GTT as part of the re-routing procedure when the service is offline, and alternate PCs are not defined or not available.

Range: **no**, **yes**

no — Do not use GTT as part of the re-routing procedure.

yes — Use GTT as part of the re-routing procedure.

Default: **yes**

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca1**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca2****Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca3****Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca4****Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 1.

Range: **0-99**

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 2.

Range: **0-99**

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 3.

Range: **0-99**

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for alternate post-GTT-translated point code 4.

Range: **0-99**

:state= (optional)

This parameter specifies the state of the service.

Re-routing is performed when the service state is **offline**.

Range: **offline, online**

Default: **offline**

Example

```
chg-sccp-serv:serv=gport:state=online
```

```
chg-sccp-
```

```
serv:serv=gport:pca1=1-1-1:rc1=10:pca2=2-2-2:rc2=20:pca3=3-3-3:rc3=30:pca4=4-4-4:rc4=40
```

```
chg-sccp-serv:serv=gport:pci1=2-2-2:rc1=10:pci2=3-3-3:rc2=10
```

```
chg-sccp-serv:serv=gport:state=online:gtt=yes
```

Dependencies

The specified point code network type must match an existing point code network type.

The point code and relative cost parameter values must be specified together as a pair in the command.

The point code cannot match the existing site identification true point code.

The mate remote point code must already exist as destination in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

The SCCP Service table cannot be full when the command is entered. For each supported service (G-Port and G-Flex), up to 7 point codes can be specified for each network type (ANSI, ITU-I, S-ITU-I, ITU-N, S-ITU-N, and ITU-N24).

A maximum of 7 point codes can be allocated to a group or SCCP Service set.

- The A-Port or IGM feature must be enabled before the **serv=mnnp** parameter can be specified.
- The G-Flex feature must be enabled before the **serv=gflex** parameter can be specified.

- The G-Port feature must be enabled before the **serv=gport** parameter can be specified.

If the A-Port or IS41 GSM Migration (IGM) feature is enabled, the **serv=gport** parameter cannot be specified.

The A-Port or IGM feature must be enabled before the **serv=mnmp** parameter can be specified.

At least one optional parameter must be specified.

At least one PC/RC pair (for example, the **pc1** and **rc1** parameters) must be specified.

The mated point code must be a full point code.

Each new point code (specified by the **pc1**, **pc2**, **pc3** or **pc4** parameter) must already exist in the destination table. See the **ent-dstn** command.

The same point code value cannot be entered more than once in the SCCP-SERV table.

New and existing point codes cannot be entered together in the same command.

The specified MRN set must already exist in the MRN table for the SCCP-SERV table.

If the Flexible GTT Loadsharing feature is enabled, the specified point code must already exist in the specified SCCP-SERV set in the MRN table.

Notes

The SCCP Service table is part of the MRN table.

When using **chg-sccp-serv** to modify relative cost values, all of the point codes that are specified in one command must exist in the same group in the SCCP-SERV table.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

This command supports the assignment of point codes to SCCP Service point code groups used for service re-route assignment. It is used to add point codes to a service group or to change the relative cost (RC) of existing point codes in a service group.

SCCP Service groups are organized by service (G-Flex or G-Port) and PC network type (ANSI, ITU-I, Spare ITU-I, ITU-N, Spare ITU-N, or ITUN-24). Up to 7 point codes can be in a network type grouping for service re-route load sharing. Up to 4 point codes can be added or modified in one command.

The **-sccp-serv** commands differ from the **-mrn** commands in that the service name (**serv** parameter) is required instead of an existing PC in the set serving as the key.

When using **chg-sccp-serv** to add new point codes, none of the point codes that are specified in one command can exist in the group in the SCCP-SERV table and must all be added to the same SCCP-SERV group.

Output

The following example changes the SCCP service for G-Port to provision the point code and relative cost values:

```
chg-sccp-serv:serv=gport:pca1=1-1-1:rc1=10:pc2=1-1-2:rc2=20

chg-sccpopts

Change SCCP Options

Use this command to change the values of one or more of the SCCP option indicators maintained in the STP options table.

Keyword: chg-sccpopts

Related Commands: rtrv-sccpopts

Command Class: Database Administration

Parameters

:class1seq= (optional)

This parameter enables or disables Class 1 message sequencing.

Range: **on, off**

on—Enabled; Class 1 messages are guaranteed to be sequenced, but the messages are not load shared.

off—Disabled; Class 1 message sequencing is not guaranteed, but the messages might be load shared (if appropriate configuration exists).

Default: Current value

System

Default: **off**

:dfltgcpcasn= (optional)

Default calling party ANSI point code set name. This parameter specifies the system default of the GTT calling party point code set for ANSI when the **gti=0** parameter is in the incoming MSU.

Range: *aaaaaaaa*, **none**

none—Removes the provisioned CgPA PC set.

:dfltgcpcisn= (optional)

Default calling party ITU point code set name. This parameter specifies the system default of the GTT calling party point code set for ITU when the **gti=0** parameter is in the incoming MSU.

Range: *aaaaaaaa*, **none**

1 leading alphabetic character and up to 8 following alphanumeric characters.

none—Removes the provisioned CgPA PC set.

:dfltgttmode= (optional)

Default GTT mode. This parameter specifies the system default of the GTT mode hierarchy for EAGLE 5 ISS to follow when performing global title translation.

Range: **acdc, acdgc, acdgcg, cd, cdg, cg, cgc, cgacd**

acdc—Advanced CdPA GTT, CdPA GTT

acdgc—Advanced CdPA GTT, CgPA GTT, CdPA GTT

acdgcg—Advanced CdPA GTT, CdPA GTT, CgPA GTT

cd—CdPA GTT only

cdg—CdPA GTT, CgPA GTT

cg—CgPA GTT only

cgc—CgPA GTT, CdPA GTT

cgacd—CgPA GTT, Advanced CdPA GTT, CdPA GTT

:gmstcapce= (optional)

This parameter enables and disables the processing of GSM Map Screening for TCAP_Continue and TCAP_End messages.

Range: **on, off**

on—Enables GSM Map Screening for TCAP_Continue and TCAP_End messages

off—Disables GSM Map Screening for TCAP_Continue and TCAP_End messages

:mobrscpopc= (optional)

This parameter specifies the OPC that is derived from the SCCP message that is used as an exception class.

Range: **sccp, mtp, tpc**

sccp— The **opc** exception class uses the point code within the CGPA, if the CGPA portion of the message is "route-on-dpcssn". If the option is "route-on-gt", the SCCP option is not used and defaults to the MTP option.

mtp— The **opc** exception class uses the original **mtp opc** value as its criteria.

tpc— The **opc** exception class uses the EAGLE 5 ISS true point code for the criteria.

:tgtt0= (optional)

This parameter enables or disables transaction-based GTT loadsharing for SCCP Class0 UDT, Class0 XUDT, UDTS, and XUDTS messages.

Range: **udt, , none xudt, , none both, none**

udt, none— Enables transaction-based GTT loadsharing for UDTS and Class0 UDT messages.

xudt, none— Enables transaction-based GTT loadsharing for XUDTS and Class0 XUDT messages.

both, none— Enables transaction-based GTT loadsharing for UDTS, XUDTS, Class0 UDT, and Class0 XUDT messages.

none—Disables transaction-based GTT loadsharing for UDTS, XUDTS, Class0 UDT, and Class0 XUDT messages.

Default: No change to current value

System

Default: **none**

:tgtt1= (optional)

This parameter enables or disables transaction-based GTT loadsharing for SCCP Class1 UDT, Class1 XUDT, UDTS, and XUDTS messages.

Range: **udt, , none xudt, , none both, none**

udt, none— Enables transaction-based GTT loadsharing for UDTS and Class1 UDT messages.

xudt, none— Enables transaction-based GTT loadsharing for XUDTS and Class1 XUDT messages.

both, none— Enables transaction-based GTT loadsharing for UDTS, XUDTS, Class1 UDT, and Class1 XUDT messages.

none—Disables transaction-based GTT loadsharing for UDTS, XUDTS, Class1 UDT, and Class1 XUDT messages.

Default: No change to current value

System

Default: **none**

:tgttudtkey= (optional)

This parameter specifies the transaction parameter for incoming UDT(S) messages. Messages with this parameter are routed to the same load-shared PC within a MAPGROUP or MRNGROUP.

Range: **mtp, tcap, sccp**

mtp— Transaction-based GTT loadsharing is performed on the **mtp** parameter for UDT and UDTS messages.

tcap— Transaction-based GTT loadsharing is performed on the **tcap** parameter for UDT and UDTS messages.

sccp— Transaction-based GTT loadsharing is performed on the **sccp** parameter for UDT and UDTS messages.

Default: No change to current value

System

Default: **mtp**

:tgtxudtkey= (optional)

This parameter specifies the transaction parameter for incoming XUDT(S) messages. Messages with this parameter are routed to the same load-shared PC within a MAPGROUP or MRNGROUP.

Range: **mtp, sccp**

mtp — Transaction-based GTT loadsharing is performed on the **mtp** parameter for XUDT and XUDTS messages.

sccp — Transaction-based GTT loadsharing is performed on the **sccp** parameter for XUDT and XUDTS messages.

Default: No change to current value

System

Default: **mtp**

Example

```
chg-sccpopts:class1seq=on
chg-sccpopts:mobrscpopc=sccp
chg-sccpopts:tgtt0=udt
chg-sccpopts:tgtt1=xudt
chg-sccpopts:tgttudtkey=mtp
chg-sccpopts:tgtxudtkey=sccp
chg-sccpopts:gmstcapce=on
```

Dependencies

At least one optional parameter must be specified.

The Origin-based MTP Routing feature must be turned on before the **mobrscpopc** parameter can be specified.

The Origin-based SCCP Routing feature must be enabled before the **dfltggtmode** parameter can have a value of **acdcd**, **cgacdcd**, **acdcdcg**, **acdcdcg**, **cgcd**, **cdcdg**, or **cg**. The Origin-based SCCP Routing feature must be enabled before the **dfltcgpcasn** or **dfltcgpcisn** parameters can be specified.

The GTT set specified for the **dfltcgpcasn** and **dfltcgpcisn** parameters must exist in the GTTSET table.

The GTT set specified for the **dfltcgpcasn** and **dfltcgpcisn** parameters must have a set type of **cgpc** in the GTTSET table.

The GTT set domain for the **dfltcgpcasn** parameter must be an ANSI network domain, and the GTT set domain for the **dfltcgpcisn** parameter must be an ITU (including ITU-I, ITU-N, ITU-N24) network domain.

The Transaction-based GTT Loadsharing feature must be enabled before the **tgtt0**, **tgtt1**, **tgttudtkey**, or **tgtxudtkey** parameters can be specified.

The GSM Map Screening feature must be turned on before the **gmstcapce** parameter can be specified.

Notes

None.

Output

```
chg-sccpopts:dfltggtmode=acdcdcg
rlghncxa03w 06-01-18 08:16:14 EST EAGLE 35.0.0
chg-sccpopts:dfltggtmode=acdcdcg
CHG-SCCPOPTS: MASP A - COMPLTD
;
```

chg-scr-aftpc**Change Allowed Affected Point Code**

Use this command to change the attributes of a specific screening reference in the allowed affected point code category. Attributes that can be changed are the point code and the subsystem number.

Keyword: **chg-scr-aftpc**

Related Commands: **dlt-scr-aftpc**, **ent-scr-aftpc**, **rtrv-scr-aftpc**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from 1-255.

Range: 1-255 *

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see the **chg-gws-actset** and **rtrv-gws-actset** commands).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7 *

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies

the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. It specifies the new *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see

, "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *

Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 00000–16383.

Range: 00000-16383 *

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**. This halts the gateway screening process, and the message then proceeds through normal routing.

Range: stop

Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000–255.

Range: 000-255 *

:nsr= (optional)

Next screening reference (*nsr*). This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000–255.

Range: 000-255 *

:nssn= (optional)

New subsystem number. An asterisk (*) indicates the full range of values from 000–255.

Range: 000-255 *

Default: Current value

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *

Default: Current value

:pcst= (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *

Example

chg-scr-

aftpc: sr=iec: ni=240: nc=010: ncm=010: ssn=254: nni=240: nnc=003: nncm=030 : nssn=253

chg-scr-

aftpc: sr=iec: ni=240: nc=008: ncm=203: nssn=253: nsfi=stop: actname=copy

chg-scr-

aftpc: sr=aft1: zone=1: area=2: id=3: nsfi=stop: ssn=1: pcst=s: npcst=none

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new affected point code and subsystem number to be changed cannot already exist in the affected point code entity set.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, the **area=*** and **id=*** parameters must be specified.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi** parameter is specified, the parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-aftp** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

A screening reference is assigned to screen sets using the **ent-scrset** command. A screening reference can belong to multiple screen sets.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

chg-scr-
aftpc: sr=iec: ni=240: nc=010: ncm=010: ssn=254: nni=240: nnc=003: nncm=0
30 : nssn=253

rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
CHG-SCR-AFTPC: MASP A - COMPLTD
;

```

Legend

CHG-SCR-AFTPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

chg-scr-blkdpc**Change Blocked DPC**

Use this command to change the attributes of a specific screening reference in the blocked DPC category. Attributes that can be changed are the blocked destination point code, next screening function identifier, and the next screening reference.

Keyword: **chg-scr-blkdpc**

Related Commands: **dlt-scr-blkdpc**, **ent-scr-blkdpc**, **rtrv-scr-blkdpc**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, **C**

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *, C

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 0-255 *, C

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 0-255 *, C

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7, *, C

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member

(*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 0-255 *, C
Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000–255.

Range: 0-255 *, C
Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from 00000–16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see , "Point Code Formats and Conversion" for information on converting the point code format.

Range: 00000-16383 *, C
Default: Current value

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from 00000–16383.

Range: 00000-16383 *, C

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s
Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cgpa**, **destfld**, **fail**, **isup**, **stop**
cgpa—Allowed CGPA is the next screening category.
destfld—Allowed destination field (DESTFLD) is the next screening category.
fail—Discard the received message.
isup—ISUP message type (ISUP) is the next screening category.
stop—The gateway screening process ends and the message proceeds through normal routing.
Default: Current value

:nsp= (optional)

The new 24-bit ITU national signaling point (*nsp*). It specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000–255.

Range: 000-255 *, C

:nsr= (optional)

Next screening reference (*nsr*). This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: *ayyy*
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Default: Current value

:pcst= (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none**, s

Default: **none**

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Example

```
chg-scr-blkdpc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=003:nncm=030
chg-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wr2
chg-scr-blkdpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cr
chg-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nc-ncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The blocked DPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

The new blocked DPC or DPC range defined by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If an asterisk (*) is specified for the new blocked DPC, nothing that matches the specified range of DPCs can already exist in the DPC screening table for the screening reference.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **msa=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is not equal to **c-c-c** or **npc** is not equal to **c**, **nsfi=fail** must be specified and the **nsr** parameter cannot be specified.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

When changing a screening entry that has **nsfi** equal to **fail**, the **nni**, **nnc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameter values cannot equal **c**.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** and **npcst** parameters cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **nncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **zone=c** is specified, the **area** and **id** values default to the character **c** in the database.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the **ent-scr-blkdpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-
blkdpc: sr=ss01: ni=240: nc=010: ncm=010: nni=240: nnc=003: nncm=030
      rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-SCR-BLKDPC:  SCREEN SET AFFECTED - SS01 25% FULL
CHG-SCR-BLKDPC:  MASP A - COMPLTD
;
```

Legend

CHG-SCR-BLKDPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

chg-scr-blkopc

Change Blocked OPC

Use this command to change the attributes associated with a screening reference in the blocked OPC category. Attributes that can be changed are the point code, next screening function identifier, and next screening reference.

Keyword: **chg-scr-blkopc**

Related Commands: **dlt-scr-blkopc**, **ent-scr-blkopc**, **rtrv-scr-blkopc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *, C

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:narea= (optional)

The new ITU-international area value. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

Default: Current value

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:nid= (optional)

The new ITU-international ID value. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Default: Current value

:nmsa= (optional)

The new 24-bit ITU-national main signaling area (*nmsa*) value. It specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:nnc= (optional)

The new network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

Default: Current value

:nncm= (optional)

The new network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member

(*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 0-255 *, C

Default: Current value

:nni= (optional)

The new network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000–255.

Range: 0-255 *, C

Default: Current value

:nnpc= (optional)

The new ITU-national point code. An asterisk (*) indicates the full range of values from 00000–16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *, C

Default: Current value

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from 00000–16383.

Range: 00000-16383 *, C

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cgpa, fail, stop

cgpa—Allowed CGPA is the next screening category.

fail—Discard the received message.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

The new 24-bit ITU national sub signaling area (*nssa*). It specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:nzone= (optional)

The new ITU-international zone. The parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *, C

Default: Current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:ssa= (optional)

The 24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *, C

Example

chg-scr-

blkopc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020

chg-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=dpc:nsr=wrld1

chg-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop:actname=none

chg-scr-blkopc:sr=bop1:npc=128:nsfi=fail:pcst=s:npcst=none

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering *c* for "continue."

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The blocked OPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

The new blocked OPC or OPC range defined by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **msa=c** parameter is specified, the **ssa** and **sp** parameters must have a value of **c**, or the **ssa** and **sp** parameters cannot be specified. If the **ssa** and **sp** parameters are not specified when the **msa=c** parameter is specified, the **ssa** and **sp** parameter values default to **c** in the database.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **ni=c** parameter is specified, the **nc** and **ncm** parameters must have a value of **c**, or the **nc** and **ncm** parameters cannot be specified. If the **nc** and **ncm** parameters are not specified when the **ni=c** parameter is specified, the **nc** and **ncm** parameter values default to **c** in the database.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000-255**.

When changing a screening entry where the **nsfi=fail** parameter is specified, the **nni**, **nnc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and the **npc=c** parameter cannot be specified.

When changing a screening entry, and the **nsfi=fail** parameter is specified, the **nni**, **nnc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or if the **npc=c** parameter is specified, the **nsfi=fail** parameter cannot be specified, and the **nni**, **nnc**, **nncm**, **nzone**, **narea**, **nid**, **nmsa**, **nssa**, **nsp**, and **nnpc** parameters cannot be specified. Point code **c-c-c** and **npc=c** cannot be changed to a numbered point code.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or the **npc=c** parameter is not specified, the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** and **npcst** parameters can be specified.

The **pcst** and **npcst** parameters cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **zone=*** parameter is specified, the **area=*** and **id=*** parameters must be specified.

If the **zone=c** parameter is specified, the **area** and **id** parameters must have a value of **c**, or the **area** and **id** parameters cannot be specified. If the **area** and **id** parameters are not specified when the **zone=c** parameter is specified, the **area** and **id** parameter values default to **c** in the database.

Notes

When a blocked OPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue.

This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkopc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

CHG-SCR-BLKOPC: SCREEN SET AFFECTED - IEC 25% FULL

CHG-SCR-BLKOPC: MASP A - COMPLTD

;

Legend

CHG-SCR-BLKOPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

chg-scr-cdpa

Change Allowed Called Party Address

Use this command to change the attributes associated with a specific screening reference in the allowed called party address category. Attributes that can be changed are the point code, subsystem number, next screening function identifier, and next screening reference.

Keyword: **chg-scr-cdpa**

Related Commands: **dlt-scr-cdpa**, **ent-scr-cdpa**, **rtrv-scr-cdpa**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from 1-255.

Range: **1-255 ***

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code

represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: **00000-16383 ***

Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s**-).

Range: **none, s**

Default: **none**

:nscmgfid= (optional)

New SCMG format ID. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1–255**.

Range: **1-255 ***

Default: Current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **aftpc, stop**

aftpc—Allowed affected point code is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nssn= (optional)

New subsystem number. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

Default: Current value

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 *, C**

Default: Current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:scmgfid= (optional)

The SCCP management (SCMG) format ID, which consists of a one-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1-255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

Range: **1-255 ***

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7, *

Example

```
chg-scr-
cdpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:scmgfid=4:nsfi=stop:nni=6:nncm
=3 :nssn=*

chg-scr-
cdpa:sr=cdp1:ni=c:nc=c:ncm=c:ssn=1:scmgfid=3:nsfi=stop:actname=co
py

chg-scr-
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=:nsfi=stop:pcs
t=s :npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The CDPA point code, **scmgfid**, and **ssn** to be changed must already exist in the CDPA entity set.

The new CDPA point code, **scmgfid**, and **ssn** cannot already exist in the CDPA entity set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnn** parameter is specified as a range, the **nnnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnn** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi=aftpc** parameter is specified, the **ssn=1** parameter must be specified.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter is specified with a value other than **stop**, the **nsr** parameter must be specified.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **ssn** parameter is specified with a value other than **1**, the **scmgfid** parameter cannot be specified.

If the **ssn=1** parameter is specified, the **scmgfid** parameter must be specified.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-cdpa** and **dlt-scr-cdpa** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-cdpa** command to define the parameter value.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-
cdpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:scmgfid=4:nsfi=stop:nni=6:nncm

chg-scr-cgpa

Change Allowed Calling Party Address

Use this command to change the attributes associated with a specific screening reference in the allowed calling party address category. Attributes that can be changed are the point code, subsystem number, routing indicator, next screening function identifier, and next screening reference.

Keyword: chg-scr-cgpa

Related Commands: dlt-scr-cgpa, ent-scr-cgpa, rtrv-scr-cgpa

Command Class: Database Administration

Parameters

NOTE: At least one of these parameters must be specified: nsfi.

:ri= (mandatory)

Routing indicator. This parameter specifies routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: dpc, gt, *

dpc—Allow a called party address with a routing indicator value of “DPC/SSN.”

gt—Screening stops and gateway screening is bypassed as a forced pass.

*****—Allow both routing indicator values.

:sccpmt= (mandatory)

SCCP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values.

Range: 9, , *10, , *17, , *18, *

9—UDT

10—UDTS

17—XUDT

18—XUDTS

:sr= (mandatory)

Screening reference. This parameter specifies the point code’s unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

Subsystem number. An asterisk (*) indicates the full range of values from 1-255.

Range: 1-255 *

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from 000–255.

Range: 000-255 *

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. It specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: 0-255 *
Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *
Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *
Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: 00000-16383 *

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s
Default: none

:nri= (optional)

New routing indicator that provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator. An asterisk (*) indicates that both routing indicator values (**gt** and **dpc**) will be accepted in the gateway screening process.

Range: dpc, gt, *
dpc—Allow a called party address with a routing indicator value of "DPC/SSN."
gt—Screening stops and gateway screening is bypassed as a forced pass.
Default: Current value

:nsccpmt= (optional)

New SCCP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values.

Range: 9, , *10, , *17, , *18, *
Default: Current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop, tt
cdpa—Allowed called party address is the next screening category.
stop—The gateway screening process ends and the message proceeds through normal routing.
tt—Allowed translation type is the next screening category.
Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new signaling point *sp* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nsr= (optional)

Next screening reference (*nsr*). This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nssn= (optional)

New subsystem number. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

Default: Current value

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, *, C**

Default: Current value

:pcst= (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

chg-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=3:ri=dpc

```

chg-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=3:ri=dpc:nsfi=stop:actname=

chg-scr-
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcs
t=s :npcst=none

```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The CGPA point code or range of point codes, **ri**, **sccpmt**, and subsystem number or numbers to be changed must exist in the CGPA entity set.

The new CGPA point code and subsystem number cannot already exist in the CGPA entity set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

The **nsfi=cdpa** parameter can be specified only when the **ri=*** or the **ri=dpc** parameter is specified.

The **nsfi=tt** parameter can be specified only when the **ri=*** or the **ri=gt** parameter is specified.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **nncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-cgpa** and **dlt-scr-cgpa** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-cgpa** command to define the parameter value.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-cgpa:sr=iec:ni=240:nc=010:nncm=010:ssn=3:ri=dpc
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-SCR-CGPA: SCREEN SET AFFECTED - IEC 25% FULL
CHG-SCR-CGPA: MASP A - COMPLTD
;
```

Legend

CHG-SCR-CGPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

chg-scr-destfld

Change an Allowed DESTFLD

Use this command to change the attributes of a specific screening reference in the allowed affected destination field (DESTFLD) category. Attributes that can be changed are the allowed affected destination point codes.

Keyword: chg-scr-destfld

Related Commands: dlt-scr-destfld, ent-scr-destfld, rtrv-scr-destfld

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **0-255 ***

Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: **00000-16383 ***

Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: stop

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:nssa= (optional)

New 24-bit ITU national sub signaling area (*ssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7 *, C

Default: Current value

:pcst= (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *

Example

```
chg-scr-destfld:sr=iec:ni=240:nc=010:ncm=019&&020:nncm=021
chg-scr-
destfld:sr=iec:ni=240:nc=010:ncm=019&&020:nsfi=stop:actname=none
chg-scr-
destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nnc-nnc-ncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new DESTFLD defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACTNAME** field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, the **area=*** and **id=*** parameters must be specified.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

The **nsr** parameter cannot be specified in this command because **nsfi=stop** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc** parameter is specified as an asterisk (**nnc=***), the **nnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

The **nsfi=stop** parameter must be specified in the command

The entry specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk can be specified for a parameter value in the **chg-scr-destfld** and **dlt-scr-destfld** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-destfld** command to define the parameter value.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

chg-scr-destfld:sr=iec:ni=240:nc=010:ncm=019&&020:nncm=021

```
rlghncxa03w 04-01-13 11:49:47 EST EAGLE 31.3.0
CHG-SCR-DESTFLD: SCREEN SET AFFECTED - SS01 25% FULL
CHG-SCR-DESTFLD: MASP A - COMPLTD
```

;

chg-scr-dpc

Change Allowed DPC

Use this command to change the attributes of a specific screening reference in the allowed DPC category. Attributes that may be changed are the point code, next screening function identifier, and the next screening reference.

Keyword: **chg-scr-dpc**

Related Commands: **dlt-scr-dpc**, **ent-scr-dpc**, **rtrv-scr-dpc**

Command Class: Database Administration

Parameters

NOTE: At least one of these parameters must be specified: **nsfi**.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**
1 alphabetic character followed by up to 5 alphanumeric characters.
none—remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *
Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *
Default: Current value

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *
Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0-255.

Range: 0-255 *
Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 000-255.

Range: 0-255 *
Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from 00000-16383.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *
Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from 00000-16383.

Range: 00000-16383 *
Default: Current value

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s
Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc**, **cgpa**, **destfld**, **isup**, **stop**
blkdpc—Blocked DPC is the next screening category.
cgpa—Allowed CGPA is the next screening category.
destfld—Allowed destination field (DESTFLD) is the next screening category.
isup—ISUP message type (ISUP) is the next screening category.
stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsp= (optional)

The new 24-bit ITU national signaling point (*nsp*). It specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, *, C**

Default: Current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s**).

Range: **none, s**

Default: **none**

:sp= (optional)

24-bit ITU national signaling point (*sp*). This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

24-bit ITU national sub signaling area (*ssa*). This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

Example

```
chg-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=003:nncm=030
chg-scr-
dpc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=003:nncm=030:nsfi=st
op:actname=none
chg-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsm=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The DPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

The new DPC or DPC range defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **zone=*** parameter is specified, the **area=*** and **id=*** parameters must be specified.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **nncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-dpc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-dpc:sr=iec:ni=240:nc=010:nmc=010:nni=240:nnc=003:nncm=030
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
CHG-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
CHG-SCR-DPC: MASP A - COMPLTD
;
```

Legend

CHG-SCR-DPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

chg-scr-isup

Change Allowed ISUP Screening Reference

Use this command to change the attributes associated with a specific allowed ISUP screening reference in the Allowed ISUP entity set.

Keyword: chg-scr-isup

Related Commands: dlt-scr-isup, ent-scr-isup, rtrv-scr-isup

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP message type or TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**. The **tupmt** parameter is not valid for SEAS.

Range: 000-255 *

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the stop action set name.

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

Default: Current value

:nisupmt/ntupmt= (optional)

New ISUP message type or new TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**. The **ntupmt** parameter is not valid for SEAS.

Range: 000-255 *

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: stop

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsr= (optional)

Next screening reference (*nsr*). The parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

Example

chg-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2

chg-scr-isup:tupmt=20:ntupmt=1:sr=tu01

Dependencies

At least one optional parameter must be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The specified **isupmt** or **tupmt** parameter value must already exist in the specified **sr**.

The specified **nisupmt** or **ntupmt** parameter value must not already exist in the specified **sr**.

If the **nsfi** parameter is specified, the parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Notes

An asterisk can be specified for a parameter value in the **chg-scr-isup** and **dlt-scr-isup** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value.

To use ISUP message type screening, an SIO screening reference with **si=05** (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (**nsr**) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (**nsr**) value.

Output

When a screening reference is specified that is not yet associated with a screen set, the following output appears:

```
chg-scr-isup:sr=is01:isupmt=2:nsfi=stop:nisupmt=4
```

```
rlghncxa03w 04-01-14 16:45:50 EST EAGLE 31.3.0
```

```
CHG-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

When a screening reference is specified that is already associated with one or more screen sets, the following output appears:

```
chg-scr-isup:sr=is02:isupmt=9:nsfi=stop:nisupmt=8
```

```
tekelecstp 04-02-17 16:35:56 EST EAGLE 31.4.0
```

```
Extended Processing Time Required -- Please Wait
```

```
Notice: The number of screensets affected is 2.
```

```
CHG-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
```

```
CHG-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
```

```
CHG-SCR-ISUP: MASP A - COMPLTD
```

```
;
```

chg-scr-opc**Change Allowed OPC**

Use this command to change the attributes associated with a specific screening reference in the allowed OPC category. Attributes that can be changed are the point code, next screening function identifier and, next screening reference.

Keyword: **chg-scr-opc**

Related Commands: **dlt-scr-opc**, **ent-scr-opc**, **rtrv-scr-opc**

Command Class: Database Administration

Parameters

NOTE: At least one of these parameters must be specified: nnc, nncm, nni, nsfi, nsr.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

none—Remove an existing gateway screening stop action set from a gateway screening rule.

:area= (optional)

ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

ITU international ID. This parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

24-bit ITU-national main signaling area (*msa*) value. This parameter specifies the main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:narea= (optional)

New ITU-international area value. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

Default: Current value

:nc= (optional)

Network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

Network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *

:ni= (optional)

Network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *

:nid= (optional)

New ITU-international ID value. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *

Default: Current value

:nmsa= (optional)

New 24-bit ITU-national main signaling area (*nmsa*) value. This parameter specifies the new main signaling area (*msa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:nnc= (optional)

New network cluster (*nnc*). This parameter specifies one or more *nnc* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster (*nc*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

Default: Current value

:nncm= (optional)

New network cluster member (*nncm*). This parameter specifies one or more *ncm* values for the screening reference specified in the **sr** parameter. It specifies the new network cluster member (*ncm*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: 0-255 *

Default: Current value

:nni= (optional)

New network identifier (*nni*). This parameter specifies one or more *nni* values for the screening reference specified in the **sr** parameter. It specifies the new network indicator (*ni*) of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *

Default: Current value

:nnpc= (optional)

New ITU-national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you use multiple-part ITU national point codes, see

"Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *

Default: Current value

:npc= (optional)

ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: 00000-16383 *

:npcst= (optional)

New point code subtype. This parameter indicates whether the specified new ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, blkopc, cgpa, dpc, sio, stop

blkdp—Blocked DPC is the next screening category.

blkopc—Blocked OPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

dpc—Allowed DPC is the next screening category.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsp= (optional)

New 24-bit ITU national signaling point (*nsp*). This parameter specifies the new signaling point (*sp*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:nsr= (optional)

Next screening reference (*nsr*). This parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: ayy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nssa= (optional)

New 24-bit ITU national sub signaling area (*nssa*). This parameter specifies the new sub signaling area (*ssa*) of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:nzone= (optional)

New ITU-international zone. This parameter specifies a new zone for the point code represented by *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7, *, C

Default: Current value

:pcst= (optional)

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

24-bit ITU national signaling point (sp). This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:ssa= (optional)

24-bit ITU national sub signaling area (ssa). This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:zone= (optional)

ITU international zone. This parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7 *

Example

```
chg-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020
chg-scr-
opc:sr=iec:ni=240:nc=010:ncm=010:nni=240:nnc=010:nncm=020:nsfi=st
op :actname=cncf
chg-scr-opc:sr=iec:nsfi=dpc:nsr=wrld2
chg-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s:npcst=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

A new point code entry must be specified by one, and only one of the four point code parameter combinations: **nni-nnc-nncm**, **nzone-narea-nid**, **nmsa-nssa-nsp**, or **nnpc**. If the new point code entry is a different point code type than the existing point code entry, all subfields of the new point code type must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The OPC specified by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

The OPC specified by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

The new OPC or OPC range defined by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If the **area=*** parameter is specified, the **id=*** parameter must be specified.

If the **msa=*** parameter is specified, the **ssa=*** and **sp=*** parameters must be specified.

If the **ssa=*** parameter is specified, the **sp=*** parameter must be specified.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc=*** parameter is specified, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a single value or a range, a single value must be specified for the **nni** parameter.

If the **nnc=*** parameter is specified, the **nnm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **nni** and the **nnc** parameters must be specified with a single value.

If the **nni** parameter is specified as an asterisk (**nni=***) or as a range, the **nnc** and **nncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-opc** command.

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** and **npcst** parameters indicate whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
chg-scr-opc: sr=iec: ni=240: nc=010: ncm=010: nni=240: nnc=010: nncm=020
rlghncxa03w 04-01-07 12:05:33 EST EAGLE 31.3.0

CHG-SCR-OPC: MASP A - COMPLTD
;
```

Legend

CHG-SCR-OPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

chg-scr-sio

Change Allowed SIO

Use this command to change a specific screening reference in the allowed service indicator octet category. Attributes that may be changed are the network indicator, service indicator, message priority, heading codes, next screening function identifier, and next screening reference.

NOTE: To use TUP message type screening, an SIO screening reference with **si=04 (TUP)** must be defined in the SIO table. This SIO screening reference is specified as the next screening reference (nsr) value in an ISUP screening reference for screening TUP message types.

Keyword: chg-scr-sio

Related Commands: dlt-scr-sio, ent-scr-sio, rtrv-scr-sio

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **nh0** , **nh1**, **nnic**, **npri**, **nsfi**, **nsi**, **nsr**.

:nic= (mandatory)

Network indicator code. This parameter specifies whether the message originated from an international (**0**) or national (**2**) network. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–3**.

Range: 0-3 *

:pri= (mandatory)

Message priority. This parameter specifies the new message priority in the SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–3**.

Range: 0-3 *

Default: Current value

:si= (mandatory)

Service indicator. This parameter specifies the type of message. The values are defined in Telcordia TR-NWT-000246.

Range: 00, 01- 15

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:h0= (optional)

This parameter is mandatory if the service indicator (**si**) value is **00**, **01**, **02**, or **03**. Otherwise, the **h0** parameter is undefined.

Range: 0-15 *

Default: Current value or undefined

:h1= (optional)

This parameter is mandatory if the service indicator (**si**) value is **00**, **01**, **02**, or **03**. Otherwise, the **h1** parameter is undefined.

Range: 0-15 *

Default: Current value or undefined

:nh0= (optional)

New H0 heading code. This parameter specifies a new H0 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-15**.

Range: 0-15 *

Default: Current value

:nh1= (optional)

New H1 heading code. This parameter specifies a new H1 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-15**.

Range: 0-15 *

Default: Current value

:nnic= (optional)

New network indicator code. This parameter specifies the new **nic** for the screening reference specified. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: 0-3 *

Default: Current value

:npri= (optional)

New message priority. This parameter specifies the new message priority in the SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-3**.

Range: 0-3 *

Default: Current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc, cdpa, cgpa, destfld, isup, stop**

blkdpc—Blocked DPC is the next screening category.

cdpa—Allowed CDPA is the next screening category.

cgpa—Allowed CGPA is the next screening category.

destfld—Allowed destination field (DESTFLD) is the next screening category.

isup—ISUP message type (ISUP) is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsi= (optional)

New service indicator. This parameter specifies the type of message for the specified screening reference. The values are defined in Telcordia TR-NWT-000246.

Range: **0- 15**

Default: Current value

:nsr= (optional)

Next screening reference (*nsr*). This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

Example

```
chg-scr-sio:sr=iec:nic=1:si=1:h0=02:h1=03:pri=*:nh0=03&&04
```

```
chg-scr-sio:sr=iec:nic=1:si=3:pri=2:npri=1
```

```
chg-scr-sio:sr=iec:nic=1:si=3:pri=3:nnic=2:nsfi=stop:actname=copy
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

At least one attribute must be changed.

If asterisk values or ranges are specified for the new heading codes, nothing that matches the entire combination of **nic/nnic**, **si/nsi**, and the specified new heading codes and priorities can already exist in the allowed SIO category for the screening reference.

An asterisk cannot be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-sio** command.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

Use Table 5-26 to determine an acceptable combination of the **nsfi** (new entries) and **si** parameters:

Table 5-26. Acceptable **nsfi** and **si** parameter combinations (**chg-scr-sio**)

If the nsfi parameter is...	...the si parameter must be:
destfl	00
cdpa	03
cgpa	03

If the **si** parameter value is greater than 2, and the **nsi** parameter value is greater than 3, the **nh0** and **nh1** parameters are used to enter the required **h0** and **h1** parameter values.

Table 5-27 shows the valid combinations of the **h0/h1** and **nh0/nh1** parameters

Table 5-27. Valid combinations for the **h0/h1** and **nh0/nh1** parameters (**chg-scr-sio**)

If the h0 (nh0) parameter is specified as:	The h1 (nh1) parameter can be specified as:
A single value	A single value
A single value	A range
A single value	An asterisk (*) entry
A range	An asterisk (*) entry
An asterisk (*) entry	An asterisk (*) entry

The **nh0** and **nh1** parameters cannot be specified if the **nsi** parameter is specified and is not equal to **00**, **01**, or **02**.

Use Table 5-28 to determine additional acceptable combinations of specified parameter values

Table 5-28. Additional Valid chg-scr-sio Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
0	s, *	s, *, r	s	s, *, r
0	s, *	s, *, r	*, r	*
1, 2	s, *	s, *, r	s	s, *, r
Legend s = single value r = range * = asterisk u = unspecified				

Table 5-28. Additional Valid chg-scr-sio Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
1, 2	s, *	s, *, r	*, r	*
3-15	s, *	s, *, r	u	u
Legend s = single value r = range * = asterisk u = unspecified				

If the **nh0** or **nh1** parameters are specified, the parameter values must be valid with the **h0** or **h1** values currently in the database.

The **h0**, **h1**, **nh0**, and **nh1** parameters cannot be specified if the **si** parameter is not equal to **00**, **01**, or **02**, and the **nsi** parameter is not specified.

The **nnic**, **nsi**, **pri**, and **nh0/nh1** parameters must not already exist in the allowed SIO category.

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters for which attributes are to be changed must be in the allowed SIO category.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with **si=05** (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references.

A network indicator value of **1** or **3** can be used in private networks.

A network indicator value of **3** can be used in some national networks to broaden the identity of a national network, but is usually spare.

Output

chg-scr-sio:sr=iec:nic=1:si=3:pri=2:npri=1

```
rlghncxa03w 04-01-14 16:45:50 EST EAGLE 31.3.0
CHG-SCR-SIO: SCREEN SET AFFECTED - SS01 25% FULL
CHG-SCR-SIO: SCREEN SET AFFECTED - SS04 35% FULL
CHG-SCR-SIO: MASP A - COMPLTD
```

;

Legend

CHG-SCR-SIO—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

chg-scr-tt**Change Allowed Translation Type**

Use this command to change the attributes of a specific screening reference in the allowed translation type category. Attributes that can be changed are the translation type, next screening function identifier and next screening reference.

Keyword: **chg-scr-tt**

Related Commands: **dlt-scr-tt, ent-scr-tt, rtrv-scr-tt**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. This parameter specifies the global title translation type value in the called party address. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0-255**.

Range: **000-255 ***

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy, none*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **cdpa, stop**

cdpa—Allowed called party address is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsr= (optional)

Next screening reference (*nsr*). This parameter specifies which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:ntype= (optional)

New translation type. The translation type identifies the global title translation type value in the called party address. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–255**.

Range: **000-255 ***

Default: Current value

Example

```
chg-scr-tt:sr=iec:type=012:ntype=014
```

```
chg-scr-tt:sr=iec:type=012:ntype=014:nsfi=stop:actname=none
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

At least one attribute must be changed.

The new translation type cannot already exist.

If an asterisk is specified for the new allowed **type**, no other translation types can exist in the screening table.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The next screening function identifier and the next screening to be added must point to one or more existing screening references.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

If the screening reference exists, the single value or range specified for the allowed **type** to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

The screening reference and translation type for which the attributes are to be changed must exist.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk can be specified for a parameter value in the **chg-scr-tt** and **dlt-scr-tt** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-tt** command to define the parameter value.

Output

chg-scr-tt:sr=iec:type=012:ntype=014

```
rlghncxa03w 04-01-07 12:05:33 EST EAGLE 31.3.0
CHG-SCR-TT:  SCREEN SET AFFECTED - IEC  25% FULL
CHG-SCR-TT:  MASP A - COMPLTD
;
```

Legend

CHG-SCR-TT—The command entered that caused this output. This is echoed to the printer.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

chg-scrset

Change Screen Set

Use this command to change the attributes of a screen set. A screen set is a group of screening references that can be assigned to a linkset. It is defined by a name and a pointer to the first screening reference of a screen set.

Keyword: **chg-scrset**

Related Commands: **dlt-scrset**, **ent-scrset**, **rtrv-scrset**

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **nscrn**, **nsfi**, **nsr**.

:scrn= (mandatory)

Screen set name. Each screening reference must have a unique name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

Action name. This parameter specifies the name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

none—remove an existing gateway screening stop action set from a gateway screening rule.

:destfld= (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is **on**, the automatic screening is applied at the end of the provisioned screen set.

Range: **yes**, **no**

Default: Current value

:nscrn= (optional)

New screen set name.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc**, **blkopc**, **dpc**, **opc**, **sio**, **stop**
blkdpc—Blocked DPC is the next screening category.
blkopc—Blocked OPC is the next screening category.
dpc—Allowed DPC is the next screening category.
opc—Allowed OPC is the next screening category.
sio—Allowed SIO is the next screening category.
stop—The gateway screening process ends and the message proceeds through normal routing.

Default: Current value

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

Example

```
chg-scrset:scrn=ss01:nsfi=opc:nsr=iec
chg-scrset:scrn=ss02:nsfi=stop:nscrn=ss03
chg-scrset:scrn=ss02:nscrn=ss03:nsfi=stop:actname=copy
chg-scrset:scrn=ss02:nsfi=stop:nscrn=ss03:destfld=no
```

Dependencies

The new screen set name cannot be in use by another screen set.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter value must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

An existing screen set must be removed from all linksets before it can be changed.

If the **nscrn** parameter is specified, the **scrn** parameter value cannot be referenced by a linkset.

If the next screening function identifier (**nsfi**) and the next screening reference (**nsr**) does not point to an existing screen, the **nsfi** must be equal to **stop** and the **nsr** parameter must not be specified.

At least one optional parameter must be specified.

Notes

If the screen set reaches 100% capacity (indicated by the “100% full” message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to the card. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The system validates the command to verify that the specified screen set name is in use.

Output

```
chg-scrset:scrn=ss01:nsfi=opc:nsr=iec
rlghncxa03w 04-01-07 09:35:10 EST EAGLE 31.3.0
CHG-SCRSET: SCREEN SET AFFECTED - SS01 25% FULL
CHG-SCRSET: MASP A - COMPLTD
;
```

Legend

CHG-SCRSET—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

chg-secu-dflt**Change System-Wide Security-Related Defaults**

Use this command to change various system-wide, security-related defaults, such as:

- The default password aging interval
- The default user ID aging interval
- Whether to allow or prohibit multiple simultaneous logins with the same user ID
- Control of the password-complexity checking algorithm
- Login warning message text

Keyword: **chg-secu-dflt**

Related Commands: **ent-user, login, rtrv-secu-dflt**

Command Class: Security Administration

Parameters

:alpha= (optional)

This parameter specifies the minimum number of alphabetic characters (a–z) required in a new password.

Range: **0-12**

Default: Current value

System

Default: **1**

:minlen= (optional)

Minimum password length. This parameter specifies the minimum number of characters that must be in a user password.

Range: **1-12**

Default: Current value

System**Default:** 8**:multlog=** (optional)

This parameter specifies whether multiple simultaneous logins can be performed with a user ID.

Range: yes, no

yes — A user ID can be logged in to more than one terminal at the same time.

no — A user ID can be logged in to only one terminal at a time.

Default: Current value**System****Default:** no**:num=** (optional)

Number. This parameter specifies the minimum number of numeric characters (0–9) required in a new password.

Range: 0-12**Default:** Current value**System****Default:** 1**:page=** (optional)

Password age. This parameter specifies the default password aging interval for newly created user IDs. If the **page** parameter is specified in the **ent-user** command, the system uses that value; otherwise, the system uses the value specified here.

Range: 0-999**Default:** Current value**System****Default:** 90**:punc=** (optional)

Punctuation. This parameter specifies the minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character, including spaces.

Range: 0-12**Default:** Current value**System****Default:** 1**:uout=** (optional)

User ID aging interval. This parameter specifies the number of successive days a user ID can go unused (no successful login) before the system denies login. If the **uout** parameter is specified in the **ent-user** command, the system uses that value; otherwise, the system uses the value specified here.

Range: 0-999**Default:** Current value**System****Default:** 90**:wrnln=** (optional)

Warning message line number. This parameter specifies the line number within the warning message to receive the new text specified by the **wrntx** parameter.

Range: 1-20**Default:** Current value

The **wrnln** and **wrntx** parameters must be specified together in this command.

Notes

The warning message lines are displayed in the scroll area in order after a successful login; that is, line 1, line 2, and so on.

Any warning message line provisioned as a zero-length null string (" ") is not displayed in the scroll area during login.

Specify at least one blank (" ") to cause a blank line to be displayed as part of the warning message.

The following message is the default message delivered with every system:

```
NOTICE: This is a private computer system.  
Unauthorized access or use may lead to prosecution.
```

Even though the minimum number of characters allowed in a password is specified using the **minlen** parameter, the password also must satisfy the minimum value requirements specified on the **alpha**, **num**, and **punc** parameters. The actual minimum password length is the greater of either the value specified on the **minlen** parameter or the total number of characters specified on the **alpha**, **num**, and **punc** parameters.

For example, if **chg-secu-dflt:minlen=5:alpha=2:num=2:punc=2** is entered, the minimum number of password characters specified on the **minlen** parameter is 5. But the total number of characters specified in the **alpha**, **num**, and **punc** parameters is 6 (**alpha+num+punc**). The effective minimum number of characters is actually 6 rather than the 5 specified on the **minlen** parameter.

Output

The following commands create the warning message that is shown in the output after the commands. The notes that are not bold in parentheses after some commands explain the displayed output. The warning message is displayed after the user enters the login command and a password. The output example shows the command output, a login command and password prompt, and the warning message that was created with these commands. See the Notes section for this command for additional information about entering this command.

chg-secu-trm

Change Terminal Access Rights

Use this command to configure the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system for the different command classes.

Keyword: chg-secu-trm

Related Commands: rtrv-secu-trm

Command Class: Security Administration

Parameters

:trm= (mandatory)

Terminal ID. This parameter specifies the port to be configured.

Range: 1-16

:all= (optional)

All non-configurable command classes. This parameter specifies whether to configure all of the command classes.

Range: yes, no

Default: Current value

System

Default: no

:cc1= (optional)

This parameter specifies a configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) stating whether the command class is allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc2= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*

1 alphabetic character followed by 2 alphanumeric characters.

A dash and the indicator value follow the command class name:

-no—This command is not allowed for the specified terminal.

-yes—This command is allowed for the specified terminal.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:cc8= (optional)

Configurable command class name (*ayy*), and an indicator **-yes** or **-no** to specify whether the command class is allowed or not allowed for the specified terminal. The parameter value is specified in the format *ayy -yes* or *ayy -no*.

Range: *ayy*
1 alphabetic character followed by 2 alphanumeric characters.
A dash and the indicator value follow the command class name:
-no—This command is not allowed for the specified terminal.
-yes—This command is allowed for the specified terminal.

:db= (optional)
Database Administration class. Specifies whether the Database Administration class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:dbg= (optional)
Debug class. Specifies whether the Debug class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:link= (optional)
Link Maintenance class. Specifies whether the Link Maintenance class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:lnpbas= (optional)
LNP Basic class. Specifies whether the LNP Basic class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:lnpdb= (optional)
LNP Database class. Specifies whether the LNP Database class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:lnpsub= (optional)
LNP Subscription class. Specifies whether the LNP Subscription class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:pu= (optional)
Program Update class. Specifies whether the Program Update class of commands is allowed.
Range: **yes, no**
Default: Current value
System
Default: **no**

:sa= (optional)

Security Administration class. Specifies whether the Security Administration class of commands is allowed.

Range: **yes, no**

Default: Current value

System

Default: **no**

:sys= (optional)

System Maintenance class. Specifies whether the System Maintenance class of commands is allowed.

Range: **yes, no**

Default: Current value

System

Default: **no**

Example

```
chg-secu-trm:trm=3:all=yes
```

```
chg-secu-trm:trm=3:sys=yes:lnpbas=yes:lnpdb=no:lnpsub=no
```

```
chg-secu-trm:trm=3:sys=yes:lnpbas=yes:lnpdb=no:lnpsub=no:cc1=u04-  
no:cc3=u11-yes
```

Dependencies

This command is not supported on telnet terminals (terminal IDs 17-40).

At least one optional parameter must be specified.

Access rights for a terminal cannot be changed while a user is logged on to that terminal.

At least two terminal ports must be configured to have security administration authority.

The Command Class Management feature must be enabled before configurable command class name parameters (**cc1**, **cc2**, **cc3**, **cc4**, **cc5**, **cc6**, **cc7**, **cc8**) can be specified.

The value specified for a configurable command class name must be a default or provisioned command class name in the CCNAMES table.

If the **all** parameter is specified and any of the individual command classes are also specified, the individual command classes take precedence.

If the **lnpbas**, **lnpdb**, and **lnpsub** parameters is specified, the LNP feature must be turned on (see the **enable-ctrl-feat** command).

If the **all=yes** parameter is specified, but the LNP feature is not turned on, the **lnpbas**, **lnpdb**, and **lnpsub** parameters default to a **no** value for the user.

If the LNP ELAP Configuration feature is turned on, then the LNP Subscription commands cannot be accessed, and the **lnpsub** parameter cannot be specified.

Notes

Up to 8 configurable command class name parameters can be entered in one command. Additional commands can be entered to change access rights for more than 8 names. To change access rights for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

Security Administration ports whose terminal port type has been configured with a value of **oap**, **none**, or **printer** do not allow commands to be entered. Because commands cannot be entered from terminals attached to these ports, they are not considered as ports configured for security administration authority.

Output

chg-secu-trm:trm=3:all=yes

```
rlghncxa03w 04-01-15 12:30:04 EST  EAGLE 31.3.0
Command entered at terminal #13.
```

```
rlghncxa03w 04-01-15 12:30:07 EST EAGLE 31.3.0
CHG-SECU-TRM: MASP A - COMPLTD
```

i

chg-sg-opts

Change IP

Use this command to change the IP⁷ Secure Gateway protocol options.

Keyword: chg-sg-opts

Related Commands: `rtrv-sg-opts`

Command Class: Database Administration

Parameters

:drkq= (optional)

The dynamic routing key quantity. The maximum number of dynamic routing key entries in the Routing Key table of each SS7IPGW or IPGWI card.

Range: 0-2500

Default: Current value

System

Default: 0

:getcomm= (optional)

This parameter specifies the community name to use for SNMP Get and GetNext request validations. This value applies for each DCM or SSEDCM SNMP agent in the system.

[illegible]

Any string up to 32 characters in length

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ').

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: Current value

System

Default: public

:inhfepalm= (optional)

This parameter specifies whether major alarms for TALI sockets whose secondary state is NEA-FEP will be inhibited. This value applies to all IPLIM and SS7IPGW cards in the system.

Range: yes, no

yes—All TALI sockets with a secondary status of NEA-FEP are reported as IS-NR and no socket alarm is raised. For IPLIM and IPLIMI cards, where each link consists of a single TALI socket, a link alarm will still be raised when the TALI socket's secondary status is NEA-FEP, regardless of the **inhfepalm** setting.

no—NEA-FEP sockets are reported as OOS-MT and a major alarm is raised for that connection.

Default: Current value

System

Default: no

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ' -TO).

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: Current value

System

Default: tekelec

:srkq= (optional)

Static routing key quantity. The maximum number of routing key entries available in the Static Routing Key table of each SS7IPGW or IPGWI card.

Range: 0-2500

Default: Current value

System

Default: 1000

:sync= (optional)

Sync code used by TALI protocol on messages sent by SS7IPGW/IPGWI cards. This value controls whether SS7IPGW/IPGWI cards use the string "TALI" or "SASI" in the header of messages exchanged by the TALI protocol.

Range: tali, sassi

Default: Current value

System

Default: `tali`

:trapcomm= (optional)

This parameter specifies the value used in the community name field when SNMP traps are generated. This value applies for each DCM or SSEDCCM SNMP agent in the system.

[illegible]

Any string up to 32 characters in length.

If the string contains characters other than alphanumeric characters, the entire string must be enclosed in single quotes (' ').

The string can be entered in upper and lower case; the system converts upper case alphabetic characters to lower case.

Default: Current value

System

Default: public

Example

chq-sq-opts:sync=tali

chg-sg-opts:srkq=500:drkq=500

chg-sg-opts:snmpcont="John Doe 555-123-4444"

```
chg-sg-opts:getcomm=public
```

chg-sg-opts:setcomm=private

chg-sg-opts:sctpsum=adler32

chg-sg-opts:trapcomm=public

chg-sg-opts:ipgwabate=yes

chg-sg-opts:iptpsalmthresh=90

Dependencies

This command cannot be entered to change the **sync** option on a card that is not in the Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD) state.

At least one optional parameter must be specified.

The Dynamic Routing Key feature must be turned on before parameter values relating to dynamic routing keys can be changed.

The sum of the values specified for the **srkq** and **drkq** parameters must not be greater than:

- 1000 if there are any DCM cards (870-1945-xx) running the **ss7ipgw** or **ipgwi** application.
- 2500 if all cards running the **ss7ipgw** or **ipgwi** application are SSED CM cards (870-2732-xx).

Replacing an SSED CM card with a dual-slot DCM card when the sum of the values for the **srkq** and **drkq** parameters is greater than 1000 will result in the DCM card being auto- inhibited.

The number of static entries in the Routing Key table cannot exceed the value specified for the **srkq** parameter.

The **srkq** parameter value must be greater than or equal to the current number of static routing key entries. Attempts to decrease the **srkq** value below the actual current number of static routing key entries are not allowed.

If **d** is the current maximum number of actual dynamic routing keys on any card that is running the **ss7ipgw** or **ipgwi** application, then the sum of **d** and the **srkq** value cannot exceed:

- 1000 for dual-slot DCM cards running the **ss7ipgw** or **ipgwi** application
- 2500 for SSED CM cards running the **ss7ipgw** or **ipgwi** application

The total number of actual routing keys cannot not exceed 2500 per card. Effectively this means that even if the **drkq** parameter value has been decreased to less than **d**, the **srkq** value cannot be increased until **d** has first been decreased.

Notes

For DCM cards:

As shown in Table 5-29, the following conditions must be satisfied when changing routing key quantity assignments.

1. **drkq** + **srkq** cannot exceed **1000**. The total number of routing keys per card cannot exceed 1000.
2. If **d** is the current maximum number of actual dynamic routing keys on any SS7IPGW card (as reported by the **rept-stat-rtkey** command), then **d** + **srkq** must be ≤ 1000 . The total number of actual routing keys may not exceed 1000 per card. Effectively this means that even if **drkq** has been decreased to less than **d**, **srkq** cannot be increased until **d** has also decreased.
3. If **s** is the current maximum number of actual static routing keys, then **srkq** must be $\geq s$. Attempts to decrease **srkq** below **s** are not allowed.

Table 5-29. Routing Key Quantity Change Examples for DCM Cards

srkq	drkq	d	s	Change	Result
500	500	500	500	drkq to 250	OK
500	500	500	500	srkq to 250	Fails #3 above
250	250	250	250	drkq to 750	OK
250	250	250	250	srkq to 750	OK
250	250	250	250	drkq to 1000	Fails #1 above
250	250	250	250	srkq to 1000	Fails #1 and #2 above
250	250	500	250	srkq to 750	Fails #2 above
250	250	500	250	srkq to 500	OK
250	250	0	250	drkq to 1000	Fails #1 above
250	250	250	250	srkq to 200	Fails #3 above

For SSEDCM cards:

As shown in Table 5-30, the following conditions must be satisfied when changing routing key quantity assignments.

1. **drkq** + **srkq** cannot exceed 2500. The total number of routing keys per card cannot exceed 2500.
2. If **d** is the current maximum number of actual dynamic routing keys on any SS7IPGW card (as reported by the **rept-stat-rtkey** command), then **d** + **srkq** must be ≤ 2500 . The total number of actual routing keys may not exceed 2500 per card. Effectively this means that even if **drkq** has been decreased to less than **d**, **srkq** cannot be increased until **d** has also decreased.
3. If **s** is the current maximum number of actual static routing keys, then **srkq** must be $\geq s$. Attempts to decrease **srkq** below **s** are not allowed.

Table 5-30. Routing Key Quantity Change Examples for SSEDCM Cards

srkq	drkq	d	s	Change	Result
1000	1000	1000	1000	drkq to 500	OK
1000	1000	1000	1000	srkq to 500	Fails #3 above
500	500	500	500	drkq to 1500	OK
500	500	500	500	srkq to 1500	OK
500	500	500	500	drkq to 2000	OK
500	500	500	500	srkq to 2200	Fails #1 and #2 above
500	500	1000	500	srkq to 1600	Fails #2 above

Table 5-30. Routing Key Quantity Change Examples for SSED CM Cards

srkq	drkq	d	s	Change	Result
500	500	1000	500	srkq to 1500	OK
500	500	0	500	drkq to 2200	Fails #1 above
500	500	500	500	srkq to 400	Fails #3 above

The **sctpcsum** parameter specifies the configured SCTP checksum algorithm. The configured SCTP checksum algorithm takes effect on the IPLIMx/IPGWx under the following conditions:

- All associations on the card are **open=no**
- No associations are provisioned on the card

If neither condition is true, the card raises a minor alarm indicating that it is not using the configured SCTP checksum algorithm. The minor alarm is cleared and the configured SCTP checksum algorithm takes effect after all associations are set to **open=no** or after the card is reset.

Output

```
chg-sg-opts:sctpcsum=crc32c
rlghncxa03w 04-01-07 09:17:40 EST EAGLE 31.3.0
CHG-SG-OPTS: MASP A - COMPLTD
;
```

chg-sid

Change Self Identification

Use this command to change the self-identification of the system. The self-identification identifies the system to the other signaling points in the network.

CAUTION: Use this command only during periods of low traffic. If you change the point code using the **chg-sid** command, the change does not become enabled until you initialize (**init-sys**) the system.

Keyword: **chg-sid**

Related Commands: **ent-sid**, **rtrv-sid**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

CAUTION: If there are STC cards in the system for the EAGLE 5 Integrated Monitoring Support (E5IS) feature, you must turn off the EIS copy function (see the **chg-eisopts** command) before you change the system CLLI. When the CLLI change is complete, use the **chg-eisopts** command to turn on the EIS copy function again.

:cli= (optional)

Common language location identifier. This parameter, which must be unique, identifies the system in terms of its physical location:

- The first four characters identify the city, town, or locality.
- The fifth and sixth characters identify state or province.

- The seventh and eighth characters identify the building.
- The last three characters identify the traffic unit.

Range: ayyyyyyyyyy
 1 alphabetic character followed by up to 10 alphanumeric characters
 The value **none** is invalid for the CLLI.

Default: Current value.

:cpc= (optional)

ANSI capability point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **cpc**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:cpc/cpca/cpci/cpcn/cpcn24= (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

:cpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Default: No change to existing point code value.

:cpcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Default: No change to existing point code value.

:cpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: No change to existing point code value.

:cpctype= (optional)

Capability point code type. Specify whether the capability point code is for the STP or for the LNP, INP, EIR (Equipment Identity Register), G-Port, G-Flex, or MNP service.

The **cpctype** parameter is used to associate a specific service or capability (for example, Local Number Portability Query Response and Message Relay service) with one or more of the capability point codes. This parameter cannot be changed after it is assigned.

Range: **lnp, stp, inp, eir, gport, gflex, mnp**

lnp—Local Number Portability

stp—EAGLE 5 ISS

inp—INAP-based Number Portability

eir—Equipment Identity Register

gport—G-Port (GSM Mobile Number Portability)

gflex—G-Flex (GSM Flexible Numbering)

mnp—Mobile Number Portability

Default: **stp**

:ncpc= (optional)

New ANSI capability point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **ncpca**

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

Default: No change to existing point code value.

:ncpc/ncpca/ncpci/ncpcn/ncpcn24= (optional)

New capability point code. Use new CPCs to replace or delete existing CPCs.

:ncpci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

Default: No change to existing point code value.

:ncpcn= (optional)

New ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Enter **none** to delete the point code.

Default: No change to existing point code value.

:ncpcn24= (optional)

New 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Enter **none** to delete the point code.

Default: No change in point code value.

:npci= (optional)

New STP ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255, none

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

Enter **none** to delete the point code.

The point code **0-000-0** is not a valid point code.

Default: No change to existing point code value.

:npci/npcn= (optional)

New STP ITU national or international point code.

:npcn= (optional)

New STP ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

Enter **none** to delete the point code.

Default: No change to existing point code value.

:pc= (optional)

ANSI STP point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

STP point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Default: No change in point code value.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: No change in point code value.

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: No change in point code value.

:pctype= (optional)

The type of point code. The **pctype** parameter does not affect ITU destinations.

Range: **ansi, other**

ansi—Supports point codes that meet the ANSI standard

other—Supports point codes that do not meet the ANSI standard.

Default: The point code type is not changed.

Example

To change the ANSI site identification STP point code:

chg-sid:pc=10-20-30

To change the site identification PCTYPE to ANSI:

chg-sid:pctype=ANSI

To change the site identification CLLI to rlghncxa03w:

chg-sid:clli=rlghncxa03w

To add a new ANSI capability point code:

chg-sid:cpc=002-002-002

To delete an ITU-I capability point code:

chg-sid:cpci=2-003-4:ncpci=none

To change an existing ITU-N capability point code, 01234, to 02092: (The existing CPC is replaced with the new CPC.)

chg-sid:cpcn=01234:ncpcn=02092

To add a new ANSI LNP CPC:

chg-sid:cpc=002-002-002:cpctype=lnp

To change an existing ITU-N capability point code with a group code of 01234-aa to 02092-si: (The existing CPC is replaced with the new CPC.)

chg-sid:cpcn=01234-aa:ncpcn=02092-si:cpctype=stp

To add an ITU national INP CPC:

chg-sid:cpcn=04567:cpctype=inp

To change the ITU-N 24-bit site identification STP Point Code when no previous ITU-N site identification STP point code exists:

chg-sid:pcn24=1-101-1

To change the ITU-N 24-bit site identification STP Point Code when a previous ITU-N site identification STP point code exists:

chg-sid:pcn=none

chg-sid:pcn24=1-101-1

To change the ITU-N site identification STP Point Code when a previous ITU-N 24-bit site identification STP point code exists:

chg-sid:pcn24=none

chg-sid:pcn=2000

To add a new ITU-N 24-bit Capability Point Code:

chg-sid:cpcn24=22-22-22

To change an existing 24-bit ITN-N Capability Point Code 22-22-22 to 33-33-33.

chg-sid:cpcn24=22-22-22:ncpcn24=33-33-33

To add a new EIR-type Capability Point Code:

chg-sid:cpctype=eir:cpci=2-30-1

chg-sid:cpctype=eir:cpcn=123

To delete an existing ITUI Capability Spare Point Code:

chg-sid:cpci=s-2-003-4:ncpci=none

To change an existing node ITU-I spare true point code from an assigned point code value to none:

chg-sid:pci=s-1-234-5:npci=none

To change an existing ITU-N spare capability point code from s-01234 to s-02092. The existing CPC is replaced with the new CPC:

chg-sid:cpcn=s-01234:ncpcn=s-02092:cpctype=stp

To change or add new node true point codes simultaneously, for multiple point code types:

chg-sid:pca=111-111-111:pci=1-234-5:pcn=12345

chg-sid:pca=111-111-111:pci=1-234-5:pcn24=233-255-255

To change or add new node true point codes simultaneously, for ITU-I spare and ITU-N spare point code types.

chg-sid:pci=s-1-234-5:pcn=s-12345

To change an existing node ITU-N spare true point code from an assigned point code value to none:

chg-sid:pcn=s-12345:ncpn=none

To change the CPC list to include an ANSI CPC for the G-Port service:

chg-sid:cpca=1-2-3:cpctype=gport

To change the CPC list to include an ITU-I CPC for the G-Flex service:

chg-sid:cp ci=2-3-4:cpctype=gflex

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before a spare point code (prefix **s-**) can be specified in the command.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed. ITU-National point code must be a full point code.

The STP destination and capability point codes can be specified only as full point codes or **none**.

If the **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24** parameter is specified, a corresponding existing **cpc**, **cpc**, **cpci**, **cpcn**, or **cpcn24** parameter must be specified.

If the **npci** parameter or the **npcn** parameter is specified, a corresponding existing **pci** parameter value or **pcn** parameter value must be specified.

If the **cpctype** parameter is specified, the **cpc**, **cpc**, **cpci**, **cpcn**, or **cpcn24** parameter must be specified.

If the **cpctype** parameter is specified, an **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24** parameter cannot be specified in the command.

If a **pc**, **pca**, **pci**, **pcn**, or **pcn24** parameter, a **cpc**, **cpc**, **cpci**, **cpcn**, or **cpcn24** parameter, and an **npci**, **npcn**, **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24** parameter are specified, their values must be different.

The STP capability point code type (domain) must match the new STP capability point code type (domain).

When the **cpctype=lnp** parameter is specified, the **cpc** parameter or the **cpc** parameter must be specified with an ANSI point code value.

If the **cpctype=inp** parameter or the **cpctype=eir** parameter is specified, the **cpc** parameter and the **cpc** parameter cannot be specified for the point code. An ANSI point code cannot be specified.

The LNP feature must be on before the **cpctype=lnp** parameter can be specified (see the **enable-ctrl-feat** command).

NOTE: The LNP feature is "turned on" when a value is shown for the LNP ported TNs quantity in the rtrv-ctrl-feat command output.

Before the **cpctype=inp** parameter can be specified, the INP feature must be on.

Before the **cpctype=eir** parameter can be specified, the Equipment Identity Register (EIR) feature must be on.

Only the **pcn** parameter or the **pcn24** parameter can be specified; however, both parameters cannot be specified in the same command.

If a 14-bit ITU-N site ID currently exists, it must be disabled before a 24-bit ITU-N site ID can be assigned.

Only one new point code parameter (**npc**, **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24**) can be specified.

If the **pcn**, **npcn**, **cpcn**, or **ncpcn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:np cfmti** parameter.

The site CLLI code that is specified in the command cannot be the same as an existing route destination CLLI code.

The STP destination point code that is specified in the command cannot be the same as an existing STP capability point code.

The STP capability point code that is specified in the command cannot be the same as an existing STP capability point code.

The new STP capability point code that is specified in the command cannot be the same as an existing STP capability point code.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the **pc**, **cpc**, or **ncpc** parameter must be **6** or greater when the specified cluster value (*nc*) is **0**.

The true point code and capability point codes cannot be the same as existing secondary point codes.

The existing true point code cannot be changed if it is in the MAP table.

The maximum number of capability point codes that can be provisioned is 96.

The STP destination point code can be deleted by specifying a value of **none** for the **pc/pca/pci/pcn/pcn24** parameter only if there are no destination point codes in the route table that have the same point code type (**pctype**) as the STP point code to be deleted.

The parameter value **none** cannot be specified for the **cpc**, **cpcac**, **cpci**, **cpcn**, and **cpcn24** parameters.

The STP destination point code that is specified in the command cannot be the same as an existing route destination point code.

The STP capability point code that is specified in the command cannot be the same as the STP destination point code.

The STP capability point code that is specified in the command cannot be the same as an existing route destination point code.

The new STP capability point code that is specified in the command cannot be the same as the STP destination point code.

The new STP capability point code that is specified in the command cannot be the same as an existing route destination point code.

The specified **pci** or **pcn** parameter value must already exist as an STP destination point code.

The same type of STP Destination point code cannot be assigned if one already exists.

When an **ncpc**, **ncpca**, **ncpci**, **ncpcn**, or **ncpcn24** parameter is specified, the specified corresponding **cpc**, **cpcac**, **cpci**, **cpcn**, or **cpcn24** parameter value must already exist in the database.

The G-Flex feature must be turned on to change the capability point code if the **cpctype=gflex** parameter is specified.

The G-Port feature must be turned on to change the capability point code if the **cpctype=gport** parameter is specified.

If the A-Port or the IS41 GSM Migration (IGM) feature is not enabled, the **cpctype=mnpc** parameter cannot be specified.

The G-Port feature must be turned on before the **cpctype=gport** parameter can be specified.

If the A-Port or IGM feature is enabled, the **cpctype=gport** parameter cannot be specified.

Notes

If one of the **pc/pca/pci/pcn/pcn24** parameters is specified to change the point code, the following message is displayed:

CAUTION: SYSTEM SITE ID HAS BEEN CHANGED, MANUAL RE-INITIALIZATION IS NEEDED

If the redirect function refers to any of the **pc/pca** or **cpc/cpca** parameters, the following message is displayed:

CAUTION: SYSTEM SITE ID WAS REFERENCED BY THE REDIRECT FUNCTION'S DPC

When the system's CLLI has been entered into the database or changed with the **chg-sid** command, the OAP configuration in the system database must be changed to include the new CLLI value. The following warning message is displayed to remind the user to update the OAP configuration:

CAUTION: System CLLI has changed, OAP configuration is required

To update the OAP configuration, use the **act-oap-config** command.

In order for the change to be fully implemented, you must enter the **init-sys** command. This initializes the entire system system, and reloads all LIMs with the new self ID.

Only one ITU-N Site ID point code can be defined at one time (**pcn** or **pcn24**). To change from one to the other, the current Site ID must be disabled before the new one can be defined.

When the **cpctype=lnp** parameter is specified, it associates a specific service or capability (for example, local number portability query response and message relay service) with one or more of the capability point codes.

After the **cpctype** is defined, it cannot be changed.

For initial installation of a system, the self point code must be entered before any destination is entered.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

When the Site ID is changed, manual initialization is required because an MSU can be in transition between a link card and an SCCP card at the time the SID table is changed. In that case, it is possible for the Destination True Point Code to no longer appear to belong to the STP node, and SCCP would not know what to do with it. The following message is displayed:

CAUTION: SYSTEM SITE ID HAS BEEN CHANGED, MANUAL RE-INITIALIZATION IS NEEDED

The **chg-sid** command is used to identify the STP in the signaling network. STP identity is determined by the Common Language (CLLI) code and the SS7 Destination/True Point Code (DPC). For MTP message discrimination, the STP can also be identified by one or more optional capability codes representing service-related SCCP capabilities resident at the STP.

The CLLI and DPC are used as paired key fields in SEAS to uniquely identify the STP and all SEAS interactions with that STP. This command is viewed as the first command to be used in provisioning a newly commissioned STP or an STP that is being reactivated in a new location or at a new network address.

The **chg-sid** command can also be used to add capability codes to the existing set for that STP after the CLLI and DPC have been initialized. Alternatively, the STP CLLI and DPC can be provisioned locally during installation, and the command used only to add new capability codes. The STP's own CLLI must be provisioned before SEAS-STP communication, in order to support UAL-level interactions.

Output

chg-sid:pc=10-20-30

```
rlghncxa03w 04-01-07 09:17:40 EST EAGLE 31.3.0
CHG-SID: MASP A - COMPLTD
```

;

chg-slt

Change Signaling Link Test Message

Use this command to change the fields of a signaling link test message (SLTM) record in the SLTM table.

Keyword: chg-slt

Related Commands: chg-l3t, ent-ls, rtrv-ls, rtrv-slt

Command Class: Database Administration

Parameters

:sltset= (mandatory)

The signaling link test message record number in the SLTM table.

Range: 1-20

:enabled= (optional)

Enables the signaling link test message.

Range: on, off

Default: Current value.

:mode= (optional)

The SLTM mode to be used when sending test messages.

Range: special, regular

special—All SLTMs generated by the links in the linkset associated with this SLTM record are designated “special” maintenance messages.

regular—All SLTMs generated by the links in the linkset associated with this SLTM record are designated “regular” maintenance messages.

Default: Current value.

:pattern= (optional)

The test pattern to be sent with a signaling link test message.

Range: aaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

2 to 30 alphanumeric characters; valid characters are 0-9, a-f, A-F.

An even number of characters must be used in the pattern. The first two characters of the pattern must be letters.

Default: Current value.

:t1= (optional)

The T1 timer for repeating the SLTM after a failure, in seconds.

Range: 4-12

Default: Current value.

:t2= (optional)

The T2 timer for the SLTM period, in seconds.

Range: 30-90

Default: Current value.

Example

chg-slt:sltset=1:t1=6:t2=60:enabled=off:pattern=aabbccdd

Dependencies

The value of **t1** should be greater than the level 3 timer **t6**. The level 3 timer **t6** can be 0 to 6 seconds. Enter the **rtrv-l3t** command to verify the value of the level 3 timer **t6**.

Notes

None

Output

chg-slt:sltset=1:t1=6:t2=60:enabled=off:pattern=aabbccdd

rlghncxa03w 04-01-07 00:21:41 EST EAGLE 31.3.0
CHG-SLT: MASP A - COMPLTD

;

chg-srvsel**Change Service Selector**

Use this command to assign the applicable service selectors required to change a service entry for DSM services.

Keyword: chg-srvsel

Related Commands: dlt-srvsel, ent-srvsel, rtrv-srvsel

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national) and **gtin24** (24-bit ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii=2, 4; gtin=2, 4; gtin24=2, 4**

:ssn= (mandatory)

Subsystem number.

Range: **0-255 ***

:tt= (mandatory)

Translation type.

Range: **0-255**

:nai= (optional)

Nature of address indicator. The nature of address indicator can be specified by a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **sub, rsvd, natl, intl**

Default: Current value

:naiv= (optional)

Nature of address indicator value. The nature of address indicator can be specified by a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **0-127**

Default: Current value.

:np= (optional)

Numbering plan. The numbering plan can be specified by a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **e164, generic, x121, f69, e210, e212, e214, private**

Default: Current value

:npv= (optional)

Numbering plan value. The numbering plan can be specified by a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified. Table A-6 shows the mapping between the **npv** and the **np** parameters.

Range: 0-15

Default: Current value.

:nserv= (optional)

New DSM service.

NOTE: The gport service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) feature; use the smsmr service. The gport service cannot be used for Portability Check for Mobile Originated SMS; use the mnpsms service.

Range: eir, gflex, gport, inpq, inpmr, mnpsms, smsmr, idpr, idps, mnp

eir — Equipment Identity Register

gflex — GSM flexible numbering

gport — GSM number portability

inpq — INP query

inpmr — INP message relay

mnpsms — Portability Check for Mobile Originated SMS

smsmr — Prepaid SMS Intercept Phase 1

idpr — Prepaid IDP Query Relay

idps — IDP Screening for Prepaid

mnp — Mobile Number Portability

Default: No change to existing value.

:nsnai= (optional)

New service nature of address indicator.

Range: sub, natl, intl, rnidn, rnsdn, none, ccrndn

sub — Subscriber number

natl — National significant number

intl — International number

rnidn — Routing number prefix and international dialed/directory number

rnsdn — Routing number prefix and national dialed/directory number

rnsdn — Routing number prefix and subscriber dialed/directory number

none — The **nsnai** is not associated with the new DSM service.

ccrndn — Country code, routing number, and national directory number

Default: No change to existing value.

:nsnp= (optional)

New service numbering plan.

Range: e164, e212, e214, none

e164 — E.164 numbering plan

e212 — E.212 numbering plan

e214 — E.214 numbering plan

none — The **nsnp** is not associated with the new DSM service.

Default: No change to existing value.

Example

chg-srvsel:gti=2:tt=10:nserv=gflex

chg-srvsel:gtin=2:tt=253:nserv=inpq

chg-srvsel:gtin=4:tt=0:np=e164:nai=intl:nsnp=e164:nsnai=rnidn

```
chg-
srvsel:gtin=4:tt=0:np=e164:nai=sub:nsnp=e164:nsnai=rnsdn:nserv=in
pmr
chg-srvsel:gtin24=4:tt=4:np=e164:nai=intl:nsnai=rnidn
chg-srvsel:gtii=4:tt=4:np=e164:nai=intl:ssn=10:nserv=eir
```

Dependencies

The G-Flex feature must be turned on before the **nserv=gflex** parameter can be specified.

The INP feature must be turned on before the **nserv=inp** or **nserv=inpq** parameter can be specified.

The G-Port feature must be turned on before the **nserv=gport** parameter can be specified.

The Prepaid SMS Intercept Phase 1 (PPSMS) feature must be turned on before the **nserv=smsmr** parameter can be specified.

The Portability Check for Mobile Originated SMS feature must be turned on before the **nserv=mnpsms** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **nserv=eir** parameter can be specified.

At least one of the following parameters must be specified: **nsnp**, **nsnai**, or **nserv**.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

The value **4** is not valid for the **gtia** parameter.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, no **np(v)** and **nai(v)** parameter combinations can be specified.

When the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. The parameters can be specified in these combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

When the **nserv** parameter value is **inp**, **inpq**, **gport**, **eir**, **mnpsms**, or **smsmr**, the **gtia** and **gti** parameters cannot be specified.

When the **nserv=inp** parameter is specified, the **nsnp=e164** parameter must be specified.

When the **nsnai** parameter value **rnidn**, **rrndn**, or **rnsdn** is specified, an **nserv** parameter value of **inp**, **gport**, **smsmr**, or **mnpsms** must be specified.

When the **nserv=inpq** parameter is specified, the **gtii** parameter cannot be specified.

When the **nserv=gport** parameter is specified, the **gtia** and **gti** parameters cannot be specified.

When the **nserv** parameter value **inpq**, **eir**, or **idpr** is specified, the **nsnai** and **nsnp** parameters cannot be specified.

When the **nserv=gflex** parameter is specified, the **nsnai=none** and **nsnp=none** parameters cannot be specified.

When the **nserv=inp** parameter is specified, the **nsnai** parameter must be specified.

An entry must already exist that exactly matches the **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

When the **nsnai=ccrndn** parameter is specified, the **nserv** parameter value **gport**, **mnpsms**, or **smsmr** must be specified.

When the **nserv** parameter value **inp**, **smsmr**, **mnpsms**, or **gport** is specified, the **nsnp=e164** parameter must be specified.

When the **nserv** parameter value **gflex**, **gport**, **inpmr**, **mnpmsms**, or **smsmr** is specified, the **nsnai** and **nsnp** parameters must be specified.

The **nsnai=none** parameter can be specified only when the **nserv=inpq** parameter is specified.

An ITU Service Selector cannot be entered when the **ansigflex** STP option is enabled (see the **chg-stpotps** command).

The Prepaid IDP Query Relay feature must be turned on before the **nserv=idpr** parameter can be specified.

When the **nserv=idpr** parameter is specified, the only valid mandatory service parameters are **tt**, **ssn**, **gtii** and **gtin**. When the **nserv=idpr** parameter is specified, the only valid optional parameters are **np** and **nai**.

The IDP Screening for Prepaid feature must be turned on before the **nserv=idps** parameter can be specified.

When the **nserv=idps** parameter is specified, the only valid optional service parameters are **np** and **nai**.

When the **nserv=idps** parameter is specified, the only valid mandatory service parameters are **tt**, **serv**, **ssn**, **gtin**, and **gtii**.

Notes

None

Output

```
chg-srvsel:gti=2:tt=10:nserv=gflex
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
Service Selector table is (114 of 1024) 11% full

```

chg-ss-appl

Change Subsystem Application

Use this command to change the application status in the database.

Keyword: **chg-ss-appl**

Related Commands: **dlt-ss-appl**, **ent-ss-appl**, **rtrv-ss-appl**

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: **lnp**, **inp**, **eir**

:nstat= (optional)

Status.

Range: **offline**, **online**

Example

```
chg-ss-appl:appl=lnp:nstat=offline
```

```
chg-ss-appl:appl=inp:nstat=online
```

```
chg-ss-appl:appl=eir:nstat=online
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **chg-ss-appl:appl=lnp** command can be entered.

The INP feature must be turned on before the **chg-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **chg-ss-appl:appl=eir** command can be entered.

The application type (**appl** parameter) must already exist in the SS-APPL table.

The subsystem must be in the opposite state of the requested change.

The subsystem must be inhibited before **status=offline** can be specified.

Notes

After the LNP subsystem is inhibited before performing an LNP ELAP bulk download, **chg-ss-appl:appl=lnp:nstat=offline** must be entered to ensure that the subsystem remains down through DSM card replacements and reloads.

Output

chg-ss-appl:appl=lnp:nstat=offline

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
CHG-SS-APPL: MASP A - COMPLTD
;
```

chg-ss7opts

Change SS7 Options

Use this command to update (change by simple replacement) the values of one or more of the SS7 option indicators maintained in the STP Options table. SS7 options can modify normal handling of SS7 traffic.

Keyword: **chg-ss7opts**

Related Commands: **rtrv-ss7opts**

Command Class: Database Administration

Parameters

:discardtfc= (optional)

This parameter enables and disables the handling of TFC traffic from ITU-I networks. If enabled, TFC traffic from ITU-I networks will be discarded.

Range: **on, off**

on — Discard TFC ITU-I traffic

off — Do not discard TFC ITU-I traffic

System

Default: **off**

:discardtfcn= (optional)

This parameter enables and disables the handling of TFC traffic from ITU-N networks. If enabled, TFC traffic from ITU-N networks will be discarded.

Range: **on, off**

on — Discard TFC ITU-N traffic

off — Do not discard TFC ITU-N traffic

System

Default: **off**

:lsrestrict= (optional)

Use the restricted linkset routing determination algorithm. This parameter enables and disables the restricted linkset routing determination algorithm on a system-wide basis.

Range: **on, off**

on—Restrictive linkset routing enabled; route traffic on the least restrictive available route with the lowest cost.

off—Restrictive linkset routing disabled; route traffic on the lowest cost route.

Default: Current value in the database.

System

Default: **off**

Example

```
chg-ss7opts:lsrestrict=on
```

Dependencies

At least one optional parameter must be specified.

When the **lsrestrict** option is **on**, the **tfatcabmlq** parameter value for C linksets can be changed to a non-zero value (see the **chg-ls** command). If the **tfatcabmlq** parameter in any C linkset has been changed to a non-zero value, the **tfatcabmlq** value must be set back to **0** for all C linksets before the **lsrestrict** option can be turned off.

Notes

None

Output

```
chg-ss7opts:lsrestrict=yes
```

```
rlghncxa03w 04-08-29 16:40:40 EST EAGLE 31.9.0
CHG-SS7OPTS: MASP A - COMPLTD
```

```
;
```

chg-stpopts

Change STP Options

Use this command to change the values of one or more of the STP node level processing option indicators maintained in the STP's options table. All values are assigned initially to system defaults at STP installation time, and they may be updated subsequently using this command.

NOTE: For those STP option attributes supporting STP event message throttling, the values for the indicated parameters shall become effective in the next event-message output interval following their activation. All other updates shall be effective immediately, as of the time of activation.

Keyword: chg-stpopts

Related Commands: rtrv-stpopts

Command Class: Database Administration

Parameters

:ansigflex= (optional)

This parameter enables ANSI G-Flex to execute at 1700 TPS per DSM card.

Range: **yes, no**

yes— Enabled

no— Disabled

Default: Current value

System**Default:** **no****:cnvcgda= (optional)**

This parameter enables discarding of the CGPA point code in ANSI SCCP messages if the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes—Enabled
 no—Disabled

Default: Current value

System**Default:** **no****:cnvcgdi= (optional)**

This parameter enables discarding of the CGPA point code in ITU-I SCCP messages if the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: Current value

System**Default:** **no****:cnvcgdn= (optional)**

This parameter enables discarding of the CGPA point code in ITU-N SCCP messages if the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: Current value

System**Default:** **no****:cnvcgdn24= (optional)**

This parameter enables discarding of the CGPA point code in ITU-N24 SCCP messages if the point code or alias point code of the destination network type is not defined.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: Current value

System**Default:** **no****:critalminh= (optional)**

Critical alarm inhibit. This parameter enables inhibiting of critical alarms.

Range: **yes, no**
 yes— Enabled
 no— Disabled

Default: Current value

System**Default:** **no****:defcc= (optional)**

Default country code.

Range: Valid digits are **0-9, A-F, a-f**.
 none—Deletes the current value.

Default: Current value

:defndc= (optional)

Default network destination code.

Range: 1-5 digits, **none**
Valid digits are **0-9**, **A-F**, **a-f**.
none—Deletes the current value.

Default: Current value

:dispactalms= (optional)

Display active alarms. This parameter displays active or total alarms in the alarm status area of the VT320 screen (see Figure 4-1). The alarm status area comprises four boxes to show counts for critical, major, minor, and inhibited alarms. When total alarms are displayed (**dispactalms=no**), the counts for critical, major, and minor alarms include any temporarily or permanently inhibited alarms. The alarm status area is labeled *Total Alarm Status*. When active alarms are displayed (**dispactalms=yes**), the counts for critical, major, and minor alarms do not include any temporarily or permanently inhibited alarms. The alarm status area is labeled *Active Alarm Status*. This parameter does not affect the count displayed in the inhibited box; the number of inhibited alarms is always displayed.

Range: **yes**, **no**
yes— Enabled; active alarm status is displayed
no— Disabled; total alarm status is displayed

Default: Current value

System

Default: **no**

:dsmaud= (optional)

DSM audit running state. Refer to the *EPAP Administration Manual* for more information about the DSM checksum audit.

Range: **on**, **off**, **ccc**
on— Running
off— Not running
ccc— Running with Corruption Cross Correction enabled. EAGLE 5 ISS LNP, G-Flex, G-Port, and INP systems contain $n+1$ DSM cards (maximum 25) running the VSCCP application. Each of the VSCCP DSM cards contains a full image of the RTDB database. If a record within the RTDB database on any card should become corrupted, a mate VSCCP DSM card can supply the corrected data. The **dsmaud=ccc** parameter enables the Corruption Cross Correction function used by the system to obtain the correct data from a mate DSM.

Default: Current value

:force= (optional)

Specify **force=yes** to change the **hsclksrc** parameter value when the TDMs are reporting that the high speed system clocks are currently valid.

Range: **yes**

:gr2878rglbl= (optional)

This parameter specifies HSL register labels and data for EAGLE 5 ISS supported registers in measurement reports to SEAS.

Range: **yes**, **no**
yes— Use GR-2878-CORE HSL labels and data in SEAS output
no— HSL labels and data are not supported to SEAS

Default: Current value

:gsmdecerr= (optional)

GSM MAP screening decode error action.

Range: pass, discard
Default: Current value
System
Default: pass

:gsmdflt= (optional)

GSM MAP screening default action.

Range: pass, discard
Default: Current value
System
Default: pass

:gtcnvdfilt= (optional)

This parameter enables routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion Table.

Range: yes, no
 yes — Enabled
 no — Disabled
Default: Current value
System
Default: no

:hscclk= (optional)

High speed master clock line length.

Range: longhaul, shorthaul
 longhaul — Gain is high for long haul
 shorthaul — Gain is low for short haul
Default: Current value
System
Default: longhaul

:hscclksrc= (optional)

High speed master clock source. The **force=yes** parameter must be specified with this parameter to change the clock source when the TDMs are reporting that the high speed system clocks are currently valid.

CAUTION: Changing the high speed master clock source can result in clock outage and loss of traffic on all links, if the new source type does not match the provisioned source for the E1 or T1 cards (what is actually plugged into the backplane).

Range: rs422, e1framed, e1unframed, t1framed, t1unframed
 rs422 — RS-422 clock source
 e1framed — E1 Framed clock source
 e1unframed — E1 Unframed clock source
 t1framed — T1 Framed clock source
 t1unframed — T1 Unframed clock source
Default: Current value
System
Default: rs422

:mtpdpcq= (optional)

MTP destination point code quantity. This parameter specifies the maximum number of DPCs that can be provisioned from the STP. The value of this parameter is dependent directly on the number of x-list entries that can be provisioned using the **mtpxlq** parameter. If the number of destinations that can be provisioned is increased, the number of x-list entries that can be maintained is decreased.

Range: **500-8000**
 500-2000—if DSTN5000 feature is not turned on
 500-5000—if DSTN5000 feature is turned on
 500-6000—if 6000 Routesets feature is enabled
 500-7000—if 7000 Routesets feature is enabled
 500-8000—if 8000 Routesets feature is enabled
Default: Current value
System
Default: **2000**

:mtplprst= (optional)

MTP low priority route set test. This parameter specifies whether low priority route set polling is enabled or disabled at the STP.

Range: **yes, no**
 yes — Enabled
 no — Disabled
Default: Current value
System
Default: **yes**

:mtplctdpcq= (optional)

MTP loop test congestion trigger DPC quantity. This parameter specifies the number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

Range: **3-10**
Default: Current value

:mtplti= (optional)

MTP loop test indicator. This parameter specifies whether the MTP loop detection procedures are enabled or disabled at the STP.

Range: **yes, no**
 yes — Enabled
 no — Disabled
Default: Current value
System
Default: **yes**

:mtpltst= (optional)

MTP loop test supervision timer. This parameter specifies the amount of time, in milliseconds, that the MTP loop test detection procedures run when started.

Range: **10000-20000**
Default: Current value
System
Default: **10000**

:mtprsi= (optional)

MTP Restart indicator. This parameter specifies whether MTP Restart procedures (both ANSI and ITU) are enabled or disabled at the STP.

Range: **yes, no**
 yes — Enabled
 no — Disabled
Default: Current value
System
Default: **no**

:mtprsit= (optional)

ANSI MTP Restart isolation timer. This parameter specifies the minimum duration of node isolation, in milliseconds, before the ANSI MTP Restart procedure is deemed necessary.

Range: 2000-900000

Default: Current value

System

Default: 5000

:mtpt10alt= (optional)

MTP T10 alternate timer, in milliseconds. This parameter specifies the interval at which the STP performs a route set test on low priority routes. The value of the **mtpt10alt** parameter must be equal to or greater than the value of the level 3 T10 timer.

Range: 20000-10000000

Default: Current value

System

Default: 30000

:mtpt31ctl= (optional)

MTP T31 congestion trigger level. This parameter specifies the signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.

Range: 1, 2

Default: Current value

:mtpxlet= (optional)

MTP x-list expiration time. This parameter specifies the maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.

Range: 0020-2400

Default: Current value

System

Default: 0100

:mtpxlot= (optional)

MTP x-list occupancy threshold. This parameter specifies the dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

Range: 0-100

Default: Current value

:mtpxlq= (optional)

MTP x-list quantity. This parameter specifies the number of dynamic status exception list (x-list) entries the system maintains. The value of this parameter is dependent directly on the number of destinations that are provisioned using the **mtpdpcq** parameter.

Range: 500-6000

500-2000—if DSTN5000 feature is not turned on

500-5000—if DSTN5000 feature is turned on

500-6000—if 6000, 7000, or 8000 Routesets feature is enabled

Default: Current value

System

Default: 500

:npcfmti= (optional)

The ITU National Point Code Format Identifier. This parameter specifies how the ITU national point code is entered into the database and how it is displayed in any outputs from the system. The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or

two, three, or four numbers separated by dashes. This parameter specifies the number of bits to allow in each position of the four members.

Range: *m1-m2-m3-m4*

Four members where each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member (*m1-m4*) is from **0** to **14**. Each member must be specified no matter how many numbers the point code format contains, and the sum of *m1+m2+m3+m4* must equal 14 (for example, **npcfmti=7-7-0-0**, or **npcfmti=0-6-8-0**). Table 5-31 defines the values of the parts of the ITU national point code.

Table 5-31. NPCFMTI Parameter - ITU National Point Code Values

Number of Bits in Point Code Section								
Bit	0	1	2	3	4	5	6	7
Range of Values	Not Used	0-1	0-3	0-7	0-15	0-31	0-63	0-127
Bit	8	9	10	11	12	13	14	
Range of Values	0-255	0-511	0-1023	0-2047	0-4095	0-8191	0-16383	

Table 5-32. Point Code Format Examples

NPCFMTI Value	Range of Point Code Values
7-7-0-0	0-0 to 127-127
0-6-8-0	0-0 to 63-255
0-0-4-10	0-0 to 15-1023
3-8-3-0	0-0-0 to 7-255-7
2-9-2-1	0-0-0-0 to 3-511-3-1
4-4-4-2	0-0-0-0 to 15-15-15-3
14-0-0-0	00000 to 16385

Default: Current value

System

Default: **14-0-0-0**

:randsls= (optional)

Random SLS (signaling link selection) option. This parameter enables the EAGLE 5 ISS to ignore the incoming SLS value and randomly generate a new SLS value to select an outgoing linkset and a link. This parameter is implemented independently of the ITU SLS Enhancement feature settings for individual linksets, which are defined by the **slsocbit** and **slsrsb** parameters of the **ent-ls** and **chg-ls** commands. The value specified for the **randsls** parameter in the **chg-stpopts** command will override the value specified for the **randsls** parameter for each individual linkset.

To enable random SLS generation per linkset, the **randsls=perls** parameter must be specified. When this parameter is specified, the SLS Bit Rotation capability (set with the **slsrsb** parameter of the **ent-ls** or **chg-ls** commands) is overridden, and cannot be used on individual linksets. The **ent-ls** or **chg-ls** commands do not prevent the user from provisioning with the parameter also enables the user to restrict Random SLS generation to Class 0 messages only.

This parameter is implemented independently of the ITU SLS Enhancement feature settings for individual linksets. These settings are specified by the **slsocbit** (Use of the Other CIC BIT capability) and **slsrsb** (SLS Bit Rotation capability) parameters of the **ent-ls** and **chg-ls** commands. When the ITU SLS Enhancement is turned on with either the **randsls=all** or **randsls=class0** parameters, the SLS Bit Rotation capability (set with the **slsrsb** parameter of the **ent-ls** or **chg-ls** commands) is overridden, and cannot be used on individual linksets. The **ent-ls** and **chg-ls** commands do not prevent the user from provisioning with the **slsrsb** parameter.

This parameter applies only to ITU SCCP messages.

Range: **class0, all, off, perls**

class0— Enables random SLS generation for Class0 SCCP traffic.

all— Enables random SLS generation for all SCCP traffic.

off— Disables random SLS generation.

perls— Enables random SLS generation on a per-linkset basis instead of a system-wide basis.

Default: Current value

System

Default: **off**

:rptlnpmrss= (optional)

Report LNP MR SS unequipped. This parameter specifies whether to generate UIM 1049 for LNP message relay (MR) messages with missing subsystems. If no MAP entry is found from a GTT done on an LNP MR message, the UIM is either displayed (**rptlnpmrss=yes**) or suppressed (**rptlnpmrss=no**). This setting applies only to LNP MR messages. All other messages display UIM 1049 when no MAP entry is found, regardless of this setting.

Range: **yes, no**

yes— Display UIM 1049 for all messages.

no— Do not display UIM 1049 for LNP MR with missing subsystems.

Default: Current value

:rstrdev= (optional)

Restore device state. This parameter enables restoration of device states when the **init-sys** command is executed and when an OAM role change occurs and maintains the inhibited state of terminals, links, and cards through an **init-sys** execution, OAM role change, and card reload.

CAUTION

CAUTION: An init-sys command causes the system to go down.

Range: **on, off**

Default: Current value

:secmtpmate= (optional)

This parameter enables security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.

Range: **off, notify, silent, test**

off— Screening is disabled; message is processed normally.

notify— Screening is enabled; UIM is generated and message is discarded.

silent— Screening is enabled; message is discarded. No UIM is generated.

test — Screening is enabled; UIM is generated and message is processed normally.
Default: Current value
System
Default: **off**

:secmtpsid= (optional)

This parameter enables security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the **chg-sid** command) that is not a route-set-congestion-message. The EAGLE 5 ISS should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked.)

Range: **off, notify, silent, test**
off — Screening is disabled; message is processed normally.
notify — Screening is enabled; UIM is generated and message is discarded.
silent — Screening is enabled; message is discarded. No UIM is generated.
test — Screening is enabled; UIM is generated and message is processed normally.
Default: Current value
System
Default: **off**

:secmtpsnm= (optional)

This parameter enables security screening for MTP SNM messages. The EAGLE 5 ISS should not receive an MTP network management message unless:

- The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)
- The EAGLE 5 ISS has a route to the OPC of the MTP network management message on the linkset which the message was received.
- The EAGLE 5 ISS has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule does not apply to RST messages.)

Range: **off, notify, silent, test**
off — Screening is disabled; message is processed normally.
notify — Screening is enabled; UIM is generated and message is discarded.
silent — Screening is enabled; message is discarded. No UIM is generated.
test — Screening is enabled; UIM is generated and message is processed normally.
Default: Current value
System
Default: **off**

:secscpcscmg= (optional)

This parameter enables security screening for SCCP SCMG messages. The EAGLE 5 ISS should not receive an SCCP network management message unless:

- The EAGLE 5 ISS has a route to the OPC of the SCMG message on the linkset on which the message was received.
- The EAGLE 5 ISS has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE 5 ISS) in the message on the linkset on which the message was received.

This parameter applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected.

Range: **off, notify, silent, test**
off — Screening is disabled; message is processed normally.

notify — Screening is enabled; UIM is generated and message is discarded.
silent — Screening is enabled; message is discarded. No UIM is generated.
test — Screening is enabled; UIM is generated and message is processed normally.

Default: Current value

System

Default: **off**

:slscnv= (optional)

Per node SLS conversion indicator.

Range: **on, off, perls**

on — SLS conversion is enabled on all linksets.

off — SLS conversion is disabled on all linksets.

perls — SLS conversion is enabled on a per linkset basis.

Default: Current value

:tfatfrpr= (optional)

TFA/TFR pacing rate. This parameter specifies the amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly recovered linksets.

Range: **0-1000**

Set in increments of 100.

Default: Current value

System

Default: **1000**

:uimrd= (optional)

Unsolicited Information Message (UIM) redirect indicator. This parameter specifies whether the UIMs are to be routed to the specified output group.

Range: **yes, no**

yes — Enabled

no — Disabled

Default: Current value

System

Default: **no**

Example

```
chg-stpopts:mtpt31ctl=2:uimrd=yes
```

```
chg-stpopts:mtpxlq=1000:mtpxlet=0200:mtpxlot=75
```

```
chg-stpopts:critalminh=yes
```

```
chg-stpopts:npcfmti=4-4-4-2
```

```
chg-stpopts:randsls=all
```

```
chg-stpopts:rptlnpmrss=no
```

```
chg-stpopts:rstrdev=on
```

```
chg-stpopts:hsclksrc=t1framed
```

```
chg-stpopts:hsclksrc=e1unframed:force=yes
```

```
chg-stpopts:hscclkll=shorthaul
```

```
chg-stpopts:ansigflex=yes
```

```
chg-stpopts:cnvcgda=yes
```

chg-stpopts:gtcnvdf1t=yes

chg-stpopts:randsls=perls

Dependencies

The values of the **mtpdpcq** and **mtpxlq** parameters are interdependent; that is, to increase the number of DPCs that can be provisioned, the number of x-list entries that the STP is to maintain must be decreased. Conversely, to increase the number of x-list entries that the STP maintains, the number of DPCs that can be provisioned must be decreased.

At least one optional parameter must be specified.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **cnvcgda**, **cnvcgdi**, **cnvcgdn**, **cnvcgdn24** or **gtcnvdf1t** parameters can be specified.

The **ansigflex** option cannot be enabled if any of the G-Port, A-Port, EIR, IS41 GSM Migration, INP, AINPQ, 1100 TPS/DSM for ITU NP, and Prepaid Short Message Intercept Phase 1 (PPSMS) features are enabled.

The G-Flex feature must be on before the **ansigflex** option can be enabled.

The **ansigflex** option cannot be enabled when Service Selector table contains an ITU entry. (See the **chg-srvsel** command.)

The **hsc1ksrc** parameter values **t1unframed**, **t1framed**, **e1unframed**, and **e1framed** cannot be specified if either TDM is a version that does not support the Global Timing Interface feature (both TDMs must be TDM-15 or later, with the Global Timing Interface **bpcdm** GPL loaded).

If changing the **hsc1ksrc** parameter value will cause system clocks to fail that are required to keep links active or TSCSYNC available, the **force=yes** parameter must also be specified. The **force=yes** parameter can be specified only with the **hsc1ksrc** parameter. Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.
- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A and B) are required.

The **hsc1kll** parameter cannot be specified if either TDM is a version that does not support the Global Timing Interface feature (both TDMs must be TDM-15 or later, with the Global Timing Interface **bpcdm** GPL loaded).

The **mtpxlet** parameter must be specified in the one of the following formats: *mm*, *hmm*, *hhmm*, where *m* is minutes and *h* is hours. For example, **43** is 43 minutes, **138** is 1 hour 38 minutes, and **2400** is 24 hours.

When the **mtpxlet** parameter is specified, the value for minutes (*mm*) must be in the range **00-59**.

The DSTN5000 (5000 Routes) feature must be turned on before the **mtpdpcq** parameter value can be increased to more than **2000**.

When the number of x-list entries (the **mtpxlq** parameter) is specified, the total number of DPCs (the **mtpdpcq** parameter) and x-list entries provisioned cannot exceed the space available in the Route table.

When the number of DPCs (the **mtpdpcq** parameter) is specified, the total number of DPCs and x-list entries (the **mtpxlq** parameter) provisioned cannot exceed the space available in the Route table.

The number of DPCs provisioned (the **mtpdpcq** parameter) cannot be increased if space allocated for maintaining x-list entries becomes full.

The value for the **mtpdpcq** parameter cannot be less than the number of DPCs provisioned.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before the **mtpxlq**, **mtpxlet**, and **mtpxlot** parameters can be specified.

The maximum allowed number of destination point codes can be changed by the **mtpdpcq** parameter. The maximum value of the **mtpdpcq** parameter is one of the following values:

- **5000** if the DSTN5000 feature is on
- **6000**, **7000**, or **8000** if the respective 6000, 7000, or 8000 Routesets feature is enabled
- **2000** if no Routes or Routesets feature is on

If the Cluster Routing and Management Diversity feature is turned on, the maximum number of destination point codes contained in the exception list can be changed by the **mtpxlq** parameter. The maximum value of the **mtpxlq** parameter is one of the following values:

- **5000** if the DSTN5000 feature is on
- **6000** if the 6000, 7000, or 8000 Routesets feature is enabled
- **2000** if no Routes or Routesets feature is on

The sum of the values of the **mtpdpcq** and **mtpxlq** parameters can be increased beyond **2500** only if one or more of the following features is turned on:

- If the DSTN5000 feature is turned on (**chg-feat:dstn5000=on**), the **mtpdpcq** and **mtpxlq** parameters cannot exceed **5500**.
- If the 6000 Routesets feature is enabled (see the **enable-ctrl-feat** command), the **mtpdpcq** and **mtpxlq** parameters cannot exceed **6500**.
- If the 7000 Routesets feature is enabled (see the **enable-ctrl-feat** command), the **mtpdpcq** and **mtpxlq** parameters cannot exceed **7500**.
- If the 8000 Routesets feature is enabled (see the **enable-ctrl-feat** command), the **mtpdpcq** and **mtpxlq** parameters cannot exceed **8500**.

The ANSI MTP restart (MTPRS) feature must be turned on before the **mtpersi** parameter can be specified.

The ANSI MTP restart (MTPRS) or ITU MTP restart (ITUMTPRS) feature must be turned on before the **mtpersi** parameter can be specified.

A value for the **tfatfrpr** parameter must be specified in increments of 100 milliseconds (0.1 seconds).

To enter seconds (instead of milliseconds) for the timer values, the timer value must contain at least one decimal place, and can contain up to three decimal places. If no decimal places are entered, the system accepts the value as milliseconds. The **rtrv-stpopts** command always displays the output in milliseconds, not seconds.

To specify the **criticalminh=no** parameter, critical alarms cannot be currently inhibited in the system.

If the **npcfmti** parameter is specified, it must be in the format *m1-m2-m3-m4* and all members must be specified. If the ITU national point code format is to only have two members, then two members of the **npcfmti** parameter must be specified as greater than zero, while the other two members must be specified as 0 (for example, **npcfmti=7-7-0-0**, **npcfmti=0-6-8-0**, or **npcfmti=0-0-4-10**).

If the **npcfmti** parameter is specified, the sum of the values specified for *m1+m2+m3+m4* must be equal to 14.

The G-Flex, INP, or AINPQ feature must be turned on, or the G-Port, Prepaid IDP Relay, or Prepaid SMS Intercept Ph1 (PPSMS) feature must be enabled before the **defcc** or **defndc** parameter can be specified.

The **defcc** parameter value cannot already exist as an entry in the GSM Options Multiple Country Code (the **multcc** parameter) list.

If a GSM Options Multiple Country Code (the **multcc** parameter) has been defined, the **defcc=none** parameter cannot be specified.

The GSM Map Screening feature must be turned on (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) before the **gsmdflt** or **gsmsdecerr** parameter can be specified.

The **secmtpmate**, **secmtpsid**, **secmtpsnm** and **secscpcscmg** parameters cannot be specified unless the Network Security Enhancements controlled feature has been enabled and turned on.

If the Origin-based MTP Routing feature is turned on, the **mtplprst=no** parameter cannot be specified.

The G-Flex, INP, AINPQ, G-Port, EIR, LNP ELAP Configuration or Prepaid SMS Intercept Ph1 feature must be on before the **dsmaud** parameter can be specified.

Notes

If the database contains ITU national point codes of a particular format, and the format is changed with the **npcfmti** parameter of the **chg-stpopts** command, the format of the ITU national point codes in the database will be changed to the new format.

The format defined by the **npcfmti** parameter applies to all database entities that use ITU national point codes except gateway screening. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If the system is using a format for the ITU national point code other than a single number, the point code will have to be converted from its current format to a single number in order to be used by gateway screening. The conversion is explained in “Converting ITU National Point Code Formats”.

For the STP option attributes supporting STP event message throttling, the values for the indicated parameters become effective in the next event-message output interval following their activation. All other updates become effective at the time of activation (immediately).

When the **slscnv=on** parameter is specified with the **chg-stpopts** command, the node acts as if the 5-bit to 8-bit SLS conversion is being performed on every linkset in the database, even those linksets that have the **slsci=no** parameter specified for them.

When the **slscnv=off** parameter is specified with the **chg-stpopts** command, the node acts as if the 5-bit to 8-bit SLS conversion has been turned off for every linkset in the database, even those linksets that have the **slsci=yes** parameter specified for them.

When the **slscnv=perls** parameter is specified with the **chg-stpopts** command, the 5-bit to 8-bit SLS conversion is performed only on the linksets that have the **slsci=yes** parameter specified for them.

When the value of the **dispactalms** parameter is changed, there could be a delay of up to five seconds as the VT320 screen refreshes to the selected display.

Eagle Clocks with TDM-GTI

Figure 5-9 shows a general schematic of clocking, without any of the redundant backup features, in the EAGLE 5 ISS with the TDM-GTI card. There are two types of input clocks that can be plugged into the control shelf backplane: low and high speed reference clocks. The TDM card takes these input clocks and uses them as timing references to generate the low and high speed clocks that are distributed to the cards in the EAGLE 5 ISS STP. These distributed clocks are used for various purposes depending on what types of links or features are provisioned.

Figure 5-9. Eagle Input and Internal Clocks with TDM-GTI

The high speed clock that is distributed to the cards in the EAGLE 5 ISS is used as the timing source only for high speed links that have been provisioned to use master timing. This clock can be derived only from the high speed input clock. Prior to TDM-GTI card the high speed input clock could be only the RS422 type. TDM-GTI adds the capability for this clock to be recovered from a framed or unframed E1 or T1 signal interface.

The low speed composite clock that is distributed to the cards in the EAGLE 5 ISS is used for timing DS0 links and for the Time Slot Counter Synchronization (TSCSYN) feature that is required for the Sentinel and IMF products. Prior to TDM-GTI this low speed clock could be generated only from a BITS clock source plugged into the control shelf backplane. TDM-GTI can generate this low speed internal clock from the high speed input clock source, with the following restriction:

- When DS0 cards are provisioned in the system, the internal low speed clock can be generated only from a BITS clock as it is without TDM-GTI.
- When no DS0 cards are present and the BITS clocks are present and valid, the internal low speed clock is generated from the BITS clocks.
- When no DS0 cards are present and the BITS clocks are not present or not valid, the internal low speed clock is generated from the high speed input clock.

Output

```
chg-stpopts:randsls=all
tekelecstp 06-07-26 12:03:28 EST EAGLE 36.0.0
CHG-STPOPTS: MASP A - COMPLTD
;
```

chg-t1

Change T1 Interface

Use this command to change a T1 interface for an E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card used as a T1 card. The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

Framing, line length, encoding, master/slave clocking options, and signaling bit setting can be specified.

On an HC-MIM card or an E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through.

Keyword: chg-t1

Related Commands: dlt-t1, ent-t1, rtrv-t1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 port number. The value must be a T1 port for which an interface has already been configured on the specified T1 card.

Range: 1-8

Ports 3 - 8 can be specified only for HC-MIM cards and E5-E1T1 cards.

:chanbrdg= (optional)

Indicates whether an odd numbered T1 port on an HC-MIM card or E5-E1T1 card is channel bridged with its adjacent even numbered port for non-signaling data pass through.

Range: on, off

Default: off

:encode= (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range: b8zs, ami

Default: Current value

:framing= (optional)

Indicator for framing format.

Range: sf, esf

Default: Current value

:ll= (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

Range: 0 - 655

Default: 133

:t1tsel= (optional)

Timing source. Indicates master (external) or slave (line) timing source, or timing source recovered from the paired master port for the channel bridged slave port.

Range: line, external, recovered

Default: Current value

Example

chg-t1: loc=1205:t1port=1:encode=ami:t1tsel=external

chg-t1: loc=1205:t1port=2:encode=b8z:ll=250s

chg-t1: loc=1205:t1port=3:chanbrdg=on:t1tsel=recovered

Dependencies

At least one optional parameter must be specified.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The specified T1 port (**t1port** parameter) must be already equipped with a T1 interface.

All signaling links that are serviced by the specified T1 card (**loc** parameter) must be deactivated before the values for the **encode**, **t1tsel**, **ll**, and **framing** parameters can be changed. See the **dlt-slk** command to delete the signaling links.

The **chanbrdg=on** parameter cannot be specified for HC-MIM card or E5-E1T1 card even-numbered T1 ports (**t1port** parameter).

The timing source parameter **t1tsel** must be specified when the **chanbrdg=on** parameter is specified.

The **t1tsel=line** parameter cannot be specified when the specified T1 port (**t1port** parameter) on the HC-MIM card or E5-E1T1 card is in channel bridging mode.

The **t1tsel=recovered** parameter can be specified only when the specified T1 port (**t1port** parameter) on the HC-MIM card or E5-E1T1 card is in channel bridging mode.

The **force=yes** parameter must be specified to provision an odd-numbered T1 port to channel bridging mode on an HC-MIM card or an E5-E1T1 card if the adjacent next higher even-numbered port is already provisioned with a T1 interface.

Parameter values cannot be changed for the even-numbered T1 port interface (**t1port** parameter) in a channel bridged pair. The values must be changed in the odd-numbered port interface.

Before an odd-numbered T1 port (**t1port** parameter) on an HC-MIM card or E5-E1T1 card can be provisioned into channel bridging mode (**chanbrdg=on** parameter), all signaling links assigned to its next higher even-numbered adjacent T1 port must be deleted. See the **dlt-slk** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when an HC-MIM card is present in the specified odd card location (**loc** parameter) and the **chanbrdg=on** parameter is specified.

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM cards or E5-E1T1 cards. The system checks for HIPR cards when the **chanbrdg=on** parameter is specified for HC-MIM cards and E5-E1T1 cards.

The following card locations cannot be specified in the **loc** parameter: 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, MDAL cards), or xy09 and xy10 where x is the shelf and y is the slot (HMUX or HIPR cards).

The **chanbrdg** parameter can be specified only for HC-MIM cards and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified if the T1 port (**t1port** parameter) has a timeslot for a channel card defined in its interface.

The **t1tsel=recovered** parameter cannot be specified for a T1 port (**t1port** parameter) on the HC-MIM or E5-E1T1 card if the T1 port status is channel bridged slave without specifying the **chanbrdg=on** parameter. The **chanbrdg=off** parameter cannot be specified for a T1 port (**t1port** parameter) on the HC-MIM or E5-E1T1 card if the T1 port timing is recovered without specifying the **t1tsel=line** parameter.

Line (slave) timing cannot be used with channel bridging. If the **t1tsel=line** parameter is specified for a T1 port (**t1port** parameter) on an HC-MIM card or E5-E1T1 card with T1 port status of channel bridged with external (master) timing, the **chanbrdg=off** parameter must also be specified. If the **chanbrdg=on** parameter is specified for a T1 port (**t1port** parameter) on an HC-MIM card or E5-E1T1 card that uses T1 port line (slave) timing, the **t1tsel=recovered** parameter or the **t1tsel=external** parameter must also be specified.

Notes

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Output

```
chg-t1:loc=1205:t1port=1:encode=ami:t1tsel=external
```

```

chg-th-alm**Change SCCP Alarm Thresholds**

Use this command to change the following alarm threshold percentages:

- The alarm threshold percentages used by the system SCCP. The SCCP will alarm whenever the transactions-per-second (TPS) for the EAGLE 5 ISS (as a whole) exceeds the value set by this command.
- Level 1 and Level 2 threshold percentages for LNP TN, LRN, and NPANXX occupancy limits. Alarms occur whenever provisioning levels of the LNP TN, LRN, and NPANXX databases exceed the predetermined occupancy limits.
- Thermal operating percentages for the HC MIM, E5-E1T1, and E5-ENET cards. Alarms occur when the temperature of a card approaches or exceeds predetermined thermal operating limits.

NOTE: This command replaces the chg-th-sccp command, which is obsolete.

Keyword: chg-th-alm

Related Commands: rept-stat-sccp, rtrv-th-alm

Command Class: Database Administration

Parameters

:gttservlv1= (optional)

The percentage for the SCCP GTT Service error ratio level 1 (lower) Threshold Alarm.

Range: 1-100

Default: 10

:gttservlv2= (optional)

The percentage for the SCCP GTT Service error ratio level 2 (upper) Threshold Alarm.

Range: 1-100

The value for the **gttservlv2** parameter must be greater than the value for the **gttservlv1** parameter.

Default: 20

:lnptndblv1= (optional)

The percentage for the TN Database provisioned level 1 (lower) Capacity Threshold Alarm.

Range: 1-100

Default: 90

:lnptndblv2= (optional)

The percentage for the LNP TN Database provisioned level 2 (upper) Capacity Threshold Alarm.

Range: 1-100

The specified value must be greater than the **lnptndblv1** parameter value.

Default: 95

:nongttservlv1= (optional)

The percentage for the SCCP Non-GTT Service (GPORT, GFLEX, EIR, LNPMR, LNPQS, WNPQS, TLNP, PLNPQS, INPMR, INPQS) error ratio level 1 (lower) Threshold Alarm.

Range: 1-100

Default: 10

:nongttservlv2= (optional)

The percentage for the SCCP Non-GTT Service (GPORT, GFLEX, EIR, LNPMR, LNPQS, WNPQS, TLNP, PLNPQS, INPMR, INPQS) error ratio level 2 (upper) Threshold Alarm.

Range: 1-100

Default: 20

:sccpalcmtld= (optional)

The TPS calculation method used to determine if the TPS Threshold Alarm levels have been exceeded or not.

Range: n, nplus1

n — All In Service Normal cards are used in the TPS calculation.

nplus1 — All In Service Normal cards minus 1 card are used in the TPS calculation.

Default: n

:sccptpscap= (optional)

The percentage for the SCCP Load Capacity Threshold Alarm.

Range: 1-100

Default: 80

:thermallv1= (optional)

Thermal Alarm Level 1 as a percentage of a card's thermal limit.

Range: 73-92

:thermallv2= (optional)

Thermal Alarm Level 2 as a percentage of a card's thermal limit.

Range: 74-100

Example

chg-th-alm: lnptndblv1=85

chg-th-alm: sccptpscap=85

chg-th-alm: sccpalcmtld=nplus1

chg-th-alm: gttservlv1=25:gttservlv2=28

Dependencies

The values for Thermal Alarm Level 1 and Level 2 cannot be the same.

Each Level 1 parameter value must be less than its corresponding Level 2 parameter value.

Notes

To display the currently configured values for the Thermal Alarm Levels, use the **rtrv-th-alm** command.

HC MIM cards have a thermal operating limit of 82 degrees Celsius. The E5-E1T1 and E5-ENET cards have a thermal operating limit of 99 degrees Celsius.

The thermal threshold values represent a percentage of the thermal operating limit of a card.

Output

chg-th-alm: thermallv1=85

rlghncxa03w 06-05-07 11:43:04 EST EAGLE 35.0.0

CHG-TH-ALM: MASP A - COMPLTD

;

chg-th-sccp

Change SCCP Alarm Thresholds

Use this command to change the value used for the system SCCP TPS (transactions-per-second) threshold alarm. An alarm (UAM 0330) triggers when the TPS for the EAGLE 5 ISS system is greater than the value set by the **chg-th-sccp** command. The alarm is a warning that the system is approaching the point where it might start losing global title transactions.

NOTE: This command is obsolete. Use the chg-th-alm command for these functions.

Keyword: chg-th-sccp

Related Commands: rept-stat-sccp, rtrv-th-sccp

Command Class: Database Administration

Parameters

:ldcap= (mandatory)

Load capacity in percentages.

Range: 0 - 100

Example

chg - th - sccp : ldcap=80

Dependencies

A threshold value must be set within the range of **0** to **100**.

Notes

It is recommended that the threshold be set at 80%, which is the system default value for the **ldcap** parameter. It is recommended that the threshold is not set any higher than 90%, to allow time to obtain additional SCCP cards and reprovision the system if the TPS capacity is reached. Also, setting the threshold at too low a level can cause excessive alarms.

Output

chg - th - sccp : ldcap=80

rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

Command entered at terminal #4.

Command Executed

;

chg-trm

Change Terminal

Use the change terminal command to configure the operational characteristics of each of the 40 terminal ports used to connect modems, printers, and terminals to the system.

Keyword: chg-trm

Related Commands: act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: Database Administration

Parameters

:trm= (mandatory)

Terminal. This parameter specifies the ID number of the terminal whose characteristics are to be changed.

Range: 1-40

:all= (optional)

This parameter specifies whether to display unsolicited messages of all types (TRAF, LINK, SA, DB, SYS, PU, LNPDB, LNPSUB, UIMRD, APPSERV, APPSS, CARD, CLK, DBG, GTT, GWS, MEAS, MON, MPS, SEAS, SLAN) in the scroll area.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: **yes**—If **type=emsalm** is specified

Current value—if **type** parameter value is not **emsalm**

:appserv= (optional)

Application server. This parameter specifies whether to display UAMs and UIMs assigned to the Application Server output group in the scroll area.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

If **all** is not specified—current **appserv** value.

If **type=emsalm** is specified—**yes**

System

Default: **no**

:appss= (optional)

Application subsystem. This parameter specifies whether to display UAMs and UIMs assigned to the Application Subsystem output group in the scroll area

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

If **all** is not specified—current **appss** value.

If **type=emsalm** is specified—**yes**

System

Default: **no**

:baud= (optional)

This parameter specifies the line speed (baud rate) for this terminal's serial port connection.

Range: **2400, 4800, 9600, 19200**

Default: If **type=oap**—**19200**

If **type** is **not oap**—no change to current value.

System

Default: **9600**

:card= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the Card output group in the scroll area.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

If **all** is not specified—current **card** value.

If **type=emsalm** is specified—**yes**

System

Default: **no**

:clk= (optional)

Clock. This parameter specifies whether to display UAMs and UIMs assigned to the Clock output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **clk** value.
 If **type=emsalm** is specified—**yes**

:db= (optional)

Database. This parameter specifies whether to display database-related unsolicited messages in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **db** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:dbg= (optional)

Debug. This parameter specifies whether to display UAMs and UIMs assigned to the Debug output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **dbg** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:dural= (optional)

Terminal lockout time. This parameter specifies the length of time the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured on the **mxinv** parameter. The value can be specified as seconds (*ss*); minutes and seconds (*mmss*); or hours, minutes, and seconds (*hhmmss*).

Range: **0-999999**
 0-59 (*ss*)
 0-5959 (*mmss*)
 0-995959 (*hhmmss*)
 999999

Default: Current value.

System

Default: **100** - 1 minute, 0 seconds

:fc= (optional)

Flow control. This parameter specifies the type of flow control used to regulate the flow of data between the system and an RS-232 connected device, so that no characters are lost (especially at high baud rates). The control setting of the system and the connected device must match.

Range: **hw, sw, both, none**
 hw—hardware flow control

sw—software flow control
both—hardware and software flow control
none—neither hardware nor software flow control

Default: If **type=oap**—**sw**
 If **type** is **not oap**—no change to current value.

System

Default: **sw**

:gtt= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the GTT output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **gtt** value.
 If **type=emsalm** is specified—**yes**

:gws= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the GWS output group in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **gws** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:link= (optional)

This parameter specifies whether to display link maintenance-related unsolicited messages in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **link** value.
 If **type=emsalm** is specified—**yes**

:lnpdb= (optional)

LNP database. This parameter specifies whether to display LNP database-related autonomous messages in the scroll area.

Range: **yes, no**
yes—Receive all.
no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **lnpdb** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:lnpsub= (optional)

LNP subscription. This parameter specifies whether to display LNP subscription-related autonomous messages in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **lnpsub** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:meas= (optional)

Measurement. This parameter specifies whether to display UAMs and UIMs assigned to the Measurements Maintenance output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **meas** value.
 If **type=emsalm** is specified—**yes**

System

Default: **no**

:mon= (optional)

Monitor. This parameter specifies whether to display UAMs and UIMs assigned to the Monitor output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **mon** value.
 If **type=emsalm** is specified—**yes**

:mps= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the MPS output group in the scroll area.

Range: **yes, no**
 yes—Receive all.
 no—Receive none.

Default: If **all** is specified—current **all** value
 If **all** is not specified—current **mps** value.
 If **type=emsalm** is specified—**yes**

:mxinv= (optional)

Login/unlock failure threshold. When a login or unlock failure occurs on a terminal, a counter of successive login failures is incremented by one. After the increment, if the counter is greater than or equal to the mxinv parameter value, the system sends an information message to all system administrator ports and locks out the port temporarily. The port is locked out for an interval that is specified in the dural parameter.

To disable the info message and temporary lockout function for the terminal, specify **mxinv=0**.

Range: **0-9**

Default: Current value.

System

Default: **5** - successive failed login/unlock attempts

:prty= (optional)

Parity. This parameter specifies the parity for this terminal's serial port connection.

Range: none, even, odd
Default: If **type=oap**—even
 If **type** is **not oap**—current value.
System
Default: even

:pu= (optional)

Program update. This parameter specifies whether to display program update-related unsolicited messages in the scroll area.

Range: yes, no
 yes—Receive all.
 no—Receive none.
Default: If **all** is specified—current **all** value
 If **all** is not specified—current **pu** value.
 If **type=emsalm** is specified—yes

:sa= (optional)

Security administration. This parameter specifies whether to display security administration-related unsolicited messages in the scroll area.

Range: yes, no
 yes—Receive all.
 no—Receive none.
Default: If **all** is specified—current **all** value
 If **all** is not specified—current **sa** value.
 If **type=emsalm** is specified—yes

:sb= (optional)

Stop bit. This parameter specifies the number of stop bits used in communications with the terminal.

Range: 1-2
Default: If **type=oap**—1
 If **type** is **not oap**—current value.
System
Default: 1

:seas= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the SEAS Maintenance output group in the scroll area.

Range: yes, no
 yes—Receive all.
 no—Receive none.
Default: If **all** is specified—current **all** value
 If **all** is not specified—current **seas** value.
 If **type=emsalm** is specified—yes

:slan= (optional)

This parameter specifies whether to display UAMs and UIMs assigned to the SLAN Maintenance output group in the scroll area.

Range: yes, no
 yes—Receive all.
 no—Receive none.
Default: If **all** is specified—current **all** value
 If **all** is not specified—current **slan** value.
 If **type=emsalm** is specified—yes
System
Default: no

:sys= (optional)

System. This parameter specifies whether to display system maintenance-related unsolicited messages in the scroll area.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

 If **all** is not specified—current **sys** value.

 If **type=emsalm** is specified—**yes**

:tmout= (optional)

Maximum channel idle time. This parameter specifies the maximum amount of time in minutes that a login session can remain idle (that is, no user input) on a terminal before being automatically logged off. To disable idle time monitoring for a terminal, specify **tmout=0**.

Range: **0-99**

Default: Current value.

System

Default: **30** - minutes

:traf= (optional)

Traffic. This parameter specifies whether to display traffic-related unsolicited messages displayed in the scroll area.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

 If **all** is not specified—current **traf** value

 If **type=emsalm** is specified—**yes**

System

Default: **no**

:type= (optional)

This parameter specifies the type of device being connected to this terminal.

Range: **vt320, ksr, oap, printer, sccs, mgmt, telnet, emsalm, none**

 The **type=emsalm** parameter value is valid for terminals 1-40.

 Only **telnet**, **emsalm**, and **none** are valid values for terminals 17 - 40.

Default: Current value.

System

Default: **vt320** - for terminals 1-16

telnet - for terminals 17-40

:uimrd= (optional)

Unsolicited messages. This parameter specifies whether to display the unsolicited messages assigned to this group.

Range: **yes, no**

yes—Receive all.

no—Receive none.

Default: If **all** is specified—current **all** value

 If **all** is not specified—current **uimrd** value.

 If **type=emsalm** is specified—**yes**

System

Default: **no**

Example

```

chg-trm:trm=8:type=oap:all=yes
chg-trm:trm=2:all=yes
chg-trm:trm=13:type=ksr:baud=9600:uimrd=yes
chg-trm:trm=1:link=yes:sys=yes:db=yes:lnpdb=yes
chg-trm:trm=17:all=yes
chg-trm:trm=22:type=none
chg-trm:trm=22:type=emsalm
chg-trm:trm=10:link=yes:card=yes:clk=yes
chg-trm:trm=1:type=ksr:gtt=yes
chg-
trm:trm=2:appserv=no:appss=yes:card=yes:clk=no:dbg=no:gtt=yes:gws
=no :meas=yes:mon=no:mps=yes:seas=no:slan=yes

```

Dependencies

At least one optional parameter must be specified.

The system requires that at least two terminals be configured as security administration terminals. If only two security administration terminals are configured, the value of the **type** parameter cannot be changed to a value that would make the terminal unusable (**oap**, **printer**, or **none**) because only one security administration terminal would remain.

The combined total line speed (baud rate) for all active terminal ports cannot exceed **168,000**. This value allows for 16 terminal to be configured at 9600 bps each.

If the **prty=none** parameter is specified, then the **type=vt320** parameter cannot be specified. A VT320 terminal does not support 7-bit data bytes and no parity. The number of data bits cannot be changed.

If the **prty=none** parameter is specified, then the **type=scss** parameter cannot be specified.

For terminals 1-16, the **type=telnet** parameter cannot be specified.

For terminals 17 - 40, the value of the **type** parameter must be **telnet**, **emsalm**, or **none**.

If the terminal **type=telnet** parameter is specified, then the **baud**, **prty**, **sb**, and **fc** parameters cannot be specified

If the **type=telnet** parameter or the **type=emsalm** parameter is specified for terminals 17-40, then an IPSM card must be equipped in the system. Parameters for these terminals cannot be changed unless an IPSM card has been added for the target terminal.

NOTE: If you install one IPSM card, telnet terminals 17-24 are available. If you install two IPSM cards, telnet terminal IDs 17-32 are available. If you install three IPSM cards, telnet terminal IDs 17-40 are available. If you remove an installed IPSM card, the eight terminal IDs that were assigned to that card are no longer available. For example, if you install three IPSM cards, and remove the second card that was installed, telnet terminal IDs 17-24 and 33-40 are available. To make the IDs consecutive again, you would need to remove and reinstall the third card that was previously installed. Then its available terminal IDs change from 33-40 to 25-32. You can enter the rtrv-trm command to display the available telnet terminal IDs.

If the terminal is not inhibited, then the **type**, **baud**, **prty**, **sb**, and **fc** parameters cannot be changed. The **all**, **traf**, **link**, **sa**, **db**, **sys**, **uimrd**, and **pu** parameters can be changed on any terminal, including the one in use, regardless of the port status (inhibited or allowed).

The port cannot be removed from service (**rmv-trm**) when the **type**, **baud**, **prty**, **sb**, and **fc** parameters are being changed.

The SEAS feature must be on before the **type=oap** parameter can be specified (see the **rtrv-feat** command output SEAS=ON entry).

The IP User Interface (Telnet) feature must be enabled and turned on before the **type=telnet** parameter (IDs 17-40) or the **type=emsalm** parameter (IDs 1-40) can be specified.

The LNP feature must be turned on before the **lnpdb** and **lnpsub** parameters can be specified. If the **all=yes** parameter is specified, and the LNP feature has not been turned on, then the values of the **lnpdb** and **lnpsub** parameters default to **no**.

A maximum of two OAP terminals (**type=oap** parameter) can be configured for SEAS.

If the **type=oap** parameter is specified, then the **baud**, **prty**, **sb**, and **fc** parameters cannot be specified.

If the LNP ELAP Configuration feature is turned on, then the LNP Subscription commands cannot be accessed, and the **lnpsub** parameter cannot be specified.

Notes

Refer to Appendix E, "Unsolicited Output Message Groups," in the *EAGLE 5 ISS Maintenance Manual* for a list of unsolicited output messages that you might see for each output group.

This command cannot be entered when an upgrade is in progress.

If your terminal has the auto-wrap feature, you must disable the feature to use the terminal on the system.

To disable the informational message and temporary port lockout feature for a terminal, specify the **mxinv=0** parameter.

To prevent a terminal from being disabled, specify the **dural=0** parameter.

To make the lockout period for a terminal indefinite, specify the **dural=999999** parameter. When disabled, a terminal remains disabled until the port is inhibited (**inh-trm** command) and then allowed (**alw-trm** command).

Terminal idle time monitoring and auto-logout applies only if the terminal **type** is **vt320**, **ksr**, or **sccs**. The **chg-trm** command can be entered with a **tmout** parameter value for other terminal types, but it has no effect.

Using the terminal type of **none** (**type=none**) conveys to the terminal processor that a particular port is not connected or is no longer in use. The terminal processor does not service output queues for a terminal port that is configured as **type=none**.

When the terminal type for a terminal is changed to **type=emsalm**, the value for all output group parameters is set to **yes**.

When the terminal type for a terminal is changed from **type=emsalm** to another type, the current value for all output groups is not changed. A command must be entered to change one or more output group values to another value.

NOTE: Though the output groups are set to yes, terminals of type emsalm do not display any reports or any UIMs except "UIM 1083 system alive".

The number of data bits cannot be changed; it is set to 7.

Software flow control (XON and XOFF pacing), involves sending control codes between the system and the connected device.

Hardware flow control (RTS and CTS pacing) uses the RTS and CTS lines of the RS-232 interface to pause and restart the flow of data between the system and the connected device.

Software flow control is recommended if the connected device is a printer. Both software and hardware flow control are highly recommended if the connected device is a modem.

To connect a modem, specify the **type=vt320** parameter.

The **all** parameter cannot be specified in the command with the other message status parameters (**traf**, **link**, **sa**, **db**, **sys**, or **pu**). If the **all** parameter and other message status parameters are specified together in the command, the terminal is assigned the other specified message status parameters and the **all** parameter is ignored.

Output

```
chg-trm:trm=2:all=yes

```

chg-ttmap

Change Translation Type Mapping

Use this command to change a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can change the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, suppose you are mapping the translation type 001 (before TT mapping) to 238 (after TT mapping). You can use this command to change that mapping to 001 (before) to 254 (after).

Keyword: chg-ttmap

Related Commands: dlt-ttmap, ent-ttmap, rtrv-ttmap

Command Class: Database Administration

Parameters

:ett= (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 0-255

:io= (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: i, o
i—incoming
o—outgoing

:lsn= (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: ayyyyyyyyy
1 alphabetic character followed by 9 alphanumeric characters

:mtt= (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message *after* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 0-255

Example

```
chg-ttmap:lsn=nc001:io=o:ett=128:mtt=55
```

Dependencies

The linkset must be defined.

Notes

None

Output

```
chg-ttmap: lsn=nc001:io=o:ett=128:mtt=55
```

```
rlghncxa03w 04-01-22 10:37:07 EST EAGLE 31.3.0
CHG-TTMAP: MASP A - COMPLTD
```

```
TTMAP table for nc001 is (2 of 64) 3% full
```

```

```

chg-uaps**Change UA Parameter Set**

Use this command to change the UA parameter set.

Keyword: chg-uaps

Related Commands: rtrv-uaps

Command Class: Database Administration

Parameters

:set= (mandatory)

UA parameter set to be changed.

Range: 1-10

Default: Current value

:parm= (optional)

Parameter number.

Range: 1-10

1—ASP SNM Options

2—ASP/AS Notifications

3—UA Serviceability Options

4-10—Unused

Default: Current value

:pvalue= (optional)

The numerical value that the parameter (**parm**) will be set to if specified. Each parameter value is 32 bits (decimal 4294967295); not all 32 bits are used for each parameter. Only the values of the used bits are evaluated to determine the parameter value.

If the default setting for one bit is ON and you want to turn ON another bit in addition, specify the value that turns both bits ON. To turn OFF a bit that is ON and leave other bits ON, specify the value that turns ON just the bits that you want to be on. See the Notes section for this command for an explanation of the meanings of the bit settings.

Range: 0-4294967295

Enter a valid decimal or hexadecimal value shown in Table 5-33 for the **pvalue** parameter for the specified parameter (**parm**).

Table 5-33. Valid and Default UAPS Parameter Values

Parameter (parm)	To Turn On Only Bit(s)	Decimal pvalue	Hexadecimal pvalue	System Default
1. ASP SNM Options	0	1	h'1	
Bit 0 = Broadcast	1	2	h'2	
Bit 1 = Response Method	6	64	h'40	Off
Bit 6 = Broadcast Congestion Status Change	0, 1	3	h'3	On
Bits 2-5 and 7-31 = Unused	0, 6	65	h'41	
	1, 6	66	h'42	
	0, 1, 6	67	h'43	
2. ASP/AS Notifications	0	1	h'1	
Bit 0 = ASP ACTIVE Notifications	1	2	h'2	
Bit 1 = ASP INACTIVE Notifications	2	4	h'4	
Bit 2 = ASP AS State Query	0, 1	3	h'3	
Bits 3-31 = Unused	0, 2	5	h'5	
	1, 2	6	h'6	
	0, 1, 2	7	h'7	Off
3. UA Serviceability Options	0	1	h'1	Off
Bit 0 = UA Heartbeats				
Bits 1-31 = Unused				

Default: Current value

:srcset= (optional)

When specified, this source UAPS will be copied into the specified UAPS (**set**).

Range: 1-10

Default: Empty

:timer= (optional)

The Timer number within the UA parameter set.

Range: 1-10

1—Unused

2—False IP Connection Congestion Timer

3—UA Heartbeat Period Timer

4—UA Heartbeat Received Timer

5-10—Unused

Default: Current value

:tvalue= (optional)

The value that each timer will be set to. Though each timer value is 32 bits (decimal 4294967295), the **ss7ipgw** and **ipgwi** applications enforce 10-200 milliseconds for timer 1 and 0-30,000 milliseconds for timer 2.

Range: **10-60000**

Timer 2—**10-30000** milliseconds

Timer 3—**100-60000** milliseconds

Timer 4—**100-10000** milliseconds

Default: Current value

System

Default: Timer 2 - **3000** milliseconds
 Timer 3 - **10000** milliseconds
 Timer 4 - **5000** milliseconds

Example

The following example copies UA parameter set 1 into UA parameter set 2.

chg-uaps:set=2:srcset=1

The following example sets the Timer 2 value to 30 milliseconds.

chg-uaps:set=1:timer=2:tvalue=30

The following example sets the UA parameter set 2 value to hexadecimal 7, which turns on bits 0, 1, and 2.

chg-uaps:set=1:parm=2:pvalue=h'7

The following example sets the Timer 2 value to 30 milliseconds, and sets the value for UA parameter set 1 to decimal 64, which turns OFF bits 0 and 1 and turns ON only bit 6.

chg-uaps:set=2:timer=2:tvalue=30:parm=1:pvalue=64

Dependencies

The **srcset** and **set** parameter values cannot be the same.

At least one of the **timer**, **parm**, and **srcset** optional parameters must be entered.

If the **srcset** parameter is specified, no other optional parameters can be entered in the command.

If the **parm** parameter is specified, the **pvalue** parameter must be specified.

If the **timer** parameter is specified, the **tvalue** parameter must be specified.

Notes

There are 10 UA parameter sets. Each UA parameter set has 10 timers and 10 optional bit-mapped parameters. The bit-mapped parameter values control SNM and extended UA notification message behavior.

Timer 2 is the False IP Connection Congestion Timer, which controls the maximum amount of time (in milliseconds) that an association will be allowed to remain congested before failing due to false connection congestion. This timer value is limited to 0-30,000 milliseconds by the IPGWx application. The default value is 3000 milliseconds. If the timer is configured to have a value greater than 30,000, then IPGWx treats the timer as configured with 30,000.

The bit-mapped parameters contain the following flags, which are set by using the **pvalue** parameter to turn the bits on or off in each bit map:

Broadcast—Controls broadcast phase SNM TFPs, TFRs and TFAs sent when a destination's status changes. If this flag is on (set to 1), SNM TFPs, TFRs, and TFAs will be broadcast to

all associations and sockets assigned to routing keys associated with the destination's network and group code. The default is to enable all broadcast phase messages.

Response Method—Sending a SNM TFC/UPU as a reply to a message received on an association or a socket for an unavailable destination. If this bit is on (set to 1), the SNM response message is sent. The default is to allow the response to be sent.

Broadcast Congestion Status Change—Controls sending unsolicited congestion status changes. If this flag is on (set to 1) for an ASP, unsolicited congestion status messages are sent by the ASP when a destination's congestion status changes. This flag is applicable only if **ipgwabate** has been turned on with the **chg-sg-opts** command. The default is do not generate unsolicited congestion status changes.

ASP ACTIVE Notifications—Controls sending ASP-Active notifications. If this flag is on (set to 1), the Secure Gateway will, when an ASP transitions to Active, send a Notify message to all inactive and active ASPs in the AS of status type "Other" and a newly defined status ID of "ASP Activation". The ASP Activation notification message will include the ASP ID of the ASP that activated, and is transmitted only if the ASP ID is present. This notification is an extension to RFC3332 and not implemented for M3UA Version 8 adapters. The default is do not send ASP Active Notifications.

ASP INACTIVE Notifications—Controls sending ASP-Inactive notifications. If this flag is on (set to 1), the Secure Gateway will, when an ASP transitions to Inactive, send a Notify message to all inactive and active ASPs in the AS of status type "Other" and a newly defined status ID of "ASP Inactivation". The ASP Inactivation notification message will include the ASP ID of the ASP that inactivated and is transmitted only if the ASP ID is present. This notification is an extension to RFC3332 and not implemented for M3UA Version 8 adapters. The default is do not send ASP Inactive Notifications.

ASP AS State Query—Controls sending ASP/AS State Notifications on request by ASP. If this flag is on (set to 1), the Secure Gateway will respond with ASP and AS state notifications if 1) the remote ASP sends ASP-UP or ASP-INACTIVE while the local ASP is in the ASP-INACTIVE state, or 2) the remote ASP sends ASP-ACTIVE while the local ASP is in the ASP-ACTIVE state. The default is do not send state notifications.

UA Heartbeats—Controls sending UA Heartbeats on request by a connection. If this flag is on (set to 1), Heartbeat messages are transmitted in the ASP-DOWN, ASP-ACTIVE and ASP-INACTIVE States on connections from the Secure Gateway to the far end.

Output

```
chg-uaps:set=2:srcset=1
  rlgncxa03w 02-03-07 11:11:28 EST EAGLE 30.0.0
  CHG-UAPS: MASP A - COMPLTD
;
```

chg-user

Change User

Use this command to change user access to commands, change user ID's, and change passwords.

Keyword: **chg-user**

Related Commands: **act-user, chg-pid, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user**

Command Class: Security Administration

Parameters

:uid= (mandatory)
User ID

Range: *azzzzzzzzzzzzzzz*
1 alphabetic character followed by up to 15 alphanumeric characters

:all= (optional)

Specifies whether or not the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP, LNPDB, LNPSUB).

Range: **yes, no**
Default: Current value

:cc1= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc2= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:cc8= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.
ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters
-no—Indicates that the command class is not allowed.
-yes—Indicates that the command class is allowed.

:db= (optional)

Access to all commands in command class Database Administration.

Range: **yes, no**
Default: Current value

:dbg= (optional)

Access to all commands in command class Debug.

Range: **yes, no**
Default: Current value

:link= (optional)

Access to all commands in command class Link Maintenance.

Range: **yes, no**
Default: Current value

:lnpbas= (optional)

Access to all commands in the command class LNP Basic

Range: **yes, no**

Default: Current value

:lnpdb= (optional)

Access to all commands in the command class LNP Database

Range: **yes, no**

Default: Current value

:lnpsub= (optional)

Access to all commands in the command class LNP Subscription

Range: **yes, no**

Default: Current value

:nuid= (optional)

New user ID

Range: *azzzzzzzzzzzzzzz*

1 alphabetic character followed by up to 15 alphanumeric characters

Default: Current value

:page= (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.

Range: **0-999 (days)**

Default: Current value

:pid= (optional)

Password ID. Required only if changing the password of a user.

Range: **yes, no**

Default: Current value

:pu= (optional)

Access to all commands in command class Program Update.

Range: **yes, no**

Default: Current value

:revoke= (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range: **yes, no**

Default: Current value

:rstlsl= (optional)

Reset the user ID. Use this command to reset the last successful login date, for this user ID, to the current date. If the user ID has been prevented login for non-use, use the **rstlsl=yes** parameter to allow the user ID access again.

Range: **yes, no**

Default: Current value

:sa= (optional)

Access to all commands in command class Security Administration.

Range: **yes, no**

Default: Current value

:sys= (optional)

Access to all commands in command class System Maintenance.

Range: yes, no
Default: Current value

:uout= (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

Range: 0-999

Default: The value specified for the **uout** parameter on the **chg-secu-dflt** command

Example

chg-user:uid=john:nuid=johnmayer

chg-user:uid=john:nuid=john*mayer

chg-user:uid=john:db=yes

chg-user:uid=user123:cc1=dab-no:cc2=krb=yes

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) unless the O&M IP Security Enhancements feature is turned on.

Changes to a user ID cannot be made while that user is logged on the system.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **lnpbas**, **lnpdb**, or **lnpsub** parameter can be specified.

If the **all=yes** parameter is specified and the LNP feature has not been turned on, the **lnpbas**, **lnpdb**, and **lnpsub** parameter values default to **no**.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1 - cc8** parameters.

The values specified in the **cc1 - cc8** parameters must be valid default (**u01-U32**) or provisioned configurable command class names.

If the LNP ELAP Configuration feature is turned on, then the LNP Subscription commands cannot be accessed, and the **lnpsub** parameter cannot be specified.

Notes

When the **pid=yes** parameter is specified, the system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen. After the password has been entered, the system issues a second prompt, and the password must be entered again. This feature ensures that no typing mistakes were made on the first entry. The password must adhere to all password provisioning rules as established by the **chg-secu-dflt** command. These rules are displayed on the screen when the password prompt is presented.

The current password is not required when assigning a new password.

Use the following rules for changing passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.

A new password cannot contain the associated user ID.

As a default, the command class Basic is assigned to all users. If no other command class is assigned, the user still has access to commands in the Basic class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, you could enter four commands with 8 names specified in each command.

Output

```
chg-user:uid=john:nuid=johnmayer
  rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  CHG-USER: MASP A - COMPLTD
;
```

chg-x25-dstn

Change X.25 Destination

Use this command to change the association of an X.25 network address with either an SS7 point code, or a subsystem within that point code. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

Keyword: chg-x25-dstn

Related Commands: dlt-x25-dstn, ent-x25-dstn, rtrv-x25-dstn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:xaddr= (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

Range: 1-15 digits

:dpc= (optional)

The real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

Default: Current value

:ssn= (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

Range: 1-255

Default: Current value

Example

chg-x25-dstn:xaddr=205255864567721:dpc=133-013-001:ssn=9

chg-x25-dstn:xaddr=205255864567721:dpc=133-013-013

chg-x25-dstn:xaddr=205255864567721:ssn=3

Dependencies

At least one optional parameter must be specified.

There must be at least four digits in the X.25 address.

The X.25 address must already exist as an X.25 destination.

The X.25 address must not be a part of an X.25 route.

The DPC must exist in the destination point code table.

The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-ncm*).

Notes

None

Output

chg-x25-dstn:xaddr=205255864567721:dpc=133-013-001:ssn=9

```
rlghncxa03w 04-01-10 11:43:04 EST EAGLE 31.3.0
X.25 DSTN TABLE 45 % FULL
CHG-X25-DSTN: MASP A - COMPLTD
;
```

chg-x25-rte**Change X.25 Route**

Use this command to change the X.25 connection type of a given X.25 route. All LIMs with the **ss7gx25** GPL share this information. Even though these connections apply to only one card, they are used by all cards.

Keyword: **chg-x25-rte**

Related Commands: **dlt-x25-rte**, **ent-x25-rte**, **rtrv-x25-rte**

Command Class: Database Administration

Parameters

:saddr= (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: 1-15 digits

:xaddr= (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

:lc2nm= (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

Range: **yes**, **no**

Default: **no** if **rt=pc** is specified

:loc= (optional)

The card location containing the X.25 signaling link.

Range: **1101-1108**, **1111-1112**, **1201-1208**, **1211-1218**, **1301-1308**, **1311-1318**, **2101-2108**, **2111-2118**, **2201-2208**, **2211-2218**, **2301-2308**, **2311-2318**, **3101-3108**, **3111-3118**,

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,
4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All card locations are displayed.

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: a

:rt= (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) route on X.25 destination point code (XPC), and (2) route using X.25 origination and destination point code combinations (PC).

Range: xpc, pc

Default: Current value

:type= (optional)

The type of X.25 connection that the link is expected to maintain.

Range: svca, svcr

svca—automatic virtual circuit

svcr—remote virtual circuit

Example

chg-x25-rte:xaddr=225255:saddr=133131:type=svca:loc=1205:port=a

chg-x25-rte:xaddr=303545:saddr=234908:type=svcr

chg-x25-rte:xaddr=225255:saddr=133131:rt=xpc

Dependencies

Each X.25 address must have at least four digits.

The combination of the two X.25 addresses must exist in the X.25 route table.

The number of SVCAs cannot exceed the maximum number of SVCs defined for the signaling link.

One of the following parameters must be specified: **type**, **rt**, or **lc2nm**.

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

If the connection type is **svca** (**type=svca**), the **loc** parameter must be specified.

The new connection type (**type=svca** or **type=svcr**) must be different from the currently defined connection type. For example, if the current connection type is **svca** (**type=svca**), the new connection type must be **svcr** (**type=svcr**).

If the **port** parameter is specified, the **loc** parameter must be specified.

If the connection type of the X.25 route is **pvc** (shown in the TYPE field of the **rtrv-x25-rte** output), the X.25 route cannot be changed.

Notes

The **lc2nm** parameter does not generate MTP level 3 network management messages to the network. Instead, it uses level 3 network management procedures internally to reroute traffic to an alternate route. If the **lc2nm** parameter is not specified, traffic is discarded when routed to a failed logical channel.

Output

chg-x25-rte:xaddr=225255:saddr=133131:type=svca:loc=1205:port=a

```

chg-x25-slk**Change X.25 Signaling Link Parameters**

Use this command to change any X.25 signaling link parameter.

Keyword: chg-x25-slk

Related Commands: rtrv-x25-rte, rtrv-x25-slk

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location containing the X.25 signaling link.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: All card locations are displayed.

:port= (mandatory)

The port on the card containing the X.25 signaling link.

Range: a

Default: Only one port per LIM is supported for X.25.

:k= (optional)

The maximum number of outstanding I frames.

Range: 1-7

Default: Current value

System

Default: 7 - 7

:l3mode= (optional)

The logical layer 3 address of the connection

Range: dte, dce

Default: dte

:mps= (optional)

The maximum packet size (in bytes) allowed on this X.25 signaling link.

Range: 128, 256

Default: 256

:n1= (optional)

The maximum number of bits in a frame.

Range: 1080, 2104

Default: Current value

System

Default: 2104 - 2104

:n2= (optional)

The maximum number of retransmission attempts to complete a transmission.

Range: 3-15

Default: Current value

System

Default: 10 - 10

:pvc= (optional)

The total number of the permanent virtual circuits (PVCs) available on this X.25 signaling link.

Range: 0-255

Default: 0

:svc= (optional)

The total number of the switched virtual circuits (SVCs) available on this X.25 signaling link.

Range: 0-255

Default: 255 minus the value for the **pvc** parameter

:t1= (optional)

The amount of time to wait before retransmitting a frame.

Range: 3-10 seconds

Default: Current value

System

Default: 5 - 5

:win= (optional)

The number of packets allowed for a window on this X.25 signaling link.

Range: 1-7

Default: 3

Example

chg-x25-slk:loc=1201:port=a:t1=3:n1=1080:n2=3:k=7

chg-x25-slk:loc=1204:pvc=10:svc=10

Dependencies

The **limds0**, **limocu**, and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** application.

The shelf and card must be equipped.

At least one of the optional parameters **t1**, **n1**, **n2**, **k**, **l3mode**, **pvc**, **svc**, **win**, or **mps** must be specified.

The sum of the values for the **pvc** and **svc** parameters must be greater than or equal to 1 and less than or equal to 255.

If the **mps** parameter is equal to 128, then the **n1** parameter must be equal to 1080.

The specified card must be out-of-service maintenance-disabled (OOS-MT-DSBLD) before the X.25 signaling link parameters can be changed. Enter the **rept-stat-card** command with the card location containing the X.25 signaling link that you want to change, to verify the state of the card.

The new quantity of PVCs cannot be greater than the number of logical channels currently assigned to the X.25 signaling link. Enter the **rtrv-x25-rte** command with the card location and port (**loc** and **port**) of the X.25 signaling link to verify the number of logical channels assigned to the X.25 signaling link. This is shown in the *LC* field of the **rtrv-x25-rte** output.

Notes

To add, remove, or change an X.25 destination, linkset, signaling link, or route, follow the procedures in the "X.25 Gateway Configuration" chapter of the *Database Administration Manual - Features*.

Output

chg-x25-slk:loc=1201:port=a:t1=3:n1=1080:n2=3:k=7

chk-unref-ent**Check Unreferenced Entities**

Use this command to check for unreferenced entities in the STP gateway screening entity sets. Unreferenced entities are those entities not referenced by another entity using the next screening function identifier and next screening reference combination, or using the linkset screening reference.

Keyword: chk-unref-ent

Related Commands: aud-data, chg-scr-aftpc, chg-scr-blkdpc, chg-scr-blkopc, chg-scr-cdpa, chg-scr-cgpa, chg-scr-destfld, chg-scr-dpc, chg-scr-opc, chg-scr-sio, chg-scr-tt, chg-scrset, dlt-scr-aftpc, dlt-scr-blkdpc, dlt-scr-blkopc, dlt-scr-cdpa, dlt-scr-cgpa, dlt-scr-destfld, dlt-scr-dpc, dlt-scr-opc, dlt-scr-sio, dlt-scr-tt, dlt-scrset, ent-scr-aftpc, ent-scr-blkdpc, ent-scr-blkopc, ent-scr-cdpa, ent-scr-cgpa, ent-scr-destfld, ent-scr-dpc, ent-scr-opc, ent-scr-sio, ent-scr-tt, ent-scrset

Command Class: Database Administration

Parameters

:aftpc= (optional)

Affected point code. Specifies whether you want to audit the affected PC/SSN entity set.

Range: yes, no

Default: no

:all= (optional)

All entity types. Specifies whether you want to audit all of the entity sets.

Range: yes, no

Default: no

:blkdpc= (optional)

Blocked destination point code. Specifies whether you want to audit the blocked DPC entity set.

Range: yes, no

Default: no

:blkopc= (optional)

Blocked originating point code. Specifies whether you want to audit the blocked OPC entity set.

Range: yes, no

Default: no

:cdpa= (optional)

Called party address. Specifies whether you want to audit the allowed CDPA entity set.

Range: yes, no

Default: no

:cgpa= (optional)

Calling party address. Specifies whether you want to audit the allowed CGPA entity set.

Range: yes, no

Default: no

:destfld= (optional)

Affected destination field. Specifies whether you want to audit the affected DESTFLD entity set.

Range: yes, no

Default: **no**

:dpc= (optional)

Destination point code. Specifies whether you want to audit the allowed DPC entity set.

Range: **yes, no**

Default: **no**

:isup= (optional)

ISUP message type. Specifies whether you want to audit the ISUP message type entity set.

Range: **yes, no**

Default: **no**

:opc= (optional)

Originating point code. Specifies whether you want to audit the allowed OPC entity set.

Range: **yes, no**

Default: **no**

:sio= (optional)

Service information octet. Specifies whether you want to audit the allowed SIO entity set.

Range: **yes, no**

Default: **no**

:tt= (optional)

Translation type. Specifies whether you want to audit the allowed TT entity set.

Range: **yes, no**

Default: **no**

Example

chk-unref-ent :opc=yes:dpc=yes:sio=yes

chk-unref-ent :all=yes

chk-unref-ent :all=yes:blkopc=no:blkdpc=no

Dependencies

At least one entity set name must be specified.

Notes

Legend

ENTITY TYPE—This field displays which entity type is being checked.

UNREFERENCED ENTITIES—This field displays whether the entity type listed is referenced by another entity.

clr-imt-stats**Clear IMT Statistics**

Every card in the system has both a card location identifier (stenciled on the shelf and provided in all output) and an IMT address. Use this command to clear the following statistics:

- The IMT level 1 and level 2 statistics for specified IMT addresses and the hourly time period statistics for IMT errors.
- The card error statistics for HMUX or HIPR cards and the hourly time period statistics for HMUX or HIPR cards.
- All IMT, HMUX, and HIPR error and hourly time period statistics. When the hourly time period statistics for IMT errors, HMUX errors, or HIPR errors are cleared, the current hourly time period number is reset to 0 (zero) on all cards.

Keyword: `clr-imt-stats`

Related Commands: `conn-imt`, `disc-imt`, `rept-imt-info`, `rept-imt-lvl1`, `rept-imt-lvl2`, `rmv-imt`, `rst-imt`, `tst-imt`

Command Class: System Maintenance

Parameters

:all= (optional)

Clear all IMT, HMUX, and HIPR statistics.

Range: `yes`, `no`

Default: `no`

:e= (optional)

End address. This parameter specifies the IMT address of the last card in the range.

Range: `0-251`

(See the *Installation Manual - EAGLE 5 ISS* for an illustration with IMT addresses).

:eloc= (optional)

End location. Specifies the card location of the last card in the range.

Range: `1101-1113`, `1115`, `1201-1218`, `1301-1318`, `2101-2118`, `2201-2218`, `2301-2318`, `3101-3118`, `3201-3218`, `3301-3318`, `4101-4118`, `4201-4218`, `4301-4318`, `5101-5118`, `5201-5218`, `5301-5318`, `6101-6118`

Default: If `sloc` is specified—current `sloc` value

If `sloc` is not specified—`1115`, which corresponds to IMT address 251 (`e=251`).

:eshelf= (optional)

End shelf location for HMUX and HIPR statistics. This parameter specifies the shelf location of the last shelf in the range. (Both HMUX and HIPR statistics will be cleared if they exist in the range between and including the `sshelf` and `eshelf` locations).

Range: `1100`, `1200-6100`

Default: If `sshelf` is specified—current `sshelf` value.

If `sshelf` is not specified—`6100`.

:s= (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range.

Range: `0-251` (See the *Installation Manual* of your current documentation set for an illustration with IMT addresses).

:sloc= (optional)

Start location. Specifies the card location of the first card in the range.

Range: `1101-1113`, `1115`, `1201-1218`, `1301-1318`, `2101-2118`, `2201-2218`, `2301-2318`, `3101-3118`, `3201-3218`, `3301-3318`, `4101-4118`, `4201-4218`, `4301-4318`, `5101-5118`, `5201-5218`, `5301-5318`, `6101-6118`

Default: If `eloc` is specified—current `eloc` value

If `eloc` is not specified—`1201`, which corresponds to IMT address 0 (`s=0`).

:sshelf= (optional)

Start shelf location for HMUX and HIPR statistics. This parameter specifies the shelf location of the first shelf in the range. (Both HMUX and HIPR statistics will be cleared if they exist in the range between and including the **sshelf** and **eshelf** locations).

Range: 1100, 1200-6100

Default: If **eshelf** is specified—current **eshelf** value.
If **eshelf** is not specified—1100.

Example

```
clr-imt-stats:s=00
```

Dependencies

The **clr-imt-stats** command cannot be entered if any of the following commands is running: **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**.

If the **s** and **e** parameters are specified, do not specify the **sloc** and **eloc** parameters; conversely, if the **sloc** and **eloc** parameters are specified, do not specify the **s** and **e** parameters.

This command cannot be entered during IMT statistics collection following an hourly boundary.

Either the start address (**s** parameter) or start location (**sloc** parameter) must be specified.

Notes

The **sloc** and **eloc** parameters allow individual **HMUX** and **HIPR** cards to be cleared.

The **s** and **e** parameters will *not* clear **HMUX** and **HIPR** cards.

The **sshelf** and **eshelf** parameters clear both **HMUX** and **HIPR** cards on bus A and bus B.

Output

```
clr-imt-stats:all=yes
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 35.0.0
Clear IMT Statistics command(s) issued...
Command Completed.
;
```

conn-imt

Connect IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to connect a manually disconnected card to the specified IMT bus. The card must have been manually disconnected from the bus previously by the **disc-imt** command. If the card was disconnected from the bus for other reasons, this command has no effect.

Keyword: **conn-imt**

Related Commands: **clr-imt-stats**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**, **rst-imt**

Command Class: System Maintenance

Parameters

:bus= (mandatory)

IMT bus to which the specified card is to be connected.

Range: a, b

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

conn-imt:loc=1201:bus=a

Dependencies

The card being reconnected must first be disconnected manually from the bus by using the **disc-imt** command.

This command cannot be entered during an IMT Fault Isolation Test.

Notes

This command has no effect if the card was disconnected from the IMT bus in any way other than manually using the **disc-imt** command.

Output

conn-imt:loc=1201:bus=a

```

```

;

copy-disk

Copy Disk

Use this command to copy a mirror image of the active fixed disk to the standby fixed disk. When the fixed disk requires replacement, or needs to be repaired or updated, this command formats the standby fixed disk and copies the contents of the active fixed disk to the standby fixed disk.

CAUTION: Before entering the **copy-disk** command, contact Tekelec Technical Services at (888) FOR-TKLC. The Technical Services engineer may be able to propose a less intrusive method for copying to a fixed disk.

CAUTION: LNP database updates may be coming through an OAP terminal without maintenance people being aware of it. Before using this command, inhibit the OAP terminals to ensure that databases do not lose synchronization.

CAUTION: If the **copy-disk** command fails and the standby TDM boots continuously, insert a removable disk with the same release as the fixed disks in the MDAL. The standby MASP should successfully boot off the removable disk. After the MASP has booted completely, re-enter the **copy-disk** command.

Keyword: **copy-disk**

Related Commands: **chg-db**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **format-disk**, **rept-stat-db**

Command Class: System Maintenance

Parameters

:dloc= (mandatory)

This parameter must specify the location of the standby fixed disk. This is the destination drive for this function.

Range: 1114, 1116
(TDM)

:force= (optional)

This parameter provides some protection against data loss from copying over a fixed disk. If the target medium is recognized as a valid system medium, the **force=yes** parameter must be specified.

Range: yes, no
Default: no

:format= (optional)

This parameter provides the choice whether or not to format the standby fixed disk before executing the copy. If a format is not necessary, specifying **no** can save a significant amount of time.

Range: yes, no
Default: yes

:sloc= (optional)

This parameter must specify the location of the active fixed disk. This will be the source drive for this function.

Range: 1114, 1116
(TDM)

Default: The location of the active fixed disk

Example

copy-disk:sloc=1114:dloc=1116:force=yes

Dependencies

CAUTION: Do not turn off measurements at midnight because doing so can cause the loss of an entire day of measurements. Do not turn off measurements during the 30 minute measurements processing period, because this can result in the loss of the measurements for the 30 minute period being processed.

Measurements collection must be turned off or the **copy-disk** command cannot be executed. Do not issue the **chg-meas** command while the **copy-disk** command is in progress. This results in read and write errors, because the standby fixed disk is not accessible and the active fixed disk only allows read-only access.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

The **copy-disk** command reserves both the active and standby disks, preventing database updates for the duration of the command. Access is allowed for read-only; writing to the disk is prohibited.

All commands that affect the database are not allowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed indicating that the command has been rejected because the **copy-disk** command is in use.

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

The **sloc** and **dloc** fixed disks must be available and compatible.

The **sloc** fixed disk must be coherent.

The **dloc** parameter must specify the standby fixed disk.

The **sloc** parameter must specify the active fixed disk.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The **force=yes** parameter is required if the destination medium is recognized as a system medium. This parameter is optional if the destination medium is not a system medium. Only media that contain the **dms.cfg** file are recognized as system media.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should also be specified.

Notes

The **format=no** parameter should be specified when upgrading a spare TDM. You should specify the **format=yes** parameter when there is a suspected hardware problem.

If the **copy-disk** command is initiated and the standby OAM initialization is not complete, command processing will be delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
Standby MASP initialization timed out - continuing...
```

The **format=no** parameter should be specified when upgrading a spare TDM. the **format=yes** parameter should be specified when there is a suspected hardware problem.

If the **copy-disk** command is initiated and the standby OAM initialization is not complete, command processing will be delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

```
Standby MASP has not finished initializing - please wait...
Standby MASP initialization timed out - continuing...
```

When the **copy-disk** command is processing, the system cannot log other commands to the security log because the active fixed disk is set to read-only. During this time, commands that would alter the database fail when entered.

The performance time required to copy a fixed disk to another fixed disk varies depending on database size and system activity. This operation should typically take no longer than 2.5 hours. (If you are not performing the low-level format (**format=no**), the operation should take no longer than an hour.) If the **copy-disk** operation exceeds three hours, contact Tekelec Technical Services for assistance at (888) FOR-TKLC. If the **copy-disk** operation without the low-level format exceeds 1.5 hours, call Tekelec Technical Services.

Output

copy-disk:sloc=1114:dloc=1116:force=yes

```
rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
copy-disk:sloc=1114:dloc=1116:force=yes
Command entered at terminal #3.
```

```
Copy-disk (fixed): from active (1114) to standby (1116) started.
Extended processing required, please wait.
```

```
Copy-disk (fixed): from active (1114) to standby (1116) completed.
Measurements collection may be turned on now if desired.
```

copy-fts

Copy to or from the File Transfer Area

This command copies tables into or from the file transfer area (FTA).

Notes

This command is used to copy into the file transfer area or out of the file transfer area. The parameters **stbl**, **dfile**, **sfile**, and **dtbl** are used to describe the nature of the copy. A copy from a DMS table into the file transfer area would use the **stbl** (source table) and **dfile** (destination file) parameters. Thus, data would move from a table into a transfer area file. To copy from the file transfer area to a DMS table, use the **sfile** (source file) and **dtbl** (destination table) parameters. Any other combination of these 4 parameters is invalid.

Output

copy-fts:stbl=1:dfile="2F1.OUT":sloc=1114:dloc=1114

```
rlghncxa03w 04-01-05 14:59:10 EST  EAGLE 31.3.0
copy-fts:stbl=1:dfile="2F1.OUT":sloc=1114:dloc=1114
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 14:59:26 EST  EAGLE 31.3.0
Copied Table 1 successfully from FIXED to F1.OUT in FTA.
;
rlghncxa03w 04-01-05 15:00:49 EST  EAGLE 31.3.0
copy-fts:sfile=dms.cfg:dtbl=0:sloc=1114:dloc=1117:drv=remove
Command entered at terminal #1.
;
rlghncxa03w 04-01-05 15:01:12 EST  EAGLE 31.3.0
Copied DMS.CFG successfully from FTA to Table 0 on REMOVABLE.
;
```

copy-gpl**Copy Generic Program Load**

Use this command to copy all approved GPLs from one drive to another. The GPLs can be copied only from the fixed disk on the active TDM to the removable cartridge, or from the removable cartridge to the fixed disk on the standby TDM.

Keyword: copy-gpl

Related Commands: act-gpl, alw-card, chg-gpl, init-card, init-sys, rept-stat-gpl, rtrv-gpl

Command Class: System Maintenance

Parameters

:dloc= (optional)

The destination location of the the GPLs to be copied.

Range: 1114, 1116, 1117

1114, 1116—The standby TDM

1117—The removable cartridge

Default: 1117

:sloc= (optional)

The source location of the the GPLs to be copied.

Range: 1114, 1116, 1117

1114, 1116—The active TDM

1117—The removable cartridge

Default: The location of the active TDM

Example

copy-gpl

copy-gpl:sloc=1117:dloc=1116

copy-gpl:sloc=1116

Dependencies

While this command is executing, the **chg-gpl** and **act-gpl** commands cannot be entered.

Notes

This command has no effect on the GPLs stored on other cards (for example, SCCP).

Output

Copying the GPLs from the fixed disk on the active TDM (card location 1114) to the removable cartridge.

copy-gpl:sloc=1114:dloc=1117

```
rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
COPY GPL: MASP A - COPY STARTS ON ACTIVE MASP
COPY GPL: MASP A - COPY TO REMOVABLE CARTRIDGE COMPLETE
;
```

Copying the GPLs from the removable cartridge to the fixed disk on the standby TDM (card location 1116).

copy-gpl:sloc=1117:dloc=1116

```
rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
COPY GPL: MASP B - COPY STARTS FROM REMOVABLE CARTRIDGE TO STANDBY TDM
COPY GPL: MASP B - COPY TO STANDBY TDM COMPLETE
;
```

copy-isupvar-attrib

Copy ISUP Variant Attribute

Use this command to copy one ISUP Variant table entry to another ISUP Variant table entry.

Keyword: copy-isupvar-attrib

Related Commands: chg-isupvar-attrib, ent-pstn-pres, rtrv-isupvar-attrib, rtrv-pstn-pres

Command Class: Database Administration

Parameters

:dpstncat= (mandatory)

The PSTN category identifying the destination Variant table entry where the source Variant table is being copied.

Range: 0-65535

:dpstnid= (mandatory)

The PSTN ID identifying the destination Variant table entry where the source Variant table is being copied.

Range: 0-65535

:pstncat= (mandatory)

The PSTN category identifying the source Variant table entry being copied.

Range: 0-65535

:pstnid= (mandatory)

The PSTN ID identifying the source Variant table entry being copied.

Range: 0-65535

Example

copy-isupvar-attrib:pstncat=1:pstnid=2:dpstncat=1: dpstnid=20

Dependencies

The **pstncat=1** and **pstnid=2** parameter combination is invalid.

Required controlled features must be enabled.

- ISUP Normalization controlled feature
- ON/OFF controlled feature for *Tekelec-defined* Variant
- Quantity controlled feature for *user-defined* Variant

The **pstncat** and **pstnid** values must have been previously defined with **ent-pstn-pres**.

The **dpstncat** and **dpstnid** values must have been previously defined with **ent-pstn-pres**.

Notes

The **copy-isupvar-attrib** command provides the user with an easy way to provision a new ISUP Variant table entry by copying all the data from another entry. Then the user changes the entry with the **chg-isupvar-attrib** command.

An ISUP Variant table entry exists for each Variant defined in the SG. Each entry contains ISUP message and parameter data specific to the ISUP protocol that Variant uses. A Variant is uniquely defined by its PSTN presentation value, consisting of a PSTN category and a PSTN ID.

The PSTN presentation is used to identify both the source and destination table entries. Both entries **must** be previously defined PSTN presentation values, such as either a *Tekelec-defined* PSTN or a *user-defined* PSTN by the **ent-pstn-pres** commands. Use the **rtrv-pstn-pres** command to display the **only** allowed values for the source and destination PSTNs.

If the source or destination Variant is a *Tekelec-defined* PSTN value, then its associated On/off control feature must be ENABLED.

The destination PSTN is not allowed to be normalized ISUP (etsiv3).

Output

The following example shows how to copy etsiv3 Variant to another Variant.

```
copy-isupvar-attrib:pstncat=1:pstnid=2:dpstncat=1:dpstnid=20
rlghncxa03w 04-01-07 00:57:31 EST EAGLE 31.3.0
COPY-ISUPVAR-ATTRIB: MASP A - COMPLTD
;
```

copy-meas

Copy Measurements

Use this command to copy all measurements tables on the active fixed disk to a measurements removable cartridge. Do this when you need to perform off-line analysis of the raw measurements data.

NOTE: This command is not supported on the Measurements Platform feature.

Keyword: copy-meas

Related Commands: chg-meas, rept-meas, rtrv-meas-sched

Command Class: System Maintenance

Parameters

None

Example

copy-meas

Dependencies

This command requires a removable cartridge formatted for measurements data. See the **format-disk** command for details on how to use the system to format cartridges.

A valid system measurements removable cartridge must be inserted in the MDAL removable cartridge drive.

Notes

To execute this command, measurement collection must be turned **off**. If measurement collection is on, enter the **chg-meas:collect=off** command to turn off measurement collection.

The *Maintenance Manual* provides a description of all measurement report parameters.

Table 5-34. Performance for the **copy-meas** command

Activity	Approximate Performance*
Copy the raw measurements data from the active fixed disk to the measurements removable cartridge.	2 minutes
* Minimum time and dependent on system activity.	

Output

copy-meas

COPY MEASUREMENTS: MASP A - COPY STARTS ON ACTIVE MASP
COPY MEASUREMENTS: MASP A - COPY TO REMOVABLE CARTRIDGE COMPLETE

copy-seculog

Copy Security Log Contents to FTA Area

Use this command to copy the contents of a security log to the file transfer area (FTA). If no parameters are specified, a file called **yymmddda.log** (see the description of the **dfile** parameter) is created in the FTA on the active fixed disk. The contents of the security log on the active fixed disk are copied into this file.

Keyword: copy-seculog

Related Commands: `act-file-trns`, `copy-tbl`, `disp-fts-dir`, `dlt-fts`

Command Class: Security Administration

Parameters

:dfile= (optional)

Target file name. This parameter specifies the name of the file that is to be created in the FTA and initialized with the security log contents.

Range: zzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz
1–32 characters

Default: If not specified, the file is named *yymmddx.log*, where *yymmdd* is the current year, month, and day, and *x* is either *a* or *s*, depending on whether the log on the active or standby fixed disk was copied.

:dloc= (optional)

Destination FTA. This parameter specifies which FTA is to receive the copy of the log.

Range: act, stb

act —Copies the log to the active fixed disk's FTA

stb—Copies the log to the standby fixed disk's FTA

Default: act

:slog= (optional)

Source log indicator. This parameter specifies which log is to be copied to the FTA.

Range: act, stb

act —Copies the log on the active fixed disk

stb —Copies the log on the standby fixed disk

Default: act

Example

```
copy-seculog
```

```
copy-seculog:dfile="somename.log"
```

```
copy-seculog:slog=stb
```

```
copy-seculog:slog=act
```

```
copy-seculog:slog=act:dloc=stb
```

Dependencies

No other security log command can be in progress when this command is entered.

No **copy-fta** command can be in progress when this command is entered.

Notes

For the **dfile** parameter, if the file name is not accepted by the system because it contains special characters such as blanks, colons, dashes, ampersands, or others; or because it does not start with an alphabetic character, enclose the file name in double quotes (Copies t) as in this example: Copies t.

Any scroll area failure message that can be produced by the **copy-fta** command can be produced also by the **copy-seculog** command.

Output

The following example shows that the log on the active fixed disk is copied to the FTA on the active fixed disk and given the default name (note the **a** in the log name).

copy-secu log

```
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1114 copied to file 960104a.log on TDM 1114
```

The following example shows that the log on the active fixed disk is copied to the FTA on the active fixed disk and given a user-specified name.

copy-secu log:dfile="somename.log"

```
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1116 copied to file somename.log on TDM 1114
```

The following example shows that the log on the standby fixed disk is copied to the FTA on the active fixed disk and given the default name (note the **s** in the log name).

copy-secu log:slog=stb

```
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Security log on TDM 1114 copied to file 960104s.log on TDM 1116
```

The following example shows that the copy of the log fails because a file already exists in the FTA with the same name.

copy-secu log:slog=act

```
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Command Failed - Destination File already exists in the File Transfer Area
```

The following example shows that the copy fails because there is not enough room in the FTA to contain the copy.

copy-secu log:slog=act:dloc=stb

```
rlghncxa03w 04-01-04 15:59:06 EST EAGLE 31.3.0
Command Failed - Not enough room exists in the File Transfer Area
```

dact-alm-trns**Deactivate Alarm Transfer**

Use this command to return all audible alarm indications to the local office.

Keyword: dact-alm-trns

Related Commands: act-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit, rtrv-trbl

Command Class: System Maintenance

Parameters

This command has no parameters.

Example

```
dact-alm-trns
```

Dependencies

None

Notes

After you enter **dact-alm-trns**, enter **rept-stat-alm** to verify the status of the alarms.

Output**dact-alm-trns**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Alarms returned to Local Maintenance Center
```

```
;
```

dact-cdl**Deactivate Command Driven Loopback**

Use this command to deactivate a previously initiated command driven loopback for testing a signaling link, if the test is active. If it is not active, the command will attempt to clear both near-end and far-end latched loopback points

Keyword: dact-cdl

Related Commands: act-cdl, act-lbp, dact-lbp, rept-stat-cdl, tst-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling ports. The signaling port to which the SS7 signaling link being tested is assigned.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dact-cdl:loc=1205:link=b
```

Dependencies

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

Link Fault Sectionalization (LFS) must not be running on the specified signaling link when this command is entered.

Command Driven Loopback testing is not available during upgrade.

A link diagnostic test is in progress on the signaling link specified in the **link** parameter, but it is not a Command Driven Loopback.

The card location specified in the **loc** parameter must be in service.

The signaling link specified in the **link** parameter must not be active.

The card location specified in the **loc** parameter cannot be reserved by the system.

Notes

None

Output

dact-cdl:loc=1205:link=b

```
tekelecstp 05-01-21 17:00:36 EST  EAGLE5 33.0.0
Command Accepted: Stop Command Driven Loopback message is sent.
;

tekelecstp 05-01-21 17:00:36 EST  EAGLE5 33.0.0
Command Completed.
;
```

dact-cmd**Deactivate Command**

This command halts processing and output of the commands listed in Table 5-35.

Used without the **trm** parameter, the **dact-cmd** command is entered on the same terminal that is currently running the command that you want to cancel.

Used with the **trm** parameter, the **dact-cmd** command is entered on a terminal other than the one that is currently running the command that you want to cancel.

Table 5-35. Commands For Which **dact-cmd** Aborts Processing and Output

Command		
rept-imt-info	rtrv-as	rtrv-map
rept-stat-as	rtrv-assoc	rtrv-mrn
rept-stat-asp	rtrv-asp	rtrv-obit (active OAM)
rept-stat-assoc	rtrv-cmd	rtrv-rte
rept-stat-card	rtrv-dcmps	rtrv-seculog
rept-stat-clk	rtrv-dstn	rtrv-secu-user
rept-stat-dstn	rtrv-gta	rtrv-slk
rept-stat-ls	rtrv-gtt	rtrv-tbl-capacity
rept-stat-rte	rtrv-lbp	rtrv-trbltx
rept-stat-slk	rtrv-log	rtrv-uaps
rtrv-appl-rtkey	rtrv-ls	
rtrv-appl-sock		

NOTE: The Basic command class allows use of this command without the **trm** parameter (for **dact-cmd**); the Security Administration command class is required for use of this command when the **trm** parameter is specified (**dact-cmd:trm=x**).

Keyword: **dact-cmd**

Related Commands: **rept-imt-info**, **rept-stat-as**, **rept-stat-asp**, **rept-stat-assoc**, **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-slk**, **rtrv-appl-rtkey**, **rtrv-appl-sock**, **rtrv-asp**, **rtrv-assoc**, **rtrv-dcmps**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-log**, **rtrv-ls**, **rtrv-map**, **rtrv-rte**, **rtrv-seculog**, **rtrv-slk**, **rtrv-trbltx**, **rtrv-uaps**

Command Class: Basic

Parameters

:trm= (optional)

The terminal on which the command is to be canceled.

Range: 1-40

Example

dact -cmd

dact -cmd:trm=3

Dependencies

You cannot specify the **trm** parameter in a **dact-cmd** command that you enter on the same terminal that is running the command that you want to cancel. The terminal will return an error: system is busy.

The **dact-cmd:trm=** command requires the security administration command class for the terminal and for the user.

Notes

The **dact-cmd** command (without the **trm** parameter) must be entered on the same terminal that is running the command you want to cancel.

If the **dact-cmd** command is entered on a terminal that is not running a command, the **dact-cmd** command completes successfully without returning an error. Likewise, if the **dact-cmd:trm=** command is entered and there is no command running on the specified terminal, the **dact-cmd:trm=** command completes successfully without returning an error.

Command aborted on terminal 2.

You might still see some output after the abort message if output accumulated in the output queue before you issued the **dact-cmd** command. When you cancel a command, the cancellation should take no longer than 25 seconds to take effect.

The **F9** function key provides the same functionality as the **dact-cmd** command (without the **trm** parameter). On a terminal in KSR mode, pressing <CTRL>I, also provides the same function.

The **dact-cmd** and the **F9** function key cannot be used for pure SEAS commands.

If you try to cancel a command other than one listed in Table 5-35, the terminal accepts the command, but output and processing of the current command continue.

When the **dact-cmd** command is entered, a command status code of AB (command aborted) is logged in the security log as follows:

- When the **dact-cmd** (without the **trm** parameter) is entered, no entry is logged.
- When the **dact-cmd:trm=** command is entered, an entry is logged.
- When the **dact-cmd** (without the **trm** parameter) is entered as a SEAS flow-thru command, an entry is logged. The **dact-cmd:trm=** command is not allowed as a SEAS flow-thru command because the **dact-cmd:trm=** command belongs to the Security Administration Command Class.

For examples of the security log entries, see the **rtrv-seculog** command.

Output**dact -cmd**

```
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
dact-cmd
Command entered at terminal #2.
```

```
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
Command aborted on terminal 2.
```

;

dact -cmd:trm=2

```
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
dact-cmd:trm=2
Command entered at terminal #3.
```

```
rlghncxa03w 04-04-27 17:00:36 EST  EAGLE 31.6.0
Command aborted on terminal 2.
```

;

dact-echo**Deactivate Echo**

Use this command to halt the echoing of command responses from the user's terminal to other terminals or printers.

Keyword: dact-echo

Related Commands: act-echo, alw-trm, canc-echo, chg-trm, inh-trm, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

Command Class: Basic

Parameters

:trm= (optional)

The ID number of the terminal for which the echo is being canceled.

Range: 1-16

Default: Cancels all active echoes

Example

dact -echo

Dependencies

You cannot cancel the echo to the same terminal from which you are issuing the **dact-echo** command.

There must be an active echo (**act-echo**) to the terminal specified.

Notes

Only the echoing of command output responses can be halted by this command. To halt the printing of alarm and network messages, you must use the **chg-trm** command.

Output**dact -echo**

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Command entered at terminal #6.
Scroll Area Output echo disabled to all terminals.
```

;

dact -echo:trm=7

```
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Command entered at terminal #1.
Scroll Area Output echo disabled for terminal 7.
```

;

dact-lbp**Deactivate Loopback Point Test**

Use this command to deactivate a previously activated loopback point test, if a test is active. If no test is active, the command attempts to clear both near-end and far-end latched loopback points.

Keyword: **dact-lbp**

Related Commands: **act-lbp, chg-lbp, dlt-lbp, ent-lbp, rept-stat-lfs, rtrv-lbp**

Command Class: Link Maintenance

Parameters

:link= (mandatory)

SS7 signaling link. The signaling link for which the loopback point test is being deactivated.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

Card location. The unique identifier of the card containing the signaling link on which loopback point testing is to be deactivated.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

dact - lbp : loc=1205 : link=b

Dependencies

The specified signaling link must be equipped.

For clearing a remotely initiated loopback or LFS test stop, the card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The **dact-lbp** command cannot be entered until any previously issued **act-lbp** or **dact-lbp** command is accepted.

If an LFS test is about to complete, a new **dact-lbp** command cannot be entered until the test completes.

The **dact-lbp** command cannot be entered to cancel a signaling link test (a **tst-slk** test).

The **dact-lbp** command cannot be entered to cancel a Command Driven Loopback test.

The specified link is not found, and the max number of allowed LFS or signaling link tests are already in progress. At least one active LFS or signaling link test must be completed before this command can be entered again.

This command cannot be entered during upgrade.

The specified signaling link must not be active.

For clearing a remotely initiated loopback, the card location specified in the **loc** parameter must be equipped.

For clearing a remotely initiated loopback, The card location specified in the **loc** parameter must be in service (**IS-NR**).

For clearing a remotely initiated loopback, the card location specified in the **loc** parameter cannot be reserved by the system.

Notes

After the deactivation of loopback point testing has started, you cannot cancel the process.

If an LFS test is aborted by a card reset, it could leave the remote far-end loop-back condition active. Use the **dact-lbp** command to cancel LFS tests.

Output

The following example output is generated only when a latched loopback is cleared and when there were no active loopback tests in progress.

NOTE: This situation could occur even if there were no latched loopbacks to be cleared.

```
dact - lbp: loc=1205: link=b
rlghncxa03w 04-02-17 16:02:05 EST EAGLE5 33.0.0
LOC = 1205 LINK = B
CLEAR STATUS = PASS, loopback was cleared.
;
```

The following example output is generated only when a latched loopback could not be cleared when there were no active loopback tests in progress.

```
dact - lbp: loc=1205: link=b
rlghncxa03w 04-02-17 16:02:05 EST EAGLE5 33.0.0
LOC = 1205 LINK = B
CLEAR STATUS = ERROR, loopback could not be cleared.
;
```

dact-rstst

Deactivate Route Set Test

Use this command to request deactivation of the routeset test being performed by the LIMs running the **ss7ansi** application. The system verifies that the point code and the linkset exist, and that the specified linkset is in the routeset of the specified point code. If it is, then a request to stop routeset testing procedures for the specified destination-linkset combination is sent to the LIM.

Keyword: dact-rstst

Related Commands:

Command Class: System Maintenance

Parameters

:dpc= (mandatory)

The ANSI destination point code of the destination, x-list entry, or cluster whose routeset testing is to be stopped, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:lsn= (mandatory)

The name of the linkset associated with the destination point code that is to have routeset testing stopped.

Range: *ayyyyyyyyy*
 1 alphabetic character followed by 9 alphanumeric characters

Example

dact-rstst:dpc=1-2-*:lsn=lsn1a

dact-rstst:dpc=1-2-33:lsn=lsn1b

Dependencies

The specified DPC must be either provisioned or an x-list entry.

The specified linkset must be in the linkset table and in the DPC's routeset.

The destination address must be a full point code or a cluster point code specified as *ni-nc-**. A DPC cannot be specified as *ni-nc-*** or *ni-nc-**** for the **dact-rstst** command.

Notes

None

Output

dact-rstst:dpc=1-2-*:lsn=lsn1a

```
rlghncxa03w 04-01-05 16:40:40 EST  EAGLE 31.3.0
Stop routeset testing request sent to SNM (scroll area)
```

```
rlghncxa03w 04-01-05 16:40:40 EST  EAGLE 31.3.0
Command Completed.
```

dact-slk

Deactivate Signaling Link

Use this command to change the state of the specified link to OOS-MT-DSBLD (out-of-service maintenance-disabled).

CAUTION: This command impacts network performance, and should be used only during periods of low traffic.

Keyword: dact-slk

Related Commands: act-slk, blk-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Link Maintenance

Parameters

:link= (mandatory)

Signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

Synonym: port

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

dact -slk:loc=1301:link=a

Dependencies

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- A DCM or SSEDCCM or E5-ENET card running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application
- An E1/T1 MIM or HC MIM card running the **ss7ansi** or **ccs7itu** application
- An E1 ATM card running the **atmitu** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

The card must be equipped in the specified card location.

Notes

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

After the **dact-slk** command is entered, verify the cancellation by issuing the **rept-stat-slk** command.

Output

```
dact -slk:loc=1301:link=a
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE5 33.0.0
Deactivate Link message sent to card
;
```

dact-user

Deactivate User

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** command.

Keyword: dact-user

Related Commands: act-user, chg-pid, chg-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

Command Class: Basic

Parameters

This command has no parameters.

Example

dact-user

Dependencies

None

Notes

The **logout** or **canc-user** commands can be used in place of **dact-user**.

Output

Not applicable.

disc-imt

Disconnect IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to disconnect a card from the specified IMT bus.

Keyword: disc-imt

Related Commands: clr-imt-stats, conn-imt, rept-imt-lvl1, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt

Command Class: System Maintenance

Parameters

:bus= (mandatory)

IMT bus to be disconnected from.

Range: a, b

:loc= (mandatory)

Card address. The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

disc-imt:loc=1213:bus=b

Dependencies

This command cannot be entered during an IMT Fault Isolation Test. The card cannot be isolated from both IMT busses.

Notes

The card can be reconnected by issuing the **conn-imt** command, or by re-inserting the card. A software reset does not affect connect status. (The **init-card** command performs a software reset.)

Output**disc-imt:loc=1213:bus=b**

```

rlghncxa03w 04-01-07 11:02:30 EST EAGLE 31.3.0
Disconnect IMT Bus B command issued to card 1213
;

```

disp-fta-dir**Display Contents of the File Transfer Area**

Use this command to display the files that are in the file transfer area (FTA) the layout of FTA, and the amount of free space in the FTA.

Keyword: disp-fta-dir**Related Commands:** act-file-trns, copy-fta, dlt-fta**Command Class:** System Maintenance**Parameters****:loc=** (optional)

The location of the fixed disk whose FTA is to be displayed.

Range: **1114, 1116**
 (TDMs)

Default: The active TDM location

Example**disp-fta-dir:loc=1114****Dependencies**

This command must display the files (along with deleted files and free slots) in the order in which they appear in the file transfer area.

The **loc** parameter must specify a TDM card.

Only one file transfer can be active at a time.

This command cannot be entered on a telnet terminal (IDs 17-40).

Notes

None

Output**disp-fta-dir:loc=1114**

```

rlghncxa03w 05-07-01 16:21:12 EST EAGLE 31.3.0

dlt-acg-mic**Delete ACG Manually Initiated Control**

Use this command to delete ACG controls that apply to certain queries. The control can apply to all queries or to specific query services and called party digits. A particular control is selected to be deleted by either specifying that it is the **type=all** control or specifying its service and digits.

Keyword: **dlt-acg-mic**

Related Commands: **chg-acg-mic**, **ent-acg-mic**, **rept-stat-lnp**, **rtrv-acg-mic**

Command Class: Database Administration

Parameters

:dgts= (optional)
 Digits
Range: 3-10 digits

:serv= (optional)
 Query service
Range: **ain**, **in**

:type= (optional)
 Type of control
Range: **all**, **sd**
Default: **sd**

Example

dlt-acg-mic:type=all

dlt-acg-mic:serv=ain:dgts=9194602132

Dependencies

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** are not allowed.

If the **type=sd** parameter is specified, optional parameters **srv** and **dgts** are required.

If the **type=all** parameter is specified, a MIC with **type=all** must exist.

If the **type=sd** parameter is specified, a MIC with the same service and digits must exist.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The **dgts** parameter value must be 3 digits or 6-10 digits in length.

Notes

None

Output

dlt-acg-mic:type=all

```
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ACG MIC table is (10 of 256) 4% full of type SD
DLT-ACG-MIC: MASP A - COMPLTD
```

;

dlt-acg-noc**Delete ACG Node Overload Control**

Use this command to delete the definition of a node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call

Gappings (ACG) to be sent when at the level. If a level is not defined, it is not used. Level 10 cannot be deleted.

Keyword: dlt-acg-noc

Related Commands: chg-acg-noc, ent-acg-noc, rept-stat-lnp, rtrv-acg-noc

Command Class: Database Administration

Parameters

:lvl= (mandatory)
Overload level.
Range: 1-9

Example

dlt-acg-noc:lvl=3

Dependencies

The specified overload level must be defined.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

None

Output

dlt-acg-noc:lvl=3

```
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
DLT-ACG-NOC: MASP A - COMPLTD
;
```

dlt-appl-rtkey

Delete Application Route Key Table

Use this command to delete static or dynamic entries from the Routing Key table. These entries are used to associate a routing key with a socket name. A static entry is created using the **ent-appl-rtkey** command. A dynamic entry is one created by receipt of a TALI message from the socket to which it applies.

There are three types of routing keys, as follows:

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Keyword: dlt-appl-rtkey

Related Commands: ent-appl-rtkey, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:asname= (mandatory)
Application Server (AS) name; AS assigned to this routing key.

Range: *aaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter

:sname= (mandatory)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

Range: *aaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter

:cice= (optional)

The end range of circuit identification codes assigned to the routing key. Specify **cice** along with **cics** to identify the routing key to be changed. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

Range: **0-4294967295**
See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The end range of circuit identification codes assigned to the routing key. Specify **cice** along with **cics** to identify the routing key to be changed. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

Range: **0-4294967295**
See Table A-4 for valid CIC values for specified SI and MSU types.

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **dpca**

Range: **000-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:loc= (optional)

Card location. This parameter is used to delete socket associations for dynamic entries in the Routing Key table of the SS7IPGW card at the specified location.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **opca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Valid only if **si=4, 5, or 13** and required if **si=4, 5, or 13**.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:opcni= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opcni24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:rcontext= (optional)

Identify a routing key by its routing context when a routing key needs to be deleted as an optional alternative to entering the **dpc/si/ssn/opc/cics/cice/type** key parameters.

The **loc** and **rcontext** parameters are not allowed together at the command line because the **loc** parameter is only used with dynamic (TALI-only) routing keys which do not support routing context.

Range: **0-4294967295**

:si= (optional)

The service indicator

Range: **0-15**

0-15 or equivalent text values:

Number = Text—Description

0 = snm—Signaling network management messages

1 = regtest—Signaling network testing and maintenance regular

2 = **spltest**—Signaling network testing and maintenance special
 3 = **sccp**—SCCP
 4 = **tup**—Telephone user part
 5 = **isup**—ISDN user part
 13 = **qbicc**

:ssn= (optional)

The subsystem number.

Range: 0-255

:type= (optional)

The type of routing key that is being changed.

Range: full, partial, default

Default: full

Example

```

dlt-appl-rtkey:sname=tekelec:si=3:ssn=255
dlt-appl-
rtkey:dpc=123-234-123:si=5:opc=122-124-125:cics=1:cice=1000:sname
=ssocket3
dlt-appl-rtkey:loc=1105:dpc=6-6-1:si=3:ssn=5:sname=dynamicsock1
dlt-appl-rtkey:dpc=1-1-1:si=3:asname=as1:ssn=255
dlt-appl-
rtkey:dpcn24=10-100-10:si=5:sname=socket01:opc=10-100-11:cics=
1 :cice=100
dlt-appl-
rtkey:dpci=s-3-11-1:si=5:opci=s-4-11-2:cics=1:cice=1000:asname=as
itu
dlt-appl-rtkey:rcontext=100
  
```

Dependencies

The SSN is valid and must be specified only when the **si=3** (or **sccp**) parameter is specified. When the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter must not be specified.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are required and can be entered only if the **si** parameter value is 4, 5, or 13.

If the **si=4**, 5, or 13 (or **tup**, **isup**) parameter is specified, or the **qbicc** parameter is specified, a value must also be specified for the **opc**, **cics**, and **cice** parameters used to route ISUP messages. The **opc**, **cics**, and **cice** parameters can be specified only if the **si=4**, 5, or 13 (or **tup**, **isup**) parameter is specified, or if the **qbicc** parameter is specified.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The routing key must be in the Routing Key table.

The socket name must be in the Socket table.

If the **asname** parameter is specified, the AS name must already be defined in the AS table. The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type used by the ASP associations assigned to the AS.

When the **type=default** parameter is specified, the **sname** and **loc** parameters are allowed.

When the **type=full** parameter is specified, the **dpc** and **si** parameters must be specified.

The following types of partial routing keys are supported:

- DPC-SI-OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC-SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

The following card locations are not valid for this command: 1113, 1115, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf). The card must be equipped and in service.

The **loc** and **rcontext** parameters cannot be specified together in the command. The **loc** parameter is used only with dynamic (TALI-only) routing keys, which do not support routing context.

Notes

A specific routing key/socket name association can be deleted by specifying a fully qualified routing key (**dpc/dpca**, **si**, **ssn**, and **sname**). By default, socket associations in the static key entries are deleted using the **dlt-appl-rtkey** command. To delete a dynamic entry, use the **loc** parameter with the **dlt-appl-rtkey** command.

The originating point code (**opc**) and destination point code (**dpc**) must not specify a cluster route.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
dlt-appl-rtkey:sname=tekelec:si=3:ssn=255

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-APPL-RTKEY: MASP A - COMPLTD
;
```

dlt-appl-sock

Delete Application Socket

Use this command to delete the Socket table entries. The Socket table is used to associate the local host/local port to a remote host/remote port.

Keyword: dlt-appl-sock

Related Commands: chg-appl-sock, ent-appl-sock, rtrv-appl-sock

Command Class: Database Administration

Parameters

:sname= (mandatory)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

Range: *aaaaaaaaaaaaa*
 Up to 15 alphanumeric characters; the first character must be a letter

Default: Delete all related sockets

Example

dlt-appl-sock:sname=tekelec

Dependencies

The socket specified in the **sname** parameter must be in an **open=no** state to modify table entries (**chg-appl-sock:open=no**).

An AS/socket entry cannot be deleted from the Socket table if it is assigned to a routing key.

Notes

None

Output

dlt-appl-sock:sname=tekelec

```
rlghncxa03w 04-02-17 15:35:05 EST  EAGLE 31.3.0
DLT-APPL-SOCK: MASP A - COMPLTD
;
```

dlt-as**Delete Application Server**

Use this command to delete an AS.

Keyword: **dlt-as**

Related Commands: **chg-as, ent-as, rept-stat-as, rtrv-as**

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name of the M3UA/SUA SCTP association to be deleted.

Range: *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

:asname= (mandatory)

Application Server (AS) name; AS assigned to this routing key.

Range: *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

:aspname= (obsolete)

Name assigned to the ASP in the ASP table.

NOTE: This parameter is obsolete.

Range: *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

Example

dlt-as:as=asx:aname=asxp1

Dependencies

An AS that is still assigned to a routing key cannot be deleted.

The connection state for the associations assigned to the AS must be **open=no** before the AS can be deleted.

The AS must be defined in the AS table.

The specified associaton name (**aname**) parameter must be defined in the AS.

Notes

None

Output

dlt-as:as=asx:as=asxp1

```
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-AS: MASP A - COMPLTD
;
```

dlt-asp

Delete Application Server Process

Use this command to delete an Application Server Process (ASP).

NOTE: This command is obsolete.

Keyword: dlt-asp

Related Commands: ent-asp, rept-stat-asp, rtrv-asp

Command Class: Database Administration

Parameters

:aspname= (mandatory)

Name assigned to this ASP.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

Example

dlt-asp:aspname=asxp1

Dependencies

The ASP must already be defined.

An ASP that is still assigned to an AS cannot be deleted.

Notes

None

Output

dlt-asp:aspname=asxp1

```
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
DLT-ASP: MASP A - COMPLTD
;
```

dlt-assoc

Delete Association

Use this command to delete the SCTP associations from the IPAPSOCK table.

Keyword: dlt-assoc

Related Commands: chg-assoc, ent-assoc, rtrv-assoc

Command Class: Database Administration

Parameters**:aname=** (mandatory)

Name assigned to the association to be deleted.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

Example**dlt-assoc:aname=tekelec****Dependencies**The association name (**aname**) must already exist in the IP Socket/Association (IPAPSOCK) table.

An association that exists on any AS cannot be deleted from the IPAPSOCK table.

An AS assigned to a routing key cannot be deleted from the IPAPSOCK table.

The connection state must be **open=no** to delete the association from the IPAPSOCK table.**Notes**

None.

Output**dlt-assoc:aname=tekelec**

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

DLT-ASSOC: MASP A - COMPLTD

;

dlt-card**Delete Card**

Use this command to remove a card entry from the system database.

Keyword: dlt-card**Related Commands:** init-card, rept-stat-card, rmv-card, rst-card, rtrv-card**Command Class:** Database Administration**Parameters****:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**Example****dlt-card:loc=1201****Dependencies**The card location slot must be between **1** and **18**, but not **9** or **10**.The card location cannot be **1113–1118**.The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

The shelf and card must be equipped.

Before this command can be entered, all TCP/IP data links assigned to the card must be deleted.

Before an E1 card or an E1/T1 MIM card used as an E1 card can be deleted, any E1 interfaces assigned to the card must be deleted.

Before an E1/T1 MIM card that is used as a T1 card can be deleted, any T1 interfaces assigned to the card must be deleted.

After the links are deleted, the card must be inhibited before it can be deleted. Use the **inh-card** command to set the card to the OOS-MT-DSBLD state.

Before this command can be entered, SS7 signaling links assigned to the card must be deleted.

Only one database change, action, backup, or restore can be in progress at a time.

Notes

None

Output

```
dlt-card:loc=1201
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
DLT-CARD: MASP A - COMPLTD
;
```

dlt-csl

Delete Common Screening List

Use this command to delete an existing entry from the Common Screening List (CSL). The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: dlt-csl

Related Commands: chg-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command.

Range: 1-15 digits

Valid digits are **0-9, a-f, A-F**.

1-15 digits—IDP Screening for Prepaid **insl** list

4 digits—IDP Screening for Prepaid **skts** list

1-15 digits—Prepaid IDP Query Relay **ccnc** list

1-5 digits—Prepaid IDP Query Relay **delpfx** list

1-6 digits—Prepaid IDP Query Relay **gta** list

1-4 digits—Prepaid IDP Query Relay **skbcsn** list

:feature= (optional)

Feature Name. The name of the enabled screening feature for which the command is entered. Enter the name as it appears in the **rtrv-ctrl-feat** command description output example.

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example. Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces.

The following part numbers are valid for this command:

- **893015501**—IDP Screening for Prepaid
- **893016001**—Prepaid IDP Query Relay

Example

```
dlt-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=123456
```

```
dlt-csl:pn=893016001:list=skbcsm:ds=4321
```

```
dlt-csl:feature="Prepaid IDP Query  
Relay":list=delpfx:ds=54321:p1=0
```

```
dlt-csl:pn=893016001:list=gt:ds=123456789abcdEF
```

```
dlt-csl:feature="IDP Screening for Prepaid":list=insl:ds=246810
```

dlt-csl:pn=893015501:list=skts:ds=36ab

Dependencies

An enabled feature must be specified using either a valid part number (**pn**) or feature name (**feature**). The specified feature must use a Common Screening List.

The specified feature name must be for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output example. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The following features use a Common Screening List:

- IDP Screening for Prepaid
- Prepaid IDP Query Relay

The feature that is specified in the **feature** parameter must be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The **list** parameter value must be valid for the specified screening feature. The following **list** parameter values are valid for the indicated feature:

- **insl, skts**—IDP Screening for Prepaid
- **gt, ccnc, delpfx, skbcsm**—Prepaid IDP Query Relay

The specified screening list entry must exist in the screening list that is used by the feature.

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccnc—ds** parameter
- **list=delpfx—ds** and **p1** parameters
- **list=skbcsm—ds** parameter
- **list=insl—ds** parameter
- **list=skts—ds** parameter

Notes

None

Output

```
dlt-csl:pn=893016001:list=gt:ds=919556
tekelecstp 05-08-21 15:18:41 EST EAGLE 34.1.0

dlt-cspc

Delete Concerned Signaling Point Code

Use this command to remove a CSPC or an entire CSPC group.

Keyword: dlt-cspc

Related Commands: ent-cspc, rtrv-cspc

Command Class: Database Administration

Parameters

One, but not both, of these optional parameters must be specified: **all**, **pc/pca/pci/pcn/pcn24**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:grp= (mandatory)

Group name

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:all= (optional)

Use this parameter to confirm that all entries for this concerned signaling point code group are to be removed.

Range: yes, no

Default: no

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Concerned signaling point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

dlt-cspc:grp=grp01:pc=144-201-001

dlt-cspc:grp=grp01:pci=s-144-201-001

dlt-cspc:grp=grp01:all=yes

Dependencies

A CPC group name must be specified. The specified group name must exist in the database.

The **grp** parameter and the **all=yes** parameter must be entered with no point code parameter, to remove a group and all of its point codes.

If a PC is specified, then the PC network type must match the group network type, and the PC must exist in the specified CPC group. The specified PC is removed from the CPC group.

Either a PC parameter or the **all=yes** parameter must be specified.

The Spare Point Code Support feature must be enabled before the spare PC prefix **s-** can be specified for an ITU-I or ITU-N point code.

A PC parameter cannot be entered together with the **all** parameter in the same command.

The specified CSPC group must not be referred to by any Mate Application entity.

If the Flexible GTT Load Sharing feature is not enabled, a CAUTION is displayed. When the feature is enabled, the command is rejected with message E4534.

Notes

The system issues a warning if a mate application entity could potentially use a group name that is being deleted.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

```

dlt-cspc:grp=grp01:pci=2-2-2
tekelecstp 04-04-08 12:42:47 EST EAGLE 31.3.0
DLT-CSPC: MASP A - COMPLTD
;

```

dlt-dlk**Delete Data Link**

Use this command to remove a TCP/IP data link from the database. The TCP/IP data link is used for the STP LAN feature, connecting the system to a remote host for message processing.

Keyword: dlt-dlk

Related Commands: act-dlk, canc-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Example

```
dlt-dlk:loc=1201
```

Dependencies

The ACM is the only card type that is valid for this command.

The shelf and card must be equipped.

The specified ACM must have a TCP/IP data link assigned to it.

The specified ACM and data link must be out-of-service maintenance-disabled (OOS-MT-DSBLD). Enter the **rept-stat-card** and **rept-stat-dlk** commands to verify the state of the ACM and data link.

Notes

None

Output

```

dlt-dlk:loc=1201

rlghncxa03w 04-02-10 11:43:02 EST EAGLE 31.3.0
DLT-DLK: MASP A - COMPLTD
;

```

dlt-dstn**Delete Destination**

Use this command to delete destinations from the Destination entity set after the STP no longer routes to those destinations.

Keyword: dlt-dstn

Related Commands: chg-dstn, chg-rte, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code (*gc*) must be specified when the ITUDUPPC feature is turned on. The *prefix* indicates a spare point code, private point code, or private and spare point code.

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

To delete destination 11-222-111:

dlt-dstn:dpc=111-222-111

To delete a network destination:

dlt-dstn:dpc=21-*-*

To delete destination 8112-ge:

dlt-dstn:dpcn=8112-ge

To delete ITU-N 24-bit destination 13-100-10:

dlt-dstn:dpcn24=13-100-10

To delete destination spare point code s-8112:

dlt-dstn:dpcn=s-8112

Dependencies

The destination address must be either a full point code, a cluster point code, or a network destination point code.

The format of the specified **dpcn** parameter must match the format for ITU national point codes that was assigned with the **chg-stpopts:npcfmti** parameter.

The specified destination point code must already exist in the Destination entity set.

The destination cannot have routes assigned to it.

The specified destination point code cannot already be defined as a remote application internal point code (IPC).

The **dpc** parameter must be defined as a destination point code.

The specified destination point code cannot already be defined as an adjacent point code or a secondary adjacent point code.

The specified destination cannot be referenced by SCCP as a destination point codes in the Mate Application table.

The specified destination cannot be referenced by SCCP as a destination point code in the Mated Relay Node (MRN) table.

If the X.25/SS7 Gateway feature is turned on, any X.25 destinations that reference the specified destination must be removed from the database before the specified destination can be removed from the database.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*-***).

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

dlt-dstn:dpc=111-222-111

```

dlt-e1

Delete E1 Interface

Use this command to delete an interface for a 2-port E1 card, or for an E1/T1 MIM card, an HC MIM card, or an E5-E1T1 card used as an E1 card. The E1 port number on the card and the E1 card location in the EAGLE 5 ISS must be specified.

On an HC MIM card or an E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The slave port interface is automatically deleted with the command that deletes its master port interface.

Keyword: dlt-e1

Related Commands: chg-e1, ent-e1, rtrv-e1, tst-e1

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 port number. The value must be an E1 port that has already been configured on the specified E1 card.

Range: **1-8**

Ports 3 - 8 can be specified only for HC MIM cards and E5-E1T1 cards.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Example

```
dlt-e1:loc=1205:e1port=1
```

```
dlt-e1:loc=1205:e1port=2
```

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **lime1** card type.

The port specified by the **e1port** parameter must be already equipped with an E1 interface.

All signaling links providing timeslots serviced by the specified E1 interface must be deleted before the E1 interface can be deleted. See the **dlt-slk** command to delete the signaling links providing the timeslots.

A channel bridged slave (even-numbered) port on an HC-MIM card or an E5-E1T1 card cannot be specified in the **e1port** parameter. To delete channel bridged port interfaces, specify the master (odd-numbered) port in the **e1port** parameter. The slave port interface is automatically deleted when its master port interface is deleted.

The following card locations cannot be specified in the **loc** parameter: 1113, 1114, 1115, 1116, 1117, 1118 (OAM, TDM, and MDAL cards), and xy09 and xy10 (x is the frame, y is the shelf for HMUX and HIPR cards).

Notes

None.

Output

```
dlt-e1:loc=1205:e1port=1
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0

;
```

dlt-frm-pwr

dlt-frm-pwr

Use this command to delete the existing power threshold entry from the Frame Power Threshold table for the specified frame. After the power threshold value is deleted, the default power threshold value of 30 Amps is assumed for the specified frame.

Range: yes, no
Default: no

:loc= (optional)

The card location of the fixed disk containing the FTA.

Range: 1114, 1116
 (TDM)

Default: The location of the active TDM

Example

```
dlt-ftp:loc=1114:file="CAM.ELF"
dlt-ftp:loc=1114:file="CAM.ELF":force=yes
dlt-ftp:loc=1116:all=yes
```

Dependencies

Removing an individual file only frees up that file name for another transfer of that file.

The **all=yes** parameter must be specified when a specific filename is not supplied.

The **all=yes** parameter not only removes all files from the FTA, but frees up the space in the FTA.

When using DOS file names, if the file name contains a special character such as an underscore (_) or begins with a numeric, the file name must be in quotes (" "), for example, "92_name.ext".

Removing an individual file only frees up that file name for another transfer of that file.

The **force=yes** parameter must be specified to remove the last file in the FTA.

The **loc** parameter must specify a TDM card.

A specific filename and **all=yes** may not be specified at the same time.

Only one file transfer can be active at a time.

Notes

None

Output

```
dlt-ftp:file=oam.elf:loc=1114
rlghncxa03w 04-02-05 15:31:59 EST  EAGLE 31.3.0
File OAM.ELF deleted from File Transfer Area on fixed disk 1114.
;

dlt-ftp:all=yes:loc=1116
rlghncxa03w 04-02-05 15:33:32 EST  EAGLE 31.3.0
All files deleted from File Transfer Area on fixed disk 1116.
;
```

dlt-ftp-serv

Delete FTP Server Entry

Use this command to delete an entry for an FTP server from the FTP Server table.

Keyword: dlt-ftp-serv

Related Commands: chg-ftp-serv, ent-ftp-serv, rtrv-ftp-serv

Command Class: Database Administration

Parameters

:app= (mandatory)

The FTP Client application at the EAGLE 5 ISS STP that interfaces with the FTP Server.

Range: meas, user

meas — the Measurements Platform application
user — the FTP-based Table Retrieve Application (FTRA)

:ipaddr= (mandatory)

IP Address of the FTP Server.

Range: 4 numbers separated by dots, with each number in the range of 0-255.

Example

dlt-ftp-serv:app=meas:ipaddr=1.255.0.102

Dependencies

Both the **app** and **ipaddr** parameters must be entered in the command to delete an FTP server.

An entry must already exist in the FTP Server table for this application at the specified IP address.

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

Notes

None

Output

dlt-ftp-serv:app=meas:ipaddr=1.255.0.102

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0

```

;

dlt-gserv-data

Delete G-Port SRI Query for Prepaid Service Data

Use this command to delete translation type, originating point code, or global title address data from the GSERV table. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid Service or normal G-Port SRI service.

Keyword: dlt-gserv-data

Related Commands: ent-gserv-data, rtrv-gserv-data

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (optional)

Global title address. Use this parameter to specify a calling party (CgPA) global title address.

Range: 1-21 digits

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: opca

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Use these parameters to specify message transfer part (MTP) originating point codes.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tt= (optional)

Translation type. Use this parameter to specify a called party (CdPA) translation type.

Range: 0-255

Example

```
dlt-gserv-data:tt=26
dlt-gserv-data:opc=1-1-1
dlt-gserv-data:gta=9194605500
```

Dependencies

The specified translation type (**tt** parameter), originating point code (**opc/opca/opci/opcn/opcn24** parameter), or global title address (**gta** parameter) must exist in the GSERV table before this command can be entered.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The **tt**, **opc**, and **gta** parameters cannot be specified within the same command.

The G-Port feature must be on before this command can be entered.

Output

```
dlt-gserv-data:tt=26
mstyp 06-07-20 09:04:21 EST EAGLE 35.2.0
DLT-GSERV-DATA: MASP A - CMLTD
;
```

dlt-gsmmap-scrn

Delete GSM MAP Screening Entry

Use this command to delete the GSM Map Screening CgPA and CdPA entries that are used to filter out or allow SCCP messages containing Map Op-Codes, CGPA GTA+NPV+NAIV, CDPA GTA+NPV+NAIV, and forbidden parameters.

Keyword: dlt-gsmmap-scrn

Related Commands: chg-gsmmap-scrn, ent-gsmmap-scrn, rtrv-gsmmap-scrn

Command Class: Database Administration

Parameters

:cgsr= (mandatory)

CgPA Screening Reference.

Range: ayy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:opname= (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command.

Range: ayyyyyy

Up to 8 alphanumeric characters

:cdsr= (optional)

CdPA Screening Reference.

Range: ayy

1 alphabetic character followed by up to 3 optional alphanumeric characters

Example

```
dlt-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall
dlt-gsmmap-scrn:opname=xyz:cgsr=fela
```

Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before the **cdsr** parameter can be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

A **cgpa** entry cannot be deleted if it is referred to by **cdpa** entries.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

Notes

Unlike GTT (Global Title Translation) entries, the GSM MAP screening commands do not support splits of ranges during deletion or changes of entries.

Output

```
dlt-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=fall
rlghncxa03w 04-02-29 08:51:12 EST EAGLE 31.4.0
GSM Map Screening table is (1 of 4000) 1% full
DLT-GSM MAP-SCRN: MASP A - COMPLTD
;
```

dlt-gsms-opcode

Delete GSM MAP Screening Operation Code

Use this command to delete GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for that operation code.

Keyword: dlt-gsms-opcode

Related Commands: chg-gsms-opcode, ent-gsms-opcode, rtrv-gsms-opcode

Command Class: Database Administration

Parameters

:opname= (mandatory)

The user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

Range: *ayyyyyyy*
Up to 8 alphanumeric characters

Example

```
dlt-gsms-opcode:opname=ati
```

Dependencies

The reserved word **none** cannot be specified as a value for the **opname** parameter.

The value specified for the **opname** parameter must exist in the GSM MAP Op-Code table.

The **opname** value being deleted cannot be referenced in the GSM MAP Screening table.

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

Notes

None

Output

```

dlt-gsms-opcode:opname=ati
rlghncxa03w 06-02-29 08:50:12 EST EAGLE 35.0.0
DLT-GSMS-OPCODE: MASP A - COMPLTD
;

```

dlt-gsmssn-scrn**Delete GSM Subsystem Number Screening Entry**

Use this command to delete an SSN (subsystem number) from the GSM (Global System for Mobile Telecommunication) SSN screening table.

Keyword: dlt-gsmssn-scrn

Related Commands: ent-gsmssn-scrn, rtrv-gsmssn-scrn

Command Class: Database Administration

Parameters

:ssn= (mandatory)

Subsystem number.

Range: 000-255

:type= (mandatory)

Subsystem type.

Range: orig, dest

orig— The origination SSN

dest— The destination SSN

Example

This example deletes a destination subsystem of 255 from the GSM SSN screening table:

```
dlt-gsmssn-scrn:ssn=255:type=dest
```

Dependencies

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

A value for the **ssn/type** parameter combination must be specified that exists in the GSM SSN screening table.

Notes

None

Output

```

dlt-gsmssn-scrn:ssn=255:type=dest
rlghncxa03w 04-02-20 09:04:21 EST EAGLE 31.3.0
DLT-GSMSSN-SCRN: MASP A - COMPLTD
;

```

dlt-gta**Delete Global Title Address Information**

Use this command to delete the GTA (global title address) information applicable to a global title selector combination.

This command deletes the routing of SCCP messages for specified global title addresses from designated destinations and their subsystem numbers.

Keyword: dlt-gta

Related Commands: chg-gta, ent-gta, rtrv-gta

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: cgpa

Range: 000-255, *

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-*- is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:cgssn= (optional)

Starting CgPA subsystem number.

Range: **0-255**

:ecgssn= (optional)

Ending CgPA subsystem number.

Range: **0-255**

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Same as the specified **gta** value

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **opca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:opc= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Example

dlt-

gta:gttsn=setcdgta:gta=123456789012345678901:egta=223456789012345678901

dlt-gta:gttsn=t800:gta=919461:egta=919468

dlt-

gta:gttsn=setcggta:gta=323456789012345678901:egta=423456789012345678901

dlt-gta:gttsn=setcgpc:cgpc=001-001-001

dlt-gta:gttsn=setopc:opca=002-001-001

dlt-gta:gttsn=setcgssn:cgssn=100:ecgssn=200

The following example specifies hexadecimal digits for the gta and egta parameters.

dlt-gta:gttsn=set1:gta=abcd:egta=abce

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **gttsn** parameter must be specified, may not have a value of **none**, and must match an existing **gttsn**.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set (**gttsn**). If the VGTT (variable length GTT) feature is turned on, you can have up to 10 GTA lengths per GTT set. When you enter the **ent-gta** command to create entries, the software keeps track of the lengths and allows only ten different lengths. The global title address specified for the GTT set must have the same number of digits as an existing GTA.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, you cannot specify an overlap with another range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

START GTA	END GTA
8005550000	8005551999
8005552000	8005553999
8005554000	8005555999

DLT-GTA: MASP A - Command Aborted

If the **egta** parameter is specified, the **gta** and **egta** value must be the same length and the **egta** value must be greater than the **gta** value.

The GTT table cannot be full in case a delete command causes a split requiring more entries to be added.

Either the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **cgssn**, or **gta** parameter must be specified.

If specified, the **ecgssn** parameter must be greater than the **cgssn** parameter.

The **cgssn** parameter cannot be specified as a wildcard (*).

The Origin-based SCCP Routing feature must be enabled when specifying the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters.

The **gta** parameter must be specified if the GTTSN set type has a value of **cdgta** or **cggtta**, and cannot be specified for other set types.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter must be specified if the GTTSN set type has a value of **cgpc**, and cannot be specified for other set types.

The **opc/opca/opci/opcn/opcn24** parameter must be specified if the GTTSN set type has a value of **opc**, and cannot be specified for other set types.

The **cgssn** parameter must be specified if the GTTSN set type has a value of **cgssn**, and cannot be specified for other set types.

If the specified GTT Set is an ANSI set, the **cgpc/cgpca** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT Set is an ITU set, the **cgpci/cgpcn/cgpcn24** and **opci/opcn/opcn24** parameters must be valid ITU point codes.

The range specified by the **cgssn** and **ecgssn** parameters must exist for the specified GTT set. An exact match is not required.

The point code specified by the **cgpc** or **opc** parameter must exist.

The range specified by the **cgssn** and **ecgssn** parameters cannot overlap a currently existing range for the specified GTT set.

The **cgpc**, **cgssn**, **gta**, and **opc** parameters are mutually exclusive. Each of these parameters must be specified individually in separate commands.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** or **egta** parameters.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

If a GTT is being deleted or changed and the point code (**dpc** or **rte**) is not found in the route table (unless the point code is the STP's true point code), the following message is displayed in the terminal scroll area:

NOTICE: No DPC and/or RTE found for GTT being deleted or changed.
The above situation may occur for the following reasons:

▲ database was upgraded from a release prior to EAGLE 5 ISS Release 27.1 or IP⁷ Secure Gateway Release 3.0 when GTT entries were not linked to the route table and the deletion of the **dpc** was permitted. The GTT referenced a **dpc/rte** that was deleted, and the enforce reference counts between the GTT and route tables were not updated.

- A serious problem occurred in which the reference count rules were not enforced and a **dpc** and/or **rte** were deleted while being referenced by a GTT entry. This indicates a software error; notify the Customer Care Center at (888) FOR-TKLC.

Output

dlt-gta:gttsn=libd:gta=9195554321

rlghncxa03w 04-02-20 09:04:21 EST EAGLE 31.3.0
DLT-GTA: MASP A - CMPLTD

dlt-gtcnv

Delete Global Title Conversion

Use this command to delete entries from the Default Global Title Conversion table. The particular entry to be deleted is identified by the direction in conjunction with the TTA or TTI, or with the TTI, NP, and NAI.

Keyword: dlt-gtcnv

Related Commands: chg-gtcnv, ent-gtcnv, rtrv-gtcnv

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: atoi, itoa, both

atoi— ANSI to ITU conversion

itoa— ITU to ANSI conversion

both— Conversion in both directions

:nai= (optional)

Nature of Address Indicator. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: 0-63 *

Default: No change to current value

:np= (optional)

Numbering Plan. This parameter is mandatory when **gtixlat=24** is specified, and cannot be specified when **gtixlat=22** is specified.

Range: 0-15 *

Default: No change to current value

:tta= (optional)

ANSI translation type. This parameter is mandatory when **dir=atoi** or **dir=both** is specified.

Range: 0-255 *

Default: No change to current value

:tti= (optional)

ITU translation type. This parameter is required when **dir=atoi** is specified.

Range: 0-255 *

Default: No change to current value

Example

The following example deletes an ANSI-to-ITU entry using the TTA of 10 to identify the entry.

dlt-gtcnv:dir=atoi:tta=10

The following example deletes an ANSI-to-ITU entry using the TTA of 11 to identify the entry.

dlt-gtcnv:dir=atoi:tta=11

The following example deletes a ITU-to-ANSI entry using the TTI of 7, NAI of 8, and NP of 6 to identify the entry.

dlt-gtcnv:dir=ittoa:tti=7:nai=8:np=6

The following example deletes a BOTH (ANSI <-> ITU) entry using the TTI of 9 and TTA of 12 to identify the entry.

dlt-gtcnv:dir=both:tta=12:tti=9

The following example deletes a BOTH (ANSI <-> ITU) entry using the TTI of 7, NAI of 6, NP of 4, and TTA of 12 to identify the entry.

dlt-gtcnv:dir=both:tta=12:tti=7:np=4:nai=6

The following example deletes an ANSI-to-ITU default entry using the TTA of * to identify the entry.

dlt-gtcnv:dir=atoi:tta=*

The following example deletes an ITU-to-ANSI default entry using the TTI of *, NAI of * and NP of * to identify the entry.

dlt-gtcnv:dir=ittoa:tti=*:nai=*:np=*

Dependencies

The ANSI-ITU-China SCCP Conversion feature must be enabled before this command can be entered.

The entry that is to be deleted must exist in the database.

When **dir=atoi** is specified, the **tta** parameter must be specified.

When **dir=atoi** is specified, the **tta** parameter must be specified.

When **dir=atoi** is specified, **tti**, **nai**, and **np** parameters cannot be specified.

When **dir=itoa** is specified, the **tti=*** parameter must be specified.

When **dir=itoa** is specified, **nai** and **np** parameter values must be ***** if specified.

When **dir=both** is specified, at least the **tta** and **tti** parameters must be specified.

When **dir=both** is specified, asterisk values for other parameters cannot be specified.

If specified, the **nai** and **np** parameters must be specified together in the command.

When **gtixlat=22** and **dir=itoa** are specified, asterisk entries cannot be specified. Specify **gtixlat=24** when **dir=itoa** is specified and asterisk entries are specified.

Notes

To delete an ANSI-to-ITU entry, specify the direction (**dir**) and the TTA.

To delete an ITU-to-ANSI entry with a **gtixlat** of **22**, specify the direction (**dir**) and the TTI.

To delete an ITU-to-ANSI entry with a **gtixlat** of **24**, specify the direction (**dir**), TTI, NAI and NP.

To delete a BOTH (ANSI <-> ITU) entry with a **gtixlat** of **22**, specify the direction (**dir**), TTA and TTI.

To delete a BOTH (ANSI <-> ITU) entry with a **gtixlat** of **24**, specify the direction (**dir**), TTA, TTI, NP and NAI.

Output

dlt-gtcnv:dir=both:tta=12:tti=9

```
rlghncxa03w 03-03-18 08:50:12 EST EAGLE 31.3.0
DLT-GTCNV: MASP A - COMPLTD
;
```

dlt-gtt

Delete Global Title Translation

Use this command to remove the routing of messages for specified global title addresses from designated destinations and their subsystem numbers.

If the EGTT (Enhanced Global Title Translation) feature is turned on, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gttset**)
- GTT Set commands (**ent/dlt/rtrv-gttset**)
- GTA commands (**ent/chg/dlt/rtrv-gta**).

Keyword: **dlt-gtt**

Related Commands: **chg-gtt**, **ent-gtt**, **rtrv-gtt**

Command Class: Database Administration

Parameters

At least one of these optional parameters must be specified: **ttn**, **type/typea/typeei/typen/typen24**.

:gta= (mandatory)

Global title start address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:egta= (optional)

Global title end addresss. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: **egta** same as **gta**

:ttn= (optional)

Translation type name.

Range: *ayyyyyyy*
 1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24= (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **0-255**

Default: No translation type is specified

Example

dlt-gtt:type=252:ttn=lidb9:gta=408908:egta=408988

dlt-gtt:gta=919833:typen24=4

The following example specifies hexadecimal digits for the gta and egta parameters.

dlt-gtt:ttn=set1:gta=abcd123456789a:egta=abcE123456789F

Dependencies

This EGTT feature must be turned on before this command can be entered.

If translation type is specified, it must exist in the database.

If the **ttn** parameter is specified, the name must correspond to a translation type entry.

If both **ttn** and **type** are specified, **ttn** must correspond to the given translation type.

The **type** or **ttn** parameter must specified.

The **gta** length must equal the number of digits specified by the translation type. If the VGTT (variable length GTT) feature is turned on, you can have up to 10 GTA lengths per translation type. When you enter the **ent-gtt** command to create entries, the software keeps track of the lengths and allows only ten different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

The global title address range as expressed by the **gta** and **egta** parameters must already exist in the global title translation.

The range, as specified by the **gta** and the **egta**, must be exactly the same as a current entry or be contained within an existing range in the GTT data for the specified translation type. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to delete a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA          END GTA
8005550000         8005551999
8005552000         8005553999
8005554000         8005559999
DLT-GTT: MASP A - Command Aborted
```

If the address range as specified by the start and end global title addresses does not exactly match the existing range, the range is split. All addresses in the existing range that are outside of the specified range are used to create new ranges. The specified range is deleted.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** or **egta** parameters.

Output

```
dlt-gtt:type=252:ttn=lidb9:gta=408908:egta=408988
rlghncxa03w 04-01-07 11:43:07 EST EAGLE 31.3.0
DLT-GTT: MASP A - COMPLTD
;
```

dlt-gttset

Delete GTT Selectors

Use this command to delete an applicable global title translation (GTT) selector.

Keyword: dlt-gttset

Related Commands: chg-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin/gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry with **gtin=2** and **tt=4** cannot be entered.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii=2, 4** and **gtin/gtin24=2, 4**

:tt= (mandatory)

Translation type.

Range: 0-255

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: sub, rsvd, natl, intl, dflt

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: 0-127

:np= (optional)

Numbering Plan. The numbering plan indicator can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: e164, generic, x121, f69, e210, e212, e214, private, dflt

:npv= (optional)

Numbering Plan value. The numbering plan indicator can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: 0-15

Example

```
dlt-gttssel:gti=2:tt=10
```

```
dlt-gttssel:gtin=4:tt=0:np=dflt:nai=dflt
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

An entry must already exist that matches the **gti**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

An entry must already exist that matches the **gtii**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

An entry must already exist that matches the **gtin**, **tt**, and **np(v)** and **nai(v)** combination of parameters.

The specified **gttsn** value must exist for the specified **gtin24**, **tt**, **np/npv/nai/naiv** parameter combination.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The parameter values **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** cannot be specified.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np/npv** and **nai/naiv** parameter combinations cannot be specified.

When the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in any combination: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

If multiple **cgssn** and/or **selid** entries exist for a specified selector, the selector cannot be deleted.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

Output

```
dlt-gttset:gti=2:tt=10
rlghncxa03w 04-02-18 08:54:41 EST EAGLE 31.3.0
DLT-GTTSEL: MASP A - CMPLTD
;
```

dlt-gttset**Delete GTT Set**

Use this command to delete the specified global title translation set.

Keyword: dlt-gttset

Related Commands: chg-gttset, chg-gttset, ent-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

Example

```
dlt-gttset:gttsn=t800
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing GTT set.

The specified GTT set cannot have any GTT selectors using it.

The specified GTT set cannot have the **gta**, **cgpc**, **cgssn**, or **opc** parameters assigned to it and cannot be used by any translation.

A GTT set cannot be deleted if it is being referenced by the SCCP Options table.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

Output

```
dlt-gttset:gttsn=t800
rlghncxa03w 04-02-19 08:20:26 EST EAGLE 31.3.0
DLT-GTTSET: MASP A - CMPLTD
;
```

dlt-gws-redirect**Delete Gateway Screening Redirect Command**

Use this command to delete the provisioning of the redirect function and subsequently to disable the gateway screening redirect function. After the gateway screening redirect function is disabled, you must use **ent-gws-redirect** to enable the function again.

Keyword: **dlt-gws-redirect**

Related Commands: **chg-gws-redirect**, **ent-gws-redirect**,

Command Class: Database Administration

Parameters

This command has no parameters.

Example

dlt-gws-redirect

Dependencies

The redirect function data that will be deleted (removed) with this command must exist in the database.

Notes

None

Output

dlt-gws-redirect

```
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0
DLT-GWS-REDIRECT: MASP A - COMPLTD
;
```

dlt-home-smsc**Delete HOME SMSC Address**

Use this command to delete HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Keyword: **dlt-home-smsc**

Related Commands: **ent-home-smsc**, **rtrv-home-smsc**

Command Class: Database Administration

Parameters

:smsc= (mandatory)

Short Message Service Center address.

Range: 1-21 digits

1-21 hexadecimal digits

Example

dlt-home-smsc:smsc=552611646

Dependencies

The Portability Check for Mobile Originated SMS (MNP SMS) feature must be enabled (**enable-home-smsc** command) before this command can be entered. (This controlled feature can be turned off with the **chg-ctrl-feat** command and the **dlt-home-smsc** command will still execute.)

The specified HOME SMSC address must exist in the HOME SMSCADDR table.

Notes

None

Output

```
dlt-home-smsc:smc=552611646

rlghncxa03w 04-02-28 08:50:12 EST  EAGLE 31.3.0
DLT-HOME-SMSC: MASP A - COMPLTD
;
```

dlt-homern**Delete Home Routing Number Prefix**

Use this command to delete a routing number prefix from the HOMERN table.

Keyword: dlt-homern

Related Commands: ent-homern, rtrv-homern

Command Class: Database Administration

Parameters

:rn= (mandatory)
The home routing number prefix
Range: 1-15 digits

Example

```
dlt-homern:rn=C441234
```

Dependencies

The INP feature or the G-Port feature must be turned on before this command can be entered.

The specified routing number must already exist in the HOMERN table.

A value of **none** cannot be specified for the **rn** parameter.

Notes

None

Output

```
dlt-homern:rn=C441234

rlghncxa03w 04-02-28 08:50:12 EST  EAGLE 31.3.0
HOMERN table is (1 of 100) 1% full
DLT-HOMERN: MASP A - COMPLTD
;
```

dlt-ip-host**Delete Internet Protocol Hostname**

Use this command to delete entries from the IP Host table. The IP Host table defines the local and remote host names and their associated IP addresses.

Keyword: dlt-ip-host

Related Commands: ent-ip-host, rtrv-ip-host

Command Class: Database Administration

Parameters

:host= (mandatory)
Host name. This parameter identifies the logical name assigned to the host device.

Range: Any string of characters beginning with a letter and comprising up to 60 characters in length

Example

dlt-ip-host: host=gw100.nc.tekelec.com

Dependencies

Before an entry can be deleted from the IP host table, it must first be deleted from the IP Link table.

Before an entry can be deleted from the IP Host table, all application socket or association references to the hostname must be deleted.

Notes

None

Output

```

dlt-ip-node

Delete IP Node

Use this command to remove an IP node from the database that is directly connected to a TCP/IP data link used for the STP LAN feature. You can remove a particular connection, a particular application on a node, or an entire node.

Keyword: dlt-ip-node

Related Commands: `ent-ip-node`, `rtrv-ip-node`

Command Class: Database Administration

Parameters

:ipaddr= (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**
 4 numbers separated by dots
1-223—first number
0-255—the other three numbers

:force= (optional)

Whether or not to remove all applications associated with the node, thus removing the entire node from the database.

Range: **yes, no**
yes — Delete all connections to node
no — Delete specified application or connection

Default: no

:ipappl= (optional)

The IP application supported by the node.

Range: stplan

Default: Default value not given

:ipport= (optional)

The logical IP port that addresses the application on the node.

Range: 1024-5000

Default: The logical IP port is not given.

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: The card location is not given.

Example

To delete the connection for a TCP/IP link associated with an STPLAN on a specified location:

dlt-ip-node:ipaddr=193.4.201.50:ipappl=stplan:loc=1201

To delete the connection for a TCP/IP link associated with an IPPORT on a specified location:

dlt-ip-node:ipaddr=193.4.201.50:ipport=1024:loc=1201

To delete all connections for TCP/IP links associated with the STPLAN on all locations:

dlt-ip-node:ipaddr=193.4.201.50:ipappl=stplan

To delete the connection for TCP/IP links associated with an IPPORT:

dlt-ip-node:ipaddr=193.4.201.50:ipport=1024

To delete all connections for a TCP/IP link associated with any application on a specified location:

dlt-ip-node:ipaddr=193.4.201.50:loc=1201

To delete all connections for TCP/IP links associated with any application on any location:

dlt-ip-node:ipaddr=193.4.201.50:force=yes

Dependencies

The **force** parameter. must be specified to remove an entire node.

At least one of the following parameters must be specified: **ipappl**, **ipport**, **loc**, or **force=yes**.

If the **force=yes** parameter is specified, the **ipappl**, **ipport**, and **loc** parameters cannot be specified.

The **ipappl** and **ipport** parameters cannot be specified together in the command.

The ACM (shown by the entry ACMENET in the TYPE field in the **rtrv-card** command output) is the only valid card type for this command.

If the **loc** parameter is specified, the shelf and card must be equipped.

If the **loc** parameter is specified, the specified card must have a TCP/IP data link assigned to it.

If the **loc** parameter is specified, the IP port on the node must be assigned to the application for the specified TCP/IP data link.

If the **loc** and **ipaddr** parameters are specified, the specified IP address must match the IP address of the card location's remote IP node.

If the **loc** and **ipport** parameters are specified, the specified IP port must match the card location's remote IP port.

If the **loc** and **ipappl** parameters are specified, the specified IP application must match the card location's remote IP application.

The specified ACM (shown by the entry ACMENET in the TYPE field in the **rtrv-card** command output) must be out-of-service maintenance-disabled (OOS-MT-DSBLD). Enter the **rept-stat-card** command to verify the state of the ACM.

Notes

A particular application can be specified by giving either the application's name (**ipappl**) or its IP port (**ipport**) on the node.

Only Class A, Class B, and Class C IP addresses are supported by the STP LAN feature.

Output

dlt-ip-node:ipaddr=193.4.201.50:loc=1201

```

;

dlt-ip-rte

Delete IP Route

Use this command to delete a static IP route entry from the Static IP Route table (destination IP address, subnet mask, and gateway IP address) for the specified card.

CAUTION: The deletion of static IP routes can adversely affect IP connection oriented transports.

Keyword: dlt-ip-rte

Related Commands: , rtrv-ip-lnk

Command Class: Database Administration

Parameters

:dest= (mandatory)

Destination IP Address. The remote destination host or network destination IP Address that is to be removed.

Range: 4 numbers separated by dots, with each number in the range of 0–255.
The IP address 0.0.0.0 is not valid.

:loc= (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:force= (optional)

A value of **yes** is required when the card is allowed and this command is to be completed.

Range: yes, no

Default: no

Example

dlt-ip-rte:loc=1301:dest=128.252.10.5

dlt-ip-rte:loc=1301:dest=128.252.10.5:force=yes

Dependencies

The **loc** parameter value must correspond to a DCM card or SSEDCCM card in the card table that is running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application.

The specified destination IP address (**dest** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must not reside on this card's A or B network

The specified destination IP address must exist in the Static IP Route table.

The card in the location specified with the **loc** parameter should typically be inhibited for this command to complete successfully. The **force=yes** parameter is required when the card is allowed and the command is entered.

Notes

None

Output

dlt-ip-rte:loc=1301:dest=128.252.10.5

```
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

dlt-lbp

Delete Loopback Point

Use this command to delete one or all far-end loopback points maintained in the Link Fault Sectionalization table for testing data signaling link elements in a single CCS7 transmission path.

Keyword: **dlt-lbp**

Related Commands: **act-lbp**, **chg-lbp**, **dact-lbp**, **ent-lbp**, **rtrv-lbp**

Command Class: Database Administration

Parameters

:link= (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

Card location. The unique identifier of a the card containing the signaling link you want to use for loopback point testing.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:all= (optional)

Deletes all loopback points for the specified signaling link or deletes only the link specified on the **lbp** parameter.

Range: **yes**

:lbp= (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

Range: **1-32**

Example

```
dlt-lbp:loc=1101:link=a:lbp=1
```

```
dlt-lbp:loc=1101:link=a:all=yes
```

Dependencies

At least one optional parameter must be specified.

The **lbp** parameter and the **all** parameter cannot be specified together in the command.

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The loopback point (LBP) must have been previously defined.

The card location (**loc** parameter) must identify a **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

The card location specified in the **loc** parameter cannot be reserved by the system

Notes

None

Output

```
dlt-lbp:loc=1101:link=a:lbp=1
```

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE5 33.0.0
DLT-LBP: MASP A - COMPLTD
```

```
;
```

dlt-lnp-lrn

Delete LNP Location Routing Number

Use this command to delete an existing location routing number (LRN) and its corresponding final overriding message relay global title translations from the database. You can delete an LRN only if it is not referenced by a 10-digit telephone number.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: dlt-lnp-lrn

Related Commands: chg-lnp-lrn, ent-lnp-lrn, rtrv-lnp-lrn

Command Class: LNP Database

Parameters

:lrn= (mandatory)

The location routing number.

Range: 10 digits
10 digits

:tt= (optional)
Translation type.
Range: 000-255
Default: delete all LRNs

Example

```
dlt-lnp-lrn:lrn=1234567890
dlt-lnp-lrn:lrn=1234567890:tt=16
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Translation type (**tt** parameter) values cannot be specified that are associated with AIN, IN, PCS, LNPQS, or WNP LNP queries.

If the **tt** parameter is specified, then a single override translation is deleted.

In all cases, if an LRN is not referenced by a 10-digit TN, and the override translation being deleted is the last translation, then the entire LRN record is removed from the database. If the LRN is referenced by a 10-digit TN, the LRN cannot be removed.

When the **tt** parameter is specified, the TT service must be assigned to the LRN.

The TT must be reserved for LNP.

Notes

None

Output

```
dlt-lnp-lrn:lrn=1234567890

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
DLT-LNP-LRN: MASP A - COMPLTD
;
```

dlt-lnp-npanxx**Delete LNP NPANXX**

Use this command to delete an LNP numbering plan area and exchange (NPANXX) and its associated LNP query or message relay default global title translations from the database.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: dlt-lnp-npanxx

Related Commands: chg-lnp-npanxx, ent-lnp-npanxx, rtrv-lnp-npanxx

Command Class: LNP Database

Parameters

:npanxx= (mandatory)
Numbering plan area.

:rmv= (optional)
 Deletion type.
Range: **all, alltt**
Default: Removes all npanxx and all its translation types

:tt= (optional)
 Translation type.
Range: **000-255**
Default: All translation types

Example

```
dlt-lnp-npanxx:npanxx=001-010-100:tt=16
dlt-lnp-npanxx:npanxx=001-010-100:rmv=allttmr
dlt-lnp-npanxx:npanxx=001-010-100:rmv=all
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Translation type (**tt** parameter) values cannot be specified that are associated with LNPQS, PCS, or WNP LNP queries.

Either all translation types can be deleted with one command (**rmv=alltt** parameter), or each translation type can be deleted individually (**tt** parameter).

Before a translation type (**tt** parameter) can be deleted, no translation type names (**ttn** parameter) can exist.

An NPANXX cannot be deleted until all of its translation types have been deleted.

If the **tt** parameter is specified, the corresponding default translation is removed only if the 10-digit ported translation type names for the NPANXX do not exist in the LNP database.

If the **rmv=alltt** parameter is specified, all default translations are removed only if the 10-digit ported directory numbers for this NPANXX do not exist in the LNP database.

Specifying the **rmv=alltt** parameter does not delete the NPANXX. Also, when the **tt** parameter is specified, you cannot delete the NPANXX.

Specifying the **rmv=all** parameter deletes the entire portable NPANXX record only if the 10-digit ported translation type numbers for this NPANXX do not exist and a telephone number-location routing number (TN-LRN) for this NPANXX does not exist.

When all 10-digit ported translation type numbers associated with this NPANXX are removed, the portable NPANXX can be removed either by specifying the **rmv=all** parameter or by not specifying any optional parameters.

This command can be entered several times for the same NPANXX to incrementally delete the default global title and eventually the NPANXX.

The **tt** and **rmv** parameters cannot be specified together in the same command.

The NPANXX must exist.

The NPANXX cannot be deleted if any associated 10-digit translation type numbers exist.

When the **tt** parameter is specified, the translation type must be assigned and must be a reserved service for LNP.

If message relay services exist, either the **tt** parameter or the **rmv** parameter must be specified.

When the **rmv=alltt** parameter is specified, at least one translation type must be assigned.

Notes

None

Output

```
dlt-lnp-npanxx: npanxx=001-010-100: tt=16
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
DLT-LNP-NPANXX: MASP A - COMPLTD
;
```

dlt-lnp-serv**Delete LNP Service**

Use this command to delete from the database an LNP service or an alias translation type associated with an LNP service.

Keyword: dlt-lnp-serv

Related Commands: chg-lnp-serv, ent-lnp-serv, rtrv-lnp-serv

Command Class: Database Administration

Parameters

:serv= (mandatory)

Reserved service type name.

Range: ain, in, pcs, wnp, class, lldb, cnam, isvm, lnpqs, wmsc, udf1, udf2, udf3, udf4

:alias= (optional)

The alias translation type.

Range: 000-255

Example

```
dlt-lnp-serv:serv=lldb
```

```
dlt-lnp-serv:serv=lldb:alias=236
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **dlt-lnp-serv** command can be entered.

The service type (**serv** parameter) must exist in the LNP database.

The service must not be referenced in the LNP database.

The **alias** that is specified must be associated with the LNP service that is specified in the command.

The value that is specified for the **alias** parameter must not already exist in the LNP database as a true translation type.

All aliases associated with the LNP service must be deleted before the service can be deleted.

Notes

When the LNP feature is on for up to 12 million TNs (see the **enable-ctrl-feat** command), the LNP services CLASS, CNAM, LIDB, and ISVM must be in the OAP configuration in the EAGLE 5 ISS database. You must update the OAP configuration (with the **act-oap-config** command) whenever you perform the following actions:

- Add LNP services to the database (with the **ent-lnp-serv** command).
- Remove services from the database (with the **dlt-lnp-serv** command).

- Change services (with the **chg-lnp-serv** command).

As a reminder, the following warning message is displayed:

CAUTION: LNP service TTs have changed, OAP configuration is required

Output

```
dlt-lnp-serv:serv=lidb
rlghncxa03w 02-11-29 16:40:40 EST EAGLE 30.0.0
DLT-LNP-SERV: MASP A - COMPLTD
Command Completed.
;
```

dlt-lnp-sp

Delete LNP Service Provider

Use this command to remove an LNP service provider from the database.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS.

Keyword: dlt-lnp-sp

Related Commands: ent-lnp-sp, rtrv-lnp-sp

Command Class: LNP Database

Parameters

:sp= (mandatory)

Service provider ID.

Range: xyyy
4 alphanumeric characters

Example

```
dlt-lnp-sp:sp=1234
```

Dependencies

The LNP feature must be turned **on** (see the **enable-ctrl-feat** command) before this command can be entered.

The service provider (**sp** parameter) must exist in the LNP database.

An LNP service provider cannot be deleted from the database if the service provider is referenced in the LNP database.

Notes

None

Output

```
dlt-lnp-sp:sp=1234

rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
DLT-LNP-SP: MASP A - COMPLTD
;
```

dlt-lnp-sub**Delete LNP 10-Digit Telephone Number Subscription**

Use this command to remove the following items from the database: an LNP 10-digit ported telephone number (TN) message relay service, a pooled TN message relay service, an LRN, or the entire subscription.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: dlt-lnp-sub

Related Commands: chg-lnp-sub, ent-lnp-sub, rtrv-lnp-sub

Command Class: LNP Subscription

Parameters

:tn= (mandatory)

The telephone number.

Range: 10 digits

10 digits—To specify a single TN subscription

7 digits with 3 asterisks (***) appended—To pool a block of 1000 TNs

:rmv= (optional)

Deletion type.

Range: all, alltt, lrn

Default: Removes all LNP 10-digit ported telephone number (TN) message relay services and all their translation types

:tt= (optional)

Translation type.

Range: 000-255

Default: Delete all translation types

Example

```
dlt-lnp-sub:tn=1234567890
```

```
dlt-lnp-sub:tn=1234567890:rmv=alltt
```

```
dlt-lnp-sub:tn=1234567890:tt=16
```

```
dlt-lnp-sub:tn=1234567890:rmv=lrn
```

```
dlt-lnp-sub:tn=1234567890:rmv=all
```

```
dlt-lnp-sub:tn=1234567***
```

Dependencies

The LNP feature must be turned **on** (see the **enable-ctrl-feat** command) before this command can be entered.

For all cases, if the delete removes the last service (between message relay and LRN data), then the entire TN subscription is removed.

The **tt** and **rmv** parameters cannot be specified together in the command.

Translation type (**tt** parameter) values cannot be specified that are associated with AIN, IN, PCS, LNPQS, or WNP LNP queries.

If no options are specified, the default is to delete the entire TN subscription.

This command can be entered multiple times for the same TN to remove each TT.

The telephone number (**tn** parameter) range must not cross an NPANXX boundary.

The **tn** parameter value must exist or it must exist in a single range.

When the **rmv-lrn** parameter is specified, LRN must be assigned to the telephone number.

When the **tt** parameter is specified, the TT service must be assigned to the telephone number.

The translation type must be a reserved service for LNP.

If the **rmv=alltt** parameter is specified, the TT service must be assigned.

If message relay global title address with LRN is assigned to the telephone number, the message relay TT service must be deleted before the LRN can be removed.

Notes

The **rmv=alltt** parameter value is provided to remove all message relay translations and the entire TN subscription, if the LRN does not exist.

The **rmv=lrn** parameter option is provided to remove the LRN and the entire subscription, if message relay services (TT) do not exist.

The **rmv=all** parameter option is provided to remove the entire TN subscription record, including LRN and all message relay services.

The **tt** parameter is provided to delete a single message relay translation type, or to delete the entire TN subscription, if the LRN does not exist and **tt** is the last translation assigned.

Output

dlt - lnp - sub : tn=1234567890

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
DLT-LNP-SUB: MASP A - COMPLTD
;
```

dlt-ls

Delete Linkset

Use this command to remove a linkset from the system database. A linkset is a group of signaling links carrying traffic to the same signaling point.

Keyword: dlt-ls

Related Commands: chg-l3t, ent-ls, rept-stat-ls, rtrv-ls

Command Class: Database Administration

Parameters

:lsn= (mandatory)

Linkset name. This parameter specifies the name of the linkset. Only one linkset name per command can be specified.

Range: aaaaaaaaa
1 alphabetic character followed by up to 9 alphanumeric characters

Example

dlt - ls : lsn=lsna

Dependencies

The linkset must be in the database.

The linkset can be removed only if all links associated with the linkset have been removed.

The linkset can be removed only if the linkset is not referenced by any routeset.

The specified linkset cannot be deleted if it has or is a mate linkset.

A gateway linkset can be deleted only from a SEAS terminal, and not from a system terminal.

The linkset cannot be deleted if an SAPC entry is present for the linkset.

The linkset cannot be deleted if it is used by an exception route.

Notes

When a linkset is removed from the system database, the related entries are removed automatically from the translation type mapping table.

Output

```
dlt -ls:lsn=lsna
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Link set table is (114 of 1024) 11% full
DLT-LS: MASP A - COMPLTD
;
```

dlt-map

Delete Mate Applications

Use this command to remove mate application entries or groups. This command removes one or more entries from the Remote Point Code Subsystem Number table.

CAUTION

CAUTION: If PC/SSNs within a weighted entity set are deleted such that the entity set's multiplicity mode becomes solitary or dominant, the weight values are reset to indicate a non-weighted entity set.

NOTE: See Notes for additional information on multiplicity modes.

Keyword: dlt-map

Related Commands: chg-map, ent-map, rtrv-map

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **all**, **ssn**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:all= (optional)

This parameter must be specified to remove all subsystem numbers associated with this point code. If this parameter is not specified, only the specified subsystem number is removed.

Range: **yes**

Default: **no**

:mapset= (optional)

The MAP set ID.

This parameter is mandatory if the Flexible GTT Load Sharing feature is enabled.

Range: **1-36000 dflt**

dflt—Default MAP set

Default: **dflt** - If the Flexible GTT Load Sharing feature is not enabled, the default value of the **mapset** parameter is **dflt**.

:ssn= (optional)

Subsystem Number.

Range: 2-255

Default: The specified subsystem number is removed for the given point code.

Example

The following example deletes the single entry PC 1-1-1 with an SSN value of 123 from its mated group. If this is the last entry in the group then the PC is also deleted from the MAP tables:

dlt-map:pc=1-1-1:ssn=123

The following example deletes each entry of PC 1-1-1 and all SSNs associated with the PC from each of the PC/SSN mated groups. The PC is also deleted from the MAP tables:

dlt-map:pc=1-1-1:all=yes

The following command deletes subsystem 10 associated with spare PC 1-1-0 from the MAP table.

dlt-map:pci=s-1-1-0:ssn=10

The following example deletes subsystem 10 associated with PC 1-1-1 in MAP set 362.

dlt-map:pc=1-1-1:ssn=10:mapset=362

The following example deletes PC 1-1-1 along with all the subsystems associated with this PC in MAP set 362.

dlt-map:pc=1-1-1:all=yes:mapset=362

The following example deletes PC 1-1-2 along with all the subsystems associated with this PC in the default MAP set.

dlt-map:pc=1-1-2:all=yes:mapset=dflt

Dependencies

Either the **ssn** parameter or the **all** parameter can be specified, but not both.

If the **all=yes** parameter is specified, all SSNs for the given PC are removed.

The DPC of the primary subsystem must be a full PC.

The specified remote PC must exist in the MAP table.

The specified SSN must exist in the MAP table entity set associated with the specified remote PC.

The STP true PC assigned to an INP, LNP, or EIR subsystem cannot be deleted.

If the **pcn** parameter is specified, the format of the PC must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the Flexible GTT Load Sharing feature is not enabled, the **mapset** parameter must not be specified.

If the Flexible GTT Load Sharing feature is enabled, the **mapset** parameter must be specified.

The specified MAP set must exist in the database.

The specified PC/SSN/MAP set must already be provisioned in the MAP table.

If the **pc** and **mapset** parameters are specified, and the **all=yes** parameter is specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the **mapset** parameter is specified as having any value other than **dflt**, then the PC/SSN/MAP set must not be referenced from the GTT, GSM-MAP Opcode or GSM MAP Screening table entry.

A PC/MAP set ID cannot be deleted from the MAP table if it is the last such entry and is being referenced by an entry in the PPSOPTS table.

Notes

For the MAP commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported.

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each MAP set is identified by a new **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

Output

```
dlt-map:pc=1-1-0:ssn=10:mapset=362
tekelecstp 06-05-27 11:11:12 EST EAGLE 35.0.0
DLT-MAP: MASP A - COMPLTD
;
```

dlt-mrn

Delete Mated Relay Node

Use this command to delete entries from the MRN table. A single command can delete one point code from the group, or delete the entire group.

CAUTION

CAUTION: If PCs within a weighted entity set are deleted such that the entity set's multiplicity mode becomes dominant, the weight values are reset to indicate a non-weighted entity set.

NOTE: See Notes for additional information on multiplicity modes.

Keyword: dlt-mrn

Related Commands: chg-mrn, ent-mrn, rtrv-mrn

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000–255**

ssa—**000–255**

sp—**000–255**

:all= (optional)

This parameter is used to delete the entire group of point codes that contains the specified point code in the MRN table.

Range: **yes**

:mrnset= (optional)

The MRN set ID.

Range: **1-3000 dflt**

dflt—Default MRN set.

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca1**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca2**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca3**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca4**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-
nnnnn—0-16383
gc—aa-zz
m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Example

The following example deletes the entire entry for the specified point code (the point code plus all of its associated point codes).

dlt-mrn:pc=1-1-0

The following example finds point codes 1-1-0 and 1-1-1, and deletes them from the group that contains them in the MRN table.

dlt-mrn:pc=1-1-0:pc1=1-1-1

The following example deletes from the MRN table the entire group of point codes that contains the specified point code.

dlt-mrn:pc=1-1-0:all=yes

The following examples include spare point codes.

dlt-mrn:pci=s-2-2-1

dlt-mrn:pcn=s-1-1-1-0235-aa

dlt-mrn:pc=1-1-9:mrnset=dflt

dlt-mrn:pc=1-1-9:mrnset=111

dlt-mrn:pc=1-1-1:pc1=1-1-9:mrnset=111

dlt-mrn:pc=1-1-9:All=yes:mrnset=111

Dependencies

ITU-N point codes must be the format set by the **npcfmti** parameter of the **chg-stpopts** command. (Use the **rtrv-stpopts** command to display the STP option settings.)

A point code that is specified in the command must already exist in the MRN table.

The PCs in an entity set cannot be deleted if the deletion leaves only one PC in the entity set. If this occurs, the entire entity set must be deleted by specifying the **all=yes** parameter.

The **mrnset** parameter can be specified only when the Flexible GTT Load Sharing feature is enabled. If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

A specified MRN set or a PC in a MRN set cannot be deleted if it is referred to in the GTT2 table.

The **rtrv-gtt** and **rtrv-gta** commands can be used to display GT Translations.

A point code in a non-default MRN set cannot be deleted from the MRN table if it is referenced by an entry in the PPSOPTS table.

If the **all=yes** parameter is specified, the **pc** parameter must be specified, and the **pc1/pc2/pc3/pc4** parameters cannot be specified.

The same point code value cannot be entered more than once for deletion.

The **pc/pc1/pc2/pc3/pc4** parameter values must be full point codes.

Notes

For the MRN commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC are in combined load sharing/dominant mode when at least two of the PC have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The Flexible Intermediate GTT Loadsharing feature adds support for loadsharing sets, which are identified by the **mrnset** parameter.

The Flexible GTT Loadsharing feature and the Intermediate GTT Loadsharing feature used together support MRN sets for flexible intermediate GTT loadsharing.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

Output

```
dlt-mrn:pc=1-1-1:mrnset=111
tekelecstp 05-05-17 10:19:51 EST EAGLE 34.2.0

;
```

dlt-na**Delete Network Appearance**

Use this command to delete a previously defined network appearance.

Keyword: **dlt-na**

Related Commands: **ent-na, rtrv-na**

Command Class: Database Administration

Parameters

:na= (mandatory)

Network appearance.

Range: **0-4294967295**

:type= (mandatory)

Type of the network appearance to be deleted.

Range: **ansi, itui, ituis, itun, ituns, itun24**

:gc= (optional)

Group Code of the network appearance.

Range: **yy**

2 alphabetic characters; valid values are **aa-zz**

Example

dlt-na:type=ansi:na=10

dlt-na:type=itui:na=11

dlt-na:type=itun:na=10

dlt-na:type=itun:na=11:gc=fr

dlt-na:type=ituis:na=4

Dependencies

Group Code (**gc**) is not allowed with network types **ansi**, **itui**, **ituis**, and **itun24**.

The specified network appearance must exist in the Network Appearance table

Notes

The ITUDUPPC feature must be turned on before a group code can be deleted for an ITU-N network type

Output

dlt-na:pstncat=5000:pstnid=1:force=yes

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
DLT-NA: MASP A - COMPLTD
```

;

dlt-prefix**Delete Prefix**

Use this command to delete a prefix based on the name of the feature, its prefix, and its prefix number.

Keyword: **dlt-prefix**

Related Commands: **chg-prefix, rtrv-ctrl-feat, rtrv-prefix**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

```
:feature= (mandatory)
```

Feature Name. This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtrv-ctrl-feat** command output.

Range: azzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with “GSM MAP.” Enter enough additional characters to identify which GSM MAP feature is being entered (at least “GSM MAP SR” to identify the “GSM MAP SRI Redirect” feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

:prefix= (mandatory)

Prefix Value.

Range: 1-15 digits

1-15 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: Current value

:prefixnum= (mandatory)

Prefix Number. The prefix number identifies the prefix value to use for the specified feature name.

Range: 1-7

1-3 for GSM MAP SRI Redirect feature prefix values

1-5 for ISUP NP with EPAP feature prefix values

6 for the ISUP NP with EPAP feature Insertion Country Code

7 for the ISUP NP with EPAP feature Deletion Condition value

1 for the Prepaid IDP Query Relay International Insert Prefix

2 for the Prepaid IDP Query Relay National Insert Prefix

3 for the Prepaid IDP Query Relay Outgoing CDPN NAI

4 for the Prepaid IDP Query Relay CGPA DEF CC Check

Default: Current value

Example

Delete a prefix with prefix number 1 for the ISUP NP with EPAP feature.

```
dlt-prefix:feature="isup np with epap":prefix=1004:prefixnum=1
```

Delete a prefix with prefix number 2 and specify part of the GSM MAP SRI Redirect feature name.

dlt-prefix:feature="GSM MAP SRI":prefix=104:prefixnum=2

Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output. The specified feature must be one of the following features that are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

The specified feature prefix value must already exist in the database.

The specified feature prefix value must be used by the specified feature in the database.

Notes

None

Output

```
dlt-prefix:feature="isup np with epap":prefix=1004:prefixnum=1

rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0
DLT-PREFIX: MASP A - COMPLTD
;
```

dlt-pstn-pres

Delete PSTN Presentation

Use this command to delete a previously defined Public Switched Telephone Network (PSTN) presentation value.

Keyword: dlt-pstn-pres

Related Commands: ent-pstn-pres, rtrv-pstn-pres

Command Class: Database Administration

Parameters

:force= (mandatory)

The **force=yes** parameter must be specified to delete the PSTN presentation value.

Range: no, yes

:pstncat= (mandatory)

PSTN category identifying the new Variant being defined.

Range: 0-65535

:pstnid= (mandatory)

PSTN ID identifying the new Variant being defined.

Range: 0-65535

Example

```
dlt-pstn-pres:pstncat=5000:pstndesc="Mexican ISUP v1.8"
```

Dependencies

The ISUP Normalization controlled feature must be enabled.

A controlled feature must exist for the **pstncat** and **pstnid** parameter combination.

You cannot delete the PSTN presentation value with parameters **pstncat=1** and **pstnid=2**.

The PSTN must have been previously defined with the **ent-pstn-pres** command.

Notes

The IP⁷ SG uses the PSTN presentation value, consisting of a PSTN category and a PSTN ID, to uniquely define an ISUP Variant.

Use the **rtrv-pstn-pres** command to display the **only** allowed values for the PSTN category and ID being deleted.

The entry in the ISUP Variant table associated with the deleted PSTN will be marked as available.

The **dlt-pstn-pres** command causes all the ISUP parameters provisioned for the Variant with the **chg-isupvar-attrb** command to be deleted.

Deleting the PSTN presentation value may cause a loss of traffic if SS7IP routing keys exist using that PSTN value. The user should use caution when performing this action. The user will also be required to use the **force** parameter.

Output

```
dlt-pstn-pres:pstncat=5000:pstnid=1:force=yes
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-PSTN-PRES: MASP A - COMPLTD
;
```

dlt-rmt-appl

Delete Remote Application

Use this command to remove remote application assignments from the database.

Keyword: dlt-rmt-appl

Related Commands: ent-rmt-appl, rtrv-rmt-appl

Command Class: Database Administration

Parameters

:ipc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-nm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-nm).

Synonym: ipca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:ipc/ipca/ipci/ipcn/ipcn24= (mandatory)

End node's internal point code.

:ipci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:ipcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:ipcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

msa—000-255

ssa—000-255

sp—000-255

:si= (mandatory)

Service indicator value that designates which user part is assigned to IPC.

Range: **3-15**

:ssn= (optional)

SCCP subsystem number. Valid only if **si=3**. Use **ssn** as the starting value of the range if **ssne** is specified.

Range: **0-255**

:ssne= (optional)

Specifies the end range of subsystem number.

Range: **0-255**

Example

dlt-rmt-appl:ipc=0-0-1:si=3:ssn=5

dlt-rmt-appl:ipc=0-0-1:si=5

dlt-rmt-appl:ipcn24=1-100-1:si=5

dlt-rmt-appl:ipci=ps-2-2-2:si=5

Dependencies

Partial point codes are not allowed.

The **ssn** parameter is required if **si=3**.

The **ssn** and **ssne** parameters are not allowed unless **si=3**.

The **ssne** parameter value must be greater than the **ssn** parameter value.

The specified **ipc** must be previously defined in the Destination table.

The new entry cannot conflict with an existing entry.

The **ipc**, **si**, and **ssn...ssne** parameter values must all match a value in the Destination table.

Notes

To specify a range of subsystem numbers, specify the **ssn** parameter value as the start of the range and the **ssne** parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
dlt-rmt-appl:ipc=0-0-1:si=3:ssn=5
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-RMT-APPL: MASP A - COMPLTD
;
```

dlt-rte

Delete Route

Use this command to remove either a single route or all routes from the system database.

Keyword: **dlt-rte**

Related Commands: **ent-rte**, **rept-stat-dstn**, **rtrv-rte**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

At least one of the following optional parameters must be specified: **dpc/dpca/dpci/dpcn/dpcn24**, **cic**, **ilsn**, **si**.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **dpca**

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields zone-area-id. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:all= (optional)

This parameter removes all destinations from the system database.

Range: **yes, no**

Default: **no**

:lsn= (optional)

Linkset name. This parameter specifies the name of the linkset associated with the route.

NOTE: This parameter must be specified when the all parameter is not specified, and cannot be specified when the all=yes parameter is specified.

Range: *ayyyyyyyyy*

1 alphabetic character followed by 9 alphanumeric characters

Default: No linkset name is specified

Example

Delete route to dpc 1-1-1 using linkset hq435326:

dlt-rte:dpc=1-1-1:lsn=hq435326

Delete all routes to dpc 2-2-2:

dlt-rte:dpc=2-2-2:all=yes

Delete all routes to dpc 21-*-*:

dlt-rte:dpc=21-*-*:all=yes

Delete route to dpcn=3-15-15-15-sp using link e1m2itun:

dlt-rte:dpcn=3-15-15-15-sp:lsn=e1m2itun

Delete route for dpcn24=10-100-14 using linkset we123624:

dlt-rte:dpcn24=10-100-14:lsn=we123624:rc=10

Delete route to private point code dpc=p-1-1-1 using linkset hq325426:

dlt-rte:dpc=p-1-1-1:lsn=hq325426

Delete all routes to private point code dpc=p-21-*-*:

dlt-rte:dpc=p-21-*-*:all=yes

Delete route to spare point code dpci=s-1-100-1 using linkset we123624:

dlt-rte:dpci=s-1-100-1:lsn=we123624

Dependencies

At least one optional parameter must be specified.

The DPC must be in the database.

If the **lsn** parameter is specified, the linkset must be defined as a route.

The **lsn** parameter cannot be specified with the **all=yes** parameter.

If the **all=no** parameter is specified, the **lsn** parameter must be specified.

The destination point code of a route must be a full point code (*ni-nc-ncm*) or a cluster point code (*ni-nc-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (**ni-nc-***), whether the ordered routes can be deleted is determined by the destination address's NCAI (nested cluster allowed indicator). The NCAI (**ncai=yes/no**) is set with the **ncai** parameter of the **ent/chg-dstn** commands:

- If the NCAI is set to **no**, the ordered route cannot be deleted.
- If the NCAI is set to **yes**, then the destination address is a member of a provisioned nested cluster where the ordered routes of the provisioned members can be deleted. Deletion of the ordered routes of a provisioned member results in the provisioned member assuming the attributes of its cluster.

If the specified destination address is a network cluster address (**ni-nc-***), how the specified ordered route attributes are deleted is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The NCAI is set (**ncai=yes/no**) with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the NCAI is set to **no**, the specified ordered route is deleted for each signaling point code having the same network identifier (NI) and network cluster (NC) codes.

- If the NCAI is set to **yes**, then the specified destination is a nested cluster where deletion of the cluster route will not delete the ordered route of the provisioned member.

If the **dpcn** parameter is specified, the format of the point code(s) must match the format you assigned with the **chg-stpopts:npfnti** parameter.

The last route for the specified DPC being removed cannot be referenced by an X.25 route, a mated application, or a concerned signaling point code, depending on the feature configuration. If this route is removed and any of these references exist, those references will not be valid.

The last route to a destination referenced by an X.25 route cannot be deleted.

The last route to a destination referenced by the redirect function destination parameter cannot be deleted.

The last route to a destination point code that still exists in the Mated Node Relay (MRN) table cannot be deleted until the point code is deleted from the MRN table.

The last route to a destination point code that still exists in the Concerned Secondary Point Code (CSPC) table cannot be deleted until the point code is deleted from the CSPC table.

If a route to a destination in use by a GTT is the last route to that destination, the route cannot be deleted until one of the following actions is performed:

- Delete the GTT using the route's destination
- Change the route used by the GTT to a route using a different destination
- Add another route using the same destination

Network routing is only valid if the NRT feature is on. The NRT feature is turned on with the **chg-feat** command.

When using network routing, if the destination point code has a value of * in the *nc* field, the *ncm* field must also be * (for example, **dpc=21-*-***).

If all routes are to be deleted in a routeset, the routeset must not be empty.

The last route to a destination that contains exception routes cannot be deleted.

The last route to a destination point code that still exists in the Prepaid SMS Options (PPSOPTS) table cannot be deleted until the point code is deleted from the PPSOPTS table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

dlt-rtx**Delete Exception Route**

Use this command to delete an exception route entry. When parameters **all=yes** and **force=yes** are specified, all exception route entries associated with the destination point code are deleted.

Keyword: dlt-rtx

Related Commands: chg-rtx, ent-rtx, rtrv-rtx

Command Class: Database Administration

Parameters

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network-cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:all= (optional)

Use the **all=yes** parameter with the **force=yes** parameter to delete all exception route entries associated with the DPC.

Range: **yes**

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **16383**

:force= (optional)

The **force** parameter is used with the **all=yes** parameter to delete all exception routes for the specified DPC.

Range: **yes**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:lsn= (optional)

Linkset Name. This parameter provides the name of the linkset associated with the specified exception route.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network-cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npclfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc**n24**= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-**, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—000-255

ssa—000-255

sp—000-255

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: 3-15

Example

```
dlt-rtx:dpca=1-1-1:opc:2-3-3:lsn=lset1
```

```
dlt-rtx:dpca=1-2-1:si=3:lsn=lset2
```

```
dlt-rtx:dpca=1-3-1:ilsn=lset2:lsn=lset3
```

```
dlt-rtx:dpci=2-100-1:ilsn=lset2:lsn=lset4
```

```
dlt-rtx:dpci=2-100-1:si=5:lsn=lset5
```

```
dlt-rtx:dpci=2-100-1:si=6:all=yes:force=yes
```

```
dlt-rtx:dpci=2-100-1:opc=8-*-*:all=yes:force=yes
```

Dependencies

Only one of the **opc**, **ilsn**, **cic**, or **si** parameters can be specified for an exception route entry.

The **lsn** parameter must be specified if the **all** parameter is not specified.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

The specified combination of exception route parameter conditions must exist.

The **lsn** parameter cannot be specified if the **all=yes** parameter is specified.

To delete all exception routes for DPC per criteria, specify the **force=yes** and **all=yes** parameters.

Output

Delete a specific exception route.

```
dlt-rtx:dpca=1-3-1:ilsn=lset2:lsn=lset3
```

```
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
```

```
DLT-RTX: MASP A - COMPLTD
```

Delete all exception routes for a specific exception criteria.

```
dlt-rtx:dpci=2-100-2:opc=8-*-*:all=yes:force=yes
```

```
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
```

```
DLT-RTX: MASP A - COMPLTD
```

dlt-sccp-serv**Delete SCCP Service**

Use this command to remove entries from the SCCP Service table. The command may either remove a PC from a group or remove the entire group.

Keyword: dlt-sccp-serv

Related Commands: chg-sccp-serv, rtrv-sccp-serv

Command Class: Basic

Parameters

:serv= (mandatory)

The name of the service being deleted.

Range: gflex, gport

:all= (optional)

Deletes all point codes from a service.

Range: no, yes

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Post GTT-translated point code 1.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca2

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Post GTT-translated point code 2.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca3**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Post GTT-translated point code 3.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Post GTT-translated point code 4.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Example

To delete a specified PC from the G-Port service:

```
dlt-sccp-serv:serv=gport:pca2=3-3-3
```

To delete all PCs from the G-Port service and to specify a network PC to delete:

```
dlt-sccp-serv:serv=gport:all=yes:pca1=1-1-1
```

Dependencies

At least one PC must be specified.

The specified PC must already exist in the SCCP Service table.

The same point code cannot be specified more than once.

The specified point code must already exist in the specified MRN set in the SCCP-SERV table.

At least one point code must be specified.

The specified MRN set must already exist in the SCCP-SERV table portion of the MRN table.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
dlt-sccp-serv:serv=gport:pca2=3-3-3
tekelecstp 05-12-20 08:54:59 EST EAGLE 35.0.0
DLT-SCCP-SRV: MASP A - COMPLTD
;
```

dlt-scr-aftpc**Delete Allowed Affected Point Code**

Use this command to remove a specific screening reference in the allowed affected point code category.

Keyword: **dlt-scr-aftpc**

Related Commands: **chg-scr-aftpc**, **ent-scr-aftpc**, **rtrv-scr-aftpc**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: **1-255 ***

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more **ncm** values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Example

dlt-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012

dlt-scr-aftpc:sr=aft1:zone=1:area=2:id=3:ssn=1:pcst=s

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

The affected point code or point code range (given by **ni-nc-ncm/ssn** or **zone-area-id** or **msa-ssa-sp** or **npc**) to be removed from the table must already exist in the screening reference.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If asterisk values are specified, the range cannot overlap or contain any of the point code ranges that already exist in the allowed affected point code screening category.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **area=*** is specified, **id=*** must be specified.

If **ssa=*** is specified, **sp=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

No AFTPC screening reference (**sr**) can be deleted that is referenced by an entity in another screening set.

You cannot remove the **sr**, **ni**, **nc**, **ncm**, and **ssn** parameters, or the **zone**, **area**, **id** and **npc** parameters, if they are the last entry in the screening reference and the screening reference is part of a screen set.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-aftpc:sr=ied:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-aftpc** output with asterisks as the same parameter values specified in the **dlt-scr-aftpc** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

dlt-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-AFTPC: MASP A - COMPLTD
;

```

Legend

DLT-SCR-AFTPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown

% FULL—Indicates the relative size of the screen set.

dlt-scr-blkdpc**Delete Blocked DPC**

Use this command to remove a specific screening reference from the blocked DPC category. Deleting the last point code (**c-c-c**) also deletes the screening reference.

Keyword: dlt-scr-blkdpc

Related Commands: chg-scr-blkdpc, ent-scr-blkdpc, rtrv-scr-blkdpc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *, C

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It

specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 *, C**

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 *, C**

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 *, C**

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 *, C**

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 *, C**

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, *, C**

Example

dlt-scr-blkdpc:sr=iec:ni=240:nc=010:ncm=010

dlt-scr-blkdpc:sr=bdp1:npc=128:pcst=s

Dependencies

At least one optional parameter must be specified.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

The blocked DPC or blocked DPC range specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the specified screening reference.

The point code to delete cannot have the value **c-c-c** if there is another point code in the blocked screen reference. The last screen reference to be deleted must have **ni**, **zone**, **msa**, or **npc** equal to **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **msa=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

The last screening reference (**sr**) entry cannot be deleted if it is referenced by another screen.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **zone=c** is specified, the **area** and **id** values default to the character **c** in the database.

Notes

If the screening reference is not referenced by any other screen, and if all entries are removed, the entire screening reference can be removed using **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** equal to **c-c-c** or **npc=c**. If more than one entry exists, **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** must not equal **c**.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-blkdpc:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-blkdpc** output with asterisks as the same parameter values specified in the **dlt-scr-blkdpc** command.

The asterisk (*) value cannot be specified with the character **c**. For example, a point code **c-c-*** is not allowed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in each unique blocked DPC screening reference to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of subfields *ni-nc-ncm*, *zone-area-id*, or *msa-ssa-sp* equal to **c-c-c** or **npc=c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-blkdpc:sr=iec:ni=240:nc=010:ncm=010

```

Legend

DLT-SCR-BLKDPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

dlt-scr-blkopc

Delete Blocked OPC

Use this command to remove a specific screening reference from the blocked OPC category.

Keyword: dlt-scr-blkopc

Related Commands: chg-scr-blkopc, ent-scr-blkopc, rtrv-scr-blkopc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255** *, C

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000-16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383** *, C

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none**, s

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255** *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7** *, C

Example

```
dlt-scr-blkopc:sr=iec:ni=240:nc=010:ncm=010
```

```
dlt-scr-blkopc:sr=bop1:npc=128:pcst=s
```

Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

The blocked OPC specified by **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

The point code to delete cannot have the value **c-c-c** if there is another point code in the blocked screen reference. The last screen reference to be deleted must have **ni**, **zone**, **msa**, or **npc** equal to **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **msa=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The Spare Point Code Support feature must be enabled before the **pcst** and **npcst** parameters can be specified.

The last screening reference (**sr**) entry cannot be deleted if it is referenced by another screen.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **zone=c** is specified, the **area** and **id** values default to the character **c** in the database.

Notes

If the screening reference is not referenced by any other screen, and if all entries are removed, the entire screening reference can be removed using **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** equal to **c-c-c** or **npc=c**. If more than one entry exists, **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** must not equal **c**.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries

whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-blkopc:sr=ied:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-blkopc** output with asterisks as the same parameter values specified in the **dlt-scr-blkopc** command.

The asterisk (*) value cannot be specified with the character **c**. For example, a point code **c-c-*** is not allowed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in each unique blocked OPC screening reference to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is either **npc=c**, or in the form of subfields *ni-nc-ncm*, *zone-area-id*, or *msa-ssa-sp* equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** must be specified.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-blkopc:sr=ied:ni=240:nc=010:ncm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

;
```

Legend

DLT-SCR-BLKOPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

dlt-scr-cdpa

Delete Allowed Called Party Address

Use this command to remove a specific screening reference from the allowed called party address category.

Keyword: **dlt-scr-cdpa**

Related Commands: **chg-scr-cdpa**, **ent-scr-cdpa**, **rtrv-scr-cdpa**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: **1-255 ***

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 *, C**

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000-16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 *, C**

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:scmgfid= (optional)

The SCCP management (SCMG) format ID, which consists of a one-octet field and uniquely defines the function and format of each SCMG message. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from 1–255.

Range: 1-255 *

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:zone= (optional)

The ITU international zone. The parameter specifies the *zone* in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0–7.

Range: 0-7 *, C

Example

```
dlt-scr-cdpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012
```

```
dlt-scr-
```

```
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=:pcst=s
```

Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering c for "continue."

The CDPA point code, **ssn**, and **scmgfid** to be removed must exist in the CDPA entity set.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range 000–255

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range 000–255.

If the **ncm** parameter is specified as a single value, or a range other than the full range of 000–255, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range 000–255.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

A CDPA screening reference (**sr**) cannot be deleted if it referenced by an entity in another screening set.

If the **ssn** parameter is a value other than **1**, the **scmgfid** parameter cannot be specified.

If the **ssn=1** parameter is specified, the **scmgfid** parameter must be specified.

Notes

If only one entry exists and is not referenced by another screening table, the entire screening table is removed.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-cdpa:sr=iec:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-cdpa** output with asterisks as the same parameter values specified in the **dlt-scr-cdpa** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-cdpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-CDPA: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-CDPA: MASP A - COMPLTD
;
```

Legend

DLT-SCR-CDPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

dlt-scr-cgpa

Delete Allowed Calling Party Address

Use this command to remove a specific screening reference from the allowed calling party address category.

Keyword: **dlt-scr-cgpa**

Related Commands: **chg-scr-cgpa**, **ent-scr-cgpa**, **rtrv-scr-cgpa**

Command Class: Database Administration

Parameters

:ri= (mandatory)

Routing indicator that provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: **dpc, gt, ***

dpc— Allow a called party address with a routing indicator value of “DPC/SSN.”

gt— Screening stops and gateway screening is bypassed as a forced pass.

*****— Allow both routing indicator values.

:sccpmt= (mandatory)

The SCCP message type. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values.

Range: **9, , *10, , *17, , *18, ***

9, *— UDT

10, *— UDTS

17, *— XUDT

18, *— XUDTS

:sr= (mandatory)

Screening reference. This parameter specifies the point code’s unique screening reference name.

Range: **ayyy**

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: **1-255 ***

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see “Converting ITU National Point Code Formats” in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s**).

Range: **none, s**

Default: **none**

:scmgfid= (optional)

The SCCP management (SCMG) format ID, which consists of a one-octet field and uniquely defines the function and format of each SCMG message. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **1–255**.

Range: **1-255 ***

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Example

dlt-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012

dlt-scr-cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=009

dlt-scr-

cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=:pcst=s

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The CGPA point code, **ri**, **ssn**, and **sccpmt** to be removed must exist in the CGPA entity set.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The specified screening reference (**sr**) must already exist in the database.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

A CDPA screening reference (**sr**) cannot be deleted if it is referenced by an entity in another screening set.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-cgpa:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-cgpa** output with asterisks as the same parameter values specified in the **dlt-scr-cgpa** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The routing indicator in the calling party address provides routing instructions for the receiving signaling point. When the routing indicator specifies global title, the message is routed based on the global title digits. If the routing indicator specifies DPC, the message is routed based on the DPC/subsystem number in the calling party address.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

dlt-scr-cgpa:sr=iec:ni=240:nc=010:ncm=010:ssn=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-CGPA: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-CGPA: MASP A - COMPLTD
;

```

Legend

DLT-SCR-CGPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided (such as IEC).

% FULL—Indicates the relative size of the screen set.

dlt-scr-destfld**Delete an Allowed DESTFLD**

Use this command to remove a specific screening reference from the allowed affected destination field (DESTFLD) category.

Keyword: **dlt-scr-destfld**

Related Commands: **chg-scr-destfld**, **ent-scr-destfld**, **rtrv-scr-destfld**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It

specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

Example

dlt-scr-destfld:sr=iec:ni=240:nc=010:ncm=010

dlt-scr-destfld:sr=dst1:zone=1:area=2:id=3:pcst=s

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **area=*** is specified, **id=*** must be specified.

If **ssa=*** is specified, **sp=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The DESTFLD specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-destfld:sr=ied:ni=240:nc=010:ncm="":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-destfld** output with asterisks as the same parameter values specified in the **dlt-scr-destfld** command.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

dlt-scr-destfld:sr=iec:ni=240:nc=010:ncm=010

```
rlghncxa03w 04-02-13 11:49:47 EST EAGLE 31.3.0
DLT-SCR-DESTFLD: SCREEN SET AFFECTED - SS01 25% FULL
DLT-SCR-DESTFLD: MASP A - COMPLTD
```

dlt-scr-dpc

Delete Allowed DPC

Use this command to remove a specific screening reference from the allowed DPC category.

Keyword: dlt-scr-dpc

Related Commands: chg-scr-dpc, ent-scr-dpc, rtrv-scr-dpc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: 00000-16383 *

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

dlt-scr-dpc:sr=iec:ni=240:nc=010:ncm=010

dlt-scr-dpc:sr=dpc1:npc=128:pcst=s

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

The DPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of DPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-dpc:sr=iec:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-dpc** output with asterisks as the same parameter values specified in the **dlt-scr-dpc** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-dpc:sr=iec:ni=240:nc=010:ncm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-DPC: MASP A - COMPLTD
;
```

Legend

DLT-SCR-DPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

dlt-scr-isup

Delete Allowed ISUP Screening Reference

Use this command to delete an allowed ISUP screening reference from the Allowed ISUP entity set.

Keyword: **dlt-scr-isup**

Related Commands: **chg-scr-isup**, **ent-scr-isup**, **rtrv-scr-isup**

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP message type or TUP message type. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**. The **tupmt** parameter is not valid for SEAS.

Range: **000-255**

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *yyyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
dlt-scr-isup:sr=iec:isupmt=9
dlt-scr-isup:sr=iec:isupmt=1&&2
dlt-scr-isup:tupmt=1:sr=tu01
```

Dependencies

The specified **sr** must exist in the Allowed ISUP entity set.

The specified **isupmt** parameter or **tupmt** parameter value must already exist in the specified **sr**.

The last entry in the specified **sr** cannot be deleted if the entry is referenced by another screen.

Notes

An asterisk can be specified for a parameter value in the **chg-scr-isup** and **dlt-scr-isup** commands *only* if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

Output

No screen sets are listed in the following example, because the specified screening reference is not associated with any screen sets.

```
dlt-scr-isup:sr=iec:isupmt=9
tekelecstp 02-09-02 11:59:41 EST EAGLE 30.0.0
DLT-SCR-ISUP: MASP A - COMPLTD

;
```

dlt-scr-opc**Delete Allowed OPC**

Use this command to remove a specific screening reference from the allowed OPC category.

Keyword: dlt-scr-opc

Related Commands: chg-scr-opc, ent-scr-opc, rtrv-scr-opc

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the *msa* of the point code represented by *msa-ssa-spt*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

Range: **00000-16383 ***

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s**).

Range: **none, s**

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: 0-7, *

Example

dlt-scr-opc:sr=iec:ni=240:nc=010:ncm=010

dlt-scr-opc:sr=opc1:npc=128:pcst=s

Dependencies

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp** ; or **npc**.

The OPC specified by **ni-nc-ncm**; **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of OPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If only one entry exists, the **sr** must not be referenced by another screening table. If the **sr** is not referenced by another screening table, the entire screening table is deleted.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-dpc:sr=ied:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **ied** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-dpc** output with asterisks as the same parameter values specified in the **dlt-scr-dpc** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
dlt-scr-opc:sr=ied:ni=240:nc=010:ncm=010
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-OPC: SCREEN SET AFFECTED - IEC 25% FULL
DLT-SCR-OPC: MASP A - COMPLTD
;
```

Legend

DLT-SCR-OPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

dlt-scr-sio

Delete Allowed SIO

Use this command to remove a specific screening reference from the allowed service indicator octet (SIO) category.

Keyword: **dlt-scr-sio**

Related Commands: **chg-scr-sio**, **ent-scr-sio**, **rtrv-scr-sio**

Command Class: Database Administration

Parameters

:nic= (mandatory)

The network indicator code identifies whether the message originated from an international (0) or national (2) network. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from 0–3.

Range: 0-3 *

:pri= (mandatory)

New message priority. This parameter specifies the new message priority in the SIO. You can specify a single value or a range of values. An asterisk (*) indicates the full range of values from 0–3.

Range: 0-3 *

Default: Current value

:si= (mandatory)

Service indicator. The service indicator identifies the type of message. The values are defined in Telcordia TR-NWT-000246.

Range: 00, 01- 15

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:h0= (optional)

This parameter is mandatory if the service indicator (*si*) value is **00**, **01**, **02**, or **03**. Otherwise, the **h0** parameter is undefined.

Range: **0-15 ***

Default: Current value or undefined

:h1= (optional)

This parameter is mandatory if the service indicator (*si*) value is **00**, **01**, **02**, or **03**. Otherwise, the **h1** parameter is undefined.

Range: **0-15 ***

Default: Current value or undefined

Example

dlt-scr-sio:sr=iec:nic=1:si=1:h0=4:h1=2:pri=*

dlt-scr-sio:sr=iec:nic=1:si=3:pri=2

Dependencies

The **nh0** and **nh1** parameters cannot be specified if the **nsi** parameter is specified and is not equal to **00**, **01**, or **02**.

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters to be removed must be in the screening reference.

Table 5-36 shows the valid combinations of the **h0/h1** parameter:

Table 5-36. Valid Combinations for the **h0/h1** and **nh0/nh1** Parameters (**chg-scr-sio**)

If the h0 (nh0) parameter is specified as:	The h1 (nh1) parameter value can be specified as:
A single value	A single value
A single value	A range
A single value	An asterisk (*) entry
A range	An asterisk (*) entry
An asterisk (*) entry	An asterisk (*) entry

The **sr**, **nic**, **si**, **pri**, and **h0/h1** parameters cannot be removed if they are the last entry in the screening reference and the screening reference is part of a screen set.

Notes

The network identifier specifies whether the message originated from an international (**0**) or a national (**2**) network.

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will

be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-sio:sr=ied:ni=240:nc=010:nccm=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains the values **ni=240**, **nc=010**, **ncm=***, and **ssn=***. For an entry to be specified in this command with asterisks as parameter values, that entry must be shown in the **rtrv-scr-sio** output with asterisks as the same parameter values specified in the **dlt-scr-sio** command.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

Output

```
dlt-scr-sio:sr=iec:nic=1:si=3:pri=2
rlghncxa03w 04-02-14 16:45:50 EST EAGLE 31.3.0
DLT-SCR-SIO: SCREEN SET AFFECTED - SS01 25% FULL
DLT-SCR-SIO: SCREEN SET AFFECTED - SS04 35% FULL
DLT-SCR-SIO: MASP A - COMPLTD
;
```

Legend

DLT-SCR-SIO—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is provided.

% FULL—Indicates the relative size of the screen set.

dlt-scr-tt

Delete Allowed Translation Type

Use this command to remove a specific screening reference from the allowed translation type category.

Keyword: **dlt-scr-tt**

Related Commands: **chg-scr-tt**, **ent-scr-tt**, **rtrv-scr-tt**

Command Class: Database Administration

Parameters

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. The translation type identifies the global title translation type value in the called party address. You can enter a single value or a range of values. An asterisk (*) indicates the full range of values from **0–255**.

Range: **000-255 ***

Example

```
dlt-scr-tt:sr=iec:type=012
```

Dependencies

The screening reference must exist.

You cannot remove the **sr** and **type** parameters if they are the last entry in the screening reference and the screening reference is part of a screen set.

The allowed **type** to be removed must already exist in the screening reference.

The single value or range specified for the allowed **type** to be deleted from the TT screen for the allowed TT screening reference must already exist in that TT screen.

Notes

The asterisk is a parameter value indicating that the gateway screening process is screening all values for that parameter in the MSU. The asterisk parameter value does not mean that multiple entries whose values may be in the range implied by the asterisk will be removed. The only entry that will be removed by this command when the asterisk is specified as a parameter value is the entry that contains an asterisk as that parameter value.

For example, if the **dlt-scr-tt:sr=ied:type=":ssn=*** command is entered, the only entry that will be removed from the database is the entry in screening reference **iec** that contains an asterisk as the value for the **type** parameter. For an entry to be specified in this command with an asterisk as the value for the **type** parameter, that entry must be shown in the **rtrv-scr-tt** output with an asterisk as the value for the **type** parameter.

Output

```
dlt-scr-tt:sr=iec:type=012
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCR-TT:  SCREEN SET AFFECTED - IEC  25% FULL
DLT-SCR-TT:  MASP A - COMPLTD
;
```

Legend

DLT-SCR-TT—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

dlt-scrset

Delete Screen Set

Use this command to remove a screen set definition from the database. A screen set is a group of screening references that belong to various categories. This command does not remove any gateway screening tables.

Keyword: **dlt-scrset**

Related Commands: **chg-scrset**, **ent-scrset**, **rtrv-scrset**

Command Class: Database Administration

Parameters

:scrn= (mandatory)

Screen set name. Each screening reference must have a unique name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Example

```
dlt-scrset:scrn=nc27
```

Dependencies

The screen set name must exist.

Before the screen set can be removed, it must be removed from all linksets.

Notes

The system validates the command to ensure that the specified screen set name is in use.

Output

```
dlt-scrset:scrn=nc27
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-SCRSET: MASP A - COMPLTD
;
```

dlt-shlf**Delete Shelf**

Use this command to remove a shelf from the system database.

Keyword: dlt-shlf

Related Commands: ent-shlf, rtrv-shlf

Command Class: Database Administration

Parameters

:loc= (mandatory)

The shelf location.

Range: 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

Example

```
dlt-shlf:loc=2300
```

Dependencies

The equipment shelf must have been configured previously.

The equipment shelf must not have any cards configured for it.

If the equipment shelf is the only provisioned shelf in the frame and a frame power threshold entry is configured in the Frame Power Threshold table for the frame, the shelf cannot be deleted until the frame power threshold entry is deleted from the Frame Power Threshold table.

Notes

All shelves in the system can be removed, except the control shelf (**1100**).

Before a shelf can be removed from the database, all SS7 signaling links and TCP/IP data links must be deactivated and removed from the database. All TSMs must be placed out of service. All X.25 signaling links, and the X.25 routes assigned to them, must be removed from the database. Then all cards in the shelf must be removed from the database. See the *Database Administration Manual - System Management* for more information on shelf removal.

Refer to the *Installation - EAGLE 5 ISS* manual for an illustration of shelf locations.

Output

```
dlt-shlf:loc=2300
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
DLT-SHLF: MASP A - COMPLTD
;
```

dlt-slk**Delete Signaling Link**

Use this command to remove a signaling link from the system database.

Keyword: dlt-slk

Related Commands: act-slk, blk-slk, dact-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Database Administration

Parameters

:link= (mandatory)

Signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:force= (optional)

This parameter must be used to remove the last link in a linkset without having to remove all of the routes that referenced the linkset.

Range: yes, no

Default: no

Example

dlt-slk:loc=1211:link=a

dlt-slk:loc=1201:link=b:force=yes

The following example deletes link a1 from a multi-port LIM, E1/T1 MIM, HC MIM, or E5-E1T1 card at card location 1205:

dlt-slk:loc=1205:link=a1

Dependencies

Card locations 1113 through 1118 cannot be specified.

The frame and shelf portions of the specified card location (**loc**) can be 11 through 13, 21 through 23; 31 through 33; 41 through 43; 51 through 53; and 61. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card

- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

The **link** parameter values **a4-a7** and **b4-b7** can be specified for E5-ENET or HC MIM cards. The **link** parameter values **a8-a31 a4-a15** and **b8-b31 b4-b15** can be specified only for HC MIM and E5-E1T1 cards that are used as E1 cards or T1 cards. The **link** parameter values **a16-a31** and **b16-b31** can be specified only for HC MIM cards that are used as E1 cards or T1 cards. Links **a4-a31** and **b4-b31** cannot be specified for Channel cards.

Links **a16-a31** and **b16-b31** cannot be specified for even-numbered card locations. HC MIM cards are dual-slot cards. The links are assigned only to the cards in odd-numbered locations.

The specified link must exist in the database.

If the specified card is running the **ss7gx25**, **atmitu**, **atmansi**, **ipgwi**, or **ss7ipgw** GPL, only the value **a** for the **link** parameter can be specified.

The signaling link must be in the unavailable (UAV) state before it can be removed. Enter the **rept-stat-slk** command to verify the state of the signaling link.

The signaling link cannot have an active LFS test in progress when this command is entered to delete the link.

The **force=yes** parameter must be specified to remove the last signaling link in a linkset that is assigned to a route.

To remove the last signaling link on a card, the state of the card must be OOS-MT-DSBLD. Enter the **rept-stat-card** command to verify the state of the card.

The card must be inhibited before the last link on the card can be deleted.

An IPLIMx or IPGWx signaling link assigned to a local host cannot be deleted if it has a socket or association with connection status **open=yes**.

The slot portion of the specified card location (**loc**) can be **1** through **8** and **11** through **18**. Slots **09** and **10** cannot be specified. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

Notes

This command disassociates the equipment of a link from a logical signaling link. The link must first be placed in the unavailable (UAV) state by entering the **chg-slk** (or **canc-slk**) command before this command can be used to disconnect it. Entering this command results in the link entity being deleted from the STP's link entity set. The link is then considered to be "disconnected." The link on the STP becomes unassigned (spare) but retains the existing equipment type and options; the link remains in the "equipped" provisioning state unless that state is changed by subsequent local craft activity. The link is also no longer associated with its assigned linkset.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

Output

```
dlt-slk:loc=1211:link=a
rlghncxa03w 05-02-07 11:11:28 EST EAGLE5 33.0.0
DLT-SLK: MASP A - COMPLTD
;
```

dlt-spc**Delete Secondary Point Code**

Use this command to delete an SPC (secondary point code) from the database. Also use this command to change an SPC by first removing the SPC from the database and then using the **ent-spc** command to enter the new SPC value.

Keyword: dlt-spc

Related Commands: ent-spc, rtrv-spc

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:spc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: spca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

:spc/spca/spci/spcn/pcn24= (mandatory)

Secondary point code.

:spci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:spcn= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

dlt -spc:spc=10-20-30

dlt -spc:spcn24=98-98-98

dlt -spc:spcn=s-12345

Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix **s-**) can be specified in the command.

A secondary point code that is referenced in the Destination table cannot be deleted.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

dlt -spc:spc=10-20-30

```
rlghncxa03w 04-02-18 08:50:12 EST  EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full
DLT-SPC: MASP A - COMPLTD
;
```

dlt-split-npa

Delete Split NPANXX

Use this command to remove the NPANXX from the database. This command verifies that the NPANXX input is in a split-NPA condition with another NPANXX.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration controlled feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: dlt-split-npa

Related Commands: ent-split-npa, rtrv-split-npa

Command Class: LNP Database

Parameters

:npnxxx= (mandatory)

Numbering plan area.

Range: 6 digits

Example

dlt-split-npa:npnxx=214254

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The NPANXX must exist and it must be already split.

Notes

None

Output

dlt-split-npa:npnxx=214254

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
DLT-SPLIT-NPA: MASP A - COMPLTD
```

;

dlt-srvsel**Delete Service Selector**

Use this command to delete a service selector.

Keyword: dlt-srvsel

Related Commands: chg-srvsel, ent-srvsel, rtrv-srvsel

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), and **gtin** (ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: 2, 4

Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2**, **gtii=4**, **gtin=2**, **gtin=4**, **gtin24=2**, **gtin24=4**

:ssn= (mandatory)

Subsystem number.

Range: 0-255 *

:tt= (mandatory)

Translation type.

Range: 0-255

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: sub, rsvd, natl, intl

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the

nai parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: 0-127

:np= (optional)

Numbering Plan. The numbering plan indicator can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: e164, generic, x121, f69, e210, e212, e214, private

:npv= (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: 0-15

Example

```
dlt-srvsel:gti=2:tt=10
dlt-srvsel:gtin=4:tt=0:np=e164:nai=sub
dlt-srvsel:gtin24=4:tt=4:np=e164:nai=intl
dlt-srvsel:gtii=4:tt=4:np=e164:nai=intl:ssn=9
dlt-srvsel:gtii=4:tt=5:np=e164:nai=intl:ssn=*
```

Dependencies

The G-Flex, INP or AINPQ feature must be turned on, or the G-Port, Equipment Identity Register, Prepaid SMS Intercept Ph1, Prepaid IDP Relay or IDP Screening for Prepaid feature must be enabled before this command can be entered.

The **np** and **npv** parameters cannot be specified together.

The **nai** and **naiv** parameters cannot be specified together.

The value **4** is not valid for the **gti/gtia** parameters.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

When the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in the following combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, no **np(v)** and **nai(v)** parameter combinations can be specified.

An entry must already exist that matches the **gti/gtia/gtii/gtin/gtin24**, **tt**, **ssn**, and **np(v)** and **nai(v)** combination of parameters.

Notes

None

Output

```
dlt-srvsel:gti=2:tt=10

rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0

dlt-ss-appl**Delete Subsystem Application**

Use this command to remove the application from the LNP database.

Keyword: **dlt-ss-appl**

Related Commands: **chg-ss-appl**, **ent-ss-appl**, **rtrv-ss-appl**

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: **lnp**, **inp**, **eir**

Example

dlt-ss-appl:appl=lnp

dlt-ss-appl:appl=inp

dlt-ss-appl:appl=eir

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **dlt-ss-appl:appl=lnp** command can be entered.

The INP feature must be turned on before the **dlt-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **dlt-ss-appl:appl=eir** command can be entered.

The application type (**appl** parameter) must exist in the SS-APPL table.

The subsystem must be inhibited before **status=offline** can be specified.

Notes

None

Output

dlt-ss-appl:appl=lnp

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
DLT-SS-APPL: MASP A - COMPLTD
```

;

dlt-subnetid**Delete Subnet ID**

Use this command to delete a Subnet ID entry from the Subnet ID list, for the ISUP NP with EPAP feature.

Keyword: **dlt-subnetid**

Related Commands: **ent-subnetid**, **rtrv-subnetid**

Command Class: Database Administration

Parameters

:subnetid= (mandatory)

Subnet ID

Range: 1-15 digits

Example

```
dlt-subnetid:subnetid=886933
```

Dependencies

The value **none** cannot be specified for the **subnetid** parameter.

The specified Vendor ID entry must already exist in the SUBNETID table.

Notes

None.

Output

```
dlt-subnetid:subnetid=886933
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
SUBNETID table is (6 of 50) 3% full
DLT-SUBNETID: MASP A - COMPLTD
;
```

dlt-t1**Delete T1 Interface**

Use this command to delete an interface for an E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card used as a T1 card. The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

On HC-MIM cards and E5-E1T1 cards, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The slave port interface is automatically deleted with the command that deletes its master port interface.

Keyword: dlt-t1

Related Commands: chg-t1, ent-t1, rtrv-e1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 card port number. The value must be a T1 port for which an interface has already been configured on the specified T1 card.

Range: 1-8

Ports 3-8 are valid only for HC-MIM cards and E5-E1T1 cards.

Example

```
dlt-t1:loc=1205:etport=1
```

```
dlt-t1:loc=1205:t1port=2
```

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **limt1** card type.

The port specified by the **t1port** parameter must be already equipped with an T1 interface.

All signaling links providing timeslots serviced by the specified T1 interface must be deleted before the T1 interface can be deleted. Use the **dlt-slk** command to delete the signaling links providing the timeslots.

A channel bridged slave (even-numbered) port on an HC-MIM card or E5-E1T1 card cannot be specified in the **t1port** parameter. To delete channel bridged port interfaces, specify the master (odd-numbered) port in the **t1port** parameter. The slave port interface is automatically deleted when its master port interface is deleted.

The following card locations cannot be specified in the **loc** parameter: 1113, 1114, 1115, 1116 1117, 1118 (OAM, TDM, and MDAL cards), and xy09 and xy10 (x is the frame and y is the shelf for HMUX and HIPR cards).

Notes

None.

Output

```
dlt -t1: loc=1205: t1port=1
      rlghncxa03w 04-02-20 09:07:58 EST   EAGLE 31.3.0
      DLT-T1: MASP A - COMPLTD
;
```

dlt-tt

Delete Translation Type

Use this command to remove a translation type from the system database.

NOTE: If the EGTT (Enhanced Global Title Translation) feature is turned on in your system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).

Keyword: dlt-tt

Related Commands: ent-tt, rtrv-tt

Command Class: Database Administration

Parameters

:alias= (optional)

The global title translation type

Range: 000-255

Default: No translation type given

:ttn= (optional)

Translation type name.

Range: ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

:type/typea/typeei/typen/typen24= (optional)

Type and **typea** specify an ANSI network, **typeei** specifies an ITU-international network, **typen** specifies an ITU-national network, and **typen24** specifies a 24-bit ITU national network. A translation type numeric value may be entered as ANSI (**type** or **typea**) and also as an ITU type (**typei**, **typen**, or **typen24**). However, they are separate entities.

Range: 0-255

Default: No translation type is specified

Example

```
dlt-tt:type=230
dlt-tt:ttn=lidb
dlt-tt:type=230:ttn=lidb
dlt-tt:type=230:ttn=lidb:alias=030
```

Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (*) parameter values are not allowed in this command.

To delete a translation type, the translation type, the translation name, or both, must be specified.

If the translation type is specified, it must already exist in the database for the network type.

If the translation name is specified, it must already exist in the database.

If the translation type is specified, it cannot be an **alias** value.

If both the translation type and translation name are specified, they must correspond.

The translation type cannot be deleted if there are current GTT entries that reference it.

To delete an **alias**, both the **alias** and the translation type must be specified, and both must already exist in the database for the network type.

If an **alias** is specified, it must be associated with the specified translation type and cannot be the value of an existing translation type.

Either the **type** parameter or **ttn** parameter must be specified.

If the **type** parameter is specified, the translation type must exist in the translation table. If the **type** or **ttn** parameter, or both, are specified, they must be the same as the values entered with the **ent-tt** command.

If the translation name is specified, it must be associated with a translation type.

If aliases exist, they must be removed from the database before the translation types can be removed.

Notes

If the specified translation type entry is not referenced by a current global title translation entry and does not have any aliases, the translation type entry is removed.

Output

```
dlt-tt:type=230

rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
DLT-TT: MASP A - COMPLTD
;
```

dlt-ttmap

Delete Translation Type Mapping

Use this command to delete from the database a mapped SS7 message translation type (TT) for a given gateway linkset name. For example, suppose you are mapping the translation type 001 (before TT mapping) to 238 (after TT mapping). You can use this command to delete that mapping from the database.

Keyword: dlt-ttmap

Related Commands: chg-ttmap, ent-ttmap, rtrv-ttmap

Command Class: Database Administration

Parameters**:lsn=** (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: aaaaaaaaa

1 alphabetic character followed by 9 alphanumeric characters

:ett= (optional)Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.**Range:** 0-255**:io=** (optional)Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.**Range:** i, o

i — incoming

o — outgoing

Default: Both incoming and outgoing**Example****dlt-ttmap:lsn=n c001:io=i:ett=128:mtt=55****Dependencies**

None

Notes

None

Output

```

dlt-ttmap:lsn=nc001:io=i:ett=128:mtt=55
rlghncxa03w 04-02-22 11:18:50 EST EAGLE 31.3.0

dlt-uim-acthresh**Delete Activity Level Threshold for STP UIM
Activity Reporting**

Use this command to clear the level of activity threshold that is used to report UIM messages.

Keyword: dlt-uim-acthresh**Related Commands:** rtrv-uim-acthresh, set-uim-acthresh**Command Class:** Database Administration**Parameters****:uimn=** (mandatory)

The UIM number.

Range: 1000-1499**Example**

Clears UIM number 1333 message threshold:

dlt-uim-acthresh:uimn=1333

Dependencies

The **uimn** parameter value must be a numeric value in the range of **1000–1499**.

The specified **uimn** value must exist in the UIM Threshold database table.

Notes

None

Output

dlt-uim-acthresh:uimn=1333

```
rlghncxa03w 04-02-01 08:50:12 EST EAGLE 31.3.0
DLT-UIM-ACTHRESH: MASP A - COMPLTD

```

dlt-user**Delete User**

Use this command to remove a user from the system database.

Keyword: **dlt-user**

Related Commands: **act-user, chg-pid, chg-user, dact-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user**

Command Class: Security Administration

Parameters

:uid= (mandatory)

User ID

Range: *azzzzzzzzzzzzzzz*

1 alphabetic character followed by up to 15 alphanumeric characters

Example

dlt-user:uid=terryjohnson

Dependencies

The first character must be a letter.

Notes

If the user being removed is logged onto the system, this command logs the user off immediately.

Output

dlt-user:uid=terryjohnson

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
DLT-USER: MASP A - COMPLTD

dlt-vendid**Delete Vendor ID**

Use this command to delete a Vendor ID entry from the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR feature.

Keyword: **dlt-vendid**

Related Commands: **ent-vendid, rtrv-vendid**

Command Class: Database Administration

Parameters

:vendid= (mandatory)
 Vendor ID
Range: 1-15 digits

Example

```
dlt -vendid:vendid=886933
```

Dependencies

The value **none** cannot be specified for the **vendid** parameter.
 The specified Vendor ID entry must already exist in the VendID table.

Notes

None.

Output

```
dlt -vendid:vendid=886933
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 200) 3% full

```

dlt-x25-dstn**Delete X.25 Destination**

Use this command to remove the association of an X.25 network address with an SS7 point code.

Keyword: **dlt-x25-dstn**

Related Commands: **chg-x25-dstn, ent-x25-dstn, rtrv-x25-dstn**

Command Class: Database Administration

Parameters

:xaddr= (mandatory)
 The X.25 network address of the X.25 destination entity or the SS7 node.
Range: 1-15 digits

Example

```
dlt -x25-dstn:xaddr=205255864567721
```

Dependencies

An X.25 address must have a minimum of four digits.
 The X.25 address must already exist as an X.25 destination.
 The X.25 address cannot be assigned to an X.25 route.

Notes

None

Output

```
dlt -x25-dstn:xaddr=205255864567721

rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0

```

dlt-x25-rte**Delete X.25 Route**

Use this command to remove X.25 routes from the database.

Keyword: dlt-x25-rte

Related Commands: chg-x25-rte, ent-x25-rte, rtrv-x25-rte

Command Class: Database Administration

Parameters

:saddr= (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: 1-15 digits

:xaddr= (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

Example

dlt-x25-rte:xaddr=225255:saddr=133131

Dependencies

Each X.25 address must have at least four digits.

The combination of the two X.25 addresses must be in the X.25 Routing table.

Notes

None

Output

dlt-x25-rte:xaddr=225255:saddr=133131

```
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0

```

enable-ctrl-feat**Enable Controlled Feature**

Use this command to enable a controlled feature that the customer has purchased.

NOTE: The “LNP (Local Number Portability) feature” is turned on when the LNP ported TNs quantity is greater than 0 in the rtrv-ctrl-feat command output. An LNP ported TNs quantity feature access key has been enabled and turned on.

Keyword: enable-ctrl-feat

Related Commands: chg-ctrl-feat, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

:fak= (mandatory)

Feature Access Key. This parameter specifies the Feature Access Key for the feature.

Range: ayyyyyyyyyyyy

13 alphanumeric characters; the first character must be a letter.

The feature access key cannot contain any special characters, including spaces and dashes. Upper-case characters are mapped to lower case.

:partnum= (mandatory)

Part number. This parameter specifies the part number for the feature.

Range: 893000000 - 893999999

Do not include dashes in the 9-digit number.

Example

enable-ctrl-feat:partnum=893xxxxxx:fak=xxxxxxxxxxxxxxxxxx

Dependencies

CAUTION: Never install or initialize MCAP cards in card slots 1113 and 1115 after GPSM-II cards are provisioned in these slots. Attempting to initialize MCAP cards after GPSM-II cards have been provisioned in slots 1113 and 1115 will cause a system outage. Before replacing an existing GPSM-II card in slot 1113 or slot 1115, contact the Customer Care Service.

Unless DSM cards or E5-SM4G cards are specifically indicated, either DSM cards or E5-SM4G cards can be used when "DSM cards" are required.

The system serial number must be locked in the database before you can enter this command for the feature (see the **ent-serial-num** command).

The feature access key must be valid for the specified feature part number and for the system serial number.

A feature cannot be enabled with this command when the feature has already been enabled with a temporary feature access key, a permanently On feature access key, or a feature access key for a quantity that is greater than the quantity specified in the command.

A temporary feature access key can be enabled only one time for a feature. After the temporary feature access key expires, you must purchase the feature before you can enable a permanent feature access key for the feature.

A temporary feature access key cannot be enabled for features that do not allow a temporary feature access key. The following features allow a temporary feature access key:

- All ISUP Normalization features
- LNP Short Message Service (LNP SMS)
- Prepaid SMS Intercept Phase I (PPSMS)
- Intermediate GTT Load Sharing (IGTTLS)
- MNP Circular Route Prevention
- Command Class Management
- IP User Interface (Telnet)
- Network Security Enhancement
- Port Check for Mobile Originated SMS
- ISNR Variant-Quantity features
- EAGLE OA&M IP Security
- LNP ELAP Configuration
- ANSI-ITU-China SCCP Conversion
- 15 Minute Measurements

If any of the G-Flex, G-Port, INP, or EIR features are turned on in the system, the maximum number of DSM cards allowed in the system is 25. If the system is running only GTT, the maximum number of DSM cards allowed in the system is 32.

The GTT feature must be on before the IDP Screening for Prepaid feature can be enabled.

If a TSM card is present in the system, the IDP Screening for Prepaid feature cannot be enabled.

The **partnum** parameter value must be 9 digits, without any dashes or spaces. The first 3 digits are **893**. The next 6 digits must be in the range **0-9**.

A valid system serial number must be entered in the database before this command can be entered for the feature (see the **ent-serial-num** command).

The LNP ELAP Configuration feature and the WNP feature must be turned on before the LNP SMS feature can be enabled.

The GTT feature must be turned on before the following features can be enabled:

- XGTT Table Expansion
- LNP ELAP Configuration
- All LNP feature (LNP ported TNs) quantities
- LNP 150,000 LRNs
- LNP 300,000 NPANXXs

For the XGTT (269,999 to 400,000 entries) feature, all SCCP GPLs must be running on TSM cards that have at least a 586K processor, or DSM cards, or a combination of TSM and DSM cards.

The XGTT Table Expansion feature with 1,000,000 entries requires all SCCP GPLs to be running on DSM cards.

For the XMAP (2000 and 3000 entries) feature, all SCCP GPLs must be running on TSM cards or a combination of TSM and DSM cards.

The DSTN5000 feature bit for the 5000 Routesets feature must be turned on before the 6000 Routesets feature, the 7000 Routesets feature, or the 8000 Routesets feature can be enabled.

The 7000 Routesets feature and the 8000 Routesets feature cannot be enabled when more than 8000 alias point codes are already assigned in the system.

The LNP (an LNP ported TNs quantity), LNP 150,000 LRNs, or LNP 300,000 NPANXX feature cannot be enabled if any of the features listed below are enabled or if the G-Flex feature bit is turned on. If any of these LNP features are enabled, none of the listed features can be enabled and the G-Flex feature cannot be turned on.

- AINPQ
- A-Port
- Equipment Identity Register (EIR)
- G-Port
- Prepaid IDP Query Relay (IDP Relay)
- IS41 GSM Migration (IGM)
- INP
- MTP Messages for Prepaid Applications (MTPR)

The LNP feature (an LNP ported TNs quantity) must be enabled before the LNP 150,000 LRNs feature or the LNP 300,000 NPANXXs feature can be enabled.

DSM cards running the **vsccp** application are required when the LNP feature, the 150,000 LNP LRNs feature, the 300,000 LNP NPANXXs feature, and the VGTT feature are turned on together in the system.

The LNP ELAP Configuration feature must be enabled, and turned on with the **chg-ctrl-feat** command, before the features for the following quantities can be enabled:

- The LNP feature for a quantity equal to or greater than 24 million TNs
- The 150,000 LNP LRNs feature
- The 300,000 NPANXXs feature

The LNP feature for 4 million TNs requires all TSM cards with a minimum of 512MB of memory.

The LNP feature for 6 million TNs requires all TSM cards with a minimum of 768MB of memory.

The LNP feature for 8 million TNs requires all TSM cards with a minimum of 1GB of memory.

The LNP feature for 12 million TNs requires all TSM cards or DSM cards with a minimum of 1GB of memory.

The LNP feature for 24 million TNs requires all DSM cards with a minimum of 2GB of memory.

The LNP feature for 36 million TNs requires all DSM cards with a minimum of 3GB of memory.

The LNP feature for LNP ported TNs quantities of 48 million TNs or greater requires all DSM cards with a minimum of 4GB of memory.

The 150,000 LNP LRNs feature requires all DSM cards with a minimum of 2GB of memory.

The 300,000 LNP NPANXXs feature requires all DSM cards with a minimum of 2GB of memory.

The LNP feature for 2 million TNs requires at least TSM cards with a minimum of 256MB of memory.

The GTT feature must be turned on before the following features can be enabled:

- Equipment Identity Register (EIR)
- GSM Map Screening (GSM)
- Hex Digit Support for GTT
- Transaction-based GTT Loadsharing (TBGTTLS)
- Intermediate GTT Loadsharing (IGTTLS)
- E5-SM4G Throughput Capacity
- Prepaid SMS Intercept Ph1 (PPSMS)

The EIR (Equipment Identity Register) feature cannot be enabled if any ASM cards or TSM cards are in the system. All DSM cards in the system must be at least 2 GB DSMs before the EIR feature can be enabled.

The ANSI-ITU-China SCCP Conversion feature cannot be enabled if the SCCPCNV (SCCP Conversion) feature bit or the TCAPCNV (TCAP Conversion) feature bit is turned on.

The ANSI-ITU-China SCCP Conversion feature requires TSM cards or DSM cards in the system.

The GSM Map Screening (GSM) feature must be turned on before the Enhanced GSM Map Screening (EGSM) feature can be enabled.

The Enhanced GSM Map Screening (EGSM) feature must be turned on before the MTP MAP Screening feature can be enabled.

The Measurements Platform feature must be turned on and the Measurements Platform collection function must be enabled (see the **chg-measopts:platformenable=on** parameter) before the MTP MAP Screening feature can be enabled (at least one MCPM card must be active).

The Spare Point Code Support feature cannot be enabled if TALI sockets have been provisioned for an IPGWI card.

The 7000 Routesets and 8000 Routesets quantity keys can not be enabled if the number of provisioned alias destinations is greater than 8000.

The G-Port feature must be turned on before the following features can be enabled:

- Portability Check for Mobile Originated Short Message Service (MNP SMS)
- MNP Circular Route Prevention
- Prepaid SMS Intercept Phase 1 (PPSMS)
- ISUP NP with EPAP
- GSM MAP SRI Redirect for Serving HLR

The GWS (Gateway Screening) feature must be turned on before the ISUP NP with EPAP feature can be enabled.

The following features cannot be enabled if the **ansigflex** system option is enabled (see the **chg-stpopts** command):

- Equipment Identity Register (EIR)
- G-Port
- INP
- 1100 TPS/DSM for ITU NP
- ANSI-41 INP Query (AINPQ)
- A-Port
- IS41 GSM Migration (IGM)
- E5-SM4G Throughput Capacity

Before an LNP ported TNs quantity greater than 96 million numbers can be enabled, an ELAP system that supports a quantity greater than 96 million numbers must be available to the EAGLE 5 ISS.

- The ELAP software must be at version 4.0 to support LNP ported TNs quantities greater than 96 million numbers and up to 120 million numbers.
- The ELAP software must be at version 5.0 or greater to support LNP ported TNs quantities greater than 120 million numbers. A quantity greater than 120 million numbers cannot be enabled until the ELAP is upgraded to the required software level, and the appropriate ELAP commands are issued to convert the 120 Million LNP Numbers database structure to the data compaction structure for more than 120 million numbers.

The **rept-stat-mps** command can be entered at the EAGLE 5 ISS to determine the ELAP software version.

The following features require at least a DSM card running the VSCCP application to be present in the system before they can be enabled:

- AINPQ
- A-Port
- EIR
- Enhanced GSM MAP Screening (EGMS)

- Flexible GTT Load Sharing
- G-Flex
- G-Port
- INP
- IS41 GSM Migration (IGM)
- LNP ELAP Configuration
- Origin-based SCCP Routing (OBSR)
- Transaction-based GTT Loadsharing (TBGTTLs)
- Weighted GTT Loadsharing (WGTTLs)
- PPSMS

Before LNP ported TNs quantities greater than 96 million numbers can be enabled, an ELAP system must be available to validate its software version to the EAGLE 5 ISS.

The Enhanced GTT (EGTT) feature must be turned on before the Origin-based SCCP Routing feature can be enabled.

The following features cannot be enabled if any TSM cards running the SCCP application are in the system:

- Origin-based SCCP Routing
- Hex Digit Support for GTT
- Enhanced GSM Map Screening (EGSM)

At least one of the EPAP-based ITU NP features (G-Port, A-Port, INP, IGM, EIR, IDP Relay, ANSI-41 INP Query, or PPSMS) must be turned on before the 1100 TPS/DSM for ITU NP feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the A-Port feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the G-Port feature can be enabled.

The GTT feature must be turned on (see the **chg-feat** command) before the IS41 GSM Migration (IGM) feature can be enabled.

The G-Flex, A-Port, or IGM feature must be turned on before the MTP MSGS for SCCP Apps (MTPR) feature can be enabled.

The A-Port feature cannot be enabled if an ASM or TSM card is present in the system.

The IGM feature cannot be enabled if an ASM or TSM card is present in the system.

If a DSM card with less than 4 gigabytes of memory is present in the system, the A-Port feature cannot be enabled.

The EIR (Equipment Identity Register) feature cannot be enabled if the INP or AINPQ feature is enabled. The INP or AINPQ feature cannot be enabled if the EIR feature is enabled.

The PPSMS feature cannot be enabled if the LNP ELAP Configuration feature is turned on.

If the MTP Msgs for SCCP Apps feature is turned on, the INP and AINPQ features cannot be enabled.

If the MTP Msgs for SCCP Apps feature is turned on, the EIR feature cannot be enabled.

DSM cards must be provisioned in the system before the Prepaid IDP Query Relay feature can be enabled.

The GTT feature must be turned on before the Prepaid IDP Query Relay feature can be enabled.

The Prepaid IDP Query Relay feature cannot be enabled if any ASM cards or TSM cards are in the system.

The Default Country Code must be provisioned (see the **defcc** parameter in the **chg-stpopts** command) before the Prepaid IDP Query Relay feature can be enabled.

E5-SM4G cards do not support LNP ported TNs quantities that are greater than 192 million numbers.

If the E5IS feature is turned on, then the E5-SM4G Throughput Capacity feature cannot be enabled.

If the E5-SM4G Throughput Capacity feature is enabled, then the LNP feature cannot be enabled.

If the LNP feature is enabled, then the E5-SM4G Throughput Capacity feature cannot be enabled.

All shelves must be equipped with HIPR cards before the E5-SM4G Throughput Capacity feature can be enabled.

Notes

XGTT or XMAP (GTT or MAP Table Increase) Feature

After the XGTT feature is enabled, the feature cannot be disabled or turned off.

After the XMAP feature is enabled, the feature cannot be disabled or turned off.

1500 Links and 2000 Links Support

After the 1500 Links feature or the 2000 Links Support feature is enabled, the feature cannot be disabled or turned off.

IPGWx Signaling TPS

This quantity is the total maximum transactions per second (TPS) allowed for all IPGWx links in the system.

An alarm appears when the actual system IPGWx TPS exceeds a threshold that is a configurable percent of this maximum (see the **chg-sg-opts** command). The default threshold is 80% of the enabled maximum IPGWx Signaling TPS. The system clears the alarm when the system IPGWx TPS drops below the configured threshold.

A feature access key can be enabled for a greater IPGWx Signaling TPS quantity, but not for a smaller quantity. A default quantity of 200 TPS is enabled in the system.

A temporary feature access key is not allowed for the IPGWx Signaling TPS feature.

SE-HSL SLK Capacity

Table 5-37 lists the total number of signaling links that can be assigned to SE-HSL cards in the system when each SE-HSL SLK Capacity quantity feature access key is enabled.

Table 5-37. SE-HSL SLK Capacity Feature Quantities

Part Number	Maximum SE-HSL Links Allowed in the System
893-0130-01	4
893-0130-02	8
893-0130-03	16
893-0130-04	32
893-0130-05	40
893-0130-06	48

Table 5-37. SE-HSL SLK Capacity Feature Quantities

Part Number	Maximum SE-HSL Links Allowed in the System
893-0130-07	56
893-0130-08	64

LNP 228 Million TNs, LNP 300,000 NPANXXs, LNP 150,000 LRNs, and LNP ELAP Configuration Features

Table 5-38 lists the types and memory capacity for the SCCP cards or E5-SM4G cards to 192 million (4G cards) required by each LNP quantity feature.

Table 5-38. Minimum Hardware Required for LNP Quantity Features

Object / Capacity	MinimumHardware	Feature Access Key
2 Million TNs	256 MB TSM	893-0110-01
4 Million TNs	512 MB TSM	893-0110-02
6 Million TNs	768 MB TSM	893-0110-03
8 Million TNs	1 GB TSM	893-0110-04
12 Million TNs	1 GB TSM or 1 GB DSM	893-0110-05
24 Million TNs	2 GB DSM	893-0110-06
36 Million TNs	3 GB DSM	893-0110-07
48 Million TNs	4 GB DSM	893-0110-08
60 Million TNs	4 GB DSM	893-0110-09
72 Million TNs	4 GB DSM	893-0110-10
84 Million TNs	4 GB DSM	893-0110-11
96 Million TNs	4 GB DSM	893-0110-12
108 Million TNs	4 GB DSM	893-0110-13
120 Million TNs	4 GB DSM	893-0110-14
132 Million TNs	4 GB DSM	893-0110-15
144 Million TNs	4 GB DSM	893-0110-16
156 Million TNs	4 GB DSM	893-0110-17
168 Million TNs	4 GB DSM	893-0110-18
180 Million TNs	4 GB DSM	893-0110-19
192 Million TNs	4 GB DSM	893-0110-20

Table 5-38. Minimum Hardware Required for LNP Quantity Features

Object / Capacity	Minimum Hardware	Feature Access Key
204 Million TNs	4 GB DSM	893-0110-21
216 Million TNs	4 GB DSM	893-0110-22
228 Million TNs	4 GB DSM	893-0110-23
150,000 NPANXXs	Any TSM or 1 GB DSM	893-0094-01
300,000 NPANXXs	2 GB DSM	893-0094-02
100,000 LRNs	Any TSM or 1 GB DSM	893-0105-05
150,000 LRNs	2 GB DSM	893-0105-01

The Flexible GTT Load Sharing feature allows a PC or PC/SSN combination to be provisioned in multiple load-sharing relationships for post-GTT load sharing of intermediate and final GTT traffic. Load sharing for intermediate GTT traffic requires the Intermediate GTT Load Sharing feature, which can be run in conjunction with the Flexible GTT Load Sharing feature. Intermediate GTT load sharing is performed through the MRN table, and the GTT destination is a PC. If both the Intermediate and Flexible GTT Load Sharing features are on, different load-sharing relationships can be defined between the same set of PCs, and different sets of destinations can contain the same PCs.

Load sharing for final GTT traffic is performed through the MAP table, and the GTT destination is a PC/SSN combination. If the Flexible GTT Load Sharing feature is on, different load-sharing relationships can be defined between the same set of PC/SSNs, and different sets of destinations can contain the same PC/SSN combinations.

The Weighted GTT Loadsharing feature allows a PC or PC/SSN combination to be provisioned with weights and threshold values to change the loadsharing method. This weight is relative to the weights of the PCs or PC/SSNs that have the same relative cost (RC group) and determines the relative percentage of traffic sent to the PC or PC/SSN. If the total available weight of the PCs or PC/SSNs in the RC group falls below the threshold, that RC group is not used and the next lowest RC group is used for traffic loadsharing.

E5-SM4G Throughput Capacity Feature

The E5-SM4G Throughput Capacity feature is used to achieve the following maximum TPS capacities. Feature and hardware dependencies must be present.

- 5000 TPS per card with GTT based features
- 150,000 TPS/sec per system, with only GTT and no EPAP-based features on
- 75,000 EPAP TPS per system, with one or more EPAP-based features on

ent-acg-mic**Enter ACG Manually Initiated Control**

Use this command to assign Automatic Call Gapping (ACG) controls to certain queries. The control can apply to all queries or to specific query services and called party digits. If the EAGLE 5 ISS LNP query service receives a query to which a control applies, then the EAGLE 5 ISS sends an ACG component, encoded as configured, with the response.

Keyword: ent-acg-mic

Related Commands: chg-acg-mic, dlt-acg-mic, rept-stat-lnp, rtrv-acg-mic

Command Class: Database Administration

Parameters

:drtn= (mandatory)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the duration index.

Range: 1-13

Default: The current value

:aintvl= (optional)

AIN interval index

Range: 1-15

Default: The current value

:dgts= (optional)

Digits

Range: 3-10 digits

000-999, 000000-9999999999

:intvl= (optional)

IN Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the gap interval index.

Range: 0-15

Default: Current value

:nd= (optional)

Number of digits

Range: 3, 6-10

Default: The current value

:serv= (optional)

Query service

Range: ain, in

:type= (optional)

Type of control

Range: all, sd

Default: sd

Example

ent-acg-mic:type=all:nd=6:drtn=6:intvl=2:aintvl=7

ent-acg-mic:serv=ain:dgts=9194602132:drtn=13:aintvl=1

ent-acg-mic:type=sd:serv=in:dgts=919:drtn=8:intvl=3

Dependencies

If the **type=all** parameter is specified, the optional parameters **nd**, **intvl**, and **aintvl** must be specified.

If the **type=all** parameter is specified, the optional parameters **serv** and **dgts** cannot be specified.

If the **type=sd** parameter is specified, the optional parameters **serv** and **dgts** must be specified.

If the **type=sd** parameter is specified, the optional parameter **nd** cannot be specified.

If the **serv=in** parameter is specified, the optional parameter **aintvl** cannot be specified.

If the **serv=ain** parameter is specified, the optional parameter **intvl** cannot be specified.

If the **serv=in** parameter is specified, the optional parameter **intvl** must be specified.

If the **serv=ain** parameter is specified, the optional parameter **aintvl** must be specified.

The **dgts** parameter value must be specified as 3 or 6–10 digits.

The **nd** parameter value must be 3 or 6–10.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

If the **type=all** parameter is specified, a manually initiated control (MIC) with the **type=all** parameter must not already exist.

If the **type=sd** parameter is specified, a MIC with the same service and digits must not already exist.

A maximum of 256 **type=sd** MICs are allowed.

Notes

None

Output

```

ent-acg-noc

Enter ACG Node Overload Control

Use this command to enter the values for the automatic call gapping (ACG) controls that you want to send when you reach the specified node overload level. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the ACG to be sent when at the level. If a level is not defined, it is not used. Level 10 is predefined.

Keyword: ent-acg-noc

Related Commands: chg-acg-noc, dlt-acg-noc, rept-stat-lnp, rtrv-acg-noc

Command Class: Database Administration

Parameters

:drtn= (mandatory)

Duration index. The amount of time that the ACG is in effect. This number is mapped to a time value at the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the duration index.

Range: 1-13

Default: The current value

:intvl= (mandatory)

Interval index. The amount of time between ACGs. This number is mapped to a time value for the LNP node. Refer to the chapter on Automatic Call Gapping configuration in the *LNP Feature Activation Guide* for a description of the use of the gap interval index.

Range: 0-15

Default: Current value

:lvl= (mandatory)

Overload level.

Range: 1-9

:qr= (mandatory)

Query rate. The number of LNP queries, which define a particular overload level, in a 30-second period.

Range: 1-2147483647

:and= (optional)

AIN number of digits. The number of digits in the global title address of an AIN query.

Range: 6, 10

Default: 6

:ind= (optional)

IN number of digits. The number of digits in the global title address of an IN query.

Range: 6, 10

Default: 6

Example

```
ent-acg-noc:lvl=3:qr=300000:and=10:ind=6:drtn=6:intvl=3
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **ent-acg-noc** command can be entered.

Either **6** or **10** must be specified for the **and** parameters.

The specified overload level must not already be defined.

Either **6** or **10** must be specified for the **ind** parameters.

Notes

None

Output

ent-appl-rtkey

Enter Application Route Key Table

Use this command to configure static entries in the Routing Key table, which associates a routing key with a socket name.

There are three types of routing keys, as follows:

- DPC, SI, SSN routing keys, which are used to route SCCP messages

- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

Keyword: ent-appl-rtkey

Related Commands: dlt-appl-rtkey, rtrv-appl-rtkey

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:asname= (mandatory)

Application Server (AS) name assigned to this routing key.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

:sname= (mandatory)

Socket name as provisioned in the Socket table and associated with this routing key.

Range: ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

:cice= (optional)

The end range of circuit identification codes assigned to the routing key.

Range: 0-4294967295

See Table A-4 for valid CIC values for specified SI and MSU types.

:cics= (optional)

The start range of circuit identification codes assigned to the routing key. This parameter is valid only if **si=4**, **5**, or **13** and is required if **si=4**, **5**, or **13** and **type=full**.

Range: 0-4294967295

See Table A-4 for valid CIC values for specified SI and MSU types.

:dpc= (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination point code.

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmfi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: opca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. This parameter is valid only if **si**=4, 5, or 13, and is required when **si**=4, 5, or 13 and **type=full**.

:opci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

New ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:rcontext= (optional)

Routing Context. The routing context parameter can be used to assign a new routing context to a routing key. The routing context uniquely identifies the routing key.

- Routing context is mandatory for routing keys associated with SUA Application Servers.
- Routing context is optional for routing keys associated with M3UA Application Servers.
- Routing context is invalid for routing keys associated with TALI connections.

Range: **0-4294967295**

:si= (optional)

Service indicator.

Range: **1-15**

0-15 or equivalent text values:

Number = Text—Description

0 = snm—Signaling network management messages
1 = regtest—Signaling network testing and maintenance regular
2 = spltest—Signaling network testing and maintenance special
3 = sccp—SCCP
4 = tup—Telephone user part
5 = isup—ISDN user part
13 = qbicc

:ssn= (optional)

Subsystem number. This parameter is valid only if **si=3** and is required if **si=3** and **type=full**.

Range: 0-255

:type= (optional)

The type of routing key.

Range: full, partial, default

Default: full

Example

```

```

Dependencies

The **srkq** parameter value in the **chg-sg-opts** command limits the maximum number of static routing keys that can be provisioned using the **ent-appl-rtkey** command.

- For **ss7ipgw** and **ipgwi** applications running on dual-slot DCM cards (870-1945-xx), there is a limit of 1000 routing keys in the system. The **chg-sg-opts** command will not allow the **srkq** parameter to be set to a value greater than 1000.
- For **ss7ipgw** and **ipgwi** applications running on SSEDCCM cards (870-2732-xx), there is a limit of 2500 routing keys in the system. See the **chg-sg-opts** command for parameter values that allow 2500 routing keys to be defined in the system.

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. When the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value entered for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

The ISUP routing-over-IP feature must be turned on before a DPC/SI/CIC routing key to route ISUP messages can be specified. The ISUP routing-over-IP feature can be turned on by entering the command **chg-feat:ipisup=on**.

A circuit identification code range (**cics** to **cice**) cannot be specified that overlaps an existing routing key.

When the **si=4, 5, or 13** (or **tup, isup, or qbicc**) parameter is specified, the **opc**, **cics**, and **cice** parameters are required. The **opc**, **cics**, and **cice** parameters can be specified only if the **si=4, 5, or 13** parameter is specified. See Table A-4 for valid **cic** and **si** values for MSU types.

Partial point codes are not allowed; no asterisks can be specified in the routing key in the command.

Mixed point code types are not allowed; the types for the **opc** and **dpc** parameters must match.

A DPC/SI routing key must be specified when the DPC is ANSI and the **si=4** parameter is specified (TUP is used only in an ITU network).

Either the **asname** parameter or the **sname** parameter must be specified in this command.

TALI sockets cannot be specified (**sname**) for IPGWI cards when the Spare Point Code Support Feature is enabled.

When the **type=full** parameter is specified, the **dpc** and **si** parameters must also be specified.

When the **type=default** parameter is specified, the **sname** parameter is the only other parameter allowed.

The group codes for the **dpc** and **opc** parameter values must match when both parameters are entered in the command.

The **rcontext** parameter must be specified for routing keys that are associated with SUA Application Servers.

The specified **rcontext** parameter value must not already exist in the database.

If specified, the service indicator parameter must be **si=3** for routing keys that are associated with SUA Application Servers.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing context.

To assign an M3UA or SUA association to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS and each AS must be assigned to a routing key with routing context.

The AS name and parameters specified for a routing key must use an address format that is valid for the adapter type used by the ASP associations assigned to the AS.

Only the **sname**, **asname**, and **rcontext** parameters are allowed for a default routing key.

The spare point code prefix (**s-**) cannot be specified for routing key point codes in routing keys when the **sname** parameter is specified for TALI connections.

The following four types of partial routing keys are supported:

- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

The DPC entered cannot be an APC or SAPC for an IPGWx linkset. Routing keys cannot be provisioned for the fake adjacent node.

Notes

The Routing Key table associates a routing key with a socket name or an Application Server (AS).

The routing key can be associated with up to 16 socket names or with 1 AS.

The originating point code (**opc**) and destination point code (**dpc**) must not specify a cluster route.

Group codes are required for ITU-N point codes and spare point codes (DPCN/OPCN) when the ITU Duplicate Point Code feature (ITUDUPPC) is turned on, and not allowed when the feature is off.

Routing key attributes for normalization and PSTN presentation will be set to default values (**pstncat=0**, **pstnid=0**, **norm=0**). Use the **chg-appl-rtkey** command to change routing key attributes.

Routing context is a routing key parameter that uniquely identifies routing keys. Routing context is mandatory for routing keys associated with SUA Application Servers, optional for routing keys associated with M3UA Application Servers, and invalid for routing keys associated with TALI connections. An AS cannot be simultaneously assigned to routing keys with routing contexts and routing keys without routing contexts.

An AS cannot be simultaneously assigned to a routing key with routing contexts and routing keys without routing contexts.

An AS can be associated with multiple routing keys that do not contain routing context. An AS can be associated with only 1 routing key with routing context. To assign an M3UA or SUA association to multiple routing keys with routing context, the M3UA/SUA association must be assigned to more than one AS and each AS must be assigned to a routing key with routing context.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

```
ent-appl-rtkey:dpcn=2000-AA:si=5:sname=socket01:opcn=2001-  
AA:cics=1:cice=1000
```

```

ENT-APPL-RTKEY: MASP A - COMPLTD

i

ent-appl-sock

Enter Application Socket

Use this command for the **iplim**, **iplimi**, **ss7ipgw**, or **ipgwi** application to configure the Socket table, which is used to associate the local host/local port to a remote host/remote port.

Keyword: ent-appl-sock

Related Commands: chg-appl-sock, dlt-appl-sock, rtrv-appl-sock

Command Class: Database Administration

Parameters

:lhost= (mandatory)

Local host name. The logical name assigned to the local host device.

[illegible]

a-z, A-Z, 0-9, -, .

Any string of characters beginning with a letter and comprising up to 60 characters in length

:sname= (mandatory)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

Range: *ayyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

:lport= (optional)

The TCP port number for the local host.

Range: 1024-65535

System

Default: 0

:port= (optional)

The signaling link associated with this socket.

Range: a, b, a1, b1, a2, b2, a3, b3

Not all card types support all **port** parameter values.

See Table A-1 for valid **port** parameter range values for each type of card that can have signaling links.

Default: a

:rhost= (optional)

Remote host name. The logical name assigned to the remote host device.

[illegible]

a-z, A-Z, 0-9, -, . (any string of characters beginning with a letter and comprising up to 60 characters in length)

:rport= (optional)

The TCP port number of the remote host.

Range: 1024-65535

System

Default: 0

Example

```
ent-appl-sock:sname=socket1:lhost=gw105.nc.coname.com:lport=1030 :rhost=gw100.nc.tekelec.com.rport=1030
```

Dependencies

The **port** parameter is used to associate a socket with a signaling link.

- Only port **a** is valid on cards that execute the **ss7ipgw** or **ipgwi** application.
- Ports **a** and **b** are valid on dual-slot DCM cards or SSEDCCM cards that execute the **iplim** or **iplimi** application and support 2 point-to-point links.
- Ports **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** are valid only on SSEDCCM cards that execute the **iplim** or **iplimi** application and support 8 point-to-point links.

The allowed maximum is 2 sockets per local host on DCM or SSEDCCM IPLIMx cards that support 2 point-to-point links, and 8 sockets per local host on SSEDCCM IPLIMx cards that support 8 point-to-point links. (IPLIMx refers to cards that execute the **iplim** or **iplimi** application.)

The allowed maximum is 1 socket per signaling link on IPLIMx cards.

The allowed maximum is 50 sockets per local host on SS7IPGW or IPGWI cards.

The allowed maximum is 4000 IP connections per system.

TALI sockets cannot be defined for IPGWI cards when the Spare Point Code Support Feature is enabled.

The socket name (**sname**) must be unique (not already used).

The specified local host name must exist in the IP Host table.

The **rhost** value must exist in the IP Host table.

To assign a socket on an IPLIMx card for a local host, the signaling link associated with the signaling link port must have its **ipliml2** value set to **saaltali**.

The **lhost** parameter must be provisioned in the IP Host table as local to this EAGLE 5 ISS.

If the entered **lhost** corresponds to an IP address associated with the B Ethernet Interface hosted by a present dual-slot DCM card, an error will be generated. If the entered **lhost** corresponds to an IP address associated with the B Ethernet Interface hosted by a provisioned but not present dual-slot DCM card, the card will be auto-inhibited upon insertion of the card. If an SSEDCCM card is inserted, the card will be allowed to boot.

If port **a1**, **b1**, **a2**, **b2**, **a3**, or **b3** is entered for an **iplim** or **iplimi** application and a non-SSEDCCM card is inserted, the card will be auto-inhibited upon insertion of the card. If an SSEDCCM card is inserted, the card will be allowed to boot.

Notes

Two sockets can be provisioned for each DCM card that runs an **iplim** or **iplimi** application and supports 2 point-to-point links. One socket is associated with signaling link port **a** and one with signaling link port **b**. Both sockets use the same physical interface connection and the same IP address.

Eight sockets can be provisioned for each SSEDCCM card that runs an **iplim** or **iplimi** application and supports 8 point-to-point links. One socket is associated with each of ports **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3** and **b3**.

The Socket table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This fully specifies the connection.

The Socket table also contains fields that receive default values even though there are no parameters in the **ent-appl-sock** command for populating these fields. These fields and their default values are:

- open=no
- alw=yes
- server=yes
- dcmps=10
- rexmit=fixed
- rtt=60

Use the **chg-appl-sock** command if you want to enter a value other than the default value or if the host names entered are too long to fit on the command with the other parameters.

Output

```
ent-appl-sock:sname=socket1:lhost=gw105.nc.coname.com:lport=1030 :rhost=gw100.nc.coname.com:rport=1030
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
ENT-APPL-SOCK: MASP A - COMPLTD
;
```

ent-as

Enter Application Server

Use this command to create an Application Server (AS) as a logical entity to serve a specific routing key. This command enters a new AS into the AS table and assigns an M3UA or SUA SCTP association to it, or assigns an M3UA or SUA SCTP association to an existing AS.

Keyword: ent-as

Related Commands: chg-as, dlt-as, rtrv-as

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name of the M3UA or SUA SCTP association.

Range: aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

:asname= (mandatory)

Name of the Application Server (AS).

Range: aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

:aspname= (obsolete)

Name of the Application Server Process (ASP).

NOTE: This parameter can no longer be used.

Range: aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

Example

```
ent-as:asname=asx:aname=asxp1
```

Dependencies

The specified **aname** must exist in the IPAPSOCK table.

The adapter layer for each association assigned to the AS must be defined.

SUA Application Servers must have routing keys with assigned routing contexts.

The service indicator must be **si=3** for routing keys that are associated with SUA Application Servers.

The adapter layer must be the same for all M3UA/SUA associations assigned to the AS.

IPLIMx connections cannot reside in an AS.

Notes

The DCM card has 16 MB of memory. Socket/association limits are based on card memory as is the ratio of associations to sockets. This ratio, known as the trade ratio, defines the number of sockets that are equivalent to one association with respect to memory consumption.

By default the AS recovery timer value is set to 200 ms when an AS is entered. This value can be changed at any time using the **chg-as** command. The new timer value will be used the next time the AS enters the AS-Pending state.

The trade ratio states the quantity of associations to sockets that may be provisioned on a certain card, as follows:

Trade Ratio = a:s

Where:

a=association : s=socket

Table 5-39 shows the maximum sockets/associations per DCM card.

Table 5-39. Maximum Sockets/Associations per Card

Card Type	Socket to Assoc Ratio	Max Sockets	Max Associations
DCM	8:1	50	4

Output

```
ent - as : asame=asx : aname=asxp1
rlghncxa03w 05-05-17 15:35:05 EST EAGLE 34.0.0
ENT-AS: MASP A - COMPLTD
;
```

ent-asp

Enter Application Server Process

Use this command to enter an Application Server Process (ASP) and bind an SCTP association with it. An ASP contains an SCTP endpoint and can be configured to process signaling traffic.

NOTE: This command is obsolete.

Keyword: ent-asp

Related Commands: chg-asp, dlt-asp, rtrv-asp

Command Class: Database Administration

Parameters

:aname= (mandatory)

Name of the association assigned to this Application Server Process (ASP).

Range: *aaaaaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter.

:aspname= (mandatory)
Name of the Application Server Process (ASP).

Range: *abcdefghijklmnopqrstuvwxyz*
Up to 15 alphanumeric characters; the first character must be a letter.

Example

ent-asp:aspname=asp1:aname=asxp1

Dependencies

The ASP cannot already be defined.

The association name must already be defined.

The association cannot already be associated with an ASP.

An ASP cannot be assigned to an association with adapter type **m2pa**.

Notes

When a new ASP is entered, it defaults to using UA parameter set (UAPS) 10. You can use the **chg-asp** command to change the UAPS for an ASP that is assigned to an M3UA association.

Output

```
ent-asp:aspname=asp1:aname=asxp1
  rlgncxa03w 04-02-17 15:35:05 EST  EAGLE 31.3.0
  ENT-ASP: MASP A - COMPLTD
;
```

ent-**assoc**

Enter Association

Use this command to configure the SCTP associations in the IPAPSOCK table. This command associates the local host and local port to a remote host and remote port in the IPAPSOCK table. This command provides the association to transport protocol data units and adapter layer peer messages. Each association is connected to a process on the far end.

Keyword: ent-assoc

Related Commands: chg-assoc, dlt-assoc, rtrv-assoc

Command Class: Database Administration

Parameters

:aname= (mandatory)
Name assigned to this association (in IPAPSOCK table).

Range: *aaaaaaaaaaaaaaaa*
Up to 15 alphanumeric characters; the first character must be a letter

:lhost= (mandatory)
The local host name as defined in the IP Host table.

Range: *abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0-9,-,.*
Any string of characters beginning with a letter and comprising up to 60 characters in length

:adapter= (optional)
The adapter layer for this association.

Range: m3ua, sua, m2pa

Default: **m3ua** if the **lhost** is an IPGWx card and the adapter type is not specified.
m2pa if the **lhost** is an IPLIMx card and the adapter type is not specified.

:alhost= (optional)

Name of alternate local host. When specified, this parameter configures the SCTP association as a multi-homed endpoint.

Range: **aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa**

a-z, A-Z, 0-9, -, . or none

Any string of characters beginning with a letter and comprising up to 60 characters in length

none—the **alhost** is not configured; the SCTP association is configured as a uni-homed endpoint

:link= (optional)

The signaling link port for this association.

Synonym: **port**

Range: **a, b, a1, b1, a2, b2, a3, b3**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: **a**

:lport= (optional)

The SCTP port number for the Local Host.

Range: **1024-65535**

Default: **0**

:m2patset= (optional)

The M2PA timer set assigned to this association.

Range: **1-20**

Default: **1**

:port= (optional)

The signaling link port for this association.

Range: **a, b, a1, b1, a2, b2, a3, b3**

Not all card types support all **port** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

Default: **a**

:rhost= (optional)

Name of Remote Host as defined in the IP Host table.

Range: **aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa**

a-z, A-Z, 0-9, -, .

Any string of characters beginning with a letter and comprising up to 60 characters in length

:rport= (optional)

The SCTP port number for the Remote Host.

Range: **1024-65535**

Default: **0**

:uaps= (optional)

Specifies the User Adapter Parameter Set used by the M3UA or SUA association for various SNM message and notification response options.

Range: **1-10**

Example

```
ent -
assoc:aname=assoc1:lhost=gw105.nc.tekelec.com:lport=1030 :rhost=gw
100.nc.tekelec.com:rport=1030:adapter=m3ua
```

Dependencies

The association name (**aname**) must already exist in the IP Socket/Association (IPAPSOCK) table.

The hostnames specified in the **lhost** and **alhost** parameters must refer to different IP addresses.

The IP host names specified in the **lhost** and **alhost** parameters must exist in the IP Host table and must be provisioned as local to this EAGLE 5 ISS.

The hostnames specified in the **lhost** and **alhost** parameters must refer to IP addresses on the same IP card.

Only **port=a** can be specified if the card is running the **ss7ipgw** or **ipgwi** application.

Only **port=a** or **port=b** can be specified for the **port** parameter value if the card is a dual-slot DCM card running the **iplim** or **iplimi** application.

Ports **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified if the card is an SSEDCCM card running the **iplim** or **iplimi** application.

To assign an association on an IPLIMx card for a local host, the signaling link associated with the signaling link port must have its **ipliml2= m2pa**.

If the **m2patset** parameter is specified, the **adapter** parameter value must be **m2pa**.

You cannot assign an association with **adapter=sua** or **m3ua** for an **lhost** on a card running the **iplim** or **iplimi** application.

Association connection parameters (**lhost**, **rhost**, **lport**, **rport**) must be unique.

The card location for the card associated with the **lhost** and **alhost** must exist in the IP Link table.

If the entered **lhost** or **alhost** corresponds to an IP address associated with the B Ethernet Interface hosted by a present dual-slot DCM card, an error will be generated. If the entered **lhost** or **alhost** corresponds to an IP address associated with the B Ethernet Interface hosted by a provisioned but not present DCM card, the card will be auto-inhibited upon insertion. If an SSEDCCM card is inserted, the card will be allowed to boot.

The allowed maximum is 1 association per signaling link on IPLIMx cards.

There is a maximum of 50 connections (association-to-AS assignments + sockets) per Local Host on IPGWx cards.

A maximum of 4000 connections (association-to-AS assignments + sockets) are allowed per system.

Notes

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. This fully specifies the connection.

SCTP associations can be configured as either uni-homed or multi-homed endpoints. Uni-homed endpoints are SCTP associations configured with the **lhost** parameter specified and the **alhost** parameter not specified. In this case, the **lhost** represents an IP address that corresponds to either the A or B network of the IP application card (see **chg-ip-lnk**). Multi-homed endpoints are SCTP associations configured with both the **lhost** and **alhost** parameters specified. In this case, the **lhost** represents an IP address corresponding to one of the networks (A or B) of the IP card while the **alhost** represents an IP address corresponding to the other network of the same IP card.

If a valid **lhost** parameter is specified that equates to a valid IP address, the **lhost** maps directly to a card location in the IP Link table, which can then determine the card's application (IPLIMx or SS7IPGWx). If the application is an IPLIMx, two additional validation checks are made:

- The **adapter** parameter value must equal **m3ua** or **m2pa**.
- The **ipliml2** value for the IPLIMx signaling link must be the same as the association **adapter** parameter value.
- The **ipliml2** value for an IPLIMx signaling link cannot be set to **m3ua**.

If the determination of the application running on the card or the signal link cannot be performed when the **ent-assoc** command is executed, the check will be performed by the **chg-assoc** command.

An association with an adapter value of **m2pa** cannot be assigned to an SS7IPGW or IPGWI host.

There are fields in the IPAPSOCK table that receive default values even though there are no parameters on this command for changing those fields. If a different value is desired, the **chg-assoc** command must be used. The **chg-assoc** command can also be used if the hostnames are too long to fit on the command line with other parameters. The fields in question and their default values are:

- open=no
- alw=no
- rmode=lin
- rmin=120
- rmax=800
- rtimes=10
- cwmin=3000
- ver=rfc
- istrms=2
- ostrms=2

For the M2PA RFC feature, when the application is IPLIMx and the **adapter=m2pa** parameter is specified, the supported M2PA version is set to M2PA RFC by default.

Output

```
ent -
assoc:aname=assoc1:lhost=gw105.nc.tekelec.com:lport=1030 :rhost=gw
100.nc.tekelec.com:rport=1030:adapter=m3ua
    rlgncxa03w 04-02-17 15:35:05 EST  EAGLE 31.3.0
    ENT-ASSOC: MASP A - COMPLTD
;
```

ent-card

Enter Card

Use this command to add a card to the database. The card type and application specifies the function assigned to the card.

Keyword: ent-card

Related Commands: dlt-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

Command Class: Database Administration

Parameters

NOTE: See Table A-7 for information on valid card types and applications for cards that use the ent-card command.

:appl= (mandatory)

Application. This parameter specifies the application for the card.

Range: xxxxxxxx

1 alphabetic character followed by up to 6 alphanumeric characters. Valid applications are:

atmansi —This application is used by the LIM cards to support the high-speed ATM signaling link feature.

atmitu —This application is used by the E1 ATM cards to support the high-speed E1 ATM signaling link.

ccs7itu —This application is used by the LIM cards for ITU-TSS MTP functionality. It is also used for the 2-port E1 card, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card.

ebdablm —This application is used by the TSM card for enhanced bulk download.

ebdadcm —This application is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 ISS at high speed over an ethernet connection for enhanced bulk download.

eroute —This application is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

gls —This application is used by the TSM cards for downloading gateway screening to LIM cards.

ipgwi —This application is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes. The system allows a maximum of 64 cards to be assigned the **ipgwi** application.

iplim —This application is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

iplimi —This application is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

ips —This application is used by the IPSM card for the IP User Interface feature.

mcp —This application is used by the MCPM card for the Measurements Platform feature.

sccp —This application is used by the TSMs for the global title translation application.

ss7ansi — This application is used by the LIM cards, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card for the MTP functionality.

ss7gx25 —This application is used by the LIM cards to support X.25 functionality.

ss7ipgw —The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 64 cards to be assigned the **ss7ipgw** application.

stplan —This application is used by the ACM, DCM, and E5-ENET cards to support the STP LAN functionality.

vxwslan —This application is used by the DCM card to support the STP LAN application.

vsccp —This application is used by DSM cards to support the EPAP-based features and the LNP ELAP Configuration feature. If the EPAP-based and LNP ELAP Configuration features are not turned on and DSM card is are present, the **vsccp** GPL processes normal GTT traffic.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:type= (mandatory)

This parameter specifies the type of hardware being added.

Range: **acmenet**, **dcm**, **dsm**, **ipsm**, **limatm**, **limds0**, **lime1atm**, **limocu**, **limv35**, **lime1**, **limt1**, **limch**, **mcpm**, **stc**, **tsm**

acmenet — Data link card for the STP LAN feature. The application type (**appl**) for this card type is **stplan**.

dcm — Database Communications Module card to support the STP LAN and enhanced bulk download features. The application types (**appl**) for this card type are **ebdadcm** and **stplan**. The DCM card also runs either the **eroute**, **ss7ipgw**, **iplim**, **iplimi**, or **ipgwi** application.

dsm — Database Services Module card to support the G-Flex, G-Port, and INP features. The application type (**appl**) for this card type is **vscpp**.

ipsm — IP Services Module card to support the IP User Interface feature. The application type (**appl**) for this card type is **ips**.

limatm — High speed ATM signaling link. The application type (**appl**) for this card type is **atmansi**.

limds0 — Signaling link with DS0 interface. For a two-port LIM, the application types (**appl**) for this card type are **ss7ansi**, **ss7gx25**, and **ccs7itu**. For a multi-port LIM, the application type (**appl**) for this card type is **ss7ansi**.

lime1atm — High speed E1 ATM signaling link. The application type (**appl**) for this card type is **atmitu**.

limocu — Signaling link with OCU interface. The application types (**appl**) for this card type are **ss7ansi**, **ss7gx25**, and **ccs7itu**.

limv35 — Signaling link with V.35 interface. The application types (**appl**) for this card type are **ss7ansi**, **ss7gx25**, and **ccs7itu**.

lime1 — E1 card or E1/T1 MIM card or HC MIM card or E5-E1T1 card used as an E1 card. The application types (**appl**) for this card type are **ss7ansi** and **ccs7itu**.

limt1 — E1/T1 MIM card, HC MIM card, or an E5-E1T1 card used as a T1 card. The application types (**appl**) for this card type are **ss7ansi** and **ccs7itu**.

limch — E1 card or E1/T1 MIM card defined as a Channel card. The application types (**appl**) for this card type are **ss7ansi** and **ccs7itu**.

mcpm — Measurement Collection and Polling Module card used for the Measurements Platform feature. The application type for this card type is **mcp**.

stc — Signalling Transport Card (STC card and E5-STC card) used for the EAGLE 5 Integrated Monitoring Support feature. The application type for this card type is **eroute**.

tsm — Memory card for GTT, gateway screening, and the enhanced bulk download feature. The application types (**appl**) for this card type are **gls**, **sccp** and **ebdablm**.

:force= (optional)

If the **force=yes** parameter is used to add a LIM to the database, it is recommended that you add the required number of SCCP cards to the database after the LIM is added to avoid the loss of global title translation traffic.

Range: **yes**, **no**

Default: **no**

Example

```

ent-card: loc=1301: type=limocu: appl=ss7gx25
ent-card: loc=1201: type=tsm: appl=sccp
ent-card: loc=1302: type=acmenet: appl=stplan
ent-card: loc=1303: type=limv35: appl=ss7ansi
ent-card: loc=1204: type=limatm: appl=atmansi
ent-card: loc=1205: type=dcml: appl=iplim
ent-card: loc=1207: type=dcml: appl=ss7ipgw
ent-card: loc=1206: type=limatm: appl=atmansi: force=yes
ent-card: loc=1208: type=limatm: appl=atmansi: force=no

```

Dependencies

NOTE: The LNP feature is "turned on" when an LNP ported TNs quantity is shown in the **rtv-ctrl-feat** command output. An LNP quantity feature access key has been enabled and turned on. See the **enable-ctrl-feat** command for more information about enabling and turning on the LNP feature.

For features that are enabled with the **enable-ctrl-feat** command, use the **rtv-ctrl-feat** command to verify whether a feature is enabled or turned on.

For features that are turned on with the **chg-feat** command, use the **rtv-feat** command to display the **on** or **off** status of the features.

Table A-7 shows the card names, the only valid card type (**type** parameter) and application (**appl** parameter) combinations, the card part numbers, and the maximum number of cards allowed in the database.

The card location must not be **1113-1118**, or **xy 09** and **xy 10** where *x* is the frame and *y* is the shelf.

The specified shelf location must be provisioned and present in the frame.

The specified card location cannot already be provisioned in the database.

The DSM card must be inserted into an odd-numbered location. The *n*+1 slot next to the DSM card must be empty, where *n* is the odd-numbered location (for example, if the DSM is in location 1101, then the 1102 slot must be empty and unprovisioned).

The Measurements Platform feature must be turned on before the command can be entered for an MCPM card (**:type=mcpm:appl=mcp**).

If the LNP ELAP Configuration feature is turned on, the following **appl** parameter values cannot be specified: **sccp**, **ebdablm**, or **ebdadcm**.

If any of the following features are enabled, DSM cards running the **vsccp** application must be provisioned in the system. ASM or TSM cards cannot be used:

- AINPQ
- A-Port
- EIR
- Enhanced GSM MAP Screening (EGMS)
- Flexible GTT Load Sharing
- G-Flex
- G-Port
- INP
- IS41 GSM Migration (IGM)
- LNP ELAP Configuration.
- Origin-based SCCP Routing
- Transaction-based GTT Loadsharing
- Weighted GTT Loadsharing
- Prepaid SMS Intercept Ph1

The n+1 slot next to the DSM or HC-MIM card must be empty, where **n** is the odd-numbered location (for example, if the DSM is in location 1101, then the 1102 slot must be empty and unprovisioned).

The GTT feature must be turned on to specify the **appl=sccp** parameter or the **appl=vsccp** parameter.

The GWS feature must be turned on to specify the **appl=gl**s parameter.

The X25G feature must be turned on to specify the **appl=ss7gx25** parameter.

The LAN feature must be turned on to specify the **appl=stplan** parameter.

The LNP feature must be turned on to specify **appl=ebdablm** and **appl=ebdadcm** parameters.

The XGTT feature with 1 million entries requires the **vsccp** application running on DSM cards.

The Enhanced GSM MAP Screening (EGMS) feature requires DSM cards running the **vsccp** application.

Table A-7 lists the maximum number of cards of each card type and application that are allowed in the system.

If any of the G-Flex, G-Port, INP, or EIR features are turned on in the system, the maximum number of DSM cards allowed in the system is 25. If the system is running only GTT, the maximum number of DSM cards allowed in the system is 32.

When the IDP Screening for Prepaid feature is enabled, TSM cards cannot be provisioned.

TSM cards running the **sccp** application cannot be provisioned when the Flexible GTT Load-Sharing feature is enabled. The Flexible GTT Load-Sharing feature requires DSM cards running the **vsccp** application.

If the A-Port feature is enabled, ASM and TSM cards cannot be provisioned in the system.

If the IGM feature is enabled, ASM and TSM cards cannot be provisioned in the system.

All provisioned shelves must contain HIPR cards before more than 115 LIM-ATM cards can be provisioned.

Notes

ITU Environment

Each SCCP card can handle the following number of transactions-per-second: 850 for a TSM and 1700 for a DSM.

When the **ent-card** command is entered to add a card that requests service from either an SCCP or VSCCP card, the EAGLE 5 ISS adds the current TPS level to the estimated TPS level for the new card. The EAGLE 5 ISS uses the following values to derive the TPS estimate: 53 for low-speed links (cards provisioned as SS7ANSI, CCS7ITU or SS7GX25 cards), 480 for ATM, and 1000 for IPLIM cards. The EAGLE 5 ISS then compares the sum to a user-configured threshold (SCCP TPS Threshold) that is set using the **chg-th-alm** command. The purpose of the SCCP TPS threshold is to generate an alarm if the threshold is exceeded. The SCCP TPS threshold also triggers an error message if the **ent-card** command is issued and the resulting TPS level (the current TPS plus the estimated TPS for the new card) would be greater than the configured threshold:

```
E3715: Cmd Rej - Insufficient #SCCP cards to support LIM - use FORCE=YES
The force parameter can be specified to add the card even if its addition would exceed the SCCP
TPS threshold. If the force=yes parameter is specified, the command is accepted but the following
warning message appears:
```

```
WARNING: System current rated TPS unable to support additional SS7 card =
use FORCE=YES.
```

If the **force=yes** parameter is specified, it is recommended that the required number of SCCP cards be added to the database after the SS7 card is added. This action avoids the loss of GTT traffic.

Another option is to add additional SCCP cards or to increase the SCCP TPS threshold, and then add the SS7 card. This action prevents the alarm from being triggered.

For additional information on using the **force** parameter, see Chapter 4, "System Administration Procedures" of the *Database Administration Manual - System Management*.

If the G-Flex, G-Port, INP or LNP ELAP Configuration feature is turned on, the system cannot contain a mix of SCCP and VSCCP card types.

ANSI Environment

In an ANSI environment with only the G-Flex feature turned on, only DSMs in the system and the **ansigflex** system option enabled, each VSCCP card can handle up to 1700 TPS.

The provisioning method of an MPL or MPL-T (multi-port LIM) and a two-port LIM is the same. The two-port LIM supports the LIMDS0, LIMOCU, or LIMV35 interface, and the **appl** value can be **ss7ansi**, **ccs7itu**, or **ss8gx25**. The MPL cards support only the LIMDS0 interface, and the **appl** value must be **ss7ansi**. The MPL cards support 8 ports, namely **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, and **b3**. The **rtrv-card** command displays the status of all ports of the MPL cards.

The EAGLE 5 ISS cannot contain more than 115 provisioned LIM-ATM cards unless every provisioned shelf contains HIPR cards. The EAGLE 5 ISS checks the card configuration when the **ent-card** command is used to add a LIM-ATM card.

Using the **dlt-card** command to reduce the ATM card count takes the card out of service.

Use the **ent-card** command to set the card type for a 2-port E1 card or Channel card (**lime1** or **limch**) in the database. Do not use the DIP switches, if any exist on the E1 card.

"STC cards" are DCM cards, SSEDCCM cards, and E5-ENET cards that run the **eroute** application.

The **type=stc** and **appl=eroute** parameters apply only when the EAGLE 5 Integrated Monitoring Support (E5IS) feature is turned on.

An "n+1" STC configuration is required to provide redundancy: therefore, a minimum of two STC cards must be provisioned in the EAGLE 5 ISS. If single-slot STC cards are provisioned in the

database, then a minimum of two single-slot STC cards must be provisioned in the EAGLE 5 ISS. For "n+1" redundancy purposes, a dual-slot STC card cannot be used to replace a single-slot STC card, and a DCM card cannot be used to replace an E5-ENET card.

The EAGLE 5 ISS can contain a maximum of 32 STC cards.

E5-ENET cards cannot be provisioned on a shelf that contains HMUX cards. If a shelf contains HMUX cards, then any E5-STC cards must be provisioned in shelves adjacent to the shelf containing the cards being monitored. The optimum configuration is to provision half of the STC cards in the previous shelf and half in the next shelf.

If non-E5-ENET cards are used as STC cards, then a maximum of 3 cards can be provisioned in a shelf that contains HMUX cards.

HIPR cards must be installed on any shelf that contains E5-STC cards.

HIPR and HMUX cards can be used at the same time in the shelf only when upgrading from HMUX to HIPR cards.

If a shelf contains HIPR cards, then the STC cards must be provisioned in the same shelf that contains the cards or links being monitored. A maximum of 4 E5-STC cards can be provisioned on a shelf that contains HIPR cards. A maximum of 16 non-E5-ENET cards that are acting as STC cards can be provisioned on a shelf that contains HIPR cards.

If IP signalling links are being monitored, then only single-slot STC cards can be provisioned. HIPR cards must be used in the shelves where the IP links are located.

The SSED CM card occupies only one slot in an EAGLE 5 ISS shelf; the dual-slot DCM cards take two slots. The provisioning rules for DCM/STC cards allow provisioning of any slot where a DCM or STC card can physically be inserted. If the slot is provisioned for a DCM card, an E5-ENET card can be inserted instead of a DCM card for **stplan**, **iplim**, or **ipgw** applications. The slot located immediately to the right of an SSED CM card can also be provisioned.

Either DCM cards or E5-ENET cards can be provisioned to run the STPLAN application.

An "n+1" STP LAN configuration is required to provide redundancy; therefore, a minimum of two cards running the STPLAN application (E5-SLAN cards) must be provisioned in the EAGLE 5 ISS. A minimum of 2 E5-SLAN cards must be provisioned in the EAGLE 5 ISS. For "n+1" redundancy purposes, a DCM card cannot be used to replace an E5-SLAN card.

E5-ENET cards cannot be provisioned on a shelf that contains HMUX cards. If a shelf contains HMUX cards, then the E5-SLAN cards must be provisioned in shelves adjacent to the shelf containing the cards being monitored. The optimum configuration is to provision half of the E5-SLAN cards in the previous shelf and half in the next shelf.

If DCM cards are used to run the STPLAN application, then up to 16 cards can be provisioned in a shelf that contains HMUX cards.

HIPR cards must be installed on any shelf that contains E5-SLAN cards.

HIPR and HMUX cards can be used at the same time in the shelf only when upgrading from HMUX to HIPR cards.

If a shelf contains HIPR cards, then the cards used to run the STPLAN application (either DCM or E5-SLAN cards) must be provisioned in the same shelf that contains the cards or links being monitored. A maximum of 2 E5-SLAN cards and up to 16 DCM cards can be provisioned on a shelf that contains HIPR cards.

If an LNP feature quantity that is greater than 192 million numbers is present in a node, and there is an attempt to insert an E5-SM4G card, then the E5-SM4G card auto-inhibits (see the **alw-card** command).

Two HIPR cards must be installed on each shelf where an E5-SM4G card is installed.

ent-csl**Enter Common Screening List**

Use this command to enter new screening data into the Common Screening List (CSL). The Common Screening List commands are used to tailor certain types of general screening information to specific features.

Keyword: ent-csl

Related Commands: chg-csl, dlt-csl, rtrv-csl, rtrv-ctrl-feat

Command Class: Database Administration

Parameters

NOTE: Either the **ds** parameter or the **pc** parameter must be specified in the command.

Currently, no features use the **pc parameter.**

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ds= (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command

Range: 1-15 digits

Valid digits are **0-9, a-f, A-F**.

4 digits—IDP Screening for Prepaid **skts** list

1-15 digits—IDP Screening for Prepaid **insl** list

1-15 digits—Prepaid IDP Query Relay **gt** list

1-6 digits—Prepaid IDP Query Relay **ccndc** list

1-5 digits—Prepaid IDP Query Relay **delpfx** list

1-4 digits—Prepaid IDP Query Relay **skbcsn** list

:feature= (optional)

Feature Name. This parameter specifies the name of the enabled screening feature for which the command is entered. Enter the name as it appears in the **rtrv-ctrl-feat** command description output example. Enter enough of the feature name to make the name unique if two features begin with the same word or acronym.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: ayyyyyyyyyyyyyyyyyyyyyy

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym.

The following feature names are valid for this command:

- IDP Screening for Prepaid

- Prepaid IDP Query Relay

:list= (optional)

This parameter specifies the name of the Common Screening List associated with the feature.

The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

Range: **delpfx, gt, skbcsm, ccnc, skts, insl**

delpfx— Delete Prefix List

gt— Global Title List

skbcsm— SK+BCSM List

ccnc— CC+NC List

skts— SK+TS List

insl— In Network Subscriber List

The following screening lists are valid for the indicated features:

- **skts, insl**—IDP Screening for Prepaid feature
- **ccnc, delpfx, gt, skbcsm**—Prepaid IDP Query Relay feature

:p1= (optional)

Parameter value 1. The parameter value is specific to the feature and list name that use this parameter.

Range: 1 digits

Valid digit values are:

0-1—For the Prepaid IDP Query Relay feature **delpfx** list, where: **0**=National, **1**=International

:p2= (optional)

Parameter 2. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:p3= (optional)

Parameter 3. The parameter value is specific to the feature and list name that use this parameter. No feature currently uses this parameter.

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. Either the **ds** parameter or the **pc** parameter must be specified for the command. Currently, there are no common screening list features that use point codes.

:pci= (optional)

ITU international point code with subfields *zone-area-id*.

Range: **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—**0-7**

area—**000-255**

id—**0-7**

:pcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pn= (optional)

Part number. This parameter specifies the 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtv-ctrl-feat** command description shows the part number in the command output example.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

Range: **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces.

The following part numbers are valid for this command:

- **893015501**—IDP Screening for Prepaid
- **893016001**—Prepaid IDP Query Relay

Example

ent-csl:pn=893015501:list=gt:ds=123456789abcdEF

ent-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=123456

```
ent-csl:feature="Prepaid IDP Query Relay":list=skbcsm:ds=4321
ent-csl:feature="Prepaid IDP Query
Relay":list=delpfx:ds=54321:p1=0
ent-csl:feature="IDP Screening for Prepaid":list=skts:ds=36ab
ent-csl:pn=893015001:list=insl:ds=123456789bcdEF
```

Dependencies

An enabled feature must be specified using either a valid part number (the **pn** parameter) or feature name (the **feature** parameter). The specified feature must use a Common Screening List.

The specified feature name must be for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output example. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The following features use a Common Screening List:

- IDP Screening for Prepaid
- Prepaid IDP Query Relay

The feature that is specified in the **feature** parameter must be enabled.

The **list** parameter must be specified for features that use more than one type of screening list.

The **list** parameter value must be valid for the specified screening list feature. The following **list** parameter values are valid for the indicated feature:

- **skts, insl**—IDP Screening for Prepaid
- **gt, ccnc, delpfx, skbcsm**—Prepaid IDP Query Relay feature

The length of the digit string that is specified for the **ds** parameter must be valid for the screening feature and list type.

A valid **ds** parameter value is required for the specified feature and list type.

The following parameters are allowed with the indicated common screening list type:

- **list=gt**—**ds** parameter
- **list=ccnc**—**ds** parameter
- **list=delpfx**—**ds** and **p1** parameters
- **list=skbcsm**—**ds** parameter
- **list=skts**—**ds** parameter
- **list=insl**—**ds** parameter

The leading digit pattern in the specified digit string (the **ds** parameter) must be unique in the specified screening list for the indicated feature:

- **skts** and **insl** lists—IDP Screening for Prepaid feature
- **gt** and **ccnc** lists—Prepaid IDP Query Relay feature

The specified **ds** parameter value must be valid for the specified screening list (**list** parameter).

The value that is specified for a common screening list parameter must be valid for the specified screening list feature.

Each list table is allowed to contain a maximum number of entries:

- IDP Screening for Prepaid feature
 - **insl** list—50 entries
 - **skts** list—25 entries
- Prepaid IDP Query Relay feature
 - **ccnc** list—20 entries
 - **delpfx** list—10 entries
 - **gt** list—50 entries
 - **skbcsn** list—25 entries

ent-cspc

Enter Concerned Signaling Point Code

Use this command to add signaling points to a current broadcast signaling point code group. These point codes are notified of the receipt by the system of subsystem-prohibited (SSP) and subsystem-allowed (SSA) SS7 SCCP management messages from an application at an adjacent signaling point and subsystem. This command can also be used to add new groups to the table.

NOTE: The command must be entered first with the group only (no point code); then the command must be entered again with the group code and the point code.

Keyword: ent-cspc

Related Commands: dlt-cspc, rtrv-cspc

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" in Appendix A for a detailed description of point code formats, rules for specification, and examples.

:grp= (mandatory)

Name of the group. This parameter is a character string associated with this broadcast list.

Range: ayyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca****Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code.

This parameter is mandatory when the group and point code are entered, after the group has been entered.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-***zone*—**0-7***area*—**000-255***id*—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-***nnnnn*—**0-16383***gc*—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-***msa*—**000-255***ssa*—**000-255**

sp—000–255

Example

When the ANSI-ITU-China SCCP Conversion feature is not on, a CSPC group can contain point codes of only one network type.

ent-cspc:grp=grp01:pc=144-201-001

ent-cspc:grp=group02:pcn24=10-100-10

When the ANSI-ITU-China SCCP Conversion feature is on, a CSPC group can contain point codes of more than one network type. ITU-N and ITU-N24 point codes are not allowed in the same group.

ent-cspc:grp=grp01

ent-cpsc:grp=grp01:pc=240-3-55

ent-cspc:grp=grp01:pci=7-233-5

ent-cspc:grp=grp01:pci=s-7-233-5

ent-cspc:grp=grp01:pcn24=234-56-245

Dependencies

Reserved words (for example, “**none**”) cannot be used to name a group.

The specified CSPC Broadcast group name must not exist if a point code is not specified. If the specified group name does not exist, and a point code is not specified, a new group is created.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N point code.

If the CSPC group name and a point code are specified, the group name must exist in the database.

The specified point code must exist in the Routing Table and cannot already exist in the specified group.

The destination point code must be a full point code (*ni-nc-ncm*).

The concerned signaling point code must have been specified previously as a full point code destination, or it must be a member of a previously specified cluster.

A maximum of 2550 Concerned Signaling Point Code Broadcast groups can be defined.

A maximum of 96 point codes can be defined for each group.

When the ANSI-ITU-China SCCP Conversion feature is not on, the first point code to be entered defines the network type for the group. All subsequent point codes for the group must be for the same network type. For example,

- **pc** and **pca** cause the group to be an ANSI group
- **pci** causes the group to be an ITU international group
- **pcn** causes the group to be an ITU national group
- **pcn24** causes the group to be a 24-bit ITU national group, which is administered as a subset of an ITU national group

When the ANSI-ITU-China SCCP Conversion feature is on, the point codes in a group can be of different network types. The only exception is that **pcn** and **pcn24** point codes are not allowed in the same group.

Notes

To broadcast SSPs and SSAs to one or more mated applications, each mate's point code must be added to the CSPC group. Otherwise the broadcast is not sent to the mate.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

The command must be entered with just the **grp** parameter to define a new group in the database.

```
ent -cspc:grp=grp01
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-CSPC: MASP A - COMPLTD
;
```

The command must specify an existing group and a point code to add the point code to the group.

```
ent -cspc:grp=grp01:pc=144-201-001
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-CSPC: MASP A - COMPLTD
;
```

ent-dlk

Enter Data Link

Use this command to add a TCP/IP data link to the database. The TCP/IP data link is used to send copies of SS7 MSUs (selected by the gateway screening feature) to a remote host for further processing.

Keyword: ent-dlk

Related Commands: act-dlk, canc-dlk, dlt-dlk, rept-stat-dlk, rtrv-dlk, tst-dlk

Command Class: Database Administration

Parameters

:ipaddr= (mandatory)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**
 4 numbers separated by dots
 1-223—first number
 0-255—the other three numbers

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:auto= (optional)

Automatic. This parameter specifies whether the hardware automatically determines duplex and speed.

This parameter is valid only for DCM cards (running the **vwxsan** GPL) or E5-ENET cards (running the **slanhc** GPL).

Range: **yes, no**
 yes—Duplex and speed are automatically determined.
 no—Duplex and speed are not automatically determined.

Default: **yes**

:duplex= (optional)

This parameter specifies the mode of operation of the interface.

This parameter is valid only for DCM cards (running the **vwxslan** GPL) or E5-ENET cards (running the **slanhc** GPL).

Range: **half, full**

half — The mode of operation of the interface is half duplex.

full — The mode of operation of the interface is full duplex.

Default: **half**

:speed= (optional)

This parameter specifies the bandwidth for the interface in megabits per second.

Range: **10, 100**

Default: **10**

Example

```
ent-dlk:loc=1201:ipaddr=196.3.202.45
```

```
ent-dlk:loc=1101:ipaddr=192.168.63.11:speed=10:duplex=half
```

```
ent-dlk:loc=1107:ipaddr=192.168.63.12:auto=yes
```

Dependencies

The shelf and card must be equipped.

The IP address (**ipaddr**) cannot be in the TCP/IP link table and cannot be a TCP/IP node.

The specified card cannot contain any data links.

The specified card's status must be out of service maintenance disabled (OOS-MT-DSBLD). Enter the **rept-stat-card** command to verify the state of the card.

The specified TCP/IP data link cannot be in the database.

The specified card must be running the **stplan** GPL.

The Gateway Screening feature and the STPLAN feature must be turned on before this command can be entered.

The first octet of the IP Address must not be **127**, because **127** represents an IP address for loopback.

If the **auto=yes** parameter is specified, then the **speed** and **duplex** parameters cannot be specified.

If the **type=acmenet** parameter is specified (see the **ent-card** command), then the **duplex** and **auto** parameters cannot be specified.

The **speed** and **duplex** parameters must be specified together in the command.

If the **speed=100** parameter is specified, then a DCM card (running the **vwxslan** GPL) or an E5-ENET card (running the **slanhc** GPL) must be used. The **type=dcn** parameter must be specified in the **ent-card** command.

Notes

If the first octet of the IP address is **127**, an error message is issued because the number **127** represents a loopback address.

The value of the **ipaddr** parameter cannot match the TCP/IP default router's IP address (the **iprte** parameter of the **ent-ip-node** command).

Output

```
ent-dlk:loc=1201:ipaddr=196.3.202.45
```

```
tekelecstp 07-04-03 11:12:34 EST EAGLE 37.0.0
ENT-DLK: MASP A - COMPLTD
```

```
;
```

The following example issues an error message because the first octet of the IP address is a loopback address.

```
ent-dlk:loc=1201:ipaddr=127.3.202.45
```

```
rlghncxa03w 07-04-03 11:43:04 EST EAGLE 37.0.0
Command Rejected : First octet of IPADDR cannot be 127.
ENT-DLK: MASP A - COMPLTD
```

```
;
```

ent-dstn

Enter Destination

Use this command to add a destination address (a destination point code, capability point code, or network cluster address) and the associated destination attributes to the destination point code table.

CAUTION: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

Keyword: ent-dstn

Related Commands: chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-rte, rept-stat-dstn, rtrv-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**, **p-**, **ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Default: No change to current value.

:aliasa= (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). This parameter is not valid if an ANSI (**dpc** or **dpca**) point code is entered.

Range: **000-255, none**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

Enter **none** to delete the point code.

The point code **000-000-000** is not a valid point code.

:aliasa/aliasi/aliasn/aliasn24= (optional)

Alias point code.

:aliasi= (optional)

ITU international alias point code with subfields *zone-area-id*. This parameter is not valid if an ITU international (**dpci**) point code is entered. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:aliasn= (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*). This parameter is not valid if an ITU international (**dpcn**) point code is entered.

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:aliasn24= (optional)

24-bit ITU national alias point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). This parameter is not valid if a 24-bit ITU national (**dpcn24**) point code is entered.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether the STP broadcasts network management messages to adjacent signaling points. The network management messages contain information about the indicated cluster and any of that cluster's member signaling points that are on its exception list. The messages whose broadcast is determined by this parameter are:

- **TFP**—transfer prohibited
- **TCP**—transfer cluster prohibited

Range: **yes, no**

yes — Network management messages are not broadcast

no — Network management messages are broadcast

Default: **yes**— for DPCs in the X.25 domain or if the DPC is a member whose associated cluster destination has **bei=yes** specified.
no—for DPCs in the cluster or if the DPC is a member whose associated cluster destination has **bei=no** specified or the **bei** parameter is not specified.

:cli= (optional)

The Common Language Location Identifier assigned to this destination.

Range: *ayyyyyyyyy*
 1 alphabetic character followed by 10 alphanumeric characters

Default: Null string

:domain= (optional)

The network in which the destination entity or node exists.

Range: *x25, ss7*

Default: *ss7*

:elei= (optional)

Exception-list exclusion indicator, for cluster destinations only. This parameter specifies whether the system *excludes* or *includes (maintains)* a dynamic status exception list (x-list) for each cluster route used to reach the member signaling points that make up the cluster.

Range: **yes, no**
yes— Do not maintain a dynamic status x-list
no— Maintain a dynamic status x-list

Default: **no**

:ipgwapc= (optional)

IP gateway adjacent point code indicator.

Range: **yes, no**

Default: **no**

:ncai= (optional)

Nested cluster allowed indicator. Specifies whether the route to the cluster point code can be different for provisioned members of the cluster. A point code is a member of a cluster point code if it has the same network identifier (NI) and network cluster (NC) values as the cluster point code. This parameter can be specified only for cluster point codes. Nested cluster routing is allowed if this parameter is set to **yes** and the CRMD and NCR features are turned on.

Range: **yes, no**
yes— The cluster point code is a nested cluster point code. Point codes that are members of this cluster point code can be assigned to route sets that are different from the route set assigned to the cluster point code.
no— The cluster point code is not a nested cluster point code. Point codes that are members of this cluster point code must be assigned to the same route set assigned to the cluster point code.

Default: **no**

:spc= (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **spca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (optional)

Secondary point code.

:spci= (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:spcn= (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

To add destination 8-1-1 with clli of systest1:

ent-dstn:dpc=8-1-1:clli=systest1:bei=yes

To add destination 8-8-8 with ITU and national aliases:

ent-dstn:dpc=8-8-8:aliasi=1-2-3:aliasn=124

To add cluster 20-2-*:

ent-dstn:dpc=20-2-*:elei=yes:bei=yes

To add a destination with an SPC of 100-100-100:

ent-dstn:dpc=20-2-2:spc=100-100-100

To add nested cluster 21-2-*:

ent-dstn:dpc=21-2-*:elei=yes:bei=yes:ncai=yes

To add network routing destination 21-*-*:

ent-dstn:dpc=21-*-*

To add ITU national destination 7654 with a group code of fr and secondary point code of 7050:

ent-dstn:dpcn=7654-fr:spc=7050-fr

To add ITU-N 24-bit destination 15-100-10:

ent-dstn:dpcn24=15-100-10:bei=no

To add a 24-bit ITU-N destination with a 24-bit ITU-N secondary point code of 99-99-99:

ent-dstn:dpcn24=12-12-12:spcn24=99-99-99

To add destination 1-6-1 with a 24-bit ITU-N alias:

ent-dstn:dpci=1-6-1:aliasn24=4-4-4

To add private ANSI destination point code p-100-100-101:with spare point code alias s-1-123-1

ent -

dstn:dpc=p-100-100-101:spca=2-2-3:aliasi=s-1-123-1:aliasn=128

To add spare ITU-I destination point code s-2-100-1 with ANSI alias point code 121-120-120 and ITU-N alias spare point code s-129:

ent -

dstn:dpci=s-2-100-1:spci=s-2-129-9:aliasa=121-120-120:aliasn=s-129

To add spare ITU-N destination point code s-231 with ITU-N secondary point code 129, ANSI alias point code 120-120-122, and ITU-I alias spare point code s-2-123-2:

ent-dstn:dpcn=s-231:spcn=129:aliasa=120-120-122:aliasi=s-2-123-2

Dependencies

NOTE: A *full point code* contains numerical values for all three segments of the point code.

A destination is defined with a mandatory true point code of one format, and two optional alias point codes that are of the other two formats. Alias point codes are used to provide alternate point codes for a particular destination. The true point code must be of the same format as the point code used for the self ID of the system and must match the format of the point code used for the destination node. For example, if the destination node uses an ANSI point code, then the true point code must be an ANSI point code.

The ANSI self-ID destination point code for the STP must be defined before ANSI destinations can be entered.

The ITU-I self-ID destination point code for the STP must be defined before ITU-I destinations can be entered.

The ITU-N self-ID destination point code for the STP must be defined before ITU-N destinations can be entered.

The 24-bit ITU-N self-ID destination point code for the STP must be defined before 24-bit ITU-N destinations can be entered. (See the **chg-sid** command.)

The Destination point code table can contain up to 2000 entries.

The destination address must be a full point code or a cluster point code.

The specified destination address cannot already exist in the Destination entity set.

A destination address cannot already be defined as an alias address.

The Spare Point Code Support feature must be enabled before the spare point code prefix **s-** can be specified for an ITU-I or ITU-N destination, secondary, or alias point code.

When a private point code is specified, the destination address must be a full point code.

The specified **dpc** value cannot match the point code, secondary point code, or capability point code of the system.

A destination can have up to two alias point codes. A destination alias point code type (ANSI, ITU-I, ITU-N, ITU-N24) must not match that destination's true point code type. If both alias point codes are defined, the point code types of the aliases must not match.

Alias point codes are supported only for destinations in the SS7 domain (**domain=ss7**).

Alias point codes are supported only for full point code destinations.

Alias point codes for destinations must be full point codes.

An alias point code cannot already be defined as a destination point code.

The format of the specified **dpcn** or **aliasn** parameter must match the format that was assigned with the **chg-stpopts:npfnti** parameter.

When the 7000 Routesets or 8000 Routesets feature is enabled, the total number of provisioned aliases in the system cannot exceed 8000.

If an ANSI or ITU-I point code is specified, either the **aliasn** or the **aliasn24** parameter can be specified, but not both.

A 24-bit ITU-N point code cannot have:

- A 14-bit ITU-N alias point code
- An ANSI alias point code

A 24-bit ITU-National point code can have an ITU-I point code alias. This allows conversion of 14-bit ITU-I routing label to 24-bit routing label and vice versa.

An ITU-I point code can have either a 14-bit ITU-N alias or a 24-bit ITU-N alias, but not both.

A 14-bit ITU-N point code cannot have a 24-bit ITU-N alias point code.

An ANSI point code cannot have a 24-bit ITU-N alias point code.

The X.25/SS7 Gateway feature (X25G) feature must be turned on before the **domain=x25** parameter can be specified.

If the **dpci**, **dpcn**, or **dpcn24** parameter is specified, the **domain=x25** parameter cannot be specified.

Cluster destinations are not supported in the X.25 domain (**domain=x25**).

Cluster destinations are allowed only if the CRMD feature is turned on.

A cluster destination cannot be defined using the same network identifier (*ni*) and network cluster (*nc*) subfields of any previously defined alias ANSI point codes.

The CRMD (Cluster Routing and Management Diversity) and NCR (Nested Cluster Routing) features must be turned on before the **ncai** parameter can be specified.

If the **ncai** parameter is set to **yes**, the maximum number of provisioned nested clusters must be no greater than 500.

When a cluster point code is specified, the collection of signaling points sharing the same network identifier (*ni*) and network cluster (*nc*) subfields must have the same route set.

Cluster DPCs are not allowed to inherit cluster members that have routes with A or E linkset types.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of * in the *nc* subfield, the *ncm* subfield must also be * (for example, **dpc=21-*-***).

The **ncai** parameter can be specified only for cluster destinations.

Alias ANSI point codes cannot have the same network identifier (*ni*) and network cluster (*nc*) subfields as a cluster point code that is already defined.

The CRMD feature must be turned on before the **elei** parameter can be specified.

The **elei** parameter can be specified only for cluster destinations (for example **dpc=ni-nc-***).

The **cli** of the destination point code cannot match the **cli** of the system.

A reserved word cannot be specified for the destination identifier (**cli**).

If the corresponding destination for the specified destination point code is an adjacent signaling point (matched a Far End point code in its linkset entity set), the **cli** of the specified destination point code cannot be assigned to any other destination address.

If the system is configured to use ANSI point codes, the network indicator value (*ni*) of the specified destination point code must be equal to or greater than 6 when the cluster value (*nc*) is 0.

If specified, the **spc** parameter value must be already be configured as a secondary point code in the Secondary Point Code table.

If specified, the **spc** parameter value must be a full point code (except when **spc=none**).

If the **spc** parameter is specified, the **domain=ss7** parameter must be specified.

If the **spc** parameter is specified (except when **spc=none**), the specified destination point code (**dpc**) must be a full point code.

If the **spc** parameter is specified (except when **spc=none**), its network type must match the network type for the destination point code (**dpc**).

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination does **not** use an SPC, the group code of the destination must be the same as the group code of the ITU national true point code. For example, if the ITU national true point code has a group code of **ee**, then you can add destinations with group codes of **ee** without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

The Route table cannot be full.

If an ITU national destination is provisioned and the ITUDUPPC feature is turned on, and if the destination uses an SPC, then the group code of the destination must match the group code of the SPC. For example, if the ITU national true point code has a group code of **ee**, then you can add destinations with group codes of **ee** without using an SPC. Destinations with a group code of **ff**, however, must use an SPC with a group code of **ff**.

Notes

Upon initial installation of the system, the self point code must be entered before you enter any destination.

When you define a DPC with the unique destination signaling point of a provisioned cluster, the DPC automatically inherits the route set of its cluster if the **ncai** parameter is set to **no**. If the **ncai** parameter is set to **yes**, the provisioned members can have a different route set.

When you define a cluster point code for previously defined destination signaling points, the cluster automatically inherits the unique route set of its members.

For ITU national duplicate point codes, you cannot change a destination's group code. To move a destination from one group to another, provision a new destination that uses the new group code and delete the old destination.

The system requires that the destination point code of each routeset be entered in the database. For example, to enter 6000 routesets in the database, 6000 destination point codes must be entered in the database.

If you have turned on the 5000 Routes feature, prior to provisioning the additional routing table entries, you must issue the **chg-stpopts** command to specify the maximum number of allowed DPCs and dynamic x-list entries.

When the 6000, 7000, or 8000 Routesets feature is enabled, if you want to enter more than 2000 destination point codes, the maximum number of point codes that can be configured on the system must be changed to 6000, 7000, or 8000 respectively, using the **mtpdpcq** parameter of the **chg-stpopts** command.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Output

The following example shows the display of the destination memory space accounting command completion response with the NCR, NRT, and CRMD features off (disabled) and all Routes and Routesets features off (disabled):

ent-e1

Enter E1 Interface

Use this command to enter an interface into the system for a 2-port E1 card, an E1/T1 MIM card, an HC-MIM card used as an E1 card, an E5-E1T1 card used as an E1 card, an HC-MIM card used as an SE-HSL card, or an E5-E1T1 card used as an SE-HSL card. You must specify the E1 port number on the card and the E1 card location in the EAGLE 5 ISS.

CRC4, CAS, CCS, encoding, timing source, and NFAS signaling bit options can be set with the command parameters. Do not use the DIP switches, if any, on E1 and Channel cards to define the E1 interface.

The E1 card can have a DIP switch called E1BKEN, which is used to enable or disable data transmission on the E1 backplane. Because there is no command parameter that corresponds to the DIP switch, the default value of enabled is assumed. The backplane is enabled for data transmit and receive on E1 port number 1.

On an HC-MIM or E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) E1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through.

Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified when the card is used as a standard HC-MIM or E5-E1T1 card respectively. No more than 2 ports on the HC-MIM or 1 port on the E5-E1T1 when used as an SE-HSL card can have defined E1 interfaces.

Keyword: **ent-e1**

Related Commands: **chg-e1, dlt-e1, rtrv-e1, tst-e1**

Command Class: Database Administration

Parameters

:e1port= (mandatory)

E1 card port number. The value must be a E1 port for which an interface has not been configured on the specified E1 card.

Range: **1-8**

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

Any 2 of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Any 1 of the 8 ports on an E5-E1T1 card can be specified when the card is used as an SE-HSL card.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:cas= (optional)

CAS multiframing (**on**) or CCS (**off**) indicator.

Range: **on, off**

CAS cannot be specified for HC-MIM and E5-E1T1 cards.

Default: **off**

:chanbrdg= (optional)

Port bridging status. This parameter indicates whether an odd-numbered E1 port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even-numbered E1 port for non-signaling data pass through.

Range: **on, off**

Default: **off**

:crc4= (optional)

CRC4 enable or disable indicator.

Range: **on, off**

Default: **on**

:e1tsel= (optional)

Timing source. This parameter indicates a master (**external**) or slave (**line**) timing source, or a timing source recovered from the paired master port for channel bridged slave ports.

Range: **line, external, recovered**

Default: **line**

:encode= (optional)

Indicator for use of HDB3 or AMI encoding/decoding.

Range: **hdb3, ami**

AMI encoding is not supported for the 2-port E1 card. AMI encoding is supported for E1/T1 MIM, HC-MIM, and E5-E1T1 cards that are used as an E1 card.

Default: **hdb3**

:linkclass= (optional)

Link class for links that are assigned to HC-MIM and E5-E1T1 cards ("channelized" links) or SE-HSL cards ("unchannelized" links).

Range: **chan, unchan**

Default: **chan**

:minsurate= (optional)

Minimum signal unit rate. This parameter indicates the minimum number of SUs present on a link uniformly distributed. This parameter is valid only when the **linkclass=unchan** parameter is specified for an SE-HSL card.

Range: **500-2000**

Default: **2000**

:si= (optional)

Value of two Spare International bits of NFAS data.

Range: **0-3**

Default: **0**

:sn= (optional)

Value of five Spare International bits of NFAS data.

Range: **0-31**

Default: **0**

Example

ent -

e1: loc=1205: e1port=1: crc4=off: cas=on: encode=hdb3: e1tsel=external: si=2: sn=12

ent - e1: loc=1205: e1port=2: cas=off: encode=ami

ent - e1: loc=1203: e1port=1: chanbrdg=on: e1tsel=recovered

ent - e1: loc=1203: e1port=3: chanbrdg=on: e1tsel=external

ent -

e1: loc=1203: crc4=on: e1port=2: encode=hdb3: e1tsel=line: linkclass=unchan: minsurate=2000

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **lime1** card type.

The port specified by the **e1port** parameter must not already be equipped with an E1 interface.

The **cas=on** parameter cannot be specified if E1 ports **3 - 8** (**e1port** parameter) have been specified or if the **chanbrdg=on** parameter has been specified.

The **chanbrdg=on** and **cas=on** parameters cannot be specified when the **linkclass=unchan** parameter is specified. The **minsurate** parameter can be specified only when the **linkclass=unchan** parameter is specified.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered E1 ports (**e1port** parameter).

The timing source parameter **e1tsel** must be specified if the **chanbrdg=on** parameter is specified.

The **e1tsel=line** parameter cannot be specified for an E1 port (**e1port** parameter) when the **chanbrdg=on** parameter is specified.

The **e1tsel=recovered** parameter cannot be specified for an E1 port (**e1port** parameter) unless the **chanbrdg=on** parameter is specified.

Only 2 ports can be used for E1 interfaces on an HC-MIM card that is used as an SE-HSL card. Any 2 of the 8 ports can be used on the SE-HSL card.

When provisioning an odd-numbered E1 port (**e1port** parameter) on an HC-MIM card or an E5-E1T1 card to channel bridging mode using **chanbrdg=on** parameter, **force=yes** must be specified if the adjacent even-numbered port is already provisioned with an E1 interface.

All signaling links assigned to its adjacent even-numbered E1 port must be deleted before an odd-numbered E1 port (**e1port** parameter) on an HC-MIM and E5-E1T1 card can be provisioned into channel bridging mode using the **chanbrdg=on** parameter. Use the **dlt-slk** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards (used as E1 cards or as SE-HSL cards) can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when E1 ports **3** through **8** are specified.

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards that are used as E1 cards or SE-HSL cards. The system checks for HIPR cards when E1 ports **3** through **8** (**e1port** parameter), **chanbrdg=on** or **linkclass=unchan** parameter is specified for HC-MIM and E5-E1T1 cards.

An SE-HSL feature quantity must be enabled before the **linkclass=unchan** parameter can be specified for an SE-HSL card. (See the **enable-ctrl-feat** command and the SEHSL SLK Capacity entry in the **rtv-ctrl-feat** command output example.)

The **linkclass=unchan** parameter can be specified only for HC-MIM and E5-E1T1 cards.

Channelized and unchannelized E1 ports (mixed mode) are not allowed on a single HC-MIM or E5-E1T1 card (the card cannot be used as an E1 card and an SE-HSL card at the same time).

Only 1 port can be used for E1 interfaces on an E5-E1T1 card that is used as an SE-HSL card. Any 1 of the 8 ports can be used on the SE-HSL card.

E1 ports **3 - 8** (**e1port** parameter) can be specified only for HC-MIM and E5-E1T1 cards.

The **encode=ami** parameter is supported only for the E1/T1 MIM, HC-MIM, and E5-E1T1 card used as an E1 card, and is not supported on the 2-port E1 card.

The **cas=on** parameter can not be specified for for HC-MIM and E5-E1T1 cards.

Notes

One or two E1 interfaces must be defined on an E1 card after the E1 and any associated Channel cards (types **lime1** and **limch**) are defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the E1 card and any associated Channel cards (with the **ent-slk** command).

For an SE-HSL card, the **minsurate** parameter indicates the least number of SUs present on a link uniformly distributed. The number of SUs present is:

- Without link traffic, the **minsurate** parameter value.
- With link traffic, the **minsurate** parameter value minus the number of MSUs.

When the **e1tsel=external** parameter is specified, a user-supplied BITS clock is required.

External timing is derived from the EAGLE High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 E1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a E1 card after the E1 card type (**lime1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the E1 card .

On a HC-MIM or E5-E1T1 card, E1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg** parameter must be specified for the odd-numbered E1 port.

Output

```
ent -
e1: loc=1205:e1port=1:crc4=off:cas=on:encode=hdb3:e1tsel=external:

;
```

ent-frm-pwr

Enter Frame Power Threshold

Use this command to add a new entry to the Frame Power Threshold (FPT) table. The frame-level power threshold value in the table is compared with the current calculated maximum power consumption for a particular frame, and appropriate alarms are raised if that consumption exceeds the threshold limit.

The entries in the Frame Power Threshold table contain a Frame ID and the corresponding power threshold value. You can use the following commands to display the threshold and calculated maximum power consumption for the frames in the system.

- The **rtrv-frm-pwr** command displays the current provisioned frame power threshold for each provisioned frame.
- The **rtrv-stp:display=power** command displays the provisioned frame power threshold for each provisioned frame, and displays the maximum calculated power consumption for each frame, based on card population.
- The **rtrv-stp:display=power:frm=xxxx** command displays the provisioned frame power threshold for the specified frame, the maximum calculated power consumption for the frame based on card population, and the maximum power consumption for each card in the frame and for a fan assembly for each shelf.

NOTE: The frame-level power threshold value needs to be determined from the capacity in Amps of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the FAP capacity.

Keyword: ent-frm-pwr

Related Commands: chg-frm-pwr, dlt-frm-pwr, rtrv-frm-pwr, rtrv-stp

Command Class: Database Administration

Parameters

:frm= (mandatory)

Frame ID.

Range: cf00, ef00, ef01, ef02, ef03, ef04

cf00 — Control frame
ef00 — First extension frame
ef01 — Second extension frame
ef02 — Third extension frame
ef03 — Fourth extension frame
ef04 — Fifth extension frame

:thrshld= (optional)

Threshold. This parameter specifies the frame-level power threshold value, in Amps. This value is compared with the current calculated maximum power consumption for a particular frame (use the **rtrv-stp:display=power:frm=** command to obtain the maximum power consumption value), and the appropriate alarms are raised if current consumption exceeds the threshold limit. The value of the **thrshld** parameter needs to be determined from the capacity of the fuse alarm panel (FAP) for the frame. Contact your site engineer to determine the frame FAP capacity.

Range: 30-65

Default: 30

Example

Enter the frame power threshold value for the first extension frame.

ent - frm - pwr : frm=ef00 : thrshld=55

Dependencies

The specified power threshold value (**thrshld** parameter) must not already be provisioned for the specified frame .

The specified frame (**frm** parameter) must be a provisioned frame.

Notes

The maximum calculated power for a frame is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE 5 ISS.

Output

```

ent - frm - pwr : frm=ef00 : thrshld=55
tekelecstp 06-04-11 15:18:41 EST EAGLE 35.0.0
FRAME POWER THRESHOLD table is (4 of 10) 40% full

```

ent-ftp-serv

Enter FTP Server Entry

Use this command to write an entry into the FTP Server table for an FTP Server.

NOTE: The FTP Serve table entry for the FTP-based Table Retrieve Application (FTRA) is entered through input from FTRA. Though the entry can be made with this command at the EAGLE 5 ISS, the information entered at the EAGLE 5 ISS will be overwritten by the information sent by FTRA.

Keyword: ent-ftp-serv

Related Commands: chg-ftp-serv, dlt-ftp-serv, rtrv-ftp-serv

Command Class: Database Administration

The FTP Server table can contain entries for a maximum of 10 FTP servers. The number of FTP servers supported by an application might be less than 10. For an application, you cannot make entries for more than the maximum number of FTP servers supported by the application.

- The Measurements Platform application (**app=meas**) supports 3 FTP servers.
- The FTP-based Table Retrieve Application (FTRA) (**app=user**) supports 2 FTP servers.

Notes

The same FTP server can be defined more than once, but the specified application must be different for each entry.

Output

```

ent-gserv-data

Enter G-Port SRI Query for Prepaid Service Data

Use this command to enter translation type, originating point code, or global title address data in the GSERV table. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port SRI service.

Keyword: ent-gserv-data

Related Commands: dlt-gserv-data, rtrv-gserv-data

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (optional)

Global title address. Use this parameter to specify a calling party (CgPA) global title address.

Range: 1-21 digits

:opc= (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

Synonym: opca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opc/opca/opci/opcn/opcn24= (optional)

Originating point code. Use these parameters to specify message transfer part (MTP) originating point codes.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*.

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opcn24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:tt= (optional)

Translation type. Use this parameter to specify a called party (CdPA) translation type.

Range: **0-255**

Example

```
ent-gserv-data:tt=26
ent-gserv-data:opc=1-1-1
ent-gserv-data:gta=9194605500
```

Dependencies

Duplicate entries cannot exist in the GSERV table.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

A new entry cannot be added to the GSERV table because all available space is in use. A maximum of 256 **tt** values, 50 **gta** values, and 50 **opc** values can be entered in the GSERV table.

The **tt**, **opc**, and **gta** parameters cannot be specified within the same command.

The G-Port feature must be on before this command can be entered.

Notes

A translation type, originating point code, or global title address (**tt**, **opc**, or **gta** parameter) value must be entered in the GSERV table and must match the corresponding SRI Query parameter for an SRI message to receive the G-Port SRI Query for Prepaid service.

The G-Port SRI Query for Prepaid feature must be on before entries in the GSERV table can be used to affect a G-Port SRI query.

Output

```
ent-gserv-data:tt=26
mystp 06-07-27 22:58:17 EST EAGLE 35.2.0
ENT-GSERV-DATA: MASP A - COMPLTD
```

ent-gsmmap-scrn**Enter GSM MAP Screening Entry**

Use this command to assign the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening entries that filter or allow TCAP messages for certain MAP operation codes. The messages are filtered or allowed based on CgPA GTA+NPV+NAIV, CdPA GTA+NPV+NAIV, and forbidden (**forbid**) parameters. Each CgPA entry is associated with one or more CdPA entries and one or more CgPA entries are associated with a MAP Opcode. This command provisions both CgPA and CdPA entries into the database.

Keyword: ent-gsmmap-scrn

Related Commands: chg-gsmmap-scrn, chg-map, dlt-gsmmap-scrn, dlt-map, rtrv-gsmmap-scrn, rtrv-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:cgsr= (mandatory)

The CGPA screening reference. CGSR uniquely identifies a CGPA entry for a specified OPNAME.

Range: ayyy

1 alphabetic character and up to 3 optional alphanumeric characters

:opname= (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command. GSM Map Screening is performed on the specified address or addresses for the referenced operation code.

Range: *ayyyyyyy*
Up to 8 alphanumeric characters

:action= (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

Range: **atierr, discard, dupdisc, duplicate, forward, pass, route**

atierr— An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

discard— The MSU is to be discarded.

dupdisc— Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

duplicate— Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward— Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass— Route the message as normal to the destination.

route— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: **discard**

:cdsr= (optional)

The CDPA screening reference. CDSR uniquely identifies a CDPA entry for a specified combination of CGSR and OPNAME.

Range: *ayyy*
1 alphabetic character and up to 3 optional alphanumeric characters

:eaddr= (optional)

In association with **npv, naiv, cgssr, and cdsr**, it is for the ending CDPA address in the range to be screened.

Range: 1-15 digits
Valid digits are **0-9, a-f, A-F**

:forbid= (optional)

The forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter.

Range: **all, none, state, location**

all— All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.

none— None of the parameters are forbidden. Route the message to its destination.

state— Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **state** as the forbidden parameter for the entered address/operation code combination. Note: The **state** parameter is valid only for GSM ATI messages.

location— Take the specified screening action defined by the **naction** parameter for messages arriving at the system that contain **location** as the forbidden parameter for the entered address/operation code combination. Note: The **location** parameter is valid only for GSM ATI messages.

Default: **all**

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **pc/pca/pci/pcn/pcn24** and **ssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: **no**

:mapset= (optional)

The MAP set ID.

Range: **1-36000 dflt**

dflt—Default MAP set

:naiv= (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching **npv** and **naiv** values, the message is rejected. The message is rejected with the default action defined by the **ent-gsms-opcode** command for the operation code (**opcode**) parameter entry referenced by the operation name (**opname**) parameter.

This parameter must be specified with the **npv** parameter.

Range: **0-127, ***

Default: *****

:npv= (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses. If a message is screened and does not contain matching **npv** and **naiv** values, the message is rejected. The message is rejected with the default action defined by the **ent-gsms-opcode** command for the operation code (**opcode**) parameter entry referenced by the operation name (**opname**) parameter.

This parameter must be specified with the **naiv** parameter.

Range: **0-15 ***

Default: *****

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. The **pc/pca/pci/pcn/pcn24** and **nssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters are used to enter the node to which the input message will be routed.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:saddr= (optional)

The starting origination address.

In association with the **npv**, **naiv**, and **cgsr** parameters, this parameter is for the single CGPA entry or the starting CGPA address in the range to be screened.

In association with the **npv**, **naiv**, and **cdsr** parameters, this parameter is for the single CDPA entry or the starting CDPA address in the range to be screened.

Range: 1-15 digits, *

Valid digits are 0-9, a-f, A-F

Default: *

:ssn= (optional)

Subsystem Number. The **pc/pca/pci/pcn/pcn24** and **ssn** parameters are used when the screening action (**action**) is **forward**, **duplicate**, or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

Range: 002-255

Example

The following example adds a MAP opname of ati with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the npv and naiv values. This example is wrapped to the next line for readability:

```
ent-gsmmap-  
scrn:saddr=919461:eaddr=919462:opname=ati:action=discard:forbid=s  
tate :npv=1:naiv=4:cgsr=fela
```

The following example adds a MAP opname of ati with a range of allowed addresses, defines a forbidden parameter for that range of addresses and an action to take if the forbidden parameter is detected, and sets the npv and naiv values. The command also defines an ITU International Point Code with Subsystem Number 5, and forbids by location messages that have an action of forward. This example is wrapped to the next line for readability:

```
ent-gsmmap-  
scrn:saddr=919461:eaddr=919462:opname=ati:action=forward:pci=1-1-  
1 :ssn=5:force=yes:forbid=location:cgsr=fela
```

The following example adds a MAP opname of xyz with an allowed hexadecimal address of abcdefabcdefabc, defines the action discard to take if a forbidden parameter is detected, and sets the npv and naiv values. The command also defines a CGSR of fela. This example is wrapped to the next line for readability:

```
ent-gsmmap-  
scrn:opname=xyz:saddr=abcdefabcdefabc:npv=10:naiv=10:cgsr=fela :ac  
tion=discard
```

```
ent-gsmmap-  
scrn:opname=test2:cgsr=t1:cdsr=cd3:saddr=125:pci=s-1-1-1:ssn=10 :a  
ction=duplicate
```

```
ent-gsmmap-  
scrn:opname=test2:cgsr=cg1:cdsr=cd1:saddr=125:pci=1-1-1:ssn=10:ac  
tion=duplicate:mapset=11
```

```
ent-gsmmap-  
scrn:opname=test3:cgsr=cg2:cdsr=cd1:saddr=125:pc=1-1-2:ssn=10:ac  
tion=dupdisc:mapset=dflt
```

Dependencies

The GSM Map Screening feature must be turned on (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) before this command can be entered.

The EGMS feature must be turned on before:

- The **saddr=*** parameter can be specified.
- Values for the **saddr** and **eaddr** parameters can contain hexadecimal digits.
- The **cdsr** parameter can be specified.
- The **pc/pca** parameter can be specified.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **eaddr** parameter is specified, then its value must contain the same number of digits as the value of the **saddr** parameter.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **saddr=*** parameter is specified, then the **eaddr** parameter cannot be specified.

If the **opname** parameter is specified, its value must exist in the GSM MAP Op-Code table.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code (**opcode**) referenced by **opname** is **71**. The **opcode=71** parameter signifies an ATI MAP operation code.

The **action=atierr** parameter cannot be specified unless the operation code (**opcode**) referenced by the **opname** parameter is **71**. The **atierr** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The GSM MAP Screening table cannot be full.

The GSM MAP Screening table must have at least two free entries to provision a CgPA entry, because a default wildcard CdPA entry is created for each CgPA entry.

If a single entry is specified for the CgPA/CdPA (the **eaddr** parameter is not specified), then the combination of **saddr/npv/naiv** and **opname** parameters must not already exist in the GSM MAP screening table.

If a range entry is specified for the CgPA/CdPA (the **eaddr** parameter is specified), then the **saddr/eaddr/npv/naiv** and **opname** combination must not already exist or overlap another range entry in the GSM MAP screening table.

If a CdPA entry is being created, then the CGSR must already exist for the specified OPNAME.

If a CgPA entry is being created, the CGSR cannot already exist for the specified OPNAME.

The specified **cdsr** cannot already exist for the specified **cgsr**.

If specified, the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

If the **action** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**, the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter must be specified.

The **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter can be specified only if the **action** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

The **force** parameter can be specified only if the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified.

If the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified, and the **force** parameter is not specified as **yes**, then the PC/SSN must be populated in the SCCP Application entity set (Remote Point Code/MAP Table).

The values for the **npv** and **naiv** parameters must be either both numbers or both asterisks (*). The parameters cannot be specified as **:npv=*:naiv=9** or **:npv=9:naiv=***, for example.

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

If the **action** parameter is specified as **forward**, **duplicate**, or **dupdisc**, then the **mapset** parameter must be specified.

If the **mapset** parameter is specified, then the **action** parameter must be specified as **forward**, **duplicate**, or **dupdisc**.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

If the value of the **mapset** parameter is not **dflt**, then the specified PC/SSN must exist in the specified MAP set.

If the **mapset=dflt** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC/SSN must exist in the specified MAP set.

Notes

GSM screening entries are handled differently from other screening entries such as GWS (gateway screening) in the system database. The following differences apply to provisioning GSM screening entries:

- GSM screening entries can be either single entries or range entries.
- Single entries have precedence in screening over range entries. Thus the single entries are searched first and if a match is found, the range entries are never searched.
- Range entries can overlap single entries.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-gsmmap-
scrn:opname=test2:cgsr=cg1:cdsr=cd1:saddr=125:pci=1-1-1:ssn=10:ac
tion=duplicate:mapset=11
tekelecstp 06-05-29 13:24:41 EST EAGLE 35.0.0
GSM Map Screening table is (1 of 4000) 1% full
ENT-GSM MAP-SCRN: MASP A - COMPLTD
;
```

ent-gsms-opcode**Enter GSM MAP Screening Operation Code**

Use this command to assign the concerned GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to provision a list of all operation codes that the system uses in performing GSM screening.

Keyword: ent-gsms-opcode

Related Commands: chg-gsms-opcode, dlt-gsms-opcode, rtrv-gsms-opcode

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:opcode= (mandatory)

MAP operation code. This parameter refers to the actual decimal value of the MAP operation codes from the TCAP layer of GSM MAP messages.

Range: 0-255 *

If a decimal Map Opcode is not found in the database, then the asterisk (wildcard *), if provisioned, will constitute a match when screening the MSUs.

:opname= (mandatory)

Name for the operation code. The **opname** value is defined with the **ent-gsmmap-scrn** command.

Range: ayyyyyyy

Up to 8 alphanumeric characters

:dfltact= (optional)

Default screening action for a MAP operation code. The default screening action is used when a matching CGPA address+NPV+NAIV entry is not found in the GSM MAP screening table.

Range: atiterr, discard, dupdisc, duplicate, forward, pass, route

atierr— Do not route the MSU. An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

discard— Do not route the MSU. The MSU is discarded (thrown away) and an appropriate UIM is issued.

dupdisc— Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

duplicate— Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

forward— Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

pass— Route the message as normal to the destination.

route— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

Default: **discard**

:force= (optional)

Check Mated Application Override. This parameter must be used to complete command execution if the **pc/pca/pci/pcn/pcn24** and **ssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: **yes, no**

Default: **no**

:mapset= (optional)

The MAP set ID.

Range: **dflt, , dflt 1..36000, dflt**

dflt—Default MAP set

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **pca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

Point code. The **pc/pca/pci/ncn/pcn24** and **ssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate** or **dupdisc** (duplicate and discard). These parameters allow the craftsman to change the defined node to which the input message will be routed.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:ssn= (optional)

Subsystem Number. The **pc/pca/ pci/pcn/pcn24** and **ssn** parameters are used when the default screening action (**dfltact**) is **forward**, **duplicate** or **dupdisc** (duplicate and discard). These parameters allow the craftsperson to change the defined node to which the input message will be routed.

Range: 002-255

Example

The following example adds a MAP operation code of 71 with a name of ati with a default action of discard:

ent-gsms-opcode:opcode=71:opname=ati:dfltact=discard

The following example adds a MAP operation code of 71 with a name of ati with a default action of forward, an international point code of 1-1-1, a subsystem number of 5, and forces:

ent-gsms-

opcode:opcode=71:opname=ati:dfltact=forward:pci=1-1-1:ssn=5:force=yes

The following example adds a MAP operation code of 71 with a name of ati with a default action of duplicate, an international point code of 1-1-1, a subsystem number of 5, and forces:

```
ent-gsms-
opcode:opcode=71:opname=ati:dfltact=duplicate:pci=1-1-1:ssn=5:force=yes
```

The following example adds a MAP operation code of 71 with a name of ati with a default action of dupdisc, an international point code of 1-1-1, a subsystem number of 5, and forces:

```
ent-gsms-
opcode:opcode=71:opname=ati:dfltact=dupdisc:pci=1-1-1:ssn=5:force=yes
```

The following example adds a MAP operation code of * with a name of xyz with a default action of duplicate, an ANSI point code of 8-8-8, a subsystem number of 20:

```
ent-gsms-
opcode:opcode=*:opname=xyz:pca=8-8-8:dfltact=duplicate:ssn=20
```

The following example adds a MAP operation code of 22 with a name of ati with a default action of discard:

```
ent-gsms-opcode:opcode=22:opname=ati:dfltact=discard
```

The following example shows a spare point code:

```
ent-gsms-
opcode:opname=test3:opcode=3:pci=s-1-1-1:dfltact=duplicate:ssn=10:force
```

The following example shows a MAP set value. The Flexible GTT Load Sharing feature is ON.

```
ent-gsms-
opcode:opname=test3:opcode=3:pc=1-1-1:dfltact=duplicate:ssn=10:mapset=7
```

The following example shows the Default MAP set value. The Flexible GTT Load Sharing feature is ON.

```
ent-gsms-
opcode:opname=ts4:opcode=4:pc=1-1-2:dfltact=dupdisc:ssn=10:mapset=dflt
```

Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be turned on before this command can be entered.

If the **dfltact** parameter is specified, then the **pass**, **discard**, **atierr**, **route**, **forward**, **duplicate**, or **dupdisc** value must be assigned.

The reserved word **none** cannot be specified as a value for the **opname** parameter.

The **pc/pca/pci/pcn/pcn24** and **ssn** parameters can be specified only if the **dfltact** parameter is specified and its value is **forward**, **duplicate**, or **dupdisc**.

If the **dfltact** parameter is specified with a value of **forward**, **duplicate**, or **dupdisc**, then a **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter must be specified.

The **force** parameter can be specified only if a **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified.

The **dfltact=atierr** parameter cannot be specified unless the value of the operation code referenced by the **opname** parameter is **71**. The **atierr** option is valid only for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The value specified for the **opcode** parameter cannot already exist in the GSM Map Op-Code table.

The value specified for the **opname** parameter cannot already be used in the GSM Map Op-Code table.

If the **pc/pca/pci/pcn/pcn24** parameter and the **ssn** parameter are specified, and the **force** parameter is not specified as **yes**, then the PC-SSN must exist in the SCCP Application entity set (Remote Point Code / Mated Application Table).

The Enhanced GSM Map Screening feature must be enabled and turned on before the **opcode=*** parameter can be specified.

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must be a full point code.

If specified, the **pc/pca/pci/pcn/pcn24** parameter value must exist as a destination in the Ordered Route entity set or reside in a cluster (ANSI only) that exists as a destination in the Ordered Route entity set (for global title routing).

The Enhanced GSM Map Screening feature must be enabled and turned on when the PC/PCA is specified.

If the **mapset** parameter is specified, then the **dfltact** parameter must be specified as **forward**, **duplicate**, or **dupdisc**.

If the **dfltact** parameter is specified as **forward**, **duplicate**, or **dupdisc**, then the **mapset** parameter must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

If the **mapset** parameter is not specified as **dflt**, or if the **mapset=dflt** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC/SSN must exist in the specified MAP set.

Notes

Origination Addresses are considered to be the SCCP CGPA address as well as the Numbering Plan and Nature of Address values.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Output

```
ent-gsms-
opcode:opname=test3:opcode=3:pc=1-1-1:dfltact=duplicate:ssn=10:mapset=7
tekelecstp 06-05-29 13:21:58 EST EAGLE 35.0.0
ENT-GSMS-OPCODE: MASP A - COMPLTD
;
```

ent-gsmssn-scrn

Enter GSM Subsystem Number Screening Entry

Use this command to provision origination and destination SSNs (subsystem numbers) to be screened using the GSM (Global System for Mobile Telecommunication) MAP (mobile application part) screening feature. The value of the **ssn** parameter that is entered with this command is added to the GSM SSN screening table. All the MAP messages with the originating or destination **ssn** entered are screened using the GSM Map screening feature.

Keyword: ent-gsmssn-scrn

Related Commands: dlt-gsmssn-scrn, rtrv-gsmssn-scrn

Command Class: Database Administration

Parameters

:ssn= (mandatory)

Subsystem number.

Range: 000-255

:type= (mandatory)

Subsystem type.

Range: **dest, orig**

dest— The destination SSN

orig— The origination SSN

Example

The following example adds an originating subsystem of 10 to the GSM SSN Screening table:

ent -gsmssn -scrn:ssn=10:type=orig

Dependencies

The GSM Map Screening feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

A value for the **ssn** and **type** parameter combination cannot be specified that already exists in the GSM SSN screening table.

Notes

None

Output

ent -gsmssn -scrn:ssn=10:type=orig

rlghncxa03w 04-01-10 11:43:04 EST EAGLE 31.3.0

ENT-GSMSSN-SCRN: MASP A - COMPLTD

;

ent-gta**Enter Global Title Address Information
Command**

Use this command to specify the GTA (global title address) information for applicable global title selectors required to specify a global title entry.

This command adds the routing object (a destination address and a subsystem number) for messages requiring a global title translation. The translation is performed on the basis of the global title address (**gta**), global title indicator (**gti**), numbering plan (**np**), nature of address indicator (**nai**), and translation type (**tt**) of each SS7 SCCP message directed to the STP with a routing indicator of 0, indicating a GTT is required.

Keyword: **ent-gta**

Related Commands: **chg-gta, dlt-gta, rtrv-gta**

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gttsn= (mandatory)

GTT set name. This parameter specifies the entity to which global title addresses and selectors are assigned.

Range: *ayyyyyyy*
1 leading alphabetic and up to 8 following alphanumeric characters.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000–255**

sp—**000–255**

:xlat= (mandatory)

Translate indicator. This parameter specifies translation actions and routing actions.

Range: **dpc, dpcngt, dpcssn, udts, disc**

:ccgt= (optional)

Cancel called global title indicator.

Range: **yes, no**

Default: **no**

:cggtasn= (optional)

CgPA GTA GTT set name.

Range: *aaaaaaaa*

1 leading alphabetic character and up to 8 following alphanumeric characters.

:cgpc= (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: **cgpca**

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

When **chg-sid:pctype=ansi** is specified, *ni*-*-* is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

:cgpci= (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:cgpcn= (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:cgpcn24= (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:cgpcsn= (optional)

CgPA PC GTT set name.

Range: ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

:cgssn= (optional)

Starting CgPA subsystem number.

Range: 0-255

:cgssnsn= (optional)

CgPA subsystem number GTT set name.

Range: ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

:ecgssn= (optional)

Ending CgPA subsystem number.

Range: 0-255

:egta= (optional)

End global title address. This parameter specifies the end of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

Default: Same as the specified **gta** value

:force= (optional)

Check mated application override. This parameter must be used to complete command execution if the **pci/pcn** and **ssn** parameter combination specified in the command is not already defined in the SCCP Application entity set (Remote Point Code/Mated Application Table).

Range: yes, no

Default: no

:gta= (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:mapset= (optional)

MAP set ID. This parameter specifies the Mated Application set ID.

Range: **1-36000 dflt**
 dflt—Default MAP set

:mrnset= (optional)

MRN set ID. This parameter specifies the Mated Relay Node set ID.

Range: **1-3000 none, dflt**
 dflt—Default MRN set.
none—The GTA translation does not participate in any load sharing.

:ngti= (optional)

New GTI code. When the ANSI-ITU-China SCCP Conversion and MGTT features are on, and the Translated Point Code is of a different network type, this parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: **2, 4**

:nnai= (optional)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: **0-127**
Default: **0xFFFF**

:nnp= (optional)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: **0-15**
Default: **0xFFFF**

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: **0-21**
Default: **0**

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.
Default: No digits

:nsdd= (optional)

New suffix digits to be deleted. This parameter specifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: **0-21**
Default: **0**

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:ntt= (optional)

New translation type. The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: **000-255**

Default: No **ntt** value provided

:opc= (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Range: **000-255, ***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni-*-** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:opc_n24= (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:opcs_n= (optional)

The OPC GTT set name.

Range: ayyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

:ri= (optional)

Routing indicator.

Range: gt, ssn

gt— Allow a called party address with a routing indicator value of “global title.”

ssn— Allow a called party address with a routing indicator value of “DPC/SSN.”

:selid= (optional)

Selector ID.

Range: 0-65534

:ssn= (optional)

New translated subsystem number.

Range: 002-255

Default: No ssn value provided

Example

The lines in some examples are wrapped for readability:

Dependencies

The EGTT feature must be turned on before this command can be entered.

The MGTT feature must be turned on before the **nnp**, **nnai**, **ngti**, **nsdd**, **nsds**, **npdd**, and **npds** parameters can be specified.

The ANSI-ITU-China SCCP Conversion feature must be enabled and turned on before the **ngti** parameter can be specified.

The ANSI-ITU-China SCCP Conversion feature must be enabled and turned on before a translated PC that is of a different domain than the GTTSN can be specified.

The ANSI-ITU-China SCCP Conversion feature must be on before a translated PC and a translation type in different network types can be specified.

Asterisks cannot be specified for the **ssn**, **ri**, **cgssn**, or **ecgssn** parameters.

The **gttsn** parameter must be specified and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24** parameter cannot be out of range.

If the **egta** parameter is specified, then the values of the **gta** and **egta** parameters must be the same length.

The length of the specified **gta** parameter must match the number of digits provisioned for the specified GTT set (**gttsn**).

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

The specified **gta/egta** range must exist for the specified GTT set in the STP active database. While an exact match is not required, you cannot specify an overlap with another range. If the range overlaps, an error is generated that displays a list of overlapped global title addresses. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, the error message displays the list of overlapped global title addresses:

The following GTA ranges overlap the input GTA range

START GTA	END GTA
8005550000	8005551999
8005552000	8005553999
8005554000	8005555999

ENT-GTA: MASP A - Command Aborted

The new translation type (**ntt** parameter) must match that of an existing ANSI GTT selector that is assigned to a GTT set (**gttsn** parameter).

The new translation type (**ntt** parameter) cannot already be defined as an alias.

If the ANSI-ITU-China SCCP Conversion feature is on, and the **ntt** parameter is specified, then the **ri=gt** parameter must be specified.

If the ANSI-ITU-China SCCP Conversion feature is on, then the **ntt** parameter can be specified only when the **xlat** parameter value is **dpc** or **dpcngt**.

The **ngti** parameter can be specified only when the translated point code and the translation type are in different domains, or are both in the ITU domain.

The **nsdd** and **nsds** parameters cannot be used in the same command with the **npdd** and **npds** parameters.

If the **ngti=4** parameter is specified, then the **nnp** and **nnai** parameters must be specified.

If the **ngti=4** parameter is specified, then the translated PC cannot be ANSI. For ANSI PCs, the GTI value must be 2.

If the **ngti=2** parameter is specified, then the **nnp** and **nnai** parameters cannot be specified.

The **ccgt** and **ngti** parameters cannot be specified together in the command.

If the ANSI-ITU-China SCCP Conversion feature is not on and the specified GTT set is an ANSI set, then the **pc/pca** parameter must be a valid ANSI point code.

When the ANSI-ITU-China SCCP Conversion feature is not on and the specified GTT set is an ITU set, the **pci/pcn/pcn24** parameter must be a valid ITU point code.

If the **xlat=dpcngt** parameter is specified, then the **ri=gt** parameter must be specified.

If the **xlat=dpcngt** parameter is specified, then the **ntt** parameter must be specified.

If the **ntt** parameter is specified, then the **xlat=dpcngt** parameter must be specified.

If the **ssn** parameter is specified, then the **xlat=dpcssn** parameter must be specified.

If the **xlat=dpcssn** parameter is specified, then the **ssn** parameter must be specified.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP's true point code, the **xlat=dpcssn** and **ri=ssn** parameters must be specified.

If the value specified for the **pc/pca/pci/pcn/pcn24** parameter is the STP's true point code and the **ssn** parameter is specified, the **ssn** parameter must exist in the SS-APPL table.

Unless the PC is the STP true PC, the value specified for the **pc/pca/pci/pcn/pcn24** parameter must exist as a destination in the Route table or reside in a cluster that exists as a destination in the Route table (for global routing).

If a final GTT (the **ri=ssn** parameter) is specified with the **xlat=dpc** parameter and without the **force=yes** parameter, then the PC (**pc/pca/pci/pcn/pcn24**) must exist in the Remote Point Code/ MAP table. The **force=yes** parameter can be specified to execute the command when the PC is not in the table; the following warning message is displayed in the scroll area of the terminal:

CAUTION: DPC DOES NOT EXIST IN MATED APPLICATION TABLE.

If the **ccgt=yes** parameter is specified, then the **ri=ssn** parameter must be specified.

If the **pc/pca/pci/pcn/pcn24** parameter is any of the STP's PCs or CPCs, then the **ccgt=no** parameter must be specified.

If the XGTT feature is enabled, the GTT table can contain up to either 400,000 or 1,000,000 entries, depending on the controlled feature Part Number that is enabled. If XGTT is not enabled, the GTT table can contain up to 269,999 user entries. An error message is displayed if a command entry would result in more than the allowed maximum number of entries in the table.

If the **egta** parameter is specified, then the value of the **egta** parameter must be greater than or equal to the value of the **gta** parameter.

The GTT Set Name must not be **none**.

The **pc/pca/pci/pcn/pcn24** parameter must be a full PC.

If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per GTT set. When the **ent-gta** command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths.

If the **ri=ssn** parameter is specified, then the **mrnset** parameter must not be specified.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the **ri=gt** parameter is specified, then the **mrnset** parameter must be specified.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified PC and SSN must exist in the specified MAP set.

The specified MAP set must exist in the database.

If the **xlat=dpc** parameter is specified, and the **force** parameter is not specified as **yes**, then the specified PC and MAP set must exist in the MAP table.

Either the **gta**, **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameter must be specified.

The **cggtasn**, **cgpcsn**, and **selid** parameters are mutually exclusive.

If the **cgssnsn** parameter is specified, the **cggtasn**, **opcsn**, **cgpcsn**, and **selid** parameters cannot be specified.

If the **cgssn** parameter is specified, the **cggtasn**, **cgpcsn**, **cgssnsn**, **opcsn**, and **selid** parameters cannot be specified.

If the **ecgssn** parameter is specified, it must be greater than the **cgssn** parameter.

If the **xlat** parameter has a value of **udts** or **disc**, the only other optional parameters that can be specified are the **gta/egta**, **cgpc**, **opc**, or **cgssn/ecgssn** parameters.

If the **xlat** parameter has a value of **dpc**, **dpcngt**, or **dpcssn**, the **gta/egta**, **cgpc**, **opc**, **cgssn/ecgssn**, **pc/pca/pci/pcn/pcn24**, and **ri** parameters must be specified.

The Origin Based SCCP Routing feature must be enabled if the **cggtasn**, **cgpcsn**, **cgssnsn**, **opcsn**, **cgpc/cgpcac/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, **(e)cgssn**, or **selid** parameters are specified, or if the **xlat** parameter has a value of **udts** or **discard**.

If the GTTSN set type has a value of **cdga** or **cgssn**, the **cgssnsn** parameter cannot be specified. If the GTTSN set type has a value of **cdgta**, the **cggtasn**, **cgpcsn**, or **opcsn** parameters must be specified.

The GTA must be specified if the GTTSN set type has a value of **cdgta** or **cggtta**. The GTA cannot be specified for other set types.

If the GTTSN set type has a value of **cgpc**, the **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter must be specified. This parameter cannot be specified for other set types.

The **opc**, **opca**, **opci**, **opcn**, or **opcn24** parameter must be specified if the GTTSN set type has a value of **opc**. These parameters cannot be specified for other set types.

If the GTTSN set type has a value of **cgssn**, the **cgssn** parameter must be specified. The **cgssn** parameter cannot be specified for GTTSN of other types.

The CgPA subsystem number range cannot overlap a currently existing range for the specified GTT set.

The value specified for the GTT set name (the **gttsn** parameter) must match the corresponding type in the GTTSET table. The following GTT set names and matching GTT set types may be specified:

- GTT set name specified by the **cgssnsn** parameter must be type **cgssn**
- GTT set name specified by the **cggtasn** parameter must be the type **cggtta**
- GTT set name specified by the **cgpcsn** parameter must be type **cgpc**
- GTT set name specified by the **opcsn** parameter must be type **opc**

If the specified GTT set is an ANSI set, the **cgpc/cgpca** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT set is an ITU set, the **cgpci/cgpcn/cgpcn24** and the **opci/opcn/opcn24** parameters must be valid ITU point codes.

The CgPC subsystem number set domain must be the same as the GTTSN set domain. If GTTSN set domain is ANSI, then the CgPC subsystem number set domain must be ANSI. If the GTTSN set domain is ITU, then the CgPC subsystem number set domain must be ITU.

The OPC subsystem number set domain must be the same as the GTTSN set domain. If the GTT subsystem number set domain is ANSI, then the OPC subsystem number set domain must be ANSI. If the GTT subsystem number set domain is ITU, then the OPC subsystem number set domain must be ITU.

The CGSSN number set domain and the CGGTA subsystem number set domain must be the same as the GTT subsystem number set domain. The possible values are ANSI or ITU.

The CGSSN range cannot overlap a currently existing range for the specified GTT set.

The **solid** parameter can be specified only if the GTTSN set type has a value of **cdgta**.

The specified **cgpc** or **opc** translation entry already exists.

The **cgpc**, **cgssn**, **gta**, and **opc** parameters are mutually exclusive. Each of these parameters must be specified individually in separate commands.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta**, **egta**, **npds**, or **nsds** parameters.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among set of destination point codes in the MRN table, which already exists in the EAGLE 5 ISS. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN set and the post-translation PC create a key that is used to perform lookups in the MRN table. The lookup results in a set of alternate PCs, one of which is selected, based on PC relative cost, to route the MSU in the most cost effective way.

When the Flexible GTT Load Sharing feature is enabled, multiple relationships can be defined among a set of PC/SSNs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

When the Origin-based SCCP Routing feature is turned on, the CdPA GTA, CgPA GTA, CgPA PC, CgPA SSN, and OPC entries can be provisioned. When provisioning, the following rules apply:

- The Advanced CdPA GTA entry can associate with CgPA GTA set, CgPA PC set, or SELID and OPC set.
- The CgPA GTA, CgPA PC, or OPC entry can associate with the CgPA SSN set.
- The CgPA SSN entry cannot associate with any other GTT set.
- The Advanced CdPA GTA entry may contain SELID, which is (together with the CgPA information) derived from incoming MSU to search the Selector table again for the CgPA GTA or CgPA PC Set.

When the Origin-based SCCP Routing feature is enabled, the GTA and EGTA can be used for the CgPA translation as well as the CdPA GTA translation.

ent-gtcnv

Enter Global Title Conversion

Use this command to provision the Default Global Title Conversion table. The table is used during conversion for MTP-routed cross network SCCP UDT, UDTs and SCCP Management messages. It is also used during conversion for GT routed messages when a matching entry exists in the Global Title address table but the NGTI value is not provisioned.

Keyword: ent-gtcnv

Related Commands: chg-gtcnv, dlt-gtcnv, rtrv-gtcnv

Command Class: Database Administration

Parameters

:dir= (mandatory)

Direction of conversion.

Range: atoi, itoa, both

atoi — ANSI to ITU conversion

itoa — ITU to ANSI conversion

both — conversion in both directions

:gtixlat= (mandatory)

Global Title Indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

Range: 22, 24

22— Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

24— Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

:tta= (mandatory)

ANSI translation type.

Range: 0-255 *

:tti= (mandatory)

ITU translation type.

Range: 0-255 *

:nai= (optional)

Nature of address indicator. This parameter is mandatory when **gtixlat=24** is specified, and not specified when **gtixlat=22** is specified.

Range: 0-63 *

Default: Not set

:np= (optional)

Numbering plan. This parameter is mandatory when **gtixlat=24** is specified, and not specified when **gtixlat=22** is specified.

Range: 0-15 *

Default: Not set

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the number of new prefix digits to be deleted. These digits will be replaced with the new prefix digits string (**npds**).

Range: 0-21

Default: 0

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits string that will replace the received prefix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:nsdd= (optional)

New suffix digits to be deleted. This parameter identifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21

Default: 0

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

Example

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

ent-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5

The following example assigns an entry used for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 4. The nsdd parameter specifies that the last 3 digits are to be removed from the end of the address digits, and the nsds parameter specifies that the digits 123 are to be appended to the end of the remaining address digits.

ent-gtcnv:dir=atoi:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsdd=3:nsds=123

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 2. The npdd parameter specifies that the first 3 digits are to be deleted from the beginning of the address digits, and the npds parameter specifies that the digits 407 should be appended to the beginning of the remaining address digits.

ent-gtcnv:dir=ittoa:gtixlat=22:tta=11:tti=7:npdd=3:npds=407

The following example assigns an entry used for ITU to ANSI conversion where the conversion is from GTI 2 to GTI 4. The nsds Parameter specifies that the digits 45667 are to be appended to the end of the address digits.

ent-gtcnv:dir=ittoa:gtixlat=24:tta=11:tti=7:nai=8:np=6:nsds=45667

The following example assigns an entry used for ANSI/ITU conversion in both directions where the conversion is from GTI 2 to GTI 2.

ent-gtcnv:dir=both:gtixlat=22:tta=11:tti=7

The following example assigns an entry used for ANSI/ITU conversion where an incoming ANSI GTI 2 is converted to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

ent-gtcnv:dir=both:gtixlat=24:tta=12:tti=9:nai=6:np=4

The following example assigns a default entry for ANSI to ITU conversion where the conversion is from GTI 2 to GTI 2.

ent-gtcnv:dir=atoi:gtixlat=24:tta=*:tti=4:nai=6:np=5

The following example assigns a default entry for ITU to ANSI where the conversion is from GTI 2 to GTI 4. The npds parameter specifies that the digits 919 are to be appended to the beginning of the address digits.

ent-gtcnv:dir=ittoa:gtixlat=24:tta=17:tti=*:nai=*:np=*:npds=919

The following example specifies hexadecimal digits for the npds parameter.

ent-gtcnv:dir=atoi:gtixlat=22:tta=*:tti=4:npdd=3:npds=abcdef0123456789

Dependencies

The ANSI-ITU-China SCCP Conversion feature must be turned on before this command can be entered.

If **gtixlat=22** is specified, the **nai** and **np** parameters cannot be specified.

If **gtixlat=24** is specified, the **nai** and **np** parameters must be specified.

When **dir=both** is specified, no asterisk (*) parameter values can be specified.

When **dir=atoi** is specified, the asterisk parameter value (*) can be specified only for the **tta** parameter.

When **dir=itot** is specified, the asterisk parameter value (*) must be specified for the **tti**, **np**, and **nai** parameters.

The specified **dir**, **tta**, **tti**, **np**, and **nai** parameter combination cannot already exist in the database.

The **nsdd** and **nsds** parameters cannot be used in the same command with the **npdd** and **npds** parameters.

The Default Global Title Conversion table can contain a maximum of 1000 entries.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **npds** and **nsds** parameters.

Notes

The use of asterisks (wildcards) is allowed only once for each direction of ANSI to ITU and ITU to ANSI. This provides a configurable default.

In the conversion direction of ANSI to ITU, an asterisk can be specified only for the ANSI **tta** parameter.

In the conversion direction of ITU to ANSI, the asterisk value must be specified for the **itu tti**, **np**, and **nai** parameters.

Asterisks are not allowed when conversion is in both directions (**dir=both**).

The suffix digit manipulation parameters **nsdd** and **nsds** cannot be specified in the same command with the prefix digit manipulation parameters **npdd** and **npds** parameters. The **npdd** and **nsdd** parameters specify how many digits to delete, if any, from the beginning or end respectively of the Global Title address digits. The **npds** and **nsds** parameters specify what digits, if any, to append to the beginning or end respectively of the Global Title address digits.

The **gtixlat** parameter is expressed in the form of the ANSI GTI and the ITU GTI. The **gtixlat** parameter is used to indicate the conversion of the Global Title Indicator between the ANSI and ITU standards. For example: A **gtixlat** value of **24** converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2.

Output

```
ent-gtcnv:dir=atoi:gtixlat=22:tta=10:tti=5

```

ent-gtt

Enter Global Title Translation

Use this command to add the routing object, DPC, and subsystem number for messages requiring global title translation. The translation is performed on the basis of the global title address (GTA) and translation type (TT) for each SS7 SCCP message directed to the STP's self-identity DPC or CPC with a routing indicator of 0, indicating a GTT is required.

If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept **-gtt** (Global Title Translation) and **-tt** (Translation Type) commands. Refer to the new command sets that replace the **-gtt** and **-tt** commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gtt**sel)
- GTT Set commands (**ent/dlt/rtrv-gtt**set)
- GTA commands (**ent/chg/dlt/rtrv-gta**).

See the "Notes" section of this command description for functions provided when various controlled features are turned on.

Keyword: ent-gtt

Related Commands: chg-gtt, dlt-gtt, rtrv-gtt

Command Class: Database Administration

Parameters

At least one of these parameters must be specified: **tt**n, **type/typea/typei/typen/typen24**.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:gta= (mandatory)

Global title address. This parameter specifies the beginning of a range of global title digits.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **pca**

Range: **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ri= (mandatory)

Route indicator. This parameter specifies whether a subsequent global title translation is required.

Range: **gt, ssn**

gt— Subsequent translation is required.

ssn— Subsequent translation is not required.

:xlat= (mandatory)

Translate indicator. This parameter specifies the type of global title translation to be performed.

Range: **dpc, dpcssn, dpcngt**

:egta= (optional)

Global title end address. This parameter specifies the end of a range of global title digits.

Range: **1-21 digits**

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: **egta** same as **gta**

:force= (optional)

When a final GTT is specified, the DPC and subsystem number must be configured in the mated application table (**xlat=dpc** and **ri=ssn**). The **force=yes** parameter allows you to override this restriction.

Range: **yes, no**

Default: **no**

:mapset= (optional)

MAP set ID.

Range: **1-36000 dflt**
 dflt—Default MAP set

:mrnset= (optional)

MRN set ID.

Range: **1-3000 none, dflt**
 dflt—Default MRN Set ID

 none—Removes the specified MRN Set ID from the MRN table

:ngt= (optional)

New global title. This parameter specifies the type of global title translation that will replace the received global title.

If the **xlat=dpcngt** parameter is specified, the **ngt** parameter must be specified. If the **xlat=dpcngt** parameter is not specified, the **ngt** parameter cannot be specified.

Range: **000-255**

:ngti= (optional)

New global title indicator code. When the ANSI-ITU-China SCCP Conversion and MGTT features are on and the Translated Point Code is of a different network type, the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

Range: **2, 4**

:nnai= (optional)

New nature of address indicator. This parameter specifies the nature of address indicator that will replace the received nature of address indicator.

Range: **0-127**
Default: **0xFFFF**

:nnp= (optional)

New numbering plan. This parameter specifies the numbering plan that will replace the received numbering plan.

Range: **0-15**
Default: **0xFFFF**

:npdd= (optional)

New prefix digits to be deleted. This parameter specifies the new prefix digits to be deleted that will replace the received prefix digits to be deleted.

Range: **0-21**
Default: **0**

:npds= (optional)

New prefix digits string. This parameter specifies the new prefix digits that will replace the received prefix digits string

Range: 1-21 digits
 If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.
 If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:nsdd= (optional)

New suffix digits to be deleted. This parameter specifies the new suffix digits to be deleted that will replace the received suffix digits to be deleted.

Range: 0-21

Default: 0

:nsds= (optional)

New suffix digits string. This parameter specifies the new suffix digits string that will replace the received suffix digits string.

Range: 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

Default: No digits

:ssn= (optional)

Subsystem number. This parameter specifies the subsystem address that will receive the message.

If the **xlat=dpcngt** parameter is specified, the **ssn** parameter must be specified. If the **xlat=dpcngt** parameter is not specified, the **ssn** parameter cannot be specified.

Range: 002-255

:ttm= (optional)

Translation type name. The name is of local significance only, and is related to the translation type.

Range: ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

:type/typea/typei/typen/typen24= (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

Range: 000-255

Default: No translation type is specified

Example

The lines in the following examples are wrapped for readability:

ent -

```

The following example specifies hexadecimal digits for the gta, egta, and npds parameters.

```

ent-
gtt:ttn=set1:xlata=dpcssn:ri=ssn:ssn=10:pc=1-1-1:gta=abcd:egta=abc
e:npds=fab

```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The end address must be greater than or equal to the start address.

The **pcn** parameter format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the **xlata=dpcngt** parameter is specified, the **ngt** parameter must be specified. If the **xlata** parameter value is not **dpcngt**, the **ngt** parameter cannot be specified.

Point code entries must be full point codes. Partial point codes are not allowed.

The start global title address length must be equal to the number of digits specified by the given translation type. If the VGTT (variable length GTT) feature is turned on, then up to 10 GTA lengths per translation type can be provisioned. When the **ent-gtt** command is entered to create entries, the

software keeps track of the lengths and allows only 10 different lengths. The global title address specified for the translation type must then have the same number of digits as an existing GTA.

If the end global title address is specified, its length must equal the length of the start global title address.

The maximum length of the resulting GTA string must not exceed 21 digits when translation is complete.

The MGTT feature must be on before the **nnp**, **nnai**, **nsdd**, **nsds**, **npdd**, and **npds** parameters can be specified.

If the **npdd** and **npds** parameters are specified, the **nsdd** and **nsds** parameters cannot be specified.

If the translation type is specified, then it must already exist and cannot be an alias.

If the translation type is ANSI (the **type** or **typea** parameter), the **pc** parameter type must be ANSI (the **pc** or **pca** parameter). If the translation type is an ITU type (the **typei**, **typen**, or **typen24** parameter), the **pc** parameter type must be an ITU type (the **pci**, **pcn**, or **pcn24** parameter).

The ANSI-ITU-China SCCP Conversion feature must be on before a translated point code and a translation type in different network types can be specified.

The **ngti** parameter can be specified only when the translated PC and the translation type are in different domains, or are both in the ITU domain.

If the **ngti=4** parameter is specified, the **nnp** and **nnai** parameters must be specified.

If the **ngti=4** parameter is specified, the translated PC cannot be ANSI. For ANSI PCs, the GTI value must be 2.

If the **ngti=2** parameter is specified, the **nnp** and **nnai** parameters cannot be specified.

The range, as specified by the start and end global title addresses, cannot exist in the global title translation data for the specified translation type. Each range may be contained completely within a previously defined range, in which case splitting is performed. However, if the ranges overlap, splitting cannot occur, the command is rejected, and a list of overlapped global title addresses is displayed. An example follows that shows what happens when the user attempts to enter a global title address range (such as 8005550000 to 8005559999) that overlaps an existing range. The overlapping links must match. If they do not, error message E2401 is generated displaying the list of overlapped global title addresses:

```
The following GTA ranges overlap the input GTA range
START GTA      END GTA
8005550000      8005551999
8005552000      8005553999
8005554000      8005555999
ENT-GTT: MASP A - Command Aborted
```

If a final GTT is specified with the **ri=ssn** parameter and the **xlat=dpc** parameter, and if the value of the **force** parameter is not **yes**, the point code must be configured in the Remote Point Code/MAP Table.

If the **xlat=dpcssn** parameter is specified, the point code and subsystem combination must be an existing subsystem in the subsystem table for the remote point code.

If the **xlat=dpcssn** parameter is specified, the **ssn** parameter must be specified. If the **xlat** parameter value is not **dpcssn**, the **ssn** parameter cannot be specified.

If the ANSI-ITU-China SCCP Conversion feature is not on, and the **xlat=dpcngt** parameter is specified, then a value for the **ngt** parameter must be specified, and the **ri=gt** parameter must be specified. If the value for the **xlat** parameter parameter is not **dpcngt**, then a value for the **ngt** parameter cannot be specified.

If the ANSI-ITU-China SCCP Conversion feature is turned on, and the **ngt** parameter is specified, then the **ri=gt** parameter must be specified.

If the ANSI-ITU-China SCCP Conversion feature is not on, the **ngt** parameter can be specified only if the **xlat=dpcngt** parameter is specified.

If the ANSI-ITU-China SCCP Conversion feature is turned on, the **ngt** parameter can be specified only if the **xlat=dpc** or the **xlat=dpcngt** parameter is specified.

Table 5-40 shows the valid combinations for the **xlat**, **ri**, **ssn**, and **ngt** parameters. All other combinations are rejected.

Table 5-40. Valid **ent-gtt** Routing Parameter Combinations

XLAT Value	RI Value	Routing Action	SSN Value	NGT Value
DPC	GT	Translate DPC only and route on GT	Cannot specify	Cannot specify unless ANSI-ITU-China SCCP Conversion is enabled
DPC	SSN	Translate DPC only and route on SSN	Cannot specify	Cannot specify
DPCSSN	GT	Translate DPC and SSN and route on GT	Must specify	Cannot specify
DPCSSN	SSN	Translate DPC and SSN and route on SSN	Must specify	Cannot specify
DPCNGT	GT	Translate DPC , new translation type (TT), and route on GT	Cannot specify	Must specify

If the XGTT feature is enabled, then the GTT table can have up to either 400,000 or 1,000,000 entries, depending on the controlled feature Part Number that is enabled. If XGTT is not enabled, then the GTT table can contain up to 269,999 user entries.

To enter this command, the Remote Point Code table cannot be full.

To enter this command, the subsystem table for primary remote point codes cannot be full.

If the **ri=ssn** parameter is specified, the **mrnset** parameter cannot be specified.

If the Flexible GTT Load Sharing feature is enabled, the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

If **ri=gt** is specified, the **mrnset** parameter must be specified.

If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

If the Flexible GTT Loadsharing feature is not enabled, the **mapset** parameter cannot be specified.

The **mapset** parameter can only be specified if the Flexible GTT Load Sharing feature is enabled, and the **ri=ssn** parameter is specified. If the **ri=ssn** parameter is specified, the **mapset** parameter must be specified. If the **ri=gt** parameter is specified, the **mapset** parameter cannot be specified.

The specified PC and SSN must exist in the specified MAP set.

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the **xlat=dpc** parameter is specified, and the **force** parameter is not specified as **yes**, the specified PC and MAP set must exist in the MAP table.

The MAP table must be accessible.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta**, **egta**, **npds** and **nsds** parameters.

Notes

The routing indicator provides routing instructions to the receiving signaling point. If the routing indicator specifies global title, global title translation then needs to be performed at another signaling point.

Up to 200,00 entries are allowed for an individual translation type if all SCCP cards are TSMs or DSMs.

The ANSI point code **0-0-0** and the ITU-I point code **0-000-0** are not valid point codes.

The EAGLE 5 ISS does not require a MAP table entry to be configured prior to provisioning a GTT entry. The EAGLE 5 ISS assumes that the GTT entry is for a solitary point code/subsystem and automatically creates a MAP entry for the point code/subsystem.

The suffix digit manipulation parameters **nsdd** and **nsds** are available only with the MGTT feature on. The **nsdd** and **nsds** suffix digit manipulation parameters cannot be specified together with the **npdd** and **npds** prefix digit manipulations parameters in the command.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

When the Flexible GTT Load Sharing feature and the Intermediate GTT Load Sharing feature are on, multiple relationships can be defined among a set of destination point codes in the MRN table that exists in the EAGLE 5 ISS. The relationship used in a particular translation is based on the GTA digits used for translation. The MRN set and the post-translation PC creates a key that is used to perform lookups in the MRN table. The lookup results in a set of alternate PCs, one of which is selected, based on the PCs relative cost, to route the MSU in the most cost-effective way.

When the FFGTTLS feature is turned on, multiple relationships can be defined among set of PC/SSNs in the existing MAP table. The relationship used in a particular translation is based on the GTA digits used for translation.

With the ANSI-ITU-China SCCP Conversion feature turned on, the Translated Point Code (**pc**, **pca**, **pci**, **pcn**, and **pcn24** parameters) can be of a different network type than the Translation Type (**type** parameter).

When the ANSI-ITU-China SCCP Conversion and MGTT features are on and the Translated Point Code is of a different network type, the **ngti** parameter specifies whether the new GTI translation format is GTI type 2 or GTI type 4.

When the MGTT feature is off, **ngti** cannot be specified and the Default GT Conversion Table is used for conversion. With the ANSI-ITU-China SCCP Conversion feature off, mixed network types are not allowed.

Output

ENT-GTT: MASP A - COMPLTD

;

ent-gtttsel**Enter GTT Selectors**

Use this command to assign applicable global title selectors to a GTT set (**gttsn**) for enhanced global title translations.

Keyword: ent-gtttsel

Related Commands: chg-gtttsel, dlt-gtttsel, rtrv-gtttsel

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin/gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry of **gtin=2** and **tt=4** cannot be entered.

Range: 2, 4

Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2, 4** and **gtin/gtin24=2, 4**

:tt= (mandatory)

Translation type.

Range: 0-255

:cdgtasn= (optional)

CdPA GTA GTT set name.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:cggtasn= (optional)

CgPA GTA GTT set name.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:cgpcsn= (optional)

CgPA PC GTT set name.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:cgssn= (optional)

CgPA subsystem number.

Range: 0-255

:gttsn= (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

The **gttsn** parameter can only be specified if the Origin-based SCCP Routing feature is off.

Range: ayyyyyyyy

1 leading alphabetic and up to 8 following alphanumeric characters.

:nai= (optional)

Nature of address indicator. The nature of address indicator can be specified by a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv**

parameter, but not both, can be specified. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **sub, rsvd, natl, intl, dflt**

:naiv= (optional)

Nature of address indicator value. The nature of address indicator can be specified by a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **0-127**

:np= (optional)

Numbering plan. The numbering plan can be specified by a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **e164, generic, x121, f69, e210, e212, e214, private, dflt**

:npv= (optional)

Numbering plan value. The numbering plan can be specified by a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **0-15**

:selid= (optional)

Selector ID.

Range: **0-65534**

Example

ent-gttssel:gtin=4:tt=60:npv=5:naiv=5:cdgtasn=setcdgta
ent-gttssel:gtin=4:tt=60:npv=5:naiv=6:cgpcsn=setcgpc:cgssn=112
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The **np** and **npv** parameters cannot be specified in the same command.

The **nai** and **naiv** parameters cannot be specified in the same command.

The **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** parameters cannot be specified.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np/npv** and **nai/naiv** parameter combinations cannot be specified.

If the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. These parameters can be specified in any combination: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

For existing TTs with **gtii/gtin/gtin24=4**, the domain of the new entry must match the existing domain.

The **gttsn=none** parameter cannot be specified.

An entry cannot already exist that matches the **gti**, **tt**, and **np(v)** and **nai(v)** parameter combination for the specified CdPA selector.

An entry cannot already exist that matches the **gtii**, **tt**, and **np(v)** and **nai(v)** parameter combination for the specified CdPA selector.

An entry cannot already exist that matches the specified **gtin**, **tt**, and **np(v)** and **nai(v)** combination of parameters for the specified CdPA selector.

The **gttsn** value cannot already exist for the **gtin24**, **tt**, **np/npv/nai/naiv** parameter combination for the specified CdPA selector.

The network domain of the specified GTT selector must match the domain of the GTT set specified by the **cdgtasn** parameter or **gttsn** parameter, unless the network domain (**netdom** parameter) of the existing GTT set has a value of **cross**.

At least one of the **cdgtasn**, **cggtasn**, or **cgpcsn** parameters must be specified.

If the **cgssn** and/or the **selid** parameter is specified, the **cggtasn** or the **cgpcsn** parameter must be specified.

The GTT selector table must not have more than 5 **nai** entries per **tt-np** combination.

The Origin-based SCCP Routing feature must be enabled before the **cggtasn**, **cgpcsn**, **cgssn**, **selid**, or **cdgtasn** parameters can be specified.

The **cdgtasn** or **cgpcsn** parameter value cannot already exist for the specified **gtin24**, **tt**, **np/npv/nai/naiv** parameter combination.

An entry cannot already exist that matches the **gtii**, **tt**, and **np(v)** and **nai(v)** parameter combination for the specified CgPA selector.

An entry cannot already exist that matches the specified **gti**, **tt**, and **np(v)** and **nai(v)** combination of parameters for the specified CgPA selector.

An entry cannot already exist that matches the **gtin**, **tt**, and **np(v)** and **nai(v)** parameter combination for the specified CgPA selector.

The SSNSELID Table cannot contain more than 10,000 entries.

The GTTSET network domain for the **cggtasn** and **cgpcsn** parameters must match the domain indicated by the **gti** parameter.

The set types for the **cggtasn** and **cgpcsn** parameters must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggt**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The GTT set specified by the **cggtasn** and **cgpcsn** parameters must exist in the database before it is assigned to a GTT selector.

The **cggtasn** and **cgpcsn** parameters cannot be specified in the same command.

The **gttsn** parameter value must match the name of an existing GTT Set.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

For **gtti/gtin=4**, although DFLT may appear in the **rtrv-gttset** output, **dflt** cannot be specified as value for the **np** or **nai** parameters when the **ent-gttset** command is entered. If a new GTT selector is specified that matches an existing GTT selector's **gti** and **tt** and the existing selector has **dflt** as the value for the **np** and/or **nai** parameters, a new entry is created with the new **np** and **nai** parameter values. The existing GTT selector entry with the **dflt** value is also retained. The **np/nai** parameter value **dflt** can be specified for the **chg/dlt/rtrv-gttset** commands.

The Origin-based SCCP Routing feature allows two GTT sets to be assigned to a GTT selector: **cdgtasn** and **cggtasn** or **cdgtasn** and **cgpcsn**. The **cggtasn** and **cgpcsn** GTT sets are mutually exclusive and cannot be assigned to the same GTT selector.

Output

```
ent-gttset:gtia=2:tt=9:gttsn=lidb
rlghncxa03w 04-02-18 08:50:27 EST EAGLE 31.3.0
ENT-GTTSEL: MASP A - CMPLTD
;
```

ent-gttset

Enter GTT Set

Use this command to specify the attributes of a new GTT set (a set of global title translations). A GTT set consists of a GTT set name, the number of digits allocated for the GTA (global title address), the domain of the point codes used in the translation, and a pointer to a GTA tree. After the GTT set is provisioned, you can enter subsequent GTT Selector commands and GTA commands.

Keyword: ent-gttset

Related Commands: chg-gttset, chg-gttset, dlt-gttset, rtrv-gttset

Command Class: Database Administration

Parameters

:gttsn= (mandatory)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

Range: ayyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

:netdom= (mandatory)

Network domain. This command does not distinguish between ITU national or ITU international because the Enhanced Global Title Translation (EGTT) feature does not discriminate between the ITU-I and ITU-N translations.

The **netdom** parameter refers to the incoming message network domain.

Range: ansi, itu, cross

:ndgt= (optional)

Number of digits. This parameter specifies the number of digits required for GTAs (global title addresses) associated with this GTT set. This parameter is not valid if the VGTT (Variable Length GTT) feature is turned on or if the value of the **settype** parameter is **cgpc**, **cgssn**, or **opc**.

Range: 1-21

Default: 6

:settype= (optional)

GTT set type.

NOTE: This parameter is mandatory if the Origin-based SCCP Routing feature is on.

Range: cdgta, cggta, cgpc, cgssn, opc

Example

```
ent-gttset:gttsn=lidb:ndgt=10:netdom=ansient-
gttset:gttsn=t800:netdom=ansi
ent-gttset:gttsn=setint000:netdom=itu:ndgt=15
ent-gttset:gttsn=setcdgt:netdom=cross:ndgt=10:settype=cdgta
ent-gttset:gttsn=setcggg:netdom=ansi:ndgt=11:settype=cggta
ent-gttset:gttsn=setxyz:netdom=ansi:ndgt=11:settype=cggta
ent-gttset:gttsn=setopc:netdom=itu:settype=opc
ent-gttset:gttsn=setcgpc:netdom=ansi:settype=cgpc
ent-gttset:gttsn=setssn:netdom=ansi:settype=cgssn
```

Dependencies

The EGTT feature must be turned on before this command can be entered.

The GTT Set table cannot contain more than 2000 entries.

The **gttsn=none** parameter cannot be specified.

If the VGTT (Variable Length GTT) feature is turned on, the **ndgt** parameter cannot be specified.

The **gttsn** parameter must be specified and must not match an existing **gttsn**.

The **ndgt** parameter cannot be specified if the value of the specified **settype** parameter is **cgssn**, **opc**, or **cgpc**.

The **netdom=cross** parameter can be specified only if the **settype=cdgta** parameter is specified.

The Origin-based SCCP Routing feature must be turned on if the value of the **settype** parameter is **cggta**, **cgssn**, **opc**, or **cgpc**.

If the Origin-based SCCP Routing feature is enabled, the **settype** parameter is mandatory.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **netdom=cross** parameter can be specified.

Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

When the Origin-based SCCP Routing feature is turned on, VGTT is supported only for CdPA GTA and CgPA GTA. The **cross** network domain is supported only for CdPA GTA.

Output

```
ent-gttset:gttsn=lidb:ndgt=10:netdom=ansi
rlghncxa03w 04-02-19 08:20:17 EST EAGLE 31.3.0

ENT-GTTSET: MASP A - CMPLTD
;
```

ent-gws-redirect

Enter Gateway Screening Redirect Command

Use this command to provision the gateway screening redirect function. The Redirect table must be provisioned before configuring gateway screening to redirect received MSUs. The values that are

specified with this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected. For example, if the **ri=gt** parameter is specified, the value **gt** is set for the routing indicator in the called party address (CDPA) of the MSU being redirected.

Keyword: ent-gws-redirect

Related Commands: chg-gws-redirect, dlt-gws-redirect,

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

Specifies the value used to set the ANSI destination point code field in the routing label of the MSU that is being redirected. The ANSI point code has subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (mandatory)

Destination point code.

:dpci= (mandatory)

Specifies the value used to set the ITU international destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *zone-area-id*.

Range: 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

zone—0-7

area—000-255

id—0-7

:dpcn= (mandatory)

Specifies the value used to set the ITU national destination point code field in the routing label of the MSU that is being redirected. The point code is in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) when the **chg-stpopts:npcfmti** flexible point code option is on. A group code (*gc*) must be specified when the ITUDUPPC feature is on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

Range: 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

Specifies the value used to set the 24-bit ITU national destination point code field in the routing label of the MSU that is being redirected. The point code has subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:gta= (mandatory)

Specifies the value used to set the global title address (dialed digits) in the SCCP called party address of the MSU being redirected.

Range: 1-21 digits

:ri= (mandatory)

Specifies the value used to set the routing indicator in the SCCP called party address of the MSU being redirected. Use the **gt** value to route by global title digits or use the **ssn** value to route by subsystem number.

Range: **gt, ssn**

:ssn= (mandatory)

Specifies the value used to set the subsystem number (SSN) in the SCCP called party address of the MSU being redirected. This number is the SSN of the SCP to which all MSUs meeting the redirect criteria are to be redirected.

Range: **000-255**

:ssn= (mandatory)

Identifies the type of the global title translation (GTT). It is the decimal representation of the 1-byte field used in SS7. This value is used to set the type of the GTT in the SCCP called party address of the MSU being redirected.

Range: **000-255**

:tt= (mandatory)

identifies the type of the Global Title Translation. It is the decimal representation of the 1-byte field used in SS7.

Range: **000-255**

:enabled= (optional)

Specifies whether MSUs that have passed gateway screening are to be redirected (**enabled=on**) or routed as normal (**enabled=off**).

Range: **on, off**

Default: **on**

Example

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=on
```

```
ent-gws-redirect:dpc=1-40-1:ri=ssn:ssn=10:tt=1:gta=1800833:enabled=off
```

Dependencies

The **dpc/dpca/dpci/dpcn/dpcn24** parameter must be defined in the Destination table or defined as the STP site point code.

If the **dpc/dpca/dpci/dpcn/dpcn24** parameter is defined as a destination, it must have at least one route defined.

The redirect function data can be entered only once.

Notes

The SCCP screening functions (CGPA, TT, CDPA, and AFTPC) cannot select an MSU to be redirected.

Do not apply a Redirect Stop Action on the Adjacent Node point code for the BLKOPC and OPC screening functions.

Do not apply a Redirect Stop Action for an allowed DPC screen rule if the rule contains the self-identity point code of EAGLE 5 ISS where the screening rule is applied. This is because the redirection of SLTAs and SLTMs (Signal Link Test Messages and Acknowledgements) will not return to the originating EAGLE 5 ISS and will cause the link to fail.

If **gwsa=off** and **gws=off** are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

Output

```
ent-gws-redirect:dpc=1-40-1:ri=gt:ssn=10:tt=1:gta=180833:enabled=
on
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENT-GWS-REDIRECT: MASP A - COMPLTD
;
```

ent-home-smsc

Enter HOME SMSC Address

Use this command to enter HOME SMSC specific addresses, currently used to identify Short Message Service Centers in the database. This command updates the HOME SMSCADDR table.

Keyword: ent-home-smsc

Related Commands: dlt-home-smsc, rtrv-home-smsc

Command Class: Database Administration

Parameters

:smsc= (mandatory)

Identifies the type of the Short Message Service Center address.

Range: 1-21 digits

1-21 hexadecimal digits. Valid digits are **0-9, a-f, A-F**

Example

```
ent-home-smsc:smsc=256489
```

```
ent-home-smsc:smsc=256489a98bccee56ad237
```

Dependencies

The Portability Check for Mobile Originated SMS (MNP SMS) controlled feature must be enabled (**enable-dtrl-feat** command) and turned on before this command can be entered.

The specified HOME SMSC address cannot already exist in the HOME SMSCADDR table.

The HOME SMSCADDR table can contain a maximum of 500 entries.

Notes

None

Output

```

ent-home-smsc:smc=256489
rlghncxa03w 04-02-28 08:50:12 EST EAGLE 31.3.0
ENT-HOME-SMSC: MASP A - COMPLTD
;

```

ent-homern**Enter Home Routing Number Prefix**

Use this command to enter up to 100 routing number prefixes for the operating network into the HOMERN table.

Keyword: ent-homern

Related Commands: dlt-homern, rtrv-homern

Command Class: Database Administration

Parameters

:rn= (mandatory)

The home routing number prefix.

Range: 1-15 digits

1-15 hexadecimal digits (**0-9, a-f, A-F**)

Example

```
ent-homern:rn=C441234
```

Dependencies

The INP or G-Port feature must be turned on before this command can be entered.

The HOMERN table cannot be full.

The routing number must not already exist in the HOMERN table.

A value of **none** cannot be specified for the **rn** parameter.

Notes

None

Output

```

ent-homern:rn=C441234
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
HOMERN table is (1 of 100) 1% full
ENT-HOMERN: MASP A - COMPLTD
;

```

ent-ip-host**Enter Internet Protocol Hostname**

Use this command to configure the IP Host table. The IP Host table defines local and remote host names for IP addresses.

Keyword: ent-ip-host

Related Commands: dlt-ip-host, rtrv-ip-host

Command Class: Database Administration

Parameters**:cap=** (mandatory)

The maximum percentage of ethernet capacity for this node connection. This capacity is added to other connections to this node for the total capacity of the node.

Range: **0-100**

:ipaddr= (mandatory)

The node's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

:ipappl= (mandatory)

The IP application supported by the node.

Range: **stplan**

Default: Default value not given

:ipappl= (mandatory)

The IP application supported by the node.

Range: **stplan**

Default: Default value not given

:ipport= (mandatory)

The logical IP port that addresses the application on the node.

Range: **1024-5000**

Default: The logical IP port is not given.

:loc= (mandatory)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

:iprte= (optional)

The default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

Range: **1-223, 0-255**

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

Example

```
ent-ip-  
node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=1  
5 :iprte=193.4.201.84
```

Dependencies

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The node IP address cannot be **127.x.x.x**, where **x** is a number from **1** to **254**.

The specified card location must be equipped with a TCP/IP data link.

The IP address must be unique to the TCP/IP link table and to the TCP/IP nodes.

Only one node can be connected for each data link and each application. The IP address, IP application, and card location combination must be unique in the database.

The IP port on each node cannot be assigned to another application. The IP address and IP port combination must always use the same IP application.

The class of the IP address (**ipaddr**) must match the class of the assigned TCP/IP data link's IP address. The system supports three classes of IP addresses, Class A, Class B, and Class C. Class A IP addresses can contain only the values **1** to **126** in the first field of the IP address. Class B IP addresses can contain only the values **128** to **191** in the first field of the IP address. Class C IP addresses can contain only the values **192** to **223** in the first field of the IP address.

The network portion of the IP address (**ipaddr**) must match the network portion of the IP address assigned to the TCP/IP data link. The network portion of the IP address is based on the class of the IP address. If the IP address is a Class A IP address, the first field is the network portion of the IP address. If the IP address is a Class B IP address, the first two fields are the network portion of the IP address. If the IP address is a Class C IP address, the first three fields are the network portion of the IP address.

If the network portion and class of the IP address of the TCP/IP node matches the class of the assigned TCP/IP data link's IP address, the **iprte** parameter cannot be specified. The **iprte** parameter can be specified only with the **ent-ip-node** command when the network portion and class of the TCP/IP node does not match the class of the assigned TCP/IP data link's IP address. The values of the **ipaddr** parameter, the IP address of the TCP/IP node, and the **iprte** parameter cannot be the same.

The capacity of all connections to the given node cannot be greater than 100%.

Notes

If the IP address is a Class A IP address, do not use the IP addresses **127.x.x.x**, where **x** is a number from **1** to **254**. These addresses are reserved for loopback.

Output

```

ent-ip-
node:ipaddr=13.49.210.50:ipappl=stplan:ipport=1024:loc=1201:cap=1
5 :iprte=193.4.201.84

```

ent-ip-rte

Enter IP Route

Use this command to configure the destination IP address, subnet mask, and the gateway IP address for the specified card in the Static IP Route table.

Keyword: ent-ip-rte

Related Commands: dlt-ip-rte, rtrv-ip-rte

Command Class: Database Administration

Parameters

:dest= (mandatory)

Destination IP Address. The IP Address of a remote destination host or network to be reached.

Range: 4 numbers separated by dots, with each number in the range of 0–255.

The IP address 0.0.0.0 is not valid.

:gtwy= (mandatory)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (**dest**) to the next-hop gateway router or final destination host.

Range: 4 numbers separated by dots, with each number in the range of 0–255.

The IP address 0.0.0.0 is not valid.

:loc= (mandatory)

Card location. The unique identifier of a specific IP card in the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:submask= (mandatory)

The subnet mask of the destination IP address, in the form of an IP address with a restricted range of values. This parameter is required if the **ipaddr** parameter is entered.

Range: The value must be valid for the class of the entered IP address.

Table 5-41. Valid Subnet Mask Values

Valid for Class A Networks	Valid for Class A or B Networks	Valid for Class A, B, or C Networks
255.0.0.0	255.255.0.0	255.255.255.0
255.192.0.0	255.255.192.0	255.255.255.192
255.224.0.0	255.255.224.0	255.255.255.224
255.240.0.0	255.255.240.0	255.255.255.240
255.248.0.0	255.255.248.0	255.255.255.248
255.252.0.0	255.255.252.0	255.255.255.252
255.254.0.0	255.255.254.0	
255.255.128.0	255.255.255.128	

The value **255.255.255.255** must be specified if the destination IP address represents a host address.

If the destination IP address represents a network address, a value must be specified that identifies the network ID and host ID portions of the address.

Example

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

```
ent-ip-
rte:loc=1301:dest=126.252.0.0:submask=255.255.0.0:gtwy=140.188.13
.34
```

Dependencies

The specified destination IP address (**dest** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must be unique per card
- Must not reside on this card's A or B local network

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)
- Must correspond to a host IP address that resides on this card's A or B local network

The IP address must be defined for the A or B network, or both, for the card before this command can be entered. (See the **chg-ip-card** command.)

Each destination IP address entered into the Static IP Route table must be unique for the card.

A maximum of 64 static IP routes can be defined for a card.

A maximum of 1024 static IP routes can be defined in the IP Route table.

The **loc** parameter value must correspond to a DCM or SSEDCCM card running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application.

The network address specified by the **dest** and **submask** parameters must be different from the network address specified by the **pvn** and **pvnmask** parameter of the NETOPTS table.

Notes

The Static IP Route table is used to store static IP route entries. Static routes are maintained across card initialization, failures, and reloads. These types of routes are used when the IP Layer cannot determine routes dynamically. Static IP route entries can be added or deleted dynamically.

Output

```
ent-ip-rte:loc=1301:dest=128.252.10.5:submask=255.255.255.255:
gtwy=140.188.13.33
```

```
rlghncxa03w 04-01-17 15:35:05 EST EAGLE 31.3.0
```

```
IP Route table is (1 of 256) 1% full
```

```
ENT-IP-RTE: MASP A - COMPLTD
```

```
;
```

ent-lbp

Enter Loopback Point

Use this command to assign a far-end loopback point for testing data signaling link elements in a SS7 transmission path.

Keyword: ent-lbp

Related Commands: act-lbp, chg-lbp, dact-lbp, dlt-lbp, rtrv-lbp

Command Class: Database Administration

Parameters

:lbp= (mandatory)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to *and including* the target device).

Range: 1-32

:link= (mandatory)

SS7 signaling link. The SS7 signaling link that is to be tested.

Synonym: port

Range: a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

:loc= (mandatory)

Card location. The unique identifier of a specific application subsystem located in the STP.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:rle= (mandatory)

Remote link element. The link element to be looped back for testing.

Range: ds0, ocu, csu, dsu, nei

:cli= (optional)

The Common Language Location Identifier (CLLI) code, or other mnemonic identifier, used to refer to the given loopback point.

Range: *ayyyyyyyyy*

1 alphabetic character followed by up to 10 alphanumeric characters.

:lfst= (optional)

Link fault sectionalization test. The type of link fault sectionalization loopback test to be performed.

Range: **llt**, **nlt**

llt — latching loopback test

nlt — nonlatching loopback test

:rep= (optional)

Repetition count. The number of link elements of the same type (not including the target device) that lie between the STP and the link element to be tested.

Range: **0-31**

Default: **0**—If the link element to be looped back for testing is NEI (**rle=nei** is specified)

0—If the LFS test is NLT (non-latched); **lfst=nlt** is specified

0—If no other LBP for this link has the same **rle** value

1-30—Next sequential number for subsequent loopback points of the link to be tested (**rle** is specified as anything but **nei**)

Example

ent -

lbp:loc=1101:link=a:lbp=1:rle=ds0:lfst=llt:rep=0:cli=r lghncxa05w

ent - lbp:loc=1101:port=a:lbp=2:rle=nei:lfst=llt

ent -

lbp:loc=1205:port=a1:lbp=1:rle=ds0:lfst=llt:cli=r lghncxa05w:rep=1

Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location (**loc** parameter) must be equipped.

The **rle=ds0** parameter and the **rle=nei** parameter cannot be specified when the **lfst=nlt** parameter is specified. The DS0 and Network Element Interface (NEI) link elements do not support non-latching loopbacks.

If the **rle=nei** parameter is specified, the **rep=0** parameter must be specified.

The **rep** parameter can be specified only if the **lfst=llt** parameter is specified.

Each specified **rep** parameter value must be greater than any previously specified **rep** value and less than any subsequent specified **rep** value.

The specified **cli** cannot be a reserved word.

The loopback point (LBP) cannot have been previously defined.

The value specified for the **lbp** parameter cannot exceed the **lbp** parameter value previously defined for a loopback point with **rle=nei** specified.

For each SS7 signaling link, only one loopback point with **rle=nei** specified can be defined.

The **rep** parameter must be specified if taking the default value results in duplicate **rep** values for loopback points.

The loopback point with **rle=nei** specified must be the terminating SS7 signaling link element.

The card location must contain a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card that is running an **ss7ansi** or **ccs7itu** application.

The card location (**loc** parameter) must not be reserved by the system.

Notes

None

Output

```
ent - lbp: loc=1101: link=a: lbp=2: rle=nei: lfst=llt
rlghncxa03w 05-02-17 15:35:05 EST EAGLE5 33.0.0
ENT-LBP: MASP A - COMPLTD
;
```

ent-lnp-lrn

Enter LNP Location Routing Number

Use this command to enter a location routing number (LRN) and its corresponding message relay override global title translations into the database. This command updates the LNP LRN Table. This command can assign a maximum of two overriding message relay global title translations at a time. If an LRN already exists, only the newly defined override service is added.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: ent-lnp-lrn

Related Commands: chg-lnp-lrn, dlt-lnp-lrn, rtrv-lnp-lrn

Command Class: LNP Database

Parameters

:lrn= (mandatory)

The location routing number.

Range: 10 digits

:nmrgt1= (optional)

New message relay global title entry 1. The arguments allow default global title translations to be incrementally changed by entering the **nmrgt1** and **nmrgt2** parameters several times. When **nmrgt1** or **nmrgt2** parameters are used, the argument values must *all* be entered and separated by a comma (,) or a dash (-) in the order *tt-pc-ssn-xlat-ri-ngt-rgta*.

Range: *tt-pc-ssn-xlat-ri-ngt-rgta*

tt—Translation type, in the range **000-255**

pc—ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

- When **chg-sid:pctype=ansi** is specified,
 - *ni*—**001-255**.
 - *nc*—**001-255** if *ni* = **001-005**.
 - *nc*—**000-255** if *ni* = **006-255**
 - *ncm*—**000-255**
- The point code **000-000-000** is not a valid point code.

ssn—Subsystem number, in the range **000-255**
xlat—Translate; valid values are **dpc**, **dpcssn**, **dpcngt**
ri—Routing indicator; valid values are **gt**, **ssn**
ngt—New global title translation; in the range **0-255**
rgta—Replace global title address (TN) with LRN; valid values are **yes**, **no**

:nmrgt2= (optional)

New message relay global title entry 2. The arguments allow default global title translations to be incrementally changed by entering the **nmrgt1** and **nmrgt2** parameters several times. When **nmrgt1** or **nmrgt2** parameters are used, the argument values must *all* be entered and separated by a comma (,) or a dash (-) in the order *tt-pc-ssn-xlat-ri-ngt-rgta*.

Range: *tt-pc-ssn-xlat-ri-ngt-rgta*

tt—Translation type, in the range **000-255**

pc—ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

- When **chg-sid:pctype=ansi** is specified,
 - *ni*—**001-255**.
 - *nc*—**001-255** if *ni* = **001-005**.
 - *nc*—**000-255** if *ni* = **006-255**
 - *ncm*—**000-255**
- The point code **000-000-000** is not a valid point code.

ssn—Subsystem number, in the range **000-255**
xlat—Translate; valid values are **dpc**, **dpcssn**, **dpcngt**
ri—Routing indicator; valid values are **gt**, **ssn**
ngt—New global title translation; in the range **0-255**
rgta—Replace global title address (TN) with LRN; valid values are **yes**, **no**

:sp= (optional)

Service provider ID.

Range: *xyyy*
1-4 alphanumeric characters

Default: Null or current value.

Example

**ent - lnp - lrn : lrn=1234567891 : sp=a123 : mrgt1=16-233-233-233-20-
dpcssn-ssn-0-no**

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

When **mrgt1** parameter or the **mrgt2** parameter is specified, the constituent values must be entered in this order: **tt**, **pc**, **ssn**, **xlat**, **ri**, **ngt**, **rgta**

An existing override service cannot be assigned to an existing LRN.

The same TT value cannot be specified more than once.

When the **xlat=dpcssn** parameter is specified, the **ssn** parameter value must not be zero.

When the **xlat** parameter is specified with a value other than **dpcssn**, **ssn=0** must be specified.

When a value other than **dpcngt** is specified for the **xlat** parameter, **ngt=0** must be specified.

When the **xlat=dpcngt** parameter is specified, the **ri=gt** parameter must be specified.

The point code must be an ANSI point code, and it must be a valid DPC (**0-0-0** is not a valid ANSI point code) that exists in the routing table. Point code entries must be full point codes. Partial point codes are not allowed.

The MRGT# message relay translation type must not already be assigned.

The MRGT# message relay translation type must be a reserved service for LNP.

The MRGT# message relay translation type must not be the TT associated with the AIN, IN, PCS, LNPQS, or WNP service.

The service provider must be specified if not already assigned, and it must match a service provider that is already assigned.

The LRN and SP tables must not be full.

Notes

The maximum number of service provider IDs allowed is 10,000.

The LNP EAGLE 5 ISS stores the 10-digit override global title NGT (new global title) value on a per service, point code, and subsystem combination basis. This design allows a user to always modify the NGT field for all LRNs assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 10-digit override (LRN) global title translation entered.

When an NGT field is modified or assigned to a particular LNP 10-digit override global title translation (either via the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing LRN entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 10-digit override (LRN) global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Output

```
ent - lnp - lnr : lnr=1234567891 : sp=a123 : mrgt1=16 - 233 - 233 - 233 - 20 -
dpcssn - ssn - 0 - no
```

```

ent-lnp-npanxx

Enter LNP NPANXX

Use this command to enter an LNP NPANXX and its associated LNP default global title translations into the database.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: ent-lnp-npanxx

Related Commands: chg-lnp-npanxx, dlt-lnp-npanxx, rtrv-lnp-npanxx

Command Class: LNP Database

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:npanxx= (mandatory)

Numbering plan area.

Range: 6 digits

:gt1= (optional)

Default global title entry 1.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ngt*
tt—translation type; value **0-255**
ni—network indicator; value **0-255**
nc—network cluster; value **0-255**
ncm—network cluster member; value **0-255**
ssn—subsystem number; value **0-255**
xlat—translate; value **dpc, dpcssn, dpcngt**
ri—route indicator; value **gt, ssn**
ngt—new global translation type; value **0-255**

:gt2= (optional)

Default global title entry 2.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ngt*
tt—translation type; value **0-255**
ni—network indicator; value **0-255**
nc—network cluster; value **0-255**
ncm—network cluster member; value **0-255**
ssn—subsystem number; value **0-255**
xlat—translate; value **dpc, dpcssn, dpcngt**
ri—route indicator; value **gt, ssn**
ngt—new global translation type; value **0-255**

:mr= (optional)

Message relay 10-digit TN search indication.

Range: **yes, no**

Default: **yes**

Example

ent - lnp - npanxx : npanxx=111111

ent - lnp - npanxx : npanxx=111111 : mr=no : gt1=16 - 233 - 233 - 233 - 0 - dpcngt - gt - 18

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The MR portability indicator defaults to an active MR portable NPANXX indication.

Translation type values associated with PCS, LNPQS, or WNP LNP queries are not allowed to be administered as NPANXX default message relay global title translations.

If the NPANXX has already been created, at least one optional parameter must be specified.

The **mr** parameter applies only to message relay default global title translations, and means a 10-digit search for ported TN's is allowed for this NPANXX.

The **mr** parameter is valid only if message relay default global title translations are assigned.

The message relay global title must exist in the route table.

The LNP query default global title point code must exist in the route table, or must be the EAGLE 5 ISS true point code and LNP subsystem.

The **gt1** and **gt2** parameters can be used to administer default message relay or LNP query global title.

The **gt1** and **gt2** parameters translation type must not already be assigned, and they must be a reserved service for the LNP

The NPANXX table cannot be full.

The same translation type value cannot be specified more than once.

When the **xlat=dpcssn** parameter is specified, the **ssn** parameter value must not be zero.

When the **xlat** parameter is specified with a value other than **dpcssn**, **ssn=0** must be specified.

When a value other than **dpcngt** is specified for the **xlat** parameter, **ngt=0** must be specified.

When the **xlat=dpcngt** parameter is specified, **ri=gt** must be specified.

The point code must be an ANSI point code, and it must be a valid DPC (**0-0-0** is not a valid ANSI point code). Point code entries must be full point codes. Partial point codes are not allowed.

The subsystem number (**ssn**) parameter must be in the LNP database.

Notes

You can enter this command several times for the same NPANXX to incrementally add default global title translations.

The maximum number of NPANXX entries allowed is 150,000.

The LNP EAGLE 5 ISS stores the 6-digit default global title NGT (new global title) value on a per service, point code, and subsystem combination basis, not on an NPA-NXX basis. This design allows a user to modify the NGT field for all NPA-NXXs assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 6-digit default (NPA-NXX) global title translation entered.

When an NGT field is modified or assigned to a particular LNP 6-digit global title translation (either via the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing NPA-NXX entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 6-digit default (NPA-NXX) global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Output

```
ent - lnp-npanxx : npanxx=111111
rlghncxa03w 04-01-18 08:50:12 EST EAGLE 31.3.0
ENT-LNP-NPANXX: MASP A - COMPLTD
;
```

ent-lnp-serv**Enter LNP Service**

Use this command to reserve an LNP translation type for a unique LNP service. The available services include up to five query services (**ain**, **in**, **pcs**, **lnpqs**, and **wnp**) and any combination of six message relay or user-defined services. Translation type names can also be defined and are defaulted to the corresponding reserved service type names.

A maximum of 10 LNP services can be assigned in systems with up to 12 million numbers, and a maximum of 14 LNP services can be assigned in systems with more than 12 million numbers (using ELAP). Two of these assigned services will always be reserved for administration of AIN and IN Translation Types. Administration of Message Relay user defined services will also be allowed.

Keyword: ent-lnp-serv

Related Commands: chg-lnp-serv, dlt-lnp-serv, rtrv-lnp-serv

Command Class: Database Administration

Parameters

:serv= (mandatory)

Reserved service type name.

Range: **ain, in, pcs, wnp, class, lidb, cnam, isvm, lnpqs, wsmcsc, udf1, udf2, udf3, udf4**

:alias= (optional)

The alias translation type.

Range: **000-255**

:dv= (optional)

Digits valid.

Range: **sccp, tcap**

Default: **sccp**—If **serv= class, lidb, cnam, isvm, wsmcsc, udf1, udf2, udf3, udf4**
tcap—If **serv= ain, in, pcs, wnp, lnpqs**

:tt= (optional)

Translation type.

Range: **000-255**

:ttn= (optional)

User defined TT name.

Range: **aaaaaaaa**

1 to 8 alphabetic characters, the value **none** is not allowed.

Default: Reserved service type name (**serv** parameter)

Example

ent-lnp-serv:serv=lidb:tt=16:dv=tcap:ttn=mr lidb

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

To specify the **nserv=pcs** parameter, the PCS 1900 LNP (PLNP) feature must be turned on.

To specify the **nserv=wnp** parameter, the WNP feature must be turned on.

To specify the **serv=wsmcsc** parameter, the LNP SMS feature must be turned on.

The **tt** parameter, the **ttn** parameter, and the **dv** parameter cannot be specified in the same command with the **alias** parameter.

The **tt** parameter must be specified if the **alias** parameter is not specified in the command.

NONE is considered a reserved name; it cannot be used for a translation type name (**ttn** parameter).

The value for the **dv** parameter must be **sccp** when a user-defined service type value is specified for the **serv** parameter.

The value for the **dv** parameter must be **tcap** when the **lnpqs**, **ain**, **in**, **pcs**, or **wnp** value is specified for the **serv** parameter.

A reserved service type name can be specified for the **ttt** parameter only if it matches the **serv** parameter value.

Neither the translation type (**tt**) parameter nor the translation type name (**ttt**) parameter can already exist in the LNP database.

The service type (**serv**) parameter must not exist in the LNP database when you are assigning a true translation type (**tt**).

LNP database when you are assigning a true translation type (**tt**) parameter.

A maximum of 6 Message Relay services are allowed.

When an **alias** is specified in the command, the service type for the **alias** must already have a true translation type assigned.

When the **alias** parameter is specified, its value cannot already exist in the LNP database as a true translation type for this service.

When the **alias** parameter is specified, the specified alias cannot be in use.

When the **tt** parameter is specified, its value cannot already exist in the LNP database as an **alias** for this service.

Notes

Translation type names must be unique for LNP services.

A translation type name can be a reserved service type name only if it matches the specified service.

When the LNP feature is on for up to 12 million TNs (see the **enable-ctrl-feat** command), the LNP services CLASS, CNAM, LIDB, and ISVM must be in the OAP configuration in the EAGLE 5 ISS database. You must update the OAP configuration (with the **act-oap-config** command) whenever you perform the following actions:

- Add LNP services to the database (with the **ent-lnp-serv** command).
- Remove services from the database (with the **dlt-lnp-serv** command).
- Change services (with the **chg-lnp-serv** command).

As a reminder, the following warning message is displayed:

CAUTION: LNP service TTs have changed, OAP configuration is required

Output

```
ent-lnp-serv:serv=lidb:tt=16:dv=tcap:ttt=mr lidb
rlghncxa03w 02-11-18 08:50:12 EST EAGLE 30.0.0
ENT-LNP-SERV: MASP A - COMPLTD
;
```

ent-lnp-sp

Enter LNP Service Provider

Use this command to enter an LNP service provider.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS.

Keyword: ent-lnp-sp

Related Commands: dlt-lnp-sp, rtrv-lnp-sp

Command Class: LNP Database

Parameters

:sp= (mandatory)
Service provider ID
Range: xyyy
1-4 alphanumeric characters

Example

ent - lnp - sp : sp=a123

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The service provider must not already exist in the LNP database.

The LNP SP table cannot be full.

Notes

The maximum number of service provider IDs allowed is 10,000.

Output

```
ent - lnp - sp : sp=a123
rlghncxa03w 04-01-29 16:40:40 EST EAGLE 31.3.0
ENT-LNP-SP: MASP A - COMPLTD
;
```

ent-lnp-sub

Enter LNP 10-Digit TN Subscription

Use this command to enter an LNP 10-digit ported telephone number (TN) or a single pooled block of 1000 TNs along with the TN's related services into the database. Related services include LNP query LRN and message relay global title information. You can assign a maximum of two services at a time: either one LRN and one MRGT# or two MRGT#s.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: ent-lnp-sub

Related Commands: chg-lnp-sub, dlt-lnp-sub, rtrv-lnp-sub

Command Class: LNP Subscription

Parameters

:tn= (mandatory)
Telephone number.
Range: 10 digits
10 digits—To specify a single TN subscription

7 digits with 3 asterisks (***) appended—To pool a block of 1000 TNs

:lrn= (optional)

Location routing number.

Range: 10 digits

Default: Null or current value

:mrgt1= (optional)

Message relay global title entry number 1.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ng, rgt*

tt—translation type; value **0-255**

ni—network indicator; value **0-255**

nc—network cluster; value **0-255**

ncm—network cluster member; value **0-255**

ssn—subsystem number; value **0-255**

xlat—translate; value **dpc, dpcssn, dpcngt**

ri—route indicator; value **gt, ssn**

ngt—new global translation type; value **0-255**

rgt—replace global title address with lrn; value **yes, no**

:mrgt2= (optional)

Message relay global title entry number 2.

The following arguments allow you to incrementally change default global title translations by entering the **mrgt1** and **mrgt2** parameters several times. When **mrgt1** or **mrgt2** parameters are used, the constituent values must *all* (mandatory) be entered and separated by a comma (,) or a dash (-) in the order **tt-pc-ssn-xlat-ri-ngt-rgt**.

Range: *tt, ni, nc, ncm, ssn, xlat, ri, ng, rgt*

tt—translation type; value **0-255**

ni—network indicator; value **0-255**

nc—network cluster; value **0-255**

ncm—network cluster member; value **0-255**

ssn—subsystem number; value **0-255**

xlat—translate; value **dpc, dpcssn, dpcngt**

ri—route indicator; value **gt, ssn**

ngt—new global translation type; value **0-255**

rgt—replace global title address with lrn; value **yes, no**

:sp= (optional)

Service provider ID.

Range: *xyyy*

4 alphanumeric characters

Default: Null or current value.

Example

ent - lnp-

sub:tn=1234567890:sp=a123:lrn=1234567890 :mrgt1=16,233-233-233,0,dpc,gt,28,yes

```
ent - lnp-
sub:tn=1234567***:sp=a123:lrn=1234567890 :mrgt1=16,233-233-233,0,d
pc,gt,28,yes
ent - lnp-
sub:tn=1234567000:etn=1234567999:sp=a123:lrn=1234567890 :mrgt1=16,
233-233-233,0,dpc,gt,28,yes
```

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat command**) before this command can be entered.

When the **nmrgt1** or **nmrgt2** parameter is used, the constituent values must be entered in this order: **tt, pc, ssn, xlat, ri, ngi, rgta**

If the telephone number (**tn** parameter) already exists, the newly entered nonfinal message relay global title translation or LRN is added.

A command cannot be entered that assigns an existing TT service to an existing telephone number.

Translation type values associated with AIN, IN, PCS, LNPQS, or WNP LNP queries are not allowed as message relay global title translations.

This command automatically creates an NPANXX for a TN-LRN record if the NPANXX does not already exist.

A maximum of 6 message relay GTTs can be assigned per TN.

The same translation type value cannot be specified more than once.

When the **xlat=dpcssn** parameter is specified, the **ssn** parameter value must not be zero.

When a value other than **dpcssn** is specified for the **xlat** parameter, **ssn=0** must be specified.

When a value other than **dpcngt** is specified for the **xlat** parameter, **ngt=0** must be specified.

When the **xlat=dpcngt** parameter is specified, the **ri=gt** parameter must be specified.

Either the location routing number or global title entry number must be specified.

The point code must be a valid ANSI point code. Point code entries must be full point codes. Partial point codes are not allowed.

The MRGT# message relay translation type must not already be assigned.

The MRGT# message relay translation type must be a reserved service for LNP.

When the **lrn** parameter is specified, the LRN must not already be assigned.

The point code must exist in the route table.

The service provider ID must be specified if not already assigned.

The service provider ID specified must match the SP already assigned.

If an MRGT# is specified, an NPANXX must exist.

When **rgta=yes** is specified, the **lrn** parameter must be specified.

The GT# message relay translation type must not already be assigned.

The GT# message relay translation type must be reserved for LNP.

The **tt** and **rmv** parameters cannot be specified together in the command.

Notes

You can enter this command several times for the same TN to incrementally add services.

This command updates data normally administered from the NPAC.

The maximum number of service provider IDs allowed is 10,000.

Pooled TNs are allocated on an even 1000-block boundary and cannot cross an NPANXX's boundary. Specific ported TNs can overlap a pooled block and contain different routing.

The LNP EAGLE 5 ISS stores the 10-digit subscription global title NGT (new global title) value on a per service, point code, and subsystem combination basis. This design allows a user to modify the NGT field for all 10-digit subscriptions assigned the same service, point code, and subsystem combination instantly with one command. Conversely, the LSMS stores the NGT field independently for each 10-digit subscription global title translation entered.

When an NGT field is modified or assigned to a particular LNP 10-digit global title translation (either via the LSMS interface or directly from an EAGLE 5 ISS terminal), every existing subscription entry in the LNP EAGLE 5 ISS with the same combination of service, point code, and subsystem will reflect that NGT. Because of this difference in how this information is stored on the LSMS versus how it is stored on the EAGLE 5 ISS, a user could get into a situation where the NGT values in the LSMS are not reflective of those stored in the EAGLE 5 ISS. The NGT value must be specified correctly every time a 10-digit subscription global title translation is updated or the LNP service on the EAGLE 5 ISS could be seriously impacted.

Output

```
ent - lnp-
sub: tn=1234567890: sp=a123: lrn=1234567890 :mrgt1=16, 233-233-233, 0, d

;
```

ent-ls

Enter Linkset

Use this command to add a linkset, with its assigned far-end point code and other linkset attributes, to the database.

Keyword: ent-ls

Related Commands: chg-ls, dlt-ls, rtrv-ls

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:apc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: apca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:apc/apca/apci/apcn/apcn24= (mandatory)

Adjacent point code. The DPC of the adjacent signaling node at the far end of the linkset.

:apci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:apcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:apcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset name. Each linkset name must be unique in the system.

Range: **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

:lst= (mandatory)

Linkset type of the specified linkset. This parameter specifies whether the specified link is an access link, bridge link, cross link, diagonal link, or extended link, as defined in Telcordia GR-246-CORE, T1.111.5.

Range: **a, b, c, d, e**

a— Access links

b— Bridge links

c— Cross links

d — Diagonal links

e — Extended links

:apcntype= (optional)

ITU-N Adjacent Point Code Type. This parameter specifies the format that will be used for changeover and changeover acknowledgement messages.

Range: **itun, itunchina**

itun — ITU National Adjacent Point Code Type

itunchina — ITU National China Adjacent Point Code Type

Default: **itun**

:asl8= (optional)

Adjacent SLS 8-bit indicator. This parameter specifies whether the adjacent node is sending MSUs with 8-bit SLSs.

Range: **yes, no**

Default: **no**

:bei= (optional)

Broadcast exception indicator. This parameter specifies whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

Range: **yes, no**

yes — TFPs are not broadcast (for X.25).

no — TFPs are broadcast (for SS7).

Default: **yes**—for X.25

no—for SS7

:cli= (optional)

Far-end Common Language Location Identifier (CLLI). This parameter specifies the CLLI assigned to the linkset.

Range: *aaaaaaaaaa*

1 alphabetic character followed by up to 10 alphanumeric characters

Default: CLLI of the adjacent point code

:gmscrn= (optional)

GSM MAP screening. This parameter specifies whether GSM MAP screening is allowed.

Range: **on, off**

Default: **off**

:gttmode= (optional)

Global title translation mode. This parameter selects a GTT Mode hierarchy for each link set.

Range: **cd, cg, acdcd, acdcg, acdcg, cgacdcd, cgcd, sysdflt**

Default: **sysdflt**

:gwsa= (optional)

Gateway screening action. This parameter specifies whether gateway screening (GWS) is on or off for the specified linkset.

Range: **on, off**

Default: **on**—if **scrn** is specified

off—if **scrn** is not specified

:gwsd= (optional)

Gateway screening MSU discard. This parameter specifies whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is on or off. This parameter is also used with the redirect function; MSUs that cannot be screened are discarded if **gwsd=on** is specified.

Range: **on, off**

Default: **off**

:gwsm= (optional)

Gateway screening messaging. This parameter specifies whether messages are generated for each message screened by gateway screening.

Range: on, off

Default: off

:ipgwapc= (optional)

IP gateway adjacent point code. Specifying **ipgw**apc=**yes** indicates that the linkset is entered for a card of application type SS7IPGW or IPGWI and the adjacent point code specified is an IP gateway adjacent point code.

Range: yes, no

Default: no

:iptps= (optional)

IPGWx Linkset TPS. The value of this parameter is a user-defined portion of the total enabled system IP Signaling TPS shown in the **rtrv-ctrl-feat** command output. This parameter is allowed and required only for IPGWx linksets (when **ipgw**apc=**yes** is specified).

The maximum range value for the **ipt**ps parameter is 188000 for future expansion. However, the maximum system IPGWx Signaling TPS capacity currently available is 112000.

Range: 100-112000

The specified value must be divisible by 10.

The sum of the **ipt**ps values assigned to all linksets in the system cannot exceed the enabled system IPGWx Signaling TPS value (see the **rtrv-ctrl-feat** command).

:itutfr= (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter specifies whether the TFR procedure is on or off on a per-linkset basis. This parameter is valid for ITU national linksets only.

Range: on, off

Default: off

:l3tset= (optional)

Link timer set. This parameter value is the value that is defined with the **chg-l3t** command.

Range: 1

Default: 1

:lsusealm= (optional)

IPTS linkset alarm threshold percent. This parameter specifies the percent of the linkset TPS (**ipt**ps) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **ipt**ps value for the linkset.

Range: 10-100

Default: 100

:mtprse= (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

Range: yes, no

yes — equipped

no — not equipped

Default: no

:multgc= (optional)

Multiple group codes. This parameter specifies whether multiple group codes can be specified.

Range: yes, no

Default: no

:nis= (optional)

Network Indicator Spare. This parameter specifies whether the Network Indicator Spare option is on or off for the specified linkset. When this option is enabled, the Network Spare value for network indicator for both ANSI and ITU-National (ITU-N) links is supported by the system.

Range: **on, off**

Default: **off**

:randsls= (optional)

Random SLS (signaling link selection). This parameter is used to apply random SLS generation for the specified linkset.

Specifying the **randsls** parameter in the **ent-ls** command enables random SLS generation on a per linkset basis only if the **randsls=perls** parameter has been specified in the **chg-stpopts** command.

Range: **off, class0, all**

off — Disables random SLS generation on a specified linkset.

class0 — Enables random SLS generation for Class0 SCCP traffic on a specified linkset.

all — Enables random SLS generation for Class0 and Class1 SCCP traffic on a specified linkset.

Default: **off**

:scrn= (optional)

Gateway screening screen set. This parameter specifies the gateway screening screen set assigned to this linkset.

Range: **ayyy, none**

1 alphabetic character followed by up to 3 alphanumeric characters, or **none**

none — Deletes screen set association with the linkset

:slkusealm= (optional)

IPTPS signaling link alarm threshold percent. This parameter specifies the percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

Range: **10-100**

Default: **80**

:slsci= (optional)

5-bit to 8-bit SLS conversion indicator. This parameter specifies whether the 5-bit to 8-bit SLS conversion feature is used to select links for outgoing messages direct to the given linkset. When enabled, the system replaces any 5-bit SLS values contained in received messages, with a random 8-bit value before the 5-bit SLS values are used by the STP to select the outgoing link in that linkset.

Range: **yes, no**

yes — enabled

no — disabled

Default: **no**

:slsocbit= (optional)

Other CIC (Circuit Identification Code) Bit. If the SLSOCB feature is turned on, this parameter specifies whether the Other CIC Bit option is to be used during link selection. If the option is to be used, specify which bit (5– 16) of the CIC is to be used as the other CIC bit. During link selection, the specified bit acts as the most significant bit of the new SLS and bits 2 through 4 of the received CIC become the least significant bits of the new SLS. This parameter is used for ITU-ISUP messages. The SLS is not modified in the outgoing message. The following example shows a received CIC where bit 9 is the other CIC bit (**slsocbit=9**). The new SLS is 0100.

16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
0	0	0	0	1	0	0	0	1	0	0	1	1	0	0	1
New SLS							0				1	0	0		

Range: 5-16 none

Default: none

:slrsb= (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter is used for ITU messages on a per-linkset basis to select the bit (1–4) to rotate as the new SLS LSB (Least Significant Bit). The SLS is not modified in the outgoing message. Table 5-42 shows how the rotation affects the four bits of the SLS during linkset selection:

Table 5-42. SLS Bit Rotation

If This Bit is Selected...	Then Bit Locations 4 3 2 1 Are Rotated To...	Description
Bit 4	3 2 1 4	SLS = 0110 becomes Rotated SLS = 1100 SLS = 1011 becomes Rotated SLS = 0111
Bit 3	2 1 4 3	SLS = 0110 becomes Rotated SLS = 1001 SLS = 1011 becomes Rotated SLS = 1110
Bit 2	1 4 3 2	SLS = 0110 becomes Rotated SLS = 0011 SLS = 1011 becomes Rotated SLS = 1101
Bit 1	No rotation is performed because bit 1 is the existing LSB	-

Range: 1-4

Default: 1

:sltset= (optional)

SLTM record. This parameter specifies the SLTM record to be associated with the linkset.

Range: 1-20

Default: 1 for ANSI
2 for ITU

Example

Adds linkset wy644368 with apc 144-201-1 with lstc:

ent - ls : lsn=wy644368 : apc=144-201-001 : lst=c

Adds linkset lsitua1 with apcn5-5-5-1 with lstc. The apcn parameter is using a four-part format where the maximum number of bits in each position is defined by the chg-stpopts:npcfnti parameter :

ent - ls : lsn=lsitua1 : apcn=5-5-5-1 : lst=c

In this example, the ITU national duplicate point code (ITUDUPPC) feature is turned on, so the ITU national point code contains a group code. Adds linkset exp123 with apcn2-3-4-5-aa, which has a duplicate point code group of aa and linkset type a:

ent - ls : lsn=exp123 : apcn=2-3-4-5-aa : lst=a

Add a linkset in which all applicable MSUs arriving on the linkset are screened using the GSM MAP screening feature:

ent - ls : lsn=lsitu1 : apcn=5000 : lst=a : gmscrn=on

Adds a link set lsn24 with 24-bit ITU-N apcn2410-100-10 and linkset type a:

ent - ls : lsn=lsn24 : apcn24=10-100-10 : lst=a

Adds link set lsa2 with private APC p-1-2-4

ent - ls : lst=a : lsn=lsa2 : apc=p-1-2-4

Adds link set lsn410234 with private and spare APCN ps-1-1-1-2047-aa::

ent - ls : lst=b : lsn=lsn410234 : apcn=ps-1-1-1-2047-aa

Adds link set lsi00001 with spare APCI s-1-1-209-7:

ent - ls : lst=b : lsn=lsi00001 : apci=s-1-1-209-7

Adds link set lsn24 with APCN24 10-100-10 with apcntype=itunchina and linkset type a.

ent - ls : lsn=lsn24 : apcn24=10-100-10 : lst=a : apcntype=itunchina

Adds link set lsa using the global title translation mode cgacdcd.

ent - ls : lsn=lsa : lst=a : apca=1-1-1 : gttmode=cgacdcd

Enables random SLS generation for Class0 and Class1 SCCP traffic on linkset lsa.

ent - ls : lsn=lsa : lst=a : apci=1-1-2 : randsls=all

Dependencies

The adjacent point code must be a full point code.

The specified adjacent point code cannot exist as an alias point code.

If the **gwsa=on**, **gwsn=on**, and **gwsd=on** parameters are specified, the **scrn** parameter must be specified.

If the **apcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

The specified adjacent point code cannot be the same as the self-ID destination point code of the STP.

The specified adjacent point code cannot be the same as any self-ID capability point codes of the STP.

If the system is configured for ANSI formatted point codes, the network indicator value of the far-end point code parameter (**ni** parameter) must be **6** or greater when the cluster value is **0** (**nc** parameter).

The specified linkset name cannot already exist in the database.

The specified adjacent point code cannot be assigned to any other linkset.

Private (**p-**) and private and spare (**ps-**) point codes can be assigned only to IPGW linksets (the **ipgwapc=yes** parameter is specified).

The maximum number of linksets that can be defined in the system is 1024.

The specified far-end **cli** value cannot be assigned to any other linkset.

The specified screen set (**scrn** parameter) must exist in the database.

If the **gwsd=on** parameter is specified, the **gwsa=on** parameter must be specified.

If a destination point code matching the specified far-end point code exists, the far-end CLLI for the given linkset must match the destination identifier (DI) of that matching destination.

If the adjacent point code is in the X.25 domain, the **bei=yes** parameter must be specified or the **bei** parameter must be omitted from the command.

The specified adjacent point code cannot be referenced by an X.25 route that specifies the **lc2nm=yes** parameter.

The **slsci** parameter can be specified only for ANSI linksets.

The **mtprse** parameter can be specified only if the MTP Restart feature MTPRS (for ANSI) is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (mtprs=yes in the output).

The **mtprse=yes** parameter is not valid for IPGW adjacent point code linksets (**ipgwapc=yes** parameter).

The **asl8=yes** parameter can be assigned only to an ANSI linkset (a linkset containing an adjacent point code in the SS7 domain).

The **apcntype** parameter can be specified only for ITU-N and ITU-N24 linksets.

The Other CIC (Circuit Identification Code) Bit Used feature (SLSOCB) feature must be turned on before the **slsocbit** parameter can be specified.

The **slsocbit** parameter is valid only for ITU linksets.

The **slsrsb** parameter is valid only for ITU linksets.

The GSM Map Screening feature must be turned on (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) before the **gmscrn** parameter can be specified.

The **itutfr** parameter is valid only for ITU national linksets on the EAGLE 5 ISS STP.

The ITU National Duplicate Point Code (ITUDUPPC) feature must be turned on before the **multgc=yes** parameter can be specified.

The **multgc=yes** parameter is valid only for ITU-N or ITU-I point codes.

The **iptps** parameter must be specified for IPGWx linksets

The **iptps** parameter cannot be specified for linksets that are not IPGWx.

The specified **iptps** parameter value must be divisible by 10.

The total of the **iptps** parameter values for all linksets cannot exceed the IPGWx Signaling TPS feature quantity that is enabled in the system.

The **lsusealm** parameter cannot be specified for linksets that are not IPGWx.

The **slkusealm** parameter cannot be specified for linksets that are not IPGWx.

The Enhanced GSM Map Screening feature must be turned on before the **gmscrn=on** parameter can be specified for an ANSI linkset.

The **mtprse** parameter can be specified only if the MTP Restart feature ITUMTPRS (for ITU), is turned on. The **rtrv-feat** command can be used to verify whether the feature is turned on (itumtprs=yes in the output).

The **itutfr** parameter is valid only for ITU linksets on the IP⁷ Secure Gateway.

A point code cannot be assigned to a linkset as an APC if the point code has been provisioned with exception routes.

An APC cannot be assigned to an IPGWx linkset that is already assigned to a route involving another linkset.

The Origin-based SCCP Routing feature must be turned on before the **gttmode** parameter can have a value of **acdcdd**, **cgacdcdd**, **acdcgdcdd**, **acdcddcg**, **cgcd**, **dcg**, or **cg**.

A new IPGW link set cannot be entered if it contains an APC that is already configured in a routing key. An SAPC cannot be added to an existing IPGW link set if the new SAPC is already configured in a routing key.

The **randsls** parameter is valid only for ITU linksets.

Notes

Of the 1024 maximum linksets supported, up to 255 of the linksets can be gateway linksets.

The system supports a maximum of 700 links. If more than 700 linksets are defined, a maximum of 700 of the defined linksets can be in use at any one time.

The links that directly connect the system with an adjacent node are grouped into one or more linksets. A linkset can contain up to 8 (international standards) or 16 (national standards) signaling links, depending on how the system was configured when the network was created.

Each linkset must be assigned the same physical links at both ends of the link (local and adjacent signaling points) and each link must be assigned the same link number.

Signaling link acknowledgments (SLTA) are the same type of maintenance message as the SLTMs received on the link.

If the **gwsa=off** and **gwsn=off** parameters are specified, all MSUs are passed.

If the **gwsa=off** and **gwsn=off** parameters are specified for all linksets, gateway screening and the GWS redirect function for the DTA feature are disabled.

If the **gwsa=off** and **gwsn=on** parameters are specified, all MSUs pass, but MRNs are generated if an MSU matches a screening condition.

If the **gwsa=on** and **gwsn=off** parameters are specified, MSUs are screened but messages are not generated.

If the **gwsa=on** and **gwsn=on** parameters are specified, MSUs are screened and MRNs are generated at the rate of one MRN every 20 seconds per link.

If the **asl8=yes** parameter is specified with the **lst=a** parameter (a linkset containing access signaling links), this indicates that the originator of the MSUs is generating 8-bit SLSSs. For other linkset types, the **asl8=yes** parameter indicates that the adjacent STP is converting 5-bit SLSSs to 8-bit SLSSs. The SLS in MSUs received by the system on a linkset that has the **asl8=yes** parameter assigned to it will not be converted. These MSUs are assumed to contain 8-bit SLSSs.

The Network Indicator Spare (**nis**) parameter can be specified only for ANSI and ITU-N links.

The **mtprese** parameter value can be specified independently of the value specified on the **mtpresi** parameter of the **chg-stpopts** command.

The MTP restart option (**mtprese**) is not a valid option on TCP/IP point-to-multipoint links (DCM cards equipped as SS7IPGW links).

When two linksets are used as a combined linkset, each linkset should have the same **slsci** and **asl8** values. MTP restart provides an orderly process for bringing signaling links back into service after the system has been isolated and restarted. A greater preference is given to restoring the STP to network service in an orderly fashion than to the speed of recovery. The time required is system dependent; Table 5-43 provides examples of some approximate times:

Table 5-43. Link Alignment Performance

System Size (Number of LIMs)	Link Alignment Delay (seconds)
up to 64	62
64 to 127	97
128 to 191	132
more than 191	167

The **slrsb** parameter alone does not provide an even distribution of ITU-ISUP messages across all links within a linkset. The system uses all four bits of the SLS to determine the actual link to route messages. Because the static bit is simply rotated within the SLS, all possible values of the SLS field will still not be realized. The **slsobit** parameter must also be specified to provide an even distribution across all links within the linkset. If both parameters are specified for a given linkset, the SLS field is processed in the following order.

1. The SLS is modified using the Other CIC Bit option.
2. The modified SLS is modified again using the Rotated SLS Bit option.
3. The modified SLS is used by the existing linkset and link selection algorithms to select a link.
4. The ISUP message is sent out the link containing the original, unmodified SLS field.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is turned on, for each group that is defined, a separate ITU national C linkset must be provisioned. The C linkset is used as the alternate route for point codes in the group.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The ITU National and ITU National China Adjacent Point Code types indicate the format that is used for changeover and changeover acknowledgement messages. China specifies a 16-bit field for data in changeover messages. The FSN occupies the first 12 bits. The trailing 4 bits are spare and are coded as 0. ITU uses a 24-bit field for data in the extended changeover/changeover acknowledgement messages. The FSN is encoded in the first 12 bits. The last 12 bits of the field are spare and are coded as zero.

The **randsls** parameter value applies only to ITU-T SCCP messages and only when random SLS generation is set to occur on a per linkset basis (the **randsls=perls** parameter has been specified in the **chg-stpopts** command).

If the **randsls=perls** parameter is specified in the **chg-stpopts** command, it is recommended that the linksets in a combined linkset be provisioned with the same **randsls** value to avoid undesired SLS distribution.

Output

```

ent-ls:lsn=wy644368:apc=144-201-001:lst=c

```

ent-map

Enter Mate Applications

Use this command to create new entries in the MAP table, which allow the assignment of mated applications for use with SCCP network management. A mated application is used if the local application becomes unavailable.

NOTE: A MAP set is a logical grouping of a set of PC/SSNs that already exist in the EAGLE 5 ISS MAP table. The Flexible GTT Load Sharing feature allows a PC/SSN combination to be part of more than one load-sharing group, with each PC/SSN combination defined by a different MAP set. When the Flexible and Intermediate GTT Load Sharing features are both enabled, all existing entries in the MAP table and all existing GTA translations in the GTT table with *ri=ssn* are stored in default MAP sets. Additional MAP sets can be provisioned, and GTT entries can be associated to the MAP sets.

Keyword: ent-map

Related Commands: chg-map, dlt-map, rtrv-map

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn24= (mandatory)

Primary remote point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:ssn= (mandatory)

Subsystem number. This parameter identifies the application's subsystem number. This attribute is composed of the decimal representation of the 1-byte field used in the SS7 protocol.

Range: **2-255**

:grp= (optional)

Concerned point code broadcast list (CSPC) group name. This parameter specifies the name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN. For ANSI, the EAGLE 5 ISS broadcasts SSP or SSA to the mate subsystem only if the mate's point code is provisioned as part of the CSPC group to receive an SSP or SSA. This parameter must be provisioned for a node if the node is to receive SSP or SSA broadcasts, even if the node is a mated application.

Range: *ayyyyyyy*
 1 alphabetic character followed by up to 7 alphanumeric characters

Default: No broadcast list for this mated application.

:mapset= (optional)

MAP set ID.

This parameter is mandatory when the Flexible GTT Loadsharing feature is enabled.

Range: **dflt, new**

Default: **dflt** - If the Flexible GTT Load Sharing feature is not enabled, the default value of the **mapset** parameter is **dflt**.

:materc= (optional)

Mate relative cost. This parameter specifies the RC assigned to the mate PC/SSN that is being added to the entity set. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the **rc** and **materc** parameters) of the subsystem.

Range: **0-99**

Default: **50**

:mpc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **mpca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

Default: **000-000-000**

:mpc/mpca/mpci/mpcn/mpcn24= (optional)

Mate remote point code.

:mpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

Default: **0-000-0**

:mpcn= (optional)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code.

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

Default: 00000

:mpcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

Default: 000-000-000

:mrc= (optional)

Message routing under congestion. This parameter defines the handling of Class 0 messages during congestion conditions.

Range: yes, no

Default: yes—if ANSI

no—if ITU

:mssn= (optional)

Mate subsystem number. This parameter specifies the mate application's subsystem number. This attribute is the decimal representation of the one-byte field used in the SS7 protocol.

Range: 2-255

Default: Parameter is not used

:mwt= (optional)

Mate point code weight. This parameter specifies the weight assigned to the mate PC/SSN that is being added to a weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

The **mwt** parameter can be specified only if the **wt** parameter is specified, and the **rc** parameter value equals the **materc** parameter value.

Range: 1-99

:rc= (optional)

Relative cost. The EAGLE 5 ISS determines the multiplicity mode based on the relative costs (the **rc** and **materc** parameters) of the subsystem. (See Notes for additional information on multiplicity modes.)

Range: 0-99

Default: 10

:srm= (optional)

Subsystem routing messages. This parameter specifies whether subsystem routing messages (SBR, SNR) are transmitted between the mated applications.

Range: yes, no

Default: yes—if ANSI

no—if ITU

:sso= (optional)

Subsystem status option. This parameter specifies whether or not the PC/SSN is to initiate a subsystem test when a RESUME is received for the PC.

Range: on, off

Default: off

:thr= (optional)

Threshold. This parameter specifies the in-service threshold assigned to each PC/SSN in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If the **thr** parameter is not specified, a value of **1%** is assigned to each weighted PC/SSN.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the weight assigned to the primary PC/SSN that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

The **wt** parameter can be specified only if the **mwt** parameter is specified, and the **rc** parameter value equals the **materc** parameter value.

Range: 1-99

Example

As shown in the following example, the **rc** parameter is not required for a solitary pc/ssn pair. If the **rc** parameter is not specified, the relative cost defaults to 10.

ent-map:pc=1-1-1:ssn=10:grp=xyz

The following example enters both 1-1-0/10 and 1-1-1/10 into the map table. both the **rc** and **materc** parameter are required for this command, which defines a map group.

ent -

map:pc=1-1-0:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:grp=xyz:srm=on

The following example enters a solitary point code in the MAP table with the Subsystem Status Option (sso) set to on.

ent-map:pc=1-1-3:ssn=20:grp=abc:sso=on

The following commands enters a solitary point code in the MAP table with the Subsystem Status Option (sso) set to off.

ent-map:pc=2-2-2:ssn=20:grp=abc:sso=off

ent-map:pc=2-2-3:ssn=20:grp=abc

The following example sets the Subsystem Status Option (sso) set to on for the primary and mate.

ent-map:pc=1-1-4:ssn=10:rc=10:mpc=1-1-1:mssn=10:materc=20:sso=on

The following example sets the Subsystem Status Option (sso) set to off (default) for the primary and mate:

ent-map:pc=1-1-5:ssn=10:rc=10:mpc=1-1-2:mssn=10:materc=20:sso=off

The following command enters a solitary point code in the MAP table with the Subsystem Status Option (sso) set to off (the default).

ent-map:pc=1-1-6:ssn=10:rc=10:mpc=1-1-7:mssn=10:materc=20

The following example enters spare point codes 1-1-0 with rc=10 and 1-1-1 with rc=10 into the MAP table. Both the **rc** and **materc** parameters are required for this command, to define a MAP group.

ent -

**map:pci=s-1-1-0:ssn=10:rc=10:mpci=s-1-1-1:mssn=10:materc=20:grp=x
yz:srm=no**

The following example creates a new MAP set, and enters 1-1-1/10 and 1-1-2/20 into the newly created MAP set.

ent -

map:pc=1-1-1:ssn=10:rc=10:mpc=1-1-2:mssn=20:materc=20:mapset=new

The following example enters both 1-1-1/15 and 1-1-2/25 into the default MAP set.

ent -

map:pc=1-1-1:ssn=15:rc=10:mpc=1-1-2:mssn=25:materc=20:mapset=df lt

The following example creates a new MAP set and enters a solitary PC/SSN value of 1-1-1/10.

ent-map:pc=1-1-1:ssn=10:mapset=new

The following example enters a solitary PC/SSN of 1-1-1/15 into the default MAP set.

ent-map:pc=1-1-2:ssn=15:mapset=df lt

The following example creates a new MAP set and enters a solitary PC/SSN 1-1-1/10 with the subsystem option ON. It specifies the sso=on parameter for all instances of PC/SSN 1-1-4/10.

ent-map:pc=1-1-1:ssn=10:sso=on:mapset=new

The following example enters a solitary PC/SSN of 1-1-1/15 into the default MAP set with the subsystem option ON. The sso=on parameter is specified for all instances of PC/SSN 1-1-4/10.

ent-map:pc=1-1-3:ssn=15:sso=on:mapset=df lt

The following examples create a weighted shared PC/SSN pair.

ent -

**map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=2
0**

ent -

**map:pc=1-1-1:ssn=10:rc=20:wt=30:mpc=1-2-1:mssn=10:materc=20:mwt=2
0:thr=40**

Dependencies

The PC/SSN pair cannot already exist in the MAP table.

The specified MPC/MSSN pair cannot already exist in the MAP table.

If the PC is entered as the **pc** or **pca** parameter, then the MPC, if specified, must be the **mpc** or **mpca** parameter, respectively. If the PC is entered as the **pci** or **pcn** parameter, then the MPC, if specified, must be the **mpci** or **mpcn** parameter, respectively.

ITU-I, ITU-N, ITU-I spare, and ITU-N spare true point codes must be entered with the same SSN.

If the ANSI-ITU-China SCCP Conversion feature is not turned on, the network type of the CPC broadcast group must match the network type of the PC. If the ANSI-ITU-China SCCP Conversion feature is turned on, network types of the CPC broadcast group and the PC network types do not have to match.

If the **pci**, **pcn**, or **pcn24** parameter is specified, the **srm=yes** parameter cannot be specified.

The primary remote point code must exist in the Routing table.

If a CSPC broadcast list group name is specified, it must already exist.

A maximum of 1024 unique remote point codes are allowed.

A maximum of 12 SSNs per remote point code can be entered.

The primary subsystem DPCs must be full point codes.

The mate subsystem DPCs must be full point codes.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before an EAGLE 5 ISS true point code and LNP subsystem can be specified.

The INP, AINPQ, or EIR feature must be turned on before a value that is a true point code can be specified for the **pcn** parameter.

The EIR feature must be turned on before a value that is a true point code can be specified for the **pci** parameter.

If a mate remote point code is specified, the mate remote point code must exist in the Routing table.

The **srn** and **mrc** parameters cannot be specified for a solitary or shared PC/SSN entry.

If the **mssn** or **matern** parameter is specified, the **mpc** parameter must be specified.

If the **pc** parameter value is an EAGLE 5 ISS true point code, the subsystem must have a lower relative cost than all other mated subsystems in the group.

The **ssn** parameter cannot be specified with a point code value that is the system true point code.

A true point code cannot be routed to itself.

The **mpc** and **mssn** parameters cannot have the same values as the **pc** and **ssn** parameters.

The point code (**pc**) must already exist in the Concerned Point Code (CSPC) group.

The number of MPC Subsystem entries must not exceed the table capacity.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified. If the Flexible GTT Load Sharing feature is enabled, then the **mapset** parameter must be specified.

The EAGLE 5 ISS True PC can be provisioned only in the default MAP set.

The Weighted GTT Loadsharing feature must be turned on before the **wt**, **mwt**, or **thr** parameters can be specified.

If the **thr** parameter is specified, the **wt** and **mwt** parameters must be specified.

If the **mpc** parameter is specified, the **rc** parameter must be specified.

The **wt** and **mwt** parameters must be specified together in the same command.

If the **matern** parameter value equals the **rc** parameter value, a Loadshared Group is indicated, and the **rc**, **mpc**, **matern**, and **mwt** parameters must be specified.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

Both OAM cards must be running GPSM II.

If the **mpc** parameter value is a true point code, the subsystem must have a lower RC than all other mated subsystems in the entity set.

A maximum of 36,000 point codes can be entered into the MAP table.

The specified true point code cannot already exist in the MAP table.

If the resulting multiplicity mode (MULT field) is SOL (Solitary) or SHR (Loadsharing), the **srn** parameter and the **mrc** parameter cannot be specified.

If the **mwt** parameter is specified, the **mpc** parameter must be specified.

If the **mpc** parameter is specified, the **mssn** and **matern** parameters must be specified.

The entity set being created must be either solitary or dominant to use the true point code as a point code.

If the **thr** parameter is specified, the **rc1**, **rc2**, **rc3**, and **rc4** parameters must be of equal value.

Notes

Up to 8 PC/SSN pairs can be entered into a mated PC/SSN group.

For the MAP commands, an entity set consists of a group of PC/SSNs that are used for traffic distribution, and an RC group consists of PC/SSNs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes/subsystems:

- When a PC/SSN pair is not replicated, the pair is in *solitary* mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

If the XMAP feature is enabled, the MAP table can have up to either 2000 or 3000 entries, depending on the controlled feature Part Number that is enabled. If XMAP is not enabled, the MAP table can contain up to 1024 user entries.

The **sso** parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE 5 ISS previously marked the subsystem status “allowed” for each PC/SSN entry. The **sso** parameter marks the subsystem status “prohibited” for each new entry that has **sso=on**. This causes the EAGLE 5 ISS to generate an SST to the remote point-code when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

When the ANSI-ITU-China SCCP Conversion feature is turned on, the Concerned Point Code (CSPC) Group’s network type can be of a different network than the mated application’s network type. For example, the mated application’s network type could be ANSI and the CSPC Group could be ITU or mixed with ANSI, ITU, and ITUN concerned point codes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each set is identified by the **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

Output

ent-mrn

Enter Mated Relay Node

Use this command to assign point codes to groups in the Mated Relay Node (MRN) table. The Intermediate GTT Loadsharing feature must be on before this command can be entered.

If the Flexible GTT Loadsharing feature is enabled, use this command to create a new MRN set, or to add entries to an existing MRN set in the MRN table. When the Flexible GTT Loadsharing feature is turned on, MRN sets are used.

NOTE: If only the Intermediate GTT Loadsharing feature is turned on, the MRN table can contain a maximum of 3000 entries. If the Intermediate GTT Loadsharing feature is on and the Flexible GTT Loadsharing feature is enabled, the MRN table can contain a maximum of 6000 entries.

CAUTION: If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Check the `rtrv-sccp-serv` command output to see if entries exist in the SCCP-SERV table.

NOTE: An MRN set is a logical grouping of PCs that already exist in the EAGLE 5 ISS MRN table. The Intermediate GTT Loadsharing feature allows PCs to be part of more than one load-sharing group, with each PC defined by a different MRN set. When the Intermediate GTT Loadsharing feature is enabled, all existing entries in the MRN table and all existing GTA translations in the GTT table with `ri=gt` are stored in default MRN sets. Additional MRN sets can be provisioned, and GTT entries can be associated to the MRN sets.

Keyword: ent-mrn

Related Commands: chg-mrn, dlt-mrn, rtrv-mrn

Command Class: Database Administration

Parameters

NOTE: See “Point Code Formats and Conversion” for a detailed description of point code formats, rules for specification, and examples.

If a point code is being added to an existing weighted entity set, and the `dflwt` parameter is not specified, the `wt1/wt2/wt3/wt4` parameter must be specified.

The `wt1/wt2/wt3/wt4` parameter can only be specified if at least two of the `rc/rc1/rc2/rc3/rc4` parameters are equal, creating a weighted entity set.

:pc= (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:pc/pca/pci/pcn/pcn24= (mandatory)

Post-GTT-translated point code.

:pci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—000-255

ssa—000-255

sp—000-255

:dfltw= (optional)

Default weight. This parameter specifies the weight to be assigned to a specified PC that is not assigned a weight with the **wt/wt1/wt2/wt3/wt4** parameter.

If a PC weight is specified with the **wt/wt1/wt2/wt3/wt4** parameter and the **dfltw** parameter is specified, the default weight is ignored, and the PC is assigned the weight specified by its respective weight parameter.

Range: 1-99

:mrnset= (optional)

MRN set ID.

Range: 1-3000 **dflt**, **new**

dflt—Default MRN set.

new—Create a new MRN set

:pc1= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca1**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc1/pca1/pci1/pcn1/pcn241= (optional)

Alternate post-GTT-translated point code.

:pc2= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca2**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc2/pca2/pci2/pcn2/pcn242= (optional)

Alternate post-GTT-translated point code.

:pc3= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca3**

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc3/pca3/pci3/pcn3/pcn243= (optional)

Alternate post-GTT-translated point code.

:pc4= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

Synonym: **pca4**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

:pc4/pca4/pci4/pcn4/pcn244= (optional)

Alternate post-GTT-translated point code.

:pci1= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci2= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:pci3= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pci4= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code **0-000-0** is not a valid point code.

:pcn1= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn2= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn241= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn242= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn243= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn244= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:pcn3= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:pcn4= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—0-14 for each member; values must sum to 14

:rc= (optional)

Relative cost. This parameter specifies the relative cost of the route for the primary PC.

Range: 0-99

:rc1= (optional)

Relative cost 1. This parameter specifies the relative cost of the route for mate PC 1.

Range: 0-99

:rc2= (optional)

Relative cost 2. This parameter specifies the relative cost of the route for mate PC 2.

Range: 0-99

:rc3= (optional)

Relative cost 3. This parameter specifies the relative cost of the route for mate PC 3.

Range: 0-99

:rc4= (optional)

Relative cost 4. This parameter specifies the relative cost of the route for mate PC 4.

Range: 0-99

:thr= (optional)

Threshold. This parameter specifies the in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If a threshold value is not specified when creating a new RC group in an existing entity set, the new RC group is assigned a threshold value of 1%.

Range: 1-100

:wt= (optional)

Weight. This parameter specifies the weight assigned to the primary PC. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If PCs are being added to an existing entity set, the **wt** parameter cannot be specified. If a new entity set is being created, the **wt** parameter can only be specified if at least two of the specified RC values are equal, which creates a weighted entity set.

Range: 1-99

:wt1= (optional)

Weight 1. This parameter specifies the weight assigned to the mate PC 1 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt2= (optional)

Weight 2. This parameter specifies the weight assigned to the mate PC 2 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt3= (optional)

Weight 3. This parameter specifies the weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

:wt4= (optional)

Weight 4. This parameter specifies the weight assigned to the mate PC 4 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

Range: 1-99

Example

The following example enters point code 1-1-0 into the MRN table with a relative cost of 10 and associates point code 1-1-1 with it as a point code with a relative cost of 20.

ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20

The following example updates the group containing point code 1-1-0 in the MRN table, to add point code 1-1-2 with relative cost of 20 and point code 1-1-10 with relative cost of 30 to the group.

ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30

The following examples include spare point codes.

ent-mrn:pci=s-2-2-1:rc=10:pci1=s-2-2-2:rc1=11:pci2=2-100-1:rc2=12

ent-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=1-1-1-235-aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3

ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=10:mrnset=dflt

ent-

mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=20:pc2=1-1-3:rc2=30:apc3=1-1-4:rc3=40:apc4=1-1-5:rc4=50:mrnset=new

ent-mrn:pc=1-1-3:pc1=1-1-6:rc1=60:pc2=1-1-7:rc2=70:mrnset=111

The following examples create a new weighted entity set.

ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10

ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10:thr=50

```
ent-
mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:pc2=1-3-2:rc2=20:wt2=30:pc3=1-10-2:rc3=20:dfltw=20
```

```
ent-
mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:wt1=30:pc2=1-3-2:rc2=10:dfltw=20:thr=60
```

The following examples add new PCs to the weighted entity set containing PC 1-1-0.

```
ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=30:wt2=40
```

```
ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:pc2=1-1-10:rc2=30:pc3=1-3-2:rc3=10:wt3=20:dfltw=30
```

```
ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=20:wt2=40:thr=30
```

```
ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=40:pc2=1-1-10:rc2=20:pc3=1-3-2:rc3=20:dfltw=25:thr=30
```

Dependencies

The Intermediate Global Title Translation Loadsharing feature must be turned on before this command can be entered.

A new point code must have the same network type as existing point codes.

When a point code parameter is specified, its relative cost parameter must be specified.

Point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

ITU-N point codes must be in the format set by the **npcfmt** parameter of the **chg-stpopts** command. (Use the **rtv-stpopts** command to display the STP option settings.)

Remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

A maximum of 3000 point codes can be entered into the MRN table.

The Flexible GTT Load-Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the Flexible GTT Loadsharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

When creating a new weighted entity set, the **mrnset=new** or **mrnset=dflt** parameter must be specified.

Each point code group can contain a maximum of 8 point codes.

The Weighted GTT Loadsharing feature must be turned on before the **wt/wt1/wt2/wt3/wt4**, **thr**, and **dfltw** parameters can be specified.

If the **wt/wt1/wt2/wt3/wt4** parameter is specified, the corresponding **pc/pc1/pc2/pc3/pc4** parameter must be specified.

When creating or modifying a weighted entity set, the **dfltw** parameter must be specified, or an individual weight must be specified for each PC.

Entity sets in a solitary or dominant loadsharing mode cannot have weights assigned to the PCs. When creating an entity set, if all of the RC values are unique, the **wt/wt1/wt2/wt3/wt4** and **thr** parameters cannot be specified.

If the **thr** parameter is specified, the **rc1**, **rc2**, **rc3**, and **rc4** parameters must be of equal value.

If the **thr** parameter is specified, the associated **wt/wt1/wt2/wt3/wt4** parameter or the **dflwt** parameter must be specified.

At least one additional point code must be specified.

Any specified point code must be a full point code.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

If a new point code is being added to the MRN table, the **pc** and **rc** parameters must be specified together in the command. If the Flexible GTT Loadsharing feature is enabled, and the **mrnset=new** parameter is specified, the **pc** and **rc** parameters must be specified together in the command.

If the **pc1/pc2/pc3/pc4** parameter is specified, the **pc** parameter value must already exist in the MRN table.

A new point code that is specified in the command must not already exist in the MRN table.

If the **rc** parameter is not specified, the **wt** parameter cannot be specified.

If PCs are being added to a weighted entity set, the **wt/wt1/wt2/wt3/wt4** parameter or the **dflwt** parameter must be specified.

If PCs are being added to a non-weighted entity set, the **wt/wt1/wt2/wt3/wt4** and the **dflwt** parameters cannot be specified.

At least one optional parameter must be specified.

If the **wt/wt1/wt2/wt3/wt4** parameters are specified, the **dflwt** parameter cannot be specified.

Notes

For the **-mrn** commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes and subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The **ent-mrn** command cannot be used to change the relative cost value for a point code; the **chg-mrn** command must be used.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If the **ent-mrn** command is used to add PCs to an existing weighted entity set, and the threshold is specified, all RC group values specified with **rc**, **rc1**, **rc2**, **rc3** and **rc4** parameters for the alternate post-GTT-translated point codes must be equal.

The following rules apply when the **ent-mrn** command is used to add PCs to RC groups:

- If a threshold value is specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold is changed to the specified threshold value and both pre-existing and new PCs in the RC group assume the new threshold value.
- If a threshold value is specified and the PCs are creating a new RC group in the existing entity set, the new RC group assumes the specified threshold value.
- If a threshold value is not specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold does not change and the PC assumes the threshold value of the existing RC group.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Entries cannot be provisioned in the MRN table unless routes are also provisioned for corresponding point codes. However, an entry without a configured route may result from upgrading to a new EAGLE 5 ISS release. If such an entry occurs, then traffic will not be routed to the corresponding point code. The entry can be deleted, or a route for the entry can be configured.

ent-na

Enter Network Appearance

Use this command to enter a new network appearance in the Network Appearance table.

Keyword: ent-na

Related Commands: dlt-na, rtrv-na

Command Class: Database Administration

Parameters

:na= (mandatory)

Network appearance.

Range: 0-4294967295

:type= (mandatory)

Type of the network appearance.

Range: ansi, itu, ituis, itun, ituns, itun24

:gc= (optional)
 Group Code of the network appearance.
Range: yy

Example

```
ent-na:type=ansi:na=10
ent-na:type=itui:na=11
ent-na:type=itun:na=10
ent-na:type=itun:na=11:gc=fr
ent-na:type=itun24:na=3
ent-na:type=ituis:na=4
```

Dependencies

The network appearance (**na**) must not already exist in the Network appearance table.

The Network Appearance table can contain a maximum of 45 entries.

Group Code (**gc**) must not already be equipped.

Group Code (**gc**) is not allowed with network types **ansi**, **itui**, **ituis**, and **itun24**.

Group Code (**gc**) is required for network type **itun** or **ituns** when the ITUDUPPC feature is turned on.

Group Code (**gc**) is not allowed for network type **itui** when the ITUDUPPC feature is turned off.

Group Code (**gc**) must be in the SID or SPC table.

The Spare Point Code Support feature must be enabled before the **ituis** or **ituns** network type can be specified.

The specified network appearance must exist in the Network Appearance table.

Notes

Network Appearance identifies the SS7 network context of the message, for the purposes of logically separating signaling traffic between the SGP and ASP over a common SCTP association. A unique network appearance value can be associated with ANSI, ITUI, 14-bit ITU-N or 24-bit ITU-N networks. When the ITUDUPPC (ITU National Duplicate Point Code) feature is turned on, network appearance can be associated with a specific 14-bit ITU-N group code.

Output

```
ent-na:type=ansi:na=10
  rlgncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
  ENT-NA: MASP A - COMPLTD
;
```

ent-pstn-pres

Enter PSTN Presentation

Use this command to define new Public Switched Telephone Network (PSTN) presentation values.

Keyword: ent-pstn-pres

Related Commands: chg-appl-rtkey, chg-isupvar-attrb, chg-pstn-pres, copy-isupvar-attrb, dlt-pstn-pres, rtrv-appl-rtkey, rtrv-isupvar-attrb, rtrv-pstn-pres

Command Class: Database Administration

Output

The following output example defines a new *user-defined* PSTN presentation value.

```
ent-pstn-pres:pstncat=5000:pstnid=1:pstndesc="mexican isup v1.8"
  rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
  ENT-PSTN-PRES: MASP A - COMPLTD
;
```

ent-rmt-appl**Enter Remote Application**

Use this command to assign user parts to an internal point code that, in turn, assigns user parts to an End Office node.

Keyword: ent-rmt-appl

Related Commands: dlt-rmt-appl, rtrv-rmt-appl

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:ipc= (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: ipca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:ipc/ipca/ipci/ipcn/ipcn24= (mandatory)

End Node's internal point code.

:ipci= (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:ipcn= (mandatory)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:ipcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (mandatory)

Service indicator value that designates which user part is assigned to the IPC.

Range: **3-15**

:ssn= (optional)

SCCP subsystem number. Valid **only** if **si=3**. Use **ssn** as the starting value of the range if **ssne** is specified.

Range: **0-255**

:ssne= (optional)

Specifies the end of the range of subsystem numbers.

Range: **0-255**

Example

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
```

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5:ssne=100
```

```
ent-rmt-appl:ipc=0-0-1:si=5
```

```
ent-rmt-appl:ipcn24=1-100-1:si=5
```

```
ent-rmt-appl:ipc=p-1-1-1:si=3:ssn=5:ssne=102
```

```
ent-rmt-appl:ipci=ps-2-2-2:si=5
```

Dependencies

Partial point codes are not allowed.

The **ssn** parameter is required if **si=3**.

The **ssn** and **ssne** parameters are not allowed unless **si=3**.

The **ssne** parameter value must be greater than the **ssn** parameter value.

The specified IPC **must** be previously defined in the destination table.

The new entry cannot conflict with an existing entry.

Notes

To specify a range of subsystem numbers, specify the **ssn** parameter value as the start of the range and the **ssne** parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-RMT-APPL: MASP A - COMPLTD
;
```

ent-rte

Enter Route

Use this command to add a route to the system.

CAUTION: When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

NOTE: A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.

Keyword: ent-rte

Related Commands: dlt-rte, rept-stat-dstn, rtrv-rte

Command Class: Database Administration

Parameters

NOTE: See “Point Code Formats and Conversion” for a detailed description of point code formats, rules for specification, and examples.

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpc/dpca/dpci/dpcn= (mandatory)

Destination point code.

:dpci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

The linkset name associated with this route.

Range: **ayyyyyyyyy**

1 alphabetic character followed by 9 alphanumeric characters

:rc= (mandatory)

The relative cost of the route

Range: **0-99**

:force= (optional)

This parameter allows a route to be added to the database even if the linkset to be assigned to the route does not have any signaling links in it.

Range: **yes, no**

Default: **no**

Example

Adds route for dpc1-1-1 to linkset we123642:

ent-rte:dpc=1-1-1:lsn=we123642:rc=25

Adds route for dpc21-*-* to linkset we123642:

ent-rte:dpc=21-*-*:lsn=we123642:rc=25

Adds route for dpcn2410-100-14 to linkset we123624:

ent-rte:dpcn24=10-100-14:lsn=we123624:rc=10

Adds route for private dpcp-1-1-1 to linkset we123642.

ent-rte:dpc=p-1-1-1:lsn=we123642:rc=25

Adds route for private and spare dpcnps-4082-ge to linkset e1ntitun.

ent-rte:dpc=ps-4082-ge:lsn=e1ntitun:rc=10

Adds route for private dpcn24p-10-100-14 to linkset we123642.

ent-rte:dpcn24=p-10-100-1:lsn=we123642:rc=10

Adds route for private and spare dpcis-1-100-1 to linkset ue123642.

ent-rte:dpci=s-10-100-1:lsn=ue123642:rc=10

Dependencies

All the linksets for the route must be defined, using the **ent-ls** command, before this command can be entered.

The **force=yes** parameter must be specified if a linkset is assigned to a route that has no links in it.

The DPC must be in the Destination Point Code table.

The destination point code of a route must be a full point code (*ni-nc-ncm*), a cluster point code (*ni-nc-**), or a network point code (*ni-*-**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-**), whether ordered routes can be assigned is determined by the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, destinations comprising a cluster inherit their ordered routes from the cluster.
- If the **ncai=yes** parameter is specified, then the destination address is a member of a provisioned nested cluster where ordered routes can be assigned to a provisioned member.

If the specified destination address is a network cluster address (*ni-nc-**), the assignment of the specified ordered route attributes is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, the collection of signaling point codes having the same network identifier (the **ni** parameter) and network cluster (the **nc** parameter) code are assigned the specified ordered route.
- If the **ncai=yes** parameter is specified, then the specified destination is a network cluster address where provisioned members's signaling point codes can be assigned the same or different ordered routes from the cluster.

If the **dpcn** parameter is specified, the format of the point code(s) must match the format that was assigned with the **chg-stpopts:npcfnti** parameter.

Only IPGW routes are allowed for private point codes.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

If the ITU Duplicate Point Code feature is on, the group code must match for all linksets that are not IPGWx linksets.

A maximum of 6 routes can be defined for each DPC.

The linkset must be defined with at least one link.

A maximum of 2 linksets can be assigned with same cost (the **rc** parameter) value.

A linkset can be entered only once as a route for each destination.

If the specified destination address is a network address (*ni-*-**), or network cluster address (*ni-nc-*-**), the linkset type (see the **chg-ls** command) used in the route must be **b**, **c**, or **d**.

Combined linksets are not allowed for X.25 destinations. In other words, routes of equal cost destined for X.25 domains are not allowed.

If the route is assigned a destination that is marked for the X.25 domain, then that destination must be assigned to at least one X.25 destination and the linkset assigned to that route must have an adjacent point code assigned to the X.25 domain.

If the route is assigned a destination that is marked for the SS7 domain, then the linkset assigned to that route must have an adjacent point code assigned to the SS7 domain.

All routes with ANSI DPCs must use ANSI linkset APCs. A route with an ITU-I DPC can go over an ITU-N APC and an ITU-N DPC can go over an ITU-I APC.

If the link set name (the **lsn** parameter) references a link set that has the **ipgwapc=yes** parameter specified, the DPC must not be a cluster route.

Network routing is valid only if the NRT feature is on. The NRT feature is turned on with the **chg-feat** command.

When using network routing, if the DPC has a value of ***** in the *nc* field, the *ncm* field must also be ***** (for example, **dpc= 21-*-***).

The STP shall ensure that the specified destination address does not correspond to the STP's own DPC as specified in its self-identity.

The STP shall ensure that the specified destination address does not correspond to any of the STP's capability codes as specified in its self-identity.

Only a single route can be assigned to an APC or SAPC for an IPGWx linkset. The entered route must include the APC or SAPC's IPGWx linkset with the destination equal to the APC or SAPC.

Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Output

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25

```

ent-rtx

Enter Exception Route

Use this command to enter an exception route entry. An exception route is associated with an entry in the Routing table. When the Origin-Based MTP Routing feature is enabled and turned on, the least cost route available for an MSU to be routed to a Destination Point Code over a specified linkset is used. See the *Database Administration - Features* manual for more information about determining routes for linksets.

Up to 6 routes can be defined to a single entry in the Routing table. Up to 8000 routesets can be defined for an STP. This total must include at least one normal route (not an exception route). The remaining 7999 routesets can include any combination of normal and exception routes.

NOTE: A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.

Keyword: ent-rtx

Related Commands: chg-rtx, dlt-rtx, rtrv-rtx

Command Class: Database Administration

Parameters

:dpc= (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:dpci= (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-, p-, ps-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:dpcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc, m1-*

m2-m3-m4-gc). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:lsn= (mandatory)

Linkset Name. This parameter specifies the name of the linkset that is associated with the specified exception route.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters.

:rc= (mandatory)

Relative Cost. This parameter is the relative cost associated with the specified exception route.

Range: **0-99**

:cic= (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

Range: **0-16383**

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:force= (optional)

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **lsn** parameter value.

Range: **yes**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters.

:opc= (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: **opca**

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:opci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:opcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:opc24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:si= (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

Range: 3-15

Example

ent-rtx:dpc=1-1-1:opca=2-3-3:lsn=lset1:rc=30

ent-rtx:dpc=1-2-1:s1=3:lsn=lset2:rc=10

ent-rtx:dpc=1-3-1:ilsn=lset2:lsn=lset3:rc=20

ent-rtx:dpc=2-100-1:ilsn=lset2:lsn=lset4:rc=10

ent-rtx:dpc=2-100-1:si=5:lsn=lset5:rc=50

Dependencies

Only one of the **opc**, **ilns**, **cic**, or **si** parameters can be specified for a exception route entry.

For an ANSI origination point code that is defined using asterisks (**nnn-*.***), the value of the *network identifier* subfield (*nnn*) must be greater than 5.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The **dpc** parameter must already exist in the Route table.

A destination point code cannot be specified if it is already being used as an adjacent point code.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

An exception route entry cannot already exist with the same input parameter values, other than the relative cost..

For the **opc**, **ilsn**, CIC range (**cic** and **ecic** parameter values are not identical), and **si** criteria, only one pair of identical exception route conditions, differing only in **lsn** assignment, can exist for a given DPC. For exception route conditions with a single CIC, there can be only one exception route per CIC value per DPC per route cost.

A maximum of 6 exception routes can be associated with the specified DPC and criteria.

A maximum total of 8000 exception routes and normal routes can be defined for the EAGLE 5 ISS. At least one route must be a normal (not exception) route. The remaining routes (up to 7999) can be all normal routes, all exception routes, or any combination of normal and exception routes.

The network domain of the APC in the linkset specified by the **lsn** parameter must be the same network domain of the specified DPC or its alias.

The APC/SAPC type and group code in the linkset specified by the **lsn** parameter must match the **dpc** parameter.

The specified CIC/ECIC range must not overlap an existing range.

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **lsn** parameter value.

The **opc** parameter must be in the same ITU-N group as the **dpc** parameter.

The Group Code of the APCN in the **ilsn** parameter must be the same as the Group Code of the **dpc** parameter.

ANSI network routing and cluster point codes as OPC exception route criteria are not allowed for ITU destinations.

ITU point codes as OPC exception route criteria are not allowed for ANSI Network and Cluster destination.

Output

```
ent-rtx:dpci=2-100-1:si=5:lsn=lset5:rc=50
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
ENT-RTX: MASP A - COMPLTD
```

ent-scr-aftpc

Enter Allowed Affected Point Code

Use this command to add a specific allowed affected point code (AFTPC) screening reference in the AFTPC entity set.

Keyword: ent-scr-aftpc

Related Commands: chg-scr-aftpc, dlt-scr-aftpc, rtrv-scr-aftpc

Command Class: Database Administration

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: **stop**

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: **1-255 ***

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000-16383**.

Range: **00000-16383 ***

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see for information on converting the point code format.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsp= (optional)

The new 24-bit ITU national signaling point (sp). It specifies the new **sp** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **0-255 ***

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: Current value

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

Range: **none, s**

Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
ent-scr-
aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop:actname=copy
ent-scr-aftpc:nsfi=stop:sr=af01:ssn=1:msa=255:ssa=255:sp=255
ent-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **ssa=*** is specified, **sp=*** must be specified.

If specified, the **nsfi** parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the screening reference exists (**sr**), the new affected point code and subsystem number to be added cannot already exist in the AFTPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

If the screening reference is valid, but does not exist, a new AFTPC screen is created.

If the screening reference exists, a new rule is added to the AFTPC screening table.

If asterisks or ranges are specified for the allowed AFTPCs, nothing that matches the specified range of AFTPCs can already exist in the AFTPC screen for the screening reference.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-aftpc** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix to has the spare point code prefix.

Output

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
```

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-AFTPC: MASP A - COMPLTD
```

```
;
```

Legend

ENT-SCR-AFTPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-blkdpc**Enter Blocked DPC**

Use this command to add a specific blocked destination point code (BLKDPC) screening reference, and associated attributes, to the BLKDPC's table. The associated attributes are: destination point code, next screening function identifier, and next screening reference. The destination point codes listed on this screen are prohibited from sending SS7 messages to the network.

Keyword: ent-scr-blkdpc

Related Commands: chg-scr-blkdpc, dlt-scr-blkdpc, rtrv-scr-blkdpc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cgpa, destfld, fail, isup, stop

cgpa — Allowed CGPA is the next screening category.

destfld — Allowed destination field (DESTFLD) is the next screening category.

fail — Discard the received message.

isup — ISUP message type (ISUP) is the next screening category.

stop — The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 000-255 *, C

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *, C

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: 0-255 *, C

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: 00000-16383 *, C

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see for information on converting the point code format.

:nsr= (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be specified if **nsfi** is **stop** or **fail**.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *, C

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: 000-255 *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: 0-7 *, C

Example

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

```

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop
ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop:actname=copy
ent-scr-blkdpc:sr=iec:ni=240:nc=:ncm=:nsfi=fail
ent-scr-blkdpc:sr=bdp1:zone=1:area=2:id=3:nsfi=fail:pcst=none
ent-scr-blkdpc:sr=bdp1:zone=2:area=2:id=3:nsfi=fail:pcst=s
ent-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s

```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362, 700 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

When a blocked DPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **msa=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is not equal to **c-c-c** or **npc** is not equal to **c**, **nsfi=fail** must be specified and the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the specified screening reference (**sr**) does not exist:

- The **ni-nc-ncm zone-area-id** , or **msa-ssa-sp** must equal **c-c-c** or **npc** must equal **c**.
- The **nsfi** parameter cannot be **fail** .
- A new BLKDPC table is created.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm zone-area-id** , or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail** .
- The **nsr** parameter cannot be specified.
- The blocked DPC, given by **ni-nc-ncm** (or **zone-area-id** or **npc**), to be added to the BLKDPC screening table for the blocked DPC screening reference cannot exist as defined or within an existing range of DPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **zone=c** is specified, the **area** and **id** values default to the character **c** in the database.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or of subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** parameters can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkdpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

```

ent-scr-blkopc

Enter Blocked OPC

Use this command to add a specific blocked originating point code (BLKOPC) screening reference and associated attributes OPC, **nsfi**, and **nsr** to the BLKOPC entity set. Any messages received on the link assigned to this screening reference that match the attributes in this table are blocked from entering the network.

Keyword: ent-scr-blkopc

Related Commands: chg-scr-blkopc, dlt-scr-blkopc, rtrv-scr-blkopc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdpc, cgpa, dpc, fail, sio, stop

blkdpc—Blocked DPC is the next screening category.

cgpa—Allowed CGPA is the next screening category.

dpc — Allowed DPC is the next screening category.

fail — Discard the received message.

sio — Allowed SIO is the next screening category.

stop — The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7** *, C

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255** *, C, && (Allow intervals)

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *, C, && (Allow intervals)

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255** *, C, && (Allow intervals)

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: 00000-16383 *, C

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *, C

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7 *, C

Example

```
ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

```

```
ent-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

```
ent-scr-blkopc:sr=bop1:npc=128:nsfi=fail:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

When a blocked OPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If asterisks or ranges are specified for the blocked OPCs, nothing that matches the specified range of blocked OPCs can already exist in the BLKOPC screening table for the screening reference.

If the **actname** parameter is specified, the **nsfi-stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **msa=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

If the specified **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is not equal to **c-c-c** or **npc** is not equal to **c**, **nsfi=fail** must be specified and the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

If the specified screening reference (**sr**) does not exist:

- The **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** must equal **c-c-c** or **npc** must equal **c**.
- The **nsfi** parameter cannot be **fail**.
- A new BLKDPC table is created.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail**.
- The **nsr** parameter cannot be specified.
- The blocked OPC, specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc**, to be added to the BLKOPC screening table for the blocked OPC screening reference cannot exist as defined or within an existing range of OPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **zone=c** is specified, the **area** and **id** values default to the character **c** in the database.

Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkopc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

ent-scr-cdpa

Enter Allowed Called Party Address

Use this command to add a specific allowed called party address (CDPA) screening reference in the CDPA entity set.

Keyword: **ent-scr-cdpa**

Related Commands: **chg-scr-cdpa**, **dlt-scr-cdpa**, **rtrv-scr-cdpa**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **aftpc**, **stop**

aftpc— Allowed affected point code is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from **1-255**.

Range: **1-255 ***

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:scmgfid= (optional)

The SCMG Format ID. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **1–255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

Range: **1-255 ***

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

Example

```
ent-scr-
cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds
ent-scr-
cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:actname=copy
ent-scr-
cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering *c* for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new CDPA entry to be added cannot match any specific, range, or asterisk entry already existing in the specified screening table.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

When **nsfi=aftp** is specified, the **ssn=1** parameter must be specified.

When **nsfi** is a value other than **stop**, the **nsr** parameter must be specified.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

When **ssn=1** is specified, the **scmgfid** parameter must be specified.

When **ssn** is not **1**, the **scmgfid** parameter cannot be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

If the screening reference is valid, but does not exist, a new CDPA screen is created.

If the screening reference exists, a new rule is added to the CDPA screening table.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cdpa** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```

ent-scr-
cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-CDPA: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-CDPA: MASP A - COMPLTD
;

```

Legend

ENT-SCR-CDPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-cgpa**Enter Allowed Calling Party Address**

Use this command to add a specific allowed calling party address (CGPA) screening reference in the CGPA entity set.

Keyword: ent-scr-cgpa

Related Commands: chg-scr-cgpa, dlt-scr-cgpa, rtrv-scr-cgpa

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop, tt

cdpa— Allowed called party address is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

tt— Allowed translation type is the next screening category.

:ri= (mandatory)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

Range: dpc, gt, *

dpc— Allow a called party address with a routing indicator value of “DPC/SSN.”

gt— Screening stops and gateway screening is bypassed as a forced pass.

*****— A full range of values.

:sr= (mandatory)

Screening reference. This parameter specifies the point code’s unique screening reference name.

Range: ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

:ssn= (mandatory)

The subsystem number. An asterisk (*) indicates the full range of values from 1-255.

Range: 1-255 *

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given.

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:sccpmt= (optional)

The SCCP message type. An asterisk (*) indicates all possible allowed values.

Range: **9, * 10, * 17, * 18***
9—UDT
10—UDTS
17—XUDT
18—XUDTS
Default: *****

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7 ***

Example

```
ent-scr-
cgpa: sr=iec: ni=240: nc=010: ncm=: ssn=224: nsfi=aftpc: nsr= wrd5: ri=dp
c
```

```
ent-scr-

cdp1
```

```
ent-scr-
cgpa: sr=cgpa: zone=1: area=2: id=3: ssn=1: sccpmt=9: ri=: nsfi=stop: pcs
t=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The new CGPA point code, **ri**, **sccpmt**, and subsystem number (**ssn**) to be added can not already exist in the CGPA entity set.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The screen referenced by **nsfi** and **nsr** must already exist.

When **nsfi** is a value other than **stop**, the **nsr** parameter must be specified.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

The **nsfi=tt** parameter can be specified only if the **ri=gt** parameter or the **ri=*** parameter is specified.

The **nsfi=cdpa** parameter can be specified only if the **ri=dpc** parameter or the **ri=*** parameter is specified.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screening reference is valid, but does not exist, a new CGPA screening table is created.

If the screening reference exists, a new rule is added to the CGPA screening table. Only one rule may exist for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**) combination. This implies

that for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**), only one value of **ri** may be specified. The **ri** for a given combination can be **dpc**, **gt**, or *****, but not **dpc** and **gt** independently.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cgpa** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

;
```

Legend

ENT-SCR-CGPA—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-destfld

Add an Allowed DESTFLD

Use this command to add an allowed affected destination field (DESTFLD) screening reference and associated attributes (destination point code, next screening function identifier, and next screening reference) to the allowed DESTFLD entity set. One or more point codes can be associated with the allowed DESTFLD screening reference. MTP Network Management messages regarding the DESTFLDs listed in this entity set are accepted from another network.

Keyword: **ent-scr-destfld**

Related Commands: **chg-scr-destfld**, **dlt-scr-destfld**, **rtrv-scr-destfld**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter indicates that the gateway screening process should stop. If this parameter is specified for this command, it must have the value of **stop**.

Range: **stop**

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop
ent-scr-destfld:sr=iec1:ni=1:nc=1:ncm=1:nsfi=stop:actname=copy
ent-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The **actname** parameter can be specified only when the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The **nsfi=stop** parameter must be specified in the command.

The **nsr** parameter cannot be specified for this command, because **nsfi=stop** must be specified. The **nsr** parameter cannot be specified when **nsfi=stop**.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-destfld** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop
```

ent-scr-dpc

Enter Allowed DPC

Use this command to add an allowed DPC screening reference and associated attributes (destination point code, next screening function identifier, next screening function reference) to the allowed DPC entity set. One or more DPCs may be associated with the allowed DPC screening reference. The DPCs listed in this entity set are allowed to receive SS7 messages from another network.

Keyword: **ent-scr-dpc**

Related Commands: **chg-scr-dpc**, **dlt-scr-dpc**, **rtrv-scr-dpc**

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: **blkdpc**, **cgpa**, **destfld**, **isup**, **stop**

blkdpc — Blocked DPC is the next screening category.

cgpa — Allowed CGPA is the next screening category.

destfld — Allowed destination field (DESTFLD) is the next screening category.

isup — ISUP message type (ISUP) is the next screening category.

stop — The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

The allowed DPC screening reference name. This parameter identifies a set of one or more allowed destination point codes.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7 ***

:msa= (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.

Range: 00000-16383 *

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: none, s

Default: none

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from 000-255.

Range: 000-255 *

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from 0-7.

Range: 0-7, *, C

Example

```
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf
```

```
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=blkdp:nsr=bdp1
```

```
ent-scr-dpc:sr=dpc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
```

```
ent-scr-dpc:sr=dpc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

```
ent-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

The **actname** parameter can be specified only when the **nsfi=stop** parameter is specified.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

The **nsr** parameter must be specified if **nsfi** is not equal to **stop**.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

When a DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the DPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-dpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-DPC: MASP A - COMPLTD
;
```

Legend

ENT-SCR-DPC—Command entered that caused this output. This is echoed to the printer.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-isup

Enter Allowed ISUP Screening Reference

Use this command to add an allowed ISUP or TUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

Keyword: ent-scr-isup

Related Commands: chg-scr-isup, dlt-scr-isup, rtrv-scr-isup

Command Class: Database Administration

Parameters

:isupmt/tupmt= (mandatory)

ISUP message type or TUP message type. A single value or range of values can be entered. An asterisk (*) indicates the entire range of 000-255. TUP is not valid for SEAS.

Range: 000-255 *

:sr= (mandatory)

The the individual ISUP screening reference to which this rule will be added. If the specified **sr** does not exist, it will be created

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*
 1 alphabetic character followed by up to 5 alphanumeric characters.

:nsfi= (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

Range: **stop**
stop — The gateway screening process ends and the message proceeds through normal routing.

:nsr= (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
 1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
ent-scr-isup:sr=iec:isupmt=9:nsfi=stop
ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop
ent-scr-isup:sr=iall:isupmt=*:nsfi=stop
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
```

Dependencies

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The specified **isupmt** parameter or **tupmt** parameter value must not already exist in the specified **sr**.

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

Notes

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-isup** command.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value.

To use ISUP message type screening, an SIO screening reference with **si=05** (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (**nsr**) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (**nsr**) value.

Output

When a screen reference is specified that is not yet associated with a screen set, the following output appears:

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
tekelecstp 04-09-02 09:39:13 EST EAGLE 31.3.0
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

When a screen reference is specified that is already associated with one or more screen sets, the following output appears:

```
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
tekelecstp 04-11-17 16:22:27 EST EAGLE 31.4.0
Extended Processing Time Required -- Please Wait
Notice: The number of screensets affected is 2.
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

ent-scr-opc

Enter Allowed OPC

Use this command to add an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference) to the allowed OPC entity set. One or more OPCs may be associated with the allowed OPC screening reference. Each OPC listed in this entity set is allowed to send SS7 messages to the customer's network.

Keyword: ent-scr-opc

Related Commands: chg-scr-opc, dlt-scr-dpc, rtrv-scr-dpc

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, blkopc, cgpa, dpc, sio, stop

blkdp— Blocked DPC is the next screening category.

blkopc— Blocked OPC is the next screening category.

cgpa— Allowed CGPA is the next screening category.

dpc— Allowed DPC is the next screening category.

sio— Allowed SIO is the next screening category.

stop— The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Screening reference. This parameter identifies a set of one or more allowed OPCs.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:area= (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:id= (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0–7**.

Range: **0-7, ***

:msa= (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:nc= (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **000-255 ***

:ncm= (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:ni= (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **000–255**.

Range: **0-255 ***

:npc= (optional)

The ITU national point code. An asterisk (*) indicates the full range of values from **00000–16383**.

Range: **00000-16383 ***

NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see in Appendix A for information on converting the point code format.

:nsr= (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*
1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

:pcst= (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

Range: **none, s**
Default: **none**

:sp= (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:ssa= (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (*) indicates the full range of values from **000-255**.

Range: **000-255 ***

:zone= (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (*) indicates the full range of values from **0-7**.

Range: **0-7, ***

Example

```
ent-scr-opc:sr=iec:nsfi=stop
ent-scr-opc:sr=iec:ni=240:nsfi=sio:nsr=iec
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=copy
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=dpc:nsr=iec
ent-scr-opc:sr=opc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
ent-scr-opc:sr=opc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
ent-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

The OPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The **actname** parameter can be specified only when the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If **area=*** is specified, **id=*** must be specified.

If **msa=*** is specified, **ssa=*** and **sp=*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

The **nsr** parameter must be specified if **nsfi** is not equal to **stop**.

The **nsr** parameter must be specified if **nsfi** is not equal to **stop**.

If **ssa=*** is specified, **sp=*** must be specified.

If **zone=*** is specified, **area=*** and **id=*** must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Notes

When an OPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the OPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (*) value cannot be used with the character **c** (for example, a point code **c-c-*** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-opc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

Output

```
ent-scr-opc: sr=iec: nsfi=stop
  rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
  ENT-SCR-OPC: SCREEN SET AFFECTED - IEC 25% FULL
  ENT-SCR-OPC: MASP A - COMPLTD
;
```

Legend

ENT-SCR-OPC—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-sio

Enter Allowed SIO

Use this command to add an allowed SIO screening reference and associated attributes (network indicator, service indicator, message priority, H0 heading code, H1 heading code, next screening function identifier, next screening function reference) to the allowed SIO entity set.

NOTE: To use TUP message type screening, an SIO screening reference with si=04 (TUP) must be defined in the SIO table. This SIO screening reference is specified in the ent-scr-isup command as the next screening reference (nsr) value in a screening reference for TUP message types

Keyword: ent-scr-sio

Related Commands: chg-scr-sio, dlt-scr-sio, rtrv-scr-sio

Command Class: Database Administration

Parameters

:nic= (mandatory)

Network indicator code (NIC). This parameter specifies an NIC for the SIO screening reference specified in the **sr** parameter. The NIC is the last 2 bits of the subservice field of an SIO. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–3.

Range: 0-3 *

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, cdpa, cgpa, destfld, dpc, isup, stop
blkdp—Blocked DPC is the next screening category.

cgpa — Allowed CGPA is the next screening category.

destfld — Allowed destination field (DESTFLD) is the next screening category.

dpc — Allowed DPC is the next screening category.

isup — ISUP message type (ISUP) is the next screening category.

stop — The gateway screening process ends and the message proceeds through normal routing.

:pri= (mandatory)

Message priority. This parameter specifies a single priority, or the beginning of a range of priorities for the SIO screening reference specified by the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–3**.

Range: **0-3 ***

:si= (mandatory)

Service indicator. This parameter specifies an SI for the SIO screening reference specified in the **sr** parameter. The SI is the first 4 bits of an SIO. The SS7 code directs the message to the MTP-user at the destination code.

Range: **00-15**

:sr= (mandatory)

The allowed SIO screening reference name. This parameter identifies a set of one or more **si/nic/pri** combinations.

Range: *ayyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

:h0= (optional)

H0 heading code. This parameter specifies a new H0 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–15**.

Range: **0-15 ***

Default: Value given if **si** value is **00**, **01**, or **02**

:h1= (optional)

H1 Heading Code. This parameter specifies an H1 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from **0–15**.

Range: **0-15 ***

Default: Value given if **si** value is **00**, **01**, or **02**

:nsr= (optional)

Next screening reference (NSR). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

```
ent-scr-
sio:sr=iec:nic=1:si=1:h0=01&&03:h1=:pri=:nsfi=dpc:nsr=abc
ent-scr-sio:sr=iec:nic=1:si=3:pri=2:nsfi=stop
ent-scr-sio:sr=iec:nic=1:si=4:pri=3:nsfi=stop:actname=cncf
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The **actname** parameter can be specified only when the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACTNAME* field of the **rtrv-gws-actset** command output.

If the **si** parameter is equal to **00**, **01**, or **02**, the **h0** and **h1** parameters must be specified. Otherwise, the **h0** parameter cannot be specified.

Table 5-44 shows the valid combinations of the **h0/h1** parameters:

Table 5-44. Valid Combinations for the **h0/h1** Parameters (**ent-scr-sio**)

If the h0 parameter is specified as:	The h1 parameter can be specified as:
A single value	A single value
A single value	A range
A single value	An asterisk (*) entry
A range	An asterisk (*) entry
An asterisk (*) entry	An asterisk (*) entry

When the **chg-scr-sio** command is entered with the **nh0** or **nh1** parameters, the specified values must be valid with the **h0** or **h1** values currently in the database.

If the screening reference exists, the **nic**, **si**, **h0/h1**, and priorities to be added to the allowed SIO entity set for the SIO screening reference cannot exist in that allowed SIO entity set.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of **nic**, **si**, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

If the screening reference does not exist, a new screening reference for the allowed SIO entity set is created.

The **nsfi** and the **nsr** values to be added must point to one or more existing entities in another entity set or the **nsfi** parameter to be added must be equal to **stop** and the **nsr** to be added cannot be specified.

Use Table 5-45 to determine an acceptable combination of the **nsfi** and **si** parameters:

Table 5-45. Valid **ent-scr-sio nsfi** and **si** Parameter Combinations

If the nsfi parameter is...	...the si parameter must be:
destfl	00
cdpa	03
cgpa	03
isup	05

Use Table 5-46 to determine the acceptable combination of the specified parameter values:

Table 5-46. Additional Valid **ent-scr-sio** Parameter Combinations

si value:	nic value	pri value	h0 value:	h1 value:
00	s, *	s, *, r	s	s, *, r
00	s, *	s, *, r	*, r	*
01, 02	s, *	s, *, r	s	s, *, r
01, 02	s, *	s, *, r	*, r	*
03-15	s, *	s, *, r	u	u
Legend s = single value r = range * = asterisk u = unspecified				

Notes

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **pri=0&&2** specifies all message priorities for the range **0** to **2**.

If the screen set reaches 100% capacity (indicated by the **100% Full** message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with **si=05** (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references.

The **h0** and **h1** parameters cannot be specified if **si** is not equal to **00**, **01**, or **02**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-sio** command.

Output

```

ent-scr-
sio:sr=iec:nic=1:si=1:h0=01&&03:h1=:pri=:nsfi=dpc:nsr=abc
  rlgncxa03w 04-02-14 16:45:50 EST EAGLE 31.3.0
  ENT-SCR-SIO: SCREEN SET AFFECTED - SS01 25% FULL
  ENT-SCR-SIO: SCREEN SET AFFECTED - SS04 35% FULL
  ENT-SCR-SIO: MASP A - COMPLTD
;

```

Legend

ENT-SCR-SIO—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - SS01—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scr-tt**Enter Allowed Translation Type**

Use this command to add a specific allowed translation type (TT) screening reference in the TT entity set.

Keyword: ent-scr-tt

Related Commands: chg-scr-tt, dlt-scr-tt, rtrv-scr-tt

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: cdpa, stop

cdpa—Allowed CDPA is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

:sr= (mandatory)

Name of the screening reference.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:type= (mandatory)

Translation type. The translation type identifies the global title translation type value in the called party address. It is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified. An asterisk (*) indicates the full range of values from 0–255.

Range: 000-255 *

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:nsr= (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

Default: No value given

Example

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wrds
```

```
ent-scr-tt:sr=iec:type=012:nsfi=stop:actname=copy
```

Dependencies

CAUTION: Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

If the screening reference is valid, but does not exist, a new TT screen is created.

If the screening reference exists, a new rule is added to the TT screening table.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-tt** command.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

If the **nsr** parameter is specified, the specified screening reference must exist.

If the screening reference (**sr**) exists, the single value or range specified for the allowed **type** to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

If an asterisk is specified for the allowed **type**, nothing can already exist in the TT screen for the screening reference.

Notes

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```

ent-scr-tt: sr=iec: type=012: nsfi=cdpa: nsr=wrds
  rlgncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
  ENT-SCR-TT: SCREEN SET AFFECTED - IEC 25% FULL
  ENT-SCR-TT: MASP A - COMPLTD
;

```

Legend

ENT-SCR-TT—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED - IEC—Identifies the screen set that was affected by the command. The screen set name is provided.

25% FULL—Indicates the relative size of the screen set.

ent-scrset**Enter Screen Set**

Use this command to create a new screen set and point it to its first screen. A screen set is a set of screens (filters) that can be assigned to a linkset. SS7 messages transmitted on a linkset assigned to a screen set require screening by the system, if screening is enabled.

Keyword: ent-scrset

Related Commands: chg-scrset, dlt-scrset, rtrv-scrset

Command Class: Database Administration

Parameters

:nsfi= (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

Range: blkdp, blkopc, dpc, opc, sio, stop

blkdp—Blocked DPC is the next screening category.

blkopc—Blocked OPC is the next screening category.

dpc—Allowed DPC is the next screening category.

opc—Allowed OPC is the next screening category.

sio—Allowed SIO is the next screening category.

stop—The gateway screening process ends and the message proceeds through normal routing.

:scrn= (mandatory)

Screenset name.

Range: ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

:actname= (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

Range: ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

:destfld= (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is **on**, the automatic screening is applied at the end of the provisioned screen set.

Range: yes, no
Default: yes

:nsr= (optional)

Next screening reference (**nsr**). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

Range: ayyy
 1 alphabetic character followed by up to 3 alphanumeric characters
Default: No value given

Example

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
ent-scrset:scrn=ss02:nsfi=stop
ent-scrset:scrn=empt:nsfi=stop:destfld=yes
ent-scrset:scrn=scr1:nsfi=stop:actname=copy
```

Dependencies

Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The **actname** parameter can be specified only when the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The **nsr** parameter cannot be entered if the **nsfi** parameter value equals **stop**.

The specified screen set name cannot be in use by another screen set.

A maximum of 63 user-defined screen sets can be defined in the database.

The next screening function identifier and the next screening reference to be added must point to one or more existing entities in another entity set. If this is not the case, the next screening function identifier added must equal **stop** and the next screening reference added cannot be specified.

The **nsr** parameter is required if the **nsfi** parameter value does not equal **stop**.

The Gateway Screening (GWS)/Global Title Translation (GTT) shared database resource (DBMM.TBL) may not be full.

Notes

Entering a new screen set may take a few minutes of processor time. The following message appears in the scroll area:

Extended processing time required-please wait

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

Output

```
ent -scrset:scrn=ss01:nsfi=opc:nsr=iec
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCRSET: SCREEN SET AFFECTED - SS01 25% FULL
ENT-SCRSET: MASP A - COMPLTD
;
```

Legend

ENT-SCRSET—The command entered that caused this output. This is echoed to the printer as a reference.

SCREEN SET AFFECTED—Identifies the screen set that was affected by the command. The screen set name is shown.

% FULL—Indicates the relative size of the screen set.

ent-serial-num**Enter Serial Number**

Use this command to enter the NT serial number into the database for an EAGLE STP IP7 Secure Gateway system.

You must enter the serial number at least once without specifying the **lock** parameter. As long as you enter the command without the **lock** parameter, you can enter the system serial number as many time as needed. After the correct serial number is entered, you must use the **lock=yes** parameter to lock the serial number table. You cannot change the serial number with administration commands after the table is locked.

Keyword: ent-serial-num

Related Commands: rtrv-serial-num

Command Class: Database Administration

Parameters

:serial= (mandatory)

The system NT Serial Number.

Range: aayyyyyyy

Up to 15 alphanumeric characters; mixed case is allowed.

The first two characters (the prefix) must be letters.

The remaining characters must be numbers.

The serial number cannot contain spaces or special characters.

:lock= (optional)

This parameter is used to lock the Serial Number table when the serial number is entered for the system.

CAUTION

CAUTION: After the serial number is locked, you cannot enter it again or change it in the database. You can use the command without the lock parameter to enter the serial number as many times as needed; then enter the command with the lock parameter and the correct serial number to lock the serial number table.

Range: yes

Default: Not locked

Example

```
ent-serial-num:serial=nt00000123
```

```
ent-serial-num:serial=nt00000123:lock=yes
```

Dependencies

The serial number must be entered at least once without specifying the **lock** parameter.

The system serial number that is entered when the **lock** parameter is specified must match the serial number that was previously entered in the Serial Number table by using the command without the **lock** parameter.

The system serial number cannot be entered again after the Serial Number table is locked.

Notes

None

Output

```
ent - serial-num: serial=nt00000123
    rlgncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
    ENT-SERIAL-NUM: MASP A - COMPLTD
;
```

ent-shlf**Enter Shelf**

Use this command to add an equipment shelf to the database.

Keyword: ent-shlf

Related Commands: dlt-shlf, rtrv-shlf

Command Class: Database Administration

Parameters

:loc= (mandatory)

The shelf location.

Range: 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

:type= (mandatory)

The type of equipment shelf to be configured.

Range: ext

Example

```
ent - shlf: type=ext: loc=1200
```

Dependencies

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

The specified shelf location must not have been configured previously.

Notes

None

Output

```
ent - shlf: type=ext: loc=1200
    rlgncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
    ENT-SHLF: MASP A - COMPLTD
;
```

ent-sid**Enter Self Identification**

Use this command to define additional true point codes for an STP. This command allows newly defined true point codes to be distributed to the cards without requiring system initialization.

Keyword: ent-sid

Related Commands: chg-sid, rtrv-sid

Command Class: Database Administration

Parameters

:pc= (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

Synonym: pca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:pc/pca/pci/pcn/pcn24= (optional)

STP true point code.

:pci= (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

zone—0-7

area—000-255

id—0-7

The point code 0-000-0 is not a valid point code.

:pcn= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—s-

nnnnn—0-16383

gc—aa-zz

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:pcn24= (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

To create a site identification STP PC for ITU-N and ITU-I:

ent-sid:pcn=123:pci=1-1-1

To create a site identification STP PC for ITU-N Spare and ITU-I Spare:

ent-sid:pcn=s-123:pci=s-1-1-1

Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the **pc** parameter must be **6** or greater when the specified cluster value is **0** (*nc*).

Only the **pcn** parameter or the **pcn24** parameter can be specified in a command; both parameters cannot be specified in the same command.

The specified STP point code must not have been previously defined as a capability point code.

An STP point code cannot exist that is the same type (ANSI, ITU-I, ITU-N, ITU-N24, ITU-ISpare, or ITU-NSpare) as the specified STP point code.

The STP point code can be specified only as a full point code.

ITU-N STP destination point codes can be specified only as full point codes.

Notes

The SID Table can simultaneously contain the node's true point codes of any following point code types: ANSI, ITU-I, ITU-N or ITU-N24, ITU-ISpare, and ITU-NSpare. (Only ITU-N or ITU-N24, not both, can be defined in the SID Table.)

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

ent-sid:pcn=123:pci=1-1-1

rlghncxa03w 05-01-07 11:11:28 EST EAGLE 31.12.0

ENT-SID: MASP A - COMPLTD

;

ent-slk

Enter Signaling Link

Use this command to add a low-speed or high-speed (ATM or IP) signaling link to a linkset in the database.

For 2-port E1 cards, E1/T1 MIM cards, HC-MIM cards, Channel cards, or E5-E1T1 cards, use this command to associate a signaling link and a timeslot with the E1 or T1 interface that will service the timeslot.

For HC-MIM cards used for SE-HSL links, use this command to assign links **a** and **b** on any 2 of the 8 HC-MIM card ports. For E5-E1T1 cards used for SE-HSL links, use this command to assign link **a** on any 1 of the 8 E5-E1T1 card ports.

Signaling links are the only elements in the database directly supported by a hardware device. When a link is added to a linkset, the link remains in the state OOS-MT-DSBLD (out of service maintenance disabled) until it is activated.

Up to 64 signaling links can be assigned to one HC-MIM card, allowing links **a**, **a1** through **a31**, **b**, and **b1** through **b31** to be provisioned. Up to 32 signaling links can be assigned to one E5-E1T1 card, allowing links **a**, **a1** through **a15**, **b**, and **b1** through **b15** to be provisioned.

NOTE: The link parameter has been added as a synonym for the port parameter. Either port or link can be used for a few more EAGLE 5 ISS releases; then the port parameter will be removed.

Keyword: ent-slk

Related Commands: act-slk, blk-slk, canc-slk, dact-slk, dlt-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

Command Class: Database Administration

Parameters

The following parameters are valid for all types of links: **loc**, **lsn**, **link**, **slc**, **bps**, **ecm**

The following parameters are valid for low-speed links: **llmode**, **l2tset**, **pcrn1**, **pcrn2**, **tset**

The following parameter is valid only for IP links: **ipliml2**

The following parameters are valid for ATM ANSI high-speed links: **atmtsel**, **ll**, **lpset**, **vci**, **vpi**

The following parameters are valid for E1 ATM links: **atmtsel**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **lpset**, **vci**, **vpi**

The following parameters are valid for E1 links: **l2tset**, **pcrn1**, **pcrn2**, **e1loc**, **e1port**, **ts**

The following parameters are valid for T1 links: **l2tset**, **ecm**, **pcrn1**, **pcrn2**, **t1loc**, **t1port**, **ts**

The following parameters are valid for SE-HSL links: **l2tset**, **e1port**

:link= (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

Synonym: port

Range: **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

If the signaling link is being assigned to an E1 or T1 card for a Channel card, specify the location of the Channel card. If the link is being assigned for the E1 or T1 card itself, specify the location of the E1 or T1 card.

Range: **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118,**

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,
4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,
5301-5308, 5311-5318, 6101-6108, 6111-6118

:lsn= (mandatory)

The name of the linkset. The linkset name must be unique.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

:slc= (mandatory)

The signaling link code.

The SLC must be unique within the linkset. It must be the same at both the system location and the distant node.

Range: 0-15

:atmtsel= (optional)

ATM timing selector. The timing source for the ATM signaling link—internal, line, or external.

Internal timing is derived from an internal clock source operating at 1.544 MHz $\pm$ 200 Hz for ANSI links and 2.048 MHz $\pm$ 103 Hz for ITU links. External timing is derived from the High-Speed Master Clock (T1 or E1). Line timing is derived from its received data stream, if present.

CAUTION: The internal timing source is used for debug purposes only, and is not to be used for production operation.

If you are using the 2.048 MHz reference clock as the timing source for E1 signaling links, the **atmtsel=external** parameter must be specified for high-speed ATM signaling links. The **atmtsel** parameter is not valid in the command when the **e1loc** or **e1port** parameter is specified for an E1 signaling link. For information on the E1 interface, see Appendix A, “E1 Interface” in the *Database Administration Manual - SS7*.

Range: external, internal, line

Default: line

:bps= (optional)

The transmission rate for the link in bits per second. E1 links running at 56000 bps and 64000 bps are allowed in linksets with other links running at 56000 bps or 64000 bps, or both, in the same linkset. T1 links running at 56000 bps or 64000 bps are allowed in linksets with other links that are running at 56000 bps or 64000 bps, or both. All other types of links in one linkset are required to have the same provisioned link speed. See Table 5-47.

Range: 4800, 9600, 19200, 56000, 64000, 1544000, 1984000, 2048000

Default: 56000

:e1atmcrc4= (optional)

CRC4 multi-frame structure enable/disable indicator.

Range: on, off

Default: on

:e1atmsi= (optional)

Value of two Spare International bits of NFAS data.

Range: 0-3

Default: 3

:e1atmsn= (optional)

Value of five Spare National bits of NFAS data.

Range: 0-31

Default: 0

:e1loc= (optional)

Card location of an E1 card with an E1 interface that will service the link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:e1port= (optional)

The port for the E1 interface on the E1 card to which a signaling link and timeslot are being assigned, or to which an SE-HSL link is being assigned.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

Any 2, but no more than 2, of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

Default: 1

:ecm= (optional)

Error correction method.

Range: basic, pcr

Default: basic

:ipliml2= (optional)

IPLIM level 2 stack.

Range: saaltali, m2pa

Default: m2pa

:l1mode= (optional)

The mode of operation used to select the link clocking source at layer 1. One end of a V.35 link must be DTE and the other end must be DCE.

Range: dte, dce

Default: dte

:l2tset= (optional)

Level 2 timer set. A signaling link can be assigned to any of the thirty timer sets.

Range: 1-30

1-10 for ANSI low speed links

11-20 for ITU low speed links

21-25 for ITUN China high speed links

26-30 for ITUN Q703.A high speed links

Default: 1 for ANSI low speed links

11 for ITU low speed links

21 for ITUN China high speed links (SE-HSL link in a linkset defined with the **apcntype=ituchina** parameter)

26 for ITUN Q703.A high speed links (SE-HSL link in a linkset defined with the **apcntype=itun** parameter)

:ll= (optional)

ATM line length in feet.

Range: 0-7

0—0-110 feet

1—110-220 feet

- 2—220-330 feet
- 3—330-440 feet
- 4—440-550 feet
- 5—550-660 feet
- 6—More than 660 feet
- 7—Allows use of external line buildout networks

Default: 0

:lpset= (optional)

Link parameter set identifier.

Range: 1-30

Default: 1—for ANSI

21—for ITU

:pcrn1= (optional)

The threshold of the number of MSUs available for retransmission. If the error correction method being used is PCR and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range: 1-127

Default: 76

:pcrn2= (optional)

The threshold of the number of MSU octets available for retransmission. If the error correction method being used is PCR, and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.

Range: 300-35500

Default: 3800

:t1loc= (optional)

Card location of a T1 card with a T1 interface that will service the signaling link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (optional)

The port for the T1 interface on the T1 card to which a signaling link and timeslot are being assigned.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

Default: 1

:ts= (optional)

E1 timeslot for the assigned signaling link.

Range: 1-31

:ts= (optional)

T1 timeslot for the assigned signaling link.

Range: 1-24

:tset= (optional)

Transmitter signal element timing.

Range: on, off

Default: off

:vci= (optional)

Virtual channel identifier.

Range: 5, 32-65535

0-4 and 6-31 are reserved values; they cannot be specified in the command.

Default: 5

:vpi= (optional)

Virtual path identifier.

Range: 0-4095

Default: 0

Example

ent -

slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:l1mode=dte:bps=64000:ecm=basic

ent -

slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:ecm=pcr:pcrn1=50:pcrn2=4000

ent -

slk:loc=1302:link=a:slc=5:lsn=atm1302a:lpset=3:vci=10:vpi=15 :ll=0:atmtsel=internal

ent -

slk:loc=1302:link=a:slc=5:lsn=atm1302a:lpset=3:vci=10:vpi=15 :ll=0:atmtsel=external

The following example adds a link to linkset ls1 at 56 KB for a multi-port LIM:

ent-slk:loc=1205:link=a1:slc=0:lsn=ls1

The following example assigns a timeslot for the signaling link on an E1 card that uses E1 port 1.

ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=1

The following example assigns a timeslot for a signaling link on an E1 card that uses E1 port 2.

ent-slk:loc=1205:link=b:slc=0:lsn=e1typ:ts=1:e1port=2

The following example assigns a timeslot for a signaling link on a Channel card in the location specified by the loc parameter. The Channel card is serviced by the E1 assigned to the E1 card in the location specified by the e1loc parameter.

ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=2:e1loc=1205

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using E1 port 2 and signaling link b2.

ent-slk:loc=1205:link=b2:slc=0:lsn=e1typ:ts=1:e1port=2

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an E1 Channel card in card location 1206. The command specifies signaling link port a1. The E1 interface that services the Channel card is on the E1 card in card location 1205 (e1loc parameter).

ent-slk:loc=1206:link=a1:slc=1:lsn=e1jwk:ts=2:e1loc=1205

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using signaling link a2. The T1 interface defaults to the interface defined for T1 port 1 (t1port parameter not specified)

ent-slk:loc=1207:link=a2:slc=0:lsn=t1jwk:bps=64000:ts=1

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using T1 port 2 and signaling link b2.

ent-slk:loc=1207:link=b2:slc=0:lsn=t1typ:ts=1:t1port=2

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an T1 Channel card in card location 1208. The command specifies signaling link a1. The T1 interface that services the Channel card is on the T1 card in card location 1207 (t1loc parameter).

ent-

slk:loc=1208:link=a3:slc=1:lsn=t1jwk:bps=64000:ts=2:t1loc=1207

The following example adds a signaling link to linkset ls1 at 2048000 bps for an E1 ATM card that will use the CRC4 multi-frame structure

ent-

**slk:loc=1205:link=a:slc=0:lsn=ls1:bps=2048000:atmsel=line:e1atmcr
c4=on**

The following example adds a signaling link to link set e1e2a using the SAALTALI Level 2 stack.

ent-slk:loc=1301:link=a:lsn=e1e2a:slc=0:ipliml2=saaltali

The following example adds a link to link set ls1 at 56 Kbps for an HC-MIM card that is provisioned as an E1 card:

ent-slk:loc=1205:link=a31:slc=0:lsn=ls1:e1port=4:ts=4

The following example adds a link to link set l21 at 64 Kbps for an HC-MIM card that is provisioned as a T1 card:

ent-slk:loc=1207:link=b27:slc=3:lsn=ls2:t1port=8:ts=6:bps=64000

Dependencies

The slot portion of the specified card location (**loc**) can be **1 - 8** and **11 - 18**. Slots **09** and **10** cannot be specified. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

Card locations **1113 - 1118** cannot be specified.

The frame and shelf portions of the specified card location (**loc**) can be **11 - 13**, **21 - 23**; **31 - 33**; **41 - 43**; **51 - 53**; and **61**. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

The **pcrn1** parameter and the **pcrn2** parameter can be specified for the **ss7ansi** and **ccs7itu** applications only when the **ecm=pcr** parameter is specified.

Use Table 5-47 to select a valid transmission rate for the **bps** parameter.

Table 5-47. Transmission Rate for the **bps** Parameter

Card Application	bps Transmission Rate	Domain
ss7ansi	56000 or 64000	SS7
ss7gx25	4800, 9600, 19200, 56000, or 64000	X.25
ccs7itu	56000 or 64000	SS7
atmansi	1544000	SS7

Table 5-47. Transmission Rate for the **bps** Parameter

Card Application	bps Transmission Rate	Domain
ss7ansi , ccs7itu (SE-HSL cards)	1984000	SS7
atmitu	2048000	SS7

The value of the **bps** parameter must be **56000** or **64000** if the card application is **ss7ansi** or **ccs7itu** (except for SE-HSL cards, for which the **bps** parameter must be **1984000**).

The value of the **bps** parameter must be **56000** if the card type is either **limds0** or **limocu**.

The value of the **bps** parameter must be **1544000** if the card application is **atmansi**.

The value of the **bps** parameter can be **1544000** only if the card application is **atmansi**.

The value of the **bps** parameter must be **56000** if the card is a multi-port LIM.

The value of the **bps** parameter must be **2048000** if the card type is **lime1atm**.

The value of the **bps** parameter can be **2048000** only if the card application is **atmitu**.

The value of the **bps** parameter must be **1984000** if the card is an HC-MIM or E5-E1T1 card used for SE-HSL links (**linkclass=unchan** is specified in the E1 interface definition).

E1 links running at 56000 bps and 64000 bps are allowed in linksets with other links running at 56000 bps and 64000 bps in the same linkset. T1 links running at 56000 bps and 64000 bps are allowed in linksets with other links that are running at 56000 bps and 64000 bps links in the same linkset. In linksets that contain other types of links, all links in one linkset must use the same transmission rate.

The values **0 - 4** and **6 - 31** cannot be specified for the **vci** parameter; these values are reserved system values.

The linkset adjacent point code (APC) type must be the same as the card application type (ANSI or ITU).

The specified linkset name must exist in the database.

The value that is specified for the **slc** parameter cannot be in use for the specified linkset.

A card must be equipped in the specified card location.

The card in the specified card location must be a LIM or MIM and must exist.

The **e1port** parameter must be specified.

If the **e1port** parameter is not specified for an SE-HSL link, the value defaults to **1**. If the value of **1** has already been specified for a link, the error message will result.

The parameters that are specified for the command must be valid for the type of card in the specified card location.

When a low-speed link is assigned to a card (card application is not **atmansi** or **atmitu**), the ATM high-speed link and E1 ATM parameters (**atmtsel**, **e1atmcrc4**, **etatmsi**, **e1atmsn**, **ll**, **lpset**, **vci**, and **vpi**) cannot be specified.

When an ATM high-speed link is assigned to a card (card application is **atmansi**), the low-speed link parameters (**ecm**, **l1mode**, **l2set**, **pcrn1**, **pcrn2**, and **tset**) cannot be specified.

When an E1 ATM high-speed link is assigned to a card (card application is **atmitu**), the low-speed link parameters (**ecm**, **l1mode**, **l2set**, **pcrn1**, **pcrn2**, and **tset**) cannot be specified.

When an IP link is assigned to a card (card application is **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi**), the following low-speed link parameters, ATM high-speed link parameters, and E1 ATM high-speed link parameters cannot be specified: **lpset**, **vci**, **vpi**, **ll**, **atmtsel**, **e1atmcrc4**, **etatmsi**, **e1atmsn**, **ecm**, **l1mode**, **l2tset**, **pcrn1**, **pcrn2**, and **tset**.

If the card application is **ss7gx25**, the **l2tset** parameter cannot be specified.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links

The **link** parameter values **a1, b1, a2, b2, a3, and b3** can be specified only when:

- The card type is **limds0**, and the card application is **ss7ansi**.
- The card type is **lime1, limt1, or limch**, and the card application is **ss7ansi** or **ccs7itu**.
- The card is an SSED CM, and the card application is **iplim** or **iplimi**.
- The card type is **lime1, limt1, or limch** (and the card is not an SE-HSL card), and the card application is **ss7ansi** or **ccs7itu**.
- The card type is E5-ENET running **iplim** or **iplimi**.

The **link** parameter values **a4-a7** and **b4-b7** can be specified for E5-ENET cards running the **iplim** or **iplimi** application. The **link** parameter values **a4-a15** and **b4-b15** can be specified only when the card type is **lime1** or **limt1** for HC-MIM and E5-E1T1 cards and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a4-a31** and **b4-b31** can be specified only when the card type is **lime1** or **limt1** for an HC-MIM card and the card application is **ss7ansi** or **ccs7itu**.

The **link** parameter values **a4-a15** and **b4-b15** can be specified only when the card type is **lime1** or **limt1** for either an E5-E1T1 card or an HC-MIM card that is used as an E1 or T1 card, and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a16-a31** and **b16-b31** can be specified only when the card type is **lime1** or **limt1** for an HC-MIM card that is used as an E1 or T1 card, and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for a Channel card or for an SE-HSL card. The **link** parameter values **a, b, a1-a7, b1-b7** are valid for E5-ENET cards running **iplim** or **iplimi** application.

HIPR cards must be in card locations **xy 09** and **xy 10** on any shelf that contains one or more HC-MIM, E5-E1T1, or E5-ENET cards. When **link** parameter values **a4-a31** and **b4-b31** are specified, the system verifies that HIPR cards are in card locations **xy 09** and **xy 10** on the same shelf with the specified HC-MIM, E5-E1T1, or E5-ENET card.

Links **a16-a31** and **b16-b31** cannot be specified for even-numbered card locations. HC-MIM cards are dual-slot cards. The links are assigned only to the cards in odd-numbered locations.

If the card application is **ss7gx25**, only the **link=a** parameter can be specified.

If the card application is **ss7ipgw** or **ipgwi**, only the **link=a** parameter can be specified.

The **tset** parameter can be specified only when the **l1mode=dce** parameter is specified. When the **l1mode=dce** parameter is specified and the **tset** parameter is not specified, the **tset** parameter value is set to **off**.

If the card is an HC-MIM used for SE-HSL links, only the **link=a** parameter or **link=b** parameter can be specified. If the card is an E5-E1T1 used for SE-HSL links, only the **link=a** parameter can be specified.

If the specified linkset has a mate linkset, only 1 SS7IPGW or IPGWI signaling link can be assigned to the specified linkset. The assigned link must be an SS7IPGW or IPGWI link.

Up to 8 IPGWx signaling links can be assigned to one linkset if the linkset is not mated.

When SCTP associations are provisioned for LHOSTs on a dual-slot DCM card that is running the **iplim** or **iplimi** application, only 2 point-to-point links can be assigned to the card. Only **link=a** or **link=b** can be specified.

If the card application is **atmansi** or **atmitu**, only the **link=a** parameter can be specified.

When an IP link is assigned to a card running card application **ss7ipgw**, the **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

When an IP link is assigned to a card running card application **ipgwi**, the **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

When an IP link is assigned to a card running card application **ipgwi**, the specified link set must be empty; only 1 IPGWI link can be assigned to a link set.

When the specified linkset name (**lsn**) is defined with the **ipgwapc=yes** parameter, the card application must be **ss7ipgw** or **ipgwi**.

When the specified linkset name (**lsn**) is defined with **multgc=yes**, all links assigned to the linkset must be of the same type (**ipgwi** links or **iplimi** links).

When the specified linkset name (**lsn**) is defined with **multgc=yes**, the card in the specified card location must be running the **ipgwi** or **iplimi** card application.

The **ipliml2** parameter can be specified only for IPLIM signaling links.

All IPLIM links assigned to the same linkset must be defined with the same **ipliml2** parameter value.

Linksets containing 24-bit ITU-N APCs or SAPCs cannot contain IPLIMI SAALTALI or E1 ATM links. These links do not support 24-bit ITU-N traffic.

Linksets with both 14-bit ITU-N and 24-bit ITU-N APCs or SAPCs can contain only IPGWI or IPLIMI M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously.

A maximum of 1200, 1500, or 2000 links is allowed in the system. The maximum depends on the enabled Large System # Links quantity (see the **rtrv-ctrl-feat** command output). A feature access key is required to enable support for more than 1200 links. A mixture of ATM high-speed, E1 ATM high-speed, and low-speed signaling links is supported. If the addition of either a low-speed signaling link or an ATM high-speed signaling link exceeds the total number of low-speed and ATM high-speed signaling links allowed in the system, the **ent-slk** command is rejected.

HC-MIM and E5-E1T1 cards cannot be used as or with Channel cards. The **e1loc** and **t1loc** parameters cannot be specified for HC-MIM or E5-E1T1 cards.

When a card location is specified in the **loc** parameter for an E1 card, a T1 card, or a Channel card (card type **lime1**, **limt1**, or **limch**), a timeslot (**ts**) must be specified for the link. When a card location is specified for a Channel card (card type **limch**) assigned to an E1 interface, the **e1loc** parameter must be specified. When a card location is specified for a Channel card (card type **limch**) assigned to a T1 interface, the **t1loc** parameter must be specified.

A specific timeslot can be assigned in the **ts** parameter to only one E1 signaling link for the E1 interface that services that timeslot.

A specific timeslot can be assigned in the **ts** parameter to only one T1 signaling link for the T1 interface that services that timeslot.

The **ts** parameter value for a T1 link must be in the range **1-24**.

The **ts** parameter cannot be specified for HC-MIM or E5-E1T1 cards that are used for SE-HSL links (**linkclass=unchan** is specified in the E1 interface definition).

If the E1 interface has CAS multi-framing enabled for an E1 card or a Channel card, timeslot 16 cannot be specified.

When the **e1loc** parameter and the **e1port** parameter are specified together in the command, the **atmtsel** parameter cannot be specified.

If a card location is specified in the **loc** parameter for a Channel card (card type **limch**),

- The card in the location specified by the **e1loc** parameter must be an E1 card (card type **lime1**).
- When a Channel card location is specified in the **loc** parameter, the **e1loc** parameter must be specified to identify the associated E1 card. The specified E1 card must be equipped.
- The port specified in the **e1port** parameter must be equipped with an E1 interface for the card specified in the **e1loc** parameter.
- Port 1 must be specified (**e1port=1**) for the associated E1 card port.
- A Channel card (**e1loc** parameter) must be located on the same shelf with its associated E1 card (**loc** parameter).

If a card location is specified in the **loc** parameter for an E1 card (card type **lime1**),

- The **e1port** parameter can be specified to select either port 1 or port 2 for the E1 interface to service the signaling link on a 2-port E1 card or an E1/T1 MIM card. The default is port 1.
- The **e1port** parameter can be specified to select ports 1 - 8 for the E1 interface to service the signaling link on an HC-MIM or an E5-E1T1 card. The default is port 1.
- The E1 interface for the specified or default port must already be defined (see the **ent-e1** command).

The parameters **t1loc**, **t1port**, and **ts** are allowed only when entering a signaling link for an E1/T1 MIM used as a T1 or Channel card or for either an HC-MIM card or an E5-E1T1 card used as a T1 card. All V.35 and HSL parameters (**l1mode**, **l2tset**, **atmtsel**, **vci**, **vpi**, **ll**, and **tset**) are invalid when entering **T1** parameters.

If a card location is specified in the **loc** parameter for a T1 Channel card (card type **limch**),

- The card in the location specified by the **t1loc** parameter must be an E1/T1 MIM card used as a T1 card (card type **limt1**).
- When a Channel card location is specified in the **loc** parameter, the **t1loc** parameter must be specified to identify the associated T1 card. The specified T1 card must be equipped.
- The port specified in the **t1port** parameter must be equipped with a T1 interface for the card specified in the **t1loc** parameter.
- Port 1 must be specified (**t1port=1**) for the associated T1 card port.
- A Channel card (**t1loc** parameter) must be located on the same shelf with its associated T1 card (**loc** parameter).

If a card location is specified in the **loc** parameter for a T1 card (card type **limt1**),

- The **t1port** parameter can be specified to select either port 1 or port 2 for the T1 interface to service the signaling link on a 2-port E1 card or an E1/T1 MIM card. The default is port 1.
- The **t1port** parameter can be specified to select ports 1 - 8 for the T1 interface to service the signaling link on an HC-MIM or an E5-E1T1 card. The default is port 1.
- The T1 interface for the specified or default port must already be defined (see the **ent-t1** command).

If a card location is specified in the **loc** parameter for an HC-MIM card,

- A maximum of 64 links can be assigned to one HC-MIM card (see Table A-1).
- Signaling links cannot be assigned to channel-bridged even-numbered ports.
- An even-numbered port that is in channel-bridged to an odd-numbered port cannot be specified for assigning a signaling link.
- The fan feature bit must be turned on before links can be assigned to HC-MIM cards (see the **chg-feat** command). The system verifies that the fan feature bit is on when links **a4-a31** and **b4-b31** are assigned.
- HIPR cards must be in the xy09 and xy10 card locations (x is the frame, y is the shelf) in each shelf that contains one or more HC-MIM cards.

If a card location is specified in the **loc** parameter for an E5-E1T1 card,

- A maximum of 32 links can be assigned to one E5-E1T1 card (see Table A-1 in Appendix A).
- Signaling links cannot be assigned to channel-bridged even-numbered ports.
- An even-numbered port that is channel-bridged to an odd-numbered port cannot be specified for assigning a signaling link.
- HIPR cards must be in the xy09 and xy10 card locations (x is the frame, y is the shelf) in each shelf that contains one or more E5-E1T1 cards.

An ANSI link (low-speed link) cannot be assigned to a card that is configured to support Synchronous E1 High Speed links (SE-HSL).

Notes

The **ll** parameter is not available in the SEAS database.

When a signaling link is assigned to a card that is running the **atmansi** application or the **atmitu** application, and the **bps**, **vci**, **vpi**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **ll**, **atmsel**, and **lpset** parameters are not specified, the ATM default values are assigned for these parameters.

The MTP Level 2 timers (**l2tset** parameter) are not valid for IP links or for ATM links.

A link is *equipped* when it is physically operational, that is, when the hardware is in place that is needed to support the link.

Signaling Links for 2-port E1 Cards

If you are configuring signaling links for an E1 or Channel card, each signaling link must be associated with a timeslot assigned in the command. Each signaling link/timeslot assigned for an E1 card or a Channel card must be associated with an E1 interface that has been defined for one of the ports on the E1 card (see the **ent-e1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot, the signaling link port (a or b), the timeslot number, and the card location and port for the servicing E1 interface on the E1 card (**e1port** and **e1loc** parameters). Timeslot numbers must be unique to the E1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 interface for different signaling links.

If the link and timeslot are for a Channel card, the Channel card location is specified in the **loc** parameter, and the associated E1 card is specified in the **e1loc** parameter.

If the link and timeslot are for the E1 card itself, the E1 card location is specified in the **loc** parameter, and the E1 interface port (1 or 2) that will service the link is specified in the **e1port** parameter.

The E1 card can service 2 timeslots assigned to signaling links for itself, and 1-31 timeslots assigned to signaling links for Channel cards on the same shelf. If the E1 card is not servicing any Channel cards, 2 links with associated timeslots can be defined—both on the interface on port 1, both on the interface on port 2, or 1 on the interface on each port. The links for any Channel cards serviced by the E1 card must be serviced by the interface on port 1. Each Channel card can have 1 or 2 links assigned to the E1 interface on port 1, for a total of 16 Channel cards and up to 31 links (Timeslot 0 cannot be used). All links for a Channel card must be assigned to the same E1 card. If the E1 card is servicing any Channel cards, the 2 links for the E1 card itself can be assigned to the interface on port 2 (which cannot service Channel card links and can service only 2 links).

Signaling Links for E1/T1 MIM Cards

One E1/T1 MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

If you are configuring signaling links for an E1, T1, or Channel card, each signaling link must be associated with a timeslot assigned in the command. Each signaling link/timeslot assigned for an E1, T1, or Channel card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E1/T1 MIM card (see the **ent-e1** or **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot, the signaling link port (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, or **b3**), the timeslot number, and the card location and port for the servicing E1 or T1 interface on the E1 or T1 card (**e1loc** and **e1port** or **t1loc** and **t1port** parameters). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for different signaling links.

If the link and timeslot are for a Channel card, the Channel card location is specified in the **loc** parameter, and the associated E1 or T1 card is specified in the **e1loc** or **t1loc** parameter.

If the link and timeslot are for the E1 or T1 card itself, the E1 or T1 card location is specified in the **loc** parameter, and the E1 or T1 interface port (1 or 2) that will service the link is specified in the **e1port** or **t1port** parameter.

The E1/T1 MIM used as an E1 card can service 8 timeslots assigned to signaling links for itself, and 1-31 timeslots assigned to signaling links for Channel cards on the same shelf. If the E1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the E1 card is servicing Channel card links, the links for the E1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each E1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by an the E1 card must be serviced by the interface on port 1. Each Channel card can have up to 8 links assigned to the E1 interface on port 1, for a total of up to 31 links (Timeslot 0 cannot be used). used.) All links for a Channel card must be assigned to the same E1 card. If the E1 card is servicing any Channel cards, the 8 links for the E1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

The E1/T1 MIM used as a T1 card can service 8 timeslots assigned to signaling links for itself, and 1-24 timeslots assigned to signaling links for Channel cards on the same shelf. If the T1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the T1 card is servicing Channel card links, the links for the T1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each T1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by the T1 card must be serviced by the interface on port 1. Each Channel

card can have up to 8 links assigned to the T1 interface on port 1, for a total of up to 24 links. All links for a Channel card must be assigned to the same T1 card. If the T1 card is servicing any Channel cards, the 8 links for the T1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

Signaling Links for HC-MIM Cards

An HC-MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the HC-MIM card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a 1-a31**, **b**, **b1-b31**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each HC-MIM used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on an HC-MIM card can service 1-31 timeslots.

Each HC-MIM used as a T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on an HC-MIM card can service 1-24 timeslots.

Signaling Links for E5-E1T1 Cards

An E5-E1T1 card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E5-E1T1 card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a 1-a15**, **b**, **b1-b15**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each E5-E1T1 used as an E1 card can have up to 32 signaling links assigned to the card. Each E1 interface on an E5-E1T1 card can service 1-31 timeslots.

Each E5-E1T1 used as a T1 card can have up to 32 signaling links assigned to the card. Each T1 interface on an E5-E1T1 card can service 1-24 timeslots.

Output

;

ent-spc**Enter Secondary Point Code**

Use this command to enter an SPC (secondary point code) into the database.

Keyword: **ent-spc**

Related Commands: **dlt-spc, rtrv-spc**

Command Class: Database Administration

Parameters

:spc= (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym: **spca**

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

:spc/spca/spci/spcn/spcn24= (mandatory)

Secondary point code.

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:spci= (mandatory)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

Range: **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:spcn= (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

Range: **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:spcn24= (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

Range: **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

msa—**000-255**

ssa—**000-255**

sp—**000-255**

Example

The following example adds a secondary point code:

ent - spc : spc=10-20-30

The following example adds a 24-bit ITU-N secondary point code:

ent - spc : spcn24=99-99-99

The following example adds a spare ITU-N secondary point code:

ent - spc : spcn=s-12345

Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix **s-**) can be specified in the command.

The specified secondary point code must be a full point code. A *full point code* contains numerical values for all three segments of the point code.

The point code **0-0-0** is not a valid ANSI or ITU-I secondary point code.

The specified secondary point code to be added must not already exist as a secondary point code.

A maximum of 40 secondary point codes may be defined.

The MPC feature must be turned on before a secondary point code can be added using this command.

The specified secondary point code must not already exist as a destination or an alias in the Destination table.

The specified secondary point code cannot match an existing true point code or capability point code in the Site Identification table.

Notes

If the **spcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

Output

ent - spc : spc=10-20-30

```
rlghncxa03w 04-02-18 08:50:12 EST  EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full
ENT-SPC: MASP A - COMPLTD
```

;

ent-split-npa**Enter Split NPANXX**

Use this command to force two different NPANXXs to reference the same last 4-digit telephone number (TN) in the database. During this time, updates to either NPANXX will update the same last 4-digit entry of a 10-digit ported TN. All existing NPANXX data is copied automatically to the new NPANXX for the split.

NOTE: This command is obsolete.

NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.

Keyword: ent-split-npa

Related Commands: dlt-split-npa, rtrv-split-npa

Command Class: LNP Database

Parameters

:nnpanxx= (mandatory)
New numbering plan area.
Range: 6 digits

:npnpanxx= (mandatory)
Numbering plan area.
Range: 6 digits

Example

ent-split-npa:npnpanxx=214254:nnpanxx=972254

Dependencies

The LNP feature must be turned **on** (see the **enable-ctrl-feat** command) before this command can be entered.

The NPANXX must not already be split.

Notes

The maximum number of NPANXX entries allowed is 150,000.

Output

```
ent-split-npa:npnpanxx=214254:nnpanxx=972254
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
ENT-SPLIT-NPA: MASP A - COMPLTD
;
```

ent-srvsel**Enter Service Selector**

Use this command to assign the applicable service selectors required to specify a service entry for DSM services.

Keyword: ent-srvsel

Related Commands: chg-srvsel, dlt-srvsel, rtrv-srvsel

Command Class: Database Administration

Parameters

:gti/gtia/gtii/gtin/gtin24= (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), and **gtin** (ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

Range: Supported value for ANSI: **gti=2** and **gtia=2**
Supported values for ITU: **gtii= 2, 4 ; gtin= 2, 4 ; gtin24 = 2, 4**

:serv= (mandatory)

DSM service.

NOTE: The gport service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) feature; use the smsmr service. The gport service cannot be used for Portability Check for Mobile Originated SMS; use the mnpsms service. The mnp service includes the G-Port, A-Port, and IS41 GSM Migration services.

Range: **eir, gflex, gport, inpq, inpmr, mnpsms, smsmr, idps, idpr, mnp**

eir — Equipment Identity Register

gflex — GSM flexible numbering

gport — GSM number portability

inpq — INP query

inpmr — INP message relay

mnpsms — Portability Check for Mobile Originated SMS

smsmr — Prepaid SMS Intercept Phase 1

idps — IDP Screening for Prepaid

idpr — Prepaid IDP Query Relay

mnp — Mobile Number Portability

:ssn= (mandatory)

Subsystem number.

Range: **10-255 ***

:tt= (mandatory)

Translation type.

Range: **10-255**

:nai= (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **1sub, rsvd, natl, intl**

:naiv= (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

Range: **0 -127**

:np= (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: **e164, generic, x121, f69, e210, e212, e214, private**

:npv= (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

Range: 10-15

:snai= (optional)

The service nature of address indicator.

Range: 1sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn

natl — National significant number

intl — International number

rnidn — Routing number prefix and international dialed/directory number

rnndn — Routing number prefix and national dialed/directory number

rnsdn — Routing number prefix and subscriber dialed/directory number

ccrndn — Country code, routing number, and national directory number

sub — Subscriber number

:snp= (optional)

The service numbering plan.

Range: 1e164, e212, e214

Example

```
ent-srvsel:gtia=2:tt=9:snp=e212:snai=natl:serv=gflex
```

```
ent-srvsel:gtia=2:tt=10:snp=e164:snai=intl:serv=gflex
```

```
ent-srvsel:gtia=2:tt=253:snp=e214:snai=intl:serv=gflex
```

```
ent-srvsel:gtin=4:tt=0:npv=10:naiv=125:serv=inpq
```

```
ent-

Dependencies

The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.

The INP feature must be turned on before the **serv=inpqr** or **serv=inpq** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The Prepaid SMS Intercept Phase 1 feature must be turned on before the **serv=smsmr** parameter can be specified.

The Portability Check for Mobile Originated SMS feature must be turned on before the **serv=mnpsms** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **serv=eir** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The value **4** is not valid for the **gtia** parameter.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, no **np(v)** and **nai(v)** parameter combinations can be specified.

When the **gtii/gtin/gtin24=4** parameter is specified, an **np(v)** and **nai(v)** parameter combination must be specified. The parameters can be specified in these combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

When the **serv** parameter value is **inpqr**, **inpq**, **gport**, **eir**, **mnpsms**, or **smsmr**, the **gtia** and **gti** parameters cannot be specified.

When the **serv=inpqr** parameter is specified, the **snp=e164** parameter must be specified.

When the **serv=inpq** parameter is specified, the **gtii** parameter cannot be specified.

When the **serv=gport** parameter is specified, the **gti/gtia** parameter cannot be specified.

When the **snai** parameter value **rnidn**, **rnndn**, or **rnsdn** is specified, a **serv** parameter value of **inpqr**, **gport**, **smsmr**, or **mnpsms** must be specified.

When the **serv** parameter value **gflex**, **gport**, **inpqr**, **mnpsms**, or **smsmr** is specified, the **snai** and **snp** parameters must be specified.

When the **serv** parameter value **inpq**, **idpr**, or **eir** is specified, the **snai** and **snp** parameters cannot be specified.

When the **snai=ccrndn** parameter is specified, the **serv** parameter value **gport**, **mnpsms**, or **smsmr** must be specified.

When the **serv** parameter value **gport**, **mnp sms**, or **smsmr** is specified, the **snp=e164** parameter must be specified.

An entry must not already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn=*** parameters, an entry matching a specific **ssn** cannot already exist.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn** parameters, an entry matching the **ssn=*** parameter cannot already exist.

An ITU Service Selector cannot be entered when the **ansigflex** STP option is enabled (see the **chg-stpotps** command)

The IDP Screening for Prepaid feature must be on before the **serv=idps** parameter can be specified.

When the **serv=idps** parameter is specified, supported mandatory parameters are **tt** , **serv** , **ssn** , **gtin** and **gtii** . Supported optional parameters are **np** and **nai** .

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

When the **serv=idpr** parameter is specified, the only valid mandatory service parameters are **tt**, **serv**, **ssn**, **gtii** and **gtin**. When the **serv=idpr** parameter is specified, the only valid optional parameters are **np** and **nai**.

The A-Port or IS41 GSM Migration (IGM) feature must be turned on before the **serv=mnp** parameter can be specified.

If the A-Port or IGM feature is enabled, the **serv=gport** parameter cannot be specified.

An entry must not already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry must not already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry must not already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

Notes

Table 5-48 provides examples of acceptable and unacceptable parameter combinations for the **ent-srvsel** command:

Table 5-48. Examples of **ent-srvsel** Parameter Combinations

Command	Comments

ent-ss-appl

Enter Subsystem Application

Use this command to reserve a subsystem number for an application and set the application status to be online or offline. You can define only one subsystem per application. The application must be unique.

Keyword: ent-ss-appl

Related Commands: chg-ss-appl, dlt-ss-appl, rtrv-ss-appl

Command Class: Database Administration

Parameters

:appl= (mandatory)

Application type.

Range: lnp, inp, eir

:ssn= (mandatory)

Primary subsystem number.

Range: 2-255

:stat= (optional)

Status.

Range: offline, online

Default: offline

Example

ent-ss-appl: appl=lnp:ssn=16:stat=online

ent-ss-appl: appl=inp:ssn=15:stat=offline

ent-ss-appl: appl=eir:ssn=11:stat=offline

Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **ent-ss-appl:appl=lnp** command can be entered.

The INP feature must be turned on before the **ent-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **ent-ss-appl:appl=eir** command can be entered.

The specified application (**appl** parameter) must not already be assigned.

The maximum number of applications must not already be assigned.

For LNP, the STP true point code and LNP subsystem must exist in the MAP table.

For INP, the STP true point code and INP subsystem must exist in the MAP table.

For EIR, the STP true point code and EIR subsystem must exist in the MAP table.

Notes

If not specified, the application subsystem status defaults to **offline**. When the application is **offline**, the application subsystem is down.

The LNP application status applies to both message relay and LNP query.

Output

```

ent-ss-appl:appl=lnp:ssn=16:stat=online
  rlgncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
  ENT-SS-APPL: MASP A - COMPLTD
;

```

ent-subnetid**Enter Subnet ID**

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (**subnetidlen** parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

Keyword: ent-subnetid

Related Commands: dlt-subnetid, rtrv-subnetid

Command Class: Database Administration

Parameters

:subnetid= (optional)

Vendor Subnet ID

Range: 1-15 digits

This number must contain the number of digits defined by the **subnetidlen** parameter value.

Valid digits are **0-9, a-f, A-F**.

:subnetidlen= (optional)

Subnet ID Length.

Range: 1-15

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

:subnetnum= (optional)

Subnet Number. The Subnet Number is used as a reference to the prefix number for the ISUP NP with EPAP feature.

Range: 1-5

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

4—Corresponds to the prefix defined with prefix number 4 (see the **chg-prefix** command).

5—Corresponds to the prefix defined with prefix number 5 (see the **chg-prefix** command).

Example

```
ent-subnetid:subnetidlen=6
```

```
ent-subnetid:subnetid=886933:subnetnum=1
```

Dependencies

The value **none** cannot be specified for the **subnetid** parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

All SUBNETID table entries must have the number of digits defined by the **subnetidlen** parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The **subnetidlen** parameter cannot be specified in the same command with the **subnetid** and **subnetnum** parameters.

Either the **subnetidlen** parameter, or the **subnetid** and **subnetnum** parameters can be specified in one command.

Notes

None.

Output

The Subnet ID length must be entered first.

ent-subnetid:subnetidlen=6

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
```

```
ENT-SUBNETID: MASP A - COMPLTD
```

```
;
```

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

ent-subnetid:subnetid=886933:subnetnum=1

```

```

```
VENDID table is (6 of 50) 11% full
```

```
ENT-SUBNETID: MASP A - COMPLTD
```

```
;
```

ent-t1

Enter T1 Interface

Use this command to enter an interface for an E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card used as a T1 card. The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

Framing, line length, encoding, master/slave clocking options, and the signaling bit setting can be specified.

On an HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through. Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified.

Keyword: ent-t1

Related Commands: chg-t1, dlt-t1, rtrv-t1, tst-t1

Command Class: Database Administration

Parameters

:loc= (mandatory)

The card location as stenciled on the shelf of the system.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

:t1port= (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

Range: 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

:chanbrdg= (optional)

Indicates whether an odd numbered port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even numbered port for non-signaling data pass through.

Range: on, off

Default: off

:encode= (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

Range: b8zs, ami

Default:

:framing= (optional)

Indicator for framing format.

Range: sf, esf

Default:

:ll= (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

Range: 0-655

Default: 133

:t1tsel= (optional)

Timing source. Indicates master (external) or slave (line) timing source, or timing source recovered from the paired master port for the channel bridged slave port.

Range: line, external, recovered

Default: line

Example

ent -

t1: loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100

ent -t1: loc=1205:t1port=2:encode=b8zs:t1tsel=external:framing=esf

ent -t1: loc=1203:t1port=1:chanbrdg=on:t1tsel=recovered

ent -t1: loc=1203:t1port=3:chanbrdg=on:t1tsel=external

Dependencies

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter must not be already equipped with a T1 interface.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered T1 ports (**t1port** parameter).

The timing source parameter **t1tsel** must be specified if the **chanbrdg=on** parameter is specified.

The **t1tsel=line** parameter cannot be specified for a T1 port (**t1port** parameter) when the **chanbrdg=on** parameter is specified.

The **t1tsel=recovered** parameter cannot be specified for a T1 port (**t1port** parameter) unless the **chanbrdg=on** parameter is specified.

When provisioning an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card to channel bridging mode using the **chanbrdg=on** parameter, the **force=yes** parameter must be specified if the adjacent even-numbered port is already provisioned with a T1 interface.

All signaling links assigned to adjacent even-numbered T1 ports must be deleted before an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card can be provisioned into channel bridging mode using the **chanbrdg=on** parameter. See the **dlt-slks** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified and an HC-MIM card is present in the specified odd card location (**loc** parameter).

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards. The system checks for HIPR cards when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified for HC-MIM and E5-E1T1 cards.

T1 ports **3 - 8** (**t1port** parameter) can be specified only for HC-MIM and E5-E1T1 cards.

Notes

One or two T1 interfaces must be defined on an E1/T1 MIM card used as a T1 card after the T1 and any associated Channel card types (**limt1** and **limch**) are defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card and any associated Channel cards (with the **ent-slks** command).

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a T1 card after the T1 card type (**limt1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card.

On a HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg** parameter must be specified for the odd-numbered T1 port.

Output

```
ent -
t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
    rlgncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
    ENT-T1: MASP A - COMPLTD
;
```

ent-tt

Enter Translation Type

Use this command to add a translation type to the system database.

NOTE: If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).

Keyword: ent-tt

Related Commands: dlt-tt, rtrv-tt

Command Class: Database Administration

Parameters

:type/typea/typei/typen/typen24= (mandatory)

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

Range: 000-255

Default: No translation type is specified

:alias= (optional)

The alias of the global title translation type

Range: 000-255

Default: No alias assignment is made.

:ndgt= (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

Range: 1-21

Default: 6

(not applicable if the VGTT feature is on)

:ttn= (optional)

Translation type name.

Range: ayyyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

Default: No translation name is given

Example

ent-tt:type=230:ttn=lidb:ndgt=5

ent-tt:type=230:ttn=lidb:alias=007

ent-tt:type=2:ndgt=5

ent-tt:type=3

Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (*) parameter values are not allowed for this command.

The translation type specified by **type** or **typea** cannot already exist in the database containing the ANSI types. A translation type specified by **typei**, **typen**, or **typen24** cannot already exist in the database containing the ITU types.

The translation name cannot already exist in either the ANSI or ITU database.

If an alias is specified, the translation type must be specified and must already exist in the database for the network type. If the translation name is specified when defining an alias, the name must already be associated with the translation type.

The translated signaling point code must be a full point code (*ni-nc-ncm*).

The translated signaling point code must have been specified previously as a full point code destination, or it must be a member of a previously specified cluster.

The **alias** parameter and the **ndgt** parameter cannot be specified together in the command.

If an alias is specified, the **alias** value cannot already be defined as either a translation type or an alias for the respective (ANSI or ITU) type.

The translation type name must be unique.

The **ndgt** parameter is not valid if the VGTT (variable length GTT) feature is turned on.

Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The **ttn** parameter always refers to a translation type. Aliases do not have translation type names.

Output

```
ent -
t1:loc=1205:t1port=1:encode=ami:t1tsel=internal:external:framing=s
f:ll=100
    rlgncxa03w 04-01-07 11:43:04 EST  EAGLE 31.3.0
    ENT-TT: MASP A - COMPLTD
;
```

ent-ttmap

Enter Translation Type Mapping

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

Keyword: ent-ttmap

Related Commands: chg-ttmap, dlt-ttmap, rtrv-ttmap

Command Class: Database Administration

Parameters

:ett= (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

Range: 000-255

:io= (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

Range: i, o
i — incoming
o — outgoing

:lsn= (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

Range: aaaaaaaaaa
1 alphabetic character followed by 9 alphanumeric characters

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc2= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc3= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *configmdclassname*, *bool*

configmdclass—; value

bool—; value **yes**, **no**

:cc4= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc5= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc6= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc7= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:cc8= (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

Range: *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

ayy—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

-no—Indicates that the command class is not allowed.

-yes—Indicates that the command class is allowed.

:db= (optional)

Access to all commands in command class Database Administration.

Range: **yes, no**

Default: **no**

:dbg= (optional)

Access to all commands in command class Debug.

Range: **yes, no**

Default: **no**

:link= (optional)

Access to all commands in command class Link Maintenance.

Range: **yes, no**

Default: **no**

:lnpbas= (optional)

Access to all commands in the command class LNP Basic

Range: **yes, no**

Default: **no**

:lnpdb= (optional)

Access to all commands in the command class LNP Database

Range: **yes, no**

Default: **no**

:lnpsub= (optional)

Access to all commands in the command class LNP Subscription

Range: **yes, no**

Default: **no**

:page= (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.

Range: 0-999 days

Default: The value specified for the **page** parameter on the **chg-secu-dflt** command

:pu= (optional)

Access to all commands in command class Program Update.

Range: yes, no

Default: no

:revoke= (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

Range: yes, no

Default: no

:sa= (optional)

Access to all commands in command class Security Administration.

Range: yes, no

Default: no

:sys= (optional)

Access to all commands in command class System Maintenance.

Range: yes, no

Default: no

:uout= (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

Range: 0-999

Default: The value specified for the **uout** parameter on the **chg-secu-dflt** command

Example

ent-user:uid=john:db=yes

ent-user:uid=john*mayer:db=yes

ent-user:uid=user123:cc5=u21-yes:cc8=u32-yes

Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

All new users are given access to the command class Basic as a default.

The specified user ID cannot already exist.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **lnpbas**, **lnpdb**, and **lnpsub** parameters can be specified.

If the **all=yes** parameter is specified, and the LNP feature has not been turned on, the **lnpbas**, **lnpdb**, and **lnpsub** parameter values default to **no**.

The user IDs **seas** or **none** cannot be entered because they are reserved for system use. Up to 100 users can be entered.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1-cc8** parameters.

The **cc1-cc8** parameter values must have valid default or provisioned configurable command class names. Default names are **u01-u32**.

If the LNP ELAP Configuration feature is turned on, then the LNP Subscription commands cannot be accessed, and the **lnpsub** parameter cannot be specified.

Notes

To disable user ID aging, specify the **uout=0** parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

Output

```
ent-user:uid=john*mayer:db=yes
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-USER: MASP A - COMPLTD
;
```

ent-vendid

Enter Vendor ID

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (**vendidlen** parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

Keyword: ent-vendid

Related Commands: dlt-vendid, rtrv-vendid

Command Class: Database Administration

Parameters

:vendid= (optional)

Vendor ID

Range: 1-15 digits

:vendidlen= (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

Range: 0-15

:vendnum= (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

Range: 1-3

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

:vendtype= (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

Range: 1-2

Example

```
ent-vendidvend: len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

Dependencies

The value **none** cannot be specified for the **vendid** parameter.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 200 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the **vendidlen** parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The **vendidlen** parameter cannot be specified in the same command with the **vendid**, **vendidlen**, and **vendtype** parameters. Either the **vendidlen** parameter, or the **vendid**, **vendidlen**, and **vendtype** parameters can be specified in one command.

Notes

None.

Output

The Vendor ID length must be entered first, before any Vendor IDs can be entered.

```
ent-vendid:vendidlen=6

ent-x25-dstn**Enter X.25 Destination**

Use this command to associate an X.25 network address with an existing SS7 point code in the routing table, and optionally, a subsystem within that point code. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

Keyword: ent-x25-dstn

Related Commands: chg-x25-dstn, dlt-x25-dstn, rtrv-x25-dstn

Command Class: Database Administration

Parameters

:dpc= (mandatory)

This parameter is the real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity. The value for this parameter is a point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

Synonym: dpca

Range: 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

:xaddr= (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

Range: 1-15 digits

:ssn= (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

Range: 1-255

Default: 5

Example

```
ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123
```

```
ent-x25-dstn:xaddr=255864567:dpc=033-001-013
```

Dependencies

- Each X.25 address must have at least four digits.
- The DPC must exist in the destination table.
- The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-ncm*).
- The X.25 address cannot exist in X.25 destination table.
- The maximum number of X.25 destinations is 1024.

Notes

None

Output

```
ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0
X.25 DSTN TABLE 45 % FULL
ENT-X25-DSTN: MASP A - COMPLTD
;
```

ent-x25-rte**Enter X.25 Route**

Use this command to define the routing parameters needed by the gateway portion of the LIMs with the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system STP.

Keyword: ent-x25-rte

Related Commands: chg-x25-rte, dlt-x25-rte, rtrv-x25-rte

Command Class: Database Administration

Parameters

:saddr= (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

Range: 1-15 digits

:type= (mandatory)

The type of X.25 connection that the link is expected to maintain.

Range: pvc, svca, svcr

pvc — Permanent virtual circuit

svca — automatic virtual circuit

svcr — remote virtual circuit

:xaddr= (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

Range: 1-15 digits

:lc= (optional)

The number of the logical channel on the X.25 signaling link to which the PVC connection is assigned.

This parameter is mandatory if the **type=pvc** parameter is specified. If the **type=svca** or **type=svcr** parameters are specified, the logical channel number is arbitrary and cannot be specified.

Range: 1-255

Default: The logical channel is not given.

:lc2nm= (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

Range: yes, no

Default: yes—if **rt=xpc** is specified

no—if **rt=pc** is specified

no—if **rt** is not specified

:loc= (optional)

The card location containing the X.25 signaling link that will maintain the connection. For an automatic virtual circuit, this link is the link on which the system STP initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

Default: The card location is not given

:port= (optional)

The port on the card containing the X.25 signaling link.

Range: a

Default: The port is not given

:rt= (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) Route on X.25 destination point code (XPC) and (2) Route using X.25 origination and destination point code combinations (PC).

Range: xpc, pc

Default: pc

Example

ent -x25-

rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3

ent -x25-rte:xaddr=225255:saddr=133132:type=svca:loc=1201:port=a

ent -x25-rte:xaddr=225255:saddr=133132:type=svcr

ent -x25-rte:xaddr=225255:saddr=133132:type=svcr:rt=xpc:lc2nm=yes

Dependencies

Each X.25 address must have at least four digits.

The **limds0**, **limdscs**, **limocu** and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL type.

The shelf and card must be equipped.

The logical channel number cannot be specified if the connection type is an automatic virtual circuit or a remote virtual circuit (**type=svca** or **type=svcr**).

The logical channel number must be specified if the connection type is PVC (**type=pvc**).

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

The **loc** and **port** parameters cannot be specified if the connection type is a remote switched virtual circuit (**type=svcr**). The far end initiates a remote switched virtual circuit and sends the system the location and port information.

The card location (**loc**) must be specified if the connection type is a permanent virtual circuit or an automatic virtual circuit (**type=pvc** or **type=svca**).

Each X.25 address must exist in X.25 destination table.

The X.25 address must be assigned to a destination in the X.25 domain.

The SS7 address must be assigned to a destination in the SS7 domain.

The combination of the two X.25 addresses must be unique in the X.25 route table.

The combination of point code/SSNs assigned to the two X.25 addresses must be unique in the X.25 route table.

The maximum number of X.25 routes in a system is 1024.

The point codes assigned to each of the X.25 destinations must also be assigned to routes.

The signaling link must be assigned to a LIM with the **ss7gx25** application.

The signaling link assigned to the X.25 route must be in the database and must be assigned to a linkset. The linkset must be assigned to a route associated with an X.25 destination and must contain an APC in the X.25 domain. This can be verified by entering the following commands:

- **rtrv-sl**—Displays the signaling links
- **rtrv-ls**—Displays the linksets
- **rtrv-rte**—Displays the routes
- **rtrv-x25-dstn**—Displays the X.25 destinations
- **rtrv-dstn**—Displays the destination point codes.

The logical channel number cannot be greater than the maximum number of permanent virtual circuits allowed for the signaling link. For example, if the total number of permanent virtual circuits allowed for the signaling link is 15, the logical channel number for this signaling link cannot be greater than 15.

The logical channel of the signaling link cannot already be assigned to an X.25 route.

The number of permanent virtual circuits cannot exceed the maximum number of permanent virtual circuits defined for the signaling link.

The number of automatic virtual circuits cannot exceed the maximum number of switched virtual circuits defined for the signaling link.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

Notes

The connection can be one of three types, a permanent virtual circuit, an automatic virtual circuit, or a remote virtual circuit.

Permanent virtual circuits are permanent X.25 virtual connections between two signaling points established on one of the logical channels of an X.25 signaling link. This connection is setup by the network, therefore no setup is required by the system to establish a permanent virtual circuit connection.

Automatic virtual circuits are essentially the same as permanent virtual circuits, except that the connection must be established by either the system or the X.25 destination entity.

Remote virtual circuits are also essentially the same as automatic virtual circuits, except that the connection can be established only by the X.25 destination entity.

All LIMs with the **ss7gx25** application share this information. Even though these connections apply to only one card, they are used by all cards.

Output

```

ent -x25-
rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0

;

```

flash-card**Flash-Card**

Use this command to load all flash images (GPL) supported by a specified card. This commands performs the same functions as the **init-flash** and the **act-flash** commands.

Keyword: flash-card

Related Commands: act-flash, init-flash

Command Class: System Maintenance

Parameters

:code= (mandatory)

The GPL type to be loaded.

Range: appr, trial

appr — Approved GPL

trial — Trial GPL

:loc= (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

Range: 1101-1112, (1113 and 1115 OAM), 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

:force= (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

Range: yes, no

Default: no

Example

```
flash-card:loc=1105:code=trial
```

```
flash-card:loc=1105:code=appr:force=yes
```

Dependencies

Cards do not have to be provisioned to use the **flash-card** command. However, if the specified card is provisioned and not inhibited, use of the **force** parameter is required.

The specified card locations must be running a flashable software image.

HMUX or HIPR cards are not supported.

If the even-numbered TDM (1114,1116) is specified, the flash occurs on the odd-numbered GPSM-II running OAM (1113,1115).

The specified card location cannot be the active MASP (either the active GPSM-II or the active TDM).

Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the **force** parameter. The **act-flash** and **init-flash** commands must then be used to reload the same code level.

Output

```

format-disk**Format Disk**

Use this command to format and initialize a system removable cartridge or standby Terminal Disk Module (TDM).

NOTE: The format-disk command leaves the disk unusable until the chg-db and copy-gpl commands are entered.

Keyword: **format-disk**

Related Commands: **chg-db, copy-disk, copy-gpl, copy-meas, disp-disk-dir, rept-stat-db, rtrv-gpl**

Command Class: System Maintenance

Parameters

:type= (mandatory)

The type of removable cartridge to format.

Range: **fixed, meas, system**

fixed — The standby fixed disk on the standby TDM

meas — The measurement cartridge

system — The system cartridge

:force= (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

Range: **yes, no**

Default: **no**

:low= (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying **low=no** can be used to decrease formatting time.

Range: **yes, no**

Default: **yes**

:prtnggrp= (optional)

Partition group. This parameter indicates which disk partition group is to be formatted. Specifying the inactive group is relevant only when **type=fixed** is specified.

CAUTION: Do not enter the format-disk:prtnggrp=inactive command unless directed to by Tekelec Technical Services to avoid possible loss of a previously archived software release.

Range: **active, inactive**

Default: **active**

Example

format-disk:type=system

format-disk:type=meas:force=yes

Dependencies

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

To format a cartridge that already contains system data, the **force=yes** parameter must be specified.

The **force=yes** parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have a **dms.cfg** file are recognized as system removable cartridges. A removable cartridge must be inserted and made ready before the **type=meas** or **type=system** parameter can be specified in the command.

Measurements collection must be inhibited during execution of the **format-disk** command. If measurements are not inhibited, **format-disk** cannot be executed.

- Do not enter the **chg-measopts:collect=on** command while the **format-disk** command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter **format-disk** until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The **low=no** parameter must be specified when the **prtngrp** parameter is specified.

Notes

The **low=no** parameter should be specified when upgrading a spare TDM. The **low=yes** parameter should be specified when there is a suspected hardware problem.

When the **type=meas** parameter is specified, a measurements removable cartridge is built.

When the **type=system** parameter is specified, a system removable cartridge is built.

A system removable cartridge can contain only GPLs and the database. Measurement data cannot be placed on a system removable cartridge. After a system removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-gpl** and **chg-db:action=backup:dest=remove** commands. The **copy-gpl** command copies all approved GPLs from the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the approved GPLs. The **chg-db:action=backup:dest=remove** command copies the database from the current partition of the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the database.

A measurements removable cartridge can contain only measurement data. Database information and GPLs cannot be placed on a measurements removable cartridge. After a measurements removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-meas** command. The **copy-meas** command copies all measurement data from the fixed disk on the active TDM to a measurements removable cartridge for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the **format-disk** command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the

standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

Standby MASP has not finished initializing - please wait...

Standby MASP initialization timed out - continuing...

The **dms.cfg** file on either the active TDM or a system formatted removable cartridge is used by the **format-disk** command when formatting the target disk. The location of the **dms.cfg** file cannot be specified by the **format-disk** command. The value of the **type** parameter is used to determine the target disk to format and the location of the **dms.cfg** file on which to base the format. Table 5-49 shows the location of the **dms.cfg** file based on the value of the **type** parameter for the **format-disk** command.

Table 5-49. DMS.CFG File Location for format-disk Command

Value of the type Parameter	Target Disk (Card Location)	Location of the DMS.CFG File
fixed	Standby TDM (1114 or 1116)	Removable Cartridge (1117)
system	Removable Cartridge (1117)	Active TDM (1114 or 1116)
meas	Removable Cartridge (1117)	Active TDM (1114 or 1116)

The **format-disk** command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

Table 5-50 shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

Table 5-50. Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of the Partition
SyQuest Removable Cartridge	1117	256 Mbytes	1	256 Mbytes
Magneto-Optical Removable Cartridge	1117	1096 Mbytes*	1	1024 Mbytes
TDM	1114 or 1116	540 Mbytes	1	507 Mbytes
TDM	1114 or 1116	2 Gigabytes	1	2014 Mbytes
TDM	1114 or 1116	4 Gigabytes	2	2047 Mbytes
* The magneto-optical removable cartridge is a double-sided cartridge that contains 2.3 gigabytes of data, but only one side of the disk can be formatted and used when it is inserted into the removable cartridge drive. The target capacity given for the magneto-optical				

Table 5-50. Disk Format Capacity

Target Disk Type	Disk Location	Target Capacity	Number of Partitions	Formatted Size of the Partition
removable cartridge is for one side of the disk in the cartridge and is approximately one half of the total capacity of the magneto-optical removable cartridge.

inh-alm**Inhibit Alarm Reporting**

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All **rept-stat-xxx** commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

Keyword: inh-alm

Related Commands: rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls, rept-stat-lsms, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log, unhb-alm

Command Class: System Maintenance

Parameters

NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

:dev= (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be inhibited.

Range: applsock, as, card, cdt, clock, dlk, e1port, ls, lsmsconn, route, seasx25, slk, t1port, trm, rtx
applsock — IP gateway application socket
as — IP gateway application Application Server
card — Cards in the database
cdt — Customer defined troubles
clock — System clock
dlk — TCP/IP data links
e1port — E1 port on E1/T1 MIM or HC MIM cards
ls — Linksets
lsmsconn — Communication link between the LSMS and the EMS
route — Route
seasx25 — The SEAS X.25 links
slk — Signaling links
t1port — T1 port on E1/T1 MIM or HC MIM cards
trm — Terminals
rtx — Exception Route

:asname= (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to inhibit alarms for the named Application Server.

Range: ayyyyyyyyyyyyyy
 Up to 15 alphanumeric characters; the first character must be a letter.

:cic= (optional)

Starting Circuit Identification Code. This parameter is used with the **ecic** parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

Range: 0-16383

:dpc= (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

Synonym: dpca

Range: p-, 000-255, *
 Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
prefix—p-
 The asterisk value (*) is not valid for the *ni* subfield.
 When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.
 When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.
 When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code **000-000-000** is not a valid point code.

:dpc/dpca/dpci/dpcn/dpcn24= (optional)

Destination Point Code

:dpci= (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

Range: **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

zone—**0-7**

area—**000-255**

id—**0-7**

The point code **0-000-0** is not a valid point code.

:dpcn= (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

Range: **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**s-, p-, ps-**

nnnnn—**0-16383**

gc—**aa-zz**

m1-m2-m3-m4—**0-14** for each member; values must sum to 14

:dpcn24= (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

Range: **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

prefix—**p-**

msa—**000-255**

ssa—**000-255**

sp—**000-255**

:dur= (optional)

Duration. The period for which the alarms are inhibited. If the **dur=temp** parameter is specified, the clearing of the event that caused an alarm also clears the alarm inhibit, and the alarms become uninhibited on the device.

Range: **perm, temp, timed**

perm — A permanent inhibition of an alarm.

temp — A temporary inhibition of an alarm.

timed — An inhibition of an alarm for a specified duration.

Default: **perm**

:e1port= (optional)

Port ID. The E1 port on the specified E1 card.

The **e1port** parameter is mandatory if the **dev=e1port** parameter is specified.

Range: **1-8**

Ports **3 - 8** can be specified only for HC-MIM cards and E5-E1T1 cards.

:ecic= (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

Range: **0-16383**

:edate= (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the **etime** parameter value.

The **edate** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **101-991231**

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yymmdd*).

:etime= (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the **edate** parameter value.

The **etime** parameter is valid and required when the **dur=timed** parameter is specified.

Range: **0-2359**

Specify the time in the format of *hour* followed by *minute* (*hhmm*).

:force= (optional)

Allows critical alarms to be inhibited on a device.

The **force** parameter is mandatory if the **lvl=crit** parameter is specified.

The **criticalminh** STP option must be turned on before the **force** parameter can be specified.

Range: **yes, no**

Default: **no**

:id= (optional)

Identification number of the customer-defined trouble (**5 - 16**). Customer-defined troubles **1 - 4** are generated critical alarms and cannot be specified as values for the **id** parameter.

Range: **5-16**

:ilsn= (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

Range: *ayyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

:link= (optional)

Signaling link on the card specified in the **loc** parameter.

Synonym: **port**

Range: **a, b, a1-a31, b1-b31**

a, b—For **dev=dlk**, **dev=slk** for a two-port LIM

a1, a2, b1, b2—For **dev=ndclk/seasx25/lsmconn**

a, b, a1, b1, a2, b2, a3, b3—For **dev=slk** for a multi-port LIM

a, b, a1-a31, b1-b31—For **dev=slk** for an HC MIM

:loc= (optional)

The card location as stenciled on the shelf of the system.

Range: **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

:lsn= (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

Range: `ayyyyyyyyy`
1 alphabetic character followed by up to 9 alphanumeric characters.
